KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā	as in ale, fate.	ch	as in chair, cheese.
ā̄	“ “ senate, chaotic.	D	“ “ Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then.
â	“ “ glare, care, and as <i>e</i> in there.	g	“ “ go, get.
ǎ	“ “ am, at.	G	“ “ German Landtag = <i>ch</i> in Ger. ach, etc.
ä	“ “ arm, father.	H	“ <i>j</i> in Spanish Jijona, <i>g</i> in Spanish gila; like English <i>h</i> in hue, but stronger.
à	“ “ ant, and final <i>a</i> in America, armada, etc.	hw	“ <i>wh</i> in which.
ɑ	“ “ final, regal, pleasant.	K	“ <i>ch</i> in German ich, Albrecht = <i>g</i> in German Arensburg, Mecklenburg, etc.
a	“ “ all, fall.	n	“ in sinker, longer.
ē	“ “ eve.	ng	“ “ sing, long.
ē̄	“ “ elate, evade.	N	“ “ French bon, Bourbon, and <i>m</i> in the French Étampes; here it indicates nasalizing of the preceding vowel.
ē̄̄	“ “ end, pet.	sh	“ “ shine, shut.
ē̄̄̄	“ “ fern, her, and as <i>i</i> in sir, etc.	th	“ “ thrust, thin.
e	“ “ agency, judgment.	TH	“ “ then, this.
ī	“ “ ice, quiet.	zh	“ <i>z</i> in azure, and <i>s</i> in pleasure.
ī̄	“ “ quiescent.		
ī̄̄	“ “ ill, fit.		
ō	“ “ old, sober.		
ō̄	“ “ obey, sobriety.		
ô	“ “ orb, nor.		
ô̄	“ “ odd, forest, not.		
o	“ “ atom, carol.		
oi	“ “ oil, boil.		
ōō	“ “ food, fool, and as <i>u</i> in rude, rule.		
ou	“ “ house, mouse.		
ū	“ “ use, mule.		
ū̄	“ “ unite.		
ū̄̄	“ “ cut, but.		
u	“ “ full, put, or as <i>oo</i> in foot, book.		
û	“ “ urn, burn.		
y	“ “ yet, yield.		
B	“ “ Spanish Habana, Córdoba, where it is like English <i>v</i> but made with the lips alone.		

An apostrophe ['] is sometimes used as in *tā'b'l* (table), *kǎz'm* (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as G, H, K, N, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XII

- IMMACULATE CONCEPTION OF THE VIRGIN MARY.
Professor Irving F. Wood.
Dr. Patrick A. Halpin.
- IMMIGRATION.
Dr. Roland P. Falkner.
Professor Alvin Saunders Johnson.
- IMMORTALITY.
Professor Nathaniel Schmidt.
Professor Evander Bradley McGilvary.
- IMMUNITY.
Dr. David Gilbert Yates.
- IMPEACHMENT.
Professor George W. Kirchwey.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

IMAGINARY POINTS AND LINES.

In analytic geometry a point is said to be imaginary if one or more of its coördinates are imaginary; e.g., the points of intersection of the straight line $x = 6$ and the circle $x^2 + y^2 = 4$, found by solving the two equations, are $x = 6$, $y = 4\sqrt{-2}$, and $x = 6$, $y = -4\sqrt{-2}$, the two values of y (i.e., the ordinates of the points) being imaginary, the points of intersection of the given line and circle are said to be imaginary. Similarly, the conjugate axis of the hyperbola (q.v.) cuts the hyperbola in two imaginary points. A line whose equation contains imaginary coefficients is called an imaginary line; e.g., the asymptotes of an ellipse or circle are imaginary lines. Their equations may be obtained from the equations of the curves thus: Let $x^2 + y^2 = 0$, then $(x + yi)(x - yi) = 0$, and $x + yi = 0$, $x - yi = 0$ are the imaginary asymptotes to the circle. Similarly,

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 0,$$

then

$$\left(\frac{x}{a} + \frac{y}{b}i\right)\left(\frac{x}{a} - \frac{y}{b}i\right) = 0;$$

and

$$\frac{x}{a} + \frac{y}{b}i = 0, \quad \frac{x}{a} - \frac{y}{b}i = 0,$$

are the imaginary asymptotes to the ellipse. All of these imaginary lines have the real point $x = 0$, $y = 0$. See CONTINUITY.

IMAGINARY QUANTITY. See COMPLEX NUMBER.

IMAGINATION (Lat. *imaginatio*, from *imaginari*, to imagine, from *imago*, image). The conscious representation of objects, relations, attributes, or processes which have not been personally experienced; or the capacity for such representation. Thus defined, imagination is the counterpart of memory, whose function is the representation of previous experience.

The fundamental mental process in both memory and imagination is the idea (q.v.), a complex of images. The power of imagination, therefore, like that of memory, is dependent, first of all, upon the individual's equipment of imagery. An individual born blind never has visual images; one born deaf never hears tunes "ringing in his head." The capacity for various sorts of images, moreover, varies greatly from

one individual to another; one person may tend to ideate in visual, another in auditory and kinæsthetic, a third in merely kinæsthetic, images. See IMAGE; MEMORY.

The distinction of idea of memory and idea of imagination has usually been the popular or logical distinction, based upon meaning or reference. The idea of memory means or refers to some part of one's past experience (one has a memory-idea of one's home or of a piece of familiar music); the idea of imagination has no personal reference (one imagines a centaur, a golden mountain, a novel phrase of music). This reference, if conscious at all, is in the case of memory an associative context, a feeling of familiarity or "at-homeness," or a conscious attitude of placing or dating. In the case of imagination, since the idea is novel, associated ideas are lacking; and the reference is carried by a feeling of unfamiliarity or strangeness, or by a conscious attitude of search or inquiry. (See MEANING; THOUGHT.) The idea of imagination itself seems to be distinguished from the idea of memory as being relatively complete, and as forming simultaneously, whereas the memory-idea is abbreviated and sketchy, and its phases constitute a development in time. This difference may be referred to differences in the interplay of determining and associative tendencies. In remembering, associative tendencies play the leading part; and the resulting formation, provided that it is in any way fitted to mean the experience to be recalled, may be partial or even symbolical. The function of imagination, on the other hand, is to represent a new experience. The idea of imagination must not only mean "something new"; it must be something new, a production rather than a reproduction. This requirement limits the part which association may play, and at the same time is the condition of a strong determining tendency. So the course of ideas in imagination, directed by a stronger and more narrowly defined determination, will be less discursive, more integrative, than that in memory.

The total consciousness in which the idea of imagination is set may show the pattern either of primary or of secondary attention (see ATTENTION), and we may speak accordingly of passive or reproductive and of active or creative imagination. The first is exemplified in the reading of an interesting novel; the second in mechanical or artistic invention or production.

In both cases consciousness is restricted to processes which are directly determined by the context or by the problem to be solved. If, in creative imagination, attention is limited more closely to ideas sharply selected for expressing a single conception or a single mood, this difference is a matter of degree and not of kind.

Consult: Bain, *The Senses and the Intellect* (London, 1888); Sully, *Outlines of Psychology* (New York, 1891); Hoefler, *Psychologie* (Vienna, 1897); Ambrosi, *Psychologia dell'immaginazione* (Rome, 1898); William James, *Principles of Psychology* (2 vols., New York, 1899); Ribot, *Essay on the Creative Imagination* (Chicago, 1906); Lucka, *Die Phantasie* (Vienna, 1908); Titchener, *Text-Book of Psychology* (New York, 1910).

IMA'GO. The adult, sexually mature form of an insect which passes through metamorphoses. See METAMORPHOSIS.

IMAM, ê-mäm' (Ar. 'imām, leader, from 'amma, to lead, set an example). The appellation given in general to teachers among the Mohammedans, as leaders whose example is to be followed. It is commonly employed to designate any of the persons belonging to the Mohammedan ulema (q.v.), or "learned" body. They are distinguished from the laity by a turban somewhat higher than usual and are held in great reverence by the people. Besides this general use, there are also certain specific applications of the term. Among the Shiites (i.e., the followers of Ali) the term "imam" is applied to the 12 legitimate successors of Ali. Among the orthodox Mohammedans the imam is properly the caliph, or leader of the entire body of Mohammedans; but the name is also extended to any authority whose views on theology and law are followed. In the course of time every Mohammedan community came to have its imam, whose chief function it was to lead the congregation in prayer. He takes his stand in front of the group of worshipers, who take up a position behind him arranged in fixed rows and imitate the genuflections and attitudes assumed by the leader in the course of the prescribed prayers.

IMAMITES, ê-mäm'īts. A Mohammedan sect whose members recognize the 12 imams, descendants of Mohammed's son-in-law Ali, whom they consider the first real imam, or caliph. They are commonly known as Shiites (q.v.).

IMAZIGHEN, ê'mâ'zê'gân'. The designation of all the Berber tribes of the Atlas Mountains, in Algeria and Morocco, comprising the Kabyles, Shulluhs, and Haratin. The Kabyles, who call themselves Imazighen, are farthest north and more mixed with Semites and Europeans; the Shulluhs (Shluhs) are to be found on the northward-sloping valleys of the Atlas Mountains, while the Haratin Berbers are on the southern slopes and mixed with negroes. (See KABYLES; SHULLUHS; HARATIN.) They are Hamites fundamentally in blood, but have long been acculturated with Arab speech and religion. Their mountain retreats have enabled the Imazighen Berbers to preserve their ancient patriarchal mode of life, so that many hundreds of clans and families keep up their small organizations at the same time that they are united into larger nations. Consult Bertholon and Chantre, *Recherches anthropologiques dans la Berbérie Orientale* (Lyons, 1913).

IMBAT'TLED. See EMBATTLED.

IM'BECILE. See MENTAL DEFECTIVES.

IM'BECIL'ITY (from Lat. *imbecillitas*, weakness, from *imbecillus*, weak). 1. Mental weakness or defect. Imbecility and idiocy are comparative terms. They are both states due to similar processes, consisting of imperfect development of the brain, and due to congenital influences or acquired injury or disease. (See IDIOCY.) Thus, it is almost impossible to determine the dividing line that separates an idiot from an imbecile, and such differentiation may entail much study and careful following of the mental development. In general understanding, an idiot is unable to attend to the simple primary affairs of his organization. An imbecile is able to attend to these. At the other end of the scale the imbecile shades into the normal average human mind by imperceptible gradations, and it may be just as difficult to separate the imbecile from feeble-minded, dull, and stupid individuals as it is to separate the idiots from imbeciles. There are large numbers of weak-minded, useless persons in every community who differ from the more robust intellects solely in degree. These are largely imbeciles or feeble-minded. But the more marked and recognizable idiocy is characterized by many of the following signs: the vacant expression, dull senses, small head, deformed body, vacillating and restless gait; pendent, thrown back, or agitated head; escaping saliva, limited and infantile language. The ideas may be few and consist of mere sensuous impressions; the temper, timid, facile, and vain; and the passions are little susceptible of control. The idiot is profoundly defective and largely unteachable. The higher grades may be slightly trained in self-help. The imbecile responds to training and generally may be materially improved, but cannot take an independent place in the world. With close moral support he may ply a simple trade and earn his living.

2. As a generic legal term, a weakness of mind falling short of idiocy (q.v.) on the one hand and full mental capacity to contract or to distinguish between right and wrong on the other. The victim of imbecility, using the word in this sense, is not absolutely incapable of binding himself by contract or of committing crime. If his weakness is taken advantage of by another, any contract or conveyance so secured may be set aside; but the mere fact that a man is of weak understanding, or that his intellectual capacity is below the average of mankind, if no fraud or no undue advantage be taken, is not of itself an adequate ground to set aside a transaction. It should be added that a lower degree of intelligence is required for a valid will than for a business contract or conveyance. In various jurisdictions imbeciles are more or less protected against the fraud of others or their own acts, of indiscretion by placing them more or less under the control of others, as in Scotland by interdiction or by the appointment of a committee or guardian. Consult Barr, *Mental Defectives* (Philadelphia, 1904), and Goddard, *Feeble-Mindedness: Its Causes and Consequences* (New York, 1914). See INTERDICTION; COMMITTEE; GUARDIAN; also see IDIOCY; INSANITY; LUNACY; and the authorities there referred to.

IMBER, im'bēr, NAPHTALI HERZ (1854-1909). A Hebrew poet and Cabbalist, born of poor parentage at Zloczow in Galicia. He received a thorough training in the Talmud and after the age of 14 led the life of a wandering

scholar, visiting in turn Constantinople, Egypt, and Palestine. There he studied the Oriental languages and especially Hebrew. From Palestine he went to England, where he worked for some time in collaboration with Israel Zangwill, whom he taught the Yiddish language. In 1892 he came to America and made his home at different times in New York City, Boston, Chicago, San Francisco, and Los Angeles. In addition to many volumes of poetry and Cabbalistic lore, he wrote extensively for the Hebrew press. In his mastery of the ancient language of the Bible he takes rank with the leading scholars of Europe and America. His poetical works in form and thought are modeled to a great extent upon the songs of Judah ha Levi (q.v.), whose fervent love for and hope in Zion Imber more than echoes. Among his works are: *Austria*, a poem; *The Mystery of the Golden Calf*; *The Keynote to Mystic Science*; *The Treasures of Ancient Jerusalem*; *The Letters of Rabbi Akibah*; *The Education of the Talmud*, printed by the United States government; *Music of the Psalms*. His "Hope of Zion" has become the hymn of the Zionist party the world over.

IMBERT DE SAINT-AMAND, ăn'bâr' de sãn'tă'măn', ARTHUR LÉON, BARON (1834-1900). A French author, born in Paris. He was privately educated, studied law, and after being admitted to practice entered the government service in the Department of Foreign Affairs. Here he rose through the several ranks to the grade of Minister Plenipotentiary of the first class in 1882 and was assigned to special service in the central offices of the department in Paris. He is best known as the author of an interesting and popular series of biographical and social studies of the women of the French courts. The first of these, entitled *Les femmes de Versailles* (5 vols., 1875-79), covered the period from Louis XIV to the close of the *ancien régime*; the second, *Les femmes des Tuileries* (37 vols., 1880-99), began with the last days of Marie Antoinette and concluded with the women of the Second Empire. The series has been translated into English under the title of *Women of the French Court*. Among his other published works, some of which have also been translated into English, are: *Portraits de femmes françaises du XVIII et du XIX siècle* (1869); *Les femmes de la cour des derniers Valois* (1872); *Madame de Girardin* (1874); *Portraits de grandes dames* (1875); *La cour de Louis XVIII* (1891); *La cour de Charles X* (1891).

IMBIBITION, im'bī-bīsh'ūn (from Lat. *im-bibere*, to drink in, from *in*, in + *bibere*, for **pibere*, to drink, Skt. *pā*, to drink, OIr. *ibim*, I drink). The physical process of swelling of solids by the absorption of liquid. It is exhibited most freely by organized bodies, i.e., those formed by living beings, which have therefore a characteristic structure, but is not confined to them. The swelling depends on a separation of the structural units of the body, which are believed to be not its molecules but rather molecular complexes. Imbibition, therefore, differs from solution in that the separation of the particles is not so extensive; and when the water is removed by evaporation or otherwise they return to their original relations, so that the body regains its previous form and structure. After solution, on the contrary, the separated molecules may rearrange themselves completely. In a normal condition all parts of plants hold large quantities of water imbibed in

their substance. Even in the walls of wood cells, the least watery material, there is usually 50 per cent of water, while in the protoplasm there may be as much as 95 per cent. Indeed, the plant may be considered as a mass of water held between the structural particles of the cells composing it and exceeding in volume the material by which it is so held. This condition alone makes it possible for plants to obtain materials from the water and air about them. See ABSORPTION, IN PLANTS.

The force of imbibition results from the surface of the ultramicroscopical particles, making up the swelling body, adsorbing water or other liquids imbibed. When a dry starch grain imbibes water, heat is developed (on account of the compression of the water) to an amount which indicates (according to Rodewald) a pressure of over 2500 atmospheres. The force exerted by a confined swelling body is at first enormous, but becomes rapidly weaker as the particles are separated farther and farther. Correspondingly water is held loosely when abundant, but more and more tenaciously when only a little is imbibed. Thus, when a bit of laminaria is completely swollen, water can be removed from it by slight pressure; when it holds 170 per cent of water, it requires a pressure of 16 atmospheres to extract water; when only 93 per cent is present, a pressure of 200 atmospheres is needed. Applications of the force of swelling are made in splitting stone by wooden wedges driven in and then wetted, in shortening ropes by wetting, in the use of laminaria for surgical distention, etc. The phenomena of imbibition afford the chief basis for theories concerning the molecular structure of organized bodies. See COLLOIDS; ADSORPTION.

IMBRIANI, ém'brê-ă'ně, VITTORIO (1840-86). An Italian poet and critic, born in Naples. He pursued studies in the universities of Naples, Zurich, and Berlin, and took part in the campaigns of 1859 and 1866. In 1884 he was appointed to the chair of æsthetics at the university of his native city, but was then too ill to assume the duties of this post. His political life was a troubled one by reason of his excessively passionate nature, which excited bitter antagonism. He is best known for his collections of popular tales and verse, such as *Canti popolari delle provincie meridionali* (1871-72), *Dodici canti pomiglianesi* (1876), *La novellaja fiorentina* (1877), etc. A number of his poems are to be found in a collection entitled *Esercizj di prosodia* (1874). Among his critical works are some monographs on Dante, and the *Fame usurpate* (1877), in which he seeks to demonstrate that Goethe's *Faust* is a production devoid of all merit.

IM'BRICATED SNOOT BEETLE. A very injurious weevil (*Epicærus imbricatus*), which damages many different kinds of garden vegetables and fruits, such as onions, radishes, cabbages, beans, watermelons, cucumbers, corn, beets, and strawberries, by sucking the juices of the leaves, stems, roots, or fruit. It also punctures the leaves and twigs of the apple and pear. The life history is not thoroughly known, although the eggs and young larvæ found on the leaves of the strawberry have been described by Chittenden. The best remedy consists in spraying with a Paris green or some other standard mixture.

IMBROGLIO, ém-brōl'yô (It., confusion). A musical term denoting the synchronous execu-

tion of conflicting rhythms in different groups of instruments or voices; as the following from Wagner's *Siegfried* (Act ii, Scene 2):

College at Bahía and the author of several treatises upon the language, history, and customs of his adopted country that were published

The passage must be executed so that the first nine eighth notes of the voice coincide exactly with the first six eighth notes of the orchestra. Voice and instruments come together on the first and third beats of the bar, but not on the second. Another famous example is found in the scene of the Last Supper in *Parsifal* (Act i). Against arpeggios of the strings in 4/4 time the wood wind executes a rhythmic figure in 6/4 time in such a manner that the two groups of instruments come together on the first and third beats, but not on the second and fourth. The most extended and complicated employment of imbroglia occurs in the finale of the second act of *Die Meistersinger*.

IMBROS, ém'brös. A Turkish island in the Aegean Sea, situated about 13 miles northeast of Lemnos (Map: Greece, E 4). Area, about 87 square miles. It is of volcanic origin, rocky, and mostly barren, but a small part of its area is very fertile. It produces wheat, barley, oats, olives, and fruit. Pop., about 8000, mostly Greeks, engaged in fishing. The chief town is Kastron (Castro), the seat of a Greek bishop.

IMERITIA, é'mè-rish'i-à. Formerly an independent kingdom in Georgia (q.v.), now constituting a part of the Government of Kutais (q.v.) in Russian Transcaucasia. Its history as an independent country begins towards the end of the fifteenth century. In 1621 it first asked Russia for aid and came under her suzerainty in 1650. About 1750 it was occupied by the Turks, who were expelled by the Russians in 1769. In 1810 it was annexed to Russia. The Imers, or Imeritians, who number less than half a million, are one of the tribes belonging to the southern, or Georgian, group of peoples of the Caucasus. They are considered by Pantiukhoff to be the purest representatives of the primitive Georgian type. See GEORGIANS.

IMHOFF, ém'hóf, AMALIE VON. See HELVIG.

IMHOFFER, ém'hóf-ër, GUSTAV MELCHIOR (1593-1651). An Austrian Jesuit and South American explorer. He was born near Graz, Styria, and went to Peru as a missionary in 1624. Twelve years afterward he crossed the Andes to the source of the Amazon and was the first European to leave upon record his exploration of that stream to its mouth. His account was published in two volumes in Madrid (1640) and in London (1689), the latter edition called *A Relation of a Journey along the River Amazon*. Father Imhoffer was head of the Jesuit

by the Society of Jesus 20 years after his death.

IMHOOF-BLUMER, ém'hóf blō'mēr, FRIEDRICH (1838-). A German numismatist, known as an authority on Greek coins. Born at Winterthur, he became interested in numismatics as a boy, gave up the business career planned for him, received a classical education, and amassed a valuable collection of more than 20,000 ancient Greek coins, bought in 1900 by the Royal Numismatic Cabinet in Berlin. The great work of the Prussian Academy of Science, *Die antiken Münzen Nordgriechenlands* (1899 et seq.), was undertaken at his instance; and in 1901 he gave to the Academy the sum of 100,000 francs for the promotion of the science of numismatics. He wrote: *Zur Münzkunde und Paläographie Böotiens* (1871); *Die Münzen Akarnaniens* (1878); *Porträtköpfe auf römischen Münzen* (2d ed., 1893); *Porträtköpfe auf antiken Münzen hellenischer und hellenisierter Völker* (1885); *Zur Münzkunde Grossgriechenlands* (1886); *Tier- und Pflanzenbilder auf Münzen und Gemmen* (1889), with Keller; *Lydische Stadtmünzen* (1897); *Kleinasiatische Münzen* (1901-13 et seq.), as well as the great illustrated works, *Monnaies grecques* (1883) and *Griechische Münzen* (1890).

IMHOTEP, ém-hō'tép. An Egyptian divinity, identified with Æsculapius; the son of Ptah and Sekhmet, who with Imhotep formed the triad chiefly honored at Memphis.

IMITATION (Lat. *imitatio*, from *imitari*, to imitate). The repetition of any thought, feeling, or act, or the copying of any example or model. The term is sometimes used in a narrower sense, to denote behavior, the model for which is another person or another like individual.

Imitation, as such, may be conscious to the imitator, as in learning a foreign language; or it may be unconscious, as when an individual in a crowd unknowingly feels and acts like his neighbors. Conscious imitation is to be explained in the same way as voluntary behavior at large. (See ACTION; WILL.) Unconscious imitation—behavior which is imitative, not to the imitator but only to the reflecting onlooker—requires further consideration. There seems to be no sufficient ground for assuming a general instinct of imitation, an inherited tendency to duplicate all impressions either in kind or symbolically. Only certain modes of behavior

are imitated; and imitation therefore should be regarded as an expression of specific instinctive tendencies. Similarity of nervous structure in similar beings must mean similarity of behavior in face of given situations; many cases of imitation may be thus understood. Perception of the movements made by an individual in response to a given stimulus may further, it seems, bring about similar movements in a second individual who would otherwise have remained at rest; but the imitative behavior here is apparently a result of attention to the stimulus, of attention attracted in a particular direction by the movement, and not a direct result of the movement itself. Again, when an individual has often been affected and has often reacted in the same way as another, with a simultaneous perception of the movement of that other, an association may be formed such that at a later time the mere perception of movement suffices to touch off a corresponding movement, or arouses a memory of the original situation and is thereupon followed by the appropriate expressive movement. The behavior of a given individual may thus in some cases be the immediate condition of similar behavior in a second individual, though it can serve as adequate incitement only if an instinctive or associative predisposition towards a similar response already exists in the imitator. See IMITATION IN ANIMALS.

In a wide sense imitation denotes the copying of any model whatever and implies merely a certain resemblance between copy and original. In this sense imitation has been used, often without rigorous analysis, as a more or less fundamental concept in a number of arts and sciences. The discussion of imitation in theory of art dates from Plato and Aristotle. In music the term has become technical, indicating the repetition of a phrase or theme in a pitch or key or vocal part different from that of the original, or a repetition with such variation of rhythm or interval as does not destroy resemblance. The importance of imitation in education has been often emphasized. In ethnology imitation has been offered as a key to the understanding of magic and primitive religion. The savage believes that he can bring about desirable conditions by imitating them: thus, he may fling water in the air to bring about rain, or he may try to bring death to an enemy by impaling an image on thorns, or he may worship his god by offering gifts to an idol, the imitation of the god. In certain systems of sociology imitation is regarded as an elementary and fundamental endowment; and custom, fashion, institutions, and the other phenomena of social life are explained in terms of it. These systems, however, fail to take account of the original similarities of activity mentioned earlier in this article; and other systems, which build upon the like responses of like organisms to the same situations, seem not only possible but also more thoroughgoing. For imitation in biology, see MIMICRY.

IMITATION. In the science of musical composition, the repetition of the same passage, or the following of a passage with a similar one, in one or more of the other parts or voices. It may be either strict or free. When the imitated passage is repeated note for note, and every interval is the same, it is called strict, and it may take place in the unison or octave, or in any other of the degrees of the scale, either above or below the original passage. The progression of a passage may also be imitated by an inversion, or by reversing the movement of the original; also by notes of a greater or of a lesser value. (See CANON; COUNTERPOINT; FUGUE.) Imitation in composition is one of the most important means of producing unity and animation in the progression of the parts and is used in a strict and also in a free manner. Many composers, however, resort to imitation improperly, either from poverty of musical ideas or from pedantry. In the works of the contrapuntal writers of the Netherlands examples of retrograde imitation are found. This is hardly legitimate art.

IMITATION IN ANIMALS. The patterning of the behavior of one animal after that of another. It has been suggested that imitation in animals might be limited to the mode of learning in which one animal acquires a new form of behavior by copying the performance of another—a definition that excludes unconscious imitative movements which do not become the basis of an habitual form of response. The wider usage is, however, more generally accepted. The broadest definition of imitation as the copying of any model whatever (see IMITATION) has not been used by comparative psychologists.

Imitation implies attention on the part of the imitating animal to the movements to be imitated. The attention may be of any degree. Further the performance copied must be repeated more or less successfully by the imitator. In certain experiments upon monkeys an untrained individual was placed in a cage with a second who had learned to obtain food by pulling one of several strings. In many cases the untrained monkey was aided in his effort to obtain food by observing the behavior of its companion. Two degrees of attention were apparent—one in which the untrained animal merely watched the other, and one in which it followed the other about. There were three levels of success: (1) a spatial discrimination, in which the monkey went to the right place in the cage; (2) an objective discrimination, in which the monkey not only went to the right place but also handled the mechanism (e.g., the string) by which the food was obtained; (3) a complete imitation, in which the animal went to the right place and immediately made the right movement to secure the food.

On the psychological side we may distinguish three kinds of imitation—two in which the imitation as such is unconscious, one in which it is conscious. 1. In *automatic imitation* the imitative movement is set off at once by the perception of the movement in another individual. The movement is not consciously anticipated; it lacks a motive. It is to be explained by reference to an already established tendency, which is usually innate. Hence this form of imitation has also been called instinctive. An example

may be seen in the pecking movements of the chick. The movements are instinctive; but they are also imitative, because they are usually first set off by the pecking of another chick or of the hen. In the absence of previous experience in food getting the action cannot be determined by the idea of the satisfaction of hunger (inferential imitation); nor can it, in its immediate perfection, be the result merely of especial interest in the object at which the peck is directed (focal imitation). 2. *Focal imitation* involves a high degree of attention on the part of the imitator to the movement subsequently imitated. The attention is usually determined by some aspect of the situation which makes a strong appeal to the animal. In the experiments with monkeys it was the sight of the food that aroused the interest of the animal in the movements connected with the getting of food. This interest, dependent upon the focal position of the perception of the movement, acts as a motive and results in the animal's going to a certain place and handling a given mechanism. After the interest is once aroused, only those processes which represent its object remain focal in the animal's consciousness; the degree of perfection of the imitation depends upon the degree of relevant selectiveness of this interest. Although the *perception* of the end accomplished may have served at the outset to determine attention, there need be no subsequent *idea* of end. 3. *Inferential* (or *telic*) *imitation* implies the participation of the idea of end in the motive to the imitative action and is therefore consciously imitative. The movements and their result are perceived. Later the idea of the result leads to the idea of the movements and thence to their performance. This form of imitation, involving as it does the free idea, is presumably rare among the lower animals, although common in man. It may be assumed when a complicated imitative act is performed correctly on the first attempt; for the idea of end may be expected to result in a more specific determination of behavior than the selective interest.

Below the vertebrates there is no evidence of imitation, since the lower forms of animals do not ordinarily attend to one another's movements. Among the vertebrates some experimenters have found negative evidence for the capacity of focal or inferential imitation in dogs, cats, white rats, and monkeys; while others, with the last three mentioned forms and with raccoons, are convinced of the possibility of an imitation which is probably of the focal type. It is possible that some monkeys are capable of inferential imitation—a form which, as we have seen, involves the free idea, and thus a higher degree of intelligence than is generally found in the animal world. Consult: Washburn, *Animal Mind* (New York, 1908); Haggerty, "Imitation in Monkeys," in *Journal of Comparative Neurology and Psychology*, vol. xix (Granville, Ohio, 1909); Thorndike, *Animal Intelligence* (New York, 1912). See IMITATION; also ANIMAL PSYCHOLOGY; INSTINCT; INTELLIGENCE IN ANIMALS.

IMITATION OF CHRIST (Lat. *De Imitatione Christi*). The most widely read, after the Bible, of all spiritual books. It is a series of counsels for the attainment of perfection, written in a spirit of sincere and humble piety, interspersed with prayers and colloquies between Christ and the devout soul. It was originally

written in Latin. It is strange that the authorship of a book so popular and comparatively so recent should have been the subject of one of the most curious controversies in literary history. Following his own counsels of humility, the author concealed his name. The oldest certainly dated manuscripts—the Wolfenbüttel (1424), the Gaesdonck (1427), and the Roelf (1431)—are all anonymous. The book was attributed with more or less positiveness to as many as 35 different authors, including St. Bernard, Innocent III, and John Scotus Erigena. The choice finally narrowed to three—Thomas à Kempis, the great Chancellor Gerson (q.v.), and a person of the name of John Gersen, a Benedictine abbot of Vercelli. Most of the fifteenth-century printed copies bear the Chancellor's name; but the proportion alters in the sixteenth, and the claimant Gersen, or Gesen, appears for the first time in 1604. The controversy raged acrimoniously in religious orders, universities, and even the Parliament of Paris. Between 1615 and 1837 no less than 150 works devoted to the question appeared in France alone. The weight of evidence, both internal and external, has for a long time been considered to rest on the side of Thomas à Kempis (q.v.). The book was finished in 1421 and first printed at Augsburg, probably between 1470 and 1472. The best critical edition of the Latin text is by C. Hirsche (Berlin, 1874; 2d ed., 1891). Consult: Kettlewell, *The Authorship of the De Imitatione Christi* (London, 1777); Malou, *Recherches historiques et critiques sur le véritable auteur du livre de l'Imitation* (3d ed., Louvain, 1858); Wheatley, *The Story of the Imitatio Christi* (London, 1891); Cruise, *Who Was the Author of the Imitation?* (ib., 1898); Montmorency, *Thomas à Kempis: His Age and his Book* (ib., 1906); and an excellent bibliography by a learned modern defender of the Gersen theory, Wolfsgruber, in *Giovanni Gersen, sein Leben und sein Werk De Imitatione Christi* (Augsburg, 1880).

IMITATIVE INSANITY, INDUCED MANIA, INSANITY BY IMITATION. These old terms were adopted upon a mistaken notion. It has been supposed that sane people became insane through imitation of maniacs, through too constant intercourse with them, or through the efforts of a strong imagination in the sane. This is untrue. The physicians or nurses who become insane while living in institutions for those of unsound mind are affected because of stress of overwork or alcoholism, or other debilitating cause which would have been operative had they been engaged in other vocations. Insane people are imitative. Frequently cases occur in a family in which a sister, previously unsuspected of being insane, betrays the delusions and adopts the obsessions of an avowedly maniacal sister. This is called *folie à deux*, or "communicated insanity." The insanity exists first, and then the imitation occurs. Imitation of crimes upon reading of them or seeing them committed is due to idiocy (q.v.) or hysteria (q.v.) in most cases.

IM'LAC. A character in Dr. Johnson's *Rasselas*.

IMMACULATE CONCEPTION OF THE VIRGIN MARY. A dogma of the Roman Catholic church, promulgated by Pope Pius IX in 1854. It declares that the "doctrine which holds the blessed Virgin Mary, from the first instant of her conception, to have been kept free

from all stain of original sin, by the singular grace and privilege of Almighty God, in view of the merits of Christ Jesus the Saviour of mankind, is revealed by God, and therefore firmly and constantly to be believed by all the faithful."

Previous to 1854 Roman Catholic theologians had commonly believed in the immaculate conception, but it was held only as a "pious opinion," not as a dogma. Its history may be traced from early times and shows gradual enlargements. The New Testament is silent on the subject of Mary's conception. In the ancient Church many persons believed in her perpetual virginity, and this found expression in some of the apocryphal Gospels. Belief seems next to have advanced to her sinlessness after the birth of Christ, then to sinlessness from her own birth, and finally to the idea that she was sinless from her very conception; Roman Catholics believe that the modern definition involves its having been held, at least implicitly, from the first. The fact that Mohammed seems to have known of these Christian tenets (cf. *Koran*, Sura, iii) is an indication that they were widespread among the Asiatic churches at an early date. The Eastern church, however, has not formulated the dogma, and to this day the immaculate conception remains only a pious opinion in that great branch of Christendom. In the West the history of the doctrine is closely associated with that of the feast. An effort was made in Lyons, in 1139, to introduce the festival of the Immaculate Conception; but it met with pronounced opposition from Bernard of Clairvaux, who did not accept the doctrine exactly as generally explained, and urged that the feast had not received official sanction from Rome. A prolonged controversy broke out early in the fourteenth century, which rather involved a minute technical point of the exact moment of her sanctification than the absolute acceptance or rejection of the main doctrine. The Schoolmen took opposite sides, Duns Scotus and the Scotists maintaining the doctrine in its exactness, while the Thomists, following their leader, Thomas Aquinas, opposed it. The dispute extended to the two great mendicant orders. Scotus was a Franciscan, Thomas a Dominican. The Franciscans accordingly sided with the Scotists in supporting the doctrine; the Dominicans sided with the Thomists in opposing it. There were keen debates, and mutual charges of heresy. The influential University of Paris at first sided with the Dominicans and Thomists; but afterward its position was reversed, and by the end of the fifteenth century it required from every candidate for its doctorate an oath to defend the truth of the immaculate conception wherever it was denied. Among many other forces which worked towards the same end, we may mention the favorable action of the Council of Basel (1439), the pronouncements of Pope Sixtus IV (especially his constitution *Grave nimis*, in 1483), the decrees of Trent, excepting Mary from the universal curse of original sin (Session V, 1546), and the strong support of the Society of Jesus (e.g., in the person of Bellarmine). In 1622 Pope Gregory XV forbade any one (with the conspicuous exception of the Dominicans, and these only in discussions among themselves) to teach that the Virgin Mary was stained by original sin. About 40 years later (1661) Alexander VII set forth the belief of the Church in terms very like those of the decree of 1854. Yet in spite of the general accept-

ance of the doctrine, the most that could be said for it down to modern times was what Benedict XIV cautiously affirmed, about the middle of the eighteenth century: "The Church inclines to the opinion of the immaculate conception."

Pius IX was assiduously devoted to the cult of the Virgin. In 1849 he addressed a circular letter to the bishops, inviting their opinions on the advisability of defining the dogma of her immaculate conception. Out of some 600 replies, the great majority favored the proposed action. Four opposed it. Several influential bishops, especially in Germany and France, deemed it inopportune, inexpedient, and possibly injurious to the Church. In view of the generally favorable sentiment, however, the Pope proceeded to promulgate the dogma, as stated above. The decree was read in the presence of about 200 cardinals, archbishops, and bishops, assembled in St. Peter's, on Dec. 8, 1854, the Feast of the Immaculate Conception. Although not a conciliar decision, it has binding force for the whole Roman Catholic world.

In explanation of the dogma, Catholic writers sometimes quote from a sermon by Bossuet, delivered on a Feast of the Immaculate Conception, in which he thus addresses Christ: "Thou art innocent by nature, Mary only by grace; Thou by excellence, she only by privilege; Thou as Redeemer, she as the first of those whom Thy precious blood hath purified." The Catholic interpretation of the matter is clearly implied in these few words. For Roman theologians distinguish between "active" and "passive" conception. The former is the physical act of the parents, and, so far as this is concerned, Mary is held to have been conceived like other mortals. The latter is the divine infusion of the rational soul (on the theory of creationism), and this, in the case of Mary, is held to have been accompanied by a special gift of grace, whereby she differs from all other mortals. She was sanctified, and therefore sinless, from the beginning. But this was through the merits of the Son who was to be born from her, not through independent merits of her own. In this way the Church believes that it solves the two main problems raised by the doctrine of the immaculate conception—first, how it affects the Virgin Mary in her relation to the rest of the human race, and, secondly, how it affects her in relation to Christ. See Gen. iii. 15; Luke i. 28, 42.

The Feast of the Immaculate Conception, in the Roman calendar, falls on December 8; in the Greek calendar, on the day following.

Consult: Passaglia, *De Immaculato Deiparæ Semper Virginis Conceptu* (3 vols., Rome, 1854-55); Addis and Arnold, *Catholic Dictionary*, art. "Immaculate Conception" (London, 1884); Wetzler and Welte, *Kirchenlexikon*, iv (Freiburg, 1886); Ullathorne, *The Immaculate Conception of the Mother of God* (2d ed., London, 1904). On the Protestant side, consult: Schaff, *Creeds of Christendom* (New York, 1877), which gives the history of the doctrine, and the Latin and English text of the constitution *Ineffabilis Deus*.

IMMAN'UEL. See EMMANUEL.

IMMEMORIAL. Of great antiquity, reaching back beyond memory or record. As a legal term, a right or usage of such long continuance that its origin cannot be traced. Specifically, in English law, a right or usage running back to the accession of Richard I to the throne (1189). Rights resting upon custom, whether

the general custom of the realm or the local custom of a community or of a particular calling, depend for their validity on the proof or on the presumption that the custom has been generally observed and practiced from that date. As in most cases the fact cannot be established by direct proof, the person relying upon the custom is aided by a presumption of law that if it has been in existence during the period of living memory its previous existence from the time of Richard I will be presumed. This presumption may, however, be rebutted by showing, if that be possible, that the custom did not in fact exist, or that it could not have existed, at that remote period.

This doctrine, which the lapse of time has converted into an absurdity, still prevails generally in England and in some of the United States, where it has been held that no customary right can exist in America by reason of the fact that it could not have been practiced in the reign of Richard I. In most American States, however, it has been superseded by a more reasonable doctrine, giving effect to a custom which has been in existence during the period of living memory, or in some instances during a fixed period of time, usually 20 years. In England also it has been provided by statute (Prescription Act, 1832) that rights to claims of common, etc., may be established by showing an uninterrupted enjoyment as of right—in some cases for 30, in others for 20, years. See COMMON; CUSTOM; and for the modern doctrine governing the acquisition of private rights, as easements and profits *à prendre* in another's land by long-continued use, see EASEMENT; PRESCRIPTION.

IM'MER GOOSE. See LOON.

IM'MERMANN, KARL (1796–1840). A German dramatist, born in Magdeburg, April 24, 1796. From the Gymnasium of Magdeburg Immermann went in 1813 to the University of Halle to study law, but he interrupted his studies to take part in the War of Liberation. Disabled by a nervous disorder, he left the field in 1815 and returned to Halle, where his brave protest to the King at the brutal treatment of a dissenting fellow student by the overzealous student societies embroiled him with the latter. He entered the government service and in 1824 became a judge. He had already in Münster become acquainted with Countess Elise von Ahlefeldt (1788–1855), with whom he lived on terms of intimacy for years. He had become widely known as a dramatist when, in 1835, he took charge of the Düsseldorf theatre, which he developed artistically; but the theatre failed for the lack of proper financial support, and he became a judge again. Immermann married Marianne Niemeyer in 1839 and died Aug. 25, 1840. His plays were strongly influenced by Shakespeare. Among his best pieces are *Das Trauerspiel in Tirol* (1827) and *Merlin* (1831). Two representative novels are *Die Epigonen* (1835), an echo of *Wilhelm Meister*, and *Münchhausen* (1838–39), in which the village life of Westphalia is imaginatively described. The beautiful prose idyl *Der Oberhof*, contained in this book, is his best-known work. Here, too, Poe may have found a hint for *The Fall of the House of Usher*. He stood at the turning point between romanticism and realism. Immermann's *Collected Works* appeared at Düsseldorf in 1835–43, and a new edition, with *Biography and Introduction*, came out in 20 volumes at Berlin in

1883; a new edition in six volumes appeared in 1911. Consult: Putlitz, *Karl Immermann, sein Leben und Werke* (Berlin, 1870); E. Schmidt, *Charakteristiken*, i (ib., 1886); Kaiser, *Untersuchungen zu Immermanns Romantechnik* (Halle, 1906); Thewissen, *Goethes Einfluss auf Immermanns Romane* (Marburg, 1907).

IMMER'SION. See BAPTISM; EMERSION.

IM'MIGRA'TION (from Lat. *immigrare*, to remove into, from *in*, in + *migrare*, to migrate). In its broadest sense, the transfer of residence from one country to another, viewed from the standpoint of the country in which the new residence is taken. The causes of this phenomenon have been discussed in the article devoted to emigration, which treated the movement at its source. We are concerned here with the effect of these movements on the countries which receive the newcomers. The invasion of the immigrant is the movement of the individual who seeks to improve his condition by a change of residence, who submits to the political institutions of the land of his adoption, and whose coming thither is frequently openly encouraged, or at least not actually opposed, by the country in which he settles.

Immigration and colonization are intimately related. When a new country is to be developed and its resources increased by human labor, immigration is encouraged by its authorities, and every gain in population is deemed an economic advantage. It has been in such countries in the past century into which the flow of emigration from Europe has been poured. They are Australia, South America, Canada, and the United States, in each of which immigration has raised diverse social and economic questions which must be individually studied and do not lend themselves to a general treatment. Before turning to the United States, where the immigration problem is perhaps the most acute, we may briefly consider the facts connected with immigration in other countries.

Australia. The Australian Commonwealth owes its origin to the penal settlement established there by Great Britain at the close of the eighteenth century, to which a considerable number of convicts were deported until the middle of the last century, when, at the earnest solicitation of the colonials, the system was abandoned. Efforts were made by the government to send out free colonists to Australia, but, despite the liberal assistance of the government, the total population by 1851 was only 430,596. Following the discovery of gold in 1850, the population increased threefold in the next 10 years, and considerable increments have been made to it at each subsequent census.

The following table gives the increase of population ascribed to the excess of immigration over emigration. In 1904 the emigration exceeded the immigration by 2889.

1851–1860.....	613,253
1861–1870.....	291,342
1871–1880.....	336,297
1881–1890.....	386,018
1891–1900.....	63,482
1912–1913.....	83,741

The colonies showed great variations from year to year, as the discovery of gold in one colony after another attracted the fortune seekers. The distance of Australia from Europe and the cost of passage have been an obstacle to immigration to that country compared with the more accessible Canada and the United

States. The attractive force of the gold mines has partially offset the difficulty, while the colonies at one time generally pursued a policy of aiding immigrants by paying a portion, if not all, of the passage money. Up to 1896 there had been introduced into the colonies, either wholly or partially at the expense of the state, no less than 756,695 persons, of whom 578,559 came in the period prior to 1881.

Under these circumstances the Australian colonies have to a large extent chosen their immigrants. It is not surprising, therefore, that the great bulk of the immigrants into Australia have been natives of the United Kingdom. According to the census of 1891, 68.58 per cent of the population were Australian born, 14.76 per cent born in England and Wales, 3.86 per cent in Scotland, 7.13 per cent in Ireland. According to the census of 1901, 76.99 per cent of the population, exclusive of aborigines, were Australian born; 10.30 per cent were born in England and Wales; 2.78 per cent in Scotland; 5.13 per cent in Ireland; leaving only 4.80 per cent natives of other British colonies and foreigners. Immigration in later years has maintained practically the same character; its volume has remained so small as not to affect the general population as indicated by the 1901 census.

South America. Of the South American countries, the Argentine Republic, Brazil, and Uruguay are the only ones in which immigration brings any considerable increment to the population. In Uruguay the immigration varies between 8000 and 10,000 persons annually. In Brazil 2,845,980 are reported for the years 1835-1912. In the Argentine Republic the immigration in the years 1857-1912 was 4,248,355, consisting of 2,133,508 Italians, 1,298,122 Spaniards, 206,912 French.

In the immigration to the South American countries the states of southern Europe are the largest contributors. Italy stands at the head of the list. In the immigration of Brazil the Portuguese take the first place, followed by the Spaniards and the Italians.

Canada. There is greater difficulty in determining the amount of immigration to Canada than to other countries, not only because a large number of persons land there whose destination is the United States, but because a considerable number whose original intention was to remain in Canada drift into the United States. So great is the difficulty of precisely ascertaining the number that a few years ago the Canadian authorities gave up the attempt. The most recent figures obtainable are put forward by the authorities with many cautions as to their accuracy. In six periods the figures are as follows:

ANNUAL AVERAGE IMMIGRATION TO CANADA	
1871-1875.....	34,212
1876-1880.....	36,304
1881-1885.....	115,413
1886-1890.....	40,911
1901-1905.....	104,298
1908-1913.....	284,691

A computation by British authorities that, from 1815 to 1889, 12,481,708 persons emigrated from the United Kingdom, showed that of these 8,317,019 went to the United States, 1,987,247 to Canada, and 1,663,388 to Australasia.

The immigration into Canada is largely from the mother country and the United States. The census of 1901 showed that there were 684,671

foreign born in the population, of whom 127,899 were natives of the United States. The United Kingdom furnished 386,545; other parts of the British Empire furnished 19,338, while the quota of foreign nations, among whom Germans and Russians predominated, was 150,889. In the period 1908-13 the United States furnished 557,800 immigrants to Canada out of 1,423,455; England and Wales furnished 371,745.

United States. The great bulk of those who have left Europe to seek new homes have come to the United States. Here the various phenomena connected with immigration can be studied in their fullest development. Records of immigration to the United States begin in 1820. For the period before that time the chief sources of information as to immigration are the frequent newspaper allusions to the arrival of vessels bringing immigrants, of whom a certain number were "foreigners," i.e., those who spoke a language other than English. The record of arrivals since 1820 is shown in the accompanying table:

NUMBER OF IMMIGRANTS ARRIVING IN THE UNITED STATES EACH YEAR FROM 1820 TO 1914

Year ending September 30	
1820.....	8,385

1898.....	229,299
1899.....	311,715
1900.....	448,572
1901.....	487,918
1902.....	648,743
1903.....	857,046
1904.....	812,870
1905.....	1,026,499
1906.....	1,100,735
1907.....	1,285,349
1908.....	782,870
1909.....	751,786
1910.....	1,041,570
1911.....	878,587
1912.....	838,172
1913.....	1,197,892
1914.....	1,218,480

In long periods the increase is marked, but year by year the fluctuation is considerable.

It mirrors the economic conditions at home and abroad. Thus, the panic of 1837 is reflected in the decline of immigration from 79,340 in that year to 38,914 in 1838. The wholesale emigration from Ireland after the potato famine is reflected in the rise of American immigration from 154,416 in 1846 to 234,968 in 1847, and before this influence and that of the political disturbances in Europe were spent came the discovery of gold and the rush to the mines, which culminated in an immigration of 427,833 in 1854, a figure not reached again until nearly 20 years later. After that year immigration fell off slightly, and received a sudden check after the panic of 1857, when it was reduced from 246,945 in 1857 to 119,501 in 1858. The year 1860 showed symptoms of a rising tide, but this was checked by the outbreak of the Civil War. The prosperous times which followed the close of the war increased immigration until, in 1873, it reached a figure of 459,803, higher than in 1854. Again economic distress brought a falling off, and in 1878 it was not more than 138,469. But the symptoms of returning prosperity in the early eighties reacted powerfully upon the vol-

DECADE	Population at beginning	Immigrants	Immigrants in 10 years per 1000 of initial population
1821-1830.....	9,633,822	143,439	15
1831-1840.....	12,866,020	599,125	47
1841-1850.....	17,069,453	1,713,251	100
1851-1860.....	23,191,876	2,598,214	110
1861-1870.....	31,443,321	2,314,824	73
1871-1880.....	38,558,371	2,812,191	73
1881-1890.....	50,155,783	5,246,616	104
1891-1900.....	62,622,250	3,844,420	61
1901-1910.....	75,994,575	8,795,386	116

It appears in this table that the greatest relative immigration has been in the 10 years ending 1910, closely followed by the decades 1861-70 and 1881-90, and it is to be noted that in each of these periods the agitation against the policy of unrestricted immigration was widespread.

The effect of this immigration on the population can be traced since 1850 in the number of foreign born enumerated by the census and is shown in the following table:

YEAR	Population	Foreign born	Per cent foreign born	Increase of foreign born over previous census	Immigration previous decade
1850.....	23,191,876	2,244,602	9.7		
1860.....	31,443,321	4,138,697	13.2	1,894,095	2,598,214
1870.....	38,558,371	5,567,229	14.4	1,428,532	2,314,824
1880.....	50,155,783	6,679,943	13.3	1,112,714	2,812,191
1890.....	63,069,756	9,308,104	14.8	2,628,161	5,246,613
1900.....	76,303,387	10,460,085	13.7	1,151,981	3,687,564
1910.....	91,972,266	13,515,886	14.7	3,174,610	8,795,386

ume of immigration, which in 1882 reached the enormous total of 788,992. By 1886 immigration had fallen to 334,203, but it soon recovered and maintained high figures until 1893. In the following year it dropped to 285,631 and reached its lowest point in recent years in 1898, when it was 229,299; but again there was a rapid recovery, and in 1903 the total was 857,046. In 1904 the number fell off slightly, but in 1905, 1906, and 1907 it passed the million mark. In 1908 and 1909, as a result of the crisis of 1907, the number of immigrants fell to 782,870 and 751,786, but rose again in 1910 to over 1,000,000. In the year 1914 the number of immigrants was 1,218,480—a point reached only once before in the history of American immigration.

Influenced by temporary causes, as we have seen, the progress of immigration has been gen-

While the total number of the foreign born has increased at each census, the proportion to the total population has not materially changed since 1860. The increase in the foreign born for each decade falls far short of the total number of immigrants by reason of the following factors: (1) deaths among the foreign born present at the beginning of the decade, and (2) emigration from among the same; (3) deaths among the immigrants during the decade, and (4) return of some of these latter to their native lands. The number who return to their country of origin fluctuates, like immigration, with prosperity and depression. Thus, in 1908, 395,073 aliens emigrated, whereas in the five years 1909-13 the average annual emigration of aliens amounted to only 273,071.

The developments of recent years are shown in the following figures:

INHABITANTS	Per cent of total immigration						
	1821-1830	1851-1860	1871-1880	1881-1890	1891-1900	1901-1905	1906-1910

erally forward, with setbacks, apparently temporary, only in the decades 1861-70 and 1891-1900. In estimating the force of immigration it is well to take into account the concurrent growth of the population. The following table brings out the facts:

There has been of late years a change in the character of immigration, and much has been written of the "undesirable" quality of recent immigration. The most desirable immigrant is doubtless he who promises most rapidly to be absorbed into the great mass of our population

IMMIGRATION

II

IMMIGRATION

and lose his identity as a newcomer. Kinship in language and race is the prime mark of this desirability. Other things being equal, English-speaking immigrants are preferable to all others, those of allied race and language more to be desired than those allied by neither race nor language to the mass of the people.

The last decade shows marked contrasts with

peoples of a certain racial kinship, who as late as the decade 1881-90 comprised nearly one-half of the immigrants, while in the later periods the nations of southern and eastern Europe have assumed the leadership. Equally instructive is the separation of the immigrants by race, which for the fiscal years 1904 to 1914 is shown in the following table:

RACES	1904	1905	1906	1907	1908	1909	1910	1911	1912	1913	1914

the first. Then more than three-quarters of American immigrants spoke English, but now this element represents less than one-fifth of the total. This relative decline was at first made up by an influx of Germans and Scandinavians,

That such a notable change in the character of immigration must affect the composition of the foreign born in the United States is obvious and is disclosed in the following statement from the censuses of 1900 and 1910:

FOREIGN-BORN POPULATION, 1910, 1900, AND 1890, BY NATIONALITIES

NATIVES OF	FOREIGN BORN, 1910		FOREIGN BORN, 1900		FOREIGN BORN, 1890	
	Number	Per cent	Number	Per cent	Number	Per cent

* In the 1910 census the classification Russia and Poland was dropped and Russia and Finland substituted.

† The total here given differs from that of a previous table, as this does not include Alaska and Hawaii.

These figures show that the older immigration, relatively stronger in the foreign born than in the new arrivals, is still losing ground. In the decades 1891-1910 the absolute number of the foreign born of the first group of races declined; of the entire group only the Scandinavians showed an increase. In the decade 1901-10 the same group, as a whole, shows a further decline, although a slight increase appears in the number of aliens born in Great Britain and in Scandinavia. On the other hand, the absolute numbers of the foreign born from eastern and southern Europe more than doubled.

The reports of the Bureau of Immigration enable us to study many characteristics of the immigrants. That males predominate over females, inasmuch as the immigration embraces so many unmarried men, and so many married men who have left their families behind them, who come to seek fortune in the New World, is well known. It is, however, interesting to note that the proportion of males is increasing. In 1893 to 1895 it was 61.5 per cent of the total; in 1896 to 1900, 63.5 per cent; and in the two fiscal years, 1904 and 1905, it averaged as much as 69.2 per cent. In 1914, however, it declined to 65.4 per cent. The older immigration was

PER CENT OF TOTAL IMMIGRATION

FISCAL YEARS	Under 15 years	15-40 years
1893-1895.....	18.8	71.1
1896-1898.....	16.1	72.7

FISCAL YEARS	Under 14 years	14-45 years
1903-1904.....	13.4	80.8
1904-1905.....	11.1	83.3
1912-1913.....	12.3	82.4

Considering the same races as in the case of the sexes, we find the percentage of children under 14 in 1913 to be as follows, the average being 12.3:

English.....	16.1	Italian (south).....	11.7
Irish.....	6.7	Polish.....	9.9
German.....	17.8	Russian.....	3.3
Scandinavian.....	7.7	Croatian and Slovenian..	8.1
Hebrew.....	22.0	Greek.....	3.2

Here again it appears that family immigration is especially prominent among the Hebrews and plays a considerable rôle among Germans and natives of Great Britain. The low percent-

OCCUPATIONS	FISCAL YEARS 1881-90		FISCAL YEAR 1905		FISCAL YEAR 1913	
	Number	Per cent	Number	Per cent	Number	Per cent
Professional.....	27,006	1.0	13,643	1.7	13,469	1.5
Skilled labor.....	540,411	19.6	180,112	22.7	160,108	17.7
Miscellaneous.....	2,195,292	79.4	600,726	75.6	727,127	80.8
Total with occupation.....	2,762,709	100.0	794,481	100.0	900,704	100.0
No occupation.....	2,483,904		232,018		297,188	
Total.....	5,246,613		1,026,499		1,197,892	

by families to a larger extent than at present, and this is seen by comparing some of the older and newer elements in it.

In 1913 the figures for some of the prominent races were as follows:

RACES	Males	Females	Per cent males
English.....	31,320	24,202	56
Irish.....	19,072	17,951	51
German.....	45,974	34,891	57
Scandinavian.....	25,243	13,494	65
Hebrew.....	57,148	44,182	56
Italian (south).....	176,472	55,141	76
Polish.....	115,772	58,593	66
Russian.....	45,633	5,839	89
Croatian and Slovenian..	31,590	10,909	74
Greek.....	35,143	3,501	91

It will be noted that the races which show a less percentage of men than 65 belong, with the exception of the Hebrews, to the older immigration. The Hebrews represent more largely than the other races immigration by families.

Among the immigrants the proportion of persons in the prime of life is always considerable. The increase of the proportion indicates a falling off of family immigration. Figures for the entire period are not uniform, but the following statement shows this characteristic plainly:

age of children among the Irish is a consequence of the large immigration of unmarried women, and this is true, in some measure, of the Scandinavians.

Statistics of occupation among the immigrants show comparatively few in the professional class or that of skilled laborers. By far the greatest number are in the classes grouped as miscellaneous, in which laborers, farm laborers, and personal and domestic servants make up nearly the entire number. The general results are given in the preceding table.

The figures above given indicate that the relative proportions of professional, skilled, and unskilled have not been greatly affected by the change in the character of immigration. Among the newer immigrants the Greeks and Italians show low percentages of professional and skilled labor, while the Hebrews show a very large percentage of skilled. This is in large measure explained by the specialization of the Hebrews to the needle trades.

	English	German	Hebrew	Italian (south)	Greek
Professional....	9.5	4.0	1.5	0.4	0.3
Skilled.....	44.5	27.5	70.1	11.8	6.3
Miscellaneous..	46.0	68.5	28.4	87.8	93.4

The immigrant population, as a whole, shows a high percentage of illiteracy. Of immigrants

over 14, for the year 1913, 26.6 per cent were illiterate. Illiteracy is very rare among English, Scandinavian, French, Dutch, and Finnish. It is relatively low among Germans, Magyars, and Hebrews. It runs very high among immigrants from southern and eastern Europe—Italians, Greeks, Dalmatians, Croatians, and Slovenians, Ruthenians, Lithuanians. Illiteracy among immigrants is largely a reflection of the backward state of education in their countries of origin. In the most extreme cases it also reflects racial oppression. Thus, the Croatians and Slovenians, the Bosnians, the Lithuanians, are peoples possessed of a language and historical traditions other than those of the race that dominates popular education. Accordingly it is dangerous to make deductions from literacy statistics as to the mental or even social quality of the immigrants.

Effect upon the Population. The influence of immigration upon the population at large depends not only upon its volume but also upon its diffusion. We have already seen that the foreign born in 1910 constituted 14.5 per cent of the total population of the country; but it is to be noted that the foreign born are concentrated in particular sections. Of the foreign born 84.8 per cent were found in the North (north Atlantic and north Central States). The South had only 5.4 per cent of the foreign born, and the West (mountain and Pacific States), 9.7 per cent. The distribution of the general population in the three sections was as follows: North, 60.6 per cent; South, 32 per cent; West, 7.4 per cent. The States having the highest percentage of foreign born in their population (25-35 per cent) were Massachusetts, Connecticut, and Rhode Island, New York and New Jersey, Minnesota and North Dakota.

The tendencies to concentration by sections are clearly shown in the table on page 14.

There is a marked tendency towards concentration of the foreign born in the cities. According to the census of 1910, while 44.2 per cent of the general population was found in urban communities, 72.2 per cent of the foreign born were living in such communities. In general, the greater the city the greater the relative proportion of foreign born. The following table gives the percentage of total population and of foreign born living in the several classes of urban communities in 1910:

COMMUNITIES	Per cent of total population	Per cent of foreign born
Cities of 2,500-10,000.....	9.2	8.8
Cities of 10,000-25,000.....	6.1	7.3
Cities of 25,000-100,000.....	9.0	62.5
Cities of 100,000-500,000....	9.6	14.6
Cities of 500,000 and over...	12.5	29.0

Over one-fifth of the population of cities of 100,000-500,000 and nearly one-third of the population of cities of over 500,000 were foreign born.

The census of 1910 shows that the tendency towards settlement in cities characterizes almost all immigrant nationalities. Only the immigrants from Norway, Mexico, and Montenegro show a less percentage urban than that of the native white population. The immigrants from northwestern Europe show a less

tendency towards urban concentration than those from southern and eastern Europe—68.3 per cent as compared with 78.6 per cent. The highest percentages of urban concentration among European immigrants are shown by natives of Rumania (91.9) and Russia (87.0)—a fact to be explained by the large Jewish element in the immigration from those countries. But Ireland follows closely with 84.7 per cent, Turkey in Europe with 79.5 per cent, and Italy with 78.1 per cent.

Russia is the country of birth of the largest contingent of the foreign born of New York City and of Philadelphia. German born are the most numerous element in Baltimore, Buffalo, Chicago, Cincinnati, Detroit, Jersey City, Los Angeles, Milwaukee, Newark, Pittsburgh, St. Louis, and San Francisco. Ireland leads in Boston and Washington; Sweden in Minneapolis, Italy in New Orleans, Austria in Cleveland. The Russian born stand second in Baltimore, Milwaukee, Newark, Pittsburgh, and St. Louis; the Germans in Cleveland, New Orleans, and Washington; the Canadians in Boston, Buffalo, Detroit, and Los Angeles; the Irish in Jersey City and Newark; the Italians in New York; the Austrians in Chicago; the Hungarians in Cincinnati; the Norwegians in Minneapolis. As a rule, immigrants are attracted to those cities already having a large population of the same nationality.

The following table gives the cities of 100,000 and over having in 1910 a foreign-born population in excess of 30 per cent of the total:

CITIES	Population	Foreign born	Per cent of foreign born
Boston.....	670,585	240,722	35.9
Bridgeport, Conn...	102,054	36,180	35.5
Cambridge, Mass...	104,839	34,608	33.0
Chicago.....	2,184,283	783,428	35.7
Cleveland.....	560,663	195,703	34.9
Detroit.....	465,766	156,565	33.6
Fall River.....	119,295	50,874	42.6
Lowell, Mass.....	106,294	43,457	40.9
New Haven.....	133,605	42,784	32.0
New York.....	4,766,883	1,927,703	40.4
Newark.....	347,469	110,655	31.8
Paterson, N. J.....	125,600	45,398	36.1
Providence.....	224,326	76,303	34.0
San Francisco.....	416,912	130,874	31.4
Worcester, Mass....	145,986	48,492	33.2

But these figures do not display the whole significance of the city concentration, for it will be remembered that immigrants are largely men and adults. The proportion of foreigners among males of voting age is perhaps a more forcible indication of their influence in the community. In 1910 foreign-born males made up the following percentages of males of voting age:

Fall River.....	63.8	Cleveland.....	53.2
Lowell.....	58.1	Bridgeport.....	51.9
New York.....	57.8	Detroit.....	50.2
Paterson.....	54.7	Worcester.....	50.0
Chicago.....	54.2		

The significance of this concentration is in its relation to the problem of assimilation. The evidences of assimilation cannot well be treated statistically, and we have only a few indications of it. One of these lies in naturalization. In 1910, of 6,646,817 foreign-born white males, 21 years of age and over, 3,034,117 were naturalized, and 570,772 had taken out their first

The high percentage of naturalization among the nations furnishing the older immigration is largely accounted for by length of residence in the country. A comparison of the figures for the newer immigration shows considerable differences. Thus, of the Greeks only 12.7 per cent are naturalized or have taken out their first papers, and only 9.9 per cent of the Bulgarians, Servians, and Montenegrins. Of the Finns, 46.5 per cent fall in this class; of the Russians, 39.1 per cent; of the Rumanians, 46.5; of those from Turkey in Asia, 31.5 per cent. The high percentages are indicative of a definite tendency of such races to expatriate themselves, and are to be explained by political conditions of the land whence the immigrants come. Finns, Russian and Rumanian Jews, Armenians and Syrians from Turkey, do not contemplate return.

Another statistical evidence of assimilation is found in the acquisition of the English language. There were enumerated, in 1900, 1,217,280 foreign-born persons over 10 years of age, or 12 per cent of the total, who could not speak English. But many of the foreign born from Great Britain and Ireland and Canada speak English as their mother tongue, as much as 24.5 per cent of all. Allowing for these, the percentage of foreign born who had no English antecedents and who had not acquired English was 18.3. The census reports do not go sufficiently into details to give us any indication how far the inability to speak English was due to unwillingness to acquire it and how far to lack of opportunity, due to recent arrival in the United States. It has already been noted that 2,609,173 of the foreign born had arrived in the preceding

of the arrivals. That the foreign element is not averse to learning English would seem to be indicated by the fact that among the native whites of foreign parentage the proportion who do not speak English is only 0.6 per cent.

If we turn now to consider the social effects of immigration, we find our testimony chiefly in the statistics of illiteracy, crime, pauperism, and insanity. As one would naturally expect, illiteracy is more common among the foreign born than among the native whites. For 1910 the figures were 12.7 per cent and 3 per cent respectively. The corresponding figures for 1900 were 12.9 and 4.6; for 1890, 13.1 and 6.2. Illiteracy among the foreign born thus tends to decline.

While illiteracy is more common among the foreign born than among the native born, the children of the foreign born show a lower percentage of illiteracy than those of native parentage. Illiteracy among the children of foreign parentage amounted to 2.2 per cent in 1890, 1.6 per cent in 1900, 1.1 per cent in 1910. The corresponding figures for whites of native parentage were 7.5, 5.7, and 3.7. The superior literacy of the children of foreign parents is doubtless due to the concentration of the foreign born in cities, where educational opportunities are good.

Crime. It is often claimed that the immigrants fill the jails and penitentiaries of the country; and the impression is widespread that, were it not for immigration, there would be little use for such institutions. This impression is entirely erroneous. While it is likely that the foreign born contribute somewhat more

than their proportional quota to the army of law breakers, the disproportion is by no means such as to change materially the amount of crime which would occur were there no foreigners in the population. The extent of their influence upon the volume of crime may be briefly studied.

According to the census of 1910, the total number of offenders in prisons on Jan. 1, 1910, was 111,498, of whom 72,797 were white, 19,438 were foreign born. Thus, while the foreign born represented 16.3 per cent of the white population, they contributed 26.7 per cent of the inmates of the prisons. But criminality is largely confined to adulthood and to the male sex. Now, when it is borne in mind that the foreign born constituted 25.1 per cent of the white population over 21, and 27.3 per cent of the white male population over 21, the apparent excess of criminality dwindles to insignificance.

Insanity and Feeble-Mindedness. A much greater excess of the foreign born appears in the figures for the inmates of hospitals for the insane. Of a total of 115,402 white inmates, on Jan. 1, 1910, the foreign born numbered 54,096, or 47 per cent. A larger proportion of foreign born than of native born was to have been expected in the case of the foreign born, on account of the disproportion of male adults. No such figure as 47 per cent can be explained in this way. The fact that the foreign born are concentrated in the cities probably has something to do with the high percentage of insanity. The strain of city life may tend to produce mental disorder; moreover, many cases of insanity that are neglected under rural conditions are of such seriousness under urban conditions as to require detention in hospitals.

Among the feeble-minded the quota provided by the foreign born is naturally small (6.1 per cent). This is chiefly a result of the rigorous selection to which immigrants are subject upon landing. The effects of this selective process seem entirely to disappear in the second generation. The native born of foreign or mixed parentage constitute 23.6 per cent of the white population and contribute 26.5 per cent of the feeble-minded in institutions. Whether this represents a real excess or not is impossible to determine, since the foreign born of foreign

general population, even when allowance is made for the greater proportion of persons of advanced age among the foreign born. Its only adequate explanation is the initial poverty of the immigrant and his failure to become adjusted to American economic conditions. It is notable that the native born of foreign parentage contributed only 13 per cent to the number of paupers in almshouses.

Industrial Effects. Looking at the immigration problem from the economic side, we not infrequently hear a complaint that immigration lowers wages. In prosperous times little is heard of this, but when depression sets in complaint becomes general.

The difficulty here is to determine the facts. So complex are the conditions affecting wages that the Industrial Commission, after hearing the most conflicting evidence on both sides of the question, was forced to conclude that a positive effect of immigration on wages cannot be predicated. The Immigration Commission, appointed in 1907, reached the conclusion that there has been a tendency for immigration to lower the wages and standard of living of industrial workers.

The proposition can be supported by inference rather than by direct proof. If the numbers of the foreign born in a given industry are small, it is contrary to reason to suppose that they have a depressing effect upon wages. This raises the question of the amount of competition in a given industry. To this the answer can be found in the census statistics of occupations. The special report on *Occupations at the Twelfth Census* of the bureau of the census shows the percentage of the various elements in the white population employed in the main occupation groups. The concentration of the foreign born in mechanical and manufacturing pursuits, which was already marked in 1890, is shown by the census of 1900 to be on the increase. An interesting point is the apparent tendency of the native born of foreign parentage to show much the same preferences for the industrial group. The percentage of all three population classes engaged in trade and transportation shows a fairly uniform increase.

The concentration of the foreigners in industrial pursuits, as indicated by this table, is to

DISTRIBUTION BY OCCUPATIONS OF MALES IN EACH PRINCIPAL ELEMENT OF THE WHITE POPULATION. GAINFULLY EMPLOYED, 1890 AND 1900

OCCUPATIONS	Native born, native parents		Native born, foreign parents		Foreign born	
	1890	1900	1890	1900	1890	1900
Agricultural pursuits	51.4%	47.6%	27.1%	26.0%	25.1%	21.3%
Professional service	4.4	4.4	3.0	3.5	2.2	2.4
Domestic and personal service	8.4	10.5	12.3	13.5	20.1	19.9
Trade and transportation	16.5	18.2	23.3	24.8	15.6	17.5
Manufacturing and mechanical pursuits . .	19.3	19.3	34.3	32.2	37.0	38.9

parentage are more decidedly urban than the native born of native parentage, and under urban conditions a degree of feeble-mindedness that might be considered innocuous in the country leads to detention in hospitals.

Pauperism. Of the 77,734 paupers in almshouses enumerated on Jan. 1, 1910, 33,125 were foreign born, or 42.6 per cent of the total. This is a contingent much in excess of the percentage contribution of the foreign born to the

be correlated with their tendency to gravitate towards the cities already discussed. They have gone to the cities because the latter furnish the opportunities of employment, and this was due to the development of mechanical and manufacturing industries. The proportion of the foreign born in these broad groups is not such as to lead us to infer that they exercise a dominating influence upon wages, even if it could be proved, which is extremely doubtful, that they are any

more willing than the native laborer to work for low wages. It can therefore only be in certain specified industries, in which the proportion of the foreign born is very large and in which the pressure for work is considerable, that any appreciable influence upon wages will be exerted. Where they do not thus dominate an industry they conform to the current rate of wages. Investigations of the Commissioner of Labor into the cost of production in the iron and steel industries and in the textile industries amply prove this proposition.

On the other hand, where the foreign born crowd for employment and dominate a given industry, as in the clothing industry in New York and Philadelphia, they reduce the rate of wages, and such a permanent reduction is possible because the standard of living which they adopt is so much inferior to that which is customary among their American competitors. The contest with the sweatshop in our great cities leaves no doubt upon this point. The report of the Industrial Commission furnishes cumulative evidence of this tendency in a few lines of activity to build up industries on a basis of starvation wages which themselves rest upon the ignorance, helplessness, and incapacity of the foreign-born population of the tenement-house districts.

The problem of immigration is a problem of assimilation; and this means conformity to modes of living, modes of thought, and modes of action in many different fields of activity. With respect to the permanent additions to the population, the question which concerns us is as to how far it is desirable that we should continue to recruit what are economically the weakest and least promising classes in the community. The idea that there must always be some one to do rough work has no standing in court. Modern engineering devises mechanical appliances for these purposes, and we have no fear that progress will cease because the human race is unwilling to be mere hewers of wood and drawers of water.

Legislation. It has already been pointed out that immigration into the United States was so much a matter of course that before 1820 it was not even recorded. While in that year records of the number of arrivals were introduced, nothing was done in the way of legislation, either to promote or to restrict immigration into the United States, until the year 1864.

We may disregard the brief period in which the famous Alien Law was in force (1798-1801), which authorized the President to expel foreigners dangerous to the peace of the nation, for this law was passed to meet a supposed political danger and not to avert a threatened economic injury. Nor did the agitation against the foreigner, which gained such force in the Know-Nothing movement during the early part of the fifties, lead to legislation. It is doubtful if the question would have assumed so large an importance had it not been for popular discontent with the older political parties. Moreover, the agitation was quite as much anti-Catholic as it was antiforeign, and no majority of the American people could be gained for an attitude savoring of religious persecution.

The police and sanitary regulations, including quarantine, affecting the immigrants upon their landing in the United States were matters of State, and not Federal legislation.

When, in 1864, Congress finally took cognizance of the immigration question, it was with

the idea of encouraging immigration into the United States. Under the pressure of the demand for laborers in industrial pursuits, an act was passed to encourage immigration which offered to the immigrants freedom from compulsory military service, and the services, upon their arrival, of a commissioner of immigration, whose duty it was to assist immigrants in obtaining transportation to their destination and to protect them from the impositions to which their ignorance exposed them. The Act was repealed in 1868, and no further legislation to promote immigration was enacted. The general spirit of the times was, however, favorable to immigration, and certain special reports of the Bureau of Statistics, *Labor in Europe and America* (1870), e.g., were widely disseminated with a view to encouraging immigration. About the same time the States, particularly those of the West, established boards and commissioners of immigration, charged with the duty of promoting immigration into their respective States.

It soon became evident that encouragement was no longer needed, and the tide of public opinion began to turn towards restriction. This did not at first extend beyond the idea of preventing the introduction into the country of manifestly undesirable elements—the criminal, the pauper, the insane, and the vicious. Section 1 of the Act of Aug. 3, 1882, imposed a head tax of 50 cents (increased to \$1 by the Act approved Aug. 18, 1894, and to \$2 by Act of March 3, 1903) on each passenger not a citizen of the United States, stipulating that the money collected shall be paid into the United States Treasury as a fund to defray the expenses of regulating immigration, of caring for immigrants, and relieving those in distress, and for the general purposes and expenses of carrying the act into effect. By Act of Feb. 20, 1907, the head tax was increased to \$4. An Act of March 4, 1909, abolished the immigrant fund and ordered the covering of the receipts from the tax into the general Treasury. Since 1903 the tax has regularly produced a surplus above the cost of administration of the immigration law. In 1913 this surplus revenue amounted to nearly \$2,000,000.

Section 2 provided that the Secretary of the Treasury should be charged with the duty of executing the provisions of the act, and for that purpose empowered him to enter into contracts with the officials of the several States at their several ports. By the Act of March 3, 1903, the Commissioner General of Immigration is placed under the authority of the Secretary of the Treasury, although the Immigration Bureau is subordinate to the Department of Labor.

Section 3 provided that the Secretary of the Treasury establish such rules and regulations, and issue from time to time such instructions, not inconsistent with law, as he should deem best calculated for the protection of immigrants from fraud and loss and for carrying out the provisions of the act and the immigration laws of the United States, etc.

Section 4 treated of the exclusion and deportation of specified classes. It provided that foreign convicts, except those convicted of political offenses, lunatics, idiots, or any persons not able to take care of themselves without becoming public charges, should be sent back at the expense of the owners of the vessels on which they had come.

The Act of 1882 is still in force in principle,

though in minor points it was modified by a Law of March 3, 1891, of which the following section is the most important:

"That the following classes of aliens shall be excluded from admission into the United States, in accordance with the existing acts regulating immigration, other than those concerning Chinese laborers: All idiots, insane persons, paupers, or persons likely to become a public charge, persons suffering from a loathsome or a dangerous contagious disease, persons who have been convicted of a felony or other infamous crime or misdemeanor involving moral turpitude, polygamists, and also any person whose ticket or passage is paid for with the money of another, or who is assisted by others to come, unless it is affirmatively and satisfactorily shown, on special inquiry, that such person does not belong to one of the foregoing excluded classes, or to the class of contract laborers excluded by the Act of February 26, 1885; but this section shall not be held to exclude persons living in the United States from sending for a relative or a friend who is not of the excluded classes under such regulations as the Secretary of the Treasury may prescribe. *Provided*, That nothing in this act shall be construed to apply to or exclude persons convicted of a political offense, notwithstanding said political offense may be designated as a 'felony, crime, infamous crime, or misdemeanor involving moral turpitude' by the laws of the land whence he came, or by the court convicting."

The act was further amended by the Law of March 3, 1903. By this law the Bureau of Immigration is given a right to deport epileptics, persons who have been insane within the five years preceding their arrival in America, and persons who advocate the overthrow of all governments or the assassination of public officials. Deportation may take place any time within three years after arrival. For the sexually immoral classes the three-year limitation has been removed.

The joint administration of immigration affairs by Federal and State officials which had been in vogue since the passage of the Act of 1882 had not proved satisfactory, and by the Act of 1891 the entire charge of the matter was assumed by the general government. The Statute of March 3, 1893, took a step in advance of previous legislation by requiring at least a preliminary inspection of immigrants at the point of departure. Each immigrant is provided with a number identifying him to the inspectors of the United States. The medical inspection provided by the act has been a useful aid in pre-

venting the introduction of disease. Furthermore, a fine of \$100 is assessed upon any steamship company that brings to the United States

an alien afflicted with a loathsome or dangerous contagious disease, tuberculosis, idiocy, imbecility, epilepsy. Under this provision \$30,200 was levied in fines in 1913.

Side by side with legislation to exclude persons morally and physically undesirable has gone the effort to exclude the contract laborer. The first law on this subject was passed Feb. 26, 1885. It made it unlawful for any person, company, partnership, or corporation in any manner whatsoever to prepay the transportation or in any way assist or encourage the importation or migration of any alien or foreigner into the United States, under contract or agreement or parole, special, expressed, or implied, made previous to the importation of such alien or foreigner to perform labor or service of any kind in the United States. The law excepted strictly personal and domestic servants from its provisions.

The object of this legislation was to prevent the agents of manufacturers from contracting in Europe with the laborers, oftentimes in herds, for the purpose of breaking strikes or introducing a supposedly more docile, because more ignorant, class of laborers. Moreover, it is plain that contracts made abroad would be made with reference to the scale of wages existing in foreign countries rather than those in force here and would thus introduce a lower-priced competition, dangerous to the well-being of the working classes. The general spirit of the law has been commended by public opinion, though in its first form it presented some crudities which placed it in a ridiculous light, as where a clergyman was denied admission to the United States by reason of a contract made in England to assume charge of a parish in New York. Subsequent modifications distinctly eliminating the professional classes and bringing the operation of the law within the intention of the legislators have much improved the statute.

The general characteristic of the United States immigration laws is that whoever enters in violation of the law is to be returned to the point of departure at the expense of the steamship company which brought him, and that this liability extends in all cases for a period of one year after arrival. The machinery for the enforcement of the law has been progressively improved. The following table will indicate the extent to which the practice of exclusion has been employed, and on what grounds, in recent years. It is to be borne in mind that the principal effect of the law is to compel a fairly minute examination, by the transportation companies, of intending immigrants.

CAUSE OF REJECTION	1907	1908	1909	1910	1911	1912	1913

venting the introduction of disease. Furthermore, a fine of \$100 is assessed upon any steamship company that brings to the United States

One of the great difficulties in the way of the thorough administration of the law is the comparative ease with which persons of the undesir-

able classes obtain access to the United States through Canada. Arrangements have been made between the Canadian government and the immigration service establishing an inspection in Canada. The effort is made to inspect not only the immigrants who give the United States as their destination, though arriving at Canadian ports, but also those who give Canada as their destination, but come into the United States. The fact that, of less than 5000 persons of the latter class inspected, 2000 were turned back, indicates clearly that the ineligible classes have been coming into the United States over the Canadian border.

The present immigration laws represent little more than sanitary measures designed to protect society from the introduction of positively vicious and undesirable elements. The demand has been heard, and has been supported by a wealth of argument, that the United States should be more liberal in its interpretation of the word "undesirable," and exclude also such immigrants as by reason of incapacity and ignorance give the least promise of assimilation.

The question of still further restricting immigration made its appearance in the early nineties. It was felt that many persons were admitted into the United States who were not desirable acquisitions to its population. The demand was heard in many quarters that the illiterate should be excluded, and the question was actively agitated in Congress until 1897. In that year a bill passed both Houses of Congress which excluded from admission to the United States all foreign persons over 16 years of age who could not read or write the English or some other language, except parents or grandparents accompanying persons otherwise qualified, or coming to join relatives already in the United States. The bill was vetoed in the closing hours of Congress, March 3, 1897, by President Cleveland, on grounds of general policy, as well as for material defects in the measure, such as the exclusion of the illiterate wives of qualified persons. The bill was reconsidered in the House of Representatives and passed over the President's veto by the constitutional majority of two-thirds; but no attempt was made to force a vote in the Senate. In 1906 a measure excluding immigrants unable to read or write English and increasing the head tax was debated in Congress, but as amended merely provided a bureau of immigration and naturalization, whose duty it is to keep a registry of all aliens entering the United States. The Immigration Commission in its recommendations, published in 1911, strongly urged limitation of immigration and favored a literacy test among the measures that would have a restricting tendency. A measure limiting the immigration of illiterates to certain specified classes was passed by both Houses of Congress in 1912, but was vetoed by President Taft. A similar measure was vetoed by President Wilson in 1915. A new principle of restriction was proposed by the Immigration Commission: the limitation of immigrants from a specific country to a definite percentage of the immigrants from that country already in the United States. This proposal was embodied in the Dillingham Immigration Bill, introduced in Congress in 1910. By Act of Congress approved March 4, 1913, a Bureau of Immigration, under the Department of Labor, was created.

IMMIGRATION, CHANGES IN BODILY FORM OF DESCENDANTS OF IMMIGRANTS. The Immigration Commission of the United States appointed Professor Franz Boas, New York City, to conduct an investigation of the modifications undergone by the descendants of immigrants residing in New York City. The results of this study were announced in 1911, from which it appears that among other changes the children of Europeans show a tendency to change their head form. Thus, according to the cephalic index (see INDEX, CEPHALIC), Sicilians born in Sicily are rated at 78, while Sicilians born in New York are rated at 80; and again European-born Jews at 83 as against 81 for the New York born. Similar changes were found among other immigrants. (For tables of measurements, consult *Report of the Immigration Commission*, Washington, 1911.) It is claimed that these changes are entirely due to the geographical or other environment, and that on the whole the differences tend towards a medium index of 80, suggesting that the American environment may be forming a distinct type by changing the anatomy of its inhabitants. To this interpretation many authorities object, but the fact remains that a difference has been demonstrated between the foreign born and the native born. To determine the true significance of these differences, further investigation will be necessary.

IMMISCH, im'ish, OTTO (1862-). A German classical scholar, born at Wartha, Lusatia. He was educated at the University of Leipzig, where he became lecturer in 1889 and was professor from 1896 to 1907. After six years at Giessen, in 1913 he became professor at the University of Königsberg. He wrote much for philological journals, and among his separately published works the more important are: *Philologische Studien zu Plato* (1896; 1903); *Die innere Entwicklung des griechischen Epos* (1904); a revision of Susemihl's *Aristotelis Politica* (1909); *Wie studiert man klassische Philologie?* (1909); *Das Erbe des Alten* (1911).

IM'MOLA'TION (Lat. *immolatio*, from *immolare*, to sacrifice, from *in*, in + *mola*, grindstone, meal, from *molere*, to grind; connected with Goth., AS., OHG. *malan*, Icel. *mala*, Ger. *mahlen*, to grind, Eng. *meal*). A Roman sacrificial ceremony in which the victim was sprinkled with meal coarsely ground and mixed with salt (called *mola salsa*). Hence, to immolate means to sacrifice.

IM'MORAL'ITY (from Lat. *in-*, not + *moralis*, moral, from *mos*, custom, right). In its broadest sense, any breach of the duty which one owes to God, to his fellowmen, or to himself; in a narrower, popular sense, an act or course of conduct which strongly violates the sense of decency of the community, especially offenses of a sexual character.

Immorality, as such, is generally not punished by law, but is left to be dealt with by the informal agencies of social control or by the ecclesiastical authorities. It is only when an immoral act or course of conduct is so harmful to others than the wrongdoer, or is so repugnant to the sense of decency and morality of the community as to excite general indignation, that its control and punishment are taken over by the law. As the foundation of criminal jurisprudence is the duty and necessity which rests upon the authorities of preserving the peace, the class of immoral acts first recognized as proper subjects for legal recognition are crimes of violence, and then, at a later stage, any other acts leading to breaches of the peace. Acts of private immorality, i.e., such as do not directly affect any others than the participants therein, as drunkenness, gambling, fornication, and the like, have not generally, except under an ecclesiastical dispensation, been noticed by the law, except in cases where they were committed publicly so as to constitute them a public nuisance.

But though the law may tolerate immorality, certain classes of immoral acts may yet incur indirectly the condemnation of the law, as by denying to the person who has been guilty of them his right to enforce a claim upon a contract or a tort arising out of such an act. Thus, a bond given for an immoral consideration, or to secure the performance of an immoral act, is unenforceable. However, a completed transfer of property, real or personal, is none the less valid and binding because based on an immoral consideration. Immorality which does not fall under the ban of municipal law rarely, if ever, affects the legal rights or status of a person. It may subject him to social censure, but it does not defeat him in the prosecution of a legal claim. Cf. *MALUM IN SE*.

The present tendency, both in Europe and in the United States, seems to be to extend the control of the law over the private lives of persons and more and more to make acts of immorality subject to legal penalties. See *ADULTERY*; *FORNICATION*; *DRUNKENNESS*; *GAMBLING*.

IM'MORTAL'ITY (Lat. *immortalitas*, from *immortalis*, undying, from *in-*, not + *mortalis*, mortal, from *mors*, death; connected with Skt. *mar*, to die, Gk. *μῆρος*, *moros*, death, and *βροτός*, *brotos*, mortal, Lith. *mirti*, to die, OChurch Slav. *mrŭtvŭ*, dead, OHG. *mord*, Ger. *Mord*, murder, AS. *morþ*, death). The endless existence of the human soul in the continued possession of its distinct personality and consciousness. How early the idea of a survival after death entered the mind of man cannot be determined. Some evidence has been recently forthcoming of such a disposal of the dead already in the later periods of the Paleolithic age as would seem to indicate at least a tendency of thought in this direction; and when the marvelous artistic development of the Magdalenian period is considered, revealing as it does a comparatively advanced religious speculation, this interpretation of certain apparent mortuary customs is

by no means improbable. In the Neolithic age not only the ornaments, weapons, tools, and food placed by the side of the dead, but the houses, mounds, chulpas, and tombs built for them, testify to a belief that some of the dead for some time continue some kind of an existence after death. It is probable that at first death was looked upon as a deep and prolonged sleep. The dead was left in his dwelling place, the survivors seeking a new home, or a special structure was made for him. Visions of the departed in dreams naturally led to the conclusion that they left their dwellings in the night, and, upon further reflection, to the theory of a double of finer material, but dependent upon the food and drink brought to the tomb. The practices of the Neolithic age already imply the development of some such theory of a "soul." The fact that these customs and the faith they imply survived into the more advanced civilizations of antiquity and are to be found extensively at the present time among peoples that have remained upon lower stages of development, indicates for them a very high age.

Tombs were the earliest temples, and the ancestral cult was the earliest form of divine worship. As long as offerings were made to the dead the departed ancestors were believed to exist and to protect their descendants. Thus the cult itself tended to create a confidence in an indefinite prolongation of existence in the case of the objects of filial worship. As the great cosmic forces began to attract more attention, the double of the dead might be connected with them in one way or another and thereby become more independent of the tomb. But even where, as in Egypt, this process can be most clearly perceived, the ancestral cult as the basis of hope for survival maintained itself to the latest times. Whether the mass of men in Egypt who were too poor to pay the cost of embalming and "a house for eternity" were regarded as long surviving the shock of death, is doubtful. But the assurance in a future life, as rich as the present and not very different in its outward conditions, for those properly embalmed and entombed, was very strong. Numerous pictorial representations and inscriptions in tombs and papyri from different periods show how intensely the inhabitants of the Nile valley believed in a life after death.

Starting from the same premises, speculation as to the future took a different turn in India. The doctrine of metempsychosis was developed. Without losing its identity the spiritual substance in man was supposed to enter into other forms of life, rising or sinking in the scale of being in consequence of the deeds wrought in the body and the character formed. (See *ESCHATOLOGY*.) This transmigration of souls implied eternal existence before as well as after any appearance in the world as a human being. It precluded the idea of a disembodied spirit, and it adjusted outward circumstance to inner character, punishment to crime, and reward to virtue more nicely than any other system of thought. But this assurance of eternal life became itself a burden to the mind of man, and it cried out for deliverance from the endlessly turning wheel of existence. Buddhism offered relief in the hope of Nirvana. In Persia Mazdaism proclaimed, possibly not in the Gathic period, but at least as early as the fifth century B.C., the doctrine of a resurrection (q.v.). This doctrine was no doubt based upon the simpler

and more widespread belief that the sleepers in the dust might be aroused. Cases of apparent death and successful resuscitation would strengthen this expectation. The animistic basis is quite evident.

Among the Iranian peoples of the northwest, the Sarmatians, the Scythians, and the Thracians, the faith in a future life was very strong. From Thrace the Orphic cult spread in the Greek world. While the Mycenæan tombs, as compared with the remains of the preceding age, reveal a growing importance attached to the life beyond, but no conceptions differing from those generally associated with the ancestral cult, and the Homeric poems tell of Elysian fields as well as of a barren and cheerless Hades, but put no emphasis upon what still is a somewhat shadowy existence beyond with no moral distinctions, the Orphic cult societies offered to the initiated the hope of a blessed immortality. (See ESCHATOLOGY; HEAVEN; HELL.) The arguments of Socrates and Plato are far from being the first intimations of immortality among the Greeks. They are not endeavors to open new vistas into a life beyond. On the contrary, they represent a critical tendency seeking to establish the truth of a view held by many, and to find the rational grounds on which it can be maintained, if at all. In the following periods skepticism prevailed in some circles, ardent belief in others. If the practical character of the Roman caused him to cling to the ancestral cult, his hospitality to religious ideas opened the doors to the doctrines taught by the Orphic and Dionysiac societies. It was a real life of battle and of joy to which the Teutonic warriors looked forward in Odin's hall, Valhalla.

Among the Semitic nations the prevailing view left little joy in the thought of man's fate after death. The Babylonians and Assyrians seem to have believed in a semiconscious later existence, but with no distinctions based on character or conduct and no feature rendering it desirable. The myth of Ishtar's descent to the nether world shows that imagination occupied itself with the abode of the dead, and the translation of some heroes to be with the gods tends to mark the contrast with the ordinary issues of human life. Substantially the same conception of the future was held by the ancient Hebrews. (See SHEOL; HADES.) There was no conception of an endless existence of the human soul in possession of a distinct consciousness, and no intimation of a difference based on conduct in this life. A poetic passage (Isa. xiv) possibly shows that the kings were thought of as sitting upon thrones—consequently a social distinction. The intense religious life of the nation did not occupy itself much with the future of the individual. Neither the prophets, nor the legislators, nor the poets, nor the great wisdom teachers, seem to have attached much importance to it. Their opposition to the ancestral cult and to necromancy may account in a measure for this indifference. Only as the sufferings of innocent individuals, particularly in the Exile, made the question of the divine government of the world acute, did "the hope of man" receive attention by the thinkers of Israel. But the author of Job presents this possibility of a restoration to life only in order to reject it. He is not willing to obscure the issues by the introduction of what he considers a vain and improbable speculation. A high type of piety thus flourished without a hope

of immortality. But the growing demand for a justification of the ways of God was met by foreign conceptions that brought relief by a temporary postponement of the problem. Persia contributed the thought of a resurrection, Greece that of immortality in the stricter sense. The conception of a resurrection appears for the first time in Jewish literature in the last chapter of the Book of Daniel (written in 165 B.C.). Here some of the dead are raised, probably the martyrs of the great persecution and their oppressors, to continue their life on earth.

There is evidence that this new life was sometimes regarded as of limited duration. In regard to the new body, some maintained that it was identical with the old, or of a similar substance; others that it was spiritual; some that it was bestowed on men at a general resurrection in the future; others that it was given immediately after death. In some circles it was thought that only the Israelites or the good would be raised; in others, that all men, even the wicked, would rise. (See RESURRECTION.) The new doctrine was chiefly accepted by the Pharisees; the Sadducees strongly opposed it. Ecclesiastes rejected the idea of a survival after death in every form. Meanwhile the Greek conception of immortality based on the nature of the soul, with or without the notion of pre-existence, found acceptance not only among the Alexandrian Jews but to some extent also in Palestine. A doctrine of a future life in which the resurrection had no place is found in the Slavonic Enoch (see ENOCH, BOOKS OF), Wisdom of Solomon, Philo, among the Essenes, and elsewhere. Jesus himself seems to have believed in a spiritual resurrection occurring immediately after death. A somewhat similar conception is found in the Pauline literature, while the Fourth Gospel presents the eternal life as a sharing in the divine nature that may begin in time and continue through eternity, and seems to use the term "resurrection" figuratively. The firm conviction of the early Church that Jesus had risen from the nether world and ascended to heaven, and that He would presently return in glory to raise the dead and establish His kingdom on earth, tended to base the hope of survival upon His resurrection.

In 1 Corinthians xv the thought is expressed that if Jesus was not risen His disciples are not raised, and that it does not matter how life is lived if that is the case. It was felt that through His resurrection He had thrown light upon life and immortality. Much of the success of Christianity was no doubt due to the prospect that it held out for a future life. It offered to all men, even slaves and barbarians not permitted to participate in the official cult and not invited to take the holy vows of the secret cult societies, the same blessed immortality that was promised to those initiated in the Orphic, Dionysiac, and Mithraic mysteries, and it was itself influenced by the thoughts that had prevailed in these religious societies. (See HEAVEN; HELL.) The Greek idea that the soul is immortal by virtue of its own nature became dominant in Christian theology. The controversies within the Church have not affected this fundamental position, but have had reference to the character of the future life.

Through Maimonides the Greek conception of immortality found its way into the synagogue. At first it had a tendency to exclude the doctrine of a resurrection; subsequently it was

made the philosophical basis of this doctrine, as in the Church. With the renaissance of learning and the development of natural science doubts as to the immortality of the soul began to be expressed. Uriel Acosta (q.v.) was persecuted for rejecting this doctrine, and he had sympathizers among the deists. The growth of evolutionary philosophy in the nineteenth century led many minds to question the survival of the human soul after death, and the possibility of a continued life of the spirit apart from the bodily organism is to-day widely denied in scientific circles. Various reasons are given for this negative position. It is maintained that the mental life of man is so closely connected with and invariably dependent upon the brain that a continuance of any intellectual functions after the dissolution of the body is inconceivable. As the mentality of man appears to differ from that of the animal only in degree, and not in kind, any argument from the peculiarities of the human mind is held to imply also the immortality of the lower organisms.

Still greater difficulties are thought to arise from man's embryological development. The lack of any convincing evidence of communication between the dead and the living is pointed out, and it is urged that the origin of the belief can be naturally accounted for, and that its persistence is largely due to the social conditions in which man is placed. On the other hand, the doctrine is defended not only from the standpoint of belief in an infallible revelation, but also by thinkers who claim the right of free inquiry and base their views solely upon what appears to them to be sufficient evidence. As a more careful exegesis renders it increasingly difficult to appeal to the Old Testament on that subject, it is generally the New Testament, and particularly the words ascribed to Jesus Himself, that furnish the authority. Even from an independent point of view, great weight is often accorded to the conception of Jesus and the New Testament writers, on the ground of the deeper intuition into religious truth possessed by them. The uncertainty, however, as to the actual words of Jesus and the growing impression that some at least of the writers of the New Testament did not believe in a natural immortality, but in an endless life bestowed as a free gift of God upon His children in an especial sense, have led many scholars who attach much importance to these spiritual authorities to accept the theory of a conditional immortality. The good, in their opinion, will continue to exist; the wicked are destined for final annihilation.

Where the question of man's survival is decided in the affirmative without an appeal to authority, the reasons given are such as the inadequacy of the objections, the difficulty of accounting for certain phenomena except as manifestations of spirits, the incompleteness of the present life, and the "intimations of immortality" to which it is felt that an objective reality must correspond. Facts are quoted that tend to show the independence of man's mind operating with great clearness, precision, and strength even in wholly abnormal physical conditions; and though, to render the argument strictly cogent, it would be necessary to prove that in these instances the brain was also affected, and that the mental power would not have been enhanced if the physical conditions had been more normal, importance seems to be rightly

attached to this consideration. That the relation between mental activities and cerebral changes is very intimate is not denied; but it is thought that a distinct and separable spirit using the brain as its organ might act upon it in such a manner as to express different perceptions through different cerebral centres. The argument based on the evolution of mental life in animal and man, and the transmission of psychical as well as physical characteristics from man to man, is met by the observation that the consciousness of self, whatever its origin, is so distinguishing a mark of human nature and so intrinsically significant that a greater permanence and a loftier destiny may well be associated with it. Instead of making self-consciousness the basis of immortality, others prefer to think of the possession of a sense of right or a peculiarly high development of the moral nature as furnishing the ground for survival.

A mass of testimony is produced, ancient and modern, to show actual communication between the dead and the living. Much of this testimony comes from persons bereaved of some relative or friend whose potent personality still occupies the mind. In almost all instances the initiative is taken by the living, and the communication is mediated through a third person. A critical sifting is often impossible. Where the manifestations through a medium have been watched and studied by scientifically trained observers, there is at best only a small residue of facts that cannot be accounted for by known laws of nature. In the present state of our knowledge of psychical phenomena it is sometimes hazardous to pronounce a judgment. The scientist is, as a rule, inclined to assume the operation of some law of nature not yet fully understood. The manifestations may thus furnish to our minds a presumption in favor of immortality, but they cannot prove it. With more effect an argument is founded upon the incompleteness of the present life. The largest part of the human race die in infancy, or before years of discretion have been reached, and it is natural to ask whether there is no outflowing elsewhere of the human life that only buds here. Even the longest lifetime raises more intellectual problems than it solves, and leaves the mind curiously looking for their solutions to the last. The moral imperfections, seen even in the best, painfully apparent in the masses of men, give the impression of something fragmentary, unfinished, partially realized. The inequalities of life as regards wealth, position, health, opportunity for self-realization, and the still more marked inequalities of character, seem to call for a readjustment, for compensations in another life. If these considerations strictly prove only a dissatisfaction with prevailing conditions, and would to some extent lose their validity as arguments in a state of society better organized, more intelligent, resourceful, and strong than the present, the shrinking from even a painless death, the sense of an inalienable personality, and the long and widespread prevalence of the hope of a future life are deemed by many to have evidential value. The fear of death may indeed be a dread of extinction, and the fear of something after death the involuntary reflection of a belief long cherished by mankind. But it is forcefully argued that a belief so strong and persistent is not likely to be a sheer delusion.

While manifestly it is not safe to conclude from the intensity and popularity of an idea that there must be an objective reality corresponding to it, and while it is especially to be considered that modern science has revolutionized that estimate of the universe, held throughout the ages, with which all eschatological speculations in antiquity were closely connected, it nevertheless seems plausible that some fact in nature's economy is reflected in the hope of immortality. That the elements composing man's body at death are imperishable and will forever continue to be integral parts of forms that manifest the eternal energy, is reasonably certain. That his psychical peculiarities survive in his offspring and in the human lives that directly or indirectly come into contact with him, is a matter of easy observation. Whether this survival in the race is endless seems to some thinkers doubtful, on the ground that the earth itself will some day have run its course and ceased to be the bearer through space of organic life. But as it is quite inconceivable that in an infinite universe, constituted, as spectral analysis shows, of essentially the same substances, a single satellite of a single sun should have produced intelligence like that of man, the secret of the earth's life may become known, and the influence of the human race, large or small, good or bad, may be felt elsewhere in the universe ere the final catastrophe comes, and even out of the death of this planet are likely to rise new forms of life.

That man will live forever in other forms of physical organization and of consciousness may therefore be regarded as exceedingly probable. Whether the consciousness of personal identity which cannot be stripped off or dissolved in the succession of fluctuating mental states and the accompanying sense of moral accountability can be fully explained as products of the brain due to the persistency of the physical type, in spite of incessant changes in the organism, may be gravely questioned. From the standpoint of idealistic philosophy this consciousness of self is interpreted as betokening the presence of a spiritual monad reflected to human sense perception only as though it possessed a material form. But even if the ultimate reality is conceived of as an infinite, eternal, and inexhaustible energy, it does not seem to follow that each or any of its individualized expressions shares its everlasting persistence. Rather would it seem as if the reality that no longer is shadowed forth to our sense in the outward form of a man must have ceased to be what it was. The idea of a conditional immortality has received some additional strength from the doctrine of a survival of the fittest. It encounters great difficulties, however, in attempting to define what constitutes fitness. The difference between a short life on earth and an endless existence is so infinitely great that the mind shrinks from ascribing the power to determine so momentous a fate to any conviction that has been formed, or disposition that has been developed, or line of conduct that had been adhered to, during a few years of earthly life, especially in view of the enormous influence of heredity and environment. If therefore scientific inquiry apparently leads to a *non liquet*, and assurance based on authority can be preserved only until the authority itself is questioned, it is the more gratifying to note the important place the doctrine of immortality has had in the education

of the human race in enhancing the worth of the individual and emphasizing his higher spiritual interests, in maintaining his confidence in the inherent rightness of the universe, and in training him to regulate his present conduct by considerations of the future."

In Occidental philosophy the question of immortality has been discussed with great vigor and interest since the time of Socrates; but in this article it will be possible to give only a few typical quotations from modern philosophers, to show how varying have been the reasons given for the affirmative answer to the question. Kant's treatment of the subject is famous; after criticizing the rationalistic position on the subject, according to which immortality can be proved from the simplicity of the soul, Kant makes of immortality not a demonstrable doctrine but a moral postulate. "The realization of the *summum bonum* in the world is the necessary object of a will determinable by the moral law. But in this will the *perfect accordance* of the mind with the moral law is the supreme condition of the *summum bonum*. This then must be possible, as well as its object, since it is contained in the command to promote the latter. Now, the perfect accordance of the will with the moral law is *holiness*, a perfection of which no rational being of the sensible world is capable at any moment of his existence. Since, nevertheless, it is required as practically necessary, it can only be found in a progress *in infinitum* towards that perfect accordance, and on the principles of pure practical reason it is necessary to assume such a practical progress as the real object of our will. Now, this endless progress is only possible on the supposition of an *endless* duration of the existence and personality of the same rational being (which is called the immortality of the soul). The *summum bonum*, then, practically is only possible on the supposition of the immortality of the soul; consequently this immortality, being inseparably connected with the moral law, is a postulate of practical reason (by which I mean a *theoretical* proposition, not demonstrable as such, but which is an inseparable result of an unconditional *a priori* practical law)." (*Kritik of Practical Reason*, pp. 262-263; Abbott's translation.) Some followers of Kant have on Kantian principles attempted to go further than their master and to *demonstrate* immortality. Thus, Professor Howison, taking the Kantian thesis that time is not objectively real, but "an expression of each mind's spontaneous activity," establishes upon this the "eternity of the individual spirit in the only ultimate meaning of eternity; since, as the ground and source of Time itself, the being of the soul must transcend Time, though including Time, and consequently, while involving everlastingness, must have its *full* meaning in just that spontaneous sourcefulness of self-consciousness from which everlastingness arises." Thus the "sourceful and directive power of our individuality" involves, "first, the essential supremacy of the soul over death, and then its intrinsic imperishableness from any cause." (*Limits of Evolution*, pp. 303 ff.) This, as is seen, is a carrying out of Kant's principles to a multipersonalistic issue. Royce, taking the position of absolute and monistic idealism, has his own way of proving immortality. According to his absolute idealism every individual finite experience is a

fragment of the eternal and absolute experience, which he calls God. Now, "in three ways, our union with God implies an immortal and individual life. For first, in God, we are real individuals, and really conscious Selves—a fact which neither human thought nor human experience, nor yet any aspect of our present form of consciousness, can make present and obvious to our consciousness, as now it is. But since this very fact of our eternal and individual Selfhood is real as a conscious fact, in God, we too, in him, are conscious of our individuality in a form higher than that now accessible to us. And secondly, the death of an individual is a possible fact, in an idealistic world, only in case such death occurs as an incident in the life of a larger individual, whose existence as this Self and no other, in its individual contrast with the rest of the world, is continuous in meaning with the individuality that death cuts short. No Self, then, can end until itself consciously declares, 'My work is done, here I cease.' But, thirdly, no ethical self, in its union with God, can ever view its task as accomplished, or its work as done, or its individuality as ceasing to seek, in God, a temporal future. In Eternity all is done, and we too rest from our labors. In Time there is no end to the individual ethical task." (*The World and the Individual*, vol. ii, p. 445.) In this a very strong echo of Kant is detected. James does not attempt to prove immortality, but to make it tenable as a working hypothesis. In his view the main argument against immortality is the fact that thought is a function of the brain. "When the physiologist who thinks that his science cuts off all hope of immortality pronounces the phrase, 'Thought is a function of the brain,' he thinks of the matter just as he thinks when he says, 'Steam is a function of the teakettle,' 'Light is a function of the electric circuit,' 'Power is a function of the moving waterfall.' In these latter cases the several material objects have the function of inwardly creating or engendering their effects, and their function must be called *productive* function. . . . But in the world of physical nature productive function of this sort is not the only kind of function with which we are familiar. We have also releasing or permissive function, and we have transmissive function. The trigger of a crossbow has a releasing function: it removes the obstacle that holds the string, and lets the bow fly back to its natural shape. . . . In the case of a colored glass, a prism, or a refracting lens, we have transmissive function. The energy of the light, no matter how produced, is by the glass sifted and limited in color. . . . My thesis now is this: that, when we think of the law that thought is a function of the brain, we are not required to think of productive function only; *we are entitled also to consider permissive or transmissive function.*" Suppose that behind the veil of material things there lies "one infinite Thought," and that "our brains are thin and half-transparent places in the veil. What will happen? Why, the life of souls as it is in its fullness will break through our several brains into this world in all sorts of restricted forms, and with all the imperfections and queernesses that characterize our finite individualities here below. . . . And when finally a brain stops acting altogether, or decays, that special stream of consciousness which it subserved will vanish entirely from this natural

world. But the sphere of being that supplied the consciousness would still be intact; and in that more real world with which, even whilst here, it was continuous, the consciousness might, in ways unknown to us, continue still." (*Human Immortality*, pp. 12 ff.) Bergson rests his belief in immortality on his view that one of the essential functions of consciousness is "to accumulate and preserve the past, that very probably . . . the brain is an instrument of forgetfulness as much as one of remembrance, and that in pure consciousness nothing of the past is lost, the whole life of a conscious personality being an indivisible continuity"; are we not by this led to suppose "that the effort continues *beyond*, and that in this passage of consciousness through matter (the passage which at the tunnel's exit gives distinct personalities) consciousness is tempered like steel, and tests itself by clearly constituting personalities and preparing them, by the very effort which each of them is called upon to make, for a higher form of existence? If we admit that with man consciousness has finally left the tunnel, that everywhere else consciousness has remained imprisoned, that every other species corresponds to the arrest of something which in man, succeeded in overcoming resistance and in expanding almost freely, thus displaying itself in true personalities capable of remembering all and willing all and controlling their past and their future, we shall have no repugnance in admitting that in man, though perhaps in man alone, consciousness pursues its path beyond this earthly life. This is as much as to say that, in my opinion, the aspirations of our moral nature are not in the least contradicted by positive science." (*Hibbert Journal*, vol. x, p. 43.) The philosophers thus quoted all believe more or less assuredly in a future life, but many philosophers are either agnostic or disbelievers. But explicit disavowal of any hope of immortality is rather rare. James says: "I confess that my surprise was great when I came to look into books for a passage explicitly denying immortality on physiological grounds, . . . I was unable to find anything blunt and distinct enough to serve. I looked through all the books that would naturally suggest themselves, with no effect; and I vainly asked various psychological colleagues. And yet I should almost have been ready to take oath that I had read several such passages of the most categorical sort within the last decade. Very likely this is a false impression, and it may be with this opinion as with many others. The atmosphere is full of them; many a writer's pages logically presuppose and involve them; yet, if you wish to refer a student to an express and radical statement that he may employ as a text to comment on, you find almost nothing that will do." The most explicit passage he could find after all this search is the following: "Not only consciousness, but every stirring of life, depends on functions that go out, like a flame when nourishment is cut off. . . . The phenomena of consciousness correspond, element for element, to the operations of special parts of the brain. . . . This fundamental proposition . . . carries with it the denial of the immortality of the soul." (Dühring, *Der Wert des Lebens*, 3d ed., pp. 48, 168.) As a good example of the agnostic position, we find Lotze's saying: "The question of the immortality of the soul does not belong to Metaphysic. We have no other principle for deciding

it beyond this general idealistic conviction: every created thing will continue if and so long as its continuance belongs to the meaning of the world; every one will pass away whose actuality had only in some transitory phase of the world's course a place that justified it." (*Metaphysic*, § 245.)

IMMORTALITY, CONDITIONAL. See ANNIHILATIONISM.

IMMORTEL, é'môr'tél', L'. A romance by Alphonse Daudet (1888), picturing with keen insight and irony the intrigues and petty strivings of the academic world.

IMMORTELLE, im'ôr-tél' (Fr., fem. sing. of *immortel*, immortal). A name applied to various species of *Helichrysum*, especially *Helichrysum arenarium* and *Helichrysum orientale*, which are grown extensively in France, where the flowers are made into compact wreaths for home use or for export. They are chiefly used as mortuary decorations, either in their natural color (yellow) or bleached white. Like other flowers, such as tuberose and callas, that have been used largely for funereal decoration, immortelles have suffered in popularity, especially since the barbarous practice of dyeing them purple and vermilion, and working them into fantastic designs, came into vogue. The most

striking feature of the immortelle is the one that suggested the name; the flowers, being dry and firm, are so-called "everlasting." They retain their natural colors for months or even years. See AMARANTH.

IMMU'NITY (from Lat. *immunitas*, exemption, from *immunis*, exempt, from *in-*, not + *munis*, serving, from *munus*, duty). Immunity may be described as the state or condition of an individual who is resistant or nonsusceptible to a particular infection. There is no such thing as absolute immunity. While animals or individuals may seem under natural conditions to be immune to certain diseases, yet when they are placed in an unfavorable environment, or when the natural vigor is lowered by climate or insufficient food, they become susceptible to diseases to which they are ordinarily immune. There is a great difference in the resistance shown to the invasion by germs of disease by certain animals of allied nature. Human beings, cattle, and guinea pigs show great susceptibility to tuberculosis, while the cat, dog, and horse resist it. Man easily becomes a victim of typhoid fever, while domestic animals never suffer from it. It has long been a matter of observation that an attack of certain infections, such as smallpox, measles, typhoid fever, cholera, typhus fever, leads to immunity, while attacks of others not only fail to confer immunity but leave the individual more susceptible than before. Among these latter are pneumonia, erysipelas, influenza, diphtheria, dysentery, tonsillitis, and acne. This phenomenon is explained on the theory of hypersusceptibility or anaphylaxis (q.v.). Immunity is either (1) *natural* or (2) *acquired*. Natural immunity is a congenital insensitiveness to infection or contagion which is possessed by certain individuals, families, or species, or which exists as a racial characteristic. The same individual may be immune against a certain disease at one age and become susceptible to it at another age; thus, infants are almost entirely immune against yellow fever, and but few cases occur among them. The Arab is said to be absolutely immune to typhoid fever, and the Japanese to scarlet fever. *Acquired immunity* is a condition of insusceptibility which results from passing through an attack of the disease, or from being inoculated with the poison of the disease, which results in a change in the blood. Immunity to yellow fever results after one attack of the disease. One attack of typhoid fever is almost a certain guard against another—a statement which is true also of scarlet fever and measles. *Active immunity* may be produced by the injection of cultures of living or dead bacteria, or their toxins, into an animal. Passive immunity is brought about by the injection of antitoxic serums. That is to say, the immunity conferred by a vaccine is an active resistance, while that conferred, e.g., by diphtheria antitoxin is a passive immunity. *Experimental immunity* results from introducing, for experimental purposes, attenuated microorganisms into susceptible animals, and thereby causing the production of immunity to virulent forms of those organisms. The house mouse and the white mouse, naturally very susceptible to anthrax, are rendered immune to this disease by receiving an inoculation of blood from a convalescent tetanic animal.

Immunity is lost or destroyed in a number of ways. It may be destroyed by (1) variation

from the normal temperature. Pasteur found that chickens, naturally immune to anthrax, become susceptible to the disease after being plunged into a cold bath. (2) Altering the chemical composition of the blood by changing the diet or by injection of drugs. (3) Loss of strength, or exhaustion, is a cause of loss of immunity, as Roget demonstrated by inoculating previously immune white rats with anthrax, after compelling them to work at revolving a wheel. (4) Removal of the spleen is followed by susceptibility to disease. (Bardach.) (5) Combining various microorganisms destroys immunity in some experimental cases.

Theories of Immunity. The exact causes of the phenomena of immunity are not well understood, but various theories have been proposed which make them more or less intelligible. In 1880 Pasteur taught that the microorganism, by its growth in the body, uses up some substances necessary for its existence and then perishes. If the removal of this substance be complete, perfect immunity results. This is the *exhaustion theory*. Sternberg combats it, saying that if it were true we must have in each of our bodies certain smallpox material, measles material, and scarlet-fever material, etc., each of which must be exhausted by its appropriate microorganism, thus necessitating an almost inconceivably complex body chemistry. The *retention theory* was advanced in 1880 by Chauveau, who suggested that the growth of the bacteria in the body probably originated some substance prejudicial to their further development. The *phagocytosis theory* was suggested by Carl Roser in 1881, received attention from Sternberg, and also from Koch, but was not advanced with any insistence until, in 1884, Metchnikoff enthusiastically championed it and gave it his name. There are two varieties of the white blood corpuscle whose duty it is to destroy bacteria; these are the large, unicellular leucocyte, or macrophagocyte, and the smaller forms, the polynuclear leucocyte, or microphagocyte. Both these forms exhibit amœboid movements and possess the attractive force called chemotaxis, which exists between amœboid cells and food particles. Phagocytosis is the incorporation of foreign particles by these amœboid white blood corpuscles. Leucocytes actually take up and envelop living pathogenic organisms, as demonstrated by Koch in 1878. The activities of the phagocytes have been shown, by Wright and Douglas, to have their effects furthered by certain substances in the blood called opsonins (from Gk. ὀψωνεῖν, to cater). These substances have the power of acting on invading bacteria, so that the latter are prepared for phagocytosis. The *humoral theory*, suggested by Grohmann in 1884, was advanced by Buchner, who claimed that not phagocytosis, but the bactericidal action of blood plasma, is the cause of the destruction of pathogenic bacteria. He showed that freshly drained blood, blood plasma, as well as aqueous humor, destroyed such organisms. It was shown in rebuttal that dispersion in a large amount of watery fluid causes the death of microorganisms, which grow well when allowed in a close colony. The prevalent and generally adopted theory is the *antitoxin theory*, defended by Behring and Kitasato, Brieger, Tizzoni, Cattani, Roux, Villard, and others. According to this theory, the metabolism of bacteria during disease gives rise, in the blood of the sick person, not only to

poisonous alkaloids called toxins (existing either in the bodies of the bacteria or produced by them), but also to defensive proteids called antitoxins, which possess the property of neutralizing the toxins. Hankin divides the antitoxins (formerly called *alexins* by Buchner) into four groups. Proteid substances that occur naturally in animals and possess the power of destroying bacteria or their products, he calls *sozins*. Similar proteids resulting from acquired immunity in animals he calls *phylaxins*. *Sozins* are subdivided into those which have the property of killing bacteria, or *mycosozins*, and those which neutralize bacterial products, or *toxosozins*. A phylaxin which destroys bacteria he calls a *mycophylaxin*, and a phylaxin which neutralizes their ptomaines he calls *toxophylaxin*.

Ehrlich's side-chain theory has received much support. Ehrlich contends that each cell has side chains or processes, whose function is to assimilate particular food. Each of these processes is specific for a particular substance and will not unite with any other. These side chains are constantly being produced and cast off, in health as well as in disease. Either a lack or a superabundance of specific side chains may explain the nature of natural immunity. Side chains are also called *receptors* and have been grouped under three heads according to their action. The first group fixes or unites molecules of simple constitution; the second group has the power of combining with the food molecule, together with a symotoxic action; and the third group combines with the food molecule and also fixes a ferment in the fluid medium surrounding an *amboceptor*. The latter is a substance which acts as an intermediary between the invading bacterium and the complement; the complement being the destructive principle.

Consult: Roser, *Entzündung und Heilung* (Leipzig, 1886); Behring, *Die Blutserumtherapie* (ib., 1892); Sternberg, *Immunity: Protective Inoculations in Infectious Diseases and Serum Therapy* (New York, 1895); Chauveau, *Traité de physique biologique* (Paris, 1901); Simon, *Introduction to the Study of Infection and Immunity* (New York, 1914). For the method of securing artificial immunity by means of defensive proteids, see ANTITOXIN; TOXIN; SERUM THERAPY; VACCINATION.

IMMUNITY, in feudal law and in international law. See FEUDALISM; INVIOLABILITY.

IMOGEN, im'ô-jën. The daughter of Cymbeline and wife of Posthumus, in Shakespeare's *Cymbeline*.

IMOGENE, im'ô-jën, THE FAIR. The heroine of Lewis's ballad "Alonzo the Brave and the Fair Imogene."

IMOLA, ē'mô-lâ. An episcopal city on the Santerno in the Province of Bologna, Italy, 21 miles southeast of the city of Bologna (Map: Italy, C 2). It has a cathedral, dating from the twelfth century (modernized in the eighteenth), a communal library with some rare manuscripts, and an old citadel. There is also an agricultural school. It has been the seat of a bishop since 422. It markets wine and vegetables and manufactures silk goods, soap, leather, majolica, bricks, and gunpowder. Near by are mineral springs. In Roman times the city was called Forum Cornelii, said by Prudentius to have been founded by L. Cornelius Sulla. Here were born Chrysologus, Archbishop of Ravenna, who died in 449, and the painter Innocenzo da Imola, who died about 1550. Two

of his paintings are in the communal palace. Pop. (commune), 1901, 33,210; 1911, 86,068.

IMOLA, INNOCENZO DA (c.1494–c.1550). An Italian painter, born at Imola. His real name was Innocenzo di Pietro Francucci, and he was the pupil of Francia at Bologna and of Albertini in Florence. Afterward he went to Bologna and painted the frescoes of the "Death and Assumption of the Virgin" at San Michele (1519), also the "Madonna in Glory," and a "Madonna with Kneeling Donors," both in the gallery of that city. Among his other works are altarpieces in the cathedral at Faenza, in Berlin, and in Munich. His best pictures are reminiscent of Raphael.

IMOSHAGH, ē'mō-shäg'. The national name of certain pastoral tribes of Tuaregs in the Sahara Desert, who are independent. See TUAREG.

IMPACT (from OF. *impacter*, *empacter*, to press close together, from Lat. *impingere*, to dash against, from *in*, in + *pangere*, to fasten). If a body in motion meets a second body—either at rest or in motion itself—there is said to be an "impact" between them. The general principles of mechanics of course may be applied to the changes in the motion. (See MECHANICS.) The geometrical sum of the linear momentum of the two bodies is not changed by the impact; nor is the sum of their kinetic energies, provided they are perfectly elastic. Consider the two bodies as moving along the same horizontal line. Let their masses be m_1 and m_2 and the velocities of their centres of inertia before and after impact be v_1 and v_2 and V_1 and V_2 respectively. Then, for all bodies

$$m_1v_1 + m_2v_2 = m_1V_1 + m_2V_2.$$

(This law was given by Wallis, Wren, and Huygens almost simultaneously, 1668. The first applied it to inelastic bodies, the last two to elastic ones.) If the bodies are absolutely inelastic, $V_1 = V_2$; if they are perfectly elastic,

$$\frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2 = \frac{1}{2}m_1V_1^2 + \frac{1}{2}m_2V_2^2;$$

if they are imperfectly elastic and of the same material, Newton has shown that

$$\frac{V_1 - v_1}{v_2 - V_2} = e,$$

a constant for a given kind of material, which is called the "coefficient of restitution." See CENTRE OF IMPACT.

IMPACTION. See HORSE, *Diseases*.

IMPALE' (from Fr. *empaler*, It. *impalare*, ML. *impalare*, to impale, from Lat. *in*, in + *palus*, pole). In heraldry, to arrange two coats of arms side by side in one shield divided per pale. It is usual thus to exhibit the conjoined coats of husband and wife, the husband's arms occupying the dexter side or place of honor, and the wife's the sinister side of the escutcheon. A husband impaling his wife's coat with his own is not allowed to surround the former with the collar or insignia of any order of knighthood to which he may belong. Bishops, deans, heads of colleges, and kings of arms impale their arms with their insignia of office, giving the dexter side to the former. In early heraldry, when two coats were represented in one shield side by side, only half of each was exhibited—an arrangement which had been called dimidiation (q.v.). Sometimes the one coat only was dimidiated. A reminiscence of dimidiation is pre-

served in the practice of omitting bordures, orles, and tressures in impaled arms on the side bounded by the line of impalement.

IMPAL'LA (African name). An antelope. See PALLA.

IMPANA'TION (Fr. *impanation*, Portug. *impanação*, It. *impanazione*, from Lat. *in*, in + *panis*, bread). A word coined in the Middle Ages to indicate a modification of the theory of transubstantiation. It first appears at the end of the eleventh century. Formed upon the model of the word "incarnation," it ought to denote that the divine Logos took upon Himself the elements of the bread and wine of the Eucharist, just as He did humanity in the Incarnation. But it was used to denote the view that, instead of a transubstantiation by which the substance of the bread and wine became the substance of the body and blood, there was in the Eucharist an assumption by the whole Christ, body as well as divine Logos, of the bread and wine, so that He was wholly present in them. This differs so little from Luther's personal view, which was that of the "sacramental permeation of the substance of the bread by the substance of the body," etc., that he was charged by Bellarmine and other Roman Catholics with reviving the old error of impanation. The official doctrine of the Lutheran church, however, is that of the "sacramental coexistence at the same place of the two substances, both continuing to exist in their unmodified integrity." See LORD'S SUPPER; TRANSUBSTANTIATION.

IMPANEL. See EMPANEL.

IMPAR'LANCÉ (OF. *emparlance*, from *em-parler*, to talk, from *en*, in + *parler*, to talk, from ML. *parabolare*, to discourse, from Lat. *parabola*, parable, from Gk. *παραβολή*, *parabolē*, comparison, from *παραβάλλειν*, *paraballein*, to place beside, from *παρα*, *para*, beside + *βάλλειν*, *ballein*, to throw). In common-law pleading, an allowance of time to the defendant in a civil suit to put in his defense. As the name indicates, the grant of time was originally made to enable the defendant, before pleading, to talk with the plaintiff, with the view of coming to an amicable understanding with him. Later, in certain classes of cases, the defendant was entitled to demand one imparlance for this purpose, and this practice in course of time became a mere device for securing a reasonable time in which to plead. The term is no longer in use either in England or the United States. Consult Blackstone, *Commentaries on the Laws of England*. See PLEA; PLEADING.

IMPAS'TO (It., covered with paste). The name given to the practice of laying on pigments so thickly as to be opaque. Certain schools at one time loaded with color the light portions of their picture and left the shadows thinly painted. In this way they thought to secure transparency, as it was called, in the shadows. The practice to-day, however, is to attain transparency in shadows by their exact relation to the light parts of the picture, and this is usually done by painting all parts with equal thickness of pigment.

IMPATIENS, im-pā'shī-ěnz. See BALSAM.

IMPEACH'MENT (OF. *empeschement*, Fr. *empêchement*, hindrance, from OF. *empescher*, Fr. *empêcher*, to hinder, from ML. *impedicare*, to entangle, fetter, from Lat. *in*, in + *pedica*, fetter, from *pes*, foot). In the most general sense, the legal process of calling a person to account for some misconduct, or of discrediting

a witness, a document, or a record. Specifically, in English and American law, the accusation and trial of a person for treason or high crimes or misdemeanors by the legislature. In England impeachment differs from the ordinary criminal prosecution in two respects: (1) the prosecutor is the House of Commons, and not the crown; (2) the trial court is the House of Lords, and not an ordinary judicial tribunal. In the United States an impeachment is generally instituted and prosecuted by the Lower House of Congress or of a State Legislature before the Upper House or Senate, although a few of the States provide for impeachments in the ordinary courts of justice, and in some the judges of the highest appellate court sit with the Senators as members of the Court of Impeachment.

This method of prosecuting criminals was employed for the first time in England, in the case of Lord Latimer and others, who were accused of frauds and malpractices connected with the revenues of the crown in the latter part of the reign of Edward III, and who were found guilty and condemned to imprisonment and removed from office. Several other cases of impeachment of crime followed; but after 1459 acts of attainder (see *ATTAINDER*) took the place of impeachments for nearly two centuries. Under the Stuarts, however, Parliament again returned to impeachments as an effective method of dealing with officers of the crown who were corrupt or oppressive. In 1621 Sir Giles Mompesson and Lord Bacon were impeached and convicted, removed from office, and heavily fined for gross official misconduct. Since that date there have been 52 cases of impeachment in England, of which number but one has occurred within recent years, and that one in 1805. The proceeding is practically obsolete there.

In the United States, however, it is still a live and vigorous institution. The court for the trial of impeachment is accounted the very capstone of American judicial systems, Federal as well as State. Its existence is secured and its organization is regulated by national and State constitutions. For example, the organic law of the Union provides that "the House of Representatives shall have the sole power of impeachment" (Art. I, Sec. 2, cl. 5), and "the Senate shall have the sole power to try all impeachments. When sitting for that purpose," it is declared, "they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present. Judgment in cases of impeachment shall not extend further than to the removal from office and disqualification to hold and enjoy any office of honor, trust, or profit under the United States, but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law." (Art. I, Sec. 3, cl. 6 and 7.) The Constitution further provides that "the President . . . shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment" (Art. II, Sec. 2, cl. 1); and again, "the President, Vice President and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors." (Art. II, Sec. 4.) Similar provisions are contained in nearly every State constitu-

tion, although a few States remit impeachment trials to the ordinary courts of justice.

Impeachment in England is only a specialized method of exercising the judicial functions of the High Court of Parliament and is not necessarily confined to the prosecution of officers of the crown. Commoners as well as lords may be tried by this method, though in practice it has usually been employed only in the case of public officials. In the United States, however, it exists only as a means of removing from office an officer of the government who has by his misconduct forfeited his right thereto. This restricted scope of the process of impeachment in America has given rise to some important questions. One of these is the question whether an official can escape impeachment by resigning his office. The Senate of the United States decided in the case of Belknap, by a vote of 37 to 29, that he cannot. On the other hand, the Supreme Court of Nebraska has held that the prime object of impeachment proceedings is to protect the State from official misconduct, and that as soon as an officer resigns, the reason for resorting to these proceedings ceases. Thereafter the offender is to be prosecuted like any other criminal by indictment and trial in the proper judicial tribunal.

Differences of opinion have developed, also, in the United States concerning the nature of impeachable offenses. According to one view, only such official misconduct as renders the wrongdoer liable to indictment will warrant an impeachment; while another view is that this proceeding was intended to be very elastic and comprehensive and to be applicable to every sort of official misdemeanor which is subversive of any fundamental or essential principle of government or highly prejudicial to the public interests. This view was adopted by the House of Representatives in preparing its articles of impeachment of President Johnson and has been approved by the Supreme Court of Nebraska. It has been embodied in the constitutions of some of the States.

In the recent impeachment of Governor Sulzer of New York (1913), the question was raised for the first time whether a public officer was liable to impeachment for acts committed by him before as well as after his assumption of office, and it was decided by the High Court of Impeachment that it was not limited to acts of an official character nor to acts committed by the impeached official while in office.

Bibliography. The literature upon this topic is quite extensive, both in England and in America. Blackstone, *Commentaries* (1st ed., 4 vols., London, 1765-69); *Chase's Trial* (Baltimore, 1805); *Prescott's Trial* (Boston, 1821); *Impeachment of President Johnson* (Washington, 1868); *Belknap's Trial* (ib., 1876); Story, *Commentaries on the Constitution* (Boston, 1882); Stephen, *History of the Criminal Law of England* (London, 1883); *Peck's Trial* (Boston, 1883); Anson, *Law and Custom of the Constitution* (Oxford, 1886); Meehem, *On the Law of Public Offices and Officers* (Chicago, 1890); Pike, *Constitutional History of the House of Lords* (London, 1894); Foster, *Commentaries on the Constitution of the United States* (Boston, 1895); May, *Parliamentary Practice* (10th ed., London, 1901); Griffin, *Select List of References on Impeachment* (Washington, 1905).

IMPEACHMENT OF WASTE. Liability

for waste committed by a tenant for life or years. The law of waste, of great antiquity, and obviously devised to protect the inheritance against the depredations of tenants, was in the course of time developed by judicial refinements into a barbarous code of restrictions which seriously hampered the tenant in the reasonable use and enjoyment of his estate. Its sole aim was to perpetuate the existing condition and use of the land and to preserve it intact for the landlord.

It was waste for the tenant to cut timber for any purpose but necessary repairs; it was waste to make any substantial improvement, as by converting waste or meadow lands into arable land, or by erecting new buildings or enlarging or rebuilding old ones; and it was waste, for which the tenant was held liable, if buildings were destroyed by the act of an incendiary or by accident, or if timber was cut by a trespasser without the tenant's fault; and the penalties for waste were of the Draconian order— forfeiture of the estate and a fine, or amercement, of three times the value of the "waste" committed or suffered.

Under these circumstances a devise of an estate for life or years was a gift of doubtful value, and accordingly it became common in such devises or in marriage settlements to provide that the estate should be held "without impeachment of waste."

This provision was held to relieve the tenant from all liability under the common law of waste and to permit him to deal with the land very much as though it were his own. But the abuse of this privilege is restrained by the courts of equity, which will by injunction interpose to prevent the wasteful destruction of the woodlands of the estate, the cutting down of ornamental timber, or the defacing or destruction of the family mansion. See WASTE.

IMPE'DANCE. A word used in connection with alternating electric currents to express a property of the circuit which corresponds in some respects with that of electric resistance in the case of steady currents. If in an electric circuit there is a resistance R and an inductance L , and if an alternating electromotive force $E = E_0 \cos pt$ is introduced, thus making the frequency $2\pi/p$, i.e., the "number of alternations" $4\pi/p$, the resulting electric current is

$$J = \frac{E_0 \cos (pt - \alpha)}{\sqrt{R^2 + p^2 L^2}},$$

where $\tan \alpha = \frac{pL}{R}$. The quantity $\sqrt{R^2 + p^2 L^2}$ is called the "impedance."

Similarly, if the circuit contains, in addition to the resistance R and the inductance L , a condenser of capacity C , the resulting current is

$$J = \frac{E_0 \cos (pt - \alpha)}{\sqrt{R^2 + p^2 \left(L - \frac{1}{p^2 C} \right)^2}},$$

where $\tan \alpha = \frac{p \left(L - \frac{1}{p^2 C} \right)}{R}$. This gives a more

general value of the impedance. The angle α is, for obvious reasons, called the "angle of lag." In the above expressions all the electric quantities are supposed to be measured in the "C. G. S. electromagnetic" system.

IMPED'IMENTS TO MARRIAGE. Facts which constitute a bar to the contracting of a lawful marriage. Such impediments were recognized by the Church and were cognizable by the ecclesiastical courts as a basis for annulling a marriage contracted while they existed, and they are recognized by all nations under the Christian dispensation. In English and American law the following impediments to marriage are recognized: (1) the existence of a prior, undissolved marriage; (2) relationship within the prohibited degrees; (3) want of sufficient age; (4) mental incapacity; (5) physical incapacity; and (6) force, fraud, or mistake.

See BIGAMY; PROHIBITED DEGREES; AGE, IN LAW; INSANITY; IMPOTENCY; and, for a general treatment of the subject, MARRIAGE.

IMPENDING CRISIS, THE. See HELPER, HINTON ROWAN.

IMPER'ATIVE, CATEGORICAL. See CATEGORICAL IMPERATIVE; ETHICS.

IMPERATIVE MOOD. See CONJUGATION.

IM'PERA'TOR. See EMPEROR.

IMPE'RIAL. A city in Imperial Co., Cal., 25 miles south of Old Beach, on the Southern Pacific Railway (Map: California, K 10). It is in a rich agricultural and stock-raising country, carries on a large trade in farming implements, cotton, and fruits, and has a cotton compress, brewery, meat-packing plant, creamery, cement works, soap factory, stock-yards, and cantaloupe and grape packing houses. The city contains a fine high school and a public library and owns its water works. Pop., 1910, 1257.

IMPERIAL CHAMBER (Ger. *Reichskammergericht*). One of the two highest courts of the Holy Roman Empire, coördinate with the Aulic Council (q.v.). It was created in 1495 by the Emperor Maximilian under pressure of the princes of the Empire, whose influence was greatly strengthened by the erection of the new tribunal, and lasted until 1806, when the Empire was dissolved. It was composed of a president nominated by the Emperor, two vice presidents, and a number of associate judges, varying at different times from 16 to 50, selected partly from among men learned in the law and partly from the ranks of the nobility. Its jurisdiction included primarily all cases involving the princes of the Empire, but it sat also as the highest court of appeal in civil cases involving the interests of the member of any estate. It also offered redress for any refusal, delay, or miscarriage of justice on the part of any inferior court. Its sessions were held at Frankfort, Speyer, and, from 1693 to 1806, at Wetzlar. Its greatest contribution was to make the Roman law the uniform law of Germany. See HOLY ROMAN EMPIRE.

IMPERIAL CITY, THE. A title frequently given to Rome.

IMPERIAL EAGLE. See EAGLE.

IMPERIAL FEDERATION. A plan to unite the parts of the British Empire by a stronger tie than that of the crown. Such a plan was conceived as early as the middle of the eighteenth century, but the motive of the mother country at that time was chiefly the extraction of revenue from its colonies, and the more important of them successfully revolted on that issue. Again, the policy of a strict control over the remaining colonies was one of the principal causes of the rebellion in Canada in 1837. The policy of granting responsible

government in the colonies was substituted on that occasion. This was in some quarters adjudged to be a badge of potential independence, and for several years the professed desire that the colonies should be detached as a means of relief from the burdens entailed by them was not uncommon. But from this extreme anti-imperialism the demand for a more united Empire has quite steadily developed for half a century, having been fostered in recent years by the growing consciousness of the need of defense and the benefit from reciprocal trade relations. In 1868 The Royal Colonial Institute was founded and took as its motto "United Empire." Four years later Disraeli, in a memorable speech, voiced the opinion that self-government in the colonies "ought to have been conceded as a part of a great policy of Imperial consolidation . . . ought to have been accomplished by the institution of some representative council in the metropolis which would have brought the colonies into constant and continuous relation with the home government." In July, 1884, a gathering of leading members of both the Liberal and Conservative parties, in London, under the presidency of the Right Hon. W. E. Forster, resulted in the formation, in November of the same year, of the Imperial Federation League. Branches or allied organizations were established in many parts of the Empire, and in 1886 the league petitioned the Prime Minister to summon an Imperial conference for the express purpose of forming an Imperial council. The petition was granted only to the extent of calling a conference to consider "union for purposes of mutual defense." However, the meeting of that first Imperial conference was a distinct advance towards practical imperialism, and the conference has since become an established institution, meeting in 1894, 1897, 1902, 1907, and 1911. Besides the subject of defense there were, even at the first conference, important deliberations on the question of Imperial preference in trade. At the meeting held in Ottawa in 1894 preferential trade and the development of trade within the Empire by means of improved communication were the chief topics discussed. The keynote of the discussions was loyalty to the mother country and a determination to maintain inter-colonial solidarity, but there was some doubt if the mother country would permit herself to be outvoted by a combination of the colonies, or whether each part would be willing to aid the others in matters not directly affecting itself. For such questions Joseph Chamberlain, the staunchest of the Imperialists, soon had a solution in his proposal of complete free trade within the Empire and liberty for each state to fix its own tariff rates on foreign goods. This proposal, however, was not popular in the mother country, and the cause of imperialism was furthered at this time rather by the loyalty of the colonies during the Boer War of 1899-1902. In 1905 Sir Frederick Pollock formulated a scheme for a representative Imperial council to act in an advisory capacity to the ministry and the administration. At the conference held in London in 1907 it was unanimously resolved, "That it will be to the advantage of the Empire if a conference, to be called the Imperial Conference, is held every four years, at which questions of common interest may be discussed and considered as between his Majesty's government and his governments of the self-governing do-

minions beyond the seas." The conference thus permanently established is made to consist of the several prime ministers, the Secretary of State for the Colonies, and such other ministers as each government may appoint, but not more than two representatives from any government may take part in a discussion, and each government has only one vote. It is further provided that in the interim between two full conferences important questions may be referred to subsidiary conferences of representatives from the governments concerned, and the colonies are authorized to refer to the Committee of Imperial Defense any local question requiring expert advice. Much closer than ever before were the representatives of the Empire drawn together in the Conference of 1911 on the question of defense, and it was then and there agreed that naval training and discipline in the colonies should be made uniform with that of the United Kingdom, and that there should be an interchange of officers and men. The same conference recommended the appointment of a representative royal commission to investigate and report on the natural resources of the several parts of the Empire and the facilities for their development, and it was appointed the following year. The proceedings of this conference show an increase in the number and variety of subjects discussed, and that the establishment of an advisory council was still urged in some quarters.

Pollard, *The British Empire: Its Past, its Present, and its Future* (London, 1909); Jebb, *The Imperial Conference* (ib., 1911); *Proceedings of the Imperial Conference* (ib., 1907 and 1911); Amery, *Union and Strength* (ib., 1912); Bussell, *A New Government for the British Empire* (ib., 1912); D'Egville, *Imperial Defense and Closer Union* (ib., 1913).

IMPERIAL INSTITUTE OF THE UNITED KINGDOM, THE COLONIES, AND INDIA. A memorial of the Queen's Jubilee of 1887, which is a public institution in South Kensington intended to contain "sample collections of the natural products and resources of every portion of the British Empire, so arranged and displayed as to be of practical benefit to commercial business men and to allow of scientific research by every class of students." It is furnished, therefore, with laboratories and with reading and lecture rooms as well as with exhibitory departments. In 1902 it was transferred to the Board of Trade by act of Parliament.

IMPERIALISM. The policy of extending the dominion of a state beyond the limits of self-coherent or at least potentially self-coherent nationality. The extension of the dominion of the United States over Louisiana and over the territories acquired from Mexico was not imperialistic, since such territories would eventually become homogeneous in population and institutions with the original territory of the United States. The annexation of the Philippines and Porto Rico, on the other hand, was essentially imperialistic, since no rational basis existed for contemplating their complete assimilation, and assimilation was not in fact contemplated by the United States. The annexation of Alsace-Lorraine by Germany was not imperialistic, because complete assimilation was contemplated.

The earliest historical examples of imperial-

ism are the great monarchies of Asia and Africa: Assyria, Persia, Egypt. The Roman Empire is the one great example of the policy in ancient Europe. The Imperial policy was revived by Charlemagne in the Middle Ages and never wholly disappeared; it culminated, in early modern times, in the Empire of Charles V, which in the middle of the sixteenth century included the Hapsburg dominions, Spain and Portugal, Naples, Sicily and Sardinia, the Netherlands, and the East and West Indies, conceived broadly to include mainland as well as islands. The extension of the personal dominion of Napoleon over non-French territories is the most striking instance of imperialism in recent times.

Down to the collapse of the power of Napoleon imperialistic policy uniformly set for itself as ultimate object dominion over the whole accessible world. After 1815 European politics were characterized by a remarkable development of the idea of nationality. Liberal opinion everywhere recognized the desirability of complete independence and unification of each naturally homogeneous nation. Among the results of the nationalist movement were the unification of Germany, the liberation of Italy from Austrian rule and its consolidation, the liberation of Greece and the Balkan states from Turkish rule. The separation of Norway from Sweden and the wars of 1912-13 in the Balkans were the latest fruits of the nationalist movement. Strivings for autonomy on the part of Hungary, Poland, Finland, and Ireland were equally inspired by the same tendency.

During the nationalist period the opinion was widely current that colonies and dependencies that could not be incorporated in the national life represented a burden upon the state. British liberal statesmen, like Cobden and Gladstone, looked forward to the time when the colonies with inhabitants of British origin should be independent. In accordance with this view Canada, Australia, New Zealand, and Cape Colony were, between 1840 and 1870, given practically complete autonomy. Colonies inhabited by non-Europeans, like India, were regarded by the same school of statesmen as an encumbrance, to be borne only until the problem of orderly government in such colonies could be solved.

Shortly after 1870 a new imperialistic movement made itself manifest in European politics. Unlike that of earlier periods, the new imperialism accepted the principle of national independence in so far as civilized states are concerned. The British imperialist would not subject to British rule France or Spain or any other modern industrial state. Only the states supposed to be incapable of self-government are regarded as fit subjects for Imperial dominion. The new imperialism contemplates not one, but a number of world states, each consisting of a civilized power together with its permanent dependencies and protectorates.

The impetus to the new imperialism was given by the Franco-Prussian War. France, deprived of Alsace-Lorraine, turned to her African province of Algeria to restore her forces. Active colonization of Algeria was soon followed by extension of the borders of the province. Thus was inaugurated the struggle between nations for the partition of Africa, which eventually engaged France, Great Britain, Germany, Portugal, Belgium, Spain, and Italy. Parallel with

the partition of Africa was the progress of imperialism in Asia, in which Great Britain, France, Germany, Russia, and Japan took part. The United States also, through the annexation of Hawaii, the Philippines, and Porto Rico, was drawn into the imperialistic movement. The years 1884-1901 represent the period of most rapid extension of Imperial dominion. The following table gives a summary of the colonial acquisitions during those years:

COUNTRIES	Area, sq. m.	Population
Great Britain.....	3,711,957	57,436,000
France.....	3,583,580	36,553,000
Germany.....	1,026,220	16,687,100
Russia.....	112,320	3,300,000
Belgium.....	900,000	30,000,000
Portugal.....	800,760	9,111,757
Italy.....	185,250	867,000
Japan.....	13,991	3,000,000
United States.....	125,000	10,004,000

From 1901 to 1914 the principal imperialistic advances were the following: annexation of Korea by Japan (84,738 square miles), 1910; annexation by Italy of Tripoli and Cyrenaica (405,000 square miles), 1912; cession by France of 1,17,270 square miles in Central Africa to Germany, 1911; establishment of French protectorate over Morocco (176,000 square miles), 1912; Russo-British establishment of spheres of influence in Persia, 1907 (Russian sphere, 305,000 square miles; British, 137,000 square miles; neutral, 188,000 square miles). Informal imperialistic enterprise is embodied in the agreement between China and Russia of 1913, by the terms of which Russia recognized the sovereignty of China in Mongolia; but both powers agreed to refrain from colonizing or sending troops into the territory, while Russia assured herself of substantial control through a six-million-ruble loan to the province, and through free trade between Mongolia and Russian territories. A similar enterprise appears in the agreements between Russia and Japan as to their respective interests in Manchuria; and in the control by the United States of the finances of Santo Domingo. Upon entry of Turkey into the Great European War in 1914 Great Britain proclaimed the annexation of Cyprus and Egypt a British protectorate.

The resurgence of imperialism since 1870 is closely connected with the revival of protectionism in the United States after the Civil War; in Germany and France after the Franco-German War; and in Russia, Japan, and Italy in the last two decades of the nineteenth century. The apparent determination of the several Great Powers to create a national industry adequate to supply domestic needs as well as to provide a balance of exports gave an impetus to the policy of annexing nonindustrial territories the markets of which could be protected against hostile customs regulations. A further impetus was given to the movement by the reduction in cost of railway building, following the substitution, in the seventies, of steel for iron rails. This change made possible the opening up of barbaric districts that had formerly been of slight commercial value and created a new field for lucrative investments. In relatively few instances, however, did the acquisition of colonies prove to be profitable to the colonizing nation, if account be taken of the military and naval

expenditures occasioned directly or indirectly by the imperialistic policy.

Since modern imperialism is a competitive policy, it has played a large part in fomenting discord among the Great Powers. The Chino-Japanese, the Russo-Japanese, the Boer, and the Turco-Italian wars are the more important conflicts directly due to the imperialist tendency. The Spanish-American War while perhaps chiefly a result of humanitarian agitation against the Spanish methods of suppressing insurrection in Cuba, was not wholly uninfluenced by imperialist motives. In addition to armed conflicts several serious international crises must be set down among the moral costs of imperialism. At the time of the Fashoda incident (1898) England and France were brought to the verge of war over the delimitation of their respective claims to Soudanese territory. In 1905, and again in 1911, France and Germany came very near war over the question of the French advance in Morocco. The international hostilities originating in imperialism played an important part in bringing on the Great European War of 1914. See WAR IN EUROPE.

In most of the Imperial nations political parties of greater or less strength have sought ineffectually to check the imperialistic tendencies. In the United States, after the acquisition of the Philippines, an active agitation was carried on by the so-called anti-imperialists, having for its object the grant of independence to the Philippines. Anti-imperialism was indorsed by the Democratic party in 1900 and commanded the loyalty of many of the leaders of that party for over a decade. In England the party opposed to the further extension of British dominion were known opprobriously as "Little Englanders." In continental states opposition to imperialism was especially strong among the Socialistic parties. The designs of Italy upon Abyssinia in 1896 were frustrated, in part, by the anti-imperialistic agitation of the Socialists at home; and popular antipathy to imperialistic designs contributed to the defeat of the Russians in the war with Japan.

The term "imperialism" is also employed to designate the movement in Great Britain and her self-governing colonies towards a closer form of union. See IMPERIAL FEDERATION.

Consult: J. A. Hobson, *Imperialism* (New York, 1902); Ernst Freund, *Empire and Sovereignty* (Chicago, 1903); Erich Mareks, *Die imperialistische Idee in der Gegenwart* (Dresden, 1903); Achille Viallate, *La crise anglaise* (Paris, 1905); G. v. Schulze-Gaevernitz, *Britischer Imperialismus und englischer Freihandel* (Leipzig, 1906); P. Adam, *Les Imperialismes* (Paris, 1908); Earl Cromer, *Ancient and Modern Imperialism* (London, 1910).

IMPERIAL MOTH. The largest of the "royal moths" (*Basilona imperialis*), sulphur yellow marked with purplish brown. The wings expand from 4 to 5 inches; the larva is thinly clothed with hairs and bears spiny horns on the second and third segments. It feeds on the hickory, butternut, and other forest trees.

IMPERIAL SERVICE ORDER, THE. A new order instituted in London, June 26, 1902, by King Edward VII, to confer honor on those who have held continuous office under the British crown either in England or in the colonies. The order consists of a sovereign and companions. The number of companions is limited to 425, of whom 250 are to belong to the Home

Civil Service and the remainder to the Civil Services of the Colonies and Protectorates. Appointments to the order will be made after 25 (or in unhealthy colonies 16) years' service.

IMPERIAL WOODPECKER. See IVORY-BILL.

IMPE'RIUM (Lat., power, jurisdiction). A term applied to the sovereign power of a Roman magistrate, especially when such magistrate was in command outside of Rome. (See EMPEROR.) When Augustus took under his own control all the important functions of the state, and the (nominal) republic was merged into a monarchy, the *imperium* became the exclusive prerogative of Augustus and his successors, and *imperator* passed to its modern meaning of emperor. Consult Smith, *A Dictionary of Greek and Roman Antiquities*, vol. i (3d ed., London, 1890), and Greenidge, *Roman Public Life* (ib., 1901).

IM'PETI'GO (Lat., from *impetere*, to attack, from *in*, in + *petere*, to seek). A disease of the skin. The term was formerly applied to many different diseases of the skin which were characterized by pimples, pustules, and scales. In modern practice the term is restricted to a disease of the skin characterized by an eruption of small itching pustules, single or in groups, terminating in scaly crusts of a yellowish color. Hebra and more recent writers discard the term and classify the old impetigo as a form of eczema (q.v.). Tillbury Fox, of London, describes impetigo contagiosa as an acute pustular, contagious skin disease, during which the patient suffers from fever, with vesicles and pustules on the face and hands, and thence extending to other parts of the body and followed by the production of yellowish crusts. Impetigo herpetiformis is a similar, noncontagious eruptive dermatosis, occurring in pregnant women, attended with grave general symptoms. Impetigo rodens is either cancer or syphilis. For treatment of impetiginous eczema, see ECZEMA.

IMPEY, im'pī, SIR ELIJAH (1732-1809). An English jurist, Chief Justice of Bengal, born at Hammersmith. He was educated at Westminster School and at Trinity College, Cambridge (B.A., 1756), and was called to the bar in 1756. He was counsel for the East India Company in 1772 and two years later was knighted and sent out to Calcutta as the first Chief Justice under the new regulating act. He naturally sided with his old schoolfellow, Warren Hastings, in that governor's political troubles, and this course of conduct, together with his condemning to death the famous forger Nuncomar, brought about his own recall and impeachment (1783); but he was discharged with honor, having been revealed as an amiable and upright judge, perhaps a trifle vain and too easily led by Hastings. Impey was elected member of Parliament for New Romney in 1790, but, although he held his seat until 1796, retired to the country in a couple of years, and spent his latter days in educating his family and enjoying the society of his friends. Consult *Memoirs of Sir Elijah Impey* (London, 1847).

IM'PEYAN PHEASANT. See PHEASANT.

IM'PLEMENTS, AGRICULTURAL. A loose term applied to all implements and tools used in farming, not only in the tilling of the soil, but in harvesting and the later preparation of the crop for market. Doubtless the first implements used were such as required only human strength in their manipulation. The crude spade, hoe, rake, sickle, or scythe, and the flail

of the ancients are the prototypes of the modern plow, cultivator, harrow, self-binder, and threshing machine. After animals were subdued by man, the primitive plow and harrow appeared. Cultivators and other implements for clearing the ground of weeds and stirring the soil are all modern inventions. Especially during the last century have improvements been made in almost every kind of farm implement. Indeed, not a few first appeared during that period, notably the perfected manure spreader, seed and fertilizer drills, harvesters, hay loaders and stackers, and combined harvester and thresher. The threshing machine has not only supplanted the flail and the use of animals in treading out the grain, but has also rendered obsolete the ancient methods of winnowing away the chaff. In short, every necessary operation of the farm is now performed with some implement or machine specially adapted to the purpose, and horse, steam, wind, electric, and other forms of power have supplanted manual labor as far as such substitution has been deemed feasible. It is largely because of the extensive use of labor-saving machinery that the United States has enjoyed such a high degree of agricultural prosperity. The value of agricultural implements manufactured in the United States in 1909 was \$146,329,268, an increase of 44.6 per cent since 1900. This was the product of 640 establishments, employing 50,551 persons. The value of agricultural implements used in the United States per acre of farm land was \$1.44, an increase of 61.8 per cent since 1900. Since the publication of Thomas's *Farm Implements and Machinery* (1859 and 1869), a few American books have appeared which illustrate and describe many farm conveniences and appliances; but improvements in farm implements have been so numerous and important, and the applications of science so striking, that all works on the subject are inadequate.

Consult: Myrick, *Farm Conveniences* (New York, 1884); Martin, *Farm Appliances* (ib., 1892); R. L. Ardrey, *American Agricultural Implements* (Chicago, 1894); Bailey, article "Tools," in *Cyclopedia of American Horticulture* (New York, 1900); Coupan, *Machiner de culture* (Paris, 1907); P. McConnell, *Farm Equipment* (New York, 1910); R. Cobleigh, *Handy Farm Devices* (ib., 1910); L. W. Ellis, *Minor Articles of Farm Equipment*, United States Department of Agriculture, Bureau of Plant Industry, Circular 44 (Washington, 1911); Carson and others, *Horse, Truck, and Tractor* (Chicago, 1913); Bornemann, *Die Motorkultus in Deutschland* (Berlin, 1913). See HARVEST AND HARVESTING; THRESHING; ETC.

IMPLU'VIUM (Lat., receptacle for rain water). A tank or basin in the centre of the court or atrium of a Roman house, placed immediately under the unroofed part, or *compluvium*, of the atrium, to receive the rain discharged from the roofed portion. The impluvium was commonly of marble, was frequently adorned with a fountain, and with busts, statues, and vases, and formed a very peculiar and interesting feature in the house. The term was also applied to the open space under the *compluvium*, even if unprovided with a collecting basin.

IMPOON, im-pōon' (Zulu name). One of the duikers (*Cephalophus grimmi*), a small antelope, very plentiful in South Africa, in wooded districts. See DUIKER.

IM'PORTS AND EX'PORTS. See INTERNATIONAL TRADE; COMMERCE; BALANCE OF TRADE; for exports and imports of the several nations, see articles on those nations.

IM'POST (Fr. *imposte*, from Lat. *impositus*, p.p. of *imponere*, to place upōn, from *in*, in + *ponere*, to place, from *po-*, Gk. *ἀπό*, *apo*, away + *sinere*, to allow). The top or cap of a pier or abutment from which an arch is sprung; the stone immediately under the springer of an arch. This stone is usually emphasized by being made to project and by moldings, especially in the classic and neo-classic styles. (See Illustration under ARCH.) In Gothic architecture, especially late Gothic, the arch often springs from the pier without any impost, architecturally speaking. When an arch springs from coupled columns, an architrave or entablature is interposed as an impost between the capitals and the arch. In some early Christian basilicas and in Byzantine buildings an impost block is often interposed between the arch springer and the capital, even over single columns.

IMPOS'TORS, THE THREE (Lat. *De Tribus Impostoribus*). The name given to a work alleged to deny all divine revelation, characterizing the three great founders of religions—Moses, Jesus, and Mohammed—as impostors. Though it is often mentioned since the tenth century, and attributed to heretics of various ages and various degrees of eminence, no authentic copy is known to have ever been seen. A book bearing this title, and professedly published in 1598, was reprinted by E. Weller, with German translation, Leipzig, 1846; without the translation, Heilbronn, 1876. In the eighteenth century renewed attention directed to the subject by the spread of infidelity caused the appearance of an apocryphal edition, which has been frequently reprinted. Consult Genthe, *De Impostura Religionum* (Leipzig, 1833).

IM'POTENCY (from Lat. *impotentia*, inability, from *impotens*, powerless, from *in-*, not + *potens*, able, from *potis*, powerful; connected with Lith. *patis*, Skt. *pati*, lord). In law, an incurable incapacity to perform the sexual act. As the procreation of children is deemed the principal object of marriage, the ability to procreate is considered an implied condition of the marriage contract; and the marriage of an impotent person, the disability not being known to the other party, is regarded as a species of fraud which vitiates the transaction and entitles the defrauded party to have it set aside or declared null and void. This is not properly a divorce, though in some American statutes it is so denominated, as a divorce is properly the dissolution of a valid marriage, and accordingly a decree nullifying a marriage on the ground of the impotency of one of the parties was recognized by the Church, which does not tolerate divorce, and may be granted in a State, like South Carolina, which does not recognize any ground for divorce. The annulment of the marriage for impotency may be obtained by either party if the disability existed at the time of marriage and is incurable, whether it results from a defect caused by nature, or by accident or disease, or by the acts of the party. It has been held, however, that, "where impotency is simply the result of old age, the marriage is still binding; that a man of 60 who marries a woman of 52 should be content to take her *tamquam soror*." The burden of proving impotency is upon the party alleging it as

a ground for the nullification of the marriage. See DIVORCE; HUSBAND AND WIFE.

IMPOUNDING. The act of putting in a place of custody cattle which have strayed on one's land and are found there doing damage, or which have been taken up as estrays, or goods which have been taken by distress. The right of impounding cattle doing damage was an incident of the right of the party injured by the trespass to hold them until the owner had made compensation for the damage committed by them, which was a species of common-law lien; whereas the impounding of estrays was for the safe-keeping of the animals until the owner reclaimed them. There were public pounds in many parishes, and where these were of convenient access the party taking up the cattle was bound to impound them there. Where this was not feasible, they might be impounded on the premises of the finder or taker. See ESTRAY; LIEN; POUND.

The term "impounding" is also used for the retention of a deed or other legal document in the custody of a court in which it is produced. This may be done where the instrument is suspected of being forged, or is otherwise of such a character as to satisfy the court that it may be used as the basis of a criminal prosecution, or it may be done merely for the purpose of preventing its being made away with by the person having the custody thereof. It is then impounded by order of the court, in order that it may be available when required.

IMPRES'SIONIST PAINTING (from Lat. *impressio*, from *imprimere*, to impress, from *in*, in + *primere*, to press). The practice of painting objects in nature as they first strike the eye, without selection or elaboration. Strictly, every painter is an impressionist in so far as he renders his own impressions, and the term Luminists has been proposed by Van Dyke as more appropriate, since the school is mainly concerned with rendering light. The theory is as follows: The only source of color in nature is the sunlight, which by its vibrations envelops and reveals all things. Without light we see no color at all; with it certain spots of color, according as the rays of the spectrum reflect a particular shade. The idea of outline is an artificial one. The impression of form, perspective, and distance is conveyed to us by different values of color. Shadow is but a different quality of light, modified by refractions and reflections. The painter therefore should only paint with the seven colors of the spectrum, discarding all others. He should juxtapose them just as in nature, trusting to distance to produce the effect. Thus only can he attain the actual, ever-changing effects of light. As the Impressionists are concerned with the representation of nature, they constitute a branch of the Naturalist school, corresponding to the modern Naturalists of sculpture and literature. They differ from Realists like Courbet in that they paint only the appearance of nature—what they actually see—not what they know it to be. It presents, they say, a series of flat, colored surfaces, and not figures in rounded contours. Their pictures are marked by an absence of modeling.

The chief object of the Impressionists is to render the effects of light. They paint everything in full light and condemn the practice of painting in the studio as giving untrue tones. All their pigments are light. Bright colors are placed side by side, and the school avoids the

middle tones by which earlier painters achieved harmony of color. Their works, being momentary impressions, are marked by great rapidity of execution and seem sketchy in character. Indeed, the members of the school have justly laid themselves open to the criticism of exhibiting unfinished sketches for pictures. Closely inspected, their paintings seem mere blotches of color roughly applied; but seen at a distance they present pictures strikingly true to nature. Their rapidity of execution enables the Impressionists to portray motion and the nuances of expression to an extent not previously attained. Their figures are real men and women in the actions of daily life, not models posed in a studio. They took the final step in the liberation of modern art from ancient tradition in color—a revolution begun by the Romanticists under Delacroix and continued by the Realists under Courbet. Being the latest school, they came nearest to solving the specific problem of nineteenth-century art—the representation of light, color, and movement.

The Impressionists found their way to public favor very slowly. At first they were the subject of much ridicule. Edouard Manet, the founder of the school, had to exhibit his first Impressionist picture in the Salon des Refusés in 1863. A powerful factor in their progress to public favor was their championship by Zola, whose articles in behalf of Manet attracted great attention. They were much aided by the picture dealer Durand-Ruel, who, at a time when they were generally condemned, held exhibitions of their work side by side with that of the Barbizon masters. It was not until the early seventies that critics and the general public began to take them seriously. Painters, however, were quicker to recognize the progress in color and atmosphere which impressionism represents. Its work is quite generally accepted and followed, and its permanent influence has been to raise the pitch of light in present painting.

The greatest names connected with the long history of impressionism are, besides Manet, Edgar Degas, Claude Monet, for the landscape, and Auguste Renoir; associated with and influenced by whom were Pissaro, Sisley, Berthe Morisot, Mary Cassatt (an American), and Boudin. Mention should be made of a series of painter illustrators connected with the movement, such as Raffaelli, Toulouse-Lautrec, Forain, and Cheret. Among important painters who have adopted the principles of impressionism, yet whose work represents more or less of a compromise with the earlier school, are Bastien-Lepage, L'Hermitte, Gervex, Dagnan-Bouveret, Carrière, Besnard, and Aman-Jean. Impressionism has had a powerful effect upon the art of Germany and Austria, especially that of Munich. In Great Britain its influence was greatest in the Glasgow school. In Spain it counts among its adherents the two greatest among present-day painters, Sorolla and Zuloaga. In the United States also its influence has been very great, and among its direct adherents may be numbered artists like Theodore Robinson, J. A. Weir, Twachtman, and Childe Hassam.

Bibliography. Among the best accounts of the movement are: Duranty, *La nouvelle peinture* (Paris, 1876); Duret, *Les peintres impressionistes* (ib., 1878; new ed., 1907); Lecomte, *L'Art impressioniste* (Berlin, 1892); Muther, *History of Modern Painting* (London,

1896); Mauclair, *The French Impressionists*, translated from the French (ib., n. d.), a brief but highly interesting account; Meier-Graefe, *Impressionisten* (Munich, 1907); Wiesbach, *Impressionismus—ein Problem in der Antike und Neuzeit* (2 vols., Berlin, 1910-11).

IMPRESSMENT. The seizure of the person or the personal property of individuals for the service of the state. The right of impressment is analogous to the power of eminent domain (q.v.), under which the government may take the lands of private persons for public use, and exists in all modern nations, though it varies a good deal, both as to the persons and property which may be taken and as to the circumstances under which it may be exercised. It is deemed an incident of the prerogative, or sovereignty, and is justified by the necessities of the state. As such necessities are, as a rule, urgent and pressing only in time of war or of preparation for war, the practice is almost unknown in the United States, but is freely employed in the countries of Europe and Asia, which are in a constant state of war or warlike preparation. The most conspicuous instance of impressment is the compulsory recruiting of the military and naval forces of those countries whose military system is based on conscription. In other respects also, as in the seizing of railroads, horses, carriages, and other means of transportation in time of war, the practice is common in military states.

Though the military and naval forces of Great Britain are wholly recruited by voluntary enlistment, the practice of impressment for service in the army and navy was formerly in use in England, but has in both cases been discontinued. It is doubtful whether impressment for military service was ever lawful. It was resorted to without statutory authority by an exercise of the royal prerogative, but was abolished by Act of Parliament in 1640 (16 Car. I, c. 28) and has never since been legalized. Impressment of seafaring men for naval service is, however, permitted by statute and was at one time extensively practiced, but is no longer in use, though it might at any time be revived by proclamation. All seafaring men, except masters and mates of merchant vessels, watermen apprentices, and certain other exempted persons, were liable to be forcibly seized, taken on board men-of-war, and compelled to serve. The practice was extended to cover men on board vessels in other than home waters. As the British government claimed a right to the services of her seamen wherever found, men were seized on board foreign merchant vessels, and even on men-of-war which were too weak to resist. Similarity of language and the fact that many American seamen were of British birth caused the United States to be the greatest sufferer from the British press gangs, and eventually this grievance became a leading cause of the War of 1812. It is stated that the number of impressed Americans serving in British ships between the years 1802 and 1812 was seldom less than the total enlisted force of the United States navy at the time, and at the beginning of the war more than 2000 Americans were discharged into prison ships for refusing to fight against their own country. In the treaty of peace Great Britain did not formally give up her claim to the right of impressment as respected seamen in American ships, for the subject was not mentioned; but the claim of the United States was

tacitly admitted, and no further attempts were made to impress men from American ships.

Impressment of horses, drivers, vehicles of all kinds, the rolling stock of railroads and of vessels, is, as has been said above, common in continental countries in time of war and may under certain restrictions be employed in Great Britain in accordance with the Army Act, 1881 (44 and 45 Vict., c. 58). The obligation to provide such facilities for the use of the state rests upon all persons enjoying its hospitality, resident or traveling aliens, as well as domiciled citizens. Consult C. M. Clode, *Military Forces* (London, 1869), and William Stubbs, *Constitutional History of England* (3 vols., Oxford, 1887-91).

IMPRISONMENT (from *imprison*, OF., Fr. *emprisonner*, from *en*, in + *prison*, prison, from Lat. *prensio*, arrest, from *prehendere*, *prendere*, to seize). The restraint of a person's liberty for any cause whatever, whether by authority of the government or by a person acting without such authority. In the latter case it is "false imprisonment." Imprisonment does not necessarily imply a place of confinement, with bolts and bars, but may be exercised by any use or display of force, lawfully or unlawfully, wherever displayed, even in the open street. A man becomes a prisoner, wherever he may be, by the mere word or touch of a duly authorized officer directed to that end. Usually, however, imprisonment is understood to imply an actual confinement in a jail or prison employed for the purpose according to the provisions of law. The power to imprison is in many cases inherent in courts or magistrates, and in others conferred upon them by statute, and it may be employed in civil as well as criminal proceedings. Imprisonment for debt, once universal in this country, under the English common law, is now generally abolished by statute, except in cases where the action of the debtor is tainted by fraud, or where he is reasonably suspected of an intention to avoid his debts by concealing his property, or of removing it and himself from the jurisdiction of the court. (See DEBTOR.) Witnesses whose testimony is necessary for the conviction of a criminal may be imprisoned to prevent their escape from the jurisdiction of the court. Persons accused of crime are either confined till the day of trial or released on bail, according to the gravity of the offense with which they are charged. Courts have the power to imprison for contempt of their authority, and persons found guilty of crime are imprisoned for periods prescribed by statute or determined by the judgment of the court.

Imprisonment as a punishment for serious crimes (felonies) is comparatively modern and came into use on the breakdown of the harsh and inhuman penal system of the last century, under which practically all felonies were punishable with death. For minor offenses (misdemeanors) and for contempts imprisonment, usually coupled with a fine or as an alternative to a fine, was permitted at common law, and the length of the sentence was limited only by the discretion of the court. The terms of imprisonment imposed for such offenses were usually short, however, rarely extending to a year, and it was not until by statute imprisonment was substituted for penal servitude and transportation (which were themselves substitutes for the death penalty of the older law) as the punishment for felony, that prisons of the modern type came into being.

Imprisonment is now, in the United States as well as in Europe, the ordinary punishment for all felonies, and either fine or imprisonment or both for most misdemeanors, except when, in cases of willful murder, the penalty of death is prescribed without the alternative of imprisonment. Modern legislation has generally vested in the courts the power to add to imprisonment the further penalty of hard labor during the term imposed, but the courts have no authority to condemn a convict to hard labor except in cases coming clearly within the terms of the statutes to that effect. See **HARD LABOR**.

The earlier statutes prescribing the penalty of imprisonment for crime fixed the term of imprisonment, graduating it according to the gravity of the offense of which the convict was found guilty on the principle of "making the punishment fit the crime." Later a considerable discretion was vested in the court imposing sentence, a maximum and a minimum period being fixed by statute for each crime or class of crimes, leaving it to the court to determine the precise term of imprisonment within the limits so prescribed. More recently, as a result of modern scientific investigation and modern theories of penology, statutes have generally been enacted in America limiting this judicial discretion and requiring the imposition of sentences of imprisonment for an indeterminate period between fixed maximum and minimum limits. Under this system a convict is sentenced to a term, say, of three to 10 years, the actual limit of his imprisonment being determined by a board of parole or other authority, whose decision is based on a consideration of the prisoner's record before conviction as well as on his conduct during the period of his imprisonment. See **INDETERMINATE SENTENCE**; **PENOLOGY**; **PRISON**; **PUNISHMENT**.

A person who wrongfully or illegally deprives another of his liberty may be sued in a civil action for false imprisonment by the person aggrieved, or prosecuted as for a criminal offense. A prisoner claiming to be unlawfully detained is entitled to a writ of habeas corpus to obtain the judgment of a competent court as to the legality of his imprisonment. See **FALSE IMPRISONMENT**; **HABEAS CORPUS**.

IM'PROBA'TION (Lat. *improbatio*, disapproval, from *improbare*, to disapprove, from *in-*, not + *probare*, to approve, from *probus*, good). In Scots law, the title of a proceeding for setting aside a deed or other instrument, which is apparently valid and probative, on the ground of forgery or fraud. It belongs to the class of 'rescissory' actions and is equivalent to the jurisdiction exercised by the courts of equity in England and America in setting aside and canceling legal instruments and in removing clouds on title. See **EQUITY**; **FRAUD**; **MISTAKE**.

IMPROMPTU (Lat., in readiness). In music, a short, extemporaneous composition. Also a title given to compositions for piano-forte that have little thematic development. The term was probably first used by Chopin, whose four impromptus are still the most remarkable works of that kind. Schubert's Impromptus, Op. 90 and 142, were entitled so later by the publisher.

IMPROMPTU DE VERSAILLES, ăN'prôn'tu' de vârsâ'y', L'. A play by Molière (1663), in which he attacked the critics of his *Ecole des femmes*.

IM'PROPE'RIA (Lat. nom. pl., reproaches).

A series of antiphons and responses which are sung in the Catholic church on Good Friday, as a part of the mass of the presanctified. Ever since 1560 Palestrina's famous Improperia have been sung in the Sistine Chapel in Rome.

IM'PROPRIA'TION (from ML. *impropriatio*, from *impropriare*, to impropriate, from Lat. *in*, in + *proprius*, own). A term used in England, signifying the transfer to a layman of the revenues of a benefice to which the cure of souls is annexed, with an obligation to provide for the performance of the spiritual duties attached to the benefice. The spiritual duties are discharged by a clergyman, who is called a vicar, and who receives a certain portion of the emoluments of the living, generally consisting of a part of the glebe land of the parsonage, together with what are called the "small tithes" (i.e., tithes of hops, potatoes and the like farming products) of the parish. The custom arose upon the dissolution of the monasteries, when the rights which belonged to them were in some cases bestowed upon laymen.

IM'PROVISA'TION (from Lat. *improvisus*, unforeseen, from *in-*, not + *providere*, to foresee, from *pro*, before + *videre*, to see). The art of producing without previous preparation a poem or a musical composition. Oratory, although in its original form it is founded on spontaneous efforts, is not ordinarily considered under the head of improvisation; but poetry and music, while subject to inspiration, are rather dominated by their complexity, and improvisation in these branches represents a peculiar and unusual ability. Poetry and music, like the dance and music, were inseparable in their early history; the Egyptian priests chanted improvised hymns to their deities; while in Greece, the real home of improvisation in antiquity, it was customary for poets to recite impromptu verses to the accompaniment of the lyre. In later Roman times Archias, the friend of Cicero, Publius Syrus, Ovid, and Statius were famous improvisatori. But as in the course of centuries languages grew more compact, and as less license was allowed, improvisation almost died out among civilized nations. Among savage peoples it has always been practiced. From the decline of Rome to the ninth century improvisation as an art was practically unknown. Then, however, came the renaissance, and the troubadours, the trouvères, the minnesingers, and the meistersingers (qq.v.) followed each other in rapid succession. Italy was quick to take advantage of the adaptability of her language, and the courts of Naples, Milan, and Ferrara became poetical centres from which the new art spread throughout the peninsula. In Germany and in France improvisation was soon superseded by careful composition, but in Spain, and especially in Italy, it lingered long. Petrarch, in the twelfth century, gave a great impetus to improvisation, and down to the present day in Italy it has played an important rôle in the imaginative life of the poorer classes. Improvisation is by no means limited to brief poems of a few verses and of simple structure, but is often carried on in complicated metres and to great length. Some of the most famous of the Italian improvisatori have been the Venetian Leonico (died 1524); Serafino of Aquila (died 1500); Accolti of Arezzo (sixteenth century); Metastasio (q.v.), who, however, soon abandoned the art; and Tommaso Syrici (died 1836). In Corsica and Sardinia there are many women (improvisatrices) who improvise long

memorial poems at funerals. Among the best-known improvisatrices may be mentioned Magdalena Fernandez (died 1800), Signora Mazzei (born c.1800), and Giovannina Milli.

In music improvisation is the art of performing extemporaneously upon an instrument. A given theme or themes may be developed in strict form, or the performer may give himself up to momentary impulses and employ any number of themes in a free fantasia. The former, however, is a great art, and nearly all the masters, notably Bach and Beethoven, excelled in it. To improvise in a given form requires not only an unusual command over the technique, but also a marvelous power of concentration. Undoubtedly the improvisation of a strict fugue is the most difficult task imaginable. Bach was a master of this.

IMPSONITE, imp'son-īt. A solid bitumen, resembling gilsonite (q.v.), which is found in the Impson Valley, Okla. An analysis gave C, 86.57; H, 7.26; N, 1.48; O, 2.00; S, 1.38; Ash, 1.31. See BITUMEN; ASPHALT.

IM'PULSE (from Lat. *impulsus*, incitement, from *impellere*, to incite, from *in*, in + *pellere*, to drive). The typical motive, or conscious condition of voluntary action. (See ACTION.) This action is at first unequivocally determined (see DETERMINING TENDENCY); the organization of the individual is such not only that a given stimulus can bring about merely a given definite movement, but also that this particular movement must necessarily follow without hesitation or reflection. The primitive impulse is thus composed merely of perception of object and perception of movement, with perhaps an affective process; the primitive impulsive action is action upon presentation. After these first movements, however, ideas may play a part in the motive. The developed impulsive action is action upon representation, and the developed impulse is a simultaneous association (see ASSOCIATION OF IDEAS) of the above-mentioned factors with an idea of own movement, based upon previous experiences, and an idea of the end or result of movement.

The motives to forms of action other than impulsive may all be derived from the impulse. In selective action the motive is a conflict of impulses, some one of which ultimately prevails as actual motive over the potential motives, its rivals. The motives in sensorimotor, ideomotor, automatic, and reflex action are degenerate impulses, i.e., are impulses from which certain of the conscious factors in the fully developed impulse have, through repetition, been lost. The process of the decay of motive may be studied experimentally in the reaction experiment. See REACTION.

It is difficult to give an example of an impulsive action, for the reason that the "impulse" is a scientific abstraction. Its mark, as we have said, is the single determination; and in concrete experience determinations are difficult to demarcate; while it is only approximately that we may speak of a single determination. What is impulsive in one man's consciousness, then, may not be so in another's, and what is impulsive for a man now may not be so under other conditions. The strong swimmer may plunge impulsively, the weak swimmer only after a good deal of hesitancy and indecision. Signing one's name to a deed is the expression of a highly complex determination; yet during a tiresome lecture one may write one's name in the note-

book again and again in a purely automatic way.

IMPU'RITIES OF WATER. See WATER PURIFICATION.

IM'PUTA'TION (Lat. *imputatio*, from *imputare*, to ascribe, from *in*, in + *putare*, to think, from *putus*, clear; connected with Lat. *purus*, pure, Skt. *pū*, to purify). One of the common technical terms of Christian theology. It denotes the transference of the *merit*, in a legal sense, of punishment or reward.

The two problems in connection with which the term is used are those offered by the universal prevalence of sin in the world, and by the forgiveness of men, which the New Testament teaches is for Christ's sake. The former problem arose in connection with the Pelagian controversies in the time of Augustine (see PELAGIANISM; PELAGIUS; AUGUSTINE), the latter in connection with the controversies of the Reformation. Paul's writings show that he held some connection between Adam's sin and the sinfulness of all men. (Cf. Rom. v. 12.) Augustine explained it by a theory of realism, that men sinned *in* Adam. By the time of the Reformation realism had disappeared as a living philosophy, and imputation took its place in theology. Calvinism taught that Adam's sin was *imputed* to his posterity, so that they were treated *as if* they had committed it, being held to the consequences of it in the form of disorder of nature and actual sin resulting therefrom. In the course of time several varieties of imputation were distinguished—immediate, the direct imputation of Adam's sin; mediate, the imputation of a corrupt nature which produces sin. In respect to the forgiveness of sinners for Christ's sake, imputation was originally applied by the Church of the Reformation only to Christ's passive obedience, or suffering on the cross; and when this was said to be imputed to us, nothing more was meant than that we are forgiven for Christ's sake. Later, by that scholastic tendency which always dominates in the period of systemization, distinction was made between the passive and the active obedience of Christ or His obedience to the law, and this was also said to be imputed to the sinner in the act of justification.

Modern theology, even when of Calvinistic descent, seeks to emphasize the internal and ethical aspects of the doctrine. The propagation of a sinful nature, instead of being explained by realism and imputation, is explained by the law of heredity. The difference is not so much that evolution has laid aside the story of the fall of Adam as that modern thought demands an explanation of the fact of moral evil which is at once scientific and ethical. The relation of Christ to the race has also been reconstructed. With the tendency to substitute moral-influence views of the atonement for the mechanical conceptions of older theology, the need of a doctrine of the imputation of righteousness has disap-

peared. Consult: W. G. T. Shedd, *History of Christian Doctrine* (2 vols., New York, 1864); G. B. Stevens, *Christian Doctrine of Salvation* (ib., 1905); W. P. Du Bose, *Soteriology of the New Testament* (ib., 1906); L. G. Broughton, *Salvation and the Old Theology* (ib., 1908). See ATONEMENT.

IMRU'LKAIS. See AMRU-'L-KAIS.

IMUS, é'mōōs. A town of Luzon, Philippines, in the Province of Cavité, founded in 1795. It lies 8 miles southeast of Cavité, a short distance from Manila Bay. It was formerly the headquarters of the Filipino chief, Aguinaldo. Pop., 1903, 12,912.

INACHUS, in'á-kūs (Lat., from Gk. "Ιναχος). The Greek name of a river in Argos and also of the god of the river. When Poseidon and Hera disputed about the possession of Argos, and Inachus decided for Hera, Poseidon is said to have dried up the bed of the Inachus, so that no water could flow through it in summer. The name Inachus was ascribed also to the first King of Argos, and leader of the Argives from the mountains to the plains, whence Argos is called Inachian. In the legends this Inachus is especially celebrated as the father of Io (q.v.).

INAGUA, ê-nä'gwá, GREAT and LITTLE. Two of the Bahama Islands, West Indies, situated at the south end of the group (Map: West Indies, D 2). Great Inagua lies about 60 miles northeast of Cuba and occupies an area of over 665 square miles. It is only slightly elevated and is surrounded by reefs. The chief settlement is Matthew Town; pop., 1911, 1106. Little Inagua lies about 10 miles northeast of the larger island and has an area of about 36 square miles and but few inhabitants. Pop. (both islands), 1911, 1343.

INAJA PALM, in-āj'á (probably from the native name), *Maximiliana regia*. A South American palm, common in the countries near the Amazon. It has a massive stem, 15 to 20 feet high; very long, drooping, pinnate leaves, which are sometimes more than 15 feet long, with leaflets in groups of three, four, or five at intervals along the midrib, from which they stand out in different directions; numerous spadices; large woody spathes; and densely clustered elongate fruit, with tough skin and soft pulp, and hard stony seed. The spathes are used by hunters to cook in, and with water in them they stand in the fire well enough for the purpose. They are also used as baskets, and as cradles by the Indians, who also eat the fruit, which is particularly attractive to monkeys and some kinds of birds. The leaves yield a serviceable fiber that is used by the natives in the manufacture of ropes, hats, etc.

INAMA-STERNEGG, ê-nä'má-stēr'nëg, KARL THEODOR VON (1843-1908). An Austrian economist and statistician, born at Augsburg. Educated at Munich, he became docent there (1867), professor at Innsbruck (1868), and at Prague (1880). In the following year he was made head of the Statistical Bureau in Vienna and professor of the University of Vienna. He was president of the Central Statistical Commission (1884) and in 1891 was named a life member of the Austrian Upper House. An economist of the historical school, he was editor of the *Zeitschrift für Volkswirtschaft, Socialpolitik und Verwaltung* (1892) and of many departmental publications. He wrote: *Verwaltungslehre* (1870); *Die Ausbildung der grossen Grundherrschaften in Deutschland während der Karolingerzeit* (1878); *Deutsche Wirtschaftsgeschichte*

(1879-1901); the important *Zur Verfassungsgeschichte der deutschen Salinen im Mittelalter* (1886); *Sallandsstudien* (1889); "Abriss der deutschen Wirtschaftsgeschichte" in Paul's *Grundriss der germanischen Philologie* (1889); *Die persönlichen Verhältnisse der Wiener Armen* (1889); *Neue Probleme des modernen Kulturlebens* (1908).

INCANDESCENT LAMPS. See ELECTRIC LIGHTING.

IN'CANTA'TION (Lat. *incantatio*, from *incantare*, to enchant, from *in*, in + *cantare*, frequentative of *canere*, to sing). The employment of song for magical purposes. In consequence of the excitement awakened by rhythmical utterance, verse has from early times been supposed to possess a divine element. Vergil and Horace represent songs as able to bring down from heaven the moon and the stars; and such influence, in these poets only fanciful, was at an earlier period commonly ascribed to sacred verses. It was further believed that both gods and ghosts were placated by song; and it is a universal feature of worship that in all ceremonies chants are employed which have been handed down from antiquity, preserved with scrupulous exactitude, and supposed to exert supernatural effect. In ancient times every function of human life was accompanied with incantations, presumed to be as essential as were the natural means employed. Poetic formulæ, it was supposed, had power to summon and banish demons, to raise and disperse storms, to bestow sunshine and rain, to grant success in war and in love, to inflict and remove disease, to cause crops to grow, wither, or remove from one granary to another, to make cattle breed and bees swarm, to bring success to the fisherman and hunter, and so on indefinitely. Song, when used for magic ends, is often reënforced by appropriate motions and actions and frequently recited by a shaman (medicine man, magician). Thus, among Navahos the rite called the Mountain Chant, primarily intended for the cure of disease, constitutes an elaborate festival of nine days' duration. It is explained by a myth, to which the songs allude. These form sequences, of which the order must not be changed, and among them are prayers of a simple character, which recite the nature of the sickness, entreat that it may be healed, and end with an assertion that the work is accomplished. Similarly, ancient Babylonian formulæ of an exorcistic character, directed against diseases conceived as evil spirits, ordinarily begin with enumerating the effects of the malady or names of the hostile powers, express the desire of the suppliant for recovery, and conclude with an invocation to Heaven and Earth, who are besought to deliver the sufferer. These also were often associated with ritual, for the performance of which directions are given. Of course, with the songs are sometimes employed other agencies, as when in the *Odyssey* the hero, injured by a boar's tusk, has his hurt bound by the sons of Autolycus, who

then proceed to employ an incantation supposed to stanch the wound. In process of time the ceremonies employed in such cases fell into disuse, and the words of such charms became half intelligible or altogether meaningless. It seems to have been always usual that the miraculous healer should recite his rhymes in a low tone of voice, in such a manner as to be unintelligible to spectators, whose sense of mystery was thereby heightened. Considering the tenacity of tradition, it might be expected that some of these formulæ should have a long history. For instance, a German incantation recorded in the tenth century, and evidently of heathen origin, relates that, while certain deities were riding in the forest, a horse dislocated his leg, which the gods wished to heal; Woden was successful by means of an incantation. A similar charm at a later time appears in Christian form, Peter and John replacing the deities, and Christ taking the place of Woden as the healer. In the nineteenth century a form of this incantation was still in use in Shetland, but accompanied by an elaborate ceremony, every part of which was regarded as essential, and which included the use of a thread spun from black wool and having nine knots wound about the sprained part. At the present day the custom remains in force among simple peoples. In English nursery lore the habit of incantation survives in some simple rhymes of children and young people, as, e.g., in verses directed against rain, or those addressed to the moon and stars in order to obtain auguries as to the future mate. Consult the authorities referred to under MAGIC; also Grendon, "The Anglo-Saxon Charms," in *Journal of American Folk-Lore*, vol. xxii (Boston, 1909).

INCAPACITY. In law, the state or condition of being incapable of incurring a civil or criminal liability. Incapacity to contract may be due to the infancy of a party, to his political or professional status, to lunacy or drunkenness, in the case of a woman to coverture, and in the case of a corporation to its artificial construction. A contract entered into by a person under such a disability may, as in the case of an infant, be merely voidable at his election, or, as in the case of a married woman at common law, absolutely void. The disability of coverture has, however, been almost wholly removed by statute, both in England and the United States, and the same is true of some of the disabilities resulting from professional or political status, as in the case of alienage; but the other grounds of incapacity, which are based not on an artificial status but on natural conditions, are still generally observed. See CONTRACT; COVERTURE; INFANT.

In criminal law children under the age of seven are conclusively presumed to be incapable of committing crimes of any nature, and boys under 14 are deemed incapable of sexual crime. See CRIME. For incapacity to contract marriage, see MARRIAGE; IMPOTENCY; PROHIBITED DEGREES; CONSENT, AGE, IN LAW; and, on the general subject, PERSON.

INCARNA'TION (ML. *incarnatio*, from Lat. *incarnari*, to be made flesh, from *in*, in + *caro*, flesh, Gk. *κρεας*, *kreas*, AS. *hrāw*, Skt. *kravya*, raw flesh). In Christian theology, the assumption of humanity, by the second person of the divine Trinity, by which He was both God and man in one person. The idea of the appearance of gods in human form is very frequent in primitive religions, in many of which the line between divine and human is not sharply drawn. In

more developed religions the idea is often found, both in the belief that certain living men, often kings or saints, are divine incarnations, and in mythological stories of the incarnation of the gods. India and Egypt were specially rich in both these forms of incarnation in beasts as well as men. The Christian doctrine of incarnation differs from these in being ethical rather than physical in emphasis, conceived as occurring once only in the history of the world and for the purpose of the redemption of mankind. The proof of the incarnation of Christ lies, not in the story of the Virgin birth, which cannot be shown to be known by any New Testament writers except the authors of Matthew and Luke, but rather in Christ's harmony with the will of God. For all purposes of modern thought, absolute union of will with the will of God is the incarnation of God. Early speculations about the incarnation, however, were concerned with questions of substance—whether Christ was of the same substance with God. (See HOMOOUSSION.) The mediæval theology laid great stress on the incarnation as furnishing the basis for an explanation of the atonement. Anselm (q.v.), in *Cur Deus Homo*, argues that an incarnation is necessary for atonement. Man has incurred the debt for sin, and man must pay it; but man cannot. Therefore the need of a God-man, who is almighty and sinless and can pay the debt, not only for himself but for all men. Modern theology still regards the incarnation as the central doctrine of Christianity, though not for the mechanical reasons of Anselm's theory. The incarnation is now interpreted rather as a revelation of the nature and character of God. Would men know what God is? God is like Christ. Christ's character is the model on which men who wish to be in harmony with God must build. The incarnation is necessary to the revelation of God, for only through a person could the character of a personal God be shown. The incarnation, then, is a necessity for the salvation of men, for it gives them a perfect example of what God requires for harmony with himself.

IN'CAS. See PERUVIAN ARCHÆOLOGY.

INCE, WILLIAM (fl. eighteenth century). An English furniture designer, whose chairs represented a transition from those of Chippendale (q.v.), which they most resembled, to Hepplewhite's (q.v.). Ince was most successful in some of his light boudoir furniture. Various details introduced by him set a style for several years. With Thomas Mayhew, for many years his partner in London, he published *The Universal System of Household Furniture* (c.1762),

whose 95 plates show more than 300 "designs in the most elegant taste." Consult, besides this work, the references cited under CHIPPENDALE CHAIRS and FURNITURE.

INCE-IN-MAKERFIELD, ins'in-māk'ēr-fēld. A town in Lancashire, England, 1 mile east-southeast of Wigan, on the Leeds and Liverpool Canal (Map: England, D 3). It has railway-wagon works, ironworks, blast furnaces, cotton works, and extensive coal mining. The town has owned its water works since 1871. Pop., 1901, 21,262; 1911, 22,034.

INCEN'DIARISM. See ARSON.

IN'CENSE (from OF., Fr. *encens*, Lat. *incensum*, incense, from *incendere*, to burn, from *in*, in + *candere*, to glow, connected with Gk. *καθαρός*, *katharos*, pure, Skt. *ścandra*, *candra*, shining, noon, from *ścand*, to be bright). A perfume the odor of which is evolved by burning. It was used in worship in Egypt, Babylonia, and Assyria, Persia, Greece, and Rome, in the later Hebrew religion, in Hinduism and Buddhism. In the Christian Church there is no positive evidence of its use during the first four centuries. The earliest authentic reference to it is in the Pseudo-Dionysius in the fifth century. In the Catholic church, both of the West and of the East, incense is used in public worship, in the solemn (or high) mass, in the consecration of churches, in solemn consecrations of objects intended for use in public worship and in the burial of the dead. The incense at present in use consists of some resinous base, such as gum olibanum, mingled with odoriferous gums, balsams, etc. There is no regular formula for it, almost every maker having his own peculiar recipe. The ingredients are usually olibanum, benzoin, styrax, and powdered cascarilla bark. These materials, well mingled, are so placed in the censer (q.v.) or thurible as to fall by sprinkling on hot charcoal, which immediately volatilizes them. In the reformed churches the use of incense was abandoned, but has been restored to some extent in the High Church branch of the Anglican communion; and the Catholic Apostolic (or Irvingite) church (q.v.) has always used it. Consult: Atchley, *History of the Use of Incense in Divine Worship* (London, 1909).

INCEP'TION. See ACT OR CEREMONY OF INCEPTION.

IN'CEST (OF., Fr. *inceste*, from Lat. *incestum*, incest, neut. sing. of *incestus*, unchaste, from *in-*, not + *castus*, chaste). Sexual intercourse between persons who are legally prohibited from marrying because of their affinity or consanguinity (q.v.). Incest is not a common-law offense, but in England is punishable in the ecclesiastical courts by excommunication and penance. It is said to be the only form of immorality which, in the case of the laity, is still punished by the ecclesiastical courts on the general ground of its sinfulness.

In the law of Scotland incest is a high crime by a statute (Scots Act, 1567, c. 14) which defines it by a reference to Leviticus (chap. xviii), and was till 1887 punishable with death. Incestuous marriages are absolutely void both in England and the United States.

In most of the American States incest is a criminal offense by statute, punishable by imprisonment for a term of years, usually not exceeding 10. In some States the marriage of persons within the prohibited degrees, even when not followed by cohabitation or accompanied by sexual intercourse, amounts to criminal incest.

Consult: Blackstone, *Commentaries on the Laws of England* (1st ed., 4 vols., London, 1765-69); Stephen, *History of the Criminal Law of England* (ib., 1883); Phillimore, *Ecclesiastical Law* (2d ed., 2 vols., London, 1895); Bishop, *Statutory Crimes* (Chicago, 1901); Slater, *Manual of Moral Theology* (New York, 1908). See CONSANGUINITY; MARRIAGE; PROHIBITED DEGREES.

INCH. See WEIGHTS AND MEASURES.

INCH, JAMES ROBERT (1835-1912). A Canadian educator, born at Petersville, Queen's Co., New Brunswick, and educated at Mount Allison University. He was principal of the Mount Allison Ladies' College (1864-78); president of the University of New Brunswick (1878-91); superintendent of education and president of New Brunswick University, the two offices having been amalgamated by act of the Provincial Legislature. In 1895 he was elected vice president of the Dominion Educational Association; in 1906 he was made a member of the committee on union of the Presbyterian, Methodist, and Congregational churches of Canada, and in 1907 he was a delegate to the Imperial Educational Conference at London, England. He resigned as superintendent of education in 1909.

INCH'BALD, ELIZABETH SIMPSON (1753-1821). An English novelist, playwright, and actress, born at Stanningfield, near Bury St. Edmund's, Suffolk. She educated herself, mostly by general reading. After vain attempts to engage herself as actress, both in Norfolk and in London, she married, in 1772, the actor Joseph Inchbald. Later in the same year she made her first appearance on the stage at Bristol in the rôle of Cordelia. With her husband she performed in the provincial towns till his death (1779) and continued to appear for 10 years more. As an actress, she had the advantage of great personal charm, but an impediment in speech prevented the highest success. Beginning to write for the stage as early as 1782, she produced about 20 comedies and farces, which were well received at the London theatres. But of her literary work only her two novels have survived: *A Simple Story* (1791; with introd. by G. L. Strachey, Oxford, 1908), which, though ill constructed, did not lack real merit; and *Nature and Art* (1796), which was very popular. Mrs. Inchbald also edited three collections of plays: *The British Theatre* (25 vols., 1806-09); *Modern Theatre* (10 vols., 1809); and *Farces* (7 vols., 1809). She wrote her memoirs, but destroyed them. Consult: Scott's edition of her *Novels* with a memoir (London, 1880); Boaden, *Memoir* (ib., 1833); Elwood, *Memoirs of the Literary Ladies of England* (ib., 1842); J. Fyvie, *Tragedy Queens of the Georgian Era* (New York, 1909).

INCH'CAPE ROCK, THE. A ballad by Southey relating how the bell buoy on the reef of this name (see BELL ROCK) near Arbroath (q.v.), Scotland, was destroyed by a pirate and how he afterward lost his own life on the spot.

INCH'COLM, or ISLAND OF COLUMBA. A picturesque islet in the Firth of Forth, in the Parish of Aberdour (q.v.), Fifeshire, Scotland, separated from the Fife shore by Mortimer's Deep, a channel about a mile wide. It is half a mile long, with a maximum width of one-third of a mile, and is noted for its monastic ruins, which exhibit traces of the twelfth-century Romanesque architecture, but are chiefly in the early Pointed style of the thirteenth and fourteenth centuries. They consist of the remains

of an abbey of Austin Canons regular, founded by Alexander I in 1123, and include a vaulted oratory, and a chapter house with groined roof and three elegant sedilia. The Latin names of the islet are *Æmona* and *Insula Sancti Columbæ*, the latter derived from St. Colm, or Columba (q.v.), of Iona, who dwelt here in the sixth century. As St. Colm's Inch, it is mentioned in Shakespeare's *Macbeth*, Act i, Scene 2. The monastery was frequently sacked by the English during the fourteenth, fifteenth, and sixteenth centuries. Consult Simpson, *Æmona and the Islands of the Forth* (Edinburgh, 1861).

INCHKEITH, *inch'kêth*. A small fortified island of historic interest in the Firth of Forth, Scotland, nearly midway between Leith and Kinghorn. It has a lighthouse, 220 feet above high water, visible 21 miles.

INCH'WORM'. See MEASURING WORM.

IN'CIDENT (from Lat. *incidere*, to fall upon, from *in*, in + *cadere*, to fall). In law, a right, privilege, or burden inseparably annexed to an estate or tenure of lands. Thus, rent reserved upon a lease for life or years is incident to the reversion, or estate of the landlord, and passes with the latter upon its assignment; and a right to distrain is incident to a rent charge and attends it into whosoever hands it may come; and a court baron is incident to a manor (q.v.), which, indeed, cannot exist without such a court. In the same sense the rights of inheritance, of free alienation, and of escheat are incidents of an estate in fee simple, and the right to take estovers (see ESTOVER) is an incident of a tenancy for life or years, while dower and curtesy are among the incidents of estates of inheritance.

More specifically the term "incident" is employed in English law to describe a certain class of obligations attaching to the several forms of feudal tenure. Viewed from the standpoint of the lord of whom the lands were held, these were certain legally defined rights which inured to him by virtue of his superior or paramount title. They were due, as a matter of legal obligation, from all land held by such tenure, and not by virtue of any understanding or agreement—which fact distinguishes them from the *services* due from the tenant to the lord, which were entirely a matter of agreement.

The most important of these "feudal incidents," as they are termed, were *aids*, *reliefs*, and *escheats*, which were due from all secular tenures, and *wardship* and *marriage*, which were peculiar to the military tenures. These will be described under their appropriate titles. Though differing greatly in the kind and amount of the burden which they imposed upon the land, they had this in common, that they came to be regarded as the essential and distinguishing characteristics of the several forms of tenure to which they were appropriate. The military structure of the feudal system in England decayed rapidly after the Conquest, and the expression "military tenure," or "tenure in chivalry," was regarded not as tenure for which military service was in fact to be rendered, but tenure attended by the burdensome incidents of wardship and marriage; while socage tenure was not so much a tenure by a fixed and determinate service as one free from those incidents.

Most of the incidents of tenure were done away with by the famous statute which abolished military tenures (12 Car. II, c. 14), and only the right of escheat remains to remind us of the feudal origin of our land law. See FEUDALISM;

SOCAGE; TENURE; and the authorities there referred to.

IN'CIDEN'TAL MUSIC. By this term is meant all music written specially for the purpose of illustrating or intensifying certain moments of a spoken drama, such as fanfares, marches, dances, serenades, songs, etc., which are performed while the action is in actual progress upon the stage. Music played between the acts, even if it has some connection with the drama, does not come under this definition, but is classed as entr'acte music. Nor are concert overtures, inspired by a drama and portraying some mood or character, included. Such examples as Wagner's *Faust Overture*, Schumann's *Braut von Messina*, Goldmark's *Prometheus*, etc., come under the heading of programme music. They were not written for performance in connection with those dramas. On the other hand, such overtures as Beethoven's *Egmont*, Mendelssohn's *Midsummer-Night's Dream*, Schumann's *Manfred*, though frequently performed at symphony concerts, constitute part of the incidental music written for those dramas. From the scenic directions found in his plays it is evident that Shakespeare relied extensively upon the aid of music; but, strange to say, not a note of the original incidental music has come down to us. When Henry Irving assumed the management of the Lyceum Theatre in London (1878), he inaugurated the practice of staging every Shakespearean play, and almost every modern drama of importance, with new incidental music written for the occasion by the foremost English composers.

IN'CI'NERA'TION. See CREMATION.

INCINERATION, REFUSE. See GARBAGE AND REFUSE, DISPOSAL OF; FIELD COOKING.

IN'CLINA'TION, MAGNETIC, or DIP. The angle made with the horizon by the axis of a magnetic needle which swings freely in a vertical plane passing through the magnetic meridian (compass direction). It varies from point to point on the earth's surface, ranging from 90° at the magnetic poles to zero at the magnetic equator. The varying amount of magnetic inclination will be found indicated on the isoclinic charts accompanying the article TERRESTRIAL MAGNETISM. The magnetic inclination was first definitely discovered by Robert Norman in 1576, and an instrument, the dip circle, was devised by him for measuring the amount. The phenomenon had previously been noticed by George Hartmann, in Nuremberg, as would appear from a letter written in 1544, but he failed to measure the amount of inclination accurately; he merely observed the dip of a compass needle which was not quite balanced. It should be carefully noted that the magnetic inclination, as above defined, is the *minimum* angle which a dip needle makes with the horizon at any given place. Thus, if the plane in which the dip needle swings is set at right angles to the magnetic meridian, then the angle of dip will be the maximum amount possible, viz., 90°; it is with the aid of this fact, indeed, that the vertical plane of the dip circle is frequently set in the magnetic meridian. Besides the dip circle an instrument known as the earth inductor is used to measure the dip. The magnetic inclination is subject to periodic and aperiodic variations, as is the magnetic declination. In order that an ordinary compass needle may swing in a horizontal plane, it is customary in northern latitudes to make the southern end of the needle slightly heavier; or

the same effect is secured by using a symmetrical needle which has been weighted with a small bit of brass on its southern half. See COMPASS; DECLINATION; DECLINOMETER; DIP CIRCLE; DIP OF THE MAGNETIC NEEDLE; ISOCLINIC; MAGNETISM; TERRESTRIAL MAGNETISM.

INCLINED PLANE. A smooth plane inclined to the horizontal plane at any point on the earth's surface. Imagine a plane section through this inclined plane and the horizontal one, perpendicular to their line of intersection. Let the plane be supported by an upright; and let two bodies of masses m_1 and m_2 , joined by an inextensible string, be placed, as shown, one on the plane and one hanging freely, the string passing over a pulley. If the bodies are in equilibrium, the forces on the body of mass m_1 , parallel to the plane, must balance each other. There is a force $m_1 g \sin \theta$ down the plane and a

INCLINED PLANE.

force $m_2 g$ up the plane; hence $m_1 g \sin \theta = m_2 g$; or, in general, the force up the plane equals the weight of the body on the plane multiplied by the sine of the angle of inclination of the plane. To produce motion up the plane of a heavy body requires therefore less force than its weight.

The "mechanical advantage" is $\frac{1}{\sin \theta}$.

Another method for solving this problem is to consider as before the two bodies in equilibrium and to produce a small displacement; let the body whose mass is m_1 move up the plane a distance x_1 , and the body whose mass is m_2 move vertically down, owing to this, a distance x_2 . By the principle of energy $m_1 g \sin \theta x_1 = m_2 g x_2$; but $x_1 = x_2$; hence, as before, $m_1 g \sin \theta = m_2 g$. Inclined planes are still used daily for rolling up heavy weights. They were used by all ancient peoples for raising heavy stones for building purposes. The screw is nothing but an inclined plane rolled around a cylinder.

INCLINOMETER. A term applied to an instrument for determining the inclination of the magnetic needle, more properly known as a dip circle (q.v.). See INCLINATION; TERRESTRIAL MAGNETISM.

INCLOSED ARC LAMP. See ELECTRIC LIGHTING.

INCLOSURE OF COMMONS. In English law, the freeing of wastes and common lands from certain common, or community, rights of user to which they may be subject. Commons, i.e., rights of common—as the right of villagers or the tenants of a manor to pasture their cattle on the waste land of the vill or manor—are among the oldest of English property rights. They were formerly very common and were doubtless a survival of primitive forms of community property, antedating the institution of private ownership. When, with the advent of the feudal system, the lands came to be regarded as the private property of greater or lesser lords, the accustomed use of the lands for pasturing cattle, cutting turf, and the like, survived as

common, customary rights of the community exercising them. As such privileged use of the land prevented its conversion to ordinary agricultural purposes, it was necessary to extinguish the common rights before this could be effected. The process by which this was accomplished was the inclosure of the commons.

At common law the only method by which the right to inclose lands subject to common rights could be gained was by mutual agreement between all who had commonable privileges therein—a tedious and unsatisfactory method. The benefits of inclosure became evident centuries ago, and as early as the reign of Henry III a general act of Parliament, known as the Statute of Merton (1235, 20 Hen. III, c. 4), was passed, authorizing the "inclosure and approvement" of commons of pasture upon certain conditions. This was followed just half a century later by the Statute of Westminster II (13 Edw. I, st. i, c. 46), which gave greater precision to the methods by which inclosure should be effected. But the transformation of English agriculture was a slow process, and 500 years more were to elapse before the common rights in waste land became a serious obstacle to the economic development of the country. In 1801 the first general Inclosure Act was passed, and this was followed by the Inclosure Act of 1845, by which, with its amendments, the inclosure of commons and wastes is now regulated. All of this legislation has aimed at facilitating the division of commons, their conversion into separate and independent land holdings, the inclosure of such holdings, and the improvement of those portions that are retained for the common use of towns or villages. Consult: Elton, *Treatise on the Law of Copyholds and Customary Tenures of Land* (London, 1874); Williams, *Rights of Common* (ib., 1880); Scrutton, *Commons and Common Fields* (ib., 1887); Gonner, *Common Land and Inclosure* (New York, 1912). See COMMON.

IN CENA DOMINI (Lat., at the Supper of the Lord). A celebrated papal bull, so called because designed to be read in the church of St. Peter's at Rome on every Holy Thursday, the day on which the Lord's Supper was instituted. It is not, as other bulls, the work of a single pope, but, with various additions and modifications, dates back to early times; some tracing it to Urban V, and others to Martin V, Clement V, and some to Boniface VIII. Its present form, however, it received from the popes Julius II, Paul III, and finally Urban VIII, in 1627, after which it continued for a century and a half to be published annually. Pius V, in 1568, decreed that it should be read every Holy Thursday until superseded. The contents of this bull have been a fertile subject of controversy. It may be briefly described as a summary of ecclesiastical censures, especially of those with which grievous violation of the faith of the Church, or of the rights of the Church or of the Roman see, are visited; excommunication being denounced against heresy, schism, sacrilege, usurpation of the rights of the Church or of the Pope, forcible and unlawful seizure of Church property, personal violence against ecclesiastics, unlawful interruption of the free intercourse of the faithful with Rome, the invasion of the Pontifical States, etc.—20 clauses in all. The bull, however, although mainly dealing with offenses against the Church, also denounced under similar censures other crimes, as piracy, plunder of shipwrecked goods, forgery, etc. This bull, being regarded

by most of the sovereigns of Europe as an infringement of their rights, encountered in the seventeenth century the determined opposition of nearly all the courts, even the most Catholic; and at length, in 1770, Clement XIV discontinued its publication, which has never since been renewed. Pius IX, on Oct. 12, 1869, abrogated it and issued a new constitution, *Apostolicæ Sedis*, in its place.

INCOMBUSTIBLE FABRICS. Much attention has been paid to the production of incombustible fabrics, and of solutions which may be applied to any fabrics to render them more or less fireproof. As typical of the first may be mentioned asbestos cloth when this fibre is used either wholly or in part to form the fabric. A drop curtain of such material at the proscenium arch is required for theatres in many cities. It is usually made of metallic asbestos cloth where a strand of asbestos yarn is wound with a strand of fine brass wire and the combination woven into a cloth usually of 36 inches width. While useful, these asbestos curtains have their limitations and fire engineers urge that too much dependence should not be placed upon them. Many salts possess the power of rendering fabrics which were immersed in solution of them incombustible; but some of these injure the fabric, spoil the color, or are so very expensive as to render their general use impossible. Three, however, viz., tungstate of soda, phosphate of ammonia, and sulphate of ammonia, produce the best results without injuring the fabric or color. The first of these acts physically by preventing contact with the air and does not interfere with the process of ironing and starching; it is therefore preferable for goods requiring washing. For fabrics which are used without previous washing, the other two are preferable. Soluble glass (silicate of soda) is a highly alkaline solution of minerals composing glass which is applied to textures, in theatres especially for curtains and scenery, to render them fireproof. Fire touching them melts the invisible minerals into a glaze which excludes air and prevents combustion. All these solutions, however, are likely to lose their efficiency if some time has elapsed since they were applied. Consult: British Fire Prevention Committee's *Red Books*, especially no. 129, "Fire Tests with Textiles" (1908), and no. 148 (1910); also *Journal of British Fire Prevention Committee*, "Fire Prevention in Paris," no. 8 (1912); various papers in the files of the *Quarterly of the National Fire Protection Association* (Boston, current), especially vol. vi, no. 2 (1902), "Fireproofing Cotton Goods." For further treatment of the subject, see FIREPROOFING.

INCOME TAX. A tax upon the income of individuals. It may be levied directly upon the individuals receiving the income, or it may be collected from the income at its source in the form of a tax upon dividends, interest on bonds, etc. It may be uniform, taxing all incomes at a uniform rate, or progressive, increasing the rate of taxation with the amount of income received by the individual. An income tax may differentiate between various forms of income, as, e.g., between incomes from labor and incomes from property, or between permanent and temporary incomes. Differentiation may be attained either by levying a higher rate upon some forms of income than upon others, or by the imposition of a supplementary tax upon property or upon consumption which will in effect fall upon the incomes discriminated against.

In states which levy an income tax it is usually the practice to exempt small incomes, or that portion of the income necessary to mere independent existence or to the maintenance of the usual standard of life, and to levy the tax only upon the excess. The theory of such exemption is that the state should not take from the individual in the form of taxes what it will be obliged to return to him in the form of poor relief or otherwise.

In theory the income tax, more nearly than any other system, meets the requirements laid down in the most advanced canons of taxation. A man should be taxed according to his ability, or "faculty"; and income is the best test of ability. A graduated tax on incomes is popularly defended on the ground that it may be employed to bring about a more equal distribution of wealth. In the latest financial theory, however, graduated taxation is justified on the ground that a man's ability to pay taxes increases more rapidly than his income. Differentiation of taxation is advocated on similar grounds. One who receives an income from permanent property is in a more favorable position than one who receives an equal income from labor, since the latter is compelled to make provision against unemployment, while the income of the former is quite at his disposal. It is, therefore, in accordance with the faculty test that incomes from property should pay a higher rate than incomes from labor.

In practice it is found to be difficult to determine directly the magnitude of a man's income. This is especially true in countries like America and England, where it is the policy of government to interfere as little as possible in the business affairs of the individual. This difficulty is greatly reduced when the tax is levied, not directly upon the individual, but upon the source of the income. Under this system corporations may be required to withhold a part of the dividends for the payment of the tax as well as a part of the salary of employees. When the tax is levied at the source, however, it is difficult to graduate it so as to tax those who receive large incomes at a higher rate than those whose incomes are small.

The income tax was introduced in England as a purely fiscal expedient. The huge expenditure of the Napoleonic wars forced the adoption in 1799 of an income tax, which with a short intermission lasted till the close of the war. It was again revived in 1842, and, although in 1874 an attempt was made by Gladstone to secure the repeal of the tax, it has maintained its position to this day as an integral part of the British financial structure. The British income tax is levied on the source of the income and does not attempt to provide for graduation or differentiation. It has proved to be a very productive tax; and by changing the rate the government is enabled to increase or diminish its revenue so as to cover exactly fiscal needs. In Italy the income tax was introduced by the law of 1864 (amended in 1877), and the fiscal needs of France after the Franco-Prussian War forced it also to adopt a national tax upon the income of corporations and associations. By a law of 1891 Prussia introduced a direct tax upon incomes. The tax was graduated, but at first made no provision for differentiation. In 1893 an auxiliary tax was levied upon property, thus establishing differentiation in effect. In 1893 Holland adopted an income-tax law which provided both for graduation and differentiation. By this law corpora-

tions as well as individuals are subject to the tax, but the holders of corporate securities pay no additional income tax on the revenue from them. A similar law was introduced in New Zealand in 1893. Switzerland, Denmark, and Austria levy income taxes, as does also Australia.

In the United States an income tax was advocated during the War of 1812 by Secretary Dallas, and in 1862 such a tax was actually adopted, and remained in force until 1872, despite the opposition of the propertied classes. No satisfactory machinery was established for its application. Individuals were required to submit estimates of their incomes; and as there was no means of verifying these estimates, the tax was paid only by those who were scrupulous enough to admit that their incomes exceeded the untaxed minimum. In spite of the great increase in national wealth, the receipts from the income tax declined from year to year. In 1894 the income tax was again introduced as a part of the Wilson Tariff Bill, and was carried largely by the Western and Southern members, despite violent opposition from the cities of the East. The tax, however, was declared unconstitutional (May 20, 1894), because, although a direct tax, it was not apportioned among the States according to population.

On July 12, 1909, an amendment to the Constitution giving Congress power "to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration," was submitted to the States by Congress. On Feb. 25, 1913, the amendment was declared adopted, the necessary two-thirds of the States having ratified it. Under its authority a law taxing incomes was incorporated in the Tariff Act of Oct. 3, 1913. Under this law every single person with an income above \$3000 is required to pay a normal tax of 1 per cent on the excess above such sum; every married person is required to pay a normal tax of 1 per cent on the excess of income above \$4000. An additional tax of 1 per cent is levied upon income in excess of \$20,000 and not above \$50,000; an additional tax of 2 per cent on income in excess of \$50,000 and under \$75,000; 3 per cent on income in excess of \$75,000 and under \$100,000; 4 per cent on income in excess of \$100,000 and under \$250,000; 5 per cent on income in excess of \$250,000 and under \$500,000; and 6 per cent on income above \$500,000. The principle of deduction at the source is employed extensively, in the case of incomes from corporate salaries, investments, etc.

Income taxes have been imposed at various times in 21 States, and in 8 States such taxes are still in force; but in no case have they been productive of large revenue. The Income Tax Law of Massachusetts dates from Colonial times and exempts incomes under \$2000 as well as income derived from property already taxed. Consult: Hill, *The British Income Tax* (New York, 1889); Müller, *Die Einkommenbesteuerung in den verschiedenen Ländern* (Halle, 1902); Kinsman, *The Income Tax in the Commonwealths of the United States* (New York, 1903); Caillaux, *L'Impôt sur le revenu* (Paris, 1910); Kennan, *Income Taxation* (Milwaukee, 1910); Seligman, *The Income Tax* (New York, 1911); Bankers Trust Company, New York, *Federal Income Tax* (ib., 1913); id., *Federal Income Tax Regulations and Law, with United States Treasury Department Rulings* (ib., 1913); id., *United States In-*

ternal Revenue Regulations Relating to Deduction of Federal Income Tax at the Source, as Issued October 25, 31, December 4-16, 1913; December 20, 1913-January 3, 1914 (ib., 1913-14); H. C. Black, *Treatise on the Law of Income Taxation under Federal and State Laws* (Kansas City, 1913); L. F. Speer, *Federal Income Tax Law Affecting Individuals and Corporations, with an Analysis of the Act and Explanatory Notes* (New York, 1913); Cordell Hull, *Federal Income Tax Law, together with Synopsis of the Law* (ib., 1914); Roger Foster, *Treatise on the Federal Income Tax under the Act of 1913* (Rochester, N. Y., 1914); Foote and Tracewell, *Analysis and Interpretation of the Federal Income Tax Law* (Washington, 1914); A. H. Walker, *The Unconstitutional Character and the Illegal Administration of the Income Tax Law Demonstrated* (New York, 1914). See FINANCE; TAXATION.

IN'COMMEN'SURABLE. See COMMENSURABLE.

INCONNU, ān'kō'nū' (Fr., unknown). A fish, usually called the Mackenzie River salmon (*Stenodus mackenzii*), which is intermediate between salmon and whitefish, and weighs about 10 pounds, though sometimes it is much larger. It ascends all the rivers of Arctic America and Asia and is of much importance to the natives of their valleys, though the fish is oily. It was discovered by Alexander Mackenzie, whose followers named it.

INCONSTANT, THE; OR, THE WAY TO WIN HIM. A comedy by George Farquhar (1702), adapted from Fletcher's *Wild Goose Chase*.

INCORPORATED SOCIETY OF AUTHORS, THE. A society organized in London, in 1884, by Sir Walter Besant, for the protection of authors and composers, and modeled on La Société des Gens de Lettres of Paris. Its purpose is to maintain the rights of authors, to advise them as to questions of copyright, to assist them in making contracts with publishers and in recovering money due under contracts. The society has also vigorously advocated amendments to the copyright law and had a large share in amending the laws of Canada and other colonies of the British Empire. The official organ is the *Author*, which is published monthly from the society's office. The society maintains a pension fund for the assistance of poor and unfortunate authors. The first president of the society was Lord Tennyson. The president in 1914 was Thomas Hardy.

INCORPORATION. The legal process by which a corporation is formed. As incorporation involves the creation of a new, artificial person, endowed by law with many of the rights of a natural person—as the power of holding and alienating property, the right of transmitting real estate by succession, the capacity of suing and of being sued as an individual, etc.—it is the exclusive privilege of the sovereign power. In England it is included in the royal prerogative, and the exercise of this power of the crown is known as a franchise (q.v.). In modern times it has come under the control of Parliament, and incorporation may be effected either by a special act or, more generally, under general statutes. In the United States the power to create corporations has never been a prerogative of the President or of the Governor of a State, but is vested exclusively in Congress and in the legislatures of the several States.

Thus, incorporation may be effected by royal

grant or charter, by special act of parliament, or a legislature, or by compliance with general statutes providing for incorporation for defined purposes and under defined conditions. The usual method employed in the United States at the present time is the last named, and the process is of the simplest character, consisting usually in the filing, with the Secretary of State, or other proper authority, of a duly executed certificate of incorporation, setting forth the name and objects of the proposed corporation, the area within which it proposes to carry on its operations, the names of the incorporators, the names of the directors for the first year, and the location of its principal place of business. Such certificate constitutes the charter of the corporation so created. In the issue of this charter the chief executive in some States has a wide authority, and in a few, as in Pennsylvania, the chief executive, on the advice of the Attorney-General, decides, subject to judicial revision, whether a given petition for a charter falls, in certain cases, within the general statute. In others, this power vests in the courts directly. Where incorporation is effected by special legislative act or by royal grant, the statute or grant creating it is itself the charter of the corporation.

The effect of the act of incorporation is to create the rights and liabilities which the law attaches to the form of corporation so created, so that future acts relating to the corporate body may affect that as a distinct legal entity instead of the individual by whom the corporation is represented or the individuals included in its membership. For a treatment of the various classes of corporations and the specific acts necessary to their creation, see CORPORATION; CHARTER; and the authorities there referred to.

IN'CORPO'REAL (from Lat. *incorporeus*, bodiless, from *in-*, not + *corporeus*, bodily, from *corpus*, body). In the common-law classification of real property, an estate, or interest, which is not accompanied by seisin, or possession. Present estates in land, such as freeholds and leaseholds in possession, are identified with the land itself, and are described as *corporeal*, i.e., as something substantial and tangible; while corresponding interests not in possession, such as futuré estates and rights in the land of others, are regarded as being of an unsubstantial and intangible nature and are accordingly described as *incorporeal*. The distinction has no scientific value, as the idea connoted by the terms "property" and "ownership" is always that of a legal right, and rights are always bodiless things and are equally immaterial and insubstantial, whether they relate to present or future enjoyment of land, and, indeed, whether they have to do with things or persons. But the distinction is a convenient one, nevertheless, and has had an important influence on the development of property law.

In our legal system the classification of property as corporeal and incorporeal is confined to interests in land. Though future interests in chattels and such property as shares of stock, patent rights, and copyrights are sometimes described as incorporeal, and though such eminent legal authorities as Sir Matthew Hale and Blackstone apply the term "corporeal" to jewels and other personal chattels, the distinction is of no value or importance in the law of personal property. On the other hand, the usual limitation of the terms "corporeal" and "incorporeal" to

hereditaments, i.e., to such interests as descend to the heir of the owner upon his death, is too narrow, as a future leasehold estate, or an easement or profit *à prendre* (qq.v.) for a term of years, which passes, like other personal property, to the executor or administrator, is equally entitled to be described as incorporeal.

It was in the methods of conveyance employed in creating or transferring the two kinds of property that the distinction between them attained its principal importance. Corporeal interests being susceptible of seisin, of possession, were said to "lie in livery," i.e., to be capable of transfer by the method of livery of seisin, or delivery of possession; whereas the more intangible incorporeal property, not being susceptible of physical transfer, was said to "lie in grant," i.e., to be transferable only by the form of deed known as a grant (q.v.). With the abolition of conveyance by livery of seisin and the general adoption of the method of conveyance by deed for all kinds of property, corporeal and incorporeal, the distinction has almost wholly lost its importance. See HEREDITAMENT; REAL PROPERTY.

IN'CREMENT, THE UNEARNED. See SINGLE TAX.

INCROYABLES, ăn'kwrä'yă'bl' (Fr., incredibles). A name applied to the Parisian dandies under the Directory, who made themselves conspicuous by their extravagance in dress, manner, and speech. One of their peculiarities was the omission of *r* in speaking, and they got their name from their favorite expression, *Ma petite pa'ole d'honneur, c'est inc'oyable* (Me wold of honnah, it's incwedible). They were mostly Royalists. The type has been known at different periods in the history of France by various names: *Agréables, Gommeux, Merveilleux, Mirriflores, Lions, Muscadins, Muguets, Petit-maitres*, etc. (See JEUNESSE DORÉE.) The term "Incroyables" is also applied to the exaggerated style of hats which they wore, which had two points and large brims in the front and back.

IN'CUBA'TOR (Lat. *incubator*, one who lies in a place, from *incubare*, to lie within, to incubate, from *in*, in + *cubare*, to lie). A term applied in poultry raising to devices used for artificial incubation or the hatching of eggs. Artificial incubation was successfully practiced in very ancient times in Egypt and China and probably other countries. The methods and appliances still used in China are quite simple and even crude, but are employed with great skill

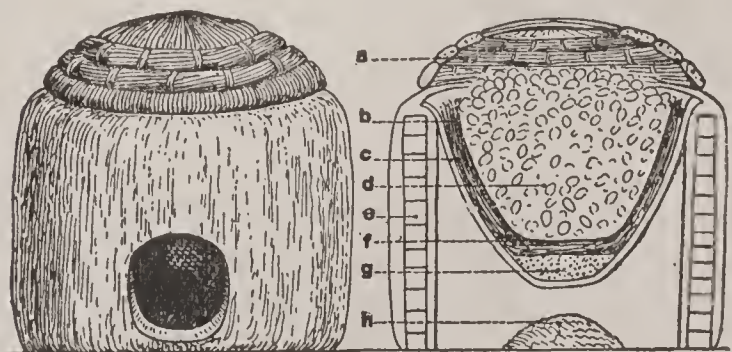

FIG. 1. CHINESE INCUBATOR.

a, cover; b, basket; c, jar; d, eggs; f, mat; g, ashes; h, charcoal.

and success. Réaumur, the eminent French physicist, used successfully a very crude form of incubator, consisting of a barrel heated with fermenting manure; but he encountered much criticism and opposition on the ground that chickens

so hatched "were unfit for human food because they tasted of the heating material, and that such chickens were absolutely sterile, and if the process were persisted in the race of fowls would necessarily die out." Similar prejudice against incubator chicks has persisted until within comparatively recent years; but artificial incubation has become so firmly established, and, the experimental stages having long been passed, the methods and appliances have been made so simple and practical, that it is considered absolutely necessary in the rearing of fowls in large numbers. There were, of course, many failures in the early attempts to devise a practical incubator, although in the first application for a patent on such a device in America, in 1847, some of the principles on which incubators should be constructed were stated with remarkable clearness and accuracy. Practical success with

FIG. 2. MODERN INCUBATOR.

modern incubators may be said to date from the Paris Exposition of 1877, at which Rouillier and Arnoult exhibited their "hydroincubator." "This incubator," says Beale, "has a very large tank, holding about 14 gallons of water, which is divided into three horizontal compartments, each communicating with the others by means of a few small holes. This tank is placed in a wooden case, and surrounded on all sides save the bottom (under which is the egg drawer) by an inch or more of felt, or some other nonconducting material, tightly pressed down. When this tank is filled with hot water, it is found that the water loses only from two to five degrees every 24 hours, according to the temperature of the place where it is kept. If the water in the top compartment only be drawn off, and that in the lower ones be left undisturbed, the former being again filled with boiling water, the heat from this will gradually affect the [temperature of the] lower body and prevent its going down. By repeating this every 12 hours the heat in the egg drawer can be maintained at almost any degree of temperature, with a scarcely perceptible variation." Notwithstanding the simplicity and efficiency of incubators of this type, attempts to devise a practical automatic, self-regulating incubator were persisted in until incubators of this kind have been brought to a high state of perfection and have been generally adopted. Incubators of the automatic type are of two main classes—hot-water and hot-air. The

advantages and disadvantages of the better makes of the two classes are very evenly balanced. There are hundreds of different makes of incubators on the market, many of them very efficient when properly handled. An average hatch of over 80 per cent of fertile eggs is secured by experienced poultrymen; but experience, skill, and careful attention to details are essential to such success.

The essentials of a good incubator are an egg chamber uniformly heated, preferably from above; a self-regulating source of heat, controlled by a thermoregulator, the actuating arm of which is situated in the egg chamber, and which is sensitive to 1° , or preferably $\frac{1}{2}^{\circ}$, above or below the desired temperature; and provisions for the ventilation of the egg chamber and for maintaining the proper degree of humidity therein. In addition to these, says Watson, "a convenient appliance for turning the eggs, positive in action, should accompany each incubator. This may be an extra tray that is to be placed bottom side up over the tray of eggs and held firmly in this position while both trays are turned, thus completely transferring the eggs from one tray to another without jar. The different machines have very different appliances for accomplishing this result." The object sought in artificial incubation is to imitate as closely as possible the conditions of heat, air, moisture, etc., which obtain in natural incubation under the hen. The temperature is carefully maintained at about 100° F. or only a few degrees above by placing the incubator in a basement, cellar, or other room where the temperature is stable, and by using a sensitive thermoregulator to control the heat applied; the moisture of the air in the egg chamber is carefully controlled, so that evaporation from the eggs proceeds as under normal conditions; and a sufficient amount of fresh air is supplied to the chamber to carry off the harmful gases which may accumulate and kill the incubating chick. The frequent turning of the eggs during the earlier stages of incubation is believed to have an analogy in the practice of the hen. However, it is not considered advisable to disturb the eggs after the eighteenth day, or to open the incubator thereafter until the hatch is complete and the chicks dry. As the success of incubation depends so largely upon maintaining the proper moisture conditions in the air of the egg chamber, some reliable means of controlling these conditions is essential. It has been proposed to use the normal loss of weight of eggs during incubation under brooding hens as a guide for this purpose. The West Virginia Agricultural Experiment Station found that the eggs which hatched under hens lost on an average 16.5 per cent of their weight in 19 days. The infertile eggs and those which did not hatch lost from 1 to 2 per cent less. The normal loss of weight of 100 eggs under natural incubation was found to be about 10 ounces in 6 days, 20 ounces in 12 days, and 31 ounces in 18 days. By weighing the eggs in the tray at the beginning of incubation, and at intervals during the process, the progress of evaporation (loss of weight) may be determined, and the ventilation and humidity so controlled as to make the loss of weight conform to the normal figures. Except in very dry climates there is said to be more danger of oversaturation than undersaturation of the air. A humidity of 45 per cent saturation is considered safe, as a rule.

If artificial incubation is practiced, some provision must be made for the care of the chicks when they leave the incubator. Various artificially heated devices known as brooders are used for this purpose. These may be very simple and cheap or elaborate and expensive. Almost all manufacturers of incubators also make brooders, and there is consequently a great variety of forms to choose from. The requisites of a good brooder are that it should be: (1) warm (90°–100° during the first week, with gradually lowering temperature thereafter), and economical of heat, which is preferably applied mainly from the sides or above; (2) clean, dry, and well ventilated; (3) simple in construction and so arranged that the chicks may be seen. The brooder should be so constructed that the chicks may go out for exercise and return at will.

Bibliography. The literature of the subject is voluminous. All up-to-date treatises on poultry raising explain the processes of artificial incubation and describe methods and appliances.

Bradshaw, *Artificial Incubation* (Sydney, Australia, 1909); G. B. Hawks, *Incubation and Brooding* (Clinton, Wis., 1909); J. W. Hurst, *Successful Incubation and Brooding* (London, 1911); P. Cooke, *Successful Incubation* (Los Angeles, 1911); *Incubators and Chicken Rearing* (New York, 1912); J. H. Robinson, *Principles and Practice of Poultry Culture* (Boston, 1912). See POULTRY.

INCUBATOR. A laboratory device used in the study of bacteria (q.v.) to provide a container in which a constant and definite temperature can be maintained, for the growth and development of bacterial cultures. It consists usually of a metal case having double walls, the space between being filled with water and often, as an additional means of insulation, a layer of felt. The temperature may be maintained at any desired point by a bunsen burner placed beneath, automatically controlled by some thermostatic device, and the condition of the contents may be examined from time to time through a door of heavy plate glass within an outer heavily insulated door. Several designs of incubators are in use in bacteriological laboratories, depending upon the particular line of investigation or the temperature desired. They are also called *brooding ovens* and *thermostats*, though the last term is commonly confined to devices intended to *control* temperature. Consult Abbott, *Principles of Bacteriology* (Philadelphia, 1909). See *Bacteriological Technique* under DISEASE, GERM THEORY OF.

INCUBUS (Lat., nightmare). 1. A sprite or demon, thought to be the cause of nightmare. In the Middle Ages it was very commonly believed that the incubus had carnal knowledge of women while asleep, and that from this connection deformed children sprang. The *succuba* was the corresponding female sprite, supposed to consort with sleeping men. Consult Tylor, *Primitive Culture* (London, 1903), and Lehmann, *Aberglaube und Zauberei* (Stuttgart, 1908). 2. Metaphorically, a burden upon mind or spirit. 3. A genus of parasitic hymenoptera of the family Braconidæ.

INCUMBENT. In English law, the holder of a benefice or ecclesiastical living. An incumbency is created by the appointment of a person who has taken holy orders to a particular living which is at the disposal of the person making the appointment. The power of appointing to a living is known as an advowson and is itself a species of real property (classed as an incorporeal hereditament) which may be alienated by the holder or transmitted by descent to his heirs. A living comprehends the parsonage, glebe, and other church lands, and carries with it the right to take tithes from the parish for the maintenance of the church and living and the support of the incumbent. The incumbent is deemed to be seised of the premises comprised within the living as of an estate for life, and may be deprived of it for illiteracy, or sexual or other gross immorality, as well as for heresy or conviction of felony. While not, like other tenants for life, strictly subject to the law of waste, his estate was nevertheless liable for dilapidations occurring during his incumbency. See ADVOWSON; BENEFICE; DILAPIDATION; TITHE; and consult Phillimore, *Ecclesiastical Law* (2d ed.).

INCUMBRANCE (OF. *encombrance*, from *encombrer*, to incumber, from *en*, in + *combrer*, to cumber, from *combre*, obstruction, from Lat. *cumulus*, heap). A generic term, including every kind of charge or burden upon land; every right to or interest in land, whether claimed as security for a debt or as an independent estate, which may be held by any one other than the real owner. Upon a conveyance of the land so charged, a real or common-law incumbrance runs with it, i.e., remains a burden upon it even in the hands of a purchaser or devisee, while an equitable incumbrance binds the land only in the hands of one who takes it without paying value therefor or a purchaser with notice. In the hands of an innocent purchaser for value the land is discharged from the burden and may thereafter be conveyed free from the incumbrance. The most frequent examples of legal (including statutory) incumbrances are afforded by judgments, leases, mechanics' liens, mortgages, easements, and similar burdens; of equitable incumbrances, trusts, equitable mortgages, and restrictive covenants.

A covenant against incumbrances is one of the usual "covenants for title" contained in a conveyance of land. As usually construed, it amounts to a contract of indemnity, securing the grantee against loss by reason of any incumbrance which may exist upon the land at the time of the conveyance. See COVENANT.

INCUNABULA (Lat., cradles). A name applied to printed books published before 1500. Specimens of such works are generally rare, and sought after for their historical bearing on the art of printing and, as in first editions of Greek and Latin classics, for their scientific value. The number of incunabula is variously estimated, but is probably upward of 20,000.

IND. A poetical form of India.

INDE'CENCY. In law, a general term for conduct of a lewd or obscene character committed in public. The term as commonly employed in statutes comprehends (1) the public exposure of the person, as by bathing without proper covering in a public place; (2) publishing or circulating written or printed matter or pictures of an obscene, lewd, or indecent character; and (3) sending such matter through the mails. The last of these is an indictable offense under the Revised Statutes of the United States cognizable by the Federal courts. The others are statutory offenses, classed as misdemeanors, in the several States. All are punishable by fine or imprisonment. In the absence of statute any indecent exhibition in public is indictable at common law as a public nuisance, if calculated to cause scandal, shock modesty, or corrupt morals. See IMMORALITY; OBSCENE.

INDEM'NITY (from Fr. *indemnité*, from Lat. *indemnitas*, security from loss or damage, from *indemnis*, unhurt, from *in-*, not + *damnum*, loss). An engagement, either express or implied, to make good a loss or expenditure. It is not a guaranty within the fourth section of the Statute of Frauds (q.v.), which requires a special promise to answer for the debt or default of another to be in writing. When the indemni-

tor performs his engagement, he may in so doing pay the debt of another, but the discharge of such debt is not what he promises to do; it is a mere accident of the situation. At times the engagement takes the form of a bond or other writing, but more frequently it is implied from the acts of the parties. Whenever a person asks another to become surety for him, the law implies the promise by the principal debtor to indemnify the surety for any loss that he may sustain by acceding to the request. So, if one joint debtor pays the whole debt, he can recover from his codebtor the latter's share, as where two or more persons become cosureties, there is an implied engagement on the part of each to indemnify the other to the extent of his share of the common loss. Fire and marine insurance policies are contracts of indemnity, the obligation of the insurer being not to pay the amount of the policy in any event, but only to save the insured harmless from loss in the event insured against. See INSURANCE. Consult the authorities referred to under GUARANTY; SURETYSHIP.

INDENT'ED (from *indent*, OF., Fr. *endenter*, It., ML. *indentare*, to notch, from Lat. *in*, in + *dens*, tooth). In heraldry, one of the partition lines of the shield notched similarly to dancette (q.v.), but with the notches much smaller and not limited in number. See HERALDRY.

INDEN'TURE. In English and American law, a deed executed by two or more parties having diverse interests, as by grantor and grantee of a deed of conveyance, obligor, obligee, and surety to a bond, etc. Most deeds, involving or creating an obligation by only one party or by several persons uniting in an identical obligation, or conveying an estate in which one or more persons have interests—as where husband and wife join in a conveyance of the husband's land—are not indentures but deeds poll. It is only where the other party, the grantee or obligee, assumes an independent obligation that an indenture is required. The name is derived from the fact that such deeds were formerly written in duplicate or as separate obligations on the same sheet of paper or parchment, and then torn or cut apart in a waving or indented line, so that their character as parts or duplicates of the same instrument could afterward be established by fitting them together. The single deed, not an indenture, was known as a deed poll because its edge was polled (shaved) or smoothly cut. Though the forms of the two classes of deeds are now identical, the fundamental distinction between them is still strictly observed. It is still the law that the grantee or obligee of a deed which purports to bind him to some payment or other act is not bound unless the deed is in the technical sense an indenture, i.e., is executed by him as well as by the grantor or obligor. See DEED.

IN'DEPEND'ENCE. A city and the county seat of Buchanan Co., Iowa, on the Wapsipicon River, 39 miles north of Cedar Rapids, on the Illinois Central and the Rock Island railroads (Map: Iowa, F 2). It is in a farming and dairying region and has manufactures of gas engines and culverts. The city contains the State Insane Hospital for Northeastern Iowa, a fine high-school building, and a public library. The water works and electric-light plant are owned by the city. Pop., 1900, 3656; 1910, 3517.

INDEPENDENCE. A city and the county seat of Montgomery Co., Kans., on the Verdigris River, 165 miles southwest of Kansas City,

Mo., on the Atchison, Topeka, and Santa Fe and the Missouri Pacific railroads (Map: Kansas, G 8). It has a public library, two hospitals, Elks Home, a good system of parks, a fine courthouse and county high-school buildings. The city is a distributing point for an agricultural region, is situated in the centre of vast gas and oil fields, and has flour mills, planing mills, cracker factories, cotton mills, paper mills, sugar mills, a window-glass factory, vitrified-brick works, Portland-cement plants, an asphalt plant, a rubber refinery, machine shops, and ironworks. Natural-gas and oil wells are numerous in the vicinity. Independence has adopted the commission form of government and has municipally owned water works. Pop., 1900, 4851; 1910, 10,480; 1914 (U. S. est.), 13,296.

INDEPENDENCE. A city and the county seat of Jackson Co., Mo., 10 miles east of Kansas City, on the Chicago and Alton, the Missouri Pacific, and the Kansas City Southern railroads (Map: Missouri, B 2). It is rapidly developing into a residential suburb of Kansas City. St. Mary's Academy is a private school situated here, and there are a fine Federal building, a sanitarium, and a public library. The industrial establishments include a large flouring mill, a planing mill, a foundry, an oil refinery, scale works, and manufactories of brooms, silos, Portland cement, insect powder, gas engines, drop forges, brick, and overalls. Fruit growing is carried on extensively in the surrounding territory, and there is a canning factory in the city. It is also a stock-breeding centre. Independence was settled and incorporated in 1827 and was organized as a third-class city in 1889, the charter of that year still being in operation and providing for a mayor, elected biennially, and a unicameral council. The electric-light plant is owned by the city. Pop., 1890, 6380; 1900, 6974; 1910, 9859; 1914 (U. S. est.), 11,088. Independence was occupied in 1831-38 by the Mormons, who regard the city as the "Zion" where the chief Mormon temple will be ultimately erected on the famous "Temple lot." About 2000 members of the Reorganized Church of Jesus Christ of Latter-Day Saints, which disclaims belief in polygamy, now live in this vicinity. In 1849-50 Independence was a rendezvous and a starting point for emigrants to California, two of the great trails leading from here westward. In the summer of 1862, during the Civil War, a Federal garrison of 312 under Lieutenant Colonel Buel was captured here by a superior Confederate force under Colonel Hughes, and here, on Oct. 22, 1864, General Pleasanton attacked and defeated the rear of General Price's Confederate army.

INDEPENDENCE. A city in Polk Co., Oreg., on the Willamette River, 12 miles southwest of Salem, on the Southern Pacific and the Independence and Monmouth railroads (Map: Oregon, B 3). It is the hop centre of Oregon and carries on a trade in goats, wheat, barley, and oats. There are saw and flour mills, a creamery, and a foundry and machine shop. Pop., 1910, 1160.

INDEPENDENCE, DECLARATION OF. See DECLARATION OF INDEPENDENCE.

INDEPENDENCE DAY. July Fourth, the United States national holiday.

INDEPENDENCE HALL. An unpretentious brick building in Chestnut Street, Philadelphia, erected in 1729-34 and intimately connected with the birth of the nation. In it the Continental Congress met, Washington was made

commander in chief of the American army in 1775, and the Declaration of Independence was adopted on July 4, 1776, and four days later read to the people assembled in the street. It is now a museum of Revolutionary and historical relics. See Plate of PHILADELPHIA.

INDEPENDENCIA, ên'dâ-pân-dân'syâ, or **FRAY BENTOS,** frî bân'tôs. A town of Uruguay, the capital of the Department of Río Negro, situated on the Uruguay River (Map: Argentina, H 4). It was founded in 1859 and is of modern construction, with wide streets. The principal edifices are the hospital, school, and court buildings. It is an important river port, being accessible to large ocean-going steamers. It is surrounded by a region devoted to stock raising and is an important centre of the meat-packing industry. The laboratories and stockyards of the Liebig's Extract of Meat Company, which are equipped with the most scientific and hygienic appliances, are located here. Its exports consist of meat products. Pop., 10,000.

INDEPENDENT CATHOLIC CHURCH IN THE UNITED STATES, THE (POLISH), known also as OLD CATHOLICS. An independent church organized among Polish immigrants in Chicago, with the hope of staying the progress of agnosticism among citizens of Polish descent who had become disaffected towards the Roman Catholic church. Its founder, the Rev. Anthony Kozlowski, attended one of the Old Catholic conferences in Europe and was there consecrated Bishop. A steady growth is affirmed of the church, both in the consciousness of actual reformatory tendencies and in numbers of adherents and strength of organization. It has established a hospital, a dispensary, an orphanage, and a Home for the Aged in Chicago, and has acquired a considerable property; primary, a grammar, high, and industrial schools have been established. All these schemes are connected and form integral parts of a central philanthropic institution, called St. Anthony's Home. In October, 1902, Bishop Kozlowski addressed a letter to the House of Bishops of the Protestant Episcopal Church in the United States asking for intercommunion. The subject was referred to a committee for consideration, but no definite action was taken. The estimates of members in the church vary. A careful computation gave it, in 1913, 32 ministers, 30 churches, and 16,000 communicants.

INDEPENDENT CHURCHES OF CHRIST IN CHRISTIAN UNION. See CHRISTIAN UNION, INDEPENDENT CHURCHES OF CHRIST IN.

INDEPENDENT METHODIST CHURCH. See METHODISM.

INDEPENDENTS. Such bodies of Christians as claim the right of each individual church to administer its own affairs, free from ecclesiastical or civil authority. In history the name has been usually applied to the Congregationalists of Great Britain, who differ from the Congregationalists of America and other countries in laying less emphasis on the fellowship of the local churches. The first Independent church was organized in London about 1555, and the Brownists (q.v.), or Separatists, as the Independents were first called, steadily increased in numbers in spite of persecutions and emigration. They were prominent in the Westminster Assembly. See CONGREGATIONALISM.

INDEPENDENT TREASURY. The name given to the system of keeping and disbursing

the public money without the intermediary action of banks, State or national, adopted by the United States in 1846. The Act of Aug. 6, 1846, provided, in brief, that the public revenues should be held, until actually paid out, in the vaults of the Treasury at Washington or in the several subtreasuries in the larger cities created by the act. Prior to this date the government receipts had been deposited in banks. The first Bank of the United States (see BANK, BANKING) was established in 1791, largely with the view of facilitating the fiscal operations of the government. In it or its branches were deposited the government funds, and from it were obtained temporary loans in anticipation of the revenue. When the bank charter expired, in 1811, the government funds were deposited in the State banks throughout the country. With the subsequent suspension of specie payments, in 1814, the government not only suffered with other creditors, but was seriously embarrassed by the fact that there was no standard national currency. In 1816 the second bank of the United States was chartered for a period of 20 years, and for the greater part of its existence it acted as the fiscal agent of the government. Its effort, beginning in 1829, to obtain a renewal of its charter led to a violent political contest, in which the opponents of the bank, led by President Jackson, won the victory. Though the charter did not expire until 1836, the President in 1833 ordered that no further deposits of government funds be made in the bank, and that the funds of the government be gradually withdrawn. This order for the "removal of the deposits" was made on the alleged ground that the bank was unsound and that the public money was in danger.

Beginning October, 1833, the government funds were deposited in State banks. Contracts were entered into between the Secretary of the Treasury and the several banks fixing the conditions upon which deposits were to be received. The refusal to recharter the Bank of the United States, together with the deposit of government funds in the State banks, led to an ominous expansion of these institutions. A speculative era, marked especially by enormous sales of public lands, and the deposit or distribution of the government surplus with the States (1837), now set in, which culminated in the panic of 1837. The government funds were tied up in the nonspecie-paying banks, and Congress was called together in September, 1837, to devise measures of relief. President Van Buren favored a complete separation of the government from the banks, the establishment of an independent treasury, and a requirement that all debts due the government be paid in specie. It was the latter provision which caused the defeat of the measure, as it appeared to the friends of the banks as a discrimination against the bank note. Towards the close of Van Buren's administration (June 30, 1840) the measure for which the President had fought valiantly was enacted into law, but not without the concession that in the first year of its operation only one-fourth of the government receipts need be in specie, a further fourth being added each year until the whole should be so payable. The victory was dearly bought, for the party went down to defeat at the polls in November. The new administration promptly repealed the law (Aug. 13, 1841), but in the fruitless controversy with President Tyler over the Bank Law failed to provide any substitute

for it. Public officials were left to their own devices in the custody of the public funds, and it was not until a new political revolution had occurred that the independent treasury system was finally established by the Act of Aug. 6, 1846.

The spirit of the measure was an absolute divorce of the Treasury from the banks. The government was henceforth to keep its own funds, and to recognize only money issued by Federal authority, specie and Treasury notes, in the government operations. The vaults and safes provided for keeping the money of the government at Washington, and at such other places of deposit as were fixed by the law, were declared to constitute the Treasury of the United States. The Treasurer of the United States and assistant treasurers, and all other officials, were required to keep safely, without lending, using, depositing in banks, or exchanging for other funds, except as allowed by the act, all public money received by them or otherwise in their custody, until the same was ordered by proper authority to be transferred or paid out. In the early experience of the system some embarrassment was created by the failure to provide at once the necessary protection for the money in all the places where it was kept. But in general the system has worked well, and loss by theft or defalcation has been slight compared to the loss suffered through dealings with unsound banks in earlier years.

The isolation of the Treasury contemplated by the act soon proved illusory, and little by little inroads have been made upon the principle. The spectacle of the Treasury coming to the "relief of the money market" has become familiar. The "relief" thus afforded consists of placing in circulation money which the law accumulates in the hands of the government. Operating with a surplus of revenue over expenditure, the government balances may and do grow to such a size as materially to affect the volume of money in circulation. This, then, is a Treasury reserve which may be unloosed when a stringency in the money market occurs, and the fact that the Secretary of the Treasury is called upon for such relief is evidence of the futility of attempting utterly to separate the government's operations from all business affairs. The independent Treasury was not 10 years old before the possible dangers of an accumulation of funds were perceived, and in 1853 large redemptions of bonds were made to avoid them. In the panic of 1857 the government escaped unscathed, and this added to the popularity of the independent treasury system.)

[But with the fiscal necessities of the Civil War the principle of isolation was broken down. The banks became essential to the support of the government. The Secretary of the Treasury secured their aid in making the first loans of the war. He would not recognize their notes in the government operations, but soon brought forward his plans for transforming the banks into national institutions under Federal control, with power to issue notes of a kind which could be recognized by the government. When the national banking system was organized, in 1863, the banks were allowed to become depositories of the public money, except the receipts from customs, under regulations established by the Treasury Department. Customs receipts, being in specie, were excluded from the funds capable of

being deposited, since banks were not then paying specie. These deposits in the banks are secured by United States bonds deposited with the Treasury Department. The extent to which the banks have been used as places of deposit has varied with the state of the Treasury and the nature of its operations. When loans have been made, the money has been paid in through banks and allowed to remain there until expended. (In the refunding operations of 1879 the banks sold nearly \$400,000,000 worth of bonds and held at one time (May, 1879) as much as \$279,544,645. On June 30, 1914, the deposits in national banks amounted to \$93,388,666, as compared with \$324,852,056 held in subtreasuries.)

The idea of the Independent Treasury Law was that the banks should not interfere with the Treasury, while in its practical administration, with the enormous growth of government revenue, the problem has been for the Treasury so to conduct its operations that it shall interfere as little as possible with the banks and the ordinary course of business. In principle the government pays cash, demands cash, and keeps its funds in a strong box—a method of conducting business entirely at variance with the usual practice in mercantile life. The income and outgo of the government have not, moreover, the regularity which frequently characterizes mercantile affairs. Money accumulating in the Treasury in anticipation of future payments is withdrawn from circulation. Such withdrawal may accentuate a stringency, while the subsequent payment may aggravate a plethora. As an offset to these disadvantages of the system, it has been contended that it equalizes conditions by permitting the Secretary of the Treasury to come to the "relief" of the money market. This is a questionable advantage. The relief is contingent upon a plethoric Treasury; it is, moreover, largely in the discretion of one man, the Secretary of the Treasury, whose impulsiveness or conservatism may materially affect the relief afforded. Finally, when determined upon, it is not always as speedy as desired. The requirement that government deposits should be secured by United States bonds worked sometimes serious hardship in time of stringency, since such bonds commanded a high price and were not always immediately attainable. By an order of the Secretary, dated Oct. 4, 1902, banks were permitted, under certain conditions, to substitute specified State and municipal bonds for the national bonds hitherto required. It was hoped that in this way the Treasury would be able to give a larger measure of relief than formerly. In the Banking Act of Dec. 23, 1913, was incorporated a provision by the terms of which the independent Treasury may, in the discretion of the Secretary of the Treasury, be practically abolished. Moneys held in the general fund of the Treasury, with the exception of funds for the redemption of national bank notes and for the redemption of Federal reserve notes, may be deposited in the Federal reserve banks; and these banks may be required to act as fiscal agents of the United States. No deposit of securities with the Treasury against moneys thus deposited with the Federal reserve banks is required by the law. The Secretary of the Treasury may deposit funds in member banks also. Consult: David Kinley, *Independent Treasury System of the United States and its Relations to the Banks of the Country* (Washington, 1910); M. S. Wildman,

"Independent Treasury and the Banks," in *American Academy of Political and Social Science, Annals* (Philadelphia, 1910); McLaughlin and Hart (eds.), *Cyclopedia of American Government*, vol. ii (New York, 1914). See FINANCE; BANK, BANKING.

INDERAB. See ANDERAB.

IN'DESTRUCT'IBIL'ITY OF MATTER. See MATTER.

IN'DETER'MINATE COEFFICIENT. See COEFFICIENT.

INDETERMINATE EQUATION. See EQUATION.

INDETERMINATE MULTIPLIERS. The use of indeterminate multipliers is well illustrated by Bézout's method of elimination in solving systems of simultaneous equations. For example, let it be required to solve the system of equations,

$$\begin{aligned} (1) \quad & 4x - 5y + 2z = 0. \\ (2) \quad & 3x + 2y + 7z = 28. \\ (3) \quad & x - y + 2z = 5. \end{aligned}$$

Multiplying the members of the first equation by λ and those of the second equation by λ' and adding to those of the third equation, we obtain the equivalent system,

$$\begin{aligned} (4) \quad & 4x - 5y + 2z = 0. \\ (5) \quad & 3x + 2y + 7z = 28. \\ (6) \quad & (4\lambda + 3\lambda' + 1)x - (5\lambda - 2\lambda' + 1)y \\ & \quad + (2\lambda + 7\lambda' + 2)z = 28\lambda' + 5. \end{aligned}$$

Selecting for λ, λ' values such that

$$\begin{aligned} (7) \quad & 5\lambda - 2\lambda' + 1 = 0, \\ (8) \quad & 2\lambda + 7\lambda' + 2 = 0, \end{aligned}$$

we find that $\lambda = -\frac{11}{39}, \lambda' = -\frac{8}{39}$, and hence, from equation (6), $x = 1$. Choosing next λ, λ' such that

$$\begin{aligned} (9) \quad & 4\lambda + 3\lambda' + 1 = 0, \\ (10) \quad & 2\lambda + 7\lambda' + 2 = 0, \end{aligned}$$

we find that $\lambda = -\frac{1}{2}, \lambda' = -\frac{3}{11}$, and hence, from equation (6), $y = 2$. It may similarly be found that $z = 3$.

INDETERMINATE PROBLEMS. See DIOPHANTINE ANALYSIS.

INDETERMINATE SENTENCE. A sentence of a person convicted of crime to an indefinite period of imprisonment. Up to a very recent date the policy of the criminal law has been to prescribe for each crime committed a definite period of imprisonment or to leave it to the judge under whom the wrongdoer was convicted to fix the period within limits prescribed by statute. Under laws providing for the indeterminate sentence the judge no longer fixes the period of detention, but sentences the prisoners for an indeterminate time between limits prescribed by him within the limits fixed by law, as, e.g., for a term of not less than three nor more than 10 years.

The indeterminate sentence represents a new principle in penology, based on the view that the object of imprisonment is not punishment for the crime committed, but the reformation of the offender and his restoration to society as soon as he has demonstrated his fitness to lead a free and responsible life. This view is based on the principle which is slowly coming to dominate the thought of civilized society, that the sole aim of a rational penal system is the protection of society and not vengeance or retributive punishment. This conception involves the corollaries that no wrongdoer should be imprisoned longer than is necessary for the protection of the community, nor be released until he has

by his course of life demonstrated that he can safely be rehabilitated as a free member of the community. In order to make the indeterminate sentence an effective means of attaining these ends it is obviously necessary, first, that prison administration shall be such as to give the convict opportunity to demonstrate his fitness or unfitness for release, and, second, in the case of wrongdoers who have formed criminal habits, that they shall be enabled to work out their salvation under reformatory conditions. Unfortunately neither of these conditions is realized in the present prison system, with the consequence that the indeterminate sentence has thus far failed to meet the expectations with which it was introduced. It has not, however, proved a complete failure, even under present conditions, and, having secured a foothold in the penal system, it furnishes a powerful incentive for the reformation of that system. In the meantime, coupled with the principle of conditional release and supervision of the discharged convict under probation, it has proved its value even in the case of inmates of the ordinary prisons, though it has naturally attained its greatest success in the case of young persons committed to institutions of a pronounced reformatory character. The system was first employed in connection with the celebrated Elmira Reformatory of New York in 1876, but it was not till 1889 that it was applied in a cautious, tentative way to commitments to the State prisons. Since that date it has gradually spread to other States and was in 1914 in force in 22 of them. It has not, however, been adopted in European countries. Foreign penologists approve it "in principle," but, except in rare instances, deem it inapplicable in their own countries for the reasons (1) that the prevailing conceptions of guilt and punishment, which are still largely based on the vindictive theory, are incompatible with the principle of the indeterminate sentence; (2) that for its successful working an individualized treatment of the offender is necessary, and that this is in practice, under present conditions, impossible to obtain; and (3) that the difficulties in the way of securing a proper and impartial administration of the function of discharging prisoners are too great to warrant the experiment. It is likely that it will be necessary for America, through the reform of her prison system, to make a more satisfying demonstration of the value of the indeterminate sentence in order to secure its acceptance in foreign countries.

Nowhere, as yet, has the principle of the indeterminate sentence been carried to its logical conclusion—of a sentence unlimited in duration, with no maximum or minimum limits imposed by law or by judicial discretion. This is the goal of the more advanced penologists and prison reformers, and it is evident that that system cannot fully accomplish the purposes which it is designed to effect without such extension; but it is not likely to commend itself to legislatures or to the public except as a part of a sweeping measure of prison reform. See IMPRISONMENT; SENTENCE; PUNISHMENT; PRISONS; PENOLOGY.

INDETERMINISM. See INDIFFERENTISM.

INDEX (Lat., indicator). An alphabetical list of names, topics, words, and the like, treated in a book, with indications of the passages in which they occur. The index usually comes at the end of the book; the analytical table of con-

tents is normally placed at the beginning, except in the case of French, Italian, and Spanish books.

As books began to multiply after the invention of printing, the need of indexes was felt, and their value was recognized. Many books of the sixteenth and seventeenth centuries have well-made indexes of such fullness and value as put to shame the farcical substitutes issued by many modern publishers when they give any at all. Numerous authorities might be cited as to the worth of a good index in enhancing the value and usefulness of a good book. Long and loud have been and are the complaints against the publication of books of knowledge without indexes, emphasizing Carlyle's growl against "books born of Chaos, which want all things, even an index." Lord Campbell of England, and Horace Binney of Philadelphia, each advocated withholding copyright from any author who published a book without an index. "I have come," says the latter, "to regard a good book as curtailed of half its value if it has not a pretty full index. It is almost impossible, without such a guide, to reproduce on demand the most striking thoughts or facts the book may contain, whether for citation or further consideration." The value still put by many scholars on the old Delphin edition of the classics is based solely on its copious indexes. An incalculable amount of time has been lost to students and scholars in fruitless search for much wanted bits of information buried from sight in unindexed pages of books of value and authority. What the seeker demands is a complete index, and it is essential that this should not only refer to the letter, but should also embody the spirit of the work indexed. To this end the indexer must possess intelligence, quickness of perception, the power of analysis and condensation, and the ability to put himself en rapport with the author and his work, of the subject of which he must himself have a very considerable knowledge. Any index is valuable in proportion as it is concise in expression and accurately exhaustive, not only of the broader statements of fact or of opinion, but also of the small points of detail, the incidental and illustrative references contained in the book or volumes to which it aims to be the guide or key.

Minuteness of indexing must vary according to character and uses of books indexed. Before beginning to make entries, an indexer should read the entire book, usually in the "page" proof. He may then indicate by underlining words in the text or writing chosen headings in the margins against the topics to be indexed. Before entering on the actual work of preparing entries he must determine the general character of the index he is to make. For a book may require a general index of quite obvious subjects treated in it, as Bryce's *American Commonwealth*; a name or word index, as for atlases, botanies, genealogies, etc.; an index of ideas more or less difficult to reduce to alphabetic key words, as Emerson's *Essays*, Holmes's *Autocrat*. The indexer cannot be too careful in choosing headings or catchwords, which must not only represent the subject treated, but also be such as would occur to the seeker who has not the text before him. In form these should approach the subject headings in a good library catalogue, and the indexer should in the main be governed by the well-known principles

of subject cataloguing. Entries on the same subject should not be scattered among various synonymous headings. Each subject must be indexed every time it occurs, and related matter should be indicated by cross references. If entries under headings are few, it is sometimes advisable to repeat them under each heading needed to make reference easy and complete; if many, a single heading may be chosen for entries and cross references made from other possible headings. Entries should invariably be concise, definite, and specific. Scattered page references should not be massed under a heading without clew to the character of the information given. Where matter relating to a single subject is given consecutively and is brief, a single reference may suffice, but if extended it should be analyzed under headings. In a book on municipal affairs, e.g., the seeker must not be forced to examine several pages on the mayor of New York to ascertain his salary. Specific rather than general headings should be chosen; e.g., entry should be under potatoes, not tubers, sparrows rather than birds, cross reference being made only when necessary. In general, indexing under the main subject of the book should be avoided. This brings too great a mass together and renders the heading practically useless. The excellent index of Fiske's *American Revolution* has but seven entries under "Revolution." A work in several volumes should have a general index to all in the last one. Separate indexes to each volume (except for serials) are seldom afforded.

Each entry should be written on a separate slip, and the slips alphabetized in trays. Library supply houses make slips 5×7.5 or 7.5×12.5 centimeters, and trays to fit. Careful, final editing of entries is necessary to assure consistency, proper cross reference, clear punctuation, and absolute accuracy. Words alike in spelling but different in meaning should be repeated as headings. Entries like the following are to be avoided:

Lead, copper
metallurgy
kindly light
poisoning

Entries should be arranged in alphabetic order, following the rules for arrangement given in Cutter's *Rules for a Dictionary Catalogue*, or some other standard authority. When verified and edited, slips may be sent to the printer either pasted in order on large sheets, or numbered, punched, and tied together, or the entries may be copied on sheets. Great care is essential in verifying both the original entries and the printer's work, an index error being serious.

Bibliography. A paper on "Indexing," by J. B. Nichols, in *Library Journal* (New York, October, 1892), gives very excellent directions and suggestions for would-be indexers. H. B. Wheatley's *How to Make an Index* (London, 1902) is entertaining reading and valuable in suggestion; it contains the rules of the English Index Society. More recent treatises are: Petherbridge, *Technique of Indexing* (ib., 1904); Clarke, *Manual of Practical Indexing* (ib., 1905); Wheeler, *Indexing: Rules and Examples* (Albany, 1905; rev. ed., 1913); Kaiser, *Systematic Indexing* (New York, 1911).

INDEX, IN MATHEMATICS. See EXPONENT.

INDEX (more fully INDEX LIBRORUM PROHIBITORUM). A catalogue published by papal authority in the Roman Catholic church of

books the reading of which is prohibited to members of that church, whether on doctrinal, moral, or religious grounds. A natural consequence of the claim of the church to authority in matters of religion is the right or the duty of watching over the faith of its members, and of guarding it against every danger of corruption from books believed to be injurious to faith or to morality. The earliest recorded exercise of this restrictive authority is the prohibition of the *Thalia* of Arius; and a council of Carthage, in the year 398, issued, even for bishops, a similar prohibition of Gentile books, although it permitted to them the reading of the works of heretics. The earliest example of a prohibitory catalogue is found in the decree of a council held at Rome (494), under Pope Gelasius, which, having enumerated the canonical books of Scripture and other approved works, recites also the apocryphal books, together with a long list of heretical authors, whose writings it prohibits. The mediæval popes and councils pursued the same course as to the heterodox or dangerous writings of their respective periods, and the multiplication of such books after the invention of printing led to a more stringent as well as more systematic procedure. Henry VIII of England published a list of prohibited books in 1526, and a larger one (containing 85 titles) in 1529, in which year Charles V published for the Netherlands his most noteworthy edict against dangerous reading, with a long list, which was included in that issued by the university press of Louvain in 1546 and again in 1550. Similar lists appeared by authority at Venice, Paris, and Cologne, and Paul IV issued in 1557 and 1559 what may be regarded as properly the first *Roman Index*. One of the gravest undertakings of the Council of Trent was a complete and authoritative enumeration of all those books the use of which it was expedient to prohibit to the faithful. A committee was appointed for the purpose and had made great progress in the work; but it was found impossible to bring the examination of the books to an end before the close of the council, and all the papers of the committee were handed over by the council to the Pope. When the work was completed, the result, known as the *Tridentine Index*, was issued with the bull *Dominici Gregis Custodiam*, by Pius IV in 1564. From this time the burning of dangerous books fell into disuse, and the church contented herself with warning her children against their use, under penalty of purely ecclesiastical censure. Further additions and certain modifications of the rules of this *Index* were made by Sixtus V, Clement VIII, Alexander VII, and Benedictine XIV. It was republished in 1595, and, with the addition of such books as from time to time it was deemed expedient to prohibit, in several subsequent editions, the most remarkable of which are those of Brasichelli (Rome, 1607); Quiroga, *Index Librorum Expurgandorum* (Salamanca, 1601); and Sotomayor, *Novissimus Index* (Madrid, 1648). In the intervals between the editions the decrees which make further additions to the *Index* are published at Rome and circulated in the various countries. The latest edition of the *Index* is by Leo XIII (Rome, 1900; reprinted under Pius X in 1904 and in 1907).

The prohibitions of the *Roman Index* are of two classes, either absolute and total or partial and provisional, until the books shall have been

corrected. The edition of Quiroga, mentioned above, gives a list of the latter class, known as *Index Expurgatorius*. The ground of the prohibition may be either the authorship of the work or its subject, or both together. Under the first head are prohibited all the writings of *heresiarchs*—i.e., the first founders of heresies—no matter what may be the subject. Under the second head are prohibited all books confessedly immoral, and all books on magic, necromancy, etc. Under the third are prohibited all books of heretical authorship treating on doctrinal subjects; all versions of the Bible by heretical authors; and all books, no matter by whom written, which contain statements, doctrines, or insinuations prejudicial to the Catholic religion. Formerly only books were examined against which complaint had been made, but in 1908 Pius X extended the care of the congregation to all published books that are likely to do harm. The preparation of the *Index*, in the first instance, was committed to the care of the Congregation of the Inquisition in Rome; but a special Congregation of the Index was established by Pius V and more fully organized by Sixtus V. This congregation consists of a prefect (who is always a cardinal), of consulters, and of examiners of books (*qualificatores*). Its proceedings are governed by rules which have been authoritatively laid down by several popes, especially by Benedict XIV, in a constitution issued July 10, 1753, which is the best and most authentic exposition of a subject on which much misconception exists. The edition of the *Index* by Brasichelli was reprinted, with an English preface, by Richard Gibbings (Dublin, 1837). By far the most elaborate study of its contents is by F. H. Reusch, *Der Index der verbotenen Bücher* (2 vols., Bonn, 1883-85). The same author also reprinted all accessible indexes of the sixteenth century in the *Bibliothek des Stuttgarter literarischen Vereins*, vol. clxxvi (Stuttgart, 1886). Consult Haven, *Censorship of the Church of Rome* (New York, 1907), and Hurley, *Commentary on the Present Index Legislation* (Dublin, 1908).

INDEX, CEPHALIC, CRANIAL, PELVIC, ETC.

A term employed by anthropologists to mark the proportions of certain related parts of the human body, or skeleton, in order to distinguish racial varieties in mankind. An important one, and easy to obtain, is the ratio of the width of the head to the length, called cranial index for the skull and cephalic index for the living subject. To avoid the decimal point at the beginning of the index, the smaller measure of any two concerned in an index is multiplied by 100 and divided by the larger one. For the index of the skull or that of the head the

$$\text{formula would be thus: } \frac{\text{Width} \times 100}{\text{Length}} = \text{I.}$$

The extreme length of the skull is between the glabella (the protruding ridge of the forehead between and just above the orbits) and the extremum occiput (the most prominent portion of the occiput), and the width is the greatest breadth, wherever that may be. All appliances necessary for these measurements, and for all direct ones of the head or skull, are a set of calipers, a sliding scale, and a tape measure. The metric system has been adopted for all anthropological measurements. For the convenience of anthropologists, printed index tables have been compiled, from which indices may

be read off without loss of time. The instruments for measuring other parts of the body, or skeleton, are of great variety and constantly undergoing improvements.

Three terms are applied by anthropologists to heads, according to these measures. Those having cephalic indices with a ratio below 77 are called dolichocephalic, those between 77 and 81.9 are mesocephalic, and those above 82 are brachycephalic. For crania, or skulls of the dead, the indices are about two points lower. In the numerous cases where a finer subdivision is necessary a quinary method of nomenclature is followed—the Germans adopting a series called the Frankfort Agreement; the French, the scheme of Broca, modified by Deniker, as follows:

	Cranial index	Cephalic index
Dolichocephals.....	below 75	below 77
Subdolichocephals.....	75 - 77.6	77 - 79.6
Mesocephals.....	77.7-79.9	79.7-81.9
Subbrachycephals.....	80 - 83.2	82 - 85.2
Brachycephals.....	83.3-84.9	85.3-86.9
Hyperbrachycephals....	85 and upward	87 upward

Dolichocephalic skulls of exceptional length have reached an index of 58, the lowest limit, while brachycephalic examples have gone as high as 90 or even 100.

Before proceeding to other indices it should be stated that the cranial and cephalic indices just described are far from being a perfect guide to the classification of mankind, for the subdivisions of the human species have no governing rule and are not subspecies, but separate varieties and mixtures, as with domestic animals.

Again, the ratio between the width and the length of the skull does not give complete information as to its shape. The measurements therefore lead to uncertain conclusions, since precisely the same figures would be obtained from crania or heads of widely different cross section, so that one having an almost rectangular shape, an oval with a narrow end far in front, and a long ellipse would lead to the same index. Unless a large number of skulls among the same people are measured and give something like a uniform result, the measurements are an unsafe guide. Very little good arises from adding a small number of indices and dividing by a number of observations. The average result might be a number to which not a single head in the whole series measured would correspond. It is customary therefore to tabulate results by coördinates. Frequently, when such a plan is pursued, there arise several apexes, as in Italy, the higher number representing the brachycephalic northern Italians with Celtic blood in their veins, and the lower number the southern long-headed Mediterranean type.

The cranial and cephalic indices are not precisely coördinated with purely descriptive characteristics of the human body. It cannot be said that any one of the subspecies of man is either dolichocephalic or brachycephalic, but tendencies towards one or the other exist, as the following table of cephalic indices shows:

Caroline Islanders (black).....	69.4
Kashmirians (yellow white).....	72.2
Bakongo (black).....	72.5
Hindus (white, mixed).....	72.8

Karaya Indians, South America (red).....	73.0
Australians (straight-haired blacks).....	74.2
Norwegians (blonds).....	76.0
Corsicans (white).....	76.6
Spaniards of Valencia.....	76.8
British Isles.....	77-79
Parsis of Bombay (white).....	82.0
Koreans (yellow).....	82.6
Malays (brown).....	82.8
Aissor, Transcaucasian (white yellow).....	88.7
Aleuts (red).....	87.8
Magyars (mixed).....	87.8
Savoyards (white).....	86.9
Sudanese (brown).....	86.3
Piedmontese (white).....	85.9
Burmese (yellow).....	85.7
Armenians (white).....	85.6
Tahitians (brown).....	85.6
Negritos, Philippines (black).....	84.7
Samoans (brown mixed).....	83.7
Italians (white).....	82.7
Arawaks, Guiana (red).....	82.6
Saras, Chad basin, Sudan (black).....	82.4
Walloons (white).....	82.2
Votyaks (yellow).....	82.0

Among the European whites the people of the British Isles are mesocephalic; of France the index is 78-88; of Italy, 75-87; of Spain, 77-80; Switzerland, 76-85, with two types, the long and the short head; Austria, 80-84.

Other indices than those expressing the relation of width to length are also employed. The facial index is the ratio of the width (greatest breadth of the malar bones) to the height, from the glabella or the nasion to the alveolar border of the upper jaw (prosthion) or to the chin point (gnathion), and separates skulls into brachyfacial and dolichofacial, or, according to the German classification, into chamæ-, meso-, and leptoprosops. The ratio of width to length in the orbital orifice separates crania into megasemes (90 and upward), mesosemes (80 to 84), and microsesmes (below 84). While the French use the dacryon or lacrimale as medial measure point of the orbital width, the German school prefers the lacrimale or, of late, the maxillo-frontale, i.e., the point where the inner margin of the orbit is met by the sutura fronto-maxillaris. The classification then is thus: chamæconch, X to 75.9; mesoconch, 76 to 84.9; hypsiconch, 85 to X. The nasal index is the ratio between the width of the nose (greatest breadth of the nasal wings in the living or of the nasal aperture of the skull) and its height, giving rise to leptorrhine, or narrow-nosed, platyrrhine, or flat-nosed (wide aperture in the skull), with the intermediate term, mesorrhine.

The dental index is based upon the importance which naturalists place on dentition in the classification of mammals. Upon the ratio of the size of the teeth to related parts, Flower divides men into megadont, mesodont, and microdont; and this series bears a surprising relation to the three anthropometric types of man—Negroid, Mongoloid, Caucasoid.

SCHEME OF PRINCIPAL CLASSIFICATIONS ACCORDING TO INDICES

Skull	{ Dolichocephalic, long skulls. Mesocephalic, medium skulls. Brachycephalic, broad skulls.
Nose	{ Leptorrhine, narrow noses. Mesorrhine, medium noses. Platyrrhine, flat or broad noses.
Eyes	{ Megaseme (hypsiconch), round eyes. Mesoseme (mesoconch), medium eyes. Microseme (chamæconch), narrow eyes.
Teeth	{ Megadont, large teeth. Mesodont, medium teeth. Microdont, small teeth.

Jaws	{ Orthognathic, straight or vertical jaws. Mesognathic, medium jaws. Prognathic, projecting jaws.
Face	{ Chamæprosopic, low or broad face. Mesoprosopic, medium face. Leptoprosopic, narrow or high face.
Pelvis	{ Platypellic, broad pelvis, - Mesopellic, medium pelvis. Leptopellic, narrow pelvis.

It may be stated that the methods of anthropological investigation are different with the different schools, but hardly to such an extent as to render results unfit for consideration in comparative work.

Bibliography. Broca, *Instructions cranio- logiques et craniométriques* (Paris, 1875); Roberts, *Manual of Anthropometry* (London, 1878); Broca, *Instructions générales pour les recherches anthropologiques* (Paris, 1879); "Frankfurter Verständigung über ein gemeinsames cranio- metrisches Verfahren," in *Archiv für Anthropologie* (Brunswick, 1884); Topinard, *Eléments d'anthropologie générale* (Paris, 1885; Eng. trans., London, 1894); Schmidt, *Anthropologische Methoden* (Leipzig, 1888); Török, *Grundzüge einer systematischen Kranimetrie* (Stuttgart, 1890); Deniker, *Races of Man* (London, 1900); Livi, *Antropometria* (Milan, 1900); Martin, "Ueber einige neue Instrumente und Hilfsmittel für den anthropologischen Unterricht," in *Korrespondenzblatt der deutschen anthropologischen Gesellschaft* (Brunswick, 1903); Bertillon and Chervin, *Anthropologie métrique* (Paris, 1909); Klaatsch, "Kranio- morphologie und Kraniotrigonometrie," in *Archiv für Anthropologie* (Brunswick, 1909); Ranke, *Der Mensch* (Leipzig, 1911); Martin, *Lehrbuch der Anthropologie* (Jena, 1914).

The standard periodicals of anthropology in different parts of the world contain also numerous articles on special methods of research work in physical anthropology. Great interest is shown in a new field of research, that of Palæoanthropology, due to recent finds of the remains of early man (Schwalbe, Klaatsch, Schoetensack (Homo heidelbergensis), Boule, Woodward, and others). See MAN, SCIENCE OF.

INDEX EX'PURGATO'RIOUS. See INDEX.

INDEX KEWENSIS, kū-ën'sis. A reference book of the names of flowering plants. It was conceived by Darwin, who, having experienced difficulty in definitely identifying many of the plant species with which he worked, provided the money for its completion. It was compiled by Benjamin Daydon Jackson (q.v.), under the direction of Sir Joseph D. Hooker, director of the Royal Gardens at Kew. The aim was to record every genus and species of phanerogamous plants published up to 1885; to follow Bentham and Hooker's *Genera Plantarum* as authority for the limitation of genera; to add to each name, whether retained or synonymic, a full reference to its place of publication, retained names being the earliest under which they were published in the recognized genus and not necessarily the earliest specific name; and, finally, to indicate the geographical distribution of each species. Three parts of the supplement which brings the work down to 1895 have appeared, a second supplement covering the period 1896-1900 was completed in 1905, and a third supplement covering the years 1901-05 was published in 1913.

INDEX LAWS. See EXPONENT AND EXPONENTIAL.

INDEX NOTATION. See NOTATION.

INDEX NUMBERS. An index number is a method adopted by statistical and economic writers to exhibit the course of prices of a group of commodities or of commodities generally.

A crude method of attaining this result is to add the prices of the various commodities together. The defects of such a procedure are apparent from the following simple illustration:

	1st date	2d date
Cotton, per lb.....	\$0.08	\$0.07
Flour, per bbl.....	3.50	3.25
Pig iron, per ton (2000 lbs.).....	18.00	18.50
Total.....	\$21.58	\$21.82

If the sum be a criterion, it appears that there has been on the whole an advance in price of the group despite the fall in cotton and flour. A little reflection will show that had pig iron been quoted by the pound instead of by the ton the result would have been different, as follows:

	1st date	2d date
Cotton, per lb.....	\$0.08	\$0.07
Flour, per bbl.....	3.50	3.25
Pig iron, per lb.....	0.009	0.00925
Total.....	\$3.589	\$3.32925

But even here there are still great differences in the initial prices, and the variations are measured on very different scales.

The index number avoids this difficulty by reducing the initial prices to common terms. It establishes the variation of each price from its own starting point and then determines the average variation. The assumed figures above given will serve the purpose of demonstration, and the following statement of relative prices is true for either of the series:

	Price at 1st date	Price at 2d date in terms of price at 1st date
Cotton.....	\$100	\$87.5
Flour.....	100	92.9
Pig iron.....	100	102.8
Total.....	\$300	\$283.2
Average.....	100	94.4

In this comparison, where each article has an equal weight in determining the result, there appears to have been a fall in price of 5.6 per cent; while in the first statement, where pig iron predominated, a rise in price of 1.2 per cent appeared, and in the second statement, where flour predominated, the fall in price appeared to be 7.2 per cent. It is obvious that the third statement or simple index number is a far better indication of the course of prices of these articles than the other two, where one article or the other dominates the result simply by reason of the fortuitous circumstance that its unit of measurement is relatively large.

The third statement is not, however, an abso-

lutely exact measure of the total price change, since it is not of equal significance that flour falls and that pig iron rises. To the individual consumer no doubt a slight fall in flour is more important than an equal rise in pig iron. It may readily be assumed that he buys for his daily needs 10 times as many things affected by the price of cotton as are affected by that of pig iron, and perhaps four times as many affected by the price of flour as are affected by that of cotton. His relative consumption might be: pig iron, 1; cotton, 10; flour, 40. Hence the price changes noted affect him in varying measure, and this must be accounted for in estimating the significance of the total change. The calculations are as follows:

	Price	Units of importance	Product
Cotton.....	\$87.5	10	875.0
Flour.....	92.9	40	3716.0
Pig iron.....	102.8	1	102.8
Total.....	\$283.2	51	4693.8
Average.....	94.4	..	92.0

On the other hand, in the aggregate consumption of the nation the proportions of the different articles might be quite different, and hence also the significance of these combined changes in the wholesale market. Let us assume them to be: pig iron 1, cotton 2, and flour 4. We then have the following calculation:

	Price	Units of importance	Product
Cotton.....	\$87.5	2	175.0
Flour.....	92.9	4	371.6
Pig iron.....	102.8	1	102.8
Total.....	\$283.2	7	649.4
Average.....	94.4	..	92.8

We have now determined by these slightly different methods the price of the group to have been at the second date, compared with the first, as 94.4, 92.0, and 92.8 respectively are to \$100, and we have in these results from assumed figures a fair illustration of the methods of index-number calculations, and the problems to which they give rise.

The problems of a general index number are not dissimilar. The first is the choice of articles whose prices are to be included. No definite statement of what articles should or should not be comprised in the index can be made except that they should be staple articles of general use. It would defeat the object of an investigation aiming to determine the course of general prices, to include specialties, or rarities, or objects of such restricted use as not to be subject to the ordinary influences affecting prices.

The character of the component price series being thus stated, how shall the number be fixed? It must evidently be large enough to include all the more important lines of staple commodities. No precise limit can be fixed. While it would seem obvious that in any effort to determine general prices the greater the number of commodities embraced in the comparison the more accurate the result, such is not the case, since, as the number multiplies, the pro-

portion of articles of limited demand which are more or less removed from the primary influences affecting prices generally increases.

The base line with which prices are compared is usually the average of a series of years, the purpose of taking such an average being to overcome any eccentricities of prices which might characterize a briefer period of time. This practice is not universal, and some well-known calculations have been based upon the prices of a single year. This method is justified on the ground that the prices so chosen were those of normal conditions.

In the combination of the price series into a general index of prices, the simple mean is the most frequent method employed, as illustrated in our first index calculation. This has been the subject of much criticism on the ground of the unequal importance of the objects concerned. To overcome this difficulty two sets of weighted averages have been proposed. The first was one which measured all articles by their importance in the national consumption as illustrated in the third calculation; the second measures articles by their importance in individual consumption as revealed by family budgets and typified in our second calculation. In applying national consumption as a test, we find that calculations of such consumption are very precarious and extend to comparatively few articles. In family consumption we can ascertain for certain groups of persons the proportions of expenditure which cover a much wider range of commodities. But the commodities covered by the family budgets are not the same as those covered by price statistics, since the former represent the retail, and the latter the wholesale markets. In the food products this makes little difference, but in textiles, metals, lumber, and the like there is no little adjustment needed to bring the prices and the relative expenditures into relation.

Those who have done the most to establish more rational and at the same time more complicated calculations have been the first to point out that the ultimate results differ but slightly from those obtained by the somewhat rough calculation of a simple average.

The index number of the London *Economist* is based upon the wholesale prices of 47 commodities which by combination are reduced to 22. The quarterly prices for 1845 to 1850 were arranged as a basis for calculation and the relative prices for subsequent years upon the January prices. The total price index for 1845 to 1850 was 2200, and for later years the price indices are also expressed as an aggregate, without reduction to 100. As in a few cases the full number of articles was not given, this was somewhat misleading. In the table opposite we give the results of this calculation as published by the *Economist*, together with a reduction to the scale of 100.

The general tendencies of price movements, the rising tendency till 1873, and the subsequent downward trend as shown in these figures are amply confirmed by other investigations. The enormous rise in the period of 1861 to 1865 was due not only to the extravagant prices for cotton paid in this period, but also to the fact that in the 22 series represented in the total as many as three were for cotton. This fact, and the prominence given to indigo, and the absence of so important a staple as coal, led to numerous efforts to improve the calculation.

Mr. R. H. Inglis Palgrave sought to remedy the defects by a system of weighing each article by its importance in the national consumption—a method already indicated.

Mr. Augustus Sauerbeck published in 1886 in the *Journal of the Royal Statistical Society* an index number which has been brought down to date in subsequent issues of that periodical, and which is in many respects an improvement upon the older calculation. His annual prices are based upon averages of the monthly, and in some important commodities weekly prices, and these are compared with the average prices of 1867 to 1877. The tables embrace 45 series of quotations; and while some commodities are repeated (in different grades), they have been chosen in such a manner that the total number of quotations for a group of commodities such as meats, textiles, iron, and steel represents approximately in its proportion to the whole number of quotations—45—the importance of this group in the commerce of the United Kingdom. The superiority of this calculation rests therefore on the more trustworthy character of its material and the breadth of choice.

In France similar calculations have been based upon the import prices of commodities, and in Germany (Soetbeer's) upon the import prices of goods at Hamburg. The latter are more comprehensive, since Hamburg was so long a free city that practically its entire trade was in commodities imported by sea and land. The calculations of Dr. Soetbeer for Hamburg, based on the average prices of 1847 to 1850, embraced 100 articles, to which were added 14 articles from the British trade returns. Neither the more limited French calculations nor those of Dr. Soetbeer developed any mode of combination other than the simple average.

"ECONOMIST" INDEX NUMBER ↓

YEAR	Total as published	Reduced to scale of 100	YEAR	Total as published	Reduced to scale of 100
1845-50	2,200	100	1885	2,098	95

* Twenty-one articles only.

In the United States comprehensive statistics of prices for the period of 1840 to 1891 were published in the Senate report on wholesale prices, wages, and transportation. The report

based its calculations upon the prices of 1860 and furnished an index number comprising 223 different series of prices. These were combined by the method of simple average, and also by estimating the importance of the price series as measured by family consumption. As in previous instances when different methods of combination had been tested upon the same figures, the results of the two methods differed but little. This price index closed with 1891, but the United States Department of Labor in its *Bulletin* has furnished the material for carrying the study of price movements down to the present day.

It should perhaps be mentioned that this report applied the index-number principle to its statement of wage statistics—a procedure which had been previously suggested, but was carried here to execution for the first time. It is also applied effectively to the study of transportation rates. The methods of the report, especially as applied to wages, have been made the subject of searching criticism by the English statistician A. L. Bowley, who has effectively used the index principle in his investigations of the course of wages in England.

INDEX OF REFRACTION. See LIGHT.

INDIA. A region comprising the middle member of the three great southern peninsulas of Asia and a territory of nearly equal extent to the north, together with Burma, extending eastward as far as the Malay Peninsula. India in this sense constitutes the Empire of India—one of the members, and by far the most populous, of the British Empire. India proper, however, does not extend farther east than the head of the Bay of Bengal, nor does it include some of the northern or westernmost districts of the Empire. The name Hindustan was formerly frequently used instead of India, but it belongs more properly to the north-central portion of India, the land of the Hindus. The name India has been used in a very broad sense, but improperly, so as to embrace the great southeastern peninsula of Asia, which is still sometimes spoken of as Farther India. This article will treat of the Empire of India. Since British influence became predominant there, no other country of the mainland of Asia has been so diligently explored or is now so well known as India. In the form of a great triangle, the Indian Peninsula extends southward between the Bay of Bengal, on the east, and the Arabian Sea, on the west, through 15° of latitude to Cape Comorin (lat. 8° 5' N.). On the north the peninsula unites with the continental mass in the lowlands of the Ganges basin and the great plains east of the Indus, which connect it with the mighty highlands of the Himalayas.

India, within the official boundaries of the British possession (including the native states), stretches north and south through about 29° of latitude. Its east and west extension is across nearly 40° of longitude. The Empire has an area of 1,093,297 square miles of British territory, and together with the native states, which are more or less under the control of the Indian government, has a grand total of 1,802,657 square miles. These figures include Burma as a part of the British territory, while the area of the native states referred to is 709,583 square miles and includes about 700 small divisions governed by native princes, ministers, or councils under political supervision of a Resident, or agent, of the British government, and range in size from Hyderabad, with 82,000 square miles, downward to those consisting of a few small villages. Geographically Burma is not a part of the peninsula of India, but has been attached for purposes of government and is therefore included in this discussion of the Empire of India. (See INDIA, NATIVE STATES OF.) India is thus about half as large as the United States (inclusive of Alaska). It is a world in itself, for the great barrier of the Himalayas, the Hindu Kush, and the Suleiman Mountains shuts it off from land communications with the rest of Asia, except through very difficult mountain passes; the sea is the only means of easy approach. Thus guarded, though by no means completely, by mountain bulwarks and wide seas against intrusion, India was able to develop a civilization and social system peculiar to itself.

Topography. The coasts of India are comparatively little indented except at the mouths of the large rivers and along the northwest shores; and though there are many roadsteads and harbors for small vessels, there are only a few good harbors for large vessels, and they are in the deltas of the rivers or, as at Bombay, under the shelter of islands. The railroad system was therefore planned so as to connect all the leading trade centres of the interior with the largest seaports.

Three distinctly defined physical regions are recognized—the mountain districts of the Himalayas, the low plains of the three great rivers of north India, and the high plateau of the Deccan, extending from the plain of the Ganges to the south end of the peninsula. The colossal ranges of the Himalayas, 1500 miles in length, extend along the north part of the country in several parallel chains separated by deep valleys and table-lands. The most northerly of these ranges is the loftiest, and Mount Everest, the highest mountain in the world, rises to a height of 29,000 feet. In the west the Himalayan ranges are continued by the Hindu Kush, from which the Suleiman and Hala chains stretch to the south, along the western borders of India. The barrier presented by the Himalayas is far more formidable than those of the other ranges and can be crossed only by passes of 17,000 to 19,000 feet in height, above which tower many snow-capped summits. It was through the less difficult but still formidable passes on the northwest border that India was long subjected to invasion; and Burma was the victim of similar attacks through the passes on its north frontier. The mountain rampart has the greatest influence on climate and fertility, for it wards off the freezing winter blasts from the north and condenses the immense volume of water vapor

brought by the summer monsoon to vivify the plain below. The barren mountain slopes fall to the south in successive terraces down to the fertile plain teeming with animal and vegetable life. But while the higher slopes of the mountains are devoid of vegetation, some of the wide, high mountain valleys are exceedingly beautiful, most notably that of Kashmir, unexcelled for healthful climate and fertile soil.

The great river plains cross India in a wide belt from east to west, south of the mountains; and at their ends the plains are projected southward, where the Indus and the Ganges-Brahmaputra have advanced their deltas far seaward. On the alluvial lands are the densest population and the richest cultivation of the Empire; for density of population is determined in India, not by the temperature, but by the supply of water available for the farms. But there are waste and almost unpeopled districts also among these lowlands; and the rainless Desert of Thar or Indian Desert, to the east of the Indus delta, extends northeastward almost to the base of the Himalayas.

The third topographic division of the country is the peninsula, the great triangular plateau of the Deccan, from 1600 to 3000 feet above sea level. The north boundary of the plateau is the Vindhya Mountains, which join the plateau to the low plain. The Deccan triangle is further defined by the Western Ghats rising above the fertile and accessible Malabar coast, and in the east by the Eastern Ghats overlooking the Coromandel coast with a narrow coastal plain, difficult of access, for the harbors are few and very poor. No other part of the world testifies more eloquently than the Deccan tableland to the prodigious energy formerly displayed by plutonic forces. The greater part of this immense plateau was built up by outpourings of lava and basalt (trap), which in places are 6000 feet thick.

The coast line of Burma is not deeply indented except where the projecting delta of the Irrawaddy forms the Gulf of Martaban. The low coast and the flooded valleys make Burma the greatest producer of export rice in the world. Farther inland, to the east of the Irrawaddy and on both sides of the river in its upper course, the country is hilly and heavily forested. See BURMA.

Hydrography. The four great rivers of India are the Indus, the Ganges, the Brahmaputra, and the Irrawaddy, the last named in Burma. The heaviest rainfall is not on the plains or on the southern plateau, but on the slopes of the mountains, which pour their torrents into the great rivers below, with the result that the Ganges and the Brahmaputra carry to the sea a volume of water that is entirely out of proportion to their length or the area of their drainage basins. The Indus contributes to the basin of the Arabian Sea the waters derived from the Punjab (land of five streams) and from the plateau of Afghanistan. It is navigable for over 900 miles, but its value as a water highway is small on account of the impetuosity of its current. It is least important among the great rivers. The majestic and smoothly flowing Ganges is far more valuable for navigation than any other river of India. Both the Ganges and the Brahmaputra, which joins it near its mouth, are turbid with fertilizing silt from the mountains, which has formed the great Bengal delta. The Irrawaddy of

Burma is navigable by steamers to Mandalay. The rivers of the peninsular part of India, though some of them are of considerable length, are not important for navigation. Among them may be mentioned the Nerbudda (Narbad) and Tapti, both flowing into the Arabian Sea, and the Mahanuddy (Mahanadi), Godavery (Godavari), Kistna (Krishna), and Kavery, which pour their waters into the Bay of Bengal.

Climate. On account of the great extent of India and its differing altitudes, the country has many differences of climate. The whole land may be described as more or less tropical except in the higher altitudes. Slopes of the Himalayas, as high as they are habitable, enjoy a temperate climate; neither is there for the natives an oppressive degree of heat on the high plateau of the Deccan. Among the Himalayas and the Nilgiris Europeans have established sanatoriums amid the most agreeable climatic conditions, where many of them take refuge from the prostrating heat of the hot months. The climate of India, except in the districts of jungle and marsh lands, is not, on the whole, unhealthful for the white race if the ordinary precautions required in all hot countries are observed. The most heated area is that of the northwest, in or about the region of the Indian Desert, where the mean July temperature exceeds 95° F.

By far the most important climatic element is the rainfall, upon which depends the very existence of the people. Throughout the country in general there are only two seasons, the dry and the rainy, also known as the season of the northeast monsoon and the season of the southwest monsoon. These names are derived from the direction of the winds prevailing in the Arabian Sea and Bay of Bengal during the two periods. They are really inapplicable, however, over a great part of India, where the winds are from directions nearly opposite to those indicated by the names of the seasons and are chiefly determined by the axial directions of the local river valleys. Thus, the winds in south Bengal are from the southeast, and in Behar from the east, during the southwest monsoon, and are from the opposite directions in the northeast monsoon. The two seasons in India might therefore more appropriately be called the dry monsoon and the wet monsoon, from their most characteristic features.

The dry monsoon, or season, usually begins in November or December and continues until May. Winds of land origin prevail more or less steadily in the interior, and hence the period is usually marked by great dryness of the air and little or no rain. The first three months of this period (December to February), characterized by a comparatively low temperature, are known as the cold-weather season; and the second three months (March to May), when the temperature increases rapidly and culminates in a period of excessive heat in May, as the hot-weather season. During the cold-weather season storms of large extent, the majority of which form in Persia, enter India from Beluchistan and traverse north India from west to east, distributing light rains in the Indo-Gangetic plains and heavy snow over the western Himalayas. The severity of the hot-weather season is occasionally relieved by the occurrence of thunderstorms and dust storms, which cool the air for brief periods. The characteristic features of the dry season are persist-

ent dry weather, with clear skies, and large diurnal range of temperature.

The rains of the wet season, or the southwest monsoon, set in suddenly on the west coast of India in the first week of June, and a little later (in the second or third week of June) on the Bengal coast, and extend more or less rapidly into the interior. The prevailing winds of this period are of oceanic origin and are, in fact, the northward extension of the winds of the southeast trades. The extension of these winds northward across the equator and into the Indian seas usually begins in the third week of May and gives a complete and permanent change of weather (lasting for five or six months), more especially over the land area of India. The winds due to the extension of these massive humid air currents usually begin to give daily rain to the Malabar coast in the last week of May and to the Bombay coast on June 4 or 5. The humid currents advance more slowly into the interior, but are usually established before the end of the month over the whole of India. Cloudy, showery, or rainy weather, with a moderately high temperature and small diurnal range of temperature, prevails during the next three months, which are in striking contrast with the excessively hot and dry weather that has prevailed during the previous two or three months. Over the mountain tracts of Assam and over the plains of Lower Burma the yearly rainfall exceeds 500-600 inches, and in one particular year the record of 805 inches was established.

Sometimes the wet monsoon is greatly delayed or has little strength, and this failure of an adequate supply of rain involves the direst tragedy. (See section on *Famines*.) India and the adjacent seas are often visited by the destructive hurricanes called typhoons, whose tracks are frequently traced by ruined towns and crops.

The soil, except on the steep mountain slopes, is of great fertility, being largely composed of alluvium throughout the plains and in the mountain valleys, and of disintegrated volcanic rocks, from which many rich soils are derived, on the southern plateau. The food demands of the enormous population make it necessary to maintain a high degree of fertility.

Flora. The very unequally distributed rainfall causes great differences in vegetation. The almost rainless region just east of the Indus has desert conditions of plant life, while the low-lying coast lands along the Gulf of Bengal have large areas of dense, wet jungle. The plains of the Deccan east of the Western Ghats have little rain, for it falls on these mountains instead of on the plains. Vegetation is therefore sparse where irrigation is not applied; while the lower slopes of the northern mountains, drenched with rain, are densely wooded; and far above the forests there is an arctic flora close to the glaciers and snow fields. The greatest possible area of plowed fields is needed for food production, and so a large amount of forest area has been cleared for cultivation. Timber supplies are chiefly derived from the mountain slopes, from the hilly lands of parts of the Deccan, and from Burma. Teak, the most valuable wood, is cut on the slopes of the Western and Eastern Ghats, in Lower Burma, and to some extent among the western hills of the Deccan. Sandalwood and blackwood are found in the teak-growing regions; sal, another hard wood, and

cedars, on the slopes of the Himalayas; and the common woods are scattered, not profusely, over various parts of the country. The larger part of the plain has no forests, and in the irrigated districts there are few trees except in the watered gardens. The government has all the best timber areas under protection and applies forestry methods to their management. The bamboo, the mango, and the coconut, useless as timber but of incalculable popular utility, are widely distributed. One of the most distinctive of the Indian trees is the banyan. The forests of Assam, Malabar, and the lower slopes of portions of the Himalayas are luxuriant in the extreme and present a wealth and variety of vegetable forms which are equaled or surpassed only by the forests of tropical America. In the Himalayas is the home of the giant rhododendron. Orchidaceous plants are markedly numerous, and the upper floral zones of the mountain range have furnished the most valuable types to the floriculturist.

Fauna. The country forms a part of the Oriental Region (q.v.) of zoögeography. Although the plains of the northwest partake of the characteristics of Central Asia, India possesses the lion (in the northwest, but now nearly extinct), the wild ass, and sundry smaller mammals, birds, and reptiles that belong rather to the country westward. The massive ranges of the Himalaya also contain a peculiar montanic fauna, characterized especially by an abundance of wild sheep, goats, and of goat antelopes (qq.v.), such as the Charal Pulis sheep, the ibex, markhor, goral, and others elsewhere described. These, too, are more closely related to Palæartic than to Oriental forms; but two or more species of goats exist on the Nilgiri Hills and other heights of the peninsula. The forests, swamps, and grassy plains of peninsular India support life in extraordinary profusion, and civilization seems to have little effect upon it because of the jungle fastnesses to which animals may everywhere retreat and be safe. The elephant (which is still met with in many parts in large herds), however, requires protection, and the wild cattle are becoming scarce. Several kinds of deer, including the sambur, axis, and swamp deer, and several kinds of antelopes are numerous, as well as very many of the minor mammals.

India is the home of the gallinaceous tribe of birds and is rich in many kinds of pheasants, partridges, and jungle fowl (to which is traced the origin of domestic poultry), besides a rich avifauna of the woods and fields. With this plenitude of prey, to which may be added a great variety of fresh-water and marine life, including many valuable food fishes, there would naturally be found carnivorous beasts, rapacious birds, and poisonous predatory reptiles. The tiger (which is probably indigenous to India), leopard, cheeta, and several lesser cats wander throughout the whole country, but are in greatest abundance in the sub-Himalayan forests, the marshes of the Gangetic delta, and the hill country of Central India, and are dangerous to man as well as beast. Other animals are the rhinoceros, gayal (or bison of the Ghats), bear, jackal, and various forms of ape. The true buffalo, as well as the camel, is domesticated and is largely used in the service of the field and farm. India is famous also for venomous snakes (see COBRA; ETC.), crocodiles, and sea snakes. The deaths of human beings by wild

beasts and snakes number thousands each year, and the loss of cattle reaches hundreds of thousands of dollars in value. On the other hand, India is one of the most attractive regions of the world for sportsmen, who annually distribute much wealth within its confines.

Geology. The topographic divisions of India with their characteristic features are based largely upon differences in geological structure. The main system of the Himalayas, so far as explored, has been found to be composed of crystalline strata—gneisses, schists, and igneous rocks of Archean age—which show the effects of upheaval and folding during the great crustal movements that elevated the ranges in late Tertiary times. In the southern flanking chains, or sub-Himalayas, the most prominent formation comprises Tertiary sandstones, conglomerates, and clays, in disturbed position. These strata (the Siwalik group) are enormously developed and contain a remarkable assemblage of fossil mammals. The great river plains of India occupy depressions in sedimentary strata, mostly of Eocene age. The Deccan plateau, especially in the north and west, is formed largely of basalt which poured out from great fissures during the Cretaceous period. These basaltic sheets occupy an area estimated at 200,000 square miles and attain a vertical thickness of several thousand feet. The Vindhya Mountains on the north have a gneissic axis, with Paleozoic sediments on the flanks. East and south of this range there is a large area underlain by sandstones and shales, to which the name Gondwana system (Mesozoic) has been given. This group extends probably from the Permian to the Jurassic period; its fossil fauna and flora are more nearly allied to the life forms of South Africa and Australia than to those of the Eurasian continent.

Mining. Considering the extent of area and the large population, the mining industry is strikingly insignificant, though the recent developments are beginning to give it some importance. Increased utilization is being made of the coal resources of the country, much to the advantage of the railroad and milling interests. The annual output of coal increased from 2,562,000 tons in 1893 to 14,706,000 tons in 1912. The provinces of Bengal, Behar, and Orissa produce over nine-tenths of the total product, the output having grown from 1,915,000 tons in 1893 to 13,432,500 tons in 1912. The increased production has resulted in the decrease of the imports of coal and coke, which amounted to £778,000 in 1913, and the increase in the exports of coal, amounting to £589,000 in 1913. Coolie labor is prominent in the working of the coal mines.

The mining of gold is important, the yield having steadily increased from 107,273 ounces in 1890 to 631,116 ounces in 1905, but has since declined to 590,555 ounces in 1912. The greater part of this is mined from the quartz deposits of Mysore, although some is obtained from river gravels in the Himalayas and elsewhere. A parallel growth is being made in the production of petroleum, the output in 1900 having been 37,729,000 gallons, and, in 1912, 249,083,500 gallons, the greater part of which was obtained from Upper Burma. The importation of mineral oil, which was in 1900 more than twice as great as the home production, amounted in 1912 to less than one-half of it (107,416,500 gallons). The government has long maintained

a monopoly in the production of salt. It is obtained mainly by the process of evaporation, and the industry is carried on along the coast region and at some of the interior lakes. The annual yield is about 1,300,000 tons. Saltpetre is obtained in the plains, lead and copper are mined in the Himalayas, manganese ore in Bombay, and tin and rubies in Burma. India was long famous for its diamonds, but the output in the last century has shrunk into insignificance.

Agriculture. This industry, which has always been the principal source of subsistence for the people of India, is increasing in importance under British control. This is due largely to the increase in facilities for irrigation and for the transportation of agricultural products. Famines, which in the past resulted in an enormous loss of life, are now much less frequent and severe, owing to the increase in food supply and better facilities for distribution by rail and upon the rivers and canals. The same system of distribution has led to an increased supply of manufactures produced by the factory system of Great Britain and the manufacturing centres of India, and this has in turn increased the percentage of the population devoting its attention to agriculture. The land of India, though varying in composition, is generally fertile and is very productive, being aided by the tropical climate. The country is, however, in continuous danger of crop failure by the general uncertainty of rainfall. Practically the only districts exempt are the southwest Malabar coast, the deltaic district of the Ganges, Brahmaputra, and Burma. (See section on *Climate*.) In some regions, as in the lower Ganges valley, the precipitation is ordinarily quite heavy, rarely failing to meet the needs.

Irrigation. From remote times the inhabitants of India have sought, by means of artificial water supply, to protect themselves against the calamities of drought. Under British control the irrigation works have been enlarged, and new ones constructed on an enormous scale. In 1911-12 there were 40,679,000 acres, one-sixth of the total crop area, under irrigation. The area actually irrigated varies with the lack of rainfall from year to year, and the commercial value of irrigation schemes varies in different sections. In Sind and Lower Punjab irrigation is necessary every year. In the valley of the Indus the necessity for irrigation decreases with the distance from the Himalayas, but the system is used as a protection against drought years and to supplement the rainfall of average years. This is true also of the upper Ganges region. In the lower Ganges valley, as indicated above, irrigation becomes less and less necessary towards the deltaic region, in portions of which the danger of drought gives place to that of inundation. In Madras (except the west coast) and the Deccan or Central India region irrigation is a practical necessity as a protection against frequent droughts and to supplement the usual rainfall. On the east coast of Madras, especially where "wet crops" principally are grown, irrigation is an absolute necessity. In Orissa and Upper Bengal, though the ordinary rainfall is quite adequate and droughts seldom occur, the government has constructed irrigation works as a safeguard against dry periods. These works are considered indirectly profitable to the government, however, since they obviate the loss of land revenue and the expense of supplying a famine-stricken district with food

during a drought year. The Orissa and some of the other canals are also valuable for navigation.

The sources and methods of irrigation vary throughout the country. Before the British occupation wells were used chiefly, and have continued to increase in absolute, though not in relative, importance, because, where practicable, they constitute the cheapest method. They are generally employed by private enterprise and are still the largest source of irrigation in the United Provinces of Agra and Oudh, and Gujarat. Reservoirs, generally called tanks, have been used since ancient times to furnish water for irrigation and are especially adaptable to broken, hilly regions, where the construction of a long system of canals is impracticable. They are found chiefly in the eastern portion of Madras, where they vary in size, according to the supply of water and the irrigable area which they command. In many instances they are dry during a part of the year, and crops are sometimes raised in them. This tank system is also carried on by private enterprise. But since India has been in the hands of the British the greatest progress in irrigation has been accomplished through the general and uniform extension of the canal system.

This method also was used in ancient times, but some of the more important systems had fallen into disuse when the British took possession. Their construction requires heavy outlays of capital and presupposes a stable form of government. The numerous legal complications which rise out of such an undertaking, and the relation of the government to the land, together with the necessity of constructing certain systems having no remunerative financial value, have all led the British government to take the system almost wholly in its own hands. The

one crop. In the Lower Punjab and Sind the channel of the Indus River lies so far below the surface of the riparian country that its waters cannot easily be diverted by dams. Through the high banks deep cuts are made, and "inundation canals" are constructed, which convey the water of the river during the flood period. By this means the land is watered sufficiently to produce one crop a year. The valleys of the upper Ganges and upper Indus are also too deep and broad to admit of damming, nor would the inundation system of the lower Indus answer the purpose. Some of the crops that are commonly raised and require irrigation grow in those seasons during which the rivers are at their lowest. For their irrigation canals are dug so as to strike the rivers where they emerge from the mountains. The channels conduct the water along the watershed of the plains, finally reuniting with the main streams. Some of these canals are notable both for their great length and capacity. Many of them are remarkable feats of engineering, owing to the difficulties surmounted in their construction, such as the crossing of other streams. In no part of the world is the irrigation system so thoroughly developed or made to add so much to the producing power of the country as in India, and this has been largely developed under British rule. Of the 40,000,000 acres under irrigation nearly one-half is irrigated by canals and about one-fourth from wells. Over one-half of the area irrigated in 1912 was supplied from government works, and the value of the crops grown on irrigated lands was approximately \$150,000,000.

A table herewith presented shows the area in the different provinces irrigated during the years 1911-12, the relative importance of the

execution of this method requires a fairly level area. The methods used for the application vary in different localities. In the Madras deltas dams are constructed across the rivers at their entrance to the delta region, and, since their beds are almost on a level with the surface of the land, water is easily diverted into artificial channels. They yield their main supply during the annual flood period, and the region dependent upon them is therefore limited to

different sources of irrigation, and the proportion of irrigated land to the total crop area. It will be seen that the Punjab is the most, and Assam the least, dependent upon irrigation.

Crops. In 1911-12 the area actually cropped was 215,981,683 acres, and the current fallow 54,982,324 acres. The estimated area of the cultivable waste for the same year was 114,700,370 acres. There were 149,605,179 acres not available for culture, and 80,851,368 acres

under forest. For crop statistics, see accompanying table.

The kind of crops grown is determined largely by the amount of the water supply. In regions

panying table will be seen the great importance of rice in Bengal, Lower Burma, and Assam. The consumption of rice is, however, not nearly so universal in India as is popularly supposed. It is not the cheapest food, and in many regions only the wealthy classes can afford it, while even in Bengal there are great numbers of the lowest classes who use but little. Sir William Hunter estimates that it is the staple food of less than one-third the total population of India. The main crop is reaped in the early winter—November to January—but in Bengal there is also a summer crop. A considerable share of the rice crop is exported, the value of the rice exports in 1912-13 being nearly twice as great as those of wheat and showing a larger total than that of any other single product. Throughout the dry, nonirrigated portions of India millet is the commonest food crop and is the largest item in the food of the lower classes over the greater part of the country, being most used in the southern districts. Practically the whole crop is used for domestic consumption, whereas rice is exported in large quantities. The planting and harvesting periods vary with different sections; in some regions two crops are raised, and in others, especially in the northwest, but one crop is produced, the rainfall being the controlling factor. The acreage shown in the accompanying table represents the area sown, but the area cropped falls short of this. After rice and millet pulse is the most important food product. There are no available figures showing the acreage devoted to millet.

Wheat is confined largely to the northwestern part of India, being the chief crop in the Punjab. It is a very important factor in the agriculture of Bengal and Behar. While there was formerly much apprehension in the United States that the wheat crop of India would drive that of the former from the world market, recent developments have not justified such fears, since the increase in area devoted to wheat in India was much less in recent years than formerly. The wheat-producing area formerly varied widely from year to year. The average, including native states, for the last decade was about 30,000,000 acres, about half of which is subject to irrigation. The average yield per acre varies with climatic conditions—in the Punjab it is about 13 bushels. The harvest occurs during April and May. Potatoes and other root crops are grown successfully, but they are not so favorite a food in India as in European countries. A large variety of tropical or semi-tropical fruits are grown for local consumption. The coconut is the most important export from the southwest coast. There are several kinds of dates having a local and commercial importance. Throughout India the raising of oil seeds receives much attention, an average of about 14,000,000 acres being devoted to their cultivation. The product has been for a long time an important item in local consumption, and in the last half of the nineteenth century large quantities were exported to Europe—the foreign demand giving an increased impetus to its cultivation.

Sugar cane is grown in most provinces, especially in the United Provinces of Agra and Oudh, the Punjab, and Bengal. The crop requires irrigation and cultivation on a capitalistic scale, which tends to limit the development of the industry. The quantity of sugar produced in India is very large, about 6,000,000,000 pounds in 1913, but it is practically all con-

where the rainfall is excessive, or an abundant supply is readily obtainable, rice is almost the only crop. It is therefore confined largely to the deltaic regions and especially to the Bengal delta. Here the annual overflow of the rivers makes irrigation easy. From the accom-

sumed in that country and is not sufficient to meet local requirements, the imports amounting to about 1,365,000,000 pounds in 1913 valued at 140,000,000 rupees. India is thus one of the largest sugar-consuming countries of the world, her consumption aggregating about 7,350,000,000 pounds against 8,250,000,000 in the United States. The production of coffee is mostly restricted to a limited area in the elevated region on the southwest coast, the coffee lands of Mysore, Coorg, the Madras district of Malabar, and the Nilgiris, comprising over 85 per cent of the whole area under coffee in India. The coffee exports amount to about 15,000,000 rupees annually. The culture of tea is due to the fostering efforts of the government. Tea culture was introduced about the middle of the nineteenth century and has continued to increase and is now one of the important crops of India. The quantity produced is about 350,000,000 pounds, and the quantity expended about 280,000,000 pounds. The value of the tea exports amounted to about 132,000,000 rupees in the fiscal year 1913, or nearly 10 times as much as the coffee exports. Requiring an abundance of water, it is best adapted to Assam and Lower Bengal and is largely confined to these two regions, being grown for foreign markets rather than home consumption.

Opium is a government monopoly, and its production is restricted to certain regions, principally Behar, the country around Benares, and Oudh. The poppy plant, from which the opium is obtained, requires irrigation and careful attention. The production, however, is rapidly declining, owing to the coöperation of the Indian government with that of China in the prevention of imports of opium into China. Some tobacco is grown in most parts of the country for local consumption. About half of the total product is grown in Bengal, and part of it is exported. The tobacco is generally inferior to that grown in other countries and therefore does not compete seriously in the European market. Indigo has ceased to hold its own even in absolute importance. The acreage for 1912 was but two-fifths of that for 1904. The industry has suffered from competition with

in the production of fibrous plants—cotton and jute.

Cotton had long been raised, but had not been drawn upon to supply the foreign market to any great extent until the Civil War in America stopped the supply from there. A reaction soon followed its rapid and extensive development, and though it subsequently increased again, it now produces about 3,500,000 bales annually. Cotton cultivation is not confined to any distinct region, but is relatively most important about the centre of the peninsula in Berar. The soil of this and the surrounding country is called the "black cotton soil" and is noted for the remarkable extent to which it holds moisture. The cotton is a short-staple grade and therefore inferior to the American and Egyptian products. The exports average about 2,000,000 bales annually. The production of jute is more restricted in extent, the plant growing best in the flooded lands along the lower Ganges and Brahmaputra in Eastern Bengal. The average annual acreage for the last decade was over 2,000,000 acres, and in 1913 it was 3,354,000. Like cotton, the product is largely exported, though there is not so large a per cent of it exported in the raw state. The exports of jute in the raw state are about equal in value to those of the manufactured product. A considerable part of the product is shipped to the United States. Silk culture is important in the Punjab, Assam, and Lower Bengal.

The methods of cultivating crops in India are such as have prevailed for centuries. The natives show little inclination to take suggestions from the British. The efforts of the latter, however, to accomplish results by means of experimental farms have resulted in a considerable improvement in methods of cultivation and in some cases have increased production per acre. There are experimental and seed farms conducted by the Department of Agriculture, the introduction of new crops and new appliances, and especially the enlargement of the irrigated areas.

Stock Raising. While India has a larger number of cattle than any other country of the world, they are of a low value as compared with

various substitutes, and with the product grown in Java. Bengal (particularly Behar), the United Provinces (Agra), and Madras lead in its production. Spices are raised and exported, but are of minor importance. During the past 60 years there has been a considerable increase

those of other countries and do not form an important factor in commerce. A number of conditions are responsible for the unsatisfactory state of stock raising. The people are given almost wholly to a vegetable diet. Religious or caste prejudices prevent the greater portion

of the Hindus from eating beef or pork. The period preceding the annual rains is characterized over a large portion of the country by a scarcity of both water and pasturage, and stock are generally reduced almost to starvation. This tends to make the breeds deteriorate. The disregard of proper methods in breeding has a similar influence. The grade of stock, therefore, is generally very inferior. Over the greater portion of British India cattle serve the same purpose that horses do in most countries. The breed of cattle is one that is unknown in this country, being of the humped variety. Buffaloes are also used as work animals throughout almost all India. They are somewhat hardier than cattle and thrive in districts climatically unfavorable to the latter. Mules and donkeys are about equal in number to horses and ponies, the former being raised in the largest numbers in the Punjab and the latter in Agra.

In the dry regions of the Lower Punjab and Sind camels are still the principal domesticated animals. In a few localities elephants are of great value in performing certain kinds of work, but their number and use are much more limited than is popularly supposed. The grazing industry is best represented in the raising of sheep and goats. These animals are valued chiefly for their wool. Pigs are raised, but their number is not recorded in the government reports. The table on page 64 shows the number of domestic animals by provinces for the year 1911-12, with the sole exception of Bengal, for which complete data are not available. Compared with the figures of a decade earlier a slight increase is found for almost every variety in most of the provinces.

Famines. From the earliest historical times India suffered often and terribly from famines, but this suffering has steadily decreased with better transportation facilities and the greater facilities for irrigation. Under British administration irrigation works have even been extended into districts where the rainfall is usually sufficient. Irrigation, however, sometimes fails, in cases where the precipitation may not be great enough to supply the reservoirs or keep the streams full enough to supply the irrigation canals.

The work of reducing the probability of distress from famines has constituted a large part of the work of the British government in India in recent years. Elaborate preliminary preparations are made in fear of their recurrence. The work is carefully systematized and officered. The country is districted, and in each district an examination is made of such matters as the water supply, the social condition of the people, the probable extent of need in case of famine, and public works. The budget makes annual provision for forest care and improvement and for the care and enlargement of the irrigation systems.

The loss of life from starvation is now much less than formerly, but deaths from diseases which so frequently accompany the famine are generally greater than by actual starvation. One of the most difficult tasks of the government during the famine period is to enforce necessary sanitary regulations. However, taking one year with another for the whole country, the loss of life from famines constitutes but a small per cent of the total death rate. The ravages of disease in India are not peculiar alone to famine periods. The climatic and

sanitary conditions give rise to pestilences which at intervals carry desolation over the country. Hospitals, richly endowed and admirably regulated, supported by government as well as by private munificence, exist in all the large towns; and great efforts are constantly made to bring the benefits of medical skill and knowledge within reach of the poorer classes. In all parts of the country dispensaries have been opened where medicines are given out and patients advised. Several millions of persons are vaccinated annually in India. Mortality is aggravated by the passion of the people for pilgrimages. All ages and both sexes each year travel vast distances for their devotions and die by hundreds on the route.

Manufactures. For centuries India has been noted for its beautiful fabrics and metal work, made chiefly in the houses of the natives. But most native Indian industries are of a primitive type, and in a society so thoroughly impervious to the spirit of progress their modification and improvement have been impossible. Consequently the development of the factory system in England made it possible to manufacture products much more cheaply than could be done by the laborious methods of Indian workmen. In addition, improvements in transportation facilities have enabled European manufacturing centres to command a large part of the Indian market, with the result that in the home market in some localities, and in some outside markets, the Indian products have been almost entirely supplanted, and this has led to an increase in the number of people devoting their attention to agriculture. The enormous growth of the imports of cotton manufactures is suggestive of the extent to which the native industry has been supplanted. The value of cotton manufactures imported into India is now approximately \$200,000,000 annually and exceeds by far the cotton-goods imports of any other country of the world. The exports of cotton yarn, however, amount to about \$33,000,000 annually, mostly going to China and other Oriental countries.

The most important manufacture is that of the coarser grades of cotton. The average number of hands employed in the cotton mills increased gradually from 53,624 in 1883 to 112,000 in 1890 and 221,000 in 1912, while the number of mills increased from 62 in 1883 to 234 in 1912. About three-fourths of this industry centres in the city of Bombay. A similar increase was observed in the jute and hemp industry, which in 1912 employed 201,324 hands, as against 42,797 in 1883. It centres in the region about Calcutta. Among the other more important establishments are woolen, paper, flour, rice, oil, and lumber mills, the breweries, coffee works and indigo and sugar factories. The total number of factories liable to inspection under the Factories Act in 1911 was 2248, employing 629,227 men, 115,090 women, and 47,627 children. The Province of Bengal employed over a third, and Bombay nearly a third, of the total force. Among other manufactured Indian products are silk (including beautiful figured stuffs), various articles of luxury, such as highly wrought work in ivory, gold, silver, copper, and brass, cashmere shawls, etc. In weaving and in carving and inlaying wood and ivory the native artisans are unsurpassed.

Transportation and Communication. The network of railways to be seen on a map of India presents a decided contrast with the

sparsity of railway lines in other parts of Asia or the tropical world. The mileage for British India is three-fifths the total for all Asia. The development of the railway system was prompted by a number of motives and has been prolific and far-reaching in results. The military exigencies, development of the resources of the country, extension of British trade, and humanitarian sentiments or the desire to lessen the horrors of famine have each played varying parts in determining the location of lines and methods of administration. The results show that each of these efforts has been abundantly justified. Closely allied with the influence of the railway system as an economic factor has been its socializing influence—the beginning of the transformation of the native society, a lessening of the rigors of caste, and at least a portend of a reconstructed civilization along more modern and progressive lines.

Railway development in India has been in the main in harmony with a policy laid down as early as 1850 by Lord Dalhousie. This policy comprehended the construction throughout India of a system of grand trunk lines with a uniform gauge, connecting all the large centres of industry and population, and the construction of subsidiary or feeding lines with a narrower gauge and on a less expensive scale. The grand trunk lines were accordingly begun in the early fifties under a system of government guarantee. The constructing companies were guaranteed 5 per cent on the capital invested for a period of 25 years, and at the end of the contract period the government had the right under specified conditions to take possession of the lines. The policy attracted capital to the country and led to a more rapid railway construction than would have been secured by state construction. The guarantee, however, led to some extravagance in expenditure and became a heavy burden to the government. A new policy accordingly was taken by the government in 1863–64, under which assistance was advanced to new lines, which in turn obligated themselves to perform certain duties for the state.

A third policy was introduced in 1870 under which new lines were built and operated directly by the government. The widespread and disastrous famines a few years later made it evident that new lines should be constructed faster than the government could assume financial responsibility for their undertaking and forced it to fall back upon private enterprise. New lines were built without regard to a uniform policy, the government generally extending a guarantee, but for as brief a period as possible. Meanwhile the contract period of four companies had terminated, and new contracts were made for another 25 years, according to which the state, allowing certain concessions, was to share in the surplus income above 5 per cent. But subsequently, at the expiration of other contracts, the lines have been acquired by the state. Though no settled system has yet been adopted for the administration of railways, it will be seen that the greatest mileage is included in the lines belonging to the government but controlled by private companies. In 1912 a little more than half of the total mileage, or 18,107 miles, was represented by government lines operated by companies; 2159 miles were owned by native states and operated by companies; 7018 miles represented state lines operated by the state; 2039 miles were owned and operated

by the native states; 4013 miles were owned and operated by assisted companies; 74 miles were owned and operated by unassisted companies, and there were 74 miles of foreign lines. The total mileage increased from 16,380 in 1890 to 27,565 in 1904 and 33,484 to Jan. 1, 1913. The total capital expended on Indian railways to the end of 1912 amounted to rx. 476,925,000 (£317,950,000). In 1911–12 the net profit to the state, after paying interest and other charges, was £3,787,770.

The number of post offices in 1912 was 18,801, which was an increase of over 75 per cent against 1895, when the number was 10,714. The number of letters handled during the same period increased 145 per cent. The Imperial system of telegraph and the railway system have been united, and there is a uniformity of telegraph charges throughout the whole system, including 78,862 miles of line and 311,034 miles of wire (1913). The mileage of wire increased 55 per cent in the last decade. There are three grades of messages—the urgent, ordinary, and deferred. The charges are less for the messages delivered with the less speed. For a period of 10 years ending in 1912 the government realized an annual average of 2.30 per cent net revenue (based on the capital sum employed) after allowing for all working expenses. The number of paid messages in this year 1912–13 was 15,449,000.

Commerce. From the earliest periods of history India has held high rank in the trade of the world, having been a large producer of commodities that were highly prized in general commerce. The attempts of Portugal, Holland, and France to secure the largest share of India's trade form an important chapter not only of its own history but of that of the world. The desire to find a short route thither by sea furnished much of the impetus given to the spirit of exploration during the fifteenth century, of which the achievement of Vasco da Gama (q.v.) affords a conspicuous example.

In 1600 an English trading company, the East India Company (q.v.), joined in the rivalry and opened the way for the extension of English influence and power over the whole country. For over two centuries trade between England and India increased slowly. After the English East India Company was deprived of its monopoly in 1834 there began an epoch of rapid trade development. The abolition of the inland duties, the assumption of control by the English government, the construction of the Suez Canal, and the improvement of inland transportation have been most influential factors in accelerating this trade movement. The magnitude of the increase since 1834, in which year the total foreign exports by sea were less than £10,000,000, is shown pro tanto by the first table on page 67.

In the year ending March 31, 1914, the imports of merchandise on private account were valued at £122,167,103, and the exports and re-exports at £166,041,434 (preliminary figures). The rate of increase has declined somewhat during the last decade. Since 1834, with few exceptions, the exports have annually exceeded the imports. A large proportion of the Indian foreign trade (about four-fifths of the imports and a little less than three-fifths of the exports) passes through the Suez Canal. Of this the greater share is with the United Kingdom. The figures for 1900 are: imports via Suez

Canal, £47,135,024, by other routes £9,413,838; exports via Suez Canal, £66,742,287, by other routes £33,013,762. Corresponding data are no

textiles. But the factories of Manchester and other foreign places have in a large measure supplanted the hand labor of India. Textiles,

* 1871-72. † 1875-76. ‡ Western Hemisphere, not including West Indies. || Including Hongkong and Treaty Ports.

It will be noticed from the table that the preëminence of the United Kingdom in the trade with India is waning as to exports. They have been reduced to less than a third of the total exports, while the imports from Great Britain are almost two-thirds of the total imports. The increase in the exports from India has been largely to other Oriental countries. The amount of American products sent to India has materially increased, but is still insignificant. The exports accredited to Egypt are intended largely for the Mediterranean trade. Among continental European countries Germany, Austria-Hungary, France, and Belgium are in the lead, the former being first in the amount of imports from India. In Asia, Java, the Straits Settlements, and Japan have a large trade with India.

Two cities, Calcutta on the east and Bombay on the west, have the only good, large natural harbors on the coast, and about three-fourths of the entire trade passes through their ports; the former being more prominent in exports and the latter in imports. Adequate harbor facilities have been secured at great expense at Karachi, and it now serves as a port for the Indus valley region. A harbor has been constructed at Madras and another at Rangoon—the port for the Irrawaddy valley region.

The large increase in commerce during the last century has been accompanied by a radical change in the quality of the trade, and considered from this standpoint the increase has not meant a corresponding growth in the welfare of the country. A large proportion of the trade during the earlier period was in manufactured products, especially manufactures of metals and

dominantly those of raw materials; the imports have become almost wholly manufactured products. As manufactured cotton leads in the imports, so raw cotton for a long time has held high rank among the exports. Cotton exportation received a great impetus during the Civil War in the United States, but it declined materially after the war. In recent years the exports have increased again; in 1913 rice alone surpassed cotton in value. Nearly all the cotton goods are imported from the United Kingdom, but that country receives only a small part of India's exports of raw cotton. The exports of India were formerly distributed among the European countries, but of late years the demand from Japan rapidly increased; in 1911-12 it amounted to £9,475,689. The importation of cotton twist and yarn increased two-thirds during the last decade, and there was a slight decrease in the exports of that article. These exports in 1912 amounted to £5,060,097, over four-fifths going to China and Hongkong.

The other leading imported commodities are hardware, machinery, iron, steel, and copper, mineral oil, railway plant and rolling stock, woolens, and sugar. Great Britain has a practical monopoly for India in the supply of railway material and machinery, and it supplies also the larger part of other metal products, Belgium, of the other countries, sharing most extensively in the trade. Mineral oil is the principal import from the United States, Russia now furnishing comparatively little. Among several exports of relatively great importance, rice—the only export upon which export duties are levied—is the most prominent and fluctuates

the least, reaching an average value in the last 10 years of about £12,000,000. Most of the rice goes to Egypt, the United Kingdom, Ceylon, and the Straits Settlements. During the last quarter of a century there has been a great increase in the exports of oil seeds to Europe, averaging for the last decade about £9,700,000. Exports of hides and skins, jute—raw and manufactured—and raw cotton increased very rapidly during the decade ending with 1913, reaching in that year values of £10,913,818, £33,281,187, and £18,740,816 respectively. Raw hides and skins and jute cloth constitute the principal exports to the United States. The amount of each increased enormously during the decade and far exceeds that sent to any other country. Exports of manufactured jute increased 150 per cent during the decade ending with 1912-13. Nearly all the tea exported (£8,630,952 in 1911-12) goes to the United Kingdom (£6,353,755 in the same year); it has become a formidable competitor with the Chinese product, the total exports of tea from India in 1912 being 279,230,000 pounds against 196,488,000 from China, 192,020,000 from Ceylon, 35,130,000 from Japan, and 23,668,000 from Formosa.

Opium, which is exported to China and the Straits Settlements, is decreasing in amount, the total value for 1913 being £7,481,088. This is largely due to the opposition by the Chinese government to its importation into that country. Exports of wheat fluctuate widely; the value for 1912, which was higher than for any year since 1905, was £8,898,972. Most of the product goes to the United Kingdom. From 1903 to 1913 exports of indigo declined from £803,788 to £146,755. Exports of coffee have also shown a tendency to decline, their value in 1913 being £1,043,503. Spices, which once were a large part of the exports, are now relatively insignificant. Treasure has long constituted one of the most valuable imports and has annually exceeded in amount the exports of treasure for more than half a century. The value for the period 1909-13 averaged over £27,000,000, nearly three-fourths of which was gold. Since the government stopped the free coinage of rupees in 1893 the net imports of gold have been gaining upon those of silver. The exports of gold and silver for the same period averaged over £4,900,000.

The imports and exports by land are not large, the totals for 1913 being respectively £6,919,558 and £6,330,715. Over two-fifths of the former and over one-fifth of the latter were to and from Nepal. The most important land imports were grain, pulse, timber, and provisions, while nearly one-half the exports were cotton goods. Native craft carry on an extensive coastwise trade, particularly along the coast of Bombay. The traffic along this coast amounts to over one-third of the total coastwise trade. The large inland trade increases with the development of means of transportation. The inland and the local trade are very largely in the hands of natives, there being certain sects or castes, as the Parsis of Bombay, who devote themselves especially to this branch of industry.

The foreign trade of India is done mainly in British vessels, the tonnage of these in 1912-13 amounting to 75 per cent of the total. In 1912-13 the total number of ships entered and cleared at the ports of India was 8737, with a tonnage of 17,452,000. This total was greater than that for the corresponding year of either of the two

preceding decades. Germany and Austria-Hungary are the most important of the other nations represented.

Government. By an Act of Parliament which received the royal assent Aug. 2, 1858, Queen Victoria was declared sovereign of India, and various regulations were enacted for the better government of the country. In 1877, in virtue of an Act of Parliament passed in 1876, the Queen was proclaimed Empress of India. The Home Government of India is vested in a Secretary of State for India, who is a member of the English cabinet. He is assisted by an Undersecretary and a council of not less than 10 and not more than 14 members. The Indian Executive Government is administered by a Viceroy or Governor-General, appointed by the crown, and acting under the control of the Secretary of State for India. The Viceroy's term of office is usually five years, and he is assisted by a council of six ordinary members, appointed by the crown. Each of them has charge of a department of the executive. The Viceroy himself retains the oversight of foreign affairs and can overrule a majority vote of his council. The commander in chief is an extraordinary member of the council. This council, whenever it acts as a legislative body, is enlarged. It now has 68 members, 36 being official and 32 nonofficial. Within certain limits the council has power to make laws for all persons in British India, for British subjects in the native states, and for all native Indian subjects in any part of the world.

For purposes of administration, British India is now divided into 15 provinces. They differ in the method of their government. The three provinces of Madras, Bombay, and Bengal are under the rule of governors appointed by the crown and assisted by legislative and executive councils. The executive council consists of only three men. From 18 to 20 others are added to form the legislative council. These bodies communicate only with regard to important matters with the Home Government through the Governor-General. As regards affairs of minor importance, they correspond directly with the Secretary of State for India. The provinces of Behar and Orissa, the United Provinces of Agra and Oudh, the Punjab, and Burma are administered by lieutenant governors appointed by the Governor-General, subject to the approbation of the Secretary of State for India. These officers act without the aid of any executive councils, but have legislative councils of not more than 20 official members, nominated by the Lieutenant Governor on the approval of the Governor-General. There are a number of points upon which the local legislators in India cannot touch, and their proceedings are void if disapproved by the Governor or Lieutenant Governor, the Governor-General, or by the Home Government. The following divisions, viz., Central Provinces and Berar, Assam, Coorg, British Baluchistan, the Andaman and Nicobar Islands, the Northwest Frontier Province, Ajmer-Merwara, and Delhi, are under chief commissioners. There are no local councils for these provinces, such legislation as they may need being supplied by the Governor-General in legislative council. All the foregoing governmental divisions are subdivided into smaller divisions called districts, of which there are in all 267, varying both in size and population. The executive officer in each district is called

the collector, magistrate, or deputy commissioner. This office is remarkable in that its powers extend over every department of administration. The officer has charge of the collecting of the revenue, of education, roads, sanitation, police, and jails, and he is judge both of first instance and of appeals.

It has been the policy of the British government to try to awaken a sense of civic responsibility among the natives, and it has encouraged the creation of the necessary machinery for local self-government. Much difficulty has attended the effort, owing to the absolute dominance which class distinction holds over the social order, making almost impossible the development of the idea of a mutual community interest. Some progress, nevertheless, is being made. Every province of India has since 1860 secured laws which place the administration of municipal affairs in the hands of local bodies. In small places these bodies are nominated from among the townsfolk, but in large places they are mostly elected. Under specified regulations the local bodies may raise funds or receive grants of public money for local purposes. In 1912 there were 714 of these municipal towns, containing an aggregate population of about 17,000,000. The total income of these towns for the year mentioned was about £8,600,000. The rural regions have also been supplied with district and local boards for purposes of self-government. In 1912 there were 731 of these boards, including a total of 5780 elected members and 7098 ex-officio and nominated members. The income of these rural regions for the year mentioned was £3,430,000. The probability of the development of a national representative native government is scarcely conceivable. The idea of a common country or a national life does not exist. The masses are ignorant of even the geographical conception implied in the name India. There is, it is true, a national native congress, which meets annually, but it is scarcely representative in any true sense or indicative of any popular national tendencies.

There are high courts of jurisdiction at Calcutta, Madras, Allahabad, and Bombay, appointments being made to them by the Home Government. These courts have a general oversight of the lower courts and are courts of appeal, but there is an ultimate appeal to the judicial committee of the Privy Council in England. The Punjab has a chief court, and the Central Provinces and Berar, Oudh, Northwest Frontier Province, Coorg, Sind, Upper Burma, and Chota Magpur have each a judicial commissioner. Lower Burma has a chief court. The great majority of the magistrates in the courts of original jurisdiction and of the civil judges are natives. Europeans have certain privileges in court not possessed by natives.

Finance. In the consideration of Indian finance regard must be given to the denomination in which the estimates are made. If estimated in pounds, as in the table on page 70, there is an apparent decrease in most of the noncommercial items of revenue and expenditure. On the contrary, if estimated in rupees, most of them show a very decided increase. The depreciation in the value of the rupee, as measured in gold, accounts for this difference; but since the burden upon the taxpayer is determined by the local purchasing power of the rupee, the question of the effect upon the welfare of the native is a subject of dispute.

Leaving out of account the productive enterprises of the government, which are largely self-supporting, it will be seen that customs and excise play a minor part in the support of the government, while land revenue has contributed on an average considerably over a fourth of the total amount. The stamp, salt, and opium revenues also play a conspicuous part. The land revenue, however, is not absolutely nor relatively so important as formerly. This revenue partakes of the nature of a rent as well as of a tax. The rent varies with soil and the distance from the town, but averages about 1s. 10d. per acre for the total acreage of cultivated land. The opium revenues are secured mainly from the monopoly of the industry in east India, and the export duty collected in west India. An increase in the salt duties in 1888 established the rate of 2½ rupees per maund (see paragraph on *Weights and Measures* below), but the rate has since been reduced to 1 rupee (March 20, 1907). The collections from stamps are principally obtained from court fee stamps. The largest item in the excise revenue is that collected from the manufacture of spirits, but other sources, as, e.g., the monopoly for the sale of liquors and intoxicating drugs, help to swell the amount. The interests of British trade have determined the policy of keeping the import duties—especially those on cotton goods—at a minimum figure, though the natives have at the same time demanded tariff protection. The general customs duties of 5 per cent existing prior to 1882 were abolished in that year, except those on salt, opium, wine, beer, spirits, and arms. In 1894 a 5 per cent ad valorem was reimposed, except on machinery and a few other articles; but two years later the duty on woven cotton goods was reduced to 3½ per cent ad valorem, and cotton yarn was exempted from duty. A corresponding excise duty is levied on the products of Indian cotton mills. From 1886 to 1903 an income tax was assessed upon incomes exceeding 500 rupees; in the latter year the taxable minimum was raised to 1000 rupees.

In the last two decades of the nineteenth century the budget yielded a surplus for 12 years of the period and showed a deficit for eight years. The heaviest drain upon the Imperial Exchequer is made by the military charges. They are followed closely by the cost of the civil service. Both of these items, according to the consensus of native opinion, are unnecessarily burdensome upon the country. The army charges are irritating because the natives consider the army too large, and particularly because of the large proportion of British soldiers who monopolize most of the best positions, and whose salaries and pensions are largely taken or sent out of the country. The civil service excites native criticism because of the practical monopoly exercised by the English over the higher offices and the excessive salaries attached to them. A few English officers receive an aggregate remuneration considerably greater than that given to the numerous native minor officials. The control of the opium, customs, post office and telegraph, tributes, mint and currency, receipts and the expenditure under the heads of army and military works, political relations, public debt, and certain trunk railways, is retained by the central government. The management of all provincial revenues and some of the Imperial revenues is delegated to the local governments.

The accompanying table gives a statement of the average annual expenditure for the two decades indicated and the year 1911-12:

taxation was greatly increased in consequence of the great fall in the value of silver, the Indian revenues being raised in silver, while

The total average for the decade 1871-80 was £55,000,000; for 1881-90, £75,000,000; and for 1891-1900, £62,800,000. The total for the year 1912 was £100,580,799.

Debt. The permanent debt of India gradually increased from £33,577,414 in 1842 to £51,327,958 in 1857, when it rapidly grew in consequence of the Indian mutiny, and stood in 1862 at £97,037,062 and gradually increased to £276,295,677 in 1912. Of this last amount, £93,309,080 was held in India and £182,986,597 in England. The greater part of the debt in India bears interest at the rate of 3½ per cent, and about one-half the debt in England bears interest at the same rate, the remainder paying interest at the rate of 3 and 2½ per cent. Besides the above there were various special loans and other obligations assumed in India for savings banks, departmental and judicial deposits, etc., which brought the total liabilities up to £303,680,800 in 1913. The total interest for 1912, amounting to £9,884,812, was distributed as follows: railways, £6,664,210; irrigation, £994,235; ordinary debt, £1,435,152; and other obligations, £602,583.

Currency. In British India accounts are kept in rupees, annas, and pies—16 annas making one rupee and 12 pies making one anna. Beginning with the early seventies, the rupee was subject to great fluctuation in value, with a general downward tendency. The burden of

great that the number of rupees raised by the government had to be increased by one-half. The financial embarrassment thus caused led the government in 1892, when the exchange value of the rupee sank to ls. 1d., to consider a plan for the closing of the Indian mints to the coining of silver. In June, 1893, a law to this effect was passed, and the rate of ls. 4d. for the rupee was established as the gold price of silver, provision being made that when the rupee rose to this value the mints should be reopened to the coinage of silver. The value of the rupee gradually rose, and, so far as the government was concerned, the financial conditions greatly improved. But complaint was made that the native growers and the European planters in India were suffering severely from the change. It was argued that these classes were obliged to pay labor on the old scale, in spite of the appreciation of the currency. Hence, while industrial expenses remained nominally the same, the employers received lower profits. Heavy losses fell also upon the natives, who as times grew hard were obliged to turn their hoards of silver into money. Finally, in the spring of 1898, a currency committee was appointed to investigate the monetary situation in India. This committee reported, in July, 1899, in favor of maintaining the gold standard and making it more effective; and to this end a law was passed in September

of the same year. Since 1899 the value of the silver rupee has been stable at the rate fixed—1s. 4d. (32.4 cents). The coinage of rupees, which for some years after 1893 almost ceased, became large in 1900-01, and the profit on the coinage was set aside as a special gold reserve fund to be used in maintaining the rate of exchange between Great Britain and India. There is a comparatively small amount of paper money in circulation in India. It is legal tender within certain limited districts. The amount outstanding in March, 1912, was 613,625,095 rupees, about two-thirds of which was in the districts of Calcutta and Bombay.

According to the Indian money system, 100,000 rupees equal 1 lakh, and 100 lakhs equal 1 crore. Hence a sum that would be read in terms of rupees only, according to the English method, would, according to the Indian method, be differently punctuated and read in terms of both the larger and the smaller denominations. To illustrate: the sum 37884517000 rupees would in English read 37,884,517,000 rupees, but in the Indian notation it would be written 3,788,45,17,000 and read "Three thousand seven hundred eighty-eight crores, forty-five lakhs, seventeen thousand rupees." In Indian money estimates sums are often given in tens of rupees, the abbreviation being rx.

Civil Service. The administrative offices are largely filled through civil-service appointments. Candidates taking the examination required to secure a position must be under 24 years of age. The successful candidate is then on probation for a year in England, during which period certain requirements are to be fulfilled, as, e.g., the learning of the Indian law.

Defense. The supremacy of the British sea power practically guarantees India from invasion by way of the sea, and the Himalaya Mountains perform a like service for a great part of the north frontier. The main interest in the defense of India centres about the northwest frontier, which is the historic gateway for invasions into India. In the last two decades of the nineteenth century the British adopted a more active frontier policy. They have established outposts and fortifications commanding the mountain passes that communicate with the west and north and more securely defend the Trans-Indus region. The British have a post of observation at Chitral and possess an "influence" at Gilgit which enables them to keep informed as to the Hindu Kush passes. Farther south the Swat valley is in the hands of the British. The important Khyber Pass (q.v.) is open, and the large garrison stationed at Peshawar serves to protect it. Continuing south, the Kuram and the Tochi valleys are controlled by the British, as are also the Gunal Pass and the Zhob valley. Quetta has been made a strong defensive point, as has also Sakkar—the city on the Indus where the railroad crosses to the westward. A number of posts along the earlier frontier line farther east are still maintained; others have been abandoned. The scheme of defense has led to the construction of railroads for military purposes, one of which extends to New Chaman, the farthest outpost on the Afghan frontier. These lines now make it possible quickly and easily to transport the soldiers to the different frontier strongholds.

The threatening approach of the Russians to the Indian frontier has established an excuse

for the British to maintain a large army. The experience of the Sepoy rebellion has led them to increase the proportion which the British troops hold to the total military force, the intention being that the latter shall constitute one-third of the total number, and that the artillery shall be almost wholly British. The native soldiers are drawn largely from a few tribes, such as the Sikhs, Gurkhas, Rajputs, and Jats, who are the warrior races of the country and are much more efficient as soldiers than are the masses of the population. Class distinctions are recognized, and the different units in the army organization are composed of homogeneous elements. Through the improvement of sanitary conditions, and the exercise of greater caution in locating British soldiers, fatalities are of much less frequent occurrence than formerly. The native states still maintain military forces, but the British have succeeded in their effort to have their number reduced and brought more or less under their own control. For a statement concerning the organization and statistics of the army, see UNITED KINGDOM, *Army*.

Weights and Measures. The unit of weight commonly used is the maund, but it varies greatly in amount, being equivalent to 82 $\frac{2}{7}$ pounds avoirdupois in Bengal, only about 28 pounds in Bombay, and 25 pounds in Madras. The tola, a small unit, is equivalent to 180 grains. In Bengal there is a unit of measure called the gaz, equivalent to 36 inches. An Act was passed in 1871 to establish a uniform decimal system of weights and measures, but it has never gone into operation.

Population. India is one of the most densely populated countries, containing between one-fifth and one-sixth of the estimated population of the world. In 1911 the number of inhabitants per square mile was 175, as against 27.14 for the United States. The population is most unevenly distributed, nearly two-fifths being found in the valley of the Ganges. As shown in the table, the density is greatest in the Province of Bengal, 578 per square mile, and in Behar, 561. The density of the population corresponds in a general way to the capacity of the different regions to support life, yet there are noteworthy exceptions, as in Assam and Lower Burma, each of which could easily support a much more numerous population than it now does. In most districts the population presses closely upon the limits of the means of subsistence, and cannot increase greatly so long as agriculture continues to be almost the sole dependence. There has been generally an increase, and in many places a very marked increase, of population since the British took possession. Prior to that time numerous wars, together with famine, plague, and pestilence, tended to check augmentation. The instability of the government discouraged industrial enterprise, and much land possible to cultivate was left waste. Under British protection such land has been largely reclaimed, and the productive capacity of the country greatly increased.

The first attempt of the British to secure a complete census was made in 1872, when the total population was estimated to be 240,931,000. The returns for certain regions were only estimated, and were generally rendered uncertain through the lack of confidence on the part of the natives in the purpose of the government. In subsequent enumerations there have been

greater confidence on the part of the people and a corresponding increase in the accuracy of the returns. The total population for 1901 was 294,361,056, and that for 1911, 315,156,396. It should be remembered that certain additions of territory have augmented slightly this increase. The gain during the decade 1891-1901 was 4.7 per cent in the provinces, while the states showed a decrease of 5 per cent. The gain in the provinces of the last decade was 5.5 per cent; the population of the native states increased 12.9 per cent, including the new territory. Decreases were shown chiefly in the Punjab. The contrast shown above between one period and the other and between one region and another is largely attributable to the variable agricultural conditions.

The following is a table of the area and population of India and its dependencies:

	Area in square miles	1911	1901

† See article INDIA, NATIVE STATES OF.

Aden, on the Arabian coast, with an Arabian protectorate embracing 15,500 square miles, and Socotra, a dependency of Aden, are officially included within the Empire of India.

A striking characteristic of the population is that it is so largely rural. Estimates show that about nine-tenths of the total belong to this class. This is true of even the most densely populated regions. The largest city in the most densely populated division of Bengal (Patna) has but 136,000 inhabitants. It must be understood, however, that the rural population is everywhere gathered in villages which may contain only a few families or may number thou-

sands. The country had not many large cities until the period of commercial development brought about by the British. Commerce has occasioned an immense growth in Calcutta and Bombay, but except these cities Madras and Hyderabad alone exceed half a million each. (See table below.) Another peculiarity is the large proportion of males compared with European countries. The great privacy to which the females are subjected, particularly among the Mohammedans, and the aversion to intrusion on their domestic privacy, may serve partly to account for this discrepancy. Statistics for famine districts show that in these regions there is a greater decrease in the male population than the female. It is generally accepted that women withstand the privations of famine better than men.

Education. Education on the part of England in India has been carried on in the face of many serious obstacles and under complex conditions peculiar to the country. Social, religious, and racial distinctions, solidified in the system of caste, were so thoroughly interwoven with the whole of the life that they circumscribed the scope and modified the methods of English instruction. British education has never had to deal in India with the implanting of Western culture on an Oriental people having no culture of their own, but with the superimposing of one system of culture upon another more philosophically profound in its sphere, and upon a people who cherished an educational lore that antedated by far the one offered them in its stead. A system of education such as it was and restricted to the sanctioned castes—chiefly the Brahman—had never been wanting in India. When the English began to introduce the new system, a bitter dispute arose as to how much recognition should be given this ancient and native learning, e.g., whether the English classics should supplant the Sanskrit and Arabic, and whether the English or the vernacular should be used as a medium of instruction. These questions were finally decided in favor of European as against Oriental knowledge, and in favor of the vernacular as a medium, though English became prominent in advanced instruction, and generous provisions were made to bring it within reach of all who desired it.

This system, which was finally adopted and which in the main continues to-day, was outlined by Lord Halifax in 1854. An investigating commission, reporting in 1883, approved the system, but favored emphasizing certain features, such as the encouragement of native schools and of primary and female education, to the end that the masses might share more liberally in the benefits of learning. Religious instruction has never been permitted in the state schools—a policy different from that pursued by the English government in the schools of England, and which has generally been opposed by the clerical and missionary interests. At the same time the state advances financial aid to missionary schools without discrimination as to sect and endeavors to avoid competition with them by not establishing schools where the missionary schools already provide adequate facilities. Both missionary and state schools are under the supervision of state inspectors and must conform to certain regulations. Grants in aid consist of salary grants, results' grants, building grants, etc. The state educational system is complete in scope, including primary, secondary, and collegiate instruction, and is systematically organized and administered. Normal schools are maintained in every province. There are five universities—Calcutta, Madras, Bombay, the Punjab, and Allahabad. They consist of examining bodies only, but have a large number of affiliated colleges. The number of persons receiving instruction has greatly increased during the past half century. The field of education is, however, limited. The attendance is largely from the middle classes, especially in the state schools, and while the missionaries reach a larger proportion from the lower castes, the entire number is small in comparison with the number of persons to whom opportunities for education never come.

Two criticisms in particular have been urged against the present system. The first is the relative overemphasis of higher education. This emphasis has been in accordance with the "filtering down theory," under which it was thought that the masses could be reached best through the agency of a highly educated native class. This theory in practice, however, leaves the masses untouched. The other criticism is that too much attention is given to classical and not enough to industrial instruction, and that accordingly the pupils are not fitted to take an active part in the industrial transformation which the country needs.

In 1911-12 there were 2,245,468 pupils in public institutions under public management, 3,892,775 pupils in public institutions under private management (aided and unaided), and 657,728 in private institutions. Of these 4116 were in British Baluchistan. Of the total 6,791,855 in India proper, only 953,989 were females. The average daily attendance represents about 77 per cent of the total number of pupils, but the relation of the average attendance to the total enrollment differs greatly in the different provinces. The grand total of all pupils in public and private institutions increased from 3,692,000 in 1890 to 6,795,971 in 1912. Native Christian pupils numbered 197,481, Hindu 4,406,983, Mohammedan 1,562,007, Europeans and Eurasians, 34,958, and others (mainly Buddhists), 600,254 (data for March 31, 1912). In public institutions there were

over 95 per cent of the pupils studying the vernacular language; the percentage of those studying the classical languages and the English language was small. Nearly 28 per cent of the proceeds used for education was derived from fees, the remainder being divided between provincial, local, and municipal funds and other sources. The total expenditure on public instruction increased gradually from £2,210,563 in 1894-95 to £5,250,922 in 1911-12.

Important changes of educational policy in 1913, apart from increased grants to elementary schools, were foreshadowed with respect to the universities. It was officially promised that a university at Dacca, with 11 constituent, residential, and teaching colleges, is to be organized as a type intended to supersede the existing universities, which consist of affiliated, non-resident examining colleges. This change would be an approximation to the lines on which Oxford and Cambridge universities are organized. Progress was also made in the work of giving native educational institutions of importance, such as the Mohammedan College at Aligarh, a university standing, and the establishing of universities also at Benares, Rangoon, Patna, and other places was discussed. In these attempts any design of interfering with religious prejudices has been entirely excluded.

RELIGION

From the earliest times India has been a land of numerous religions, and the creeds professed there to-day are almost as great in number as they are varied in spirit and character. The majority of the people acknowledge Hinduism or Brahmanism (q.v.) as their faith. In the census of 1911 their number is given as over 217,000,000. Next in proportion, claiming about a third of this number, is Mohammedanism, which was introduced into India in the eleventh century and spread with great rapidity. Its adherents claim no less than 66,000,000 souls throughout India, their numbers being largest in the north. Together these religions make up the faith of approximately 90 per cent of the entire population. The number of Buddhists is given at over 10,000,000; they are nearly all inhabitants of Burma. Statistics show that the number of nature worshipers, who are roughly classed under the head of animistic, is over 10,000,000, while the Sikh religion is professed by over 3,000,000 individuals. Besides these there is a large representation of Jains (over 1,000,000) and a scattering number of Parsis (about 100,000). The spread of Christianity among the natives has been extensive, for the number is considerably above 3,000,000 souls. There are nearly 21,000 Jews. Separate articles will be found devoted to the most important branches of Indian religions. (See BRAHMANISM; BUDDHISM; HINDUISM; JAINISM; MOHAMMEDANISM; PARSIS; SIKHS.) The results of the religious survey of India in the census of 1911 present the statistics on page 74. The first table is itemized by provinces for British India, with totals for native states and agencies. The second is for the summary of the Christian population.

For convenience of treatment, the religious development of India may be divided into the following periods: first, the Vedic era, or earliest religious beliefs of the Aryan Hindus; second, Brahmanism proper, or the faith incul-

cated by the priests in the religious books called Brahmanas, and in the philosophical Upanishads (q.v.); third, the period of the two great religious reforms, Buddhism and Jainism (q.v.),

works known under the name of *Puranas* (see PURANA) and *Tantras* (see TANTRA); their commentaries and sectarian literature; the material for the developments after 1500 B.C. must be

Hindu sectarian outgrowths and the tendencies of the popular faiths. The *Rig-Veda* and *Atharva-Veda* represent the literature of the earliest period; the *Yajur-Veda* is nearer to the second religious phase, or the Brahmanism of the priests; the sacred books of the Buddhist and Jainistic reformations are written respectively in Pali (q.v.) and Prakrit (q.v.); again, the great Sanskrit epic poems of the *Mahābhārata* and the *Rāmāyana* represent both the purer Brahmanic stage and the later sectarian tendencies; for the latter our chief source of information is that class of mythological

gathered from various sources. With reference to the time of these eras we can only say in a general way that the Vedic period runs from a very early period down to about 1000 B.C. or a couple of centuries afterward, and merges into the Brahmanic age, which closes perhaps about 500 B.C. The age of Buddhism was from about 500 B.C. to 500 A.D., and the period of epic Hinduism, according to Hopkins, covers about the same centuries. From 500 to 1500 A.D. is the era of Brahmanic counterreforms and of sectarianism, while since that time unifying tendencies have been more operative than ever before. It is necessary at the outset, however, to guard the reader against attempting to connect dates with the earlier of these periods. It has not been uncommon for writers on this subject to assign thousands of years before the Christian era as the starting points of various phases of Hindu antiquity; others, more cautious, marked the beginnings of certain divisions of Vedic works with 1200, 1000, 800, and 600 years B.C. The truth is that, since Hindu literature itself is almost without known dates, owing either to the peculiar organization of the Hindu mind or to the convulsions of Indian history, the present condition of Sanskrit philology does not afford the scholar the requisite resources for embarking with any chance of success in such chronological speculations. The question of Hindu chronology will be more particularly considered in the article VEDA. In the meantime the utmost stretch of assumption which in the present condition of Sanskrit philology it is permitted to make is that the latest writings of the Vedic class are not more recent than the second century before Christ. A like uncertainty hangs over the period at which the two great epic poems of India were composed, although there is reason to surmise that the lower limits of that period did not reach beyond the beginning of the Christian era. The Puranic period, on the other hand, scholars are gen-

erally agreed to regard as corresponding with part of our mediæval history, or roughly from 500 to 1500 A.D., although the material in these writings is often much older in its content.

Vedic Religion. If the Rig-Veda—the oldest of the Vedas, and one of the oldest literary documents in existence—coincided with the beginning of Hindu civilization, the popular creed of the Hindus, as depicted in some of its hymns, would reveal not only the original creed of this nation, but throw a strong light on the original religion of humanity itself. Unhappily, however, the imagination, indulging in such an hypothesis, would have little foundation to work on. There are, of course, numerous traces in the Rig-Veda of survivals of earlier animistic beliefs, of spiritism, fetishism, and ancestor worship; but the Hindus, as depicted in these hymns, are far removed from the starting point of human society; they may, in fact, fairly claim to be ranked among those already civilized communities experienced in arts, defending their homes and property in organized warfare, acquainted even with many vices which are found only in an advanced condition of artificial life. Yet, in examining the ideas expressed in the greatest number of the Rig-Vedic hymns, it cannot be denied that they are neither ideas engendered by an imagination artificially influenced nor such as have made a compromise with philosophy. The Hindu of these hymns is essentially engrossed by the might of the elements. The powers which turn his awe into pious subjection and veneration are: *Agni* (q.v.), the fire of the sun and lightning; *Indra* (q.v.), the god of the storm and the thunder; the *Maruts* (q.v.), or winds; *Surya* (q.v.), the sun; *Ushas* (q.v.), the dawn, whose hymns are among the most beautiful; and various kindred manifestations of the luminous bodies, and nature in general. He invokes them, not as representatives of a superior being, before whom the human soul professes its humility, nor as superior beings themselves, which may reveal to his searching mind the mysteries of creation or eternity, but because he wants their assistance against enemies—because he wishes to obtain from them rain, food, cattle, health, and other boons. He complains to them of his troubles, and reminds them of the wonderful deeds they performed of yore, to coax them, as it were, into acquiescence and friendly help; in fact, he seeks them more for his material than for his spiritual welfare. What we should call the ethical side is less pronounced. Sin and evil, indeed, are often adverted to, and the gods are praised because they destroy sinners and evildoers; but one would err in associating with these words our notions of sin or wrong. A sinner, in these hymns, is rather a man who does not address praises to those elementary deities, or who does not gratify them with the oblations they receive at the hands of the believer. He is the foe, the robber, the demon—in short, the borderer infesting the territory of the “pious” man. The latter, in his turn, may injure and kill, but, in adoring *Agni*, *Indra*, and their kin, he is satisfied that he can commit no evil act. Yet some of the hymns, especially those addressed to the super-sensuous, transcendental god *Varuna* (q.v.), the guardian of order and right, seem to imply the strongest sense of moral obligation and of sin as we understand the word. On the whole, it may also be said that the internal condition of the Hindu community, the features of which

may be gathered from the hymns, seems to bespeak union and brotherhood among its members; and the absence, in general, of hymns which appeal to the gods for the suppression of internal dissensions or public vices, bears testimony apparently to the good moral condition of the people whose wants are recorded in these songs.

It may be imagined that the worship of elementary beings like those we have mentioned was originally a simple and harmless one. It is true that the sacrifice of sheep and goats, bulls, and even horses, was known, but it was not general. By far the greatest number of the Rig-Veda hymns know of but one sort of offering made to these gods; it consists of the juice of the soma (q.v.), or moon plant, which, pressed out and fermented, was an exhilarating and inebriating beverage, and for this reason, probably, was deemed to invigorate the gods and to increase their beneficial potency. It was presented to them in ladles or sprinkled on the sacred *Kusa* grass. Clarified butter, too, poured on the fire, is mentioned in several hymns as an oblation agreeable to the gods, and it may have belonged to the primitive stage of the Vedic worship. There were no temples of the divinities and in early times no images. The altar, if used, was very simple. The gods easily gathered from the atmospheric region round about.

There is a class of hymns, however, to be found in the Rig-Veda which already depart materially from the simplicity of the conceptions we are referring to. In these the instinctive utterance of feeling makes room for the language of speculation; the allegories of poetry yield to the mysticism of the reflecting mind; and, the mysteries of nature becoming more keenly felt, the circle of beings which overawe the popular mind becomes enlarged. Thus, the objects by which *Indra*, *Agni*, and the other deities are propitiated become gods themselves; soma, especially, the moon plant, with its juice, is invoked as the bestower of all worldly boons. The animal sacrifice, the properties of which seem to be more mysterious than the offerings of soma or of clarified butter, is added to the original rites. Mystical allusions and symbolic expressions begin likewise to crop out in the later portions of the Veda, revealing the fact that the Hindu mind was no longer satisfied with the adoration of the elementary or natural powers, and giving evidence that the religion was beginning to deal with the problem of the mysteries of creation. In the tenth and last book of the Rig-Veda, speculations are found with regard to the origin of the universe, the whence and the whither, the who and the what. As soon as the problem implied by hymns like these was raised in the minds of the Hindus, Hinduism must have ceased to be the worship of only elementary powers. Henceforward, therefore, we see it either struggling to reconcile the latter with the idea of one supreme being or to emancipate the inquiry into the principle of creation from the elementary religion recorded in the oldest portion of Vedic poetry.

Brahmanism Proper. The development from the older into the newer, from the elemental and natural into the artificial, ritualistic, and philosophic, or from the early Rig-Veda stage of religion into Brahmanism, may be traced through the *Yajur-Veda*, or book of knowledge of the sacrifice and the ritual. The priestly

power of the Brahmans is supreme in this sacred book, and in the Yajur-Veda may be seen the beginnings of Brahmanism, as shown in its fuller development in the branch *Brahmanas* (see VEDA) and in the philosophical writings termed *Upanishad*. (See UPANISHAD.) In the *Brahmanas*—a word of the neuter gender, and not to be confounded with the similar word in the masculine gender, denoting the first Hindu caste—the mystical allegories which now and then appear in what we have called the second class of Vedic hymns, are not only developed to a considerable extent, but gradually brought into a systematic form. Epithets given by the Rig-Veda poets to the elementary gods are made the bases of legends, assuming the shape of historical narratives. The simple and primitive worship mentioned in the hymns becomes highly complex and artificial. A ponderous ritual, founded on those legends and supported by a far more advanced condition of society, is brought into a regular system, which requires a special class of priests to keep it in a proper working order. Some of the Vedic hymns seem to belong already to the beginning of this period of the Brahmana worship, for in the second book of the Rig-Veda several such priests are enumerated in reference to the adoration of Agni, the god of fire; but the full contingent of 16 priests, such as is required for the celebration of a great sacrifice, does not make its appearance before the composition of the *Brahmanas* and later Vedas. Yet, however wild many of these legends are, however distant they become from the earlier veneration of the elementary powers of nature, and however much this ritual betrays the gradual development of the institution of castes—unknown to the hymns of the Rig-Veda—there are still two features in them which mark a progress of the religious mind of ancient India. While the poets of the Rig-Veda are chiefly concerned in glorifying the visible manifestations of the elementary gods, in the *Brahmanas* their ethical qualities are put forward for imitation and praise. Truth and untruth, right and wrong—in the moral sense which these words imply—are not seldom emphasized in the description of the battles fought between gods and demons; and several rites themselves are described as symbolical representations of these and similar qualities of the good and evil beings, worshiped or abhorred. A second feature is the tendency, in these *Brahmanas*, to determine the rank of the gods, and, as a consequence, to give prominence to one special god among the rest; whereas in the old Vedic poetry, though we may discover a predilection of the poets to bestow more praise, e.g., on Indra and Agni than on other gods, yet we find no intention on their part to raise any of them to a supreme rank. Thus, in some *Brahmanas*, Indra, the god of the firmament, is endowed with the dignity of a ruler of the gods; in others, the sun receives the attributes of superiority. This is no real solution of the momentous problem hinted at in the Vedic hymns, but it is a semblance of it. There the poet asks “whence this varied world arose”; here the priest answers that “one god is more elevated than the rest,” and he is satisfied with regulating the detail of the soma and animal sacrifice according to the rank which he assigns to his deities. See BRAHMANISM.

A real answer to this great question is attempted, however, by the theologians who ex-

plained the “mysterious doctrine,” held in the utmost reverence by all Hindus, and laid down in the *Upanishad* (q.v.). It must suffice here to state that the object of these important works is to explain not only the process of creation, but the nature of a supreme being and its relation to the human soul. In the *Upanishads*, Agni, Indra, Vayu, and the other deities of the Vedic hymns become symbols to assist the mind in its attempt to understand the true nature of the one absolute being, and the manner in which this being manifests itself in its worldly form. The human soul itself is of the same nature as this supreme or great soul; its ultimate destination is reunion with the supreme soul, and the means of attaining that end is not the performance of sacrificial rites, but the comprehension of its own self and of the great soul. The doctrine which at a later period became the foundation of the creed of the educated—the doctrine that the supreme soul, or (the neuter) Brahman, is the only reality, and that the world has a claim to be noticed only in so far as it emanated from this being, is already clearly laid down in these *Upanishads*, though the language in which it is expressed still adapts itself to the legendary and allegorical style which characterizes the Brahmana portion of the Vedas. The *Upanishads* became thus the basis of the enlightened faith of India. They are not a system of philosophy, but they contain all the germs whence the three great systems of Hindu philosophy arose; and like the latter, while revealing the struggle of the Hindu mind to comprehend the one supreme being, they advance sufficiently far to express their belief in such a being, but at the same time acknowledge the inability of the human mind to understand its essence.

From the Brahmanic religion with its theology, its sacrifice, its stifling ritual, and widespread priestcraft, there was bound later to come a revolt. Premonitory symptoms of this are plainly to be seen in the *Upanishads*, which prepared the way for emancipation. The reform wave swept over India in the two great reactionary movements of Buddhism and Jainism. The character and extent of these reformatory movements are spoken of under special articles and need not be discussed here. The eastern part of India was the source from which they sprang, but Jainism gradually spread westward especially, and Buddhism expanded itself over other parts of India to Ceylon and far beyond the borders of Hindustan.

Hinduism. In spite of the reform movements the old Brahmanism was not destined to disappear. But it was forced to undergo changes which were largely due to the influence of the protesting faiths of Buddhism and Jainism. During the very time while they were flourishing it quietly but firmly held its own, was consciously or unconsciously being remodeled and adjusted to altered conditions and environments, and was gradually but surely changing into the newer Hinduism, with all that restoration meant. It is this changing Brahmanism and earlier Hinduism in its sectarian developments that is presented to us in the great Hindu epics.

The epic period of Hinduism is marked by a similar development of the same two creeds, the general features of which we have traced in the Vedic writings. The popular creed strives to find a centre round which to group its imaginary gods, whereas the philosophical creed finds

its expression in the groundworks of the Sankhya, Nyaya, and Vedanta systems of philosophy. In the former we find two gods in particular who are rising to the highest rank, Vishnu and Siva, the Vedic Rudra; for *Brahmā* (the masculine form of Brahman), though he was looked upon now and then as superior to both, gradually disappears and becomes merged into the philosophical *Brāhmā* (the neuter form of the same word), which is a further evolution of the great soul of the Upanishads. In the *Rāmāyaṇa* the superiority of Vishnu is admitted without dispute; in the great epos, the *Mahābhārata*, however, which, unlike the former epos, is the product of successive ages, there is an apparent rivalry between the claims of Vishnu and Siva to occupy the highest rank in the pantheon. It is one of the difficult problems of Sanskrit philology to unravel the chronological position of the various portions of this work, to lay bare its groundwork, and to show the gradual additions it received, which must be done before it will be possible to determine the successive formation of the legends which are the basis of classical Hindu mythology. A great deal has been done, however, and this much seems to be clear even already, that there was a predilection during this epic period for the supremacy of Vishnu, one of whose incarnations was the much-beloved Krishna (q.v.), and that the policy of incorporating rather than combating antagonistic creeds led more to a quiet admission than to a warm support of Siva's claims to the highest rank.

The philosophical creed of this period adds little to the fundamental notions contained in the Upanishads, but it frees itself from the legendary dross which still imparts to those works a deep tinge of mysticism. On the other hand, it conceives and develops the notion that the union of the individual soul with the supreme spirit may be aided by penances, such as peculiar modes of breathing, particular postures, protracted fasting, and the like; in short, by those practices which are systematized by the Yoga doctrine. The most remarkable epic work which inculcates this doctrine is the celebrated poem *Bhagavadgītā*, which has been wrongly considered by European writers as a pure Sankhya work, whereas Sankara, the great Hindu theologian who commented on it, and other native commentators after him, have proved that it is founded on the Yoga belief. The doctrine of the reunion of the individual soul with the supreme soul was necessarily founded on the assumption that the former must become free from all guilt affecting its purity before it can be remerged into the source whence it proceeded; and since one human life is apparently too short for enabling the soul to attain its accomplishment, the Hindu mind concluded that the soul, after the death of its temporary owner, had to be born again, in order to complete the work it had left undone in its previous existence, and that it must submit to the same fate until its task is fulfilled. This is the doctrine of metempsychosis (*saṃskāra*), which is a logical consequence of a system which holds the human soul to be of the same nature as that of an absolute God. The beginning of this doctrine may be discovered in some of the oldest Upanishads, but its development belongs to the epic time, where it pervades the legends and affects the social life of the nation. See METEMPSYCHOSIS.

Puranic Hinduism. The Puranic period, with its various cults, comprises the development of the newer Hinduism from about the sixth century of our era to the sixteenth century. The *Puranas* (see PURANA) and the *Tantras* (see TANTRA) represent this phase of the religion which succeeded epic Hinduism and supplanted Buddhism. The old Brahmanic vigor was not dead, but was ready to revive. In the eighth century Kumarila strengthened it on the ritualistic side, and the great Vedantist Sankara in the ninth century added to its power on the philosophic side. But the Puranic period of Hinduism was a period of decline, so far as the popular creed is concerned. Its pantheon is nominally the same as that of the epic period. Brahma, Vishnu, and Siva remain still at the head of its imaginary gods; but whereas the epic time is generally characterized by a friendly harmony between the higher occupants of the divine spheres, the Puranic period shows discord and destruction of the original ideas whence the epic gods arose. Brahma withdraws, in general, from the popular adoration, and leaves Vishnu and Siva to contest in the minds of their worshipers for the highest rank. The elementary principle which originally inhered in these deities is thus completely lost sight of by the followers of the Puranas. The legends of the epic poems relating to these gods become amplified and distorted according to the sectarian tendencies of the masses; and the divine element which still distinguishes these gods in the *Rāmāyaṇa* and *Mahābhārata* is now more and more mixed up with worldly concerns and intersected with historical events, distorted in their turn to suit individual interests. Of the ideas implied by the Vedic rites, scarcely a trace is visible in the Puranas and Tantras, which are the textbooks of this creed. In short, the unbridled imagination which pervades these works is neither pleasing from a poetical nor elevating from a philosophical point of view. Some Puranas, it is true—e.g., the *Bhāgavata*—make in some sense an exception to this aberration of original Hinduism; but they are a compromise between the popular and the Vedantic creed, which henceforward remains the creed of the educated and intelligent. They do not affect the worship of the masses as practiced by the various sects; and this worship itself, whether harmless, as with the worshipers of Vishnu, or offensive, as with the adorers of Siva and his wife Durga, is but an empty ceremonial, which here and there may remind one of the symbolical worship of the Vedic Hindu, but, as a whole, has no connection whatever with the Vedic Scriptures, on which it pretends to rest. It is this creed which with further deteriorations, caused by the lapse of centuries, is still the main religion of the masses in India. One of these causes of deterioration is the Yoga (q.v.), or belief in a supernatural state which individuals may enter by going through certain practices. Its most authoritative literary exposition is the *Yōga-sūtra* of Patanjali (q.v.).

The philosophical creed of this period, and the creed which is still preserved by the educated classes, is that derived from the tenets of the Vedanta philosophy. It is based on the belief in one supreme being, which imagination and speculation endeavor to invest with all the perfections conceivable by the human mind, but the true nature of which is, nevertheless, declared to be beyond the reach of thought, and

which on this ground is defined as not possessing any of the qualities by which the human mind is able to comprehend intellectual or material entity. See VEDANTA.

Hindu Sects and Modern Popular Faith. Under this designation may be comprised the sects which arose during the last period of Hinduism and the beliefs which are common to the Hindus to-day. These believers suppose that their religion is countenanced by the Vedas, but its source in reality is to be found in the Puranas and Tantras. They have in common a general sort of recognition of the Hindu trinity or triad—Brahma the creator, Vishnu the preserver, and Siva the destroyer—but in practice they are either Vishnuites or Sivites; for Brahma is little more than an abstraction and plays a very subordinate part to-day contrasted with his rivals. Sivaism may loosely be said to be more popular in the northeast and south of India; Vishnuism rather in the northwest, but also in the south. The wives or female energies of these two gods also receive adoration. (See VAISHNAVAS; SIVAS; SAKTAS.) Common to them all are certain acts of worship, reverence for the cow, the offering of votive gifts, adoration in the temples, and the performance of special ceremonies, such as the fulfillment of vows by going on religious pilgrimages for the purpose of acquiring merit. The caste system also has a strongly religious bearing, although it tends to break down through association with Occidentals. (See CASTE.) Besides the great sects there are likewise some of limited extent and total insignificance, such as the worshipers of Agni, the god of fire; of Surya, the sun god; of Ganesa, the god of wisdom and remover of obstacles. Some of these latter sects were looked upon as partly unorthodox, partly heterodox, as early as the ninth and fourteenth centuries of our era. Regarding the sect of the Sikhs, which arose in the fifteenth century, reference may be made to the special article on that topic. Reform movements in India have been familiar since the early days of Buddhism and Jainism, down through Sikhism to the modern times. In the nineteenth century a special religious agitation was set on foot by Rammohun Roy (1774–1833) (q.v.), which resulted in the establishment of the Brahmo-Somaj (q.v.), a sort of national church of the Hindus. The movement has extended widely throughout India, and, like the Arya-Somaj, it is eclectic in its tendencies, seeking to combine the teachings of the Veda with the tenets of the Bible and the sacred books of other faiths. There are also in India some 20,000 believers in the Jewish religion, and allusion has been made above to the presence of some 100,000 Parsis, who made their home in India more than 1000 years ago. These topics are treated under separate headings. See also HINDUISM.

Christianity in India. With reference to the spread of Christianity in Hindustan, as mentioned above, it may be stated that India was one of the earliest fields of Christian missions. Tradition assigns it as the scene of the Apostle Thomas's labors and martyrdom. Whether this was the case or not, we find a Syrian church planted in Malabar in south India, which undoubtedly had a very early origin. The colonization of Goa by the Portuguese was followed by Franciscan and Dominican propaganda. The Jesuit missionaries, from

the middle of the sixteenth century onward, had a large success in India. (See FRANCIS XAVIER.) The appointment by the popes of Vicars Apostolic led to a long conflict with the Portuguese clergy, which only subsided after the Concordat of 1886. The earliest Protestant missionaries in India came from Holland and Denmark. With the latter mission the eminent Schwartz was connected. England's first missionary effort was made by the Society for the Propagation of the Gospel, and the Christian Knowledge Society, which commenced in the beginning of the eighteenth century by aiding the Danish mission already established in south India. Subsequently the East India Company adopted the policy of excluding missionaries altogether from their territories; but since the beginning of the last century, when these restrictions were withdrawn, great activity has been manifested, in which all denominations are represented. In the proclamation to the princes, chiefs, and people of India, read in the principal cities, on Nov. 1, 1858, it was declared "that none shall be in any wise favored, none molested or disquieted, by reason of their religious faith and observances, but that all shall alike enjoy the equal and impartial protection of the law." The fullest toleration in matters of faith is the rule throughout British India. Fanaticism only, as when it sought to enforce the burning of widows or suttee (q.v.) or to offer human beings in sacrifice, is curbed by the ruling power. There is no exclusively endowed state church, but the government continues to pay the state grants made to Hindu temples and to Mohammedan mosques. Clergymen of the Church of England, the Church of Scotland, and the Roman Catholic church, are retained on the government establishment as civil or military chaplains. There are Church of England bishops at Calcutta, Madras, and Bombay. The number of Christians in India in 1913 was given in the census as 3,876,196, of whom 1,490,864 were Roman Catholics. The members of the Church of England numbered 492,317. The rest belonged chiefly to Protestant denominations.

For a study of the entire religious development of the Hindus, consult: Wilkins, *Modern Hinduism* (2d ed., London, 1887); Barth, *Religions of India* (3d ed., ib., 1890); Hopkins, *Religions of India* (Boston, 1895); Hardy, *Indische Religionsgeschichte* (Leipzig, 1898); Monier-Williams, *Hinduism*, in the series of "Non-Christian Religious Systems" (London, 1900); Winternitz, *Geschichte der indischen Litteratur* (Leipzig, 1908-); Moore, *History of Religions*, vol. i (New York, 1913).

Archæological Remains. The antiquities and the archæological remains in India are largely of an architectural character. (See INDIAN ART.) From the prehistoric age there are no monuments surviving beyond possibly some cairns and cromlechs; and the same is true of the Vedic period of Aryan India, because the structures were mostly of wood or of destructible material. Indian archæology begins practically with the age of Buddhism and Jainism. Connected with these faiths there are characteristic shrines, temples, and monuments in various parts of India, dating from 250 B.C. onward. Most famous from the standpoint of archæological research are the great cave at Karli, and also the caves at Ajanta, Ellora, and Lena, constructed with their assembly halls or churches (*chaityas*) and their monastic cells

(*vihāras*). Of like interest are the huge mounds or tumuli (*stūpas, tōpas*), like that at Sanchi, near Bhilsa, erected to contain in a shrine (*dāgoba*) some relic of Buddha. The balustrades about these structures are well known because of their artistic value and because of the light they throw on scenes connected with Buddhist life. (See GAUTAMA BUDDHA; JATAKA.) Of particular antiquarian interest, likewise, are the various columns or shafts (*stambhas, lāts*), set up in various parts of India by King Aśoka (q.v.). They show evidence of Persian influence. The inscriptions on these, like his rock-cut edicts, are of special importance. Under a slightly different category, but of similar antiquarian interest, are the famous Gandhara sculptures, representing incidents in Buddha's life. The influence of Græco-Bactrian art is plainly evident in these. Of a much later date, but quite Hindu in character, are the cave temples of Elephanta (q.v.), near Bombay, with their sculptured figures of Brahma, Vishnu, and especially Siva. These may not, however, antedate the ninth century of our era. The remaining groups of antiquarian remains, chiefly architectural, are grouped under the head of Dravidian architecture, the Bengali and Chālukyan style of temple structure, and the artistic building of the era of Mohammedan rule. For details regarding these, consult: Fergusson, *History of Indian and Eastern Architecture* (London, 1876; new ed. rev. by Burgess, 1910); Le Bon, *Les monuments de l'Inde* (Paris, 1893); A. Grünwedel, *Buddhist Art in India* (London, 1901); Fanshawe, *Delhi Past and Present* (ib., 1908); E. B. Havell, *Indian Architecture . . . from the Mohammedan Invasion to the Present Day* (ib., 1913); Vincent Smith, *History of Fine Art in India* (Oxford, 1911). In 1897 arrangements were made in connection with the International Congress of Orientalists to establish an Association for Archæological Research and Exploration in India, and special archæological work under the supervision of the French government has since been carried on in Cambodia, besides the researches conducted by various scholars individually in India itself.

Language. With its hundreds of millions of inhabitants, there is as great a diversity of languages in India as there is variety in the peoples themselves. By far the larger majority, over 220,000,000, speak languages or dialects belonging to the Indo-Germanic group of tongues, and related, though perhaps not by direct descent, to the ancient Vedic dialect. This Indo-Aryan division is therefore first in importance, and three periods or stages may be recognized in its historical development. The earliest of these is sometimes called the Old Indic speech and includes the Vedic dialect, Pali, in the broad sense now given to this term, and the literary or classic Sanskrit. The second period embraces the Middle Indian Prakrits. (See PRAKRIT.) The third, termed New Indian, includes the modern Indian vernaculars, which are in the main descended from popular Prakrit dialects, and are spoken largely in the north, east, and central provinces of India. Under this designation are comprised Punjabi, Kaśmiri, and Sindhi, the speech of over 21,000,000 people, on the north and west; next, the Hindi, spoken by 80,000,000, and called Urdu or Hindustani when admixed with Persian and Arabic; again, Gujarati and Marathi, the chief languages of the Bombay Presidency, and claiming over 27,-

000,000 speakers; furthermore, Bengali, the vernacular of more than 44,000,000 individuals in the east, together with Uriya and Behari, likewise in eastern India; also Nepali, the language of Nepal, and Assami, still farther to the east. Separate articles regarding the characteristics of these various Indo-Aryan vernaculars will be found under the individual names. Among the non-Aryan languages the most important family is the Dravidian (q.v.), the tongue of some 56,000,000 people inhabiting the peninsular portion of India. The Kolarian or Munda branch numbers about 3,179,000 speakers, while the Tibeto-Burman family has more than thrice as many. The Khasi group (Assam) and the Mon-Annam and Shan families aggregate together over half a million speakers. Gypsy dialects are spoken by some 350,000 people. These figures are those of the 1901 census. In addition to this the division of Iranian languages (q.v.) is represented on the borders of Afghanistan and Baluchistan. The linguistic statistics of India include, moreover, the languages, like English, German, French, etc., which are used by Europeans resident in India, and similarly such other languages as may be used by various Asiatics living at the time in Hindustan. See INDIAN PEOPLES. Schmidt, *Grundzüge einer Lautlehre der Mon-Khmer Sprachen* (Vienna, 1906).

HISTORY

The early history of India is wrapped in legend. Only by references in native or in foreign writings and by inscriptions can the story of the ancient period be reconstructed. The Indian mind is essentially an unhistoric one. We have, indeed, many sovereigns mentioned and even whole dynasties given in the Puranas (see PURANA), the epics, and other Sanskrit writings; but of history, in the real sense of the word, there is practically none. The accounts which are given are so interwoven with myth and fancy that they have almost no value to the historian. Indian history falls roughly into three periods: the National or Hindu period (c.2000 B.C. to 1001 A.D.), the Mohammedan period (1001-1757 A.D.), and the period of the establishment of European dominion (1757-).

National or Hindu Period. The Aryans (q.v.) entered the Punjab perhaps as early as 2000 B.C. They came from the Iranian country, apparently by two routes, through the mountain passes in southern Afghanistan and by way of Chitral, and, gradually forcing their way east and south, expelled or subdued the aborigines, such as the Dravidians, and occupied the entire territory north of the Vindhya Mountains. There are but few historic allusions in the earliest part of this period, although the Rig-Veda (q.v.) mentions a battle of 10 kings against

Sudas, King of the Tritsu clan, evidently a tribal war, and contains a number of references to Aryan victories over the aboriginal tribes. The epics of the *Mahābhārata* and the *Rāmāyana* contain legends of wars which must have been of much importance. (See *ARMIES, Ancient Armies, Indian*.) The former epic narrates almost as its main theme the strife between the Kurus and Panchalas, both on the upper Ganges, while the latter tells of the war waged by the Kosalas of Oudh against the demoniac armies of Lanka, supposed to be Ceylon. By the close of the period described in the former epic there were 10 great Hindu kingdoms: Magadha (South Behar), Anga (West Bengal), Vanga (East Bengal), Kalinga (Orissa), Avanti (Malwa), Saurashtra (Gujarat), and the kingdoms of the Andhras (Deccan), the Cholas (Coromandel), the Cheras (Malabar), and the Pandyas (extreme south). Of these Magadha became the chief before the dawn of authentic history in India. The earliest historic Indian date thus far known is 557 B.C., the reputed birth year of Buddha. Bimbisara (q.v.) of the Saisunagar dynasty began to rule soon after this (died 485 B.C.), and this line reigned until the early part of the fourth century. The invasion of Alexander the Great was to be the forerunner of a long series of inroads, which were to end 2000 years later in the final surrender of India to the West. The stay of Alexander in India was short (327 B.C.); but the Maurya king Chandragupta, called by the Greeks Sandracottus (q.v.), who brought all northern India under the sway of Magadha, entered into an alliance with the Greek ruler of Persia and Bactria, Seleucus Nicator, whose daughter he married, and to whose ambassador, Megasthenes (q.v.), we are indebted for our earliest non-Indian information on Hindustan. The capital of the Maurya kings was Pataliputra (Patna). The great Maurya Sandracottus was succeeded by his son Bindusara in 291 B.C., and his grandson, Aśoka (c.272-232 B.C.), is famous as the royal promulgator of Buddhism. A series of weak kings followed, and the foreign influence in India steadily gained strength. A Græco-Bactrian invasion was followed (100 B.C.) by a conquering raid of the Sakas, a mixture of Iranians and Greeks. These fell themselves under the sway of the Yue Chi (q.v.) tribes. The most famous Yue Chi ruler was Kanishka, a great protector of the Buddhists. The date of his reign is not generally agreed upon—Fleet placing his accession at 58 B.C., while Vincent Smith dates his reign 85-125 A.D. The Kushan kings of the Yue Chi entered into diplomatic relations with the Romans. Both the Kushan and the native central Indian dynasty of the Andhras were supplanted by the Guptas towards the end of the third century. The name of Chandragupta I (about 319) is one of the most important in this dynasty. He made his house supreme over practically all northern India, and his son, Samudragupta, was equally powerful. During the Gupta period the Hindus flourished in arts and in religion. The tradition which connects this revival of Sanskrit literature with a king of Ujjain named Vikramaditya has no historical foundation. About this time Chinese travelers, notably Fa-Hien (400), Hiouen-Thsang (643), and I-Tsing (671), came to India seeking for a knowledge of Buddha's teachings in their purity, and the

records which they left form the only non-Indian information on Hindustan which we possess from the time of the Greeks until the coming of the Arabs. The power of the Guptas was finally broken in the early part of the sixth century, having previously been weakened by the invasions of the Ephtalite Huns. In the first half of the sixth century Harshavardhana, who was the hero of the one historical romance in Sanskrit, extended his sway over all northern India, even conquering Nepal. From this time the Hindu power began gradually to decline. Of the succeeding dynasties the most important were the Chalukya and Chola of Deccan, but the day of native monarchy over India was past. Petty kings came and went, warred with each other, and by their lack of harmony helped to prepare the way for the second great epoch of India, the Mohammedan period.

The subject of early Hindu eras and dates is very involved, and only the chief epochs can be given here. Hindu chronology begins with the Kaliyuga (q.v.), an astronomical era, 3102 B.C.; Chandragupta established the Maurya dynasty, 315 B.C.; the Samvat (q.v.) era (attributed wrongly to Vikramaditya) begins 57 B.C. This is the chief era of north India. The Saka (q.v.) or Salivahana (the chief south Indian) era begins 78 A.D.; the Gupta or Vallabhi era, 319 A.D.; the Harshavardhana era, 606 A.D.; the modern Burmese era, 639 A.D. According to a new theory of Bhandarkar (not accepted by scholars generally), the Saka and following dates have to be increased by 200.

Mohammedan Period (1001-1757). *House of Ghazni* (1001-1186).—The Sultan Mahmud of Ghazni, founder of the house of the Ghaznivides (q.v.), was the first conqueror who permanently established the Mohammedan power in India, and the Hindu princes fell one by one before a succession of Mohammedan dynasties. The house of Ghazni succumbed to the *House of Ghor*, which was supplanted by the *Slave Kings of Delhi* (1206-88). One of these sovereigns, Altamsh, who ascended the throne in 1211, added the greater part of Hindustan proper to his dominions. He died in 1236. *The Khilji Dynasty* (1290-1320).—Under Ala-ud-Din (1295-1316), of the house of Khilji, the Afghan power in India reached its highest point. He crushed the Hindus in Gujarat, defeated the Moguls in several battles on their invading the Punjab, and, most important of all, invaded the Deccan. Like so many Oriental conquests, however, his success was but temporary. *House of Tughlak* (1321-1414).—Ala-ud-Din's descendants having been slain, Tughlak, Governor of the Punjab, seized the throne in 1321. The Tughlak dynasty was short-lived; and in 1398, during the reign of the last of the Tughlak kings, the Tatar Timur, or Tamerlane, sacked Delhi and proclaimed himself Emperor of India. Two short-lived and unimportant dynasties followed the Tughlaks, the *House of Sayyid* (1414-50) and the *House of Lodi* (1450-1526). To the kings of this dynasty succeeded the *Great Moguls of the House of Timur* (1526-1707). Baber (q.v.), a descendant of Timur, who had for 22 years been sovereign of Kabul, invaded India for the fifth time towards the end of the year 1525, and after defeating Sultan Ibrahim Ludi on the plain of Panipat (April, 1526) he entered Delhi in triumph, and established himself as Emperor of the Mohammedan dominions

in India. He died in 1530 and was succeeded by his son, Humayun. Akbar (q.v.), son of Humayun, one of the greatest of Mohammedan monarchs, became Emperor in 1556 and reigned for nearly 50 years. His son, Jehangir, ascended the throne in 1605, and his grandson, Shah Jehan (q.v.), at the beginning of 1628. Shah Jehan is celebrated as the builder of the Taj Mahal (q.v.) at Agra (q.v.), one of the most splendid monuments of Oriental architecture. In 1658 Shah Jehan was imprisoned by his son, the famous Aurungzebe (q.v.), who usurped the Imperial power. This remarkable man raised the Mogul Empire to the highest pitch of greatness and splendor. The death of Aurungzebe took place in 1707, and the decay of the Empire, which had begun a few years before, proceeded rapidly. In 1739 the Persian Nadir Shah invaded India, sacked Delhi, and carried away the famous peacock throne as well as a vast amount of treasure. Viceroys of the Great Mogul formed their provinces into independent states; while Hindu and Mohammedan adventurers carved out kingdoms with the sword. Of these the most important were the nizams of the Deccan, the rajahs of Mysore, the peshwas of the Mahrattas, and the Rajput and Sikh princes. The Mahrattas reached the height of their power about the middle of the eighteenth century, but in 1761 they sustained a crushing defeat at the hands of the Afghan ruler, Ahmed Shah (q.v.), in the battle of Panipat. The dismemberment of the Mogul Empire opened a wide field for admission and enterprise to the nations of Europe. The Venetians, the Genoese, the Portuguese (the first to reach India by way of the Cape of Good Hope in 1498), and the Dutch had by turns traded with India; and in 1602 the English appeared on the scene. See EAST INDIA COMPANY.

In 1653 Madras was erected into a presidency, and in 1668 the island of Bombay, which was the dowry of Charles II's Queen, the Infanta Catharine of Portugal, was transferred by the crown to the East India Company. The year 1686 witnessed the foundation of Calcutta. See GAMA, VASCO DA; ALBUQUERQUE; GOA; PONDICHERRY; CHANDERNAGAR.

British Rule (1757-). Great jealousy existed between the English and the French. The war for ascendancy began in 1745 and did not end until the Peace of Aix-la-Chapelle in 1748. (See DUPLEIX.) The struggle in the Carnatic continued with ardor under the pretext of supporting the claims of rival native princes to sovereignty. Clive (q.v.), one of the most famous persons in Anglo-Indian history, turned the contest in favor of the English. His memorable defense of Arcot in 1751 broke the spell of French invincibility. Five years afterward, however, Siraj-ud-Daula, Nawab or Governor of Bengal, attacked and captured Calcutta. The English prisoners, 146 in number, were confined in the small military prison known as the Black Hole, and only 23 survived till morning. Clive quickly took command of an expedition fitted out at Madras, recovered Calcutta (1757), and, assisted by Admiral Watson, prosecuted the war vigorously, till, after a hollow peace and a renewal of hostilities, he thoroughly defeated Siraj-ud-Daula in the battle of Plassy, June 23, 1757. This victory gave the English the provinces of Bengal and Behar, and from this year is dated by the English themselves the foundation of their Empire in

India. From Mir Jafar, whom the East India Company appointed to succeed the defeated Nawab, they exacted vast sums of money. The government of an empire by a commercial corporation was a strange political experiment. Naturally the members had no thought of administering affairs for the benefit of their subjects, or even of far-reaching improvements in their own interest, but were guided throughout by the narrowest and most sordid selfishness. After the victory of the English at Baxar in 1764, over the united forces of Shuja-ud-Daula, Nawab of Oudh, and the Mogul Emperor (Shah Alam), the latter asked protection of the English. He confirmed the company in its possessions and granted it the collectorate (*diwānī*) of Bengal, Behar, and Orissa, on condition of receiving the sum of £300,000 as tribute to himself from Bengal and £600,000 as an annual allowance to his Nawab. These enormous grants were soon cut down by Clive and were eventually repudiated by the company, which also failed to fulfill other engagements which it had entered into with Shah Alam. On the other hand, the cost to the company of maintaining its authority and standing army prevented it from undertaking public works and from developing the resources of the country. Clive purged the Indian government of oppression, extortion, and corruption; from the work he did during his last visit (1765-67) began a purer administration of the British Empire in the East. The Regulating Act, passed in 1773, substituted a new council of four at Calcutta in place of the far larger council which had hitherto managed affairs for the company. The new body was to assist and check the Governor-General, instituted in the same year. It was also given a limited control of the actions of the Madras and Bombay presidencies and was thus made the political head of the British possessions. To Warren Hastings (q.v.), the first Governor-General (1774-85), the new council was exceedingly hostile. Hastings, on his part, used unscrupulous means of replenishing the company's exchequer, but by his talent and energy he averted dangers which threatened the British supremacy in India. The powerful Mussulman sovereigns, Hyder (Haidar) Ali, ruler of Mysore, and the Nizam of the Deccan, assisted by French officers, combined with the Mahrattas against the English. Sir Eyre Coote broke up the confederacy, and defeated Hyder Ali in 1781. Next year the Supreme Court of Justice, which had always harassed the Governor-General, was deprived of its independent powers, and the policy of Hastings was successful, both in the council and in the field. In 1784 Pitt instituted the Board of Control under a cabinet minister. By this act the English government began to deprive the company of its monopoly of political power in India. Lord Cornwallis (q.v.), who succeeded Hastings in 1786, was both Governor-General and commander in chief. To check the corruption of the English revenue officials, he made the *zemindars* (native collectors of revenue) proprietors of their districts on condition of paying a fixed annual sum to the company. He also improved the judicial administration by forbidding a revenue official to act as a judge. These were his chief reforms. With the Nizam, the Mahrattas, and the Rajah of Coorg as allies, Cornwallis in 1790 made war on Tippu, Sultan of Mysore, who had invaded Travancore, then un-

der British protection. Terms were dictated to Tippu at his capital, Seringapatam, and he was compelled to cede half of his domains to the company. Cornwallis was succeeded by Sir John Shore (1793-98), whose rule was in no respect memorable. Shore was followed by the Marquis Wellesley (1798-1805). The British Empire in the East, like that of Napoleon I in Europe, could be maintained only by constant fighting. Tippu broke his faith by intriguing against the English, both with the French and with native princes. His bad faith cost him his crown and life; in May, 1799, Seringapatam was stormed and Tippu killed. The Hindu dynasty displaced by Hyder Ali was restored, and the administration was carried on successfully for the young Rajah by Sir Arthur Wellesley, afterward Duke of Wellington. In the famous battle of Assaye, in 1803, he defeated the Marhattas under Sindhia, and the victories of Lord Lake in north India extended considerably the dominions of the company. As Lord Wellesley's policy was too aggressive to suit the views of the East India Company, he was superseded by Lord Cornwallis, who returned to India only to die. Lord Minto, who governed from 1807 to 1813, organized the districts conquered by Wellesley. This administration was peaceful—a reaction of the profit-seeking company against the ambitious policy of Minto's predecessor.

The Marquis of Hastings (1813-23) conquered the Gurkhas of Nepal, forced the Marhatta ruler of Indore to cede a great part of his territories, crushed the robber gangs called Pindaris, and made the British power supreme in India. The next administrations were those of Earl Amherst (1823-28) and Lord William Bentinck (1828-35). The first was signalized by the First Burmese War, the second by the suppression of suttee and the thugs. It was Bentinck, in fact, who introduced the idea of governing India for the good of the governed. The Earl of Auckland (1836-42) followed Bentinck. He is known chiefly by his unjustifiable and disastrous attempt to make British influence paramount in Afghanistan (q.v.). An unexpected insurrection in Kabul compelled the retreat of the British army, which was overwhelmed in the Kurd-Kabul Pass (1842). Auckland was succeeded by the Earl of Ellenborough (1842-44). The "army of retribution" proceeded to Kabul soon after Lord Ellenborough took the reins of government. Kabul was sacked and several public buildings razed to the ground, after which the country was evacuated and Dost Mohammed allowed to reoccupy his throne. The conquest of Sind by Charles Napier, followed by its annexation, also belongs to this administration. Lord Ellenborough having been recalled by the East India directors, from alarm at his martial tendencies, Sir Henry Hardinge (1844-48) was sent to take his place. The attention of the new Governor-General, however, was soon diverted from works of peace to battle with the bravest people of India. Ever since the death of Runjit Singh, the ally of the English in 1839, the Punjab had been in a state of disorganization. The Sikhs, uneasy at the conquests made by the British in Sind and Gwalior, resolved to invade British territory. The First Sikh War (1845-46) commenced on the part of the Punjab by the passage of the Sutlej, and was followed by the bloody battles of Mudki, Ferozshah, Aliwal, and Sobraon, in which, after hard fighting, the Sikhs

were defeated with great slaughter. The result of the war was that a British resident and British troops were stationed at Lahore, although the boy prince, Dhulip Singh, was acknowledged as Maharajah under a protectorate. The Cis-Sutlej States, the Jalandhar Doab, and the region between the Ravi and the Sutlej were annexed.

The administration of the Marquis of Dalhousie (1848-56), who succeeded Hardinge, is memorable for the commencement of superb public works, the introduction of cheap uniform postage, railways, telegraphs, improvements in government, and social progress generally; a second Sikh war, ending in the victory of Gujarat, Feb. 21, 1849; a second Burmese war, finished in 1852; and the annexation of four kingdoms—the Punjab, Pegu, Nagpur, and Oudh, besides lesser territories, such as Satara. The organization of the Punjab into a model province, soon to become notable for prosperity as well as for its faithfulness to England, was a splendid achievement, of which Dalhousie had reason to be proud. When Lord Canning (1856-62) assumed office, everything promised peace and prosperity. With the early days of 1857, however, came the first mutterings of the storm that was to sweep over a large portion of British India. At the commencement of the year cakes of flour were circulated mysteriously through the region of the upper Ganges; by this means the natives were concerting rebellion. Treasonable placards appeared at Delhi, and other suspicious occurrences gave warning of native disaffection or conspiracy. The chief causes of discontent seem to have been the annexation policy and the rapid introduction of modern European improvements, which, by threatening to destroy the whole native civilization of India, roused the fears and superstitions of Hindus and Mohammedans alike. At the same time the English civil and military officials failed to respect the religious feelings of their subjects. For instance, the Enfield rifle with its cartridge, greased with tallow and lard, was at this time put into the hands of the Sepoys without explanation or precaution; and General Anson, the commander in chief, disregarded caste and was against all concession to the "bestly prejudices" of the natives. It must be remembered that the Hindu considered the cow sacred, and he would lose caste by tasting anything prepared from its meat, while the Mohammedan was not permitted by his religion to eat pork. Suddenly the disaffection broke out into open revolt before the English were aware of the impending danger. On May 10, 1857, the Sepoy Mutiny began at Meerut, a town in the neighborhood of Delhi, with a frenzied uprising of the native troops, who had been exasperated by the imprisonment of a number of their men who had refused to handle English cartridges. The mutineers liberated their comrades and proceeded to massacre the Europeans. The British troops failed to act promptly, and the Meerut Sepoys rushed to Delhi to raise the standard of the fallen Mogul. His person, invested with the traditions of native sovereignty, naturally became the centre of rebellion. Delhi at once fell into the hands of the mutineers. Nana Sahib of Bithur, whose claims as the adopted son of the Peshwa of the Marhattas had not been recognized by the British government, fanned the insurrection. At the end of June General Wheeler was forced to sur-

render to him at Cawnpore; and, in spite of the promise of safe-conduct to Allahabad, all the men were immediately massacred. The women and children were butchered on July 15, by order of Nana Sahib, when he heard of Havelock's march from Allahabad. Nana Sahib was unable to withstand Havelock, who entered Cawnpore. The Europeans in the residency at Lucknow were besieged on June 30. Four days afterward, the commandant, Sir Henry Lawrence, died of his wounds, and his place was taken by Inglis, who bravely held out till he was relieved, on September 25, by the heroic Havelock. The final relief was achieved by Sir Colin Campbell, and on November 17 the city was again in complete possession of the British. In the meanwhile, in September, Delhi was retaken by Gen. Archdale Wilson. By June, 1858, no city or fortress of any importance remained in the hands of the mutineers. Oudh was entirely reduced by the beginning of the year 1859. The able rebel leader, Tantia Topi, a Mahratta Brahman, was taken, tried by court-martial, and hanged. During the mutiny valuable assistance and protection were received from many native chiefs. On the other hand, it was the fate of the last representative of the East India Company to sentence the last Great Mogul and heir of the house of Timur "to be transported across the seas as a felon." He died in Pegu in 1862. The transfer of the government of India to the British crown (1858) was the immediate consequence of the mutiny. Under the system then inaugurated, the government of India is vested in a Principal Secretary of State, responsible to the crown, and assisted by a council sitting in London. Subject to this authority is the Governor-General, henceforth termed the Viceroy, aided by an Executive Council, corresponding to the old Council of Calcutta, and by a new Legislative Council, composed in part of nonofficial members, native as well as European. The first Viceroy was Lord Canning. The two following viceroys were the Earl of Elgin (1862-63) and Sir John Lawrence (1863-69). Towards the close of Lord Elgin's administration a Mohammedan rising in north-west India was apprehended, and it was considered most desirable that the new Viceroy should have practical experience of Indian affairs. Sir John (afterward Lord) Lawrence was accordingly appointed Viceroy. He conducted the government with prudence and zeal, but unfortunate events occurred during his term of office. A war in Bhutan terminated unsatisfactorily for England in 1865; and a dreadful famine in Orissa, resulting from a drought, caused the death of 1,500,000 people. He was succeeded by the Earl of Mayo (1869-72). This administration was inaugurated by a great demonstration at Ambala, March 27, 1869, when the Ameer of Afghanistan was received in state and given a supply of arms, and the first installment of a money subsidy of £120,000 a year. In returning from Rangoon to Calcutta the Earl of Mayo was assassinated by a convict (February, 1872). Lord Northbrook (1872-76) was the next Viceroy. The chief events of his administration were "the Bengal famine," which, however, was foreseen and provided for, and the visit of the Prince of Wales to India (1875). Northbrook was followed by Lord Lytton (1876-80). The most important events in the tenure of office of Lord Lytton were the proclamation of the Queen as Empress of India (1877), an-

other famine, and the Afghan War (1878-80). The Marquis of Ripon (1880-84), the Earl (afterward Marquis) of Dufferin (1884-88), and the Marquis of Lansdowne (1888-93) were the next three viceroys, under whose administrations much was done for the improvement of the natives. In 1885 King Thebau of Burma was dethroned, and on Jan. 1, 1886, the country was formally annexed by the English. The Earl of Elgin became Viceroy in 1893. During his term of office the demarcation of the boundary between Afghanistan and India, as determined by the Durand Treaty of 1893, was practically completed. In 1895 the region called Bashgal, in the basin of the Chitral River, was taken from the British sphere of influence and annexed to Afghanistan. In 1897 there was a serious outbreak of the Afridis on the Afghan frontier. The administration had also to contend with famine and plague. Elgin made substantial progress in internal improvements. In 1898 Lord Curzon of Kedleston became Viceroy. He devoted himself with great energy to the task of combating the plague and famine from which the country was suffering. In 1899 the gold standard was established. In 1901 the Northwest Frontier Province was organized. In 1903 an expedition was dispatched to Tibet, which by treaty of the following year was opened to British trade. Reappointed in 1904, the Viceroy incurred great unpopularity among the natives because of the partition of Bengal (q.v.) in 1905. In the same year he entered into a controversy with Lord Kitchener, commander in chief of the army, over the latter's attempt to weaken the influence of the civil authorities in military affairs, and, finding himself unsupported by the home government, resigned. He was succeeded by the Earl of Minto.

Discontent in India increased during the administration of the new Viceroy. Many Hindus who had studied in British and American universities came back determined to introduce Western political ideals among their people. The more radical element thought that this could be done only by encouraging national aspirations to repudiate British rule, which they proceeded to do by mass meetings, secret societies, and a vigorous press propaganda. The victory of Japan over Russia was a powerful stimulus in the same direction, for it demonstrated that an Asiatic nation armed with Western knowledge and trained according to Western methods of military organization could triumph over a first-class European Power.

Inevitably an aroused Indian nationalism, looking towards independence, meant hostility to British rule. Riots occurred in Madras and in the Punjab; English officials were assassinated, and a boycott called the *Swadeshi* was instituted against English goods. John Morley, the Secretary of State for India, although a champion of radical democracy, was compelled to take severe measures against this movement, for at no time since the great mutiny was British supremacy in India so vigorously challenged. Agitators were summarily imprisoned or deported, seditious meetings were forbidden, stringent laws were enacted regulating the manufacture and sale of explosives, and the Criminal Code was so amended as to permit judicial inquiry in private and trial without jury of those accused of treason.

While on one hand the government sternly put down sedition, on the other it introduced

reforms. Two native Hindus were appointed on the council of the Secretary of State and one on the council of the Viceroy, and in 1908 promises were made to introduce gradually a system of representative government for India. In 1909 an Act of Parliament reorganized the various Indian legislative councils and created new executive councils. Henceforth the legislative councils were to have more power and the majority of the members were to be Hindus elected by regularly organized constituencies. These bodies are not indeed legislatures, but they do have the power to supervise the budget and to criticize the executive. The reforms had the effect of stilling somewhat the agitation against the British government. In 1910 Lord Hardinge succeeded the Earl of Minto as Viceroy. On Dec. 2, 1911, King George, accompanied by Queen Mary, came to visit his far-distant possession and to be crowned Emperor of India on Indian soil. He was the first British sovereign to take this course, and a magnificent celebration, known as the Coronation Durbar, was given in honor of the royal personages. To commemorate the occasion the King announced the transfer of the seat of government from Calcutta to Delhi, the ancient Indian capital.

In spite of these demonstrations of good will on the part of the British, the discontent of the Indians continued. On Dec. 23, 1912, an unsuccessful attempt was made to assassinate the Viceroy. The Mohammedans, hitherto friendly to the British, became restless because of the misfortunes of their coreligionists in Turkey and north Africa (1912-14). At the outbreak of the European War of 1914, however, the country seemed loyal to the British crown. Many of the Indian princes came out in hearty support of Great Britain. Indian troops were sent to France, where they greatly distinguished themselves in the battles with the Germans (see WAR IN EUROPE).

(Leipzig, 1859-61); Torrens, *Empire in India: How we Came by it* (London, 1872); Hunter (ed.), *Rulers of India* (ib., 1890 et seq.); Lyall, *Rise of the British Dominion in India* (ib., 1893); Bose, *History of Hindu Civilization during British Rule* (Calcutta, 1894-96); Frazer, *British India* (London, 1896); Lyall, *Rise and Expansion of British Dominion in India* (ib., 1896); Forrest, *History of the Indian Mutiny* (2 vols., ib., 1904); Curzon, *Lord Curzon in India* (New York, 1906); Rees, *Modern India* (London, 1910); Inness, *The Sepoy Revolt* (ib., 1897); Gough and Inness, *The Sikhs and the Sikh War* (ib., 1897); Crooke, *Northwestern Provinces of India* (ib., 1897); Malleon, *History of the Indian Mutiny* (6 vols., ib., 1899); Morison, *Imperial Rule in India* (ib., 1899); Warburton, *Eighteen Years in the Khyber, 1879-98* (ib., 1900); Dutt, *India in the Victorian Age* (ib., 1904); Wood, *The Revolt in Hindustan* (ib., 1908); Fraser, *India under Curzon and after* (ib., 1911); Strachey, *India: Its Administration and Progress* (ib., 1911).

INDIA, FRENCH. Possessions of France in India, comprising the five towns of Pondicherry, Chandernagar, Karikal, Mahé, and Yanaon (see these respective titles), with a total area of about 196 square miles. Pop., 1901, 273,185; 1909, 282,379. For history, see under EAST INDIA COMPANY, section *French East India Company*; CLIVE; DUPLEIX; LA BOURDONNAIS.

INDIA, FURTHER, or FARTHER. See INDO-CHINA.

INDIA, NATIVE STATES OF. There are more than 600 native states in India which do not come under the administrative system of British India, but which have varying degrees of independence and are mostly governed by native princes. Their total area is 709,583 square miles, with a population of 70,888,854. The population is very heterogeneous, and in many of the states the ruler belongs to a minority or alien race and religion.

The early policy of the East India Company was to make alliances with the different states, recognizing the native princes as its equals. The plan did not prove satisfactory, as it was impossible to preserve harmony while the native princes were not subject to more positive restraint. The policy was then introduced of recognizing them as subordinates and limiting their military forces, the British themselves guaranteeing protection and taking charge of the external relations of these states. In the middle of the nineteenth century the policy of annexation was followed for a short time—Oudh, e.g., being annexed in 1856. But since the Sepoy Mutiny (1857) the policy has been to allow the states to enjoy a share of independence under native rulers. The extent to which the British authority is exercised varies greatly among different states and at different times in the same state. They are not permitted to make wars or to receive foreign consuls. The commercial treaties made by the British embrace also the native states, their interests being recognized as identical with those of the provinces. The guaranty of protection implies the right to establish such military forces within the native territories as the purposes of defense demand, and to have control of railroads and telegraph lines which are not "local," i.e., do not begin and end within the states. Each state is thus protected from external attack and internal revolt, and a large local army is not necessary.

Since the peace of the Empire is in danger of being broken by disputes over the succession to the rulership in any state, or the rule of certain candidates may be deemed prejudicial to the Imperial welfare, the British may intercede to determine the succession and prevent the choice of a prince objectionable to them. If flagrant and intolerable instances of misrule arise, the right of interference is presumed to follow as a further consequence from the rôle the Imperial government plays as guarantor of the protection of the states' general welfare. Under special circumstances, as, e.g., the murder of a British commissioner, the British have resorted to some extraordinary methods of interference. But ordinarily in the important states the rulers are given a free hand in determining the state policy and executing it. In the numerous small states the Imperial jurisdiction is usually much more extensive, and many of them are administered by a British officer in the name of the chieftain. The British at times have exercised absolute rule even in some of the larger states. Their rule in Mysore had extended over half a century when (1881) it was restored to native rule. Some of the states pay a tribute to the British, but it is always small, and usually by way of compensation for special services. In 1911-12 these tributes amounted to £595,005. The policy of allowing native states to exist alongside of British provinces has its advantages and disadvantages. Eminent Indian officials hold that as far as British interests are concerned it would be better to annex a number of the leading states. The fact that this is not done is assumed to be an evidence of the unselfish motives of the Imperial policy. The proximity of the native states causes such inconveniences as rise out of the different prevailing systems of currency, limitations in the development of the Imperial irrigation system, and violations of the regulations concerning the growing of the poppy. It also tends to render certain laws inoperative as, e.g., those against infanticide.

In order to facilitate the relations with the native states, to watch over the course of affairs within their territories, and be in a position to exert a needful influence, the British appoint "residents" or political agents. With rare exceptions the agent resides within the territory to which he is accredited. The agents to the principal states are under the immediate jurisdiction of the Imperial government. Hyderabad, the largest and most populous of the internal states, employs European officers and experts in the more important branches of administration. The general condition of affairs in the native states compares unfavorably with that prevailing in regions under British administration. The British claim that the burden of taxation upon the masses falls heavier in the states than in the provinces. At the same time the public is benefited much less, for the expenditure is largely for the unnecessary wants of the ruler and his coterie of adherents, while roads, irrigation, schools, and other public needs are sadly neglected. Education is progressing, but Mysore is probably the only one among the states whose educational system may be said to be on a high level. Freedom of the press is not tolerated. Laws are made or revoked as it suits the whim of the ruler. Mysore, the most progressive of the states, has a so-called "representative assembly," but its members have no

vote in making the laws or appropriations. This state has had a Legislative Council since 1907. In several other states such legislative councils have been established, while in others the chiefs exercise their authority through ministers. Rural boards have also been established in this state, but they have no money at their disposal. Consult the authorities referred to under INDIA, paragraphs *History* and *Government*; and for a more detailed statement concerning the different states, see the articles under their respective titles.

Bibliography. Rousselet, *India and its Native Princes* (London, 1896); Ghose, *The Modern History of the Indian Chiefs, Rajas, and Zamindars* (ib., 1883); Tupper, *Our Indian Protectorate* (ib., 1893); Griffith, *India's Princes* (ib., 1894); Chakrabarti, *The Native States of India* (Calcutta, 1895); Mehta, *The Hind Rajasthan* (ib., 1896); Lyall, *The Rise and Expansion of the British Dominion in India* (London, 1907); Lee-Warner, *The Native States of India* (ib., 1910); Forrest, *History of the Indian Mutiny* (Edinburgh, 1904-14).

INDIA, PORTUGUESE. Possessions of Portugal in India, comprising Goa, Daman, and Diu. (See these respective titles.) Area, 1638 square miles. Pop., 1881, 420,868; 1900, 531,798. For history, see under INDIA; EAST INDIA COMPANY; DÍAS; GAMA; ALMEIDA; CASTRO.

INDIA, PRIDE OF. See CHINA TREE.

INDIA, STAR OF. See STAR OF INDIA, ORDER OF THE.

INDIA INK. A black pigment, formed by mixing lampblack and glue, or size, or gum, into a paste and then pressing it into molds where it dries into sticks of various shapes. It was originally made in China and Japan, where it is said to have been invented some 2600 years B.C. The best grades are still produced in those countries, the common lampblack of Occidental countries being too coarse for many purposes. It is said that the Japanese collect the lampblack used in its manufacture from the oil of sesame. In China India ink is applied with a brush, both for writing and painting. In Europe and America it is chiefly used for black-and-white drawings, it being possible to regulate the depth of the shade by the amount of water used in mixing the ink. India ink is the only true black ink produced, all other grades having a tinge of some other hue. It is made specially prepared and ready for use by draftsmen, very few of whom now grind the sticks up with water, as was once the practice.

INDIA MUSEUM. A collection in London, illustrating the antiquities, history, and resources of India. In 1880 it was placed under the management of the South Kensington Museum and has been much enlarged.

INDIANA, in'dī-ān'á, known as the "Hoosier State." One of the Middle Western States. It lies between Ohio and Illinois and between Michigan and Kentucky, spanning the space between the Ohio River and Lake Michigan. It is crossed by many east-west trunk lines of railroad and plays the part of a bridge or "midland gap." Its boundary lines, the meridians of 84° 49' and 87° 32' W., the parallel of 41° 42' N., and the Ohio and Wabash rivers, inclose an area of 36,354 square miles.

Topography. Indiana may be included in the glacial-drift plain, only about one-sixth of it having escaped glaciation. The highest land in the State, nearly 1300 feet, is in Randolph

County. Morainic hills in Steuben County reach nearly 1200 feet, and a small area in Brown County lies above 1100 feet. At the shore of Lake Michigan the elevation is 581 feet, at the southwest corner of the State 484 feet, and at the mouth of the Wabash River 313 feet. The average elevation of the State is 700 feet. There are three physiographic regions: *The Lake Plain*.—The area north of the Wabash River forms a part of the Lake Plain. It is traversed by massive marginal moraines, which form belts of drift hills especially rugged and lofty in Kosciusko, Whitley, Noble, Dekalb, Lagrange, Steuben, and St. Joseph counties. The valleys contain about 1000 small lakes, of which Turkey, or Wawasee, in Kosciusko County, and James, in Steuben County, are the largest. The irregularity of surface and the numerous lakes give to this region pleasing and picturesque scenery and render it attractive for pleasure and summer resorts. The shore of Lake Michigan is bordered by a belt of sand hills, blown up by the wind to a height in some cases of 300 feet. The basins of the Kankakee and Iroquois rivers comprise extensive plains of outwash from the ice sheets which once bordered them and formerly contained large marshes, now mostly drained. A part of eastern Allen County lies in the former bed of glacial Lake Maumee and is very flat and fertile.

The Central Plain.—The Shelbyville moraine, the southernmost marginal moraine in the State, marks an important physical division. It extends in looped curves through Vigo, Parke, Putnam, Morgan, Johnson, Bartholomew, Decatur, Fayette, Wayne, and Franklin counties, and marks the south boundary of heavy glacial drift. The area between the Shelbyville moraine and the Wabash River is a smooth plain underlaid by glacial clay from 100 to 300 feet deep and broken only by shallow-stream valleys and low moraine ridges of gentle slope. This is the richest and most densely populated part of the State.

Southern Indiana.—South of the Shelbyville moraine the glacial drift is thin or absent. Strata of alternately softer and harder rock, outcropping in north-south belts, give rise to escarpments, which divide the area into east and west lowlands and a middle upland. The surface is generally hilly, with smooth tracts on the softer rocks. A prominent feature is the Knobstone escarpment, an abrupt descent to the east, which extends from Floyd County to West Bartholomew County. It takes its name from the Knobs, or steep outlying hills, which occur along its south portion. It forms the east edge of the upland of resistant rocks, about 50 miles wide, which extends from the Ohio River to Brown and Monroe counties. Most of the upland surface has been maturely dissected into a complex system of valleys, ridges, and knobs, which attain their most rugged form and highest elevation in Brown County, sometimes called the Hoosier Switzerland. The middle portion of the upland, underlaid by porous and soluble limestones, is riddled by underground drainage channels, forming sink holes, "gulfs," and caves, among which Wyandotte and Marengo caves in Crawford County rival in extent and beauty the Mammoth Cave of Kentucky. The upland held back the edge of the ice sheet and, with the southern portion of the western lowland, is devoid of glacial drift.

Drainage. The Ohio River, as far down as

Cannelton, has a valley 1 to 2 miles wide, bounded by picturesque bluffs 300 to 500 feet high. Below Cannelton it crosses softer rocks, the valley widens to 5 to 10 miles, and the bluffs are lower. It is subject to great floods, the water at Lawrenceburg sometimes rising 70 feet. It is navigable for vessels drawing 6 feet of water. The streams flowing directly into the Ohio River are short and steep. The falls of Clifty Creek, near Madison, 70 feet high, form the highest cataract in the State. The Wabash River drains two-thirds of Indiana. Its headwaters, rising from the height of land near the Indiana-Ohio line and from the northeastern hills, are largely moraine-guided. Its valley has had a complex history and is quite variable, but its course is free from falls or rapids. Below Parke County it has a wide flood plain and resembles the lower Ohio. It is navigable to Terre Haute. The numerous forks of White River rise from the east height of land and, crossing the Central Plain and middle upland, discharge to the Wabash a volume of water which rivals that of the trunk stream. The Whitewater River flows from the height of land directly to the Miami and Ohio rivers and has a rapid fall. In the north the St. Joseph drains the moraine to Lake Michigan and furnishes valuable water power. The Kankakee and Iroquois rivers flow very sluggishly westward to the Illinois. In the northeast the St. Marys and St. Joseph unite at Fort Wayne to form the Maumee, flowing to Lake Erie.

Soils. The glacial clay of the Central Plain forms one of the most productive and enduring soils in the world. The soils of the Lake Plain are more variable, the sandy and gravelly tracts being less valuable than the clay. In southern Indiana the shale and limestone soils are generally good, while those of the knobstone and sandstone are distinctly poor. Throughout the State the wide river bottoms and terraces are unrivaled for corn and wheat.

Climate and Vegetation. The mean annual temperature varies from 48° F. in the north to 56° F. in the south. The average for July ranges from 74° F. to 79° F. and for January from 24° F. to 33° F. Extremes of 106° F. and — 20° F. occur. The period between killing frosts averages about 140 days in the north and east and 200 days along the Ohio. The annual rainfall varies from 36 inches in the northwest to 42 inches in the south. Indiana is not a prairie State, seven-eighths of its area having been originally covered with a heavy growth of hardwood timber.

Mining. The chief mineral products of Indiana are coal, clay, cement, and stone. In the production of coal, which is a principal mineral product, Indiana ranked seventh in 1913, with an output amounting to 17,165,671 short tons, valued at \$19,001,881. The principal coal-producing counties—Greene, Sullivan, and Vigo—in the southwestern part of the State, embrace an area of approximately 6500 square miles. All the coal is bituminous. Along the east edge of the fields is a series of basins, some of which are but a few acres in area, which produce a variety of coal known as block or semi-block, of a very pure, dry, noncaking nature, suitable for use in its raw state as a blast-furnace fuel, though usually mixed with coke when so used. Cannel coal is mined at several places. The beds of bituminous coal range from 3 to 10 feet in thickness, and most of the

mines are worked on 5 feet or more of coal. The record production of the State was made in 1909, when, as a result of long-continued labor troubles in Illinois, an abnormal demand was created for Indiana coal, and the production rose to 18,389,815 tons. The number of men employed in the coal mines in 1913 was 22,235; the average production per man was 706 tons for the year.

The erection of 560 coke ovens at Gary has caused Indiana to assume high rank in the production of coke. In addition to the Gary plant, there are retort ovens at Indianapolis and at Muncie. Production amounted to 2,727,025 short tons, valued at \$13,182,136, in 1913. Pig iron produced in 1913 was valued at over \$20,600,000. Natural gas is produced in large quantities, but the value of this product decreased from \$9,404,909 in 1905 to \$948,278 in 1913. The petroleum field is a part of the so-called Lima-Indiana oil field. Production in 1913 was only 956,095 barrels, valued at \$1,279,226, as over against 11,339,124 barrels in 1904.

The clay-working industries ranked third in importance among the mineral activities of the State in 1913, the value of these products being \$8,498,646. Portland cement ranked second in value, and of this there were produced, in 1913, 10,219,492 barrels, valued at \$10,218,867. The chief clay products are draitile, building brick, and vitrified brick. Cement is manufactured in the northern and southern parts. The principal quarry product of Indiana is limestone. The Bedford limestone quarried in Lawrence and Monroe counties is highly prized for structural qualities and is the principal stone product. Sand and gravel beds yield products valued in excess of \$1,000,000 annually. Other mineral products are gems, lime, mineral paints, mineral waters, oilstones, pyrites, sand-lime brick, and sulphuric acid from zinc smelting. The value of the mineral products in 1913, exclusive of pig iron and coke, was \$46,607,864. The total value was upward of \$80,000,000.

Agriculture. The larger portion of the State is admirably adapted to agriculture. All the soils of the glacial upland are well suited to the production of corn, oats, winter wheat, and the grasses. The soils of the glacial lake region in the northwest are prevalently dark-colored, somewhat mucky loams and sandy loams, with extensive areas of peat and muck, where artificial draining has been installed. They constitute fertile land for the production of staple crops and for cabbages, onions, and celery. The silty soils of the nonglacial region of the southern two-fifths of the State are better suited to the production of winter wheat, oats, and grass than to corn growing. Tobacco is chiefly grown upon the silty soils derived from the loess in the southwest and upon the river terraces and the glacial upland soils along the Ohio boundary.

There was a decrease of 2.9 per cent in the number of farms and of 1.5 per cent in the acreage of farm land from 1900 to 1910. The total number of farms in 1910 was 215,485. Of an approximate land area of 23,068,800 acres, there were in farms, in 1910, 21,299,823 acres. The improved land in farms in 1910 amounted to 16,931,252 acres. The average acreage per farm in 1910 was 98.8. The total value of farm property, including land and buildings, implements and machinery, domestic animals, poultry, and bees, in 1910, was \$1,809,135,238, and the

average value of land per acre, \$62.36. Of the total number of farms, in 1910, 150,798 were operated by owners and managers and 64,687 by tenants. There were 805 negro and nonwhite farmers in 1910, as against 204,951 native and foreign-born white.

The following table shows the acreage, production, and value of the principal crops in 1914, as estimated by the United States Department of Agriculture. The total value of

CROPS	Acreage	Prod. bu.	Value
Corn.....	4,949,000	163,317,000	\$94,724,000

† Pounds.

the crops in 1909 was \$204,210,000. The general character of Indiana agriculture is indicated by the fact that about three-fourths of the total value of crops in 1909 was contributed by the cereals and about one-eighth by hay and forage. The remainder, representing in value about 13.4 per cent of the total, consisted chiefly of potatoes and other vegetables, forest products, and fruits and nuts. Orchard fruits are an important product; the total quantity produced in 1909 was 4,714,000 bushels, valued at \$3,709,000. These consisted of apples, peaches, nectarines, pears, plums, prunes, quinces, and grapes. Nuts and small fruits are other important crops, black walnuts constituting the chief item of the former and strawberries of the latter.

Live Stock and Dairy Products.—The number and value of domestic animals on farms on Jan. 1, 1915, according to the estimates of the United States Department of Agriculture, were as follows: cattle, 693,000, valued at \$24,394,000; horses, 854,000, valued at \$97,356,000; mules, 86,000, valued at \$10,062,000; swine, 4,167,000, valued at \$42,920,000; sheep, 1,114,000, valued at \$6,016,000; milch cows, 646,000, valued at \$35,530,000. During 1909 194,736,962 gallons of milk were produced. From this 43,181,817 pounds of butter were made, valued at \$9,402,994, and 63,619 pounds of cheese, valued at \$7,800. The total value of dairy products sold in 1909 was \$16,666,374. Poultry of all sorts on the farms, on April 15, 1910, numbered 13,739,109, valued at \$7,762,015.

Forest Products.—Of the total number of farms, in 1909, 75,397 reported forest products, the total value being \$5,603,322. These include firewood, fencing material, logs, railroad ties, telegraph and telephone poles, materials for barrels, bark, and naval stores. There were cut, in 1909, 556,418 M feet of rough lumber, 3600 thousand lath, and 7340 thousand shingles. Practically the entire output in 1909 was hard wood, 41.1 per cent of which was oak, the remainder being made up of numerous varieties, of which beech, maple, and elm were the most important.

Manufactures. From 1849, when Indiana ranked fourteenth among the States in the value of its manufactures, with a total value of products of \$18,725,000, the State has in each decade shown a large increase. In 1909 the value of manufactured products amounted to \$579,-

075,000, and the State ranked ninth. This growth has been dependent largely upon the natural resources. During the decade 1900-10 the supply of timber, petroleum, and natural gas fell off greatly, and some of the industries depending upon these materials showed a decrease in their output or less advance than in previous years. The manufacturing industries of the State as a whole, however, have continued to flourish; lumber has been secured from outside the State to supplement the local supply, while the increasing amount of coal mined in the State has compensated largely for the smaller supply of natural gas and has stimulated manufacturing in many lines.

In 1849 an average of 14,440 wage earners, representing 1.5 per cent of the total population, were employed in manufactures, and in 1909 an average of 186,984 wage earners, or 6.9 per cent of the total population, were so engaged. During this period the gross value of products per capita of the total population increased from \$19 to \$214. The proportion which the manufactures of the State represented of the total value of products of manufacturing industries for the United States increased from 1.8 per cent in 1849 to 2.8 per cent in 1909. The table on pages 90 and 91 gives the most important data relating to the manufactures of the State for 1909 in comparison with 1904. On account of limitations of space only those industries whose products had a value of \$1,000,000 or more in 1909 are included in this table.

The value added to products by manufacture best represents the net wealth created by manufacturing operations. During the year \$121,816,000 were paid out in salaries and wages. The average number of wage earners in 1909 was 186,984. Of these 163,698 were men and 23,286 women. There were employed 3612 children under 16 years of age. For the great majority of wage earners employed in the manufacturing industries the usual hours of labor in 1909 ranged from 54 to 60 hours a week. The totals presented in the table do not include the statistics for an establishment operated by the Federal government, the general depot of the Quartermaster's Department, located at Jeffersonville. In 1909 this plant employed an average of 590 wage earners, and the products, which consisted principally of clothing, were valued at \$401,801.

The most important industries in the point of value of products are those connected with slaughtering and meat packing, the value of products of these industries amounting to \$47,289,000 in 1909. Second in value are the products of the flour and gristmill industries, the outgrowth of the large crops of cereals grown in Indiana. The value of products in 1909 was \$40,541,000. The most important output is that of white flour, amounting to \$4,784,708 barrels in 1909. Industries connected with iron and steel, including steelworks and rolling mills, have shown increased importance. The value of the product in 1909 was \$38,652,000. The establishment of large steelworks and rolling mills at Gary, in the northern part, on Lake Michigan, has been largely responsible for a gain of 800 per cent in value of product since 1889. The importance of the iron and steel industry as a whole is much greater than is indicated by the figures in the table, since the statistics of blast furnaces and for the manufacture of tin plate and terneplate can-

not be shown without disclosing the operations of individual establishments.

Indiana is one of the most important States in the manufacture of distilled liquors. The manufacture of automobiles has become of great importance. In 1899 there was but one establishment engaged in this industry; in 1909 there were 67 establishments, the value of whose products amounted to \$23,764,000. These figures are not complete, for the manufacture of automobile bodies and parts is so interwoven with other industries that it is not possible to show how fully the statistics show the magnitude of the industry. Other important manufacturing industries are those connected with the manufacture of carriages and wagons, furniture and refrigerators, agricultural implements, and glass. In the last-named product the State ranks third. Its growth dates from 1886, when natural gas was discovered in the State, and it attained second place in 1899.

The reduction of the output of natural gas checked its growth in the next decade.

Indianapolis is the most important city in the value of manufactured products. These were valued at \$126,522,113 in 1909. The other ranking cities with the value of their products are South Bend, \$27,854,527; Fort Wayne, \$23,686,809; Evansville, \$22,829,024. Cities the value of whose products exceeded \$10,000,000 were Terre Haute, Hammond, Anderson, Mishawaka, and Richmond. The city of Gary is not included in this list. For further information in regard to manufacturing cities mentioned, see titles of these cities in other portions of this work. In all the manufacturing industries of the State combined, 29.7 per cent were in 1909 under corporate ownership. Of the total value of products, however, the establishments operated by corporations in 1909 furnished 85.6 per cent, as against 14.4 per cent for those under all other forms of ownership.

Transportation. The State has fairly good facilities for water transportation. The Ohio River forms the entire southern boundary, and its tributary, the Wabash, is navigable at high water as far as Lafayette. On the north is Lake Michigan. During the early history of the State the National Road, running east and west through the central part, was an important thoroughfare. Two canals—one the Wabash and Erie and the other the White Water—have been superseded by railroads. The railway facilities are exceptionally well developed. All lines from the East centring in Chicago pass through the State, as do most of the lines connecting the great commercial centres of the East with those of the West. There are in addition some important north to south lines. The total mileage of railways on Jan. 1, 1913, was 7359, and of this 4688 miles were main lines. There were on Jan. 1, 1913, 45 companies operating or leasing electric railroads. The general administration of railways is in the hands of the Railroad Commission of Indiana. Rates were made subject to its decision, and it is permitted to suspend any rate for 30 days. An Act also passed in this year deals with the liability of common carriers and includes a bill-of-lading law.

Banks. There were on June 4, 1913, 255 national banks, with capital amounting to \$27,896,000 and deposits of \$144,162,000. There were 348 State banks, with deposits subject to check aggregating \$41,923,947 and savings deposits of \$7,319,277. The savings banks numbered 5, with 33,205 depositors and deposits amounting to \$13,001,084. There were also 134 loan and trust companies, with deposits subject to check amounting to \$18,052,393 and savings deposits amounting to \$39,036,937. The private banks numbered 194, with deposits subject to check amounting to \$15,434,904 and savings deposits amounting to \$1,483,195.

Government. The present constitution was adopted in 1851, and it is the second under which the State has been governed. Amendments to the constitution may be proposed in either branch of the General Assembly; and if agreed to by a majority of the members elected to each of the two Houses, in two successive sessions, it shall then be the duty of the General Assembly to submit them to the electors. If a majority shall ratify the same, the amendment shall become part of the constitution. An amendment must receive a majority of all the votes cast at the election and not merely a majority of the votes cast for or against the amendment. The Legislature of 1911 proposed a new constitution to be submitted to the people in 1912, but the method of drafting and adopting this instrument was declared unconstitutional by the State Supreme Court.

Legislative.—Legislative authority is vested in a General Assembly, which consists of Senate and House of Representatives. The Senate must not exceed 50, nor the House of Representatives 100 members. Senators are elected for a term of four years and Representatives for a term of two years. Enumerations for the apportionment of Senators and Representatives are held every six years. Such an enumeration was held in 1914. The sessions of the General Assembly are held biennially, commencing on Thursday after the first Monday in January. The Governor may by proclamation call special sessions.

Executive.—Executive power is vested in a

Governor, who holds office for four years and is not eligible for election for more than four years in any period of eight years. The administrative officers are a Secretary, Auditor, and Treasurer. These are elected for a term of two years and are not eligible to office more than four years within a period of six.

Judiciary.—The judicial power is vested in the supreme court, appellate court, circuit court, and such other courts as may be established by the General Assembly. The supreme court consists of from three to five judges, who hold office for six years. The State is divided into as many districts as there are judges of the supreme court, such districts being formed of contiguous territory, as nearly equal in population as is possible. One judge, a resident, is elected from each district by the electors at large. The circuit courts each consist of one judge elected from the judicial circuits into which the State shall be divided from time to time. There is elected in each judicial district a prosecuting attorney, who holds office for two years. There are also probate, juvenile, and superior courts, the judges of which hold office for four years.

Suffrage and Elections.—Voters must be male citizens of the United States who have attained their majority and who have lived in the State six months immediately preceding the election, in the township 60 days, in the ward or precinct 30 days. Males of foreign birth who have declared intention of obtaining citizenship, conformably to the national laws of naturalization, are also eligible to vote. These qualifications are fixed by the constitution and cannot be changed by the Legislature. The general elections are held every Tuesday after the first Monday in November. Indiana is one of the States in which no provision has been made for direct primaries or direct nomination of candidates for office.

Local and Municipal Government.—As noted above, the county officers are a clerk of the circuit court, auditor, recorder, treasurer, sheriff, coroner, and surveyor. No person shall be elected or appointed a county officer who is not an elector of the county. The General Assembly has power to confer upon the boards doing county business powers of a local administrative character. This has reference to the boards of county commissioners which are the principal governmental agencies of the county. Indiana is one of the States in which the Legislature has no provision for a commission form of government in towns and cities.

Other Statutory Provisions.—Combinations in restraint of trade are illegal, and all persons engaged in such combinations are guilty of misdemeanor and are liable to a fine not to exceed \$5000 and to imprisonment. A pure food law conforming in its essential provisions to the national law was passed in 1907 and revised in 1911. The employment of children under 14 years of age in other than farm work or domestic service is prohibited. There is a stringent employers' liability act. The selling of liquor is regulated by a city and township local-option measure, passed in 1911, nullifying the county option law previously in force. A remonstrance law, adopted in 1905, affords the people an opportunity to abolish saloons in townships also. The remonstrance feature also applies to city wards and the local-option feature to all municipalities. At the end of 1913,

of the 94 cities in the State 30 were "dry," and of 360 incorporated towns about 300 were without a saloon. Of the townships, which number about 1015, about 825 had voted "no license."

Finance. The report of the Treasurer for the fiscal year ending Sept. 30, 1914, shows that receipts for that period amounted to \$12,545,007 and disbursements for all purposes to \$12,273,314, leaving a balance of \$629,964. The State debt at the end of the fiscal year was \$1,470,163. Of this, \$1,064,548 was domestic debt and \$405,615 was foreign debt. The per capita debt in 1912 was only \$0.49, compared with the per capita debt of the whole country, \$3.52.

Militia. The total number of males available for military duty in 1910 was 647,449. The organized militia consists of one brigade of infantry, a battalion of field artillery, a company of signal troops, and a company of sanitary troops, including an ambulance company and a field hospital. The infantry brigade consists of three regiments of 12 companies each, and the field artillery of one battalion and three batteries. The number of enlisted men in 1913 was 2297, and the officers numbered 179.

Population. The population of the State by decades is as follows: 1800, 5641; 1810, 24,520; 1820, 147,178; 1830, 343,031; 1840, 685,866; 1850, 988,416; 1860, 1,350,428; 1870, 1,680,637; 1880, 1,978,301; 1890, 2,192,404; 1900, 2,516,462; 1910, 2,700,876. The estimated population on July 1, 1914, was 2,779,467. Indiana has been much less affected by immigration than most of the other Middle Western States. A large percentage of the population came originally from the South—Kentucky, North Carolina, and Virginia—and was to a large extent unaffected by the Western wave from New England and New York. Of the total population in 1910, 78.9 per cent were native whites of native parentage; 13 per cent were native whites of foreign or mixed parentage; 5.9 per cent were foreign-born whites, and 2.2 per cent were negroes. The population per square mile in 1910 was 74.9, compared with 70.1 in 1900. The urban population in 1910 was 1,143,835, compared with 876,294 in 1900. The rural population in 1910 was 1,557,041, compared with 1,640,168 in 1900. The male population in 1910 numbered 1,383,295, and the female 1,317,581. There were in 1910 five cities with a population of 25,000 or over: Indianapolis, 233,650; Evansville, 69,647; Fort Wayne, 63,933; Terre Haute, 58,157; South Bend, 53,684. Other important cities are Muncie, 24,005; Anderson, 22,476; Richmond, 22,324; Hammond, 20,925; Lafayette, 20,081. The city of Gary, which did not exist in 1900, had in 1910 a population of 16,802. There were, in 1910, 89 cities with a population of 2500 or over.

Education. The educational standards of the State have always been high, and the administration of the school system has rapidly improved in recent years. The Legislature has passed many excellent measures tending to keep up the high standard of the administration and instruction.

The proportion of illiteracy is low. In 1910 there were 66,213 illiterates over 10 years of age—a percentage of 3.1 per cent of the total population, a decrease from 4.6 per cent in 1900. The illiterates of native parentage form only 2.2 per cent of the population of 10 years or over. The percentage of illiteracy amongst the negroes was 13.7 per cent, a decrease from

22.6 per cent in 1900. In 1914 there were 766,383 persons of school age and an enrollment of 548,497. Education is compulsory; all children between the ages of 6 and 14 are obliged to attend a full term in a local school. The minimum school term is fixed by law as six months, and the average length varies from 140 days in township schools to 187 days in city schools.

There were, in 1912, 373 commissioned and 425 noncommissioned high schools. Secondary education has had an interesting development. Seminaries, established in each county by law in 1831, have gradually been superseded by the free public high schools, the first of which was organized in 1850 in Adamsville, and in 1873 the first step was taken towards their standardization. In 1907 high schools were defined as part of the common-school system and classified as commissioned and noncommissioned. The commissioned high schools were further classified to include noncommissioned schools reaching a certain standard. Vocational and industrial education has been an important part of the educational system, and in 1913 the General Assembly passed very good laws in this regard. Laws were also passed in this year relating to school sanitation and health supervision.

The consolidation of the rural schools has improved the system of grading and has established an advanced district high school. Several counties employ supervisors for the rural schools to overlook the work, advise and direct the teachers. The department of agriculture of Purdue University has in recent years carried on a campaign for the organization of corn, potato, and tomato raising and canning clubs for boys and girls.

A large proportion of the teachers have received a collegiate and normal-school training. The State has always been liberal in the support of schools. The common-school fund on June 1, 1912, amounted to \$8,960,113, and the congressional township fund to \$2,475,856. The total amount distributed for the support of schools in 1912 was \$16,443,654. Of this \$9,910,801 was expended for teachers. The average yearly salary of teachers of all grades in the high schools was \$566.20 in 1912. The township institute is an important feature of the educational system; at least one Saturday in each month during the school term is devoted to township institutes or model schools for the improvement of teachers, the work being outlined each year by the State Superintendent of Education. This feature has been a powerful factor in rural education, being the means by which teachers with little supervision may exchange ideas and methods and cooperate for the advancement of education.

There are a number of special schools—for the education of the blind, for the education of deaf mutes, the Indiana Boys' School, the Indiana Industrial School for Girls, Soldiers and Sailors Home, the Indiana Reformatory, School of Letters, and the Indiana School for Feeble-Minded Youths. There are normal schools at Indianapolis, Terre Haute, Danville, Marion, Muncie, and Angola. The institutions of higher learning are Indiana University at Bloomington (coeducational), St. Joseph's College at Collegeville, Wabash College at Crawfordsville, Earlham College (coeducational) at Earlham, Concordia College at Fort Wayne, Franklin College at Franklin, Goshen College at Goshen,

De Pauw University at Greencastle, Hanover College at Hanover, Butler College at Indianapolis, Purdue University at Lafayette, Moores Hill College at Moores Hill, Taylor University at Upland, Valparaiso University at Valparaiso, and Vincennes University at Vincennes. The last-named 10 colleges are all co-educational. There are also St. Mary's College and Academy for Women, University of Notre Dame at Notre Dame, and St. Meinrad College at St. Meinrad. These three are under the auspices of the Roman Catholic church. The Rose Polytechnic Institute at Terre Haute is an important scientific institution.

Charities and Corrections. There were, in 1914, 17 State charitable and correctional institutions. These included the Central Hospital for the Insane at Indianapolis, the Eastern Hospital for the Insane at Richmond, the Northern Hospital for the Insane at Logansport, the Southern Hospital for the Insane at Evansville, the Southeastern Hospital for the Insane at Madison, the Soldiers Home at Lafayette, the School for Feeble-Minded Youth at Fort Wayne, the Village for Epileptics at New Castle, the School for the Deaf and the School for the Blind at Indianapolis, the State Prison at Michigan City, the State Reformatory at Jeffersonville, the Indiana Girls School at Clermont, and the Indiana Boys School at Plainfield. These institutions on Sept. 30, 1913, had 12,529 inmates, and for the fiscal year 1911-12 there were expended for their support \$2,318,347, an average of \$202.69 per inmate. In addition to maintenance expense the institutions spent \$316,443, or a grand total of \$2,634,791. Under a law enacted in 1909, all these institutions operate under a uniform plan of administration. A bipartisan board of four trustees for each institution is appointed by the Governor; these boards appoint their respective superintendents; the superintendents appoint and discharge their subordinates, who under the law must be selected on account of their fitness, without regard to political or religious affiliation. All these charitable and correctional agencies are under the supervision of the Board of State Charities, created by the Legislature of 1889. Its purpose is the supervision of the whole system of public charities of the State; its duties are to see that every inmate of every public institution receives proper care, that the public funds are properly expended, that the institutions are properly conducted, and that their management is protected from unjust criticism.

Religion. The Methodists from the pioneer days to the present have been the leading denomination, having more members in Indiana in proportion to the total State membership of all churches than in any other Northern State. In recent years the "Christian" church has had a phenomenal growth. The Roman Catholics are proportionally weaker than in any other Northern commonwealth. Altogether 55 different denominations are represented. Besides those mentioned, the most important are the Lutherans, Baptists, Presbyterians, United Brethren, and Friends.

History. French trappers and fur traders appeared within the present limits of Indiana as early probably as 1679. It is certain that La Salle, on his way to the Illinois Indians, crossed the northwestern part of the State by way of the Kankakee in 1680. The Miamis and Ouabachi (or Wabash) Indians then occupied the region

and welcomed the French, who built Fort Ouatanon, on the Wabash, in 1720, and Fort Vincennes in 1727. The first permanent settlement was founded in 1734-35, by a number of families who made their home in the neighborhood of Fort Vincennes. The population increased slowly; but, owing to the richness of the soil, the inhabitants (French entirely, together with negro and Indian slaves) enjoyed ease and great plenty. The territory came into the possession of England in 1763, but the English occupation was too brief to effect any change in the people or the laws. In 1778-79 George Rogers Clark (q.v.), with a handful of men, wrested the country from Great Britain. Hostilities with the Indians, continuing from 1781 to 1795, when a peace was conquered by General Wayne, brought great distress upon the settlers at Vincennes. In May, 1800, the Indiana Territory was organized, comprising all that portion of the Northwest Territory lying west and north of Ohio. Michigan and Illinois were subsequently set off, reducing Indiana to its present extent. The capital was moved from Vincennes to Corydon in 1813 and to Indianapolis in 1825. In 1811 Gen. William H. Harrison (q.v.), at the head of a force of regulars and militia, crushed the Indian tribes under the brother of Tecumseh at the battle of Tippecanoe (q.v.). When the war with England broke out, the Indians renewed hostilities; but they were speedily subdued and nevermore troubled the settlers. As in the case of Illinois, a large proportion of the immigrants into Indiana came from the South, and before 1816 repeated attempts were made to legalize slavery in the Territory, in spite of the Ordinance of 1787. In 1816, the year of the State's admission into the Union, the question was definitely settled against slavery by the first constitutional convention, though a law prohibiting negroes and mulattoes from immigrating into the State remained in force till after the Civil War. The growth of the State in wealth and population was accelerated greatly by the construction of the National Road and the Wabash and Erie canals. Wild speculation in lands and railroads led to a general bankruptcy in 1837; but after 1846, when a compromise with the public creditors was effected, the economic and financial condition of the State improved steadily. Its prosperity since the Civil War has been due in great measure to the discovery of extensive coal, iron, and gas fields, and valuable deposits of building stone, in different parts of the State. Conditions have been monotonously peaceful, except for spasmodic eruptions of mob violence, notably in the years 1869 and 1888, and the disorders around Hammond attending the great railway strike of 1894, when strikers and Federal troops came into conflict. As a result of the strike, a board of labor commissioners was created in 1897 to act as a permanent tribunal of arbitration. In the same year an antitrust law and a factory-inspection law were passed, and primary education was made compulsory. For more than 20 years after 1878 the State balanced almost perfectly between the two great political parties, vacillating, in State elections especially, from side to side by minute majorities in a total vote of several hundred thousand. The opportunity for political manipulation was correspondingly great, and in national elections every device known to practical politics was brought into play to gain the electoral vote of the State.

Lawmaking was carried on frequently in a partisan spirit, and it was a favorite manœuvre with the minority in the Legislature, Republican or Democrat, whenever it was hopelessly outnumbered on an important question, to resign in a body, so as to prevent a quorum and thus block legislation. In national elections the State was Democratic up to 1860, excepting in the years 1836 and 1840, when it cast its vote for William H. Harrison, the Whig candidate. It was Republican from 1860 to 1872, Democratic in 1876, 1884, and 1892, and Republican again in 1880, 1888, 1896, 1900, 1904, and 1908. It was Democratic in 1912. The Governors, since its organization as a Territory, have been as follows:

TERRITORIAL

William H. Harrison.....	1800-11
John Gibson.....	1811-13
Thomas Posey.....	1813-16

STATE

Jonathan Jennings.....	Democrat-Republican.....	1816-22
William Hendricks.....	" "	1822-25
James B. Ray.....	" "	1825-31
Noah Noble.....	" "	1831-37
David Wallace.....	Whig.....	1837-40
Samuel Bigger.....	"	1840-43
James Whitcomb.....	Democrat.....	1843-49
Joseph A. Wright.....	"	1849-57
Ashbel P. Willard.....	"	1857-61
Henry S. Lane.....	Republican.....	1861
Oliver P. Morton.....	"	1861-67

Isaac P. Gray.....	Democrat.....	1885-89
Alvin P. Hovey.....	Republican.....	1889-91
Ira J. Chase.....	"	1891-93
Claude Matthews.....	Democrat.....	1893-97
James A. Mount.....	Republican.....	1897-1901
Winfield T. Durbin.....	"	1901-05
J. Frank Hanly.....	"	1905-09
Thomas R. Marshall.....	Democrat.....	1909-13
Samuel M. Ralston.....	"	1913-

Prior to 1908 laws were in existence placing definite restrictions on the licensing and conducting of saloons. In that year, at a special session, Governor Hanly obtained the passage of a county option law. The Democrats were victorious in the elections of that year, but failed in an attempt to have this law repealed, their object being the substitution of a local-option law. During the year 66 out of 92 counties voted no license. The election that year was hard fought, and though Taft was victorious by a plurality of 10,731 votes, a Democratic Governor and Legislature were elected. The vote was as follows:

PRESIDENT	GOVERNOR
Taft, Rep.....348,993	Marshall, Dem.....348,493
Bryan, Dem.....338,262	Watson, Rep.....334,040
Debs, Soc.....13,476	

The Democratic Legislature resulted in the election, on Jan. 19, 1909, of B. F. Shively to the United States Senate. In 1910 Thomas Taggart, leader of the State Democratic organization, opposed John W. Kern, defeated candidate for Vice President in the past election, for nomination for the seat held by Senator Beveridge in the United States Senate. Though the majority of the delegates were pledged to Taggart, strong opposition arose, and Kern secured the nomination. The election of a Democratic Legislature insured his election on June 17, 1911. In January the Legislature repealed the county option law, substituting the township or ward as the unit of option. On February 26 the first election was held in 40

cities and townships under the new law. As a result, three cities—Martinsville, Connersville, and Wabash—changed from "dry" to "wet," and Crawfordsville, Tipton, Frankfort, Mitchell, and Bedford voted "dry." Governor Marshall's participation in the national campaign of 1912 as candidate for Vice President caused unusual interest. Ex-Senator Beveridge was a Progressive candidate for Governor, opposed to Winfield T. Durbin, Republican, and Samuel M. Ralston, Democrat. The result of the election follows:

PRESIDENT	GOVERNOR
Wilson, Dem.....281,890	Ralston, Dem.....275,357
Roosevelt, Prog.....162,007	Beveridge, Prog.....166,124
Taft, Rep.....151,267	Durbin, Rep.....142,850
Debs, Soc.....36,931	

The Legislature was again Democratic. In the election of 1913, mostly for municipal offices, the Democrats swept the State. Indiana has 13 members in the House of Representatives. In November, 1914, Senator Shively was reelected.

INDIAN AFFAIRS. The position of the Indians still under tribal organization within the limits of the United States is anomalous. Strictly speaking, they are not a part of the body politic, but are regarded as "domestic dependent nations" and are officially spoken of as the "wards" of the nation. Their right to regulate their domestic affairs is conceded, but this right has been restricted by acts of Congress enlarging the jurisdiction of the Federal courts in respect to crimes committed by Indians. The Cherokees, Chickasaws, Choctaws, Creeks, and Seminoles, formerly known as the Five Civilized Tribes, developed well-ordered governments. Each nation had its own popularly elected executive, legislature, and judiciary. They were permitted to enact such laws for the regulation of their internal affairs as did not conflict with the Constitution and laws of the United States, while the decisions of their courts received the same recognition as to faith and credit as did those of the Territories. The title to land occupied by them was vested, not in the individual members of the tribe, but in the nation as a whole, and it could be alienated only with the consent of the United States government. The Supreme Court has held that an Indian born within the jurisdiction of a tribe can become a citizen of the United States only by naturalization. By an Act of Congress, however, passed in 1887, it was provided that Indians residing on lands allotted to them in severalty should be considered as citizens of the United States without the formality of naturalization. The immediate effect of the Act of 1887 was to confer citizenship upon 10,122 Indians to whom allotments had already been made

under special laws and treaties. Every year from 1000 to 2000 Indians signify their desire of becoming citizens by taking allotments. By Act of 1911 the property of the Five Civilized Tribes was allotted in severalty. The work of distributing the lands and of selling unallotted lands for the benefit of the members of the Cherokee nation was practically completed in 1914, and the tribe had ceased to exist as a political entity. In 1914 it was estimated that about two-fifths of the Indians of the United States were still living in tribal relations with property unallotted. The Constitution confers upon Congress the power to regulate commerce with the Indian tribes, and until the year 1871 the common method of dealing with them was by treaty through the agency of special commissioners. In that year, however, an Act of Congress abolished this practice and placed under the immediate control of Congress all commercial or diplomatic intercourse with the Indians.

From an early period it has been the practice of the government to conclude treaties with the Indians for the extinction of their possessory right to the lands occupied by them and for their removal to certain territories, known as reservations, specially set apart for their occupation. Whenever the United States sets apart an Indian reservation, whether within the territorial limits of a State or not, it has full authority to protect the Indians in their persons and property and to provide for the punishment of all offenses committed within the reservation. An Indian reservation lying within the limits of a State is, however, subject to its jurisdiction also except so far as concerns the government and protection of the Indians themselves, unless otherwise provided by treaty with the Indians. While all territory officially known as "Indian country" is subject to the jurisdiction of the United States, and while it belongs to Congress to enact laws for the regulation of intercourse of Indians with one another and with citizens of the United States, it is the policy of the government to leave to the Indians the regulation of their own domestic concerns as far as practicable. By acts of 1885 and 1890 Congress curtailed the jurisdiction of the Indian tribal courts. By the Act of 1885 the authority to administer their own criminal laws among themselves, so far as certain enumerated crimes committed by Indians are concerned, was withdrawn and vested in Territorial courts.

It is the policy of the United States to exercise a general supervision over the affairs of the Indians and to protect them from the encroachments of unscrupulous whites, as well as from the evil consequences of their own ignorance and improvidence. Many statutes have been passed by Congress to prohibit hunting on their lands, to prevent cutting timber from their lands or pasturing stock on them, to prevent the sale of intoxicating liquors to them, etc. Citizens of the United States of good moral character are permitted to trade with Indian tribes, upon giving bonds. The power of appointing and licensing Indian traders, as well as prescribing rules concerning the kind, quantity, and prices of goods to be sold, belongs to the United States Commissioner of Indian Affairs. This officer is further empowered to remove from Indian reservations all persons found there contrary to law or whose presence is deemed detrimental to the peace and good order of the Indians.

Until 1832 the supervision of Indian affairs was intrusted to a bureau in the War Department. In that year Congress authorized the President to appoint a commissioner charged with general superintendence of Indian affairs. He has the direction of eight inspectors and a large number of superintendents, agents, teachers, mechanics, etc. Since 1849 the business of Indian affairs has constituted a bureau in the Department of the Interior. The most numerous officials in the Indian service are the agents, appointed by the President for a term of four years, who are required to give bonds. Their duties are to superintend the intercourse among Indians within their respective agencies and to execute the orders of the commissioner. An important feature of the Indian service is the educational work. The President is empowered to employ capable persons to instruct the Indians in agriculture and to teach their children reading, writing, and arithmetic. By an Act of 1882 he was authorized to appoint an inspector of Indian schools. The schools under government control are the nonreservation training schools and the reservation boarding and day schools. Besides these there are contract schools under the supervision of religious associations which receive government aid. By an Act of Congress passed in 1890, provision was made for field matrons who organize sewing schools, weekly clubs, and Sunday schools among the Indians. In 1913 there were nearly 40,000 pupils in government Indian schools and between 7000 and 8000 in other schools receiving government aid. The policy now being pursued by the government will result in the incorporation of all Indians in the body politic as citizens, and with it the Indian reservations will disappear, the individuality of the Indian will be recognized, and the paternal care and control now exercised by the United States will cease.

INDIANAPOLIS. The capital and largest city of Indiana, and the county seat of Marion County, situated in the centre of the State, on the west fork of White River, 183 miles southeast of Chicago and 111 miles northwest of Cincinnati (Map: Indiana, C 3). It lies 700 feet above sea level, is a broad rolling plain, rich in agricultural and mineral resources and in forest trees of exceptional beauty. Large oil fields are in the vicinity; also coal lands 6500 square miles in extent, and deposits of building stone, marl, and other minerals. Wholly an inland city, Indianapolis relies on railways for its commerce, and its location within 50 miles of the centre of population of the United States for the past three decades has made it a great railway centre. Here terminate nine divisions of the Big Four system, six divisions of the Pennsylvania Railroad, one division of the Illinois Central System, the Lake Erie and Western, Chicago, Indianapolis, and Louisville, and the Cincinnati, Hamilton, and Dayton, besides 12 electric systems. The railways bring their passenger trains into a union

station, and the interurban lines have erected a large union terminal station costing over \$1,000,000. Freight passing Indianapolis is carried over a belt railway 15½ miles long, on which are situated 125 industrial establishments, including the Union Stock Yards. The street-railway system represents an outlay of about \$9,000,000, with 144 miles of tracks, and a park (Fairview) containing 200 acres.

The city has broad streets, ranging from 40 to 120 feet in width and shaded mainly by maples and elms and crossing at right angles. In the heart of the city is a circular plaza, once known as the Governor's Circle, and now called Monument Place, from which radiate four avenues to the four corners of the city. The park system comprises 1662 acres and includes Riverside, extending for 5 miles along both sides of White River, Garfield, Brookside, Military, St. Clair, University parks, and Ellenberger Woods. The most notable structure in Indianapolis is the Soldiers' and Sailors' Monument, designed by Bruno Schmitz, of Berlin. It was erected by the State to commemorate the part Indiana bore in the wars of the Union. The monument is a shaft of stone and bronze, 285 feet in height, surmounted by a figure of Indiana. About the base are allegorical groups in stone representing war and peace, and beneath these are two great fountains. Near the monument are four subsidiary bronze statues of Gen. George Rogers Clark, Gen. William Henry Harrison, Gov. James Whitcomb, and Oliver Perry Morton. There are also statues of Schuyler Colfax, Oliver P. Morton, and a bust of Robert Dale Owen, in University Park, and, in the Capitol grounds, of Thomas A. Hendricks. In the County Court House grounds there is a statue of Gen. Henry W. Lawton. The buildings most worthy of note are the Capitol, 492 by 185 feet, built of Indiana limestone at a cost of \$2,000,000; the United States Court House and Post Office, which cost \$2,500,000; Christ Church; Columbia Club; the Propylæum, a woman's building devoted to literary and social purposes; the Public Library, with 100,000 volumes; and the John Herron Art Institute. There are many large business blocks and hotels, e.g., the Merchants National Bank Building, the Odd Fellows', the Masonic Temple, the Fletcher Savings and Trust Company, the Terminal Station, the Hume mansion, the Claypool Hotel, and the Severice Hotel. The Benjamin Harrison Army Post is north of the city. Six of the city's bridges possess more than ordinary beauty; they span Fall Creek at Illinois Street, Meridian Street, Central Avenue, College Avenue, and Thirtieth Street, and White River at Thirtieth Street. The public-school system includes the common schools with 65 buildings, three high schools, and a normal training school. The medical college in the city is a department of Indiana University. The Long Hospital is a part of this. In addition there are the Indiana Dental College, the Indiana Law School, Butler College (a high-grade standard institution), Indian Central University (under control of the United Brethren church), and the Art School connected with the Herron Art Museum.

The State has placed some of its institutions in Indianapolis. There are, e.g., the Indiana Prison for Women, with a correction department, the Central Hospital for the Insane, the State School for the Deaf, and the State School for the Blind. The hospitals are the Deaconess,

Methodist, St. Vincent, City Hospital, and many private institutions.

All religious denominations are well represented by 257 organizations with buildings. The Christian Associations have three centres—the Young Men's Christian Association, the Young Women's Christian Association, and the Colored Young Men's Christian Association.

There are many clubs, literary, social, and political. Perhaps the best known are the Woman's Club, the Indianapolis Literary Club, the Männerchor and Deutsche Haus (both with excellent buildings), the Marion, Columbia, and Indiana Democratic clubs. The best-known theatres are the Murat and English's.

The city government consists of a mayor, a council of nine members (elected at large), a city clerk, and a police judge, all elected by the people every four years. The members of the various boards are appointed by the mayor: board of safety and board of public works of three members each and board of health and park board of four each. The mayor also appoints the corporation counsel, city attorney, and city controller. By the charter the boards name their subordinates. The school corporation is independent of the city corporation and is composed of five members chosen by the people and serving four years. This school board chooses a school superintendent, business director, and city librarian.

Expenditures for 1912 are given as follows: finance, \$206,366.20; public works, \$1,199,510.16; public safety, \$874,551.63; health and charities, \$181,263.58; legal, \$16,667.71—a total of \$2,478,359.28. The park board expenditure should be added to this, \$562,716.99. The disbursement for school purposes amounted to \$1,519,198.74. The assessed valuation is \$218,029,220; the bonded indebtedness, \$3,403,300.

Pop., 1850, 8091; 1860, 18,611; 1870, 48,244; 1880, 75,056; 1890, 105,436; 1900, 169,164; 1910, 233,650. The population in 1910 included 19,767 foreign born and 21,816 negroes. United States estimate for 1914, 259,413.

Indianapolis is a port of entry and a point for the receipt and distribution of foreign as well as domestic commerce. Its chief articles of trade are grain, live stock, meats, and the output of its extensive manufactories—milling machinery, engines, drugs, vehicles, furniture, bags, woolens, and starch.

Settled in 1819, Indianapolis received its name in 1821 and became the capital on Jan. 1, 1825, the seat of government being removed from Corydon. The opening of the first railroad in the State from Madison, on the Ohio River, occurred on Oct. 1, 1847, and gave the little town its first impetus. The growth since 1889, when the introduction of natural gas revolutionized manufacture in Indiana, has been remarkable. INDIAN ART. The chief art of India his-

torically is its architecture, though the decorative arts, sculpture, and mural painting, together with a highly developed art of designing in metal work, jewelry, miniature and other painting, pottery, and textile fabrics, have a peculiar value and interest of their own.

ARCHITECTURE

In the antiquity of its architectural monuments India cannot compare with a number of ancient nations, because the earliest constructions were made of wood and clay. In the remote period of Vedic times (see VEDA) the houses seem to have been built almost entirely of wood, as they still were as late as the end of the fourth century B.C., when Megasthenes was the Greek Ambassador of King Seleucus (c.300 B.C.) to the Mauryan court at Pataliputra; for Megasthenes then spoke with admiration of the vast wooden halls of the Indian King, with their richly adorned columns, embellished with gold and silver. From allusions in the ancient hymns of the *Rig-Veda*, it seems clear that the builder's art, besides erecting buildings, extended also to the construction of fortified inclosures, of use in war, consisting of earthworks strengthened by a stockade or occasionally reinforced by stone. Yet none of these early structures have survived, and it is doubtful if traces of this application of the builder's skill, prior to the sixth century B.C., can be found. Stone and brick came into general use in the third century B.C., in the time of Asoka (c.250 B.C.), and here architectural history begins. It falls into three main religious divisions: (1) Buddhist (300 B.C. to c.700 A.D.), in which period architecture commences to decline in the fifth century; (2) Jaina and Brahman, existing side by side in harmony with Buddhism in certain regions, from 600 to 1200 A.D., and then dividing the field with the (3) Mohammedan style, which began with the Afghan invasion in the early eleventh century. Since the English conquest Indian architecture has lost much of its vitality. There is no unity in India under these periods or styles. Local differences are enormous. The two main geographical divisions are north India, which was the earlier to develop, and south India. At the same time Indian art as a whole has certain common characteristics throughout its various local schools. It far excels in architecture at least the art of China and Japan, and it governs the art of neighboring regions like Tibet, Cambodia, Burma, and Siam, and islands like Java and Ceylon, which owe their civilization to India.

In seeking to explain the origin of Indian architecture, some traces of Greek influence have been found in the north, filtering through the Greek Kingdom of Bactriana, and visible in early monuments of Kabul and Kashmir, in the Ghandhara monasteries of Jamalgiiri and Takhti-Bahi, and in India proper at the Amravati Stupa; but the strongest early influence appears to have been that of Persia, which was flourishing when Indian art commenced. Yet whatever suggestions were received, they serve but to bring out the originality of Indian art, which stands at the antipodes of Greece in its exaggeration of forms, its multiplication of details, its love of complicated and confused lines, its lofty disregard of utilitarian considerations and of structural expression. At the beginning com-

parative simplicity reigned, and it was not until long after the Christian era that the richness of design was reached which remained characteristic. This was partly due to the use of brick, instead of stone or marble, in nearly all open-air structures before the tenth century A.D., which diminished the opportunity for elaborate surface ornamentation. To classify Indian architecture, to divide it into well-marked styles and periods, is impossible, because of the scarcity of the historical records, and the confusion and overlapping of races (Aryan, Dravidian, and Mohammedan) and the different religious needs. To a certain extent the dominance first of Buddhism and later of Jainism suggests natural divisions. But Buddhism has wholly disappeared as an architectural factor; while, since the tenth century the Jaina and Brahman faiths have existed side by side and the Moslem faith in addition since the twelfth. On the whole, as indicated above, Fergusson's system serves as well as any, and, slightly modified in nomenclature, will be followed here. Leaving the Moslem architecture to be treated under the article MOHAMMEDAN ART (q.v.), we assume five style divisions: the Buddhist, the Jaina, the Brahman in northern, central, and southern India. Thus the distinctions of style are partly chronological, partly religious, partly geographical.

Buddhist Period. Buddhism and Jainism (q.v.) appear to have arisen nearly at the same time (in the first half of the sixth century B.C.), but all the early monuments of India down to 600 A.D. belong to the Buddhist faith. They comprise *chaityas*, or chapels, *vihāras*, or monasteries, and *stūpas*, or shrines, usually of circular plan. The chaityas and viharas were almost all excavated in the rock between 250 B.C. and 600 A.D., the majority of them in the Bombay Presidency. The temples are large oblong halls, divided into nave and aisles by two rows of heavy columns, approached by a vestibule with an arched façade, richly carved, and have at the apsidal end a *dagoba* (*dāgaba*), or shrine, or sometimes a statue of Buddha. The earliest—at Bhaja—are the smallest and simplest. At Karli (78 B.C.) the nave has a stilted tunnel vault, and the heavy columns are octagonal, with elephant capitals, and the interior somewhat resembles a dark, tunnel-vaulted French-Romanesque church. Even more impressive are the largest cave temples at Ajanta, Nasik, and Ellora (q.v.), where temples and monasteries are multiplied side by side in the face of the rock. The sculptures and frescoes at Ajanta are of special interest. The monasteries, often grouped about these temples, consist each of from one to four courts or central halls surrounded by cells, all cut out of the rock. One of those at Ajanta has a court 65 feet square, supported by 20 pillars; the court of the great vihara at Bagh is 96 feet square, with 36 columns, and is preceded by a rock-cut colonnaded porch, 200 feet long. None of the early wooden viharas has survived. The third class (the *stūpas*, or *topes*) are great brick memorial mounds of circular form. They are of conical or of domical outline, surmounted by a little chapel or shrine, and surrounded by a marble rail or balustrade entered by four gates. They are found in groups, the most important at Bhilsa, Manikyala, and Amravati in India, and in Ceylon. The Sanchi tope is in splendid preservation and is remarkable for its elaborate and beautiful figured sculptures. The only structural (as distinguished from rock-

hewn) monument of the Buddhist period, Buddh Gaya, or Boddhi Gaya (c.100 B.C.), is in the form of a tower-like edifice in many stepped stories, upon a square base, at the corners of which rise four small pyramids. It is 52 meters high, and, like all the other early monuments, it is built of brick.

Jaina Style. The existence of a distinct Jaina style has been disputed by some authorities, like Vincent Smith and Coomaraswamy, who hold that the so-called Jaina style of architecture, as in Gujarat and elsewhere in the west, is not especially Jainistic, but is a local style, characterized by a free use of columns, richly carved, and other particular features. On the other hand, certain specialists, like Fergusson, claim that the Jaina temples previous to 1000 A.D. are easily distinguished from the Brahman, both by their plans and their details. While Jainism arose contemporaneously with Buddhism, it has left us few monuments earlier than 900 A.D., and its architecture ceased to be distinctive within a few centuries thereafter. The Jaina monuments, with the exception of a few caves, indistinguishable from the Buddhist caves, at Badami, Ellora, etc., are structural. The temples are elaborate edifices, set in courts surrounded by cells containing seated figures of Tirthakaras, or deified saints. The sanctuary is preceded by a *mantapam*, or porch, and surmounted by a lofty *sikhra*, or tower, its other portions being covered by domes built in horizontal courses. The architectural details of sculpture and carving are extraordinarily rich and intricate, and stone brackets, obviously derived from wooden prototypes, are notable features. The earliest and perhaps finest group is on Mount Abu (1032); others are at Girnar, Somnath, Gwalior, etc. In many cases, as at Khajuraho, the later Jaina temples are identical in style with the Brahman; in others they resemble the Moslem mosques in detail, though not in plan. Towers of Victory at Chittur are striking monuments of Jaina design. It is in the Jaina architecture that one first notes the tendency to stratification and endless multiplication of breaks, both vertical and horizontal, in exterior design—characteristics which became almost universal in the Brahman styles and to some extent in the Indo-Moslem. See JAINISM.

Brahman Styles. The Brahman, or Hindu, architecture comprises three quite distinct styles: the northern, the central, or Chalukyan, and the southern, or Dravidian. The monuments of the northern style are hardly to be distinguished from the Jaina temples, except by the absence of courts with Tirthakara cells and of bracketed domes. As in the Jaina temples, their most conspicuous feature is a *vimana*, or *sikhara*, topped with the *amalaka*, or melon-shaped ornament. They date chiefly between 600 and 1200 A.D. and are by some authorities subdivided into three groups: (1) in the northeast, Orissa; (2) in Bundelkhand and Rajputana; (3) in Gujarat.

The earliest monuments of the style are in Orissa, where it flourished for 700 or 800 years. The numerous temples at Bhuvanewar are its highest expression. The tower of the larger temple (c.600 A.D.) is 180 feet high, and near it is the Black Pagoda, whose superb decoration marks a new era. But in general these temples are small. Much later (c.1200 A.D.) is the temple of Jaganath (Juggernaut), at Puri, which shows the decadence of this style.

Quite distinct is the contemporary school of Rajputana, whose ruined city, Khajuraho (Khajurao), with its miles of ancient buildings, is unsurpassed in India. Among its 40 temples, belonging to the Jaina religion and to both branches of the Brahman—the Vaishnavite and Shaivite—there is little or no distinction of style. Their plan is elaborated by the projection of wings and porches, and the elevation is enriched by the grouping of many subordinate spires around the central *vimana*. Each temple stands on a stone platform and ordinarily measures about 40 meters in height and 35 meters in width. Like the preceding, the remarkable temples at Gwalior date from the tenth to the eleventh century. Decorative and figured sculpture now spreads luxuriantly over every inch of surface. The interiors are small and dark, the supports heavy and broken, and the decoration of the pyramidal exterior by innumerable small repetitions of its own form has become the most effective part of the style. The famed Khandarya Mahadeo (c.1000 A.D.) is the most remarkable of this extraordinary group. At Brindaban is a fine ruined temple; at Kantannagar a very late temple of terra cotta in a mixture of the Brahman and Moslem styles (1704).

Chalukyan. Passing to the centre of India, we find few but important works. The temples of Ellora (q.v.), famous the world over, exemplify the fusion of Buddhism and Brahmanism. There are about 30 excavated in the rock over a distance of two kilometers. The earliest and greatest temple is that of Visvakarma, 26 × 13 × 10 meters, divided into three aisles by 38 pillars. The temple of Indra is remarkably rich decoratively, but less so than the Kailasa (see ELLORA), which is a free-standing monolithic temple, cut out of a single mass of rock, and one of the most fantastic and brilliant creations of Indian art. Another group of subterranean temples is on the island of Elephanta (q.v.), dating approximately from the eighth century and easily visited from Bombay. The absorption of Buddhism by Brahmanism, seen during its earlier stages at Ellora, is almost complete at Elephanta, as shown by the sculptures and ritual. Some of the colossal statues are very impressive. These rock-cut temples, however, do not exhibit the characteristics of the structural temples of the so-called Chalukyan style, so named from the dynasty to whose reigns they belong. This style prevails in various centres between the Nerbudda and Kistna rivers and in the Province of Mysore to the southwest. The Chalukyan temples have shrines star-shaped in plan, and the *vimana* is a low pyramidal mass, not a lofty *sikhra*. All the details are extraordinarily rich. The temples stand on raised platforms, and their lower portions are deeply cut into stratifications, with successive bands of sculptured animals and carved ornament. Pierced stone slabs fill some of the intercolumniations. Some of the temples have double shrines, and a few are even triple. The earliest, dating from the tenth century, is at Buchhanapally, near Hyderabad; the most magnificent is the Great Temple at Halebid in Mysore; other examples are at Bailur, Hanamkonda, and Somnathpur. At Norangal is a remarkable gate, the Kurti Stambha.

Dravidian. In the south Buddhism never had a strong hold, though there are some subterranean rock-cut temples, the earliest monuments in the region. There are two groups, at

Mahabalipur and at Badami. At the former is a most interesting series of small monolithic temples in the open, similar to the Kailasa at Ellora, and apparently the prototypes of the later pagodas of the south. Both groups are thought to belong to the sixth century A.D. and are among the earliest-known Brahman temples.

Coming now to the distinctively Brahman monuments of the style which Fergusson has called the Dravidian, we encounter a gap of about four centuries in the art of the south, until we reach the earliest pagodas, or *gopurams*, which are characteristic of this region. These *gopurams* are rectangular truncated pyramids in several stories, forming towers or pylons over the principal gateways of the temples; the largest is about 50 meters high and has seven stories. The temples are not single structures, but aggregations of courts, pillared halls (*choultries*), porches (*mantapams* or *mandapas*), and corridors, the whole covering a vast area surrounded by walls pierced by *gopuram* gateways. As singular as their vast extent and the richness of their details is the lack of interior loftiness; the height of halls and corridors being usually between 10 and 30 feet. The plan of the Great Temple at Chillambaram is a rectangle of 500 and 400 meters. There is a large sacred pond (100 × 60 meters), and the main temple has 1000 columns and measures 103 × 60 × 13 meters. In contrast with the buildings of the north is the enormous horizontal scale of such monuments; the *choultry* of Tiramalla Nayak at Madura measures 100 × 32 meters; the corridors at Ramisseram are 220 meters long. At Tanjore (eleventh century) are a great *gopuram* tower in 15 stories directly over the sanctuary, the *mantapam* (or temple) of the sacred bull, an open colonnaded shrine in three aisles, and in one of the two courts the small but exquisite shrine of Soabramanya, with details curiously suggestive of the Renaissance styles. Another group of extremely sacred pagodas—inaccessible to Europeans—is at Tripatty, still another at Conjecveram.

But the greatest group in the entire south is at Vijanagara (q.v.), which has remained a deserted city since 1565. Its monuments are comparatively late, dating mostly from the fifteenth and sixteenth centuries, and they belong to the culminating period of art in this region. The great pagoda of Liva and the temple of Vitoba illustrate the grandiose and monumental character of the buildings, although their taste is less pure than that of previous centuries. Still later is the great pagoda, or *gopuram*, at Madura, an immense and imposing composition (seventeenth century). One of the best portions is the present Bazar, or Puthu Mantapam, 100 × 30 meters, with a roof supported by an imposing avenue of 128 piers, mostly in the form of realistic monsters and divinities, in a style much used in the south, but never with such richness and lifelike detail as in this centre of southern architectural remains.

In the matter of size and imposing composition nothing equals the great pagoda of Srirangam, one of the most gigantic edifices in the world and situated in the Trichinopoly district. Here successive rulers added to the original inclosure until there are seven concentric rectangles, the outer one measuring 880 × 760 meters. Aside from its size, there is little merit in the pile, as it is bare or poor in detail and design.

Buddhist Style in Neighboring Lands. Passing now to outlying parts of India and neighboring provinces, we find in the sequestered Province of Nepal, between India and Tibet, an archaic style that explains some of the origins of Indian art and illustrates a connection with China. A first type of monument is that of the large circular domical stupas of earth and brick, set upon a simple plinth without a balustrade and dedicated to Buddha. These are the earliest (Svayambunath, Buddhath). A second and far commoner type is that of the pagoda-like temples in brick and wood formed of several stories of superposed roofs, each one in retreat and raised at the corners, in perfect analogy to Chinese monuments (Bhatgaon, Patan). A third type is that of stone temples of quite a different style and of admirable design. Chronologically all these buildings are late—not more than two to five centuries old—but they represent earlier types in a region that remained in a prehistoric undeveloped condition. So the class of pagoda-like temples of brick and stone is of extreme interest. It is the same in Burma, where many monasteries were built of wood or brick.

Of even greater architectural interest is Cambodia, whose ruined cities have only recently been explored, with buildings dating between 950 and 1350. Here brick construction and stonework are very successfully combined. The ancient capital, Angkor, has a superb series of temples, particularly that of Nakhon Wat. Its inclosure measures about a mile each way, and the buildings are well composed. As in southern India, there is a large pond surrounded by courts, corridors, and temples. Grouped pyramids are used, in stories of decreasing size. Monumental staircases most effectively connect the buildings. The sculpture is exceedingly rich, but is symmetrically arranged, and the lines are not broken up, but compose simply in a manner quite un-Indian. The Renaissance character of some of the ornamentation is startling; it is undoubtedly a true Indian renaissance from traditions of classic Hindu influences. In quality of detail the Angkor buildings are unsurpassed in India.

In Java, also, there is an interesting offshoot of Buddhist art. Its chef-d'œuvre is the famous Boro Buddor (q.v.), built in the seventh century A.D., a perfect epitome of Buddhist art before its fall. It is a stupa or dagoba in seven stories, approached by five processional paths, along which are 72 small domes surmounting separate dagobas which surround the central one. Nothing like this remains in northern India among Buddhist monuments, so that for comparison one must go to Gandhara, in the northwest, to Jamalgiri and Takht-i-Bahi, which are its prototypes.

Still another region abounding in archæological remains is the island of Ceylon, which also contains a mass of Buddhist monuments. The ancient capital, Anuradhapura, is unique in having a series of Buddhist monuments built throughout nearly a millennium, and long after Brahmanism had displaced Buddhism on the mainland. There remain seven separate stupas, with processional paths, as in Java. Two of these stupas have three rows of high columns surrounding the central mound, monoliths about 26 feet high, suggesting the columns of Persepolis. There is but little sculpture used in the decoration, and in some of it the lines of

hieratic animals give additional points of resemblance to western Asia.

Mohammedan Style. The superb Mohammedan architecture of India is treated under MOHAMMEDAN ART. In some cases, as at Ahmadabad, the fusion with pure Indian art is so thorough as to leave only part of the credit to imported ideas from Persia and Bagdad. But at Agra, Delhi, and Bijapur the style is fundamentally foreign.

DECORATIVE ARTS

General Character. The religious character of Indian art is quite as prominent in other branches as it is in architecture. A knowledge of the intricacies of the Hindu pantheon (see Illustration under INDIA) is a necessary prerequisite to the study of the sculpture and painting, the pottery and even the lacquers, bronzes, and goldsmith work. There is little æsthetic value in most of the mediæval and modern representations of the human figure as such in India; they interest in the mass, as decoration, and because of their subject, as illustrative material for the study of Indian thought. Indian art is essentially symbolic and religiously idealistic. It employs form only as a vehicle for ideas. The Hindu ideal is the very opposite of the Greek inasmuch as form is made light of and moral elevation and meditation are more valued than mere beauty and force. Indian art is thus much nearer to the Byzantine and Gothic than to the Greek. While it is true that many Indian mediæval and modern productions are grotesque or hideous because of a symbolism which disregards æsthetic considerations, the fact must not be lost sight of that for 2000 years "during the so-called dark ages Indian and Ceylonese painting attained a degree of proficiency not matched in Europe before the fourteenth or fifteenth centuries" (V. Smith). The endless repetition of the same theme in the same monument is characteristic of its symbolic use, as it is, indeed, of the Oriental spirit. This impersonal character has favored the extraordinary tenacity of tradition and continuity of style still to be observed in the various provinces. This has been made possible by the hereditary nature and continuous life and organization of the different crafts, not only in the guilds of the cities, but especially in the groups of artisans which, organized as guilds, have for some 3000 years formed an integral part of the village communities of India, supplying its inhabitants by perpetual contract. The sumptuary arts fostered by the aristocracy naturally flourished in the cities and not in these village communities. Despite their adherence to tradition Indian workmen are capable of imitating with skill and success. Although originality vanished centuries ago, no fundamental damage had been inflicted on Indian arts until under British rule the incongruous architecture of Europe, and the degrading methods of machine manufactures came into fashion in place of the native methods of hand work. This tenacity makes it possible to study some of the methods of antique art in modern India, because the continuous overland trade during antiquity and the Middle Ages kept India in constant relations with Persia, Babylonia, and Assyria, Egypt, and the late Hellenic states after Alexander's time, and later with the Mohammedan powers. The stepped temples of Babylonia, the filigree gold

jewelry of Etruria and Greece, the enameled tiles of Persia, the products of the looms of Mesopotamia, and, later, the arts of the Mohammedans of Egypt, Syria, and Persia, were all paralleled or echoed in India with greater or less purity. Yet there was always enough of a transformation to give an aspect of Hindu unity to whatever was borrowed. Indian art has always been full of a character of its own. Its greatest successes have been in its decorative work, both on a small scale and in masses, and in the imposing compositions of its architecture. Its failures are due to a poor sense of form both in line and composition.

Sculpture. The early Indian sculpture combines naturalistic modeling with ideal dignity of figure. It does not know the monstrous and grotesque which characterize the mediæval period of architecture. The earliest glyptic monuments are the famous pillar edicts of Asoka (q.v.) and the encircling marble rails belonging to the Sunga dynasty and found at Beshagar, Bharhut, Buddh Gaya, and Sanchi. The sculpture of the Kushan dynasty is not properly Indian but Græco-Roman. It reached its acme in the first two centuries of the Christian era in the remarkable Buddhist reliefs at Gandhara; they are carved on blue clay slate and exhibit traces of color and gilding. Other centres of Greek art are Mathura (Muttra), Sarnath (near Benares), and Amravati (in Madras). This foreign art does not seem to have exercised a lasting influence on the development of Indian sculpture. The monuments of the Gupta dynasty (inaugurated 320 A.D.) are thoroughly Indian. Excellent examples of Gupta workmanship are found at Ajanta, Bagh, Aurangabad, and other places. Neither this sculpture nor that of the succeeding centuries up to the tenth is marred by the introduction of the monstrous as decorative element. Southern sculpture, especially "remarkable for its enormous quantity, fantastic character, often degenerating into the grotesque, and marvelous elaboration, rarely, if ever, exhibits the higher qualities of art" (V. Smith). The three centuries before and the nine after the Christian era witnessed the development, under Buddhist influence, of the most artistic schools of sculpture that India ever saw. In certain parts of the north and northwest, especially, there are traces of Greek and Persian influences, as in several monuments of the region of Peshawar. They frequently show evidence of a realism which was lost later when the figure of Buddha became an object of worship and crowded out the other representations of the male figure. The Buddhist style was continued in Ceylon after it had decayed on the mainland, as is shown at Anuradhapura. The Ceylon sculptures are inferior to those of the mainland. A high degree of excellence is shown by the Boro Buddor (Java) sculptures of about the eighth century A.D., which are very remarkable for their execution as well as their elegant simplicity, directness, and sincerity. Most of these sculptures can be studied in the South Kensington Museum (London) or the Indian Museum (Calcutta) and in the British Museum and the Madras Museum.

The subordination of sculpture to architecture is evident even at this early period: the human figure, though used in colossal size in statues and high reliefs, especially in representations of Buddha, is usually in rather minute proportions and in confused and intricate composi-

tions. Line upon line of reliefs are superposed, in which architectural detail and decorative design play an important part. The rock-cut figures of the caves are hardly as delicate as the earlier sculptures of the rails or the later work on the open-air temples. The almost classic style of Muttra, of which echoes even survive at Amravati, is gradually replaced by one given to grotesque and exaggerated forms: the female figure especially is treated with undue emphasis, the breasts and hips being exaggerated and the arms disproportionately long. Much of the figure is, moreover, hidden by bracelets and other ornaments. Indian sculpture and painting seem to have been checked in their development by Buddhist asceticism. With the worship of Buddha's figure the ideal artistic type came to be the Yogi, an emaciated ascetic sitting cross-legged on a mat and lost in profound and pious meditation. This ideal the Hindus admirably succeeded in embodying in their art, and from this Buddhist point of view the material shortcomings of Buddha's representations—stereotypy, stiffness of the folds, schematic outline, want of anatomical details and of proportion—matter little as long as the transcendent religious idea is clear. Mahayana (q.v.) Buddhism merely multiplied these representations and combined them with symbolic elements which recall the exuberant fancy of the Puranas.

The relative scarcity of portraiture, the prevalence of wood-carving technique in sculpture, and the subordination of this art to architecture are due to its close connection with religious worship. Where religious preoccupation is absent, as in the representation of animals, realism asserts itself, and, especially in the minor decorative pieces, grace, force, and a limited amount of realism are met with. In the words of Mr. Percy Brown, "the very highest form of fine art in India is to be met with in the terracotta statuettes made at Lucknow," which are thoroughly realistic. These works of art are the strongest argument in favor of those who, like Havell, hold that the deficiency of religious art is not due to a lack of the æsthetic sense among the Hindus, but to a voluntary renunciation of beauty of form.

The Jaina period of the eleventh century, typified in the temples at Gwalior, Mount Abu, and Khajuraho, shows the existence of a style of exquisite delicacy and profuse richness. Every part of the surface of the temples at Mount Abu, both within and without, is carved, and the later style of Hindu sculptures finds here its prototype. Horizontal lines are emphasized: decorative design is given more importance than purely figured sculpture. Unfortunately the exaggerated deference to ritualistic prescriptions left no room to the artists' fancy. The Digambara sect makes use of the nude. Then and even earlier the art of sculpture received great development in outlying regions, in Kashmir, Tibet, and the French sphere of influence. There probably never existed a style of art in which sculptured ornament was so profuse as in the art of India and its neighbors. A second decadence came with the Mohammedan conquest: decorative design still flourished, but the Moslem dislike for the portrayal of the figure had its effect. Hindu traditions, however, were stronger than the Mohammedan belief: the recent sculpture of Delhi, Bombay, and Madras is directly derived from the eleventh-century style through intermediary stages. Martaud and Avantipur

in Kashmir, Madura, Ellora, Puri, and Khajuraho contain the foremost works of the old Hindu school. Vincent Smith's *History of Fine Art in India* gives a good classification of the sculptures. The three divisions of the Brahman style—Dravidian, Chalukyan, and northern Brahman—all afforded great scope for sculpture by the elaborate plans and colossal proportions of their sacred buildings. The most extensive and magnificent sculptured effects in the Dravidian style are found at the temple of Rameswaram, in the Chalukyan style (with great prevalence of animal and bird friezes) at that of Halebid, in the northern Brahman (Hindu) at Bhuvaneshwar.

The lack of æsthetic qualities in composition and form, which prevented monumental sculpture from reaching a high level of achievement, was not noticeable in the smaller branches of sculpture, such as carving in wood, marble, soapstone, and ivory, metal work, clay figurines, as well as inlaying and enameling. The naturalism and exquisite detail here appear to advantage. Work in black wood, ebony, and sandalwood is still carried on in many villages, for small objects, and in teakwood for the details of house decoration. Carved ivory is as popular as in China and Japan, both for statuettes and for reliefs of religious and genre scenes, hunts, animals, and birds.

Indian workmen are very adept at incrustations of varied materials—metal, ivory, ebony, etc.—on all sorts of objects. The fabrication of furniture is rather an industry than an art, and is chiefly produced for exportation, Hindu houses being, as a rule, furnished only with beds and trunks, as chairs and tables are for the use of strangers and found only in the reception rooms. The Bombay furniture with its closely carved surface is perhaps the best known. Mughal influence is visible in the decoration of doors and in the woodwork of perforated windows, which are often very artistic.

Painting. There is not the same continuity in the use of painting as in the other larger arts. The oldest example of painting was found in the Jogimira cave of Ramgarh Hill, in the Surguja State; it dates from the second or first century B.C. The wonderful frescoes of the Ajanta caves cover the period from 50 to 642 A.D. These paintings, which sometimes attain colossal proportions, exhibit scenes from the life of Buddha, remarkable for their lines, coloring, and power of expression. Other specimens of painting have been found at Bagh in Malwa. The explorations of Turfan (Chinese Turkestan), carried out since 1891 by Le Coq, Stein, and Grünwedel, have revealed the existence of fresco and distemper painting in which Indian influence is joined to Hellenistic, Persian, and Chinese, without its being possible at present to determine the share of India. On the other hand, Indian influence is clearly traceable in the Sigiri (Ceylon) frescoes of the fifth century A.D. and in the Buddhist art of Tibet, where it came from Nepal, of Cambodia, and of China. The latter country subsequently discharged its debt to India by indirectly influencing Indian miniature painting, though not so much as Persia and Central Asia. While the iconoclastic efforts of the Moslems are chiefly responsible for the absence of remains of painting in India for the nearly 1000 years elapsing between 642 (the close of the Ajanta series) and 1570 (the reign of Akbar), Indian tradition, combined with

Mughal influence, still survives in the Kangri paintings, of which there is an admirable collection in the Central Museum at Lahore. At later times painting was spasmodically employed and became popular in the decoration of sculpture. The identification of the numerous gods by means of their symbols or emblems, and the emblematic use of different colors in their dress, made color an essential element in statuary and relief work. The Mughals introduced the illumination of manuscripts from Persia, and miniature painting became popular, especially at Delhi. The Emperors Akbar and Jahangir are especially famed as promoters of this art. Excellent collections of miniatures are shown in the Calcutta Art Library, the Khuda Bakhsh Library at Bankipur, the Newcastle Library, etc. The Cochran collection in the Metropolitan Museum of Art, New York, contains a number of beautiful specimens. Colored facsimiles of fine miniatures may be seen in Havell, *Indian Sculpture and Painting* (London, 1908). A Bengali national school of Indian painting is a part of the *swadeshi*, or Nationalist, movement in India. Its chief representative is A. N. Tagore. Popular, religious, and mythological painting, too conventional to admit of individual treatment, was probably never absent from India. In its details are often brought out in relief, and gilt gesso and glass and sometimes pearls and jewelry are used to enhance the effect. The purely decorative religious symbols are frequently graceful and elegant of design.

Jewelry. Of all the smaller arts in India, jewelry is the most universally interesting and beautiful. The techniques of filigree and granular work, only recently rediscovered in Europe after antique models, were never lost in India. (See FILIGREE.) There are at least three very primitive types of jewelry: (1) the heavy gold wire twisted into collars, girdles, bracelets, anklets, and necklaces, used originally throughout India; (2) the chopped gold style, made of flat or cubic pieces, strung together and either solid or hollow, all of general use, but now most popular in Gujarat; (3) the flat beaten silver type of many primitive tribes, similar to early Celtic work. There evidently is great similarity between the Indian races and the Etruscans in the profusion of jewelry that was always worn, as is evident from the earliest literature, such as the *Rig-Veda*; and the sculptures show that its forms have remained unaltered for over 2000 years. The present schools are those of Ahmadabad, with its archaic style; of Mysore, Vijanagara, and other towns, in thinnest pieces of beaten gold; of Kashmir and the Punjab, for the use of gems and enamels in richest but always tasteful variety; of Sind and Baluchistan, similar but more solid and severe; of Oudh, formerly centred in Lucknow, similar to that of Delhi and Lahore; of Cuttack in Orissa, famous for silver filigree work; and a multitude of minor centres, like Dacca and Dinajpur in Bengal, the work of the last-mentioned place strongly resembling the primitive Indian. The Parsis of Bombay long held on to antique Persian forms, and the south used mythological subjects. The school of Trichinopoly, with very rich chains, necklaces, and bracelets, has long been a favorite one with Europeans. In short, India has sounded every extreme and form of jewelry, from the most simple and primitive to the richest and most elaborate. (See JEWELRY.) Goblets and other objects of gold and silver are

made by jewelers, as the arts of jewelry and gold work are not separate in India.

Pottery. Even more than jewelry the pottery of India, especially in its unglazed varieties, preserves the ancient forms shown in the early sculptures and paintings. The potters of the villages have never changed these forms since very early times. In fact, the special pre-eminence of the best Indian pottery has always been the strict subordination of color and ornament to form and the conventionalizing and repetition of natural forms in the decoration. Unglazed pottery has been made everywhere in India, and still survives quite generally, especially in the Punjab. Decorative pottery for commercial purposes, painted, gilt, glazed, or even pierced, is made in special varieties in different provinces: e.g., the gilt pottery at Amroha, the black and silvery ware at Azimghar, whose meretricious art is in great contrast to the beautiful glazed ware of Sind (Hyderabad, Jatta, Jerruck, etc.), of Madura, and of the Punjab (Lahore, Delhi, Yang, etc.). The glazed ware of these three schools only is worthy of standing beside the beautiful primitive unglazed pottery. Their knob and flower patterns, and other favorite floral designs, imitate classic and even Assyrian, Persian, and Egyptian originals; the shapes of the vases recall the antique examples found in Oriental, Etruscan, and Greek tombs. The turquoise blue, golden brown, dark green, or purple colors are the most beautiful. The exquisite color tones and combinations can be studied even better in the glazed tiles which came into fashion with the Mohammedan conquest after the eleventh century. These encaustic tiles, when used to cover large wall spaces, or even entire buildings such as mosques, produce an unparalleled effect of splendor. Here especially is Persian influence predominant. The potter was also the image maker, producing innumerable painted clay figurines, mainly of the gods, to be worshiped in families and shrines. The Indians never fabricated porcelain.

The great skill of the Indian potter can be judged from the size as well as from the quality of the vessels he shapes on his wheel and afterward succeeds in baking. In Ahmadabad and Baroda are made jars for storing grain often 5 feet high; in Dacca, on the banks of Dol Samudra, jars of nearly a ton capacity; in Bengal, clay figures of Karthikeya, the Indian Mars, from 25 to 30 feet high. The sumptuous glazed pottery of Sind and the Punjab was probably introduced into India from China via Persia by the Afghan Moguls through the influence of Tamerlane's Chinese wife. Some of the unglazed water vessels still made in every Hindu village have the same forms as those represented on ancient Buddhist sculptures and paintings. The fact that the Hindus have a religious prejudice against using an earthen vessel twice, generally breaking it after the first pollution, causes an immense native demand for the cheap unglazed cooking pots, water jugs, and frying pans. The tiles made in India are inferior to, but resemble, Oriental tiles of the type that adorn the mosques of Egypt, Syria, Turkey, and Persia.

Metal Work. The best illustration of the skill of the Indians in foundry is furnished by the huge iron pillar at Delhi from the time of Chandragupta II (fifth century A.D.), the like of which European industry was not able to pro-

duce up to the latter part of the nineteenth century. Although wholly exposed to rain, it never rusted. A still larger one (over 42 feet in length) is found at Dhar. It dates from 321 A.D. Among the branches of artistic metal work that of the arms and equipment of the great chieftains is prominent. The Buddhist, Hindu, and Jaina sculptures show how antique are many of the forms still in recent use, but of actual works that are preserved the finest do not date back of the great Mahratta warriors. There are two main schools, the Hindu and the Persian. The Punjab and Rajputana have been among the main centres of the art. A comparison of the three great schools of the mediæval Orient shows that the most delicate and simple was the Arab, with its fine filigree work; richer and more highly colored was the Persian with its damaskeening, enameling, and carving; but richest of all was the Indian, which indeed sinned, perhaps, by excess of decoration, breaking the outlines and the color scheme by high relief, hammered and cut goldwork, and a multitude of gems. The collection of the late King Edward VII has the finest examples of damaskeened suits, of crusading blades carved in relief, and of early matchlocks. The use of carved ivory often gives added brilliancy. Diamonds, rubies, and emeralds are the principal stones used, and the designs are largely floral. The collection of the India Museum ranks next to that of King Edward VII. Of the chieftains' swords valued as heirlooms and state possessions, the finest are those of Sivaji, Sultan Chand, and Polygar Katabomma Naik.

Damaskeening (*koft*) in gold and silver wire is a process probably imported during the Middle Ages into India from Persia and Syria. It is practiced in Kashmir, the Punjab, and the Nizam's dominions, though originally of wider use. The ornamentation is in floral patterns, either naturalistic (*Bider*) or conventional (*Purniah*). The boxes, hookah bowls, vases, and caskets with this decoration often equal the best Mohammedan work of Egypt and Persia and are among the most harmonious of Indian industrial works for form and well-composed ornament. The relief work in metal is less chaste and admirable, whether in brass, copper gilt, bronze, or the precious metals, where the high relief technique and human and animal figures are often used. The gold and gilt work, however, is usually exquisite. The oldest examples are Buddhist pieces found in the Punjab and Afghanistan with Græco-Roman characteristics. The later work in chased parcel-gilt and gold sometimes pierced, especially that of Kashmir, is beautiful in shape, the gold being often given a ruddy hue or olive brown. Lucknow, Dacca, Cutch, and Gujarat have been famous goldsmith centres. The copper industry is especially flourishing at Tanjore and Madura. It is practiced by a special caste.

Images or idols of gold and silver, brass and copper, or of an elaborate alloy, have always been profusely used in private houses for worship. Some are of gold, as those of Krishna and Sarasvati; others of silver, as those of Sitala; others of copper, such as those of the sun Surya and the serpent Naga. The larger figures are always cast and finished by hand. Mention may also be made of the inimitable bronze statuettes from Vizagapatam, which are a part of the collection of King Edward VII.

Of especial merit are the *champlevé* enamels

in red, green, and blue on gold, done at Jeypore by Sikhs whose ancestors were brought there from the Punjab by Maharajah Jeysingh. There still exist in India innumerable specimens of arms and armor, showing how important was the armorers' work until the *Pax Britannica* put an end to the constant wars between the native states and principalities. Damascus steel is still made at Samandrum, near the Dimdurti mines that have been a source of supply from time immemorial.

Carving. Anciently, elaborate wood carving adorned the thrones of rajahs and princes, the chariots of warriors, and the buildings of all classes. In the Punjab, the Northwest Provinces, Central India, and the Bombay and Madras presidencies, carved façades, doors, windows, balconies, partition screens, and furniture are still made, of high quality and in large quantity. In Burma the Buddhist monasteries and temples are mostly of wood elaborately carved. Carving in *black wood* is an art that has been especially developed in the Madras Presidency. Teakwood carving is also becoming common, as is *tarkashi* work that combines inlaid brass with carving. Sandalwood is a favorite material for fans, combs, rosaries, paper knives, etc. Ivory carving and lacquer work (q.v.) of high quality are produced in many parts of India. See INLAY; MOSAIC; RUGS, ORIENTAL; TEXTILE PRINTING.

Enamel. The extremely difficult art of enameling in *champlevé* is still practiced in greatest perfection by Sikh craftsmen at Jaipur in Rajputana, unique for the beauty of its ruby reds, coral reds, emerald greens, and turquoise and sapphire blues. Somewhat less perfect are the products of the schools of Lucknow, Benares, and Lahore. Gujarat puts out small objects. Indian enamels are combined remarkably with precious stones. Transparent enamels are used with success, and sometimes a thin plate of gold cut in elaborate scenes of figures and ornamentation and etched with a graver is superposed over an enamel ground melted on a gold back. Spoons, cups, vases, etc., of enameled gold are made at Jaipur, Merwara, Delhi, and Benares; Lahore, Hyderabad, and Lucknow excel in silverwork. The caskets of Pertabghar and the niellé copper objects of Muradabad and Kashmir enjoy a well-deserved fame. In lacquer work, especially as associated with Persia, Indian art is even more preëminent.

Woven Fabrics. The brocades, embroideries, woven tissues, laces, tapestries, and the like, so long one of the greatest prides of India, have suffered more than any other branch of art industry. Kashmir is the home of world-famous woolen shawls, rich in color, brilliant; Surat produces silk prints; while the most sumptuous brocades come from Ahmadabad, Benares, and Murshidabad. The gold-embroidered velvets for state canopies, housings, and caparisons are especially rich. But their designs are not so purely Oriental as are those of the *appliqué* work on cloth and the early rugs and carpets with their Persian compositions of birds and animals. The jail industry and the so-called schools of industry have done even more than the rush orders from Europe to degrade the quality—both material and artistic—of India carpets.

Textiles. India has long been famous for its silk and cotton textiles, printed and embroidered as well as loom-figured. Cotton fab-

rics of almost every kind are made in Lahore, Amritsar, Multan, and Ludhiana, the last-named city giving its name to the drills and checks produced there. The ehintzes of Jaipur and Jodhpur are prized all over India for the purity, brilliance, and fastness of the dyes. At Benares are made gold-figured muslins, and at Bijnor the sacred gold cord and sacrificial thread of the Brahmans. The *bandana* fabrics of Gujarat and Rajputana in the Bombay Presidency are especially interesting on account of the method of dyeing. The cloth, while still in the natural, is tied up with thread into a pattern of tiny squares. When the knots are untied after dyeing, the red or blue ground is seen to be figured with tiny white squares which the dye could not reach. The centre of these squares is often painted yellow by hand. From this process *bandana handkerchiefs* got their name. Sometimes the process is complicated by a succession of tyings and dyeings and is then called *phul-wadi* (flower garden). The *wax-printed* cloths of Peshawar and Deesa are made by applying a mixture of melted lac and beeswax with a wooden stick. Finely powdered mica is then sifted over the design, and the mixture dries hard so that the cloth can stand washing and rough usage. The mica gives it a brilliant lustre. From Poona and Satara come gold-leaf prints, studded with tiny pieces of mirror glass. From Surat come *razais* (bedcovers) brocaded in small squares. The quantity of stuffs, part cotton and part silk, made in India is very great, the Mohammedans being forbidden by the laws of their religion to use pure silk. The brocaded *kincabs* from Benares, Surat, and Ahmadabad have been famous for centuries. From Surat and Madras come silk *sarees* with fancy edgings and trimmings worn by the Hindu ladies as gowns. Embroideries are part of the costume of almost every native in India. The most famous embroideries are those of Kashmir. Excellent in design and workmanship are the silk-on-cotton *phulkaries* from the Punjab and the Hazara frontier. The colors of the Cutch *phulkaries* are particularly attractive. The tinsel-embroidered stuffs of Delhi, Agra, and Madras, are used for gowns, draperies, bed and table covers, cushion and pillow covers. Rampore *chuddars* are made in plain texture from *pashm*, or *pashmina*, which is the fine, short, soft flossy underwool of the *Capra hireus*, a goat that lives on the lofty table-lands of Tibet. The reason for the name *chuddars* (ring shawls) is that one of them 6 by 12 feet can easily be passed through a finger ring. From this same *pashmina* are made the famous Kashmir shawls, some figured in tapestry weave, with the usual open slits left in tapestry weaving where colors meet parallel with the warp, as well as intricate embroideries in which the "cone" is a prominent feature. The making of pile rugs in the Persian fashion appears to have been introduced into India by the Mohammedans in the fourteenth century and became an important art industry in the sixteenth century. (On modern India rugs, see the article RUGS, ORIENTAL.) Among rugs for ceremonial use are those richly embroidered in gold and silver at Benares and Murshidabad, and those with silk pile made at Tanjore and Salem. Commonly used in India, and also exported to Europe and America, are *durries* (cotton rugs woven flat without pile) in great variety of designs.

During the last half of the nineteenth century

the decline of the decorative arts in India was marked. Machine-made goods were imported from Europe in constantly increasing quantities to take the place of the beautiful native handmade draperies, furniture, clothing, and jewelry, that centuries of artistic development and inheritance had brought almost to perfection. Even the rajahs and the princes of India ceased to encourage domestic art, and the wealthy traders no longer purchased what they could no longer sell. Thousands of the most skillful artisans faced starvation, and many were compelled to obtain other employment. Finally the British government of India began to appreciate the situation and endeavored to remedy it by establishing art schools at Bombay, Madras, Calcutta, Ruttanagiri, and Lahore. The native states opened similar schools at Jaipur, Alwar, Cutch, and Kolhapur. Large commercial firms, both native and European, began to exploit native Indian decorative goods in the markets of Europe and America, and the exhibit of Indian art at the Chicago Exposition in 1893 was noteworthy.

Bibliography. Important work on the history of Indian art has recently been done by Vincent Smith and Ananda Coomaraswamy. Especially useful are Smith, *History of Fine Art in India and Ceylon* (London, 1911), which gives full bibliographical information, and Coomaraswamy, *Arts and Crafts in India and Ceylon* (ib., 1913), with a useful chronological synopsis of India's art history. *The Journal of Indian Art and Industry* (London, 1886 et seq.) is a rich mine of information; Le Bon, *Les civilisations de l'Inde* (Paris, 1887), is good in spite of its early date of publication. For architecture, consult: *Archæological Survey of India*, published by the government (London, 1874-1901); Fergusson and Burgess, *Cave Temples of India* (ib., 1880); Le Bon, *Les monuments de l'Inde* (Paris, 1893); Fergusson and Burgess, *History of Indian and Eastern Architecture* (London, 1899; 2d ed., 1910), which must be consulted in connection with the work of Smith mentioned above; Burgess, "Indian Architecture," in the *Imperial Gazetteer of India*, vol. ii (Oxford, 1907), with bibliography; Havell, *Indian Architecture* (London, 1913); and the various publications of Cunningham. Sculpture is well analyzed in the work of Vincent Smith; a less scholarly treatment of the subject is by Havell, *Indian Sculpture and Painting* (London, 1908), excellently illustrated, written from an artistic standpoint as distinguished from the archæological, but somewhat overenthusiastic. For the minor arts, the best general authority is still Brantwood, *Industrial Arts of India* (London, 1880, 1884), which must be used in conjunction with vol. xii of the *Journal of Indian Art and Industry* (ib., 1907-09) and with Watt, "Arts and Manufactures," in the *Imperial Gazetteer of India*, vol. iii (Oxford, 1907). Vol. xi of that publication is devoted to rugs. The bronzes have been dealt with, among others, by Coomaraswamy in the *Burlington Magazine*, pp. 86-94 (London, 1910). For Buddhist art, consult: Griffiths, *Paintings in the Buddhist Cave Temples of Ajanta* (ib., 1896-97); Grünwedel, *Buddhist Art in India* (trans. and rev. by Burgess, ib., 1901); Foucher, *L'Art gréco-bouddhique du Gandara*, vol. i (Paris, 1905). The latest publication on Jaina art is by Coomaraswamy, "Notes on Jaina Art," in *Journal of Indian Art and Industry* (London, 1914). Consult

further, Baden-Powell, *Manufactures and Arts of the Punjaub* (Lahore, 1872); Fergusson, *Tree and Serpent Worship* (2d ed., London, 1873); J. F. Watson, *The Textile Manufactures and Costumes . . . of India* (ib., 1866); id., *Collections of Specimens of Textile Manufactures* (2d series, ib., 1873-77); Mukharji, *Handbook of Indian Products* (Calcutta, 1883); id., *Art Manufactures of India* (ib., 1888); Coles, *Catalogue to the Objects of Indian Art in South Kensington Museum* (London, 1874); Hendley, *Memorial of the Jeypore Exhibition* (ib., 1884); id., *Uwar and its Art Treasures* (ib., 1885); id., *Jeypore Enamels* (ib., 1886); Watt, *Indian Art at Delhi* (ib., 1903); Vincent Smith, "Archæology of Historical Period," in the *Imperial Gazetteer of India*, vol. ii (Oxford, 1907); Havell, *Ideals of Indian Art* (London, 1911); Coomaraswamy, *Mediæval Sinhalese Art* (Broad Campden, 1908), and his series of illustrations of Indian art, *Viśva-Karma* (ib., 1912 et seq.); Martin, *Miniature Painters of Persia, India, and Turkey* (London, 1913).

INDIANA UNIVERSITY. A coeducational institution of learning, situated at Bloomington, Ind. It was founded in 1820 as Indiana Seminary and was rechartered as a university in 1838. The university is an integral part of the State public-school system and admits pupils from commissioned high schools without examination. It maintains professional schools of law and medicine and confers the degrees of bachelor of arts, bachelor of science, bachelor of laws, doctor of medicine, master of arts, and doctor of philosophy. The university has a biological station on Winona Lake. The summer school, formerly privately conducted, is now a part of the university. The elective system was introduced in 1885. In 1914 the faculty numbered 125, and the attendance was 2530, including 168 in the law school. At the same time the university had grounds and buildings valued at \$650,000, an endowment fund of \$600,000, and an annual income of \$500,000. The library contains 80,000 volumes. The president in 1914 was William L. Bryan, Ph.D., LL.D.

INDIAN BADGER, BUFFALO, ETC. See BADGER; BUFFALO, ETC.

INDIAN BEAN TREE. See Plate of CALABASH, ETC.

INDIAN BIBLE. An Algonquin version of the Bible made by John Eliot (1661-63). This translation was the earliest version of the Bible to appear in America.

INDIAN CAUCASUS. See HINDU KUSH.

INDIAN CORN. See MAIZE.

INDIAN CRESS. See TROPÆOLUM.

INDIAN EMPEROR, THE, OR, THE CONQUEST OF MEXICO BY THE SPANIARDS. A tragedy by Dryden, successfully produced in 1665. It forms a sequel to the *Indian Queen*.

INDIAN FIG. See CACTUS; PRICKLY PEAR.

INDIAN FIRE, or BENGAL LIGHTS. A bright white signal fire, consisting of a mixture of potassium nitrate 24 parts, sulphur 7 parts, and arsenic sulphide (realgar As_2S_2), 2 parts. The latter is often replaced with antimony sulphide. Slow-burning mixtures are produced by replacing the sulphur with ground shellac. Mixtures of collodion and magnesium powder are evaporated in thin plates; these burn with great brilliancy.

INDIAN HEAD. A town in Qu'Appelle district, Saskatchewan, Canada, on the Canadian Pacific Railway, 40 miles east of Regina, the

capital of Saskatchewan (Map: Saskatchewan, G 7). It is situated in a rich grain-producing district. It possesses a fine park. Its industries include lumber yards and planing-mill factories. A Dominion experimental farm and forestry farm are located here. Pop., 1911, 1285.

INDIAN HEAD. The highest point of the Palisades of the Hudson, opposite Hastings, so called from its resemblance to the features of a human being.

INDIAN HEMP. A very strong bast fibre obtained from the perennial herb *Apocynum cannabinum* and used by the American Indians for weaving and for cards and nets. It is also sometimes called Canada hemp.

INDIAN INDUSTRIAL AND TRAINING SCHOOL. (Official title UNITED STATES INDIAN INDUSTRIAL AND TRAINING SCHOOL.) An institution for the industrial and academic education of Indian youth, founded in 1879 at Carlisle, Pa. The school resulted from experiments in Indian education made by Capt. R. H. Pratt, beginning about 1875. At that time the government schools which had in charge the education of Indians admitted also colored students. Captain Pratt, being convinced of the differing characteristics of the Indians and the negroes, resulting from conditions of their heredity and environment, wished to attempt the experiment of educating Indians alone. He considered best for the success of the venture that the school should be situated in the midst of civilization, in order that the students might become influenced, perhaps unconsciously, by the habits and customs of civilized white persons. The school was established at an abandoned army post at Carlisle, and the first pupils were 82 Sioux boys and girls. The school prospered, and Indians from more than 70 tribes have been received and graduated. One of the aims of the school is to develop the individuality of its students, and in order to familiarize them with conditions of life among white people, a system of placing students out in families and as farm laborers has been evolved, over 800 students each year being thus placed out. The school is composed of an industrial and an academic department. In the industrial department instruction is given in practical mechanics, and in the academic department the courses correspond in a measure to those of the common and high schools. Athletics have always been a prominent feature, and it has been found that the young men have special aptitude for football. The Carlisle football team has been for more than 20 years one of the most famous of college teams and has defeated at one time or another most of the large colleges and universities. There were in the school, in 1914, 995 students and 44 instructors. There is a library of about 2500 volumes. The supervisor is Oscar H. Lipps.

INDIAN LANGUAGES. The languages of India are both numerous and important. Cust, in his book on the *Modern Languages of the East Indies* (London, 1878), enumerates nearly 250 Indian languages and some 300 dialects. Of these languages divisions are: first, the group of Aryan tongues spoken throughout the entire northern half and central portion of India; second, the unrelated Dravidian group (see DRAVIDIANS) in the south; third, the Kolarian languages scattered here and there in central Hindustan; fourth, the Tibeto-Burmese family of non-Aryan tongues, distributed over

the vast area which the name implies; fifth, the Khari, an isolated language near Bhutan. To these may be added likewise two Indo-Chinese spoken families, viz., the Thai, under which comes the Siamese, and the Mon-Annam family, which takes in the Cambodian and Annamite. It may furthermore be stated, for completeness, that the languages of the great Malayan family spoken in Sumatra, Java, Borneo, and the Celebes, and even in the Philippines, have certain Indian affinities or show the influence of the various tongues of India.

The Aryan group of languages in India has preëminence alike for the number and the character of the people that speak those dialects, and for the genius of the languages themselves, as well as for the long historical development of this branch and for the literature attached to it. In point of time the Aryan division of Indian tongues covers a period of culture extending from at least 1000 years before the Christian era down to the present time. Broadly viewed, these periods may be recognized in the history of this division of dialects: (1) *Old Indian*, comprising the earliest Vedic dialect and the historic form of the speech known as Sanskrit (q.v.); (2) *Middle Indian*, which embraces Prakrit (q.v.) and Pali (q.v.), both of which are descended rather from the Vedic dialect, or its kin, than from the classical Sanskrit; (3) *New Indian*, including the modern vernaculars of the more cultivated peoples of Hindustan. The general characteristics of the Vedic idiom, together with certain peculiarities of the epic speech, and the classical development of the language will be found in the article on SANSKRIT LANGUAGE. Under the Middle Indian or Prakrit group are comprised the Maharashtri dialect, or Prakrit par excellence, with its Jaina varieties, likewise the Māgadhī or Ardha-Māgadhī, the Saurasenī, which is found in the dramas, the Aphabhramśa and the Pāiśācī. The New Indian group, geographically arranged, takes in the vernaculars of Assam, Nepal, and Kashmir (the latter called Kasmiri), also Uriya, Bengali, Behari, Hindi, the dialects of the Punjab and of Sind, likewise Gujarati, Marathi, the Singhalese of Ceylon, Maldive, and Gypsy. See also INDIA, *Language*.

Bibliography. The standard work on the Aryan languages of India is Grierson, *Linguistic Survey of India* (Calcutta, 1903-). Consult also: Beames, *Comparative Grammar of the Modern Languages of India* (3 vols., London, 1872-79); Cust, *Modern Languages of the East Indies* (ib., 1878); P. Schmidt, *Grundzüge einer Lautlehre der Mon-Khmer Sprachen* (Vienna, 1906); Bailey, *Languages of the Northern Himalayas* (Royal Asiatic Society Monographs, vol. xii, London, 1908). For the influence of the vernacular on English as spoken in India, consult Yule and Burnell, *Hobson-Jobson, being a Glossary of Anglo-Indian Colloquial Words and Phrases* (ib., 1886); and for the phonology, Gray, *Indo-Iranian Phonology, with Special Reference to the Middle and New Indo-Iranian Languages* (New York, 1902). A statistical table, based on the returns of the 1901 census, is found in pages 166-169 of Baines, *Ethnography* (Strassburg, 1912).

INDIAN MADDER. See CHAY ROOT.

INDIAN-MEAL MOTH. One of the most familiar moths (*Plodia interpunctella*) that infest the cereals, Indian meal, dried yeast cakes, and dried fruits, nuts, etc. The moth has wings

which are reddish brown on the outer two-thirds and dirty whitish gray on the inner third. It has a wing expanse of rather more than half an inch. The larva is white, brownish-headed, and wormlike. It spins silken tubes through the substance on which it is feeding, and its excrement and portions of the food adhere to this web.

INDIAN MILLET. A term applied to certain nonsaccharine sorghums. See MILLET.

INDIAN MUSIC. The music of the aborigines of North America, although never reduced by them to a written science, is nevertheless marked by distinct racial characteristics. Of the greatest importance to the Indian musician was the emotion to be expressed; to this everything was subordinated. As a result, the Indian songs can be divided into certain stereotyped classes (such as burial, love, war songs), in each of which the similarity of the different melodies is most marked. This monotonous character of their tunes is an outgrowth of the very elements which among civilized peoples have been skillfully blended to produce original and unusual effects; for preëminent in Indian music are complicated rhythms (many of them as intricate as those of Schumann and Chopin) and a frequent use of syncopation. When it is remembered that they had no strict forms to restrain them, it will be seen how these two strong elements came in time to dominate and confine their whole musical system. The strictly technical side of Indian music is of less interest. Their scale, like the Chinese, Hindu, etc., consisted of five tones and was for the most part major; their melodies generally ran from the top of the scale to the bottom; their conception of time was very exact; but they had no part singing, no way of determining pitch and consequently no universal key. Of most interest to the cultured musician are the wonderful transitions which we find everywhere throughout the native songs. The smoothness and rapidity of their changes from key to key are unsurpassed even in European music. The Indians had a sense of harmony, but, owing to the crudity of their musical science, it was never developed. Only by the use of wooden drums, tuned to different pitches, did they get a sort of crude bass. Besides the drums their instruments consisted merely of a flute (with a scale of seven notes), a whistle (with a scale of five notes), and a rattle, made of dry gourds, loaded with sand or pebbles. In recent years the study of Indian music has received considerable attention, and every effort is now made to collect and preserve as much of the aboriginal melodies as can be found. Some American composers, especially Victor Herbert in his *Natoma*, have made use of real Indian themes.

Bibliography. N. Curtis, *The Indians' Book* (New York, 1907); F. R. Burton, *American Primitive Music* (ib., 1909); J. Tiersot, *La musique chez les peuples indigènes de l'Amérique du Nord* (Paris, 1910); F. G. Speck, *Ceremonial Songs of the Creek and Yuchi Indians* (Philadelphia, 1911); C. Troyer, *The Zuñi Indians and their Music* (ib., 1913); F. Dinsmore, *Chippewa Music* (Washington, 1913).

INDIAN MUSIC. See HINDU MUSIC.

INDIAN MUTINY, or SEPOY REBELLION. See under INDIA.

INDIAN MYTHOLOGY. The mythology of India as found in the ancient hymns of the *Veda* deserves especial consideration, because it represents an earlier state of thought with regard

to mythological subjects than is found in any other literary monument of the Indo-Germanic peoples. The development of Hindu mythology down to the present is furthermore of interest because of the chance it gives for a long historical perspective. Attractive parallels may likewise be drawn between the oldest mythological figures of India and those in the pantheon of Greece and Rome, like Father Heaven and Mother Earth (Skt. *Dyāus Pitar*, *Prthivī Mātā*, Gk. *Zeus παῖρ*, Lat. *Jupiter*); but they are often erroneous, dangerous, or misleading. Despite, e.g., the recognized possibility of kinship by reason of common Aryan or Indo-Germanic unity, such etymological equations as those between Lat. *Uranus*, Gk. *Οὐρανός* (Heaven), and Sanskrit *Varuṇa*, in Indian mythology, or again between *Kérvavpos* and *Gandharva*, or the fire myth of *Prometheus* in connection with Skt. *pramanthana*, the rubbing stick used in kindling fire, break down or become uncertain under the searching light of keen linguistic criticism. Nevertheless such comparisons are always interesting, and they are often instructive as showing how myths may develop independently or on grounds remotely associated or even disconnected. The mythology of India frequently helps to throw much light on such subjects. Myths abound in the *Rig-Veda*; they are the outgrowth of personifications of the powers of nature and meteorological phenomena. (See AGNI; INDRA; MARUT; MITRA; SOMA; SURYA; USHAS; VAYU; YAMA.) In later Hindu mythology the gods of the old régime gradually become replaced by the great Hindu trinity or triad, Brahma, Vishnu, and Siva, with all the beliefs and notions associated with each of these names. The later pantheon is occupied likewise by a band of minor deities, godlings or demigods, like Ganesa, Kartikeya, Kubera, and the goddesses Durga, Lakshmi, and Sarasvati. (See the articles under these names.) India of all ages has known also many myths, legends, or fables connected with the stars and planets, with sacred rivers, streams, and trees, birds, and animals. Consult: Dawson, *Dictionary of Hindu Mythology and Religion* (London, 1879); Macdonell, "Vedic Mythology," in Bühler, *Grundriss der indo-arischen Philologie und Altertumskunde* (Strassburg, 1897); W. J. Wilkins, *Hindu Mythology* (London, 1900); Viggo Fausbøll, *Indian Mythology According to the Mahābhārata in Outline* (ib., 1903). See BRAHMANISM; HINDUISM.

INDIAN OCEAN. One of the five grand divisions of the hydrosphere, bounded on the west by Africa and the twentieth meridian east of Greenwich (running through Cape Agulhas, the south extremity of Africa), on the north by Asia, on the east by the East Indian Archipelago, Australia, and the one hundred and forty-seventh meridian (running through the south extremity of Tasmania) (Map: World, Eastern Hemisphere, K 28). The south boundary is in an indefinite way assumed to be approximately the Antarctic circle, although many geographers prefer to call what is south of lat. 40° S. the Southern Ocean. In its broader sense it covers about 27,500,000 square miles. Gradually narrowing from south to north, the Indian Ocean forks at Cape Comorin into the Bay of Bengal on the east and the Arabian Sea on the west, the latter again branching off into two arms, the Persian Gulf and the Red Sea, which reach respectively the mouth of the Euphrates-Tigris

and the neighborhood of the Mediterranean. These limitations exclude the waters of the Indian Archipelago, as belonging rather to the Pacific Ocean. From Africa it receives the waters of the Limpopo and the Zambezi, and from Asia those of the Irrawaddy, Brahmaputra, Ganges, Indus, and the Shat-el-Arab. It contains numerous islands, chiefly confined to the northern and western regions. Of these Madagascar and Ceylon are the only ones of considerable magnitude, the others being mostly small groups of volcanic or coral formation, the volcanic islands being usually surrounded by coral reefs.

The greatest depth of the Indian Ocean is found in the northeastern part, where, close to the southeast of Java, soundings have been made of 20,340 feet, and a basin, 50,000 square miles in area, of nearly this average depth lies to the northwest of the Australian continent. An elevated ridge running along the fortieth parallel has an average depth of 12,000 feet. Krümmel estimates the average depth of the ocean to be 10,970 feet, although it is generally given as about 14,000 feet. The surface temperature of this ocean is higher than that of the others, the mean temperature of the northern portion being considerably over 80°, while the bottom temperature, falling below 40° at the equator, indicates an undercurrent of cold water from the Antarctic region. The currents of the Indian Ocean depend to a great extent on the winds. North of the equator they reverse their direction with the annual change of the northeast monsoon to the southwest monsoon, while under the equatorial calm belt the equatorial counter-current flows eastward. South of the equator, under the southeast trade winds a current flows west, bending south along the coast of Africa through the Mozambique Channel, and meeting the Atlantic westward current at the Cape, where it is turned back to the east towards the south coast of Australia. The winds over the Indian Ocean are, as a rule, gentle, with frequent protracted calms, though hurricanes occur occasionally. This ocean was the first to find a place in the history of commerce. As a commercial channel, it virtually maintained its superiority during 2000 years, being habitually traversed in a direct line between Arabia and Hindustan, while coasting voyages alone were known in the Atlantic. This comparatively bold navigation of the Indian Ocean was suggested and facilitated by the periodically alternating monsoons of the northern part.

INDIAN OIL TREE. See BUTTER TREE.

IN'DIANO'LA. A city and the county seat of Warren Co., Iowa, 22 miles by rail south of Des Moines, on the Chicago, Rock Island, and Pacific, and the Chicago, Burlington, and Quincy railroads (Map: Iowa, D 3). It controls a large trade in grain, butter, eggs, live stock, fruit, and vegetables. The city has a Carnegie library and Simpson College (Methodist Episcopal), opened in 1867. The water works and electric-light plant are owned by the municipality. Pop., 1900, 3261; 1910, 3283.

INDIAN PEOPLES. For the anthropologist India is of remarkable interest. On its soil may still be met all grades of culture, from the savagery of hill and swamp to the urban civilization born of river and plain, and all forms of human social aggregates, from the primitive family group or clan to the foreign-ruled provinces with their magnificent and luxurious capi-

tals. Here all forms of agriculture are to be found, from the burned-over forest plot to the terraced hillside of the north; in the west and south the utilization of the desert by canals and tanks; all varieties of human dwellings, from the primitive abode in tree and cave to magnificent palaces and temples; all forms of human government, from the primitive democracy and tribal anarchy to organized despotism of the civilized sort; all kinds of marriage, from polygamy to the strictest monogamy, and all varieties of both these systems and of polyandry as well; and also all forms of religion from the crudest animism and Shamanism to the agnosticism of certain developments of Buddhism. All these things have been invented, exploited, modified, improved, or degraded by members of the black, the brown, the yellow, and the white races of man for many thousands of years; so that nowhere else in the world have so many millions of human beings done so many things at so many times in so many ways as in India. Remains of the industry of Paleolithic man have been found almost everywhere throughout the peninsula, which makes India seem almost as old as the race of man itself. By far the most important peoples of India belong to the Aryan stock. They are responsible for a number of social and religious ideas and institutions, many of which are simply the expression of the mentality of the more northern and western Aryan in the process of, and after adaptation to, an Oriental and largely tropical environment. They never overcame the land by mere force of numbers, and their influence upon the pre-Hindu population was less racial than social and religious. Many primitive tribes who took over the culture of their conquerors have become assimilated to the Aryan type while preserving intact their aboriginal speech. The complicated caste system (see CASTE) is largely, if not entirely, the result of the contact of the Aryan invaders with the aboriginal population (Dravidian, Kolarian, etc.) of the peninsula, and of the efforts of the conquering race to preserve its purity as much as possible against miscegenation. It was very early dominated by religious ideas, but recent investigations have shown that the lines of caste are not nearly so coincident with racial distinctions as had been assumed to be the case. After the Aryans of India, the Dravidians (the civilized Tamils, Telugus, Kanarese, and Malayalam), the more or less civilized Kodagu, or Koorgs, and the tribes of the Nilgiris, Central India, Orissa, part of Bengal, etc., such as the Irulas, Kurumbas, Badagas, Todas, Kotas, Kader, Khonds, Gonds, Oraons, and Maler, are the most important peoples. The various tribes of this stock illustrate all grades of human culture, from the jungle-dwelling Kurumbas to the high developments of the civilized Tamils, who in literature, architecture, and other arts have shown great ability, and some of them notable capacity for assimilating both Hindu and Christian culture. The Dravidian area lies chiefly in southern India; but the Tamils have extended their influence over the north of Ceylon, forming a very important part of the population of that island.

Next to the Dravidians are to be considered the Kolarian peoples (Munda-Kols, Larka-Kols, Bhumij, Santals, Kharia, Juang, Saoras, etc.) of the Orissa-Bengal country and farther inland. The Santals represent the highest development of Kolarian culture, and the Juangs per-

haps the lowest; while the others, except some of the Kols, are more or less primitive. Like the Dravidians, the Kolarians, who are looked upon by some as a people even older, have given to and taken from the ancient and modern Hindus and have also undoubtedly affected the physical type of both Dravidians and Aryans. In the Kolarians, as in the Dravidians, certain scholars detect traces of negroid intermixture, as well as much Aryan and some Mongolian blood. The Veddas of Ceylon, by some ethnologists classified as a separate variety of mankind, certainly are one of the most primitive peoples now existing. They have been thought to represent the oldest nonnegroid population of India, now disappearing. Some have sought to class the Todas of southern Hindustan as a peculiar people. The islands off the Indian coast present some interesting tribes. The Selungs of the Mergui Archipelago are classed by Deniker as Indonesians; but this is rather doubtful, and a like uncertainty exists regarding the inhabitants of the Nicobar Islands, the natives of the interior of Great Nicobar being savages of a rather primitive type. The Minkopis, or Andaman Islanders, are characteristic Negritos, whose extension must at one time have been much greater. In Assam, Burma, and the Malaccan possessions and protectorates of Great Britain, a great variety of peoples are to be found, chiefly of Indo-Chinese, Proto-Malay, and so-called Indonesian origin, besides the Sakai and Semang of Malacca, who are more or less Negritos. Among the most notable of these peoples, outside of the Burmese, Karens, etc., are the Nagas of Manipur, the Chins of Burma and Arakan, the Lushai tribes of Assam, the Shans of northern Burma, and some other tribes.

The anthropological history of India includes the following successions and impacts of races: pre-Dravidian and pre-Kolarian (with mixtures of Negrito and Proto-Malay); Aryan (invasion by the northwest as early as 2000 B.C. at least); Greek invasion, in the time of Alexander the Great (locally important in the Indus region, and more important as partly opening India to the Western world); Bactrian invasions of the northwest (following the Greek and of local importance); Mohammedan invasions (1000-1400 A.D.), resulting in the establishment of many dynasties in the northwest and west, including the famous Mogul Empire of Delhi and its successors of the eighteenth century, which were broken up by the revolt of the Mahrattas and Sikhs, who restored Aryan supremacy. Besides these must be counted the Pathan influence in the northwest at various times, the Mongol (Tibeto-Sinitic) influence from a comparatively early period in the Himalayan region, and Indo-Chinese and related influences in the northeast. Malayan elements also were present in the south and east, with the later Arabo-Persian, Dutch, Portuguese, French, and British commercial, missionary, and political achievements. The Parsis (Persians), who are settled chiefly in Bombay, are of great importance in spite of their limited numbers; the Jews have had some influence on the east coast; and the Chinese in Ceylon. Since coolie labor has been in demand, natives of India have found their way to Madagascar, the West Indies, Guiana, and Africa.

Eskimo.....	4,600
Grand total.....	109,556

INDIAN QUEEN, THE. A tragedy by Sir Robert Howard, in collaboration with Dryden, produced with great splendor in 1664.

INDIAN RED. An impure ferric oxide of a dark-red color, with a tinge of purple. It is used as a pigment. Indian red is prepared by calcining natural red ochre until most of the water of hydration is expelled. Occasionally soft red hematite of proper shade is obtained from deposits and requires no further treatment than grinding.

INDIAN RESERVATIONS. As early as 1786 the United States inaugurated the policy of setting aside certain lands and confirming the titles of Indians thereto. All such transactions were by treaty, thus recognizing to some extent the independence of the Indian tribes. At the same time control over the Indian was extended by conquest, so that in 1871 the government ordered that no more treaties should be made, but that all dealings with Indians should be under the immediate control of Congress. The administration of the reservations was, however, an executive function and, as such, delegated to the Department of the Interior, under which a distinct division was organized, Department of Indian Affairs. A reservation, as the name implies, is a tract of land reserved from settlement and held in trust for its Indian occupants. Such tracts were usually the residue of tribal claims after conquest or purchase. In 1887 the government adopted the allotting policy by which the lands of all tribes should be gradually divided with individual holdings and the surplus sold or thrown open to settlement, as the case required. Under this policy the reservations have been greatly reduced in size and number. Since under individual ownership the Indian becomes a citizen, it can only be a question of time when all such reservations shall have vanished.

The following is a list of the reservations existing in 1914:

ARIZONA

See INDIAN AFFAIRS; INDIANS, AMERICAN; TREATIES, INDIAN.

INDIAN RIVER. A long shallow lagoon on the east coast of Florida, varying in width from 4 miles to a few hundred feet and extending along just inside the coast from lat. 28° 48' N. about 107 miles in a southerly direction (Map: Florida, F 3). For about 17 miles south of Cape Canaveral to Jupiter Inlet, in many places it is separated from the ocean only by narrow strips of beach, which in two places is cut by inlets. Indian River Inlet is about 60 miles south of Cape Canaveral; this is navigable through a channel about 5 feet deep.

INDIAN RUNNER. See DUCK, and Plate of DUCKS.

INDIANS, AMERICAN. The name applied first by Columbus and his immediate successors to the natives of the newly discovered islands and mainland of America, under the mistaken impression that these regions were a part of the outlying coast of Asia. The name most frequently used by scientific writers, especially in Europe, is simply *American*, *American Indian*, or *American Races*.

It is customary to classify the races in three ways—by language, physical type, and culture; and it is not until a given group of people has been characterized in these three aspects that their descriptive anthropology is regarded as known. The natives of both North and South America, however, present a great variety of linguistic, anatomical, and cultural characters, making it necessary to discuss them in groups and subdivisions. The best-known tribes are those of the United States and Canada, which we shall consider under one head, giving another section to Mexico and the Central American States and still another to South America. However, before proceeding with these divisions of our subject, we may note a few general points. Culturally the American race may be credited with decided individuality in the development of a few cultivated plants—maize, tobacco, peanuts, and cotton. On the other hand, they were weak in the domestication of animals, the dog being the only one of extensive distribution. They were also weak in navigation, for, though good canoeists, they did not develop sail vessels.

While true bronze was developed in parts of South America, the race as a whole had made little progress in metals. Architecture existed only in the few specialized cultures of the south, where it reached an advanced stage, but is peculiar in the absence of the true arch. Basketry in the north and cloth in the south reached a high state of artistic perfection. Ritualistic religion was highly developed. The race as a whole showed a keen interest in natural phenomena, which, coupled with a poetic temperament, gives their mythology a highly symbolic character and a decided æsthetic charm. Perhaps this, more than anything else, has led to the extensive modern American use of Indian motives in art and literature.

The origin of so important a race must always be a matter of great interest. Though no definite solution to the problem has yet been attained, some progress has been made. The great linguistic diversity and independence seem to indicate a long period of isolation from the Old World. On the other hand positive evidence for the peopling of the Americas before the last Glacial period is wanting, necessitating the assumption that very little change has occurred in continental configuration since the Indian came. His ancestors must therefore have crossed from Asia to Alaska. Anatomically he resembles most closely the Mongolian and bears a striking resemblance to certain Siberian tribes. As may be inferred from the previous discussion, there is very little in American culture that can be directly connected with the Old World. A few things seem to have come from northern Asia—e.g., the sinew-backed bow—but they are unimportant. There are also some doubtful traces of Pacific Island culture in South America, but on the whole the cultures of the two hemispheres are so strikingly different that we must assume the crossing over to have been very long ago, while the cultures of Asia were exceedingly simple. These primitive folk must have spread over the entire New World, for the most advanced traits of American culture seem to have been developed later in two special centres, Central America and the middle Andean country of South America, from which cultivated plants, weaving of cloth, work in metals, painted pottery, etc., spread to other areas. The Eskimo, the numerous small stocks of the Pacific coast, in North America, and the Patagonians, Tierra del Fuegians, with many of the tribes on the Atlantic slope in South America, are now believed to represent in a degree the original cultures of the immigrant folk from the Old World, now surviving on the margins of the continents where they were pushed out by the more vigorous development of specialized cultures in the interior. During this long period, however, they have been so strongly influenced by environment and tribal contact that we are not justified in taking their cultures as we now find them as specific types of the original American culture, but can only infer simplicity and negative traits therefrom. See ARCHÆOLOGY, AMERICAN.

INDIANS OF THE UNITED STATES AND CANADA

According to the 1910 census there were living representatives of 280 Indian tribes in the various States, and in Alaska 21, with 45 additional Eskimoan tribes. No such complete enumeration of those in Canada is available;

but, exclusive of the Eskimo, they certainly equal half the number in the United States. When America was discovered, the number of tribes must have been greater, for many of those enumerated in Colonial literature are now extinct; but this seems only true of New England, eastern Canada, and a narrow belt along the Atlantic coast and the Gulf of Mexico. A few tribes in California and elsewhere have become extinct in historic times, but the number is insignificant. One hundred is quite a liberal estimate of the number extinct, so that, contrary to the popular opinion, scarcely one-fourth of the original number of tribes have been wiped out by the whites. Further, such extinction was often political rather than otherwise, in that the survivors were assimilated by a kindred tribe or even by the whites. That extinction was not due entirely to Colonial wars is clear from the fact that the process is still operative and will no doubt continue until citizenship and dispersion among the white population bring about complete loss of identity. There is also archaeological and linguistic evidence of the rise and extinction of tribes in prehistoric times, when the white race could not have been a factor; but there have been very few instances of the formation of new tribes since the Colonial period.

This does not imply that the actual number of individuals has not greatly decreased. No satisfactory estimate of the Indian population in 1492 can be made. In 1910 the census enumerated 291,014 Indians for the United States and Alaska, which is about the count of the Indian Office in 1870, indicating approximate stability in population. The present estimate for Canada is 115,000. Thus, in round numbers the total present Indian population north of Mexico is 400,000. James Mooney, United States government expert, estimates the total population in 1492 at 1,115,000. The chief factors in the causes for modern stability are the prevalence of European diseases, especially tuberculosis, and the lack of sufficient food, which result in a very high death rate.

Intermarriage between Indians and whites still continues, but with other races scarcely at all. In the United States proper 33 per cent of the total number of Indians in 1910 were of mixed white descent, while of negro and other mixtures there were less than 3 per cent. In Alaska 15 per cent report white blood, which is also about the estimated proportion for Canada. The thirteenth census of the United States makes it clear that both the fecundity and vitality of mixed white marriages are higher than for the full-blood Indian, as also marriage among mixed bloods. If this tendency continues, the full-blood Indian is destined to disappear and the whole race to be wiped out by assimilation.

In almost every case the survivors of the various Indian tribes retain their original language and, in more or less completeness, their former culture, to which is due our extensive anthropological knowledge of American peoples. For more than 20 years they have been under investigation by the Bureau of Ethnology at Washington, the American Museum of Natural History in New York, the Field Museum of Natural History in Chicago, the University of California, and other institutions whose numerous publications constitute one of the most important sources of anthropological data in the world.

Culture Areas. The several tribes present varying forms of culture—some being quite identical, while others show all degrees of difference; hence it has been found desirable to group or classify them with respect to their customs and habits. Accordingly anthropologists recognize nine culture groups, which in a general way correspond to as many geographical areas, or culture areas. The approximate boundaries to these areas are indicated on the map on page 114. It should be noted, however, that the divisions on this map are relative rather than absolute, for rarely can a tribe be found anywhere that does not share in some measure the culture traits of all its immediate neighbors. Yet certain groups of tribes often have highly characteristic traits in common, whence they are said to be of the same general culture type. A culture area, therefore, does not imply absolute identity of tribal cultures, but agreement in most of the typical traits.

The Plains Area.—Geographically this area comprises the plains and prairies west of the Mississippi and was formerly the range of the largest herds of buffalo or bison. The typical plains culture is characterized by the following traits: buffalo hunting; the tepee (tipi); in historic times the use of the horse, formerly of the dog, with the travois; the camp circle; the soldier police; the sun dance and a highly individualistic geometric art. Woman's costume is also quite distinctive, as are the methods employed in dressing skins. The tribes having these traits in their most intense and exclusive form are the Assiniboin, Arapaho, Blackfoot, Crow, Cheyenne, Comanche, Gros Ventre, Kiowa, Sarsi, and Teton-Dakota. These tribes lived almost entirely upon buffalo meat, used the portable tepee, used skins instead of cloth, made no pottery, and did not practice agriculture. The horse was introduced from the Spanish settlements at an early date, probably before 1630, and reached the Blackfoot of the Far North before 1751, so that before their discovery by Europeans these tribes became nomadic horsemen. They also used dogs as beasts of burden, hitching them to A-shaped drag frames, or travois. A similar frame was later used for horses. This development of dog transportation suggests that these tribes were already nomadic hunters before the introduction of the horse.

Along the eastern border of the area lived the Arikara, Hidatsa, Iowa, Kansas, Mandan, Missouri, Omaha, Osage, Oto, Pawnee, Ponca, Santee-Dakota, and Wichita. These differed somewhat from the others in living in earth, mat, or grass covered houses in permanent villages, though using tepees when on the hunt; in the cultivation of small fields of corn (maize), the manufacture of pottery, and the limited weaving of baskets and bags. In most other respects they resembled the more typical tribes. To the northeast around Lake Winnipeg were the Plains-Cree and Plains-Ojibwa, divergent groups of larger divisions in the Eastern Woodland Area, and with a culture intermediate to the two areas. Again on the west are the Bannock, Nez Percé, Northern Shoshoni, Ute, and Wind River Shoshoni, who manifest some of the traits typical of the Plateau Area. Consult Clark Wissler, *North American Indians of the Plains* (New York, 1912).

The Eastern Woodland Area.—Geographically this area is a broad belt on either side of the Great Lakes, extending to the Atlantic Ocean.

Excepting the extreme western and northern borders, the entire area was forest. Recent investigations make it clear that this area is composed of several divisions, having much less in common than those of the preceding area. Thus, in the north between the Great Lakes and Hudson Bay and eastward, we have a subarctic forest in which range the Cree-Montagnais tribes, including the Naskapi of Labrador and the Northern Saultean west of James Bay. They live entirely by hunting and fishing, are quite nomadic, use a kind of tepee covered with bark or skins, the birch canoe, snowshoes, make no

ders of the Great Lakes is the Central Algonquian group; the Ojibwa, Menominee, Potawatami, Sauk (Sac), Fox, Kickapoo, Ottawa, and perhaps the almost extinct Illinois Confederacy (Piankishaw, Peoria, Kaskaskia, etc.). So far as the tribes of this Central Algonquian group have been studied, they may be characterized by intense clan organizations, highly developed religious concepts and ceremonies. Among the latter the most distinctive is the midewiwin (grand medicine society), a semisecret ritualistic order with four or more degrees, the purpose of which seems to be the preparation of the spirit for

CULTURE AREAS OF NORTH AMERICAN INDIANS.

pottery, dress in skins, have a loose social organization and no complex ceremonies. They stand out in contrast to the remainder of the area in the absence of agriculture, pottery, and complex social, political, and ceremonial organizations. On the other hand, costume, folklore, certain religious concepts, and art seem to possess general similarities throughout. The Iroquois (q.v.) had a highly specialized form of this culture, as did the Delaware (q.v.) and Powhatan Confederacy (q.v.). The various New England tribes seem to have had certain decided individualities, though good data are lacking because of their almost entire extinction. On the southern bor-

entrance into the "life after death." (Consult W. J. Hoffman in the *Seventh Annual Report of the Bureau of American Ethnology*, Washington, 1891.) As the name indicates, the tribes constituting this Central group are of Algonquian stock, but associated with them in culture are the Winnebago (q.v.) of Siouan stock.

Perhaps more than elsewhere, in this area this group made use of wild rice as a food. This grain was of great economic importance along the southern border of the Great Lakes and down the St. Lawrence, because of the climatic check upon agriculture. Its use is mentioned by French explorers, and the whole subject is fully

treated by A. E. Jenks in the *Nineteenth Annual Report of the Bureau of American Ethnology* (Washington, 1900).

In the Plains Area we noted certain culture differences among the tribes on its eastern border; these differences are chiefly due to the intrusion of Central Algonquian traits, and likewise among the Central Algonquian we find some traits from the Plains, especially among the Winnebago and Illinois.

The Southeastern Area.—This area includes the States of Tennessee, North and South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, with the adjoining parts of Arkansas and Texas. The principal tribes were the Atakapa, Alibamu, Apalachicola, Apalachee, Catawba, Cherokee, Croatan, Upper and Lower Creeks, Chickasaw, Choctaw, Caddo, Carrizo, Karankawa, Kichai, Koasati, Kusa, Natchez, Quapaw, Seminole, Tutelo, Tuscarora, Timuquanan, Tunican, Towakoni, Tonkawan, Waco, and Uchee. A few of these are now extinct. In culture a general uniformity prevailed in intense agriculture, permanent villages, complex political organizations, social grades and slavery, head deformation, good pottery, weaving of cloth to a limited extent, the ceremony of the Busk, etc. East of the Mississippi the blowgun was used for small game, apparently an intrusive trait from South America via the West Indies. Some of the tribes built mounds to serve as house foundations and monuments. We also find permanent buildings for housing religious objects or shrines, which are in a way primitive temples, though very simple in structure. In all these respects the tribes east of the Mississippi stand somewhat apart from those west and must be classed with the very highest types of Indian culture north of Mexico. The Natchez and their neighbors made very fine cloth of mulberry fibre, and all the eastern tribes were noted for their netted cloaks of turkey feathers. The Busk, or green-corn dance, is in many respects one of the most interesting of all Indian ceremonies, and in its simpler form found its way into parts of the Eastern Woodland Area and even into the Plains. The complete ceremony requires eight days and is characterized by the kindling of new fire, the renewal of garments, the cleansing of houses, etc.—in short, the renewal of everything. Also enemies were forgiven and all malefactors absolved of their crimes. The famous "black drink," a powerful emetic, was also used to purify the priests of the ceremony. The underlying conception of the whole procedure seems to be a general thanksgiving for the fruits of the harvest as represented in the maize.

Very little is known as to the culture of the Carrizo, Karankawa, Tonkawan, and Atakapa skirting the coast of Texas, except that they were less advanced than the other tribes of the area. Consult C. C. Jones, *Antiquities of the Southern Indians* (New York, 1873), and J. R. Swanton, *Indian Tribes of the Lower Mississippi, etc.* (Washington, 1911).

The Southwest Area.—This area comprises chiefly the States of Arizona and New Mexico with adjacent parts of Texas, Mexico, and California. It is a warm arid region, but well adapted to certain kinds of agriculture. In it we find many prehistoric remains, some of which are undoubtedly the work of tribes still living, while others are farther removed. (See ARCHÆOLOGY, AMERICAN; CLIFF DWELLER.) The historic tribes comprise the true Pueblos (the

Hopi, Zuñi, Acoma, Laguna, Taos, Picuris, San Juan, Santa Clara, Cochiti, Jemez, Sia, Santa Anna, San Ildefonso, Pojoaque, Tesuque, Nambe, Santo Domingo, San Felipe, Sandia, and Isleta), the Navaho, Apache (Jicarilla, Mescalero, Tonto, Lipan, White Mountain, San Carlos, and Chiricahua), the Walapai, Havasupai, Chemehuevi, Mohave, Yavapai, Yuma, Cocopa, Maricopa, Pima, and Papago, all within the United States, and in addition certain Mexican tribes (the Opata, Chihuahua, Tarahumari, and others). In a general way we have here two types of culture, pueblo and nonpueblo. The pueblo dwellers are clearly distinguished by their type of village (see Plate to ZUÑI), but have many other cultural characters in common, as the use of the kiva (q.v.), kachina dances, altars and sacred corn meal, tilling of the fields and weaving of cloth by the men instead of the women, a clan system and clan ceremonies, the domestication of the turkey. The Hopi are best known for the highly individualized ceremony of the snake dance (q.v.), not found among the other Pueblos.

The nonpueblo, or more nomadic, tribes are far less uniform in culture, the Navaho being in many respects the most specialized. All without exception made some efforts to cultivate fields—the Apache least of all, the Pima the other extreme. The latter, in common with the Hopi and a few other Pueblos, raised cotton, when first observed by the Spanish. The Navaho (q.v.) are now best known for their flocks of sheep and woolen blankets, the knowledge of which they acquired from the Spanish settlers. With the possible exception of the Navaho, Mohave, and Yuma, the nonpueblo tribes are fine basket weavers, those of the Pima, Chemehuevi, Yavapai, and Apache being especially prized by collectors. All without exception made some pottery, though quite inferior in quality and decoration to that of the pueblo tribes. Likewise their social and political organization was much simpler and more like that of the Plains Area.

In general, it may be said that all the tribes of the Southwest cultivated corn, made pottery, conducted more or less complex masked dramatic ceremonies, and depended far less upon animal than upon vegetable foods. Among the nonpueblo tribes we find a high development of basket weaving and in later times extensive use of the horse by the Navaho, Apache, and Papago; among the pueblo tribes, a high type of masonry, pottery, cotton cloth, masked ceremonies, and complex social organization. Consult P. E. Goddard, *Indians of the Southwest* (New York, 1913).

The Californian Area.—This area includes all of the State of California, except the extreme southeastern part, and a portion of southwestern Oregon. Within its bounds are found representatives of more linguistic stocks than in any other area and, in proportion to its size, a greater number of tribes. There are 21 of these stocks, all but three of which are not represented elsewhere; they are the Athapascan, Chimarikan, Chimmesyan, Costanoan, Esselenian, Karok (Quoratean), Lutuamian, Maidu, Miwok (Moquelumnan), Pomo (Kulanapan), Salinan, Shastan, Shoshonean, Washoan, Wintun (Copehan), Wiyat (Wishoskan), Yanan, Yokuts (Mariposan), Yukian, Yurok (Weitspekan), and Yuman. These stocks are each represented by one or more small tribes. In contrast to

this great diversity of ethnic groups there seems to have been very little migration or tribal differentiation within historic times, for even migration traditions are wanting, each group residing in its traditional habitat, suggesting that their distribution must have occurred at a remote period. There is also decided cultural uniformity. One of the striking characteristics is the almost entire absence of political organization, the small villages being the units, with the only bonds between them those of language and topography.

California culture was perhaps the crudest and simplest type to be found in America. Though the art of basketry was highly developed, perhaps superior to the basketry of other areas, other arts were quite primitive. Pottery was practically unknown, agriculture was nowhere practiced, though the chief food was vegetable. The acorn was the great staple, from which was produced a kind of meal, and in turn a bread. The seeds of wild grasses and roots were also used. Hunting of deer and small game and fishing were supplementary. Social organization was little more than the family unit, and while ceremonies were in some respects elaborate, they did not possess the complex rituals of other areas.

Certain minor cultural differences between the northern and southern parts of the State seem due to intrusive traits. For example, in the extreme north we find some rectangular houses of native planks, like those of the South Pacific Area. However, these differences are far less accentuated than those marking off the subdivisions in the culture areas so far discussed. Consult A. L. Kroeber, *Types of Indian Culture in California* (Berkeley, 1904), and id., *Religion of the Indians of California* (ib., 1907).

The North Pacific Coast Area.—From southern Oregon to the Alaska Peninsula we have a long stretch of country between the Pacific Ocean and the western slopes of the Cascade Range. In the south we have rather level open tracts, but in the north rocky coasts with deep valleys. The Indians throughout this long coast belt had many similar traits of culture. In the first place they were accomplished canoeists and fishermen. Their country was heavily timbered, in consequence of which we find work in wood highly developed. Especially in the north we find large rectangular houses of split planks, with picturesquely carved posts and totem poles (see TOTEMISM). Dishes, bowls, and spoons were of wood. No pottery was made, so boiling was in wooden boxes and baskets by dropping in hot stones. No food plants were cultivated, but in a few localities some tobacco was planted. Costume was simple. A large woven umbrella-like hat was worn in rainy weather; the feet and legs were usually bare, and excepting a kind of cloak or mantle there was little in the way of body clothing. The social organization was rather complex, some of the tribes having not only numerous clans but also phratries. Each clan, or family, had a body of tradition and ceremonies, some aspects of which were objectified in the form of "crests," carved upon totem poles and house fronts. Society consisted of at least four grades—chiefs, nobility, citizens, and slaves. More than elsewhere in North America the sense of wealth was developed with extensive barter and forms of credit. As a part of this credit system, we have the famous potlatch celebration, which is in the main a conventional display of

family riches. There are many religious societies, all of which have rather complex rituals.

The most typical tribes of this area are the Tlinkit, Haida, and Tsimshian of the north; next in order are the Kwakiutl, Nootka, and Bella Coola. In Washington and Oregon are the still less typical coast Salish (q.v.), the Chinook, and other small tribes. Consult A. P. Niblack, "Coast Indians of Southern Alaska and Northern British Columbia," in *Report of the United States National Museum for 1888* (Washington, 1889), and Franz Boas, *Tribes of the North Pacific Coast* (Toronto, 1906).

The Plateau Area.—As the name indicates, this comprises the highlands in Nevada, Utah, Idaho, Oregon, Washington, and British Columbia—a region in which the geographical conditions vary from the arid south to the rather mild forested north. However, almost the entire native population was found in the northern half. In the deserts of Utah and Nevada were scattered bands of the Gosiute, Pavant, and Piute, but from the Snake River northward were the Bannock, Snakes, Nez Percé, all the interior Salishian tribes, and the Kutenai. Their combined ranges covered the drainage of the Columbia River, which brought them into the great salmon area. This fish furnished the chief food, though the Snakes and Nez Percé made some use of the buffalo, the Salish of the north of the deer and bear. Vegetable foods, however, made up a large part of their menu, especially wild-grass seeds, roots, and berries. Pottery was unknown, except possibly to a few of the southern tribes; but basketry was highly developed, and some weaving of bark fibres was attempted. Cooking was in baskets and pits with hot stones. An underground house was used in the north, a brush shelter in the south. Social organization and ceremonies were relatively simple, though less so than those of California. Some of the tribes on the east, as the Nez Percé, Bannock, Flathead, and Kutenai, borrowed many traits from the Indians of the plains, while others on the west borrowed from the coast tribes. Consult A. B. Lewis, *Tribes of the Columbia Valley and the Coast of Washington and Oregon* (Lancaster, Pa., 1906).

The Mackenzie Area.—As may be seen from the map, this area comprises the Great Northwest, or the interior of northwestern Canada and Alaska. Unlike the preceding areas, its native inhabitants are of a single linguistic stock, Athapascan, passing under the general designation of Déné (see ATHAPASCAN STOCK). Part of the area is mountainous and part subarctic. The winters are long and the conditions of life hard, perhaps even more so in the north than for the Eskimo, who live on sea food. In all these respects the environment is similar to that of the Cree and other extreme northerly tribes of the Eastern Woodland Area. The increasing severity of the climate from south to north naturally modifies the culture of the natives, which in Alaska and the Far North becomes generally similar to the Eskimo. Yet considerable uniformity prevails. We find a loose social and political organization, the unit being the band, or family group. For food the chief dependence is on the caribou, whose skins also furnish clothing and tents. Toboggans, snowshoes, and bark canoes are in general use. Utensils are of basketry and bark, and boiling is usually with hot stones. The chief tribal divisions are the Kutchin, Loucheux, Hares, Slavey, Dog-Ribs, Cop-

per-Knives, Chippewayan, Beaver, Carriers, Nahane, Sekanie, and Babine. Consult Samuel Hearne, *Journey to the Northern Ocean* (London, 1795), and A. G. Morice, "Notes on the Western Dénés," in *Transactions of the Canadian Institute*, vol. iv (Toronto, 1895).

The Arctic Area.—The territory included in this area is a narrow strip along the entire coast from the Alaska Peninsula to the Gulf of St. Lawrence, the Aleutian Islands, and all the inhabited Arctic lands between Banks Land and Greenland inclusive. It is occupied by tribes of the Eskimoan stock, whose culture has been discussed under the title **ESKIMO**.

General Cultural Characters. In conclusion, a few general points may be noted. As to foods, there is a tendency to make one food the main support for a considerable area; thus, maize, or corn, was the one important staple for the Pueblo Indians of the Southwest, all other foods being supplementary; in California it was the acorn; in parts of the Plateau Area, the seeds of wild grasses were important; in the southeastern and the southern two-thirds of the Eastern Woodland areas, maize, with wild rice along the northern border of the maize area. In the Mackenzie Area, the North Pacific Coast, the Eskimo country, and parts of the Plains Area, vegetable foods were a negligible factor. Of animal food, the typical Indians of the Plains depended upon the buffalo almost as completely as the Eskimo upon seals and caribou; the tribes of the Columbia drainage and northward depended upon salmon, and those of the Mackenzie Area, together with those in the extreme north of the Eastern Woodland, upon animals of the deer kind: of manufactured foods, chiefly those of pulverization—maize where grown, acorns in California, grass seeds and roots in the Plateau Area, even berries in parts of the Plains and Mackenzie areas. This process was also applied to animal food—as buffalo pemmican in the Plains, deer pemmican in the Eastern Woodland and parts of the Mackenzie Area, and in parts of the salmon area where the dried fish were pounded fine and stored. Another unique product is the maple sugar of the Eastern Woodland. The smoking of tobacco or other vegetable substances was associated with religious and social concepts among the Plains, Southeastern, Eastern Woodland, and adjacent parts of the Plateau and Mackenzie areas; while not unknown elsewhere, it was of minor importance. Tobacco was cultivated in the eastern part of the continent and by a few tribes along the Missouri and Columbia, not otherwise agricultural. Fishing was rare in the Plains and the Southwest, but common elsewhere.

The moccasin was worn in the Plains, Southeastern, Eastern Woodland, parts of the Mackenzie, Plateau, and Southwest areas. Many of the Indians of California and the North Pacific Coast went barefoot. The Eskimo and tribes of the extreme North wore boots. Nowhere except in the extreme North and Southwest was a hat or other head covering used as regular dress. Clothing was made of skins, except in parts of the North Pacific Coast Area and the Southwest. California, Plateau, North Pacific Coast areas, and part of the Mackenzie Area were the "stone boiling" region; i.e., food was boiled in baskets or boxes by dropping in hot stones. Aside from a limited use of hammered copper in a few localities, metals were unknown. Individual ownership of land was rare.

Slavery was a regular institution on the Pacific coast from Alaska to California, the slaves being prisoners of war, their children and descendants, who thus constituted a permanent slave caste within the tribe, condemned to hard labor, harsh treatment, sale, or death at the will of their masters. Slavery of a milder type seems to have existed among the South Atlantic tribes. In more modern times the Southern Indians followed the example of the colonists and became the owners of negro slaves.

Woman, while subject to her husband in ordinary affairs and debarred from certain societies and ceremonies, had yet well-defined rights of her own. She was complete mistress in household affairs, and among the Eastern tribes had either a voice or a representation in councils. With the Iroquois all important questions must be passed upon by a council of the women, who alone had power to declare war. The right of adoption, which meant the decision of a captive's fate, rested also with the women. In general her position was highest in those tribes where descent and inheritance were reckoned in the female line. In the division of labor most of the heavy work fell to her share, while the dangerous and arduous undertakings belonged to the man. Polygamy was recognized in most of the tribes.

The method of disposing of the dead varied, but was usually inhumation. Graves or pits were common throughout the greater part of the Southeastern and Eastern Woodland areas; scaffold burial was found in the Plains, and elevated canoe burial in parts of Washington and Oregon; cremation was the usual method in California and parts of the Southwest; elsewhere the body was placed upon the ground, variously protected. Thus, east of the Mississippi we have burial in the ground; in the remainder of the continent the body was usually placed on or above the surface.

Not all Indians were fond of war. The most warlike were those of the Plains and east of the Mississippi. Those of California and the Pueblos of the Southwest were least inclined to war. Among the former social position depended upon war deeds, but elsewhere in the continent they were of less importance.

Among extreme Northern tribes the principal weapons were the knife, club, and lance. To these were added farther south the bow and arrow and the hatchet or tomahawk. The bow and arrow were practically universal, but the lance and shield as a rule were used only by the equestrian tribes of the open plains and the desert Southwest, the timber people finding them a hindrance to active movement. Aside from the shield, defensive armor was not commonly used, excepting among tribes of the Alaskan coast, who had protective cuirasses of ivory plates, wooden slats, or of a very tough hide.

Service in any particular expedition was entirely a matter of individual choice, and the authority of the leader rested solely upon the voluntary obedience of his followers. On the plains the invitation was usually given by sending around a war pipe, which every volunteer was expected to smoke. The going and the homecoming were attended with numerous ceremonies, and a successful campaign was celebrated with the scalp dance, in which the women carried the captured scalps and sang the praises of the victors.

Indiscriminate massacre was the ordinary

rule; but prisoners were frequently taken, either for torture, slavery, or adoption. If adopted, the prisoner was taken into a family and became a full member of the tribe. If condemned to death, he met his fate with all the courage of his Indian training. On the plains captives were seldom tortured, but were more often taken into the tribe, being rarely, however, so completely admitted to membership as in the East. The practice of scalping the slain enemy was far from universal. In many tribes it was customary to feast upon the flesh of one of the slain enemy after a notable victory. However, all the native methods of fighting were greatly modified by the early introduction of guns and from experience with European antagonists.

The leisure of the Indian was taken up with athletic contests, games, dances, feasts, and story-telling. The ball play was the chief athletic game everywhere east of the plains, as well as among some tribes of the Pacific coast, the ball being handled with netted sticks somewhat resembling tennis rackets. From this game are derived the lacrosse and racquet of Canada and Louisiana. Next in importance in the East was the game known to the old traders as *chunky*, played with a circular stone disk or wheel and a pole curved at one end in the fashion of a shepherd's crook. The wheel was rolled by one of the contestants, while the other tried to slide the stick after it in such a way that the wheel would lie within the crook when both came to a stop. The plains tribes had a very similar game in which a netted wheel took the place of the stone disk. Foot-racing was common among the agricultural tribes and horse racing on the plains. Dice games were universal.

A favorite pastime of the plains women was the awl game, played with marked sticks which were thrown down upon a stone set in the middle of a blanket, tally being kept by advancing an awl along certain marks around the margin of the blanket. Shinny and football were also played by the women. Hunt-the-button games were played within the tepee during the long winter nights, the players accompanying the movements of the hands with songs intended to distract the attention of the other side.

Social dances, usually followed by feasting, were of great variety.

Musical instruments were the drum, flageolet or flute, eagle-bone whistle, rattles of various kinds, and even a notched stick rubbed in saw fashion with one end resting upon a gourd for a sounding board. There were songs for every occasion—lullaby, work, love, gaming, medicine, war, and ceremonials. See INDIAN MUSIC.

To most of the Indians every animal, plant, and object of nature was animated by a spirit, beneficent or otherwise, according as it was propitiated or offended. Certain of these were regarded as especially powerful or active, as the sun, fire, and water among the elemental gods, the buffalo, eagle, and rattlesnake among the animals, and the cedar, cottonwood, corn, tobacco, and peyote among plants. The number four was peculiarly sacred, as having reference to the cardinal points. Colors had symbolic meanings and sometimes also sex and local abiding places. Thus, with the Cherokee the red gods of victory lived in the Sunland, or east, while the blue spirits of disaster dwelt in the north. Spirits were propitiated and implored with prayer, sacrifice, vigil, and fasting, and the purificatory sweat bath usually preceded every

important ceremony. There was no overruling "Great Spirit," excepting as certain gods were of more frequent importance than others. Among the plains Indians the spirit buffalo was all-important, while with the agricultural tribes of the Southwest the rain gods took precedence. The sun and its earthly representative, fire, were everywhere venerated. Certain tribes had tribal "medicine" or palladiums, with which the nation's prosperity was supposed to be bound up and around which centred their most elaborate ceremonial. Thus, the Kiowa had their Taime image of stone, the Cheyenne their sacred arrows, the Arapaho their "flat pipe." Each man had also his own secret personal medicine.

The priests were frequently organized into cult societies, and there were also brotherhoods bound together by certain secret rites. Great stress was laid upon dreams and sacrifice. Almost everywhere all religious sanctions and even detailed ceremonies are believed to have been handed down in dreams. Among the Pawnee, in former times, a captive girl was annually sacrificed to the goddess of fertility. The cannibalistic practices of the Eastern tribes after a victory, and the cannibal feasts of the Northwest coast, in which a slave was the usual victim, were also more or less sacrificial in motive. With these exceptions human sacrifice was rare, such bloody rites as those of the Aztecs being unknown in the North. There were special ceremonies for girls at puberty, and for young men on first taking rank with the warriors. Among the great religious ceremonials may be noted the green-corn dance of thanksgiving for the new crops, among the Eastern tribes; the sun dance and the more recent ghost dance of the plains tribes; the salmon dance of the Columbia region, and the celebrated snake dance of the Hopi of Arizona. To these may be added the peyote cult of the Southern plains. Tribal religions were sometimes subject to revival or revolution as new prophets arose from time to time. Thus, the religion of the ghost dance, which has practically superseded the old beliefs and ceremonial forms of the plains tribes, had its origin in Nevada towards the end of the nineteenth century. (See WOVOKA.)

Each tribe had its genesis tradition and its culture hero—usually a great trickster and frequently an anthropomorphic animal—together with giants, dwarfs, fairies, witches, and various monsters, as well as animal tribes and chiefs, concerning all of whom there was a great deal of myth and folklore.

Language. The first attempt at classifying the North American languages was made by Albert Gallatin in 1836, the relationships being established chiefly by a comparison of word roots. The beginning of regular systematic research dates from the establishment of the Bureau of Ethnology, under Major J. W. Powell, in 1879. The number of linguistic stocks north of Mexico, as at present recognized, is 56, as given in the tabulated list on page 120. While it is possible that further study may reduce this number, such reduction is highly improbable except in case of a very few minor stocks.

Some tribes had made fairly successful attempts at recording their history and mythic traditions by means of pictographs. Of these the best known are the Walam Olum of the Delaware, and the Kiowa calendars. Intertribal compacts were commemorated among the Eastern tribes by means of symbolic wampum belts.

The Cherokee alone had a literature recorded in an alphabet of their own invention. No accurate estimate of the number of distinct languages making up these stocks can be formed, but they probably exceed 200. To this should be added the dialects of all degrees of divergence to even a greater number. Among so many forms of speech we must expect great variety in structure, yet there are certain characteristics

the plural even in the pronoun, its place being taken by ideas of collectivity and distribution. While there are other differences, these are the most obvious. Within the continent itself the 56 stocks enumerated in the table may be grouped according to certain special characteristics, which, however, show a tendency to conform to geographical areas and are therefore most likely due to historic contact.

MAP SHOWING THE LOCATION OF THE LINGUISTIC STOCKS OF NORTH AMERICA.

that serve to distinguish American languages as a whole. Of these, the most important are great complexity of grammar, because to a much greater degree than among the languages of other parts of the world American languages express ideas by grammatical processes instead of additional words; the expression of new ideas by affixes or even stem modification; rare use of gender for sex differentiation, the usual distinction of objects being animate and inanimate, good and bad, round and flat, etc.; and rarity of

Another point of interest is the distribution of these 56 stocks. Their great number in California has been noted, but if we take the whole Pacific coast belt we find in all 36 stocks. Again, we note that of the 20 remaining, 9 are small stocks skirting the Gulf and the Atlantic. The causes of this distribution have been the objects of much speculation, but so far nothing positive can be stated.

This diversity of language was a bar to political and social unity, but did not prevent all in-

tertribal communication. It was usual for some member of a tribe to learn the languages of neighboring tribes, some of which became by general consent the intertribal speech for their respective areas. In the Plains Area a peculiar sign language was developed to such a degree that it served all purposes. While this language seems to have been prehistoric, the well-known trade jargons were developed under the influence of European traders. See MOBILIAN TRADE LANGUAGE; CHINOOK JARGON.

The map on page 119 and the table on this page show the number and location of the North American linguistic stocks.

Anatomical Characteristics. In the first place, there is quite an obvious difference between the Eskimo (q.v.) and the Indian of the United States, though this difference becomes far less certain in Alaska and parts of Canada where mixture has occurred. Taking the Indians of the United States and Canada as a whole, we find them conforming to the general American type of straight black hair, chocolate-brown skin, prominent cheek bones, and tall stature. The forms of face and head differ greatly, but show tendencies to geographical

rather than to linguistic or cultural distributions. Thus, low statures tend to prevail throughout the entire Pacific Coast and Plateau regions and again in the Southeastern Area, while the several types of cranial form are distributed less regularly. (Consult W. Z. Ripley, *The Races of Europe*, Boston, 1900.) Anatomical studies of the living Indians have, however, not advanced far enough for a definite classification of the various tribes, and, even if they had, it is doubtful if such grouping would have any particular significance. The various tribes show differences of feature and limb analogous to family characteristics among us, which are often so marked among small tribes that an experienced observer can identify typical individuals by this criterion alone.

INDIANS OF MEXICO, CENTRAL AMERICA, AND WEST INDIES

The tribes of Mexico and Central America exhibited every stage of culture from the brutish Coehimí and wild Guatuso to the civilized Maya, Taraseo, or Aztec, with their highly developed agriculture, architecture, and literature. From the Rio Grande to Panama some 30 linguistic stocks were represented, besides the Arawakan and Cariban tribes of the West Indies. From traditional and other evidence nearly all of the more important tribes of Mexico and Guatemala, including those of Piman, Nahuatlán, and Mayan stock, appear to have migrated from the north. The Otomí and Chinantec, however, appear to have antedated this movement and may properly be considered indigenous. There are shadowy traditions of earlier cultivated races, the Ulmec and Toltec, from whom the ruder Aztec acquired their first civilization, but it is difficult to decide whether these names belong to the domain of history or of myth. The roving tribes of the northern frontier seem to have been akin to the Apache, but have now so completely disappeared that even their affinity is not certainly established. The Comanche and Kiowa, as well as the Apache, made constant inroads from the north, penetrating as far down as Zacatecas. The destruction of the peaceable Carrizo tribes of the lower Rio Grande is chiefly due to these raids.

The tribes of the California peninsula, apparently of Yuman stock, were quite primitive. The Seri of Tiburon Island in the adjacent gulf were but slightly higher in the scale, but earned respect by their determined defense of their territory against all intruders. Their southern neighbors, the Yaqui, were as much noted for their fighting qualities as for their superior industry and reliability. The Tarumari and other Piman tribes of the Sierra Madre, as far south as Jalisco, differ but little in general habit of life from the northern Pueblos. Physically they are dark and rather undersized. The Otomí of the central plateau were but little inferior in culture to the Aztec, by whom they had been subjected.

The Nahuatlán tribes which constituted the nucleus of the ancient Aztec Empire dwelt chiefly in the present states of Mexico and Puebla, the Aztec proper having their capital on the site of the present city of Mexico. Detached offshoots of the same stock were found as far south as Costa Rica. The Empire included many tribes or nations of diverse stocks; but not all the cognate Nahuatlán tribes, even in the central

territory, were under the rule of the Aztec, their bitterest enemies in fact being their neighbors and kinsmen, the Tlascaltec.

By reason of their military importance the Aztec have been somewhat overrated. Their general culture, while high in itself, was not superior to that of the Tarasco or Zapotec and was inferior to that of the Maya. In their social organization they had passed the matriarchal stage and reckoned descent and inheritance in the male line. The national prosperity rested upon agriculture. Land belonged to the clan, and marriage was regulated by gentile laws. In architecture they had reached a high stage of advancement, the pyramid of hewn stone being one of the most characteristic features. They knew the secret of bronze, and were skillful

exacted as an annual tribute from the conquered tribes. The characters were iconomatic, or partly ideographic, partly phonetic, upon the principle of the rebus. Their calendar recognized 365 days in the year.

In southern Mexico were the Tarasco, Totonaco, Zapotec, and Mixtec, all populous and civilized nations equal in culture to the Aztec, if not superior. They built houses of cut stone, brick, and mortar, planted fields and orchards, worked gold and copper—the Tarasco wearing complete body armor of wood plated with copper or gold—made beautiful inlaid pottery, and wove cotton garments and robes of bright-colored feathers. They had elaborate ritual religions, accompanied sometimes by human sacrifice, with calendar systems and hieroglyphic literatures

workers in gold and copper; but stone implements continued in common use, particularly obsidian for cutting purposes. Their dress was of native cotton, woven and dyed in brilliant colors. They had an extensive pantheon with orders of priests and priestesses, and a ritual ceremonial, impressive but cruel and bloodthirsty in character, thousands of human victims being annually sacrificed to the god of war, and their flesh afterward eaten by the multitude. Children of the higher classes were educated in public schools, where boys studied military science, writing, history, and religion, and girls were taught cooking, household work, weaving, and morals. There was a large native literature preserved in books written upon parchment or maguey paper, 24,000 bundles of this fibre being

like those of the Aztec tribes. The Totonaco, who practiced circumcision and head-flattening, claimed to have built the pyramid ruins of Teotihuacan, a few miles northwest from the city of Mexico. The wonderful ruins of Mitla are claimed by the Zapotec.

Passing by the ruder Zoque, Mixe, and Chinantec, and the more advanced Chiapanec, in Oaxaca and Chiapas, we enter the territory of the highly civilized Mayan tribes, who held the whole peninsula of Yucatan, with large portions of Tabasco and Chiapas and most of Guatemala, and had an outlying colony in the Huastec of Vera Cruz. Their principal nations, besides the Maya proper in Yucatan, were the Quiche and Cakchiquel of Guatemala. There is evidence that the ancient builders of Palenque and Copan,

already in ruins at the time of the conquest, were of the same stock. The Maya proper had at one time formed a powerful confederacy, which, however, had broken up into a number of independent states before the arrival of the Spaniards, by whom they were conquered in detail, the last free remnant being driven from their citadel of Chan Santa Cruz by Mexican troops only as late as 1900, after a stubbornly contested war of several years. The great cities Mayapan, Uxmal, and Chichén-itzá, in ruins when first discovered, were once flourishing centres of dense populations, which had attained the highest point of native American civilization. In government they retained a modified clan system, with an hereditary chief ruler, assisted by a council from his own clan. They were preëminent in architecture, building palaces, pyramids, and cities of cut and polished limestone, set in mortar and covered with figures and hieroglyphic inscriptions. Strange as it must seem, all this was done without metal tools, gold and copper being used only for ornamental purposes. Agriculture was the principal industry, the common lands being portioned out by the village chiefs. Honey and wax were obtained from domesticated bees, and an active commerce was carried on by sea along the southern Gulf coast as far as the island of Cuba, copper disks and cacao beans being used as currency. Their intricate calendar, with its cycles of 20, 52, and 260 years, has been the subject of much scholarly interest, as also their remarkable hieroglyphic records, written upon parchment or maguey paper, or carved or painted upon the walls of their ruined cities, and for which as yet there is no interpreter. The cognate Cakchiquel and Quiche were similar to the Maya in culture, differing only in dialect and extent of territory and influence. The great *Popol Vuh*, a native compendium of the ancient mythology and history of the Quiche, translated by Brasseur de Bourbourg, has been characterized as "one of the most valuable monuments of ancient American literature."

Honduras, Salvador, Nicaragua, and Upper Costa Rica were occupied by tribes of different stocks, some of them of considerable advancement, others, particularly along the east coast, mere savages. The Xinca, on the Guatemala-Salvador frontier, are believed to have been a remnant of the pre-Mayan tribes. The Carib, on the Honduras coast, were exiles from the Antilles. The Mosquito, Ulva, and Rama, farther south along or near the coast, were all wild tribes of different degrees of savagery. The Ulva also have the custom of head-flattening. The Guatuso of northern Costa Rica were an agricultural but brave and savage people, now near extermination, owing to the cruelties of the rubber gatherers. South of their territory were found tribes of higher culture grade, the northern outposts of the civilized Chibchan tribes of Colombia.

The whole of the West Indies, with the exception of a possible Tupí colony from Brazil in central Haiti, was held by tribes of the two great South American stocks, Arawakan and Cariban, the former being indigenous, while the latter were recently invaders, who at the time of the discovery had as yet colonized only the southern islands. The Arawakan tribes were peaceful and agricultural, skillful weavers, wood carvers, and stone polishers.

On page 121 are given a map and a list of the

linguistic stocks of Mexico and Central America, so far as it is possible to classify them. Consult: H. H. Bancroft, *The Native Races of the Pacific States* (5 vols., New York, 1875-82); A. P. Maudslay, *Biologia Centrali-Americana* (London, 1889); W. H. Holmes, *Archeological Studies among the Ancient Cities of Mexico* (Field Columbian Museum Publications, Anthropological Series, vol. i, Chicago, 1895); Hartman, *Archeological Reserchcs in Costa Rica* (Stockholm, 1901).

INDIANS OF SOUTH AMERICA

Our acquaintance with the ethnology of South America is still very imperfect, for the reason that vast areas are yet unexplored, while in some regions brought under Spanish or Portuguese dominion so much confusion has been wrought by the migration, disintegration, or complete extermination of tribes that the writings of early missionaries or travelers help little to clear up the difficulties. Here, as wherever else the uncivilized man confronts the European, we find the same steady march towards extinction, brought about originally by wholesale massacres and cruelties at the hands of the white conqueror and later by the new diseases which followed in his wake.

As in North America, we find also on the southern continent the phenomenon of vast areas occupied by tribes of some half-dozen linguistic stocks, differing little in habit and all upon nearly the same culture plane, with other areas of mountainous or otherwise difficult country held by a multitude of small stocks with habits almost as widely variant as their languages. In general we may group the tribes by three great regions, viz., the Andean, the Amazonian, and the Pampean—the first being the mountainous territory extending along the Pacific coast from the Isthmus to about 35° south, in central Chile; the second, the whole interior stretching eastward from the summit of the Cordillera to the Atlantic, with the exception of the Chaco; and the third, comprising the Chaco Forest and the grassy plains of the Pampas, between the Andes and the Paraná River, together with southern Chile, and stretching southward to Cape Horn.

In the Andean region we find the highest culture, represented by the Chibcha, Yunca, Aymará, and above all the Quichua, whose empire extended nearly 2000 miles along the coast and made its influence felt even among the wild tribes of the upper Amazon and the Chaco border. In nearly all these nations we find a firmly established system of government, with social distinctions clearly defined; careful and successful agriculture, including irrigation and the use of manures; superior pottery, with curious designs found nowhere else; weaving of cotton and the hair of domesticated animals; beautiful metal work in gold, silver, and bronze; and an architecture with such enduring monuments as the stupendous ruins of Gran Chimú, Paucartambo, and Tiahuanaco. So far as can be learned, the various governments were based upon the clan system, even in Peru, where the Inca himself was but the executive officer of a council of the gentes. Of the various religious systems the best known is that of the Quichua, whose great god was the Sun, after whom came their culture hero, the white and bearded Viracocha. The dead, usually wrapped in various garments and pieces of cloth, were buried in the

earth; often the grave was walled in with flat stones. Anything in the nature of a hieroglyphic system appears to have been unknown. The Quichua used the *quipu*, or knotted cords, in keeping their accounts. The descendants of

The tribes of the Amazon region, the Orinoco, and the Paraná, were all in various degrees of savagery, although nearly all sedentary and more or less agricultural in habit. Cannibalism prevailed extensively, the word itself being de-

these cultured Andean nations still number many millions, in fact constituting the bulk of the population over large areas; and although in theory accorded equal civil rights, they are yet, like aboriginal races elsewhere, in a state of practical vassalage to the dominant race of the conqueror.

rived from the name of the fierce Carib tribe. The custom still exists on some of the southern head streams of the Amazon. Living mainly under the tropics, many tribes went entirely naked, and tattooing and body painting, although occasionally found, were rare. Labrets were worn by a number of tribes. Scalping was un-

known, excepting in a portion of the Chaco territory, but several tribes preserved the heads of their slain enemies. (See HEAD-HUNTING.) The blowgun and poisoned arrow were general throughout the upper Amazon and Orinoco regions, curari poison constituting a chief article of intertribal trade. Government was of the loosest, and confederations were almost unknown. The prevailing religious form was a crude animism, apparently several degrees lower than that of the North American savages. Throughout this vast area the tribes which have not disappeared are still nearly in their primitive condition, excepting where devoted missionaries have gathered them into villages, chiefly in Peru, Bolivia, and Paraguay. The Jesuit missions among the Guaraní are recognized as the most successful ever established in America. At one time they contained over 300,000 Christianized Indians, the basis of the modern civilized states of Paraguay and Uruguay.

The tribes of the northern and central Pampean region, including the Chaco and Pampas sections of Argentina, are warlike equestrian nomads and hunters, living in tents of skin, subsisting almost entirely upon meat, and in other respects also very similar to the plains tribes of North America, but superior in the possession of herds of cattle and sheep as well as horses, and in a certain skill in ironworking. The Araucanians of southern Chile, an extension of one of the most important Pampean stocks, have successfully maintained their independence both against the Inca emperors and the conquering Spaniard. The Patagonians resemble their northern neighbors of Argentina, but represent a somewhat lower grade of culture. Like them, they are brave fighters and of fine physique. The natives of bleak Tierra del Fuego are in perhaps the lowest stage of culture found in South America, occupying the merest temporary shelters, going almost naked even in coldest weather, and having no apparent tribal forms or ceremonials. On the other hand, they are skillful hunters and daring fishermen.

On page 123 are given a tentative list and a map, after A. F. Chamberlain, of the existing South American linguistic stocks, so far as present very deficient knowledge permits a classification, Brinton being the chief authority.

Bibliography. The literature is voluminous, but there are few good general works. The special literature is cited in the separate articles for the different tribes, but for a general view the following may be consulted: H. H. Bancroft, *The Native Races of the Pacific States* (5 vols., New York, 1875); A. H. Keane, *Man: Past and Present* (Cambridge, 1900); D. G. Brinton, *The American Race* (Philadelphia, 1901); Livingston Farrand, *Basis of American History* (New York, 1904); Church, *Aborigines of South America* (London, 1912).

As special references for South American Indians, consult: Martin Dobrizhoffer, *An Account of the Abipones* (London, 1822); Im Thurn, *Among the Indians of Guiana* (ib., 1883); Von der Steinen, *Unter den Naturvölkern Zentral-Brasiliens* (Berlin, 1897); Max Schmidt, *Indianerstudien in Zentral-Brasilien* (ib., 1905); Koch-Grünberg, *Zwei Jahre unter den Indianer* (ib., 1909); A. F. Chamberlain, "Linguistic Stocks of South American Indians," in *American Anthropologist*, vol. xv (Lancaster, Pa., 1913).

INDIAN SARSAPARILLA, NUNNARI ROOT.

The roots of *Hemidesmus indicus*, an East Indian shrub of the family Asclepiadaceæ, used as a substitute for sarsaparilla.

INDIAN SUBREGION. A zoögeographical district of the Oriental Region, comprising India from the valley of the Indus eastward to the delta of the Brahmaputra and southward nearly to its terminus, where it mingles with the Ceylonese Subregion, which includes Ceylon and the extremity of the Indian Peninsula. It is rich in animal life, which, as a whole, is Oriental in its affinities. The Mediterranean (Palearctic) Subregion seems to extend eastward to the arid valley of the Indus, and India thus possesses several Ethiopian forms, which have led some zoölogists to regard its fauna as Ethiopian rather than Oriental; but the weight of opinion has turned against this view. The eastern shore of the Bay of Bengal is the home of so mixed an animal population that it has sometimes been called an Indo-Malayan subregion, but this is not generally recognized. Northeastern India, along the midslopes of the southern Himalaya ranges, is very different, faunistically, from the peninsular plains or the low hot coastal regions, owing to its elevation, and forms a long westward-reaching tongue of the Indo-Chinese and Manchurian subregions (q.v.). Consult J. G. Bartholomew, *Atlas of Zoögeography* (New York, 1911). See maps under DISTRIBUTION OF ANIMALS; and the paragraph on *Fauna*, under INDIA.

INDIAN SUMMER. A short season of pleasant weather in the Central and Atlantic Coast States, usually occurring in October or November, more rarely in December, and characterized by an almost cloudless sky, calm or light airs, a hazy atmosphere, and mild temperature in the daytime, but rather cool at night. It may last one or two weeks and may recur two or three times during a season, but rarely more than twice. During Indian summer weather the barometer stands above the average, and the cloudless sky indicates that there is in general a descending tendency of the air at some distance above the earth. Balloons ascending to great heights show that there is very little horizontal movement in the air, but what there is is towards the east. At this season the leaves of most plants dry up and drop away, adding their débris to the dust in the atmosphere. Owing to the prevailing dryness, forest fires and prairie fires occur at this time, and the smoke adds to the intensity of the Indian summer haze, but is not necessarily the sole cause of it. Frequently such smoke spreads slowly eastward, gathers moisture to itself, and is followed by clouds and gentle rain. Precisely similar weather occurs in Germany, where it is known as the "Old Woman's Summer" and "St. Luke's Summer," and in England, where it is known as "St. Martin's Summer," or "All Hallow Summer"; these terms being applied to it according to the various dates on which it happens to occur in October or November. There are also many indications of its existence in China and Siam. The haze attending the African Harmattan in December and January appears very similar to that of Indian summer, but the diatom dust that characterizes the former has not yet been found in the latter.

As to the origin of this expression, Mr. Albert Matthews has shown that it does not occur anywhere either in printed books or manuscripts

until the year 1794; but at that time it was in use throughout the Atlantic States. The popular belief that Indian summer weather was predicted by the native Indians in conversation with the first European settlers finds no documentary corroboration, and the idea that the term "Indian summer" was employed by the early settlers seems to be a myth. In general, neither this term nor anything corresponding to it is to be found in any Indian language. The term "Indian summer" in its present usage was introduced into England from America. In 1778 Horace Walpole used the same expression, but he evidently had in mind the intense heats of the midsummer weather in India and the West Indies. For full information on the whole subject, consult the *Monthly Weather Review*, vol. xxx, pp. 19-29 and 69-79 (Washington, 1902). No material further contribution has been made to this interesting subject since that date.

INDIAN TAILOR BIRD. See Plate of PENSILE NESTS with article NIDIFICATION.

INDIAN TERRITORY. A former Territory of the United States, now included in the State of Oklahoma (q.v.). It was originally a part of the Louisiana Purchase, settled by the Creek Indians in 1827, and set aside by Congress for the use of the Indians living east of the Mississippi River in 1829. In 1890 the area was decreased about one-half by the creation of Oklahoma Territory from its western part. The Indian Territory as then formed had an area of 31,246.41 square miles. Because the Territory had been reserved for Indian tribes it long remained practically unexplored. According to late treaty provisions it belonged for a long time to the Five Civilized Tribes—the Cherokees, Creeks, Seminoles, Choctaws, and Chickasaws. The Five Civilized Tribes came to it under an agreement with the United States government which guaranteed their tribal authority. These tribes organized for themselves forms of government not unlike those of the States of the Union, having a Principal Chief, or Governor, and a Legislature consisting of a House of Kings and a House of Warriors, elected by popular vote, a national court, school system, and treasury. In the earlier period of its existence this system worked well, but with the influx of white population conditions altered. These whites found themselves without voice in the government and were unable to secure such privileges as were necessary for proper protection and the development of property. Accordingly enactments were passed by Congress having for their purpose the extension of Federal jurisdiction over the Territory, the extinction of Indian governments, the opening of the country to unrestricted white settlement, and the ultimate creation of a State. In 1893 Congress appointed a commission to the Five Civilized Tribes, known as the Dawes Commission. This was given authority to enter into negotiations with the Indians in the Territory for the allotment of their lands in severalty, or to procure a cession of their lands to the United States. This commission had by 1901 finally secured from each of the Five Tribes tentative agreements looking towards allotment and citizenship. In the following years the work of the commission was pushed forward with noteworthy rapidity, and by June 30, 1905, when the commission was discontinued, allotments had been practically completed. In 1897 an Act had been

passed giving United States courts jurisdiction within the Territory, and in the following year the Curtis Act was passed, June 28, 1898 (30 Stat. 495), which had for its general purpose the transfers of the control of property rights from tribal authority to that of the United States. It provided, among other things, for the enrollment of citizens preparatory to the allotment of lands, for the regulation of town sites, and the incorporation of towns; and it gave the President a veto power over acts of the tribal governments. Before the preparations for the formal abandonment of communal ownership in favor of individual possession were completed, Congress provided, by an Act of April 26, 1906, for the indefinite continuance of the tribal form of government with certain modifications. By this act tribal taxes were abolished and schools outside of incorporated towns were placed under the control of the Interior Department.

The enrollment of the Five Tribes was definitely completed on June 30, 1907, and at that time the citizenship of the nations was as follows: Seminoles, 3,119; Creeks, 18,712; Cherokees, 41,693; Choctaws, 26,730; and Chickasaws, 10,955. The total tribal membership was thus 101,209, of whom 26,634 were full-bloods. The citizenship rolls were closed by operation of Sec. 2 of the Act of April 26, 1906 (34 Stat. 137), on March 4, 1907. In 1914 the allotments were practically completed, although there remained considerable work in connection with the closing of final records and other details and the disposition of the remaining tribal property. In June, 1914, the Cherokee allotments were completed, and members of this tribe became citizens of Oklahoma. The property in possession of the Indians and administered for them by the United States government includes 431,080 acres of coal and asphalt and agricultural lands; 101,080 acres of this are leased, and the proceeds, during the fiscal year 1914 amounting to \$250,504, are divided among the Indians for the support of Choctaw and Chickasaw Indian schools. Up to June 30, 1914, there were filed at the Union Agency, which has general charge of affairs of the Five Civilized Tribes, 31,866 leases, of which 29,820 were for oil and gas; 7,701 oil and gas leases were approved; 56,201,000 barrels of oil were sold during 1914. There were collected during the year for individual Indians from oil and gas leases \$1,449,252 on 12,571,321 barrels of oil, and for the Choctaw and Chickasaw tribes, as royalty from coal and asphalt leases, \$250,504. The proceeds of lands sold in 1914 for Indians under the supervision of the agency aggregated \$636,042.80. The total property of the Five Civilized Tribes was valued in 1913 at \$175,292,444. In 1914 the tribal government consisted of a Principal Chief, or Governor, with such clerical force as is necessary. Practically no governmental functions are exercised, the principal duties of the officials being to look after the interests of the tribe generally and execute conveyances, etc., until such time as tribal affairs are finally closed and the tribal government can be dispensed with entirely. Congress makes annual appropriations to assist the public schools of the State of Oklahoma within the territory occupied by the Five Civilized Tribes for the reason that so much of the allotted land is not subject to taxation that sufficient revenue was not received from taxation

to maintain schools properly. About \$300,000 is appropriated annually for the maintenance of about 3000 school districts, in which are enrolled about 25,000 Indian and freedmen pupils. The administration of the affairs of the Five Civilized Tribes is in the hands of the Interior Department, through the Commissioner of Indian Affairs.

The agitation for statehood for the Territory began in 1892. This led to the adoption of a constitution by a convention held in the summer of 1905. In November of that year, by an almost unanimous vote, the citizens of the Territory favored separate statehood. In line with these actions a bill was introduced in Congress providing for the admission of Indian Territory as a separate State. Congress, however, favored the joint statehood of Oklahoma and Indian Territory and in June, 1906, passed the Statehood Bill, and, Nov. 16, 1907, the Indian Territory became a part of the State of Oklahoma. See OKLAHOMA.

INDIAN TURNIP. See ARUM; JACK-IN-THE-PULPIT.

INDIAN YELLOW, or PURREE. A coloring matter highly esteemed by artists. It is exported from the East Indies and China in spherical masses, which are of a dark-brown color externally, but of a bright orange yellow in the interior. It is obtained in Bengal as a sediment from the urine of cows fed on decayed and yellow mango leaves. Its odor is peculiar and resembles that of castoreum. It consists chiefly of the magnesium salt of an acid termed *purreic*, or *euxanthic acid* ($C_{19}H_{18}O_{11}$). Alkaline solutions dissolve this acid and form a yellow liquid. A solution of euxanthate of potash, when mixed with the solutions of the salts of the earths, gives brilliant yellow, sparingly soluble precipitates, and with acetate of lead it forms an insoluble yellow. Purree is fugitive as a water color and injures many lakes, but is unaffected by sulphur compounds. It is often found adulterated with chrome yellow.

INDIA RUBBER. See RUBBER.

INDICAN. A substance found in the blood and urine of man and the Herbivora. According to Abderhalden, the indoxyl of urine is wrongly called indican. It is chemically indoxyl potassium sulphate and is an oxidation product of indole in the fæces. It is believed to be formed by the oxidation of indole in the intestines, forming indoxyl, which latter substance combines in the liver with sulphuric acid and is eliminated as indoxyl-potassium sulphate, or indican. The occurrence of indican in the urine is thought by many to indicate putrefaction in the intestinal canal and to be significant of "intestinal auto-intoxication," but this theory has lately been shown to have little or no basis in fact. See INDIGO.

INDICATOR (Lat., pointer). In steam engineering, an instrument to measure and to record by means of a diagram the pressure of the steam in the cylinder of a piston engine. The indicator was invented by James Watt, of steam-engineering fame, and the modern indicator is merely a structural modification of Watt's original design. Concisely described, the modern steam-engine indicator consists first of a small cylinder having communication with the

interior of the engine cylinder by means of a short pipe provided with a stopcock. In this small cylinder works a piston having a piston rod extending out of the top of the cylinder. This piston is normally pressed down to the bottom of the cylinder by a calibrated spiral spring; but when steam is admitted below the piston by

FIG. 1. STEAM-ENGINE INDICATOR.

opening the stopcock previously mentioned, the pressure forces the piston upward against the spring, compressing it a greater or less amount, according to the steam pressure and the resiliency of the spring, which is known and measured. The top of the piston rod is attached to a lever which carries a pencil at one end. This pencil bears against a slip of paper attached to a drum, which rotates back and forth on its axis for a distance and with motion which corresponds exactly to the stroke and movement of the engine piston. In operation the indicator piston rises and falls with the rise and fall of the steam pressure in the cylinder, and the pencil point is thus given a vertical movement whose magnitude corresponds to the intensity of the steam pressure and is measurable on the diagram when the compression of the spring and the motion of the pencil per pound of pressure are known. At the same time the rotation of the drum gives the paper a horizontal movement under the pencil point, corresponding in magnitude and speed to the engine-piston movement, so that the result of the two operations is the inscription of a closed diagram on the paper. These diagrams, being drawn to scale, enable the steam engineer familiar with their use to calculate the power of the engine, to examine and adjust the actions of the engine valves, and to make certain inferences concerning the transformation of heat into work, and the influence of the metal of the cylinder on that operation. Special forms of indicator have come into use with the high speeds and high temperatures which are met in the internal-combustion engine (q.v.). One of these is a maximum-pressure indicator, giving no diagram, but indicating by motion of a lever when and at what pressure the maximum pressure takes place. The other is called the manograph, and in it a flexible calibrated diaphragm receives the pressure, and a mirror reflects the double motion of pressure and

piston. (See MANOGRAPH.) A concise treatise on the subject of indicators and indicator diagrams is Peabody, *The Steam Engine Indicator* (New York, 1900).

information (q.v.) in that it is the act of a grand jury, while an information is the written accusation of crime by the law officer of the crown or of the state. It differs from present-

FIG. 2. INDICATOR DIAGRAM.

INDICTION, in-dik'shūn (Lat. *indictio*, imposition of a tax, period of 15 years, from *indicere*, to declare, from *in*, in + *dicere*, to say, Skt. *dis*, to show). A period or cycle of 15 years, the origin of which is involved in obscurity. It began to be used in reckoning time, chiefly by ecclesiastical historians, during the life of Athanasius; it was afterward adopted by the Popes, through whose influence it came to be so generally employed during the Middle Ages that the dates of charters and public deeds of this period are expressed in indictions as well as in years of the Christian era. See CHRONOLOGY.

INDICTIO PASCHALIS, in-dik'shī-ō pās-kā'lis (Lat., Easter declaration). A custom that arose in the early Christian Church of Alexandria of announcing on Epiphany the days on which Easter would fall. Later this declaration was called the *Indictio festorum mobilium*, the announcement of the movable feasts, because the time when these should be celebrated depended upon the appointment of the days for Easter. The custom soon became general; the fourth Synod at Orléans (541) issued a formal order for the observance in its first canon.

INDICTMENT, in-dit'měnt (from OF. *enditer*, *endicter*, *inditer*, *indicter*, to accuse, Lat. *indictare*, frequentative of *indicere*, to proclaim, from *in*, in + *dicere*, to say, Skt. *dis*, to show). The formal written accusation of crime against a person, presented on oath by a grand jury (q.v.), and upon which he is tried by a petit jury. In Scotland an indictment is also the accusation on which a prisoner is tried; but it runs in the name of the lord advocate, addressed to the prisoner. In England a prisoner is not entitled, before trial, to a copy of the indictment or a list of the witnesses against him except in case of treason. An indictment differs from an

ment (q.v.) in that the latter is an accusation by the grand jury of its own motion, and without any charge of crime or any bill of indictment being laid before it.

In the United States persons who are accused of felonies or grave misdemeanors can be brought to trial only upon an indictment which a grand jury has declared to be "a true bill," the right to be prosecuted only on indictment by a grand jury "for a capital or otherwise infamous crime" being preserved by the Constitution of the United States (Amendments, Art. V) as well as by those of the several States. When a criminal court is convened, and the grand jury has been duly constituted and instructed, the State's attorney, or some other duly qualified officer, lays before them drafts of indictment against the alleged offenders and furnishes them with the names of the witnesses whose testimony is relied upon to support the accusation. These witnesses the grand jury examines *ex parte*, not to determine the guilt or innocence of the accused, but to ascertain whether there is or is not *prima facie* evidence of guilt sufficient to warrant their trial. If 12 or more members of the grand jury pronounce in the affirmative, the presentment, with the words "a true bill" indorsed upon the back thereof, is sent to the court; and, upon the charges therein contained, carefully set forth in the indictment subsequently prepared, the accused is put upon trial before a petit jury. The indictment is prefaced by a "caption," in which are set forth the name, term, and place of meeting of the court, the names of the justices, and the fact that the grand jury was lawfully constituted. Then comes a full and particular description of the alleged crime; the name of the accused must be given if known; and if not, he must be described in such a way as to make his identity sure. The time and place

of the commission of the crime must also be stated, though it is not always necessary to conviction that these particulars should be exactly supported as charged. In some cases, however, a failure upon this point is fatal to the indictment. In trials for perjury the exact day when the offense was committed must be named. To prove that the crime was committed on some other day will not avail. In cases of murder the death must be described as occurring within a year and a day of the time when the alleged fatal injury was inflicted. When several persons have been concerned in the commission of a crime, they may be indicted either jointly or separately. It is usual to describe the alleged offense in different ways, in what are usually called "counts," in order to cover any uncertainty that may exist beforehand as to the precise way in which it was committed. It is enough if the prisoner is convicted upon a single count. The indictment must charge explicitly whatever is necessary to constitute the offense. But though the offense of a prisoner may have involved the commission of two or more distinct crimes, as, e.g., arson, burglary, and murder, the indictment can charge only one of the crimes. The others must be charged in separate indictments. Formerly in England and to-day in some of the United States the drawing of an indictment is an exceedingly delicate and precarious undertaking because of the tendency of the courts, in the interests of the accused, to quash the indictment or even to set aside a conviction because of technical errors, even of the most trifling character, such as a mistake in spelling, the insertion of a superfluous word, the failure to dot an *i* or cross a *t*. This tendency had originally a certain justification when courts and juries were forced into a tacit conspiracy to defeat the harsh and inhuman penal law which prevailed in England in the eighteenth and early part of the nineteenth century, but its survival in American criminal jurisprudence is to-day only an abuse of justice. It is only fair to say, however, that in most American States as well as in England this reproach has been removed by statute or by the adoption of a more enlightened attitude by the courts. In many of the States the harsh rule of the common law which denied the right of a person accused of treason or felony to have a copy of the indictment has been abolished. Consult: Pike, *History of Crime in England* (London, 1876); F. Wharton, *Precedents of Indictments and Pleas* (4th ed., 2 vols., Chicago, 1881); Stephen, *History of the Criminal Law of England* (ib., 1883); Pollock and Maitland, *History of English Law* (2d ed., Cambridge, 1899); H. C. Joyce, *Treatise on the Law Governing Indictments* (Albany, 1908); also the authorities cited under CRIMINAL LAW. See GRAND JURY.

INDIF'FERENTISM (from *indifferent*, from Lat. *indifferens*, not different, from *in-*, not + *differre*, to differ, from *dis-*, apart + *ferre*, to bear). A term used in philosophy and ethics to designate the theory that the human will is absolutely indifferent to all motives. The doctrine is also called indeterminism, or the doctrine of the liberty of indifference, and is opposed to determinism. See FATALISM; DETERMINISM; ETHICS; FREE WILL.

IN'DIGES'TION (from Lat. *indigestio*, indigestion, from *in-*, not + *digestio*, digestion, from *digerere*, to digest, from *dis-*, apart + *gerere*, to carry), or DYSPEPSIA. A term somewhat vaguely

applied to various forms of disease of the stomach or of the small intestines in which the natural process of digesting and assimilating the food is deranged. The common cause of indigestion, where organic disease is absent, is the eating of too much food, too rapidly, or without sufficient mastication.

The symptoms of indigestion are by no means constant in all cases. There is often *anorexia* (or want of appetite), but occasionally the appetite is excessive and even ravenous. Nausea not infrequently comes on soon after a meal; while in other cases there is no nausea, but after the lapse of a couple of hours the food is vomited, the vomited matters being very acid, and often bitter from admixture of bile. In severe cases the vomiting has been known to occur after every meal for several months. Flatulence, relieving itself in eructations, is one of the standard symptoms of this affection, the gas that gives rise to this symptom being sometimes evolved from undigested matters in the stomach. It is very apt to occur in dyspeptic patients if they have fasted rather longer than usual. *Cardialgia* (popularly known as *heartburn*), *pyrosis* (q.v.), or water brash, and *gastrodynia* (commonly designated *spasm* or *cramp* of the stomach, and coming on at uncertain intervals in most severe paroxysms) are somewhat less common symptoms of indigestion.

The treatment of indigestion is more dietetic than medicinal. All bad habits suggested above must be corrected. The quantity of food which can be digested by the gastric juice and intestinal fluids being limited (see DIGESTION, ORGANS OF), care should be taken to avoid excess; moreover, the meals should not succeed each other too rapidly. With regard to the nature of food best suited to dyspeptic persons, it may be safely asserted that a mixture of well-cooked animal and vegetable food is in general more easily digested than either kind taken exclusively. Each patient should be advised by his physician as to his dietary. The unquestionable benefit which dyspeptic patients often derive from a visit to a hydropathic establishment is due perhaps not so much to any specific action of the water as to the well-regulated diet, the withdrawal of the mind from personal cares, and the change of scene. The use of purgatives and remedies for indigestion is much overdone by the laity and lays the foundations of chronic gastric disorder that cannot be cured. See DYSPEPSIA and GASTRITIS, the chronic form of which is generally accompanied by indigestion.

INDIGIRKA, ĕn'dyĕ-gĕr'kĕ. A river of east Siberia. It rises in the Stanovoi Mountains, 400 miles east of Yakutsk, and, after flowing in a northeasterly direction for about 900 miles across a sparsely populated and frozen desert region, it empties through a large delta into the Arctic Ocean, 460 miles east of the mouth of the Lena (Map: Asia, Q 2). It is navigable during the summer months.

IN'DIGO (Sp. *indigo*, *indico*, from Lat. *indieum*, from Gk. *ινδικόν*, *indikon*, indigo, from *Ἰνδία*, *India*, India). A coloring matter first employed as a dyestuff in India, whence it was brought by traders to the Mediterranean countries. Europeans were not acquainted with its vegetable origin until the time when its importation assumed considerable dimensions, after the circumnavigation of Africa; and as the method of dyeing with woad did not present the

indigo in substance, the virtual identity of the two was not suspected. Of late years artificial indigo has been produced from coal-tar products and is seriously threatening the existence of the indigo plantations. For the history of artificial indigo, see COAL-TAR COLORS.

Most of the natural indigo of commerce is obtained from species of *Indigofera*, of the family Leguminosæ. The genus embraces about 400 species, widely distributed throughout tropical

INDIGO.

and subtropical regions. The best-known and most widely cultivated species, as well as the ones which supply nearly all the indigo found in the markets, are *Indigofera anil*, a native of tropical America, and *Indigofera tinctoria*, the original home of which is not positively known, although it is said to occur wild in the Bombay Presidency. *Indigofera argentea*, a native of Arabia and parts of Africa, is a source of much of this valuable dye. Indigo plants are extensively cultivated in the East and West Indies (especially in Bengal), in Central America, parts of Europe and Africa, etc. The plants are shrubby, attaining a height of about 6 feet, have pinnately compound leaves and usually pink or purple flowers. The pods of *Indigofera anil* are sickle-shaped, short, and compressed, while those of *Indigofera tinctoria* are straight, cylindrical, and many-seeded. When cultivated, the indigo plant requires a rich, friable soil, well watered, but not too wet. The seeds are sown in drills about a foot apart, and the plants are cut when beginning to flower. In the tropics this can be done at frequent intervals, and four or five crops a year obtained. After cutting, the crop is handled in various ways, fermented in tanks, as described below, and the indigo extracted. Although the plants are perennial, the greatest yields are obtained from annual plantings. In addition to the species mentioned above, at least half a dozen other species of *Indigofera* are known to produce indigo of good character. It is also produced by species of *Sophora*, *Baptisia*, *Amorpha*, *Tephrosia*, and *Galega*, all belonging to the order Leguminosæ. *Baptisia tinctoria* and *Amorpha fruticosa* are known as "false indigo" in the United States, where they are widely distributed. Plants of other families produce indigo, as *Isatis tinctoria*, a cruciferous plant which was cultivated in Europe during the Middle Ages and is still planted in southern France (see WOAD); *Wrightia* and *Nerium*, which belong to the family Apocynaceæ; *Mars-*

denia tinctoria and *Gymnema tingens*, of the natural order Asclepiadaceæ; *Polygonum tinctorium*, of the order Polygonaceæ; *Strobilanthes flaccidifolius*, of the order Acanthaceæ; *Spilanthes tinctoria* (Compositæ), and *Scabiosa succisa* (Dipsacaceæ), as well as many others, representing widely separated orders of plants.

Neither the indigo plant nor *Isatis tinctoria* contains the dyestuff (indigotin) ready formed, but rather a colorless glucoside, indican (q.v.), which breaks up, by fermentative processes, into indigotin, and a glucose sugar called indiglucin. It is a curious fact that indican is a normal constituent of human urine and becomes very plentiful in certain diseases. Natural indigo is prepared for the market in the following fashion: The plants are cut down just before reaching the flowering stage and are thrown into vats, where they are steeped in water and allowed to ferment for 12 to 15 hours, practically out of contact with air. This produces the soluble *indigo white*, which is taken up by the water; the liquid is then drawn off into "beating vats," where it is violently agitated by machinery, in order to promote contact with the air, so that the indigo white is oxidized to the insoluble *indigo blue*, which forms a thick scum on the surface and then sinks to the bottom as a bluish mud. After settling, the clear liquid is drawn off, and the indigo blue is collected, squeezed between cloths, and dried in the air. It is sold in irregular lumps, which differ in tint, size, and texture according to the various localities in which they are produced. The amount of available dyestuff ranges from 20 to 90 per cent of the commercial product, some of the impurities being accidental, although intentional adulteration is common enough. This irregularity of composition in the natural product is one of the causes that have advanced the manufacture of artificial indigo, which is always chemically pure.

There are a large number of patented processes for the preparation of synthetic indigotin, chiefly held by the German color factories and largely based upon the researches of Adolf Baeyer, who showed, about 1880, what the exact chemical constitution of this substance is and indicated the general principles for its preparation from aniline derivatives. At present artificial indigo is manufactured by a process worked out by the Badische Anilin-und Sodafabrik at Ludwigshafen upon a basis furnished by Heumann. Naphthalene, an abundant ingredient of coal tar, is first oxidized by fuming sulphuric acid to phthalic acid, from this phthalimide is formed, and this converted into anthranilic acid. This latter reacts with monochloroacetic acid to form a compound (phenylglycocoll-carboxylic acid) which fused into caustic soda is converted into indoxyl, which by atmospheric oxidation yields pure indigo blue. The working out of the artificial indigo manufacture brought in its wake the development of the new contact process for sulphuric acid and the production of electrolytic chlorine. In 1906 it was estimated that 80 per cent of the world's consumption of indigo was supplied by the artificial product, while the cultivation of the indigo plant has shrunken correspondingly. Natural indigo is still used, either with or without woad, in certain cases of cloth dyed for government consumption. Pure indigotin, whether extracted from natural indigo or prepared artificially, is crystalline, with a coppery

lustre and a very characteristic odor; when crushed, it forms a blue powder, and when fixed upon the fibre it constitutes a remarkably fast and brilliant "navy-blue" dye. Numerous compounds of indigo are now prepared as dyes, such as indigo red, indigo scarlet, and indigo yellow. In the first two indigo is combined with sulphur as Thio-Indigo Red B and Thio-Indigo Scarlet R; in the last the combination is with benzoyle chloride.

Dyeing with Indigo. As indigo blue is insoluble in water, it must first be converted into indigo white, which is soluble in alkaline liquids. This change is produced by the chemical addition of hydrogen, so that the blue, $C_{16}H_{10}N_2O_2$, goes over into the white, $C_{16}H_{12}N_2O_2$. This is effected in *cold* vats, which are employed for the dyeing of cotton and linen, by metallic reducing agents, such as sulphate of iron, zinc dust, and alkaline sulphites; while wool and silk are dyed in *warm* vats, where the reduction is caused by a fermentation of vegetable substances, preferably woad, in a manner analogous to that by which indican is converted into indigo white. These vats are always alkaline. When the reduction of the indigo is completed, the liquid is colorless, with a light bluish scum on top. The scoured materials are then drawn through the vats and exposed to the air while drying. The atmospheric oxygen immediately reconverts the white into the blue, by removing the extra hydrogen atoms. Indigo blue is also soluble in fuming sulphuric acid, forming "indigo-sulphonic acid," or Saxon blue, which was formerly known as a dyestuff, but has been replaced in modern practice by its sodium salt, *indigo carmine*. The solution of this carmine produces a blue precipitate upon the fibre with an alum mordant, but the color is neither as deep nor as fast as that of the unaltered indigotin from the reducing vats. With artificial indigo the final synthesis can be produced on the fibre itself, as when orthonitrophenylpropionic acid and potassium xanthogenate are applied separately and the doubly impregnated cloth is then steamed.

Printing with Indigo. Indigotin is not suited to printing in pigment form, and figured goods are produced by dyeing processes. To procure a blue-and-white pattern, the whole fabric may first be dyed blue, and the white produced by printing on bleaching agents which will remove the color. Or the cloth may first be printed with a "reserve," or resist, a paste composed of gum, pipe clay, and copper salts, to prevent the deposit of indigo upon the spots which they protect, while the material passes through the vat. Artificial indigo can again be produced by printing one chemical upon the fibre and putting the other into the bath through which it is subsequently passed.

INDIGO BIRD. See INDIGO BUNTING.

INDIGO BUNTING. A North American

finch (*Passerina cyanea*) of the eastern United States. It breeds as far north as Nova Scotia and Minnesota, but migrates southward in the fall to Central America, where it spends the winter. It is about $5\frac{1}{2}$ inches in length, and the adult male is rich dark blue in color, variously tinged and shaded, the lores and angles of the chin velvety black. The female is gray brown. It frequents open places on the edges of woods and delights to sit on the top of a high tree singing a very sweet and peculiar melody, continued late into summer, after most other birds have stopped singing. It is easily domesticated. The nest is built of grasses, leaves, bark, and long hairs, in a little bush or on weeds near the ground. The eggs are three or four, pale bluish white, without spots. See Colored Plate of EGGS OF SONG BIRDS.

INDIGO SNAKE. See GOPHER SNAKE.

INDIRECT HEATING. See HEATING AND VENTILATION.

IN'DIUM (Neo-Lat., from Lat. *indicum*, indigo). A metallic element, discovered spectroscopically by Reich and Richter in 1863. It occurs in minute quantities in various zinc ores, especially in the zinc blendes of Freiberg, in some galenas from Italy, in the flue dust of zinc furnaces, and in various manganese ores. In the metallic state the element may be obtained by reducing its oxide in a current of hydrogen, or by fusing the oxide with sodium, or else by the electrolysis of its chloride, nitrate, or sulphate. The oxide itself is obtained by dissolving Freiberg zinc in weak sulphuric acid, precipitating the solution with metallic zinc, and separating out, from the precipitate, lead, copper, and iron. With oxygen indium forms an oxide of the formula In_2O_3 . Its hydroxide, $In(OH)_3$, is similar to that of aluminium. A number of its salts have been prepared, but none of them has any economic value. In its salts indium may act as a univalent, bivalent, or trivalent element. Thus, it forms three different chlorides: $InCl$, $InCl_2$, and $InCl_3$. As a rule, only the salts of trivalent indium can be dissolved in water without being decomposed. Metallic indium is ductile, silver white, and lustrous. Its specific gravity is about 7.1, and it melts at $155^\circ C.$ ($311^\circ F.$). Its chemical symbol is *In*, and its atomic weight is 114.8.

IN'DIVID'UALISM (from *individual*, from ML. *individualis*, relating to an individual, from Lat. *individuus*, indivisible, from *in-*, not + *dividuus*, divisible, from *dividere*, to divide). The doctrine that society is only an artificial device, whose value is to be gauged by its conduciveness to the good of the several associated members or by some other standard set by these individuals. Individualism must be distinguished from egoism, with which it is often confounded. While individualism perhaps is generally egoistic in character, it is not always so. An individualist may maintain that the end which justifies all justifiable means is "the greatest good of the greatest number"; what makes him an individualist is his conception of the greatest number as composed of *independent* units, the happiness of each of which is to be reckoned as *a separate item* in the sum total of general happiness. Such being the nature of individualism, it is clear that in all the sciences which deal with man as a social being there may be individualistic tendencies. And as a matter of fact individualism has been a marked charac-

teristic of many prominent theories in political science, in economics, and in ethics.

In political theory the consistent individualist regards the state as a means to subserve individual ends. He may be an egoistic anarchist, desiring to remove all restraints which the state imposes upon his freedom of action. On the other hand, he may be an absolutist, believing that the restraints imposed by a supreme government are necessary to prevent the disastrous consequences which would follow from every man's acting upon his unregulated desires and thus involving himself in perpetual warfare with all his neighbors. Thus, we see that the sovereignty of government, which the individualist must deny in ultimate theory, he may stoutly maintain in practical politics. Hobbes, the prime individualist of modern times, was nevertheless one of the staunchest supporters of unlimited despotism when despotism was making its last stand against parliamentary government in England. Again, an altruistic individualist may, like the egoistic, be either an anarchist or a believer in government. The anarchism of our day is in large measure a reaction against absolutism, a reaction motivated by a sincere desire to secure for mankind at large the blessings of freedom. The trouble with it is that it conceives freedom as license and regards license as in its nature humane when not irritated by authority. Other altruistic individualists, however, who do not share with the benevolent anarchist the optimistic belief that man is by nature a saint and only by government a sinner, justify government as a necessary evil—an evil because individuality is more or less repressed by law, but a necessity because without some measure of such repression some individuals would make life intolerable or even impossible for others. It is thus clear that individualism as a political theory is quite compatible with acquiescence in and support of almost any form of government or even with revolt from all government. Practical individualism, on the other hand, may prevail to a large extent along with anti-individualistic theories, for it is quite logically consistent for a thinker to maintain that the true end of all government is the welfare of society as an organic whole, and yet that this welfare can best be served by allowing every individual to pursue his own ends.

In economics individualism has generally advocated the practice which is formulated in the well-known precept, *Laissez faire, laissez passer*. The state is to keep hands off of the economic machinery. Free competition, resulting in the survival of the economically fittest, is the individualistic ideal. Hence we find among individualists a tendency to oppose all sumptuary and other economic legislation. Compensation for service rendered is held to be a matter which concerns merely the parties immediately involved, and no general laws, it is urged, should control the unrestricted privilege of any man to buy labor as cheap and to sell it as dear as the relation between supply and demand allows. No minimum of wage, no maximum of hours, no restriction upon the age or sex of employees, no employer's liability except as specified by contract, no fostering of industries by tariff or subsidy, no political arbitration of economic disputes, no government ownership or operation of any industrial plant—in short, no state interference in production, distribution, or consump-

tion—this is what absolute and unadulterated individualism is apt to hold before itself as the true type of the industrial life. But pure economic individualism is at the present day more a theory than a practice. Public policy has asserted itself against private license, and the struggle at present is not so much between state interference and free competition as between different views as to the points at which state interference is advisable. Individualism has become more of a war cry than an accurate designation of economic principle. The question is only as to the character of the limitations to be put upon the freedom of the individual in his economic relations.

In ethical theory individualism is not now so important a factor as it was a century or so ago. Pure individualism is often thought incompatible with morality as ordinarily understood. If each man's ideals are the measure of his morality, morality, it is claimed, ceases to have any general meaning. This is frankly recognized by some individualists; but some, on the other hand, still maintain the possibility of carrying their theory out logically without detriment to morality. The typical representatives of the latter view are to be found among those who claim for the individual conscience the right to pass definitively upon all questions of morals. "There is no such thing as an erring conscience," they say. In some thinkers, as, e.g., Kant, the individualism of the conscience theory of morals is offset by the universalism of the criterion of reason, which directs the conscience. One must see one's duty only in what can be duty for all. The combination of individualism and anti-individualism in an ethics of conscience is, however, a *tour de force* which can be successfully achieved only by those who unknowingly have a higher standard for morality than either conscience or pure reason. But when this higher standard is lacking, individualism gets the upper hand, and we have as the logical result the view that everything is right which a man thinks to be right. The individual with all his idiosyncrasies becomes the measure of the universe. Most ethical thinkers have come to see that this is the natural consequence of the contention that conscience is the supreme *arbiter morum*, while moral practice has always been controlled by other influences besides the conscience of the individual. Or perhaps it would be more correct to say that these other influences operate upon a man by giving character and direction to his conscience, so that while he is guided by his conscience, that conscience is not merely an individual peculiarity. It reflects with greater or less accuracy the ideals of his community—a community sometimes large, sometimes small, but, whether large or small, of decisive influence in determining the kind of conscience the man is to have. Hence, as conscience is not something ultimate and intuitive, but derivative, there is no reason for supposing that its dictates are infallible. The individual reflects the opinions, prejudices, superstitions, and sane judgments of a community and gives to them perhaps an individual coloring, especially in matters bearing on his own conduct. The result we call conscience.

INDIVIDUALITY (ML. *individualitas*, from *individualis*, relating to an individual). Separate or distinct existence. There is some difference of opinion as to what constitutes individuality, the discussion being principally confined to the domain of natural history. Driesch, a modern vitalist, defines an individual living organism as a typical constellation of different elements, preserved in spite of metabolism, existing in numerous exemplars, exhibiting the phenomenon of development, and possessing as its most important properties the faculties of regulation, reproduction, and active movement. Such an individual, he maintains, is more than the sum of its inorganic parts; for its behavior, especially in morphogenesis, cannot be explained in terms of substance and causality, or matter and energy, but only through a new category, individuality, and in terms of entelechy—an autonomous factor which is not energy, and which does not deflect, but merely suspends or relaxes energy. Mechanists tend to define individuality less absolutely. They emphasize independence in the sense of ability to maintain a typical structural form in spite of minor changes and accidents, a typical chemical composition (protoplasm), and the ability to grow and to reproduce. Any substance which exhibits these characters they regard tentatively as an individual. In the concrete case the demarcation of individuality is often difficult. Certain crystalline forms, e.g., exhibit many of the characters of the living individual organism. Consult Driesch, *Science and Philosophy of the Organism* (London, 1908), and Huxley, *The Individual in the Animal Kingdom* (Cambridge, 1912).

Individuality, in the psychological sense, implies a unity of experience, which is socially effective and socially recognized, and which is constituted in the main by consistency of purpose and continuity of personal memory. (See MENTAL CONSTITUTION; SELF.) The problems which individuality presents to normal psychology are discussed under INDIVIDUAL PSYCHOLOGY. The term is also employed in psychopathology. Cases have not infrequently been reported where, as the result of hypnosis or of some form of disease, the memory-continuum has been broken off, and another (with different determinations) instituted in its place. A person thus affected loses all memory of previous existence, together with name, home, family, and

friends, and begins a life so new and so different that he may be called another and different individual. Alternations of the two personalities may appear; and not only two, but as many as nine or ten personalities may exist, in the same body, in complete or partial independence of one another. See DOUBLE CONSCIOUSNESS.

Janet, *L'Automatisme psychologique* (Paris, 1899); id., *Mental State of Hystericals* (New York, 1901); id., *Major Symptoms of Hysteria* (ib., 1907); Morton Prince, *Dissociation of a Personality* (ib., 1906); id., *The Unconscious* (ib., 1914).

INDIVIDUAL PSYCHOLOGY, or DIFFERENTIAL PSYCHOLOGY. That branch of psychology which deals with the minds of individuals and with the likenesses and differences between the minds of individuals. Differential psychology has sometimes been taken to include the study not only of these differences, but also of the differences between collective minds. (See SOCIAL PSYCHOLOGY.) Individual psychology differs from general psychology (see PSYCHOLOGY) as concrete from abstract, phenomenological from universal. For general psychology individual minds are important, because only through them is it possible to arrive at a knowledge of mind at large; they are important, i.e., not as such, but as manifestations of a general or typical mind whose uniformities are to be discovered. For the individual psychologist, on the contrary, individual minds are directly important. They are themselves the objects of investigation, units whose nature and whose differences it is his immediate task to describe.

The principal problem of individual psychology, as above defined, is (1) to determine the nature and the range of mental variations. This main problem may be subdivided into three subordinate problems. The individual psychologist must (a) investigate single processes in a large number of minds, thus determining the range and distribution of the various mental factors (theory of variations). He must (b) investigate a large number of factors in the single mind, determining the relations of the single factors to one another and their significance for the mind as a whole (psychography). And he must (c) investigate two or more factors in a number of minds, determining the general tendencies of the single factor to vary directly or inversely with the others or independently of them (theory of correlation). A limiting case of this problem appears when the number of factors is large, and the number of minds is reduced to two, the aim then being to determine the factor or group of factors to which the general or total difference of the two minds may be attributed (theory of comparisons). The results of these inquiries form the contents of individual psychology proper. We have, however, further to inquire (2) into the conditions of the variations which we have established; we must investigate the influence of heredity, climate, position in life, education, sex, age, etc. And lastly (3) we must examine, classify, and explain the expressions of mental difference in handwriting, physiognomy, characteristic gesture, literary style, etc.

The first of the three main problems is at present the most important. The theory of variations has led to the elaboration of a doctrine of psychological types, such as the temperaments and the memory types, the grades of intelligence, types of abnormality, etc. Psychography has thus far furnished us with the psychological portraits of a few eminent persons and with a programme of future work. The theory of correlation shows a vigorous activity. It is the most systematic of the three minor branches of individual psychology, and by its methodical range promises to contribute more both to science and to practice than the other two.

The special methods of individual psychology are three. The first is that of abnormal cases: we may take advantage of instances in which there is extreme enfeeblement (perhaps even loss) of some function to study the resulting modification of other functions. We may ask, e.g., how loss of memory affects imagination, attention, etc. The second is that of mental tests. (See MENTAL TESTS.) In theory we may find problems whose solution depends essentially upon the presence or the concernment of some single mental factor; and thus, by experimental means, we may measure directly the influence of single factors. In practice, however, such accurately diagnostic tests have been only approximated. The third method is that of correlation. Having measured a number of factors in a large number of individuals, the degree of correspondence between any two of the factors (technically called the index of correlation) may be mathematically computed and numerically expressed. A positive index means a tendency of the factors to vary directly with each other, unity expressing complete uniformity; a zero index means that the factors vary independently; and a negative index indicates a tendency of the factors to exclude each other.

Experimental work directly attacking the second main problem has for the most part borne upon the influence of heredity; the influence of age, sex, and other conditions has come to light rather incidentally in investigations undertaken with other purposes. The exact study of the third problem has hardly begun.

Consult: Kraepelin, *Psychologische Arbeiten* (Leipzig, 1896); Titchener, *Experimental Psychology* (New York, 1901); Stern, *Die differentielle Psychologie* (Leipzig, 1911), which contains an extended bibliography; Whipple, *Manual of Mental and Physical Tests* (Baltimore, 1914).

INDO-CHINA. A geographical term formerly designating the southeastern peninsula of Asia (Farther India), embracing Burma, Siam, French Indo-China, etc.

INDO-CHINA, FRENCH. See FRENCH INDO-CHINA.

INDO-CHINESE. The name applied as a general term to the great majority of the native population of Farther India, or Indo-China. It originally indicated that these peoples were related by speech and physical characteristics to the Chinese, but in part also somatically and culturally to the peoples of Hindustan. The Indo-Chinese peoples speak what are called tonic monosyllabic languages, forming, with the Tibetan and Chinese groups, the extensive and important Sinitic, or Tibeto-Chinese, stock or family. The chief Indo-Chinese peoples are the following: Burmese, Siamese, Annamese, Cambodians, Tonkinese, who have all in some respects

reached the status of civilization. Related to the Siamese are the other Thai tribes, Shans and Laos, who preserve (some of them, at least) the primitive type of the Thai stock better than the Siamese and are likewise less civilized, though in the past they have created or have been the bearers of several half civilizations. The Cambodians, or Khmers, about whose linguistic and somatic relationship there is still some dispute, authorities crediting them with Aryan affinities especially as to physical characters, have behind them the more or less indigenous culture represented by numerous inscriptions and by the remarkable temples and monuments of Angkor-Vat, etc. The culture of the Indo-Chinese peoples has been largely influenced by both India and China, while the more primitive Malays have also had a not insignificant share in the physical and social complexes there existing. The Khmers have in earlier times borrowed not a little from Hindu sources, though this borrowing may not have been so great as has hitherto been assumed. The Burmese owe a good deal of their civilization to India; the Siamese almost as much, though more indebted to China than the Burmese; while the social life and culture of the Annamese is largely a reflection of Chinese. The Assamese of the Northwest, who speak an Aryan language closely related to Hindi, are probably a mixture of some of the more primitive tribes and Hindus. The exact relationship of some of the savage tribes of the northern parts of Farther India is not yet clear, but those not distinctly Thai are more closely connected with the pre-Sinitic inhabitants of southern China and the Tibetan area. The Mois, by which general name a number of more or less primitive tribes scattered over the eastern mountains and tablelands are known, are an aboriginal race with perhaps a Caucasian strain. The Kuis of the Shan States are probably aboriginal, like the Mois; the Kuis of Cambodia have for some time been rapidly assimilating in speech and otherwise to the Cambodians. The Mons, or Talaing, of Burma, formerly had a much greater extension, but have been driven back by the more civilized peoples and the mixed races of modern origin. The Tchiam, or Chiam, who are the modern representatives of the people who founded the ancient Empire of Champa, are by some authorities thought to possess Malay linguistic affinities. The Karens of Burma, who have recently shown themselves to be so amenable to missionary influences, are related to the Burmese linguistically and physically, but are of a more primitive type. The numerous Chin tribes of the Northwest are probably closely related to the primitive Burmese, but some of them are of very mixed type. The Lushai tribes are perhaps similarly related in general; they, together with the Nagas of the mountains of Manipur, are now more or less mixed—some of them have been thought to have Malay affinities. The Indo-Chinese peoples as a whole are probably of Mongolian stock, with early and later admixtures of Aryans and non-Aryans from India, etc., Malays and possibly Negritos, besides interminglings with the more modern peoples of the Indo-Chinese area. Like Hindustan, Farther India has had a history of primitive occupation, indigenous culture evolutions, foreign conquests, native combinations and disputes, etc. The more civilized peoples have more or less exploited for agricultural, commercial, and labor purposes the less civilized; the Burmese and Siamese the

Shans, the Annamese the Mois, the Laos the wilder peoples of their country; and to this general exploitation the Chinese, whose coming into this area as colonists and traders antedates the Christian era, have added much. Back of the modern civilization of Burma, Siam, Annam, Cambodia, etc., lie older half civilizations of the more primitive tribes—Khmers, Shans, Laos, etc.—whose remains are of considerable importance and of great antiquity. Back of these, again, are the monuments of prehistoric man in this part of the world—the kitchen middens of Cambodia, the stone monuments of the Khasi country, etc., and, earliest of all, the chipped implements discovered by Noetling in 1894 near Yenangyoung, on the Irrawaddy, in Upper Burma, which are claimed to prove the existence of Tertiary man in this region. It is probably from some of the proto-Indo-Chinese or their closely allied predecessors that the Malayan stock has sprung. Some of the Indo-Chinese, however, exhibit closer somatic affinities with certain of the Mongolian natives of northeastern Asia, such as the Tchuktchi, etc. Consult: Von Helwald, *Hinterindische Länder und Völker* (Leipzig, 1880); Forbes, *Comparative Grammar of the Languages of Farther India* (London, 1881); Bastian, *Völkerstämme am Brahmaputra* (Berlin, 1883); Ehler, *Im Sattel durch Indo-China* (ib., 1894); H. C. Clifford, *Further India* (New York, 1904).

INDO-CHINESE SUBREGION. In zoögeography, a faunal district of the Oriental Region, comprising all that part of China south of the high mountains which carry the Himalaya Range eastward nearly to Foochow and form the watershed between the south coast and the valley of the Yang-tse; also all of Annam, Siam, Yunnan, Burma, and Assam, and a long, narrow extension westward along the southern slopes of the Himalaya, between the levels of about 2500 and 9000 feet. The name Himalayan or Himalo-Chinese is therefore sometimes given to this fauna and subregion. It is one of the richest faunas in the world and is especially distinct in its birds, of which more than 40 genera are peculiar, among which the pheasants are conspicuous. In the higher mountains Palæartic forms mingle with it to some extent, but on the whole the affinities are distinctly Oriental. See Map under DISTRIBUTION OF ANIMALS.

IN'DO-EU'ROPE'ANS. A term frequently applied to the so-called Aryan race (see ARYAN; EUROPE), as being inhabitants of India and Europe. The word is, however, linguistic rather than ethnological. Even in linguistic parlance the term is no longer so frequently used by authorities, except among French and Italian scholars, having been replaced by "Indo-Germanic." See INDO-GERMANIC LANGUAGES.

INDO-GERMANIC LANGUAGES, often called INDO-EUROPEAN, ARYAN, or sometimes INDO-CELTIC. The name given to the great cognate group of tongues spoken by the kindred peoples of southern and southwestern Asia and Europe and extending from India as far as the people of Germanic blood have spread. (See ARYAN.) This great group is quite distinct from the Semitic family of languages, from the forms of speech spoken by the Mongolian tribes, and from the various other recognized groups of tongues which are distributed over the world. The question as to the situation of the primitive home of the Indo-Germanic peoples has been much discussed. The original Indo-Germanic

habitat is now generally thought to have been in central or northern Europe rather than in Asia. Various theories have been advanced, especially a generation ago, to account for the present distribution of these languages. The genetic arrangement of the tongues in a genealogical tree by Schleicher and other scholars, or views as to migratory movements or dissemination, like Johannes Schmidt's "wave theory," will be found referred to in most books relating to linguistics and comparative philology. The present tendency is to regard these languages as the development of dialectal differences within the original Indo-Germanic mother tongue. In other words, the attempt is no longer made to "reconstruct" a unitary primitive tongue. On the other hand, the kinship of these languages has been scientifically proved by the family features and general likeness in their structure. In point of age they go back as far as the literary monuments of the Vedas.

The division of the Indo-Germanic peoples as represented by the various branches of speech is generally considered to be eightfold, as follows: (1) Indo-Iranian or Aryan proper, the ancient and modern languages of India and Persia; (2) Armenian, forming a sort of bridge between Asia and Europe; (3) Grecian or Hellenic, with its modern representatives in the tongues of northern Greece and the Peloponnesus; (4) Albanian, a more modern representative of the ancient Illyrian; (5) Italic, the Latin, with its modern descendants in the Romance tongues; (6) Celtic, or Keltic, originally occupying the west of Europe, but now confined chiefly to the British Isles, and of particular interest to the historical student of English and French philology; (7) Germanic, the important group to which the Anglo-Saxon, the English, the German, and other Teutonic tongues belong; and lastly (8), the Balto-Slavic group, the chief representative of which is the modern Russian. The various subdivisions of these language divisions, together with their branches or dialects, will be found under the respective titles. Besides these there are some sporadic traces or representatives of other Indo-Germanic idioms which are not included in the list because the fragments are too scanty or too scattered to allow a determination in detail of the real character of the speech. Such are the Phrygian, which has affinities with the Armenian, or again the Messapian, which may be connected with the Albanian, or, still further, the Macedonian, Gallic, Burgundian, or the like.

With reference to the general features, the Indo-Germanic languages are an inflectional group of tongues, sprung from a common ancestor no longer in existence. They have certain marked or distinctive features or variations of sound and accentuation that are more or less common to all, and they show a general similarity in structure as to roots, affixes, composite forms, with kindred variations of nouns, adjectives, pronouns, and verbs through eight cases, three numbers, including a dual, and a variety of moods and tenses, together with certain common phenomena in syntax and word order.

INDO-IRANIAN LANGUAGES. A branch or group of the Indo-Germanic family of languages. It comprises the Indo-Germanic languages of ancient and modern India, Ceylon, Persia, Afghanistan, Baluchistan, Kurdistan, and the Ossetic portion of the Caucasus. Although the vowel system is meagre, the consonants, generally speaking, best represent the pre-Indo-Germanic conditions. In inflection this group is the most primitive and highly developed of all the Indo-Germanic language divisions, while the most ancient literature in Indo-Germanic is preserved in Indo-Iranian. See AFGHAN; AVESTA; BALUCHI; BENGALI LANGUAGE AND LITERATURE; CEYLON, *Language and Literature*; GUJARATI LANGUAGE AND LITERATURE; HINDUSTANI LANGUAGE AND LITERATURE; INDIAN LANGUAGES; INDO-GERMANIC LANGUAGES; IRANIAN LANGUAGES AND LITERATURES; KASHMIRI; KURDISH; MALDIVE LANGUAGE; MARATHI LANGUAGE AND LITERATURE; NAIPALI; OLD PERSIAN LANGUAGE; OSSETIC LANGUAGE; PALI LANGUAGE AND LITERATURE; PAHLAVI LANGUAGE AND LITERATURE; PANJABI LANGUAGE AND LITERATURE; PERSIAN LANGUAGE; PRAKRIT LANGUAGE AND LITERATURE; SANSKRIT LANGUAGE; URIYA LANGUAGE AND LITERATURE.

INDO-MALAYAN SUBREGION. See MALAYAN SUBREGION; INDIAN SUBREGION.

INDONESIAN, in'dō-nē'zhan (from Gk. Ἰνδός, *Indos*, Indian + νῆσος, *nēsos*, island). A term, coined in analogy with Polynesian, Melanesian, Micronesian, etc., used by certain ethnologists to denote certain peoples of the East Indies and Polynesia who are neither Malays nor Papuans, but Caucasian in type. Such authorities would include under this head the Eastern Polynesians, certain tribes of Sumatra, Java, Borneo, the Philippines, etc. The differences between the so-called Indonesians and the Malayan stock are, however, neither so important nor so significant as these writers claim, and there is good reason for looking upon the former as only a more primitive Malayan type, or proto-Malays. The Indonesians and Malays are probably closely related, the former being

really primitive Malays. The term Indonesian was introduced by Logan, who attributed a Caucasian (Indian) origin to the lighter-colored natives of some parts of the East Indies, and extended in meaning by Hamy and others, who enlarged upon this theory. The term Indonesia is used by some authorities to designate the Malay Archipelago, or island group of the East Indies.

INDOOR BASEBALL. This sport varies but little from the regular game of baseball (q.v.). It originated at Chicago in 1887 and is credited to George W. Hancock and fellow members of the Farragut Club of that city. It can be played by from seven to nine players in any hall of size which will permit of sufficient light and room for the diamond and fielding, the minimum playing floor measuring 40 × 50 feet. The rules are designed to equalize the difference of size and surroundings from outdoor baseball, as are also the implements of the game. Each side of the diamond is from 27 to 35 feet long, according to the floor space at command. The ball must be not less than 16¾ inches nor more than 17¼ inches in circumference, must weigh not less than 8 nor more than 8¾ ounces, and must have a white cover. The bat must be 2¾ feet long and 1¾ inches in maximum diameter. The bases are 15 inches square, and half filled with sand or other heavy substance sufficient to anchor them in place, and the rules of the National Indoor Baseball Association of the United States govern the game. Consult *Indoor Base Ball Guide*, "Spalding's Athletic Guide" (New York, 1914, and annually).

INDORE, in-dōr'. A native Mahratta state of the Central India Agency (Map: India, C 4). It is traversed from east to west by the Nerbudda River and also by the Vindhya Mountains, their loftiest point within its limits being 2500 feet above the sea. Area, 9469 square miles. It has large forests of valuable timber, in which are found many wild animals. Wheat, rice, tobacco, sugar cane, cotton, poppy, and maize are cultivated. Some cattle are raised, and opium is one of the chief manufactures. The state owns and rents out all the land. The Bhils, one of the wildest and most savage of the aboriginal tribes of India, inhabit Indore. Besides the capital of the same name (q.v.), the principal towns are Rampura, Mehadpur, Bhampur, and Mhow. Pop., 1901, 850,690; 1911, 1,004,569. The Mahratta ruler bears the name of Holkar (q.v.).

INDORE. The capital of the native Mahratta state of the same name, India, situated at the junction of the Saraswati and Khan rivers, 440 miles east of Bombay (Map: India, C 4). It is 1738 feet above sea level. Indore was founded in 1767 and contains the palace of the Holkar, the Daly College for sons of Central India chiefs, government offices, barracks, and a mint. It has a modern drainage system, a good water supply, and maintains a public lighting plant, market, reading room, and dispensary. It has manufactures of cotton and a considerable trade in grain, tobacco, opium, cloth, and metal vessels. A suburban district (pop., 1911, 9195), assigned by treaty, contains a British residency, the seat of an agent and his staff, and the government opium depot of Central India. Pop., 1901, 86,686; 1911, 44,947.

INDORSED, or **ENDORSED.** See HERALDRY.

INDORSEMENT (from ML. *indorsare*, to indorse, from Lat. *in*, in + *dorsum*, back). In

its broadest sense, any writing on the back of an instrument. As a technical term of the law, it denotes the writing of the holder's name upon a bill of exchange, check, promissory note, or other negotiable instrument, on transferring it to another. While this writing is ordinarily on the back of such an instrument (whence its name), it is equally effective if made on its face or on a paper annexed to the instrument. In order to convert the writing into a contract, it must be delivered with the intention of giving effect thereto, or it must find its way into the hands of a bona-fide holder. The contract obligation of an indorser is to pay the indorsed instrument, provided payment is duly demanded, and payment is refused, and due notice of the dishonor is given to him. If the payee or holder simply signs his name, the indorsement is said to be in blank, and the subsequent holder may fill out the indorsement to any one as indorsee or transferee. A special indorsement is one which specifies the person to whom or to whose order the instrument is to be payable, e.g., "Pay C. D. or order. (Signed) A. B." When personal liability as indorser is to be avoided, the words "without recourse" are added. Such an indorsement does not prevent the further negotiation of the instrument or cast any suspicion upon its validity. A similar restriction is made in England in the case of checks by "crossing" them. An indorsement which restricts further negotiation is called a restrictive indorsement, e.g., "Pay Corn Exchange Bank only." It is provided by modern legislation that when an indorsement is conditional a party required to pay the instrument may disregard the condition and make payment to the indorsee or his transferee, whether the condition has been fulfilled or not. This changes the old rule, under which an acceptor or maker paid a bill or note with such an indorsement at his peril if the condition was not fulfilled. That was thought to be unduly hard upon the party required to pay. See BILL OF EXCHANGE; CHECK; NEGOTIABLE INSTRUMENT.

INDRA. The great national god of Vedic India. Although Indra lost his supremacy through the rise of Brahma, Siva, and Vishnu, he is still preserved as a figure in the Hindu pantheon. As represented in the *Veda* (q.v.), he is primarily the god of the lightning and thunder, with the attendant phenomena of the storm, wind, and rain; by vanquishing the demons of drought and darkness he restores the sun to the sky, the light of dawn, and the day. The realm of his activity is the atmosphere; and the many hymns of the *Rig-Veda* that are devoted to his praise—far outnumbering those to any other god—are rich in meteorological imagery and poetic allusions to natural phenomena. Armed with the thunderbolt (*vajra*), his special weapon, and inspired by copious drafts of intoxicating *soma*, his favorite beverage, he goes forth to do battle with the demons, especially Vritra, who, wrapped like a choking serpent about the clouds, has shut up the waters as prisoners. One of the hymns that describe this battle and the god's triumph over the dragon (*Rig-Veda*, l. 32) is an epic in miniature. As the god of battles, Indra is looked upon in the historical hymns of the *Veda* as the royal patron of the victorious Aryans in their conflicts with the aboriginal inhabitants of India. His supremacy during the whole Vedic period is unquestioned; the more ethical and

transcendental Varuna is no rival to his prowess.

In the later mythology a change takes place; Indra gradually sinks to a secondary rank among the gods. His installation as god of the lesser divinities is described in the *Aitarēya-Brahmana*; and from that time onward he becomes rather a figurehead in the pantheon, and the type of a mortal king, than the former supreme lord of heaven. The Epic and Puranic periods distinctly show that he has ceased to enjoy the worship accorded him in Vedic times. He remains ruler of the atmosphere, it is true, and one of the eight world guardians, regent of the eastern quarter of the sky, wielding his thunderbolt and sending down rain, but his real power is gone. Instead of descriptions of him as the great god of battles, praises are lavished on the delights of his paradise or heavens, *Svarga*, with its heavenly musicians and enchanting nymphs, the *Gandharvas* and *Apsarasas*, and all the joys of this happy abode of the gods, faithful worshipers, and heroes slain in battle. Like the later writings, the epics bring to view the sensual side of Indra's character in his amours with Ahalya, the wife of a sage—a bit of scandal as old as the Brahmanas. In consequence of the curses of the outraged seer, the god was doomed to lose his virile power; the conqueror Indra ceases to be invincible; even a son of the demon Ravana vanquishes him, as told in the *Rāmāyana*, and wins the title *Indra-jit* (victor over Indra) for his prowess. The *Purānas* likewise describe him as worsted by the rising god Krishna, an incarnation of Vishnu, and they name various successors of Indra as rulers in the different *manvantaras*, or ages of the world.

Among the Hindus at present Indra is little worshiped. In Bengal a single day of the year is consecrated to his service, and, on occasions of drought, he is prayed to in other parts of the country. In Nepal, too, his annual festival (*Indra-jātra*) is the occasion for processions and dances. Nevertheless Indra the mighty is no more. His golden chariot in the *Veda* is now replaced by an elephant on which he is generally represented as riding, and the thunderbolt is grasped in his hand. The face and body are sometimes portrayed as covered with figures resembling eyes, into which they are said to have been mercifully transformed from the thousand vile marks that came out upon his person in consequence of the curse brought upon him for his incontinency with Ahalya. (See HINDUISM.) For a full description of Indra during the Vedic period, consult: Perry, "Indra in the *Rig-Veda*," in the *Journal of the American Oriental Society*, vol. xi (New Haven, 1880); Macdonell, *Vedic Mythology* (Strassburg, 1897); Bloomfield, "The God Indra and the Sārna-Veda," in *Wiener Zeitschrift für die Kunde des Morgenlandes*, vol. xvii (Vienna, 1903); id., *Religion of the Veda* (New York, 1908). For the later Indra, consult: Dowson, *Hindu Mythology* (London, 1879); Hopkins, *Religions of India* (Boston, 1895); Wilson, *Hindu Mythology* (new ed., London, 1900). See Plate of Hindu Deities in article INDIA.

INDRANI, in-drä'nē (Skt. *Indrānī*, Indra's wife). A name of the wife of the Hindu god Indra (q.v.) in the *Veda*. She is called Saci or Andri in the later legends.

INDRE, ān'dr'. A river of France, rising on the northern border of the Department of Creuse (Map: France, N., G 6). It flows northwest through the departments of Indre and

Indre-et-Loire, past the towns of La Châtre, Châteauroux, and Loches, and joins the Loire 17 miles below Tours, after a course of 136 miles, for the last 40 of which it is navigable for small craft.

INDRE. A central department of France, the western portion of the old provinces of Berry, Orléanais, Marche, and Touraine, lying immediately south of the Department of Loire-et-Cher. Area, 2664 square miles, of which about four-fifths are in tillage and pasture (Map: France, N., G 6). Pop., 1901, 290,216; 1911, 287,673. The chief rivers are the Indre, the Vienne, the Creuse, and its tributary, the Anglin. The surface falls naturally into three parts, Boischaut, Champagne, and Brenne. The first two are level and fertile; the last was formerly marshland, but has been largely reclaimed. There are large crops of wheat and barley, but the principal resources of the department are its vineyards and its flocks. The principal manufactures are woolen and linen cloths, hosiery, scythes, paper, and porcelain. Iron mines are worked. Capital, Châteauroux.

INDRE-ET-LOIRE, å lwär. An inland department of France, part of the ancient provinces of Touraine, Orléanais, Pitou, and Anjou, lying northwest of the Department of Indre (Map: France, N., F 5). Area, 2377 square miles, of which more than one-half is arable. Pop., 1901, 337,916; 1911, 341,205. The department is watered by the Loire, the chief river, and by its tributaries, the Cher, the Indre, and the Vienne, all of them navigable. In the south, or Brenne district, the surface is hilly, but in the other parts it is undulating and fertile. Cereals are grown, but wine is the most important product. The chief manufactures are bar iron, woolen cloth, silk, rope, paper, and leather. Capital, Tours.

INDRI, in'dri. A large, monkey-like lemur (*Indris indris*), of Madagascar, which is regarded as the most highly organized of the tribe and differs from other lemurs in several important particulars, such as having only 30 teeth, the large size of the hind limbs as compared with the fore limbs, the webbing of the toes, and the fact that only one offspring is produced annually. The coat is variable black and white curiously contrasted, and the ears look like hairy tufts. Unlike most lemurs, the indris are wholly diurnal, going about in the forests of the east coast, to which they are confined, in small parties, and subsisting mainly on fruit. Their voices are loud, and when angry or hurt the animals utter piercing shrieks or mournful cries. These howlings and other characteristics have led to many native superstitions in regard to the indri, which alone constitutes a subfamily of the Lemuridæ. See Plate of LEMURS.

INDUCED ELECTRIC CURRENTS. See ELECTRICITY; INDUCTION.

INDUCED MANIA. See IMITATIVE INSANITY.

INDUC'TANCE. See INDUCTION, 2.

INDUC'TION (Lat. *inductio*, inference, from *inducere*, to lead in, from *in*, in + *ducere*, to lead). The logical process of arriving at general principles from particular facts. In order to understand any fact or event, we need not only to be able to know its sensible qualities or constituents, but also to know in what relation it stands to other facts or events. Such relation is a general character, or, as it is called in logic, a universal relation. If,

using some already discovered relation between some objects as a point of departure, we assume such a relation to exist between other similar objects, we are said to generalize or to make an induction. Induction may thus be defined as the universalizing of perceived relations or connections between objects. Among these relations one of the most important is that of antecedence and consequence. (See CAUSALITY.) This universalization is corrected or confirmed by further observation of these connections in other individual cases until at last often a valid judgment asserting unconditional connection is reached. Such a judgment is said to be valid when no known fact is at variance with it, but such a validity is theoretically always provisional; practically it has complete assurance. A valid induction is one which, starting from particular observations, thus reaches a valid universal judgment. Scientific inductions do not differ in principle from the naïve inductions we have already described; the difference is one of method employed, not of kind.

Looking now at inductions ascertained to be valid, we discover three stages in the process of arriving at certified results. The first stage is called *preliminary observation*. At this point actual coexistences and sequences or other relations are observed and form the data for the induction. The second stage consists in the generalization of some actually ascertained coexistence or sequence, or other relations. This is *induction* proper. The third stage is *verification*, the correcting or confirming of the validity of the generalization by further observation. Frequently the term "induction" is used to include all these three steps; in this case the second step is called generalization. Let us now take up these three steps in order.

I. Preliminary observation may be quite casual and accidental, or it may be intentional. A person may happen to see some connection between phenomena, or he may be intently looking for connections. In the latter case the observer may simply look at things as they offer themselves to his notice, or he may set about to interfere with the spontaneous course of events in order that he may the better observe the connection. The latter sort of observation is called an experiment. When experiment is possible, it is usually of great assistance in collecting data for generalization. Indeed, almost all the great advances in modern science have been due to experimentation rather than to mere observation. In intentional observation, whether it be simple or experimental, it is extremely important for the observer to know what he is to look for. Not every detail in the complex of details under observation is pertinent to the matter in hand; and yet no a priori rules can be given to direct an investigator. Much depends on experience and skill not subject to rules. But by analyzing successfully conducted inductions resulting in valid inductions, logicians are able to formulate several important rules of procedure, which thus are a posteriori. For our present purposes we can do no better than quote John Stuart Mill's canons of induction. These state the conditions under which generalization may be made. Hence the observer should be on the watch for the occurrence of these conditions.

The canons are as follows: First Canon, for the Method of Agreement: *If two or more*

instances of the phenomenon under investigation have only one circumstance in common, the circumstance in which alone all the instances agree, is the cause (or effect) of the given phenomenon. Second Canon, for the Method of Difference: *If an instance in which the phenomenon under investigation occurs, and an instance in which it does not occur, have every circumstance in common save one, that one occurring only in the former, the circumstance in which alone the two instances differ, is the effect, or the cause, or an indispensable part of the cause, of the phenomenon.* Third Canon, for the Joint Method of Agreement and Difference: *If two or more instances in which the phenomenon occurs have only one circumstance in common, while two or more instances in which it does not occur have nothing in common save the absence of that circumstance, the circumstance in which alone the two sets of instances differ, is the effect, or the cause, or an indispensable part of the cause, of the phenomenon.* Fourth Canon, for the Method of Residues: *Subduct from any phenomenon such part as is known by previous inductions to be the effect of certain antecedents, and the residue of the phenomenon is the effect of the remaining antecedents.* Fifth Canon, for the Method of Concomitant Variations: *Whatever phenomenon varies in any manner wherever another phenomenon varies in some particular manner, is either a cause or an effect of that phenomenon, or is connected with it through some fact of causation.* In all these cases what Mill calls a "circumstance" is assumed to be the cause if it precedes, and an effect if it succeeds, the "phenomenon." These are statements of the conditions under which scientific men make inductive inferences. Hence in our observations for the purposes of induction we should keep the following questions in mind: Is it the case that any instance in which the phenomenon under investigation occurs, and any instance in which it does not occur, have every circumstance in common save one? Is it the case that two or more instances of the phenomenon under investigation have only one circumstance in common? Is it true that two or more instances in which the phenomenon under investigation occurs have only one circumstance in common, while two or more instances in which it does not occur have nothing in common save the absence of that circumstance? Is a part of this phenomenon under investigation known to be the effect of certain causes? Does the phenomenon under investigation vary in any manner whatever whenever some particular circumstance varies in some particular manner? In case any of these questions can be answered in the affirmative, an induction may be made. It must not, however, be supposed that an investigator sets about his work with only such general clues as are furnished by these questions. In any particular investigation a knowledge of exactly what has already been done by previous workers is indispensable. If he has this knowledge, the investigator is in a position to ask much more definite concrete questions than the five we have just mentioned. But, however much more definite his problem may be, it may always be reduced to general expression, and when so reduced it will assume the form of one of the five questions stated above, which give the headings for the treatment of the methodology of observation. Any more specific methodology can be worked out only on the basis of the practical

experience of the expert in any particular line of research.

II. It has already been said that when any one of the five questions given in the last paragraph can be answered in the affirmative, we universalize the actually observed relation between phenomenon and circumstance. But now it will probably be asked what warrant there is for this universalization. The answer is somewhat as follows: To universalize is a natural, an instinctive tendency of thought. The child jumps at conclusions in very much the same way as the kitten jumps at a moving string. What the child does, the ordinary adult also does, and unless corrected by experience the probability is that every one would generalize every observed relation. But experience does check the tendency in a measure. The child who generalizes the observed connection between shape and reboundingness, or color and reboundingness, comes by later experience to find that his generalization is invalid. The truth of the universal judgment implied in his expectation is not borne out by later developments. But he is nowise daunted. He proceeds to generalize some other observed connection until at last he gets a general law which is uncontradicted by experience, and which he therefore accepts as true. The first generalizations are naïve, instinctive attempts to find uniformity in the world of experience. The attempt in any particular direction may be baffled, but only to be followed by an attempt in another direction. In other words, some attempts fail and others succeed. To succeed is to find that subsequent experience conforms and continues to conform to the expectation aroused by previous experiences. To fail is to find that subsequent experience disappoints this expectation, while in either case the expectation is, from the point of view of logic, an unreflective generalization. In later life consciousness becomes reflective; it looks back upon its own processes and finds that in cases of successful generalization certain conditions are present, while in cases of failure these conditions are absent. The same instinctive generalizing tendency which led to the generalization of the earliest connections discovered, now leads to the generalization of the connections between successful generalization itself and *the conditions under which the success is achieved.* These latter generalized connections are logical laws of thought. We now are in a position to see that there are two kinds of laws of thought, logical laws and psychological laws. The psychological laws are those which express the modes of thought behavior, whether the results of the behavior be ultimately satisfactory or not. The logical laws express the conditions under which the results of thought behavior are ultimately satisfactory to the thinker. Thus, it is a psychological law that an immature thinking consciousness generalizes instinctively, i.e., without any foresight of the results to be gained; it is a logical law that if the generalization is to be valid it must be made only under certain conditions, such as those stated in the five canons mentioned above. This logical law is itself validated by the fact that it is a generalization made in conformity with the law of which it is itself the expression. In other words, it is self-consistent and also consistent with all the known facts. A more stringent test of the validity of any law seems to be impossible. If now it is further asked whether we know that

the thought which conforms to the laws of thought thus discovered will continue to be successful in the future as it has been in the past, we can answer by saying that we have only one plausible reason to suppose it should not be successful, while every other reason that we know would lead us to believe that it will be successful. That one exception is the fact that in past experience, when we thought that we had discovered laws, we often found that we were in error. Hence it may be reasoned that it is possible that we may be in error now as to the logical laws of thought. But this argument has not the force that at first sight we might be tempted to ascribe to it. If we know that in the past we thought wrongly in many instances in which we thought that we were right, and if we now generalize this knowledge and say that therefore on the same principle we may now be in error and may always be in error, we are making an uncriticized induction; and such inductions our past experience has proved to us to be very precarious. If now our generalization as to the valid laws of thought is made in conformity with conditions lack of conformity to which made other inductions invalid, then the invalidity of those other inductions is no reason for attributing invalidity to these laws of thought. Past errors in induction should indeed make us very circumspect. We should use our utmost endeavors to avoid the causes which misled us; but having avoided the causes, we need not be timid as to the validity of an induction which in the past has never been impeached by experience, but, on the contrary, has been verified time and time again. A persistent objector may still argue that the fact of our having made errors in the past is still a good reason for doubting the validity of all inductions, and therefore for doubting the validity of the laws of thought which we have discovered by induction. A man who argues thus exposes himself to a valid form of the *argumentum ad hominem*. (See ARGUMENT.) He obliges us to remark that he assumes for the purposes of his argument the validity of the law he is assailing. He is assuming the right to generalize from experiences of error in the past. What he thus does he may not consistently decline to let others do. And further, he is generalizing from experiences of error and ignoring the experiences of success in valid induction, while his opponent discriminates between the two cases and bases his faith on the discrimination. In other words, the skeptic is credulous with regard to the possibility of error and incredulous only with regard to the possibility of truth. What is an appeal to the fact of past error in proof of the fallibility of all laws of thought? It is nothing but an *induction* from past experience. The correctness of the conclusion of this induction would carry with it the invalidity of all argument by induction, and therefore the invalidity of this argument which seeks to prove by induction the correctness of the conclusion. Here as elsewhere (see KNOWLEDGE, THEORY OF) we see that one cannot reason against the laws of reason without putting one's self out of court. In the last resort, however, all belief in general laws is an assumption.

III. Verification of an induction consists in testing it in new instances. Any newly made induction is presumably based on a limited experience, and it needs to be examined in its bearings upon other parts of experience. The

question in the mind of a person verifying an induction is this: Does the universalized relation prove its universal character in all our experience so far as this experience is pertinent to the relation at issue? This question can be answered only by looking at our past experience and by getting further pertinent experience. No verification of a true universal can be exhaustively completed; but, as we saw under II above, it may be practically conclusive. There may be no reason left for doubting a proposition except the bare possibility that it may not be true in cases as yet beyond our ken, but a bare possibility is always an unreasonable possibility.

The relation of induction to deduction is treated under DEDUCTION. The question whether any general proposition can be arrived at without induction has often been affirmatively answered. (See A PRIORI.) But the tendency at present is to regard all general knowledge as the result of induction. Recent logic tends to be empirical. (See KNOWLEDGE, THEORY OF.) For instance, the geometrical axiom that things equal to the same thing are equal to each other is by empiricism regarded as derived from experience by induction. It is first seen in individual instances that individual things equal to the same individual thing are equal to each other. This relation is then universalized. So with the arithmetical judgment: "Two and two are four." Hegel and J. S. Mill are the great logical protagonists of this view. Mill's statement of the view is more familiar than Hegel's, but it is defective in that it is based on an atomistic view of experience (see ATOMISM), a view which makes against the validity of induction by reducing all induction to mere simple enumeration (*inductio per enumerationem simplicem*), or a bare telling off of isolated findings, and a summation of the results of these findings into a collective statement.

Consult the authorities referred to under LOGIC; especially to be named here are the logics of Hegel, J. S. Mill, Bain, Minto, Jevons, Ueberweg, Lotze, Wundt, Sigwart, Bradley, Bosanquet, Hibben, Bode, and Creighton; also Hobhouse's *Theory of Knowledge* (London, 1896); A. Schuyler, *Critical History of Philosophical Theories* (New York, 1913).

INDUCTION. If an electrified body is brought near an uncharged one—either conductor or nonconductor—the latter will exhibit electrical forces; it is said to be charged by induction. In general, if a charged body is surrounded by a uniform medium, such as air, and if a body of any other material than that of the medium is introduced, thus making the surrounding medium heterogeneous, there will be induced charges on the body introduced. The question as to the character of the charges on this body and their distribution depends upon the relative electrical inductivity of the body and the surrounding medium. (See ELECTRICITY.) Similarly, if there is a magnet surrounded by a uniform medium, such as air, and if a body of a different kind of material from the medium is brought near the magnet, it will exhibit magnetic forces and is said to be magnetized by induction. The character and distribution of this induced magnetization depend upon the relative magnetic inductivity of the medium and the foreign body. (See MAGNETISM.) If the body which is introduced is iron or any magnetic body, and if the medium is air, the induced magnetization is such as to produce attraction by the magnet; if bis-

mith is introduced, there will be repulsion. Electromagnetic induction is the phenomenon observed when the magnetic field of force included by a conducting circuit is altered in any way, viz., electric currents are produced in this circuit. These induced currents are due to the *changing* of the field of magnetic force and are in such a direction as to tend to neutralize the change; they last only so long as the field is changing. See ELECTRICITY.

Tubes of Electric Induction are tubes which can be imagined drawn in the medium surrounding electrified bodies by choosing any small closed curve in this medium and drawing lines of force through each point of it. A hollow tube is thus made which has one open end on a positively charged body and the other on one negatively charged. If this tube is made of such a cross section that it includes unit electrostatic charges as its two ends, it forms a Faraday tube.

Tubes of Magnetic Induction are tubes formed in the same manner in the field around magnets by drawing lines of magnetic force through the points of any small closed curve. Faraday conceived the idea of these tubes being continuous through magnets and all bodies, not ending on any surface; they form, therefore, closed circuits, like a rubber tube with the two open ends brought together. The tubes are conceived to be of such cross sections that the number leaving a north pole of unit strength is 4π , where $\pi = 3.1416$. See MAGNETISM.

Owing to an electric current in a closed circuit, there is a magnetic field of force inclosing it; the tubes of magnetic induction form closed curves around the conductor. The *coefficient of self-induction*, or the *inductance*, is the number of these tubes threading through the circuit when there is a unit current in the conductor. Some of these tubes of magnetic induction may also in their paths pass through a neighboring closed conducting circuit, and the number of those tubes which do so when there is a unit current in the first circuit is called the *coefficient of mutual induction* of the two circuits. It may be shown that if there is a unit current in the second circuit, thus producing tubes of magnetic induction of its own, the number of these which thread the first circuit is the same as in the last case. The coefficient of self-induction depends upon the shape of the circuit, the number of turns of the conducting wire, and on the surrounding medium; and the coefficient of mutual induction depends upon these properties for each circuit and upon their relative positions. If L is the coefficient of self-induction for a single turn of wire, and if there are n turns in the coil, the coefficient is n^2L . Similarly, if in one coil there are n_1 turns and in the other n_2 turns, the coefficient of mutual induction is proportional to the product n_1n_2 . If the two coils are so placed that the currents in them are "parallel," the coefficient of mutual induction is positive; if the currents are in opposite directions, the coefficient is negative. It can be shown that inductance plays the same part in the phenomena of electric currents that inertia or mass does in the motion of matter. The practical unit of induction is the henry (q.v.).

INDUCTION BALANCE. An instrument to determine the presence or character of a piece of metal, which may be either concealed, as a bullet in a human body, or in the form of a

counterfeit coin or alloy. It was originally devised by Dove in 1841, but was improved and constructed in a serviceable form by Hughes in 1879. It consists of two sets of induction coils in which the primaries are connected in a circuit that includes a battery and a microphonic or other circuit breaker, while the secondaries are in connection with a telephone used by the observer. The current traverses the primary coils in opposite directions, and the secondary coils are so arranged that the sound of the microphone or circuit breaker is not heard, owing to the inductive effect being neutralized completely. If a coin or other metallic substance is introduced into the vicinity of one of the pairs of coils, this equilibrium will be disturbed, as part of the induction acts upon the metal and gives rise to induced currents. This of course produces an audible sound in the telephone. The instrument has been used to measure hearing, and it then is known as an audiometer, the perception of sound being tested by altering the positions of the coils. An arrangement of the induction balance was devised by Prof. Alexander Graham Bell to locate a bullet in the human body, and apparatus based on the foregoing principle was employed and numerous different forms made and tested. It was used in an attempt to discover the bullet by which President Garfield was killed, but the presence of the metallic mattress interfered with the operation of the instrument. Instances, however, of its successful use are on record. This method, employing modern apparatus, was suggested for use in European hospitals during the Great War of 1914, and its possibilities were thoroughly discussed. Consult Bell, "Induction Balance," in *American Journal of Science* (New Haven, 1883), and Hopkins, *Experimental Science* (New York, 1890).

INDUCTION COIL. A form of electrical apparatus used for transforming an interrupted current of low potential or pressure into one of high potential and alternating in direction. The fundamental fact of electromagnetic induction was first stated by Michael Faraday in a paper presented to the Royal Society on Nov. 24, 1831, in which he derived the conclusion that any change in a magnetic field will induce an elec-

FIG. 1. DIAGRAM OF INDUCTION COIL.

tric current in a conductor situated in it. This basic principle of electromagnetic induction underlies the construction and operation of the induction coil. As regards its construction, it consists of four essential parts: a bundle of soft iron wire, AA (Fig. 1), called the core; the primary coil, $BBBB$, of insulated copper wire wound on the iron core, which is usually made of comparatively large wire and short in length; a much larger secondary coil, CC , of longer, finer copper wire; and a device, D (Wagner's

hammer, 1839), called the rheotome or interrupter, which alternately makes and breaks the connection of an electric current through the primary coil. In dimensions they vary from a few inches in length and a fraction of a pound in weight to those of large dimensions used for wireless telegraphy.

The operation of the apparatus is as follows: The small spring *S*, being in contact with the point *P*, allows the current from the battery *E* to flow through the primary coil, converting it and its core into a powerful electromagnet. The production of this powerful magnetic field in and around the secondary coil induces in it a momentary current of high potential and opposite in direction to the primary. This secondary current is usually able to pass as a spark between the terminals of the secondary *TT*. When the core *AA* becomes magnetic, it attracts the piece of soft iron *I* on the spring *S* and draws it up, thereby breaking the connection between the spring *S* and the point *P* and interrupting the flow of current in the primary. Thereupon the electromagnet *AB* loses its magnetism, and, ceasing to attract the iron *I*, the spring returns to

described, some operating independently but still electromagnetically, others driven by an independent motor and purely mechanical, and still others of an entirely different type known as electrolytic interrupters.

Figure 2 illustrates an early form of mercury interrupter due to Foucault. One circuit runs from the binding post *k'* through the magnet *D*,

FIG. 3. EARLY RITCHIE INDUCTION COIL.

FIG. 2. FOUCAULT INTERRUPTER.

its original position, restoring the contact between *S* and *P* and again starting the current in the primary. The disappearance of the magnetic field on breaking the primary circuit induces a momentary current of high potential in the secondary coil in the same direction as the primary current, and hence in the opposite direction to the current induced in the secondary upon starting the current in the primary. The above cycle of operations repeats itself periodically, at a rate depending upon the spring *S*. Many modifications of the interrupter are used—some attached directly to the coil, as above

pulling down the armature *a* supported by the spring *c*, and lifting the wire *B* out of the mercury cup *B'*, interrupting the current, whereupon *a* springs up and *B* enters the mercury, again starting the current. This device may be introduced into the primary circuit of an induction coil, or the latter may be connected to the posts *F*, *H*, *K*, so as to use the wire *A* and cup *A'* for interrupting the current for the induction coil, while *B'* operates to keep the apparatus in motion.

A commutator consisting of a hard rubber cylinder with metal contact pieces is shown at *I*, with binding posts at *n* and *m*. Figure 3 shows another form of interrupter attached to an early form of induction coil. Figure 4 shows a modern coil, with independent mechanical interrupter, capable of giving a 46-inch spark. In this an electric motor revolves a disk built up of conducting and

insulated segments upon whose periphery a brush bears and makes and breaks the circuit.

The mercury-jet interrupter is another type where a cylindrical block of steel, mounted on a vertical shaft and with its lower end immersed in mercury, has a vertical hole drilled part way through it and a lateral hole connecting with the vertical. On revolving the block rapidly, the mercury is drawn up through the vertical hole and then out of the lateral opening in the form of a jet, which impinges on a copper plate placed so as to be part of a circuit, which is closed on the passage of the jet from the block

to it. Accordingly the circuit is completed when the jet impinges on its target, and the number of interruptions may be controlled by the speed of the motor rotating the steel block. To prevent oxidation of the mercury, the revolution may take place in oil, alcohol, or coal gas. A modification of this device in a coal-gas atmosphere does away with the independent electric motor by providing an armature, acted upon by a coil, which serves to rotate the block and keep the pump in operation. There are various modifications of this and other types of mercury interrupters.

Quite distinct from the types of interrupters just described are the electrolytic interrupters, of which that invented by Dr. Wehnelt in 1899 is most frequently used. This consists of two fixed electrodes immersed in a bath of dilute sulphuric acid, containing about 20 per cent of

is a primary winding of a few turns, having a spark gap and shunted by a condenser. The alternating current of from 5000 to 10,000 volts sent through the primary charges the condenser until the voltage across the air gap breaks it down and the condenser is discharged. Accordingly an oscillating current is produced in the primary winding, which with the secondary is wound on an air core, and this induces a high-frequency electromotive force in the secondary which is sufficient to break down a long spark gap. When used with an alternating current the induction coil becomes practically a transformer, and the action is essentially the same as in apparatus of this class. See TRANSFORMER.

The quantity of electricity moved at the break is equal to that moved at the make in the primary circuit; but, owing to the fact that the magnetism in the core vanishes much more

rapidly at the break than it builds up at the make, the effect at the break is more compressed, and the potential, or electrical pressure, much greater than at the make. The suddenness of the break is of the greatest importance, and most of the improvements in interrupters have been designed to make the break as sharp as possible. The important factors which affect the potential or length of spark produced by an induction coil are the relative number of turns of wire in the primary and in the secondary, the suddenness of the break, and the voltage or potential of the current used in the primary coil.

Pohl in 1835 made a very crude induction apparatus of a different style; but the first to make large coils of the above type were Stöhrer and Ruhmkorff, and from the latter, who in 1851 produced a famous coil giving a spark in air 2 inches in length, is derived

the name Ruhmkorff coil, which is frequently used as a synonym of induction coil. In 1855 Poggendorff increased the suddenness of the break by so arranging the device that the interruption occurred under an insulating liquid or in vacuo. (The cups B' , A' in Fig. 2 have alcohol over the mercury.) In 1857 Ritchie, of Boston, devised a means of winding the secondary coil in sections, like circular disks, which, laid together and connected, formed the cylindrical coil. This obviated to a great extent the danger of a spark jumping across from one turn of the secondary to another through the insulation. Ruhmkorff was so impressed with the superiority of a Ritchie coil exhibited in Paris that he adopted the Ritchie method of winding, and it prevails at present. Poggendorff proposed, and in 1853 Jean tried with good success, the use of a liquid as the insulation of the secondary, and at present most of the high-potential coils use liquid insulation. The advantage lies in the fact that, if a spark should jump over, the hole in the insulation would immediately close. Fizeau suggested a decided improvement in 1853, introducing a condenser

FIG. 4. A MODERN INDUCTION COIL.

acid. The anode is formed by a small platinum wire insulated by glass or porcelain, except at its extremity, while the cathode consists usually of a sheet of lead. Where the continuous electromotive force is applied to a circuit containing such an electrolytic cell and an inductive resistance, the resulting current is not continuous but is intermittent, several hundred interruptions occurring per second. For example, with 24 volts impressed upon a primary circuit, 450 interruptions per second will be secured when the electrolyte is circulated. No primary condenser is required in such a circuit, but there must be sufficient inductance. The resulting spark at the secondary is of a different character from that given by the hammer break. Modifications of this device have been introduced by Caldwell and Campbell Swinton. The electrolytic break has been used in connection with X-ray and electrotherapeutic apparatus, but has not been found as useful in radiotelegraphy.

In some cases an alternating current is used in the primary without an interrupter, as in the case of the Tesla coil, where an electromotive force of high frequency is required. Here there

at the break, as shown at *F* (Fig. 1). This enables the extra current of the primary to run into the condenser for an instant, while the points *S* and *P* are first separating, and by the time that *F* is charged *P* and *S* are too far apart for the current to jump across. This gives an oscillatory electromotive force in the secondary winding and increases its value.

In 1869 a coil was built for the London Polytechnic Institute the core of which was 5 feet long, 4 inches in diameter, and weighed 123 pounds. The primary had 6000 turns of wire 0.095 inch in diameter and 3770 yards long, weighing 145 pounds. The wire of the secondary was 0.015 inch in diameter and 150 miles long. This coil gave a spark 29 inches long, while the modern coil shown in Fig. 4 gives a spark 46 inches long.

The induction coil is especially used in the study of the electric discharge in rarefied gases, as in Geissler, Crookes, and X-ray tubes; also in electrotherapeutics, for automatic gas lighting, gas-engine ignition, X-rays, and wireless telegraphy. Although transformers have supplanted the induction coil in the best X-ray laboratories, it still holds an important place in wireless telegraphy, though here also it was by means of such a coil that Heinrich Hertz carried out his brilliant researches which led to the discovery of electric waves, thus confirming the great theoretical hypothesis of Maxwell and laying the foundation for wireless telegraphy.

The size, design, and construction of an induction coil depend upon the purpose for which it is to be used; i.e., the ignition coil of a gasoline engine is much smaller and simpler than a coil used for the production of electric waves in radiotelegraphy or X-rays (q.v.). When used for radiotelegraphy, a coil capable of a 10-inch spark in the air gap of its secondary circuit can be employed most advantageously and represents about the largest apparatus of this type that can be used for this purpose. Such a coil would have a primary circuit of thick wire, generally No. 12, wound in 300 or 400 turns on a core formed by a bundle of soft iron wires about 2 inches in diameter and about 18 inches in length. The primary is inclosed in an ebonite tube slightly in excess of 2 inches in diameter. The secondary winding is usually of No. 36 copper wire covered with silk and aggregating a length of 10 to 17 miles. The secondary is wound in a large number of coils or sections between paper or ebonite disks, the ends of the various coils being connected together. The whole secondary coil is immersed in melted paraffin to exclude air and provide adequate insulation and is usually finished by being inclosed in a case of thin ebonite, with ends and supports of the same material. Some form of interrupter is provided, and a condenser is placed across the gap. Various modified forms of induction coil have been designed to secure advantages of one kind or other.

As employed in wireless telegraphy, a 10-inch induction coil takes a mean primary current of about 10 amperes and requires from 16 to 20 volts supplied from a battery or storage cells—in other words, about 150 watts or 0.2 of a horse power are required, which will afford sufficient energy for radiotelegraphy up to a distance of 100 miles. Beyond this point, however, more power is required, and some form of alternating current transformer must be used, as described under WIRELESS TELEGRAPHY.

All of the large manuals of experimental physics also devote considerable space to this class of apparatus, while new designs and improvements are described in the electrical and physical journals.

INDUCTION MOTOR. See DYNAMO-ELECTRIC MACHINERY.

INDUCT'OPHONE (from *induct* + Gk. *φωνή*, *phōnē*, voice). A form of apparatus consisting of coils of wire and a telephone receiver, designed to afford communication between moving trains and stations. The apparatus and system were devised by Willoughby Smith, of London, in 1882, but never have been practically applied. Signals were transmitted inductively from coils of wire placed along the line to other coils in the train and received by means of a telephone.

INDUL'GENCE (Lat. *indulgentia*, indulgence, from *indulgere*, to indulge). A term of Roman Catholic theology, signifying the authoritative remission of temporal penalties due to sin, the guilt of which has been forgiven. An indulgence is not a permission to sin nor a pardon for future sins. It does not remit guilt; only sacramental absolution avails for that; but it affects the punishment which would otherwise be inflicted in the regular exercise of ecclesiastical discipline. According to Bellarmine's statement, one who has been absolved from guilt in the sacrament may be released from penalty by an indulgence. It is an act, not of "order," but of "jurisdiction," based upon the power of the keys. (See KEYS, POWER OF.) So complete is this power held to be that the efficacy of an indulgence is believed, in a true sense, to satisfy divine justice, as well as to secure the remission of temporal penalties, whereby it is made to extend beyond this present life into the state of purgatory. The ground of this satisfaction is sought in the treasure of merit laid up by Christ and the saints, and always at the disposal of the Church whenever need requires. This *thesaurus meritorum* is fundamental to the fully developed theory of indulgences. The clergy are its duly appointed custodians; its beneficiaries are the adherents of the Church throughout the world who avail themselves of its virtues; the indulgence is its channel of communication.

The history of indulgences begins with Roman law, where the word *indulgentia* means the remission of a punishment or of a tax. From legal usage the word easily passed into ecclesiastical usage. A sovereign church, like a sovereign state, might exercise clemency, instead of exacting the full measure of punishment which the law required. But long-continued and some-

times bitter controversies indicate the doubts which many Christians felt as to the propriety of this contention, which finally led to the catastrophe of the sixteenth century, when Luther voiced the protest of a large section of Christendom against certain current abuses of the doctrine. The first important step towards establishing the dispensing power of the Church was taken in consequence of the Decian persecution, beginning 250 A.D., when the problem arose how to deal with the lapsed. These questions were answered by the beginnings of penitential discipline. It was held that the Church, which had the power to inflict discipline, had also the power to remit it in whole or in part. The main exercise of this power in the fourth and fifth centuries was in shortening the canonical periods of penance, evidence of which is found, e.g., in the teaching of Gregory of Nyssa.

By degrees a variety of substitutes for the canonical penalties were introduced. Fasting might be remitted in consideration of repeating a certain number of psalms, or of paying a fine (as by Theodore of Tarsus, Archbishop of Canterbury, in the seventh century). Almsgiving, pilgrimages, and holy wars came to be the most popular means of securing indulgences, especially in the period of the Crusades. (See CRUSADE.) The Council of Clermont (1095) asserted that the pilgrimage to the Holy Land took the place of all other penance. With the decline of the Crusades indulgences were offered for fighting against heretics, such as the Albigenses and Hussites (q.v.). The first great jubilee indulgence was published by Pope Boniface VIII in 1300. The fully developed scholastic theory upon which indulgences are based is found in Thomas Aquinas and Alexander of Hales. The importance there attached to the "treasure of merit" naturally led to a popular belief among the ignorant that pardon for sin and immunity from punishment were matters of ecclesiastical bookkeeping—that they could be bought and sold. It was in view of this popular impression, and the undoubted abuses which grew out of it, that Luther published his theses on indulgences in 1517, the event which marks the beginning of the Protestant Reformation. See LUTHER.

The Council of Trent, at its twenty-fifth session (1563), condemned those who assert that indulgences are useless, or deny that the Church has power to grant them; but in reaffirming its belief the Church decreed the abolition of all evil gains and other abuses which had grown up in connection with the indulgence system. Since that time the Church has attempted to guard against misinterpretations of the doctrine and to safeguard it from the criticisms to which it had previously been exposed.

From what has been said it will be evident that Roman Catholics do not understand by an indulgence a remission of sin itself nor a purchased benefit to an impenitent sinner. They hold that its benefits can be enjoyed only by a sinner who has repented and resolved to lead a new life, and they deny the charge that the indulgence system has introduced any laxity of principle into the Church.

The power to grant indulgences for the whole Church resides only in the Pope, but primates, archbishops, and bishops have power to grant them within their own jurisdictions. The indulgence may be either plenary or partial—the former remitting the whole of the temporal punishment, the latter something less than the

whole. For example, an indulgence of 40 days is understood to remit as much as would have required 40 days of penance without it. Indulgences may be attached to certain articles (e.g., a crucifix) or to certain places (as a shrine). In these cases the original possessor of the article or the pilgrim to the shrine receives the benefit of the indulgence. A custom of granting indulgences for the dead grew up in the Middle Ages. The right and efficacy of such grants have been much debated; but the Church holds them to be salutary, even though their precise scope cannot be defined. As limited by Sixtus IV (Constitution of 1477), they are "only by way of suffrage," i.e., the Church does not assume direct authority over the dead.

INDULGENCE, DECLARATION OF. See DECLARATION OF INDULGENCE.

IN'DULIN. See COAL-TAR COLORS.

INDULT' (Lat. *indultum*, indulgence, from *indulgere*, to indulge). A term derived from the Roman Imperial codes, and used in canon law to designate an exceptional concession or privilege granted by the Pope to one or more persons. The best-known examples apply to the privilege allowed in certain cases to kings and other rulers of nominating to bishoprics and ecclesiastical benefices; thus Francis I of France received this power when the Pragmatic Sanction was abolished in 1516. Indults were frequently granted in the Middle Ages allowing perpetual non-residence at the same time that the income was drawn; but this practice was abolished by the Council of Trent, except that canons who have a record of forty years' irreproachable service are dispensed by indult from further residence in the seat of their chapter. An indult differs from a dispensation in that the indult gives a permanent privilege, the dispensation applies to only a particular case.

INDUNO, ên'dōō-nō, GIROLAMO (1827–91). An Italian genre painter, born in Milan. He studied at the Milan Academy under Sabatelli and first exhibited at the Paris Salon in 1855. His pictures are mainly of military or humorous subjects. Among them are "Garibaldi's Soldiers," "A Vivandière," "Dancing Lesson in the Last Century," "A Souvenir of Rome," "The Musicians," "Entry of King of Italy into Venice," "Visit of Garibaldi to Victor Emmanuel at Rome." Girolamo and his brother Domenico were leaders about 1860 in the Naturalistic movement of the Lombard school.

IN'DURITE. See EXPLOSIVES.

IN'DUS (Lat., from Gk. *Ἰνδός*, from Skt. *śindhu*, river). The great river that bounds India on the west, separating it from Afghanistan and Baluchistan (Map: India, A 3). It is over 1800 miles long, and the drainage area of its basin is estimated at 372,000 square miles. It rises in the vicinity of the Manasarawai Lakes, 50 miles southeast of Gartok, an important trading centre in Tibet, its source being 15,000 feet above sea level, on the north side of Kailas, a Himalayan peak, 22,000 feet high. Its

general course, till it forces its way between the Himalaya proper and the Hindu Kush, is towards the northwest. It flows past Leh, the capital of Ladak; receives the waters of its important Trans-Himalayan tributary, the Shyok, from the north; and after a descent of 11,000 feet in a course of 500 miles, dividing the Mustagh from the Karakoram Mountains, through some of the grandest mountain scenery of the world, about 60 miles below Iskardo bends sharply southward, above the confluence of the Gilgit. It flows past Bunji, on the Kashmir-Kohistan border, and 20 miles below takes a western course to Kotgata, where again it turns southward, and at Darband emerges from the Kohistan Mountains into the plains of the Punjab. It becomes navigable for the native flat-bottom steamers at Attock (ancient Taxila), the scene of Alexander the Great's passage, 870 miles from its source. Here it receives the Kabul River (q.v.), its chief affluent on the right. Continuing past Dera Ismail Khan, Dera Ghazi Khan, and other minor towns, near Mithankot, about midway in its farther course of 940 miles to the Arabian Sea, it receives the waters of the Chenab, the Ghara, the Jhelum, the Ravi, the Beas, and the Sutlej, through the Panjnad (literally, 'five rivers,' which gives its name to the Punjab). Each of these rivers, as well as the Kabul, is practicable for inland craft to the mountains.

Below the confluence of the Panjnad the volume of the Indus, past Sakkar and Hyderabad, becomes gradually less. Through the arid, rainless, alluvial plain of Sind it divides into numerous channels, many of which do not return to the main stream, while others return much shrunken in volume. This wasting of the waters is not very apparent to the eye, owing to the gradual slackening of the current and the ascent of the tides. Miani, 8 miles north of Hyderabad and 75 miles from the sea, is the head of the delta which extends for 130 miles along the coast of the Arabian Sea. The chief outlets of the Indus are the Kori, Mal, and Yatho mouths. Until very recently the Puran carried the main waters to the Rann of Cutch, 70 miles east of the present mouth. The annual rise of the river, owing to the melting of the mountain snows, extends from May to August and is often attended by considerable inundations and changes of the deltaic channels, chiefly owing to the enormous amount of sand and clayey silt brought down by the current. Modern engineering has done much to obviate the inconveniences caused. The value of the Indus as a navigable route of traffic, never considerable, has been lessened since the building of railways through its valley from Karachi to Attock, and navigation is now confined to native craft. In a hot climate, where precipitation is almost nil, the river is more important as a means of irrigation, and the various works, especially the storage dam at Kasur, towards this end inaugurated by the British government have led to a remarkable agricultural development throughout Sind. The river is spanned by several modern bridges, of which the chief is the huge cantilever bridge of Sakkar, and the northernmost an iron suspension bridge above Bunji. Fish of excellent quality abound in its waters and form the staple article of commerce and food of the surrounding country. The gavial, or long-snouted alligator, is the amphibious reptile of the river. The Indus is the "King River" of Vedic poetry.

INDUSIUM, ĩn-dū'shĭ-ŭm or -zhĭ-ŭm (Lat., tunic). In ferns, a flaplike outgrowth which covers the sorus or group of spore cases (sporangia). Indusia are exceedingly varied in structure and furnish characters for classification. Occasionally the sporangia are developed along the leafy margin which inrolls to cover them, as in the maidenhair fern and the common bracken. In this case the inrolled leaf margin is spoken of as a "false indusium." See FERN.

INDUSTRIAL ACCIDENTS. See ACCIDENTS, INDUSTRIAL.

INDUSTRIAL ARBITRATION. See LABOR AND CAPITAL, RELATIONS OF.

INDUSTRIAL COMMISSION. A nonpartisan commission, created by Act of Congress, June 18, 1898, to investigate industrial conditions and to suggest Federal and State legislation for the better regulation and adjustment of conflicting industrial interests. The commission consisted of 19 members, of whom 5 were Senators, appointed by the President of the Senate, 5 Representatives, appointed by the Speaker of the House, and 9 especially qualified persons, appointed by the President with the consent of the Senate. The specific duties of the commission were, first, to investigate questions of immigration, labor, agriculture, manufacturing, and business, and, second, to suggest, on the basis of the facts ascertained, proper congressional legislation and also uniform State legislation, equitable at once to employer and employee, producer and consumer. The life of the commission was limited to two years, but this time was subsequently extended to Dec. 15, 1901, and to Feb. 15, 1902, successively. The work of the commission, owing to the inevitable preoccupation of its congressional members in their own and in public affairs, was largely carried on by the presidential appointees and by specially engaged experts. Of the latter may be mentioned: on strikes and arbitration, E. Dana Durand; on labor legislation, Frederic J. Stimson; on trusts and industrial combinations, Jeremiah W. Jenks; on transportation, William Z. Ripley; on agriculture, John F. Crowell; on immigration, John R. Commons; on taxation, Max West; on labor organizations, Charles E. Edgerton. The fact that no equally competent body of men, empowered to call for witnesses and documentary papers, had ever before examined American industrial methods and organizations, together with the fact that the period of prosperity succeeding 1897 brought industrial phenomena into accentuated relief and activity, resulted in the commission's bringing together a great body of new correlated and substantiated evidence concerning practically every phase of industrial life. Testimony was taken from nearly 700 witnesses, including heads of trusts, railroads, and mercantile establishments, public officials and leaders of trade-unions, and in addition the commission collected much valuable but hitherto scattered information from official, national, and State documents, from judicial decisions, and from the researches of experts. The *Report of the Industrial Commission*, completed Feb. 19, 1902, and issued as a government publication, consists of 19 volumes, as follows: Trusts and Industrial Combinations (2 vols.); Trust and Corporation Laws; Prison Labor, Transportation (2 vols.); Labor Legislation; Distribution of Farm Products; Capital and Labor in Manufactures and General Business (2

vols.); Chicago Labor Disputes; Agriculture and Agricultural Labor; Agriculture and Taxation; Capital and Labor in the Mining Industries; Immigration and Education; Foreign Labor Legislation; Labor Organizations; Labor Disputes and Arbitration; Railway Labor; Industrial Combinations in Europe; Final Report—Miscellaneous. See INDUSTRIAL RELATIONS COMMISSION.

INDUSTRIAL CRISIS. See CRISIS, ECONOMIC.

INDUSTRIAL EDUCATION. That type of education which seeks to prepare for the industrial occupations, and hence may in the broad sense be used to refer to the whole range of education from manual training in the elementary schools to professional technical education of university and college grade. The term is, however, coming to be used in the more restricted sense to apply to that type of specialized vocational education which is given to boys and girls between the ages of 14 and 18 preparing to engage in industries. The subject is treated fully under TECHNICAL EDUCATION, with which it is more closely related as one of the lower branches of specialized technical preparation. See also MANUAL TRAINING.

INDUSTRIAL EXHIBITIONS. See EXHIBITIONS, INDUSTRIAL.

INDUSTRIAL FRUITS. Such of the produce of the soil as is the result of cultivation during the year. The expression is of rare occurrence in English and American law (though it has been adopted into the law of Scotland), but it is not unusual in its Latin form. *Fructus industriales*, such as grain, vegetables, and the like, are distinguished from *fructus naturales* (natural fruits), such as the fruit of trees, growing timber and grass, which "grow from ancient roots" and are not the result of labor expended during the year. In legal effect the two classes of produce are sharply distinguished, industrial fruits being in many respects dealt with as personal property, or chattels, even before severance from the soil, while natural fruits under the same circumstances retain strictly the character of real property. Thus, industrial fruits may be attached or levied upon as the personal property of the occupier of the land, whether owner or tenant for life or years, while unsevered natural fruits remain a part of the freehold and are the property of the owner thereof, subject, of course, to the right of the tenant to gather them when ripe for his own use or for sale. For a special application of the distinction, see EMBLEMENTS.

INDUSTRIALISM. A term first applied by Saint-Simon and his followers to the "modern régime," but also to the peculiar systems of social organization which they advocated. In his *Data of Ethics* Spencer uses the term as descriptive of "a theoretically possible form of society purely industrial in its activities." Pure "industrialism" according to Spencer would be reached when men were scrupulously honest in the fulfillment of agreements, while yielding "to one another no advantages beyond those agreed upon."

The meaning to be attached to the term has not yet been definitely established. By some it is employed to characterize the modern industrial system in which manufacturing industries predominate; others employ it as a description of modern civilization as opposed to the "militarism" of preceding times. (See IMPERIALISM.)

The definition which has been most generally accepted agrees in the main with Spencer's conception. This is exemplified by the deprecations of the "industrialism" of modern life, found in literature and religious writings.

INDUSTRIAL MANAGEMENT. A term used to describe the highly organized systems of conducting industrial and, particularly, manufacturing operations that have been developed in recent years. The movement towards systematic management took its rise in the last two decades of the nineteenth century, having been created by the growing complexity and increasingly large scale of manufacturing operations under the influence of which the old traditional methods of management began to prove inadequate. As usually understood, the term includes the activities of organization, administration, finance, purchasing, storage, and transportation of materials, provision and upkeep of buildings and machinery, design and manufacture of product, management and direction of men, determination and control of costs, and marketing of product.

The trend towards the new methods received its first considerable impetus from the introduction of F. A. Halsey's "premium system" (see PREMIUM SYSTEM) of rewarding labor in 1891. This was widely discussed and adopted both in the United States and also in England, where a modification known as the Rowan premium was put into use. Next in order came the publication of Slater Lewis's classical work, *The Commercial Organization of Factories*, in 1896, which, while emphasizing the necessity for accurate cost determination, also brought prominently into notice the fact that a modern manufactory is an organization in which all the constituents need equally careful attention. The studies of A. Hamilton Church on the expense burden, made public in 1901, further developed the idea that manufacturing was not a simple affair of labor and its direction alone, but that a stage had been arrived at where activity had become factorial or functionalized, and that each factor or function had its own separate cost and therefore its own separate efficiency.

During most of this time Frederick W. Taylor had been engaged in his experiments on high-speed steels, which afterward developed into the discovery that no less than 12 variables were concerned in the apparently simple work of cutting metals by lathe tools. From this discovery to the adoption of the idea that every step in the actual operative use of tools and machinery deserved study *before* expending time and money on the work itself was a natural deduction. Beginning as a method of rate fixing in connection with a special type of piece rate devised by Dr. Taylor, the idea developed until what is now known as time study (q.v.) and its further extension, motion study (q.v.), were ultimately worked out. Although unquestionably developed anew by Taylor, it is worthy of mention that the idea of carefully analyzing the ultimate elements of machine work is one that was developed quite early in the last century and afterward seems to have been lost sight of, probably owing to the vast rate of increase of manufacturing industry, which made intense production of more importance than extremely economical production.

In 1903 Dr. Taylor presented a paper entitled "Shop Management" before the American Society of Mechanical Engineers, in which for the first time the various devices and improvements

in method which had been accumulating for many years were exhibited as part of one working whole. This was followed by the publication in 1910 of H. L. Gantt's *Work, Wages, and Profits*, in which papers made public at various times since 1904 were collected and completed. (See TASK; BONUS.) The work of Harrington Emerson on *Efficiency*, issued in 1909, and of Gilbreth on *Motion Study* also belong to the pioneer literature of the subject.

It is unnecessary to dwell further on the historical development of industrial management, especially as the apportionment of personal credit for this development would involve controversial questions. It will be more important to enumerate the leading features of modern systems of administration, with some attention to the way in which they differ from the older methods.

It is often supposed, though it is wholly erroneous, that there is some one system which is par excellence "scientific" management and is universally applicable to all sorts and conditions of manufacturing enterprise. On the contrary, the new elements which have been injected into the old traditional methods are not so much revolutionary as evolutionary. Nearly all of them have existed in more or less complete and recognizable form in the past, but they have been extended, improved, and given greater precision. The general direction in which they have been developed is that of setting up a more complete and exhaustive knowledge (1) of the aim in view, (2) of the materials and forces by which this aim is to be attained, and (3) of the detailed means by which the forces are to be applied to the materials to produce the effect aimed at. It should be remembered that some of these forces are merely physical, but, on the other hand, many of them arise from the efforts and the coöperation of living beings and hence involve much more subtle elements than any problem that deals with inanimate matter has to cope with.

Before anything can be made, the necessary equipment and organization for its manufacture must already exist. With equipment, as such, management has nothing to do. It may be good or bad, but in discussing problems of administration it must always be assumed that the equipment is the best that can be obtained under the existing circumstances, otherwise no datum line for discussion can be drawn. With the organization, on the other hand, management has everything to do, for the organization is the instrument by which the behests of the management are set in motion and produce results. We may therefore begin by considering some of the more important features of modern factory organization, and for this purpose machine-shop or engineering manufacture may be selected as typical.

In regard to the aim in view modern management makes a much more detailed study than was formerly customary. In both cases the aim in view (e.g., a machine or device to be manufactured in quantity) has to be designed, and reduced to a drawing, before manufacture can be attempted. Then material has to be purchased, stored until wanted, delivered at some machine, and worked on. The resulting work has to be passed on as satisfactory, and it has then to be worked on again, or passed to an "assembler," who will fit it to the other parts of the machine or device in due course. It can-

not be said that the old and new methods differ materially in sequence of these perfectly necessary steps, but under the newer practice the process marches from first to last with greater precision, and with the elimination of errors, delays, wastes, and irregularities that are plentiful where modern methods are not yet introduced.

The difference between the old and new methods begins at the very outset, viz., in the preparation of the design and even in regard to what is properly to be considered as part of a design. The newer practice gives a much greater extension to the idea of design than was formerly customary. The acts of design frequently include to-day, not merely specification of the physical shape and materials of each piece or component, but also detailed instructions as to how it is to be made, what operative machines are to be used in its manufacture, and what accessory tools are to be employed in dimensioning it. Nor is this all. Closely connected with the specification of the method of manufacture is the question of the amount of time that should be consumed at each successive stage by the machines and operatives to be employed in making it. Where this is doubtful, time study is undertaken for each successive element of the operations, so that the final specification in advance contains not only predetermination of size, shape, and material, but a close forecast of what steps must be taken to realize the design in practice.

It will be obvious that all the foregoing is a specification of intention. It is a plan of operations and nothing more. When it is completed, the work of the organic function of design reaches no farther. Moreover, this plan of operations is confined to the making of one piece and has no bearing on other pieces. Hence at this stage another organic function of manufacturing comes into play—the function of control, which is the great coördinative influence that gathers up the specifications of innumerable separate pieces and sets in motion the materials and forces by which all these separate specifications are to be carried out at the right time, in the right place, and on the right material. It will be readily understood that in the modern plant the function of control is not only very important but also complex.

The first step in control has reference to material. All plants keep a great deal of material in stock, and this may run to many thousands of different varieties. Elaborate accounting methods are necessary to insure that none of these items shall be permitted to fall below a minimum quantity, depending on the call for the particular item. But more than this is necessary. Material, when ordered, takes time to arrive. Consequently arrangements must be made to forecast as far as possible the demand on material, so that no waiting is involved. This is accomplished by means of the specifications above referred to. As soon as any one of these is issued, the material required for it is tabulated, and the quantity of each item assigned to the material ledger account corresponding. If this sets up a future demand greater than the visible supply in hand or on order, steps are taken to order more to arrive before the demand matures. By this means one of the most serious sources of delay and trouble, waiting for material, is reduced to a minimum.

The next important step in control has reference to instructions or orders. The design or

specification already referred to is merely a plan. It does not of itself set anything in motion. In fact it may die still-born. The setting in motion of the forces of production must obviously be made in a certain sequence, having regard to the date at which delivery of product is required and to the expected deliveries of material. This is accomplished by the issue of orders, which are definite instructions to perform certain kinds and quantities of work on certain kinds and quantities of material on or before certain definite dates. Considerable coördination is obviously involved. The instructions, the material, and a machine and operative qualified to do the work and free at the moment to do it must all meet together, so that the piece may be processed and passed on to the next stage in regular order of sequence and also on time.

The assignment of orders for this purpose is frequently called "planning." In some industries it involves a somewhat complex organization. The element of time being involved, provision must be made to ascertain the "loading" of machines and operatives, i.e., the extent to which their capacity for turning out work is already committed, and the earliest day or hour at which they will be free for new work thus ascertained. This scrutiny must be carried out for every piece or component that is to be manufactured, since, if any one were neglected, it may happen that the assembly of parts into the finished product will be held up far beyond the promised date of delivery by the absence of some essential but comparatively insignificant piece.

Careful organization of the function of control, then, serves to set things in motion in a regular sequence and according to a predetermined time schedule. It secures that the material shall be at hand when required, it directs its movements from process to process, it keeps account of the capacity of the various production centres of the plant as regards their capacity already pledged, just as it keeps account of its stock of various materials and how far they are already pledged, and by means of these activities it keeps the stream of production flowing at a steady rate with an absence of annoying delays and untimely discoveries of matters which have been overlooked or forgotten that can be secured in no other way.

Alongside the function of control and to a large extent interwoven with it lies the function of comparison. It is not enough to specify in advance, nor is it enough to issue instructions and orders. It is also necessary to ascertain what has actually taken place and to compare the result with what was intended to take place. The function of comparison has two sides—one dealing with physical matters, commonly known as inspection, and one dealing with numbers and values, usually known as accounting. By means of inspection the intentions of design as regards shape, size, dimensions, and material are compared with the resulting piece. This frequently involves delicate measurements and is always a matter requiring great judgment and practical ability. The modern tendency to make the components of a product interchangeable has greatly developed the necessity for accurate inspection at every stage of the work. By means of accounting a wholly different class of results is compared with the original intentions, not only of design but also of control. The time taken to do work, the cost of material and labor, the actual movements of material as compared

with their expected output, are all matters of accounting depending for their value on comparison with something previously planned.

In modern manufacturing the trend is towards setting up predetermined and fixed standards of effort, based on previous experience, on time and motion study and other careful observations, with which comparison may be made. Any falling short of these standards is termed "inefficiency," and a particular machine or class of work is then spoken of as 66 per cent or 75 per cent efficient, as the case may be. Unfortunately, in the present state of the art of management, the determination of reliable standards is exceedingly difficult, with the result that a good deal of charlatanry has masqueraded under the terms "efficiency" and "scientific management" with very harmful results. Generally speaking, however, it may be truthfully said that industrial management is passing from the qualitative to the quantitative stage. It begins to think in terms of quantity and number in every department, and although a great deal of its attention, possibly far too much, has been confined to the question of the quantity of labor in a given job—labor being the most obvious, though not always nor necessarily the most important factor in production—there are signs that the quantitative view is being applied to the other functions of management in increasing degree.

INDUSTRIAL RELATIONS COMMISSION. A national commission created by virtue of an Act of Congress, Aug. 23, 1912, to inquire into the general condition of labor in the principal industries of the United States, including agriculture, and especially into those which are carried on in corporate forms; into existing relations between employers and employees; into the effect of industrial conditions on public welfare and the rights and powers of the community to deal therewith; into conditions of sanitation and safety for employees and the provisions for protecting the life, limb, and health of the workers; into the growth of associations of employers and wage earners and the effect of such associations upon the relations between employers and employees; into the extent and results of methods of collective bargaining; into any methods which have been tried in any State or in foreign countries for maintaining mutually satisfactory relations between employ-

ees and employers; into methods for avoiding or adjusting labor disputes through peaceful and conciliatory mediation and negotiations; into the scope, methods, and resources of existing bureaus of labor and into possible ways of increasing their usefulness; into the questions of smuggling or other illegal entry of Asiatics into the United States or its insular possessions and of the methods by which such Asiatics gain admission, the commission being required to make recommendations to prevent such smuggling and illegal entry. "The commission shall seek to discover the underlying causes of dissatisfaction in the industrial situation and report its conclusions thereon."

The commission consists of nine members, including at least three employers of labor, three representatives of labor organizations, and three representatives of the public at large, and is given extensive powers in the matter of holding public hearings and compelling testimony. President Taft, on Dec. 17, 1912, appointed nine persons as commissioners under the Act, but the appointments so made failed to give general satisfaction and failed of confirmation by the Senate. In the few months that remained of his administration President Taft made no further effort to put the law into effect, but left the matter to his successor. The commission was finally (June 26, 1913) constituted by President Wilson as follows: representing the public, Frank P. Walsh of Missouri (chairman), John R. Commons of Wisconsin, and Mrs. J. Borden Harriman of New York; representing employers, Frederick A. Delano of Illinois, Harris Weinstock of California, and S. Thurston Ballard of Kentucky; representing employees, Austin B. Garretson of Iowa, John B. Lennon of Illinois, and James O'Connell of Washington, D. C. These nominations were confirmed on September 10.

The commission has proved to be a very active body, holding public hearings in all parts of the country and conducting investigations covering a wide range of industrial relations. A partial report of its proceedings was submitted to the President in December, 1914. By the terms of its creation the life of the commission, unless renewed, will expire on Aug. 26, 1915.

INDUSTRIAL REVOLUTION. In the latter part of the eighteenth century and the early part of the nineteenth the economic life of England underwent a great transformation, which has aptly been called the Industrial Revolution. As late as 1760 the "open-field" system (q.v.) was the prevailing characteristic of British agriculture. Even in 1794, when the process of inclosing the commons and open fields had been progressing rapidly for a quarter of a century, out of 8500 parishes in England 4500 were still farmed in common. Great stretches of country lay quite unimproved; extensive bogs and heaths were found in all parts of the island. In many counties the miserable crops merely afforded sustenance to the agricultural population. The means of transportation were so defective that in one county surplus produce went to waste, while in an adjoining county scarcity prices prevailed. Industry was carried on by the domestic system, under which the manufacturer or merchant put out his materials to be worked up in the laborers' homes at piece wages. Exchange was still carried on largely by means of weekly markets, annual fairs, and through itinerant traders. British foreign trade

was, however, increasing rapidly, and with the increased demand for goods prices of manufactures rose, affording the means of supporting a larger industrial population. The increased need for food rendered systematic agriculture more profitable, and the development of capital diverted much wealth to husbandry. A number of wealthy gentlemen turned their attention to the improvement of stock and the proper treatment of the soil (see AGRICULTURE) and demonstrated that agriculture could furnish returns rivaling those of trade, with the result that methods of agriculture were revolutionized. The continental wars enhanced the prices of agricultural produce and gave a great impetus to the adoption of the new methods. Between 1760 and 1843 nearly 7,000,000 acres of land were inclosed and put to intensive tillage.

At the same time the domestic system in industry was giving way to the factory system, as a result of the great mechanical inventions. In 1770 Hargreaves patented the spinning jenny; the water frame was invented by Arkwright in 1771; Crompton's mule was introduced in 1779. In 1769 Watt obtained his first patent for an improvement in the steam engine, and in 1785 it was successfully applied to the cotton manufacture. The effect of these inventions was enormously to increase output, the cotton manufacture trebling from 1788 to 1802. The iron industry, which had hitherto been relatively insignificant and was dwindling to still greater insignificance with the destruction of the woods, was revived by the employment of pit coal in smelting, rendered possible by the application of the steam engine to furnish power for the blast. The adoption in the woolen industry of the improvements in cotton manufacture extended the new system greatly. As a result of all these changes, English commerce, foreign and domestic, developed rapidly; shipping increased, good roads were built, and an era of canal building set in. Industry shifted from the rural towns to the large cities of the north of England, where labor was concentrated in factories, with the effect of improving the organization of labor and of making practicable numberless subsidiary labor-saving devices. Immense fortunes were made by those who were able to make use of the improved methods; population grew rapidly with the increased chances of employment. From 1791 to 1821 the population of England increased 43 per cent.

The period was, however, marked by a great deal of hardship to the working classes. The open-field farmers, displaced by inclosures, flocked to the cities and helped to reduce wages at times to a starvation level. The introduction of machinery deprived the hand workers of their means of livelihood; the crowding together of population in the large cities resulted in untold evils, moral and physical; the new life in the factory was not yet subjected to the regulations afterward found to be imperatively necessary. The employment in factories of women and children, with all its attendant evils, became common in all the manufacturing towns. The general effect of the revolution, however, was to give England a century's start over her rivals in the competitive race. The foundations for the prosperity of England to-day were laid by the thorough change in industry.

The rapid transformation from a low order of industrial organization to a higher order, that characterized the English Industrial Revolution,

made its appearance at a later period in other modern states. In the United States this transformation did not begin until near the close of the first half of the nineteenth century; its full effects were not in evidence until the second decade after the Civil War. In Germany the changes corresponding with those of the British Industrial Revolution took place after the formation of the Empire. In Russia and Japan similar changes occurred towards the close of the nineteenth century. In the case of England the necessity of waiting upon the progress of invention prolonged the period of change. Other countries were able to introduce technical processes already tried out in England and hence became industrialized in a relatively brief time.

In every country the process has been accompanied by a rapid congregation of population in cities, with resultant moral and political problems; exploitation of the labor of women and children, finally requiring legislative intervention; and the development of an organized labor movement. Consult: Held, *Zwei Bücher zur sozialen Geschichte Englands* (Leipzig, 1881); Gibbins, *Industry in England* (New York, 1897); Warner, *Landmarks in English Industrial History* (London, 1899); Cheyney, *Introduction to the Industrial and Social History of England* (New York, 1901); Toynbee, *Industrial Revolution* (6th ed., London, 1902); Cunningham, *Industrial Revolution* (Cambridge, 1908). See FACTORIES AND THE FACTORY SYSTEM.

INDUSTRIAL SCHOOLS. This term, now passing out of general use, has been variously and loosely applied to a large class of schools, mainly of a philanthropic, reformatory, or experimental nature, in which industrial work has been taught to boys and girls at a comparatively early age. This kind of school has been represented perhaps more fully than elsewhere in England, where the Ragged School was a prominent type. The primary purpose of such schools is generally other than industrial, and the aim of the industrial instruction varies from the mere desire to keep boys off the streets to the serious effort to teach a trade. These institutions have not, however, filled the purpose of real trade schools, mainly on account of the early age of the pupils and the short period of instruction. Simple operations like broom and brush making, chair seating, or basketry, have been prominent in such schools; tailoring, shoemaking, and wood working less so. Industrial classes, which represent the same characteristics as the above, are often a feature of orphan asylums or homes for juvenile defectives. On the whole, this type of school has not demonstrated any important function in training for industrial work, and its place in the social order, as has been pointed out, is mainly pathological. In the early discussion on the introduction of manual training into the common schools the term "industrial education" was very often applied to this subject. See INDUSTRIAL EDUCATION; TECHNICAL EDUCATION; MANUAL TRAINING; GEORGE JUNIOR REPUBLIC.

INDUSTRIAL WORKERS OF THE WORLD. A revolutionary labor organization, popularly known as the I. W. W. The origin of the I. W. W. may be dated from a meeting in Chicago, 1904, of a group of radical labor leaders of whom the leading spirits were Thomas J. Haggerty, editor of the official organ, and Clarence Smith, general secretary treasurer, of the American Labor Union. A second meeting of

some 30 labor leaders was held in January, 1905, which issued a call for an industrial union convention. At this convention, held in Chicago, June, 1905, were representatives from unions with aggregate membership of 40,000 men. The most important of these unions were the Western Federation of Miners and the American Labor Union. The convention adopted the name of the Industrial Workers of the World and a platform radically opposed in sentiment to those of the conservative trade-unions. Daniel de Leon and a number of his followers, representing the Socialist Labor party, were denied recognition at the convention, and formed a second organization at Detroit, known as the Detroit Industrial Workers of the World. The two organizations, although apparently in agreement on fundamental revolutionary principles, have been implacably hostile to each other. Hostility between both branches and the Socialists is even more intense.

The radical character of the principles of the I. W. W. is indicated by the preamble of their platform: "The working class and the employing class have nothing in common. . . . Between these two classes a struggle must go on until the workers of the world organize as a class, take possession of the earth and the machinery of production, and abolish the wage system." The antithesis to the principles of trade-unionism is indicated as follows: "Instead of the conservative motto, 'A fair day's wages for a fair day's work,' we must inscribe on our banner the revolutionary watchword, 'Abolition of the wage system.'"

According to the I. W. W. view, the employer has ceased to be an historical necessity and is merely a pernicious parasite. There can be no agreement with the employer morally binding upon the employee; arbitration and permanent settlements are impossible. It is the duty of the worker to injure the employer wherever possible. In accordance with this underlying philosophy the tactics of the I. W. W. is that of guerilla warfare. Whenever it is possible to take the employer at a disadvantage, as, e.g., when the rush season is on, or contracts with penalties attached have been signed, the I. W. W. tactics demand a strike. When it appears that further injury to the employer is impracticable, the strike ceases, and the workers return, not with the intention of abiding loyally by the results of the conflict, but with that of injuring the employer still further while in his employ. Such methods of injuring the employer are known as sabotage. Sabotage may consist in throwing the progress of production out of order through tampering with machinery, improper use of materials, or even systematic loitering at work. Among the most improved methods of sabotage are obedience to the letter of the employer's instructions to the prejudice of the employer's intent; the use of materials better and more costly than the conditions of the market demand; exposure of the employer's trade secrets. I. W. W. speakers and writers have indicated, with some detail, how various industrial processes can be made to turn to the employer's loss without risk to the employee. Destruction of industrial plant, buildings, etc., is, however, not approved by the I. W. W., since it is the hope of the organization to take over from the present capitalist owners an efficient industrial equipment.

The I. W. W. has little faith in achieving "the

emancipation of the working class" through politics. "Direct action"—i.e., the strike, sabotage, etc.—is held to be the only efficient means of expropriating the private owners of industrial property. In late years, however, there has been a growing feeling among members of the organization that it would be desirable to employ political means at least to the extent of insuring the "neutrality" of the police in conflicts between labor and capital.

The organization of the I. W. W. follows industrial lines. Its chief strength consists in industrial unions among textile, lumber, and marine-transport workers; but it has a scattering support in local industrial unions over a wide range of industry. Although on account of the activity of its leaders and the revolutionary nature of their doctrines, it has received much popular attention, its membership is small. According to Vincent St. John, general secretary treasurer of the I. W. W., the average paid up membership in the period March to August, 1913, was 14,310. With due allowance for members on strike and therefore exempt from the payment of dues, it would appear that the organization never has a bona-fide membership above 40,000, or 50,000 at most. Nevertheless it has been successful in conducting several spectacular strikes, of which the Lawrence strike of textile workers and the Akron strike of workers in the rubber industry are the most noteworthy. The effectiveness of the organization was due to its method of sending trained organizers to the scene of a dispute that had already broken out between employers and employees. In such conditions the I. W. W. is very successful in securing the enrollment of great numbers of the disaffected workmen, who however drop out, for the most part, after the dispute has been settled.

In both ideals and methods the I. W. W. bears a close analogy to syndicalism (q.v.). In its origin and development, however, it has been practically independent of syndicalist influence. Consult S. F. Brissenden, *The Launching of the Industrial Workers of the World* (Berkeley, Cal., 1913), and J. G. Brooks, *American Syndicalism: The I. W. W.* (New York, 1913).

INDY, ăn'dé', PAUL MARIE THÉODORE VINCENT D' (1851-). A French composer and pianist, born in Paris. It was his mother who gave him his first practical instruction, and at 14 years of age he was reckoned a master of the piano. From 1862 to 1865 he studied under Diémer, after which he studied theory under Lavignac and attended the lectures of Marmontel. In 1870 he enlisted in the army and at the conclusion of the Franco-Prussian War took up his studies under César Franck. In 1873 he became a member of the organ class at the Conservatory. Afterward he was engaged as second kettledrummer and choirmaster of the Société des Concerts du Châtelet. In 1885 he took over the management of the Société Nationale de Musique, and when César Franck became president of it, he acted as secretary, together with Chausson, and practically managed all its affairs. After Franck's death, in 1890, he became president. Besides his appointment of inspector of music in the city schools of Paris, he received the decoration of Chevalier of the Legion of Honor and was given charge of various important choral societies. Together with Ch. Bordes and A. Guilmant he founded in 1896 the Schola Cantorum, which soon ranked with the world's most famous music schools.

(See CONSERVATORY.) In 1906 he made a very successful tour of the United States, when he conducted his own works with the Boston Symphony Orchestra. His creative genius finds its happiest expression in instrumental music, although two of his three operas, *Fervaal* (1897) and *L'Etranger* (1903), both on his own text, have met with more than average success. Berlioz, Franck, and D'Indy may be classed as the three preëminent instrumental masters of modern France. With Berlioz D'Indy shares a predilection for the classical forms, filling them with individual and very modern content; and a weakness in thematic invention skillfully disguised by a masterly, frequently dazzling technique. His music seldom makes an immediate appeal; it rather repels through bold and startling harmonies, to which one becomes only gradually accustomed. His principal works are: two symphonies, in G and B flat; the symphonic poems *Jean Hunyade*, *La forêt enchantée*, *Wallenstein* (a symphonic trilogy after Schiller), *Souvenir*; two orchestral suites, *Tableaux de voyage* and *Jours d'été à la montagne*; symphonic variations, *Istar*; a dramatic legend, *Le chant de la cloche*; a scene for baritone, chorus, and orchestra, *La chevauchée du Cid*; considerable chamber music; choruses; works for piano and for organ. As a writer, he published biographies of César Franck (1906) and Beethoven (1910), and in collaboration with A. Sérieyx a *Cours de composition musicale* in three volumes (1902-12). Consult: A. della Corte, *Profili di musicisti contemporanei* (Rome, 1913); L. Borgex, *Vincent d'Indy; sa vie et son œuvre* (Paris, 1913); A. Sérieyx, *Vincent d'Indy* (ib., 1914).

INEBRIETY. See INTOXICATION.

IN'EQUAL'ITY (Lat. *inæqualitas*, from *inæqualis*, unequal, from *in-*, not + *æqualis*, equal, from *æquus*, even). The relation between two magnitudes which are not equal. If a 1-1 correspondence can be set up between the individuals of two groups, *a*, *b*, they are said to be equal. But if this correspondence extends to all of the individuals of *a* and to only a part of those of *b*, then $b > a$, and vice versa.

INER'RANCY. See INFALLIBILITY.

INERTIA, in-ēr'shī-ă (Lat., sluggishness, from *iners*, idle, from *in-*, not + *ars*, art). A general property of matter of which we become conscious through our muscle senses whenever by our muscles we change the motion of matter, e.g., throw or stop a ball, open a door, stop a revolving wheel, etc. It is noticed that the intensity of the sensation depends both on the material body itself and on the *rate* at which its motion is changed, i.e., the acceleration. It is believed that, if there were nothing external to the moving body affecting it, it would continue to maintain its motion unaltered forever. Galileo was the first to advance this idea; and it is now assumed as one of the principles of mechanics. It is sometimes referred to as the "principle of inertia." On the other hand, if there is some external action on the body, it takes time to produce a change in its motion, and the change produced in a given time will vary inversely as the quantity of matter, i.e., mass; or, to produce a given change in motion, the external action required varies directly as the quantity of matter, i.e., mass. It is to Newton that we owe our ideas of mass as a measurable fundamental property of matter. Up to his time weight was the only property of matter used as a measure of the "quantity

of matter," although Galileo clearly understood the fact that matter had this property and made use of it in his discussions.

The article MECHANICS shows how numerical values may be given to the masses of bodies, and also that the proper measure of an external agency in producing acceleration is the product of the mass by the acceleration. Looked at in a different way, it may be said that "a material body offers opposition to having its motion changed," the numerical value of the opposition being the above product *ma*. This may be properly called the "force of inertia." See CENTRE OF INERTIA.

IN'ESCUTCH'EON (*in* + *escutcheon*, from OF. *escusson*, *escuçon*, Fr. *écusson*, *escutcheon*, from OF. *escut*, *escu*, Fr. *écu*, shield, from Lat. *scutum*, shield). In heraldry (q.v.), a single small shield charged on a larger one. When one's wife is an heir or coheir, the inescutcheon is used to display her arms. See ESCUTCHEON.

INES DE CASTRO, ē'nās dā kā'strō. See CASTRO, INEZ DE.

INEX'PIABLE WAR, THE. A war of extermination waged by Carthage against her unpaid mercenaries in 241-238 B.C. (See CARTHAGE; HAMILCAR, 7.) The scenes of this war are pictured in Flaubert's *Salammbô*.

INFAL'LIBIL'ITY (from ML. *infallibilis*, infallible, from *in-*, not + *fallibilis*, fallible, from *fallere*, to deceive, Gk. *σφάλλειν*, *sphallein*, to overthrow, AS. *feallan*, OHG. *fallan*, Ger. *fallen*, Eng. *fall*). The immunity from error, in definite dogmatic teaching regarding faith and morals, which is claimed by the Roman Catholic church and, at least as regards the past, by the Greek church, as represented in the decrees of the councils which the latter looks upon as ecumenical. The latter claim, however, which does not go beyond that of inerrancy, or actual exemption from error up to the present time, differs widely from that of infallibility as put forward by the Roman church, which involves not alone an actual historical immunity from error, but also such a positive and abiding assistance by the Spirit of God as will at all times both protect against the possibility of error and guide and direct in the faithful teaching of all necessary truth. The infallibility claimed by the Roman church is thus of two kinds, passive and active—the first (Matt. xvi. 18), in virtue of which the Church never can receive or embrace any erroneous doctrine, no matter by whom proposed; the second, in virtue of which she is charged with the function (Matt. xxviii. 19; Mark xvi. 15; Eph. iv. 11-16) of permanently teaching to the world the essential truths of God, of actively resisting every access of error, and of authoritatively deciding every controversy by which the oneness of belief among the faithful may be endangered. Catholics regard this gift as a necessary accompaniment of authority in the matters of faith. Catholic doctrine held from early times that the body of bishops throughout the Church, acting in common with the Pope, constitute the most perfect organ of the infallibility of the Church; and hence, that when they unite in any way, whether as assembled in a general council or separated in place, their judgment is infallible. Thus, if a doctrinal decree were addressed officially by the Pope to the whole Church and either expressly confirmed or tacitly accepted by the bishops, this decree was held to be infallible. In like manner, if a doctrinal decree,

emanating even from a local council, as that of a national or even a provincial church, should be universally accepted by the Pope and the bishops, that decree also was held to be infallible. In a word, wherever there is found the united judgment of the Pope and the bishops, all agree in accepting it as the infallible judgment of the Church. Whether the Pope could judge without the bishops, was the great subject in dispute between the Gallican and Ultramontane divines—the latter affirming, the former denying, the papal judgment to be infallible, but all agreeing that it was not binding as an article of Catholic faith so long as it had not received the assent of the body of the bishops. The formal definition of papal infallibility as *de fide* dates from the Vatican Council of 1870. The minority of bishops who opposed the decree did so, as a rule, not because they disbelieved the doctrine, but because they considered its imposition as a necessary article of faith inexpedient. Those who refused to accept the dogma broke away and formed the Old Catholic church (q.v.). As formally declared, the definition is that the doctrinal decrees of the Pope teaching *ex cathedra*—i.e., when in discharge of the office of pastor and doctor of all Christians, by virtue of his supreme apostolic authority, he defines a doctrine regarding faith and morals to be held by the universal Church—are to be accepted as possessing the same infallibility which attaches to the teaching of the Church. See COUNCIL.

On the matter of subjects to which the gift of infallibility extends, Catholics are agreed in one principle, that it embraces all those subjects, and those only, which are necessary for the maintenance of divine truth in the Church. Hence, presupposing divine revelation, either written or oral, it embraces all questions of faith and morality, all subjects of general discipline, so far at least as to preclude the introduction, by authority of the Church, of any discipline which should be injurious to faith or to morality. On the other hand, it does not embrace questions of science, or matters of fact, or abstract opinions unconnected with religion. Thus, the popular misconception that the decision in the case of Galileo bears on the question of this strictly defined infallibility is seen to be baseless. It may be well also to point out that the Pope is not supposed to have the power to invent and enforce new doctrines, but can only declare and define those which have been held either implicitly or explicitly in the Church from the beginning. Consult: Hefele, *Honorius und das sechste allgemeine Konzil* (Tübingen, 1870); Rive, *Unfehlbarkeit des Papstes* (Paderborn, 1870); Salmon, *Infallibility of the Church* (London, 1888), a Protestant statement; Purcell, *Life of Cardinal Manning* (2 vols., ib., 1896); Foster, *Fundamental Ideas of the Roman Catholic Church* (Philadelphia, 1899); Wilfrid Ward, *Life of Newman* (2 vols., New York, 1912).

IN'FAMOUS CRIME (OF. *infameux*, from ML. *infamosus*, from Lat. *infamis*, infamous, from *in-*, not + *fama*, fame). An offense which is deemed to reveal such an absence of moral principle as to indicate that the culprit would totally disregard the obligation of an oath. Such crimes are punished according to their character, and the disabilities of infamy are imposed as an incident thereof. One of these disabilities was the incompetency of the convict

to testify in a court of law, but this consequence has been removed by statute in England (6 and 7 Vict., c. 85) and everywhere in the United States. At the common law treason, felony, forgery, and offenses tending to pervert the administration of justice by falsehood and fraud, such as perjury, conspiracy, and cheating, were included in this classification. The Constitution of the United States provides that "no person shall be held to answer for a capital or otherwise infamous crime unless on presentment and indictment of a grand jury." The Federal courts have included all crimes punishable by imprisonment in a State prison or penitentiary in this category, and most of the State courts have adopted this classification. See INFAMY. Consult the authorities referred to under CRIMINAL LAW.

INFAMY (from Lat. *infamia*, from *infamis*, infamous). The condition of legal disability imposed upon a person convicted of an infamous crime (q.v.). The term originated in the Roman law, under which system many derelictions of duty, such as a simple breach of certain contracts, as well as certain crimes, were punished with the civil and political disabilities of infamy. In the early English law the doctrine of attainder (q.v.) attached to the more serious crimes, and infamy only involved incompetency as a witness and incapacity to serve on a jury. The disabilities attaching to infamy are largely regulated by statute to-day, and in England and most of the United States all disqualifications on this account have been abolished.

INFANT. At common law, any male or female person under the age of 21 years. As the common law takes no account of a fraction of a day except when a question of property is involved, a person is held to become of age on the day before the twenty-first anniversary of his birth. It has always been the policy of the law to safeguard infants from the consequences of their own indiscretion by modification of many of the rules of law applicable to adults. Thus, an infant's contracts are voidable (not wholly void, like those of married women). That is, they are binding upon an adult contracting with an infant, but they may be avoided by the infant upon the ground of his infancy; but if the infant expressly or by implication ratifies the contract after he is of age, it cannot be afterward avoided by him. Whenever an infant disaffirms his contract he is entitled, upon principles of quasi contract (q.v.), to recover from the other party the reasonable value of the consideration or performance which he (the infant) has given under the contract, even though he has, before coming of age, squandered the consideration which he received. If, however, the infant have any money or property which he received under the contract, he must return it to the other party in order to be entitled to disaffirm the contract. While an infant is not bound by his contract, he is bound to pay for necessaries (q.v.) purchased by him, his liability being based on the theory of quasi contract. An infant may also pledge his parent's credit for necessaries upon the theory of implied agency if the parent does not supply them. See AGENT.

In general, infants are liable for their torts. Where, however, the effect of holding the infant for his tort is indirectly to enforce his contract, the courts have denied his liability in tort. The practical application of this rule involves some

very nice discriminations. Thus, an infant who hires a horse, and so negligently cares for him that the horse is injured, is not liable for tort or upon his contract; but if the infant appropriates the horse to his own use by going to some place other than that specified in the contract, he is deemed to have abandoned his contract and to be liable in tort.

An infant who is a property holder is subject to the laws of taxation, and his land is liable to be taken from him by eminent domain as if he were of age. At common law a legal marriage might be contracted between a boy of 14 and a girl of 12. See AGE; CONSENT.

An infant of sufficient age and understanding to have criminal intent is responsible for any crime that he may commit. It is a rule of the common law, however, that this responsibility can never arise before the infant is seven years of age. After that period until he is 14 the law indulges the presumption that he acted without guilty intent. His capacity to understand the nature and consequence of his act must be proved by the prosecution in order to establish his guilt. After he has attained the age of 14 his position under an accusation of crime is that of an adult, with no presumption due to his infancy.

The parents of an infant are entitled to his custody during infancy, and they are also entitled to his earnings until this right is voluntarily renounced by them, when the infant is said to be emancipated. As between the father and the mother, the father was at common law absolutely entitled to the guardianship of the child, and he is still generally regarded as having the prior right, though the modern tendency of the courts is to accord the custody in case of dispute to the parent best able and qualified to care for the child.

In many States male infants of 18 years or over may be executors and administrators.

Infants are not permitted to sue in their own name and right either at law or in equity. The action must be brought by the infant's near friend (*prochain ami*) or guardian *ad litem* appointed for the purpose, who is a relative, a friend, or other proper person permitted by the court to prosecute the action in the infant's behalf. Courts of equity early constituted themselves the especial protectors of infants, giving them relief in various ways, particularly by appointing guardians over their person and property. The care of an infant's property by guardian is now generally regulated by statute (see GUARDIAN), the effect of which is to place the infant's property in the possession of a guardian appointed by the court, who is required to invest and care for the property as a trustee for the infant. See CHILD, GROWTH AND DEVELOPMENT OF; CONTRACT; DOMESTIC RELATIONS; PARENT AND CHILD; and consult the authorities there referred to.

INFANT, CARE OF. See CHILD.

INFANT, DEVELOPMENT OF. See CHILD.

INFANT BAPTISM. See BAPTISM, INFANT.

INFANTE, ên-fân'tâ (Sp., Portug., infant). The title given in Spain to the princes of the royal family, with the exception of the heir apparent, and to the consorts of the royal princesses. The corresponding title of Infanta is given to the princesses and to the consorts of the infantes. Since the fourteenth century the heir apparent to the throne in Spain has been styled Prince of Asturias. The title was for-

merly used in Portugal, also, the heir apparent bearing the title of Prince of Brazil.

INFANTE, JOSÉ MIGUEL (1778-1844). A South American statesman, born in Santiago de Chile. He played a prominent part in the revolution of 1810, was President of the Government Junta in Chile after 1814, and went on a diplomatic mission to the Argentine State in 1817. His patriotism was unselfish; he was opposed to arbitrary authority, and refused office when he thought his country in no need of his services. In 1821 he founded, and he edited till his death, the newspaper *El Valdiviano Federal*, in which he defended the federal idea. In 1843 he declined the position of Chief Justice of the Supreme Court, offered him as a mark of the nation's gratitude. He contributed greatly towards the emancipation of slaves in Chile and took active part in the establishment of the common-school system.

INFANT FEEDING. See **INFANTS, FEEDING OF.**

INFAN'TICIDE. The killing of an infant or newly born child; often, in a broader sense, the killing of an infant, whether entirely born, or in the act of being born, or of the matured fœtus in the womb.

As an institution or customary practice, infanticide has existed in most savage or semi-civilized races and still survives in many; as an occasional or abnormal act, it has existed in all times and among all peoples.

Some authorities, as McLennan, have claimed that the custom has been practically universal among primitive races; but the researches of other investigators, as Spencer and Westermarck, have shown it to have been much less widespread than this. Infanticide as practiced among early peoples is to be traced ultimately to conditions of hardship attached to the bringing up of children. Thus, among the Abipones, where the women often practice infanticide, the boy was generally sacrificed; for when a son grew up it was necessary to buy a wife for him, while a grown-up daughter could always demand her price. But this hardship more usually attaches to the bringing up of female children, and it is therefore the females who are usually killed rather than the males. This is said to be especially true of those tribes who maintain a precarious existence among enemies, and who are forced by their manner of living to lead a migratory life. The practice of killing female children among these people often left the primitive hordes with very few marriageable women, so that they were forced to prey upon each other for their wives. This by some has been considered to account for the rise and growth of exogamy; while others have (with less reason) attributed infanticide to the custom of exogamy. In Africa, where the warm climate and the abundance of tropical fruits make the conditions of existence easy, there are no well-authenticated cases of the custom of destroying new-born children.

The natives of two-thirds of the South Sea islands practice infanticide probably more extensively than any other peoples known to history. The chief reason is probably the fact that the islands are of very limited extent and are as thickly populated as they could be and support life by the natural products of the soil. In parts of Australia it is said that the *mother* destroyed all but two boys and one girl, while in Samoa and other Pacific islands and in some

parts of Australia the custom is unknown. Generally speaking, therefore, infanticide is most commonly practiced among races living where the struggle for subsistence is most severe, or where custom imposes the most serious burdens upon those rearing children. The best-known instances of infanticide are those which existed in various forms through India, but which are now mostly suppressed in the territory under the control of the British government by a system of compulsory reporting of births and deaths and of police supervision in districts suspected of the practice. It was practiced among certain of the tribes of lower caste as well as among the Rajputs, although forbidden both by the Koran and the Vedas. Among some tribes it was due to hardship attaching to the procuring of the means of subsistence, and among others its origin, or the persistence of it, was due to artificial hardships attendant upon child rearing, as among the Rajputs, with whom it was dishonorable for a girl to remain unmarried, and the necessary expenses of her marriage were a ruinous burden upon the parents. A similar condition obtains among certain of the American Indians of the Northwest.

When infanticide has become established as a custom among a savage race, its practice, like all practices connected with birth or marriage, frequently assumes a sacrificial or religious import, and it is by some considered to be the explanation of the origin of the practice of sacrificing children to the gods. So, also, the method of killing becomes in many cases a matter of custom, as by casting into the Ganges in some parts of India (whence the reverence paid to the alligator, which fed upon the children), or poisoning with opium or datura smeared upon the mother's breast, or by sacrifice to some god. Where the practice survives as a sacrifice, it is usually the boy child that is killed. Any change in social conditions or habits which makes child rearing less of a burden tends to decrease or do away with infanticide. It may however, still be permitted or survive as a means of disposing of the weak or defective, as was the case in ancient Greece, where the killing of weak children was enjoined in the ideal systems of Aristotle and Plato and by the actual laws of Lycurgus and Solon.

Infanticide, as it exists among peoples whose laws or customs forbid its practice, is due to special abnormal causes, as extreme destitution, insanity, abnormal antipathy to the child, fear of disgrace, etc. The usual cause among modern civilized nations is the desire on the part of an unmarried mother to escape the shame of illicit childbearing or to escape the burden of caring for an illegitimate child. (See **ILLEGITIMACY.**) In some cases, as in France, laws have been passed which aid the mother in supporting her illegitimate child without exposure or undue burden; and these laws are said to have reduced the proportionate number of infanticides, but to have increased the number of cases of illegitimacy.

The laws of all modern civilized nations treat infanticide as a crime, but they vary too greatly to admit of being specifically stated here. Some of them treat it as a special crime of less gravity than murder, restricting infanticide to the killing of an infant which is newly born (within the time limited by the law); and others make no distinction between infanticide and murder, the question as to when the infant was born

being immaterial. The latter is the case at the common law of England and the United States, where the unlawful killing of a fully born child is murder, as distinguished from the killing of an unborn child, which is abortion. See ABORTION; BIRTH.

Consult, for the full discussion of the law as to infanticide and much of the general history, the works referred to under MEDICAL JURISPRUDENCE, such as Taylor, *Principles and Practice of Medical Jurisprudence* (3d ed., Philadelphia, 1883); Wharton and Stillé, *Medical Jurisprudence* (4th Amer. ed., ib., 1884); *Manual of Medical Jurisprudence* (12th Amer. ed., ib., 1897). For the other aspects of infanticide, consult: Sir John Lubbock, *Origin of Civilization, and the Primitive Condition of Man* (3d ed., London, 1874); id., *Prehistoric Time* (7th ed., ib., 1913); McLennan, *Studies in Ancient History* (ib., 1876); Lecky, *A History of European Morals* (3d ed., ib., 1877); Westermarck, *The History of Marriage* (New York, 1891); and, for the history of the subject in India, consult Browne, *Infanticide: Its Origin, Progress, and Suppression* (London, 1857).

INFANTILE SORE MOUTH. See THRUSH.

INFANTILE SPINAL PARALYSIS.

Acute anterior poliomyelitis. An acute febrile disease of children and young adults, due to a special but unknown microorganism. Flexner and Noguchi discovered in 1913 a minute organism which they believe to be the cause of the disease. The malady is characterized by inflammation of the gray matter of the spinal cord and medulla and results in paralysis of certain muscles or groups of muscles. The disease was first recognized by Heine in 1840. Vogt and Duchenne described the malady in adults in 1858 and 1864 respectively, but the large majority of cases occur during the first five years of life. Animal experimentation has established the fact that the specific bacteria finds lodgment and multiplies in the mucous membrane of the nasopharynx, and it is probable that the disease is disseminated by means of the secretions of the nose and throat. Efforts have been made to show that the virus is carried by the stable fly, but the evidence is not conclusive. The virus is easily killed outside of the body, but may persist for a long time in the mucous membrane even of healthy individuals, who may be the innocent cause of spreading the infection. A child attacked with acute poliomyelitis is noticed to be out of sorts, restless, without appetite, and may have a temperature of 100° to 103° F. The attack may come on with vomiting or convulsions. In the course of a day or two the legs or arms, or both, become paralyzed and tender to the touch. Complete recovery may take place, but usually one leg or an important group of muscles remain paralyzed and wasted. This results in lameness and various deformities, which have to be corrected by orthopaedic appliances or operation. Treatment during the stage of recovery must be hygienic, massage and electricity helping materially in the cure. See POLIOMYELITIS.

INFANT MORTALITY. The mortality of infants is of interest not alone to the family but to the social worker and the statistician. About one-fifth of the total deaths are of infants under one year of age, and nearly one-quarter of all deaths are of two years or under; hence they constitute an important factor in mortality records.

The percentage ratios vary, depending upon whether they are based on census returns or upon records of living births. In France in the decade ending 1905 the infant rate per 1000 born alive was 149, while the rate per 1000 enumerated in the census was 172. The same differences in ratio prevail in all countries. It might be stated here that Ireland had the lowest rates, viz., 102 and 123, and that Bavaria had the highest, 249 and 321, on the same basis during the same years. There is a sex difference, the deaths of males ranging from 16 to 30 per cent higher than females. The younger the infant, the higher the mortality; one-third of the first-year deaths occur during the first month and one-half of them within three months.

There are many factors in infant mortality—prenatal causes, illegitimacy, heredity, race, climate, manner of feeding, manner of living (urban or suburban), overcrowding, season of the year, also specific diseases (general or infectious). It is claimed that from 20 to 25 per cent of pregnancies fail to mature, and it is certainly true that the birth rate is steadily falling in nearly all countries.

BIRTH RATE PER 1000 POPULATION

COUNTRIES	Years	Rate	Years	Rate
England and Wales..	1851-60	34.1	1901-05	28.1
France.....	1851-60	26.3	1901-05	21.3
Germany.....	1851-60	35.3	1901-05	34.8
Italy.....	1871-80	36.9	1901-05	32.4
United States.....	1851-60	33.6	1901-05	* 24.0

* Average of Connecticut, Maine, and Massachusetts (Webb, 1911).

Illegitimacy is an important factor. While all children may be born with equal health, the illegitimate infant is frequently neglected or sent to an institution and fed artificially. Their death rate is double that of legitimate births; e.g., Norway's rate of 89 legitimate versus 177 illegitimate per 1000, Italy 163 versus 239, France 149 versus 255. It is interesting to note that illegitimacy is declining. In England the rate is now 3 per cent instead of 6.5 per cent, as in 1860.

Heredity. The offspring of tuberculous or alcoholic parents are lacking in vigor and are more susceptible to disease. The alcoholic tend to be mentally defective.

Race. In New York City and Chicago the rate for colored infants is the same as for white, but in many of the Southern cities having a large number of colored people, many of them very poor, the colored rate is double that of the white, e.g., Washington with a rate of 105 for white and 244 for colored infants per 1000. There is reason to believe that this difference is due more to economic conditions than to race characteristics.

Climate and Season. The difference between a cool and a warm country is illustrated by the infant rate of Stockholm in 1910, 92; while Rio de Janeiro for the same year had a rate of 166 per 1000. In temperate climates it is well understood that the hot months are the hardest for the infants. Heat diminishes the activity of the digestive glands and lessens the desire for food. It causes increased watery evaporation from the skin and in general lowers the vitality. In July and August we also have

an increase in humidity and an increase in the likelihood of food decomposition. In Manchester it was noted that the death curve of diarrhoea in infants corresponded closely to the prevalence of flies. This gives a hint in favor of cleanliness. Another study showed that the death rate rose as the wages fell, which means more crowding of persons in small rooms. The same study showed that poor ventilation led to overheating and consequent high death rate. The death rate for all ages rises with increased density of population, but the rise is four times greater for infants than for other ages. The rural rate for diseases of early infancy in the United States registration area is about half that of cities; e.g., in 1907 the city rate was 82.2 and the rural rate 49.4.

Manner of Feeding. A study of 844 breast-fed infants in Westminster (London) in 1907-08 showed 84.8 per cent of them healthy, and that only 2.3 per cent died within one year. Of 140 bottle-fed babies 47.1 per cent were healthy and 12.1 per cent died in one year. Institution babies generally have a higher death rate than those outside. For example, New York City maintained an infant's hospital for 33 years. There the average rate for children with mothers was 10.8 per cent; bottle-fed (foundlings), 53; farmed-out, 35.3; wet-nursed, 17.7.

Special Diseases. Diarrhoea and enteritis head the list. According to the United States mortality statistics from 80 to 85 per cent of these occur under two years and chiefly during the months of July and August. Next come bronchitis and pneumonia, 48 per cent of the latter occurring under two years in 1910. Death rates have been falling steadily in recent years in all civilized countries, and it is a pleasure to note that it is especially true of infants. In New York City, e.g., the rate of 1880 was 288 per 1000 living infants, while in 1914 it was only 94.6 per 1000. There are many factors leading to these results. Modern boards of health have departments of infant or child hygiene. Day nurseries (see NURSERY, *Day Nursery*) are common—New York having 94 in 1914, Chicago and Philadelphia more than 30 each, other cities in proportion. Since 1911 New York has also had 79 milk stations for dispensing pasteurized milk free or at small cost, and a special force of 190 physicians and nurses to visit the tenement children during hot weather. There are numerous private charities in most of the large towns in this and other countries, all for the babies' welfare.

The American Association for Study and Prevention of Infant Mortality was organized in 1909 and maintains an executive secretary in Baltimore, Md. Consult: G. B. Phelps, *Statistical Study of Infant Mortality* (Boston, 1908); G. B. Mangold, *Child Problems* (New York, 1910); American Association for Study and Prevention of Infant Mortality, *Reports of Annual Meetings* (Baltimore, 1910-11); Registrar-General of Great Britain, *Annual Report, 1911; Mortality Statistics, 1913*, United States Bureau of the Census. See VITAL STATISTICS.

INFANTRY (Fr. *infanterie*, from Sp. *infantería*, from *infante*, child, boy, servant, foot soldier, from Lat. *infans*, infant; foot soldiers being formerly the servants and followers of knights). Soldierly serving on foot, as distinguished from cavalry; that part of a military establishment using small arms and equipped for marching and fighting on foot, constituting the

oldest of the arms into which armies are conventionally divided, as a company, regiment, or brigade of infantry. The infantry forms the great bulk of any army; it is they whose means of transportation are their own feet, who carry their own weapons, ammunition, shelter, and food, and who on the march and in combat bear the heaviest burdens and losses. Beginning with the higher units, the infantry is organized into *brigades*, of three regiments each. The brigade is commanded by a brigadier general. The *regiment*, commanded by a colonel, is made up of three battalions. Each *battalion*, under command of a major, consists of four companies. The *company* is the command of a captain, who is assisted by two lieutenants; it is the smallest administrative unit, but for purposes of training and combat is divided into *platoons* and *squads* under the lieutenants, sergeants, and corporals.

Infantry is adapted for combat with firearms as well as with the bayonet, for attack as for defense, for action in close as in extended order. It can fight on any terrain which is at all passable and is more independent of weather and seasons than the other arms; it surpasses the other arms in endurance—a man, on account of his will power, bearing privations and exertions better than a horse.

According to Herodotus, when Greek met Persian at Plata, in courage and in strength the Persians were not inferior, but they were without armor, and moreover they were unversed in war and unequal to their opponents in skill. The Greek armies consisted almost entirely of infantry. The leaders fought either on foot, like the rest, or from chariots. The men were gallant, high-spirited, and intelligent, and well fitted to become distinguished soldiers. The Medes and Persians were highlanders, the bow was their native weapon, and as children they were taught to ride, to shoot, and to speak the truth; but Cyrus taught them to hold the foot soldier in little esteem, and it has always been true from very early times that infantry never reached a high standard where foot service was despised.

The Greek infantry played such an important part in all of the early wars that it is worth while to notice it rather carefully. It was divided into three classes. First were the heavy troops, called *hoplites*, or *hoplitai*, armed with spear, dagger, corselet, and a large oval shield. These formed the phalanx or main line of battle and were composed entirely of free citizens. Secondly, the light troops, armed with javelins, but carrying little defensive armor and no shields. These were destined for skirmishing and covering the movements of the phalanx. Thirdly, there were irregular light troops, carrying no defensive armor, but provided with javelins, bows and arrows, and slings and other things with which to harass the enemy. The best men were placed in the front rank, and for marching and manœuvring each man was allowed 6 feet both in breadth and depth, but ranks and files closed up for the fight and even locked shields. A battle was regarded as a duel, and the tactics were very simple—a direct advance and engagement along the whole line. All faith was placed in shock tactics, but there was always a tendency to drift to the right, each man seeking protection for his unshielded side, and this habitually led to the outflanking of the left of each army by the other. Fighting

over rough ground or breaking through obstacles was avoided, if possible, as disorder always resulted.

The phalanx was the basis of all Greek tactics; the number of men in each phalanx, and the number of phalanxes into which the battle formation was divided, varied according to circumstances, but from 2000 to 4000 men was about the usual strength of a phalanx. The weight of impact, both in the triangular and rectangular formations, was the great advantage of the phalanx, but this had to be sacrificed to a certain extent in order to obtain a more flexible machine.

It was likewise a Theban custom to fight in deep formations; at Delium (424 B.C.) their phalanx was formed in 25 ranks. Epaminondas modified their phalanx, forming it on a narrower front with greater depth and the soldiers standing so close together that they could not turn around. This formation gave more weight at the point of impact. The Theban column which crushed the Lacedæmonian phalanx at Leuctra (371 B.C.) and Mantinea (362 B.C.) was 50 ranks deep as compared with a depth of 8 in the phalanx of their enemies. In these battles, too, Epaminondas introduced for the first time the distinction of an *offensive* and *defensive* wing, which completely surprised his enemy and gave the Thebans a primacy which lasted until his death.

It is interesting to note that Philip of Macedon spent some years in Thebes while Epaminondas lived, and afterward turned to good account the lessons of his victories and the improvements in the military art which half a century of war had developed in Greece. The famous Macedonian phalanx which he created had a normal depth of 16 ranks, and the units were the file of 16 men, the section of 4 files, and the battalion of 64 files. The Macedonian hoplite wore a leather jacket with metal plates, light greaves, and a round hat. He had a short sword and a small shield; his spear was about 21 feet long, of which 13 feet were to the front and 8 feet to the rear of the hoplite when the spear was leveled. Hence five rows of spear points would show beyond the front of the phalanx. The 11 hinder ranks held their spears upward over the shoulders of the men in front of them to intercept missiles.

Upon Philip's death he left a standing army to his son Alexander, whose military genius enabled him to establish the largest empire the world had yet known. The infantry in the army which accomplished this result was divided into heavy and light armed, and the actual force with which Alexander crossed the frontier was 30,000 infantry and only 4500 cavalry. The Macedonian grand phalanx, as evolved by Alexander, numbered 16,384 heavy-armed infantry, and at Arbela (331 B.C.) his army consisted of two such phalanxes. In the wars of Alexander's successors armies were very similar in numbers and quality, and mobility lost some of its importance. The increasing use of elephants marked a decline in the use of infantry, as they made any advance and engagement of the foot troops difficult. The Macedonian phalanx was the crowning point of Greek military organization, but it lacked mobility, and as a result it went down before its Roman foe, which to a greater extent possessed that most valuable military asset.

The wonderful supremacy which Rome so long

maintained had its foundation in the Roman legion, which was raised in the following manner: a township consisted of 10 wards (*curiæ*), each comprising 10 families (*gentes*) or 100 households. Each household furnished one foot soldier (*miles*), and each family one horseman (*eques*). However, in the earliest days the three tribes of Rome furnished three times that strength or 3000 foot and 300 horse. The legions were later greatly increased. The first three classes of Roman citizens furnished the heavy infantry, but only the first class was bound to be fully equipped with arms and armor. This class furnished the front ranks of the legions, which were drawn up in battle six deep in continuous line.

Owing to the disaster which befell them at the Caudine Forks (321 B.C.), however, the Romans made a fundamental change in their formation. Continuous lines were given up, and the legion was subdivided into thirty *maniples*, which were placed checkerwise in three lines called *hastati*, *principes*, and *triarii*, so that the maniples of the second line were opposite intervals in the first. This afforded a flexible formation which adapted itself readily to broken ground and at the same time afforded strong reserves. The maniples of the first two lines were normally 120 strong, those of the third line 60. The *triarii* were the oldest soldiers and generally formed the third rank. The *principes* were the best men; they were heavily armed and formed the two front ranks. The *hastati* were lightly armed with a spear or *pilum*; they were the youngest men and later came to be used in the front rank. The legionary infantry was armed with shields, body armor, and a short heavy spear or *pilum*; but the primary weapon of the Roman soldier was a straight two-edged sword which was used for thrusting rather than for cutting.

At Cynoscephalæ (177 B.C.) and at the battle of Pydna (168 B.C.), the legion proved the value of its tactical flexibility over the solid mass formation of the phalanx.

The Roman armies owed their extraordinary ascendancy to three principal causes—discipline, promptness in adopting military improvements, and, above all, to the care in selection, training, and exercise of the individual soldier. But under a succession of weak and profligate emperors all discipline was lost; the legions degenerated into a worthless militia and fell an easy prey to the daring tribes of the North.

During the Middle Ages the races which occupied north Germany and Scandinavia attracted considerable attention on account of their splendid infantry. So it was, too, with the Franks, whose infantry were so well practiced in war that they were able to turn back the tide of Saracen invasion at Poitiers (732 A.D.). This sturdy infantry, however, soon disappeared, and it was nearly 1000 years before French infantry recovered its reputation. It declined with the growth of feudalism, and foot soldiers became mere attendants for the mounted men at arms.

The army with which William invaded England not only included bowmen, but some mail-clad infantry armed with spears and swords. It was by the coöperation of archers and cavalry that the battle of Hastings was won, and from that time archers formed an important part of English armies, and archery was encouraged as a national sport.

The Crusader armies were largely composed of foot troops. The victories of Cœur de Lion were due to skillful coöperation of heavy cavalry and crossbowmen. But for infantry to recover its old position it was necessary to combine excellence in the use of missiles with excellence in hand-to-hand fighting, and it was the association of the English archer with the dismounted man at arms that gave the feudal military system its first real shock.

At the battle of Crécy (1346) the English army consisted of 20,000 men all told, but there were 10,000 archers, and although the French army was three times as large as the English, it was almost annihilated by the English longbowmen. The long bow with which this result was accomplished was about 6 feet long, and two shots a minute could be delivered from it with great accuracy to a range of 220 yards.

The French were taught at Crécy that they must be prepared to fight on foot, and while this instruction was being given to France, the Swiss were administering to the knights at Morgarten (1315) and at Laupen (1339) even stronger lessons, showing what determined infantry could do against mounted or dismounted foes; and when the Swiss infantry in the three battles of Granson, Morat, and Nancy defeated the Burgundian chivalry, the feudal military system was dealt a deathblow, and the great prestige which had been attached to mailed horsemen was forever destroyed. The idea that the wearing of armor and the use of weapons were reserved by God and nature for persons of quality was dismissed, and infantry regained the universal esteem in which it had been held in ancient armies, and that esteem has never again been lost.

Early in the sixteenth century the use of firearms became general, but many years passed before the pike was entirely supplanted. At the battle of Ravenna (1512) artillery played its first decisive part on a battlefield. The increased use of firearms, and especially of artillery, was a hard blow to the Swiss infantry shock tactics, as it has become to all troops in battle. The Swiss infantry, through neglect of proper training, rapidly declined, and at Pavia, owing to their behavior and the effectiveness of the Spanish infantry fire, Francis I was defeated and became the prisoner of Charles V.

The Swiss pikemen have been aptly compared to the Macedonian phalanx, and the Spanish sword-and-bucklermen to the Roman legionaries, and it is interesting to observe that in each case the infantry armed with weapons better suited for hand-to-hand fighting triumphed. The Spaniards made more use of defensive armor than the Swiss did, which gave the former a great advantage in close fighting.

Gonsalvo de Córdoba, Ferdinand's "Great Captain," was the creator of the magnificent Spanish infantry, which was originally modeled on the Swiss; it soon eclipsed the latter and became in turn the model for other nations. More heavily armed than the Swiss, it trusted, like them, to massive formations and the irresistible weight of its attack. During the sixteenth century it maintained its reputation, and it was not until the close of the century that its renown began to fade. Its success was largely due to the fact that its recruits were natives of the rugged provinces of the North, hardy, temperate, patient, and quick to learn the use of firearms; men of the highest rank

were proud to command a company of infantry and often preferred it to a cavalry command.

EARLY ORGANIZATION

The regiment was created as an administrative unit, and battalions (*battaglia*, battle array) became the recognized tactical unit for infantry. The earliest infantry organization was the company and originally represented a group of men who followed a knight to battle. Maurice of Nassau, whose introduction of the intrenching tool necessitated tactical changes, favored small battalions (400 men), formed in three lines, thus creating a mobile force and at the same time units which could best assist and relieve one another. The three divisions of the infantry thus formed (van, battle, and rear) are, and in various crude forms have been always, recognized as the correct principle for infantry combat. The steady improvements in firearms necessitated more frequent changes in tactics; the dependence upon shock action came to be recognized as a dangerous thing.

Infantry played the chief part in the Dutch war of independence, and its fire action was greatly developed. The lance was practically laid aside, and shock tactics were superseded by fire tactics.

Gustavus Adolphus adopted a new tactical formation for his infantry, which was a modification of the Dutch order. His battalions consisted of four companies of 54 pikemen and 72 musketeers; he adopted a formation of 6 ranks instead of 10. The battalions were grouped by threes into brigades, the middle one being pushed forward beyond the alignment of the other two. The brigades were drawn up in two lines; this combination of line and column was valuable both in attack and defense. Gustavus equipped his troops with the most modern and effective firearms. At Lützen (1632) the Swedish infantry was put to the test, and it proved its worth and set a new standard for armies.

During the seventeenth century the firelock gradually succeeded the matchlock as an infantry weapon. A "charge" of infantry came to mean a fire fight at close quarters until one side gave way rather than a collision; still less use was found for pikemen, as there was little scope for them in attack and defense of intrenched positions and they were of little value in broken country. The bayonet was devised in order that infantry might fight cavalry without the aid of pikes. During the sieges of the Thirty Years' War infantry made considerable use of hand grenades.

Towards the end of the seventeenth century there were four kinds of infantry—pikemen, musketeers, fusiliers, and grenadiers; but during the War of the Spanish Succession these were practically reduced to one kind, all armed with firelock and socket bayonet. This simplified formations and tactics; ranks were reduced to four and sometimes to three. With three ranks the front rank knelt and often reserved its fire.

By the middle of the eighteenth century Prussia had taken the place which Sweden held a century before as the pattern of excellence for infantry. Frederick the Great was a strict disciplinarian, and for that reason he discouraged open fighting and aimed at mechanical precision. However, this precision was of very

great importance in rapid loading and firing, and Frederick's masterpiece in defeating the Austrians at Leuthen was made possible by the strict Prussian drill. In 1771 Frederick issued instructions for the guidance of his officers, in which he shows an appreciation of the effect of infantry fire as a means of winning battles, and to him is due the credit of initiating the use of horse artillery as an aid to infantry.

Henry Bouquet (q.v.) was one of the first men to recognize that light infantry was needed for American warfare and that much could be learned from the Indians. Lord Howe developed these views, and in the expeditions against Louisburg and Quebec light infantry played a leading part. As a result of the early Indian wars and the War of American Independence, the practice of forming infantry in two lines instead of three was introduced.

The period around the French Revolution (1792-1815) gave further proof of the value of light infantry, and the skirmisher played the leading part in the struggles of that memorable period. After the Peace of 1815 there was a reaction towards the rigid close-order drill of the old school; but this was for a short time only, and about 1850 the methods of skirmishing, the full development and maintenance of infantry fire, and its use in combination with the action of artillery and cavalry had become the chief military problem.

The Crimean War and the War of Italian Liberation were fought with better infantry weapons and further showed the value of infantry-fire action. During the great American Civil War the infantry on both sides was at first practically worthless, but experience wrought them into splendid fighting troops. The battalions were deployed, and attacks were made in line, covered by skirmishers. The infantry opened out as it advanced to the attack, and gained ground by rushes. Bayonets were rarely properly used, and the actions were almost always decided by infantry fire. This war showed plainly that, with arms of precision, looser fighting formations, advances by rushes, dismounted action of cavalry, and increased use of infantry intrenching tools were military problems of very great importance.

The Franco-Prussian War (1870) found Germany with perhaps the finest infantry that had ever been seen, and, although the French had by far the better rifle, their infantry had not been well trained, and the battle of Wörth, in which MacMahon was driven from the field with the loss of nearly half his army, was one of the conspicuous results.

The Russo-Turkish War (1877) afforded another means of judging of the effect of rifled breechloaders. The Turks were inferior in organization and numbers, but their infantry possessed the better rifle, and in the engagements around Plevna Russia suffered severe losses as a result.

The War in South Africa (1899) was a brilliant example of what men skilled in the use of small arms can accomplish. This war settled many doubtful points about infantry training. One thing, however, was clear, and that was the fact that the British infantry soldier was no match for the Boer as a skirmisher; it was plain that the extension of infantry would have to be carried much further than had ever before been thought necessary, and that the discipline should become less mechanical and

more intelligent. It is interesting to note that "infantry training" was promptly substituted for "infantry drill" in the British army.

The French infantry drill regulations of 1902 and 1904 were aimed at simplification and the development of initiative in infantry training. Captains were allowed more liberty in training their men, and fire control was recognized as being of vital importance. During the Russo-Japanese War (1904) the fighting was done mainly by infantry, and this war further emphasized the necessity for simple and direct methods for infantry in combat and the great importance of individual training.

From the foregoing it will be seen that those armies which had their proper proportion of well-trained infantry were victorious generally in all ages. An army is nothing more than a machine composed of many parts, and in order to insure victory each part must do its proper share of the work. The infantry is recognized as the "backbone" of every army, and its importance increases with every improvement in arms; upon its training and efficiency depends the fate of practically every battle. Cavalry, artillery, engineers, signal troops, and all of the various others are but auxiliaries which work with a view to assist the infantry to close with the enemy and deal the decisive blow. The old idea, so prevalent in America, that it is only necessary to arm a man and send him forth to battle and count him a soldier, was long ago abandoned by those nations which have given to the subject proper thought. The idea, too, that comparatively little training is necessary to convert a recruit into a true infantryman has been discarded by most of the leading nations. Were further proof needed of this, it was found in the Great European War of 1914, and the prolonged drill and training which the British volunteers received before being sent to the front may be cited. Indeed, this war seemed to have many lessons in not only the training, but the equipment and employment, of the modern foot soldier, and the tactical changes and studies, which will be found treated in the military discussion under WAR IN EUROPE, should be consulted in this connection.

Modern combat demands the highest order of training, discipline, leadership, and morale on the part of infantry; it must take the offensive to gain decisive results, and in the local combats which make up the general battle that infantry which is the better trained in the use of ground, fire efficiency, and discipline will win. Infantry must have the tenacity to hold every advantage gained, the individual and collective discipline and skill needed to master the enemy's fire, the determination to close with the enemy in attack and to meet him with the bayonet in defense. Modern war requires but one kind of infantry—excellent infantry.

The Rôle of Modern Infantry in Battle. It is the business of modern infantry to win battles, and *decisive results can only be obtained when infantry is permitted to take the offensive*; the *defense* may repulse the enemy, but only the attack can annihilate him. On the offensive, combats are generally waged in accordance with the following *plan*:

1. It is necessary to attack the enemy vigorously with troops enough to compel him to take up a *defensive* position, force him to bring up his reserves and to disclose the weak points of his line; at the same time to withhold the

remaining troops under cover—a part for a general reserve and the rest for a powerful effort at the decisive point, keeping the enemy in doubt as to where the decisive blow is to fall. This is called the *preparatory stage*; it may last for hours, and in a great battle it may extend *through several days*.

2. To make a powerful effort at the decisive point with the forces withheld for that purpose. This constitutes the *decisive action*, or main attack.

3. To employ the general reserve to complete the action and with all available troops make a vigorous pursuit, or to avert disaster in case of failure. This is called the *final stage*.

The principal work during an attack is done by the *infantry*. Assisted by artillery, the principal duty of which is to support the infantry in the most effective manner, the infantry works its way from point to point towards the assigned objective. The infantry which is withheld for the main attack should be fresh, and its appearance as it begins the final advance a surprise. It is moved so as to escape observation, by night if necessary, and established under cover as near as practicable to the point from which the attack is to be launched. From this point (*position of rendezvous*) an *attacking line*, strong enough to form the necessary *firing line* and its *supports*, is sent forward. The remaining infantry forms a *reserve* to be used according to the exigencies of the situation. Until fire is to be opened, the attacking line advances in any formation that minimizes losses and occasions no unnecessary delay. The commander of the attacking line determines when fire is to be opened, and in order to secure and maintain a *superiority of fire* over the enemy, the firing line is made as dense as possible (about one man per yard) consistent with effective work *by each rifle*; the losses are constantly replaced from the supports which follow the firing line as closely as possible, and which, when fire is opened, constitute from *one-fourth* to *one-half* of the attacking line.

The infantry rarely opens fire until well within effective range of the hostile position (1200 to 600 yards), but from that moment its fire, assisted by that of the artillery and other infantry, firing over the heads of the attackers, must be superior to the enemy's fire or success cannot be assured; in fact, the defenders must be practically blinded by a hailstorm of bullets and fragments. This requires a constant, accurate fire from the advancing line.

In order to maintain this fire, avoid heavy losses, and at the same time *continue the advance*, ground to the front is gained by rushes of parts of the line, varying from battalions to individuals according to the intensity of the enemy's fire; but superiority of fire must be maintained during these rushes, as it is absolutely essential to the success of the attack.

The *reserve*, in close formation, follows the attacking line as long as it can find cover, and at the proper time from it a second line is sent forward in time to join the attacking line in the final assault and to secure the captured position. If the attacking line is temporarily checked, it hastily intrenches, and the intensity of the artillery covering fire must be increased to keep down the fire of the enemy. *Ground to the front once gained should never be abandoned until all hope of final success is gone*. As the attack progresses, part of the artillery is moved

up to successive positions to render more effectual aid in keeping the enemy down, so that the attacking infantry may close with the enemy and, if need be, dislodge him in a hand-to-hand bayonet fight.

When the attacking line arrives within "charging distance" (somewhere between 25 and 100 yards of the enemy's position), it opens a rapid fire, bayonets are fixed individually, with the least possible interruption of fire, and the united lines charge with fixed bayonets to consummate the attack.

When the attacking line nears the enemy's position, it becomes necessary for the artillery to increase its range so as to impede the movements of possible hostile reserves and to spread confusion in rear of the enemy's position. Under favorable conditions the artillery can continue its fire on the enemy's position until the advancing infantry is about 300 yards therefrom.

When the attacking forces succeed in carrying the enemy's position, they will be at a disadvantage for a moment; there will be much confusion, the troops will be exhausted, and many officers will be gone. If the defender, reinforced by fresh reserves, takes advantage of this moment, he may be able to turn the tide of battle. Here the general reserve must be brought forth to clinch the victory and to prosecute a vigorous pursuit of the enemy, while the attacking troops should be promptly reformed, their ammunition supply replenished, prisoners removed, and the captured position made secure against counter attacks, and thus the *final stage* of the battle completed.

When the enemy's works cannot be reduced by artillery, the fire of that arm has little effect until the infantry advances and compels the defenders to expose themselves; and when his works cannot be captured by open assault, the infantry advances by slow and tedious siege operations.

INFANTRY, MOUNTED. A general term applied to soldiers trained to fight on foot, but provided with horses, mules, camels, carts, bicycles, or other means of transportation, in order to give them greater mobility than regular infantry; nothing more than regular infantry provided with a more rapid means of transport. Although modern infantry is very powerful, it is very slow in its movements. It has long been recognized that a very great advantage will accrue to that side in a battle which can rapidly move a strong body of men to a decisive point and put them into action as infantry. Hence the idea of mounting infantry.

The absolute necessity for the dismounted action of mounted troops, or of foot soldiers

possessing a high power of mobility, has been felt in all ages, and under Napoleon especially, the constant endeavors to produce a "dragoon" for this service were very persistent, though little success was accomplished.

The Americans in 1862-64 were conspicuously successful in the use of mounted infantry; the so-called cavalry during the Civil War being in reality nothing more than good mounted infantry. It would appear that the dismounted action desired is the peculiar duty of cavalry alone, who are now trained to act on foot, and such is largely the case in the American army; but all that can be demanded of cavalry is that it should be able, when occasion requires, to render such services; cavalry can ill afford to be drawn into sustained combats, or attempt, when dismounted, to cope for any length of time with the enemy's infantry. By no process can cavalry compete with infantry under conditions favorable to infantry fighting.

It is imperative that mounted infantry should preserve their identity as infantry, as their great efficiency lies in their ability to ride only well enough to get over such ground as is required, and to make the very best use of their firearms on foot when collision with the enemy becomes necessary.

Few countries have given the subject of mounted infantry thorough attention. Gen. Sir Henry Havelock-Allan, an able English military writer, in 1866 classed the use made of mounted troops in the American Civil War as one of the three leading military questions of the day, and England was the first European country to raise a modern mounted infantry regiment. The Prussians to a limited extent followed suit. The Russian "dragoon" has by many been looked upon as a model mounted infantryman. However, the Boer War (1899) fully demonstrated the great importance of mobile infantry. The Boer skirmisher possessed mobility to a marked degree, while, on the other hand, perhaps the best army that had ever left British shores was practically paralyzed owing to its lack of mobility. This British defect was gradually overcome, and in the second phase of the war, when Lord Roberts advanced from Bloemfontein on Pretoria, three-tenths of his command consisted of cavalry or mounted infantry; his success was largely due to the fact that his mounted men did most of their fighting on foot, seizing points of vantage and holding them until reinforcements came up.

The rôle of mounted infantry is generally *offensive*. When an enemy has occupied villages, buildings, defiles, or bridges, which cannot be turned, when nothing can be effected by the mounted action of cavalry, mounted infantry may be usefully employed. The infantry soldier, with his magazine rifle and careful training in musketry, is able to deal with an enemy's infantry in a manner which cavalry, armed with carbine and equipped for mounted service only, could not hope to attempt.

The most important uses of mounted infantry may be summarized as follows: (1) to accompany the cavalry in rapid movements, in order to seize positions, threaten or attack flanks or communications, and to act with cavalry in the pursuit of an enemy; (2) to reinforce rapidly and at a critical moment infantry which is overtaken, or which has succeeded in gaining some vantage ground in the general line of attack, and which requires assistance to make

good its footing; (3) to overtake a retreating enemy and force him to turn and fight; (4) to enable a commander to disengage his infantry from action. Mounted infantry is also very valuable in relieving infantry of much wear and tear in marching to and from outpost positions and of many fatiguing duties incident to advance-guard work.

INFANTS, FEEDING OF. The proper food for a young infant is its mother's milk. The infant should be put to the breast a few hours after birth, for though the milk does not appear until the third day, the colostrum is quite enough for the child's needs. The colostrum is rich in fats and is also laxative, both wisely provided by nature. The infant will get from four to six ounces daily for the two days before the normal milk appears. Nursing is physiologically necessary for the mother and the child. The child should have no water, sweetened or otherwise, as it will lead to colic and indigestion besides lessening the vigor of nursing. Should the milk not appear on the third day or be insufficient in quantity, give the mother gruels of corn meal or oatmeal or some preparation of malt with hypophosphites of lime and soda.

Should the mother die or there be conditions that make nursing impossible, substitute feeding must be resorted to. Wet-nursing is no longer popular in America, owing to the possibility of the nurse bringing disease into the household, to say nothing of domestic discord. Moreover, the child of the wet nurse is likely to die as the result of neglect or unwise feeding. Should such a nurse seem essential, she should be subjected to the tuberculin test for tuberculosis and the Wasserman test for syphilis. Mother's milk is the perfect food and is found to contain fat 4 to 5 per cent, proteid 1 to 2 per cent, sugar 6 to 7 per cent, and 1½ per cent of salts or ash. Cow's milk is similar to human milk; but its ingredients are in different proportions, the fats and sugar being one-third less and the proteid twice as high. Moreover, the proteid is a compound body composed of casein and lactalbumen; the former predominates in cow's milk and the latter in human milk. The former is difficult of digestion, the latter is soluble and readily absorbed.

Milk is therefore "modified" to overcome the unlike features. This is easily done by diluting the top portion of milk allowed to stand in a quart bottle until the cream has risen. During the first week a suitable formula would be top milk 3 tablespoonfuls, i.e., an ounce and a half, milk sugar half an ounce, and pure water 10 ounces; divide in 10 bottles and feed every two hours. At one month use 9 ounces of top milk, 2 tablespoonfuls of milk sugar, and of water 23 ounces; divide in eight bottles and feed every three hours. At six months take 15 ounces of the top milk, 7 tablespoonfuls of milk sugar, and 17 ounces of pure water; divide in six bottles and feed every three hours.

The one-month formula contains fat 4 per cent, sugar 7 per cent, and proteid 1.5 per cent. That gives more than 600 calories as the daily

food allowance. The six-month formula also represents more than 600 calories. An infant requires 40 or 45 calories of fuel per pound weight each day. An adult needs about one-third as much per pound, it being true that the smaller the animal the greater the proportionate loss by radiation. A restless or crying baby consumes more food than a quiet one, but grows less. A well infant was found to radiate 30 to 45 grams of perspiration per hour, while a restless and crying one radiated five times as much. After all, only 9 per cent of the energy taken into the body is retained for growth; 80 per cent is eliminated.

An infant should be weighed twice a week while small and once a week when older, in order to know whether it is growing and increasing in weight properly, i.e., at the rate of an ounce and a quarter a day. The average weight at birth is 7.5 pounds, at one month 9 or 10 pounds, at six months 15 pounds, at one year 18 or 20 pounds. The following table, compiled from authoritative sources, shows approximately the composition of the more common artificial foods in use compared with milk:

COMPOSITION OF INFANT FOODS WITH CALORIC VALUE

	Pro- teid	Fat	Sugar	St'ch	Salts	Cal- ories per oz.
Woman's milk.	2.0	4.0	7.0	...	0.2	22
Cow's milk.	4.0	4.0	4.5	...	0.7	22
Horlick's malted milk	16.5	9.0	68.0	...	3.9	135
Mellin's food.	11.5	0.2	80.0	...	3.6	120
Eskay's food.	6.0	1.0	68.0	21.0	1.3	128
Imperial granum. . . .	14.0	1.0	2.0	73.5	0.4	120
Nestle's food.	11.4	4.4	51.3	28.4	1.7	120
Barley water.	0.09	0.05	...	1.63	0.03	2.19
Mead's dextri-maltose	*51.0	†47.0	2.0	120

* Maltose.

† Dextrin.

A study of this table shows clearly why some foods are not enough for some infants and how to remedy the matter. The proprietary foods are nearly all deficient in fats. This may be overcome by making up the mixture with milk or cream, especially for young infants. Occasionally milk preparations undergo changes and persist in causing indigestion so that they must be given up entirely for a time. In such an event barley water is substituted for a few days (barley two tablespoonfuls to one quart of water). When there is need of energy, but digestion is weak, dextro-maltose may be given.

The milk must be not only clean to look at, but free from disease germs and bacteria that cause fermentation or decomposition. In cities it is best to use "certified milk" or pasteurized milk. Pasteurizing is heating to 165° F. for 20 minutes. This will destroy the germs of diphtheria, typhoid fever, and tuberculosis, also the streptococci, staphylococci, and the lactic acid group of bacilli. Milk containing 100,000 bacteria to the cubic millimeter is unfit for use, 10,000 being all that should be allowed. Special milk is produced with less than 1000 to the cubic millimeter. After pasteurizing, the milk should be kept at a temperature near 41° F. to prevent the development of spores that may have escaped destruction during the heating.

There are numerous processes of modifying milk and many methods of computing ratios and values. These are too technical for this article, but may be found in the following books: Holt

and Howland, *Diseases of Children* (New York, 1911); Pfaundler and Schlossman, *Diseases of Children* edited by Shaw and LaFétra (Leipzig, 1912); C. G. Grulee, *Infant Feeding* (Philadelphia, 1914).

INFANT SCHOOL. An educational or, rather, charitable institution which sprang up during the latter part of the eighteenth and early part of the nineteenth century, at first on the Continent and later in Great Britain and in the United States. The object was to care for neglected children of early age, especially those of factory women, who were left with few physical comforts and no moral oversight. Such children were gathered together during the day, and, in order to render their care less irksome, they were taught to march, to perform simple gymnastic exercises, to sing simple songs, to repeat the multiplication tables, names of the days of the week, and similar things, and in later years at some places to read and sew. The educational purpose was purely secondary, at least until the influence of the Pestalozzian ideas prevailed in the second quarter of the nineteenth century. There is no historic connection with the origin of the kindergarten (q.v.).

The first infant school was founded in 1780 by Oberlin (q.v.), the pastor of Walbach in France. He appointed women in his own parish to assemble the children between the ages of two and six and to interest them, by conversation, in pictures, maps, sewing, etc. In Great Britain the first infant school was opened (1800) by Robert Owen in connection with his communistic establishment at Lanark, Scotland. In 1827 the Glasgow Normal Seminary was founded by David Stowe to carry out this idea of the infant school. In 1819 a similar school was established in London in charge of Wilderspin, under the patronage of such men as James Mill, Zachary Macaulay, and Lord Brougham. Other schools soon followed, and in 1836 this movement was unified in the formation of the Home and Colonial Infant School Society, which contributed more than any other instrumentality to the extension of the infant school by training teachers and instituting model schools. Up to this time the movement had succeeded by keeping distinct the processes of training and instruction and by not attempting any educational work of the latter character. The society was the outgrowth of the influence of the Mayos, brother and sister, one of whom had been a student of Pestalozzi at Yverdon. Thereafter the work of the infant school was to include instruction after the Pestalozzian methods. Under the educational grants of Parliament many infant schools were established, and especially since the Royal Commission of 1858-61 they may be considered as a component part of the British school system. Within recent years the infant schools have undergone considerable reform, and in place of the formal work in the three R's the infant schools are absorbing slowly the spirit of the better type of kindergarten. In continental Europe it is the kindergarten built upon Fröbelian lines that is very generally established. In France, however, the public *crèche*, which is for children of two and three years of age, is very general. The *école enfantine* for children of four and five years of age is a kindergarten. Such schools, as distinct parts of school systems, will be described under the title NATIONAL EDUCATION, SYSTEMS OF. In

the United States the first infant school was established in Boston, in 1826, under A. B. Alcott. While this school was a marked success, and there were numerous similar attempts in various other American cities, there was no great demand for such institutions in a population not primarily urban and engaged in manufacture. Similar needs were met by the Sunday school and, before there arose any great need for the charity infant school, by elementary public schools with free tuition.

L. Kandel, *Elementary Education in England* (Washington, 1914). See, also, KINDERGARTEN; NATIONAL EDUCATION, SYSTEMS OF.

INFECTION (Lat. *infectio*, a dyeing, from *inficere*, to dye, mix, from *in*, in + *facere*, to make). The condition produced by the entrance into and multiplication within the body of pathogenic microorganisms, whether bacteria or protozoa. Every infectious disease has its infectious element. This element may be propagated by contagion from particles carried by the air, as where the virus of the disease clings to scales of epidermis in scarlet fever or smallpox; it may be propagated by contagion from faecal matter in which the virus is discharged, as in typhoid fever or cholera. Whether microorganisms can be transmitted after elimination in the breath is yet uncertain. Probably they can be detached from mucous surfaces by the currents of the breath, freed by expulsive coughing. The mode of elimination of the virus from the body decides whether the disease be contagious or not. The significance of the question of the reproduction of infectious microorganisms outside of the body is great. Drinking water may be contaminated with typhoid-fever germs; milk may be contaminated with pus germs. The virus of some diseases may be carried by the air, as in the case of pulverized sputa of tubercular patients. Many protozoan diseases, such as malaria and yellow fever, are carried by insects. Actual contact with the agents of infection, however, constitutes the chief means of infection. Predisposition plays a secondary part as a factor in such causation. Race influences susceptibility to disease. The size of the dosage of bacteria is important, a large injection producing disease where immunity to small doses exists.

Auto-infection occurs where in a parturient woman, e.g., septicæmia occurs as a result of infection of the uterus with pathogenic germs which have gained entrance into the vagina. See IMMUNITY; CONTAGION; INSECTS, PROPAGATION OF DISEASE BY.

INFECTIOUS DISEASE. A disease which is communicated by means of bacteria or protozoa which enter the body. A contagious disease is propagated by means of virus carried from person to person upon mucus from the mouth or respiratory tract, upon scales from the skin, etc. Contagious diseases include measles, smallpox, scarlet fever, tuberculosis, etc. On the other hand, typhoid fever and cholera are not contagious. They are transmitted through the use of drinking water or food containing the germs of each disease. All the diseases men-

tioned are infectious, including those of the contagious class. See INFECTION.

INFECUNDITY. See STERILITY.

INFESTMENT AND SASINE. A Scottish law term, corrupted from the "feoffment" and "seisin" of the feudal law of England and employed to denote the formal act whereby the title to land was formerly conveyed. It consisted in the symbolical transfer of possession by handing over a twig or clod of earth in token of the land conveyed. The instrument of sasine was the notarial instrument, or deed, embodying the fact of infestment. But now the necessity of a separate formality is unnecessary, it being sufficient to register a conveyance in the register of sasines in Scotland. In England there is no similar register for deeds, and the title is complete when the conveyance is executed and delivered to the purchaser. In Scotland an *infestment in security* is a conveyance in the nature of a mortgage to secure payment of an obligation, and an *infestment of relief* is a similar security to protect a surety or bondsman against his contingent liability.

INFEOFFMENT, in-fēf'ment. See FEOFFMENT.

INFERENCE (ML. *inferentia*, inference, from Lat. *inferre*, to infer, from *in*, in + *ferre*, to bear): In logic, the process of so coördinating and systematizing one's knowledge that new knowledge is thereby gained. Inference may be induction or deduction. See INDUCTION; DEDUCTION.

INFERIOR COURTS. In England courts of common law over which the superior courts (formerly known as the courts of King's Bench, Common Pleas, and Exchequer, now by statute consolidated in the Supreme Court of Judicature) exercise a supervisory jurisdiction by writs of mandamus, certiorari, prohibition, or similar writs. These include local courts, such as borough and county courts, courts baron, the City of London Court, the Mayor's Court of London, the University courts, and many others of like character throughout the kingdom.

In the United States the expression is used in the same sense and comprehends usually magistrates courts and courts of special sessions as well as county, city, and other courts of a local character and of a limited jurisdiction, civil or criminal. See COURT.

INFERNO, THE. See DANTE ALIGHIERI.

INFILTRATION. See DEGENERATION.

INFINITE (Lat. *infinitus*, boundless, from *in-*, not + *finitus*, bounded, from *finire*, to bound, from *finis*, bound, from *findere*, to cleave; connected with Skt. *bhid*, to split, Goth. *beitan*, OHG. *bizzan*, Ger. *beissen*, AS. *bitan*, Eng. *bite*). In philosophy, a term used in various senses, while at the same time there has been much discussion as to the reality of any object denoted by the term. The extended objects of our ordinary perception do not occupy all the span of our field of vision. They have outlines which mark off their area from circumjacent space. And so with temporal magnitudes. Objects last for a longer or shorter period, before which they were not experienced and after which they are no longer experienced. Their duration is finite, because set off by limits—i.e., by their initial and final moments. Intensive magnitudes also are conceived by analogy as finite. Thus, I hear a sound which is followed by a louder one. In this case the less is not marked off from the greater by limits. It is not a part

of the greater, although it may be that the space traversed by the vibrations of the air which cause the lighter sound is part of the space traversed by the vibrations which cause the louder sound. Whatever may be the reason that makes us use in the case of these so-called intensive magnitudes the same terminology (e.g., greater and less), there is no doubt that we do so speak of a "finite" intensity whenever we conceive of a greater intensity as possible, although here the less is not included in the greater, and therefore it is not marked off or limited within the compass of the greater. It is important to keep this distinction in mind, for corresponding to this distinction we have two senses at least of the word "finite" and of course as many possible senses of the word "infinite." 1. The infinite is that which is not an extended or enduring part of some larger extension or duration. Now, if this be the meaning of infinite, we may say there are possible two kinds of infinities, (a) those which, though spatial or temporal, are not parts of larger spatial and temporal wholes, and (b) those which are not spatial or temporal at all. The most promising candidates for inclusion under (a) are "infinite space" and "infinite time" and "infinite number." Under (b) would fall all intensive qualities. For instance, the loudness of any auditory sensation would be infinite in this sense, although the duration of the sensation and the distance at which the sound is heard are both finite.

2. The infinite is that which, having intensity, exceeds everything else in intensity. An infinite sound in this sense would be a sound which had a loudness surpassing that of all other actual or possible sounds. Infinite heat would be a heat-temperature sensation surpassing in intensity all other actual or possible sensations of like sort; and so with the affections and the emotions. Now, with given conditions—i.e., a certain sentient and affective organism in a given state—there is something that corresponds to this definition. A sound of a certain definite degree of loudness is the loudest sound a particular sentient being can hear. A greater wave length of air could not be heard. But no one seems disposed to call such a sound one of infinite loudness. Again, we can "bear" pain up to a certain point, differing in individuals. Beyond that point we become insensible.

3. Still another sense of the infinite is the unconditioned. Everything that appears in experience is conditioned; it is what it is because other things are what they are; but in contrast to these conditioned realities some philosophers of almost all ages have believed in a reality lying behind experience and having a self-subsistent character not defined by any qualities that appear in experience. Herbert Spencer's (q.v.) unknowable is an infinite of this character. Such an infinite is sometimes called an abstract infinite—abstract because it is without any definite positive quality, and because it is considered to have its essential being in separation from the concrete world we know.

4. Still another meaning of the infinite is the unattainable limit of an unending process of construction. This is well illustrated in the view taken by some idealists that time and space are constructed in the act of thinking them. This construction is conceived, not as complete, but as having no limit to the possi-

bility of its continuance. Infinite space is thus the unattainable result of the unending process of constructing space. It is the fact that you can never come to the end of possible space construction. One species of the mathematical infinite seems to fall under this head. Thus, in the improper fraction $\frac{1}{x}$, as the value of x decreases by one-half, the value of the fraction is doubled. If the decrease is continued without end, the fraction is conceived as approaching infinity. Here, again, infinity is the unattainable result of the unending process of halving the denominator. This infinite differs from the infinite of space and time considered under (a) in that space and time are often regarded as existing apart from any construction on our part, while the former is considered simply as the algebraic expression of the fact that our construction can continue without end. It is not considered as an actual reality, but as an unattainable ideal, while infinite space and infinite time are by some realists considered to be actual facts.

5. Infinite in another sense is any member of an all-inclusive system of reciprocally determining members. Thus, according to Hegel, all reality is infinite. Hegel justifies the use of the term by pointing out that in a true system any member in being determined by the other members is really self-determined, because its systematic relation to the other members is an integral constituent of its own nature. These other members exercise no foreign compulsion upon it to make it what it is. They determine it only because it is part of its own being to be so determined. They do not set limits to it which it may not pass, but they give it opportunity to be itself. To take one of the apparently most refractory instances, the billiard ball is not infinite in sense 1a, because, though spatial, its place is only a part of a larger space from which it is marked off by definite boundaries. But the ball is something more than so much space. It is an object that undergoes various changes under certain conditions—e.g., when struck it rolls. This dependence of its changes upon the action of other objects is often considered another evidence of its finitude. But Hegel would have pointed out that it is only because it is the nature of the ball to roll when struck that it rolls at all. In rolling it does not succumb to external force, but it acts its own part. Though determined, it is self-determined. Though compelled, it is free. This free, self-determined nature of every member of any free system is what Hegel calls infinite. He considers the term "infinite" appropriate because the systematic conditions which determine the ball's action do not limit it in the sense of repressing its spontaneous tendency to act out its own nature. They simply give it a chance to show one side of its nature in a certain definite movement. There is no reason why the term "infinite" should not be employed in this case. But there is every reason to remember that this sort of infinitude is thoroughly compatible with finitude in another sense, e.g., spatial. When Hegel says that the finite is essentially infinite, he means that what is conditioned (*bestimmt*) is conditioned because it is its very nature to act in response to these conditions; that condition is not restraint (*Schranke*) of an inherent tendency by an external limit (*Grenze*).

6. In recent mathematics (see SERIES) the term "infinite" is applied to any series of terms such that for every term in the series there is a corresponding term in some part of the series. Thus, the series of number integers is infinite in this sense because, e.g., corresponding to every integer there is an *even* number in the series of even numbers, which series is a part of the larger series of integers. This definition of infinite, developed by such mathematicians as Cantor (q.v.) and Couturat, is now adopted by many philosophers.

A reader in philosophy must keep himself always on the alert to detect the various meanings of the word "infinite," and then he will be able to understand many paradoxes that at first appear to be logical contradictions. Whether the infinite really exists depends on the kind of infinite you mean. The existence of infinite 1a is discussed elsewhere (see NUMBER; SPACE; TIME); infinites 1b, 2 in at least certain cases, and 5 are unquestionable. Infinite 3 is, if it does exist, unknowable, and there is no positive empirical reason to assert its existence. Infinite 4 does not exist at any particular time from the very nature of the case, because it is an unattainable ideal. The infinite process is real at least in the case of time in the sense that the flow of time never ceases; but at no moment has it completed its unending course, and in this sense infinite time does not now exist, nor ever has existed, nor ever will. But when the present tense is used not specifically but universally, it is then true that there is infinite time. Any further treatment of the question of infinity would be out of place here.

INFINITE SERIES. See SERIES.

INFINITY AND THE INFINITESIMAL (Lat. *infinitas*, from *infinitus*, boundless). A number conceived to be greater than any assignable number, however great, is called an infinite number. The symbol ∞ , meaning indefinitely great, cannot be used in operations as a finite number; e.g., $\infty - \infty$ is not necessarily zero, and $\frac{\infty}{\infty}$ is not necessarily 1. A number that varies and becomes and remains smaller in absolute value than any assignable number, however small, is called an infinitesimal number. The use of the symbol 0 is also limited; e.g., $\frac{0}{0}$ is not necessarily 1. (See FRACTION.)

In modern geometry the notion of infinite points and infinite lines has led to great generalization and supplied the condition for continuity (q.v.) of many relations; e.g., for the statement "Two coplanar lines are concurrent or parallel" may be substituted "Two coplanar lines are concur-

rent in a finite or an infinite point." In modern analysis the infinitesimal has played an important rôle. From the time of Kepler mathematicians have struggled with the infinitesimal, especially as employed in the differential calculus, and some, notably Lagrange, have tried to avoid its use entirely. But through the efforts of Legendre, Gauss, Carnot, and especially Cauchy, the meaning of the propositions concerning infinitesimals has been established, and a safe foundation for the differential calculus has been laid. See CALCULUS.

INFIRM'ARY. See HOSPITAL; DISPENSARY.

IN'FLAMMA'TION (Lat. *inflammatio*, from *inflammare*, to set on fire, from *in*, in + *flamma*, flame; connected with *flagrare*, Gk. *φλέγειν*, *phlegain*, to blaze, Skt. *bhraj*, to be bright). A morbid condition characterized by altered function of the elements of the tissue involved, changes in circulation, derangement of local nutrition, and generally an exudation infiltrating the tissues affected. It is a process of extreme complexity, presenting variations depending upon the exciting cause and upon the kind of tissue in which it occurs. It is therefore impossible to define it satisfactorily. The most obvious symptoms or phenomena of inflammation, when it attacks an external or visible part, are pain, redness, heat, and swelling, together with altered function. The general characters of the process will be best understood by an assumed case. If a healthy man has a splinter of wood or any other foreign body embedded in any fleshy part, he begins to experience pain at the part, and this is soon succeeded by redness of the skin, a firm and extremely tender swelling at and around the spot, and a sense of abnormal heat. These purely local symptoms are succeeded, if the inflammation reaches a certain degree of intensity, by a general derangement of the vascular and nervous systems, to which various names, such as constitutional disturbance, symptomatic or inflammatory fever, pyrexia, etc., have been applied. If the foreign body is extracted, the probability is that all these symptoms will gradually abate, until the part at length regains its natural appearance and sensations. If, however, the cause of irritation is not removed, or if the intensity of the morbid process exceed a certain point, the following phenomena occur: The swelling assumes a more projecting or pointed form, the part becomes softer, and the skin at its centre, which is usually the most projecting part, becomes whiter. There is a sensation of throbbing pain, and if the skin be not divided with a knife it finally breaks, and a yellow, creamlike fluid, known as pus (q.v.), escapes, after which the symptoms rapidly abate. This process is known as *suppuration*.

If the original injury was very severe and the inflammation intense, there may be actual death of the part affected. In that case the red color of the skin becomes purple or greenish black, the pain ceases, and the part becomes dead and putrid. This is *mortification*. Under favorable circumstances this dead part, which is called a *slough*, spontaneously separates from the adjacent living parts by a process known as *ulceration*, and the cavity which is thus formed gradually fills up and heals.

The *pain* may vary from mere discomfort to intense agony. There is usually most pain in those parts in which the tension produced by the swelling is the greatest, as under the periosteum,

or beneath serous or fibrous membranes, etc. The pain occurring in inflammation is always aggravated by pressure, and by this means the physician can often distinguish between inflammatory and noninflammatory disorders. The *heat* is seldom so much increased as the sensations of the patient would lead him to believe; it does not rise above the maximum heat of the blood in the interior of the body. This increase of heat depends upon the increased flow of arterial (or highly oxidized) blood to the part. The redness depends upon there being more blood than usual in the vessels of the affected part. The *swelling* depends in part upon the distention of the blood vessels and upon the presence of various fluids, such as blood serum and pus, in the tissue of the affected part.

For the study of the details of the inflammatory process and of the sequence of the changes which take place, it is most satisfactory to observe their progress in living tissues. If the mesentery of a frog whose muscular system has been paralyzed by curare be exposed to the air, this unaccustomed exposure starts inflammatory changes which can be observed under the microscope. There is first seen to be an increase in the rate of blood flow through the capillaries; then the capillaries become somewhat dilated, and the blood current becomes slower than normal. White blood cells accumulate along the capillary walls and at various points stop and attach themselves to the endothelial cells. If these white blood cells be watched carefully, some of them may be seen to pass through the cement substance between the endothelial cells and in this way pass out into the surrounding tissues. Some fluid is also seen to accumulate in the tissues, this fluid having evidently come from the fluid elements of the blood. Also red blood cells in greater or less numbers may pass out of the vessels and be found in the surrounding tissues. These elements which leave the vessels and accumulate in the tissues during the inflammatory process are called exudates. Their passage from the vessels into the tissues is known as exudation, and this form of inflammation is often designated exudative inflammation. The passage of the blood corpuscles out into the tissues is called emigration, or diapedesis. The serum of exudation contains the fibrin-forming elements of the blood and so may lead to the formation of more or less fibrin in the tissues. The white blood cells die and disintegrate (as they are especially prone to do in the presence of certain forms of bacteria) and form with the serum the thick, opaque, yellowish fluid that is known as pus, the dead white blood cells being the pus cells. According to the way in which the elements of the exudate are associated and their relative proportion, the inflammation is known as serous, serofibrinous, seropurulent, or purulent. When red cells are present in unusual numbers, the inflammation is designated hemorrhagic inflammation. Such an inflammation as that described in the frog's mesentery may subside on the removal of the exciting cause. The serum is reabsorbed into the blood vessels or lymphatics, the living blood cells find their way back into the circulation, while those that are dead disintegrate and are absorbed. This process is known as resolution. The character of an inflammation is largely modified by the nature of the tissue in which it occurs. Thus, when an inflammation occurs in dense fibrous tissue there is little chance for much

distention, and the amount of exudate is limited by pressure. In tissues of looser texture the amount of exudate is apt to be larger. Mucous surfaces such as those lining the gastrointestinal canal, the respiratory tract, and the genito-urinary tract, react to the inflammatory process by at first a decrease in the amount of mucus, following which there is a marked increase of mucous secretion. This being in many cases the dominant feature, the inflammation is designated mucous or catarrhal inflammation. On serous surfaces such as the pleura, peritoneum, and pericardium, the serofibrinous exudate often leads to an agglutination of the opposing surfaces and the formation of adhesions. These adhesions bind the surfaces together and materially interfere with the natural free motion of the parts. Such a condition obtains in the so-called fibrinous form of pleurisy. It is very common after inflammations of the pelvic organs in the female and after appendicitis. These adhesions may become organized by the development of blood vessels in them and so become converted into actual living tissue. In abdominal operations extensive adhesions resulting from present or previous inflammatory processes and binding together the different viscera often offer the most difficult problem with which the surgeon is confronted. In inflammation of the iris the pupil may be rendered irregular or immovable or may be even closed up by the formation of adhesions. In endocarditis, or inflammation of the membrane lining the heart, fibrin may be deposited in wartlike masses upon the valves, thus interfering with their functions and causing some of the worst forms of cardiac disease. See HEART, DISEASES OF.

During the progress of an inflammation, when minute particles of foreign substances are present in the tissues, or where there is decomposition of tissue elements, certain cells, derived probably mainly from the white blood cells, make their appearance. These cells are known as phagocytes and have the power of taking up these particles of foreign matter or of disintegrated tissues and either digesting them or carrying them off for deposit at other points.

The healing of wounds is, in a pathological sense, an inflammatory process. If after a clean-cut wound through tissues which have little vascularity the sides of the wound be closely approximated, there is a little oozing of serum which sticks the cut surfaces together, some of the more injured cells die and disintegrate, while of those which remain intact some proliferate and cross the line of the wound, new connective-tissue fibres are formed, and the whole becomes firmly united. Such healing is known as healing by first intention. If the injury to the tissues is greater, or if the wound is left open, healing takes place in a manner essentially the same as just described, but somewhat more elaborate. Serum is poured out upon the surface of the wound, and intermingled with the serum are red and white blood cells. If bacteria are present, pus is formed. After a varying length of time minute red points begin to stud the surface. These are known as granulations. Each granulation consists of loops of minute capillaries surrounded by newly formed connective-tissue cells. This tissue is called granulation tissue, and its new thin-walled vessels allow it to bleed easily. Over this granulation tissue—if the wound be not too large—the skin slowly extends by growth from

the edges of the wound, until complete repair takes place. Such healing is known as healing by granulation or healing by second intention. In some cases the growth of new blood vessels is in excess of the production of the connective tissue, and the tufts of new and easily bleeding vessels project above the surface of the wound. These are known as exuberant granulations, or proud flesh. Young granulation tissue is composed almost entirely of small round or oval connective-tissue cells and blood vessels, the intercellular substance being very small in amount. As the tissue becomes older, the connective-tissue fibres appear, the cells become fewer and more like adult connective-tissue cells. Finally, the cells may almost entirely disappear, leaving dense white fibrous tissue, to which the term "cicatrix," "cicatricial tissue," or "scar tissue" is applied.

Under certain conditions, whether due to increased nutrition of the parts or to some little-understood factor we do not know, there occurs an active increase in the connective-tissue elements of some of the organs of the body. This is known as productive inflammation. This production of new connective or interstitial tissue may be slight in amount. It may, on the contrary, be quite extensive. Its proliferation is always at the expense of the parenchyma or functioning elements of the organ and often results in considerable destruction of the latter. Not easily differentiated from this productive inflammation is the process known as replacement connective-tissue hyperplasia, in which the formation of new tissue is secondary to degeneration of the parenchyma and for the purpose of its replacement.

The significance of the inflammatory process and the relation which it bears to the normal physiological activities of the body are matters of extreme importance. If we exclude bacterial infection with the formation of pus and the production of large amounts of fibrin, which occurs in some cases—in other words, if we take such an example of inflammation as we studied in the exposed frog's mesentery—we note that all the phenomena observed are but exaggerations of normal physiological processes. Thus, in normal physiological activity the relations existing between the blood inside the capillaries and the tissues outside are extremely intimate, and serum and white blood cells, with probably some red blood cells, have more or less free access to the tissues. The action of phagocytes also occurs as a normal physiological process. We have referred to the pathological identity of wound repair and the inflammatory process. Such facts favor the consideration of inflammation, not as a destructive but as a conservative process, a reaction which healthy tissue presents against external irritation. Even in the case of bacterial infection with the formation of pus, the inflammatory reaction is essentially conservative, the white blood cells acting as distinctly germicidal agents, destroying bacteria themselves by their phagocytic powers, and when dead disintegrating and diffusing their germicidal substances throughout the serum or pus. We must thus look upon the inflammatory reaction of tissues in the presence of bacterial invasion as of the nature of a rising of the body forces for purposes of defense against the invasion.

Treatment. In acute inflammations all sources of irritation and all causes of the con-

dition must be sought and removed; local action must be lessened, complications must be avoided or treated if present; pain must be relieved; and the patient's strength must be supported. Rest must be obtained. The patient in an exhausting case must be put to bed; inflamed parts must be supported with bandages, splints, slings, or cushions, securing proper position and slant. In many cases the application of cold is desirable, and this is secured by using an ice bag or ice coil, evaporating lotions, or irrigation with cold water. Heat may be desirable, to favor suppuration and encourage "pointing" of an abscess or a furuncle. But in the case of bacterial infection heat often does harm by lowering the resistance of tissue and inviting further spread of the microorganisms. Poul-tices especially offer rich ground for the propagation of bacteria. Local bloodletting may be desirable, by means of the artificial leech, cupping, incisions or scarifications, or punctures. Pressure, by means of gauze or rubber bandages, is occasionally indicated. Incisions may be necessary to relieve tension, as in erysipelas, where deep cuts in the axis of the limb relieve pain. Astringent and stimulating drugs may be used, such as belladonna, silver nitrate, tannic acid, hydrastis, zinc salts, etc. Counter-irritation is effectual in certain cases, in which the cautery, caustics, vesicants, or rubefacients are used. See BIER'S HYPERÆMIA.

Among the constitutional agents used in combating inflammation are bloodletting in certain cerebral or thoracic conditions; diet; drugs, including aconite, colchicum, belladonna, diuretics, iodide of potassium, opium, quinine, mercury, and purgatives. Stimulants, together with increased nourishment, may be demanded in exhaustion or in chronic cases. The measures appropriate to each disease in which inflammatory conditions arise are mentioned under the appropriate title. Consult A. H. Smith, "Intermediate Inflammatory Process," in *Transactions of the Association of American Physicians* (New York, 1900), and Delafield and Prudden, *Text-book of Pathology* (9th ed., ib., 1911).

INFLAMMATION OF THE BOWELS. An old and inexact term, which was probably used indiscriminately as a name for enteritis, gastro-enteritis, colitis, appendicitis, and peritonitis, before some of these ailments were differentiated.

INFLAMMATION OF THE BRAIN. An old and unscientific term, which has been applied to both cerebritis and meningitis, and which should be abandoned. Cerebritis, or inflammatory change of the brain substance, may occur in vascular portions of the brain after injury. See MENINGITIS.

INFLAMMATION OF THE KIDNEYS. An unscientific term applied indiscriminately to those diseases of the kidneys one of the symptoms of which is inflammation. See BRIGHT'S DISEASE.

INFLAMMATION OF THE LARYNX. See LARYNGITIS.

INFLAMMATION OF THE LUNGS. See PNEUMONIA.

INFLAMMATION OF THE MIDDLE EAR. See OTITIS MEDIA.

INFLAMMATION OF THE UDDER. See MAMMITIS.

INFLAMMATION OF THE VEINS. See PHLEBITIS.

INFLECTION (Lat. *inflexio*, a bending,

from *inflectere*, to bend, from *in*, in + *flectere*, to bend). The changes undergone by words to denote their varying relations to other words. This forms one of the main divisions of philology and is itself subdivided into conjugation and declension. It is a distinguishing mark of the Indo-Germanic and the Semitic languages, as compared with other language groups, such as the so-called agglutinative (q.v.) and the like. Broadly speaking, the line between inflection and agglutination is drawn by the individual intelligibility of the components of a word. While in many noninflecting languages each of the several formative parts has an independent meaning and existence, as Turk. *sevmek*, to love, *sevdirmek*, to cause to love, *sevdirilmek*, to cause to be loved, *sevdirilmemek*, to cause not to be loved, and so on, the components of an inflecting word no longer have any independent meaning, so that Lat. *agit* means "he drives," but neither *agi-* nor *-t* has any signification when used separately. This distinction, however, is a somewhat artificial and evanescent one and should be accepted only as a basis for rough classification. To all intents and purposes many of the so-called agglutinative, incorporating (or polysynthetic), or even analytic languages are as truly inflectional as those whose right to the term is undisputed. The phrase "inflectional" may nevertheless be used to denote the Semitic and Indo-Germanic groups if its somewhat conventional and inexact applicability be clearly understood. The inflections of the Semitic languages are relatively simple and will be treated in detail under the title SEMITIC LANGUAGES. In the Indo-Germanic family, on the other hand, they are quite complex, although far surpassed by many of the agglutinative and incorporating tongues. In general, the Vedic Sanskrit (see SANSKRIT LANGUAGE) seems to come nearest to the hypothetical pre-Indo-Germanic language type. It has two main declension systems, pronominal (see PRONOUN) and nominal (see NOUN). These were probably independent originally, although by the operation of analogy the two systems of declension frequently became confused, some cases of the noun being inflected pronominally (e.g., Skt. *tē*, Gk. *οἱ*, these, *λύκοι*, but Skt. *vrkās*, wolves), and vice versa (as Oscan *Núvlanús*, citizens of Nola, *pús*, who? but Lat. *qui*, Skt. *kē*). The inflection of the pre-Indo-Germanic noun and pronoun was evidently far richer even than the Vedic Sanskrit, for a comparison of the Indo-Germanic languages shows a number of terminations for single cases—as, e.g., the instrumental singular Av. *vehrka*, Skt. *vrkē-ṇa*, Armen. *gailov*, OChurch Slav. *vlŭkomi*, with a wolf. It is entirely possible, even though merely a hypothesis, that the four modes of formation of this case just cited, which would be in pre-Indo-Germanic **ulqō*, **ulqē*, **ulqobhi*, **ulqomi* (also **ulqebhi*, **ulqemi*), indicate an original differentiation of meaning; or, in other words, they were different cases. These cases, if this is true, later syncretized, a process for which the historic Indo-Germanic dialects furnish abundant analogies, as the Latin ablative, which unites the functions of the pre-Indo-Germanic locative, instrumental, and ablative, or the Greek dative, which comprises the primitive dative, locative, and instrumental. The inflectional terminations are, in general, ultimately the same for any given case throughout the various declensions. The

apparent divergencies are usually due, except where nouns are inflected pronominally or pronouns nominally, to the phonetic laws of sound combination. (See PHONETICS.) The conjugation of the verb, likewise, was originally far more complex than it is now. The tense system, although the future was originally lacking, was rich, especially in aorists. The Vedic Sanskrit had three main varieties, the simple, reduplicating, and *s-* aorists, of which the first had two subdivisions and the third had four. Here, again, it is quite possible that these seven aorists originally had distinctive meanings, although even as early as the Veda they were, so far as now known, mutually equivalent. The moods were more numerous, the verb having the indicative, subjunctive, optative, imperative, and perhaps a mild imperative called the injunctive (in form the augmentless aorist, and later the augmentless imperfect). As inflection was twofold, so conjugation had a double system, primary and secondary. The primary conjugational terminations were found in the present, perfect, and, when a future was developed, in this new tense also; the secondary endings were employed in the tenses which denote past time.

The older writers on comparative linguistics devoted much attention to the original meanings of inflectional terminations. A deeper research has, however, led to less dogmatic views, and it would seem that in our present state of knowledge no conclusion as to the primitive force of inflections can be reached. It may be true that *s* is characteristic of the plural (as Goth. *wulfōs*, *wulfans*, Skt. *vrkēsu*, *vrkēbhyas*, *vrkaiṣ*, wolves—nom., acc., loc., abl., instr.), but *s* is also a mark of the nominative masculine and genitive singular (as Lat. *lupus*, wolf, Gk. *ὄφις*, of a serpent). It is just possible that the case endings were indeed originally independent words, which became stereotyped and meaningless terminations. A possible analogue is furnished by the modern Indo-Iranian languages as compared with the ancient, as Hind. *ghōṛake*, of a horse, corresponding to Prak. *ghōḍaassa kacchē*, Skt. *ghōṭakasya kaksē*, at the side of a horse, or Pers. *šāhrā*, for the king, corresponding to OPers. *xšāyathiyahyā rādiy*, for the sake of the king. This, however, is a mere hypothesis, a suggestion of a process which may have taken place. In the case of the verbs repeated endeavors have been made to trace the endings back to the personal pronouns. Thus, the terminations of Skt. *bharāmi*, *bharati*, *bharāvas*, I bear, he bears, we two bear, may be compared with some plausibility with *mām*, me, *tam*, him, *āvām*, we two, but the other persons of the verb oppose such a hypothesis. It is true that many agglutinative languages seem to bear out the old view; but it is, notwithstanding this, too faulty a theory to be adopted as even plausible, much less probable. There is little doubt, however, that certain verb endings arose merely from the juxtaposition of an auxiliary to the original root. Thus, imperfections like the Lat. *amabam*, futures like the Lat. *amabo* and Gk. *δώσω*, and perfects like *amavi* and *duc-si* are composed of the verb "to be" (which is in Skt. *bhū* and *as*, in Lat. *fuo* and *esse*) joined to the principal verb. An example of a more recent formation of that kind may be found in the Fr. future *aimerai*, which is composed of *amare* and *habeo*.

Inflection comes only at the end of an Indo-

Germanic word, excepting in the reduplication of the aorist and perfect (as Skt. *ajījanam*, aorist of *jan*, to be born, *tutōda*, perfect of *tud*, to thrust, Gk. *γέγονα*, perfect of *γίγνεσθαι*, to become, Lat. *memordi*, perfect [aorist] of *mordere*, to bite, Goth. *haihait*, preterite of *haitan*, to call). This reduplication is probably intensive in origin, as is seen in the intensive or frequentative and desiderative conjugations in Sanskrit. The separable initial letter used regularly in Sanskrit and Greek, and sometimes in Armenian, to denote past time when prefixed to a preterite tense (as Skt. *abharam*, imperfect of *bhar*, to bear, Gk. *ἔφερον*, imperfect of *φέρειν*, to bear, Armen. *ekaç* beside *kaç*, preterite of *kal*, to stand) does not properly belong to inflection, and the same exclusion holds true with regard to ablaut (q.v.).

Inflection may, however, be internal and initial as well as final in Semitic. As examples from Arabic, which is the most highly inflected of all the Semitic dialects, may be cited *qatala*, he kills, *qutūla*, he is killed, *yaqtulu*, he killed, *yuqtalu*, he was killed, *uqtul*, kill! *tuqātilūna*, ye fought, or *wajaba*, it is necessary, *ujibu*, I made it necessary, *nastawjibu*, we considered it necessary for ourselves.

The decay and loss of inflection has been constant from the pre-Indo-Germanic period to the present day. The analytic type of language (see PHILOLOGY) has steadily encroached on the inflectional, until we have such relatively inflectionless languages as the English and the modern Persian. It has been estimated that a Greek verb can have as many as 249 different forms without counting its infinitives and participles, whereas for the Sanskrit it may reach the astounding number of 891 different forms. If we compare with these the very limited number of verb forms in modern English, we can obtain some idea of the tremendous loss of inflections that has marked its growth. It is still a moot question whether the growth of the analytic type at the expense of the inflectional marks an advance. Certain scholars, notably Jespersen in his *Progress in Language with Special Reference to English* (London, 1894), have answered in the affirmative, for in an inflectional form, as Lat. *amaveram*, I had loved, we have the attitude of the speaker, the person of the speaker, the time of the action, and the verbal force all combined, which may be more elements than are necessary in some instances for the speaker's immediate purpose. On the other hand, the inflectional languages are more compact than the analytic. A fair answer to this problem may be that the surrender of inflection to analysis marks a linguistic loss but a psychological gain. Such a conclusion carries with it the implication that, as psychological requirements ultimately condition all but the mechanical (phonetic) side of language, the final balance is in favor of the analytic type of speech.

INFLECTION IN LIGHT. See DIFFRACTION AND DIFFRACTION GRATINGS.

INFLORES'CENTE (from Lat. *inflorescere*,

to begin to flower, from *in*, *in* + *florescere*, to begin to flower, from *florere*, to flower, from *flos*, flower; connected with OIr. *bláth*, OHG. *bluoma*, Ger. *Blume*, Goth. *blōma*, Icel. *blōme*, flower, and with AS. *blōstm*, Eng. *blossom*). The manner in which flowers are arranged in a cluster; or sometimes simply a flower cluster. In many plants the flowers occur singly, either at the end of the stem or among the leaves; but when

INFLORESCENCE.

1, spicate raceme; 2, compound umbel; 3, panicle; 4, elongated cyme; 5, corymb.

a definite region of the plant is set apart for flowers, it is called an inflorescence. The arrangement of flowers in such clusters is very diverse, and numerous technical terms are employed to designate the different kinds of inflorescence. All kinds, however, are usually reduced to two categories—the indeterminate, or *botryose*, and the determinate, or *cymose*.

In the botryose type no flower stands upon the end of the axis, which therefore may continue its growth indefinitely (hence an indeterminate inflorescence). As a consequence, the flower buds continue to appear at or near the growing tip of the axis, and since the older flowers are below, this method is called *acropetal* or *ascending*. There are numerous forms of the botryose type, conspicuous among which are the following: *Raceme*, in which each flower, upon its own stalk, stands upon an elongated axis, as in spring beauty (*Claytonia*) and shepherd's purse (*Capsella*). Such an inflorescence is elongated, open, and spraylike. *Panicle*, a modification of the raceme, in which the flower stalks, especially the lower ones, branch, bear a small cluster of flowers, and together produce a general cluster more or less pyramidal in outline, as in the spraylike inflorescence of many grasses (as redtop). *Thyrus*, a modification of the panicle, in which the flowers are so congested as to form a compact pyramidal cluster, as in the lilac and a bunch of grapes. *Spike*, a modification of the raceme, in which the individual flowers have no stalks, but rest directly upon the elongated axis (sessile), as in the common plantain and many grasses (e.g., timothy). Sometimes these sessile flowers are so close together as to cover the axis completely, in other cases they are more or less scattered along it. A *spikelet* is literally a

small spike, but the term is applied almost exclusively to the small spicate flower clusters which together make up the general spike or panicle of grasses. *Ament*, or *catkin*, practically the same as a spike or raceme, but with the subtending bracts so conspicuous as to conceal the flowers until pollination, as in the pussy willow, alder, birch, etc., which in consequence are often called amentaceous plants. *Spadix*, a modification of a spike, in which the axis becomes fleshy, as jack-in-the-pulpit (*Arisæma*) and calla. In this case the fleshy spike or spadix is more or less enveloped by a great ensheathing bract called the *spathe*, which is often conspicuously colored. In the calla it is waxy white and represents to most persons the "flower." This inflorescence is characteristic of the great family of Aroids. *Corymb*, in which the stalks of the lower flowers are elongated in such a way as to produce a more or less flat-topped cluster. In such a cluster the lower flowers are the outermost, and, as they bloom first, the order of blooming, while really ascending or acropetal as in the raceme, appears to be from the circumference towards the centre, or *centripetal*. Most of the so-called corymbs are cymes (see below). *Umbel*, in which the floral axis does not elongate. The flower stalks appear therefore to rise from the same point, like the braces of an umbrella. This also results in a flat-topped cluster, as in wild carrot, wild parsnip, etc. Since each flower stalk is usually subtended by a bract, in an umbel the bracts are thrown together in a rosette, which is called the *involucre*. Umbels very often become compound, i.e., each main stalk (ray) of the cluster bears another umbel, so that the general umbel is composed of a collection of small ones called *umbellets*, whose involucre is called *involucel*. This inflorescence is characteristic of the great family Umbelliferae. *Head*, a modification of an umbel, in which the flowers are sessile (without stalks) and result in a compact, headlike cluster, as in sunflower, dandelion, etc. In this case also an involucre is a conspicuous feature, and in the great family Compositæ the whole head with its numerous flowers is commonly spoken of as a single flower.

In the *cymose* type of inflorescence the first flower appears at the end of the axis, which therefore ceases to elongate (hence a determinate inflorescence). As a consequence, the flower buds appear successively down the axis; hence this method is called *basipetal* or *descending*. There are several modifications of the cymose type, but the single term in most common use is *cyme*, which is a flat-topped cluster resembling a corymb. It may be distinguished easily, however, by the fact that the flowers begin to bloom in the centre (top) of the cluster, and the succession is towards the circumference, or *centrifugal*, as in elder and hydrangea. A *glomerule* is a cyme in which the flowers are so much crowded as to form a sort of head, as in some dogwoods. For bibliography, see references under BOTANY.

INFLUENCE LINES. See GRAPHIC STATICS.

INFLUENZA (It., influence), EPIDEMIC INFLUENZA, or LA GRIPPE. An infectious disease due to a specific bacillus and characterized by great weakness and prostration, with mental depression, and generally by catarrh of the nasal and respiratory passages.

History. Authorities differ as to the first

account of this disease as well as to the identity of epidemics occurring before 1580. A severe epidemic in 412 B.C., described by Hippocrates and Livius, is thought to have been influenza. Authentic epidemics of the disease have occurred frequently since 1173. In that year the disease spread over Italy, Germany, and England. The next epidemics occurred in 1239 and 1311, as far as available records show, though it is possible that the pestilence which devastated France in 1311 was of another nature. In 1323, 1327, 1387, and 1403 epidemics of *la grippe* certainly occurred, as well as in 1404, 1411, 1414, and 1427. The first pandemic of the disease reported appeared in 1510 and spread over all Europe, apparently rising in Africa. It was benign in character. In 1557 occurred a repetition of the experience, all Europe suffering, having been invaded by way of Asia, and spreading, some historians report, to America. The mortality from this epidemic was very large. In 1580 the second pandemic appeared, and it was characterized by special virulence. Epidemics followed in 1591, 1593, 1597, and 1626. In 1647 the influenza spread through the plantations of America and in the West Indies. Hubbard reports that there died in Barbados and St. Kitts 5000 or 6000 each. The years 1658, 1675, 1688, 1693, 1709, 1712, 1729, and 1732 were *grippe* years. In the last-named year the American colonies suffered, as also the West Indies, Mexico, and South America; Russia, Poland, Germany, Switzerland, Holland, England, Scotland, France, Spain, and Italy were attacked in about the order named. People upon vessels in the open sea were said to have been attacked. In 1737 and 1742-43 the dread disease reappeared. In accounts of the latter epidemic the terms "influenza" and "grippe" first appeared. In 1758, 1761, 1762, 1767, 1775, 1780, 1781-82, 1788-89, 1799-1800, 1802-03, the disease was reported in epidemic form, and from 1803 to 1830 it spread from country to country, disappearing and reappearing after short intervals. China is supposed to have suffered most in 1830-32, Upper Asia, Europe, and North Africa being invaded in 1833. From 1836 to 1848 it prevailed in various localities, as also from 1850 to 1889. In 1847-48 the influenza was pandemic, with a high mortality. The pandemic in which the present generation is most interested began in 1889, when the disease spread over the whole globe. Since that date the United States has hardly been free from influenza, for the epidemics of 1893-94 and 1905 must be viewed as recrudescences of the persisting epidemic, individual cases or small epidemics having been separately observed. The pandemic of 1889 originated in Central Asia. From Bokhara it was traced successively to Siberia, European Russia, Sweden, Denmark, France, Germany, Belgium, and England; Asia Minor, Italy, Turkey, and Greece being attacked simultaneously with Germany and England. Shortly thereafter it appeared in Tunis, later in Mexico, South America, and Australia. It invaded Boston at the same time London was attacked, and San Francisco contemporaneously with Buenos Aires. Human intercourse and especially commerce appear to be the determining factors in its dissemination. The mortality in later epidemics has been variously estimated at from 17 to 50 per cent.

Cause. The aërobe causing influenza is called *Pfeiffer's bacillus*. It was discovered in 1891 by

Pfeiffer, Kitasato, and Canon, working independently. It is a bacillus occurring singly, in pairs, or chains, or clumps, appearing as a straight rod with rounded ends, nonmotile, and not forming spores. It is best stained by a weak solution of carbol-fuchsin applied for at least 10 minutes. The bacillus grows best on glycerin-agar smeared with blood, at body temperature. The bacilli are found chiefly in the respiratory passages, mixed with other organisms, in the nasal mucus, or in the sputum from the bronchi, and even penetrating to the submucous stratum of the mucous membrane. They are occasionally found in the blood in small numbers. They are found in the secretion in grippal middle-ear inflammation and also in the exudate in cases of grippal meningitis. The chief symptoms of the disease are due to toxins resident in the bodies of the bacilli or produced by them as excretory matter, and absorbed by the victim from the respiratory tract. The bacillus has not been found in any other disease, but is always present in the secretions of the respiratory tract in true influenza. Experimental inoculation of monkeys has caused high fever, followed by death, no definite results being reached. But there is no evidence that any of the lower animals suffer from influenza under natural conditions.

Symptoms. The symptoms of a typical attack of influenza are headache with especially severe pain in the orbits and at the base of the occiput; fever, with a temperature of 102° or 103°, generally following an initial chill; great prostration and weakness with mental depression; pain in many of the joints and bones, and tenderness in the muscles; swelling of the mucous lining of the nasal passages with increased flow of mucus; cough, with expectoration of small masses of thick yellowish or greenish mucus, accompanied by tenderness in the region of the breast bone; rapid and generally weak pulse; buzzing noises in the ears; and slight tremor of the whole body. There is an inflammation of the throat, its mucous lining being congested and the palatal folds swollen and rigid. There may be sudden attacks of vertigo or of syncope, or of unconsciousness resembling that due to apoplexy. In some cases, in the place of severe catarrhal symptoms, an eruption, resembling an urticaria, appears on the body. In others the most severe symptoms are referable to the gastrointestinal tract; the tongue being coated, the breath foul, the abdomen very tender on pressure, vomiting occurring, and the action of the bowels being irregular. In still other cases the headache, backache, neuralgia (trigeminal, occipital, cervicobrachial, or intercostal), myalgia, insomnia, syncope, and vertigo are the most prominent symptoms. Influenza is peculiarly apt to attack the accessory nasal sinuses and the ears, empyema of these cavities and of the mastoid process of the temporal bone being a common complication. The predominance of sets of symptoms in certain classes of cases has led to the attempt by some physicians to divide influenza into respiratory, gastrointestinal, and nervous forms, of which the last has been fairly adopted. In all cases there is danger of pneumonia (q.v.). Both pleuræ and lungs are involved with surprising rapidity very early in some cases, with or without bronchial implication. The pneumonia is lobular in variety, disseminated in separate areas throughout the lungs, with irregular and

atypical invasion. It resolves by lysis and not by crisis, and predictions of its termination are impossible. The grippe pneumonia is much more fatal than the ordinary lobar pneumonia. The only safe place for a patient with influenza is in bed, during the attack, lest myocarditis (q.v.) or pneumonia should suddenly appear, and the patient's life be actually jeopardized, and lest the effort to continue one's vocation in spite of undermined strength result in a protracted neurasthenia as a sequel to the attack.

Treatment. The treatment of epidemic influenza consists in rest in bed, as has been said, as soon as the prostration supervenes, or the temperature rises above the normal. Among drugs quinine occupies the front rank. It is of great value in every case, not in large doses and not necessarily prolonged. Other drugs of value, at different stages or in different types of the disorder, are antipyrin, phenacetin, salipyrin, salicylate of sodium, iodine, digitalis, benzol, carbolic acid, ipecacuanha, camphor, alcohol, and strychnine. Several of these remedies being powerful and dangerous drugs, they should not be indiscriminately used, or used at all without a physician's advice. A weak heart may be crippled by the unintelligent use of a depressant or an overstimulating drug.

Prophylaxis. The contagium of the disease is carried by the sputa and the nasal mucus, and precautionary measures should be employed, where possible, to limit the disease. *Grippe* patients in hotels, sanitariums, and schools should be isolated. Their table utensils and bed linen and body clothes should be disinfected with boiling water. Prevention should be secured of the deposition of secretions upon carpets or furniture. Gargles, nasal sprays, and mouth washes prevent infection by clearing out mucus that might form a nidus for the disease in a healthy mouth. Quinine internally is a good prophylactic. The bacillus has been found dead after two hours' exposure to sunlight or dry air, in nasal mucus. Infection of another may occur from the moisture in the breath of a patient who coughs out a spray of fine mucus into the atmosphere. Reinfection of a convalescing patient frequently occurs. Patients should therefore cough into a moist handkerchief; avoid kissing others; use separate utensils at table; sterilize these and all clothing of body and bed; spit into a cup containing water, this cup to be cleansed frequently with very hot water; or if in a school, hotel, sanitarium, etc., be isolated. Patients suffering with tuberculosis, bronchitis, pharyngitis, or nasal catarrh should avoid mingling with *grippe* patients.

Huxham, *Opera Physio-Medica* (Leipzig, 1874); Schweich, *Die Influenza* (Berlin, 1836); Wolff, *Die Influenza-Epidemie, 1889-92* (Stuttgart, 1892); Edson, *La grippe* (2d ed., New York, 1894); Tyson, *Practice of Medicine* (Philadelphia, 1913); Hopkirk, *Influenza* (New York, 1914). Lichtenstern's account in Hermann Nothnagel, *Handbuch* (Berlin, 1870), is very complete. See BACTERIA; EPIDEMIC.

INFLUENZA (in animals), HORSE DISTEMPER, EPIZOÖTY, PINK EYE, TYPHOID FEVER, or BILIOUS FEVER (Fr. *grippe*, Ger. *Pferdestaupe*). An acute febrile, contagious disease of the horse, ass, and mule that occurs frequently in stables in an enzoötic form, the primary cause of which has not been established. Two forms are distinguished: one, the

catarrhal influenza, characterized by acute catarrh of the mucous membranes; the other, the pectoral influenza, characterized by severe inflammation of the lungs and pleura. The affection is characterized by stupor, alteration of the blood, great depression of the vital forces, and frequent inflammatory complications of the important vascular organs, especially of the lungs, intestines, brain, and laminae of the feet. The animal becomes dull and indifferent to surroundings, has a rapidly developing fever, and stands with its head down. The eyes become puffed and secrete a watery discharge, and the mucous membranes of the eye and mouth become reddened or yellowish. Dropsical swellings may appear on the legs and undersurface of the abdomen. When the disease has run its course, which requires a period of six to ten days, the fever abates as rapidly as it began. Death may occur from extreme fever, failure of the heart's action, asphyxia following congestion of the lungs, etc., the disintegration of the red blood corpuscles. The most important complications of the disease are inflammatory processes in the lungs in about 50 per cent of the cases, in the brain, or laminar tissue of the feet. The majority of horses are susceptible to influenza, and it is fatal in many cases, even with the best treatment. One attack usually protects from future attacks, but not always. Since the red corpuscles are destroyed by the disease, bleeding should not be practiced except in strong subjects. It is important that the sick horse should be placed in a well-ventilated box stall, and that it consume a moderate quantity of nourishing food. The temperature may be reduced by injecting large quantities of cold water into the rectum. To reduce the temperature, antipyrin may be used with alcohol or strychnine. Quinine and salicylic acid in dram doses will also lower the temperature. Mustard poultices, baths of alcohol, turpentine, and hot water are useful in relieving congestion of the lungs. Aconite has an almost specific action in congestion of the brain. Excellent results have been obtained during the last few years from the administration of salvarsan and neosalvarsan, but the high cost of these drugs has prevented a more general use. Consult: United States Department of Agriculture, *Special Report on Diseases of the Horse* (rev. ed., Washington); Hutyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals* (Am. ed. from 3d rev. Ger. ed., 2 vols., Chicago, 1912); E. W. Hoare, *System of Veterinary Medicine* (ib., 1913).

IN FORMA PAUPERIS. See FORMA PAUPERIS, IN.

INFORMATION (Lat. *informatio*, outline, representation, from *informare*, to sketch, to inform, from *in*, in + *forma*, shape). In English and American law, a summary method of instituting criminal proceedings at the instance of the public authorities and without the process of indictment (q.v.). The free use of this proceeding under the Tudor and Stuart kings and its abuse by the Court of Star Chamber constituted one of the grave abuses of the royal prerogative at which the revolutions of 1645 and 1688 were aimed. The process was greatly restricted by Act of Parliament in 1641 (16 Car. I, c. 10) and 1693 (4 and 5 Wm. and Mary, c. 18). In theory the right to institute criminal proceedings by information was always

limited to the class of offenses known as misdemeanors, but the distinction between misdemeanors and felonies was too indefinite to make this a complete safeguard of the liberty of the subject. The Constitution of the United States (Amendments Art. V) restricts the use of informations to crimes which are not capital or of an infamous character by requiring an indictment by a grand jury in all such cases. In practice, at the present time, in England an information filed by the Attorney-General or Master of the Crown Office is resorted to only in cases of such misdemeanors as tend to disturb the peace or affect the administration of the government, as libels on judges, magistrates, or public officers, bribery at elections, etc. This information is usually called a criminal or an ex-officio information, and the defendant is put on his trial in the same way as under an indictment. In form and substance it is precisely like an indictment, differing from it only in the fact that it is presented upon the official oath of a duly authorized officer of the government and not upon presentment alone by a grand jury.

There are other informations, such as those called *quo warranto*, to test the validity of an election or appointment to a public office, etc. An information by the Attorney-General in chancery is a suit on behalf of the crown as to any misapplication of a public charity or on behalf of an idiot's or lunatic's property. The term is also commonly used to denote the written statement made on oath before a justice of the peace, or committing magistrate, previous to the issuing of a summons or complaint against a person charged either with a crime or an offense punishable summarily. There are also informations in the Court of Exchequer to recover penalties for the breach of the revenue laws. The term is not now used technically in Scotland, except in cases of difficulty, when the court of justiciary orders informations—i.e., written arguments.

In the United States courts actions for minor offenses, such as attempts to evade the revenue laws, etc., sometimes proceed upon information. In several of the States all misdemeanors, except misprision of treason (q.v.), may be prosecuted upon information, but in the case of felonies indictment is everywhere necessary. Information is also the form of proceeding employed in certain civil cases. By this process a person filling a civil office may be brought into court to show by what authority he assumes to exercise the functions thereof, with a view to his displacement in case it can be shown that his authority is insufficient and that the office belongs to another. If an unincorporated association assumes corporate powers, it may be ousted by this process, while a legal corporation may be thus arraigned for a violation of its charter or any infraction of law. See the bibliography under CRIMINAL LAW, and consult Stephen, *History of the Criminal Law of England* (London, 1883), and Sir William Blackstone, *Commentaries on the Laws of England* (4th ed., 2 vols., Chicago, 1899).

INFORMER. In English and American law, a person who brings a criminal accusation against another. This term is not technically applicable to the officer of the government who presents an information (q.v.) against an offender, but to the person on whose "relation" the proceeding is instituted. As at common law

the prosecution of criminal offenses was generally left to private initiative, the informer played an important part in the enforcement of the criminal law. With the institution of a crown prosecutor in England and of prosecuting attorneys in the United States, the importance of the informer has gone. At common law the informer had no private interest in the proceedings instigated by him, but by statute in many classes of cases, especially in violations of the revenue laws, informers are given a right of action for a penalty imposed by the law. The term "informer" has thus come to be commonly employed to describe a person entitled to enforce such a claim or demand. In England, when the informer sues in such an action, it is called a penal or *qui tam* action; but, in general, the penalty is now recoverable before justices of the peace in a summary proceeding. In informations and suits in chancery, which require to proceed in the name of the Attorney-General, the informer is called a relator. In Scotland an informer is the party who sets the Lord Advocate in motion in criminal prosecutions; and the Lord Advocate is bound to give up the name of the informer, who is liable in case the prosecution instigated by him was without reasonable and probable cause. See MALICIOUS PROSECUTION; and consult the authorities referred to under CRIMINAL LAW.

INFRALAPSA'RIAN (Lat. *infra*, below + *lapsus*, p.p. of *labi*, to slip), or **SUBLAPSARIAN**. In theology, one who holds that God permitted the fall of man without positively foreordaining it and makes His election of certain men to salvation and others to condemnation dependent upon His foreknowledge of the fall. According to this view God determined to create the world, to permit the fall, and to elect from the mass of fallen men some to eternal life, and leave the residue to suffer the just penalty of their sins. Election is thus made from those fallen by their own act, and this act is not necessitated by the divine power. Opposed to this view is that of the supralapsarians, who hold that the fall of Adam with all its evil consequences was predetermined from eternity, and that election to salvation or reprobation precedes the purpose to create and permit the fall and has no relation to it. God's purpose in creating and governing the universe is to manifest His attributes and glory; and He decrees the fall and creates some to be saved and others to be lost to exhibit His grace and justice. John Calvin wrote some passages which seem supralapsarian, but in his later work he is infralapsarian. The terms themselves did not come into use until after his time. The Creeds of the Synod of Dort (q.v.) and of the Westminster Assembly are infralapsarian. Many Calvinists were supralapsarians, e.g., Beza and Edwards, but this is rather hyper-Calvinistic than Calvinistic. The distinction is not confined to Calvinists. It is found also among the Roman Catholics. See CALVINISM; ELECTION; FALL, DOCTRINE OF THE; FOREKNOWLEDGE AND FOREORDINATION.

INFRINGE'MENT (from Lat. *infringere*, to break, from *in*, in + *frangere*, to break; connected with Goth. *brikan*, OHG. *brehhan*, Ger. *brechen*, AS. *break*). In its most general sense, any violation of a law or invasion of a legal right which gives rise to a cause of action, in law or equity, in favor of the person injured thereby. The term is, however, more commonly

employed in a technical sense to describe an unlawful appropriation of writings or works of art, inventions or trade-marks, when protected by copyrights, patents, or registration. The usual and proper remedy for an invasion of these rights is an action at law for the damages sustained, or a proceeding in equity for an injunction to restrain the infringement, thus securing an absolute enjoyment or monopoly of the inventions, writing, or trade-mark embraced in the work or device so protected.

Infringement of Patent. The manufacture, use, or sale of a thing, the subject matter of which is a patented invention, constitutes an infringement of the latter. To prove that an alleged new device incorporates the substance of an invention so protected, it is necessary to establish that the same result is accomplished, the same functions performed, and that the mode of operation is substantially the same. If these characteristics are present, a mere change in the form or in the arrangement of the parts of a patented article will not save the device thus constructed from being condemned as an infringement of the patentee's rights. See PATENT.

Infringement of Trade-mark. This consists in the unlawful use of a mark or device which another has registered to provide a means of identification of his goods for the general public. Any device which is so similar to a registered trade-mark as to deceive or mislead the public constitutes an infringement thereof, even though it would not be difficult to distinguish the two when closely examined. The usual remedy for such infringement is by injunction. See TRADE-MARK; TRADE NAME; LABEL. For the treatment of the subject of *Infringement of Copyrights*, see COPYRIGHT; LITERARY PROPERTY; and also ABRIDGMENT.

INFUNDIB'ULUM (Lat., funnel). A term used in anatomy to denote tubular passages that are somewhat funnel-shaped. The infundibulum of the brain is a hollow process continuous with the tuber cinereum and terminating in the pituitary body. The infundibulum of the nose, or infundibulum of the ethmoid bone, is a long cellular canal which passes from the frontal sinus through the anterior ethmoidal cells to the middle meatus of the nose. The infundibulum of the heart, or conus arteriosus, is that portion of the right ventricle of the heart which approaches the orifice of the pulmonary artery. The infundibula of the kidney are the three prolongations of the pelvis of the kidney, which are in turn subdivided into the calices.

INFU'SION (Lat. *infusio*, a pouring in, from *infundere*, to pour in, from *in*, in + *fundere*, to pour; connected with Goth. *giutan*, AS. *gēotan*, OHG. *giozan*, Ger. *giessen*, Gk. *χεῖν*, *chein*, Skt. *hu*, to pour), or **INFUSUM**. A term applied in pharmacy to an aqueous solution of a vegetable substance obtained without the aid of boiling. Such solutions are usually prepared by digesting in soft water (which may be either hot or cold, according to circumstances) the sliced or powdered substance in an earthenware vessel fitted with a cover. Cold water is preferable when the active principle is very volatile, or when it is expedient to avoid the solution of some ingredient in the vegetable which is soluble in hot but not in cold water. In most cases, however, hot water is employed. Infusions are preferred to decoctions when the active principle volatilizes at a boiling heat, as in the case of essen-

tial oils; or when ebullition readily induces some chemical change.

Infusions may also be prepared by percolation (q.v.), a process which is extensively employed in the preparation of tinctures. In all cases they should be prepared freshly for each day's consumption. Some pharmacists add less water than the stated amount in preparing an infusion by percolation, then add a considerable percentage of alcohol, and stock the preparation till demanded. When ordered, they add to this concentrated infusion enough water to equal the proportion in the fresh article. Four infusions are official in the United States Pharmacopœia, viz., cinchona, digitalis, *Prunus virginianæ*, and senna.

IN'FUSO'RIA (Neo-Lat. nom. pl., from Lat. *infusorium*, reservoir of a lamp, from *infusor*, pourer, from *infundere*, to pour in). The highest or most specialized class of Protozoa (q.v.). The name is of interest historically because originally applied to all those microorganisms which swarm in organic infusions, but it became gradually restricted to its present limits with the advancement of biological research. The name was first used about 1763, and the class Infusoria was removed from the Polypes by Lamarck in 1807. The name of Ehrenberg is, however, especially associated with the Infusoria, his epoch-marking work on them appearing in 1837. An excellent monograph of the group is that of W. S. Kent, *Manual of the Infusoria* (London, 1880-82). Consult S. T. Hickson, "The Infusoria," in E. R. Lankester, *Treatise on Zoölogy*, vol. i, part ii (ib., 1903), and M. M. Hartog, "Protozoa," in *Cambridge Natural History*, vol. i (ib., 1906).

INFUSO'RIAL EARTH. See DIATOMACEOUS EARTH.

INFU'SUM. See INFUSION.

INGALLS, in'galz, JAMES MONROE (1837-). An American soldier and authority on ballistics. He was born at Sutton, Vt., and served in the Civil War for a year and a half, at its close being promoted first lieutenant. Afterward he was engaged in reconstruction duty in the South until 1871. A year later he graduated from the Artillery School at Fortress Monroe, Va., where in 1882 he established the department of ballistics, and where he taught until 1898. He was promoted through the various grades to that of lieutenant colonel (1900) and was retired (1901); in 1904 he was made colonel retired. Besides contributing articles to Johnson's *Universal Cyclopædia*, he is author of *Exterior Ballistics* (1883, 1885, 1886); *Ballistic Machines* (1885); *Handbook of Problems in Exterior Ballistics* (1890, 1901); *Ballistic Tables* (1891, 1900); *Interior Ballistics* (1894; 3d ed., 1912); *Ballistics for the Instruction of Artillery Gunners* (1893).

INGALLS, JOHN JAMES (1833-1900). An American politician and publicist, born at Middleton, Mass. He graduated at Williams College in 1855, studied law, and in 1857 was admitted to the Massachusetts bar. In the following year, becoming interested in the "free State" movement in Kansas, he removed to Atchison in that State and began practice. He was a member of the State Constitutional Convention in 1859, was elected Secretary of the Territorial Council in 1860, and after the admission of Kansas to the Union in January, 1861, became Secretary of the new State Senate. The next year he was elected a member of the Senate,

but failed to get the Republican nomination for Lieutenant Governor. From 1863 to 1865 he was editor of the *Atchison Champion*, and in 1873, after a sharp contest, was elected as a Republican to the United States Senate. In the Senate, to which he was reelected in 1879 and 1885, he was a fluent and frequent speaker, brilliant at repartee, and was an excellent parliamentarian. He was a faithful champion of the various Republican administrations, and was president pro tempore of the Senate from 1887 until 1891, when he lost his seat as a result of the strength of the Democratic-Populist movement in his adopted State. He wrote much for newspapers and magazines on public topics and on farming. Consult Connelley, *Life of John J. Ingalls* (Kansas City, Mo., 1903).

INGALLS, MELVILLE EZRA (1842-1914). An American railroad official, born at Harrison, Me., and educated at Bridgton Academy, at Bowdoin College, and at Harvard University (LL.B., 1863). He practiced law at Gray, Me., and later at Boston, and was a member of the Massachusetts Senate in 1867. He became president in 1870 and receiver in 1871 of the Indianapolis, Cincinnati, and Lafayette Railroad, which he reorganized upon a sound financial basis as the Cincinnati, Indianapolis, St. Louis, and Chicago. Later, by the consolidation of this road with others, he formed the Cleveland, Cincinnati, Chicago, and St. Louis—the "Big Four System"; of this he was chairman until his resignation in 1912, and he served also as president of the Chicago and Ohio Railway Company from 1888 to 1900. In 1905 he was president of the National Civic Federation.

INGALLS, RUFUS (1820-93). An American soldier, born in Denmark, Me. He graduated at West Point in 1843 and served through the war with Mexico. In 1854-55 he accompanied Colonel Steptoc's expedition across the continent. During the Civil War he served with the Army of the Potomac, chiefly in the quartermaster-general's department, and was present at many of the most important battles, including Fredericksburg, Chancellorsville, Gettysburg, and the Wilderness. He was mustered out of the volunteer service on Sept. 1, 1866, with the brevet rank of major general both in the volunteer and in the regular army. In 1882 he was made brigadier general and quartermaster-general, and on July 1, 1883, was retired.

INGAUNI, in-ga'nè. An ancient tribe dwelling on the mountains and seacoast of what is now the western Riviera of Italy. They were active in the wars between the Romans and the Ligurians and were allies of the Carthaginians in the Second Punic War. After the battle with Æmilius Paulus (181 B.C.), in which they lost 15,000 men, very little was heard of them. Their chief town was Album Ingaunum, or Albingaunum (now Albenga, q.v.).

INGE, inj, WILLIAM RALPH (1860-). An English theologian, born in Crayke, Yorkshire, son of the provost of Worcester College, Oxford. He was educated at Eton and at King's College, Cambridge, of which he was fellow in 1886-88, being assistant master at Eton from 1884 to 1888. In 1889-1904 he was fellow and tutor of Hertford College, Oxford. He was repeatedly select preacher at Oxford and Cambridge, was Bampton lecturer in 1899 and Paddock lecturer (*Personal Idealism and Mysticism*, 1906) in New York, and was Lady Margaret professor of divinity at Oxford in 1907-11. In 1911

he was chosen dean of St. Paul's. Among his works are: *Society in Rome under the Cæsars* (1886); *Eton Latin Grammar* (1889; 3d ed., 1900), with Rawlins; *Christian Mysticism* (1899); *Faith and Knowledge* (1904); *Studies of English Mystics* (1906); *Truth and Falsehood in Religion* (1906); *Personal Idealism and Mysticism* (1907); *Faith* (1909); *Speculum Animæ* (1911); *The Church and the Age* (1912).

INGEBORG, ینگ'e-börg', or **INGEBURGE**, ینگ'e-bōōr'ge (c.1176-c.1237). A French queen, born in Denmark. She was the sister of Canute IV of Denmark and married Philip Augustus, King of France, in 1193. About three months after this marriage the King repudiated her and tried to obtain a separation. Pope Innocent III supported the Queen's rights and excommunicated Philip, who had married Agnes of Meran (1196), and he put France under an interdict. Philip promised to reinstate the Queen; but she was kept in prison, and it was not until 1213, when Philip Augustus needed her aid, that she regained her rights. Consult Davidson, *Philip II, August von Frankreich, und Ingeborg* (Stuttgart, 1888).

INGEGNERI, ینگ'gā-nyā'rè, MARCO ANTONIO (c.1545-92). An Italian composer, born at Verona. He was a pupil of Vincenzo Ruffo and later the teacher of Monteverde (q.v.). Some time about 1575 he became maestro di cappella at the cathedral of Cremona, where he died. His work is of such excellence that for a long time his *Responsoria Hebdomadæ Sanctæ* was ascribed to Palestrina and even printed in Breitkopf and Härtel's complete edition of Palestrina's works, although as "opus dubium." The discovery by F. X. Haberl, in 1897, of a printed copy of this work, bearing the date 1588 and the name of Ingegneri as the composer, established the real authorship. Other works that have been preserved are two books of masses for five, six, and eight voices, a book of madrigals for six voices, five for five voices, and two for four voices.

INGELOW, ینگ'jè-lō, JEAN (1820-97). An English poet and novelist, born in Boston, Lincolnshire. To the public she was unwilling to give the details of her life. Her first volume of verse, *A Rhyming Chronicle of Incidents and Feelings* (1850), published anonymously, excited considerable interest. Another volume, *Poems* (1863), which included "The High Tide on the Coast of Lincolnshire," possessed that kind of appeal which gave it immediate and instant success and sent it eventually into more than 20 editions. Subsequently she wrote *The Story of Doom, and Other Poems* (1867) and *Poems of the Old Days and the New* (1885). Her prose works include the novels *Off the Skelligs* (1872); *Fated to Be Free* (1873); *Sarah de Berenger* (1880); *Don John* (1881); *John Jerome* (1886); and also *Stories Told to a Child* (1865); *Mopsa the Fairy* (1869); *The Suspicious Jaekdaw* (1871); *A Motto Changed* (1893); and others. Jean Ingelow is at her best in lyrics, especially those of a ballad nature. In her poetry there is the sweetness of her own character; but a something stilted and affected hurts her verse, as does also a certain tendency to improvisation. The charm of her poetry passed into some of her novels, notably *Off the Skelligs*; and *Mopsa* is a pretty tale of fairyland. Consult her *Poems* (Boston, 1892); selections from her poems with biographical and critical note, in *Warner's Library of Best Liter-*

ature, vols. xiv, xx (New York, 1896-99); and her collected *Poems* (London, 1898).

INGEMANN, ینگ'e-mán, BERNHARD SEVERIN (1789-1862). A Danish poet and novelist. He was born at Torkildstrup on the island of Falster, May 28, 1789, and was trained at the University of Copenhagen. His first *Poems* (1811) were of a dreamy and melancholy religiosity. *Procne* (1813) shows evidences of requited love; *The Black Knights* (1814) marks growing power, and the tragedies *Blanea* and *Masaniello* (1815) achieved a success of sentimental sensation. Ingemann received a government stipend, traveled, and on his return showed marked talent in narrative in *Fairy Tales and Stories* (1820). *The Magnetism in the Barber's Shop*, an unsuccessful comedy, closed his career as a playwright (1821). He now became lecturer on Danish language and literature at Sorö College, married, and wrote historic poems and novels voluminously, with a childlike faith that he was contributing to history (*Valdemar the Great and his Men*, 1824; *Valdemar the Victorious*, 1826; *Erik Menved's Childhood*, 1828; *King Erik and the Outlaws*, 1833; *Prince Otto of Denmark*, 1835; *Holger Danske*, 1837, and others). He wrote also a collection of very popular *Morning and Evening Hymns*. In 1846 he became director of Sorö College and retired in 1849. In the last decade of his life his work was almost wholly religious. His last book, *The Apple of Gold*, appeared in 1856. Ingemann's collected *Works* were published in 41 volumes (Copenhagen, 1843-65).

Bibliography. Ingemann's autobiography, edited by Galskjöt, *Min Levnedsbog* (Copenhagen, 1862); Heise, *Breve til og fra Ingemann* (ib., 1879); S. Grundtvig, *Grundtvig og Ingemann, Brevveksling, 1821-59* (ib., 1882); Nörregaard, *Ingemanns Digterstilling og Digterværk* (ib., 1886); Schwanenflügel, *Ingemanns Liv og Digtning* (ib., 1886); G. Brandes, *Essays* (1889).

INGENHOUSZ, ینگ'en-hous', JAN (1730-99). A Dutch scientist. He was born in Breda and studied and practiced medicine in his native country, but removed to London about 1765. Accident brought him an introduction to the Austrian Imperial family, whom he served professionally with such success that in 1768 he was made Aulic Councilor and body physician to Maria Theresa and to Joseph II. In 1779 he returned to London. He devoted much time and study to research in electricity and invented about 1760 the plate electrical machine which bears his name. Ingenhousz wrote several scientific treatises and essays, such as *Experiments on Vegetables, Discovering their Great Power of Purifying the Common Air in Sunshine, but Injuring it in the Shade or at Night* (1779); *Anfangsgründe der Electricität* (1781); and *Essay on the Food of Plants and the Renovation of Souls* (1796). A number of his papers were published in two volumes in Paris in 1785-89 under the title *Nouvelles expériences et observations sur divers objets de physique*.

INGERMANLAND, ینگ'ēr-mán'lánt, or **INGRIA**, ینگ'grī-à. The old name for a region in northwest Russia, constituting part of the Government of St. Petersburg. It belonged originally to Novgorod, and from 1617 to 1702 it was held by the Swedes, who lost it again to Russia in the wars of Peter the Great.

INGERSOLL, ینگ'gēr-söl. A town in Oxford Co., Ontario, Canada, on the Thames River, 19 miles northeast of London, on the Grand Trunk

and the Canadian Pacific railroads (Map: Ontario, D 7). It is a great exporting point and has manufactures of machinery, woolen goods, agricultural implements, furniture, tools, flour, knitted goods, cheese, fertilizers, pork-packing products, hearses, fruit packages, pianos, baskets. Pop., 1901, 4573; 1911, 4763.

INGERSOLL, CHARLES JARED (1782-1862). An American lawyer, writer, and politician, the son of Jared Ingersoll (1750-1822), a framer of the Constitution. He was born in Philadelphia, entered the College of New Jersey, where he remained three years, then studied law, traveled in Europe, and was for a time attached to the United States embassy in Paris. In 1801 he wrote the tragedy *Edwy and Elgiva*, which was produced at the New Theatre in Philadelphia, and in 1808 he published a strong political pamphlet in defense of the Republican policy of Thomas Jefferson. Three years later appeared his *Inchiquin the Jesuit's Letters on American Literature and Politics*. He was elected to Congress in 1812, was for 14 years United States district attorney for Pennsylvania, and again served in Congress from 1839 to 1849. His most ambitious work was *Historical Sketch of the Second War between the United States of America and Great Britain* (4 vols., 1845-52), which deals with the events of 1812-13. Consult W. M. Meigs, *Life of Charles J. Ingersoll* (Philadelphia, 1898).

INGERSOLL, CHARLES ROBERTS (1821-1903). An American politician and public official, son of Ralph Isaacs Ingersoll. He was born in New Haven, Conn., graduated at Yale in 1840 and at the Yale Law School in 1844, and, after several terms in the Connecticut Legislature, was Governor of the State from 1873 to 1877. He was a Democratic elector in 1876.

INGERSOLL, ERNEST (1852-). An American naturalist, born at Monroe, Mich. He studied for a time at Oberlin College and afterward in the Museum of Comparative Zoölogy at Harvard, where he was a pupil of Louis Agassiz. He went West as naturalist in the Hayden survey (1874 and 1877) and did much work with the United States Fish Commission. He became widely known as a writer of special magazine articles and of numerous guide books and as a popular lecturer upon scientific subjects. In 1901 he was lecturer on zoölogy at the University of Chicago. His books include: *Nests and Eggs of North American Birds*, parts i-vii (1880-81); *Oyster Industries of the United States* (1881); *Knocking 'round the Rockies* (1883); *The Ice Queen* (1884), and other juvenile novels; *The Crest of the Continent* (1885); *Down East Latch Strings* (1887); *Wild Neighbors* (1897); *The Book of the Ocean* (1898); *Nature's Calendar* (1900); *Wild Life of Orchard and Field* (1902); *Life of Animals: The Mammals* (1906; 2d ed., 1907); *Eight Secrets* (1906); *The Wit of the Wild* (1906); *Animal Competitors* (1911).

INGERSOLL, JARED (1722-81). An American politician, born in Milford, Conn., and educated at Yale College. In 1765, after the passage of the Stamp Act, he accepted, under Franklin's advice, the appointment as stamp agent for Connecticut, but soon, after undergoing the insults and personal abuse that fell to the lot of all Colonial stamp agents, was forced by the people to resign. In 1766 he published a pamphlet entitled *The Stamp Act*. He became an admiralty judge in 1770.

INGERSOLL, JARED (1750-1822). An American jurist, born in New Haven, Conn., son of Jared Ingersoll (q.v.). He graduated at Yale in 1766 and later went to London, where he studied law. His sympathies were with the patriot party in America, however, and at about the time of the signing of the Declaration of Independence he went to Paris, where he became intimate with Franklin, Izard, and other Americans then in the French capital. In the autumn of 1778 he returned to America and settled in Philadelphia, where he soon became well known as a lawyer. In 1780 he was elected to Congress and in 1787 was chosen a member of the Constitutional Convention. He was the first Attorney-General of Pennsylvania, was the Federal candidate for Vice President of the United States in 1812, and at the time of his death was presiding judge of the district court of Philadelphia County.

INGERSOLL, JOSEPH REED (1786-1868). An American politician, born in Philadelphia. He was the son of Jared Ingersoll (q.v.), a framer of the Constitution; the grandson of Jared Ingersoll (q.v.), and brother of Charles Jared Ingersoll (q.v.). He graduated at Princeton in 1804 and after studying law began to practice in Philadelphia. He was a member of Congress from 1835 until 1837, and again from December, 1841, until 1849. In 1852 he was appointed Minister to England by President Fillmore, but returned to America the next year. His most important publication is a pamphlet entitled *Secession a Folly and a Crime*, which appeared at the outbreak of the Civil War. He also wrote a *Memoir of Samuel Breck* (1863) and translated Roccus's *De Navibus et Naulo* and *De Assecuratione* (1809).

INGERSOLL, LEONARD ROSE (1880-). An American physicist, born in New York City. He graduated from Colorado College (B.S., 1902) and from the University of Wisconsin (Ph.D., 1905), where he was instructor in physics (1905-08), assistant professor (1908-10), and associate professor after 1910. He participated in the Smithsonian expeditions to Mount Wilson, Cal., in 1905, 1906, and 1909. He published *An Introduction to the Mathematical Theory of Heat Conduction* (1913).

INGERSOLL, RALPH ISAACS (1788-1872). An American lawyer and statesman. He was born in New Haven, Conn., graduated at Yale in 1808, was a prominent member of the bar, and a leading Democratic speaker in the Connecticut Legislature (1819-25), earning the name of "Young Hotspur" from his political opponents. Ingersoll was a Representative in Congress (1825-33), then Connecticut State attorney, and from 1846 to 1848 United States Minister to Russia.

INGERSOLL, ROBERT GREEN (1833-99). An American lawyer and infidel writer and lecturer. He was born at Dresden, N. Y., Aug. 11, 1833, the youngest of the five children of a Congregational minister of liberal views. The family removed to Illinois in 1845, and there Robert studied law, was admitted to the bar, and entered politics as a Democrat. In 1857 he made his residence in Peoria, where he soon became recognized as an able lawyer, chiefly employed in railroad litigation. In 1860 he was nominated for Congress, but was defeated. In 1862 he went to the war as colonel of the Eleventh Illinois Cavalry and was taken prisoner, but exchanged. He returned to citizenship

a Republican in politics and was appointed Attorney-General of Illinois in 1868. In 1876, at the Republican Presidential Convention at Cincinnati, he delivered a fervid and vigorous speech in favor of the candidacy of James G. Blaine, which won for him a national reputation, and from this time he was recognized as one of the foremost orators of the country. He soon after entered the lecture field, where the matter as well as the manner of his discourse excited public attention. He became a pronounced opponent to Christianity and, adopting religious topics as his subjects, attacked the popular Christian beliefs with all the force of which he was capable and with the advantage of splendid rhetorical powers. Colonel Ingersoll was counsel for large corporations. His published works include: *The Gods, and Other Lectures* (1876); *Some Mistakes of Moses* (1879); *Great Speeches* (1887); *Lectures Complete* (1883); *Prose Poems and Selections* (1884). His complete works were published in New York, 1900, 12 volumes. Consult the biographical sketch by Hanford (Chicago, 1899); E. C. Smith, *Life and Reminiscences of Colonel Robert G. Ingersoll* (New York, 1906); H. E. Kittredge, *Ingersoll: A Biographical Appreciation* (ib., 1911).

INGERSOLL, ROYAL RODNEY (1847-). An American naval officer, born at Niles, Mich. He graduated from the United States Naval Academy in 1868, served in various parts of the world, and became captain in 1903 and rear admiral in 1908. He commanded the *Supply* during the Spanish-American War and the *Maryland* in 1905, was chief of staff of the Atlantic fleet during its voyage from Hampton Roads to the Pacific, and later served on the General Board of the Navy. He was retired in 1909. He is author of *Text-Book of Ordnance and Gunnery* (1887; 4th ed., 1899); *Exterior Ballistics* (1891); *Elastic Strength of Guns* (1891).

INGHAM, ing'am, BENJAMIN (1712-72). An English evangelist. He was born at Ossett and graduated from Queen's College, Oxford, in 1734. He had, in 1733, become associated with the Wesleys and after his ordination, in 1735, accompanied them to Georgia. About 1737 he became a Moravian, broke with the Wesleyans, and founded in Yorkshire many Moravian congregations, which followed him when he separated from that sect. They were known as Inghamites until their head joined Sandeman, about 1760, when they broke up.

INGHAM, CHARLES CROMWELL (1796-1863). An American portrait and figure painter. He was born in Dublin, Ireland, and studied at the Dublin Institution under William Cuning. He came to America in 1817 and settled in New York, where he became celebrated as a portrait painter of women and children and as a miniature painter. He is interesting as having been identified with the first efforts to promote painting in this country. He was one of the original members, in 1826, of the National Academy of Design, of which he was vice president from 1845 to 1850, and was one of the founders of the Sketch Club. Among his figure pieces are: "Death of Cleopatra," "Day Dream," the "White Plume." His "Flower Girl" in the Metropolitan Museum is illustrated in Isham's *American Painting*. Among his portraits of prominent men are those of De Witt Clinton, Lafayette, and Gulian C. Verplanck. His colors were pure

and brilliant, and his details were finished with painstaking accuracy, but his work lacks strength and is inferior in composition.

INGHAM, COL. FREDERIC. The nom de plume under which Edward Everett Hale wrote *The Ingham Papers* (1869).

INGHAM, SAMUEL DELUCENNA (1779-1860). An American statesman and politician, born in Pennsylvania. Very little is known of his early life except that he had charge of a paper mill in New Jersey for a number of years. After serving in the Pennsylvania Legislature he was elected to Congress in 1813. He was a member of the House of Representatives till 1818 and again from 1822 to 1829. On March 6, 1829, he was appointed Secretary of the Treasury by President Jackson, a position which he held till Aug. 1, 1831. When the Portsmouth branch of the United States Bank was complained of as being conducted with partiality towards opponents of the administration, it was Ingham's correspondence with Nicholas Biddle, president of the bank, that resulted in its declaration of its intention to pursue an independent course and in the consequent struggle with Jackson.

INGHAMITES, ing'am-its. A sect founded by Benjamin Ingham (1712-72), who, after visiting the German Moravians with John Wesley, endeavored to unite the chief features of the Moravians and the Methodists in a new body, called, after him, Inghamites. The organization had at one time a large number of adherents in England, but Ingham and the greater part of his followers at last went over to the Sandemanians, and the sect disappeared.

INGHIRAMI, ɛn'gɛ-rä'mě. An Italian noble family of Volterra.—Its earliest member of importance was the humanist, TOMMASO (1470-1516), called Fedra, because of his success as Phædra in a presentation of Seneca's *Hippolytus* (or *Phædra*), but best known for his Latin orations, such as *Oratio in funere card. Ludovici de Podocataro*; *Oratio in laudem Ferdinandi Hispaniæ regis*; *Oratio in laudem Petri de Vicentia, episcopi Cesenatensis*, published by Galletti in Amaduzzi's *Aneddotti letterarii di Roma*, and for a few critical works in manuscript form on Horace and Plautus.—FRANCESCO (1772-1846), an archæologist of the same family, was also born at Volterra. Originally intended for the navy, he early showed such love for antiquities that he soon abandoned the career of arms. He studied under Lanzi and was a friend of the famous Hackert. Director of the Volterra Public Library, which was rich in Etruscan relics, he devoted himself especially to Etruscan archæology, and when in 1811 the Marucellian collection was transferred to Florence, he moved to Fiesole, where he founded his *Poliografia Fiesolana* and later published his great work, *I Monumenti Etruschi* (1820-27). Some of his other works are: *Galleria omerica* (1827-38), *Pittura dei vasi fittili* (1831-37), and the incomplete *Storia della Toscana* (1841-45). He also helped in the publication of the *Museo Etrusco-Chiusino* (Florence, 1833).—FATHER GIOVANNI (1779-1851), brother of Francesco, a famous astronomer and mathematician, and greatly revered as a priest, was professor of astronomy and mathematics in the Ximenian Institute, director of the Florence Observatory, and member of the most celebrated academies of the world. His fame rests especially on the very simple method used by him in the compilation of his *Effemeridi di occultazione delle piccole stelle sotto la luna*

from 1809 to 1830. He also wrote: *Principii idro-meccanici, La statica degli edifizii* (1803-05); *Tavole astronomiche universali portatili* (1811); *Effemeridi di Venere e Giove ad uso dei naviganti pel meridiano di Parigi* (1821-24); *Carta topografica e geometrica della Toscana* (1830); and other minor works and articles.

INGLE, ینگ'ل, RICHARD. An English seaman of the seventeenth century. He was engaged in the Maryland tobacco trade at the time of the Civil War in England and, taking the side of Parliament, drove Gov. Leonard Calvert out of the province in February, 1645. In December, 1646, Calvert returned at the head of a force of hired soldiers and regained control of the government. During his brief period of power Ingle behaved in a most lawless manner and on his return to England was called upon to answer charges preferred against him. He met this attack by presenting a petition to Parliament in which he said that his behavior had been dictated by conscience, and that he had plundered only "papists and malignants." He was especially exempted from the pardon extended to the other rebels by the restored proprietary government and last appears in history on Nov. 14, 1653, when he endeavored to secure a share in some prize money. Consult Ingle, *Capt. Richard Ingle, the Maryland Pirate and Rebel, 1642-53* (Maryland Historical Society Fund Publications, No. 19, Baltimore, 1884).

INGLEBY, ینگ'ل-بی, CLEMENT MANSFIELD (1823-86). A Shakespearean critic, son of a solicitor, born at Edgbaston, near Birmingham, England, Oct. 29, 1823. He graduated from Trinity College, Cambridge (B.A. 1847; M.A. 1850), and was received into partnership with his father, but he gave up law and settled near London (1859), and died Sept. 26, 1886. Ingleby wrote for the magazines and published several books on scientific and metaphysical topics. He is, however, best known for his studies on Shakespeare, of which the most notable are: *A Complete View of the Shakespeare Controversy* (1861), a full exposure of J. P. Collier's fabrications; *Shakespeare Hermeneutics* (1875), textual criticism; *Centurie of Prayse* (1875; enlarged, 1879, and entitled *Shakespeare Allusion Book* and edited and revised by J. J. Munroe, 2 vols., New York, 1909), allusions to Shakespeare between 1591 and 1693; and *Shakespeare: The Man and the Book* (two parts, 1877, 1881).

INGLEFIELD, ینگ'ل-فیلد, SIR EDWARD AUGUSTUS (1820-94). An English admiral and Arctic explorer, son of Rear Admiral Samuel Hood Inglefield (1783-1848). Born at Cheltenham and educated at the Royal Naval College at Portsmouth, he went to sea when he was 12. He is known principally through his summer search for Sir John Franklin, in the *Isabel*, in 1852, when he broke through the "continuous land" of Smith Sound reported by the British Arctic expedition of 1818. (See ROSS, SIR JOHN.) All things considered, it was the most successful of modern summer voyages in the Arctic. He discovered the West Greenland Channel leading to the Polar Ocean, and on August 27 made the highest latitude to date in the Western Hemisphere, 78° 28' N. In 1853 he went to the relief of Sir Edward Belcher and on his return was the first to announce the discovery by McClure of the northwest passage. He was second in command of the Mediterranean fleet in 1872-75, was knighted in 1877, and was

promoted to the rank of admiral in 1879. Inglefield was the inventor of the hydraulic steering gear, a painter of marine subjects, and author of *A Summer Search for Sir John Franklin* (1853). Consult *Blue Books, Arctic Expeditions* (London, Dec. 20, 1852, and January, 1855).

INGLIS, ینگ'لیس, CHARLES (1734-1816). An Anglican bishop of Nova Scotia, born in New York. After teaching school a few years he became a clergyman, and was appointed a missionary at Dover, Del. In 1765 he became assistant minister of Trinity Church in New York City. He was prominent as a controversialist and replied trenchantly to Thomas Paine's *Common Sense*. During the War of Independence he was a sturdy Loyalist and refused to obey Washington's command to omit from his church service the prayer for the King and royal family. He retired temporarily to Flushing, Long Island, after the Declaration of Independence, but returned to New York City after Washington's defeat and in 1777 became rector of Trinity Church. When the British evacuated New York City in 1783, he joined the United Empire Loyalist emigration and went to Halifax. In 1787 he was consecrated at Lambeth, London, as the first Bishop of Nova Scotia, with jurisdiction over the other British North American provinces, and was the first colonial bishop of the Church of England. Dr. Inglis was honored with academic distinctions by King's College (now Columbia University) and in 1770 became one of the governors of the college.

INGLIS, HENRY DAVID (1795-1835). An English author, better known by his pen name, Derwent Conway, born in Edinburgh. His books include: *Tales of the Ardennes* (1825); *Narrative of a Journey through Norway, Part of Sweden, and the Islands and States of Denmark* (1826); *A Tour through Switzerland and the South of France and the Pyrenees* (1830-31); *Spain in 1830* (1831); *The Tyrol with a Glance at Bavaria* (1833); *The New Gil Blas, or Pedro of Pennaflor* (1832), less successful than his travels; *Ireland in 1834* (1834; 5th ed., 1838); and *Rambles in the Footsteps of Don Quixote* (1837), illustrated by Cruikshank. He also edited the *British Critic*, a Jersey newspaper, for two years (1832-34).

INGLIS, JOHN, LORD GLENCORSE (1810-91). A Scottish jurist, born at Edinburgh. He was educated at Glasgow University and at Balliol College, Oxford (B.A., 1834), entered the Faculty of Advocates in his native city in 1835, and became dean of the same in 1852. He was a conservative supporter of Lord Derby, who made him Solicitor-General and then Lord Advocate of Scotland in 1852, Lord Justice Clerk, and a president of the Court of Session in 1858, and a member of the Privy Council in 1859. In 1867, as Lord Glencorse, he became Lord Justice General of Scotland and Lord President of the Court of Session. He was also prominent in educational matters, was made lord rector of King's College, Aberdeen, in 1857, and of Glasgow University in 1865, and was chancellor of Edinburgh University (1869).

INGLIS, SIR JOHN EARDLEY WILMOT (1814-62). A British soldier, born in Nova Scotia. He entered the army as ensign in 1833, took part in the suppression of the rebellion in Lower Canada in 1837 and also in the Punjab campaign of 1848-49. It was as one of the defenders of Lucknow at the outbreak of the Indian Mutiny in 1857 that his most notable service was ren-

dered. His regiment had taken refuge in Lucknow on July 1 of that year, and the city was besieged by the enemy in overwhelming numbers. When his superior officer, Sir Henry Lawrence, was wounded, Inglis took command and held out against the Sepoys until the relief of the city by Sir Henry Havelock. For this he was promoted to be major general. In 1860 he was appointed to the military command of the Ionian Islands, which at that time were in the possession of Great Britain.

INGLIS, SIR WILLIAM (1764–1835). A British soldier in the Peninsular War. At the age of 15 he entered the army as ensign and in 1781 went with his regiment to America, where he remained for 10 years. In 1793 he returned to England. He took part in the campaign in Flanders and three years afterward served with distinction at the capture of St. Lucia. As commander of the First Battalion of the Fifty-seventh Regiment, he went with it to the Peninsula in 1809, where he participated in the battles of Busaco and Albuera. At Albuera he commanded the Fifty-seventh, which behaved with the utmost gallantry and suffered the loss of more than three-fourths of its number. Inglis was severely wounded, but afterward fought in several other engagements, including that at Ortez, in French territory, in 1814. After the war he was made a lieutenant general and was knighted.

INGOLDSBY, ɪn'gɒlz-bɪ, SIR RICHARD (?–1685). A British soldier, born in Buckinghamshire. As a kinsman of Oliver Cromwell, he naturally espoused the Parliamentary cause at the beginning of the Civil War. In 1645 he commanded a regiment which took part in several actions and garrisoned Oxford. At that time he apparently sympathized with the radical faction, which was bent upon inflicting the extreme penalty upon Charles I. He was a member of the court which tried the King, and his signature was affixed to the death warrant. After Oliver Cromwell's death he at first heartily supported Richard Cromwell, but after the latter's short and weak protectorate was ended, Ingoldsby was quite willing to make terms with Charles II and, having loudly asserted his unwilling participation in the trial and execution of the King, was exempted from the punishment suffered by the other regicides. During the interval in which General Monk was dictator he arrested General Lambert and dispersed his soldiers. Charles II conferred knighthood upon him. Ingoldsby was a member of Parliament during part of Cromwell's régime, sat in the Protector's House of Lords, and was also member for Aylesbury during most of the reign of Charles II.

INGOLDSBY LEGENDS. A well-known collection of legends, written by the Rev. Richard Harris Barham, under the pseudonym of Thomas Ingoldsby, originally published in *Bentley's Miscellany* and republished in three series from 1840 to 1852.

INGOLSTADT, ɪn'gɒl-shtɑt. An ancient fortified town of Bavaria, situated on the left bank of the Danube, 46 miles by rail from Ratisbon (Map: Germany, D 4). Its most noteworthy buildings are the fifteenth-century Frauenkirche, the old castle, and the old university buildings. The Jesuit University of Ingoldstadt was founded in 1472 by Duke Ludwig the Rich and by the end of the sixteenth century had about 4000 students. It was transferred in 1800 to Lands-

hut and in 1826 to Munich. The town has a notable town hall, a theatre, a Franciscan cloister, and a fifteenth-century church containing the tomb of Dr. Eck, who opposed Luther. Ingoldstadt contains a number of establishments for the manufacturing of ammunition, weapons, and armor, and a school of military engineering. Soap, brushes, and beer are made. Pop., 1900, 22,207; 1910, 23,745, mostly Roman Catholics. Ingoldstadt existed as early as the ninth century. It received municipal rights at the beginning of the fourteenth century and was fortified in the first half of the sixteenth century. The town was besieged by Gustavus Adolphus in 1632, and its fortifications were destroyed by the French after a three months' siege in 1800. They were rebuilt during the first half of the nineteenth century.

IN'GOMAR THE BARBA'RIAN. A play by Maria Anne Lovell (1851), adapted from the German *Der Sohn der Wildnis* of Friedrich Halm.

IN'GOT. See IRON AND STEEL, METALLURGY OF.

INGRAHAM, ɪn'grɑ-hɑm, DUNCAN NATHANIEL (1802–91). An American naval officer, born in Charleston, S. C., the son of a Nathaniel Ingraham who served under John Paul Jones in the *Bon Homme Richard*. In 1812 he was appointed a midshipman in the United States navy and served through the second war with Great Britain. In 1825 he became a lieutenant and in 1841 a commander. He was one of the officers in Commodore David Porter's expedition against the Caribbean pirates and during the Mexican War served in the blockading fleet of Vera Cruz and was present at the capture of Tampico. Soon after the close of the war he was placed in command of the *St. Louis* on the Mediterranean station. His firm stand against the attempt made by Austria to seize Martin Koszta, who had participated in the Hungarian revolution of 1848 and had taken steps towards becoming a citizen of the United States, was supported by the United States and aroused great popular enthusiasm. (See KOSZTA AFFAIR.) In 1855 he was commissioned captain, but at the outbreak of the Civil War he resigned from the service and became chief of the Bureau of Ordnance, Construction, and Repair of the Confederate Navy, in which he rose to the rank of commodore.

INGRAHAM, JOSEPH HOLT (1809–60). An American novelist, born at Portland, Me. He went to sea when he was a boy, served in South American revolutions, and after graduation at Bowdoin in 1832 became a teacher in Natchez, Miss. His *The Southwest by a Yankee* (1836) was a great success, and was quickly followed by sensational volumes like *Lafitte; Burton, or the Sieges; Captain Kyd; The American Lounger* (1839); *The Hunchback and the Roué* (1843). In 1855 he took orders in the Episcopal Church and settled at Holly Springs, Miss., where he wrote his popular biblical series, including *The Prince of the House of David* (1855), *The Pillar of Fire* (1859), and *The Throne of David* (1860).

INGRAILED. See ENGRAILED.

INGRAM, ɪn'grɑm, ARTHUR FOLEY WINNINGTON (1858–). An Anglican bishop, born in Worcestershire, the grandson of Bishop Pepys of Worcester. He was educated at Marlborough College and at Keble College, Oxford, was a private tutor for three years (1881–84),

and from 1885 to 1889 was private chaplain to the Bishop of Lichfield. In 1889 he became head of Oxford House, Bethnal Green, in 1896 rural dean of Spitalfields, in 1897 canon of St. Paul's and Bishop of Stepney, and in 1901 Bishop of London and dean of the chapels royal. He visited America in 1907. He wrote: *Old Testament Difficulties* (1892); *New Testament Difficulties* (1893); *Church Difficulties* (1896); *The Men who Crucify Christ* (1896); *Work in Great Cities* (1896); *Christ and His Friends* (1897); *Banners of the Christian Faith* (1899).

INGRAM, JOHN KELLS (1823-1907). An English economist and Positivist, born in Donegal, Ireland, and educated at Trinity College, Dublin. He was fellow there (1846), professor of oratory and English literature (1852), regius professor of Greek (1866), librarian (1879), and finally vice provost. He wrote: *A History of Political Economy* (reprinted, 1888, from the *Encyclopædia Britannica*); *On the Present Position and Prospects of Political Economy* (1878); *Outlines of the History of Religion*, in which work he declares himself a Positivist; *History of Slavery and Serfdom* (in *Encyclopædia Britannica*, 1888; published separately, 1895); *Sonnets and Other Poems* (1900); *Passages from the Letters of Augustus Comte* (1901); *Practical Morals* (1904); and edited *The Imitation of Christ*, from the manuscripts of the first English translation at Dublin and Cambridge (1892).

INGRASSIA, in'grās-sē'ā, or **INGRASSIAS**, GIOVANNI FILIPPO (1510-80). A Sicilian anatomist, born at Palermo. The plague at Palermo in 1575 was checked largely by his methods and through his work. He made discoveries of great importance in anatomy and described them in his *In Galeni Librum de Ossibus Doctissima et Expertissima Commentaria*. He published several other interesting works.

INGRES, ān'gr', JEAN AUGUSTE DOMINIQUE (1780-1867). A French historical and portrait painter, a leader of the Classicists. He was born at Montauban, Aug. 29, 1780, the son of a sculptor. He soon became the most important pupil of David, whose school he entered in 1796. In 1801 he received the Prix de Rome with the picture "Achilles Receiving the Messenger of Agamemnon," now in the Ecole des Beaux-Arts; but, owing to the state of the national finances, he was compelled to remain at Paris. He occupied himself with drawings, portraits, and mythological subjects until 1806, when he was sent to Rome. There he learned to know the works of Raphael, who exercised a dominating influence upon him. He also studied the antique fresco and vase painting, and these new influences brought him into conflict with the strict Classicists. While he continued to execute large historical pictures, he was compelled to earn his living by drawing those admirable crayon portraits—300 in number—which are perhaps the most extraordinary of his works. In 1820 he migrated to Florence, laboring under the same difficulties until, in 1824, the brilliant success of his "Vow of Louis XIII" (now in Montauban Cathedral) caused him to return to Paris.

He soon became the head of a large school and the acknowledged leader of the Classicists, hard pressed by the Romanticists, under the leadership of Delacroix. In 1829 he completed his "Apotheosis of Homer," a decoration of one of the ceilings of the Louvre, which is considered his finest epic painting. Weary of the hostile

criticism which this painting provoked, he gladly became director of the French Academy at Rome in 1834, remaining there until 1841. During his second stay at Rome he painted two of his most admirable works, "Stratonice" and "Cherubini Inspired by the Muse" (Louvre), which were received with the highest praise. On his return to Paris, in 1841, he was made Officer of the Legion of Honor, Commander in 1845, and Grand Officer in 1855; he was named Senator on May 25, 1862; and he was soon after appointed a member of the Imperial Council of Public Instruction. At the Paris Exhibition of 1855 a room was set apart for his pictures, and one of two grand medals of honor was awarded to him, Delacroix getting the other. "La source," sent to the London Exhibition of 1862 and now in the Louvre, showed powers unimpaired by age. He died in Paris, Jan. 17, 1867.

Ingres's greatest strength lay in his drawing. *Le dessin, c'est la probité de l'art*, was his motto. His consummate skill is very evident in his admirable crayon studies and drawings, of which the Montauban Museum contains the most valuable collection, left by the painter to his native town. To him more than to any other the French school owes that excellency of draftsmanship for which it is famous. His studies also show an incredible perseverance and sincerity of purpose. These qualities, however, were attained at the expense of color, which, when not almost monochrome, was coarse and hard. His works also show lack of originality. The figures, even of his best paintings, may be traced to models in works of Raphael, Michelangelo, or Greek vase painting.

Among the most important historical paintings of his first Roman period are: "Œdipus and the Sphinx" (1810), in the Louvre; "Jupiter and Thetis" (1811), Aix Museum; the "Sleep of Ossian" (1811) and "Romulus Conquering Acron" (1812), frescoes for Napoleon's palace on the Monte Cavallo; the "Odalisque" (1814), Louvre; "Virgil Reading the *Æneid* to Augustus"; "Pedro of Toledo Kissing the Sword of Henry IV" (1814); "Raphael and the Fornarina" (1814); "Aretino and the Envoy of Charles V" (1816); "Roger and Angelica" (1819) and "Christ Delivering the Keys to St. Peter" (1820), both in the Louvre. His later works include: "Martyrdom of St. Symphorian" (1834), Autun Cathedral; "Madonna with the Host," St. Petersburg; "Christ among the Doctors" (1842); "Birth of Venus" (1848); "Aretino Visiting Tintoretto" (1848).

Ingres is, perhaps, greatest in portraiture, where he stands in closest contact with nature. Among the best of his painted portraits are those of himself (1804); "Napoleon as First Consul" (1804), Liège Museum; "Napoleon Enthroned," Hôtel des Invalides (1806); "Lemoine" (1819); "Charles X" (1829); and especially "Bertin the Elder" (1833). The Louvre contains those of "Philibert Rivière and Wife" (1806) and of "Cherubini" (1843). Ingres also designed cartoons for the celebrated glass paintings in the chapel of St. Fernando, Paris. His works were admirably engraved, especially by Richehomme and Henriquel-Dupont. The most important of his large school of pupils was Hippolyte Flandrin (q.v.).

Bibliography. Ernest Chesneau, *La peinture française au 19e siècle* (Paris, 1862); lives by Blanc (ib., 1870), Delaborde (ib., 1870), Balze (ib., 1880), Schmarson, in Dohme, *Kunst und*

Künstler (Leipzig, 1884); E. T. L. Gautier, *Portraits du 19e siècle* (Paris, 1895); Henry de Chennevières-Pointel, "La nouvelle salle des portraits-crayons d'Ingres au Musée du Louvre," in *Revue de l'Art*, vol. xiv (ib., 1903); De Wyzewa, *L'Œuvre peint de Ingres* (ib., 1907). The best and most complete monograph on the life and works of Ingres is by H. Lapauze (ib., 1911).

INGRIA. See INGERMANLAND.

IN'GULPH, or **INGULF** (c.1030-1109). Abbot of Crowland, or Croyland, Lincolnshire. He is supposed to have been born in London and to have studied at Oxford. He became a favorite of Edgitha, the wife of Edward the Confessor; visited Duke William of Normandy at his court in 1051 and became his secretary. After a pilgrimage to the Holy Land he entered a Norman monastery. Here he remained till 1086, when he was invited to England by the Conqueror and made Abbot of Crowland, where he died Nov. 16, 1109. The *Historia Monasterii Croylandensis* (printed by Savile in London in 1596 and in more complete edition by Fulman, at Oxford, in 1684; translated into English for *Bohn's Antiquarian Library* by Riley, 1854) was long attributed to him. In 1826 Sir Francis Palgrave in an article in the *Quarterly Review*, and in 1862 H. T. Riley in the *Archæological Journal*, maintained by cogent arguments that the whole so-called history was little better than a novel and was probably the composition of a monk in the thirteenth or fourteenth century. These conclusions have been almost universally adopted. What few facts about him are known come from the *Historia Ecclesiastica* of Ordericus Vitalis (ed. Migne, Paris, 1855).

IN'HALA'TION (from Lat. *inhalare*, to inhale, from *in*, in + *halare*, to breathe). In medicine, a term used to signify the receiving into the lungs of vapors or gases for producing anæsthesia or for curative purposes. The ordinary manner of administering chloroform is as follows: Over a skeleton wire pan, the size and shape of a small deep saucer, a flannel bag is drawn. Chloroform is dropped on the bag, and the contrivance is inverted over the patient's nose and mouth. To give ether, a large square nose bag is made by folding fairly strong paper inside of a towel and then doubling the double fabric together and fastening it with safety pins. Less wasteful and more exact in the amount used, as well as vastly more elegant, are the regular inhalers, apparatus designed for the purpose and made of metal and rubber. Such an apparatus is necessary for the administration of nitrous oxide, or laughing gas. (See ANÆSTHETIC.) The vapor of hot water is employed in throat diseases, often affording great relief; and medicinal substances, such as benzoin and camphor, are sometimes used in conjunction, but it is often desirable to use the watery vapor without any combination. A very convenient and, in the absence of other apparatus, the only available way is to place a funnel over an open vessel containing hot water and inhale the hot vapor through the spout. A deep vessel, such as a two-quart earthen pitcher, may be used, containing a pint of boiling water—the patient breathing from the open mouth, putting his face close over the vessel, with care to moderate the heat of the contents. The vapor of carbolic acid is often beneficial as an inhalant and may be administered in a similar manner. The volatile oils, however, are most generally used. There are various kinds of apparatus for inhalation,

with the common object of introducing vapor to the lungs in the proper strength or temperature and due admixture of air. Oxygen is administered by inhalation in many diseases, especially in anæmia and pneumonia. It is given from a cylinder, from which it escapes as regulated by a cork, passing through a "wash bottle" containing water before it reaches the tube, or inhaler, held in the patient's nostril or mouth.

INHAMBANE, ē'nyām-bā'nā. An important seaport town in Portuguese East Africa, situated on Inhambane Bay, in lat. 23° 50' S., long. 35° 25' E. (Map: Africa, H 7). It has many fine European buildings, including a fort, churches, and a mosque. Its harbor admits vessels of 28 feet draft, and its trade in wax, copal, ivory, mafurra, nuts, and rubber amounts to about £250,000 (\$1,250,000) annually. Pop., about 4000, of whom 100 are Europeans and 250 Asiatics.

INHERITANCE (OF. *enheritance*, from *enheriter*, *inheriter*, to inherit, from Lat. *inhereditare*, to appoint as heir, from *in*, in + *heres*, heir; connected with *herus*, master, Gk. *χείρ*, *cheir*, hand, Skt. *har*, to take). In a popular sense, the acquisition of property, either real or personal, whether by will or intestacy, through the death of the former owner. In the more restricted sense of the English and American law, however, the term is confined to the transmission of real property by descent only. The popular use of the term to describe gifts, whether of land or goods, by last will and testament is wholly inaccurate. Personal property does not in any event pass by inheritance, but upon the death of the owner intestate goes to his personal representatives for purposes of administration (q.v.) and distribution (q.v.).

Strictly speaking, therefore, inheritance is confined to certain kinds of interests in land which have come to be known as estates of inheritance. (See ESTATE.) These include the two classes of estates known as fee simple and fee tail (qq.v.). In the former the inheritance is unrestricted—or "general," as it is termed—being open to all persons standing in any degree of consanguinity to the decedent, collateral as well as lineal. In the latter the inheritance is restricted to the issue of the intestate, or even to a special class of lineal descendants, as to the issue of a certain wife begotten, or even to the male or the female issue. This quality of inheritability, now regarded as an essential attribute of the absolute ownership of real property, has not always been a characteristic of such estates, but, like the corresponding quality of alienability, was gradually added to the fee as that originally existed under the feudal system of land tenure. For the rules governing inheritance, see DESCENT; HEIR; HEREDITAMENT.

The term "inheritance" is also frequently employed to describe the property or estate acquired by descent. This may, in addition to the real estates of inheritance above described, include also certain privileged chattels, known as heirlooms. (See HEIRLOOM.) Consult the authorities referred to under DESCENT.

INHERITANCE TAX. A charge or assessment on the succession or devolution of property from a deceased person to his heirs or legatees.

Such taxes were imposed in Rome over 2000 years ago and in some form have been a source of revenue in several of the continental countries of Europe almost since their organization as independent governments. In England Gladstone

called the various inheritance tax charges "death duties," and the name has since come into common usage. The self-governing colonies of Great Britain, particularly Australia and New Zealand, have followed her example, and death duties are one of the chief sources of revenue in those progressive commonwealths. Taxes of a similar character were imposed by the United States government as a part of its internal revenue system during the Civil War, but were repealed some time after its close. However, in some form or other, this form of taxation is imposed in a number of the United States.

The form, rates, and method of assessment and collection of such taxes vary considerably in different states and countries. There are, however, certain general characteristics common to most jurisdictions. Such laws sometimes provide for a progressive rate according to the amount of property of the estate, also a graduated rate according to the degree of relationship of the individuals entitled thereto. In some jurisdictions the portion to which a widow or minor children become entitled is exempt up to a certain amount, and lineal descendants are favored in preference to collateral relatives whenever any distinction is made.

The English death duties are graduated from 1 per cent to 10 per cent, according to the amount involved and the degree of relationship of the beneficiaries. The Canadian provinces have followed the English statutes closely, both as to rates and in other respects. On the Continent Germany, Austria, France, Switzerland, Holland, Russia, Italy, Spain, Portugal, Greece, Denmark, and Sweden have inheritance or succession taxes.

The laws imposing such taxes have occasioned a great deal of litigation in the United States. Their constitutionality has been attacked in several States, the contestants claiming that they do not provide a uniform method of taxation affecting all persons alike, as required by the constitutions of most States, but this contention has been repudiated by the courts of most of these jurisdictions. These decisions have proceeded on the ground that such a tax is equally imposed and properly apportioned upon all classes; that it is a tax on the succession or devolution of property rather than on the property itself and is therefore uniform in its operation and effect. Deathbed gifts, made obviously to escape such charges, are usually included within the scope of these laws. The justice and convenience of this form of taxation have appealed to most economic writers, and it is rapidly growing in popular favor. Consult: B. F. Dos Passos, *Collateral Inheritance, Legacy, and Succession Taxes* (2d ed., New York, 1895); Tristram and Coote, *Probate Practise* (London, 1900); University of Wisconsin, *Inheritance Tax: A Bibliography* (Madison, 1910); Lee, Higginson and Company, *Inheritance Tax of all the States* (Boston, 1911). See DEATH DUTIES; INHERITANCE; SUCCESSION; TAX AND TAXATION.

INHIBITION (Lat. *inhibitio*, from *inhibere*, to hold back, from *in*, in + *habere*, to hold). A term used in physiology to denote a prevention or restraining action. Inhibition in a nervous mechanism is a resistance to disordered or excessive action. An inhibitory nerve is one which controls the organ or other structure to which it goes, preventing undue functional activity.

INHIBITION, WRIT OF. A writ or process directed to an individual forbidding him to do

some particular act. It is derived from the civil law, where it was employed by the courts of appeal to stay the execution of judgments by inferior courts during the pendency of the appeal. The writ was used in the early English law for the same purpose, but was later superseded by the writ of prohibition. The term survives only in ecclesiastical law and in the practice of the Roman and English churches. Consult Sir Walter Phillimore, *Ecclesiastical Law* (2d ed., 2 vols., London, 1895).

IN HOC SIGNO VINCES, in hōk sīg'nō vīn'sēz (Lat., In this sign thou shalt conquer). The legend on a flaming cross which, according to tradition, appeared in the sky to the Roman Emperor Constantine I before his battle with Maxentius.

IN'IA. A cetacean of the family Platanistidæ, and thus related to the susu of the Ganges, which inhabits the Amazon and its larger tributaries. Only one species (*Inia geoffrensis*) is known. It reaches a length of 8 feet and may be wholly pink in color or a varying mixture of black and pink. The Indians regard it with mingled fear and superstition, and it is hard to learn what are its true habits.

IÑIGUEZ. See GARCÍA IÑIGUEZ.

INIOMI, in'i-ō'mī (Neo-Lat. nom. pl., from Gk. *ivlon*, *inion*, muscle at the back of the shoulder + *ᾠμος*, *ōmos*, shoulder). An order of teleost, soft-rayed, deep-sea fishes, which are closely allied to the Isospondyli, but lack the mesocoracoid and have an imperfect connection between the shoulder girdle and the cranium. It consists of several families of fishes dwelling in the oceanic abysses, most of which have phosphorescent light organs or photophores. (See LANTERN FISH.) Consult Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1896). See ISOSPONDYLI.

INITIATIVE. A political device, originating in Switzerland and which has recently gained a foothold in the United States, which aims to secure to the mass of the voters a more direct participation in legislation by requiring the submission either to the legislature or to popular vote of proposals for legislation initiated by one or more of such voters. In its developed form, as applied in some of the American States, the initiative may be regarded as an application of the "town-meeting" form of government to communities too numerous and complex to make that form of legislation strictly applicable, or as a device for making effective the right of petition. A petition addressed by a citizen or body of citizens to his or their representative legislature may be granted or rejected or wholly ignored. Laws providing for the initiative in effect forbid this last method of dealing with a petition asking for specific legislative action, by requiring the submission to a vote of such a measure if properly presented and supported. Historically, however, the initiative had its origin in the "direct democracies" (*Landsgemeinde*) of the smaller Swiss cantons—popular assemblies composed of all the voters of the cantons—where a single voter may require the submission of his proposal to popular vote. In the larger cantons the number of petitioners required for the initiation of a legislative measure varies from 70 in the Outer Rhodes to 12,000 in Bern. The principle has been adopted in all the Swiss cantons except Lucerne, Fribourg, and Valais, and was adopted in 1891 by the Confederation as a

method of proposing an amendment to the constitution.

The initiative made its first appearance in the United States through its adoption by the State of Oregon in 1902. It has since been adopted in some 20 States, and proposals for its adoption are pending in about a dozen other States. In some States it is restricted to the initiation of ordinary legislation, but in others it is applied to the amendment of the State constitution as well. The number of petitioners required to put it into effect varies from 25 per cent of the registered voters (Arizona) to 3 per cent (Ohio). In all the States it is coupled with the referendum, requiring the submission of the proposed measure to popular vote—either, as is generally the case, in the first instance or, as in Ohio, in case the legislature fails to approve the proposal. In the latter case there is a double initiative—first to secure the consideration of a measure by the legislature and then as a method of appeal from the legislature to the body of voters.

The initiative thus takes its place as one of a number of related political devices whose object is to obviate in some degree the misrepresentative character of the American representative system by giving to the people, by direct political action, a more immediate control of the business of government. Other devices of this sort, such as the referendum, the recall of elective officials, direct primaries, the presidential preference primary, the direct election by popular vote of United States Senators, woman suffrage, and the short ballot, are described and discussed under their appropriate titles. Of all these devices of popular government the most difficult to set up as a working institution is the initiative. The technical difficulties attending the drafting of legislative measures are coming to be understood even in a country where legislation has often been of a haphazard character and where the preparation of bills has usually been left to private initiative. But even the most slipshod measure, when subjected to legislative scrutiny, may be converted by amendment into a workable and effective piece of legislation. This is clearly impossible in the case of a measure proposed by the initiative, which may be put forth by any one who secures a sufficient number of signatures to the initiating petition.

The "Wisconsin Plan," as it is called, seeks to obviate this objection by permitting any person, after securing the introduction of a bill in the legislature and not otherwise, to have the measure submitted, on a proper petition, to popular vote. As against this theoretical objection it is urged that, in those States in which the initiative has been in operation, the difficulty urged has not in practice proved to be a serious one, and that the system has demonstrated its efficacy by the good quality of the legislation which has resulted from it. However this may be, it cannot be doubted that the device is growing in popular favor, and that it is likely in the near future to be adopted in all the States of the American Union. It should be noted that both the Progressive and Socialist parties have adopted the initiative as a part of their programme of political reform. See LEGISLATION; PRIMARY ELECTION; REFERENDUM; RECALL; POPULAR GOVERNMENT; ELECTION; ELECTORAL REFORM.

INJALBERT, ăn'zhâl'bâr', JEAN ANTOINE

(1845–). A French sculptor, born at Béziers. He was a pupil of Dumont and won the Prix de Rome in 1874. At the Exposition of 1889 he won the Grand Prix and in 1900 was a member of the jury. In 1905 he was made a member of the Institute and in 1910 Commander of the Legion of Honor. His work shows powerful imagination and strong personality as well as great knowledge. Among his statues are "Hippomenes," at the Luxembourg; "Eve after the Fall," at Montpellier; "Sadi-Carnot," at Cette; "Love Conquering the Lion," "Fame," "The Laughing Child," and several others, at Béziers.

INJECTION (Lat. *injectio*, from *in* + *jacere*, to throw). A term applied in medicine to a fluid thrown into the passages or cavities of the body by means of a syringe or elastic bag. The fluids thus injected into the rectum or lower bowel are termed enemata. (See ENEMA.) The injection of a dilute solution of salt into the veins has been in use since about 1879 and has been found to be of great service in many diseased conditions. The injection of blood into the veins is described in the article TRANSFUSION OF BLOOD. See HYPODERMIC MEDICATION.

INJECTOR (Lat. *in* + *jacere*, to throw in). Specifically an apparatus for feeding water into a steam boiler by means of a steam jet from that boiler, acting through a tapering or converging nozzle upon the mass of water to be forced into the boiler. Generally an apparatus by which one fluid moving at high velocity through a tapering or converging nozzle can be made to set in motion another fluid upon which it impinges in its flow, in the direction of the flow of the fluid of higher velocity. The injector principle is used in the chimney stacks of locomotive or other boilers to cause draft, in the atomizers or spray apparatus of physicians and perfumers, and in the burners for liquid fuels under boilers. When the pressure against which the injector feeds is equal to or nearly that of the impelling or actuating jet, the device is an injector. When the resistance pressure is much lower than that of the impelling jet, it is called an ejector. With a given pressure of the impelling jet, ejectors deliver much more liquid against their low resistance than the injector working against a high resistance.

Injectors and ejectors are of two classes: in one the water to be impelled is at the level at which the injector is set up; these are nonlifting types. In the other the water has to be raised by atmospheric pressure from a level lower than the injector, and hence the latter must first create and then maintain at its suction end a pres-

sure below atmosphere and sufficiently so to enable the water to be raised. These are lifting injectors. The lifting injector is the general case. The accompanying diagram is a schematic presentation of the essentials of such a device. Dry steam from the steam boiler to be fed with water in the specific type of boiler-feeding in-

jector enters through the pipe *a* at high velocity. The pipe *c* leads from the tank or supply of water and is full of air, as is the body of the instrument. The rapid flow of the jet of steam and the impact of its particles carry the air above the water in the pipe *c* out of the injector to the open air through the waste pipe *g*, and the flow towards *g* therefore reduces the air pressure in *c*, which is air-sealed at the bottom by the water it contains. Hence atmospheric pressure outside of *c* forces the water up until it meets the steam jet in the "combining tube" *d*. Here two things happen: the steam is condensed by the cooler water, and the rapidly moving jet imparts some of its previously high velocity by impact upon the water. The heat energy of the mass of steam is imparted to the water, raising its temperature; the kinetic energy or living force of the jet or mass of steam passing per second is wholly imparted to the water, but, by reason of the greater mass of the water, only a part of the original steam velocity is imparted to the water. Enough remains, however, to make the combined jet of steam and water jump past the break between nozzles *d* and *e* and rush with great energy of mass and velocity in the direction of jet motion and impinge against the check valve *f*, opening it against the static pressure on its back and allowing the water to pass into the boiler against such pressure. The rush of the water jet removes all air and steam in the waste pipe and in the body of the injector and maintains the necessary low pressure in the suction pipe *c*. If the velocity of flow in *a* falls below that necessary to impart kinetic energy to the jet of water, the injector "breaks," as it is called, and steam and water escape from the waste, the suction ceases, and the instrument must be cooled off and started again.

Modern injectors have simplified the practical operation of feeding by interconnecting the waste-pipe valve and the starting-jet valve. Double-tube injectors are also much in use—sometimes called "inspirators" as a trade name—in which there are two jets side by side in successive chambers. The first is the steam jet and inducing chamber; the second is the forcing chamber, taking the first jet of warmed water and using it as a further inducing jet for a second supply of water and forcing the latter into the boiler. The injector principle was first advanced by Henri Jacques Giffard, a French engineer and mathematician. Restarting injectors are such as will resume their function after a "break" in the flow without the attention of the operator. Injectors preheat the feed water and hence are much in use where this is an advantage. They are less efficient as movers of cool water than the ordinary power pump. They are light in weight, compact, and dispose of their own exhaust steam. For a history of the development of the injector and the principles of its action, consult Kneass, *Practice and Theory of the Injector* (New York, 1910), and for descriptions and illustrations and representative forms, consult Hutton, *Mechanical Engineering of Power Plants* (ib., 1909); Inchley, *Steam Boilers and Boiler Accessories* (London, 1912); Wakeman, *Practical Guide for Firemen* (New Haven, Conn., 1906); Hughes, "Injector Metal and Fittings," in *Journal of the Institute of Metals* (London, 1911); *Proceedings of the American Railway Master Machinists Association* (Chicago, 1913). For theory, consult Wood, *Thermodynamics, Heat Motors, and Re-*

frigerating Machines (8th ed., New York, 1899), and Peabody, *Thermodynamics of the Steam Engine and Other Heat Engines* (6th ed., ib., 1909); and for a brief discussion, Kent, *Mechanical Engineers Pocket Book* (8th ed., ib., 1913).

The ejector principle is used in steam-engine condensers, where the flow of condensing water meets the exhaust steam, as in the combining tube *d*, and by its condensation and its flow maintains a pressure less than atmosphere in the pipe *a* which leads from the engine cylinder. The outfall through *f* need only have a velocity sufficient to overbalance the tendency of atmospheric pressure to enter and establish itself from that direction. The injector principle is also used in many forms of blue-flame wickless gas stoves, where the jet of gas is the impelling jet, and the air for combustion is entrained with and by it.

IN'JIA. See BOUTO.

INJUNC'TION (Lat. *injunctio*, from *injungere*, to command, from *in*, in + *jungere*, to join; connected with Gk. *ζευγνύωαι*, *zeugnynai*, Skt. *yuj*, to join, and ultimately with Eng. *yoke*). A judicial writ or process of a court of equity, commanding a person or persons named therein to do or not to do a particular thing. It had its origin in the Roman law, under which system a somewhat similar process, known as an interdict, was employed. The idea was introduced into England and Scotland by the early chancellors, as a result of their search for remedies to modify the harshness of the common law and to supplement it where inadequate to meet the ends of justice, though it had at an earlier period been employed with considerable freedom by the king's court (*curia regis*). The scope of its use and application has greatly widened until to-day it is perhaps the most important remedy of an equitable nature.

The purposes for which an injunction may be employed may be described generally as follows: (1) to prevent the commission of certain wrongs of a civil nature; (2) to protect rights; (3) to compel the restoration of rights. The greatest proportion of injunctions fall under the two classes first named and are usually termed *preventive*, because they operate to prevent wrongs by restraining acts, while the third class, called *mandatory*, as descriptive of their purpose to compel the affirmative performance of an act, are more rarely used. A common example of a preventive injunction is one to restrain the continuance of a nuisance, such as generating unusual quantities of black smoke and cinders in a great city; whereas an injunction to compel the restoration of running water to its natural channel by a person who has wrongfully diverted it therefrom would be classed as mandatory. Some other important uses of preventive injunctions are: to prevent the violation of contracts; to restrain or prevent waste, or nuisance; to protect patent rights, copyrights, and trade-marks from infringement; and to stay proceedings in a court of law. The latter object is effected by enjoining one or both of the parties to the action from proceeding further in the cause. A court of equity will sometimes enjoin a party or parties within its own jurisdiction from prosecuting an action in another jurisdiction. A notable example of such exercise of power is where a United States court restrains all creditors prosecuting actions in State courts for the enforcement of their claims against a bankrupt from proceeding further in

their actions, thus leaving all matters relating to his estate to its own determination.

A court of equity follows the same rules in this summary method of procedure as in the exercise of its other functions, and therefore will only grant an injunction when the remedy at law is inadequate to give a party who is wronged the complete relief to which he is entitled. One reason for issuing an injunction is to prevent irreparable damage. Where, e.g., a person maintains an offensive nuisance which operates to keep away customers from a near-by shop, the shopkeeper could recover damages in a court of law; but, as a long delay may ensue before his cause can be reached, his business may be ruined in the meantime. His damages in that event would be hard to estimate and therefore that relief would be manifestly inadequate to protect him; whereas, if the nuisance is immediately abated, in compliance with an injunction order, he is saved irreparable damage. Much criticism and controversy have been occasioned by cases where the courts have enjoined striking laborers or others from inducing or coercing workmen to strike for the purpose of forcing their employers to grant the concessions demanded. This use of the injunction has been stigmatized as "government by injunction" and has been denounced by labor organizations and some publicists as an unwarranted, new, and arbitrary exercise of power by the courts. Except in the case of certain extreme injunctions improperly granted, this contention is not supported by legal authority, as the right to conduct one's business without interference or molestation from others in any manner is a long-established principle of the common law, the violation of which is an actionable wrong at law, and a court of equity has jurisdiction to prevent wrongs and injuries to persons and their property and to restrain combinations and conspiracies for unlawful purposes. Of course the crux of the question in all these cases is, what legally constitutes an unlawful interference with another's business; and upon this point opinions are widely divergent. There has recently been considerable agitation in favor of legislation limiting the power of the courts to issue injunctions and punish for contempt in cases arising out of labor disputes.

The courts have not defined or limited the circumstances in which relief by injunction will be granted, but reserve the right to exercise their power whenever a novel state of facts may seem to present urgent equitable grounds for doing so.

With reference to the time when they are granted and remain in force, injunctions are also classified as *preliminary*, or *interlocutory*, and *perpetual*. Where there is danger that great damage will be done by one party to another before the questions between them can be determined on their merits, a court of equity, or judge thereof, may, on application of one party to him on the bench or at chambers, at any time of the day or night, and without notice to the other party, grant an injunction to prevent the continuance of the wrongs complained of during the pendency of the action, or, if no action has been commenced, to operate as a stay until an application is made to the court by the party enjoined to have it dissolved. Upon such application all the facts on both sides are presented to the court, and it may then dissolve the injunction or make it permanent. In order

that the party thus summarily enjoined may not suffer damage if it is finally determined that he was within his rights in doing the acts complained of, the court or judge requires the party seeking the relief to give sufficient security that he will pay all damages that his adversary may sustain by reason of the injunction if it is thereafter dissolved for lack of sufficient legal grounds to sustain it. This temporary, or interlocutory, injunction may be made perpetual if the court later determines that the grounds advanced for its continuance are valid in law and have been sustained by the proof.

For many years the granting of the remedy of an injunction was the special prerogative of the courts of chancery in England and the United States. During the last century, however, the power of issuing injunctions in certain classes of cases was by statute conferred on the ordinary courts of common law in England and in several of the United States. The merging of the courts of equity and common law in a single tribunal in England and most of the United States has done away with the distinction. See CHANCERY; EQUITY.

Consult: Beach, *Treatise on the Law of Injunctions* (Chicago, 1895); W. W. Kerr, *Treatise on the Law and Practice of Injunctions* (4th ed., London, 1903); J. L. High, *Treatise on the Law of Injunctions as Administered in the Courts of the United States and England* (4th ed., Chicago, 1905); H. C. Joyce, *Treatise on the Law Relating to Injunctions* (3 vols., Albany, 1909); A. P. Thom, *Judicial Power and the Power of Congress in its Relation to the United States Courts* (Washington, 1912).

INJURY (from Lat. *injuria*, harm, from *injurius*, acting wrongfully, from *in-*, not + *jus*, right, law). In the legal sense, an actionable wrong; any act in violation of the rights of another of which the law will take cognizance by allowing the injured party an action against the wrongdoer to recover specific property or damages or both. In the practical sense the term may also be said to embrace actionable wrongs against the state, in which case the result sought by the action brought by or on behalf of the state is the punishment of the offender, usually by criminal process. Injury, in the legal sense, is to be distinguished from wrongs which are *damnum absque injuria*, i.e., acts resulting in harm to another for which the law gives no remedy.

An injury may also be *injuria absque damno*, i.e., an injury which, although a technical invasion of a right, is without actual damage to the injured party, in which case the injured party may recover nominal damages or, in rare cases, obtain an injunction restraining the wrongdoer. The principles governing the law of civil or private injury are discussed at length under TORT and under EQUITY, which exercised its preventive jurisdiction over torts. See also CONTRACT; TROVER; TRESPASS. The principles governing the law of public wrongs are discussed under CRIME; CRIMINAL LAW.

INK (OF. *enque*, *enche*, Fr. *encre*, Prov. *encaut*, It. *enchiostro*, ink, from Lat. *encaustum*, Gk. *ἐγκαυστρον*, *enkauston*, purple ink, from *ἐγκαυστρος*, *enkaustos*, burned in, from *ἐγκαλεῖν*, *enkaiein*, to burn in, from *ἐν*, *en*, in + *καλεῖν*, *kaiein*, to burn). Any colored fluid used in writing or printing. The use of ink for writing was known to the ancients, and papyri and manuscripts dating back to more than 4000

years ago are to be found in various museums. Many of these writing fluids were pigments, consisting chiefly of various forms of carbon, such as ivory black, lampblack, and soot mixed with gum, in order to avoid too great fluidity; others were apparently actual dyes of iron and acids, to which carbon was added. The liquor of the cuttlefish is reported by Cicero and Pliny to have been used among the Romans as a writing fluid. Elegant manuscripts, written in gold and silver inks, are well known, and among these may be mentioned the celebrated *Codex Upsal*, which is written in silver ink on violet parchment, the initials and certain passages being in gold. Some written wholly in red ink, made of vermilion, purple, or cinnabar, are still preserved, although red was more frequently used for the headings and initials of books, chapters, and pages. The emperors of Constantinople were in the habit of signing their acts in red ink, and the first secretary was guardian of the vase containing the cinnabar, or vermilion, which the emperor used. Green ink, though rarely found in charters, often occurs in Latin manuscripts, especially those of later years. It was also used by the guardians of the Greek emperors before their wards attained their majority.

Inks are commonly treated under the two heads of writing ink and printing ink.

Black Writing Ink. Ordinary black writing ink is a compound obtained by the action of ferrous sulphate on an infusion of nutgalls or any similar compound containing tannin and is essentially a ferroso-ferric gallate. Typical of this kind of ink is the one consisting of the following ingredients: nutgalls, 12 pounds; ferrous sulphate, 5 pounds; gum Senegal, 5 pounds; and 12 gallons of water. It is prepared by carefully selecting nutgalls, preferably the variety from Aleppo, as that contains a larger proportion of gallic and tannic acids than other varieties. They are then crushed and treated with distilled water for several days, after which the clear liquid is carefully drawn off, and to it is added a clear mucilage, made by previously dissolving the gum in hot water and filtering. Finally, the ferrous sulphate is dissolved separately and mixed with the foregoing solutions. Some recommend, instead of a solution of ferrous sulphate, that clean iron filings be added to a portion of nutgalls and gum and the liquid agitated until it becomes deep black in color. In either case the color is due to the oxidation of the iron salt and its combination with the gallic acid in the solution. It has been determined that the proportion of three parts of the galls to one part of the ferrous sulphate yields a satisfactory ink, but in actual practice more ferrous sulphate is usually added. In order to obtain a deeper black, logwood and indigo extracts are sometimes added. Runge in 1849 described a chrome ink which he made by adding 1 part of potassium chromate to 1000 parts of a solution of logwood, made by exhausting 1 pound of logwood with 6 quarts of boiling water. The potassium chromate is added gradually when the solution is cooled, the mixture being constantly stirred during the addition. This ink is cheap, permanent on paper, and unaffected by exposure to water or acids. The class of inks known commercially as alizarine inks as a rule do not contain alizarine at all, but are gallate of iron inks acidified with acetic acid to prevent the formation of sediment.

The ink, however, acts upon a steel pen until a protective coating is formed upon the pen. The use of ammonium vanadate, with an infusion of nutgalls, produces an exceedingly black writing fluid, but the expense of the vanadium salt has prevented its common use. Certain aniline blacks, e.g., nigrosine, owing to their fluidity and the fact that they form no sediment, have been extensively used in fountain pens.

Red Writing Ink. Red inks are commonly prepared from brazilwood, cochineal, or carmine; those made from brazilwood are regarded as more permanent, while those from cochineal yield the most brilliantly colored fluids. An excellent quality of red ink may be had by boiling 2 ounces of brazilwood in 32 ounces of water, and by adding to that solution, after straining, $\frac{1}{2}$ ounce of stannous chloride (tin salt) and 1 dram of gum arabic. Brazilwood inks have been almost wholly, and cochineal inks largely, replaced by aniline dyes. Magenta or aniline red and eosin are the chief dyes used. They are usually dissolved in spirit, which is then suitably thinned out with water.

Blue Writing Ink. Ordinary blue ink is a preparation of Prussian blue and may be made by triturating 6 parts of this substance and 1 part of oxalic acid with a little water to a perfectly smooth paste and diluting the mass with a sufficient quantity of distilled water. An excellent blue ink is made by dissolving soluble Paris blue ("cornflower blue") in alcohol.

Aniline Writing Inks. The general formula for making aniline inks is to dissolve 15 parts of any aniline color in 150 parts of strong alcohol in a glass vessel and, after allowing the solution to stand for three hours, adding 1000 parts of distilled water; the liquid is then heated gently for some hours, or until the odor of the alcohol has quite disappeared, whereupon it is mixed with a solution of 60 parts of powdered gum arabic in 250 parts of water. This formula may be followed for the ordinary violet or purple ink, as well as for the many other colors, such as green, yellow, etc., which are sometimes used.

Metallic Inks. Gold, silver, and similar metallic inks may be made by taking equal parts of the metal in leaf and triturating with honey until the metal is reduced to the finest possible state of division; then agitating with 30 parts of hot water, allowing to settle, decanting the water, repeating the washing several times, and finally drying the metal and mixing it with a medium consisting of equal parts of pure gum arabic and soluble potash glass in four parts of distilled water. Three or four parts of this medium will be found sufficient for one part of the powder.

Special Inks. Copying ink is made by adding a thickening substance, such as gum arabic, gum Senegal, dextrin, or glycerin, to ordinary ink. Hectograph inks, designed to furnish approximately 100 copies, consist of some strong soluble coloring matter in 10 per cent glycerin solution. An aniline blue is usually employed. Dyes insoluble in water or glycerin, such as magenta, are dissolved in alcohol before mixing with the other ingredients. The ordinary marking or indelible inks are made by dissolving a silver salt, usually the nitrate, in water and ammonia, to which a small quantity of gum is added. Such inks may be removed by treatment with potassium cyanide. More permanent inks may be made by using solutions of gold or platinum chloride.

Sympathetic or Secret Inks. These are fluids which produce colorless writing upon paper; but, when the latter is subsequently exposed to heat or proper chemical action, the writing becomes colored and clearly readable. Among the favorite secret inks may be mentioned solutions of lead acetate, whose invisible marks on paper turn black on exposure to sulphureted hydrogen, owing to the formation of sulphide of lead. Cobalt nitrate solution furnishes another favorite secret ink, its marks on paper turning blue on treatment with oxalic acid. A solution of either cobalt chloride or the nitrochloride will yield characters which are green when heated, but which disappear on cooling; also a weak solution of nickel and cobalt chlorides will produce green tracings.

Ink Powders. These are nothing but the common constituents of ink in a dry state. Black ink powder may be made by mixing 4 parts of powdered nutgalls, 2 parts of ferrous sulphate, and 1 part of gum arabic. The dry aniline colors may be similarly used.

Printing Inks. Any ink used in printing is essentially a pigment of the required color, mixed with an oil or varnish. John Underwood in 1857 before the Society of Arts described the properties essential to a good printing ink as follows: It must distribute freely and easily and work sharp and clean; it must not have too much tenacity for the type, but come off freely and adhere to the paper; it must dry almost immediately on the paper and not dry at all on the type or rollers; it should be practically proof against the effects of time and chemical reagents and never change color. The pigment used for the best black ink is lampblack, and the vehicle is usually linseed oil. Mineral pigments are generally used to produce the different colored printing inks. Details concerning the manufacture of printing inks may be found in any of the larger handbooks on printing. In lithography the writing ink for drawing on the stone may consist of equal parts of tallow, wax, soap, and shellac, mixed up with a sufficient quantity of Paris black. The printing ink used to take the impression of engraved plates, with a view to transference to the stone, may consist of equal parts of tallow, wax, soap, shellac, and pitch.

A. Melcher, *Mechanical Ink Marks* (Philadelphia, 1914).

INK'BERRY, or WINTERBERRY (*Ilex glabra*). An evergreen shrub, 2 to 4 feet high, which belongs to the holly family (*Aquifoliaceæ*), and which is found upon sandy soils in the United States from Massachusetts to Florida. The leaves are dark green, an inch or more long, wedge-lanceolate or oblong, smooth and shining on the upper surface; the sterile flowers in clusters of from three to six, fertile ones solitary and followed by small black berries. Its leaves and bark were formerly used as a remedy in intermittent fever. Its principal use is for decoration, for which purpose it is shipped to New York and Philadelphia from southern New

Jersey. Sometimes it takes the place of the American holly (*Ilex opaca*), but it is not so ornamental.

INK CAP (*Coprinus atramentarius*). An edible toadstool. See MUSHROOM.

INKERMAN, in'kēr-män'. An elevated site in the Crimea, near the eastern extremity of the harbor of Sebastopol (Map: Russia, D 6), memorable as the scene of a battle of the Crimean War between an army of Russians about 40,000 strong and detachments of the allied forces, consisting of about 14,000 troops actually engaged. At about five o'clock on the morning of Nov. 5, 1854, the Russians, who had marched from Sebastopol, concealed by the darkness and a thick, drizzling rain, appeared crowding up the slopes of the plateau on which the allies were posted. Here a portion of the English Royal Guards made an heroic stand for six hours against a body of Russians that was probably five times as numerous. When victory seemed almost assured to the Russians, French reënforcements came to the aid of the British and by a splendid charge drove the enemy off the field.

IN'KLE AND YAR'ICO. A drama by George Colman the Younger, produced in 1787.

IN'KNEE. See KNOCK-KNEE.

IN'LAY'. A general word for decorative or picture ornament, usually flat, produced by the insertion or application on a hard surface of pieces of wood, metal, shell, ivory, tile, stone, or enamel (glass), in contrasting colors; mostly on furniture, walls, floors, and jewelry. In the Metropolitan Museum, New York, is an Egyptian stool, dating from about 2000 B.C., with legs and bottom cross rails terminating in ducks' heads, the eyes and markings on which are rendered by inlays of ivory and ebony. There are similar stools in the British Museum and in the Louvre. In the *Odyssey* Ulysses, describing to Penelope the bridal bed that he has made, says: "Beginning from the headpost, I wrought at the bedstead till I had finished it, and made it fair with inlaid work of gold and of silver and of ivory." Many of the bronze mounts of beds that survive from Pompeii have inlays of silver and of copper. Much of the jewelry (q.v.) of the Germanic tribes consisted of *plate inlay*—garnets or red glass jewels cut in slices and inlaid on gold plate. Other methods of jewelry inlay are cloisonné and champlevé. (See ENAMEL.) Other metal inlays are niello (q.v.) and damaskeening (q.v.). The Italian name for the famous Florentine colored-pebble inlays is *pietra dura* (q.v.). All inlays of small and comparatively uniform pieces of colored glass, marble, and other stone are grouped under the head of mosaic (q.v.). The Italian name for wood inlay is *tarsia* (q.v.). The French name for furniture inlays, especially thin wood or veneer (q.v.) inlays, and inlays of the type developed by André Charles Boulle (q.v.), is *marquetrie*. The name for floor mosaics of wood, large in scale and from ¼ to 1¼ inches thick, is *parquetry* (q.v.). Mosaic inlay of carnelian, jasper, agate, jade, lapis lazuli, and other beautiful stones, on white marble was introduced into India in the sixteenth century by the French artist who decorated the Taj Mahal (q.v.). Of this kind of work there is a splendid example in the Metropolitan Museum, New York, in the form of a pedestal of white marble, one of four that formerly carried the platform of the gorgeous peacock throne of the palace of Shah Jehan (reigned 1628-58) in

Delhi. Both base and abacus of the pedestal, that is 22½ inches high with capital 11 inches square, are inlaid with floral arabesque, and the short bulbous shaft is 16-sided and faceted into triangles and hexagons, each hexagon being inlaid with conventional flowers.

INMAN, HENRY (1801–46). An American portrait, genre, and landscape painter. He was born at Utica, N. Y., Oct. 20, 1801, and was for seven years an apprentice pupil of John Wesley Jarvis in New York City. He was the first vice president of the National Academy of Design. He excelled in portrait painting, but was less careful in genre pictures. Among his landscapes are "Rydal Falls, England," "October Afternoon," and "Ruins of Brambletye." His genre subjects include "Rip Van Winkle," "The News Boy," and "Boyhood of Washington"; his portraits, those of Henry Rutgers and Fitz-Green Halleck in the New York Historical Society, of Bishop White, Chief Justices Marshall and Nelson, Jacob Barker, William Wirt, Audubon, De Witt Clinton, Martin Van Buren, and William H. Seward. In the Metropolitan Museum, New York, are his "Martin Van Buren," "The Young Fisherman," "William C. Maccready as William Tell." During a year spent in England, in 1844–45, he painted Wordsworth, Macaulay, John Chambers, and other celebrities. He returned to America in failing health, and at the time of his death, Jan. 17, 1846, was engaged on a series of historical pictures for the Capitol at Washington.

IN MEMORIAM. A poem by Tennyson (1850), in memory of his friend Arthur Henry Hallam.

INN, in. An important tributary of the upper Danube, rising in the southern part of the Swiss Canton of Grisons, at an altitude of over 8000 feet (Map: Germany, E 4). It flows through the canton in a northeastern direction, traversing the valley of Engadine, and as a violent mountain torrent enters Tirol through the Finstermünz Pass. It maintains its northeastern direction through Tirol, where its valley is famous for its scenery, and turns north at Kufstein, a short distance below its entrance into Bavaria. At the town of Rosenheim the Inn increases considerably in volume, becoming broad and filled with islands, and it exceeds the Danube in length and volume down to the point at Passau where it enters. The total length of the Inn is about 320 miles. It becomes navigable at Hall, a short distance below Innsbruck, but its commercial importance is greatly detracted from by the rapidity of its course. It is largely used for floating timber rafts from above Innsbruck. Its chief tributaries are the Salzach and the Alz.

INN (AS. *inn*, *in*, house, chamber, from *in*, within, Goth., OHG., Ger., OIr., Lat. *in*, Gk. *ἐν*, *en*, in). The older English name of a place of public entertainment for travelers. In the early ages, when among all except the most savage peoples the law of hospitality was strictly interpreted, and when, owing to the unsettled condition of most lands, it was a necessity of existence, there was little need for public houses. The earliest approximation to what was later meant by an inn is found in the caravanserais (q.v.) of the East—unfurnished lodgings on the highroads which travelers might occupy on their passage. Such was the "inn" mentioned in connection with the birth of Christ. The temples of the ancient religions usually afforded shelter

for pilgrims to their shrines. This custom has been kept up in pilgrimage places of a later time; thus, St. Philip de Neri had an immense hospice built to receive those who came to the jubilee of 1600.

Under the Roman emperors houses were established at the posting stations on the great roads, which began to approximate to the modern inn. These were not, however, open to all comers, but were at the service of Imperial messengers and of favored persons who could show an authorization known as *diploma tractatorium*. There were also lodging places for unofficial wayfarers, known as *diversoria* or *stabularia*, the latter affording accommodation to both man and beast. A classical description is that of Horace in his account in the *Satires* of his journey to Brundisium, where he characterizes the innkeeper in a spirit of modern protest as *perfidus caupo*. The city of Rome had many small inns, or rather lodging houses, which had a bad name and were daily inspected by the lictors of the prætor or ædile.

In Christian times, hospitality being named by St. Paul as a special duty of a bishop, the episcopal cities were the first to provide shelters for strangers; and the monasteries provided shelter and food for travelers throughout the Middle Ages. Some establishments of this kind remained celebrated even at a later date, such as those on the Alpine passes of the Great and Little St. Bernard, the Simplon, and Mont Cenis. The unusual amount of traveling brought about by the Crusades led to the establishment of brotherhoods specially devoted to the duties of hospitality, whether the recipients of it were sick or well. See HOSPITALERS.

The modern inn, at which entertainment was afforded as a matter of business, was of later growth. Erasmus gives a vivid and amusing picture of the crude provisions of the German inns in his time. Nowhere in Europe did these establishments so soon attain a recognized and respectable character as in England, where many of the old inns, with designations frequently adopted from the devices of powerful families, became famous—in London, e.g., the Angel, the Bell, the Belle Savage, the Bull and Mouth, and the White Horse. The older ones were usually built round a courtyard, entered from the street by a wide covered passage. This form, possibly a survival of Roman architectural methods, was common also in France and Italy. The English inns play no small part in the literature of the eighteenth and early nineteenth centuries; and where they still exist, in the smaller places, the friendly personal attention to the guest's comfort gives them an attractiveness seldom found in the more pretentious modern hotel (q.v.). The spread of railways all over the civilized world has given rise in great cities to a host of hotels of immense size and often palatial in their appointments, while the bicycle and the motor car have greatly increased the number and the quality of inns in smaller and less accessible places. See INNKEEPER.

C. Crawford, *Among Old New England Inns* (New York,

1907); Maskell and Grégory, *Old Country Inns of England* (ib., 1907); Hackwood, *Inns, Ales, and Drinking Customs of Old England* (ib., 1909).

INNATE IDEAS (Lat. *innatus*, inborn, from *in*, in + *nasci*, to be born). Ideas which by some philosophers are supposed to form part of the actual equipment or content of consciousness at birth, or, if they do not appear till later, are supposed not to be due to any experience falling within the life of the individual. The difficulty of accounting for our universal and necessary judgments (see JUDGMENT; INDUCTION) gave rise to this theory of innate ideas. We find the first suggestion of this theory in Plato's (q.v.) doctrine of reminiscence, and a vigorous defense, and perhaps the most elaborate statement of it, in Leibnitz's philosophy. Kant advocated not innate but a priori conceptions, the a priori being distinguished from the innate in that a priori conceptions are not merely formed at birth but are transcendental. (See KANT.) Since Kant's day innate ideas have played small part in philosophy save in the Scottish school (q.v.), being replaced among evolutionary writers by inherited tendencies to think in certain definite ways.

INNER HOUSE. The name given in Scotland to the higher division, or chamber, of the great court of the kingdom, the Court of Session (q.v.). It exercises an appellate jurisdiction over the inferior division, known as the Outer House, though its original jurisdiction is in general coördinate with that of the latter.

INNER MISSION (Ger. *Innere Mission*). The name given in Germany to a movement originated by Theodor Fliedner (q.v.) and further developed by Johann Hinrich Wichern (q.v.), who gave it its name in 1848. It is intended to elevate the whole man, and so, besides specific Church work, such as Sunday schools, rescue missions for drunkards and prostitutes, meetings for sailors, railroad employees, and strangers, it supports deaconesses to nurse the sick, maintains asylums and homes of all kinds, and takes part in the Red Cross work. Underneath all this exertion is the idea that until the spiritual nature is aroused little can be done for permanent improvement. It is distinctively a Protestant movement. There is a central committee, but it does not exercise control of the local committees. Consult: H. Behm, *Die Innere Mission, eine kirchliche Reformbewegung des 19. Jahrhunderts* (Gütersloh, 1892); *Fünfzig Jahre der Inneren Mission* (report of the Central Committee, Berlin, 1898); Schaffer, *Kalendar der Inneren Mission* (Gütersloh).

INNER PERCEPTION. See INTROSPECTION.

INNER RHODES, or INNERRHODEN. See APPENZELL.

INNER TEMPLE. One of the four ancient guilds of lawyers known as Inns of Court in London, having the exclusive privilege of calling persons to the English bar. It, together with its sister society, which came to be known as the Middle Temple, derived its name from the fact that early in the fourteenth century it gained possession of the New Temple, erected a short time before by the order of Knights Templars, as its "hostel," or place of residence. See INNS OF COURT.

INNES, in'ēs, COSMO (1798–1874). A Scottish lawyer and antiquary, born at Durris. He was educated at the High School of Edin-

burgh and at the universities of Aberdeen, Glasgow, and Oxford. He studied law, but never had a large practice. He arranged the documents of Register House and edited *Rescinded Acts* and *Acts of the Scots Parliament, 1124–1707*. He displayed so great an interest in the pre-Reformation period that he was suspected of sympathy with Rome. From 1846 to 1874 he was professor of constitutional law and history at Edinburgh. His works, besides the editions mentioned and many chartularies of Scottish religious houses, were: *Scotland in the Middle Ages* (1860); *Sketches of Early Scotch History* (1861); *Lectures on Scotch Legal Antiquities* (1872); *Memoir of Dean Ramsay* (1874).

INNES, THOMAS (1662–1744). An historian of Scotland. He was born at Drumgask, Aberdeenshire, in 1662 and was educated in Paris, where he graduated, M.A., in 1694. He passed most of his remaining years in Paris, occasionally visiting England and Scotland, chiefly for historical research. The great object of his life was to refute the fabulous narratives of Scotland, which had been hitherto generally accepted by his countrymen, and to supply in place of fable a true history. The preparatory task he accomplished in his *Critical Essay on the Ancient Inhabitants of . . . Scotland* (2 vols., London, 1729). In the preparation of this work he examined all the manuscripts and other material relating to the subject which he could find in France, England, and Scotland. The task was extremely difficult, for in his time most of these manuscripts were wholly unknown except to a few antiquaries; but the success of his labor is admitted by all who are acquainted with this portion of Scottish history. The *Critical Essay* has been reprinted with a memoir of the author by Grub in his *Historians of Scotland*, viii (Edinburgh, 1879). After finishing the critical part of his task Innes began his constructive work in his *Civil and Ecclesiastical History of Scotland*. The first volume only was completed by the author, and the second, so far as he had progressed with it, reaches merely to the year 821 (ed. by Grub for the Spalding Club, Aberdeen, 1853). Besides these principal works he wrote many dissertations and letters and made valuable collections of manuscripts. His death occurred in 1744. In addition to his *Memoir*, by Grub, mentioned above, consult: Chambers, *Biographical Dictionary of Eminent Scotsmen* (Glasgow, 1837); Forbes, *Ane Account of the Familie of Innes* (compiled 1698; printed for Spalding Club, Aberdeen, 1864); Thomas Cooper, in *Dictionary of National Biography*, vol. xxix (London, 1892).

INNESS, in'ēs, GEORGE (1825–94). The greatest of early American landscape painters. He was born at Newburgh, N. Y., May 1, 1825, and passed his boyhood at Newark, N. J., whither his family had removed. He took his first drawing lessons when 14 years of age, but two years later entered a store. Soon afterward he worked for one year with a firm of map engravers, but delicate health forced him to relinquish this occupation. Following his natural bent, he studied and made sketches from nature near Newark, and two years later worked for a short time in the studio of Régis Gignoux in New York. There he opened a studio of his own, achieving material success; but, dissatisfied with his own work, he studied prints of the old masters, and finally, through a patron and friend, was offered a trip abroad. He spent 15

months at Rome, returning with a style still unformed. In 1851 he spent a year in Paris, acquiring and assimilating, but without imitating. He was associated especially with the painters of Barbizon, whose aims were similar to his own. Studying their works, he began to form the individual style by which he is chiefly known. On his return he first lived in Brooklyn, N. Y., then in Medfield, Mass., and in 1862 made his home in Eagleswood, near Perth Amboy, N. J. In 1868 he was elected to the National Academy and later to the Society of American Artists. He again went abroad in 1871, remaining four years, chiefly at Paris and Rome. The latter part of his life was spent in and near New York, and his last years at Montclair, N. J. While traveling for recuperation, he died at Bridge of Allan, Scotland, Aug. 3, 1894. He was a man of profound spirituality, much given to mystic and psychical speculation, and in later life became a Swedenborgian. He possessed high intellectual qualities and keen wit and was always ready to express his thoughts on art subjects with strong, clear statements.

Inness is justly considered the most prominent figure in early American landscape, by the excellence as well as the scope of his art and the versatility of his treatment. Although he preferred the rich tones of the autumn and the sunset, he was equally successful with gray days, witness his magnificent "Woodgatherers," in possession of Mrs. George A. Hearn. His subjects included the pageants of sunrise, high noon, sunset, and evening; each picture seeming to pulsate with luminous qualities and atmospheric charm. Their chief beauty is one of color, his line tends to be indistinct; but the poetic sentiment expressed is always profound. He was essentially a painter of moods and emotions. His works, as to style, may be classed into two periods. The first period includes his early years of conscientious study, when great importance was given to detail, and an intimate knowledge of all the forms of nature; the subjects of these paintings were often panoramic in character, although always good in composition and color tone. After 1878 his works were rather the interpretation of some passing effect or emotion; they were full of personality and expressed with great breadth and simplicity in technique.

In public collections Inness is best represented in the Art Institute of Chicago, which devotes to him an entire room, containing 18 pictures, among them the "Millpond," "Florida Pines," "Threatening," and "Rainbow after a Storm." In the Metropolitan Museum of New York are seven, including "Peace and Plenty," "Delaware Valley," "Autumn Oaks," and "Spring Blossoms"; the National Gallery, Washington, contains four fine examples, including "September Afternoon," the well-known "Georgia Pines," and "Niagara." Inness is represented also in the museums of Brooklyn, Boston, Worcester, Buffalo, Pittsburgh, Toledo, St. Louis, and other cities, and very extensively in private collections of American painting.

Bibliography. No satisfactory biography of Inness has yet been written. Consult, however, the charming appreciation by his pupil Elliott Daingerfield, *George Inness, the Man and his Art* (New York, 1911); id., *Fifty Paintings by George Inness* (ib., 1913). Consult also: A. Trumble, *George Inness, a Memorial* (ib., 1895);

C. H. Caffin, *American Masters of Painting* (ib., 1902); and especially Samuel Isham, *History of American Painting* (ib., 1905).

INNESS, GEORGE, JR. (1854-). An American animal and landscape painter. He was born in Paris, of American parentage, and was a pupil of his father, George Inness, in Rome and for a few months of Bonnat in Paris, afterward sharing his father's studio in New York. From 1895 to 1899 he had a studio in Paris, exhibiting annually at the Salon. He was elected a member of the National Academy in 1899. In 1913 he became connected with the *Century Magazine*, in which his work frequently appeared thereafter. His "Shepherd and Sheep" and "The First Snow at Cragmoor" are in the Metropolitan Museum, New York. His animal pictures, such as the "Monarch of the Farm," the "Surf Horse," and the "Mother of the Herd," are vigorous and well drawn; his landscapes, such as "The Coming Storm" and "Morning on the River," resemble his father's latest work, having the same rich haze of color, with the light glowing through.

IN'NISFAIL (Ir., Island of Destiny). An ancient name applied by the bards to Ireland.

IN'NISKIL'LING. See ENNISKILLEN.

INN'KEEP'ER. In point of law an inn is a public house of entertainment for travelers. An innkeeper is a person who holds himself out as engaged in the business of receiving and affording accommodation (including food, drink, and lodging) for travelers or other transient guests for compensation. A tavern, being a place where only food and drink are served, was not included in the term "inn"; but the more modern "hotel" is, in a legal sense, an inn.

From the earliest times the common law regarded innkeepers (like common carriers, wharfingers, and farriers) as persons engaged in a public calling and therefore as coming under peculiar obligations to those whom they served. The innkeeper is legally bound, so long as he has accommodations, to receive all proper persons applying for accommodation and is liable in damages for his failure to do so. He is not bound, however, to receive one who is drunk, disorderly, affected with a contagious disease, or who is otherwise obnoxious. The prospective guest is not entitled to select whatever accommodation the inn affords, and if he will not accept such reasonable accommodation as is offered the innkeeper may refuse to serve him. As an incident of his public calling, the innkeeper has a lien on the horse and carriage and goods of the guest for his bill or reckoning which entitles him to detain them until the bill is paid, even though they are not the property of the guest (see LIEN), but he cannot detain the person of his guest to enforce payment.

While an innkeeper has his remedy by lien for his charges, he is under great responsibility for the safety of the goods of his guests. In general, he is absolutely liable for the safety of all goods which form a part of the traveling equipment or luggage of a guest, unless the loss occurs by act of God or the public enemy. Hence the innkeeper is liable to his guest for loss by fire or theft, although in a few American States the innkeeper is exempted by statute from liability for loss by fire not caused by the negligence of himself or his servants. The innkeeper is excused if the loss is caused by the guest's own negligence—as, e.g., by his leaving the door of his room unlocked or by his leaving a box

or package containing valuables in a public room of the inn without delivering the package to the innkeeper or his servants. An innkeeper cannot escape liability by posting a notice in the guest's room or other part of the house to the effect that he will not be answerable for such losses, such notice being contrary to the policy of the law which imposes the extraordinary liability on the innkeeper. He may, however, make reasonable regulations for protecting the property of the guests, as by requiring all valuables belonging to guests to be deposited in the innkeeper's safe; and if the guest after fair notice fails to comply with the regulation, the innkeeper is not liable for loss of the valuables, unless due to his own misconduct or that of his servants.

One who takes his meals in a public restaurant attached to an inn is not a guest of the inn itself, and his rights are merely those of a casual boarder. An innkeeper may entertain boarders living regularly in his house as well as transient guests or travelers; but as to these his liability is only that of a boarding-house keeper. Innkeepers are subject to various statutory regulations which, owing to the fact that the innkeeper is engaged in a public calling, do not violate any of the constitutional provisions guaranteeing the rights of citizens. Thus, he may be compelled to keep a regular register of his guests, provide safety appliances to avoid danger of fire, and he may even be subject to regulations as to food and accommodations. (See PUBLIC CALLINGS; BOARDING HOUSE; LIEN.) Consult: J. Schouler, *Law of Bailments* (Boston, 1880); Pymar, *Law of Innkeepers* (London, 1892), a comparison of English and Roman laws; Jeff and Hurst, *Law of Innkeepers* (ib., 1904); J. H. Beale, *Law of Innkeepers and Hotels* (New York, 1906); *American and English Encyclopædia of Law* (ib., 1909-).

INNOCENT. The name of 13 popes.—**INNOCENT I** (Pope, 402-417), a native of Albano. His pontificate was one of the most important in the early centuries, in its development of the relations of the Roman see with other churches, both Eastern and Western. He seems to have extended, if not originated, the system of naming legates to represent the Pope. He maintained with a firm hand the right of the Roman Bishop to hear appeals from other churches, and his letters abound with assertions of universal jurisdiction. At the request of St. Augustine and the North African bishops, in 404, he induced the Emperor Honorius to pass laws for the protection of the Catholics against the Donatists. He strongly supported St. John Chrysostom against his opponents. His last years were full of trouble, owing to the attacks of Alaric upon Rome, which in 410 was pillaged, with the exception of the Shrine of the Apostles. His last two letters were written to encourage St. Jerome in his difficulties with the troublesome Eustochium and Paula and with the Origenists. The whole of his important correspondence is in Migne, *Patrologia Latina*, xx. Consult H. H. Milman, *History of Latin Christianity*, vol. i (New York, 1903), and Hartmann Grisar, *History of Rome and the Popes in the Middle Ages*, English translation edited by L. Cappadelta (3 vols., London, 1911-12).

INNOCENT II (Gregorio Papareschi). Pope, 1130-43. He was opposed by a faction among the cardinals, who set up an antipope under the title of Anacletus II. But Innocent was sup-

ported by Louis VI, the French bishops, and St. Bernard, and restored to Rome by Lothair, whom he crowned as Emperor. Anacletus still maintained possession of the castle of Sant' Angelo until his death, in 1138, and Innocent was obliged to absent himself from Rome during much of that time. In 1139 he held the second Lateran Council, which was attended by about 1000 bishops, and confirmed the condemnation pronounced by several councils on Abélard and the followers of Arnold of Brescia, and excommunicated Roger, the King of Sicily. In 1141 a conflict regarding the appointment of archbishops arose between the Pope and his former supporter, Louis VII, which resulted in an interdict covering any place where the King might be, and only removed by Celestine II. Consult: Mühlbacher, *Die streitige Papstwahl des Jahres 1130* (Innsbruck, 1876); Martens, *Die Besetzung des päpstlichen Stuhles unter Heinrich III. und Heinrich IV.* (Freiburg, 1886); H. K. Mann, *Lives of the Popes in the Early Middle Ages*, vols. ix, x (London, 1914); and the letters of Innocent II in Migne, *Patrologia Latina*, clxxix (Paris, 1844-64).

INNOCENT III (Lotario de' Conti). Pope, 1198-1216. This was by far the greatest Pope of the name, and under him the power of the papacy over temporal authority was more widely extended than ever before. He was born at Anagni in 1161 and made Cardinal by his uncle, Clement III, after a distinguished scholastic career in Paris, Bologna, and Rome. His election to the papacy at the age of 37, while he was still a layman, was looked upon with misgiving, which finds expression in a poem by the famous Walther von der Vogelweide: "O wê, der bâbest ist ze junc: hilf, hêrre, dîner kristenheit" (Alas, the Pope is too young: help, Lord, thy Christendom). But the combined strength and wisdom of his rule soon allayed these fears. His first success was the restoration of the papal authority in Rome and the States of the Church, but he soon extended his influence to every part of Europe. In Germany he adjudicated with authority upon the rival claims of Otho, son of Henry the Lion, and Philip of Swabia; and a second time he interposed effectually in behalf of his ward, Frederick II. In 1202 he affirmed in a decretal the right of the Pope to confirm or reject the election of the Emperor and to crown the Emperor when elected according to his will. In France he espoused the cause of the injured Ingeborg, whom Philip Augustus had attempted to repudiate in order to marry Agnes of Meran. Another interposition in favor of the sanctity of the marriage tie was that by which he disciplined Alfonso IX of León, who had married within the prohibited degrees. His legates crowned the Prince of the Bulgarians and the King of Bohemia, and even the King of Armenia received the investiture of his kingdom from them. The history of his relations with England (see JOHN; LANGTON, STEPHEN) is no less noteworthy as an exhibition of the extent of his supremacy. That nothing might be wanting to the completeness of his authority throughout the then known world, the Latin conquest of Constantinople put an end to the shadowy pretensions of the Eastern rivals of his power, spiritual as well as temporal. As an ecclesiastical administrator, Innocent III holds a high place. He was a vigorous guardian of public and private morality, a steady protector of the weak against oppression, and

zealous in conflict with simony and other abuses of the time. He prohibited the multiplication of religious orders by private authority, but he lent all his influence to the furtherance of the remarkable spiritual movement in which the two great mendicant orders (see FRANCISCANS; DOMINICANS) had their origin. The celebrated fourth Lateran Council (q.v.), held in 1215, marked the zenith of his remarkable reign. In the following year, while busily engaged in promoting peace among the Italian cities, so as to remove obstacles to the Crusade, Innocent was seized with a fever and died at Perugia in his fifty-sixth year. His letters and decretals are in Migne, cxiv-cxviii.

Von Hurter, *Geschichte des Papstes Innocenz III. und seiner Zeitgenossen* (4 vols., 3d ed., Hamburg, 1841-43); Delisle, *Mémoire sur les actes d'Innocent III, suivi de l'itinéraire de ce pontife* (Paris, 1857); Gasparin, *Innocent III* (ib., 1873); Deutsch, *Papst Innocenz III. und sein Einfluss auf die Kirche* (Breslau, 1877); Brischar, *Innocenz III. und seine Zeit* (Freiburg, 1883); Lindemann, *Kritische Darstellung der Verhandlungen Innocenz III. mit den deutschen Gegenkönigen* (Magdeburg, 1885); Barry, *Papal Monarchy* (New York, 1903); Luchaire, *Innocent III* (Paris, 1904-08); Pirie-Gordon, *Innocent the Great* (London, 1907); Mann, *Lives of the Popes in the Early Middle Ages*, vols. ix, x (ib., 1914).

INNOCENT IV (Sinibaldo de' Fieschi, Count of Lavagna). Pope, 1243-54. He was born at Genoa, of a distinguished family, and was elected at Anagni by the cardinals who had fled from Rome, then occupied by the Emperor Frederick II. His first and most difficult task was to compose the strife which had long raged between this brilliant and vigorous prince and the holy see. Terms of peace were agreed to in 1244, the Imperial commissioner being Peter de Vineia (q.v.), afterward an antipope; but they did not agree upon the interpretation, and Frederick attempted to seize Innocent, who escaped to Genoa and thence to Lyons. To this city he summoned a general council in 1245 to deal with the questions at issue. (See LYONS, COUNCILS OF.) Innocent was unable to return to Italy until after Frederick's death, arriving in Rome in 1253. The conflict still continuing, he excommunicated the new Emperor, Conrad IV, on Maundy Thursday of 1254. Conrad died six weeks later, the power of the Ghibellines declined, and peace revisited Italy. Manfred, the natural son of Frederick, then took up arms again at the head of a Moorish army and inflicted a severe defeat on the papal forces on December 2. Five days later Innocent died at Naples. He was considered a man of great learning and did much to advance the universities of Paris and Bologna. He wrote a commentary on the Decretals of Gregory IX, which was first printed at Strassburg in 1477.

Bibliography. Masetti, *I pontefici Onorio III, Gregorio IX ed Innocente IV a fronte dell'Imperatore Federico II* (Rome, 1884); Berger, *Les registres d'Innocent IV* (Paris, 1884); Weber, *Der Kampf zwischen Papst Innocenz IV. und Kaiser Friedrich II. bis zur Flucht des Papstes nach Lyon* (Berlin, 1900); H. K. Mann, *Lives of the Popes in the Early Middle Ages*, vols. ix, x (London, 1914). His English relations are discussed from a point of view favorable to the Church, in F. A. Gasquet, *Henry the Third and the Church* (London, 1905).

INNOCENT V (Pietro di Tarantasia). Pope, 1276. He was born in Savoy, entered the Dominican Order, and taught with great success in Paris. He was made Archbishop of Lyons in 1271 and Cardinal immediately afterward. His Pontificate lasted only five months, from January 21 to June 22, and was marked by endeavors to reconcile the Guelphs and Ghibellines and to reunite the Eastern churches with Rome. He left commentaries on a large part of the Bible and on the Sentences of Peter Lombard. Consult: Carboni, *De Innocentio V, Romano Pontifice* (Rome, 1894); Bryce, *Holy Roman Empire* (New York, 1911); H. K. Mann, *Lives of the Popes in the Early Middle Ages*, vols. ix, x (London, 1914).

INNOCENT VI (Etienne Aubert). Pope, 1352-62. He was born at Mont in the Diocese of Limoges, and elected Pope at Avignon, where he resided during his pontificate. He was a distinguished canonist and did much to reform ecclesiastical discipline. His influence was exerted for peace in many quarters of Europe, and he encouraged learning, inviting Petrarch to reside at his court. Consult: Ferdinand Gregorovius, *History of the City of Rome in the Middle Ages*, vol. vi (London, 1898); Ludwig Pastor, *History of the Popes*, vol. i (ib., 1906); *Innocent VI et Blanche de Bourbon, lettres du pape* (ed. Daumet, Paris, 1901); Bryce, *Holy Roman Empire* (New York, 1911).

INNOCENT VII (Cosimo de' Migliorati, a native of Salmona in the Abruzzi). Pope, 1404-06. He had distinguished himself by a knowledge of canon and civil law and by a holy life, so that he was made Cardinal in 1389 by Boniface IX, whose successor he was chosen amid the troubles of the great schism. Little else than these tumults distinguished his short reign, which was marked by nepotism. Consult: Ferdinand Gregorovius, *History of the City of Rome in the Middle Ages*, vol. vi (London, 1898); Mandell Creighton, *History of the Papacy*, vol. i (ib., 1904); Ludwig Pastor, *History of the Popes*, vol. i (ib., 1906).

INNOCENT VIII (Giovanni Battista Cibo). Pope, 1484-92. He came of a noble Genoese family; his father had been a Roman senator and Governor of Naples. He was a widower when he entered the clerical state and won the favor of Paul II, who appointed him Bishop of Savona, and Sixtus IV, who made him Cardinal. He strove to promote peace among Christian princes and to unite them against the Turks, who had not long before conquered Constantinople. He quarreled, however, with King Ferdinand of Naples over the payment of the customary tribute, excommunicated him, and transferred his kingdom to Charles VIII of France, whereupon Ferdinand yielded. His nepotism was marked; he gave his illegitimate son Franceschetto several towns near Rome and secured for him the hand of Maddalena, daughter of Lorenzo de' Medici. This son was born to Innocent VIII in his youth, before he began an ecclesiastical career. In compensation he made her 14-year-old brother Giovanni Cardinal and thus opened the way of the family to the papal throne. Consult: Serdonati, *Vita e fatti d'Innocenzo VIII* (Milan, 1829); Mandell Creighton, *History of the Papacy*, vol. iv (London, 1903); Ludwig Pastor, *History of the Popes*, vols. v, vii (ib., 1911).

INNOCENT IX (Giovanni Antonio Facchinetti). Pope, 1591. He was born at Bologna in 1519

and studied law. He was the first Bishop named by Pius IV and, after the close of the Council of Trent, was nuncio at Venice for six years. Gregory XIII made him Cardinal, and he held important offices under this Pope and his two successors, practically administering the papacy during the illness of Gregory XIV. His own reign, however, was cut short by death after two months, during which he had supported the League in France. He left a number of learned philosophical and political writings. Consult *New Schaff-Herzog Encyclopedia of Religious Knowledge*, vol. v (New York, 1909).

INNOCENT X (Giovanni Battista Pamfili). Pope, 1644-55. He was the candidate of the Spanish party in the conclave and thus opposed by the French. He was much influenced by his sister-in-law Olimpia Maidachini, but the insinuations of Gregorio Leti are characterized by Ranke as a baseless romance. In the bull *Zelus domus Dei* of 1648 (published in 1651) he condemned the Peace of Westphalia as injurious to the rights of the Church, and in 1653 he condemned the famous five propositions of Jansen. (See **JANSENISM**.) On this point consult Hergenröther, *Katholische Kirche und christlicher Staat* (Freiburg, 1872), and, for his life, Ciampi, *Innocenzo X Pamfili e la sua corte* (Rome, 1878); Leopold von Ranke, *History of the Popes*, vols. ii, iii (London, 1908-12); Bryce, *Holy Roman Empire* (New York, 1911).

INNOCENT XI (Benedetto Odescalchi). Pope, 1678-89. He was born at Como in 1611 and named Cardinal by Innocent X in 1645. Appointed Bishop of Novara in 1650, he devoted the revenues of the see to the poor and later resigned it to his brother, taking up his residence in Rome. He was a vigorous and judicious reformer, and his reign is entirely free from the stain of nepotism. In 1679 he censured as lax 65 propositions taken from various theological works, and by the constitution *Cœlestis Pastor* of 1687 condemned still more strongly 68 propositions of Molinos (q.v.). Although he owed his election to the French party, he was soon involved in conflicts with Louis XIV, which lasted throughout his pontificate. One arose over the claim of the French Ambassador in Rome to a right of asylum, which enabled him to shelter criminals not only in his palace but in the surrounding quarter. Precipitated by an alleged attack by the Corsican guards of the Pope, it led to a military expedition being launched against the holy see. A more serious conflict arose when the Pope attempted to put an end to the abuse of the King's keeping sees vacant, in virtue of what was called the *Droit de régale*, and appropriating their revenues. The resistance to this attempt drew forth the celebrated declaration of the French clergy as to the "Gallican liberties." (See **GALLICAN CHURCH**.) Innocent, as did Bossuet and Fénelon, disapproved of Louis XIV's methods of converting the Huguenots by force. On this point consult Gérin, "Le pape Innocent XI et la révocation de l'Edit de Nantes," in *Revue des questions historiques* (Paris, 1878); also consult, id., *Innocent XI et la révolution anglaise de 1688* (ib., 1876); Michaud, *Louis XIV et Innocent XI* (4 vols., ib., 1883); Gérin, *Louis XIV et le Saint Siège* (2 vols., ib., 1890); Im-mich, *Papst Innocenz XI*. (Berlin, 1900); Leopold von Ranke, *History of the Popes*, vol. ii (London, 1908).

INNOCENT XII (Antonio Pignatelli). Pope,

1691-1700. He was born at Naples in 1615 and, after filling important diplomatic posts, was made Cardinal by Innocent XI, whose reforming policy he set himself to imitate when raised to the papacy after a session of the conclave lasting nearly six months. He brought about a reconciliation with France, after the French bishops had retracted the "four articles," and abandoned the anti-French policy which, since Urban VIII, the popes had maintained almost without exception. Consult *Cambridge Modern History*, vol. v (Cambridge, 1908), and Leopold von Ranke, *History of the Popes*, vol. ii (London, 1908).

INNOCENT XIII (Michelangelo de' Conti, the son of Carlo II, Duke of Poli). Pope, 1721-24. He was born in 1655 and raised to the episcopate and the cardinalate by Clement XI. He chose his title as Pope in memory of Innocent III, who had belonged to his family. Like his predecessor, he strongly supported the Pretender, who was always recognized as James III in Rome. At the instance of the French court he very unwillingly made the Minister Dubois Cardinal, but he refused to recall the bull condemning Jansenism. Consult Mayer, *Die Papstwahl Innocenz*, vol. xiii (Vienna, 1874), and Leopold von Ranke, *History of the Popes*, vol. iii (London, 1912).

INNOCENTS, HOLY, FEAST OF (CHILDERMAS). A festival which commemorates the massacre of the children at Bethlehem (Matt. ii. 16-18). These children are referred to as martyrs by St. Cyprian and still more explicitly by St. Augustine; and it is to them that the exquisite hymn of Prudentius, *Salvete Flores Martyrum*, is addressed. The feast is first mentioned in the *Leonine Sacramentary* (c.485). In the modern Church this feast is celebrated as a special holiday by the young, and many curious customs connected with it prevail in some countries. One of these is that in private families the children are on this day privileged to wear the clothes of the elders and in some sort to exercise authority over the household in their stead. The Greek church keeps the day on December 29 (O. S.); the Latin, December 28. In the Roman Catholic church, the color of vestments (except when the festival falls on Sunday, when red, the usual color of martyrs, is employed) is violet, the color of mourning, since the innocents died before the completion of the work of redemption.

INNOCENTS, MASSACRE OF THE. See **MAS-SACRE OF THE INNOCENTS**.

INNOCENTS ABROAD. The best-known work of Samuel Langhorne Clemens ("Mark Twain") (1869). It is the account of a trip undertaken in 1867 by a party of Americans, who chartered the *Quaker City* and visited various countries of Europe.

INNOCEN'ZO DA IM'OLA. See **IMOLA, INNOCENZO DA**.

INNOM'INATE ARTERY (Lat. *arteria innominata*, artery without a name). The first large branch given off from the arch of the aorta at a distance, on the average, of 3½ inches from the aortic valve. It divides into the right carotid and the right subclavian arteries. It is separated by an interval of less than ½ inch from the left common carotid artery. Its calibre is large, and its average length is about 1½ inches. Its course corresponds to a line drawn from the middle of the sternum, or the point of junction of the manubrium and the gladiolus,

to the right sternoclavicular joint. Its relations are as follows: In front, the inferior cervical cardiac branch of the right pneumogastric nerve, the left vena innominata and right inferior thyroid veins, the thymus gland, and the sternothyroid and sternohyoid muscles; behind, the trachea; on the right, the pleura, the right vena innominata, and the right pneumogastric nerve; on the left, the left carotid artery and the thymus gland. Through the innominate artery flows all the blood to the right side of the head and neck and to the right upper extremity. Unsuccessful attempts have been made to cure aneurism of the right subclavian by tying the innominate; but they have resulted only in bringing out the fact that the collateral circulation established in such cases after the operation is ample. See AORTA.

INNOMINATE BONE (Lat. *os innominatum*, bone without a name). In human anatomy, the bone which forms the hip and is provided with the socket into which the head of the femur is received. There are two of these bones in the skeleton, and each is formed by the union of the ilium, the ischium, and the pubic bone. See SKELETON.

INNSBRUCK, ins'bruk, in English often written INNSPRUCK. The capital and the most picturesque town of the Austrian Crownland of Tirol, situated in the Alps, at an elevation of nearly 1900 feet, on both banks of the Inn, in a region abounding in beautiful views (Map: Austria-Hungary, B 3). It lies in a broad valley, surrounded by high mountains, and has, despite its high location, a very moderate climate, the annual temperature averaging 47° F. The streets are spacious and the buildings attractive. Innsbruck comprises the old town on the right bank of the Inn and the two suburbs of Mariahilf and Sankt Nikolaus, connected with the old town by three iron bridges. In Innsbruck is found the oldest Capuchin monastery in Austria. It was begun in 1598. The Franciscan, or court, church (1553-63) is interesting. It contains a magnificent monument to Maximilian I, consisting of a bronze statue of the Emperor on a marble sixteenth-century sarcophagus, surrounded by 28 bronze statues of his ancestors and contemporaries. The sides of the sarcophagus are adorned with fine marble reliefs representing the principal events of the Emperor's life. The church possesses also a silver statue of the Virgin and several monuments to Tyrolese patriots. The Jesuit church, which is a seventeenth-century edifice in baroque style, not completed until 1902, surmounted by a dome of nearly 200 feet, and the parish church, with an altarpiece by Cranach, are worthy of mention.

The secular structures of Innsbruck are also interesting. The chief among them are a palace (about 1525), with a rich marble balcony, in late Gothic style, covered with a roof of gilded copper known as the Goldne Dachl (balcony and roof date from 1500); the Imperial palace, a rococo building of the eighteenth century, containing a spacious hall ornamented with splendid frescoes; the Ottoburg, dating from the thirteenth century; the municipal theatre; the Ferdinandeum, or Tyrolese National Museum, with a façade adorned with busts of eminent Tyrolese citizens; the new orphanage; the Triumphal Gate, erected in 1765, in honor of the reigning family; and the municipal buildings, possessing a collection of paintings and graced

by the Leopoldsbrunnen in front of it. Innsbruck has a monument to Walther von der Vogelweide. First among the educational institutions is the university. It was founded in 1677 by Leopold I. It has four faculties—jurisprudence, philosophy, theology (under Jesuit control), and medicine. There are over 1300 students, 400 being theological. In 1912, the library contained 258,620 volumes. The university possesses valuable Tyrolese archives. Other prominent educational institutions are the national Gymnasium (founded in 1562), the municipal Oberrealschule, the commercial academy, and the military school. The Ferdinandeum contains, among its interesting collections, a picture gallery, and a library of about 30,000 volumes, including the works of all the Tyrolese authors. There are important hospitals. The chief industries are cotton and wool spinning, glass painting, and the manufacture of mosaics. There is a chamber of commerce. Innsbruck is the seat of the Court of Appeals for Tirol and Vorarlberg. Among the interesting features in the environs are the historic and beautiful Isel Mountain, with Natter's bronze statue to Hofer, and the famous mediæval Ambras Castle, with a celebrated collection of weapons. Pop., 1890, 23,320; 1900, 26,866; 1910, 53,194, chiefly German-speaking Roman Catholics. In ancient times the name of Innsbruck was *Æni Pons* or *Ænipontum*. The town received municipal privileges from Otho I, Duke of Meran, in 1234. From 1363, the year of the annexation of Tirol to Austria, until 1665, Innsbruck was for the most part the residence of the Tyrolese rulers of the house of Hapsburg.

INNS OF CHANCERY. Certain houses or sets of buildings in London, which were originally places of residence and study for the "clerks of the chancery," who prepared and issued the legal writs for suitors in the royal courts, and their students and apprentices; hence, also, the societies which occupied the buildings. These Inns of Chancery, which were formerly called *hospitia minora*, were formerly 8 or 10 in number and were attached to the Inns of Court, near which they were situated, from the fifteenth or sixteenth century to the eighteenth; but they now have no public function, though several of them still exist as societies, with corporate property. The chambers are occupied by solicitors and others. The last surviving Inns of Chancery were Clifford's Inn, New Inn, and Furnival's Inn. It seems that, in the fourteenth and fifteenth centuries, when the Inns of Court constituted a great legal university, the Inns of Chancery occupied the position of preparatory schools to the more dignified foundations and furnished elementary instruction in the drawing of writs and other legal papers. See INNS OF COURT.

INNS OF COURT. The four sets of buildings in London (the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn) belonging to the four legal guilds or societies which have the exclusive privilege of admitting persons to practice at the bar; hence the societies themselves. The origin of the Inns of Court traces back to the mediæval inns of law, the origin of which is lost in antiquity, and their present importance is but a dim shadow of their former greatness. As early as the beginning of the fourteenth century they are known to have taken possession of the houses from which they derive their names and in the later Middle Ages

they became the seat of great schools of law, to which students resorted from all parts of England, and in which scholars, statesmen, and men of affairs, as well as the leaders of the bench and bar, were trained. To-day they are little more than clubs of barristers, which maintain lectures for law students and guard their admission to the bar. The distinction of the four principal inns of law (i.e., houses where law was taught), as Inns of Court, was fully established in the fifteenth century; but in earlier times, and sometimes later, the name Inns of Court, or its equivalent, seems to have included both the *hospitia majora* of the early period and the *hospitia minora*, or lesser inns, to which the Inns of Chancery (q.v.) belonged.

The four Inns are each governed by a committee or board, called the benchers, who are generally king's counsel or senior counsel, self-chosen, i.e., each new bencher is chosen by the existing benchers. Each Inn is self-governing and quite distinct from the others, all, however, possessing equal privileges; but latterly they have joined in imposing certain educational tests for the admission of students through the medium of a council of legal education, consisting of delegates appointed by each Inn from among its benchers. It is entirely in the discretion of an Inn of Court to admit any particular person as a member, for no member of the public has an absolute right to be called to the bar, there being no mode of compelling the Inn to state its reasons for refusal. But practically no objection is ever made to the admission of any person of good character. Each Inn has also the power of disbarring its members, i.e., of withdrawing from them the right of practicing as counsel. This right has been rarely exercised, but of late years there have been examples of persons abusing their profession and indulging in dishonest practices; in such cases the Inn has its own mode of inquiring into the facts affecting the character of a member and is not bound to make public the results of its investigation. By this high controlling power over its members a higher character is supposed to be given to the bar as a body than if each individual were left to his own devices, unchecked except by the law. The buildings of each Inn consist of a large area of houses or chambers, which are in general occupied exclusively by barristers, and sometimes by attorneys, and are a source of great wealth to the societies to which they respectively belong. The buildings of the four Inns are not marked by any general plan or uniformity in grouping or style of architecture, but represent the growth of many centuries. The Inner Temple has a fine hall of the time of Elizabeth, with an open-timbered roof of much beauty; the Middle Temple has a library which is a nineteenth-century building with a roof studied from that of Westminster Hall.

Pearce, *Guide to the Inns of Court and Chancery, with Notices of their Ancient Discipline, Rules, and Customs* (ib., 1855); Alexander Pulling, *Order of the Coif* (ib., 1884); Cecil Headlam, *Inns of Court* (New York, 1909); H. Ringrose, *Inns of Court* (Chicago, 1909); W. B. Odgers (ed.), *Six Lectures on the Inns of Court and of Chancery* (New York, 1912). See **BAR**; **BARRISTER**; **LEGAL EDUCATION**.

INNSPRUCK. See **INNSBRUCK**.

INNUENDO, in'ū-ēn'dō (Lat., by hinting). In law, a clause in a declaration for slander or libel, in which the relation or application of the alleged slanderous or libelous words to the plaintiff is pointed out and explained. This clause is necessary only if their meaning or application is ambiguous. The term is used only in jurisdictions where common-law pleading prevails. See **DECLARATION**; **DEFAMATION**; **LIBEL**; **SLANDER**.

INNUIT, in'nū-īt. A name sometimes applied to the American Eskimo. See **ESKIMO**.

I'NO (Lat., from Gk. Ἴνώ), or **LEUCO'THEA**. In Greek legend, the daughter of Cadmus and Harmonia, and wife of Athamas (q.v.), who reigned in Phthiotis, or Bœotia. He had previously wedded the goddess Nephele, who bore him Phrixus and Helle (q.v.). Ino also bore two sons, Learchus and Melicertes (q.v.), and in her jealousy plotted the destruction of her stepchildren, who were rescued by their mother. As Ino had cared for the infant Dionysus, son of her sister Semele and Zeus, Hera visited Athamas with madness, and in his frenzy he killed his son Learchus. Ino, fleeing with Melicertes in her arms and pursued by her husband, leaped into the sea and was received by Poseidon and the nymphs as a new goddess under the name of Leucothea. The worship of Ino-Leucothea and her son Melicertes-Palæmon was widespread. She aided the shipwrecked Odysseus and was in general regarded as the special helper of those in extreme distress and peril at sea. The story of Athamas and Ino is used with many variations by Sophocles and other Greek dramatists and by the Roman poets Ennius and Accius in their tragedies.

IN'OCAR'PUS (Neo-Lat., from Gk. ἴς, *is*, fibre + καρπός, *karpos*, fruit), *Inocarpus edulis*. The South Sea (or Tahiti) chestnut, an important tree to the inhabitants of the South Sea Islands for its fruit, a nut, which, while green, is gathered and mashed to supply a considerable part of their food. The tree is of stately growth and fine foliage; the leaves evergreen, of delicate texture, oblong, 6 or 8 inches in length. Instead of increasing uniformly in thickness the trees throw out buttresses to support the trunk. Small projections appear on the lower branches, which later become 2 or 3 inches thick, and extend sometimes 4 feet from the trunk at the bottom in nearly straight lines from the root to the branches. They look like plank buttresses covered with bark. The central stem may continue for many years only 6 or 7 inches in diameter. These natural planks are used for paddles of canoes and for other purposes. This tree has been extensively planted throughout the tropics. At Calcutta 10-year-old trees were reported 25 to 30 feet in height.

IN'OCER'AMUS (Neo-Lat., from ἴς, *is*, fibre + κέραμος, *keramos*, tilé). A characteristic fossil lamellibranch (pelecypod) of the Jurassic and Cretaceous rocks. The valves have rounded outlines, with the surfaces broken by concentric folds, beaks low, and hinge line without teeth. These shells are very abundant in the Jurassic and Cretaceous rocks of the Western States, some of them attaining the diameter of 2 feet. See **JURASSIC SYSTEM**.

INOC'ULA'TION (Lat. *inoculatio*, from Lat. *inoculare*, to graft, from *in*, in + *oculus*, eye). Intentional infection of an individual with a disease by introducing its virus into the tissues

or fluids of the body. Inoculation of the lower animals is used in the study of bacteriology, for it is possible by this means to reproduce in animals, with some organisms, the pathological condition presented in the natural disease. Cultures are made of the microorganisms of the disease; or tissues, secretions, or excretions are obtained from the diseased body, to constitute the material for use. (See DISEASE, GERM THEORY OF.) The inoculation is either *subcutaneous*, *intrascrous*, *intravascular*, or *intracerebral*, according as the injection is made respectively into the tissue under the skin, into a serous cavity like the pleura, into a vein, or directly into the substance of the brain.

Criminals have been inoculated with disease for experimental purposes, as well as volunteers for science' sake. Preventive inoculation is practiced in the case of several diseases, as rabies, plague, diphtheria, etc. Virus of disease which has become weakened (attenuated) by being passed through several animals is injected into human beings who have been or are to be exposed to the disease, and the desirable blood change, together with the development of antitoxin, is obtained. (See ANTITOXIN; IMMUNITY; SERUM THERAPY.) The first use of inoculation in human beings was probably the intentional transference of smallpox. From very ancient times the Hindus, and from as early as the sixth century the Chinese, inoculated persons with smallpox and then cared for them, with the result of a smaller mortality than if they had caught the disease during an epidemic. In 1717 Lady Mary Wortley Montagu, wife of the English Ambassador in Turkey, became convinced of the advantages of inoculation with smallpox, as practiced by the Greeks and Armenians there. In 1721 she caused her son to be inoculated in London. Six condemned criminals at Newgate were the next experimental cases; and, after the two children of Caroline, Princess of Wales, were also inoculated, the fashion became established among the wealthy and high-born. The mortality from smallpox in England at that time was one in five, while the mortality of the inoculated was but one in 3000. The Chinese used crusts, placed in the nostrils, or caused the children to wear the clothes of a smallpox patient. Following the Hindu method, the English made incisions in the arms, into which the pus from a pustule was introduced. In general, a milder course was taken by the disease resulting from inoculation, about 50 pocks appearing, it is said; but in some cases intense invasion followed with a fatal result. The disadvantage of the method appears from the fact that every inoculated person became a focus for the spread of the disease, and isolation was expensive. Besides, the percentage of deaths from smallpox, in spite of (or possibly because of) inoculation, increased till at the end of the eighteenth century one-tenth of the population of England died of the disease. After becoming very fashionable and spreading over the civilized world, inoculation fell into disrepute shortly after Jenner's introduction, in 1796, of vaccination, which he had discovered, in 1775, to be a preventive of smallpox. The entire efficiency of vaccination and its safety and ease caused its rapid supplanting of inoculation. Prussia in 1835 prohibited inoculation for smallpox, and Great Britain enacted laws against it in 1840. Inoculation is said by Plehn to be still practiced in certain parts of

Central Africa, with few fatalities. It is said to be still in vogue in China and in Algiers. For many years vaccination was carried on by inoculation, the contents of the vaccinia pustules being transferred from patient to patient. Consult: Moore, *The History of Smallpox* (London, 1815); Collinson, *Smallpox and Vaccination Historically and Medically Considered* (ib., 1860); Carl Oppenheimer, *Toxins and Antitoxins* (Philadelphia, 1906); S. A. Arrhenius, *Immunochemistry* (New York, 1907); R. W. Allen, *Vaccine Therapy: Its Theory and Practice* (3d ed., Philadelphia, 1910); J. B. Citron, *Immunity* (ib., 1912); E. H. Schorer, *Vaccine and Serum Therapy* (St. Louis, 1913); H. T. Ricketts, *Infection, Immunity, and Serum Therapy in Relation to the Infectious Diseases of Man* (2d ed., Chicago, 1913). See VACCINATION; JENNER.

INOCULATION, IN PLANTS. A term rarely used in horticulture in the sense of budding (q.v.).

IN'OFFI'CIOUS TESTAMENT (ML. *inofficiosus*, contrary to duty, from Lat. *in-*, not + *officiosus*, dutiful, from *officium*, duty, from *opificium*, doing of work, from *opifex*, one who does work, from *opus*, work + *facere*, to do). In the civil law, a testament which makes no provision for the issue of the testator and assigns no reason for so doing. Such a will is deemed contrary to the duty which a parent owes to his offspring and is therefore wholly or partially void. This doctrine has been adopted into the legal systems of the Continent, of Scotland, of Louisiana, of Quebec, and of other states whose law is derived from that of Rome, but does not obtain in the common-law system of England nor in most of the United States. Where it exists it is now generally regulated and defined by statute. See HEIR; SUCCESSION; TESTAMENT. Consult the authorities referred to under CIVIL LAW.

IN'OSITE (from Gk. *īs*, *is*, fibre), or MESO-INOSITE, $C_6H_6(OH)_6 + 2H_2O$. A compound of carbon, hydrogen, and oxygen, extensively found in vegetables and sparingly in the muscles, lungs, kidneys, spleen, liver, and brain of man. It may be prepared by extracting unripe beans with water, boiling the extract with some acetic acid, filtering, adding normal lead acetate to the filtrate, again filtering, adding some ammonia and basic lead acetate to this second filtrate, separating the precipitate thus produced and dissolving it in aqueous sulphureted hydrogen, and finally mixing the sulphureted-hydrogen solution with alcohol and ether; the inosite is then obtained in crystalline form, viz., in the form of large rhombic tablets. The composition ($C_6H_{12}O_6$) and the sweet taste of inosite led chemists to mistake it for a chemical relative of the ordinary sugars (carbohydrates); it has, however, been shown to be a derivative of benzene, C_6H_6 , or rather of cyclohexane, C_6H_{12} . (See HYDROCARBONS, *Hydroaromatic Hydrocarbons*.) The presence of inosite in a substance submitted for examination may be detected by mixing a small amount of the given substance with a little nitric acid, evaporating to dryness in a platinum crucible, and treating the residue with ammonia and a little strontium acetate. The presence of inosite is thus revealed by the formation of a violet precipitate and a greenish coloration. Inosite does not ferment with yeast, does not (like the true sugars) reduce Fehling's solution (q.v.), and when heated with strong hydriodic acid at 170° C., it yields such products as car-

bolic acid and its tri-iodo derivative, and some benzene—which indicates its relationship, already mentioned, not to the true sugars, but to substances of the aromatic and hydroaromatic series. It is also much less soluble than the true sugars. When anhydrous, it melts at 225° C. (437° F.).

This "ordinary" inosite, which is sometimes called *anti-* or *meso-inosite*, is optically inactive; i.e., its solutions do not rotate the plane of polarized light. There are, however, two modifications of inosite that are optically active; these are known, respectively, as *dextro-inosite* and *levo-inosite*, the former having a specific rotatory power of +65°, the latter of -65°, circular. Like meso-inosite, they do not ferment with yeast, do not reduce Fehling's solution, yield carbolic-acid derivatives when heated with strong hydriodic acid, etc. Either of them melts at 247° C. (476.6° F.), and they are somewhat more readily soluble in water than meso-inosite. Neither of them has been found in nature in the uncombined state. Dextro-inosite was obtained by Maquenne by the action of hydriodic acid upon pinite—a crystalline substance contained in the resin of *Pinus lambertiana*, a species of pine growing in Oregon and Nebraska. Levo-inosite was similarly obtained from quebrachite—a substance contained in quebracho bark.

Finally, the two optically active modifications of inosite just described combine, when mixed in equal amounts, giving what is known as *racemic inosite*, a substance which melts at a higher temperature than the other modifications, viz., at 253° C. (487.4° F.), and is much less soluble in water than the others. Optically it is, of course, inactive, the optical activity of each of its components neutralizing that of the other. That, however, unlike ordinary inosite, it is made up of two distinct substances is indicated by the fact that *Aspergillus niger*, a species of fungus occurring on damp plants, attacks its two components with unequal effect, the levo-inosite being destroyed more rapidly; so that, after the action has proceeded for some time, the components are no longer present in equal amounts, the dextro-inosite is present in some excess, and the substance as a whole rotates the plane of polarized light to the right. See STEREO-CHEMISTRY.

INOUYE, ē'nō-ōō'yā', KAORU (1835-1915). A Japanese statesman, born in Choshu. With his friend Ito (q.v.) he went to Europe in 1863 and studied in London. He returned in time to prevent his clansmen from fighting the allied squadrons at Shimonoseki (q.v.) in 1864. His progressive spirit and loyalty to the Emperor drew upon him the wrath of reactionary assassins, who wounded him with their swords and left him for dead on the snow. He recovered, however, and subsequently was made Vice Minister of the Treasury in Tokyo, in which position he was influential in having the chief thoroughfare of the city rebuilt in brick after the great fire of 1872. He was made Minister of Public Works in 1878 and of Foreign Affairs in 1881. After holding this office for seven years, he became Minister of Commerce and Industry, in 1892 Minister of the Interior, and in 1898 Minister of Finance. In 1884 he was made Count. After the war with China he went to Korea to inaugurate reforms, but his programme was marred by the assassination of Queen Min. He belongs to the group of elder statesmen whose

influence was apparent during the war with Russia in 1904-05. Consult Arthur Lloyd, *Every-Day Japan* (New York, 1911).

INOWRAZLAW, ē'nō-vrāts'lāf. A town in the Prussian Province of Posen, situated 21 miles southwest of Thorn (Map: Germany, H 2). It has ruins of an eleventh-century church, a Kurhaus, a Gymnasium, and manufactures iron-work, machinery, sugar, flour, chicory, and bricks. It is a good market for cattle and finely bred horses. In the vicinity of the town are situated extensive government salt works. Pop., 1900, 26,141.

IN PAR'TIBUS IN'FIDE'LIUM. See TITULAR BISHOPS.

IN PERSO'NAM (Lat., against a person). In the classification of legal rights, a right in personam is one available against a particular person as distinguished from one maintainable against the whole world, known as a right in rem (q.v.). Rights in personam arise out of specific engagements entered into by individuals or out of duties imposed on individuals by the policy of the law. They thus comprehend all contract rights, the rights that arise out of the domestic relations or out of fiduciary or official position. Thus, the right to the performance of a contract, the right of a husband to the society of his wife, the right of a beneficiary against a trustee, in each case asserted against a determinate person, are all rights in personam. But by far the largest class of these rights is that which springs from the violation of other rights, whether rights in rem or in personam. A right once violated—whether a right of property by a trespass, or the right of personal security by an assault, or a contract right by a breach of contract—a cause, or right, of action arises, and this right of action, being limited to the person or persons committing the act complained of, is necessarily a right in personam. See IN REM; RIGHT; and consult Holland, *Elements of Jurisprudence*.

The phrase "in personam" is also employed in a narrower sense to describe the nature of the jurisdiction exercised by a court. The courts of chancery are said to act in personam, i.e., by ordering a person to do or to refrain from doing a certain thing, while courts of law, whose function is not to command, but to adjudicate controversies, are said to act in rem. See CHANCELLOR; CHANCERY, COURT OF; EQUITY.

IN'QUEST (OF. *enquête*, Fr. *enquête*, from LL. *inquista*, from Lat. *inquisita*, p.p. fem. sing. of *inquirere*, to inquire, from *in*, in + *querere*, to search). In early English law, a body of "lawful" men (*legali homines*) summoned and sworn to inquire into matters of fact of which the authorities desired cognizance and to report thereon under oath. Later the proceeding itself came to be known as an inquest, and this is the modern sense of the term. The process is one of great antiquity and was freely employed by the Norman and Angevin kings in England for a great variety of purposes, administrative as well as judicial. Domesday Book is the record of numerous inquests conducted by the Conqueror for the benefit of the royal exchequer. The chief interest of the inquest for modern lawyers lies in the fact that it is the direct progenitor both of trial by jury and of the inquiry into crimes and other matters which is the present function of the grand jury.

Specifically the inquest is still employed in English and American law under that name in

three classes of cases, all of them survivals from the period to which reference has been made. These are (1) the coroner's inquest, (2) the sheriff's inquest, and (3) inquest of office.

1. *The coroner's inquest* is an investigation conducted by the ancient official known as a coroner (so called because his original function was to maintain pleas of the crown, *placita coronæ*) into the cause or manner of death of any person who has been slain, has died suddenly, is found dead, or has died in prison. Where foul play is suspected, the inquest may develop into a quasi-judicial investigation into the culpability of the suspected person and may result in a finding which charges him with the homicide; but, as the proceeding is not strictly judicial nor in any sense a trial of the accused, the latter is not entitled to make a defense or be heard in his own behalf. In some of the American States the office of coroner has been abolished and a medical inspector substituted, but the procedure remains substantially the same. The jury in a coroner's inquest is known as a coroner's jury.

2. *The sheriff's inquest* is an inquiry conducted by the sheriff of a county and a jury to ascertain the amount of damages due a plaintiff under a judgment against a defendant in default. When a defendant fails to appear or answer in a cause, the plaintiff is entitled to judgment without proving his cause of action, which is deemed admitted by the defendant's default. But as he is, under his judgment, entitled only to the damages actually sustained by him, it is the practice in such cases for the court to direct an inquest for the purpose of ascertaining the amount. As the proceeding in the inquest is not a trial of the issue between the parties, no evidence need or can be given thereon, but the hearing will be confined to the precise question of the damages sustained by the plaintiff—a fact which must be determined in order that he may have execution. The defendant may be heard on this, as well as the plaintiff, and may summon witnesses to testify in his behalf. The practice still prevails in the United States as well as in England, but in New York and some other States the proceeding, still known as an inquest, is taken in court before any jury that may be in attendance. The sheriff's inquest is also employed in cases of attachment of goods, replevin, or garnishment, to determine which of two or more claimants is entitled to the possession of the property in controversy.

3. *Inquest of office* is an inquiry, now usually directed by the Attorney-General, to ascertain whether or not the crown, or state, is entitled to lands by escheat or to lands or goods by forfeiture. As the right of the state in such a case depends on certain facts, as the death of a landowner without heirs or, formerly, the conviction of a property owner of treason or felony, the duty of the inquest is to ascertain and report on these facts. As the proceeding is in England strictly a plea of the crown, the function of holding the inquest formerly belonged to the coroner. It is now in the United States generally exercised by a commissioner or other officer designated for the purpose by the chief law officer of the State. The procedure is also known as "office found" (q.v.).

In States where aliens are, as at common law, forbidden to acquire real estate, inquest of office is the appropriate process for ascertaining

the facts on which the right of the State to take the property depends.

See CORONER; JURY; INQUISITION.

INQUILINE, in'kwī-lin (from Lat. *inquilinus*, one dwelling in a place not one's own, from *incola*, inhabitant, from *incolere*, to inhabit, from *in*, in + *colere*, to cultivate). An insect which lays its eggs in a nest of some other insect, thus living parasitically at the expense of the host. The Inquilinæ form a group of gallflies called "guest gallflies," which are unable to produce galls themselves, since they do not secrete the gall-producing poison, though possessing a well-developed ovipositor. Hence, like the *Nomada*, etc., among bees, they are "cuckoo flies," laying their eggs in galls already formed, the larvæ feeding on the inside of the gall in company with the larvæ of their host. These inquilines strikingly resemble their hosts and are difficult to separate. There are several hundred species. The Inquilinæ, forming a section of the family Cynipidæ, are, according to Walsh, distinguished from the true gallflies by the sheaths of the ovipositor always projecting more or less beyond the "dorsal valve," which is a small hairy tubercle at the top of the seventh abdominal segment. This dorsal valve also projects greatly. In almost all the species the ovipositor projects from between the tips of the sheaths. Among the inquiline genera are *Synophrus*, *Amblynopus*, *Synergus*, and *Aulax*, which are "guests" of various species of Cynipides. The cuckoo flies (Chrysididæ) are all inquilines, laying their eggs in the nests of wasps and solitary bees; some are true parasites.

One of the eight species of British wasps is said by Sharp to be a guest wasp. Guest bees are not rare; they do not work, the organs for collecting and carrying pollen having been lost by disuse. Guest bees enter the nests of both solitary and social bees and lay their eggs, the young feeding upon the pollen stored up for the young of their hosts, but not directly destroying their young hosts. *Nomada* (q.v.) is a gayly colored bee which boards with species of *Halictus*, *Andrena*, etc. Packard states that there seemed enough food in the nest for the young of both host and boarder, as they were found to live harmoniously together, and their hosts and their parasites are disclosed both at the same time. The species of *Cœlioxya* live on the leaf-cutting bee (*Megachile*), those of *Psithyrus* on the bumblebee. In this guest bee the mandibles of the female are acute and two-toothed, their legs (tibiæ) are convex, so that they cannot carry pollen, while they have no polliniferous organs. The habits of these guest bees afford interesting examples of the effect of change of habits on their structure. For the guests of ants and termites, see INSECT, *Social Insects*.

INQUIRY, COURT OF. See COURTS, MILITARY.

INQUIRY, WRIT OF. A common-law writ

or process issuing out of a court directed to a sheriff commanding him to empanel a jury for the purpose of assessing damages against a defaulting defendant. The proceedings under such a writ are termed an inquest. See INQUEST.

IN'QUI'SI'TION (Lat. *inquisitio*, inquiry, from *inquirere*, to investigate, from *in*, in + *quærere*, to seek), THE (*Inquisitio hæreticæ pravitatis*), called also the Holy Office. A tribunal in the Roman Catholic church for the discovery, repression, and punishment of heresy, unbelief, and other offenses against religion. The punishment of heresy by force arose after the Roman Empire became officially Christian. Soon after the Council of Nicæa (325) had formulated its creed Constantine attempted to repress all dissent, but it was not until 385 that any one was executed for heresy. (See HERESY.) From this time, in the East, persistence in heresy was legally punishable with death. In the West, however, among the more tolerant Teutonic tribes there was no tendency for several centuries to inflict the capital sentence for heresy. In the twelfth century there were some executions, but the Western church in general preferred milder measures. The ecclesiastical cognizance of heresy, and its punishment by spiritual censures, belonged to the bishop or episcopal synod; but the bishops seldom fulfilled this duty, because they were too fully occupied. No special machinery for the purpose was devised, however, until the spread, in the twelfth and thirteenth centuries, of certain sects reputed dangerous alike to the state and to the church—the Cathari, Waldenses, and Albigenses—excited the alarm of the civil as well as of the ecclesiastical authorities. At that time heresy was regarded as a crime against the state no less than against the church. An extraordinary commission was sent by Pope Innocent III into the south of France to aid the local authorities in checking the spread of the Albigensian heresy, and a council held at Avignon in 1209 directed that in each parish the priest and two or three laymen in good repute should be appointed to examine and report to the bishop all such offenses discovered within the district. The fourth Lateran Council (1215) earnestly impressed, both on bishops and magistrates, the necessity of increased vigilance against heresy.

So far, however, there was no permanent court distinct from those of the bishops; but by successive edicts, from 1227 on, a special tribunal for the purpose was instituted, the direction of which was confided chiefly to members of the Dominican Order (1232). The Inquisition thus constituted became a general instead of, as previously, a local tribunal; and it was introduced into Italy, Spain, and the southern provinces of France.

The procedure of the Inquisition deserves a brief notice. A person suspected of heresy or denounced as guilty was liable to be arrested and detained in prison, to be brought to trial only when it might seem fitting to his judges. The proceedings were conducted secretly. He was not confronted with his accusers, nor were their names even then revealed to him, but the suspect could make known his enemies, whose evidence would thereupon be excluded. The evidence of an accomplice was admissible, and the accused himself was liable to be put to the torture in order to extort a confession of guilt. Any such confession, however, had to be repeated afterward without torture in order to be ac-

cepted; but if the accused refused to repeat his confession he might be tortured again. As a punishment, the condemned were sentenced to make pilgrimages, to wear signs of infamy such as the yellow cross, or to imprisonment, and in extreme cases were condemned to death. This extreme penalty, however, could be inflicted only by the state, and out of 636 persons condemned between 1308 and 1322 only 40 were turned over to the state for this purpose. The state was required to enforce the laws of the church as a part of the ruler's duty as a Christian. If the ruler refused, he might be excommunicated or in extreme instances deposed. The Papal Inquisition had no standing in England and the northern countries, where all such matters were attended to either by the Bishops' Inquisition or, as in England, by the royal power. In Languedoc the Inquisition was very active for about a century, but by the end of the first quarter of the fourteenth century it had practically spent its force. In northern France the history of the Inquisition is more obscure, but by the end of the fourteenth century it is certain that it was decadent. Philip the Fair, however, made use of the Inquisition against the Templars and in 1312 made it a state tribunal. In most of the Italian cities except Venice it was very powerful. In Germany it had very slight influence.

It was in Spain, Portugal, and their dependencies that the Inquisition attained its fullest development. As an ordinary tribunal similar to those of other countries, it had existed in Spain from an early period. In 1237 the duties of the Inquisition were given to the Dominicans and Franciscans. Early in the reign of Ferdinand and Isabella, in consequence, it is said, of the alarms created by the alleged discovery of a plot among the Jews and the Jewish converts—who had been required either to emigrate or to conform to Christianity—to overthrow the government, an application was made to Pope Sixtus IV to permit its reorganization (1478); but in reviving the tribunal the crown assumed to itself the right of appointing the inquisitors and, in fact, of controlling the entire action of the tribunal. The establishment of the tribunal of the Inquisition was sanctioned by the Cortes at Toledo in 1480, and from this date the Spanish Inquisition became a state tribunal. In order to prove that the church generally, and the Roman see itself, was dissociated from that state tribunal, the bulls of Pope Sixtus IV, which protest against it, are cited. Notwithstanding this protest, however, the Spanish crown maintained its control of the Inquisition. The work of the Inquisition began in 1481, when Miguel Morello and Juan Martín, members of the Dominican Order, were appointed inquisitors for Seville. In 1483 the Inquisition was extended over Aragon and León, and the Dominican Tomás de Torquemada (q.v.) became the first Grand Inquisitor. The Inquisition asserted an independence not pleasing to Rome, and when Spain sought to introduce it into Naples also, Pope Paul III, in 1546, exhorted the Neapolitans to resist its introduction. However severe the weight of the Inquisition may have been on heretics and unbelievers, the number of its victims as given by Llorente, the antipapal historian of the Inquisition, is enormously exaggerated. His statements deserve no credence whatever, although he had excellent opportunities of learning the truth, as he was for a time the secretary of the Inquisition. He

was a violent partisan, and his errors and exaggerations have been exposed, especially by Hefele in his *Life of Cardinal Ximenes* (Eng. trans., 2d ed., London, 1885); Ranke does not hesitate, in his *Fürsten und Völker des südlichen Europas* (4th ed., Leipzig), to impeach his honesty. While Llorente gives the number of executions as 341,042, the Catholic authority Gams states 4000 to have been the total. Protestant writers have usually given figures varying between the lowest and the highest. Charles V (1516-56) and Philip II (1556-98) made attempts to transfer the Inquisition also to the Netherlands, but there is no question that here its object was political, intended to suppress a revolt rather than a heresy.

The Spanish Inquisition is condemned by Protestants and non-Spanish Catholics alike. Spanish Catholics, however, are inclined to defend it and hold that its form of proceeding was not as usually stated, but was fair and equitable, considering what a fearful crime heresy was and is in the eyes of the Catholic church. There is no doubt, moreover, that many of the crimes tried by the inquisitors in Spain were such as would now be brought into our ordinary civil courts.

The rigor of the Spanish Inquisition abated in the latter part of the seventeenth century. In the reign of Charles III it was forbidden to punish capitally without the royal warrant, and in 1770 the royal authority was required as a condition even for an arrest. In 1808, under King Joseph Bonaparte, the Inquisition was suppressed. It was revived under the Restoration, was again suppressed on the establishment of the constitution in 1820, but was partially restored in 1825, nor was it till 1834 that it was finally abolished in Spain, its property being applied two years later to the liquidation of the national debt.

From Spain the Inquisition was transplanted into all the Spanish-American countries, and it continued to exist in these countries until they became independent. From Portugal the Inquisition was extended to the Portuguese colonies in India. The rigor of its process, however, was much mitigated in the eighteenth century, and under John VI it fell entirely into disuse.

The Inquisition in Rome and the Papal States never ceased, from the time of its establishment, to exercise a severe and watchful control over heresy, or the suspicion of heresy, which offense was punished by imprisonment and civil disabilities; but of capital sentences for heresy the history of the Roman Inquisition presents few instances, and according to Balmes, *On Civilization* (6th ed., Madrid, 1875), that tribunal "has never been known to order the execution of a capital sentence" for the crime of heresy. The tribunal still exists under the direction of a congregation (*congregatio sancti officii*), originally founded by Paul III in 1542 and reorganized by Sixtus V, but as by its very constitution it must call upon the state aid to enforce its decrees, and as such state aid can nowhere be obtained at the present day, its action is limited to the imposition of spiritual punishments, such as excommunication.

nel Ximenes (Eng. trans., 2d ed., London, 1885); Tanon, *Histoire des tribunaux de l'inquisition en France* (Paris, 1893); Frédéricq, *Geschiedenis der inquisitie in de Nederlanden* (2 vols., Ghent, 1892-96); Lea, *History of the Inquisition in Spain* (4 vols., New York, 1906-07); id., *History of the Inquisition of the Middle Ages* (3 vols., ib., 1906); id., *Inquisition in the Spanish Dependencies* (ib., 1908).

INQUISITION. The formal instrument in writing setting forth the verdict or decision of a sheriff's or coroner's jury as a result of their inquiry into the facts of the matter referred to them. It is certified and signed by each of the jurors and is usually required to be filed in some public office as a record of the inquest. It does not operate as a judgment, but is sometimes the basis of further proceedings in the matter. For example, if a coroner's jury summoned to inquire into the cause of the death of A find that he was killed by B under circumstances not justifiable by law, the proper authorities will cause the latter to be indicted. The inquisition is not evidence against him, being merely for the information of the public prosecutor.

The word is less frequently used to describe the proceedings at an inquest, but this leads to confusion and is not sanctioned by the best authorities. See **INQUEST**.

IN REM (Lat., in, or with respect to, a thing). In the classification of legal rights, a right in rem is a right of a general character, available against the whole world, as distinguished from a right in personam, which is a right against a determinate person (*in personam certam*). Rights in rem are not limited to things, i.e., to property, as the phrase might indicate, but comprehend all rights, whether in respect to person or property, which are claimed or asserted against all persons whatsoever, and not against any particular individual. Thus, the right not to be assaulted, the right to personal liberty and security, are rights in rem, as well as the right to be free from invasion of a property right. See **IN PERSONAM**.

The expression is also employed to designate a form of action in which the remedy sought is not damages against an individual, but the seizure and detention of specific articles. In such cases the thing sought to be recovered or charged with the claim of the plaintiff is personified for the purpose of making it the defendant in the action. Such proceedings are not common in our legal system, the ordinary process for the recovery of land or goods being really an action in personam against the person wrongfully withholding the property. But in admiralty practice such actions are common. They are brought for the enforcement of maritime liens against a vessel or cargo, for the recovery of salvage, to procure the forfeiture of property for a violation of the revenue laws, or to obtain possession of a prize in time of war. See **MARITIME LAW**.

I. N. R. I. The first letters of the Latin inscription placed on the cross by Pilate at the crucifixion of Christ: *Iesus Nazarenus Rex Iudæorum*, 'Jesus of Nazareth, the King of the Jews' (John xix. 19).

INSANE ASYLUM. An institution for the care and treatment of the insane. Monasteries appear to have been the representative of such retreats in the mediæval Christian times, but restraint and rigid asceticism characterized their management. Out of conventual establishments

grew the bethlems, or bedlams, with which the English of two generations ago were familiar. (See BEDLAM.) The vast majority of the insane must have been neglected; in some countries, revered as specially God-stricken; in others, tolerated or tormented or laughed at as simpletons or buffoons; in others, imprisoned as social pests, even executed as criminals. In a few spots, enjoying a reputation for sanctity, or where miraculous cures of nervous diseases were supposed to have been effected, such as Gheel (q.v.) and Saint-Suaire, communities were formed, of which lunatics, sent with a view to restoration, formed a large part, and resided in the houses of the peasants and partook of their labor and enjoyments. Asylums, properly so called, date from the commencement of the nineteenth century; and for many years after their institution, although based upon sound and benevolent views, they resembled jails, both in construction and the mode in which they were conducted, rather than hospitals. Until about 1880 a model erection of this kind was conceived necessarily to consist of one vast building, the centre of which was appropriated to the residence of the officers, the kitchen and its dependencies, the chapel, etc., from which there radiated long galleries, in which small rooms, or cells, were arranged upon one or both sides of a corridor or balcony, having at one extremity public rooms, in which the agitated or non-industrial inmates, as the case might be, spent the day, while the more tractable individuals were withdrawn to engage in some pursuit, either in workshops, clustered round the central house, or in the grounds attached, which were surrounded by high walls. The population of such establishments, when they were appropriated to paupers, ranged from 100 to 1400 patients. These were committed to a staff composed of a medical officer, matron, and attendants, to whom were directly intrusted the management, discipline, and occupation of the insane, in accordance with regulations or prescriptions issued by the physician. A gradual but great revolution has taken place in the views of psychologists as to the provisions and requirements for the insane during seclusion, chiefly through Conolly's influence, in 1847 and subsequently. As a result of this change, asylums, especially for the wealthy classes, are similar in their arrangements to ordinary dwelling houses; while it is proposed to place the indigent in cottages in the immediate vicinity of an infirmary, where acute cases, individuals dangerous to themselves or others, or in any way untrustworthy, can be confined and actively treated, as their condition may require. In all such establishments, whether now entitled to be regarded as cottage asylums or not, the semblance and much of the reality of coercion have been abolished; the influence of religion, occupation, education, recreation, the judicious application of moral impressions, and the dominion of rational kindness and discriminating discipline, have been added to mere medical treatment, and substituted for brute force, terror, and cruelty. In fact, the word "asylum" has been supplanted by "hospital"; "keepers" have given place to "nurses" and "attendants"; and the insane are treated, especially in institutions in the United States, as sick people.

See INSANITY.

INSANITY (Lat. *insanitas*, from *insanus*, insane, unsound, from *in-*, not + *sanus*, sane, sound; connected with Gk. *σάος*, *saos*, *σῶς*, *sōs*, sound, safe), or LUNACY. A manifestation of disease of the brain characterized by a general or partial derangement of one or more of the mental processes, in which, while consciousness is not abolished, mental activity is weakened or perverted. This definition is modified from that given by Hammond and, like all attempted definitions of the term, is inadequate. Insanity is not mental disorder, although disorder of mind is always present in insanity. A person who mistakes red for gray has disordered mentality; but he is not insane, though color-blind. Defective reasoning, which leads a man, e.g., into a bad investment, is a disordered mental process, yet not insanity. Thus, it is a matter of extreme difficulty to define insanity so as not to include the conditions existing in sleep, or trance, or the common manifestations of general neuroses like epilepsy, hysteria, and chorea, the delirium of fever, acute intoxications, etc. There is no rigid line of demarcation between sanity and insanity. The conditions of each bear close resemblance. The processes of mental action in sanity and in insanity are of the same kind, although they differ in their origin and in the degree of their intensity. It is often said that every one is more or less insane. This is an absurdity, as insanity is a manifestation of disease, not merely a name for mental disorder. The notion, also, that one may be insane on one subject and otherwise perfectly sane is erroneous for the same reason. An insane person may betray his mental condition when drawn out by one line of thought, or when one topic is broached; but, if insane, he is diseased and in no respect sane, even if able to carry on his business or perform complex acts properly.

To understand insanity one must understand the normal action of the mind and have some knowledge of the physical basis of mental action, i.e., of the cerebral cortex and its association fibres. (See NERVOUS SYSTEM.) The functions of the cerebral cortex are: (1) to receive impressions from the organs of sensation (conscious perceptions); (2) to group these impressions into a unit, known as a concept; (3) to store up these concepts, for future recognition and recollection (memory), for gathering into novel combinations (imagination), and for use as a basis of thought; (4) to express thought in speech and action; (5) to experience emotion which accompanies mental activity; (6) to exert self-control over all mental action (Starr). This statement is true enough for the practical study of insanity and is made to avoid opening the subject of the connection between nervous and mental phenomena. While many alienists accept the anatomical basis and believe in a

transference of the mental into the material, others claim that the activity of the highest nervous centres is attended by a mental state, but is not in itself a mental state. (See MIND.) At all events, when areas of the cortex are diseased, one or more of the cortical functions named may be suspended, and mental disorder results. If changes in blood supply or in nutrition occur, or if disease affects the entire cortex, insanity may result; and, as a result, thought becomes illogical, emotion becomes excessive or arises without external stimulus, action is irregular or purposeless, and conduct is not properly adjusted to surrounding circumstances. In the insane person impressions from sense perceptions may be wrongly interpreted. An illusion is a falsely interpreted sense perception. For example, a chair may be mistaken for an animal; the rumble of a wagon may be mistaken for the angry voices of a pursuing mob. Ideas may arise without any sense perception. When quiet exists, the insane person may hear voices; he may see faces in an empty space; he may smell burning flesh when no odor is present. These false perceptions without external origin in sensory experiences are called hallucinations. A mistaken idea may be harbored by any one; e.g., one may believe that a stone is much larger than it is. Measurement and examination convince him of his error, and, if he is sane, he corrects his judgment. The insane man is not affected by logical methods and retains his erroneous idea in spite of demonstration and reasoning. A mistaken idea accepted without logical foundation is a delusion; if retained in spite of demonstration of its falsity, it is an insane delusion. Insane people frequently, though not necessarily, exhibit delusions, varying according to the bodily ills, the occupation or profession, the emotions experienced, or their surroundings. Certain forms of delusion are fairly constant in certain types of insanity. For example, in the depressed type of manic-depressive insanity or in involutional melancholia patients often declare that they have committed some great sin; in paranoia, delusions of persecution and of conspiracy are present; in manic states, delusions of identity or of being an important person are frequent; in alcoholic insanity the delusion of marital infidelity is common; in general paresis a number of grandiose delusions—of power, of wealth, of strength, of beauty—are present in one stage; and in early stages of dementia delusions of grandeur are also noticed, with less frequency. *Disturbances of emotional feeling* occur in insane people: depression, exaltation, languor, and absurd joy are noticed in different cases. Acting under the impulse of delusion or hallucination, the insane exhibit *disturbance in voluntary action and conduct*. Insufficient motive causes action, because of impaired intellectual power or impaired memory or subconsciousness. *Consciousness is impaired*; external objects are often ignored; changes of personality occur.

Besides these mental signs of insanity, there are many somatic, or physical, symptoms. These are generally divided into five classes: 1. Sensory symptoms, such as pain, hyperæsthesia (q.v.), or anæsthesia (q.v.). 2. Changes in reflex action, from disease or other cause, such as lessened knee jerk (q.v.) or dilated pupils. 3. Motor disturbances, such as loss of muscular control, shown in altered handwriting, altered speech, gait, attitude, etc.; convulsions or pa-

ralysis may also occur. 4. Changes in circulation and nutrition, such as pallor or flushing, loss of flesh, impaired digestion. 5. Disturbances of sleep, which occur commonly.

The study of disease affecting the mind is called psychiatry, less often (in Great Britain) mediopsychology. The specialists who give their attention to insanity and the treatment of the insane are called alienists.

An accurate classification of diseases affecting the mind is difficult. Various alienists have produced different tables, but very convenient is the classification of White of Washington, D. C., as follows:

1. **Paranoia and Paranoid States**, characterized by systematized delusions of persecutions and conspiracy or by extreme jealousy, usually with hallucinations of hearing, and evincing little intellectual impairment for years. See PARANOIA.

2. **Manic-Depressive Insanity**, including the old *mania* (characterized by an exalted emotional state, with psychomotor excitement and great flight of ideas), the old *melancholia* (characterized by a depressed emotional state, difficulty of thinking, psychomotor retardation), *hypomania* (a mild form of maniacal excitement, characterized by a disorder in the process of thinking, over activity, tiresome intensesness, good humor, increased self-esteem, occasional great aversion or impulsive anger), and *circular insanity* (alternating depression and exaltation).

3. **Paresis**. An organic disease of the brain with inflammatory and degenerative changes, caused by syphilis (often innocently acquired), involving both the brain and its coverings, and characterized by progressive mental deterioration. The patient often manifests "delusions of grandeur," as of great strength (although tottering and feeble), of great mental ability, or great wealth. Speech defects, lapses of memory, convulsions, hypochondriacal ideas, ataxia, occur during different stages. (See PARESIS.) The disorder is called progressive general paralysis of the brain, paretic dementia, and popularly, though incorrectly, "softening of the brain."

4. **Dementia præcox**. A disorder of adolescence or youth, resembling the dementia of the aged, and tending to progress to a hopeless terminal state, though often characterized by remissions. It often results from a hereditary factor, such as alcoholism, tuberculosis, age, or neurasthenia in the parent, or may be caused by sexual excess, excessive study, a sexual episode followed by intense worry, fright, or protracted or severe emotional strain. It may therefore be due to faulty mental hygiene and be of purely psychic origin. Failure of voluntary attention and lack of interest are early observed, orientation is preserved for a long time; but emotional deterioration is characteristic, and appears early in the case. After a precocious childhood the patient shows a shallowness, with fantastic delusions, making absurd statements often with marked incoherence. Emaciation, loss of appetite, and insomnia are common, and the parents may notice rapid heart action and blueness of the extremities. Hysteriform attacks frequently occur. Four forms of dementia præcox are observed, and there may be a fifth variety consisting of mixed forms. In one form, the catatonic, the patient presents at times rigidity and muscular tension, holding a limb for a considerable time in whatever position it is placed by the physician. In this

variety of case there is frequently a negativism, and senseless rhyming or repetition characterizes the patient's speech.

The course of dementia præcox is chronic, and the tendency is toward a deep dementia. The condition is usually permanent, but some of the cases have remissions lasting for years.

5. **Involutorial Melancholia** occurs in women between the ages of 40 and 50, and in men usually after 50, being a psychosis of the involutorial period or climacteric. Commencing senile decay and arteriosclerosis are exhibited by most of the patients. Shock or other mental stress seems to be the precipitating factor in these instances. Heredity is a factor in about 60 per cent of the cases (White). This condition is characterized by deep depression, apprehension, and anxiety, often with agitation and confusion, and delusions of a hypochondriacal variety. Grandiose ideas are rare and appear late, if ever, in the course of the psychosis. Persecution, poverty, sinfulness, are the burden of the delusional thought for the most part. Constant vigilance is necessary to prevent suicide. The recoverable cases usually change for the better after three years of suffering, and these constitute about 40 per cent of the whole number.

6. **Senile Psychoses.** Virchow's aphorism, "A man is as old as his arteries," is very pertinent in the formation of a judgment of senility. A patient suffering from senile psychosis will exhibit vertigo, depression, anxiety, followed by gloom, moroseness, and seclusiveness, and later hypochondriacal delusions or persecutory ideas, irritability, lack of judgment, loss of memory, egotism, and a decided failure of the normal mental grasp. A corresponding physical change occurs. Persons suffering from this disorder frequently lose their way in familiar streets, attempt to will away property they do not own, contemplate new matrimonial alliances while the marital partner is still living, and often prowl about at night, attempting violence of various kinds. They do not improve and often demand custodial care.

7. **Infection-Exhaustion Psychoses** occur most frequently in parturient women or in post-febrile conditions. Delirium, confusion, hallucination of vision, and great fatigue characterize the cases. Where they are caused by prolonged anxiety, loss of blood, or severe mental shock, they may present collapse or a great degree of excitement with disorientation, incoherence, and finally stupor. About half of the cases recover.

8. **Toxic Psychoses.** This group consists of insanities caused either by poisons formed within the body (autotoxins) or by poisons introduced from without. The autotoxic condition may be caused by absorption of altered renal secretions or of poisons formed during diabetes, or by gastro-intestinal disturbances or thyroid disease, or may be due to alcohol, opium, cocaine, paraldehyde, iodoform, lead, etc. Of these, alcoholic insanity is by far the most frequent. It is characterized by flight of ideas, loss of propriety, lessened power of voluntary attention, thick speech, altered sight, and hallucinations of vision, with boisterousness or depression, if it be the psychosis known as *drunkenness*. If it be a chronic condition resulting from repeated inebriety, there may be added to the foregoing symptoms suspicions of marital infidelity, ataxia, muscular weakness, and mental enfeeblement,

with possibly convulsions, possibly aural and visual hallucinations and persecutory delusions, far less often an amnesic state lasting many days. Of all insane men, about 30 per cent owe their insanity to alcohol, many to so-called "moderate" drinking. In a series of 960 patients in Manhattan State Hospital, Wards Island, New York City, whose entire history was well known, in 55 per cent of the men and 22 per cent of the women alcohol was beyond a doubt the precipitating cause.

9. **Psychoses Associated with Other Diseases.** This group includes phenomena that sometimes are found in hysteria, deliria, dream states (as in alcoholism), depressions and phobias of certain types of neurasthenia (a psychoneurosis), epilepsy, multiple sclerosis, chorea, syphilis, arteriosclerosis with brain softening, or mental states following injuries.

10. **Borderland and Episodic States.** This group is made up of obsessions, impulses, tics, phobias, delirium of contact, as Janet classifies them, and due to *lowering of the psychological tension*, to use his expression. Psychasthenia belongs here; likewise the periodical morbid desires known as dipsomania (q.v.), pyromania (q.v.), kleptomania (q.v.), and arithmomania, as well as the *formes frustres* of paranoia, whose component units are called "cranks"; and finally the varieties of sexual anomalies, including sexual inversion (instinctive desire for the same sex) and sexual perversion (abnormal gratification of sexual desire).

It will be seen that perversion of the will is present in almost every case of insanity. This fact led Hammond to incorporate in his definition of the term the statement that in insanity "mental freedom is weakened, perverted, or destroyed." Free determination of the will is presented by delusions, by inferences from delusions, by abnormal emotional states, by delirium, by incoherence of ideas, or by dementia. Often the mental processes of the insane are identical with those of the sane, but the premise from which the argument springs is false. In many forms of insanity the ego is preëminent. A lunatic may consider himself powerfully equipped, mentally and physically. He is expansive, elated, extravagant, arrogant, and garrulous. His condition is termed *hyperbulia*. Another may be depressed, dejected, apathetic, mentally slow and impeded, hopeless, and even suicidal. This condition is termed *abulia*. Fanciful subdivisions of the divisions of the older nomenclature have been made by some alienists, founded upon certain trains of thought or often recurring ideas, and terms have been devised to indicate the trend of imagination in patients experiencing these ideas. For example, *agoraphobia* denotes fear of being in an open place or street; *claustrophobia*, fear of being shut in a room or house; *mysophobia*, fear of defilement, pollution, or contamination; *pyrophobia*, fear of fire; *astraphobia*, fear of lightning; *anthropophobia*, fear of society. This list might be prolonged indefinitely.

Causes. The causes of insanity other than heredity, among 6061 first admissions, as ascertained in New York State by a complete and painstaking system of securing facts, were reported as follows for the year ending Sept. 30, 1913, by Dr. James V. May, medical member of the New York State Hospital Commission: alcohol, 15.2 per cent; syphilis, 14.8 per cent; drugs, 0.8 per cent; arteriosclerosis, 12.1 per cent; se-

nility, 10.6 per cent; inferior or defective constitution, 18.5 per cent; injury to head, 1.6 per cent; acute illnesses, 1.0 per cent; epilepsy, 2.8 per cent; sexual irregularities or difficulties, 3 per cent; death in family, 2.1 per cent; financial loss, 2.2 per cent; disappointment in love, 1.4 per cent; and childbirth, 3.3 per cent of the women. Dr. Pollock, the statistician of the Hospital Commission, presents the causation in illuminating tables which show the unequal proportions affected in the sexes and the principal causes of the psychoses.

CAUSES OF INSANITY IN MALES AND FEMALES

CAUSE IN NEW YORK STATE, 1912-13	PER CENT	
	Males	Females
Alcohol.....	22.6	7.6
Syphilis.....	21.1	7.8
Senility.....	9.3	12.1
Arteriosclerosis.....	13.2	11.0
Acute illnesses.....	0.5	1.6
Injury to head.....	2.6	0.4

Pollock comments: "The psychoses due to harmful indulgence and exposure are far more prevalent in men than in women, while those arising from bodily weakness are, as a rule, more common to women."

PRINCIPAL CAUSES OF CERTAIN PSYCHOSES

PSYCHOSES	Principal etiological factor other than heredity	Per cent
Senile	Senility	100.0
	Arteriosclerosis	57.7
Dementia paralytica (paresis)	Syphilis	100.0
	Alcohol	8.9
	Inferior constitution	6.9
	Arteriosclerosis	4.6
Dementia paralytica (paresis) with other brain or nervous diseases	Arteriosclerosis	63.3
	Syphilis	18.9
	Alcohol	8.7
	Inferior constitution	7.4
Alcoholic	Alcohol	100.0
	Inferior constitution	13.1
Dementia præcox and allied to dementia præcox	Inferior constitution	28.5
	Sexual irregularities	6.5
	Alcohol	4.7
Manic-depressive and allied to manic-depressive	Inferior constitution	14.4
	Childbirth (women only)	7.8
	Alcohol	5.7

Native and Alien Insane. Dr. Spencer L. Dawes, special commissioner by appointment of Governor Dix of New York State, corroborated the previous claim that there are confined and supported in this country a number of alien insane out of all proportion to the native born. In 1912 the foreign-born insane constituted 43.4 per cent of the insane in civil hospitals in that State against 30.2 per cent of foreign born in the general population. This excess imposes an immense expense upon the taxpayers, for their net cost to the State in that year was \$2,579,902, Dawes reports, omitting all reference to hundreds of aliens removed from the State hospitals in 1912. If allowed to complete their

average hospital residence, the probable net cost of the 9241 aliens (out of 13,728 foreign born) under care on Sept. 30, 1912, will be \$25,412,038. The danger to the population from absorbing a deteriorated and degenerate foreign stock is apparent. The present law (1915) provides that an immigrant may be returned to his native country if he becomes insane within two years, from causes existing at the time of immigration, prior to landing. Economists are calling attention to the necessity of making the time of probation at least five years and of conducting a searching examination into the history and antecedents of all immigrants.

Prognosis. About 60 per cent of the cases of manic-depressive insanity recover. Many relapse, if similar causes operate. Terminal dements, paranoiacs, senile dements, syphilitic dements, and paretics never recover. The average number of recoveries of all kinds of cases, excepting the hopeless, is about 29 per cent. Most recoverable cases emerge during the first year of their illness; few recover after two years have passed. Early confusion of ideas, indecency, persistence of delusions, and obesity are unfavorable symptoms. Recurrence occurs in about 21 per cent of ordinary asylum patients. The offspring of insane parents are defective; therefore no one who has ever been insane should propagate children.

Treatment. The treatment of insanity is a matter of great complexity. There can be no magical removal of manifestations by specific drugs. All improvement is slow. Dietetics forms an important part of the regimen, as do regular exercise; judicious control or direction; diversion by means of games, music, or the play; occupation, which is of great importance; isolation from worry, care, noise, company, or habitual environment; and the contact with the healthy, hopeful, reasoning minds of nurses and physicians. Drugs are indispensable in many conditions of malnutrition, insomnia, disordered circulation, etc. Restraint by means of mechanical contrivances is almost abolished in well-ordered asylums, except the restraint of confinement and of regulations. But some form of mechanical restraint is necessary and very helpful in certain cases, such as absolute refusal to take food or determined attempts at suicide. Most cases require and are benefited by sanitarium treatment or custodial care.

Medico-Legal Aspects of Insanity. The plea of insanity as an excuse for crime has been fashionable at intervals. There are cases of imperative impulse under which the lunatic commits an act which would be a crime in a sane man, but for which the lunatic is irresponsible. No case occurs in which but one insane act is committed, while the person was well balanced before that act and remains well balanced forever after it. In authentic cases a well-marked history of insanity before the act can be elicited, and insanity continues thereafter. "Temporary aberration" in an otherwise sane person does not occur. Amnesic and irresponsible intervals occur in psychic epilepsy (see EPILEPSY), during which crime may be committed; but the preceding and continuing epilepsy will be established. The knowledge of right and wrong is an improper basis upon which to judge the mental condition of a criminal. With a keen sense of right and wrong, a desire to do the right, and a dread of punishment, an insane person may obey and commit a crime under the

all-powerful compulsion of an imperative impulse, in utter helplessness. But when insanity is established as the cause of a crime, the unfortunate perpetrator should be committed to a hospital and never, under any circumstances whatsoever, to a jail. Lunatics should be, in general, confined in hospitals or retreats. Their prospect of improvement or recovery is never injured by incarceration in a proper institution. Society deserves protection from their acts, fraught with danger to themselves or others. The physical and financial interests of their families deserve consideration. Their individual interests are advanced by confinement in the majority of cases. See next article.

Commitment of the Insane to Asylums or Hospitals. In many countries, and in most of the States in the Union, special safeguards are erected by laws to prevent the confinement of sane people in institutions for the insane, as well as to secure to the insane a full enjoyment of their rights. For instance, in the State of New York an alleged insane person may be committed to an institution legally licensed for the reception and care of the insane only after a complicated though not public process. In this State the word "asylum" exists no longer, but has been replaced by "hospital." There are no more "keepers," but trained nurses and instructed attendants have the immediate care of the mentally astray. A State Hospital Commission controls all matters relating to the insane. This commission is composed of a medical man of at least five years' experience in the actual care of the insane in an institution of some size and who has been in charge of institutions for the insane, a lawyer of at least five years' experience in his profession, and a layman, all three appointed by the Governor of the State. These commissioners issue or revoke licenses to physicians whereby they are permitted to conduct or forbidden to conduct institutions for the care and treatment of the insane. They also are charged with the duty of visiting all State and private institutions in which insane are treated and confined, supervising and in a sense directing their government. Any judge of a court of record may appoint as an examiner in lunacy a physician of whom he approves, who has been in the actual practice of his profession at least three years, and who is a permanent resident of the State. The commitment paper, as formulated by the New York State Commission, consists of five parts: (1) a petition, to be made by a member of the family of the alleged insane person, by a person living in the house with him, or by a county officer, setting forth the reasons of the petitioner for believing the person insane and asking the court to act in the matter; (2) a certificate made under oath by two examiners in lunacy, giving the results of their joint examination of the patient; (3) a waiver of personal service of the order of court upon the person in question, to be signed by the committing justice in his discretion, or a substitutional service; (4) an order for a hearing before the justice, if in his opinion this be necessary or desirable, or be requested; (5) an order of a judge of a court of record committing the alleged insane person to the chosen hospital or retreat, after officially declaring him to be insane. In the case of indigent lunatics, who are partially or totally a charge upon the State, a further statement is made by the justice concerning the

patient's financial condition, as far as can be ascertained. This entire proceeding may be concluded, with the exception of the *hearing*, without publicity or violation of the privacy that should surround family matters; yet it prevents a conspiracy to incarcerate a sane man as insane.

INSANITY. Technically, in law, a disease or disturbance of the mental faculties which may produce some effect on the legal character or quality of the insane person's acts. It may or may not render him non compos mentis, i.e., subject to legal restraint or control of his person and property. It may thus be distinguished from lunacy, which may be described as such mental unsoundness as to incapacitate the insane person for all legal transactions and justify the state through the proper agency in taking charge of his person and property.

The law takes cognizance of insane persons as such, chiefly for the following purposes: (1) to ascertain their responsibility for crime; (2) to ascertain their capacity to make contracts; (3) to ascertain their liability for their torts; (4) to ascertain their capacity to make wills.

1. **Responsibility for Crime.** The insanity of one charged with crime may preclude the existence of the criminal intent which is an essential element of the crime. When, therefore, the plea of insanity is set up on behalf of one charged with crime, the question raised is, Was the accused capable of forming a criminal intent at the time when he committed the act? The law on this subject was first fully considered, and a legal test of insanity in criminal cases adopted, in M'Naghton's case by the English House of Lords in 1843. M'Naghton, having killed another while under the influence of an insane delusion, was charged with murder, and the question of his responsibility under the law was put to the judges of the House of Lords. They answered in substance that mere insanity was not a defense; that to establish want of criminal responsibility it must appear that the party accused was laboring under such defect of reason as not to know the nature and quality of the act he was committing; that an insane delusion would not establish want of responsibility unless the delusion if true would justify the defendant in doing the act with which he is charged. Thus, one who killed another under an insane delusion that the other was threatening his life under circumstances of immediate danger to himself is not criminally responsible for the homicide; but an insane delusion that another was slandering the defendant would not excuse him for killing or even assaulting the supposed slanderer, assuming always that in other particulars the defendant knew the nature and quality of his act. M'Naghton's case still represents the law in England, and its rules have been adopted by the courts of most of the United States.

The effect of these decisions is to hold to full legal responsibility one who commits an offense under the influence of an insane, irresistible impulse if he knew at the time the nature and character of his act. And this is generally the law, although it is conceded that there can be no criminal act without a free agent, and there may be in a given case the strongest evidence of the existence of such an impulse. The courts of a few States, however, under the influence of the medical doctrine that such insanity does in effect rob the afflicted person of the power to act in accordance with his knowledge of the nature and quality of the contemplated act, recognize such a plea as a good ground of defense, but hedge about their ruling with the most stringent requirements as to proof of such mental defect. Idiocy or imbecility is also a defense to crime. The test adopted, viz., that one must have as much mental capacity as a child 14 years old in order to be convicted of crime, is not very satisfactory, but is probably the best possible. So-called moral insanity and emotional insanity have never been recognized by the courts as a legal defense to crime, though the former is not infrequently the real reason for the jury's acquittal of a person committing murder under such circumstances—a result popularly known as the application by the jury of "the unwritten law."

On the trial of a person for a crime, the prosecution is not in the first instance required to introduce evidence of sanity of the defendant. Upon the defendant's offering evidence to establish his insanity the burden of proving sanity is thrown upon the prosecution. Theoretically, since the effect of insanity is to show absence of criminal intent, the prosecution should be required to prove sanity beyond a reasonable doubt in order to establish criminal intent. In a few States this is the rule. In the majority, however, the defendant is required to prove his insanity by the preponderance of evidence, and in one or two to prove his insanity beyond a reasonable doubt. Insanity may also be a bar to the trial or punishment of one charged with a crime. The test of insanity in the one case is the defendant's ability to understand the nature of the charge and of the trial, and in the other the nature and purpose of the punishment.

2. Capacity to Contract. The contracts of a lunatic, i.e., one who has judicially been placed under control, are void, and no rights or liabilities are acquired under them either by the lunatic or the person dealing with him. The contracts of one who is insane, but who has not been judicially declared to be a lunatic, are in general voidable, i.e., they stand as valid until he or his legal representative set them aside. Formerly it was held that the law would not allow one to plead his own insanity in order to avoid his contracts, since he would by so doing stultify himself. This harsh and unjust rule no longer obtains. If the insanity is of a character such as to prevent an insane person from understanding and reasoning properly with reference to the contract and its terms, and the insanity is known to the person dealing with him, then the contract may be avoided at the option of the insane person or his legal representative. If, however, the person dealing with him does not know of the insanity, and he have nothing to put him on his guard, the weight of authority is that such a contract cannot be avoided unless the same party could be placed in statu quo.

An insane person is absolutely liable for necessaries duly supplied to himself or his wife upon the theory of quasi contract (q.v.). See NECESSARIES.

3. Liability for Torts. Justice and public policy require that insane persons should be bound to pay from their property for damage caused by their torts to others, and it is generally the law that insane persons are liable for their torts. In the case of malicious torts, as libels and slanders, insanity may render the mind incapable of entertaining malice, in which case there is no liability, and for the same reason insanity of a defendant may be a ground for not awarding punitive or vindictive damages. See TORT; DAMAGES.

4. Capacity to Make a Will. Insanity does not necessarily render one incapable of making a will. It is declared by the best judges that so high a degree of mental ability is not needed to make a will as is requisite to the formation of a valid contract. The criterion of testamentary capacity in this respect, as stated by the New York Court of Appeals in the celebrated Parish will case (*Delafield v. Parish*, 25 New York, 9, 35), has been generally accepted and acted on in England and the United States. It is that the testator must be capable of understanding the nature of the business in which he is engaged, of summoning before his mind, without prompting, the property of which he wishes to dispose, and the persons who are the natural objects of his bounty, and of retaining them in his mind a sufficient length of time to arrive at a rational conclusion. The two salient elements of this requirement are a retentive memory and the capacity to form a rational conclusion. A person's mind may be greatly deranged or somewhat enfeebled and yet be sufficiently strong to meet this requirement. Insanity of a testator is also of importance in determining the question of undue influence which under certain circumstances may invalidate a will. See WILL.

An insane person is a competent witness to testify as to all matters about which he is not insane or mentally unbalanced. In dealing with questions of insanity courts concern themselves very little with the theories and speculations of psychologists and physicians, and no attempt is made to classify the various forms of insanity, except in the manner already indicated. The important question in every case is the mental competency, according to the well-settled rules of law, of the person upon whose acts judgment is to be passed regardless of the precise cause or nature of his disorder. The fact of insanity must be established by direct evidence and is usually, though not invariably, established by experts, who are allowed great latitude in giving testimony as to the mental capacity of the alleged insane person.

INSATIATE COUNTESS, THE. A tragedy by John Marston (1603), sometimes attributed to Barkstead.

INSCRIPTIONS (Lat. *inscriptio*, from *inscribere*, to write upon, from *in*, in, upon + *scribere*, to write). The name applied to writings upon durable material, such as stone or bronze or terra cotta. Ordinarily such writings are engraved, but they may also be painted. The number and variety of the inscriptions of the past are very great, and the term is of course applied with equal correctness to the records on gravestones or other monuments of the present. The far greater use of inscriptions in ancient times, and the large variety of subjects upon which they furnish information, have made epigraphy, or the study of this class of monuments, an important branch of the science of antiquity. For many peoples the inscriptions are almost the only source of our knowledge of their history, language, and customs. This is the case with Babylonia, Assyria, ancient Persia, and to a very great extent with Egypt; the Lycian, Phrygian, and Etruscan languages are known only through the records on the monuments, and these are only a few examples of languages whose peoples are revealed to us by inscriptions. Even where an extensive literature has been preserved in other forms, as in the case of Greece and Rome, the monumental records throw new light on the classic texts and add numberless details, which enable us to fill out the picture of ancient life, of which the literature so often preserves only the outline. Inscriptions in the widest sense include the picture writings of the North American Indians, the hieroglyphics of Central America and Mexico, and all the other forms in which man has endeavored to preserve his records upon indestructible materials. In many of these cases, however, the content of the record is either unintelligible or unimportant, and the interest centres in the form. These systems are therefore more appropriately described under WRITING. In cases where the inscriptions are the chief or only source for the life and history of their makers, or are noteworthy for the kind of writing employed, they are naturally discussed in connection with the lands from which they come or the characters used. Consult, therefore, the articles ASSYRIA; BABYLONIA; CUNEIFORM INSCRIPTIONS; EGYPT; ETRURIA; HIEROGLYPHICS; HITTITES; MINÆANS; SABÆANS; WRITING.

The most ancient inscriptions are those found in Mesopotamia and in Egypt, and these countries have furnished by far the largest number of these records of Oriental history and civilization; but in their form and contents they extend beyond the domain of epigraphy and are more properly treated under the special titles just mentioned.

Under Semitic inscriptions should strictly be included any inscription composed in a Semitic language. For practical purposes, however, the term is usually limited to such inscriptions as are written in the systems of alphabetic writing developed by Semites, and these systems furnish a convenient basis of classification. Two great groups may thus be distinguished: the North Semitic, employing an alphabet of which the Phœnician is the type, and including Hebrew and Aramaic together with Nabatæan and Palmyrene; and the South Semitic, whose alphabet is represented by the modern Abyssinian character (Amharic, Tigrina). The *North Semitic* group is divided into two principal sections:

1. The *Phœnicio-Palestinian*, including Phœnician (to which the Carthaginian, or Punic, both old and new, belongs), Hebrew, Moabitic, and Samaritan. 2. The *Aramaic*, which begins about the second century B.C. and later can be separated into Nabatæan, or Sinaitic, Palmyrene, Syriac, and Mandæan. Not all of these groups are of equal importance, for in some cases the scanty epigraphic material adds but little to what is known from the literature, while in general it may be said that only the early documents are of special interest either in language, contents, or form.

Though the published Semitic inscriptions are numerous, the great mass are brief records from gravestones, or isolated names, or graffiti, such as cover the rocks of the Sinaitic Peninsula. The immense variety that characterizes Greek and Latin epigraphy is lacking here, partly perhaps because so few sites have been systematically explored. Two of the most important North Semitic inscriptions, the Moabite Stone and the Siloam Inscription, are treated in separate articles. (See MOABITE STONE; SILOAM.) The most important Phœnician inscription is that on the sarcophagus of Eshmunazar, King of Sidon, now in the Louvre, which is probably from the end of the fourth century B.C. Earlier but shorter are the inscriptions of Eshmunazar's father, Tabnith, and of King Jechaumelech of Byblos, which may be as early as the fifth century B.C. The earliest evidence for the existence of a North Semitic language is furnished by the Tell el-Amarna Letters, which themselves belong in the fifteenth century before our era; while especially interesting is the Hebrew inscription found in the tunnel leading to the pool of Siloam. This inscription refers to the completion of the tunnel and probably dates about 700 B.C., when Hezekiah had in mind to supply Jerusalem with water. The earliest writing of this group is probably on the fragments of metal cups from Cyprus, which seem to be even earlier than the Moabite stone and may perhaps belong in the tenth century B.C. At a later date, in the fourth century and later, come many inscriptions from various places in Cyprus. An important Carthaginian document is the long inscription in Marseilles, containing regulations regarding sacrifices, including the fees to be paid by the worshiper and the division of the victim with the priest. An important group is formed by the Aramaic inscriptions, now in Berlin, of Senjirli, in northern Syria, some of which belong to the first half of the eighth century B.C. and throw an interesting light on the relations of these petty kings to Tiglath-pileser III of Assyria, their suzerain. The Nabatæan inscriptions, which are numerous, show a rather cursive type. At Palmyra many

inscriptions in the local alphabet have been found, for the most part mortuary and dating from the first three centuries of our era. Of especial interest is a long bilingual, in Greek and Palmyrene, of 137 A.D., containing the customs, duties, and tolls, which are recorded to obviate the frequent disputes between the caravans and the customhouse officials. Among the late inscriptions especial interest attaches to a bilingual, Syriac and Chinese, in western China, relating to the work of Nestorian missionaries in the region about 781 A.D. The North Semitic inscriptions are best discussed, and the important texts collected and illustrated in facsimile, in Lidzbarski, *Handbuch der nordsemitischen Epigraphik* (Weimar, 1898), which also contains a very complete bibliography; consult also Cooke, *Text-Book of North Semitic Inscriptions* (Oxford, 1903). The inscriptions are collected in the still incomplete *Corpus Inscriptionum Semiticarum* (Paris, 1881 et seq.), prepared under the direction of the French Académie des Inscriptions et Belles-Lettres.

The *South Semitic* group of inscriptions, though but little known until comparatively recent times, have furnished valuable information in regard to the early history of Arabia, and their study has developed into a most important branch of Semitic research. This group may be provisionally divided into four sections: the *Safaitic*, the *Lihjanian*, the *South Arabian*, and the *Abyssinian*. 1. The *Safaitic* inscriptions, found in the neighborhood of Es-Safa, south of Damascus, are chiefly epitaphs and contain little more than the names and genealogies of the deceased whose memory they preserve. Apparently they do not antedate the first century of the Christian era. Consult Halévy, *Essai sur les inscriptions du Safa* (Paris, 1882), and Littmann, *Zur Entzifferung der Safâ-Inschriften* (Leipzig, 1901). 2. *Lihjanian* is the name given to a class of inscriptions found in recent times at El-Oela, in northern Hejaz, because the King of Lihjan (an Arabian tribal name) is mentioned in them as the ruler of the district in which they occur. They are not numerous, and the mutilated condition in which most of them have been found renders their interpretation extremely difficult. Their date is somewhat doubtful, but they seem to be contemporary with the rule of the Ptolemies in Egypt. Consult D. H. Müller, *Epigraphische Denkmäler aus Arabien* (Vienna, 1889), and Nöldeke, *Die semitischen Sprachen* (Leipzig, 1899). Far more important than the two classes just mentioned are (3) the *South Arabian* inscriptions, found principally in the southwestern corner of the Arabian peninsula. These inscriptions, which are very numerous, refer chiefly to the dedication of buildings or the presentation of various objects to the gods, and they throw much light upon the religion of the ancient Arabians. They contain, moreover, many valuable historical and geographical allusions and enable us to reconstruct at least an outline of the history of the country for a period which until recent years has been involved in complete obscurity. The *South Arabian* inscriptions exhibit several dialects, each possessing marked grammatical peculiarities. The oldest inscriptions are composed in the dialect of the *Minæans*, whose kings ruled over a large part of Arabia at least as early as the fourteenth century B.C., their influence extending as far north as the borders of Palestine. About the

eight century B.C. their dominion passed into the hands of the *Sabæans*. In these two dialects the great mass of the *South Arabian* inscriptions are composed. The dialects of *Katabân* and *Hadramaut*, in the extreme southern part of Arabia, are represented by a few inscriptions. Both these dialects seem to have been more closely related to *Minæan* than to *Sabæan*. Of the large number of *South Arabian* inscriptions collected by various explorers, notably by the Austrian scholar Eduard Glaser, a very considerable portion yet awaits publication. Consult: Glaser, *Skizze der Geschichte und Geographie Arabiens* (Berlin, 1889-90); Winckler, *Musni, Meluhha, Ma'in* (ib., 1898); Weber, *Studien zur südarabischen Altertumskunde* (ib., 1901); id., *Arabien vor dem Islam* (Leipzig, 1902). Hommel, *Südarabische Chrestomathie* (Munich, 1893), contains a very complete bibliography of the subject, down to the date of publication. See also *MINÆANS*; *SABÆANS*. 4. The *Abyssinian* inscriptions, found at the ancient capital Axum, are few in number and belong to a late period. The earliest date from about 350 A.D. and are written in the *Sabæan* modification of the *South Semitic* alphabet. In inscriptions of a later date (about 500 A.D.) the *Ethiopic* system of writing, as used in the manuscripts, is found fully developed. Consult: Bent, *Sacred City of the Ethiopians* (London, 1893); D. H. Müller, *Epigraphische Denkmäler aus Abessinien* (Vienna, 1894); Glaser, *Die Abessinier in Arabien und Afrika* (Munich, 1895). For *Semitic* inscriptions in general, consult the *Corpus Inscriptionum Semiticarum*. See also *ETHIOPIA*.

In recent years considerable attention has been paid to the study of the *Hittite* monuments, which are found throughout Asia Minor as far west as Smyrna, though they occur most abundantly around the Bay of Iskanderun, in Cappadocia, in Cilicia, and in northern Syria. In 1899 a long *Hittite* inscription was found at Babylon, whither it had been conveyed as a trophy. The *Hittite* inscriptions employ a species of hieroglyphic writing, the individual characters representing parts of the human body, animals, birds, and other objects. In the older inscriptions the hieroglyphs are cut in relief, while in those of later date they are incised. Many attempts have been made to decipher these inscriptions, but so far with slight success. Professor Jensen of Marburg has at least made a beginning, and his identifications of ideographs and sign groups for various countries seem to rest upon solid grounds. He believes that the language belongs to the *Armenian* branch of the *Aryan* family, but the known facts are too scanty to warrant a definite conclusion upon this subject at present. Consult: *Corpus Inscriptionum Hettitarum* (Berlin, 1900-06); Messerschmidt, *Die Hettiter* (Leipzig, 1902); A. H. Sayce, in the *Proceedings of the Society of Biblical Archaeology* (London, 1903, 1905, 1907); A. T. Olmstead and others, *Travel and Studies in the Nearer East*, vol. i, pt. 2 (Cornell Expedition, 1911); D. S. Hogarth, "Hittite Problems and the Excavations of Carchamish," in *Proceedings of the British Academy* (Oxford, 1912). See also *HITTITES*; *AMARNA LETTERS*.

The old *Persian* inscriptions are exclusively regal. The longest and most typical one is that at Behistun (q.v.), which recounts the life and deeds of Darius I. The shorter inscriptions of

the same King, as well as of his successors, Xerxes I and Artaxerxes I, II, and III, are more occasional in subject. They are in the main dedicatory tablets, set up at Susa, Persepolis, Elvand, Naqs-i-Rustem, and Suez. Like the Behistun inscription, these minor texts express a deep and unfeigned religious spirit. In style the Old Persian inscriptions show in many phrases the influence of the earlier Assyro-Babylonian tablets, although the freer Aryan spirit is manifest throughout. The Old Persian inscriptions have been edited several times. The best editions are by Rawlinson, "The Persian Cuneiform Inscription at Behistun," in *Journal of the Royal Asiatic Society*, old series x-xi (London, 1846); Spiegel, *Altpersische Keilschriften* (Leipzig, 1881); Tolman, *Persian Inscriptions* (New York, 1892); Weissbach and Bang, *Altpersische Keilschriften* (Leipzig, 1893). Consult also the bibliography of CUNEIFORM INSCRIPTIONS.

Far more numerous than the remains of the Semitic peoples are the inscriptions in Greek and Latin. It was the custom of both peoples to record in this form all documents which it seemed desirable to bring or keep before the public eye. Hence almost any excavation on a large scale brings to light a multitude of inscribed stones. The number of these monuments is entirely unknown; in 1891 Larfeld estimated the Greek inscriptions alone at 50,000, and the intervening years have brought large increase. The Latin inscriptions are far more numerous, and any estimate must be merely conjectural.

Greek. Greek inscriptions are found upon various types of monuments; but of these the funerary monuments, or stelæ, are especially rich in inscriptional forms. But also of great frequency are the state documents which appear on separate stones or even upon the walls of buildings. There is evidence for the coloring of the letters. In the matter of form of the letters marked differences are to be observed as time progresses. The earliest inscriptions, if the primitive form of the letters does not mislead, are the rock-cut names of the island of Thera (Santorin), which may be dated in the seventh century. With these, though probably later, may be classed the rude names carved by the Greek mercenaries of King Psammeticus of Egypt on the colossi at Abu-Simbel. It is still a matter of dispute whether Psammeticus is the first (654-617 B.C.) or second (594-589 B.C.) of that name, but the analogy of other early inscriptions seems to favor the former date. The archaic inscriptions, written in local, or *epichoric*, alphabets, are tolerably numerous, but for the most part of interest and value chiefly for the history of the alphabet or the language, as they form one of the most important sources for the study of the Greek dialects. These early inscriptions are frequently written retrograde, i.e., from right to left, or *boustrophedon* (*βουστροφηδόν*), i.e., alternately from right to left and left to right. By the end of the fifth century the various local alphabets were generally superseded by the Ionic alphabet of Miletus, but the local dialects lived much longer. Progress of course varied with the locality. Crete, e.g., long retained the ancient forms, and the longest and most important of archaic inscriptions, the laws of the Cretan Gortyna, in alphabet and dialect appears so primitive that it is still placed by some scholars early in the sixth century B.C., though the weight of competent authority is in

favor of a date in the last half of the fifth. The classification of Greek inscriptions is, in the first place, geographical. If the number of inscriptions from a locality is very great, or changes in the alphabet sharply marked, it is often found convenient to introduce chronological subdivisions. A good example is the arrangement of the collection of the Attic inscriptions, by which the first volume contains the inscriptions before 403 B.C., when in the archonship of Euclides the old Attic alphabet was officially replaced by the Ionian; the second volume includes the period from 403 to 31 B.C., the date of the battle of Actium, which was chosen for practical convenience rather than from any natural cleavage at this point, and the third embraces the inscriptions of the Roman Imperial period. Such elaborate subdivision was needed in this case because of the enormous mass of Attic inscriptions, which far exceed those from any other locality. Under the several localities, or periods, the inscriptions are grouped according to their contents. Two great groups may be distinguished, according as the inscriptions proceed from the governing body of the community or from private individuals or associations. The *public* inscriptions include decrees and ordinances of all kinds, treaties, lists of magistrates, and reports of official boards; they are naturally of the greatest value for the study of governmental institutions and ancient communal life. Thus, our knowledge of the details of the organization of the Athenian Empire, the assessment of the tribute, and the relations of the subject cities, rests in large part upon the records of the Hellenotamiæ and the decrees of the Athenian assembly. The *private* inscriptions are even more inclusive, as they touch ancient life at almost every point. Mortuary inscriptions naturally form the largest class, but we have also many honorary inscriptions and especially dedications to the gods. Here also belong the numerous records of manumissions, such as covered the wall of the portico of the Athenians at Delphi, in which the slave is by a legal fiction purchased by the god. An important group is composed of the records of private corporations, either business, religious, or social. Of great value for the history of art are the numerous signatures of ancient artists, usually on the pedestals which once bore their works. (Consult Loewy, *Inschriften griechischer Bildhauer*, Leipzig, 1885.) A curious example of a private inscription, which also illustrates the importance attached to this mode of publication, is furnished by Diogenes of Œnoanda in southeastern Caria, who recorded on the wall of a portico for the edification of his fellow townsmen a long summary of the teachings of Epicurus, with letters and other quotations from the writings of the master. (Consult *Bulletin de correspondance hellénique*, vol. xxi, Paris, 1897.) A detailed discussion of the characteristics of the several classes of Greek inscriptions does not lie within the scope of this article, but it will be well to add a brief notice of the material and the places used for these records. In general, stone, usually marble, is the material employed. Relatively very few of the Greek inscriptions are on bronze. In the case of graves, votive offerings, or honorary statues, the inscription is obviously an accessory, and the place is primarily determined by other conditions. For decrees, treaties, records of officials, royal letters, or any other documents

for which publicity was desired, the market place, or acropolis, of a city, or the precincts or even walls of a temple, were the favorite places. The great sanctuaries, such as the Acropolis of Athens, Delos, Delphi, and Olympia, were crowded not only with statues and works of art, but also with inscribed slabs of stone, often containing some vote of a distant community. The expense of private inscriptions was of course borne usually by the persons concerned, and public enactments were in like manner engraved at the expense of the state; but there are very many cases where the decree of a state or corporation honoring an individual was published in stone at the expense of the recipient, who in this way showed his appreciation of the honor conferred.

The value of these records as a source of information did not escape the ancient historians. Herodotus, Thucydides, and Xenophon, as well as the orators, refer to them, but do not, as a rule, quote them directly, unless perhaps in citing the terms of treaties. But the systematic collection and use of inscriptions seem to begin at the end of the fourth century. The records of the public games and dramatic contests were utilized in compiling lists of victors or in determining the chronology of plays. Attic inscriptions were collected by Philochoros (320-261 B.C.), while Polemo of Ilion, at the beginning of the second century, diligently gathered dedications, artists' signatures, and numerous other records from the Greek sanctuaries; his work is partly preserved in the guidebook of Pausanias. The Greek Anthology owes many of its poems to the collections of epigrams compiled from the monuments by earlier scholars. During the Middle Ages interest in Greek, and still more in Greek inscriptions, was almost unknown, and it was not till the fifteenth century that the study of Greek epigraphy secured the attention of scholars, who naturally were at first attracted by the more abundant Latin remains. Cyriacus of Ancona (q.v.) in his numerous travels in the Levant copied many inscriptions, but his zeal frequently outran his knowledge, and in many cases it seems only too clear that his ancient documents owe their origin to the classical authors rather than to the stones. It was not till 1603, however, that an attempt at a complete collection of inscriptions appeared in the *Inscriptiones Antiquæ Totius Orbi Romani* of I. Gruter (2d ed., in 4 vols., 1707, by Grævius). In this and a number of similar works which followed, the inscriptions were grouped in classes, while the language and chronology were wholly neglected in the arrangement. Naturally the Latin inscriptions were in a vast majority. During the seventeenth and eighteenth centuries the attention of epigraphists was given rather to the acquisition of new material from the gradually opening Levant, which was visited by scholars sent out by the French Académie des Inscriptions et Belles-Lettres and the English Society of Dilettanti, as well as by numerous independent travelers, than to the compilation of complete collections. The vast increase in the material rendered such a collection a necessity, and in 1815 the Berlin Academy intrusted the preparation of such a work to August Boeckh. After 10 years of labor the first part of vol. i of the *Corpus Inscriptionum Græcarum* appeared, and the complete volume, which contained first the oldest inscriptions, important

for their alphabet, and then those of Attica, Megaris, Peloponnesus, Bœotia, Phocis, Loeris, and Thessaly, in 1828. Vol. ii did not appear till 1843, nor vol. iii till 1853, while vol. iv, though partly published in 1859, was not completed by the addition of the indexes till 1877. Though this work labors under what would now be considered serious defects, it laid the foundation which alone made possible the development of the severely critical methods of modern epigraphists. Even before the appearance of the second volume the increase in the material resulting from the independence of Greece and the active exploration of Hellenic lands showed that new collections would be needed, and before the completion of the work it was obvious that the projected supplement would be entirely inadequate to a proper publication of the new inscriptions. In 1871, therefore, the Berlin Academy entered upon the preparation of a new *corpus*, which is still in course of publication. (See *Bibliography*.) Along with this gigantic collection of all the monuments there has gone on the publication of many lesser collections—either inscriptions in a single museum, as the British Museum, or from single places, as Olympia and Pergamon, or noteworthy for their age or dialect—while all the archaeological journals devote much space to the new material which explorers, especially in Asia Minor, or excavators are continually bringing to light. In conclusion, brief mention should be made of the Greek inscriptions of Cyprus, which are written in part in a peculiar syllabic alphabet, wholly unlike the Greek, but possibly with affinities to some of the undeciphered syllabaries of Asia Minor, and of the use of Greek characters for inscriptions in non-Greek languages, such as Lycian, Phrygian, Carian, Pamphylian, and the unknown tongue represented by two inscriptions from Præsos on Crete. Though the values of the letters are generally certain, the languages themselves are not yet read with any certainty.

Bibliography. For a general introduction, the best is still the essay of Sir Charles T. Newton, "On Greek Inscriptions," in his *Essays on Art and Archæology* (London, 1880). Handbooks for the student are: S. Reinach, *Traité d'épigraphie grecque* (Paris, 1885); Kirehhoﬀ, *Studien zur Geschichte des griechischen Alphabets* (4th ed., Gütersloh, 1887); Roberts, *An Introduction to Greek Epigraphy*, part i, *The Archaic Inscriptions and the Greek Alphabet* (Cambridge, 1887), part ii, *The Inscriptions of Attica* (ib., 1905); Larfeld, *Handbuch der griechischen Epigraphik*, of which has appeared vol. ii, *Die attischen Inschriften* (Leipzig, 1898, 1902); id., in Müller, *Handbuch der klassischen Altertumswissenschaft*, vol. i (3d ed., Munich, 1914). The great *corpus* is *Inscriptiones Græcæ*: vol. i, *Inscr. Atticæ Anno Euclidis Vestitiores*; ii, *Inscr. Atticæ quæ est inter Euclidis Annum et Augusti Tempora*; iii, *Inscr. Atticæ Ætatis Romani*; iv, *Inscr. Argolidis*; v, *Inscr. Arcadiæ Laconicæ Messeniæ*; vi, *Inscr. Elidis et Achaicæ*; vii, *Inscr. Megaridis et Bœoticiæ*; viii, *Inscr. Delphorum*; ix, *Inscr. Regionum Græciæ Septentrionalis*; x, *Inscr. Epiri, Macedoniæ, Thraciæ, Scythiæ*; xi, *Inscr. Deli*; xii, *Inscr. Insularum Maris Ægæi præter Delum*. In connection with this should be mentioned the *Inscriptiones Græcæ* of the Berlin Academy, which had up to 1914 reached 14 volumes. Other important collections are: *The Ancient Greek In-*

scriptions in the *British Museum*, vols. i, iii, iv, 1 (Oxford, 1874 et seq.); *Olympia*, vol. v, *Die Inschriften* (Berlin, 1890); *Die Inschriften von Pergamon* (2 vols., ib., 1890, 1895). Consult also Le Bas and Waddington, *Voyage archéologique en Grèce et en Asie Mineure pendant 1843-44* (Paris, 1847-76), and Cauer, *Delectus Inscriptionum Græcarum propter Dialectum Memorabilium* (2d ed., Leipzig, 1882). For dialectic inscriptions, consult Collitz, *Sammlung der griechischen Dialektinschriften* (Göttingen, 1884-1905). For the archaic alphabets, the standard collection is Roehl, *Inscriptiones Græcæ Antiquissimæ præter Atticas in Attica Repertas* (Berlin, 1882), and a volume of facsimiles only, *Imagines Inscriptionum Græcarum Antiquissimarum* (2d ed., ib., 1894). Dareste, Haussoullier, and Reinach, *Recueil des inscriptions juridiques grecques*, i, ii, 1 (Paris, 1890-98), is important for Greek legal inscriptions. Useful collections for the student are: Michel, *Recueil d'inscriptions grecques* (ib., 1900); Hicks and Hill, *Manual of Greek Historical Inscriptions* (2d ed., Oxford, 1901); and, above all, Dittenberger, *Sylloge Inscriptionum Græcarum* (2d ed., 3 vols., Leipzig, 1898-1901). The metrical inscriptions have been collected by Kaibel, *Epigrammata Græca ex Lapidibus Conlecta* (Berlin, 1878), and (for the period before 250 B.C.) by Hoffman, *Sylloge Epigrammatum Græcorum* (Halle, 1893). A collection of the Greek Christian inscriptions has been begun by the French Academy.

Latin. The earliest Latin inscriptions cannot rival the antiquity of the Greek. The gold fibula, or brooch, of Præneste is probably of the sixth century B.C., and some have claimed an even greater antiquity for the broken column of the Roman Forum, though the best authorities consider it scarcely older than the middle of the fifth century. Another early example, the so-called "Duenos inscription" on a curious triple-bodied vase from the Esquiline, is very probably of the fourth century, but is still a puzzle to scholars. With very few exceptions, however, the Latin inscriptions are not older than 300 B.C. In its earliest forms the alphabet shows strongly its connection with the Greek, which reached the Romans from the Chalcidians of Cumæ and, like other early attempts at writing, is marked by crude and variable forms for the letters. Later were developed the large square and handsome monumental characters (*scriptura quadrata* or *lapidaria*), which were carefully carved after preliminary tracing and then colored, usually with red. Painted inscriptions, not carved, naturally show freer forms, and these were later often imitated in stone, as were sometimes the common cursive hands, which are found in wax tablets in graffiti and often on domestic utensils of various kinds. The inscriptions are usually divided into two great classes: 1. *Tituli*, employed to designate some definite object, giving the needed information to distinguish it from similar objects; such are mortuary, dedicatory, and honorary inscriptions. 2. *Acta*, or documents, which are engraved for purposes of publication. The former are far more numerous and show naturally a more stereotyped form. Among the mortuary inscriptions are noteworthy the many metrical epitaphs, often crude in metre and cold in expression, but also not infrequently showing tenderness and deep family affection. In general the classes of inscriptions are the same as recur

in Greece, but one or two Roman customs may be mentioned. The person who erected a temple or any other public building was usually allowed to engrave his name upon it, and these *tituli* are a much more important class of monuments than in Greece, where this was not a usual habit. Such inscriptions are valuable sources of information as to the date and circumstances under which these works were constructed. The numerous milestones not only mark the course of the ancient roads, but show the distances and names of the chief towns and the dates when the roads were built or repaired and by whom the work was directed. For the *acta*, bronze seems to have been the favorite material before the time of Augustus, but later the Greek use of marble was commonly adopted. They include treaties (rare), laws, decrees of the Senate and, in great numbers, of various town councils and corporations, the edicts and letters of Roman magistrates and especially of the emperors, and the numberless documents relating to the service of the gods. Among the Imperial edicts belong the military diplomas, or formal discharges which conferred on the retiring veterans special privileges. In connection with the service of the gods belong the calendars which were prepared during the early Empire. Here may also be mentioned the *fasti*, or lists of consuls and other important magistrates, of which there are many remains. Among these religious inscriptions an important place is taken by the records of the Arval Brothers (q.v.), and the account of the great secular games of 17 B.C., with its mention of Horace's *Carmen Sæculare*. A special place is occupied by the great *Monumentum Ancyranum*, the account by Augustus of his deeds (*index rerum a se gestarum*), engraved in Greek and Latin on the walls of the temple of Augustus and Rome at Ancyra in Asia Minor, after the original bronze tablets on the mausoleum of the Emperor in Rome. (Consult Mommsen, *Res Gestæ Divi Augusti*, 2d ed., Berlin, 1883, and Fairley, *Monumentum Ancyranum*, Philadelphia, 1898.) The Romans do not seem to have collected inscriptions as did the Greeks, though references to them are not infrequent in the histories, as Livy or Suetonius, and in other writers, from whom no complete collection has yet been made. At the very end of the ancient time and the beginning of the Middle Ages, when Rome became a place of pilgrimage, during the eighth and ninth centuries, many of the inscriptions were copied by visitors, and several of these compilations have been preserved wholly or in part, the most celebrated being the *Anonymus Einsiedelensis*. After the ninth century came a long period of neglect of the classical remains, and one of the first to revive these studies was the celebrated tribune of Rome, Cola di Rienzi, who about 1344 prepared a description of Rome in which he used the epigraphic material at his hand. Another collection was prepared in the early fifteenth century by the enthusiastic student of the past, Poggio Bracciolini, and from that time collectors of inscriptions are numerous and at times decidedly unscrupulous. Latin epigraphy in the sixteenth century suffered from forgers, at whose head stands Pirro Ligorio, of Naples, and their work deceived many until its character was disclosed by the exact scientific criticism of the nineteenth century. The earliest printed collection seems to have been that of the inscriptions of Ravenna (1489). Gruter's great collec-

tion of 1603 has already been mentioned. (See under *Greek*.) It was followed by collections by Reinesius, Fabretti, and others, till Muratori published his *Novus Thesaurus Veterum Inscriptionum* (4 vols., Milan, 1739-42), which his lack of knowledge made of but little real service. The foundations for the modern study of Latin epigraphy were laid by the careful and minute investigations of Bartolommeo Borghesi (died 1859), who devoted his life to a study of the *fasti* of Roman magistrates. A *corpus* of Latin inscriptions had been planned by the Berlin Academy, and also suggested by the French Academy; but the project was first realized when after a long period of preparation there appeared in 1863 the first volume, edited by Theodor Mommsen and Wilhelm Henzen. Since then the work has steadily continued, though it is still incomplete and from the nature of the case is always likely to be in need of supplements.

Bibliography. There are not many handbooks. In English the best is Egbert's *Introduction to the Study of Latin Inscriptions* (New York, 1896). Consult also Rushforth, *Latin Historical Inscriptions* (Oxford, 1893). Better than these is Cagnat, *Cours élémentaire d'épigraphie latine* (3d ed., Paris, 1898); Supplement (ib., 1904). Hübner, in Müller's *Handbuch der klassischen Altertumswissenschaft*, vol. i (2d ed., Munich, 1892), provides only a brief outline. Useful is Ricci, *Epigrafia Latina* (Milan, 1898). For the alphabet, consult Hübner, *Exempla Scripturæ Latinæ Epigraphicæ* (Berlin, 1885). The great *Corpus Inscriptionum Latinarum* is in 15 volumes, many of which are in several parts, and provided with supplements: vol. i, *Inscriptiones Latinæ Antiquissimæ ad Cæsaris Mortem* (2d ed., partes 1, 2, Berlin, 1893, 1895); ii, *Inscr. Hispaniæ* (1869), *Supplementa* (1892, 1897); iii, *Inscr. Asiæ, Provinciarum Europæ Græcarum, Illyrici* (1873), *Supplementa* (1888, 1891, 1893); iv, *Inscr. Parietaræ Pompeianæ, Herculaneses, Stabiæ* (1871), *Supplementum*, i (1898); v, *Inscr. Galliæ Cisalpinæ* (1872, 1877); vi, *Inscr. Urbis Romæ*, partes 1-5 (1876-85); vii, *Inscr. Britannicæ* (1873); viii, *Inscr. Africa* (1881), *Supplementa* (1891, 1894); ix, *Inscr. Calabriæ, Apuliæ, Samnii, Sabinorum, Piceni* (1883); x, *Inscr. Bruttiorum, Lucaniæ, Campaniæ, Siciliæ, Sardinicæ* (1883); xi, *Inscr. Æmiliæ, Etruriæ, Umbriæ*, i (1888); xii, *Inscr. Galliæ Narbonensis* (1888); xiii, *Inscr. Trium Galliarum, Duarum Germaniarum*, i, 1 (1899); xiv, *Inscr. Latii Antiqui* (1887); xv, *Inscr. Instrumenti Domestici Urbis Romæ*, i, ii, 1 (1891, 1899). With vol. i was published *Tabulæ Lithographæ Priscæ Latinitatis Monumenta* (ed. Fr. Ritschl, Berlin, 1862). Additional material is published in the *Ephemeris Epigraphica*, i-ix (Rome, 1872-1913). Lesser collections of value to the student are the older works of Orelli-Henzen, *Inscriptionum Latinarum Amplissima Collectio* (3 vols., Zurich, 1828, 1856), and Wilmanns, *Exempla Inscriptionum Latinarum* (Berlin, 1873), but especially the work of Dessau, *Inscriptiones Latinæ Selectæ*, i, ii, 1 (ib., 1892, 1902). See also W. M. Lindsay, *Handbook of Latin Inscriptions* (Boston, 1897). The metrical inscriptions are collected by Bücheler, *Anthologia Latina* (Leipzig, 1897). For the inscriptions in various Italian dialects, consult: Fabretti, *Corpus Inscriptionum Italicarum Antiquioris Ævi* (Turin, 1867, 1872-77); Zvetajeff, *Sylloge Inscriptionum Oscarum* (St. Peters-

burg, 1878); Bücheler, *Umbrica* (Bonn, 1883); *Inscriptiones Italiæ Mediæ Dialecticæ* (Leipzig, 1884); *Inscr. Italiæ Inferioris Dialecticæ* (Moscow, 1886); Schneider, *Dialecticorum Italicorum Ævi Vetustioris Exempla Selecta*, i, 1 (Leipzig, 1886); Pauli, *Corpus Inscriptionum Etruscarum* (ib., 1893 et seq.), under authority of the Berlin Academy and the Leipzig Scientific Society. The Christian inscriptions of Rome are collected in De Rossi, *Inscriptiones Christianæ Urbis Romæ* (Rome, 1857, 1888); of Gaul in Le Blant, *Inscriptions chrétiennes de la Gaule* (Paris, 1855-65); of Spain in Hübner, *Inscriptiones Hispaniæ Christianæ* (Berlin, 1871); of Britain in Hübner, *Inscriptiones Britannicæ Christianæ* (ib., 1876); of the Rhine in Kraus, *Die altchristlichen Inschriften der Rheinlande* (Freiburg i. Br., 1890-94); and of Switzerland in Egli, *Die christlichen Inschriften der Schweiz* (Zurich, 1895).

IN'SECT (Lat. *insectum*, insect, from *insecare*, to cut in, from *in*, in + *secare*, to cut). In its strict sense, a member of a group of six-legged arthropods known as the class *Insecta* or *Hexapoda*. Vulgarly the term is applied to almost any small crawling creature; and even among naturalists until comparatively recent years it was applied to the spiders and their relatives (*Arachnida*) and to the centipedes and thousand legs (*Myriapoda*). Insects constitute by far the largest group of living creatures and in fact form much the larger part of the land animals of the world. In number of species they are more numerous than all of the other groups of land animals together, while in number of individuals they are countless. The most conservative estimate places the number of species of insects in existence at 5,000,000, while the estimate of Riley, the famous entomologist, was 10,000,000. They are extremely variable in their habits.

Food. The great majority feed upon vegetation of one kind or another, and practically every part of every living plant is liable to insect attack. They feed not only upon living vegetation, but also upon dead plant tissue in every stage of decay, and even upon soil mold wherever it occurs, and are largely instrumental in the rapid disappearance of dead vegetation. Thousands of species also prey upon animals of different groups, from the warm-blooded vertebrates down to creatures of their own class and the other lower forms of animal life. They feed not only upon living animals, as parasites and predatory enemies, but also upon dead animal matter of all kinds, including excrementitious substances, as well as upon fabrics and other things composed of animal material. Although predominating so enormously on land, insects lose their preponderance in water, yet very many species are aquatic during the whole or some portion of their lives.

Economic Importance of Insects. It has been pointed out by the United States Department of Agriculture that the tax imposed by insects upon the agricultural and timber industries of the United States is greater than "the entire expenditures of the national government, including the pension roll and the maintenance of the army and navy." The damage done by insects is nearly 10 times that done by fire. Since before the plagues of Egypt man has had to contend with insect enemies, and, notwithstanding our increasing knowledge of the habits of insects and the inventions of new methods

of controlling the injurious species, the economic loss from insects seems to be increasing.

The most destructive species are usually those which have been introduced from some other country, because it usually happens that parasites which kept these pests from multiplying to an excessive extent in their native land were not imported with them.

The *Hessian fly* (q.v.) is the most important enemy with which the wheat, rye, and barley growers must contend. It destroys from 10 to 50 per cent of the sowings. This damage amounts to about \$75,000,000 annually in the United States alone. *Aphids* (see APHID) cause a further loss to the same crops of more than \$15,000,000.

The Mexican *chinch bug* (q.v.) has cost the corn growers of America at least \$400,000,000 in the last 50 years. It now levies an annual tax of more than \$30,000,000. The Western corn rootworm, the ear worm, and other enemies doubtless make the total loss at least three times this amount.

Hay and forage crops are subject to the attacks of many insect enemies. The best known of these is the *army worm* (q.v.), which often costs the United States several million dollars in a single season. It is estimated that 10 per cent (worth about \$65,000,000) of American hay crops is destroyed by insects every year.

In 1904 the Central American *cotton boll weevil* (see COTTON INSECTS) cost Texas, alone, \$25,000,000. It has spread throughout much of the cotton district; but fortunately it is yielding to control measures, so that the annual damage done by it in America is only about \$20,000,000. The cotton worm and minor pests bring the total annual tax levied by insects on the cotton industry up to about \$85,000,000. The same sort of tax on tobacco amounts to about \$10,000,000.

Insects decrease the profits of the truck farmer about 20 per cent; but, since there are no figures to show the total value of truck crops, it is difficult to say what the total damage is. It is probably about \$60,000,000.

The fruit growers suffer greatly from insects. If a continual warfare were not waged against it, the European *codling moth* (q.v.), or *apple worm*, would entirely prevent the growing of marketable apples. The loss and cost of treatment come to about \$20,000,000 annually in the United States. Another introduced pest, the *San José scale* (q.v.), has destroyed millions of trees. It costs, each year, from 10 to 25 cents per tree to keep it under control. There are, in all, about 300 species of insects which are more or less injurious to American fruit trees. With much difficulty and expense only about 80 per cent of fruit in the United States is saved from insects. It may be remarked in this connection that *Phylloxera* (q.v.), an American insect which is mildly injurious to grapes in the United States, found its way to France, where it destroyed the vineyards of whole districts.

In addition to eating the leaves of forest trees and sapping their vitality in other ways, insects bore into the standing timber and reduce its market value, sometimes even killing large numbers of trees. They also damage lumber after it has been made ready for the market. One hundred million dollars a year would not pay for these depredations. The introduced *gypsy moth* (q.v.) and *brown-tailed moth*, although

still confined to New England, have become such a pest that fully \$1,000,000 are spent in their control. This does not include the damage they do. The latter has recently shown itself capable not only of great damage to trees, but also of direct harm to human beings, actually causing serious illness in some cases. This brown-tailed moth (*Euproctis chrysorrhæa* Linnæus, family Liparidæ) was accidentally brought from Europe to Massachusetts about 1890. It became established there and has since spread throughout much of New England. There is still a possibility of its reaching new districts, chiefly by being carried on nursery stock; but it is now so well known that there is no likelihood of its becoming a serious pest elsewhere.

The adult moth measures about 1 inch or 1½ inches across the white wings. The end of the abdomen is conspicuously brown, hence the common name. The adults appear in July, congregating in great numbers about lights. Each female lays a mass of 300 or 400 eggs, which she covers with brown hairs from the tip of her abdomen. These eggs are laid on the terminal leaves of almost any sort of deciduous tree. Caterpillars hatch in about three weeks and feed until cold weather, when they fasten a number of leaves together and to a twig with strong silk. Several hundred caterpillars, usually those which hatched from a single egg mass, gather in each hibernaculum thus formed and pass the winter. They emerge as the buds burst in the spring, and after feeding for a month or six weeks they spin thin cocoons of white silk, inside of which they pupate and complete the life cycle by appearing as adults in July.

The larvæ are very dark brown marked with patches of orange. They have numerous tubercles, which bear so many short brown hairs as to give the creature a velvety appearance. These hairs are barbed, and when they touch the human skin they enter it, causing a rash much like that produced by poison ivy. The larvæ are frequently so abundant that the air is filled with their hairs, and whole communities become affected by the rash. In addition to this they are one of the most destructive of the insect enemies of deciduous trees, frequently defoliating large areas.

Besides the damage done by insects to forest trees and other wild plant growths, neither harvested crops nor manufactured articles are free from insect attack. Various kinds of beetles and caterpillars feed on dried vegetable products as well as eat woollens. This damage probably amounts to about \$200,000,000 annually.

Furthermore the dairymen and cattle raisers have important enemies among insects and nearly related creatures. The ox warble (see BOR), an immature fly which causes "grubby" cattle hides, causes an annual loss in the United States of about \$25,000,000. Other species of bots attack horses and sheep. It is impossible to say how greatly the milk supply is decreased by the numerous flies which at first thought seem to be merely annoying to cows. It is estimated that the annual injury inflicted upon American live stock by insects and ticks amounts to the enormous total of \$420,000,000.

All the estimates given above are very conservative. They are based upon most careful estimates and the best obtainable statistics. The total damage done every year in the United States by a few species of insects amounts to more than \$1,250,000,000.

It is pleasant to turn now to the other side of the question. Although insects lessen our fruit crop by 20 per cent, we owe nearly all our fruits to insects, because fruit trees depend largely upon insects for pollination. All our most beautiful flowers seem to have been developed by the cross-fertilization (see POLLINATION) carried on by insects. Insects destroy 10 per cent of the hay crop, but we should have no clover were it not for them. It is safe to say that the earth would be uninhabitable in a few years if all the insects were suddenly exterminated.

Furthermore predacious and parasitic insects are the most efficient agents known for the control of injurious species. Aphids are greedily devoured by the immature as well as by the mature ladybird (q.v.) beetles. The army worm is rarely very injurious in the same locality in two successive seasons, because its increase one year is favorable to the increase of its parasites, which hold it in check the next year. The citrus industry of California seemed doomed because of a scale insect, but a predacious beetle was imported from Australia and saved the day. Had the parasites of the gypsy and brown-tailed moths been imported with them and become established, it is not likely that these moths would have been notably injurious. After all other methods of controlling them had failed, the United States government began the systematic importation of parasitic insects. There is great hope of ultimate success.

Certain insects furnish articles of commercial importance. The most notable are honey, silk, and lac. Honey is the surplus food laid up by the *honeybee* (see BEE) for winter consumption, and beeswax is the material which forms the comb. Silk is a substance produced by the caterpillar of the *silk moth* (see SILKWORM) for protection during its quiescent pupal stage, when the creature changes from a caterpillar to a winged moth. *Lac* (q.v.) is an exudation from a scale insect. Formerly the red body fluid of the *cochineal* (q.v.) scale insect was much used as a dye, but aniline dyes have now largely taken its place.

In order that injurious insects may be more successfully combated and beneficial ones more generally propagated, all civilized governments employ trained entomologists. The United States Department of Agriculture has a Bureau of Entomology which investigates and reports on entomological matters of national importance. These reports may be obtained from the superintendent of documents, either free or at a nominal charge. Each State also has an entomologist, whose office is usually in the State capital. Some of the State bulletins are very instructive, and queries concerning injurious insects should usually be addressed to the State entomologist. Quarantine against foreign insects which are or are likely to become injurious is carried on by both the Federal and State governments. Consult: O'Kane, *Injurious Insects and how to Recognize and Control them* (New York, 1912); E. D. Sanderson, *Insect Pests of Farm, Garden, and Orchard* (ib., 1912); Slingerland and Crosby, *Manual of Fruit Insects* (ib., 1914); *Journal of Economic Entomology* (Concord, N. H.); and the various State and national bulletins.

Insects and Disease. As annoying man himself, insects play an important part, since there are very few regions of the habitable globe where

man is not troubled by them. Bedbugs, fleas, lice, mosquitoes, the screw-worm fly (see BEDBUG, FLEA, LOUSE, MOSQUITO, SCREW WORM), and many other species are troublesome. It is, however, as carriers of disease that insects are perhaps of the greatest importance. The filaria diseases of the East (elephantiasis, chyluria, and lymph scrotum) are transferred by certain mosquitoes. The Texas fever of cattle in the United States, the red-water diseases of Africa, and other cattle fevers are transmitted by certain ticks which are not insects but arachnids. The tsetse fly of Africa carries the microorganisms of disease; the purulent conjunctivitis of the Egyptians and Fiji Islanders is communicated by the house fly; the eye disease known as "pinkeye" in the southern United States is transported by minute flies of the genus *Hippelates*. Asiatic cholera and typhoid fever are carried by the house fly; and the bubonic plague is spread by fleas from rats. All forms of malaria are carried about by mosquitoes of the genus *Anopheles* (see MOSQUITO), and yellow fever by those of the genus *Stegomyia*. (See MOSQUITO.) It has also recently been claimed that dengue fever is in Syria spread by a mosquito of the genus *Culex*; that anthrax bacilli in malignant pustules in human beings are caused by the bite of flies of the genera *Tabanus* and *Stomoxys*; and that the famous "surrah" disease of cattle in Oriental regions is also carried by gadflies.

Poisonous Insects. Certain insects may be considered under this head which poison human beings in any one of several different ways: 1. They may have a sting which is a modified ovipositor, and which is connected with a specific poison gland, as with the bees, wasps, stinging ants, and certain other Hymenoptera. 2. There may be a modified salivary gland which has a poisonous secretion and is connected with a piercing beak, as with certain bugs of the order Heteroptera, and as with many dipterous insects like mosquitoes and other biting flies. 3. The hairs covering the body surface may be modified into sharp bristles, which may be simple or barbed, and which, when coming in contact with the skin of human beings, produce an urticating or nettling effect. Poisonous insects of this group are confined to the caterpillars or larvæ of certain moths, especially of the family Limacodidæ, and, to a much less marked extent, a few of the caterpillars of Bombycidæ, such as *Orgyia leucostigma*, *Euproctis chrysorrhæa*, as well as to a few of the Saturniidæ, like the larva of the Io moth. 4. Certain beetles when crushed produce a blistering effect upon the skin. These are confined to the family Meloidæ, or blister beetles. See BLISTER BEETLE.

The poison of bees is formed by the mixture of the secretions of two glands, one of which is acid and the other alkaline. With the burrowing wasps the alkaline gland is absent or atrophied, and the poison consists only of the acid. The effect of the sting of these wasps is either to stupefy the prey or to kill it. In either case the insects stung remain in excellent condition as food for the larvæ of the wasps for a considerable length of time. (See WASP.) The severity of the sting of the aculeate Hymenoptera and the amount of poison injected into the wound differ with different species. The sting of our large mud wasp (q.v.) is especially severe, and as a rule the stings of wasps have a more poisonous effect upon human

beings than the stings of bees. There are cases on record where many bee stings on the same individual have produced death. Several instances have been well authenticated by medical men of the death of a human being from a single sting of a wasp, the sting acting as a very powerful irritant poison on the nerve centres of the patient. As a rule, such cases are confined to exceptionally nervous individuals, to those inheriting gouty tendencies, who are remarkably susceptible to the action of certain medicines. Persons handling bees and wasps become immune to their poison; the stings have little effect upon them. This immunity, however, disappears in the absence of continuous reinoculation. This fact is well known to beekeepers, and entomologists who collect wasps and other stinging Hymenoptera in large numbers have called attention to the same fact. The remedy for the stings of both bees and wasps is the immediate application of an alkali.

Many of the poisonous flies are treated of under MOSQUITO; GADFLY; BLACK FLY.

The true bugs which give a poisonous bite with a piercing beak, and which may attack man, belong almost entirely to the family Reduviidæ (see CONE-NOSE), to which the terms "pirate bugs" and "kissing bugs" are applied. The Eastern species are *Opisacetes* (or *Reduvius*) *personatus*, *Melanolestes picipes*, and *Melanolestes abdominalis*; and the principal Southern and Western forms are *Rasahus biguttatus* and *Conorhinus sanguisugus*. (See CONE-NOSE.) The bite of these bugs is specifically poisonous, but the great inflammation which so often occurs is doubtless due to the entrance into the circulation of germs of putrefaction, since the bugs are attracted to dead animal matter. The Eastern species (*Melanolestes picipes*) is a shining black bug rather more than half an inch in length. The principal Western species (*Rasahus biguttatus*) is reddish in color with blue-black fore wings, each marked with a round reddish spot. This latter species is, according to Davidson, the cause of nearly all of the supposed cases of "spider bites" in the Southwest.

Ecology. As a class, insects are represented in practically all parts of the world. While flourishing more abundantly in the tropics, they are found in countless numbers in the temperate regions and are also very numerous in boreal regions. They abound inside the Arctic circle, and in the short Arctic summer many species of nearly all orders may be collected. As a rule, as with other classes of animals, the forms occurring in tropical regions are larger in size and more brilliant in color. Many groups are confined to the tropics; others have a wide geographic distribution. The value of the class Insecta in the study of the geographic distribution of life is very great with certain groups, while others have comparatively slight faunistic value. Civilization exerts a direct and destructive influence upon the insect faunas of large regions. Insects being largely dependent, directly or indirectly, upon vegetation, the destruction of the wild flora and sylvia and the introduction of cultivated crops almost immediately change completely the characteristics of a given insect fauna. The rapid development of methods of transportation, and especially intercommunication between remote regions, by means of the constantly increasing number and speed of vessels, has resulted in the accidental introduction and acclimatization of many hundreds

of species of insects into regions remote from their original homes, many of which succeed in establishing themselves. The facility of acclimatization varies greatly with different groups, and this facility is dependent upon the degree of simplicity of the life of the insect and upon the degree of simplicity of its natural environment. So great has become the danger of the introduction of injurious species from one country to another during late years that many nations seek to protect themselves by special quarantine measures.

From what has preceded, it is evident that insects, in spite of their small size and their consequent slight strength, have been remarkably successful in the so-called struggle for existence. They have a long geological history, and the insects of Tertiary rocks are in some instances almost generically related to living forms. Rapidity of growth and power of multiplication have been prime factors in this persistence, while the relations which exist between circulation and respiration have been almost equally significant. In many instances the growth from the egg to the individual occupies only a few days, while in some species a single female will lay several thousands of eggs. The functions of circulation and respiration are so related that nutrition can be carried on very rapidly and very efficiently. By the phenomenon of metamorphosis, growth and development are isolated from each other, allowing growth to go on unchecked and uncomplicated by development.

The social life of insects is very remarkable; organized societies are formed with many species, especially the Hymenoptera (bees, wasps, and ants) and the Isoptera (white ants, or Termitidæ). In these societies great numbers of individuals live together and are greatly modified in structure in accordance with the different functions which they perform in the community. See ANT; BEE; WASP; TERMITE; and *Social Insects*, below.

Reproduction. Nearly all insects undergo in the course of their lives remarkable changes in form. A few forms are ovoviviparous, i.e., bring forth living young, but the great majority lay eggs. (See EGG.) With some forms there is a development without metamorphosis, and in these the young insect just hatched from the egg is of the same form as the adult insect. With others there is what is termed an incomplete metamorphosis, i.e., where, although the young greatly resemble the adult, there is still a striking change of form during life. With others still there is what has been termed a complete metamorphosis (q.v.), in which the young just hatched is strikingly different from its subsequent stages. With the bees, butterflies, flies, beetles, and other insects, the form which hatches from the egg, and which is known as the "larva," is a "grub" or a "caterpillar." This, after reaching full growth, passes into another form, which is known as the pupa, and in which in the majority of cases the insect is quiescent, while from this stage there eventually emerges the perfect insect. Larvæ grow by molting; the skin is more or less hard and is composed of chitin; a new skin is formed beneath the old skin, which eventually bursts and permits the larva to emerge. The number of molts differs with the larvæ of different groups and ranges from two or three to as many as 12 or more. The phenomenon known as hypermetamorphosis

sometimes occurs. With certain of the blister beetles, e.g., the first larvæ which are born possess legs, by the aid of which they can cling to a bee and be carried to its nest, where they will live on the food stored by the bee; after a molt they lose their legs and become almost organless, floating about in the honey. Later still, another form of larva is found. See METAMORPHOSIS, IN ANIMALS; LARVA; PUPA.

Social Insects. A great many insects lead solitary lives. Others, either as larvæ or as adults, are gregarious, and in gregarious feeding and gregarious life we have the beginning of social communities. Many lepidopterous larvæ, or caterpillars, feed together in great masses, like the army worm (q.v.) of the United States, and more especially the larvæ of certain silk-spinning moths, like the European processionary moth (*Cnethocampa processionea*), and less markedly the American tent caterpillar and fall webworm (qq.v.). These tents or webs for community feeding are carried to a higher degree of perfection in the European tineine moths of the genus *Hyponomeuta*, and still more perfectly in the community nests of a tropical butterfly (*Eucheira socialis*). A number of moths make communal cocoons, but nearly all of these are tropical. The beginning of a true communal life is seen with the ambrosia beetles (q.v.) of the family Scolytidæ. These are beetles which make galleries under the bark of trees, apparently cultivating a fungus which they use as food, preparing a bed for its cultivation; they also carefully remove excrement from the fungus gardens and practically bury their dead. The most perfect socialism, however, occurs among the bees, wasps, and ants of the order Hymenoptera, and among the termites, or so-called "white ants," of the order Isoptera. Not all bees are social. A large group is composed of solitary bees. Among the social bees a more or less primitive social life is found with the bumblebees. Here there is a communal existence. Nests are made, cells are constructed for the young, the young are fed by the adults, and there is a separation into three castes, viz., females, males, and drones. There is also the beginning of a separation of the drones into two castes—the larger ones in general attending to the mending of the covering of the nests and to the ripening of the honey, while the smaller ones for the most part do the inside housework, such as the wax repairing and the nursing of the young. The community life of the hive or honey bee is much more complicated than that of the bumblebee, but the workers seem to be more uniform in their duties. The stingless tropical bees of the genera *Trigona* and *Melipona* form very large communities, some of them even exceeding in size those of the honeybee, but the social life is practically the same. See BEE.

The wasps are also both social and solitary. The social species belong for the most part to the genera *Vespa* and *Polistes*. Their communities are much like those of the social bees. They are, however, not so perfect and not so persistent as those of the true honeybee or the ants, but resemble more nearly those of the bumblebee. The communities of the bumblebees and the wasps are annual. Those of the honeybees and the ants, as well as of the termites, last for a number of years. Among the wasps is a form known as worker, just as with the social bees; and the workers here, as in

the other cases, are undeveloped females. Here also, as with the social bees, these undeveloped females or workers may lay eggs which invariably produce males or drones. Most of the social wasps make paper cells and nests, using for this purpose a wood pulp composed of fragments of wood moistened with saliva and macerated in the mouth. The economy of the social wasps is not perfectly understood, doubtless owing to the difficulty of studying them, due to the irritability of the insects and to their poisonous stinging. The size of the communities varies at the season when they are largest, from a few individuals to many hundreds, as many as 1200 cells being found in a single nest. On the approach of winter the males and workers perish, and the fertile females crawl into such protected situations as crevices of walls and in the bark of trees and there pass the winter in the dormant state. At the opening of spring each surviving female founds a new colony. At first she performs the duties of both queen and worker. A small nest is made, eggs are laid in it, and when the larvæ hatch they are fed and cared for by the queen until they are mature. This first generation is composed entirely of workers. They relieve the queen of the duties which belonged to her, and from this time forth her only duty is to lay eggs. The workers are engaged in the enlargement of the nest, in the construction of new cells, and in the care of the young.

With the ants we come to a more complicated social life. Here not only do great numbers of separate individuals live together and adopt different functions, according to the positions which they occupy in the colony, but these individuals are also greatly modified in structure and in their physiological processes, in such ways as to fit them especially for the parts they have to play. With the different families of ants the character of the colony differs very considerably. For a general account of the community life of the higher families and the general phenomena of ant life, see ANT; also DRIVER ANT; FORAGING ANT; HONEY-MAKING ANT.

The family Poneridæ, as pointed out by Wheeler, constitutes a primitive and generalized group of ants, wherein the colonies consist of a comparatively small number of individuals like the incipient colonies of the higher families. These small colonies appear to be annual growths formed by swarming, as in bees, and not by single fertilized female ants, unaccompanied by workers, as in the higher families, and as described under ANT. Two and more colonies of the same species can be fused to form another colony without much difficulty, which is not easily accomplished with many species of the more specialized ants. Their architecture is of a primitive character, consisting of a few irregular and unfinished galleries. The queen and worker differ but little in size and structure. Ergatoid females, or forms intermediate between the queens and the workers, are of normal and comparatively frequent occurrence in some species. The habits of the queen and worker are very similar; the female is not an individual to whom especial attention is paid by the workers. The workers show no tendency to differentiate into major and minor castes. They are carnivorous and live by hunting, in contrast with the various harvesting, fungus-growing, honey-collecting, and aphid-guarding members of the higher groups. They do not feed one another

by regurgitation; nor are the larvæ fed by regurgitation, but are given pieces of insects, from which they suck the juices. It is fair to suppose that from such generalized beginnings the highly specialized and wonderful colonies of the higher groups of ants have sprung, and that the slave-making habits, the care of honey-producing insects, the differentiation of a soldier caste, the fungus-growing habit, and others have been developed by gradual evolution.

The phenomenon of polymorphism (q.v.) becomes very marked with ants, although it reaches a still higher development among the termites. The causes of the modifications seen in the different castes are still in dispute. Dewitz states that the caste is already determined in the insect before leaving the egg; Weismann associates the caste with some hypothetical rudiments existing at the very earliest stage of the embryonic process; Herbert Spencer and others believe that the character of the insect is determined by the nutrition of the larva, just as is the case with the honeybee. The chief forms of polymorphism in ants are the ordinary winged male, the ergatoid male, the winged female, the ergatoid fertile female (a form intermediate between female and worker), the soldier, the worker major, and one or more kinds of worker minor. In addition to these there are apparently cases of females with postmetamorphic growth in the Dorylides, but these have not yet been the subject of investigation. The fact that the social insects in which the phenomena of caste or polymorphism occur, though belonging to very different groups, all feed their young, is suggestive and lends weight to the theory that the differentiation is the result of character of the larval food. Emery accounts for this differentiation by assuming that it has been gradually acquired by numerous species, and that we now see it in various stages of development; also, according to Sharp, "that the variation in nutrition does not affect all the parts of the body equally, but may be such as to carry on the development of certain portions of the organization while that of other parts is arrested."

The so-called intelligence of bees, and especially of ants, has been a subject of wonder and comment on the part of many writers for hundreds of years. The observations of Lubbock, however, indicate that bees have not the high degree of intelligence with which many writers have credited them, and that in this respect they do not compare with the higher ants, which are ranked as the highest in point of intelligence among social insects. Riley, in his work entitled *Social Insects from the Psychological and Evolutional Points of View*, expressed himself as of the opinion that no one can doubt the possession by the social insects of intelligence, of conscious reasoning and reflective powers. He makes the statement, "We can never properly appreciate nor properly bring ourselves into sympathy with these lower creatures until we recognize that they are actuated by the same kind of intelligence as ours." Bethe (1898), however, in discussing the question as to whether or not we may ascribe psychical qualities to ants and bees, points out the danger of the observer injecting his own personality into the subject investigated. He shows, e.g., that, while we see, all we know about bees and ants is that they are influenced by the light, and that it would be most unscientific to say that

they do anything as highly psychical as seeing, until it is proved. Some of the peculiar and apparently highly intelligent things which ants do, such as recognizing the enormous number of members of the same colony, and such as finding their way to their own nests and to food supplies and communicating intelligence of the location of food supplies from one to the other, have been carefully tested by Bethe, who concludes that he can find nothing in the phenomena exhibited by bees and ants to prove the existence of any psychical qualities. Lubbock thought that he had proved that ants communicated with one another, but Bethe used one of Lubbock's own experiments to show that it proved nothing. He concludes that they learn nothing, but act mechanically in whatever they do, "their complicated reflexes being set off by simple physiological stimuli." See facts under this head in article INSTINCT. For the best and most recent summary of facts and theories relating to the social life of the true ants, consult W. M. Wheeler, *Ants, their Structure, Development, and Behavior* (New York, 1910).

In the termites, or "white ants," we reach a very specialized form of the social or community life of insects. They reach their highest development in tropical regions; the females or queens grow to be of enormous size, the abdomen swollen with eggs sometimes becoming as big as a potato, or 20,000 or 30,000 times the bulk of a worker. The eggs may be laid at the rate of 60 a minute, or 80,000 a day. The species are all social, and communities consist of both wingless and winged individuals. The winged individuals are with most species excessively numerous, and as a rule they are divided into two castes, viz., the ordinary workers and the soldiers. The so-called soldiers also exist with the true ants, but they have not in these creatures become such a structurally well-differentiated caste as with the termites. In the latter the jaws have become enormously developed, and in some cases the soldier is five times the size of the worker. In some species some of the workers have branched off into another caste, the "nasuti," in which the head has become elongated into a long noselike process, at the tip of which is a hole through which is exuded a fluid which is used in making and mending the walls of the habitation. Although the social life of a termite colony is superficially much like that of an ant colony, the development of the social habit and the differentiation of forms have taken place along entirely different lines: the termites have an incomplete metamorphosis, the ants have a complete metamorphosis; the young of the termite is more or less capable of self-support soon after birth, whereas the larvæ of the bees and ants are entirely helpless during development and are fed by the adults. The fundamental difference between the two groups is that with the termites the workers or neuters, including the soldiers, are not undeveloped females, as with the workers and soldiers of the ants and the workers of the bees, but they consist of both sexes and are in reality the arrested or modified larvæ in which the sexual organs are imperfectly developed or are completely atrophied.

With the hive bee multiplication of colonies takes place by division, but the colonizing swarm carries with it a queen, and thus the foundation of a new colony is easy. With the higher termites multiplication of colonies also

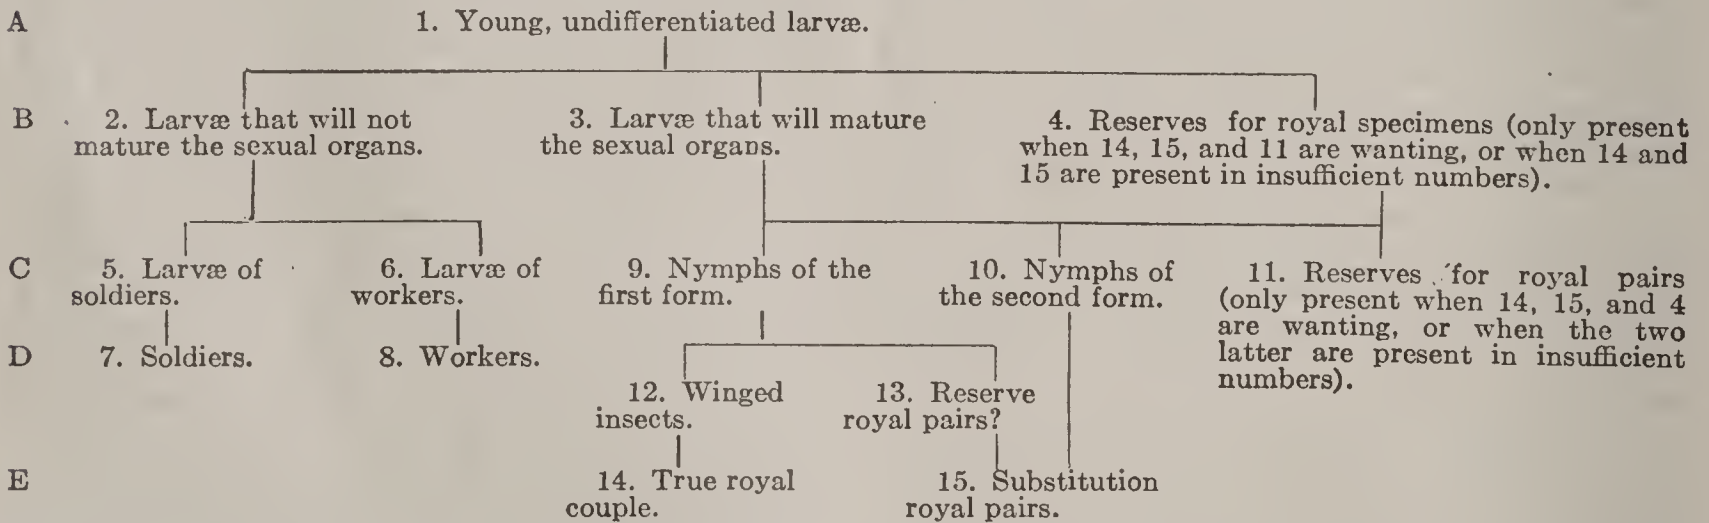

takes place by division; but this is carried out by the workers and soldiers, which travel away and capture one of the royal pairs that wander about after they have swarmed and thrown off their wings. Many colonies of termites will be found in which there is no queen. Among the different species of termites there is a marked gradation from a simple to a more complex economy. The continuance of a termite community is entirely dependent upon the king and queen, which are the adult individuals of both sexes which have swarmed and lost their wings. There is usually but a single pair in a nest, and they are frequently inclosed in a cell which they cannot leave. In consequence of the disorganization of the community if anything happens to the king or queen, termites keep certain individuals in reserve in such a state of advancement that they can rapidly be developed into kings and queens should occasion require it. When such individuals, however, are developed to meet the emergency, they are generally immature in the anterior parts of the body. The termite queen differs in one respect from any other known insect, i.e., in actual growth after reaching the adult stage, this growth being confined to the abdominal region of the body and being due to the necessity for an extraordinary number of eggs.

The complicated character of a termite colony is seen from the following table (from Sharp), which indicates the numerous forms which exist in certain communities:

these organs. Certain rove beetles occurring in termites' nests are fed directly by their hosts. Many of the guests are curiously modified so as to present a striking resemblance to their hosts. With those living with blind ants the form is not modified, but the structure and the hair growths have become similar to those of ants. Among these guest insects (which when occurring in ants' nests are known as "myrmecophilous" and in termites' nests as "termitophilous") there are representatives of no less than 31 different families of Coleoptera, seven families of Hymenoptera, several families of Lepidoptera, Diptera, Orthoptera, Neuroptera, Pseudoneuroptera, Hemiptera, Thysanura, and there are also living as guests in these nests certain curiously modified myriapods, scorpions, spiders, mites, and isopod crustaceans. See INQUILINE; TERMITES.

Structure of Insects. The insects are most closely related to the myriapods and to the spiders and their allies (Arachnida). The body consists of not more than 21 segments, which are usually of unequal size and shape, arranged in three usually well-defined regions—head, thorax, and abdomen. The head is small and flattened or rounded, and is composed of not less than six segments, bearing eyes and at least four pairs of appendages, viz., one pair of antennæ and three pairs of mouth parts. The mandibles are one-jointed, without appendages. There are two pairs of maxillæ—the first pair separate, usually three-lobed, and with a palpus

FORMS OF TERMES LUCIFUGUS. (AFTER GRASSI)

A very remarkable feature of the life of social insects is the frequent occurrence, in the colonies of almost all species, of "guests," or inquilines. Insects of several orders live in ant colonies, and symbiosis (q.v.) presents itself here under various aspects, among which, according to Wasmann, real hospitality (myrmecoxenie and termitoxenie) and relations of friendship (symphylic) take first rank, and, as far as we can tell, are unequalled elsewhere in the animal kingdom. Wasmann has studied more than 100 different species of insects living in the nests of ants and more than 100 different species in the nests of termites, but states that these form but a fraction of those hidden in the nests of tropical ants and jealously guarded by their "jailers." New and interesting discoveries are constantly coming to light in the tropics. Certain of the beetles found in these nests possess certain peculiar tufts of hair and are licked by the hosts on account of the pleasant secretion which comes from them. The peculiarly shaped antennæ of the guests indicate that they summon the ant at feeding time by tapping it with

which is never more than six-jointed. The second pair unite to form the underlip and bear a pair of palpi never more than four-jointed. The epipharynx forms the roof of the mouth and bears taste organs. The hypopharynx is usually well developed and lies on the underside of the mouth just above the labium and receives the end of the salivary duct. There are a pair of compound eyes and usually from two to three simple eyes (ocelli). The thorax consists of three segments. There are three pairs of legs, each foot ending in a pair of claws; two pairs of wings, a pair to each of the two hinder thoracic segments. The wings are occasionally reduced or wanting in forms which, however, had winged ancestors. The abdomen consists at the most of from 10 to 12 segments, and there are no functional abdominal legs except in the Thysanura and in the larvæ of Lepidoptera. The genital openings are usually single, but are paired in some orders.

The digestive canal is highly differentiated in the winged orders. In larvæ it is a nearly straight tube extending from one end of the

body to the other. In adult insects, however, it is usually much longer than the body and therefore is more or less folded. It is situated below the dorsal vessel and above the ventral chain of nerve ganglia. There are three main divisions, viz., the anterior, middle, and posterior. The anterior and posterior divisions are morphologically considered as invaginations of the extremities of the skin. The œsophagus is usually narrow, dilating behind to form the crop. Sometimes it dilates immediately behind the mouth, and this dilatation is known as "pharynx." It is followed by the "gizzard," or proventriculus. The true stomach, or chylic ventricle, is always present and is very variable in shape and size. Sometimes it is coiled like an intestine and sometimes bears pouches varying in number from two to very many. The intestine varies greatly in length, being smaller anteriorly and frequently widening to form a rectum. There are sometimes a cæcum and odoriferous glands. The alimentary canal has two coats of muscles, a longitudinal and a transverse coat. Salivary glands are present in many insects, discharge into the mouth, and vary greatly in their development. The silk spun by many larvæ comes from long silk glands similar in form and situation to the simple tubes of the salivary glands. Malpighian tubules are present in most insects in the hinder end of the body, opening into the alimentary canal usually at the junction of the stomach and intestine. They vary greatly in length and number.

The nervous system consists of a well-developed brain, and no more than 13 pairs of ganglia, which may be more or less confused in the specialized orders. The cephalic ganglia are placed above the œsophagus, while the other ganglia are ventral. There is an accessory sympathetic system which is complex and difficult of dissection. Respiration is carried on by means of a system of air vessels called tracheæ, which ramify through all parts of the body. These tracheæ connect with the outer air through a series of spiracles which are orifices at the side of the body, there being usually one pair for each segment. The tracheæ are elastic and consist of an outer cellular coat and an inner chitinous layer, the latter strengthened by a spiral fibre. With some insects, as with certain bees and locusts, the tracheæ expand in places to air sacs, and these sacs, as well as the finest capillary branches of the tracheæ, lack the spiral fibre.

Circulation is carried on through the dorsal vessel or heart, which is situated in the upper part of the body (just beneath the dorsal skin), extending from the head or thorax to the posterior extremity. It is an elongate tube consisting of a number of united chambers and is usually closed behind but open in front, having also several orifices at the side. There is a muscular layer with internal and external membranous layers. The blood is forced forward into the body cavity, receiving oxygen from the terminal branches of the tracheæ. The muscular system is extensive, nearly 4000 muscles occurring in certain caterpillars. See GILL.

Classification. According to the generally accepted classification, there are 19 orders of insects, as follows:

- Thysanura*, springtails and bristletails.
- Ephemera*, May flies.
- Odonata*, dragon flies.
- Plecoptera*, stone flies.

- Isoptera*, white ants.
- Corrodentia*, psocids and book lice.
- Mallophaga*, bird lice.
- Euplexoptera*, earwigs.
- Orthoptera*, grasshoppers, crickets, etc.
- Physopoda*, thrips.
- Hemiptera*, true bugs, plant lice, scale insects.
- Neuroptera*, aphid lions, ant lions, etc.
- Mecoptera*, scorpion flies, etc.
- Trichoptera*, caddis flies.
- Lepidoptera*, butterflies and moths.
- Diptera*, true flies.
- Siphonaptera*, fleas.
- Coleoptera*, beetles.
- Hymenoptera*, bees, wasps, ants, sawflies, etc.

Representatives of these groups are illustrated by typical forms on the accompanying colored plate, which are described elsewhere, under their respective names. For a simpler arrangement of orders, see CLASSIFICATION OF ANIMALS. See also Colored Plates of BEETLES, BUTTERFLIES, DRAGON FLIES, and MOTHS.

See CHEMICAL SENSE IN ANIMALS.

INSECTA (Lat. nom. pl., insects). A class of six-legged arthropods, equivalent to the Hexapoda. See INSECT.

INSECTICIDE (from Lat. *insectum*, insect + *-cida*, murderous, from *cædere*, to kill). A substance used by man to kill insects. Besides those materials properly included by this definition, however, there are many other agents of great importance as insect exterminators, of which the following may be classed as natural controls: changes of temperature at critical times in the life histories of insects; rain, flood; drought; forest and prairie fires; bacteria, fungi, mites, spiders, predacious and parasitic insects, and other invertebrates; fish, toads, reptiles, birds, anteaters, and other vertebrates. Though each of these exercises an important function in checking insect depredation, their offices are beyond the scope of the present article, which deals with artificial or man-applied controls.

For convenience of discussion the classification of insecticides may be made according to the two ways by which insects obtain food. Plant-feeding insects either chew plant tissue by means of movable jaws or else suck the juices through punctures in the epidermis made by their tubelike beaks. The chewing species may be subdivided into those that feed beneath the surface and those that feed in exposed positions. To the concealed feeders belong the leaf miners, which live beneath the epidermis of leaves, etc., and the borers in living and dead plants, timber, and grain. The only way these may be controlled is by poisonous gases (bean weevil), by drowning (peach borers, sometimes), burning infested parts (raspberry cane borer), or by digging them out (apple borer), the feasible method depending upon the habit of the species. To the exposed feeders belong caterpillars, grasshoppers, beetles, etc., which are usually controlled by stomach poisons, such as arsenical compounds, especially Paris green used at the rate of a pound in from 100 to 300 gallons of

water, or Bordeaux mixture. (See FUNGICIDE.) Another popular poison is arsenate of lead, which adheres to the foliage better than Paris green and may be applied in larger quantities with less danger of injury. Of the newer insecticides, zinc arsenite and lead chromate are considered valuable. Hellebore is most frequently used upon small plants, especially for the currant worm. Some soft-bodied chewing insects may be controlled in the same way as sucking insects.

Sucking insects, among which are some of the most destructive pests of crops, cannot be controlled by stomach poisons, because they obtain their food from beneath the epidermis of the plant. Because of their small size, insidious habits, enormous prolificacy, and capability of withstanding treatment, they are among the most dreaded crop pests. Some (e.g., the squash bug) have never been effectually and economically controlled by any method yet devised. In general the most feasible controls are such as either obstruct the respiratory passages of the insects (tobacco, insect powder, oils, etc.) or have a caustic action through penetrating their spiracles, or breathing pores, dissolving the fats and paralyzing the nerve centres (lime-sulphur mixture, miscible oils, oil emulsions, whale-oil soap, etc.). Substances used for this purpose are known as contact insecticides. Since kerosene can rarely be applied with safety to growing plants, it is emulsified by mixing and churning violently 2 gallons of kerosene with a solution of 8 ounces of hard soap in 1 gallon of hot water, and diluted when needed for use with from 5 to 10 times as much water. Experiments have been made with pumps that mix kerosene and water in definite proportions as they are drawn from two respective tanks by the one piston stroke. Miscible oils and lime-sulphur mixture have come upon the market in recent years and are being used quite extensively. Whale-oil soap is applied as a solution of 1 pound in 1 to 10 gallons of water. Certain insects, notably the San José scale, a serious pest of woody plants, and the chinch bug, an equally troublesome pest of cereals, have been experimented upon in a unique way; fungus parasites were spread among them, in the first case by means of infected water sprayed upon them; in the latter by infected insects. The results have not been particularly satisfactory in either case. Not so in the case of the cottony cushion scale, a pest on citrus trees in California. A ladybird beetle, imported from Australia, in a few years extirpated the pest. This is perhaps the most notable instance of man's utilizing a natural control and making it an insecticide in the narrow sense. See LADY-BIRD. Much has also been done with insect parasites, notably in the case of the gypsy and brown-tail moths and sugar-cane fulgorid.

Certain species of insects (clothes moths and granary insects) may be best destroyed by suffocation in the fumes of carbon disulphide evaporated in shallow dishes placed at the top of the air-tight receptacle containing the material to be fumigated. An ounce to 50 or 75 cubic feet is the usual proportion, the box being kept closed for 24 hours or more. Since the fumes of carbon disulphide are very explosive, lights must be kept away. Hydrocyanic-acid gas is also largely used to suffocate insects, especially certain greenhouse, nursery stock, and citrus pests, particularly scale insects and the

so-called white flies, or aleyrodids. The gas is generated from potassium or sodium cyanide (98-99 per cent pure) in a mixture of sulphuric acid and water, the proportions being 1 ounce cyanide of potassium, $2\frac{1}{4}$ ounces water, $1\frac{1}{2}$ ounces sulphuric acid for each 100 cubic feet for nursery stock operated upon; 125 cubic feet for trees, granaries, flour mills, and rooms; and 250 cubic feet for greenhouses. The usual exposures are from half an hour to an hour for plants and trees, according to whether they are growing or dormant, and 12 to 24 hours for rooms, etc. Since both the gas and the salt from which it is made are virulent poisons, no person who is not both careful and competent should employ them.

The insects that attack domestic animals and man, though individually serious pests, form a numerically insignificant group when compared to the great group of plant-feeding species. Hogs and sheep may be freed from lice by greasy mixtures and tobacco or carbolic washes; infested horses and cattle should be thoroughly curried once a week until the animals are free, the brush being dipped frequently in kerosene emulsion diluted with five or six parts of water. Similar remedies apply to the related parasites of the human subject, vaseline or lard being substituted for the kerosene emulsion. For the body louse and the crab louse hard boiling of infested clothes for half an hour or longer is essential, since the eggs are very resistant. Poultry may be kept free from lice by a liberal supply of fine dust, and their houses by fumigation with carbon disulphide or hydrocyanic-acid gas and the frequent application of kerosene and whitewash. Carbolic soap is a standard insecticide against fleas in pet animals. With animals of all kinds, however, cleanliness is a great safeguard, since the insects which arrive first are destroyed before they have a chance to breed.

INSECTIVORA (Neo-Lat. nom. pl., from Lat. *insectum*, insect + *vorare*, to devour). An order of placental mammals, containing about 250 species, arranged in two suborders: (1) true Insectivora; (2) Dermoptera. The former includes the hedgehogs, tenrecs, moles, and mole-like animals, elephant shrews, true shrews, and the like, and the latter the "flying lemur" (*Galeopithecus*). None of the Insectivora are of large size; most of them are small timid creatures, generally nocturnal in their habits, and useful in the economy of nature chiefly in preventing the undue increase of worm and insect pests. Although many of them are not exclusively insectivorous, all of them have the summits of the molar teeth beset with small conical tubercles, well adapted for breaking up the hard coverings of insect prey. Their dentition is characterized by a distinct tendency towards suppression of the milk dentition, but otherwise is variable. The legs are short, and the feet of most of them are plantigrade. The cerebrum is small and smooth and does not cover the cere-

bellum. The order is regarded as one of the inferior and among the most ancient of the mammalian groups; and, with the exception of a single genus (*Solenodon*, of Cuba), they are now confined to the Northern Hemisphere and to South Africa and Madagascar, i.e., to Artogæa. An excellent review of the order is Dobson, *A Monograph of the Insectivora* (London, 1886-90). Also consult W. D. Matthew, in *Memoirs of American Museum of Natural History*, vol. ix (New York, 1909).

INSECTIVOROUS PLANTS. Plants that catch and digest insects as part of their food. See CARNIVOROUS PLANTS.

INSECT POWDER, PYRETHRUM, BUHACH, DALMATIAN or PERSIAN INSECT POWDER. A brownish-yellow powder obtained by grinding the dried flower-heads of two species of *Chrysanthemum* (*Pyrethrum*), a genus of plants of the natural order Compositæ. The species employed are *Chrysanthemum coccineum*, popularly known as *Pyrethrum roseum*, and often grown as an ornamental summer-bedding plant, and *Chrysanthemum cinerariæfolium*, also called *Pyrethrum cinerariæfolium*. From the flowers of the former, a Persian species, is made Dalmatian or Persian insect powder—better known in Europe than in America; from those of the latter, a Caucasian species, extensively cultivated in California, is manufactured the insect powder buhach or pyrethrum, common in the United States. When fresh, the powder made from each species seems to be equally effective; but since the volatile oil upon which their effectiveness depends is lost with age and also by exposure to air and heat, the California product is considered with more favor in America than the imported powder. *Chrysanthemum cinerariæfolium* is preferred in California, because its flowers may be gathered at approximately one time, whereas *Chrysanthemum coccineum* has an extended period of bloom. The volatile oil acts upon insects by asphyxiation; upon man and other animals it has no serious effect; workmen in the pyrethrum mills suffer no more inconvenience than millers do from the dust in flour mills. The plants are fed to horses and other stock after the flowers have been gathered. In California, where some large farms are devoted wholly to this plant, the industry commenced in 1870, and three years later the small product was sold at \$16 a pound. In 1885 the price had fallen to \$0.45 a pound and has never since risen to unreasonable figures. The seed is sown about half an inch deep in light soil during autumn or spring, and the young plants transplanted when a few inches tall to the field, 2 feet by 4 feet apart, given irrigation each month during the dry season, cultivated by horse, and kept free of weeds by hand. A partial crop may be obtained the first year after planting, but the crop of the third year is usually the largest. Generally the plants continue to bear profitably for six years. The flowers are combed from their stems by hand during May and June, sundried, and ground between burr stones similar to those of old-fashioned flour mills, and after bolting packed in air-tight tin cans. Insect powder is usually employed in household use as dust. When flies, mosquitoes, and other insects are numerous and troublesome, it is often heated in closed rooms and the stupefied creatures swept up and destroyed before they recover. It is similarly used in greenhouses. Frequently also it is applied as a solution in

water (1 ounce to 2 or 3 gallons) or in alcohol (1 ounce to 4 ounces by weight). The former is applied as mixed; the latter, after daily shaking for a week or more, is filtered and the clear liquid applied with an atomizer. This decoction, if applied to plants, should be diluted somewhat. Pyrethrum is also sometimes mixed with kerosene emulsion or other insecticides. See INSECTICIDE.

INSECTS, FOSSIL. Of all animals the insects, with their aërial habits of life, would seem at first thought to be the least liable to entombment and preservation in a fossil state. They are, however, found in great abundance in several localities where the nature of the deposition was particularly favorable to their fossilization. These deposits are nearly all of fresh-water (lacustrine or marsh) or of estuarine origin, though some few are purely marine. As a rule, the embedding materials are finely grained shales or limestone concretions in shales, or fossil gums and amber; the amber has furnished by far the most perfect fossil insects known. The shale beds of the Oligocene Tertiary at Florissant, Colo., are also noted for the abundance and perfection of their insect contents. Other noted repositories of fossil insects are the Carboniferous coal-measure beds of Comentry, France, described by Brongniart; the Liassic beds of Schambelen, Switzerland, of Dobbertin, Germany, and of Gloucestershire, England; and the Jurassic lithographic limestone of Bavaria. The Tertiary localities, from which great numbers of insect remains have been derived, are the Baltic provinces of Germany and Russia, where they occur in amber; the shales of Aix, France, Florissant and the White River District of Colorado, and Oening, Radoboj, and Parshberg. The wings seem to be preserved as fossils far more often than other parts of the insect body, and in many formations these are the only parts found.

The known fossil insects do not present any great points of difference from those now living. Those found in the Mesozoic and Tertiary rocks can be readily placed in modern families; but all Paleozoic insects show a certain general resemblance, with here and there points of relationship to the orders of modern insects. These orders did not become fully differentiated until Triassic time, although ancestral forms are easily distinguishable among the earlier members of the class. The Paleozoic insects have on this account been grouped under the name of Paleodictyoptera, a synthetic group, and have been distributed, according to their resemblances to modern forms, among several orders—the Orthopteroidea, Neuropteroidea, Hemipteroidea, etc., which are directly ancestral to the Post-Paleozoic and modern orders of Orthoptera, Neuroptera, Hemiptera, etc. The Paleozoic insects are of more primitive type, as illustrated chiefly in the wing structure, than are the Mesozoic insects. As a rule, their front wings are membranous—i.e., they had not yet evolved hardened front wings, such as the elytra and tegmina, that serve as protective coverings for the more delicate hind wings of modern insects. Some of the early insects were of gigantic size, compared with their living descendants—*Meganeura*, an ancestral dragon fly found in the Carboniferous of Comentry, France, had a body 16.5 inches long, and its wings spread over 28.5 inches. Another point of interest is that the Paleozoic insect fauna was made up almost entirely of cock-

roaches. These must have swarmed in the woods and swamps of the Carboniferous and Triassic periods, for their remains are found in abundance in the shales and sandstones associated with the coal deposits of those ages.

The earliest insect remains are of a very fragmentary nature. A fossil from the Ordovician rocks of Sweden has been supposed to be a wing of an ancestor (*Protocimex*) of the bedbugs, but this is doubtful. Cockroaches probably appeared in the Silurian, and they were the predominating types in the Devonian and Carboniferous. The Carboniferous fauna consists principally of Orthoptera and Neuroptera, and of forms intermediate between these two orders, and also of extinct types intermediate between the Orthoptera and the Hemiptera, and it is interesting because of its large number of generalized or synthetic types. In the Triassic the beetles appear suddenly with their characteristic hardened front wings fully developed. This difference in the character of the front and hind wings is fully marked for the first time in all Triassic insects, and it has become more strongly marked since that period. In the Liassic epoch of the Jurassic period insects were abundant, as might be expected from the general extension of terrestrial conditions during that period. Beetles abound, and as they represent many families still living, they have been used to determine the conditions of life and climate during that period. Leaf and fungus eating beetles and dung beetles are known. The earliest ants; the first well-marked bugs, allies of the squash bug; the first flies, bees, and perhaps also the earliest moths, are found in this epoch. The Cretaceous insect fauna is small, but that of the succeeding Tertiary, beginning with the Eocene, is almost as well differentiated as that of the present day, for many of the genera are still members of the living insect fauna. In all about 3000 species of fossil insects are known, and these are distributed among the geological eras as follows: about 10 per cent are Paleozoic, 15 per cent Mesozoic, and 75 per cent have been described from the Tertiary formations.

INSECTS, PROPAGATION OF DISEASE BY.

Careful observation and patient investigation have resulted in establishing the fact that the transmission of disease, in many instances hitherto unexplained, has been due to the agency of insects. The most momentous medical discovery during the year 1899 was that of the cause of malaria in human beings. There are several scientists to whom credit is due in the matter; but the lion's share of it belongs to Patrick Manson, of Dublin, and Major Ross, a surgeon in the British army, stationed at Calcutta. During several years of laborious work they forged the links that completed the discovery. As long ago as 1807 Crawford, an American physician, suggested the possibility of the transmission of malaria to man by the mosquito. Again, in 1848, Nott, of New Orleans, referred to the part played by insects in propagating malarial fever. In 1883 A. F. A. King (q.v.), of Washington, D. C., reiterated the theory at some length. Laveran (q.v.), who in 1880 discovered the *plasmodium malariae*, or *hæmosporidium*, the parasite of the disease, declared in 1891 his adherence to the mosquito theory, as did also Flügge in the same year. In 1892 Pfeiffer showed that certain protozoa, called *coccidia*, which are found as parasites in the rabbit, are capable of two cycles of development, one being exogenous. He mentioned that Koch (q.v.) had suggested that a similar condition might hold good for the parasite of malaria, and that exogenous malarial spores might be conveyed to man by the agency of blood-sucking insects. In 1894 Manson, of Dublin, appeared as a vigorous supporter of the mosquito theory as best calculated to explain the various conditions of the problem. He drew a parallel between the malarial parasite and the *filaria bancrofti*, which he had investigated very thoroughly. He suggested that the female mosquito fills herself with infected blood, deposits her eggs, and dies beside them. The water in which she lies becomes contaminated with the spores developing in her body and is then drunk by men, or the spores are inhaled with dust from dried puddles, or the larvæ after being hatched feed on the dead body of the mother and thus become carriers of infection, or the ground may become infected by the bodies of mosquitoes that die and fall upon it. Ross's work in his studies of malarial organisms in birds' blood is really monumental. He discovered that after a special variety of gray mosquito had fed on the blood of birds containing a certain mature organism called *proteosoma*, the stomach wall of the insect always contained certain pigmented *coccidia* two days later. After other changes had occurred on the eighth or ninth day, the *coccidia* ruptured and set free innumerable threadlike bodies which are distributed by the blood current of the mosquito through her tissues. Eventually these bodies are found in certain glands in the thorax of the insect, whose ducts open at such a point as to furnish secretion that lubricates the lancets of the mosquito. When she punctures the skin of her victim, this secretion, containing the threadlike bodies, is injected into the bottom of the wound. Manson and his pupil, Daniels, proved that these threadlike bodies, or germinal spores, develop into mature proteosomata in a bird bitten by the infected mosquito, thus completing the cycle. While Manson was conducting his experiments, Grassi, the distinguished Milanese, was completing his studies on the mosquitoes of Italy.

In 1898 he determined that *Anopheles claviger* was the variety that carried malarial infection. A man who had never been subjected to malarial infection was exposed to the bites of the mosquito *Anopheles claviger* and in a short time began to suffer from malarial fever. Quinine cured him of the attack. The Italian scientists Bignami, Bastianelli, and Grassi, working in conjunction, arrived at the conclusion that the malarial hemisporidia (which consist of small reproductive cells produced within a cyst) run through a cycle in man which is characterized by a long amoeboid stage and an absence of the encapsulated phase, reproducing themselves a great number of times during the completion of this cycle, and also giving rise to forms which remain sterile in man, known as Grassi's gametes. These latter forms, taken into the stomach of the *Anopheles* with the blood she draws from an infected man, develop into sporozoa, and these in turn form sporozoites, delicate filaments which find their way to the salivary glands of the *Anopheles*. The saliva anointing the lancet of the *Anopheles* carries the infection to the next victim bitten. In East and Central Africa experiments were made by Daniels which led him to believe that *Anopheles funestus* (Giles) is the chief agent in distributing malaria in that country, and that man is the only intermediate host of the malarial parasites.

A practical confirmation of the mosquito theory resulted from the labors of Low, Celli, Grassi, and the Red Cross of Italy, which demonstrated in 1901 that the use of the mosquito net and the draining of stagnant pools prevented malaria in individuals living in notoriously malarious countries. Covering the surface of stagnant water with a pellicle of crude petroleum suffices in many instances to kill the larvæ of the mosquito, and decrease of malaria follows. A solution of permanganate of potash, 1 to 1500, was found to be as effective, though not as cheap, as petroleum. It has been ascertained that goldfish may be used as the agent for the destruction of the larvæ of mosquitoes, as they eat them eagerly. Ducks are said to be even more efficient destroyers.

Extensive and important studies in New Jersey established the facts that the most abundant species of mosquitoes in that State, *Culex sollicitans*, breeds not only in brackish and salt water, but also in water that is 25 per cent more salty than ordinary sea water; that it does not breed in fresh water at all; that adult mosquitoes may be found in great abundance from 20 to 40 miles from their breeding places; and that mosquitoes occur from 5 to 15 miles off shore, over the open ocean, at points to which they have been carried by the wind. *Culex pungens*, next in abundance to *Culex sollicitans*, was found breeding in every place where water is not salt. The breeding time for these mosquitoes is late in the fall, and the adults hibernate.

The mosquito is also accepted as the means of transmission in the case of yellow fever. This theory was first advanced by Dr. Carlos Finlay, of Havana, in 1881. Reed, Carroll, Agramonte, and Lazear, who formed the commission appointed in 1900 by the surgeon-general of the United States army to investigate yellow fever in Cuba, proved that the mosquito serves as the intermediate host for the parasite of yellow fever, and that the disease is propa-

gated only through the bite of this insect. *Stegomyia fasciata* is the mosquito that acts as host for yellow fever. The mosquito has a part also in the dissemination of leprosy. Kaposi has instanced a case of this disease, easily traceable to a mosquito bite. The experiments of Alvarez, as quoted by Carmichael, support this theory of mosquito transmission in leprosy. It is admitted without reserve that filariasis is transmitted by mosquitoes. Corroborative experiments and studies in the development of *filaria nocturna* were made by Low, of Rome, Italy, in 1901. He found active filaria embryos in the thoracic muscles of *Culex territatus* between 12 and 24 hours after this mosquito had fed on a patient suffering from filariasis. In *Culex fasciatus* he found perfected filariæ in the head, neck, and proboscis. Elephantiasis has been transmitted by the mosquito. Its parasite was found in their bodies by the investigations of the Liverpool School of Tropical Medicine in Nigeria, Africa, in 1900.

The fly is properly charged with the transmission of many diseases. Nuttall fed the bacillus of the bubonic plague to flies and ascertained that they could convey the infection. Carmichael believes that leprosy is communicated by the same insect. The bacilli of anthrax (malignant pustule) have been found in flies. Grassi, of Milan, and, much later, Beale, of Calcutta, demonstrated that cholera was a fly-borne disease, and the germs of typhoid fever are carried by the same insect which swarms over faecal evacuations. Hervieux, of France, ascribed the spread of smallpox to flies. Simond's investigations, carried on during 1899, together with the results obtained by Yersin, favor the theory of the spread of plague from rat to man by the flea. Bæck charges the itch mite (q.v.) with being an active agent in the spread of leprosy. Smith and Kilbourne established the fact that the tick propagates Texas fever among sheep.

Kobler's experiments led him to accuse the ant of carrying the infection of bubonic plague to man. From a sheep that died of anthrax in Cyprus in 1901, ants transmitted the fatal disease to a woman in a cottage near by. Roaches are believed to carry typhoid fever in the same way as do flies. The bedbug is responsible for the spread of leprosy (Carmichael), cancer (Moran), tuberculosis (Denevre), and relapsing fever (Titkin). Bubonic plague (q.v.) is carried by the rat flea, and sleeping sickness (q.v.) by two species of the tsetse fly (*Glossina palpalis* and *G. morsitans*). Dutton has proved that the house flea (*Pulex irritans*), the bedbug, the American cockroach (*Periplaneta americana*), and fruit fly may and often do transfer typhoid fever and other diseases. Typhus fever (q.v.) is now believed to be carried by the louse.

Insects, it is seen, propagate diseases in two ways: (1) as carriers, bringing infection to a wound or to food and drink on the surface of their bodies, after crawling over an infected spot, or bringing the infection in the form of bacilli in their intestinal tracts; (2) as intermediary hosts, bringing to the victim the infection in the fluids of their bodies and inflicting wounds through which the poison is introduced into the body of the victim. The mosquito is a true intermediary host. Flies are examples of carriers. Coplin, of Philadelphia, experimenting in the line of the researches of Sangres, caused roaches, flies, and bedbugs to walk over

cultures of various disease germs and then to walk over sterile agar plates, many hours later, having been kept in the meantime in large jars, under as natural conditions as possible. Examinations of the agar plates made subsequently showed active cultures of the various bacilli of infection. The feet, the ventral portion of the body, and the wings of insects carry infection and plant the disease organisms in rows and small colonies throughout the surface of the sterile plates. Forty-eight hours of continuous infectivity was shown in the case of many disease germs thus transmitted. In one case the typhoid bacilli carried on the body of a roach retained their virulence for 96 hours.

But one germicide has proved of avail in disinfecting bacteria-laden material, and this is formaldehyde. The great difficulty in rendering harmless the insect carrier of disease is easily appreciated, and the only effective way of dealing with such carriers is to destroy them, their hosts, and breeding places.

INSIDIOUS FLOWER BUG. A minute heteropterous insect (*Triphleps insidiosus*) common in the United States. It belongs to the family Anthocoridae, closely related to the bed-bug family (Cimicidae), is black with yellow-tipped wings, and is often found in flowers. It is predatory in its habits, feeding upon other insects, is a voracious foe of plant lice, lace bugs, and other minute creatures, and an important enemy of the grapevine phylloxera.

INSIGNIA, MILITARY. See MILITARY IN-SIGNIA.

IN'SOLA'TION. See HEAT STROKE.

INSOLVENCY (from *insolvent*, from *in-*, not + *solvent*, from Lat. *solvere*, to solve, relax, from *se-*, apart + *luere*, Gk. *λύειν*, *lyein*, to loose). As a legal term, the legal status (1) of any one who cannot pay his debts as they mature; or (2) of one who has been brought within the jurisdiction of the insolvency laws. The earliest insolvency statute in England is c. 20 of 22 and 23 Car. II, passed in 1670. Its preamble recites: "Forasmuch as very many persons now detained in prison, are miserably impoverished, either by reason of the late unhappy time, the sad and dreadful fire, their own misfortunes, or otherwise, so as they are totally disabled to give any satisfaction to their creditors, and so become, without advantage to any,

a charge and burden to the kingdom, and by noisomeness (inseparably incident to extreme poverty) may become the occasion of pestilence and contagious diseases, to the great prejudice of the kingdom." It is apparent from this preamble that the cruel fiction that a person who failed to pay a judgment debt was guilty of a breach of the peace, and the inhuman practice, resulting therefrom, of arresting and imprisoning the debtor, had worked badly and threatened to produce a pestilence. Hence parliamentary interference, making provision for debtors' securing release from "durance vile," upon surrendering any remnant of property they might have and making an oath to their poverty and their honesty. This was the beginning of remedial legislation, which within the last century has resulted in abolishing imprisonment for honestly contracted debts.

From 1670 to 1861 insolvency statutes, insolvency proceedings, and insolvency courts were entirely distinct from *bankruptcy* (q.v.) statutes, proceedings, and courts. The leading features of English bankruptcy laws were: (1) that they applied to traders only; (2) that proceedings under them were instituted by creditors for the compulsory distribution of the debtor's assets; (3) that such proceedings resulted in the discharge of the honest bankrupt from his debts. On the other hand, insolvency statutes (1) applied to all debtors; (2) proceedings under them were voluntary, i.e., were instituted by the debtor; (3) they might result in discharging the insolvent from jail, but they left his future acquisitions liable for old debts.

In 1861 the bankruptcy statutes were extended to include nontraders, and insolvency proceedings were abolished. Since that date insolvency, as distinguished from bankruptcy, means that a man has ceased or is unable to pay his debts as they come due. In the United States the sharp distinction between the two terms which existed in England until 1861 has never been sanctioned by either legislative or judicial usage. Speaking in general terms, we may say that the term "bankruptcy" has been restricted to proceedings had under the several bankruptcy acts passed by Congress and to the status of the debtor who took advantage of those acts, while the term "insolvency" describes the condition of a person who is unable to pay his debts or one who has come under the operation of the State statutes relating to such persons. A third use of the term "insolvent" to describe one whose entire estate taken together is not sufficient to discharge his indebtedness appears in the present United States Bankruptcy Act.

Even prior to the Revolution the Colonies were accustomed to legislate for the relief of debtors; but their statutes, although providing at times for the discharge of the insolvent from all his debts, after the manner of bankruptcy statutes in the mother country, were called insolvency statutes. After the adoption of the Federal Constitution, with its grant of power to Congress to establish uniform laws on the subject of bankruptcies, it was natural that the Colonial nomenclature should be retained by the States, even when adopting comprehensive bankruptcy statutes, such as have existed for many years in a number of the States. These laws were not abolished by the Federal Statute of 1898; but their operation, so far as it conflicts with that of the Federal law, is suspended.

State statutes relating to insolvency have

been very divergent and from some points of view very unsatisfactory. They may be divided roughly into five classes, although in some States statutes falling within two or more of these classes will be found: (1) simple insolvency laws; (2) statutes regulating general assignments for the benefit of creditors; (3) those providing for the distribution of the estates of insolvents for their discharge from debts, in voluntary proceedings only; (4) those providing for discharge from debts under general assignments; (5) true bankruptcy statutes, applying to all debtors and providing for voluntary and involuntary proceedings. As the States are prohibited from passing any law impairing the obligation of contracts, and as, therefore, State legislation cannot operate to discharge a debtor from liabilities to creditors outside the State, without their consent, such legislation can never perform the functions of a Federal bankruptcy law. Consult: J. L. Bishop, *Treatise on the Law Relating to Insolvent Debtors* (New York, 1895); E. C. Brandenburg, *Law of Bankruptcy* (3d ed., Chicago, 1903); S. W. Jones, *Treatise on Law of Insolvent and Failing Corporations* (Kansas City, 1908). See BANKRUPTCY; DEBTOR.

INSOMNIA (Lat., sleeplessness), or SLEEPLESSNESS. A condition caused by cerebral excitation, mental or physical exhaustion, toxic conditions (as from alcohol or from disordered digestion), grief, etc. It frequently accompanies febrile conditions. It is best treated by attacking and removing the cause, if this can be ascertained. Hygienic measures, as hot baths, massage, ingesting hot food, applying heat to the extremities, ventilating the sleeping apartment, etc., should be tried before resorting to drugs to overcome the condition. See HYPNOTICS; SLEEP.

INSPECTION (Lat. *inspectio*, from *inspicere*, to look in, from *in*, in + *specere*, to look; connected with Gk. *σκέπτεσθαι*, *skeptesthai*, Skt. *spás*, *pas*, to look, OHG. *spchōn*, Ger. *spähen*, to spy). Military inspections in the United States army include every branch of military affairs. They may be divided into six general classes: 1. The *ceremony of inspection*, or simply "inspection," by which is meant the formal assembling of troops as prescribed in the drill regulations of the arm of the service to be inspected. Such inspections include a detailed examination of the arms, equipments, animals, and of the general appearance of the individuals and units composing the command. These inspections are usually made weekly and monthly by commanding officers of organizations and at irregular intervals, usually yearly, by officers of the inspector general's department. 2. *Annual tactical inspections* are made by brigade and division commanders, assisted by inspectors general of the arm to be inspected whenever practicable. Such inspections are made under field conditions and have for their object the determination of the preparedness of organizations for war service and the capacity of officers for the exercise, in the field, of command appropriate to their rank. Subjects included are camping, sanitation, marching capacity, cooking, the supply service, field fortification, firing problems, and field orders issued in the solution of a tactical problem simulating war. 3. *Annual garrison inspections* are conducted by officers of the inspector general's department during the period of garrison training, to determine the

state of discipline and efficiency attained in garrison training and administration. This inspection includes an investigation of the money accounts of all disbursing officers. 4. *Special inspections* are made by inspectors general, of soldiers' homes, armories, arsenals, military academy and other service schools, depots, general hospitals, recruiting stations, prisons, cemeteries, money accounts of the War Department, army transports, etc. 5. *Militia inspections* of the organized militia are made by regular officers detailed for that duty by the department commander. 6. *Inspections of military civilian schools and colleges* at which a regular officer is on duty are made by selected officers of the general staff of the army.

INSPECTOR GENERAL. A military officer charged with the duties and responsibilities of inspection. In the United States army the title is officially applied to *all* the officers of the inspector general's department, no matter what their grade. The organization in 1914 included the inspector general of the army, with the rank of brigadier general, three inspectors general with the rank of colonel, four with the rank of lieutenant colonel, and nine with the rank of major. In addition to these there were four acting inspectors general of the following rank: one colonel, one lieutenant colonel, and two majors. Total, 21 inspectors general, including the inspector general of the army. All but three of the officers mentioned are detailed from the line of the army for a period of four years. Upon the retirement of the three permanent officers the entire department will be composed of detailed line officers. Normally inspections are made by officers of the arm of the service being inspected. Officers of this department are responsible for the proper inspection of troops, including their strength, efficiency, and equipment; stations; accounts of disbursing officers; irregularities or misconduct of officers; attempts to defraud the government; all matters pertaining to the supervision of the accounts of receipts and expenditures in connection with the National Home for Disabled Volunteer Soldiers; all depots, armories, arsenals, and public works of every kind under charge of officers of the army, except works of engineering conducted under the direction of the Secretary of War, and supervision of the chief of engineers. Inspections of engineering works cover the business and military administration and methods and do not include the scientific or technical character of the work. Inspectors general and acting inspectors general are required, in addition to the above duties, to make such suggestions as may appear to them practicable for the correction of any defect that may come under their observation in any command to which they may be assigned. When assigned to a military command, an inspector general is under the immediate direction of its commanding general; when not so assigned, he is under the orders of the War Department. They are also expected to designate from time to time the articles which in their opinion should be procured and kept for sale by the quartermaster corps to officers and enlisted men. The annual inspection of the Soldiers' Home in the District of Columbia is made by the inspector general of the army in person. In the English army there are an inspector general of the home forces and an inspector general of the oversea forces. The former officer

has under him an inspector of cavalry, of horse and field artillery, of garrison artillery, of engineers, and of infantry. He has also under him general officers commanding territorial districts, and other commands, who personally or through the officers of their staff inspect the component parts of their commands. In Germany, France, and continental Europe generally, the duties of the inspector general's department are carried out by the general staff of the army or of a territorial district. For further particulars, see ARMY ORGANIZATION; INSPECTION.

INSPECTORSHIP DEED. In English law, a deed executed between an insolvent person and his creditors, whereby they accept a part payment and allow the insolvent debtor to carry on the business under their supervision with a view to further payments. It derives its name from the fact that certain of the creditors named in the deed, as inspectors, assume the duty of supervising and controlling the subsequent management of the business by the debtor. The practice is not common in the United States. See INSOLVENCY.

IN'SPIRA'TION (Lat. *inspiratio*, from *inspirare*, to inspire, from *in*, in + *spirare*, to breathe). A theological term used to denote the divine action upon men by which the Bible has been produced. In its most general use it designates the whole of this process; but often a distinction is made between revelation and inspiration, according to which *revelation* denotes that divine activity by which the knowledge of the truth is supernaturally conveyed to the minds of chosen men, and *inspiration* that divine guidance by which the same men were qualified to write the existing Bible. Employed in the latter sense, the inspiration of the Scriptures signifies a special divine authority in the books of Scripture as depositories of religious truth. Properly inspiration (breathing in) is a personal term and applies to the influence of one person upon another. Divine inspiration, the influence of God upon man, is a term of far wider application than merely to the writers of the Bible. Its use in regard to a book, like the Bible, is secondary. It means that the writers were so divinely guided that they wrote words of special religious significance. The doctrine is not limited to the biblical religions. Brahmanism believed in the inspiration of the Vedas; Zoroastrianism, of the Avesta; and Mohammedanism, of the Koran—the last holding a more extreme theory than any church has ever propounded regarding the Bible.

The beginning of biblical inspiration was in the feeling of the prophets that God was speaking through them. From the writings of the prophets the conception extended to other books sacred for any reason—to the Psalms, used in worship, and at last to the religious histories of the nation and books of religious wisdom. Before the rise of Christianity the method of inspiration was already conceived in a mechanical way, as though man were only the passive recipient of a supernatural message from God. Christianity inherited its idea from Judaism. Tertullian and Athenagoras speak of the prophets as being lutes or lyres under the hand of God. The idea that inspiration preserved the Scriptures from all error is found in Augustine; but Chrysostom, Jerome, Theodore of Mopsuestia, and others recognize human elements in Scripture. Even in the time of the Reformation there was little discussion of this

subject. In the writings of Calvin and Luther passages representing contradictory views can be found; but while both held to the fact of inspiration, Calvin recognized, and Luther emphasized, the human elements in the Bible. Neither held that inspiration involved perfect historical accuracy; nor has any Catholic or Protestant creed, except the Second Helvetic (see CREEDS AND CONFESSIONS), so affirmed. Various theories have been held by individual theologians.

1. The theory of *plenary* or *verbal* inspiration is that the whole letter of Scripture is inspired, that the words were immediately dictated by the Holy Spirit and are literally the words of God and not of man. The several writers of Scripture were nothing more than the penmen of the Divine Spirit. The inspired document is throughout faultless, equally in its form and in its essence, in its spirit and its letter. It admits of no gradation; all is equally divine, and therefore equally accurate, whether it relate to some ordinary fact or to some truth of the supernatural life. Those who hold this view do so on the a priori ground of necessity; such infallibility is held to be implied in the very idea of a revelation of the divine will; while those passages which seem inconsistent with the facts of science or of history, or with other parts of the Bible itself, admit, it is maintained, of satisfactory explanation. It is objected to this theory that it does not take account of the facts of the Bible, which show no such perfection; and that it would need to add an infallible interpretation, to insure the perfect knowledge of truth.

2. The theory of *dynamic* inspiration is that the writers of the Bible were so filled with the divine power that, while perfectly free in the employment of all their faculties, they were preserved from all error in conveying the truth which the Bible was written to convey, viz., that pertaining to the way of salvation. This theory has numerous forms, and any statement of it would fail to satisfy many who adopt its general conception of inspiration. Its most important form may be summarized in the definition, the inworking power of God preserved the writers of the Bible from all error in matters of faith and morals, but not necessarily from all error in matters of history and science. This theory attempts to meet the facts of the biblical narratives, as seen by modern biblical study. It is found that the Gospels in their accounts of the same event differ in various points. Not only is there an entire ignoring of scientific facts, but often statements which are inconsistent with them. The use of the Old Testament in the New is inaccurate and often violates principles of exegesis which modern scholars would feel compelled to observe. None of these errors, however, affect the main current of the biblical doctrine. They show that men wrote the Bible acting naturally as men act and under human limitations, but they do not impair the value of the Bible for its great purpose of bringing men into harmony with God.

3. A third theory is that of the school of Ritschl. It may be said to deny inspiration as a separate operation and lay all the emphasis upon revelation. We must maintain the supernatural communication of divine knowledge to men, it is said; but after they have this knowledge, they are left to communicate it according to their natural abilities, and the books they write are committed to the stream of history

to be borne where the providence of God may guide them, as all other books are. Thus, the human element in the books is large, and no infallibility of any sort, even in matters of faith and morals, is to be affirmed; but the truth of God is there as in no other book in the world. The evidence for the element of revelation in the Scriptures lies in the fact that the highest ideas which the mind of man has conceived have come from the Bible alone.

4. Another theory is based upon the facts of evolution as seen in history. It dispenses with not only inspiration but even special revelation. The causes operating in religion are, like all the causes recognized by evolution, immanent. It is not the supernatural enlightenment of chosen minds which we find here, but that enlightenment which comes in the course of all development under the operation of the laws of variation and the operation of environment, and which has given us the steam engine and other instruments of progressive civilization. In this human progress lies the real divine revelation. Thus, the Bible is a purely human book, but it is the greatest of all human books and should retain its place at the foundation of our religious structure.

INSPIRED TINKER, THE. A name sometimes applied to John Bunyan.

IN'STALLA'TION (Lat. *installatio*, from *installare*, to install, from *in*, in + *stallum*, place, from OHG. *stal*, Ger. *Stall*, AS. *steall*, Eng. *stall*; connected with Gk. *στέλλειν*, *stellen*, to send, and ultimately with Lat. *stare*, Gk. *ιστάναι*, *histanai*, Skt. *sthā*, OHG. *stēn*, Ger. *stehen*, to stand). In the Anglican church, the ceremonial act or process by which a person presented and legally confirmed in a benefice is formally put into possession of his office, and by which he is fully empowered not only to exercise its functions, but to enjoy its honors and emoluments. The ceremonial form, as well as the name, differs according to the office which is conferred, as "enthronization" for a bishop, "induction" for a rector, etc. "Installation" properly regards the office of a canon or prebendary. (See **INDUCTION**.) In the nonepiscopal churches installation is used for the ceremony by which a pastor elect is formally placed in his office.

IN'STANCE, COURT OF. The branch of the English Court of Admiralty which exercised all the jurisdiction of that court in matters triable under the ordinary or municipal law (q.v.). This included all classes of cases to which the jurisdiction of Admiralty extended, except "prize" cases, which involved international law, and for the trial of which the court required a special commission authorizing it to act as a prize court. The entire jurisdiction of the Admiralty Court was transferred to the High Court of Justice by the Judicature Act (q.v.) in 1873. The above distinction in the exercise of jurisdiction has never prevailed in the United States. However, the term is still employed in England and the United States to describe the kind of jurisdiction exercised in cases involving exclusively the municipal law. See **ADMIRALTY**; **MARITIME LAW**; **PRIZE COURTS**.

IN'STAURA'TIO MAGNA (Lat., Great Renewing). A great work on the reorganization of the sciences, by Francis Bacon (q.v.). Almost all his philosophical writings actually form part of this vast scheme, or were intended to be included in it.

INSTERBURG, in'stēr-burk. A town of Prussia, in the Province of East Prussia, situated on the left bank of the Angerapp, about 60 miles east of Königsberg (Map: Germany, J 1). It has several old churches with fine wood carving, a castle, a Gymnasium, a museum of antiquities, and a seminary for female teachers. It manufactures linen, machinery, stoves, cement, fertilizers, and shoes. Raising horses is an important industry. Insterburg had its origin in a castle of the Teutonic Knights built in the fourteenth century. Pop., 1900, 27,287; 1910, 31,627.

IN'STINCT (Lat. *instinctus*, impulse, from *instinguere*, to impel, from *in*, in + **stinguere*, to prick; connected with Goth. *stiggan*, AS. *stingan*, to push). "Instinct is one of those historical concepts which has been overgrown by meaning. It is so incrustated with traditional significance that it is almost impossible to use it for the exact descriptive purposes of science" (Yerkes). The greatest source of confusion lies in the use of the term in two distinct disciplines. Instinct is subject matter for both biology and psychology, and the successful synthesis of the meanings derived from the two contexts can hardly be expected. In general, instinct may be said to be the characteristic by virtue of which a living organism acts in accordance with a fixed mode of behavior that is determined prior to the lifetime of the individual. Thus, instinct is simply inherited behavior and is opposed to habits (see **HABIT**), which are acquired during the individual's life and may be based on its experience. Instinctive behavior is the sum total of inherited movements, but instinctive action implies the action consciousness and is a narrower term in that it is restricted to conscious instinctive movements, and a broader term in that it involves the psychological aspect of the action. Psychologically, the term "instinct" can refer only to the action consciousness involved (see **ACTION**).

Instinctive Movements. Biologically considered, any movement of which the form is inherited may be called instinctive. Thus, instinct includes both the unconscious reflex, like the wink or even the heartbeat, and also the more complicated conscious movements, like

nest building in the bird or the behavior expressive of the maternal instinct in the human being. The instinctive character of a movement as inherited may be attested by any one of three marks.

1. Behavior performed in the same general way by all members of the species is instinctive. Thus, we find spiders spinning webs and birds building nests in much the same way for the given species, but with slight differences according to individual or external conditions.

2. Behavior is instinctive which meets a need of an individual who can have had no previous experience of the need or of its mode of satisfaction. The solitary wasp places within the cavity that it has made for its egg a particular kind of prey which subsequently serves as food for the larva, and seals both food and egg in the cavity. Then it leaves, never to return. The experience of the wasp cannot explain its anticipation of the need of the larva for food.

3. Behavior is instinctive which meets a racial need that is of frequent occurrence in the species, though it may not constitute a need for the particular individual. Spiders sometimes steady their webs by suspending a pebble from the centre, and a spider may take this course for the first time when there is no especial need for the additional stress. In the individual case, the instinct may even be at fault and may result in harm. The creature which, surprised by the hunter, remains motionless may not blot itself out against the background, but furnish an easy mark.

In a narrower biological usage, instinct is not defined merely as inherited movements, but is separated from the simpler innate movements—the tropisms, differential sensitivity, and, in the complex organisms, the reflexes. (See ANIMAL PSYCHOLOGY; TROPISM.) The instinct represents a complication of the tropic reactions, while it is further often asserted to involve consciousness. This tendency to shift to a psychological criterion is doubtless responsible, not only for much confusion, but also, to a great extent, for the attempt to limit the concept of instinct. A distinction can, however, be made on purely biological grounds.

1. In the first place, from this point of view, the instinctive movement, unlike the reflex, is that which involves the whole organism. The animal crouches in fear, advances in anger, disports itself in play. The reflex affects a single organ or member of the body.

2. The widespread nature of the reaction assures us that it must be *complicated*. Moreover, the stimulus is complex. As in the emotion (q.v.), the animal reacts to a total situation. The movements expressive of parental love may be aroused by the call of one's own child in distress; the same sounds from a phonograph will not bring out the response.

3. Finally, instinctive behavior is characterized by *variability*. It is subject to inhibition or reënforcement in the same manner as are other determinations, and it thus combines with other determining tendencies, innate and acquired, in the formation of habits. We are told that certain instinctive movements in the chick occur earlier "if imitation be not excluded." If this is true, it is probable that one instinctive tendency is facilitated by another. The instinctive behavior is touched off, not only by its proper stimulus, but also by other like stimuli,

which involve undoubtedly similar nervous excitations. Instinctive behavior is also subject to specialization; it is liable to become "systematically organized about certain objects or ideas," so that a very specific stimulus replaces the more general one. Lastly, the instinctive movements are often transitory, appearing only at a definite period in the lifetime of the individual. Insects in the larval stage exhibit a whole group of instincts which are later replaced by an entirely different set, and in man the instincts of play and of sexual love follow a course of growth and decay in the individual lifetime.

Definite, inherited forms of response, adapted to the needs of the species, appear in all animal forms, and in this sense instinct may be said to be coextensive with animal life. Instinct, as a widespread, complicated, and variable movement, does not clearly occur in the animal scale below the earthworm. The highest development of instinct is found in the very complex behavior of the social insects. (See ANIMAL PSYCHOLOGY; ANT; BEE.) Among the vertebrates instinctive movements are numerous. In chicks, for example, we may note the following: pecking, walking, scratching body, preening down and feathers, stretching up and flapping wings, scratching the earth, squatting down and dusting body, scattering and crouching when alarmed, making the danger "churr." In man the instincts are very numerous, although they are less highly developed than in the insects, or at least less potent because of the greater plasticity of his nervous system. They include, on the one hand, movements which approximate the reflex: coughing, smiling, sneezing, swallowing, beating time to music; in the infant: sucking, biting, creeping, crying. There are, on the other hand, large general tendencies: the tendency which makes us take the world of perception as a world of real things; the empathic tendency, which makes us humanize our surroundings; the tendencies to imitate, to believe, to dichotomize. Certain movement complexes expressive of the emotions (see EXPRESSION, EXPRESSIVE MOVEMENTS) must also be considered instinctive.

The Instinctive Consciousness. Instinctive action implies an action consciousness, and it is to this consciousness that we must look for a psychological description of instinct. The instinctive action is in general like any other action, and its consciousness is of the form of every action consciousness. It is, however, primarily an organic consciousness. The widespread bodily reaction finds its echo in a mass of organic sensation. In this way instinct resembles emotion. It is apt to be highly affectively toned, as is usual with those consciousnesses which anticipate the satisfaction of an organic need. There is, in fact, no sharp psychological line of division between the instinct and the emotion. Fear, love, jealousy, rivalry, curiosity, pugnacity, repulsion, self-abasement, and so on have been called "instincts proper," but the names indicate emotive complexes equally well. If, in order to be psychological, we neglect the innate character of the determining tendency of the instinct, the instinct and the emotion appear in many cases to be practically identical. Both are predetermined consciousnesses, affectively toned and organic, set off by a total situation and following a given course.

The instinctive action, like impulsive action, may change upon repetition, degenerating into a "psychomotor" form or becoming enriched by association. The smile is an example of the former, the maternal instinct of the latter tendency.

A knowledge of the instinctive consciousness gives us a clue to the mental lives of those animals which are principally governed by instinct—the insects. In any given consciousness affective processes probably play initially an important rôle; yet we can hardly say that, in the average, these creatures lead highly emotive lives. For if we invoke the principle of analogy to show that the instinctive consciousness in the insect is, like that in man, similar to the emotive, we must also apply the principle still further and admit affective adaptation. The key to the insect consciousness lies, then, rather in the predominance of organic processes. The insect's experience must be a succession of nicely discriminated, complex, organic patterns, with intermittent flashes of true feeling. The insect, we might say, is "body conscious," where man is "object conscious."

Instinct and Intelligence. There is a popular belief that instinct is the peculiar property of the animal world and that in man it is replaced by reason. The animal acts "on instinct," but man "by reason." The distinction is not valid. We have already seen, on the one hand, how great a part is played by instinct in man; on the other hand, if intelligence (q.v.) is constituted by the individual's ability to profit by his own experience, one cannot deny intelligent behavior even to the lowest animal forms.

An attempt is also made to establish a hierarchy of actions. We are told of three grades of "mentality": the reflex action or tropism, the instinctive act, the act of reason. There seems to be little foundation, however, for the belief that intelligent action is in some way superior to instinctive. The one does not necessarily represent higher development than the other. The social insects are further advanced on the instinctive side than is man, who, conversely, represents a greater evolutionary development with respect to intelligence. Of the insects, Yerkes says: "To compare them directly in their mental life with the human being is difficult, for in some respects they are more remarkable than the two-year-old child, while in others they are hopelessly inferior. With reason one might claim that certain of the insects are psychologically superior to man and represent a stage in the evolution of mind which, although strikingly different, is more advanced than our own. Rather we may conclude that the social insects represent the highest development of mind in one direction; and man, the highest development in another direction." It is not even true that intelligence is necessarily more efficient than instinct. The instinctive response to a strange environment may be no more wasteful, no less well adapted, than the intelligent response to a new situation. Instinct implies fixity of the nervous system; intelligence, plasticity. The plastic system, as it undergoes adjustment, is wasteful to the extent to which it is out of adjustment—an intrinsic wastefulness, but a constantly diminishing one. The fixed response eliminates the waste of adjustment, but is constantly inefficient in the degree that it is unsuited to the particular environment.

Some writers believe that in every act instinct and intelligence are present as concurrent factors, separable only by abstraction. For Morgan instinctive behavior is "congenitally determined" and "practically serviceable on the occasion of its first performance." It is not, however, perfect, and is subject to modification by intelligence. Intelligence, he argues, is distinct from instinct with regard to meaning, for the instinctive process in its first occurrence possesses "primary meaning," inherent in its mere succession. In the repetition of a process, on the other hand, there is an anticipation or "preperception" of phases, unrealized as yet, by a revival of the first occurrence—an anticipation which supplies "secondary meaning" and characterizes the behavior as intelligent. A vaguely, conscious "preperception" may accompany the first occurrence of the performance; instinct and intelligence may thus occur together from the very first. Myers insists, on the contrary, that instinct and intelligence are merely different aspects of the single entity, "instinct intelligence." Instinct is characterized by mechanism, intelligence by finalism. "Instinct regarded from within becomes intelligence; intelligence regarded from without becomes instinct."

INSTITUTE (Lat. *institutum*, regulation, ordinance, from *institucere*, to set up, from *in*, in + *statuere*, to establish, from *stare*, to stand). In the land law of Scotland, the person who is designated in the instrument creating an entail (q.v.), and so "instituted" as the tenant of the entailed estate. The persons in whom the estate thereafter becomes vested by descent are described as substitutes. See ENTAIL; ESTATE; FEE TAIL.

INSTITUTE OF FRANCE. The official name for a group of learned societies in France organized at different times, but having for their object the fostering of some special branch in literature, art, the sciences, or philosophy. At present the Institute comprises five distinct bodies known as (1) Académie Française; (2) Académie des Inscriptions et Belles-Lettres; (3) Académie des Sciences; (4) Académie des Beaux-Arts; (5) Académie des Sciences Morales et Politiques. The first three academies, dating as separate institutions from the seventeenth century, were abolished by the Convention on Aug. 8, 1793. Two years later, under the title of Institut National des Sciences et des Arts, there was established by the Directory an association for the promotion of arts and sciences, which was divided into the three following classes: (1) physical sciences and mathematics; (2)

moral and political sciences; (3) literature and fine arts. In 1803 Napoleon I reorganized the body, dividing it into four classes—mathematical and natural sciences, French language and literature, classical languages and literatures, and fine arts—and giving it subsequently the name of Imperial Institute of France. After the Restoration it was again reorganized (1816) into four academies, comprising the first four bodies enumerated above, to which was added in 1832 the fifth academy, the name of the whole being changed at the same time to Institut de France. The Institute has always enjoyed great prestige, even under the consular and Imperial régime. In his Egyptian campaign Napoleon put, at the top of his proclamations, "Bonaparte, General in Chief, member of the Institute"—"so as to be sure," said he, "to be understood even by the very drum boys."

Each academy in the Institute has its independent government and the free disposition of the funds allotted to it, while an agency and secretaries, the library, and the valuable collections of the Institute are common to the five. Among these collections one of the most important is that of the château of Chantilly, which was presented to the Institute by the Duke d'Aumale in 1886. It comprises a great library and a magnificent art collection. The general fund is managed by a committee of 10 members, two from each academy, under the presidency of the Minister of Public Instruction. The members, of whom there are in addition to the regular members, honorary members, corresponding members, and foreign associates, are all elected by ballot, and the election is confirmed by the public authorities. Each member receives an annual salary of 1500 francs, and the perpetual secretaries are given 6000 francs. An annual meeting is held on October 25, when public announcements are made of the award of important prizes.

1. The Académie Française was founded by Cardinal Richelieu in 1635. The letters patent were granted Jan. 29, 1635, but were not ratified by Parliament before July, 1637. It had its origin in a small group of literary men, who as early as 1626 were accustomed to meet at one another's homes for the purpose of exchanging their views on various topics in literature, art, and science. They met particularly in the home of Valentine Conrart, a rich and learned man. Richelieu, on becoming aware of the existence of this informal society, offered them the royal protection if they would hold their meetings in public; and the society, after much hesitation on the part of the members, was thereupon constituted as the Académie Française. From 1793 to 1816 the Académie Française, as such, did not exist. (See above.) Within two years from the date of its formal authorization the membership of the Academy had risen to 40, at which number it has since remained. The members are popularly spoken of as "immortals." From the original 40 only a few have come down to us in literature: Balzac, J. Guez; Chapelain; Gomberville; Vaugelas; Voiture. Richelieu wished the Academy to be the final authority on all questions pertaining to language and literature. As early as 1637 the Academy had to pass formal literary judgment. In 1636 Corneille had written the epoch-making *Cid*. Immediately the quarrel of the *Cid* arose; the chief critic of Corneille was Scudéry, who was supported by Richelieu. The quarrel waxed

warm, and finally, at Richelieu's command, the Academy appointed a committee of three to thresh out the whole question. After some delay a report was drawn up by Chapelain and submitted to Richelieu. The manuscript underwent several revisions and was finally published in 1638 under the title of *Sentiments de l'Académie sur le Cid*. The special function, however, of the organization was the improvement and conservation of the French language. For this purpose, at the suggestion of Chapelain, work was begun on a dictionary of the French language, which, however, did not see the light till 1694. (There have been seven editions of the dictionary—1694, 1718, 1740, 1762, 1798, 1835, 1878.) The original purpose of the Academy has not been forgotten. At the present day its chief business is still the revision of the *Dictionnaire de l'Académie Française*; but as a matter of fact in the intellectual world of France the French Academy holds a much higher rank than that of a mere lexicographical bureau. From an early date admission to the French Academy was sought as an honor, and for more than a century an election to a seat among the 40 "immortals" has been considered as the crowning glory to a successful literary career. The manner of election to the Academy has been changed. To-day the candidate who thinks that he has a chance presents his candidacy, and after an obligatory visit to all the members (called *visite académique*) he is nominated, and if elected it is by "absolute majority." Often the election is deferred when three ballots have shown no election; Casimir Delavigne, e.g., was elected only at the third attempt. At the general meeting, open to the public, the candidate about to become "immortal" is presented by a member of the Academy, who has been named his sponsor, or parrain. In his speech the sponsor sometimes, in a clever manner, criticizes rather harshly the prospective academician. When the candidate has undergone this baptism of eloquence with all the good grace at his command, his duty is presumably to eulogize and sometimes to criticize with veiled modesty his predecessor who sat in the "armchair" that he is about to occupy. By tradition a vacancy is filled from the ranks of the particular field that the late incumbent occupied. The Academy has laid itself open to reproach for a certain pettiness of spirit in shutting its doors on some of the greatest men in the history of French literature. The critics of the Academy have taken keen pleasure in counting the obscure names of some members. However, if one takes the list as a whole, it does seem as though membership has been representative. Those men upon whom literary criticism has put its stamp of approval and who have not become academicians are said to sit in the forty-first "armchair." Thus, it is that in the seventeenth century Descartes, Molière, Pascal, Scarron, were not members, but we find Boileau, Corneille, Racine, and La Fontaine. In the eighteenth century we do not find Diderot, Condillac, Beaumarchais, or Rousseau; fortunately we see Montesquieu, Voltaire, D'Alembert, and Marmontel. It is harder to explain why we do not see the name of the only real great poet perhaps of that century, André Chénier. In the nineteenth century we find Lamartine, Hugo, Vigny, Cousin, Villemain, Sainte-Beuve, Guizot, Thiers, Lacordaire, Montalembert, Cuvier, and other important names. We do not find, however, Béranger, Gautier, Comte,

Stendhal, Balzac, Daudet, Maupassant, Goncourt, or Verlaine. The influence of the Academy for good or bad has been for a long time a mooted question. It has been accused of impoverishing the French language. There is some truth in that accusation, but the Academy has maintained a certain distinction of expression and purity of form which have been invaluable. Besides its work on the dictionary, the Academy has been mainly occupied with the awarding of prizes for literary competitions. There are as many as 23 prizes a year, of which 17 are *prix littéraires* and 6 *prix de vertu*. Among the more important prizes are one of 2000 francs, awarded to the best poem or essay on a given subject; the Montyon prize of 22,463 francs, given as a reward for the most heroic deed done by a native of France; and one of 21,940 francs, given to a native of France who has written and published a work having the most valuable application to the arts; the Gobert prize for the most important work on the history of France, as well as a large number of other prizes. Its annual public meeting is held in November. See ACADEMY.

2. The Académie des Inscriptions et Belles-Lettres was founded in 1663, by Colbert, and has 40 ordinary, 10 honorary, and 50 corresponding members, and 8 foreign associates. It has for its principal objects the study of medals, inscriptions, monuments, antiquities, and ancient and Oriental languages. It has various prizes at its disposal and publishes *Mémoires*. Its annual public meeting is held in November.

3. The Académie des Sciences was founded in 1666, by Colbert, and has 66 ordinary, 10 honorary, and 106 corresponding members, and 8 foreign associates. Its prizes include an annual sum of 3000 francs, given alternately, for the best discussion of a subject in mathematics and physics; the Montyon prizes, six in number, having an annual value of 44,845 francs; the Laland prize, given annually, for astronomical work; and several others. This Academy publishes *Mémoires*. Its annual public meeting is held in December.

4. The Académie des Beaux-Arts was founded by Mazarin in 1648, and the subjects of painting and sculpture, music, and architecture were added respectively in 1664, 1666, and 1671. It has 40 ordinary, 10 honorary, 10 foreign associates, and 40 corresponding members. Besides the prizes in painting, sculpture, architecture, engraving, and music, awarded to the pupils of the Ecole des Beaux-Arts and the Conservatoire de Musique, it has under its charge the publication of the *Dictionnaire général des beaux-arts*. It also conducts the examination for the Prix de Rome in the various arts. Its annual public meeting is held in October. See ECOLE DES BEAUX-ARTS.

5. The Académie des Sciences Morales et Politiques was restored in 1832, through the appeal of Guizot to King Louis Philippe, after having been suppressed in 1803, and has 40 ordinary, 10 honorary, and 60 corresponding members, and 8 foreign associates; it is divided into five sections and has for its chief purpose the discussion of mental philosophy, law and jurisprudence, political economy and statistics, general and philosophical history, and politics, administration, and finance. It has the Baujour, Faucher, Halphen, Bordin, and other prizes at its distribution. It publishes *Mémoires*, and its annual public meeting is held in December.

The academies forming the Institute of France meet regularly in the Mazarin Palace, which is on the left bank of the Seine, at the Quai de Conti opposite the Louvre, and their meetings are attended with much ceremony. From 1795 to 1806 the meetings were held in the Louvre Palace. Since 1806 they have been held in the present quarters. Consult De Franqueville, *Le premier siècle de l'Institut de France* (2 vols., Paris, 1895).

INSTITUTES, LEGAL. An ancient term derived from Roman usage for a treatise, usually but not necessarily, of a comprehensive character. Among the most famous nonlegal works bearing that title is the reformer Calvin's *Institutes of the Christian Religion*, published in 1536. Among the legal treatises known as Institutes the most celebrated are the *Institutes* of Gaius, probably the earliest commentary on Roman law, written in the second century of the Christian era, which was lost for many centuries but recovered in 1816; the *Institutes* of Justinian, a comprehensive treatise on the civil law prepared for the use of law students; and Coke's *Institutes*, in four volumes, comprising an elaborate commentary on Littleton's *Tenures* (known as "Coke upon Littleton"), commentaries on the more important of the English statutes, and a treatise on the English criminal law. The term is little used in modern times except in Scotland, where legal treatises are still published under the title of Institutes, as Erskine's *Institute of the Laws of Scotland*. See CIVIL LAW; GAIUS; JUSTINIAN; COKE, SIR EDWARD; COMMENTARIES.

INSTITUTIONAL CHURCH, THE. A cross-sectional split among the 150 sects in the United States has developed ritualistic and institutional tendencies in the churches. The ritualistic churches lay emphasis upon the efficacy of certain beliefs, forms, sacraments, and a limitation of functions, and appeal to the economically superior classes. The institutional church, on the other hand, demands activity, apparent results, the amelioration of the outward as well as of the inward life of its members; it reaches out for the reclaimables in the social-debtor class, and it is identified with social rather than distinctly religious movements. The name "institutional church" was first used by President Tucker, of Dartmouth College, and applied to Berkeley Temple, Boston. Ever since 1840 some of the English churches have been taking on new functions, but the new church movement in the United States dates back hardly to 1880, and as a recognized movement it is scarcely older than 1890. It had its origin in the same impulses which created the university settlement, Christian socialism, and the Salvation Army—a feeling that the churches were not reaching the masses, and that each community had much work to be accomplished which could be done by the Church. The object is distinctly humanitarian. The institutional church becomes the centre and inspiration of the daily lives of its members, to whom it ministers according to their immediate needs, and has, as a result, reabsorbed certain functions (educational, medical, charitable) which had been assumed by the state and other organizations since the Roman Catholic church ceased to be the universal Church.

The characteristics of the institutional church are, in general, an adoption of secular methods. The platform of the Institutional Church League

states that it "stands for open church doors for every day and all the day, free seats, a plurality of Christian workers, the personal activity of all Church members, and a ministry to all the community through educational, reformatory, and philanthropic channels." The organization of such churches is very complete. The numerous committees have definite duties, such as welcoming strangers, house-to-house canvassing, visiting members, and superintending work of different kinds. The finances are placed in competent hands and managed upon business principles. The ushers for church services are carefully chosen. Subpastors, deaconesses, sisters, and nurses carry on certain features of the work. The distinctly religious work consists of attractive services; music, frequently by large choirs or choruses; well-organized Sunday schools; pleasant Sunday afternoons; prayer meetings with special features; open-air meetings in summer; and the encouragement of helpful associations, such as men's Sunday evening meetings, the brotherhoods of St. Andrew and of Andrew and Philip, and Christian Endeavor societies. The secular work aims at educational, social, and physical improvement. Some churches have established special schools and colleges, which give an opportunity to obtain or to supplement a rudimentary education; industrial classes are maintained; lectures, illustrated and university extension, are given; literary and debating clubs are encouraged; and provision is made for libraries, reading rooms, and recreation rooms, with billiards, bowling alleys, and games; gymnasiums, swimming pools, military drills, and athletic teams. The philanthropic work includes employment bureaus, aid to worthy poor, wood yards, dispensaries, hospitals, crèches, penny provident funds, and personal efforts to reach the vicious or intemperate. When funds are sufficient, special buildings have been constructed.

The denominations especially engaged in this work are the Episcopal, Congregational, and Baptist, although there are a number of Presbyterian, Roman Catholic, Unitarian, and Methodist churches which make use of the same methods. Some of the prominent institutional churches are: Ruggles Street Baptist and Parker Memorial, of Boston; Fourth Congregational Church, of Hartford; St. George's, St. Paul's, St. Bartholomew's, and Judson Memorial, of New York; Tabernacle, or People's Palace, of Jersey City; Grace Church (The Temple) and Bethany Church, of Philadelphia; Pilgrim Church, of Cleveland; Ninth Street Church, of Cincinnati; Plymouth Tabernacle, Institute, and People's College, of Detroit; People's Church, of St. Paul; the Tabernacle, of Denver; and, one of the oldest of all, Plymouth Church, of Indianapolis.

The Open and Institutional Church League was organized in New York in 1894. The League has given aid and counsel by correspondence; it published for three years a magazine, the *Open Church*, and it has held conventions in various cities. At present the League is doing little active work; but its secretary, in connection with the Federation of Churches in New York, has organized the National Federation of Churches and Christian Workers, which, in 1905, called a conference of the principal American Protestant churches to formulate a plan for united action upon matters of common interest, among them the prosecution of social work. The

principles of the League have taken a strong hold on Church life, and many churches are adopting institutional methods.

INSTITUTO HISTORICO E GEOGRAFICO BRAZILEIRO, ên'stê-tôô'tô ê-stô'rê-kô â jã'ô-grã'fê-kô brã'zê-lyã'rô (Portug., Brazilian Historical and Geographical Institute). A society founded at Rio de Janeiro in 1839. Its organ, the *Revista Trimensal*, is devoted to the publication of historical and geographical documents.

INSTRUMENT (Lat. *instrumentum*, tool, from *instruere*, to construct, from *in*, in + *struere*, to build). A term of law to describe any formal written document by which legal rights are created. Thus, a deed of conveyance, a last will and testament, a memorandum of agreement, a promissory note, a bill of lading, a bond, a mortgage, are all legal instruments; but the term is not properly applicable to an entry in a book of account, or to a memorandum made for the sake of evidence or for perpetuating testimony.

INSTRUMENTALISM. A term applied in philosophy to a variety of pragmatism (q.v.) developed by John Dewey (q.v.) and his former colleagues of the University of Chicago. According to instrumentalism, thinking is an organic function whose aim is to restore experience to its smooth flow when this flow has been arrested by the presentation of a problem. A problem is always due to an interruption of immediate unreflective experience, caused by the fact that the habitual or instinctive modes of reaction no longer fit the present situation that confronts the agent. One way of meeting the difficulty is to think, and this is the characteristic way taken by intelligent beings. Intelligent beings are so called because they resort to this method when in difficulties. Thinking, or the experience of ideas, is the formation of plans of action, action not being restricted to overt bodily behavior, but extended to any reaction that is made to a situation. Plans of action are necessary when habitual action or instinctive action is not able to cope with the predicament in which the experient finds himself. Every idea that he entertains in such a contingency is a possible plan to escape the difficulty. Every idea means the presence of its object, but is itself a kind of presence of its object; for there are two kinds of presence. An object may be present as present or it may be present as absent. "We must not balk at a purely verbal difficulty. It suggests a verbal inconsistency to speak of a thing present as absent. But all ideal contents, all aims (i.e., things aimed at) are present in just such fashion. Things can

be presented as absent, just as they can be presented as hard or soft, black or white, 6 inches or 50 rods away from the body. The assumption that an ideal content must be either totally absent or else present *in just the same fashion* as it will be when it is realized, is not only dogmatic but self-contradictory. The only way in which an ideal content can be experienced at all is to be presented as *not present in the same way* in which something else is present, the latter kind of presence affording the standard or type of *satisfactory* presence. When present in the same way, it ceases to be an ideal content. Not contrast of bare existence against nonexistence, or of present consciousness over against reality of our present consciousness, but of a satisfactory with an unsatisfactory mode of presence, makes the difference between the 'really' and the 'ideally' present." In other words, in our experience some things are present in a way which is immediately satisfactory, and some are not. The difference between them is an immediate fact, just as much experienced as anything else. When experience does not run smoothly, in thinking beings there arises in experience an object present as absent, and this object is immediately there, but there in an unsatisfactory way. The subsequent conversion of this unsatisfactory presence into a satisfactory presence is a matter of the eventual course taken by the experience. The idea, or the unsatisfactorily present object, aims at its presence in a satisfactory fashion. This aim is its *meaning*, and if this aim is achieved, the idea *becomes true*. This aim is realized by the fact that the idea is an active reconstructive factor; it is an instrument for its own transformation into a satisfactory kind of presence. Knowledge is not a characteristic possessed by experience in any one cross section of it. It is a process. "An experience is a knowledge, if in its quale there is an experienced distinction and connection of two elements of the following sort: *one means or intends the presence of the other in the same fashion in which itself is already present, while the other is that which, while not present in the same fashion, must become so present if the meaning or intention of its companion or yokefellow is to be fulfilled through the operation it sets up.*" Thus, this view regards ideas and knowledge as instrumental in the development of experience, and having exclusively such a function. Hence it is called the instrumental theory of knowledge, or, briefly, instrumentalism. Consult: John Dewey, *Studies in Logical Theory* (Chicago, 1903); William James, *Pragmatism* (New York, 1907); id., *The Meaning of Truth* (ib., 1909); John Dewey, *The Influence of Darwin on Philosophy* (ib., 1910). See EMPIRICISM; KNOWLEDGE, THEORY OF; PRAGMATISM.

INSTRUMENTAL MUSIC. A term applied to music performed exclusively on instruments, as distinguished from that performed by voices, or even voices with instrumental accompaniment. Even in ancient Greece purely instrumental music was known. In the sixth century B.C. Sacadas of Argos is said to have performed publicly on the *aulos* (flute) at the Pythian Games. In the same century Agelaus of Tegea won great distinction as a performer on the *kithara*. But instrumental music as performed by a number of instruments was unknown. The Greek orchestra served only to accompany the voices. Harmony being unknown

to the Greeks, such accompaniment was nothing more than a performance of the vocal part in unison or octaves upon the instruments. With the use of stringed instruments played by a bow a new phase of instrumental music began. The *fiddle* was brought over from the Orient and soon became the instrument upon which the troubadours accompanied their songs. It was also adopted by the wandering fiddlers (*fahrende Spielleute*) of the Middle Ages. The oldest compositions written expressly for instrumental performance were dances. But the style of these is entirely vocal. It is during the sixteenth century that the first traces of an individual instrumental style are perceptible. It was the keyed instruments which contributed to a differentiation between the vocal and instrumental styles. As they were unable to produce sustained tones or chords, composers soon discovered that broken chords and figuration were better adapted to these instruments. Even in compositions for the organ this principle was adopted; and before long the new style of figuration, and rapid note progression, were also adopted for orchestral instruments. Three instruments have become prominent in the development of the instrumental forms, viz., the organ, violin, and pianoforte. The great organists took from the vocal style the fugue. The instrumental fugue reached its growth in the masterpieces of J. S. Bach, which to this day still are unrivaled. The violin and pianoforte developed the sonata form, which is regarded as the highest of all instrumental forms. The cyclical forms can be traced to two main sources, viz., the old dances and the Florentine musical drama. By uniting a number of dances (all in the same key) the *suite* originated. The older operas were opened by an instrumental prelude which originally was nothing more than a madrigal arranged for instruments. But soon a special instrumental composition took its place. The form of this *sinfonia*, as it was called, was taken from the aria, i.e., it had three parts, A, B, A, of which the third was a repetition of the first. Gradually the three parts were detached and appeared as separate movements. Composers paid special attention to the first movement; from which gradually the sonata form was evolved. A sonata was originally any instrumental work (chiefly performed on a keyed instrument with strings) as opposed to a vocal one. Then "sonata" was applied to a cyclical composition for piano. The great sonatists of the eighteenth century (though composing for the violin) retained the name. The form was finally established by Stamitz and filled with the loftiest contents by the genius of Beethoven. The symphony is nothing else than a sonata of large dimensions for orchestra. Trios, quartets, concertos, etc., are all sonatas for a particular group of instruments. Instrumental music today is divided into absolute and programme music. The former kind is music written for its own sake; the latter attempts to portray definite ideas according to a given programme. Consult: W. v. Wasielewski, *Geschichte der Instrumentalmusik im 16. Jahrhundert* (Leipzig, 1878); L. Torchi, *La musica instrumentale in Italia nei secoli 16, 17, e 18* (Turin, 1899); W. J. Henderson, *Orchestra and Orchestral Music* (New York, 1899); D. G. Mason, *Orchestral Instruments and What they Do* (ib., 1909); H. Botstiber, *Geschichte der Ouvertüre und der freien Orchesterformen* (Leipzig, 1913).

INSTRUMENTATION, or ORCHESTRATION. The art of arranging the parts of an orchestral composition for the various instruments. Although from the beginning of the sixteenth century composers wrote for various combinations of instruments, instrumentation has become a real art only in the last half of the eighteenth century. The Gabriellis, e.g., employed violins in their instrumental works, but had no idea of the true character of this instrument. They used it only, like the trombones, for sustained notes. Even the instrumentation of Bach and Handel is very primitive. Gluck seems to have been the first to use the various instruments with a conscious purpose and a knowledge of their peculiar character. Haydn and Mozart made scarcely any advance in instrumentation over Gluck. In the works of Beethoven we find for the first time each instrument speaking its own language, and with him a new epoch of instrumentation may be said to begin. Weber accomplished for the opera orchestra what Beethoven had done for the symphony orchestra. In the works of Wagner and Berlioz instrumentation reached its culmination as far as then existing instruments are concerned. Quite independent of each other, these two masters discovered every conceivable combination and effect. Wagner even had special instruments (tubas) constructed for his *Ring des Nibelungen*. By increasing the number of the wood and brass choirs and by introducing new instruments, especially the celesta and heckelphone (qq.v.), Richard Strauss was enabled to advance even beyond Wagner on the merely technical side. Just as there is a special style of writing for the pianoforte (*Klaviersatz*) so there is also one for the orchestra (*Orchestersatz*). It is not sufficient for a composer to know thoroughly the compass and peculiarities of each instrument. Effective instrumentation requires also the proper distribution of the separate tones of a chord among the various instruments. Thus, if a composer should write the C major chord for trombones in successive thirds, *c, e, g*, the effect would be a confused mass of sound; whereas the proper effect would be obtained by writing *c, g, e'*. The science of instrumentation teaches the pupil the compass and peculiarities of the different instruments as well as their combinations. But talent for instrumentation and orchestral writing is independent of purely creative talent, although all great composers since Beethoven, with the one notable exception of Chopin, have been masters of the orchestra. The best works on instrumentation are those of Marx, Lobe, Prout, and especially Berlioz (translated into German and enlarged by F. Weingartner) and Gevaert. Consult F. Volbach, *Das moderne Orchester in seiner Entwicklung* (Leipzig, 1910). See ORCHESTRA; SCORE.

INSTRUMENT OF GOVERNMENT, THE. A written constitution for the Protectorate in England, set forth on Dec. 16, 1653. Since Jan. 15, 1649, the Agreement of the People (q.v.) had been nominally in force, its provisions being only partially carried out, but there was urgent need of some effective guaranty of civil liberty. The instrument provides for a constitutional government, administered by a Lord Protector, and a Parliament of a single house. An elective assembly is to be summoned on the 3d of September, 1654, and thereafter once in

every third year. The distribution of county and borough seats in England and Wales is based on the schedule provided in the Agreement of the People, although there are important changes. For the first time provision was made for a parliamentary union of England, Ireland, and Scotland. With the exception of those who had engaged in the war against the Parliament since 1641, or in the Irish rebellion, or professed Roman Catholicism, the franchise and the right of being elected are conferred upon "persons of known integrity, fearing God, and of good conscience, and being of the age of twenty-one years," if seised or possessed of real or personal estate to the value of £200. There is no provision for the borough franchise, that being left apparently to the existing custom of each place. No Parliament was to continue longer than three years, and no Parliament was to be dissolved within less than five months after it was first convened without its own consent.

The extended powers of the Protector in foreign, military, and civil affairs are limited by the Parliament and the Council of State. A council of 15 members is appointed in the instrument itself. Other members may be added, but the number may never be more than 21 nor less than 13. Councilors are to hold office during good behavior. To fill a vacancy in the Council the Parliament is to nominate six persons, the Council to choose two out of these six, and the Protector to appoint one of the two. By the instrument Oliver Cromwell is created Lord Protector for life. His successors are to be elected by the Council. A veto upon legislation is not granted the Protector. All bills passed by Parliament must be presented to him; and if his consent be not given within 20 days, they become laws, unless he can convince Parliament that his objections are sufficient reason for rejection or that they are contrary to the Instrument. There is a responsible ministry. The "Chancellor, Keeper or Commissioners of the Great Seal, the Treasurer, Admiral, Chief Governor of Ireland and Scotland, and the Chief Justices of both the benches" are to be chosen by the consent of Parliament. All other appointments are apparently left in the Protector's hands. Religious liberty is guaranteed, except to "Popery or Prelacy," and to "such as, under profession of Christ, hold forth and practice licentiousness."

The Instrument of Government reveals the remarkable ability of its framers. The most serious defects are the lack of any provision for amendment and the failure to secure the national sanction. It broke down because the Parliament summoned under its provisions assumed the power of a constituent assembly. It was later amended in the *Petition and Advice* (q.v.). For the text of the Instrument, consult: Gardiner, *Constitutional Documents* (Oxford, 1889); and for discussion, id., *Commonwealth and Protectorate* (New York, 1894-1901); Masson, *Life of Milton*, vol. iv (London, 1873-94); Jenks, *Constitutional Experiments* (ib., 1891); Inderwick, *Interregnum* (ib., 1891).

INSTRUMENTS, MUSICAL. See MUSICAL INSTRUMENTS.

INSUBRES, in'sû-brêz. A Gallic people, a branch of the Ædui (q.v.), who crossed the Alps in the fourth century B.C. and settled in Italy north of the Po, between the rivers Adda and Ticinus and the Alps. Next to the Boii, they were the most powerful and warlike tribe

found in Cisalpine Gaul at the time this region first came in contact with Roman arms, in 222 B.C. By 194 B.C. the Romans captured their capital, Mediolanum (now Milan), and reduced the tribe to submission—a victory which completed the Roman conquest of all the country lying between the Alps and the Apennines in the western part of Italy. Consult Heinrich Nissen, *Italische Landeskunde*, vol. ii (Berlin, 1902), and the article "Insubri," in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

INSUR'ANCE (OF. *enseurance*, from *enseurer*, to insure, from *en*, in + *seur*, sure, from Lat. *securus*, free from care, from *se-*, without + *cura*, care). Insurance must be differently defined according to the aspect of it which is under consideration. Every person who embarks his capital in any kind of industrial activity is obliged to make accumulations to replace that part of it which is used up in the productive operation. Some of these accumulations are made to meet losses which are certain and definite both in time and in amount. Such accumulations should be large enough to replace the capital used up and no larger. Other accumulations are made to meet losses of a more or less uncertain character. Such accumulations are, for the entire group engaged in any line of industrial activity, larger than the losses, and the excess of accumulation over loss varies directly as the degree of uncertainty. The accumulations of an individual to meet uncertain losses constitute his insurance fund, and so far as he makes such accumulations he may be said to insure himself. From this point of view insurance is the accumulation of funds to meet uncertain losses.

One person whose property is exposed to a risk of some kind may be able to transfer that risk to another person for a consideration. The latter person undertakes to make good to the former any loss which he may suffer from certain specified accidental causes. The person guaranteeing the reimbursement for such accidental loss may be said to insure against the loss. From this point of view insurance is the transfer of an existing risk from the person exposed to it to another person or group of persons.

When one person merely assumes the risk of some other person, there is little or no social gain from the transaction. Whatever accumulation the former would have had to make if he had carried his own risk, the latter must make after he assumes the risk. The burden which the risk imposes on society remains unaffected. If, however, the risks of many individuals are brought together in a group, a new principle is brought into play. The uncertainty as to the amount of loss to be expected steadily diminishes as the number of risks included in the group increases. Thus an insurance company, which has assumed the risks of thousands of individuals, is exposed to much less uncertainty as to the amount of loss it will have to indemnify in a given period of time than any one of the individuals is as to the amount of loss he would suffer during the same period if uninsured. The total amount of loss which the company experiences increases as the number of risks it is

carrying increases; but the proportion of the total loss which may be considered as certain steadily increases and the proportion of uncertain loss diminishes. For the company the only uncertainty is as to how much the actual loss will differ from the average loss, and by the well-known law of averages the percentage of variation between actual loss and average loss diminishes as the number of cases increases. Now the insurance company under competitive conditions makes its accumulations under the same conditions as the individual. To meet definite losses it accumulates only the amount of the losses; to meet uncertain losses it accumulates in the long run an amount in excess of the losses, and this excess varies with the degree of uncertainty. It will be seen, therefore, that the company can carry the risks of 100,000 individuals on a much smaller accumulation than would be made by the individuals if each were carrying his own risk. This reduction in the cost of carrying risks is one of the economic advantages of commercial insurance.

The second advantage arises from the diffusion of loss. While it is true that for the entire group of persons engaged in a particular industry accumulations to meet uncertain losses will exceed the amount of the losses, it is equally true that some will suffer loss in excess of their accumulations, while others will make the accumulations and escape the loss. In other words, while the group as a whole will make extra gains on account of the existence of risks, these gains will be unequally distributed among the members of the group. Those who suffer the loss will be seriously crippled financially if not actually ruined, while those who escape the loss will reap all the advantage. If, on the other hand, the members of the group are all insured, the system of premiums and indemnities diffuses the losses actually suffered among all the members of the group. This causes such losses to fall on the least important part of the capital of all instead of being concentrated on a few unfortunate individuals. In this way the economic evils caused by the accidental destruction of property are greatly modified. From the social point of view, therefore, insurance may be defined as an economic institution for reducing the accumulation to meet uncertain losses and for lessening the evil consequences of the accidental destruction of property, through the combination of the risks of many individuals in one group. Accumulation to meet uncertain losses and the transfer of risk are both involved, and in addition the combination of many risks in one group. It is this definition of the term that covers the business of insurance as it is carried on in the economic world.

The Relation of the Individual to Uncertainty. If we turn now from the social aspects of insurance to consider it from the point of view of the insured person, we find that for him its chief characteristic is the substitution of certainty for uncertainty, of a certain and definite expense for the possibility of an uncertain loss. Every person engaged in any form of industrial activity is exposed to many chances of accidental loss. Some forms of danger may be practically eliminated through the adoption of measures calculated to reduce the possibility of loss. Such measures may be grouped under the name "prevention." It is to be noticed that the fact that it is possible to avoid the danger of loss in a particular case by the adoption of pre-

ventive measures does not prove that it is desirable to do so. Such measures may cost more than they save. Preventive measures, therefore, will be adopted only so far as they are found to be economically advantageous.

A person engaging in industrial activity finds himself exposed to the possibility of accidental losses from various sources and of various degrees of uncertainty. To protect himself he may adopt any one of three methods. So far as it is economically advantageous, a prudent man will adopt preventive measures which will reduce the danger of loss and so lessen the degree of uncertainty. Against some of the remaining risks he may, from necessity or by choice, protect himself by making accumulations to replace the capital accidentally destroyed. He may then be said to be insuring himself, although the term "self-insurance" is more commonly restricted to such conduct with regard to risks against which it is possible to purchase protection from the insurance company. Where the transfer of risks to a company is impossible, as in the case of the danger of a shrinkage in the value of a stock of goods through a change in human wants, the method of self-insurance is the only one that can be adopted. Finally, with respect to a limited number of risks, protection may be secured by transferring them to insurance companies and substituting the obligation to make fixed and definite payments to the company for the necessity of making individual accumulations. The choice between these three methods of preparing to meet uncertain accidental losses will be made by a prudent person on the basis of their relative cost. Where insurance in an established company is possible, the choice of self-insurance would never be justifiable if the cost of insurance in the company were as low as it could be made with entire safety. It is only because insurance companies fail to reduce premiums to the cost level that many large business concerns find it advantageous to carry their own risks. A large concern with many detached risks can do it where a small concern cannot, but under ideal conditions it would not be a profitable proceeding even for the former.

COMMERCIAL INSURANCE

Commercial insurance comes under the last of the three definitions given at the head of this article. It is an economic institution for dealing with uncertain losses. The study of it may be conveniently made under three heads: the relation between the insured and the company, including an examination of the nature of the insurance contract; the kinds of insurance companies and their characteristics, including their methods of operation; the relation of the government to insurance, including a discussion of what it ought to be, as well as what it is.

The Relation between the Insured and the Insurance Company. *The Risk.*—An insurance contract transfers a liability to uncertain loss of a more or less narrowly defined nature from the person insured to the insurance company. For the insured it is the substitution of a definite payment or series of payments for the possibility of an uncertain loss; for the company, conversely, it is the acceptance of an uncertain liability in exchange for a definite payment or series of payments. It may be noted in passing that in the case of the mutual insurance company there is in theory the transfer of only

a part of the uncertainty. The insured, being also insurer, is still exposed to some uncertainty as to the amount of loss he will suffer in the form of assessments. In practice, however, the difference between insurance in a mutual company and in a stock company is very slight, and during the present discussion may be disregarded. (Further reference to this matter will be made in considering the different kinds of insurance companies.) The insurance company assumes the legal obligation of paying to the insured certain specified sums on the occurrence of certain specified events. It assumes these liabilities, however, with the certainty that in the great majority of cases it will not be called upon to make the payments. Its actual liability is much less than its full legal liability. The actual liability which the company assumes in granting insurance at any time is technically known as "the risk." The most important question in this connection is how the risk is determined. In seeking an answer to this question two things have to be taken into account—the amount which the company binds itself to pay and the probability that it will have to make payment. These two factors will be considered in turn.

The maximum amount for which the company renders itself contingently liable is usually expressed in the policy. This amount ought in all cases to be limited to the insurable interest of the insured, i.e., to the amount of loss he would actually suffer from the occurrence of the event against whose consequences he is insured. To promise a larger amount is to make it for the interest of the insured to bring about the occurrence of the event—a condition of things which is prejudicial to the welfare of the company and contrary to public policy. In the insurance of property the attempt is nearly always made to apply this principle. In life insurance, however, and in other forms of insurance against loss of income from labor, no such attempt is made in many cases. A life insurance company does not undertake to limit the amount of insurance which any man may take out on his own life to the capitalized value of his income-earning capacity, any more than it limits his choice of beneficiaries to those who are actually economically benefited by his living. It cannot be denied that the results of this policy are in some respects very unfortunate. It leads to an increase in the incentive to commit two kinds of crimes—suicide and murder—and to a certain increase in the number of such crimes actually committed. That the situation is not intolerable is due to the fact that other motives are at work which are sufficiently strong in most cases to overcome entirely the economic motive.

Insurable interest, then, fixes the maximum amount for which a policy should be made out. Insurable interest may be defined as any legal or equitable right or interest such that the contingency insured against will result in financial loss to the insured. This definition, while not complete, covers the greater number of examples of insurable interest. Thus a mortgagee or pledgee has an insurable interest in the property mortgaged or pledged. A vendee of property under an executory contract of purchase has an insurable interest in the property. A common carrier or other bailee has an insurable interest in the goods bailed. The carrier also has an insurable interest in the prospective freight upon goods actually laden upon his ship or other

vehicle for carriage. It will thus be seen that several different persons may have distinct insurable interests in the same property, and that these insurable interests may in the aggregate exceed the value of the property insured.

In general, no particular amount of insurable interest is necessary to make the insurance contract valid. It is enough if, at the time of effecting the insurance policy, the insured has some interest in the life or property insured. There is, however, one exception in the case of life insurance. Although in the case of insurance of the life of a relative the law does not require any limit to be placed on the value of the life insured, when the interest of the insured is purely financial, the insurance by a creditor of the life of a debtor, the amount of the insurance must bear some relation to the amount of the debt plus interest and the cost of insurance or it will be deemed void as a gambling contract.

One of the most important principles of the law of insurance is that the contract of insurance is a contract of indemnity only. It follows that in most forms of insurances the insurer must not only have an insurable interest at the time he effects the insurance, but that he must have an insurable interest at the time of the loss in order to recover on the policy, and the amount of the recovery will be measured by the amount of his insurable interest. The life insurance contract constitutes an exception to the rule. It is not strictly a contract of indemnity, but a contract to pay a fixed amount of money; and if the insured has an insurable interest at the time of effecting the insurance, so that the policy is then valid, he may recover the entire amount of the policy upon the happening of the loss, even though the insurable interest has then ceased. Insurance policies, known as "valued policies," are sometimes written in which an agreed value is assigned to the interest of the insured. In the event of loss the insured must still have his interest in the property insured, but the value of his interest is determined by the policy. In several States insurers against loss by fire are required by statute to issue only valued policies.

When there are several insurers of the same interest in the same property, their position in the event of loss is not unlike that of cosureties. If the amount of the several policies exceeds the value of the interest, the insured may not recover the full amount of property from the insurer, but each is required to contribute ratably to the loss; or, if the insured elects to recover the amount of the loss from any one insurer (as he may do in the absence of stipulation to the contrary in the policy), that one, on payment of the loss, may compel contribution pro rata by each of the other insurers.

In the case of marine insurance policies the insured is deemed to be a coinsurer with his insurer if the amount of insurance is less than the full value of the interest insured. The marine policy is therefore a policy of indemnity only if the property or interest insured is insured for its full value. If insured for less than its full value, the insured can recover on his policy only such proportion of the amount insured as the loss bears to the value of the whole interest of the insurance on the property.

The amount stated on the face of the policy is the maximum amount for which an insurance company may become liable. In some forms of

insurance, as in life, accident, and sickness insurance, the amount stated in the policy is the amount actually paid if the specified event occurs, regardless of whether an equivalent loss is actually suffered or not. With most forms of insurance of property the situation is different. Whatever may be the face of the policy, the indemnity is not expected to exceed the loss actually experienced. If insured property is partially destroyed and the loss does not exceed the amount of the insurance, the amount of loss fixes the maximum amount to be paid as indemnity. In some countries in fire insurance any person who insures his property for less than its full value is held to be his own insurer for the difference between the value of the property and the amount of the insurance; and if the property is partially destroyed and the loss does not exceed the insurance, the indemnity actually paid is such part of the loss as the total amount of insurance in force is of the total value of the property. If, e.g., property insured for three-fourths of its value is partially destroyed, the indemnity actually paid will be three-fourths of the loss. The rest of the loss will fall upon the insured as coinsurer. In the United States this principle is not commonly applied except in marine insurance. In general, when insured property is partially destroyed and the loss does not exceed the amount of the insurance, the insurance company becomes responsible for the entire amount of the loss.

When the loss fixes the maximum amount of indemnity, it is clear that the amount stated in the face of the policy cannot be taken as the measure of the real liability which a company assumes in insuring a piece of property. It is true that there is an abstract possibility that every time a loss occurs it will be large enough to call for the full amount of the insurance, but there is a practical certainty that in many cases loss and indemnity will be less than the face of the policy. It is necessary, therefore, to calculate what is the probable ratio of the indemnity to the amount of insurance, or, in other words, to estimate the probable intensity of the loss. This can be ascertained, not by a study of the characteristics of the insured property, but only by the statistical analysis of the results of past experience. If it were shown by such analysis that for any particular kind of property the indemnity in a large number of cases had been on the average one-half the amount stated in the face of the policy, then the amount the insurance company would actually have at stake in a policy issued on property of that kind would be one-half the amount stated in the face of the policy.

Degree of Probability.—The determination of the probability of the occurrence of the event against whose economic consequences insurance is granted is a much more complex matter than the determination of the amount which the insurance company has at stake on a given policy. It is evident that this probability will vary with the length of time for which the insurance is to be in force; that, other things being equal, the probability of the occurrence of a chance event is twice as great for two years as for one year. It will be convenient to approach the problem by leaving out of consideration the element of time and assuming that all insurance is granted for a uniform period, say for one year. We may then consider what changes, if any, the introduction of the time element will involve.

It is to be noted in the first place that it is impossible to determine the degree of probability by the most exhaustive study of the individual risk. It is easy to see that there is more danger in one case than another—that, e.g., other things being equal, a wooden house is more likely to be burned than a stone house; but what the absolute probability is in either case does not appear. Whether either will be destroyed or not is a matter of chance, though with different degrees of probability. By this it is not meant that the destruction is uncaused, but that the forces at work are so complex that human knowledge is incapable of analyzing them completely.

As it is impossible to determine the degree of probability directly, the attempt is made to discover it in an indirect way. The method is the application of the theory of probability to the statistical results of past experience. The average of the past is the probability of the future. If the records show that for a series of years an event has occurred 10 times a year for every 10,000 opportunities for its occurrence, the degree of probability that it will occur in a future year, conditions remaining unchanged, is denoted by the fraction $10/10,000$, or $1/1000$. The actual number of occurrences in any one year may vary more or less from the probable number as indicated by the average. The probable degree of this variation may be determined from the character of the past series. The greater the fluctuations in the series in the past, the greater the variations of actual from average that may be expected in the future. But whatever the character of the past series, it will always be true that increasing the number of opportunities, provided they are all alike, diminishes the probable variation of the actual number of occurrences in any future year from the probable number as determined by past experiences. To state the same principle in a form more directly applicable to insurance, the greater the number of similar risks included in a group, the smaller the percentage of variation between the average number of losses for a series of years and the actual number of losses for any particular year.

The influence of time on probability under these ideally simplified conditions, i.e., on the hypothesis that all circumstances affecting the degree of danger remain unchanged, is very simple. The probability varies directly in proportion to the time. For n years the probability is n times as great as for one year. If, then, we represent by a the amount which an insurance company has at stake on a given policy, by p the probability of the occurrence of a loss within one year, and by n the number of years for which the company issues its policy, we should have the annual risk assumed by the company represented by the formula $a \times p$, and the total risk for the n years represented by $a \times p \times n$.

The real difficulties involved in the attempt to estimate risk have not yet been touched upon. They are practical rather than theoretical. The determination of future events by the application of the theory of probabilities to the results of past experience proceeds on the basis of two assumptions—that all the cases included, whether past or future, are alike in all essential respects and that the lapse of time brings no change in the factors affecting the degree of probability. Neither of these assumptions corresponds to the fact. As to the first we see that

hardly any two lives or pieces of property are alike in all essential respects. In the case of fire insurance, e.g., the number of circumstances affecting the probability of destruction is very great. It is only by overlooking many minor points and assuming a degree of similarity that does not actually exist that the application of the statistical method is at all possible. The same considerations apply more or less to all other forms of insurance. The common practice is to group risks in classes, according to their more prominent elements, and collect data about the different classes from which to calculate the average. Each class has its own average and its own degree of probability. In estimating an individual risk the average of the class to which it belongs is used as a basis from which the particular risk is calculated by making allowance for any special conditions affecting it. The result is at the best a more or less close approximation to reality.

It is interesting to consider what the effect of the imperfect classification of risks is, both on the insuring companies and on the insured. To the companies it would make no difference of any kind if all adopted the same classification and applied it in the same way. A general underestimating of risks would, of course, lead to ruin. But an imperfect classification, as a result of which there were as many risks overestimated as there were underestimated, would do them no harm. An average of all kinds of risks would be perfectly safe for them, provided all kinds of risks were charged for according to the average. Thus, if there are 10 risks which, when properly estimated, amount to 1, 2, 3, and so on up to 10, the risk assumed by a company which insured them all would amount to 55; but the company is equally safe whether it charges each risk according to its proper value, 1, 2, 3, and so on up to 10, or charges each of them according to the average risk, which is $5\frac{1}{2}$. Where there are competing companies, however, and one estimates risks more closely than the others, the result of imperfect classification is an unfavorable selection of risks. If one company assumed all risks from 1 to 10 at their proper valuation, while another assumed them all at the average valuation of $5\frac{1}{2}$, the former company would get all the small risks, those from 1 to 5, and the latter the large ones, those from 6 to 10. We see, then, that where all insurance companies use the same classification, they have no incentive to perfect their system, but where one company introduces a more accurate classification, others are constrained to do the same or suffer from adverse selection.

The effect of imperfect classification of risks upon the insured is to cause a disproportionate distribution of the burden of insurance. In an ideal system this burden would be so distributed that each person would pay to the company in proportion to the risk he brought upon it. This ideal can never be reached, but the more nearly exact the calculation of risks, the more closely is the ideal approximated. The extent to which the attempt is made to estimate the risks accurately varies in the different forms of insurance. It is probably carried furthest in fire insurance, while in life insurance and other similar kinds comparatively little attention is paid to it. Most life insurance companies recognize only two classes of risks—those which come up to a certain standard and those which fall

below it. The latter are rejected, while the former are all accepted at equal rates for equal ages. Yet in many cases the examining physicians would have no hesitation in declaring that some of those accepted would in all probability live longer than others. The result of this imperfect classification of risks is like that already noted—that in the long run the stronger and healthier lives pay a part of the cost of insurance of those possessing less viability. This injustice is partially eliminated through the return to the insured of a part of their premiums in the form of dividends, of which the longer lives receive the larger share. But that can mean no more than that the premium rates are scaled so high that the excess paid by the stronger lives is sufficient to make up the deficiency on the weaker and leave a remnant to be returned as dividends.

The fact that most insurance companies refuse to insure lives that do not come up to a certain standard suggests the question, What is an insurable risk? The answer clearly is that any risk—i.e., any chance of loss depending on the occurrence of any uncertain event—is insurable, provided there are sufficient data to enable the degree of probability to be estimated, and provided it is of such a nature that the insured cannot too easily make use of the insurance for his own economic advantage. However hazardous the risk, it may be covered by putting the premium high enough. It is sometimes stated that only those risks are insurable which threaten a large number of individuals at the same time. The larger the number of risks, the more closely the degree of probability can be estimated; but it is possible to make some estimate of it on the basis of a very small number of risks and cover the high degree of uncertainty by a high premium rate. No more is it true that the danger must be of such a nature that the loss cannot actually befall a large proportion of the insured at the same time. Here again it is a question of putting the premium rates high enough and accumulating large reserves. If every one of the insured lost at the same time, the company could meet the loss provided it had estimated the risks correctly. Nor, finally, does it make any difference how great the danger of loss may be. It is simply a matter of adjusting premiums to risks. A life insurance company insuring only the lives of consumptives might be on just as sound a financial basis as one which made a specialty of insuring only extra-healthy lives.

But while the theory of insurance is equally applicable to all forms of uncertain losses, its actual extension is limited by practical difficulties. The chief one of these is the impossibility of inducing people to pay the high rates which would make it safe for a company to assume very hazardous risks. Unless there is considerable difference between the uncertainty to which an individual is exposed and that to which an insurance company is exposed from the same risk, the gain from insurance becomes very slight when the cost of conducting the business is added to the first cost of the insurance. It is evident, however, that many risks are still untouched by insurance companies which offer a fair field for their activity.

One other point in connection with the subject of risks deserves brief consideration. While it is the purpose of insurance to reduce the burden which chance losses bring upon society, one of

its consequences is an increase in the actual amount of loss. This is due to the effect of insurance upon the mind of the insured. An honest man may become less careful in protecting his property, a dishonest man may even seek to destroy his for the sake of obtaining the insurance. The danger of the loss through the carelessness or misconduct of the insured is commonly referred to as "the moral risk." It constitutes one element in every risk that the insurance company assumes, and one which in general it is very difficult to estimate. It is for the interest of the company to reduce the danger as much as possible, and it is contrary to public policy to allow them to increase it unnecessarily. Various forfeiture provisions are inserted in policies for the purpose of compelling greater carefulness and reducing misconduct. The chief reliance, however, must be on the strict application of the principle of insurable interest. It may even be practically advantageous to limit the amount of insurance to a certain percentage of the insurable interest in order to create a positive incentive to carefulness and honesty. Serious as the moral risk in insurance is, there can be little doubt that it is exaggerated in the popular opinion. Of all fires in Massachusetts for the period 1906-11, 2.4 per cent proved to be of incendiary origin, and less than one-third of these were set for the purpose of obtaining insurance. Doubtless some fires apparently of accidental origin were really incendiary. Nevertheless, it is a safe estimate that fires for the sake of defrauding the insurance companies represent only between one and two per cent of the total fire loss.

The Premium.—The amount paid to the insurance company by the insured is called the premium. It consists of two parts—the "natural premium" and the "loading." The amount of the natural premium is determined by the risk, or, to speak more precisely, it equals the risk. The loading is the amount added to the natural premium to cover the cost of insuring the risk. In other words, the natural premium pays the losses and the loading pays the expenses. The insured in any company must pay all the losses and all the expenses of the company, interest on the capital invested in the business included. This cost of administration is distributed among all the insured, each contributing a certain proportion of his natural premium.

It is interesting to consider what part of the entire premium is natural premium and what part is loading. In life insurance natural premiums are actually calculated and loadings added to them. In many forms of insurance, however, no such division is made in practice, but the whole premium is estimated together. In such cases the proportion of loading can be discovered only by an examination of the expense account, which will reveal what part of the receipts from premiums has been returned to the policyholders and what part has gone for expenses. It will be found that the proportion of loading varies a great deal from one kind of insurance to another and from one company to another. In some cases the loading does not exceed 20 per cent of the natural premium, in others it is as high as 100 per cent.

While from the social point of view the loading represents the cost of insurance, for a person seeking insurance the entire premium constitutes its price. He is consequently interested in the question whether the competition of insur-

ance companies may be relied on to reduce the price to the lowest point consistent with absolute safety. It is evident that the competitive principle would operate in this field at a tremendous cost. Competition works through the elimination of the least efficient. The failure of an insurance company, however, may entail a far greater loss on the insured than it does on the insurers. The severity of the process of elimination has been greatly mitigated by the action of legislatures, many of which have provided for the compulsory winding up of the affairs of a company on the appearance of certain indications of danger, while the company is still able to take care of the insured by reinsuring its risks. Furthermore, the very uncertainty which constitutes an essential element of the insurance business makes unrestricted competition particularly dangerous. During a series of good years, when losses ran below the average, there would be an almost irresistible tendency to reduce the price of insurance to the level made possible by the prevailing favorable experience. If years of unusually high losses followed, as they naturally would follow, the company would find itself hard pressed to meet its obligations. Thus there is always the danger that competition would reduce the cost of insurance below the margin of safety.

Is competition the force that is actually regulating the rates of insurance? There is keen competition among the agents of different companies, but it does not manifest itself in a fall in rates. The agents have no authority to make reductions. There are occasional periods of actual competition between companies, but for the most part they retain schedules of rates founded on a basis reached by common agreement. The statute books of the different States contain many laws which were enacted for the purpose of preventing such agreements and securing competition, but they have accomplished little. The opportunities for secret agreements are too numerous. For the most part the companies do not seek to extend their business by lowering rates; they rely on the persistence of their agents and the attractive features of their policies.

The Insurance Contract.—The agreement between the insurer and insured constitutes the insurance contract. This contract is of a kind which in some respects resembles a wager, and a few writers have been misled into identifying the two forms. In both cases one party to the agreement binds himself to pay a certain sum on the occurrence of an uncertain event. The event may be the same in the two cases. Thus, a house may be insured by its owner and at the same time may be the subject of a wager between two disinterested persons, so that if the house burns, each of the two men receives the amount stated in the agreements. The illustration brings out the fundamental distinction between insurance and gambling. The one is the transfer of an existing risk from the person exposed to it to another party; the other is the voluntary creation of supposedly equal risks by two persons, neither of whom was before exposed to the risk. It is this principle that underlies the legal doctrine of insurable interest, in accordance with which the courts distinguish between insurance contracts and wagers. In the case of life insurance, as we have seen, this doctrine is very imperfectly followed.

The real subject matter of the insurance con-

tract is security. The insured buys security by the payment of the premiums. The insurer performs his part of the contract just as much in the case of those of the insured who escape loss, and to whom consequently no indemnity is paid, as in the case of those who suffer loss and receive indemnity from the insurer.

The insurance contract is one of good faith. The insured is bound to reveal to the insurer all circumstances within his knowledge which have any bearing on the possibility of loss. The willful misrepresentation of any material fact, i.e., of any fact affecting the probability of loss, usually works the forfeiture of the insurance.

The insurance contract is a personal one; it is between the company and the person taking out the insurance. A transfer of the insured property does not transfer the insurance, but renders it void, since the insured no longer has the insurable interest. In practice, however, insurance companies frequently allow the transfer of insurance to be effected by indorsement. This personal character of the contract makes it possible to control to some extent the moral risk. If the insurance went with the property insured, the company would have no protection against the passing of the insurance into the hands of a person whose reputation showed him to be an undesirable risk.

The Policy.—The writing in which the insurance contract is set forth is called the policy. This consists of two parts—the application of the person desiring insurance and the agreement of the company to give it. The application is expressly stated to be a part of the contract. In it the applicant sets forth all the material facts about the risks which he desires insured. Some of the statements are representations, others are warranties. In many policies there is an express provision that every statement of the insured in his application shall be regarded as a warranty. A misstatement in a warranty, whether it is material or not, works forfeiture of the policy. A misstatement in a representation does so only when it concerns a material fact. A misstatement is material whenever it induces a company to enter into a contract which it would not have accepted if the truth had been known. Common forms of representations or express warranties are the statement that there is no other insurance upon the property, statements as to the location of the property, or as to the character of the business carried on in or upon the property, and, in the case of life insurance, statements as to business or condition of health of the insured. In contracts of insurance other than marine insurance, warranties must appear directly or by reference upon the face of the policy; but in marine policies there are three important warranties implied by law, irrespective of the terms of the policy. See MARINE INSURANCE.

Waiver or Estoppel.—Growing out of the doctrine of representation and warranties is the important doctrine of waiver, or estoppel as it is somewhat incorrectly called. As the effect of misrepresentation or breach of warranty is to give the insurer the right to avoid the policy, the right itself may be waived either expressly or by the contract of the insurer. Thus the receipt and acceptance of a premium by the insurer with knowledge by him of a breach of warranty waives the breach and renders the contract valid.

Upon similar grounds, if the insured gives

imperfect or ambiguous answers to the questions asked by the insurer at the time of effecting the policy, the insurer is declared to have waived fuller or more specified answers and cannot avail himself of a defective answer as a ground for avoiding the contract. The question of waiver, or estoppel, has frequently arisen in cases where the written application for the insurance policy, which is made a part of the policy, is filled in by the agent of the insurer, although signed by the applicant. If the agent does not correctly transcribe the answers of the applicant for insurance, it is open to the insurer, in event of loss, to rely upon the untruth of the written answers as a breach of warranty avoiding the policy. In many States the courts have held that the insurance agent, although in fact doing an act expected of and attributed to the insured, remains the agent of the insurer, and that the insurer, through his agent having notice by the answers of the insured of the matter relied upon by the insurer as a breach of warranty, and having after such constructive notice issued the policy with full knowledge of the alleged breach of the written terms, is estopped from relying on the breach as a defense to his liability on the contract of insurance. While the doctrine undoubtedly works out substantial justice, it has been subject to severe criticism on the ground that it is not a true estoppel (see ESTOPPEL) and that it violates the parole evidence rule (see EVIDENCE) in permitting the insured to contradict the written answer contained in his application.

Life insurance policies are freely assignable, and if issued in good faith to one having an insurable interest, the assignee need not have an insurable interest in the life insured. Policies of marine insurance are also freely assignable; but as the marine policy is purely one of indemnity, it is necessary that the assignee should acquire the interest insured in order to recover on the policy. Fire insurance policies, owing to the importance of the personality of the insured, can be assigned only with the consent of the insurer.

The policy contains precise statements as to the conditions under which the insurance will be forfeited, the conditions under which the indemnity becomes payable, and the procedure by which the insured is to prove loss and obtain the indemnity. Sound policy would seem to require that all these conditions should be of such a nature that they would put no unnecessary obstacles in the way of honest insurance, and set forth so clearly that the insured could have no excuse for misunderstanding the exact nature of the contract he has entered into. The better class of insurance companies have undoubtedly aimed to give the insured fair treatment. In too many cases, however, companies have shown a disposition to take advantage of obscurities or technicalities in the contract to avoid paying honest losses. So prevalent has this practice been that the legislatures of many of the States have considered it necessary to come to the protection of the policyholders. For example, the practice of printing some essential feature of the policy in very small type so that it easily escaped the notice of the insured has been met by legislation prescribing the smallest size of type that may be used; the requirement of formalities in proving claims which in many cases the insured are unable to fulfill has been declared illegal and not binding.

In interpreting all the claims of the insurance policy it is a general rule that, inasmuch as the insurer in fact proposes the policy and fixes the terms, the terms of the policy will be construed most strongly against the insurer. Thus, a policy which stipulates that the building insured is "detached 50 feet," in the absence of express language to the contrary will be deemed to mean detached 50 feet from any building affecting the risk, and not from any building irrespective of the character.

Kinds of Insurance Companies and their Characteristics. *Public and Private Insurance.*—Insurance companies may be classified in various ways according to the characteristics on which the classification is based. Thus, with respect to the nature of the insuring body, public insurance may be distinguished from private insurance. Public insurance is insurance issued by a body politic, whether nation, State, or a minor civil division; private insurance is insurance issued by a private person or by a group of private persons. Public insurance will be discussed in the concluding part of this article.

Mutual and Joint-Stock Insurance.—Private insurance may be further subdivided into mutual insurance and insurance for gain, sometimes called commercial insurance. In its simplest form a mutual insurance company is based on an agreement entered into by each member to pay a share of the loss sustained by any other member from certain specified causes. The proportion to be paid by each member is based on the risks to which he himself subjects the company. Mutual insurance is seldom found except in the case of risks which are nearly uniform in character, so that the degree of risk varies almost invariably with the amount of insurance. Thus we find one class of mutual fire insurance companies insuring cotton mills, another insuring packing houses, a third insuring farm buildings, and a fourth confined to city dwellings. It is the comparative uniformity of the risks involved which has been partly responsible for the general application of the mutual principle to life insurance.

When the funds to reimburse losses are collected by assessment after the occurrence of the loss, the annual contribution of each member, i.e., the cost of his insurance, is more or less uncertain. As has already been pointed out, insurance in a mutual company collecting its funds in that way is the substitution of a smaller degree of uncertainty for a greater degree, of the prospect of making small annual payments varying within a comparatively slight range for a much smaller probability of a far greater loss. The more regular the loss from year to year, the less are the fluctuations in the assessments, and therefore the more advantageous the insurance on the mutual plan. The relatively great regularity of loss from year to year has made possible the application of the assessment principle to life insurance to a far greater extent than to other kinds.

Very few mutual insurance companies are now run on the pure assessment principle. In nearly all companies there is some accumulation of reserves which may be used to equalize the premiums in spite of considerable fluctuations in the amount of loss. Some of the older companies, especially in fire insurance, have thus accumulated very large reserves, which enable them to return to the insured in the form of dividends a part of the premiums collected.

It is in life insurance that the mutual principle is applied most extensively. The practical difference between the old-line mutual companies and the joint-stock companies is very slight. The capital stock of a stock company is of importance only so long as it constitutes a considerable part of the fund which serves to guarantee sufficient security for the protection of the policyholders.

From the point of view of the policyholder, a more important difference consists in the fact that the stockholders in a joint-stock company have a control over the investments of the company which may be exercised with little regard to the interests of the insured. (See LIFE INSURANCE.) The stockholders may, however, give a certain representation on the board of trustees to the policyholders. Thus, in 1906, the charter of the Equitable was so amended as to give the policyholders the right of electing a majority of the board of trustees.

Mutual companies are most numerous in fire insurance. These are small companies, usually confining their operations to a limited area and to some one or two classes of risks. The reason for their existence is usually to be found in the belief, whether justifiable or not, that the stock companies are not managed as economically as they ought to be, thus enabling the mutual companies to make a saving in the cost of management; and that the particular kind of property in question is improperly classified and the premium rate in consequence unjustifiably high.

Individual Underwriting.—Insurance for gain is most commonly issued by joint-stock companies, but sometimes by individuals. There is no reason why insurance issued by a single person might not be as secure as that issued by a joint-stock company, provided the insurer sets aside a sufficient guarantee fund. As a matter of fact, however, comparatively little insurance is written by individuals. Some of the States have gone so far as to prohibit the practice entirely, influenced largely by the constitutional and other difficulties in the way of exercising adequate supervision. In marine insurance, however, individual underwriting is still common. In the English Lloyds it is the prevalent form of insurance. Within recent years attempts have been made to establish an ostensibly similar form of underwriting in the fire insurance business in the United States. The promoters of the American Lloyds have claimed exemption from the jurisdiction of the insurance departments on the ground that they were not insurance companies within the meaning of the law. They still enjoy this exemption in a few States, but there is a general tendency to bring them under the same regulations as apply to joint-stock companies. Few of the Lloyds survive after their freedom of action is thus restricted. It is to be noticed, however, that the failure of so many of them is due, not to the practice of individual underwriting in itself, but to the fact that the ostensible reserve for the protection of the policyholders has usually been of little real value.

The most obvious classification of insurance companies is on the basis of the kinds of risks which they assume. Thus, we have fire insurance companies insuring against loss by fire, marine insurance companies against loss at sea, plate-glass insurance companies against the breaking of plate-glass windows, and so on. Some companies confine their business to one kind of risk, while others assume two or more

kinds. This division of the field of insurance among different companies is purely a matter of practical convenience of administration. There is no a priori reason why one company should not issue insurance against all kinds of insurable risks; in fact, the theoretical arguments are all on the side of such action. So long as each risk is correctly estimated according to the principles already pointed out, the more risks the company assumes the more cheaply it can afford to grant insurance, since the element of uncertainty in the amount of loss to be expected constantly diminishes as the number of risks increases. The combination of fire and marine insurance on the one hand, and of life and accident insurance on the other, is by no means unusual, and outside of these forms the tendency seems to be for companies to extend the field of their activity. Thus the Fidelity and Casualty Company of New York has a charter authorizing insurance of "any contingent event whatever, life, fire, and marine risks excepted, which may be the subject of legitimate insurance." The company actually carries on the following kinds of insurance: accident, burglary, employers' liability, fidelity and surety, plate-glass, and steam-boiler.

By far the largest part of the insurance in force is for protection against loss through the destruction of property by the action of natural forces. This is the case, e.g., in fire, marine, plate-glass, tornado, steam-boiler, and elevator insurance, and in most forms of so-called agricultural insurance, such as insurance of live stock and growing crops. The chief differences between these various forms are connected with the technique of the business rather than with its general principles. Thus, the body of data from which to calculate average losses is much smaller in some kinds than in others; the difficulty of determining the amount of loss varies greatly from one kind to another; and the moral risk involved in the various kinds is very unequal.

The class of insurance which ranks next in importance is made up of those forms which undertake to give indemnity for the loss of income through the sickness, injury, or death of the person insured or his inability to obtain employment. Life insurance is treated in a separate article under that title. Other forms of insurance in this class deserve brief notice on account of their great social significance.

Sickness and Accident Insurance.—Sickness insurance and accident insurance are carried on under various forms. There are a number of joint-stock insurance companies in the United States and in foreign countries which issue accident insurance policies, and a considerable number which guarantee weekly indemnity in case of sickness from certain specified diseases. Many fraternal associations and trade-unions assure their members indemnity for loss of income through accident or sickness. Several large business corporations have established funds for the insurance of their own laborers against accident or sickness or both, in some of which membership is voluntary, in others compulsory. Finally, several European countries, following the lead of Germany, have introduced a system of governmental insurance of workmen against certain contingencies, sickness and accident included. Private accident insurance was first introduced into the United States in 1863, though one or two railways had previously at-

tempted to sell tickets insuring travelers over their own lines. The development of the business was very rapid. It was taken up by many insurance companies and for a time by several railroads. Short-time insurance of travelers still constitutes a very considerable part of the business of accident companies, though general policies, usually covering a year, are now common. In many companies these policies are limited to accidents which result in death or total disability. Some companies, however, issue policies which cover also certain specified injuries of a permanent nature, such as the loss of an eye, a hand, or a foot. The indemnity varies with the nature of the injury and the amount of the premium.

Commercial sickness insurance is as yet offered by a small number of regular insurance companies in the United States. The policies generally guarantee a weekly indemnity during illness or for a limited period, in case of certain specified diseases. Sometimes the company undertakes to pay a stated lump sum for a permanent disability such as total blindness or paralysis.

The moral risk constitutes a very large element in both accident and sickness insurance, especially in the case of laborers with small incomes. Merely limiting the indemnity to an amount less than the wage of the laborer does not remove all incentive to simulate or even bring about the disability which entitles the insured to indemnity. He is comparing not merely daily indemnity with daily wage, but indemnity and idleness with wage and 8, 10, or 12 hours of work. Experience has shown that the moral risk can be much better controlled where the insurance is granted by a body like a trade-union or a lodge. Here the knowledge the members have of one another's affairs affords a more efficient check upon malingering than any which a regularly established insurance company is able to use. Hence it is not surprising to find that by far the largest part of the insurance of workers against sickness and accident, in those countries where the government has not taken up the business, is in the hands of these organizations of the laborers themselves. For the development of governmental sickness and accident insurance, see *WORKINGMEN'S INSURANCE*.

Employers' Liability Insurance.—Closely allied to accident insurance is the insurance of employers against claims for damages arising from accidents to their laborers, so-called employers' liability insurance. This form of insurance, like the preceding, originated in England. It was introduced into the United States in 1886 by a London insurance company. There are now a number of companies engaged in the business in America. They no longer confine their operations to the employer's liability for accident to his employees, but cover also liabilities for accidents to persons not in the employ of the insured. Railroad corporations, construction companies, manufacturing concerns, protect themselves in this way. The risk varies greatly in different occupations and there is a corresponding variety of premium rates. The schedule of classifications adopted by the companies embraces nearly 1000 different kinds of risks. The development of the business in recent years has been greatly accelerated through the general extension by statute of the liability of the employer for indemnity for accident

which he was not obliged to indemnify under the common law.

Unemployment Insurance.—Insurance of workers against loss of income on account of lack of employment presents greater difficulties than those involved in accident insurance. The moral risk here becomes very great. Such insurance has never been carried on successfully by commercial insurance companies. Many of the trade-unions pay out-of-work benefits to their members, but the business is not run on scientific insurance principles. In none of the benefits paid by the trade-unions is there any attempt to correlate the risk and the assessment, nor is there any separation of the insurance fund from the other funds of the union. Unemployment insurance has been tried by some of the Swiss communes, but with poor success. It is an unfortunate fact that insecurity of employment, which constitutes such a serious evil in the life of laborers, is a form of uncertainty with which it is extremely difficult for insurance to deal. See *WORKINGMEN'S INSURANCE*.

Fidelity and Surety Insurance.—Of the remaining forms of commercial insurance two are of special interest—fidelity and surety insurance and credit insurance. Fidelity insurance, according to the distinction made by the New York State Insurance Department, consists in giving bonds for the honesty of employees and public officials, while surety insurance consists in going on the bonds of administrators and executors of estates. This kind of insurance is interesting as illustrating the regularity in human conduct to which Quetelet first called attention. It is only because of the comparative regularity in the annual number of defalcations and similar crimes that the insurance company is able to assume the risk of such occurrences for a premium small enough to make the business practicable.

Credit Insurance.—Credit insurance undertakes to indemnify merchants and business men who give credit for losses through bad debts. This form of insurance was first introduced into the United States about 1890. The successful prosecution of this form of underwriting is extremely difficult, owing to the high degree of moral risk involved. To guard as far as possible against the abuse of the system by the insured, a very ingenious method was adopted. The insurance applied only to credits given to persons with a rating in the mercantile agencies, and the amount of credit to be given to them was usually limited to 20 per cent of their lowest capital rating. Moreover, the insurance did not apply to any particular credit, but was based on the average loss for a year. The person applying for insurance was required to furnish a statement of the amount of his credits and the amount of his losses from bad debts for a number of years, and the average annual ratio of losses to credits was ascertained. The insurance applied only in those years when the ratio of loss to credits exceeded the average, and covered only the excess of the loss above the average.

There are many other interesting applications of the insurance principle which must be passed over without notice. As indications of its possible development may be mentioned the following instances. The saloon keepers in a particular city form an association which undertakes to pay an indemnity to any member who is unable to secure a renewal of his license; the

newspaper publishers of Finland enter into an agreement to indemnify one another for losses incurred through the suppression of particular issues of their papers by the order of the Russian government; finally, the manufacturers of Austria bind themselves to pay indemnities for losses occasioned by strikes instituted by workers in their factories.

Preventive Activity of Insurance Companies.—In comparing premiums and indemnities for the purpose of ascertaining the actual cost of the administration of the insurance business, it is necessary to bear in mind the fact that insurance companies carry on other forms of activity besides guaranteeing indemnity. One of the most prevalent of these forms is their preventive activity, under which name may be included all the efforts which the companies make to prevent the occurrence of the event against whose consequences they grant insurance. The relative amount of such activity varies greatly in the different kinds of insurance. There is very little of it in life insurance. In accident insurance we find the companies distributing books and pamphlets containing information as to the first aid to the injured. It is in the insurance of property, however, that such activity is most common. In the case of elevator and steam-boiler insurance a very considerable part of the expense of management is due to the systematic inspection of insured elevators and boilers which the companies carry on.

In the early days of insurance the distinction between insurance and prevention was not very sharply drawn. The early English fire insurance companies, e.g., laid special emphasis on the service which they rendered the community through the maintenance of fire brigades. A survival of this confusion of ideas can be seen in the legislation of many of the States compelling fire insurance companies to support wholly or in part the fire service of the cities. Whatever payments the companies make for such service are made out of the funds collected from the insured. The injustice of compelling a limited number of property owners, the insured, to support such an institution as the fire department, intended for the benefit and use of the whole community, seems too obvious to need argument.

While life insurance companies do little or nothing to prevent the occurrence of loss, only a small part of their activity can be strictly called insurance. A very large proportion of the premiums they receive are rather in the nature of investment. The relation between the two forms of activity is discussed in the article on LIFE INSURANCE.

Reinsurance.—The custom of reinsurance which prevails to a great extent among insurance companies may be briefly described. To avoid the possibility of being called upon to pay excessive indemnities at any time, insurance companies are accustomed to limit the amount of insurance that they will carry on any one risk. The maximum risk carried by one company may be \$10,000, that of another company \$50,000. If a company insures a piece of property for more than the maximum risk it carries, it protects itself by reinsuring the excess in another company. The practice of reinsurance is naturally seldom found among mutual companies, but it is very common among stock companies. Many of the latter have from 10 to 20 per cent of the

risks they have assumed reinsured, while occasionally one is found with three-fourths of its risks so protected. Conversely, there are companies which devote themselves entirely to the practice of reinsurance, issuing no policies directly to property owners.

Relation of the Government to Insurance. The economic and social value of insurance can hardly be overestimated. The application of the insurance principles in the production of wealth reduces materially the cost of commodities and services; the proceeds of life insurance policies keep many families from want or charity; while the peace of mind which insurance creates is certainly of great value. It is therefore of great importance that the system should be widely extended and that as many people as possible should enjoy its advantages. It is pertinent to inquire whether the management of insurance by private companies is as efficient as it ought to be; whether there are any a priori reasons for expecting better results from governmental management; and what has been the experience of such governmental insurance offices as have been already established.

The first requisite of a satisfactory system of insurance is security. In this respect no criticism can be brought against the older companies in the established lines of insurance. It must be admitted, however, that while many companies have of their own initiative adopted such methods as are calculated to secure their stability, many others have been reckless or even dishonest in their management. The total amount of money collected in the form of insurance premiums by companies which have failed to make the agreed returns to the insured is very large. The general high level of security in the insurance business in the United States is due to no small extent to the stringent requirements of the insurance departments in the various States.

The second requisite of a satisfactory system of insurance is cheapness, premium rates as low as is consistent with safety. In this respect the results of private underwriting leave much to be desired. As already pointed out, unrestricted competition would be both an imperfect and an extremely costly method of regulating rates. As a matter of fact, in the United States, competition has comparatively little influence in fixing rates or compelling economies of management. In all lines of insurance the rates are fixed by agreements, and the attempts of the legislatures of various States to reinstate competition by legislative fiat accomplish practically nothing. It may be true that in many cases the rates are none too high to cover losses and expenses as insurance companies are at present managed, but in many cases losses and expenses are unnecessarily high. It is one of the advantages of unrestricted competition that it forces the adoption of economical methods. In the insurance business, however, such competition as survives does not result in cheaper methods and a lower cost of insurance, but rather in the expenditure of larger sums in the attempt to secure new business, and in the presentation of more attractive but more expensive methods of settling policies. Moreover, altogether aside from the question of cost within a single company, large numbers of companies, and the consequent multiplication of managers, agents, and material equipment, greatly increase the cost of insurance. There is no other line of economic

activity in which the gain from production on a large scale is so great as in the insurance business.

With respect to security, governmental insurance clearly has the advantage. Nothing could be more secure than the insurance policy guaranteed by the government. With respect to cheapness the case is not so simple, though the advantage would probably be with the government office. The possible saving in the actual management of the business would be enormous, and the large scale on which governmental insurance could be carried on would greatly reduce its cost. It would be unnecessary for the government to accumulate large reserves when the number of the insured had become so great that the amount of loss was practically uniform from year to year. The only reason why there can be any uncertainty as to the comparative economy of governmental insurance and private insurance is that the government is generally a wasteful manager; but in this particular case the opportunities for economy are so numerous that it seems hardly doubtful that the net cost of insurance would be lower if the entire business were in the hands of the government. The difficulties in the way of governmental insurance are of a political nature, and that they are very serious cannot be questioned. The business would present unlimited opportunities for the manifestation of favoritism for the purpose of furthering personal and political ambition; so that while an ideally managed governmental insurance would be far preferable to the present system of private underwriting, the political evils which would result might be so great that they would overbalance the economic gain.

The experience of the governmental offices already established does not afford conclusive evidence either for or against public insurance. Public fire insurance offices have been maintained for many years by some of the Prussian towns and by some of the Swiss communes. All sorts of methods have been tried—governmental monopoly with compulsory insurance, governmental monopoly with voluntary insurance, compulsory insurance with choice of public or private office, and voluntary insurance with the same choice. The experience of the public offices is, on the whole, unfavorable to governmental insurance. The governments have generally found it necessary either to introduce a large amount of formality and supervision, thus rendering the business unpopular, or to adopt a loose classification of risks, which, in cases where the competition with private companies was allowed, resulted in the better risks going to the private companies with a more accurate classification and the poorer risks going to the government office. Finally, all these public offices are on so small a scale, generally limited to a single town or commune, that they have failed to realize the great advantage which comes from a large number of well-distributed risks, viz., the relatively slight fluctuation in loss from year to year.

The English government has for nearly 50 years offered life insurance to its citizens through the Post Office Department. It has made no attempt to develop the business, either through personal canvassing by its agents, after the manner of private companies, or through advertising. The amount of business written has been very small. This experience, however, is not conclusive as to the results of a similar experiment in the United States, where the

habit of insurance is more thoroughly established than in any other country, except possibly New Zealand.

New Zealand furnishes the only example of a thoroughly successful governmental life insurance office. In this case, however, the success of the office has been largely due to the deliberate adoption of the methods of private companies, especially the solicitation of business through agents paid by commissions. This has prevented the office from realizing any great economies of management, and its rates do not differ much from those of private offices. New Zealand is said to have a greater per capita amount of life insurance than any other country, and a little over half the business is taken out through the public office.

The only feasible alternative to governmental management of the insurance business is governmental regulation of private companies. This is the method actually in use in nearly all civilized countries. The degree of regulation and supervision varies greatly from one country to another. There is as little of it in England as in any country, and as much of it in the United States as anywhere. In the latter country each State regulates the business within its own borders and imposes such restrictions on the activities of the companies as it sees fit. The most general provisions are the requirements of annual reports from the companies, exhibiting in detail the business for the preceding year, and the requirement of a reserve bearing a certain ratio to the amount of insurance in force. Some of the States have shown a disposition to impose vexatious conditions upon the companies, the only effect of which is to increase the cost of insurance within their borders. But however reasonable the laws of each State, considered by themselves, may be, the variation in the requirements of different States and the multiplication of reports and examinations impose a great deal of unnecessary expense on the companies, all of which in the end must come out of the policyholders. Insurance men and State officials alike join in the attempt to bring about greater uniformity among the requirements of the different States. It would be a great gain in this respect, as well as for other reasons, if the national government would take over the regulation and supervision of the insurance business. Unfortunately, the United States Supreme Court, in the case of *Paul v. Virginia*, has ruled that the business of insurance is not commerce; that consequently it is not interstate commerce when an insurance company incorporated in one State carries on business in another; and that, therefore, the regulation of the business is reserved to the individual States.

Bibliography. The English and American writings on insurance are nearly all of a technical or practical character. The only general work of any great merit in the English language is Walford's *Insurance Cyclopædia* (London, 1871-80). Of the numerous general works in French and German, the following are among the best: Chaufton, *Les assurances* (Paris, 1884); Emminghaus, "Versicherungswesen," "Feuerversicherung," "Lebensversicherung," in Conrad's *Handwörterbuch der Staatswissenschaften*, vols. vi, iii, and iv (Jena, 1890-94); Brämer, *Versicherungswesen* (Leipzig, 1894); Wagner, "Versicherungswesen," in Schönberg's *Handbuch der politischen Oekonomie*, vol. ii (Tübingen, 1896-98); Moldenhauer, *Versicherungswesen* (Leip-

zig, 1905). The work which, when it is completed, will undoubtedly be the most erudite and exhaustive in any language is the *Handwörterbuch des gesammten Versicherungswesen*, edited by Baumgartner, the first volume of which was published in 1897-98 (Strassburg). The annual *Cyclopedia of Insurance in the United States*, published by the Insurance Journal Company of Hartford, Conn., contains valuable digests of the insurance legislation of the various States and of judicial decisions affecting insurance, and also descriptions of the forms of policies issued by the different life insurance companies. Ehrenzweig's *Assekuranzjahrbuch* (Vienna, 1880) gives information about insurance in European countries. For statistics of the United States the best source of information is the *Reports of the insurance departments of the various States*. Among the more valuable of these reports are those of Massachusetts, New York, and Ohio. The *Spectator Year-Book* (New York, 1869 et seq.) gives full information about fire insurance in the United States. Consult also Martin, *History of Lloyds and of Marine Insurance in Great Britain* (London, 1876); Hugo Schramm-Macdonald, *Feuerversicherungswesen* (Dresden, 1883); Gow, *Marine Insurance* (London, 1895); Griffin, *Library of Congress List of Works Relating to Government Regulation of Insurance* (Washington, 1906); Richard, *Théorie mathématique des assurances* (Paris, 1908); Manes, *Einführung in die Versicherungspraxis* (Tübingen, 1908); Huebner, *Property Insurance* (New York, 1909); Gephart, *Principles of Insurance* (ib., 1911); id., *Insurance and the State* (ib., 1913). See ACCIDENT INSURANCE; FIRE INSURANCE; LIFE INSURANCE; MARINE INSURANCE.

INSURANCE OF TITLES. See TITLE INSURANCE.

INTAGLIO, in-täl'yo, *It. pron. ên-tä'lyô* (It., incising, cutting into). The opposite of cameo (q.v.). While the design of a cameo rises above the background, that of an intaglio sinks below it. (See GEMS.) In other words, a cameo is a relief (see RELIEF SCULPTURE), an intaglio is a hollow. In making a wood engraving (q.v.) background is cut away, leaving the part that is to print in relief like the design of a cameo; in making a copperplate the surface is cut into with burin or acid, leaving the design hollowed out like that of an intaglio. (See ENGRAVING.) In order that seals (see SEAL) may be in relief, the matrixes of the signet rings or stamps from which the impressions are made on wax or lead or clay, or in ink on paper, are cut intaglio.

INTAR'SIA. See TARSIA.

INTEGRAL CALCULUS. See CALCULUS.

INTEGUMENT (Lat. *integumentum*, covering, from *integere*, to cover, from *in*, in + *tegere*, Gk. *στέγειν*, *stegein*, to cover; connected with OHG. *dah*, Ger. *Dach*, Icel. *pak*, Eng. *thatch*). The external coating or skin of animals. The term "integument" is also sometimes used synonymously with cell membrane, a product of secretion which serves for the support or protection of the cell.

Lower Orders. The cell integument found in certain Infusoria consists of a chitinous or cellulose membrane, which may even harden into a shell by the impregnation of carbonate of lime. In *Diffugia* this membrane becomes a case by its union with small foreign particles. The integument or body epithelium (epidermis) of the Cnidaria consists of one layer of epithelial cells.

These cells may be ciliated or flagellate, and in this layer occur the stinging cells or nematocysts (q.v.). These stinging cells may be grouped in masses, in which case they are known as stinging knobs or stinging batteries. Moreover, in the ectoderm sensory, nerve, muscle, gland, and pigment cells may arise. In the flatworms a body epithelium occurs among this type only in Turbellaria. It is ciliated, and in it are glands, the so-called rods or rhabdites. In trematodes and cestodes its place is taken by an elastic cuticular membrane, usually perforated by fine pores. In nematodes and *Sagitta* it is a single layer, in some species ciliated. The entire outer surface of mollusks is covered by a single layer of epithelium which may be ciliated in regions not protected by a shell. In this layer are many unicellular glands or the ducts of others that have sunk below the surface of the epithelium. The shell of mollusks is a calcified cuticle. Stinging cells may occur in the integument of gastropods, although the pigment usually occurs in the deeper cutis. The integument of cephalopods is a cylindrical epithelium, and is made up of deep-lying connective tissue which contains contracting and expanding pigment cells, the chromatophores. The integument of echinoderms consists of a unicellular epithelium, and beneath it a layer of connective tissue of mesenchymatous origin. In the latter the skeletal structures develop. In some forms (Crimoidea, Ophiuroidea), particularly in adult stages, there is no sharp line of distinction between epithelium and cutis. The epithelium is covered by a cuticle, and in Asteroidea and Echinoidea it is ciliated over the whole surface; in other forms usually the food groove alone is ciliated. Unicellular glands and pigment cells also occur in the epithelium; while sensory cells, nerve ganglia, and fibres differentiate out of it. The integument of annelids consists of the hypodermis or body epithelium and an outer cuticle. The latter may be thin, with pores for cilia to pass through, or it may be a thick protective covering and offer support for the attachment of muscles. It may be chitinous or even calcified into a hard shell, and is either produced by gland cells in the hypodermis or else it is a product of the metabolism of these cells. The hypodermis may be so much reduced as to be little more than a strong cuticle, as in the case of the Polyzoa, where it is hardly recognizable. A basal membrane sometimes underlies the hypodermis.

Arthropods. The chitinous secretion of the hypodermis is still more strongly developed in arthropods than in worms. It covers the whole surface of the body and appendages, and is known as the exoskeleton, and to it the muscles are attached. As its presence is a barrier to the increase in size of the animal, it is thrown off from time to time, and its place is taken by a soft, flexible coating which has developed underneath it. The new coating soon hardens when exposed on the surface. See MOLTING.

Vertebrates. The integument or skin of vertebrates is an organ of much extension, but of little thickness. Physiologically it is one organ because its parts are closely united together and act together, and in most vertebrates they are easily separable from underlying tissues. The integument functions as an organ of support and protection to internal tissues and as an organ of secretion and excretion. Morphologically it is made up of organs of widely

dissimilar origin and histological character. It is divisible, however, into two layers. The outermost of the two is derived wholly from the ectoderm and consists of an epithelium of cuboidal or flattened cells. The inner layer is derived from mesenchyme and consists chiefly of fibrous connective tissue in which there is a large amount of secreted substance. The outermost layer is called the epidermis, the innermost the derma (or dermis), also corium or cutis. Each of these parts contains other organs.

Three types of epidermis may be distinguished: (1) that of *Amphioxus*; (2) that of fishes; and (3) that of the Amniota. The Amphibia occupy a middle ground between the second and third, in that their epidermis is at first fishlike and later similar to that of the Amniota. In the first type the epidermis consists of a single layer of cuboidal cells—the condition of the epidermis in all invertebrates. This type may be called unistratous. The second and third types differ from the first and agree with each other in that they possess more than one layer of cells; hence they may be called multistratous. The epidermis of fishes consists of many layers of columnar or cuboid cells, the more columnar ones lying at the base. There is a cuticle over the free surface provided with fine pore canals. From the essential similarity of the epidermal cells throughout, the epidermis cannot be divided. This type may therefore be called homostratous. The epidermis of animals that live in the air (Amniota) has become modified to withstand desiccation. There may now be distinguished in man, e.g., two regions in the epidermis—a deep one composed of active cuboidal cells and a more superficial one of flattened cornified cells. The first is known as the stratum mucosum, the second as the stratum corneum. These cornified cells have become such through gradual flattening of the deeper-lying cells, accompanied by a change in chemical constitution by which the cells are metamorphosed into keratin. These cells are gradually worn off and are replaced from the layers below.

In seeking a knowledge of the origin of the many-layered epidermis we must study the comparative ontogenetic and phylogenetic development of epidermis. At the time of gastrulation the ectoderm of mammals, from which alone the epidermis is derived, is unistratous. In this condition it is like the epidermis of all invertebrates. In this condition, too, it persists in *Amphioxus* to an adult stage. Quite early in the embryonic development of mammals, however, the nuclei arrange themselves in two layers as though forced to do so by pressure. Such a condition prevails in the human embryo of two months. (See EMBRYOLOGY, HUMAN.) The more superficial layer consists of flattened, transparent, hexagonal elements—the deeper layer of smaller cells; so that already a separation into a “stratum corneum” and “stratum mucosum” has appeared. This partly differentiated condition of the epidermis occurs in the amphibian larvæ. In the adult Amphibia the epidermis may become many-layered. The outer layer is cast from time to time in one piece in Amphibia and Reptilia. In birds and mammals the cornified cells are being constantly shed. In *Amphioxus* and fishes the epidermis is provided with a cuticula, while in some larval forms and in certain regions of adults it is ciliated. The epidermis is separated from the cutis by a basement membrane.

Types of Derma. The derma is composed of connective tissue and is derived from mesenchyme. This is a more compact layer than the looser subdermal tissue that lies still deeper. Three types of derma may be distinguished: (1) that of *Amphioxus*, consisting of a layer of flat cells, together with a gelatinous substance which they have secreted from their outer surfaces; (2) that of fishes and amphibians, in which the bundles of connective tissue run in two directions, parallel and perpendicular to the surface; (3) that of birds and mammals, in which the above-described distribution of connective tissue bundles is lost, and the boundary between derma and epidermis is no longer straight, but strongly corrugated. The derma sends up projections or papillæ into the epidermis. The derma of man belongs to this type, but in its ontogenetic development it passes through stages much resembling the first two.

Within the integument various structures are differentiated, such as pigment in granules or specialized cells; glands, both unicellular and multicellular—scutes or scales of reptiles, feathers of birds, hair, nails, hoofs, and claws; and dermal bones and teeth.

Dermal bones and teeth of higher vertebrates have probably been derived from the dermal bones or bony scales and the tooth structures of fishes. Neither *Amphioxus* nor cyclostomes possess any trace of an exoskeleton. Longitudinal and transverse rows of small denticles are present in selachians. Each denticle consists of a basal plate and a spine. The dentine of this scale is formed by the mesoderm, while the ectoderm forms the enamel which covers the denticle. The first impulse towards tooth formation seems to reside in the derma. The teeth of fishes are fused with the tooth cement. The teeth of some reptiles lie in sockets in the bone. The teeth of selachians lie in several rows upon the upper and lower jaws. Only one or two of these rows are functional at a time. The outer rows are replaced from time to time by the younger and inner rows. In mammals the process of replacement of teeth is limited in most cases to one occurrence, and the number of teeth is also limited. The gap in the number of teeth in selachians and mammals is bridged by the gradual reduction occurring in intermediate forms. Between scales and the teeth of selachians also intermediate forms occur. The dermal bones such as occur in the vertebrate skull, or in the pectoral arch of fishes, are homologous with the basal plates of the dermal denticles of selachians. They are probably formed by a fusion of such plates. The dermal skeleton is phylogenetically older than the endoskeleton, but it tends gradually to disappear the higher we ascend in the animal scale. Consult: Arnold Lang, *Text-Book of Comparative Anatomy* (2 vols., New York, 1895–06); T. H. Huxley, *Manual of the Anatomy of Vertebrated Animals* (ib., 1898); R. E. E. Wiedersheim, *Comparative Anatomy of Vertebrates* (3d ed., ib., 1907).

INTEGUMENT, IN PLANTS. A general term, but technically applied in seed plants to the specially developed coat of the ovule. The integument is usually not absolutely complete, leaving at the apex of the ovule a small opening through which the pollen tube enters, known as the micropyle, and at the opposite end of the ovule (chalaza) it is not distinguishable as a layer. The number of integuments varies in an

interesting way through the great groups of seed plants. In general the ovules of Gymnosperms have a single massive integument. Among Angiosperms the Archichlamydeæ and the Monocotyledons usually have two integuments; while the Sympetalæ, the ranking group of Angiosperms, are characterized by the single massive integument. The evolutionary history of the integument, therefore, is a single massive integument at the beginning, later two integuments, and finally a return to the single massive integument. It is usually in connection with the tissues of the integument that the hard seed coat (testa) is developed. See OVULE.

INTELLECT (Lat. *intellectus*, understanding, from *intellegere*, *intelligere*, to perceive, from *inter*, between + *legere*, to choose, gather). The common name for mental processes concerned in the function of cognition. The division of mind into intellect and desire (*νοῦς* and *ὄρεξις*), made by Aristotle, was retained by later thinkers to the time of Tetens and Mendelssohn, who introduced the threefold division into cognition or intellect, feeling, and conation or will. This classification, first clearly defined and expounded in English by Hamilton, has since remained current and fundamental in the psychology of common sense. In the older psychology a further distinction was drawn, in various ways, between higher and lower forms of cognition (see FACULTY), and intellect was thus marked off from sense or from sense and imagination. Kant's "pure intellect" is, similarly, an intellect freed in its operations from the intermixture of sense.

In structural psychology (see PSYCHOLOGY) the word "intellect" is employed, in rough accordance with historical usage, as a classificatory term covering the doctrine of sensation and its derivatives; its treatment involves the study of the formation of perception and idea, the association of ideas, memory and recognition, imagination, thought and reasoning. The word "intellection" is sometimes reserved for the formation of concepts and judgments and for reasoning. (See the discussion of these processes under LOGIC.) Functional psychology marks off and subdivides the intellectual functions in various ways; but the classifications appear to depend rather upon logical analysis than upon direct observation of mind, and no proposed grouping has found universal acceptance. In animal psychology and in applied psychology the parallel concept of intelligence betrays a similar lack of definiteness.

Titchener, *Experimental Psychology of the Thought Processes* (New York, 1909); G. T. Ladd, *Psychology, Descriptive and Explanatory* (ib., 1910); Josef Geyser, *Lehrbuch der allgemeinen Psychologie* (Münster, 1912). See INTELLIGENCE; INTELLIGENCE IN ANIMALS.

INTELLECTUALISM (from *intellectual*, from Lat. *intellectualis*, pertaining to the understanding, from *intellectus*, understanding). The philosophical theory that the intellect, rather than the affections or the will, is the fundamental process of consciousness and therefore, on an idealistic interpretation of reality, the ultimate basis and support of all existence. It stands opposed to voluntarism and to certain forms of

mysticism (q.v.) which emphasize the epistemological and metaphysical importance of the affections. In very recent philosophy pragmatism (q.v.) and Bergsonism (see BERGSON) represent strong protest against intellectualism.

INTELLIGENCE (Lat. *intelligentia*, discernment, from *intellegere*, *intelligere*, to perceive, from *inter*, between + *legere*, to choose, gather). In general, the capacity to cognize or understand, and, as such, synonymous with intellect (q.v.). In current usage, however, the terms are roughly differentiated. The intellectual man possesses special ability in dealing with the abstract and theoretical, while the intelligent man is efficient in concrete situations and practical affairs. So we speak of animal intelligence, in the sense of an ability to profit from sensory experience, and we refuse to speak of animal intellect, as seeming to imply a power to deal with abstract ideas.

Some writers on applied psychology (see PSYCHOLOGY, *Applied*) maintain that intelligence is essentially involved only in the higher mental processes. Accordingly we find it defined as "the capacity for thinking and judging," or as "the general capacity of an individual consciously to adjust his thinking to new requirements." Sometimes only the synthetic side of thinking is emphasized, and "the activity of intelligence" becomes "the activity of intuitive synthesis." Degree of intelligence is supposed to be measurable by the success achieved in certain mental tests. See MENTAL TESTS.

It is, however, an open question whether this general ability has any real psychological status. Some experimenters have found high correlations between the ranks of individuals in a group as assigned by very different mental tests, and also between ranking based upon tests and ranking based upon school marks or teachers' estimates. They have concluded that "all these performances, however different, depend partly upon a general common factor," viz., general ability or general intelligence. But good will on the part of the subject, ready understanding of instructions, and the like, may account for the consistently high rank attained by certain individuals; and the assumption that a number of identical simpler functions rather than a single general function is concerned, may explain the appearance of high correlations. Indeed, another experimenter "is tempted" to state that "there is *nothing whatever* common to all mental functions, nor to any half of them." In the face of such disagreement we can only say that the existence of a simple or separate "general function of intelligence" has as yet been neither proved nor disproved, though there is no reason to suppose that refinement of method may not ultimately lead to a definite result.

INTELLIGENCE IN ANIMALS. The ability of an animal to profit by individual sen-

sory experience. (See INTELLIGENCE.) Thus, the ability of an animal to learn is usually taken as a measure of its intelligence. (See LEARNING IN ANIMALS.) Learning is most rapid in the presence of the free idea, since the immediate modification of behavior in accordance with a given end implies the presence of that form of experience. Thus, the free idea marks not only a high degree of mental development, but also a high degree of intelligence. (See ANIMAL PSYCHOLOGY; MEMORY IN ANIMALS.) Inferential imitation, which is a rapid form of learning, involving the free idea, is therefore a criterion of intelligence. See IMITATION IN ANIMALS.

Intelligence is frequently opposed to instinct by the opposition of the individually to the racially acquired, or of the finalistic to the mechanistic, or of the preperceived to the perceived. For a discussion of this topic, see INSTINCT, *Instinct and Intelligence*, and the references there given.

INTEMPERANCE. See ALCOHOLISM; INTOXICATION; DRUNKENNESS; TEMPERANCE.

INTEN'SION OF A TERM. See CONNOTATION.

INTEN'SITY OF SENSATION (from Lat. *intensus*, p.p. of *intendere*, to stretch out, from *in*, in + *tendere*, to stretch, Gk. *τείνειν*, *teinein*, Skt. *tan*, to stretch). One of the five attributes of sensation, the others being quality, clearness, extent, and duration. Theoretically every sensation must possess a certain intensity in order to enter consciousness. In the sphere of vision, however, there exist certain facts which make it advisable, according to some psychologists, to eliminate the attribute of intensity. Variation of the amplitude of vibration of the stimulus acting upon the retina means in every case (so they declare) a qualitative change in sensation;

FIG. 1. APPARATUS FOR TESTING SENSITIVITY TO TOUCH.

The rack bears rods with cork pellets of different weights depending from them. The weight of the lightest of these cannot be perceived by the normal subject.

so that in this department of sense intensity merges in quality. This is the position of Hering and Hillebrand. König, on the other hand, maintains that there are two places in the spectrum (the one in the red and the other in the violet) where the qualitative change cannot be remarked.

G. E. Müller has, furthermore, sought to overcome the difficulty by defining intensity as the distance of a sensation from its zero point. If two visual stimuli are both reduced, that sensation which reaches the zero point first has the less intensity. Müller also offers a theoretical

FIG. 2. APPARATUS FOR DETERMINING THE LIMEN OF SOUND INTENSITY.

The forceps Z containing a leaden ball is placed on the head of a micrometer screw. The ball is released by pressure of the forceps and falls, along the dotted line, on the slanting surface, which is covered with cloth and on which is laid a glass or copper plate. If all other conditions remain the same, the height of the fall regulates accurately the objective intensity of the sound stimulus.

explanation of the interdependence of visual quality and intensity. See VISUAL SENSATION.

The main problems of intensity are two: (1) that of the minimal intensity of sensation, and (2) that of the change in intensity of stimulus which is just noticeable in sensation. There must be, accordingly, a determination for each sense department of the intensive limen (q.v.) and of the intensive sensible discrimination.

The liminal intensity of *pressure* depends upon the place stimulated. With cork pellets as weights, it has been found to be 2 mg. upon the forehead, temples, and back of forearm and hand; 5 mg. upon the nose, hip, chin, and abdomen; 10 mg. upon the fingers; and 1 g. on the nails. By stimulating individual pressure spots with fine hairs, Von Frey obtained much lower values, averaging for the calf 1.44 gr. mm. and for the wrist 1.28 gr. mm. (where gr. denotes the pressure exerted by the hair, and mm. denotes the radius of its cross section). The *pain* limen, as recorded by the hair method, gives the following values in gr/mm², where mm² denotes the area of the cross section of the hair: over the epicondyle of the humerus, 30; over the radius, 20; over the kneepan, 49; over the olecranon of the ulna, 40; on the conjunctiva of the eye, 2 to 7. On account of the variation of the actual temperature of the skin, or the physiological zero point, the examination of the intensive sensitivity to *temperature* presents great difficulties. The sensitivity is greater over the lateral surfaces of the body than in the median plane; and, as a rule, it increases from the periphery towards the trunk. The values for both cold and warmth vary from 0.2 to 1.1° C., measured from skin temperature. The liminal intensity for *taste* depends not only on the concentration of the solution, but also on the area stimulated, the amount of movement within the buccal cavity, and the general condition of excitability of the taste nerves prevailing at the time. Furthermore, the tip of the tongue is most sensitive to sweet, the base to bitter, the

sides to sour, and the body to salt. The average limens have been found to be represented by the following figures, based upon a solution in 100 parts of distilled water: salt, 0.24; saccharine, 0.49; hydrochloric acid, 0.0063; sulphate of quinine, 0.00005. The intensity of *olfactory* sensations is likewise dependent upon the rate and manner of breathing, the rate of diffusion of the odorous vapor, and the general condition of the olfactory organs, as well as upon the amount of saturation of the air with the minute particles of the odorous substance. Current figures show that the limen is very low for some qualities; e.g., musk, 1/2000000 mg.; sulphureted hydrogen, 1/5000 mg.; bromine, 1/600 mg. In *audition* the existence of absolute silence is to be doubted. Most authorities agree that we can never get free from the noises caused by the pumping of the blood through the ears. Closing the ears, or standing with open ears near any reflecting surface, only intensifies the sound. The liminal intensity for *noise* may, then, be regarded as that intensity which is just perceptible above this internal sound. A cork pellet weighing 1 mg. and falling through 1 mm. upon a glass plate can just be heard at 91 mm. from the ear. A *tone* from a pipe giving 181 vs. per second is audible when the air particles set in motion by it possess an amplitude of excursion of only 0.00004 mm., and the mechanical work done by it upon the ear is 0.0033 mg. mm. Other investigations have placed the latter value much lower. The sensitivity to high tones is in general greater than that to low tones. The investigation of the limen of *light sensation* reveals a difficulty analogous to that cited in connection with the auditory limen. The existence of the "idioretinal light" precludes absolute sightlessness, as the "idioaural noise" precludes absolute silence. For external stimulation, the limen may be put at the illumination of black velvet by a stearin candle 9 meters distant. It has also been estimated (though incorrectly; the estimate is too high) at 1/300 the light of the full moon. In one-half second this light exerts upon the retina the energy required to raise 1/15 mg. of water 1/000000000000 of a degree C. For the liminal sensitivity to *articular* sensations, see MOVEMENT, PERCEPTION OF.

The investigations of the intensive sensible discrimination are included under Weber's law, a uniformity which may be stated thus: under constant conditions of experimentation, the ratio of the increment of stimulus, necessary to give a noticeably different sensation, to the existing stimulus is constant. The problem is, then, to discover whether this principle of the constancy of the relative difference limen is applicable to every sense department, and to ascertain the numerical value of the constant in those departments in which its applicability is established. E. H. Weber himself determined the constants for *pressure* as follows: with simultaneous application of the weights to both hands, 1/3; with successive applications to the same hand, 1/14 to 1/30; with simultaneously lifted weights (involving both pressure and strain sensations) 1/15 to 1/20; with weights lifted successively with one hand, 1/40. These figures have been modified by subsequent investigators; and indeed, since the limen varies with variation of experimental conditions, it is clear that all such measures have but a very rough significance unless accompanied by a statement of the circum-

stances under which they were obtained. The discriminability of *temperature* intensities varies with the part of the body tested, and especially, it seems, with the thickness of the epidermis. It varies also with the extent of the skin surface stimulated. With the whole hand involved, moderate temperatures differing by 1/20° C. may be discriminated. The region of finest discrimination seems to be that between 26° and 39° C. Cooling is noted sooner than warming, in the proportion of three to two. Of *taste*, little is known save that Weber's law holds approximately for bitter and salt. The phenomenon of "taste contrast" is a source of unavoidable disturbance in this field. A careful survey of the olfactory sense has confirmed the applicability of Weber's law to *smell*, and established the constant at 1/3 for 36 per cent of the substances tested and at 1/4 for 26 per cent. Most successful results are those obtained in audition. The relative sensible discrimination for *noise*, tested by the gravity phonometer or the sound pendulum, remains constant at 1/3 within a wide range of intensities. Technical difficulties impede the observation of *tones*, but enough has been done to show that, at least within the central part of the scale, variations in tonal intensity follow the law. Work with *light* is subject to many sources of error—difficulties in securing standard conditions of adaptation, accommodation, etc. The many investigations which have been completed do not, therefore, concur as to the constant, which is variously estimated at 1/60, 1/100, 1/120, to 1/230. The value 1/110 may be assumed as a fair average. Of interest in this connection is an apparatus which can be employed to demonstrate the existence of the constancy or to indicate its numerical value. "Masson's disks" are white disks, on one radius of which a number of heavy black sections are marked. Upon rapid revolution there is produced a series of concentric gray rings decreasing in darkness towards the periphery. The same ring remains, within certain limits, just visibly gray when the illumination is changed.

INTENT' (Lat. *intentus*, purpose, from *intendere*, to stretch, intend, from *in*, in + *tendere*, to stretch; connected with Gk. *τείνειν*, *teinein*, Skt. *tan*, to stretch, and ultimately with Eng. *thin*). In law, the purpose or design with which an act is done. Ordinarily the legal consequences which flow from acts are entirely independent of the intent or motive with which the acts are performed. This is true of all violations of the general rights, known as rights in rem, more commonly described as property and personal rights. Thus, the right to be free from trespass and the right to be se-

cure from violence or from arbitrary arrest do not depend in the least on the motive or intent of the person violating them. It is only in those cases in which the rights claimed flow from the engagements of a party, or in which the law has, from motives of its own, attached consequences to the intent with which an act is performed, that intent acquires any legal significance. Obviously any rights claimed under a will, a deed, or a contract flow from the intent of the person executing it, and, in certain classes of torts, a malicious or fraudulent motive may constitute the gravamen of the offense complained of.

But in all of these cases it is not the actual and secret motive, but the expressed intent which determines the legal character of the act in question. This is the real meaning of the rule which forbids the introduction of parol evidence to contradict or vary the terms of a written instrument. The grantor of land is not permitted to show that he intended to convey another and different parcel of land. He must stand by the intent as expressed in his deed. So, in a will, a legacy to A cannot, by proof of a contrary intention on the testator's part, be converted into a gift to B, nor can one who has sold a horse for \$100 show that he intended to charge \$150 for the animal. Analogous to this principle is the rule applied in those wrongs in which intent is an element, as in malicious mischief and certain cases of defamation and negligence. The person committing the injury is held to have intended the reasonable and probable consequences of his acts, and cannot exonerate himself from liability by showing that his intention was really of an innocent or benevolent character.

There are other classes of cases, however, in which the actual intent with which an act was performed is a proper matter for judicial inquiry. This is especially so in cases where the wrongful intent is the gist of the wrong, as in crime, deceit, and, under certain circumstances, in fraudulent conveyances. See CRIME; MOTIVE; DECEIT; FRAUDULENT CONVEYANCE; INTERPRETATION; and the authorities there referred to.

IN'TERAC'TION. The relation between two or more things or systems which mutually influence one another, and especially the theoretical relation of mind and body which involves such influence. Consult, for a typical statement of the theory of interaction, R. H. Lotze, *Microcosmus* (Leipzig, 1856-64; trans., Edinburgh, 1898). See BODY AND MIND; PARALLELISM.

INTERAM'NA. The name of several cities in ancient Italy. 1. Interamna Nahartium. (See TERNI.) 2. Interamna Prætuttianorum. (See TERAMO.) 3. Interamna Lirenas, 5 miles southeast of Aquinum, near the modern Pignataro Interamna. This town was founded as a Roman colony, in 312 B.C., to serve as a base of operations against the Samnites. On its site Roman ruins and ancient inscriptions have been found.

INTER'CALARY. A supplementary day or month. See CALENDAR; BISSEXTILE; LEAP YEAR.

IN'TERCEL'LULAR SYSTEM (from Lat. *inter*, between + Neo-Lat. *cellula*, *cellule*, dim. of Lat. *cella*, cell). The system of spaces in plants, often continuous, between the cells. They may be formed by the splitting of cell walls (schizogenously) or by the breaking down of masses of tissue (lysigenously). Spaces formed by splitting are found only in the higher plants

and do not occur at all in plants below the mosses. When a tissue is very young, its cells are angular and in such close contact that there are no intercellular spaces; but as the cells grow older, they may become rounded, and the common walls may split at the angles, thus producing intercellular spaces of various extent. When the spaces are very large, as in the stems of water lilies (*Nymphaea*), they are called air chambers. Smaller intercellular spaces are almost universal in the spongy parenchyma of leaves, in the pith of stems, and in older parenchyma generally. To this category belong many glandular passageways, like the resin ducts of conifers, the mucilage ducts of cycads, the gum-resin ducts of the umbellifers, etc. Spaces formed by the breaking down of masses of tissue give rise to the hollow stems of grasses and many other plants. The cavities in the leaves of quillworts (*Isoetes*) and many other plants are also formed in this way. The oil glands of the orange and lemon, many glands on leaves which appear to the naked eye as "pellucid dots," the gum cavities in the tissues of cherry trees, are all examples of lysigenously formed glands. See MORPHOLOGY; AÉRATION.

IN'TERCES'SION, DOCTRINE OF (Lat. *intercessio*, from *intercedere*, to intervene, from *inter*, between + *cedere*, to go). A doctrine of theology, based on certain passages of Scripture which are held to represent Christ, after having finished His redemptive work on earth and ascended into heaven, as pleading with God on behalf of those whom He has redeemed (Rom. viii. 34; Heb. vii. 25; 1 John ii. 1). It was not meant to imply, however, that God needs to be interceded with, as if He were still reluctant to forgive men, or that Christ's intercession makes Him more merciful than before. The intercessory work of Christ is to be regarded rather as His activity in behalf of all men, and especially of His followers. The doctrine of the intercession of Christ is held alike by Protestants and Roman Catholics; but the latter, in addition, believe in the intercession of the Virgin and the saints, on which see SAINT. Islam also has a doctrine of the intercession of Mohammed for his followers on the day of judgment.

IN'TERCOLUM'NIA'TION (Lat. *inter*, between + *columnar*, column). The clear space between two columns, measured where the diameter is greatest, sometimes, but incorrectly, used of the spacing measured from axis to axis. In classic and neoclassic architecture names are given to certain spacings according to Vitruvius (bk. iii, chap. 2) as follows: *picnostyle*, to an intercolumniation of $1\frac{1}{2}$ diameters; *systyle*, of 2 diameters; *eustyle*, of $2\frac{1}{4}$; *diastyle*, of 3; *aræostyle*, of more than 3 diameters. See ORDERS OF ARCHITECTURE.

IN'TERDICT (Lat. *interdictum*, prohibition, from *interdicere*, to forbid, from *inter*, between + *dicere*, to say, Gk. *δεικνύναι*, *deiknynai*, Skt. *dis*, to point out; connected with Goth. *gateihan*, to tell, OHG. *zihan*, Ger. *zeihen*, AS. *teon*, to accuse). An ecclesiastical censure or penalty in the Roman Catholic church, which deprives the faithful of certain sacraments (q.v.), of participation in the celebration of the divine offices, and of ecclesiastical burial. Interdicts may be of three kinds—personal, local, and mixed. When the censure affects only some designated individuals, it is called a particular personal interdict. When it affects a whole community or

corporation, it is called a general personal interdict. A local interdict affects only such individuals as are present in a designated place and can be avoided by removing from the place. A particular local interdict affects only a single monastery, church, or seminary. A general local interdict applies to an entire parish, city, province, or kingdom. In such general censures certain churches are usually excepted. Lastly, mixed interdicts affect both a locality and all its inhabitants wherever they may go, or a person and any place in which he or she may be. The last is called an ambulatory interdict. The principle on which this ecclesiastical penalty is founded may be traced in the early discipline of public penance, by which penitents were for a time debarred from the sacraments, and from the privilege of presence at the celebration of the Eucharist. It grew out of excommunication (q.v.) and at first was called a general excommunication. Then it usually deprived the persons who dwelt in the excommunicated place of all sacraments. From 375 on, there are instances of such general excommunications. But the interdict proper took its peculiar form, although not its name, in northern France in the ninth century. It was adopted by the Popes about the middle of the eleventh century, and the term "interdict" was used in its technical meaning by 1031. It came into use as an ordinary Church censure in the frequent conflicts of the ecclesiastical and civil power. It was designed to awaken the popular conscience to the nature of the crime, by including all alike in the penalty with which it was visited. In this way public pressure could be brought upon the rulers who had offended. The most famous interdicts are those laid upon England in 1208, upon France in 1200, and on Venice in 1606. The description of England under the interdict named, as detailed by some of the contemporary chroniclers, presents a striking picture of the condition of a country where the interdict was obeyed. It would be a great mistake, however, to suppose that during the continuance of an interdict the people were entirely destitute of spiritual assistance. The severity had been greatly lessened by the middle of the eleventh century; it was permitted to administer baptism, confirmation, penance, and the Eucharist in all cases of urgency; privately to confess and absolve all who were not personally the guilty participators in the crime which the interdict was meant to punish; to celebrate marriage, with only the witnesses present; and to confer orders in cases of necessity. Gregory IX allowed mass to be said once a week, behind closed doors, in order to consecrate the host for the use of the sick; Boniface VIII permitted the offices to be said in the churches, but the laity were to be excluded; public celebration of services was allowed on Christmas, Easter, Pentecost, the Assumption of the Blessed Virgin, the festival of Corpus Christi, the festival of the Conception, and a few other occasions. The Council of Basel enacted very stringent rules as to the use of this penalty, and in later times the general interdict has been entirely disused. The interdict on Venice in 1606 is often cited as the last one pronounced, but occasionally, in very special circumstances, and to mark the horror of the church for some enormous crime, later instances are recorded in which a particular place or church has been visited with the penalty of a

local interdict. Interdict differs from *excommunication*, in that those under the censure are not given over to eternal damnation. It differs also from *suspension*, which applies only to ecclesiastics.

B. Krehbiel, *The Interdict: Its History and its Operation* (Washington, 1909).

INTERDICT. In the civil law, a judicial process analogous to the injunction of English and American law. In its earliest form in Roman law it was a peremptory decree of the prætor, restraining any interference with property the right to the possession of which was in dispute. It seems still, in the modern civil law, to be generally restricted to prohibitions as to the possession of property, though in Scotland the term is applied to any process of the Court of Session restraining the performance of an unlawful act. An interdict is not, however, limited to the prohibition of contemplated acts, but may also be employed to compel the restitution of property of which a person entitled to possession has been forcibly deprived, and to compel the presentation, or "exhibition," of an account. Interdicts are accordingly classified, according to the purpose sought to be effected, as prohibitory, restitutory, and exhibitory. See **INJUNCTION**; and consult the authorities referred to under **CIVIL LAW**; and John Erskine, *Institute of the Law of Scotland* (Edinburgh, 1773; new ed., 1898).

INTERDICTIO A'QUÆ ET IG'NIS. See **EXILE**.

IN'TERDICT'ION. A process of the civil law employed for the purpose of depriving a person who is *non compos mentis* of the control of his property and, on occasion, of other civil rights. The process is analogous to the inquisition in lunacy (q.v.) of English and American law, whereby the incapacity of a person to manage his own affairs may be inquired into and the management of his interests committed to a guardian or trustee. The jurisdiction thus exercised is as old as the Twelve Tables, but it was originally employed only to restrain prodigals from dissipating their estates. By modern codes it is generally confined to cases of imbecility and lunacy. In such cases interdiction may be only partial, the interdicted person being forbidden to sue, to borrow, to pledge or hypothecate his property, or to make any conveyances without the consent of the court; or it may be complete, in which case a guardian or curator is appointed and the management of the affairs of the interdicted person committed to him. The practice in Scotland, Louisiana, and Quebec is substantially the same as in the continental states, whose legal systems are borrowed from that of Rome. Consult the authorities referred to under **CIVIL LAW**; also John Erskine, *Institute of the Law of Scotland* (Edinburgh, 1773; new ed., 1898).

IN'TERES'SE TER'MINI (ML., interest in a term). At the common law, the interest which a tenant for years has in the lands leased to him, before he has entered upon them. The lease is regarded as conferring only an inchoate title or

estate, which requires an entry by the tenant to perfect it. But though the *interesse termini* falls short of being a complete leasehold estate, it is yet more than a mere chose in action (q.v.) or right of entry (q.v.). It is a true interest or estate, a right in rem (q.v.), capable of alienation and of transmission upon the death of the tenant to his personal representatives, and generally in the United States the same remedies are available for its protection and recovery as in case of the perfected estate. The principal common-law disability of the tenant for years who had not entered into possession was that he was incapable of acquiring the full legal title by release from the lessor. See LEASE; LEASEHOLD; RELEASE.

INTEREST (OF. *interest*, Fr. *intérêt*, interest, from Lat. *interest*, it concerns, 3d pers. sing. pres. ind. of *interesse*, to concern, from *inter*, between + *esse*, to be). A certain profit or premium for the use, forbearance, or detention of money. In spite of the natural feeling that the payment of interest was a hardship, and that to exact interest from a borrower was to take an unfair advantage of his necessities, all the chief peoples of antiquity recognized that interest might lawfully be stipulated in connection with a loan and might be awarded in the discretion of the court even when no such stipulation had been made. Babylonian tablets show ordinary loans at moderate interest, and also maritime loans, in which the claim of the creditor for his principal was extinguished by the loss of the ship and on which a much higher rate of interest was exacted. It was very common among the ancient Hebrews, and the Mosaic law contains a prohibition against the taking of usury (or interest, as it should have been translated) from the Jews, but permitted it as to all other races. The Greek and the Roman laws recognized interest. The Romans called it payment for use (*usura*) and assimilated it to the natural yield or increase derived from organic nature by classing it, with rent, among civil or legal fruits (*fructus civiles*). They did not limit it to the loan of money exclusively: any generic or fungible things, like wheat, wine, or oil, could be stipulated.

Aristotle speaks of it, but condemns it as vicious, holding that money is "naturally barren" and that to make it "breed money" is preposterous and a perversion of the end of its institution, which, he declared, was to serve as a medium of exchange and not for purposes of increase. Through a misconstruction of the real intent and purpose of the law of Moses, which was clearly a political and not a moral precept, and following the curiously narrow philosophy of Aristotle on this subject, the Christian Church and laymen early condemned the custom and held any interest to be usury and against good morals. The secular law in Christian nations naturally followed the ecclesiastical in those times, and the taking of interest was forbidden in England from the reign of King Alfred in the ninth century to the time of Henry VIII. The prohibition of interest led, of course, to many evasions: and to one of the most ingenious and successful of these the word "interest" owes its modern technical meaning. At Roman law, interest (*quod actoris interest*, the difference to the plaintiff) meant damages. The Church itself did not deny that one from whom money was wrongfully withheld was entitled to dam-

ages. Contracts for the repayment of money loaned were accordingly so drawn as to insure a technical default on the part of the borrower, and the damages to be paid on default were stipulated in advance. The prohibition of interest led also to the development of new legal institutions like the *commandita*, or silent partnership, in which payment for the use of money took the form of a share of profits. The prohibition of interest was generally rescinded by secular legislation before or at the close of the Middle Ages; in Germany, however, not until 1577. By the Statute of 37 Hen. VIII, c. 9, in 1545, interest to the amount of 10 per cent per annum was permitted. This was accomplished in a negative manner by simply providing penalties for taking more than that amount, thus giving only an indirect sanction to taking it at all. By Statute of 12 Anne II, c. 16, 5 per cent was fixed as the maximum amount of interest which could be demanded. In the United States the demand of interest on money due has always been recognized as just. However, the right to interest exists only by virtue of such statutes or by agreement of parties and does not follow necessarily as a legal right from the mere fact that one has another's money in his possession or owes him money by contract. For example, in the absence of statute or agreement, if A loans B \$100 to be paid on demand, A may demand payment five years hence, but is not entitled to interest for that time; and even under such statutes interest does not begin to accrue until money is due and payable, because not until that time is there an unjust detention from the owner. Previous to the debt becoming due, the matter is, in contemplation of law, regulated by agreement of the parties.

The statutes in most jurisdictions provide that interest shall be allowed at a fixed rate on all sums when they become due, as on a debt for goods sold and delivered when the period of credit has expired. It is not customary, however, to exact interest in such cases unless the creditor is forced to sue on his claim. In some States and in England interest is allowed in certain tort actions on the amount of the damages awarded from the time the claim accrued, but this is not the general rule.

A distinction is usually made between the rate which will be allowed by law, usually called the legal rate, where it is not agreed upon by the parties or where allowed by operation of law, as on a judgment, and the maximum rate which may be stipulated for by contract, sometimes known as the conventional rate. For example, in Ohio the statutes provide that 6 per cent shall be allowed on all sums on which interest is chargeable by operation of law, as on a judgment after its entry, and on sums due where no rate is agreed upon by the parties, whereas 8 per cent may be legally demanded if provided for by express contract.

In Great Britain, after the existence of rigorous measures against excessive interest for centuries, all statutes against usury and fixing rates of interest were repealed by the Act of 17 and 18 Vict., c. 90 (1854). The power of the court of equity to relieve against unconscionable bargains as to interest still exists; and in 1900, by the Money Lenders' Act, special provision was made for setting aside a contract made with a professional lender of money where an oppressive rate of interest is charged. In France the legal

rate is 5 per cent, but more may be demanded by contract.

The following are the rates of interest fixed by law January, 1914, in the States and Territories of the United States:

STATES AND TERRITORIES	Legal rate per cent	Rate allowed by contract per cent
Alabama.....	8	8
Alaska.....	8	12
Arizona.....	6	10
Arkansas.....	6	10
California.....	7	any
Colorado.....	8	"
Connecticut.....	6	6
Delaware.....	6	6
District of Columbia.....	6	10
Florida.....	8	10
Georgia.....	7	8
Idaho.....	7	12
Illinois.....	5	7
Indiana.....	6	8
Iowa.....	6	8
Kansas.....	6	10
Kentucky.....	6	6
Louisiana.....	5	8
Maine.....	6	any
Maryland.....	6	6

Vermont.....	6	6
Virginia.....	6	6
Washington.....	6	12
West Virginia.....	6	6
Wisconsin.....	6	10
Wyoming.....	8	12

These rates are occasionally changed by statute, but there has been comparatively little variation in recent years. An interesting fact is that several Eastern States, as Massachusetts, have removed all limitations on rates by contract, and in New York any rate may be charged by contract on loans exceeding \$5000 payable on demand, and known to the financial world as call loans.

The usual method of calculating interest is to compute it on the principal sum originally due for the period which has elapsed at the time of computation, but by agreement compound interest may be allowed; i.e., the arrears of interest for each year are added to the principal sum and interest for the following year is computed on this accumulation, and so on, thus giving the investor interest upon interest. It is customary to compute interest in this manner upon deposits in savings institutions.

In popular usage interest is the payment made by a borrower for the use of a sum of wealth for a definite period of time; it is expressed as the ratio which that payment bears to the value of the wealth loaned—the princi-

pal. In economic theory the term "interest" is used in a broader sense and signifies the return for the use of capital, whether the employment of capital is made directly by its owner or by another person to whom it has been loaned. In the latter instance it appears as a sum paid by the borrower over and above the amount received in loan. It is calculated at a certain percentage of the capital to be paid annually. Economists distinguish from interest that part of the gross product which is necessary to replace the original capital, and the extra return to capital which appears in enterprises involving risk of loss, as well as chance gains and the abnormal return due to superior management. The last three forms of income are usually classed under the head of profits (q.v.).

Loan or contract interest may be paid for wealth for immediate consumption as well as for wealth which is employed as capital. In the earlier stages of industrial development, when little capital was used, loans normally assumed the former character. Money was loaned to those persons who were in temporary distress or to spendthrifts who desired to anticipate future revenues. In either case the repayment of the principal was a hardship and the additional payment of interest, usually calculated at a high rate because of uncertainty of repayment or because of the necessities of the borrower, was peculiarly vexatious. This fact is a partial explanation for the canonical and civil prohibitions of interest mentioned above. This was the case in ancient and mediæval nations, and much the same attitude survives in backward communities of the present day. With the development of capitalistic production the gain to the borrower who invests the wealth borrowed in productive enterprise became so obvious that the opposition to interest declined and no longer exists among business men.

In competitive industry there is a close connection between loan interest and the return to capital. It is obvious that a justification for loan interest lies in the fact that had the owner of the capital employed it himself he could have secured a return from its use. When he turns it over to some one else he foregoes this return and must be compensated for it. It is immaterial whether the lender would have used his capital in productive enterprise or whether the borrower does so. The fact that it might be so used establishes a claim for compensation. Such an explanation does not make it clear why the owner of capital secures a return for its use, but admitting that in the present economic order he does so, it explains why the borrower pays interest upon a loan. It also serves to indicate certain limits upon the rates of interest under normal circumstances. Lenders cannot demand more, nor can borrowers expect to pay less than the return normally expected from the employment of capital in productive industry.

Explanation of the phenomena of interest must be sought in the laws which make it possible for capital to produce a net return. A large number of theories have been advanced to explain the existence of net return to capital. (See POLITICAL ECONOMY.) We may notice here three theories which have attained the largest following: (1) the *abstinence* theory, which regards interest as a reward for the abstinence which the capitalist exercises in em-

ploying his wealth for productive purposes instead of consuming it unproductively; (2) the *productivity* theory, which lays emphasis upon the fact that capital represents an instrument which greatly increases the efficiency of labor, and therefore normally entitles its owner to a reward; and (3) the *exploitation* theory, which regards labor as the sole source of wealth, the income known as interest being merely a tribute to the capitalists who hold a monopoly of the opportunities for employment.

In recent economics a variety of the abstinence theory has gained a large following under the leadership of Professor Böhm-Bawerk, who explains interest as a result of the universal undervaluation of future goods as compared with present goods. The productivity theory finds its foremost champion in Prof. J. B. Clark. In his view capital, as a limited agent capable of increasing the output of industry, is productive in the same sense in which labor is productive, and the measure of this productivity is the loss to industry which would result if the least important portion of capital were withdrawn. In explaining the laws which govern interest Prof. Alfred Marshall and his followers take a position midway between the productivity and abstinence schools. The rate of interest depends upon the relations between the demand and the supply of capital. The demand for capital varies with the opportunity for its productive employment; the supply varies with the readiness of individuals to postpone consumption to a future date. If productivity is high, the inducement to save is correspondingly great, and consequently the supply of capital increases. With increase in supply of capital, its productivity declines, until no reason exists for further creation of capital. The rate of interest, therefore, tends to become fixed at the point where the productivity of capital is just sufficient to compensate those who save for the disadvantages which attend the postponing of consumption, or "waiting."

In Böhm-Bawerk's theory the productivity element is admitted among the causes for the undervaluation of future goods. Since present goods can be used to institute fruitful productive operations requiring a long time for their consummation, present goods are "technically superior" to future goods. The theory of Böhm-Bawerk, stripped of all productivity implications, serves as the basis of the interest theories of F. A. Fetter and Irving Fisher. In the view of these economists, preference for present goods is the sole possible explanation of interest.

INTEREST, IN PSYCHOLOGY. An affectively toned attention, or a relatively permanent susceptibility to that state. We say popularly that an accident or a mysterious event "excites" our interest, or that a person whose attention goes

easily to chess problems and coins "has" or "shows" an interest in chess or in numismatics. The psychologist, however, must keep the two meanings of the term separate.

The problem of interest, in the first sense, is the problem of the relation of affective processes to the clearness of sensory processes in attention (q.v.). Several views as to the nature of this relation have been held. It has been said, e.g., that feeling is a condition of (or an incentive to) attention. But, if that were the case, feeling would necessarily precede attention; and since the verdict of introspection is directly against such a sequence, this view cannot be accepted. It has been said, again, that feeling and attention are merely two aspects of the same state; feeling is the "reaction of apperception upon sensory contents." The universal concomitance of feeling and attention is here affirmed, and the existence of a state of attentive indifference is denied. The contention seems plausible. We are wont to think of attention as a sporadic and occasional matter; we are now attentive, now inattentive; and when we attend, it appears, we always feel. Attention, however, defined psychologically as clearness, is not an occasional, but a normal, state of mind; what is popularly called inattention is, in fact, only an indication of attention to "something else." If we recognize this fact, and if we distinguish carefully between feeling and the organic sensations with which it is likely to be confused, we find that states of attentive indifference are in reality frequent. This second view, therefore, must also be given up. A third view, which admits a close relation between feeling and attention without maintaining their universal concomitance, is still possible. We may suppose that, originally, attention did imply feeling; the conditions of primitive attention were conditions of a powerful impression of the nervous system; and such conditions are very likely to lead to the arousal of feeling. But the attentive consciousness, like the action consciousness (see ACTION; IMPULSE), seems to have become simplified in the course of development; so that we now have what we may call a mechanized or reflex attention, without affective concomitant. Interest, in fine, arises only when the conditions both of attention and of feeling are given, and then only when the balance is poised between the attentive indifference with which we meet the habitual and customary, and the dominance of consciousness by emotion. See EMOTION.

Taken in the second sense, interest sets for psychology the problem of the conditions of special susceptibility to emotively tinged attention. Why does one man delight in mechanical, another in artistic, objects and activities? The conditions of such an interest are to be found in mental constitution (q.v.), in the inherited and acquired determining tendencies which facilitate and inhibit associations. (See DETERMINING TENDENCY; ASSOCIATION OF IDEAS.) Herbart and his followers have made this sort of interest of primary importance in the theory of education. The child, they say, cannot learn things entirely new, but only such things as can be assimilated to his present stock of ideas. (See APPERCEPTION.) Interest is most easily aroused where an object has many relations to past experience. Instruction, therefore, should build carefully on the foundations of knowledge

already present and in the direction of preëxisting interests. A correct theory of education, however, must take into account the fact that natural interests are not necessarily the most valuable, and that voluntary attention is a necessary stage of mental progress. There is, moreover, at times a pedagogical advantage in confronting the pupil with statements which are wholly novel, and perhaps even contradictory of his previous ideas; for these ideas may well be incorrect, and novelty of content tends to make a statement impressive.

IN'TERFER'ENCE (from *interfere*, from OF. *entrefcir*, to exchange blows, Fr. *interférer*, to interfere, from Lat. *inter*, between + *ferire*, to strike). In any medium capable of transmitting waves the effect at any point when two trains of waves are passing simultaneously is the sum of the effects which each wave by itself would produce, provided that the amplitudes of the waves are small compared with the wave lengths; so that the resultant motion is the combination of the two waves. This is called interference. The interference of two trains of waves on the surface of water is often seen. The phenomenon of beats in acoustics (q.v.) is due to interference. Waves in all media, air, water, the ether, etc., can be made to interfere; and, conversely, if interference phenomena occur in connection with any physical action, it is evident that this action must be due to wave motion. One of the most important illustrations is the formation of "stationary vibrations," or "standing waves," e.g., the vibrations of air in an organ pipe, Lippmann's method of color photography, etc. The first application of the principle of interference in the explanation of physical phenomena was made by Newton in his *Principia*, in accounting for a remarkable tidal effect described by Halley in the *Philosophical Transactions* for 1684. The next applications were made by Thomas Young in 1800 in explaining various phenomena in acoustics, notably that of beats. Young almost immediately extended the principle to many observations in the field of light. He was convinced that light was due to waves in the ether and devised several new experiments in order to test his theory.

One of the simplest cases of interference is when two identical trains of waves are sent out from two vibrating sources close together. At any point whose distances from the two sources differ by half a wave length, by three half wave lengths, or by any odd number of half wave lengths, the action of one train of waves is permanently neutralized by that of the other; whereas, at any point whose distances from the two sources are equal, or differ by a whole wave length, or by any number of whole wave lengths, the action is twice what it would be, due to either train of waves by itself. Thus, let light of one definite wave length, i.e., of a definite color, e.g., yellow, be passed through a narrow slit in an opaque screen and fall upon a second opaque screen in which there are two other

narrow slits parallel to the first and at equal distances from it; if this pair of slits are close together, and if the light from them falls upon a distant screen of some kind, there will be bands of colored light upon it, separated by dark bands where the action of the waves from one slit is neutralized by that of the waves from the other. The device of having the two slits illuminated by light coming from the first slit is in order to secure two *identical* sources of waves; for if the sources were to send out different waves, or waves without any definite phase relation, there could be no permanent interference. In a perfectly similar manner waves in the air produced by whistles may be made to give "interference bands" of silence and sound. The distance apart of the bands in any case evidently varies directly as the wave length of the trains of waves. (See LIGHT.) This experiment was devised by Thomas Young in order to test the nature of the agency causing light.

Another case of interference is seen in the beautiful colors of soap bubbles, of thin films of oil on water, etc. These colors are due to the fact that, when white light falls upon the thin transparent film, some is reflected at the first surface, and of the light that enters the film some is reflected at the second surface and the rest transmitted. There are, of course, a series of internal reflections, and, looking at the film from either side, the eye receives waves which have passed over paths of different lengths. There is also a difference in the character of the reflection at the two surfaces of the film, which is equivalent to a difference of path. If the difference in phase is such as to amount to half a wave length or any odd number of half wave lengths of waves of any definite wave length, they will be absent from the light received by the eye. But white light from which any train of waves is absent will appear colored, having the color complementary to that of the absent waves. Since energy cannot be destroyed, the colors seen on viewing the film by reflected and by transmitted light will themselves be complementary, assuming that the film itself does not absorb any light.

INTERFERING. See HORSE.

IN'TERIM (Lat., in the meantime). The name given to three attempts made in Germany during the Reformation to draw up a formula which might serve as a basis of agreement between Catholics and Protestants until the points of difference could be decided by a general council. The *Ratisbon Interim* was the result of the deliberations of a commission appointed during the Diet of Ratisbon in 1541, of which Eck, Pflug, and Gropper were the Roman Catholic, and Melanchthon, Bucer, and Pistorius the Protestant members. On the greater number of doctrinal points the commission found it possible to agree on terms which might be deemed consistent with the views of both parties; but as to the sacraments and the power of the Church, the differences were irreconcilable. At the next Diet at Augsburg in 1548 a new interim at the command of the Emperor, Charles V, was prepared by Pflug, Helling (Sidonius), and Agricola. It is called the *Augsburg Interim*. In it the use of the cup by the laity, the marriage of priests, and some other minor things were conceded to the Protestants; but it met with very general opposition, particularly in the north of Germany, and was revoked in 1552. By

the exertions of the Elector Maurice of Saxony, a third interim, the *Leipzig Interim*, or the *Great Interim*, was adopted at the Diet of Leipzig, Dec. 22, 1548, which guarded the Protestant creed, but admitted great part of the Roman Catholic ceremonial and recognized the power of popes and bishops when not abused. It was the work of Melanchthon, Bugenhagen, Cruciger, Major, Eber, and Pfeffinger. It proved no more satisfactory than those which had preceded it and gave rise to the adiaphoristic controversy. (See ADIAPHORISTS.) Consult: Druffel, *Briefe und Acten zur Geschichte des 16. Jahrhunderts* (Munich, 1875); Beutel, *Ueber den Ursprung des Augsburger Interims* (Dresden, 1888); T. M. Lindsay, *History of the Reformation*, vol. i (New York, 1906-07).

INTERIOR, DEPARTMENT OF THE. One of the 10 executive departments of the United States government, whose chiefs constitute the President's cabinet. It was organized in 1849. At its head is the Secretary of the Interior, whose salary is \$12,000, and associated with him are two assistant secretaries whose salaries are \$5000 and \$4500 respectively. The scope of this department is wide and diversified. It has supervision of Indian affairs; of the public lands, including mines; of pensions; of patents; of the census, when directed by law; of the geological survey; of education; of the custody and distribution of public documents; of railroads which have received subsidies from the United States; of the Territories; of national parks and reservations; of certain charitable and penal institutions in the District of Columbia; of the returns office in which are filed returns of contracts made by the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior, and of some other miscellaneous business. Most of the bureaus into which the department is divided are presided over by commissioners, appointed by the President by and with the advice of the Senate; but the Secretary's office is the great clearing house of the department, and the various commissioners are subject to the Secretary's directions in the performance of their executive duties.

INTERIOR BALLISTICS. See BALLISTICS.

INTERIOR DECORATION. The art of decorating and furnishing the interiors of a building, especially the important rooms of a residence. The purpose of the present article is to supply the historic and decorative background likely to be of special service to those who buy, install, or make furniture, rugs, wall paper, draperies, lamps, etc. The styles treated are: Gothic, Renaissance, Elizabethan, Jacobean, Louis XIV, Louis XV, Louis XVI, Empire, Charles II, William and Mary, Queen Anne, Georgian, and Adam. For the other historic styles, see ARCHITECTURE; FURNITURE.

Classic v. Romantic. In the world of decorative art, as in the world of literature, two principles strive for mastery, the classic and the romantic. The soul of the classic is balance and proportion and perfection of form; of the romantic, enthusiasm, mystery, and life. The former is exquisitely measured; the latter is beyond measurement. The most perfect of the classic styles is Greek; the greatest of the romantic styles is Gothic. Other classic styles are Egyptian, the mother of Greek; Roman, the daughter of Greek; and Renaissance, the granddaughter. Other styles properly classed as ro-

mantic are Persian, Chinese, Japanese, and Art Nouveau. Byzantine, Romanesque, and Rococo are mixed styles, partly classic and partly romantic. This distinction between classic and romantic is vital in interior decoration. Once apprehended, it makes easy the lesser distinctions between Louis XIV and Louis XV, Elizabethan and Jacobean, Georgian and Adam.

Gothic. Of the nonclassic styles, the most important is Gothic, that in the last half of the twelfth century began to be created in northern France out of Romanesque, and that flourished in western Europe for three centuries—the thirteenth, fourteenth, and fifteenth. In Gothic the long process of transformation that had orientalized Roman into Byzantine, and out of Byzantine and Roman had developed Romanesque, was completed. Decoratively as well as architecturally Gothic is the antithesis of classic. Most of the Gothic furniture, tapestries, and other interior decorations that have been preserved, date from the fifteenth century or the first few years of the sixteenth, so that, from the decorative point of view, the Gothic of the fifteenth century, particularly that of the territory controlled by the dukes of Burgundy—not only the Duchy of Burgundy in east central France, but also and especially the Netherlands and a strip of northern France including such prosperous cities as Arras and Lille—is of prime significance. The Burgundian court was the richest and most fashionable in Europe. For Philip the Good (1419-67) and his son Charles the Bold (1467-77) were made by their own subjects the richest costumes, the finest furniture, the most beautiful tapestries, the most brilliant paintings, and the most exquisite illuminated manuscripts. The King of France they regarded as an inferior, and the King of England and the Emperor they met on equal terms. After the defeat and death of Charles the Bold, in 1477, ensued a splendid efflorescence of late Gothic and Gothic-Renaissance decorative arts in Flanders and the rest of the Netherlands under the suzerainty of the Emperor, and in France under Charles VIII (1483-98) and Louis XII (1498-1515). During this period were woven at Brussels the Mazarin tapestry now in the New York Metropolitan Museum, and the numerous similar pieces in the Royal Spanish collection. (See TAPESTRY.) The museums that best illustrate Gothic interior decoration are the Cluny and the Louvre (Musée des Arts Décoratifs) in Paris, the Victoria and Albert in London, the Metropolitan in New York, the Kunstgewerbe in Berlin, the Bavarian National in Munich, the Germanisches at Nuremberg, the National at Copenhagen, the Cinquantenaire at Brussels, the Rijks at Amsterdam, the Steen at Antwerp, the Trimolet at Dijon.

Of a Burgundian banquet hall, 140 feet long by 70 wide and 60 high, built to celebrate the marriage of Charles the Bold to Margaret of York in 1468, Olivier de la Marche has left us a most picturesque contemporary account. He says: "In this hall were three tables, one of which was placed across the ends of the others. This table, higher than the others, stood upon a platform. The other two tables were placed on the two sides of the hall, occupying the whole length; they were very long and very handsome, and in the centre of the said hall a high and rich buffet in the form of a lozenge was placed. The top of the said buffet was inclosed with a

balustrade, and the whole was covered with tapestries and hung with the arms of Monsieur le Duc; and above rose the steps and degrees on which were displayed many vessels, the largest on the lowest, and the richest and smallest on the top shelves; that is to say, on the lowest shelves stood the silver-gilt vessels, and above them the vessels of gold garnished with precious stones, of which he had a great number. On the top of the buffet stood a rich jeweled cup, and on each of the four corners large and entire unicorn's horns. . . . These vessels of parade were not to be used, for there were other vessels, pots and cups intended for service."

Of a Burgundian bedchamber, that of Isabella, first wife of Charles the Bold while he was still only Count of Charolais, Aliénor of Poitiers, whose mother was maid of honor to the third wife of Philip the Good, gives us an account. She says that it was very large and contained two beds, about 5 feet apart, beneath a canopy of green damask, from which hung curtains of satin that could be drawn to completely screen the beds when desired. The curtains and the lambrequin of the canopy had a green silk fringe. On each bed was an ermine counterpane, with very fine violet lining. The show feature of the room was the *dresser*, "of four beautiful shelves, filled with vessels of crystal garnished with gold and precious stones, and some of fine gold." In the corner near the dresser was a little low table containing the cups and saucers in which something to drink was served to callers after they had been offered a dragée from the drageoir or bonbonnière that stood on the dresser.

Gothic is the antithesis of classic. In Gothic the vertical is accentuated at the expense of the horizontal, the number of spire shapes and nearly perpendicular lines being vastly increased, while the number of horizontal lines and bands like those of the classic entablature is diminished, and the effect of those that remain is weakened by breaking them. This is what gives Gothic furniture as well as Gothic cathedrals and stained-glass windows such an uplifting effect—an effect that is much closer to nature than that of Greek and Roman, and that even suggests the lines and shapes of some of the more symmetrical lofty caves and mountains and trees produced by nature. Gothic columns are totally unlike classic columns, being far slenderer—attenuated by comparison—so that the vertical impression they give is extreme, whether they stand singly or grouped in piers. Their capitals are not the classic ones, but have necks of oak leaves and other domestic foliage—sometimes supplemented by quaint animal or human heads at the corners—naturalistically carved, with a slender molding below, and a round, square, or polygonal cap above, formed of an expanding series of moldings. These moldings as well as those on the bases are exceedingly decorative, but totally unlike the classic ones, being much sharper and slenderer. The most obvious feature of Gothic is the pointed arches that not only frame gables and the tops of doors and windows, but repeat themselves over and over again, combined with columns and circles and trefoils and quatrefoils, in the tracery work of stained-glass windows. Duplicating the outlines of this tracery work, perhaps borrowed from it, are the carvings, sometimes pierced, that adorn the panels of furniture

and other woodwork. Based upon this ornament and developed in sympathy with it, are the patterns of Gothic damasks and brocades and embroideries, while slender and fancifully jeweled columns and arches are often used to divide and subdivide the different scenes of picture tapestries. So that between Gothic architecture and the other decorative arts of Gothic there is a peculiar sympathy, despite the fact that all the ornament of Gothic tapestries and embroideries and decorative painting, and most of that of Gothic stained-glass windows, is absolutely flat, without shadows to force forms into realistic relief. This fact is, of course, closely associated with the tiny scale of Gothic decoration, details being minute and infinite in number, but all adequately portrayed. The attempt to show them in high relief would have obscured them by the blackness of the shadows, making it necessary to work on a larger scale, as was illustrated later in the development of Baroque.

Renaissance. Renaissance was the rebirth of classic—a reaction from the then modern to ancient, from Gothic to Roman. Banished was the lofty and aspiring perpendicularity of pointed arches, and restored was the horizontal solidarity of round arches and low pediments, of heavy entablatures and square lintels. Once more flourished Doric and Ionic and Corinthian capitals and columns and pilasters, together with ornamental shapes like the egg and dart, the bead and fillet, the Greek fret, the anthemion, and the acanthus leaf in its numerous developments—all employed to enrich interiors as well as exteriors.

The home of the Renaissance was Italy. In Italy the Renaissance of the classic decorative arts began a century earlier than in France, the Netherlands, England, Germany, and Spain. In the latter countries it was of the sixteenth century only and much mixed with survivals of Gothic, Romanesque, or Moorish. In Italy it was of the fifteenth century as well as of the sixteenth. Not difficult was it for the Italians to discard Gothic that they had never completely assimilated. Easy and natural it was for them to revive the style of their ancestors, actual examples of whose architecture they saw all around them, and actual examples as well as illustrations of whose interiors they found in buried palaces, like the Golden House of Nero, which at the beginning of the sixteenth century taught so much to Raphael and his pupils—chief among them Giulio Romano, some of whose designs for tapestries illustrate so brilliantly the Grotesque ornament of ancient Rome. The great names of the Italian Renaissance are Brunelleschi, Alberti, and Bramante of the fifteenth century, Palladio and Vignola of the sixteenth. Alberti achieved fame, not only by his buildings, but also by the posthumous publication of the first *printed* book on architecture, accompanied by illustrations and based on Vitruvius, the Roman architect of the time of Augustus, a manuscript copy of whose *De re ædificatoria* had been discovered a few years before. It was one of a long series of such books, the best known of which are those by Palladio and Vignola, which for centuries served to guide youthful students towards the shrine of classic art. Alberti's book was in Latin, the latter two in Italian. The invention of printing in 1453 had a profound and far-reaching

effect upon Renaissance art, both decorative and pictorial. It enabled forms and figures originated in sculpture, wood carving, painting, fresco, stained glass, and tapestry to be spread broadcast inexpensively on paper. In other words, it popularized knowledge about art at the expense of knowledge of art and tended to substitute book knowledge for first-hand knowledge. But the immediate result was brilliant, for it brought book knowledge to those already equipped with knowledge practical and concrete, so that of all the periods in decorative art the richest in many respects is that 50 years before and after 1500.

Elizabethan. The Elizabethan style (1558-1603) is not a simple style. It is a style for show rather than for comfort. Elizabethan mansions were planned for the purpose of displaying to the world the wealth and culture of English landed proprietors. Nor is the Elizabethan style a pure style. There are many traces of Gothic, and the Renaissance part is by no means of the purest Italian type. Nevertheless, of all the English styles, it is in many respects the most interesting. Like Elizabethan literature, it is so full of affectations as to seem natural because so frankly parading them. Like Shakespeare, it borrowed materials from every available source, transforming them into vivid and spirited though seldom altogether classic works of art. During the reign of Elizabeth's father, Henry VIII (1509-47), there had been no real amalgamation of Renaissance with English Gothic. The new Renaissance mausoleums and other buildings produced in England were designed and erected by imported Italian artists and artisans. But when Elizabeth ascended the throne, all this was changed. English workmen learned to execute the details of the fashionable imported style. English architects, trained by travel in Italy and France and by study of engraved plates and illustrated books, learned to supply home-made plans for English Renaissance residences. What contrasted Elizabethan Renaissance with continental Renaissance and particularly with Italian Renaissance, was the English Gothic that survived as part of it. The general arrangement of houses remained English, with the spacious and often stately hall as the main apartment. But the elaboration of the other rooms was on a scale far more magnificent than before. A point to be especially noted is that Elizabethan mansions were not fortified castles but peaceful country houses. The settled conditions of life during the reign of Henry VIII had rendered fortification no longer necessary. And the suppression of the monasteries had turned all the building resources of the kingdom into the creation of homes for noble families, so that on domestic architecture and decoration was spent the money that previously had gone to construct and equip churches and convents. A prominent feature of Elizabethan mansions is the windows mullioned in the Gothic fashion with small panes of clear or stained glass, and with square instead of pointed top, sometimes filling the whole façade, as at Hardwicke Hall. Another prominent feature is the fireplaces—prominent for service as well as decoratively—framed elaborately and with elaborate overmantels of stone or wood. Here the influence of German and Flemish books of design made itself felt in ornate strapwork and coats of arms, and in stat-

uettes of the Virtues or Scientia or Arithmetica or Geometria. An especially interesting Elizabethan chimneypiece is the one found in the hall of "Losely," a mansion near Guildford, begun by Sir W. More in 1562, completed by his son 50 years later, and several times honored by the visits of royalty. The ceilings of an Elizabethan residence were apt to be elaborately patterned in plaster, and the walls paneled in oak or hung with tapestry. In the ceiling patterns as well as in the mullioned windows the Gothic feeling is often strong, whether the designs are executed in ribbed or strap work. Floors were simply treated, usually strewn with rushes, with perhaps one rug in the main hall and another in the main parlor or "withdrawing room," for the use of the master. Windows and doors and the huge four-poster beds were elaborately draped sometimes with tapestries, but more often with embroideries in silk or linen, in elaborate floral and grotesque patterns. Heavy imported velvets and damasks and brocades were also used; and for upholstery, leather embossed in the Spanish fashion.

Jacobean. If the English during the seventeenth century had not been so busy dethroning the Stuarts and bringing them back again, or, in other words, if the full development of a Charles I style had not been obstructed by Parliament, London instead of Paris might have become the decorative capital of the civilized world, and Charles instead of Louis might be the supreme name in the history of decorative art. As it is, Jacobean is a convenient term under which to group the styles of James I (1603-25) and Charles I (1625-49), the corresponding French period being that of Louis XIII. How ambitious James and Charles, inspired by Buckingham, were to surpass the example of the French King Henri IV in encouraging the art industries, is shown by the establishment of the Mortlake tapestry works in 1619, and especially by the tapestries woven there for Charles I with a Latin inscription in the bottom border that says, "Kings foster the arts." (See TAPESTRY.) Cromwell and the Commonwealth not only ended the prosperity of the tapestry works, but also dealt another severe blow to the decorative arts when they dispersed the "household goods, jewels, plate, etc., belonging to the late King." These were sold "by order of the Council of State, from ye severall Places and Palaces." The tapestries, both antique and modern, were especially noteworthy, and helped greatly to enrich the French, Swedish, and other continental collections. While late Elizabethan and early Jacobean are hard to distinguish, so that Jacobean furniture and interiors have often been described and sold as Elizabethan, between the periods as a whole the line of demarcation is definite. During the Jacobean period the last vestiges of Gothic disappear, and the victory of the foreign style is complete. Under the leadership of Inigo Jones and others who visited Italy in order to study the ancient buildings and familiarize themselves with the most approved examples of modern Italian work, all the freedom of Elizabethan invention disappeared. The instructions given in the famous book of the Italian Palladio were followed in England much more strictly than he followed them himself. Columns and pilasters and other classic ornaments began to be used less fancifully and with scrupulous adherence to what was regarded as

Greek and Roman precedent. The best examples of Jacobean interior decoration are those at Knole, near Sevenoaks, 21 miles southeast of London. Outside and inside this baronial mansion has changed little since the time when James I was entertained there, sleeping in the bedroom specially prepared for him by Richard, then Earl of Dorset, at a cost of \$40,000. Illustrations of the principal rooms of Knole are given by Nash in his *Mansions of England in the Olden Time*, and some of the ancient tapestries are now on exhibition at the Metropolitan Museum in New York, lent by Mr. J. P. Morgan, whose father acquired them from the present owner of the estate in 1912. Particularly interesting at Knole is the "Spangled Bedroom," because the furnishings of it were the gift of James I, presumably in recognition of the hospitality shown him. The plaster and woodwork ornamentations of it are strikingly simple and classic as compared with Elizabethan, but what was saved in modeling and carving was more than made up for by the richness of upholstery and draperies. The posts of the bed are slender and simple, and in the age of Elizabeth they would have been massive and richly carved; but they are concealed by elaborate draperies. On chairs and stools upholstery replaces carving. There is a large rug on the floor, the walls are crowded with tapestries, and both windows and doors are heavily draped.

Louis XIV. During the reign of Louis XIV Paris became the decorative capital of the civilized world and the style of Louis XIV was imitated not only in Flanders and England, but also in Germany, Italy, and Spain. Earnestly, but not always faithfully, were copied the furniture and fabrics originated at the Gobelins and displayed at Versailles. The style of Louis XIV is a finished style. It has the completeness one would expect from a style developed under the influence of a powerful monarch who sought to dominate every field of artistic activity and whose reign lasted for 72 years, from 1643 to 1715. To be sure, at the beginning, during the minority of Louis XIV and the premiership of Mazarin, there was a period of transition from the style of Louis XIII; and at the end, during the old age of Louis XIV, there was a period of transition towards the Rococo of the Régime and of Louis XV; but the reign of Louis XIV was long enough to provide for these transitional periods, and at the same time to develop in the middle during the years when the Gobelins flourished under the direction of Charles Lebrun, one of the most interesting and adequate styles of decorative art the world has ever known. The style of Louis XIV is not a simple style and not a primitive style. It is not suited to country houses or modern cottages and city apartments; but it is suited to palatial city residences and to public buildings, when applied with due regard for changes of environment and condition. The style of Louis XIV is a classic style, but it is the Baroque classicism of the seventeenth century, not the Renaissance classicism of the sixteenth century. It is a magnificent style, solid and symmetrical, luxurious with gold, and, above all, dignified, but overloaded with ornament, especially ornament in relief, and often confusing with its variety of broken lines and curves. During this period the Gobelins was the centre of decorative activity. Here were designed and made furniture, tapestries,

bronzes, mosaics, gold and silver ware for the King and the King's friends. Here in the month of "September, 1667, in the buildings of the Gobelins," according to the inscription at the entrance, "was established the Furniture Factory of the Crown under the direction of Charles Lebrun." The home of the Louis XIV style is the palace of Versailles, now a national museum, but not a museum in the ordinary sense of the word. It is not a haphazard collection of objects unsympathetically arranged in an unsuitable building. Versailles is Louis XIV himself incarnate in the decorative forms that expressed his personality and that of his artists and artisans. The Louis XV rooms there merely accentuate the grandeur of "the Sun King." Intimate and exquisite as they are, they seem like the refuges of diminished descendants seeking shelter from the glory of an ancestor whose too brilliant destinies it was their duty to attempt to sustain. It was in 1663 that Louis XIV began to visit Versailles frequently, deserting for it Saint-Germain-en-Laye, where he was born, which had been a favorite resort of the French kings since the twelfth century. Finding too small the palace built at Versailles by Louis XIII, i.e., the central part of the present palace, he decided in 1668 to enlarge it. The principal architect was Mansart, and the decorations were by Lebrun, who in gold and bronze and marble and stone enshrined the allegories of Victory and Empire, Europe conquered and the nations enchained, and crowded the heavy and tumultuous ceilings with Apollos and Alexanders, whose features are those of Louis XIV, advancing in triumph among terrified mortals and respectful divinities. One of the most interesting rooms at Versailles is the bedchamber of Louis XIV, which for many years was the centre of society and government in France. Here he held his great audiences and received the remonstrance of the Parliament. Here, on Sept. 1, 1715, he died, and in this bed his body was exposed to view after death.

Louis XV. Of the three great Louis styles, that of Louis XV is as much distinguished for *originality* as that of Louis XIV for *grandeur*, and that of Louis XVI for *simplicity*. The style of Louis XV was to some extent an *art nouveau*, or *new art* style. It represents a definite attempt to break away from tradition and, while retaining French Renaissance architecture, to adorn it with original decorative forms adapted and developed from rocks and shells and trees and plants. From this introduction of rock and shell motifs, *rocaille* and *coquille* in French, came the nickname of Rococo applied to the style of Louis XV. While the style of Louis XIV had eliminated Italian Renaissance feeling in French furniture and decorations, much that was ancient Roman still remained. In Louis XIV ornament the figures were Roman figures nude or clad in Roman draperies, and the characters were derived from Roman mythology. When Louis XIV or members of his family or court were introduced, it was in the guise of Roman gods and heroes. From the Watteau grotesques of the Régence, the term often applied to the style of the minority of Louis XV (1715-23) when Philippe of Orléans was Regent of France, the Roman tradition has entirely departed. The figures are avowedly French, clad in contemporary French costumes, and the buildings resemble those of the French court. The

most obvious characteristic and the one that enables the novice most quickly to distinguish the style of Louis XV from that of Louis XIV is *lack of symmetry*. In the patterns of Louis XIV the right side is a replica of the left side, and a vertical median divides them symmetrically into equal halves. But in the patterns of Louis XV the sides are often totally unlike and do not correspond or repeat. Cartouches and shields often have the main axis in an oblique position. Another noteworthy characteristic of the style of Louis XV is *dread of the straight line*. Profiles bend into S's, and everything twists and undulates. Flat surfaces are replaced by surfaces bombé, or bulbous. The foremost designer in the Rococo style was Jules Aurèle Meissonier, who is described on the title-page of his book of furniture and decorative designs as "painter, sculptor, architect, and designer of the King's Chamber and Cabinet." Meissonier also published a book on plants and vegetables as furnishing material for the designer, thus indicating clearly enough the back-to-nature tendencies of himself and his school. In the reign of Louis XV the romantic spirit dominated life and art alike. Woman was supreme. Her smiles and frowns decided matters of state, and the lords of the council chamber trembled before the ladies of the boudoir. For their comfort or to please their fancy, rooms were made smaller and more homelike, beamed ceilings disappearing and mirrors taking the place of huge paintings and enormous bas-reliefs. Chairs and tables and stands became graceful and coquettish, even capricious. Colors as well as forms became lighter in the period of Louis XV. The gold and crimson and green of Louis XIV were succeeded by gold in combination with white and ivory and delicate tones of lilac and lemon, sky blue, rose, blue gray, etc. Draperies also became lighter, and the use of lace curtains more general.

Louis XVI. While Louis XVI did not ascend the French throne until 1774, the classic revival that bears his name was already beginning to assert itself in 1760. Indeed, one of the leaders in the movement that substituted the back-to-classic style of Louis XVI for the back-to-nature style of Louis XV, was the latter's fair friend, the Marquise de Pompadour, who sent decorative artists to Italy to study the ancient interiors and decorative treasures unearthed at Pompeii 1700 years after Vesuvius buried them. The popular phrase in decorative circles was "in the antique style," and many books were published illustrating and describing Pompeian forms and ornament, where models and designs were copied with almost slavish fidelity. The style of Louis XVI was not only a classic style; it was also a pastoral style. In 1768 Louis XVI, then Dauphin, was pictured at the plow. Political economists preached the land as the source of all wealth; writers turned out idyllic stories like *Paul and Virginia* and the *Nouvelle Héloïse*; decorators substituted fruit, flowers, and vegetables for the rocks and shells of Rococo. The style of Louis XVI is, above all, a gentle style. From it is banished all violence of line, shape, and color. The subjects of the tapestries, medallions, panels, bronzes, etc., are restful. There is none of the cold dignity of Louis XIV, none of the saucy affectation of Louis XV. Especially soothing are the colors, with their subdued grays and lack of brilliancy.

The style is also essentially flat. There are none of the bold reliefs so common in the form of cornices, moldings, pediments, and furniture carvings in the days of Louis XIV. In both structure and ornament the straight line and the right angle rule. Parallelism of motifs is frequent, and rectangular panels are apt to be comparatively narrow. In small objects and for frames the oval is common. Besides pastoral forms, Louis XVI decorators loved also sentimental and allegorical forms—bows and arrows, cooing doves, and torches. Especially characteristic is the bow of ribbon applied to the top of panels and medallions, with ends floating down on each side. The style of Louis XVI is distinctly more refined than that of Louis XV. There is less coarseness and less suggestiveness in the paintings and the tapestries. It also differs from the style of Louis XV and resembles that of Louis XIV in being a symmetrical style, the motifs on the left of a panel repeating themselves on the right. But while the style of Louis XIV is a grand style, that of Louis XVI is dainty and intimate—a style for the home rather than for the court, and one that can be modified in the direction of simplicity and inexpensiveness without losing character; so that, of all the French styles, it is the one best fitted for general use, and the one most used to-day in English and American residences. Famous interiors in the style of Louis XVI are the apartments of Marie Antoinette in the palace at Fontainebleau and in the Petit Trianon at Versailles. The numerous vases and cameos used in the ornament of the former make clear why the Germans call this the *Zopfstil* (vase style) and indicate the close relationship between it and the contemporary English style of Adam, with its Wedgwood vases and plaques.

Charles II, William and Mary, Queen Anne. When Charles II (1660–85) returned to England after his long exile in France, he brought back with him French manners and tastes, and during the next half century the style of Louis XIV was dominant at the court and in the royal palaces of England and was followed or imitated by most of the English nobility. The surroundings of Charles II were luxurious to a degree previously unknown in England, and the establishments of his fair friends (Castlemaine and Portsmouth and Mazarin), made duchesses by him, were among the sights of London, very quickly swallowing up the £60,000 a year that he received from Louis XIV. The diarist Evelyn was particularly moved by the solid silver furniture in the apartments of the Duchess of Portsmouth—a Frenchwoman, Louise de Kérouaille in the pay of Louis XIV—and by the new French tapestries (Gobelins) which he naïvely describes as "incomparable imitations of the best paintings—Versailles, Saint-Germains, and other palaces of the French King, with hunting figures, landscapes, and exotic fowls, all to the life ready done." Nell Gwyn had a silver bedstead with embossed representations of the King's head, slaves, eagles, crowns, cupids, and Jacob Hall the tight-rope dancer. The King's head weighed 197 ounces, and the other ornaments 2168 ounces, costing altogether £906. Latham, in his *English Homes*, illustrates several pieces of silver furniture still preserved at Knole.

The quieter courts of James II (1685–88) and of William and Mary (1689–1702) encouraged

simpler and more practical furnishings, and of course during the reign of the latter the Dutch influence was strong, and importations from Holland were many. Much of the luxury that Charles II had loved was destroyed by the burning of Whitehall Palace in 1698, with its 1000 elegantly furnished apartments. The most prominent architect of the period was Sir Christopher Wren (1632-1723), who rebuilt a large part of London after the great fire of 1666. He never visited Italy, but was in Paris in 1665, returning thence, as he himself said, with "All France on paper." While in Paris he met the great Italian Baroque architect Bernini, who gave him a glimpse only of designs he was then making for the façade of the Louvre, and which Wren said he would have "given his skin" for a chance to copy. Upon the accession of William and Mary, Wren was commissioned with the enlargement of Hampton Court Palace and constructed the existing suite of state apartments in avowed imitation of the splendor of Versailles. One of the most important rooms at Hampton Court is the bedchamber of Queen Anne (1702-14), with elaborate four-poster bed in crimson Genoa velvet, and walnut chairs, benches and stools to match, all very good Louis XIV in style. The mural paintings by the Italian Verrio in Queen Anne's drawing room are each 20 by 35 feet, and, being overhung with green damask in 1735, were only brought to light again in 1899. They picture Queen Anne and Prince George in allegorical scenes, with Europe, Asia, Africa, and America come to offer homage. The most famous residence built in the reign of Queen Anne is Blenheim, tribute of the English nation to the Duke of Marlborough for his great victory over the French at Blenheim. It cost over half a million pounds, and the three state rooms with their tapestries picturing the Duke's victories, all in the style of Louis XIV, with furniture to match, are particularly imposing.

Georgian. During the reigns of George I (1714-27) and George II (1727-60) French decorative styles continued to be copied in England, and in both countries we find the same tendency to make decorations romantic, while keeping architecture classic. Especially in England the romantic movement was violently opposed by leading architects who had studied in Rome and drew their inspiration, not from Sir Christopher Wren and France, but from Inigo Jones and Italy. Indeed, it was from Inigo Jones that they derived the massive mantel-pieces in wood and plaster that are so characteristic of the early part of the Georgian period. Massive and elaborate also was the woodwork framing doors and windows and paneling walls. But it was commonly painted in cream and in light tints of blue and green instead of being left in the natural, as in the seventeenth century. The great name of the period is that of William Kent (1684-1748), whose taste was regarded as second to none, and who, as Walpole remarks, "was not only consulted for furniture, frames of pictures, glass, tables, chairs, etc., but for plate, for a barge, and for a cradle," and even for gowns. One lady he accordingly dressed in a petticoat decorated with columns of the five orders. But while Kent was designing houses, furniture, decorations, and costumes in the classic style, the romantic spirit was abroad in the land. Langley in 1742 published a book

on Gothic decoration and ornament, and a little later persuaded Walpole to let him build him a Gothic residence on Strawberry Hill. Edwards and Darley published their book of Chinese designs in 1754, while Langley, Johnson, Ince and Mayhew, Halfpenny, Manwaring, and others saw to it that Rococo was not neglected. So that Isaac Ware, in his book on *Classic Architecture* published in 1756, wrote: "His own misfortune to see at this time an unmeaning scrawl of C's inverted, turned and hooked together, take the place of Greek and Roman elegance, even in our most expensive decorations. This is not because the possessor thinks there is, or can be, elegance in such fond, weak, ill-jointed, and unmeaning figures; it is usually because it is French; and fashion commands that whatever is French is to be admired as fine." Elsewhere in the same book Ware laments that "paper has taken the place of sculpture"—by paper meaning wall paper; and by sculpture, columns and pilasters and pediments and moldings in wood and plaster. Wall paper began to be commonly used in England about this time and must have aroused Ware's wrath, not only because it displaced wood and plaster, reducing the frames of doors and windows to simple casings, and minimizing or eliminating chimney-pieces, but also because it is of Chinese origin and because a large proportion of the early French and English papers have designs that were Chinese (more or less) in character, or Chinese and Rococo mixed. (See WALL PAPER.) Just as in France under Louis XV, so in England rooms became smaller, and pieces of furniture more numerous and more comfortable. Now there began to be chairs for all; and interiors not only looked less like Roman temples but felt less like them—which explains why the Georgian period was so distinctly an age of chairs and affords so appropriate a background for Thomas Chippendale (q.v.).

Adam. Not without reason has the name Adam become attached to the English classic revival contemporary with Louis XVI, for in interior decoration as well as in architecture the influence of Robert Adam was preëminent. Though Hepplewhite and Sheraton (q.v.) justly acquired fame as furniture designers, as far as style is concerned, they were followers rather than leaders, and were only too glad to model their chairs and other furniture to conform with the prevailing classic style. The common fault of the English classic interiors that preceded the Adam period was *ponderousness*. As Robert Adam himself says in the preface to the *Works on Architecture of Robert and James Adam*, published from 1773 to 1779, with a posthumous supplement in 1823, Robert Adam having died in 1792 and James Adam in 1794: "In place of the massive entablature, the ponderous compartment ceiling, the tabernacle frame, almost the only species of ornament formerly known in this country, we have adopted a beautiful variety of light moldings, gracefully formed, delicately enriched, and arranged with propriety and skill. We have introduced a great diversity of ceilings, friezes, and decorated pilasters and have added grace and beauty to the whole by a mixture of grotesque stucco and painted ornaments, together with flowery *rainceau* (rincau) with its fanciful figures and winding foliage." The previous ponderousness, Adam goes on to explain, was due to the first

masters of the Italian Renaissance, who applied to residences massive ornament copied from Roman temples and other public buildings. In consequence of their mistake "all Europe has been misled and has been servilely groaning under the load for three centuries past." The Romans themselves, wrote Adam, were extremely careful as to proportion, and the decorations of their private apartments were "all delicacy, gayety, grace, and beauty." A lesser example of what Adam means are the famous Boncereale frescoes in the New York Metropolitan Museum. An important factor in the development of the Adam style was the secret of making compo ornament, which, together with workmen who understood the process, Robert Adam brought back from Italy. This compo, cast in various patterns in wooden molds and then applied to ceiling or wall, was much cheaper than wood carving or plaster work executed in position, and, for delicate ornament in the Adam style, much better. An individual note in the Adam style was the introduction of ornament copied from the vases and urns of the ancient Etruscans. Robert Adam also got fresh material from Diocletian's vast palace at Spalatro in Dalmatia, of which he was the first to make drawings, published as a folio volume in 1764. The book above all others from which to get an accurate knowledge of the Adam style is the *Works on Architecture*, mentioned above, that presents superb copperplate engravings not only of the exteriors but also of the interiors and the decorations of famous residences planned and executed by Robert Adam.

Contemporary American Decoration.

Towards the close of the nineteenth century the French styles of Louis XIV, Louis XV, and Louis XVI were the fashion in the United States. The highest ambition of the decorative salesman was to be able to point out to customers the distinguishing marks of the three periods. As the years rolled on, and French and English decorators, as well as American decorators with French training, began to execute French interiors worthy of the name, there began to be a revival of interest in Old American furniture and furnishings, under the name Colonial. Naturally the first attempts at reproduction were crude, and many of the Colonial rooms composed of antiques or bad reproductions were confused in style and unsatisfactory in taste. By degrees, however, as Colonial furniture began to be assembled in intelligent collections by individuals and societies, furniture makers displayed more interest and more skill in the copying of fine models, and decorators made groupings that were harmonious. Of course, the study of Colonial soon led across the water to England, where most of it originated, and before long English and American decorators were creating Jacobean, Queen Anne, Georgian, and Adam interiors for American patrons. Gradually the French styles were eliminated entirely from merchandise shops, surviving only in the city homes of the very wealthy, mostly those who are willing to pay the price for antique French furniture and tapestries. In large American country homes we now find mainly Colonial and English interiors, with some of the more magnificent apartments in the style of the Italian Renaissance, and an occasional hall or living room Gothic or Gothic-Renaissance transition. A

large percentage of the furniture is reproduced with considerable fidelity from excellent antique pieces, and a small percentage is genuinely antique. Around important old tapestries or pieces of furniture rooms are often built, all the other furnishings being planned to harmonize in style and scale.

Some of the best interiors are executed by the architects who have given attention to the art of interior decoration, but there are also men and women of different degrees of training and taste who are engaged in this work, and, as is perhaps natural, the jealousies among interior decorators of various classes or groups are bitter. The interests of the *merchandise house*, whether department store or furniture and carpet store, are constantly opposed to the interests of the decorative shop that devotes itself exclusively to *fine work*, while both are annoyed by the *upholsterer decorator* doing business on a small scale, and by the so-called *consulting decorator* without a shop. The most hopeful sign for peace among the warring elements, as they are found in New York, is the continued existence of the Art in Trades Club, organized in April, 1906, by graduates of Frank Alvah Parsons's classes in interior decoration, consisting of men in the decorative trades. The objects of the club are: "To bring into association men engaged in, or interested in the Arts and Art Trades, for mutual advancement and study; to study the principles of Art as applied to Trades connected with the decoration and furnishing of buildings; to harmonize commercial activities with the growing Art tendencies of the present time; to foster feeling and taste for Art expression in general; and to strengthen the natural bond between those thus allied by fellowship and a community of interests."

The increasing number of amateur decorators, with a brief training at some art or decorative school, causes considerable perturbation in the trade, especially among those who have been insufficiently educated, having "grown up in the business," without any special knowledge of art and of æsthetic theory. But the effect of this irruption into trade circles is decidedly uplifting and has raised the standards of culture and taste appreciably among decorative salesmen. Not the least important result of the work done by schools and universities along decorative lines is the development of a public whose knowledge compels increased knowledge on the part of the trade and promotes good taste even in the cheapest shops. Helpful in the same direction is the installation of well but very inexpensively furnished apartments of two or three rooms in some of the public schools, as well as of "period rooms" and "model houses" in many of the large merchandise shops.

Bibliography. Robert Adam, *Works in Architecture of Robert and James Adam* (London, 1773-1822); J. Nash, *Mansions of England in the Olden Time* (4th series, ib., 1839-49); James Ward, *Historic Ornament* (2 vols., ib., 1897); August Man, *Pompeii: Its Life and Art* (New York, 1904); Richard Glazier, *Historic Ornament* (ib., 1906); Alexander Speltz, *Styles of Ornament* (Berlin, 1908); Charles Latham, *In English Homes* (3 vols., London, 1909); Tipping, *English Homes, Elizabethan and Jacobean* (ib., 1912); Haencke, *Entwicklungsgeschichte der Stilarten* (Leipzig, 1913); and the numerous editions of Vitruvius, Palladio, Vignola, and

Serlio. Books on present-day furniture and furnishing are being brought out in bewildering variety; but many of the American books on decorative subjects are unworthy of serious consideration. Among exceptions to the rule are Wharton and Codman, *The Decoration of Houses* (New York, 1897); Elsie Dewolfe, *The House in Good Taste* (ib., 1913); G. L. Hunter, *Home Furnishing* (ib., 1913). Authoritative American books on special decorative subjects are G. L. Hunter, *Tapestries* (ib., 1912); L. V. Lockwood, *Colonial Furniture in America* (ib., 1913). Valuable for what is quoted rather than for the opinions expressed are Esther Singleton, *French and English Furniture* (ib., 1903); id., *Dutch and Flemish Furniture* (ib., 1907); id., *Furniture of our Forefathers* (2 vols., ib., 1913). Among American magazines that contain articles helpful to the interior decorator are *American Architect* (New York), *Architectural Record* (ib.), and *The Craftsman* (ib.). See DECORATIVE ART; FURNITURE; ARCHITECTURE.

IN'TERJEC'TION (Fr. *interjection*, Lat. *interjectio*, a throwing between, from *interjicere*, to throw between, from *inter*, between + *jacere*, to throw). One of the parts of speech. (See GRAMMAR.) Interjections proper are merely emotive reflex movements of the vocal organs accompanied by voice, as *ouch*, *O*, *grrh*, *poo*, and many of a like nature. Sounds of this type are the most primitive of all forms of speech and are the only sort of vocal language shared by man with other animals. The present tendency of logicians is to treat the interjection as the most primitive form of judgment. The term "interjection" is often applied to vocatives and imperatives when they are employed as isolated exclamations, as *heavens*, *the deuce*, *alas*, *Charles*, *stop*, *go on*, and the like. The vocative interjection may be a representative of the single-membered sentence consisting of a subject only, with no predicate. This is not undisputed, however, for there certainly is in many cases, and may perhaps be in all, an ellipsis of a predicate. The imperative interjection seems to be a predicate with an ellipsis of the subject. It is to be noted that though interjections proper stand isolated and complete in themselves, both vocative and imperative interjections are frequently elliptical and, strictly speaking, equivalents for sentences, and are not real sentences, as are the true interjections. Consult: Delbrück, *Grundfragen der Sprachforschung* (Strassburg, 1901); Wundt, *Sprachgeschichte und Sprachpsychologie* (Leipzig, 1901); Mauthner, *Beiträge zu einer Kritik der Sprache* (2d ed., Stuttgart, 1906-13); Paul, *Prinzipien der Sprachgeschichte* (4th ed., Halle, 1909).

INTERLAKEN, in'tēr-lä'ken (between the lakes). A summer resort of Switzerland, in the Canton of Bern, delightfully situated, 1863 feet above sea level, on the left bank of the Aar, in the Bördeli, a plain between lakes Thun and Brienz (Map: Switzerland, B 2). The name is applied to the whole plain, which is from 5000 to 6000 feet above sea level, and includes the villages of Interlaken, Matten, and Unterseen. Its mild climate (averaging 48° F.), dry air, and magnificent mountain scenery, which includes views of the famous Jungfrau Mönch, Schwalmern, and the Bernese Alps, make Interlaken one of the most popular resorts in the Alps. It is visited annually by between 30,

000 and 50,000 tourists. There are numerous good hotels, restaurants, and a Kursaal on the Höhweg—the principal avenue. The chief building is that of the old monastery, founded in 1130 and suppressed in 1528. It is now occupied by the government offices and the hospital. During the season Roman Catholic, Scottish, Anglican, and Presbyterian services are held in its ancient church. Pop. (commune), 1900, 2962; 1910, 3747.

IN'TERLIN'EA'TIONS (from ML. *inter-lineare*, to write between lines, from Lat. *inter*, between + *linea*, line). In a deed, will, or other legal instrument, additions or corrections, written either on the margin or between the lines. They do not invalidate or cast suspicion upon the instrument in which they appear, but there is a presumption that they were inserted after its execution and that they are not to be taken as a part thereof. This presumption may, however, be rebutted by evidence that they formed a part of the original writing at the time of its execution. See EVIDENCE.

IN'TERLOCK'ING DIREC'TORATES. A method of insuring harmony of action between corporations in competitive relations, or in such other relations as may profitably be stabilized. By this plan, which was first employed extensively in the first decade of the twentieth century, the stockholders of one corporation elect to their directorate one or more men who serve as directors on the board of a second corporation; the stockholders of the latter reciprocate in kind. Thus, each corporation is represented in the board of control of the other by men primarily identified with its own interest. Originally this end was attained through the purchase, by those most heavily interested in one corporation, of enough stock in the other to secure the election of one or more directors. In the more highly developed form of the device such stock purchase was dispensed with. Often the representative directors held no more stock than was required to qualify them under the law for the directorate—an amount varying with the several jurisdictions from one share to five.

The device of interlocking directorates was employed extensively in the field of transportation, as a means of securing that unity of policy that could not be secured through combination or consolidation, in view of the prohibitions of the antitrust law. A more frequent object sought through this means was the securing of favorable treatment from important customers or from powerful financial agencies. Thus, the directors of the United States Steel Corporation established themselves as directors in railroad companies representing about one-half the mileage of the United States, in steamship companies, in street-railway companies, and in a large number of industrial companies consuming steel. The aggregate assets of all the companies thus interlocked amounted to over \$16,000,000,000. The great financial houses made it a practice of securing representation in the directorates of other banking houses, and also in the directorates of railway and industrial companies that required their services in stock and bond flotations, etc. According to the report of the Pujo congressional committee, 18 banking houses were represented by directors or officers in at least 134 other corporations.

Popular opposition to the interlocking directorate became active about 1910. It was di-

rected especially against the principle as employed by the banking houses. In this field the interlocking directorate was believed to constitute a gigantic money trust, controlling the flow of money and credits and thus reducing industry to a state of subjection to financial interests. The principle as employed by industrial companies was also very unfavorably regarded. It was widely believed that the only possible object to be attained by an industrial company like the Steel Corporation, through representation on boards of steel-using corporations, was a market free from competition. While persons serving as directors in two companies made it a rule not to take an active part in fixing the terms of contracts between such companies, yet it was assumed that their wishes were tacitly considered and were reflected in the terms of such contracts.

A minor evil imputed to the system was that the multiplicity of directorships sometimes held by one man rendered it plainly impossible for him to give due attention to the interests of any corporation. Instances have been cited of 40 or more directorships held by a single individual. Inevitably his knowledge was restricted to the affairs of a few of these corporations; in the meetings of the others his vote was cast according to the wishes of some other person. Directors thus voting were popularly known as "dummy directors."

The Clayton Trust Bill of 1914 sought to check the evil of interlocking directorates by prohibiting any one from serving as director in more than one corporation of a capitalization of \$1,000,000 or more, except in the case of common carriers. Directors of corporations dealing in railway securities, or in railway materials or supplies to the extent of \$50,000 or more per annum, were prohibited from serving as directors of railways. See TRUSTS; RAILWAYS; CORPORATION.

INTERLOCKING SIGNAL. See BLOCK-SIGNAL SYSTEM.

INTERLOC'UTORY JUDGMENT. See JUDGMENT.

INTERLUDE (ML. *interludium*, from Lat. *interlude*, to play between, from *inter*, between + *ludere*, to play). 1. In the drama, primarily a short performance interposed between the parts of a longer entertainment, as the play of *Pyramus and Thisbe* in the *Midsummer Night's Dream*. The term was early used of dramatic moralities (q.v.), played in the intervals of banquets and other court festivities. During the sixteenth century, however, interlude came to be the specific name for a rude form of dramatic representation which sprang from the moralities, and was, as it chanced, historically intermediate between those and true comedy. It differed from the former in that its *dramatis personæ* consisted not of abstractions of moral qualities, but of real persons; it was shorter in dialogue and of a merrier and more farcical nature. The most noted author of such plays was John Heywood (q.v.), who flourished at the time of the great controversy between the Roman Catholic church and the Reformed church in England. His *Four P's* is an excellent specimen of this phase of the drama. A Peddler, a Pardoner, a Palmer, and a Poticary each tries to tell the greatest lie. At last the Palmer happens to say that he never saw a woman out of temper, whereupon the others declare that his is the

greatest lie that can be told, and gains for him the victory. 2. In music an interlude is a short melodious phrase played by an organist (generally extempore) between the stanzas of a hymn; also, any short instrumental selection played between portions of the church service. Consult: Collier, *History of English Dramatic Poetry*, vol. ii (London, 1831); Dodsley, *Collection of Old English Plays*, vol. i (4th ed., ib., 1874); Ward, *English Dramatic Literature*, vol. i (ib., 1875); Symonds, *Shakespeare's Predecessors in the English Drama* (ib., 1884).

INTERMAR'RIAGE. The intermarriage or intercourse of near relatives has been universally believed to entail degeneration upon the offspring, and the act has been condemned and prohibited. The physical deformity and mental debasement of the Cagots of the Pyrenees, of the Marrons of Auvergne, of the Sarrasins of Dauphiné, of the Cretins of the Alps, and the gradual deterioration of the slave population of America have been attributed to consanguineous alliances. More recently the same opinion has been supported by the history of deaf-mutism and of idiocy. Of 235 deaf and dumb children whose parentage could be traced, 70, or nearly 30 per cent, were the offspring of the intermarriage of blood relations. But in opposition to, and apparently destructive of, such an hypothesis may be adduced the unimpaired condition and symmetry of the Jews, of the small Mohammedan communities in India, of the isolated tribes in North America, among whom the repeated intermarriage of near relatives is compulsory. Moreover, this opinion does not hold in the analogous cases among the inferior animals. (See BREEDING.) Darwin states that the first and fundamental law of heredity is that every attribute of the parents tends to be inherited by the offspring. Opposing influences counteract the tendency. If two brothers inherit strongly the characters of one of their parents, and if each transmits these characters strongly to his children, the cousins thus produced will have not only a close relationship of blood, but a close similarity of physiological characters, and if they marry, their offspring will be likely to be imperfect (Mercier). Insanity follows consanguineous marriages where the contracting parties inherit the same tendencies of a neurotic nature. If one of two brothers shows a reversion to a maternal ancestor, and the other inherits the father's character strongly, the first cousins springing from such brothers will have considerable physiological dissimilarity, and if these cousins marry, their offspring are likely to be well developed. See CONSANGUINITY.

INTERME'DIATE STATE. The condition of the disembodied spirit from the hour of death till the general resurrection. 1. Probably the most popular view is that the souls of the righteous pass to heaven and those of the wicked to condemnation immediately upon death. 2. A second theory is that the intermediate state is one of sleep or unconsciousness. This was taught in the middle of the third century by certain Arabians called Thnetopsychites, and combated by Origen. It was disapproved by the University of Paris in 1240 and by Benedict XII in 1366. It was revived by certain Swiss Anabaptists and opposed by Calvin. It has been held by a few in later times, most notably by Archbishop Whately in his *Future State*. 3. It is held that an intermediate place is provided

wherein the souls of the dead exist until the day of resurrection. The most definite form of this view is the Roman Catholic doctrine of purgatory. The church only lays down as *de fide* that there is a place of purification for departed souls and that the souls detained therein are aided by the prayers and masses offered by the faithful on earth (Council of Trent, sess. vi, xxii, xxv). The doctrine of purification after death for those who die in God's favor, but not yet sufficiently free from imperfections to enter His presence, is based upon such passages as Matt. xii. 32, 1 Cor. iii. 11-15, Matt. v. 25, 1 Pet. iii. 19, 20, iv. 6, as well as on the custom, of which Tertullian speaks at the end of the second century, of praying for the dead. The doctrine is also held to satisfy the demands of common reason, since many are not prepared at death to pass immediately into a state of perfect beatitude. As to whether purgatory is a definite place, and as to the method of purification employed, nothing has been defined; it is clearly understood, however, that no matter what are the pains incident to the purifying process, the souls undergoing it do so willingly and gladly, since they know that each moment brings them nearer to the goal of their desire, union with God.

The ancient Hebrew thought had no room for an intermediate state. With the rise of the ideas of a Messianic kingdom and a final judgment came the problem of the state of the dead before this judgment. This problem is first presented in the apocalyptic books, where the intermediate state is often one of rewards and punishments (Enoch x. 22, 100; Jubilees xxii, etc.). The teaching of Jesus does not discuss it, and the figures and parables which touch it are designed for ethical, not for dogmatic teaching. The writers of the New Testament reflect the thought of the current Judaism, which evidently had no well-defined theory. 1. In some passages the figure of "sleep" is used, and emphasis is sometimes laid, not on the blessedness of life after death, but on the "glorious appearing" of Christ at the resurrection (Thess. iv. 13-18). 2. Other passages show that the writers thought of the souls of the righteous as passing immediately into reward. Paul presents this view as well as the other (Phil. i. 23). It is natural that with this biblical variation there should be a variety of theories in the history of the Church.

INTERMEZZO, in'tēr-měd'zō (It., interlude). In larger instrumental works, a short movement in slow tempo inserted between two main movements. It generally takes the place of the slow movement if the composer does not wish to write a full andante or adagio, as in Beethoven's Sonata, op. 53. In Schumann's Concerto in A minor the intermezzo is sufficiently extended to be considered the legitimate slow movement of the work. Sometimes an entirely separate and independent composition bears the title intermezzo. Brahms seems to have had a special fondness for this title, using it for a number of pieces in op. 76, 117, 118, 119. In the old suite any extra movements added to the four obliga-

tory ones (allemande, courante, sarabande, gigue) and always inserted between the third and fourth are called intermezzi. The intermezzos originally were short musical interludes or entr'actes which it was customary in Italy to perform between the acts of a tragedy. When the *opera seria* began to flourish in the seventeenth century, intermezzos treating some mythological subject were performed between the acts. Originally the different intermezzos had no connection one with the other. But gradually the intermezzo became a secondary plot. For the sake of variety it always treated a comic subject, so that a performance of an *opera seria* consisted alternately of a serious act of the opera itself and a comic act of the intermezzo. The next step was the emancipation of the intermezzo into a separate art form, the *opera buffa*. Its place in the *opera seria* was then taken by the ballet (q.v.). The intermezzos in the spoken drama of to-day are purely instrumental. See INCIDENTAL MUSIC.

IN'TERMIT'TENT FEVER. A form of fever in which the rise of temperature above the normal (98.6° F.) is not constant, but in which there is a defervescence, or fall of temperature to the normal point, at intervals, to be followed by a successive rise to an abnormal point. The interval or intermission may be a few hours long (as in the double quotidian type of malarial fever) or it may be two days long (as in the quartan type of malarial fever). The intermittent form of fever occurs in abscess of the liver, in chronic obstruction of bile passages by gall stones, in Hodgkin's disease, in pyæmia, in pyelitis, in septicæmia, sometimes in secondary syphilis, in tuberculosis, and in some forms of malarial fever. The term, however, has been principally and popularly used to denote the ordinary tertian type of malarial fever, as a synonym of "chills and fever," and replacing the old term "ague." See MALARIA; REMITTENT FEVER.

INTER'NAL-COMBUS'TION EN'GINE. A form of prime mover utilizing the energy released in the form of heat when the combustion of a fuel or combustible takes place within the working cylinder of the engine. The pressure to move the working piston is the result of heating, to a high temperature within a confined space, the air required for combustion and the products of such combustion. The expansive tendency of such heated air and gases is the motive force. It is all released within the confines of the working cylinder and is not conveyed thereto by piping from a reservoir or receptacle exterior to it. This principle differentiates the internal-combustion engine from the hot-air engine (q.v.), in which the heat is imparted to the working medium (air) by transmission through the cylinder walls from without; and from the steam engine (q.v.), in which the heat from the combustion in a furnace is imparted to water and the resulting steam is allowed to pass in the form of pressure energy to the working piston. These last two may be called external-combustion engines.

The problems to be met and solved in an internal-combustion engine are threefold. The first is that of receiving the pressure energy of the heated air and gases and transmitting and transforming such energy so that it will do mechanical work. The second is that of the combustion of the fuel and the controlling of the

inconvenient temperatures in respect to the materials of which the mechanical parts consist. The third is the problem of control of the energy (quantity of fuel) as the resistances may vary, and the controls of the time of admission and release of potential energy as respects the cycle of the cylinder action. The first and third problems are mechanical in kind, the second is chemico-physical, and each laps over or is interwoven with the other two. Moreover, in the internal-combustion engine the problems incident to size of the cylinder and consequent power capacity of the motor are not only different in degree in small engines and in large, but so different that they become really different in kind. The problems of the small engines, or those of less than 500-horse-power capacity, will be considered first.

The basic requirement of an internal-combustion engine is a confined space within which the combustion of the fuel and the increase of pressure consequent thereon may take place. This combustion chamber must have one or more movable, gas-tight walls capable of moving outward, that in such motion the work concept of

DIAGRAM OF SIMPLE VERTICAL INTERNAL-COMBUSTION ENGINE.

a force acting through a space may be realized. (See WORK.) This is most easily secured by having a cylinder within which fits a piston. Behind or above the piston is a space (usually about one-third of the space swept through by the piston in its stroke) into which the combustible mixture of fuel and air can be introduced and ignited. Under the pressure of such

increase of temperature as the combustible mixture undergoes when fully heated, the piston will be forced outward and the space increased. Such piston motion must be controlled in extent and made available for a continuous motion which can be utilized. This is done by connecting the piston, by a connecting rod, to a crank on a revolving shaft, whereby the length of the piston travel is controlled, its energy used to rotate the crank shaft, and the piston itself brought back to the starting point for another stroke. On account of heat difficulties belonging to the second problem the cylinder is usually not closed at the end nearest the crank and shaft, and the cylinder is therefore single-acting or works only on the outgoing stroke and has atmospheric pressure on the crank end. Larger engines are sometimes or often double-acting, like the usual steam-engine cylinder.

The walls of this pressure or working cylinder and of the combustion chamber which is its extension must be strong enough to resist any internal pressure produced on the ignition of the charge. They must be gas-tight, so that no loss of pressure may occur through leakage, but they must have openings, also capable of being closed gas-tight, through which the combustible mixture may be admitted and through which the products of combustion may be expelled after the expanding gases have done their work. These openings must be closed completely by valves when the pressure is driving the piston, and at the proper times of the piston stroke these valves must open. The high temperatures to which the valves are exposed are sources of trouble. Small valves were at first of the flat, sliding type, but the difficulty of making and keeping these tight and the troubles of lubricating them resulted in a replacement of the sliding type by the lifting or poppet type, which needs no lubrication and is easily ground tight in place. A sliding-sleeve type has reappeared for small motors, but it cannot be easily applied to larger sizes and has certain objections even in smaller sizes under the higher temperatures of heavy service. Large engines have lifting poppet valves with a water circulation in hollow channels within their figure to keep them from warping and distorting under heat.

The valves controlling the admission of the combustible mixture are called inlet or admission valves; those controlling the escape of the burnt gases are called exhaust valves. Both are usually operated by cams on a secondary or "lay" shaft driven by gears from the crank or motor shaft and having the cams so timed as to function at the proper moments and during the proper period. Sleeve valves may be driven by eccentrics and some noise and clatter of valve motion thus eliminated at high rotative speeds. The cams bear upon hardened steel rollers and at low speeds make no detectable noise. Rotary valves have been designed in which cylinders or parts of cylindrical surfaces slide over cylindrical seats either lengthwise or at right angles to the cylinder axis. These are cheap to manufacture and reduce losses by clearance, but they are not likely to remain gas-tight, nor can they be made so after they have become worn.

The admission valves and a separate "throttle" valve in the pipe or channel through which the fuel or the combustible mixture passes on its way to the engine is the means of controlling the speed or power of the engine by controlling each charge admitted to the cylinder. Govern-

ing of the speed and power of the internal-combustion engine can be effected by having a speed governor control the throttle valve and varying the weight of charge by varying its pressure and density, or by varying the duration of the period of admission by varying the cam action on the valve spindles. Larger engines usually govern by this latter method. The internal-combustion motor requires a flywheel on the revolving crank shaft to minimize irregularities of the turning effort caused by the intermittent pressure upon the piston. The mass of such flywheel will be less as the number of cylinders actuating the crank shaft is increased.

The second series of problems are those related to the combustion of fuel in the working cylinder. The first of these is that of securing perfect combustion, or complete union of the fuel elements with the oxygen of the air. Every particle of the fuel must be so intimately mixed with the air that its combustion shall be practically instantaneous. The fuel particle must

to gas in the mixture is from 10 to 13 to 1. This mixture in due proportion must enter the cylinder, and this can be brought about only by having the pressure within less than that without, or the pressure outside greater than that within. An early solution was to have two pumps, their volume being in the desired relation of gas to air, and to have these fill on an aspirating stroke and force their capacity into the working cylinder on a compressing stroke; or to have one pumping cylinder receiving both gas and air in desired ratio on its suction stroke and delivering the mixture on the displacing stroke. Furthermore, it was early proved mathematically that an internal-combustion engine was efficient in proportion as the combustible charge was compressed mechanically before being fired. Hence the debt of obligation to Dr. Nicholas A. Otto for working out the Beau de Rochas "cycle" in 1878, whereby the necessary functions for efficient operation could be realized in the single working cylinder by taking two revolu-

SUCCESSION OF CYCLES IN A FOUR-CYCLE GAS ENGINE.

therefore be so small or in so fine a state of division as not to be detectable by the senses of sight or touch. This means that the fuel must be in the gaseous state or in that of a mist or vapor and intimately mechanically mixed or disseminated through the air. The combustion is to be so rapid as to be comparable to that which takes place in an explosion. This requirement that the fuel in the cylinder at the moment of firing shall be a gas in effect makes the term "gas engine" (q.v.) synonymous with internal-combustion engine; but many internal-combustion engines make a liquid fuel supplied to them into the necessary gas by a process of carbureting the air supplied to them and are therefore not true gas engines. The term "internal combustion" is the broader and more comprehensive term and will apply to a wide range of fuel supplied—gas or liquid, volatile or non-volatile hydrocarbons, oils, tars, and petroleum distillates.

The next consideration involved in the combustion is the introduction of the mixture of combustible fuel and air into the combustion chamber and the removal of the burnt gases after the working stroke has been completed. Experiments indicate that the best all-round results are secured when the proportion of air

tions of the crank shaft or four reciprocations of the piston in the cylinder to complete them.

This four-cycle, or more properly four-stroke cycle, requires:

1. *Aspirating or Suction Stroke.*—Piston moves outward, lowering pressure in combustion chamber. Inlet valve open, combustible mixture flows in. Exhaust valve shut.

2. *Compression Stroke.*—Piston returns; inlet valve shut; mixture ordinarily compressed to about 40 pounds' pressure per square inch.

3. *Working or Power Stroke.*—Mixture is fired at or just before piston reaches its innermost position. Pressure rises to about 200 pounds per square inch and drives the piston outward. Pressure falls by the increase of the volume behind the piston. Both valves are shut during working or power stroke.

4. *Exhaust Stroke.*—Piston returns to position of No. 1 with exhaust valve open, inlet valve shut. Products of combustion escape. Exhaust valve shuts at end of piston traverse, so that only the clearance above or behind piston is left full of exhaust or burnt gases. Then the four-stroke cycle repeats itself.

The objection to the four-stroke cycle is that only one traverse of the piston in four is a working or power stroke. This is corrected by

making four cylinders (or more) work upon one crank shaft, so that there are four (or more) working impulses in the two revolutions, as there would be in a double-acting single-cylinder steam engine.

The "two-stroke cycle," or, more briefly, the

SUCCESION OF CYCLES IN A TWO-CYCLE GAS ENGINE.

"two-cycle" engine seeks to secure the same cycle of operations in two traverses of the piston and thus to have one working stroke in one revolution of the crank shaft. It does this by inclosing the crank and connecting rod air-and-gas-tight, and causing the mixtures of gas and air to be drawn into such crank case by the inward or upward stroke of the piston, while the compression stroke is in progress above such piston. The sliding piston operates as its own valves, opening a port in the cylinder wall at the end of the working stroke to allow escape of burnt gases, and immediately thereafter opening an inlet port connecting the crank case and its contents with the space above the piston. The charge in the crank case has been compressed slightly by the outward traverse of the working stroke, enough to cause it to flow into the space above the piston when the intake port is opened, and it further acts to displace the burnt gases which dispute its occupancy there. A deflection plate neutralizes a tendency for the fresh mixture to rush directly out at the open exhaust port. The two-stroke cycle has the advantage that the crank shaft can turn in either direction, for the steps of the cycle change at the dead centres. There are no valves, since the sliding of the piston performs the valve functions; and the power strokes are twice as frequent as in the four-stroke cycle. There are dangers of annoying explosions in the crank case full of combustible mixture; the engine is not at its best with variable resistances, so that it is current practice to call its power 1.65 that of the four-stroke cycle engine of the same number of cylinders, instead of twice.

The Otto cycle in two-stroke or four-stroke engines assumes the combustion or heating process to take place without measurable change in the volume which the gases occupy. In scientific phrase, the heating is at constant volume. Two other types are practical: in one the heating may be done at constant pressure, but therefore necessarily with an increasing volume as the heat is supplied in each stroke. This was the cycle used by Brayton in his "ready-motor" of 1873. The other has the heating done at constant temperature and hence with both pres-

sure and volume varying in the process. This is the cycle of the Diesel engine, first proposed in Germany, and used for stationary engines and even for marine purposes and railway locomotives. In the Diesel, and to an increasing degree in other cycles, the air only is highly compressed, and the fuel in liquid form injected into the air, to burn rapidly or more slowly therein. This diminishes the dangers of crank-case firing in the two-stroke cycle type, and in the Diesel type not only attains the high efficiency desired but simplifies construction and operation, since the high pressure is secured without dangers of preignition, and the high temperature of the compressed air makes the fuel ignite easily and surely, so that very non-volatile or reluctantly flaming hydrocarbons may be used, such as crude oil or distillate or tarry residues. The excessive high pressures specified give trouble with the pump and other valves.

The third combustion problem is that of firing or igniting the combustible mixture at the proper time. This is universally done electrically in recent designs, either from a magneto or dynamo, or from a storage or other battery, except where the high temperature of the compression and the combustion chamber are sufficient. The magneto can be low-tension with a secondary coil to raise the voltage, or high-tension current can be generated directly. The electric spark is caused to jump a gap between terminals which stand in the mixture to be ignited, and a local ignition at the gap is propagated through the mixture. In low-tension systems a "make-and-break" ignition may be used, the spark passing when an opening or gap is made in a closed circuit, across which the current must jump at the proper time. The terminals are usually mounted in the *jump-spark*

VERTICAL SECTION OF DIESEL ENGINE.

system in a *spark plug* which has one or both terminals carefully insulated and so constructed that it can be conveniently removed and replaced if necessary. As there is also some lag or delay in the propagation of the flame on the electrical transmission to the terminals, the

timing of the spark passage should be variable with the speed of the motor for best effect, and a retarding of the spark can be used as a means of speed and power control. If the spark passes after the inner dead centre is passed, the pressure on the piston is much less than when the

HIGH TENSION SPARK PLUG.

ignition or firing takes place in the more greatly compressed charge. Late firing makes an unnecessarily hot cylinder, and perhaps a flaming exhaust gas whose combustion was not completed within the cylinder. Ignition by an open flame, by incandescent metal, and by hot tubes have now only historic interest.

The fourth problem incident to internal combustion is the preventing of excessive temperature or overheating of the cylinder and valves. Overheating causes warping and distortion of valves and their seats so that they are not tight, excessive stresses in the metal of bed plates, undesired preignition of charges, the seizing of surfaces which should move easily over each other, and prevents proper and effective lubrication of rubbing surfaces. In large engines the difficulty of cooling makes it a question whether a diameter of cylinder greater than 18 inches should be attempted. Cooling is most effectively done by circulating water through passages in the cylinder walls and heads—*water jackets*—through hollows left in the valves and valve seats, and through the passages in hollow pistons and piston rods. Water-cooling may also be effected by injecting water into the working mixture, and a small power gain be realized from the resulting steam. Small engines may cool the cylinder walls only. Air-cooling by currents of rapidly moving air is applicable to engines of small cylinder diameter—say, below 8 inches—but not for large cylinders. Back-firing by preignition of compressed charges is too great a danger.

For motor-vehicle engines the cooling is done by water circulated by an attached pump, and such water air-cooled in its turn by being passed in thin films through a cooler or radiator over which air is moved by a rapidly revolving fan. Boat engines are cooled by circulating the water from outside the hull through the jackets. Cooling water in motor vehicles is not supposed to get hotter than 180° F. under heavy hauling, but in mountain work it is sometimes difficult

to keep it from boiling, particularly at high altitudes. A certain amount of heat energy is carried off to waste with the water or air used in cooling, but to attempt to save this loss is to introduce greater practical difficulties than are represented by the value of the saving of heat.

A fifth difficulty in internal-combustion engines is that due to the deposit of carbon or lampblack as a hard coating on metallic surfaces exposed to flame. These deposits cause leaky valves and pistons and also cause preignitions if they become hot enough. They are removed by scraping, by burning off with oxygen in oxyacetylene or other blowpipes, or by solution in tetrachloride of carbon or other solvent. The carbon is the result of reluctantly combustible elements in the fuel and from deposits left by the cylinder lubricants.

Carburetors and Carburation. Stationary internal-combustion engines may be supplied from a source of natural or of manufactured gas (q.v.). Usually the natural gas is a fuel gas low in illuminants, and producer gas may be cheaply manufactured for engines. But for portable engines, such as those used in motor vehicles and boats, storage tanks of compressed gas are not economic or desirable, and the liquid fuels are more easily obtained, more convenient, and usually cheaper. Hence, in such cases, the internal-combustion motor must be supplied with an accessory device to make the liquid fuel into a gas as it is needed by the engine. The convenient type of gas to be so made and supplied is an air gas, made by carbureting air or saturating it with as much vaporized or atomized hydrocarbon as it will carry without dropping. Most carburetors depend on the principle of injecting by pressure through a small nozzle a jet of the liquid into a moving current of air. The latter absorbs the liquid, divided as it is into atomized particles, and thus intimately mixes the fuel and air, so as to make either a true combustible gas or a fog or mist,

VERTICAL SECTION OF TYPICAL FLOAT FEED CARBURETOR.

which will burn like a gas when it meets additional air to support such combustion. This process is called carburation. The liquid fuel must be kept at constant head and at a level such that no flow of fuel shall take place except when needed. This is accomplished by means of

a float in a chamber forming part of the carburetor. This float controls a fuel flow or feeding valve from the fuel supply pipe and is borne upon the liquid fuel in the float chamber. As the desired level of fuel in the float chamber is reached, this float will rise and by its attached valve stop the flow from the fuel reservoir. The fuel jet pipe or passage leads from the float chamber and terminates in the pipe or passage carrying air to the cylinder inlets. The orifice or nozzle is adjusted to be about 1/16 of an inch above the level of the liquid in the float chamber when pressures at the jet and in the float chamber are the same. Under these conditions no flow takes place until the pressure at the orifice of the jet and in the air pipe is reduced by the movement of the piston during the aspirating stroke of the cycle in the engine cylinder. This reduced pressure does not affect the air on top of the fuel in the float chamber, and at once a jet of the liquid fuel is forced through the nozzle mixing with the flowing air, and carburation occurs. It is the necessity for making this suction pressure at the jet to carburet the air that makes it necessary to "turn the engine over" or "crank" the engine for the first stroke of the pistons in starting. The fuel jet is usually made capable of adjustment for a quantity of fuel per second, to meet variable speeds of motor; and in addition a second adjustment, either automatic or hand-controlled, is added to prevent a proportionate excess flow of liquid at the higher speeds or when the aspiration fall of pressure is the greatest. This is either an automatic air valve opening only

The principle of carbureting air by means of a carbureting device was a great step in the progress of the internal-combustion motor and was first taken by Maybach and Daimler.

Starting the Engine. The cycle of the internal-combustion motor is a complete process. It leaves no energy stored except in the revolving flywheel, and hence when the engine is to be restarted after a stop some energy must be drawn upon external to the engine itself to cause the first stroke. This may be muscular effort of man in small engines, when the resistance of the compression is not too great for his strength. In larger engines a supply of compressed air in a reservoir may be drawn upon, the pressure being exerted on the motor piston of one or more cylinders to turn the crank shaft and allow the others to draw in the combustible charges and fire them. Or the starting may be done by turning the crank shaft by an electric motor. The compressed-air system is preferred for larger engines, the engine compressing the air into tanks by means of a compressor which it drives while running. The necessity for starting by external power makes it desirable that the useful resistance or work of the engine be disconnectible from it, so that the external power shall have only the internal resistance of the engine to overcome during the starting process. A clutch or engaging device is therefore a feature in nearly all internal-combustion motors, so that its crank shaft can be turned without turning all the machinery which it is to drive.

Advantages of the Internal-Combustion Engine. The Internal-Combustion principle offers the following advantages:

1. There is no stored energy in form of heat and pressure, as in the steam boiler, which may deal destruction if the shell is ruptured.
2. It has not the weight and bulk of boiler, chimney, and furnace, and the economic losses in indirect heating of the power medium.
3. The inconveniences due to poor water or to the absence of water in arid territory do not occur.
4. Licensed engineers are not required where there is no boiler with its dangers.
5. The engine is ready to start without delay for getting up pressure.
6. The expense of operation stops when the engine stops.
7. The machine is self-feeding as respects fuel, so that a second man is not required, and there is no trouble from ashes nor from sparks.
8. A high rotative speed and light weight per horse power are possible; this adapts the internal-combustion type for aëroplane work.
9. The higher thermodynamic efficiency of the operation.

Disadvantages of the Internal-Combustion Engine. 1. The motor has to be started by an auxiliary power, usually accumulated or stored from a previous running of the engine.

2. The four-cycle type does not reverse its direction of rotation, but where occasional reversals are to be required these must be secured by gearing in the transmission machinery between the motor and its work.

3. It is efficient at only one speed, and to meet lower speeds of the resistances it must be geared down in order to secure power.

4. Its superior limit of speed and power cannot be exceeded in emergencies.

5. It has only one power stroke in four piston traverses; hence to secure uniform turning ef-

GNOME ROTARY AÉROPLANE MOTOR.

The diagram above shows a typical rotary aëroplane motor, with a number of cylinders whose pistons act on a single shaft, and indicates how the problem of obtaining maximum power with minimum weight has been satisfactorily solved in one type engine of which there are numerous examples. The Gnome motor illustrated above has had considerable vogue, both in Europe and the United States for aëroplanes, and has been built up to 160-horse power and with as many as 9 cylinders, making 1200 revolutions per minute. The action of this motor will be apparent from the diagrams shown after reading the explanation of the vertical engines on the preceding pages. Aëroplane motors are also made with vertical cylinders as in an automobile engine with a V-arrangement of the cylinders, and may be water-cooled as in the case of the Curtiss and Wright motors, instead of being air-cooled as in the Gnome motor.

under such lowered pressure of the greater suction; or the flow of fuel is cut off proportionately as the suction pressure is lowered. Excess fuel is not only wasteful, but a mixture too rich in fuel ignites less easily and deposits soot and carbon. Where liquid fuel is injected into highly heated compressed air, the carburetor can be dispensed with, as in the Diesel system.

fort for every traverse of the piston, or half-revolution of the crank shaft, the number of cylinders has to be increased.

6. If anything interrupts the functioning of the fuel supply or the ignition, the engine stops short and without a period of warning.

Capacity and Efficiency. The largest single unit internal-combustion engine of the present day has a capacity of 2000-horse power in its four cylinders. Where larger capacities than these are desired, they are secured by duplicating or multiplying the units, or by a return to the steam-engine or steam-turbine principle. The efficiency of the internal-combustion engine as a heat engine has been raised to 0.27 in special examples, and is about 0.20 for small types. Small gas engines are nearly as efficient as large ones, while small steam engines are much less efficient than large ones.

INTERNAL-REVENUE SYSTEM. The revenue derived by the United States government from taxation other than that of imports is commonly designated as internal revenue. In its widest sense the term includes the direct taxes levied in accordance with the constitutional rule of apportionment according to population, in 1798, during the War of 1812, and in 1861. But as the constitutional rule noted differentiates such direct taxes widely from all other forms of internal taxation, we may properly exclude them from the discussion of the internal revenue.

Internal taxation did not acquire a permanent place in the fiscal system until 1862, though the nation had, in 1794, 1800, and 1813-17, gained some experience in this form of taxation. This earlier experience was not without value to the financiers of the Civil War and may be briefly examined here.

Soon after the inception of the national government the revenues proved to be inadequate. The fiscal policy of Hamilton had not sought to evade the responsibilities which the creation of a national government imposed, and the burden of State debts created in the common struggle for independence was assumed by the nation. The debt charges assumed in this manner were considerable, and the customs revenues insufficient to discharge them. As early as March, 1790, the Secretary of the Treasury proposed that excise taxes be laid upon snuff and tobacco, carriages, sales at auction, stamps, and on wines and distilled spirits. Alcoholic beverages were subjected to a moderate tax by an Act of March 3, 1791. Liquors produced from foreign materials were taxed at rates ranging from 11 to 30 cents a gallon, and those produced from domestic materials at rates ranging from 9 to 25 cents. The act was very unpopular

and gave rise to much opposition, which interfered greatly with its operation, increasing the costs of collection and diminishing the returns. Nowhere was this opposition stronger than in western Pennsylvania, where in 1794 a display of military force was necessary to put down the uprising known as the Whisky Insurrection (q.v.). Despite the falling off in receipts due to this opposition, the revenues could not be dispensed with, and further taxation became imperative. In June, 1794, carriages, sales at auction, snuff, sugar, and tobacco were made taxable, and licenses were required for the sale of wines and liquors. Taxes on legal instruments were imposed in 1797. These measures were enacted in the face of vigorous opposition. As to the carriage tax in particular, the constitutional objection was raised that it was a direct tax and not levied in the manner prescribed, and when this failed to impress Congress, the matter was carried to the courts. The Supreme Court of the United States, in *Hylton v. The United States*, upheld the act, and in effect declared that land and capitation taxes were the only direct taxes in the constitutional sense. The opposition to this form of taxation was due to the fear that thereby the Federal government would gain increased power, and we may well surmise that Hamilton's advocacy of these measures was in part influenced by the desire to assert as soon as possible all the power which he believed to reside constitutionally in the Federal government.

With the rise of the Democratic party to power in 1801 all forms of internal taxation were abandoned. Party principles were opposed to them, and the treasury did not need them. Revenues from customs amply supplied all needs and permitted a considerable reduction in the public debt.

When the War of 1812 broke out, there was at first no thought that any additional revenues would be needed for current expenses, and it was believed that the costs of the war could be met by loans. Both public revenue and public credit were impaired by such a policy. In 1813 it became necessary to seek new sources of revenue, and, by acts of July 24 and Aug. 2, 1813, those taxes which had proved most advantageous before the opening of the century were reimposed. Duties on carriages, on sugar refined in the United States, license taxes on the distillers of spirituous liquors, and on retailers of wines and spirits, with stamp duties on legal instruments, etc., and taxes upon sales at auction, reappeared. These taxes were, however, designated as temporary, and the pledge was made that they should be repealed within a year from the close of hostilities. As it took some time to create the machinery for the collection of these taxes, the actual returns were slow in coming in. Before any appreciable revenue had been derived from this source (\$1,662,984 being collected in 1814), rates were increased in December, 1814, and new taxes were imposed in January, 1815. They embraced pig iron, iron castings, bar and rolled iron, nails, candles, paper, leather, playing cards, vellum, hats, umbrellas, saddles, bridles, boots, shoes, beer, ale, tobacco, cigars, and snuff.

For the actual conduct of the war these taxes came too late to be available, but in the settling up of accounts they proved of great assistance. The Secretary of the Treasury was unwilling to part with them wholly and advocated the reten-

tion of a part of the excise system in order to meet any emergency which might arise. Congress, however, by Act of Dec. 23, 1817, abolished these taxes, and no further resort was had to internal taxation until the Civil War.

When the great struggle opened, it was generally believed that the war would soon be terminated, and that the expenses of the contest could be entirely provided by loans. As in 1812, there was a delay in the creation of new sources of revenue. A direct tax of \$20,000,000 was levied on the States by Act of Aug. 5, 1861, but it was not until July 1, 1862, that an Act was passed to raise any considerable revenue from internal taxation. The law embraced almost every conceivable object of taxation. There were taxes on liquors of all kinds, license taxes upon merchants, taxes on all manufactured articles, on auction sales, carriages, yachts, billiard tables, plate, the gross receipts of railroads and other transportation companies, on the dividends of banks, trust, savings, and insurance companies, on advertising, on incomes over \$600, on legacies, and stamp taxes upon bills of exchange and other mercantile papers. It took some time to establish the machinery necessary to the proper administration of this system of taxation; it produced in the fiscal year 1863 only \$37,640,787, though its advocates had anticipated a revenue of \$100,000,000. In the following fiscal year these taxes produced \$109,741,134, without any change in rates. The demand for increased revenue led, June 30, 1864, to increased rates. New objects of taxation were discovered, and rates were considerably increased upon articles already taxed. On manufactured products generally the rate ranged from 3 to 5 per cent, while on specific articles it was doubled. On liquors rates rose from 60 cents per gallon, under the Law of March 7, 1864, to \$1.50 and \$2, while the maximum rate on tobacco rose from \$3.50 per thousand to \$40 per thousand, the latter rate applying to cigars valued at \$45 per thousand. The revenue rose in the fiscal year 1865 to \$209,464,215, but it was not in those articles which were so extravagantly taxed that the increased revenue was most conspicuous. Indeed, the product of the tax on distilled liquors fell from \$30,329,149 to \$18,731,422, while that of the tobacco taxes rose only from \$8,592,098 to \$11,401,373. A further increase of rates was made by an Act of March 3, 1865, and the fiscal year 1866 with revenues of \$309,226,813 showed the high-water mark of internal-revenue receipts.

The increase of revenue resulting from these several acts was rapid, and the annual deficit grew relatively smaller, as compared with revenues, although it increased absolutely as the war progressed. Even more important, perhaps, than the actual revenue received was the improvement in public credit, which resulted from these serious efforts to place the revenues on a sound basis. The last act, while raising rates, contemplated their speedy reduction and provided for the appointment of a revenue commissioner charged with the duty of studying the whole revenue system and proposing suitable modifications. Extraordinary military expenditures were no longer required, but the general scale of national expenditure was vastly greater than before the war. The abolition of internal-revenue taxation was not thought of, but a reduction of the burden and the removal of some of the more vexatious taxes were generally de-

manded. By a series of acts in the years 1866, 1867, and 1868 many taxes were abolished, and rates on many others diminished. It was estimated that \$196,000,000 would be taken from the revenue, but the actual diminution was less than \$1,250,000. The greater productivity of moderate rates was amply demonstrated. In the case of distilled spirits a rate of 50 cents a gallon, enacted July 20, 1868, produced in the fiscal year 1870 a revenue of \$55,606,094, while the maximum revenue under the \$2 rate in 1867 had been \$33,542,951.

In 1870 taxes still remained on spirits, tobacco, fermented liquors, gross receipts, licenses, incomes, legacies, successions, gas, stamps, and some few other articles. The income tax, which in 1870 had produced \$37,775,873, was abandoned in 1872. The tax on spirits was raised to 90 cents in 1875, but elsewhere, especially on tobacco, there was a reduction of rates, and all stamp taxes ceased in 1883. While ultra-protectionists like William D. Kelly urged the abolition of all internal taxes, this plan did not secure any large following, the sentiment in favor of taxing liquor and tobacco, the main supports of the internal revenue, being well-nigh universal. The experience of recent years has, moreover, firmly demonstrated in the minds of the people that such taxation of the internal resources of the nation is an indispensable element in any revenue system, since it is capable of adjusting itself to the needs of a sudden emergency.

No essential changes were made in the system of internal taxes till 1894, when the Tariff Act of August 28 sought to compensate for the prospective falling off in customs duties by raising the tax on distilled spirits from 90 cents per gallon to \$1.10 per gallon and by imposing a tax upon incomes. The Supreme Court of the United States decided the income tax established by the law to be unconstitutional (see INCOME TAX), while the increased rate on spirits did not prevent a diminution of revenue from that source.

When, in 1898, war was declared against Spain, internal taxation was chiefly relied upon to meet the increased expenditures. In framing the War Revenue Act of 1898 there was ample experience to draw upon, and that measure shows a judicious use of the taxing power. The act, which went into effect on July 1, 1898, provided an increase of rates upon some articles and reestablished some of the taxes which the experience of 1862 and 1870 had demonstrated to be most productive. It imposed a special tax on bankers, brokers, proprietors of theatres, circuses, and other entertainment enterprises, tobacco dealers and manufacturers. It left untouched the rates on distilled spirits. On fermented liquors and also on tobacco and snuff the rates were doubled, while on cigars and cigarettes, previously heavily taxed, they were slightly increased. An important feature of the law was the imposition of stamp taxes upon mercantile papers of all kinds and upon proprietary articles (patent medicines) and wines. The revenue receipts under the law as amended are shown in the following table, which gives for comparison the years 1897 and 1898:

Fiscal year ending	Internal revenue receipts
June 30, 1897.....	\$146,688,574
June 30, 1898.....	170,900,681
June 30, 1899.....	273,437,162
June 30, 1900.....	295,327,927
June 30, 1901.....	307,180,664

A comparison of receipts in 1897 and 1899 will show the effect of the new law and will also reflect the increasing prosperity of the country, as shown in the larger returns of 1899 in the foregoing table, without change of rates:

FISCAL YEAR ENDING JUNE 30

RECEIPTS FROM	1897	1899
Spirits.....	\$82,008,542.92	\$99,283,534.16
Tobacco.....	30,710,297.42	52,493,207.64
Fermented liquors.....	32,472,162.07	68,644,558.45
Special taxes.....	4,921,593.21
Legacies.....	1,235,435.25
Stamps.....	43,837,816.66
Miscellaneous.....	1,628,691.06	3,068,426.07
	\$146,819,693.47	\$273,484,571.44

With the return of peace the demand for a reduction of revenue became general. By a Law of March 2, 1901, taking effect July 1, 1901, considerable reductions were made, the tax on fermented liquors being reduced from \$2 per barrel to \$1.60, the maximum cigar tax going back to what it was before the war, while all stamp taxes on proprietary articles and the most troublesome taxes on business papers, such as bills of lading, express receipts, certificates of various kinds, insurance contracts, mortgages, bank checks, and telegrams, were repealed. A further Act of March 2, 1902, which went into effect July 1, 1902, removed the last vestiges of the war taxes, old rates being restored and the remaining new taxes being abolished. By Act of Aug. 5, 1909, a new element was added to the internal-revenue system by the so-called excise tax on the net earnings of corporations. This tax was fixed at one per cent on all earnings above \$5000. This tax was transformed into an income tax on corporations by the Law of 1913. (See **INCOME TAX; TAXATION.**) By the same law taxes on individual incomes were incorporated in the system. The relative importance of the two new elements is indicated by the following figures for 1914:

Ordinary internal revenue.....	\$308,613,483
Revenue from corporation tax.....	43,079,819
Revenue from individual income tax.....	28,306,336

INTERNATIONAL DATE LINE. An irregular line drawn somewhat arbitrarily on the map of the Pacific Ocean, near the 180° meridian of longitude. It marks the place where navigators "change their date" on the trans-Pacific voyage. The following is a brief explanation of the cause of this change of date. When a person travels westward, he lengthens his day by one hour for every 15°, since he moves along with the motion of the sun; by going westward entirely round the earth, lengthening each day by a certain amount, four minutes for every terrestrial degree he travels, he will have lost one day at the arrival at the

starting point. The second of a month, e.g., is to him the first; Monday is Sunday, according to his reckoning. This is obvious, since by going round the earth from east to west he has, in respect to himself, diminished by one the number of revolutions made by the earth during this time. Going round the earth eastward the reverse takes place, and a person gains one day, since he makes one more revolution than the earth does. Thus, two persons, having started from the same place and traveled round the earth in opposite directions, when they meet at their place of starting, will differ from each other two days in their reckoning. Thus, it becomes necessary to have a date line somewhere on the earth's surface, since it is impossible that the reckoning of days should go unbroken round the earth. Any meridian might do theoretically for this purpose, but for two important practical reasons the 180° meridian of longitude has been chosen for the international date line. These two reasons are: (1) that it lies nearly in the middle of the Pacific Ocean and thus far away from civilization; (2) it is exactly 12 hours from Greenwich. Thus, the theoretical date line coincides with the 180° meridian; but for reasons of convenience an arbitrary irregular line has been adopted in its place. This line is shown on the accompanying map; it has the advantage that no change occurs between important neighboring islands.

Since the line is an arbitrary one, we might expect cartographic authorities to differ considerably in its delineation; and this is, in fact, the case. Indeed, to have such a line drawn with perfectly definite authority, it would be necessary for the principal nations to have the line determined by a joint commission and then to adopt the commission's recommendations by international agreement or treaty. But this has never been done, and so in one sense it may be said there is no *international* date line. The term has, however, come into general use and may well be employed pending such governmental action. It is possible, however, to mark out the line as it is actually used in the Pacific islands. For this purpose it is merely necessary to find out, by correspondence with all the various settlements, whether the date in public use is the American or Asiatic one. Correspondence of this kind was carried on by Prof. George Davidson, of the University of California and formerly of the United States Coast and Geodetic Survey. His results were published by the United States government and form the basis of the accompanying map, which presents unquestionably the most authoritative date line so far placed at our disposal. The principal change from other recent authorities transfers Morell Island to the east of the line. The change of the Samoan Islands from west to east was made by order of King Malietoa in 1892. INTERNATIONAL INSTITUTE OF AGRICULTURE. A world institution, located at Rome, Italy, for the collection and dissemination of statistical and other information relating to agriculture. Its chief object is to furnish to the various countries prompt and reliable estimates and statistics of agricultural production and distribution, general information re-

garding the progress of the industry and means for its improvement, and matters pertaining to the economic and sociological aspects of agriculture. It is under the patronage of the King of Italy and is supported quite largely by the joint contributions of the adhering countries, numbering about 50.

The establishment of the institute was due to the initiative of David Lubin, a prosperous business man of Sacramento, Cal., who after various attempts to win support for his plans in a number of countries succeeded in interesting King Victor Emmanuel of Italy, who called a conference of the nations in 1905. This conference was held in Rome and was attended by delegates from 40 countries. The enterprise received approval, and a treaty was formed providing for the organization and maintenance of the institute as a permanent institution and defining its field of operations. The King of Italy endowed the institute with revenues amounting to about \$60,000 annually, and the Italian government has erected a handsome building for its use in the environs of Rome.

The institute is governed by a general assembly of delegates from the constituent countries, held every two years, and a permanent executive committee, composed of one member from each country. This permanent committee directly manages the institute. Its chairman is president of the institute. The general assembly reviews the work and the plans of the institute, approves the budget, and considers various matters relating to its methods and development. For example, the fourth session of the assembly, held in May, 1913, discussed methods of crop reporting, an international service of statistics, live-stock statistics, agricultural coöperation, crop insurance against hail, an international service of agricultural meteorology, proposal for an international agreement for the control of plant diseases and insect pests, protection of useful birds, and investigations on dry farming.

The work of the institute is divided among four bureaus: (1) the bureau of the secretary general, (2) the bureau of general statistics, (3) the bureau of agricultural intelligence and plant diseases, and (4) the bureau of economic and social institutions. The bureau of the secretary general deals with the *personnel*, financial, and other routine business, printing and distribution of publications, the library and bibliographical work, and the preparation and publication of an annual compilation of agricultural legislation in the different countries of the world. This *Yearbook of Agricultural Legislation* records the progress in the domain of law of the world-wide movement for the improvement of the economic and legal conditions of agriculture and rural communities.

The bureau of general statistics collects, collates, and publishes statistics of production and commerce in agricultural products, both animal and vegetable, throughout the world. These statistics are supplied by the adhering governments, the object being to secure a prompt dissemination of knowledge regarding the prospective and the actual world's supply of important products, farm live stock, etc. Monthly bulletins and an annual report on agricultural statistics are issued. The bureau of agricultural intelligence and plant diseases collects and publishes matter of interest regarding the progress of scientific and experimental investi-

gations and practical experience in agriculture throughout the world, and as a branch of this work gives special attention to the diseases of plants and to entomology. The bureau of economic and social institutions gathers and publishes statistics and general information in regard to agricultural coöperation, insurance, and credit, together with other matters relating to the economic and social organization of rural communities. Each of these bureaus issues a monthly bulletin upon its work.

The institute has accumulated a large library of the world's agricultural literature, and issues a weekly bibliographical bulletin containing a list of the works received, notices of articles of general interest in the periodicals, and titles of legislative acts relating to agriculture. A universal bibliography of agriculture is planned. French is the official language of the institute, but the monthly bulletins are now issued in the French, German, English, Spanish, Italian, and Hungarian languages, the expense of translation and separate publication being borne by the respective countries. This attests the appreciation in which the publications of the institute are held.

The institute also endeavors to promote various enterprises which are of interest to one or more countries and which can be helped through this international agency. Thus, it aided the commissions on rural credit sent from the United States to study the subject in Europe in 1913, and it served as a meeting place of the International Phytopathological Conference in 1914, collecting in advance a vast amount of information regarding the inspection services in different countries.

The budget of the institute for 1914 was about \$220,000—a considerable increase, growing out of the development of its activities, which necessitated raising the contributions of the adhering governments. The officers of the institute in that year were president, Marquis Cappelli, of Italy; vice president, M. Louis-Dop, of France; secretary general, Prof. G. Lorenzoni, of Italy. Mr. David Lubin has represented the United States on the permanent committee since the institute was established.

Consult *L'Institut International d'Agriculture, son organisation, son activité, ses résultats* (Rome, 1912), and "International Institute of Agriculture at Rome," in *Document No. 196, United States Senate, 63d Congress, First Session* (Washington, 1913).

INTERNATIONAL INSTITUTE OF SOCIOLOGY (Fr. *Institut International de Sociologie*). A French scientific society founded in July, 1893. The membership is small and almost entirely confined to Europe. Congresses are held from time to time for the discussion of sociological topics.

INTERNATIONAL LANGUAGE. A phrase applied in the specific sense to languages artificially formed for the purpose of ready communication by persons whose natural language is different. The idea is to do away with the difficulties and irregularities with which historical accidents have encumbered the existing languages and to construct, from old or new materials, a language so simple and regular that any person, regardless of his nationality or degree of intelligence, can acquire it with ease and use it with all the necessary precision. Most of the schemes proposed are intended to serve the purposes of business, travel, and correspondence,

and not in any way to displace the existing languages nor, in spite of the efforts of some enthusiasts, to serve as vehicles of literary expression.

When, by the beginning of the seventeenth century, Latin had been given up as the scientific language, scholars were naturally the first to feel a need for an international tongue as a means of intercommunication. So, as early as 1641, a definite attempt was made by Bishop Wilkins to form a scientific language to take the place of Latin. This was a classification of ideas and of words by ideas and a scheme of characters, much like shorthand, to represent them. Leibnitz tried to improve it by making it even more philosophical, and his idea of *pasigraphil*, or language by signs, is still quoted as a *curiosum*. All of the fundamental ideas of the modern systems, however, are found in his scheme. Thus, he desired but one declension and one conjugation, both absolutely regular and without exception, complete suppression of the distinction of genders, simplification or suppression of flecional endings in verbs or nouns, etc. With the discovery of the relations of Sanskrit to English in the eighteenth century, thereby instituting the science of comparative philology, efforts at the formation of international languages multiplied rapidly. The first time an attempt was made to form a language a posteriori, i.e., from existing languages and not an independent philosophical scheme, was in 1765 in the famous encyclopædia of Diderot and D'Alembert. The author of this article, Faiguët, Treasurer of France, laid down the general principles which have been followed to the present day. Of course the disciples of the French Revolution, desirous of reforming everything, did not neglect language. In 1795 Delormel presented his project, which possesses some interesting features. It would be impossible to mention here all the systems created in the nineteenth century, for their number is legion. We should not forget, however, Sudre's *Soldrésol*, or universal musical language. Originally established in 1817, an effort was made by Gajewski in 1902 to revive it. Among other projects that may be considered of importance are those of Grosseclin (1836); Schipfer's *Communicationssprache* (1839), the first complete scheme of an a posteriori language; Vidal (1844); De Rudelle's *Pantos-Dimou-Glossa* (1858), an international commercial language; Letellier (1850), whose creation enjoyed considerable popularity for many years; Sotos Ochando (1845); Renouvier (1855); Pirro's *Universal-Sprache* (1868), of which Latin is the basis for the vocabulary; Dyer (1875), originator of the *Lingualumina*, or language of light; Volk and Fuchs's *Weltsprache* (1882); Courtonne's *Langue internationale néolatine* (1885), which furnished Zamenhof with the fundamental idea in his elaboration of Esperanto; Maldant (1887); and Eichhorn (1887). During the past 30 years, on account of the great increase in commercial relations and the development of pacifist ideals, considerable interest has been taken in the subject of international intercourse.

The point of departure of this sudden awakening of interest dates from the publication in 1879 of *Volapük* (q.v.) by Monseigneur Schleyer, which enjoyed the greatest popularity of any international language formed up to that time. As the basis of this project was principally English, nationalist tendencies were at once aroused,

and within a few years more than a dozen schemes for international languages were put forth. Some proposed Latin or Greek, which they have sought to adopt to modern requirements, such as the *Novilatin* of Beermann (1895); others preferred to adopt one of the modern European languages, as, e.g., Novicow, who argues brilliantly in favor of French.

Of all the efforts of this kind in recent years, we are forced by the limits of this article to mention only three or four, which have had the greatest vogue and have therefore been worked out in detail. The first of these is *Volapük*, which is discussed under a separate heading and which has elicited a number of imitations. Among these may be mentioned *Spelin*, invented by Bauer (1888), *Dil* by Fieweger (1893), and *Balta* by Dormoy (1893), all of which represent attempts to perfect Volapük; *Veltparl* and *Dilpok*, creations of Von Arnim (1896) and Marchand (1898) respectively, being simplifications of Volapük; and Mill's *Antivolapük* (1893), which, as its title indicates, is opposed to the artificial universal language. The second is *Bolak*, or the *Blue Language*, widely advertised by its inventor, M. Bollack, a merchant of Paris (1899). The author himself has devoted no less than nine volumes to this ingenious creation. The main defect of Bolak is that, notwithstanding its pretensions for practical purposes, its artificiality and extreme difficulty render it of little practical value. The author makes but little appeal to the intelligence of the learner, whereas the numerous and complicated rules of the grammar and the richness of the vocabulary make such demands on the memory that a complete mastery of the language is almost impossible. One might be inclined to say that M. Bollack has not invented a new language, but a new system of language. According to this system there are two categories of words, those expressing *vague* ideas, i.e., subjective ideas or ideas of relation, and those expressing *precise* ideas, i.e., objective ideas, complete in themselves. In conformity with the general usage of European languages, the first are represented by *motules*, or short words, and the second by *granmots*, or long words. As in ordinary grammar there are eight parts of speech, so in Bolak there are eight classes of words, to wit: *interjections*; *mots-eadres*, expressing affirmation, negation, interrogation, and the general ideas of relation; *connectives*, i.e., prepositions and conjunctions; *designatives*, being pronouns and pronominal adjectives; *nouns*; *verbs*; *attributives*, or adjectives and participles; and *modificatives*, or qualifying adjectives and gerundives. Each one of these classes of words is distinguished by its *aspect*, i.e., by its length and its form. The motules have from one to three letters, and if they have three letters, they end in a vowel; the granmots contain three or more letters, and if they have three letters, they end in a consonant. Interjections are composed of a single vowel, which, however, may be repeated. Nouns have generally one syllable and begin and end with a consonant. Verbs are formed by adding a vowel to a noun, and therefore consist usually of two syllables. The pronouns are declined in four cases, and the verbs have three moods, with eight tenses in the indicative alone. To show the artificiality of the language, we may quote the rule for comparison of attributives and modificatives, which is entitled the rule of the Marguerite. Thus, the degrees of com-

parison are indicated by prefixed vowels, used also as interjections, *a* signifying indifference, *o* doubt, *e* exuberance, *i* joy. Hence, *aloved* means the least loved, *oloved*, less loved, *eloved*, more loved, and *iloved*, the most loved.

As for the third language, *Esperanto* (q.v.), its great advantage lies in the fact that it makes use as far as possible of our living languages. Taking what is common to all tongues and dropping what is special to any of them, it is quite easily acquired.

Finally the *Idiom Neutral*, which may be said to represent what is best in both Volapük and Esperanto, originated with the Russian engineer Rosenberger (1902), but really is the product of the efforts of a number of enthusiasts. Though it developed out of Volapük, the subordination of grammar to vocabulary is in direct contradiction with the spirit of that language. At the same time it borrows many good principles from Esperanto, as, e.g., the abandonment of the use of purely arbitrary formatives, preferring formatives taken from Latin or English. Thus, *dom*, house, *domi*, houses, the affixed *i* being the sole sign for the plural. The accent always falls on the vowel that precedes the last consonant. There are no articles and no case endings, the genitive and dative relations being expressed by the prepositions *de* and *a* (*de dom*, *a dom*, etc.). The verbs have only a single conjugation and are invariable in number and person. Thus, *mi am*, I love, *il am*, he loves, *mi amav*, I loved, *mi av amed*, I have loved, *mi amero*, I shall love, *vo amerio*, you would love, etc. The passive is formed by means of the corresponding moods and tenses of the verb *esar* (to be), followed by the past participle. The prepositions, conjunctions, etc., are chiefly adopted or adapted from Latin or French. The object of easy intelligibility is thus fairly attained. It is claimed that an educated reader can read the *Idiom Neutral* almost at sight without the aid of either grammar or dictionary. So much of the text is intelligible on mere inspection that the rest may be inferred.

Americans have always taken an active interest in this movement, and many new languages have been proposed on this side of the water, such as *Ro* by Foster (1910) and *Altutonianish* or *Pangerman* by Molee (1911).

In order to promote the use of the *Idiom Neutral* in international correspondence and commerce, a society entitled the Delegation for the Adoption of an International Auxiliary Language was formed in Paris on Jan. 17, 1901, and many publications have been issued by it. It remains to be seen what effect the present war will have upon this movement, for one of its main principles is the promotion of peace.

All of the literature on the subject up to the time of publication can be found in Couturat and Leau's excellent *Histoire de la langue universelle* (Paris, 1903), which has been translated into English. Among more recent works, consult: Couturat, *Weltsprache und Wissenschaft* (Jena, 1909), translated by F. G. Donnan into English under the title *International Language and Science: Considerations on the Introduction of an International Language into Science*, by L. Couturat, O. Jespersen, R. Lorenz, W. Ostwald, L. Pfandler (London, 1911); Ostwald, *Sprache und Verkehr* (Leipzig, 1911); Novikov, *Le Français, langue internationale de l'Europe* (Paris, 1911); Couturat, *Lingvo internaciona di la delegitaro (sistemo Ido); angla guidlibreto*

vidita ed aprobita de la sekretaryi, by Couturat and Leau (London, 1908); *Les nouvelles langues internationales*, by the same authors (Paris, 1907); Schuchardt, *Rapport sur le mouvement tendant à la création d'une langue auxiliaire internationale artificielle* (ib., 1904). For a good bibliography, consult the *List of Works in the New York Public Library Relating to International and Universal Languages* (New York, 1908). Among periodicals are *Lingvo Internacia* (Paris) and *Progreso* (Paris). For a discussion of the possibility of an artificial language, see Schinz, in the *Revue Philosophique* (ib., July-August, 1905). For the work of the Delegation mentioned above, see *Educational Review* (New York, May, 1907).

INTERNATIONAL LAW. The rules and usages by which sovereign states coincide in regulating, on most issues, their conduct and that of their citizens or subjects in their intercourse or dealings with the governments, citizens, or subjects of other similar states. It is neither solely nor chiefly *international*, for it primarily involves the government of a state and only concerns the nation or individual where statute, governmental decree, or accepted usage makes it the law of the land. And it is not, strictly speaking, *law*—being made up of rules and customs which have no binding force except that of abstract right or justice, policy, tacit acquiescence, or definite treaties or conventions, while some of its widely accepted precepts have never been recognized by certain governments. However, the humanitarian trend of modern thought, the closer relations of alien peoples with each other, the improved methods of communication, the increased regard for the rights of others, the prevailing practice of submitting matters of dispute to arbitration, the voluntary declarations of intention to comply strictly with its rules, and many other causes, have done much to give to international law a binding force which it has not hitherto had, aside from the fear of retaliation, or the pressure exerted by other governments who may deem violations of the rules as hurtful or dangerous to their interests. Nevertheless, in times of war (and under extreme circumstances in times of peace) history has shown that treaties, agreements, and rules of international law are broken without hesitation by states who deem observance of such conventions to be dangerous to their existence or subversive of their serious interests.

The beginnings of international law are doubtless as old as civilization, and even savage tribes have held themselves bound to observe certain formalities in intertribal intercourse. The civilization of antiquity was not calculated to do much in the way of regulating international relations except by special treaties between two adjacent monarchies. As a rule, the states were too large and intercourse too difficult to extend these agreements to many of them. Before the days of railways, telegraphs, and practicable roads it required a number of small, adjacent, independent, civilized states really to develop a system of international rules. Though the Greek states fulfilled these requirements, the character of their civilization and the condition of human thought had not yet developed to a point at which anything approaching a system of rules could be initiated. It therefore fell to the small mediæval states of Italy to begin the work. Their commerce, internal trade, close proximity, jealous rival-

ries, religious quarrels, and other sources of antagonism combined to invite war, and the practice of employing hired soldiery made war easy—indeed, almost inevitable—on the slightest provocation. The wiser rulers and their advisers often desired to avoid hostilities and, when they had begun, to mitigate their severities as leading to discontent among the people and to revolution. The result was the development, in this collection of miniature states, of the modern system of diplomatic representation and the beginning of international law and comity—the institution of passports, the distinction between armed forces and civilians, the laws of war on land and sea, and even the general idea that states have a mutual interest in the observance of law and order among themselves.

This condition of affairs did not obtain in northern Europe, because there the smaller states were overshadowed by the larger ones, and the rule that “might makes right” was carried out to the detriment of the weaker communities. The brutality of the Netherlands war for independence directed one of the greatest minds of the age towards ameliorating such conditions. This was Huig van Groot, who is best known as Hugo Grotius, the Latinized form of his name. He was a jurist, a dramatist, an historian, and a statesman. In 1604, at the age of 20, he composed a work called *De Jure Prædæ*. The manuscript remained unknown until 1868, when it was discovered and published. It is interesting because it shows the main principles and plan of the first part of his great work *De Jure Belli ac Pacis*, which was not written until 1623–25, while Grotius was an exile in Paris (published in 1625). The success of the latter work was immediate, and his fame as the father of international law—or “law of nations” (*jus gentium*), as he termed it—was secure. Grotius practically exhausted the subject so far as theoretical arguments are concerned, and almost nothing has been added to them by all of his successors. This work came at an opportune time, in the midst of the Thirty Years’ War, and had a profound effect upon subsequent events.

Grotius was followed by Pufendorf, who published *De Jure Naturæ et Gentium* in 1672; Leibnitz, *Codex Juris Gentium Diplomaticus* (1693–1700); Van Bynkershoek (who was first to give special treatment to public maritime law), *De Dominio Maris* (1721); Wolff, *Jus Naturæ et Jus Gentium* (1740–49); and Vattel, *Droit des Gens* (1758). The writers upon international law since Vattel are too numerous to mention even the most distinguished of them. For a description and criticism of their work, consult Rivier’s sketch in Holtzendorff, *Handbuch der Volkerrechts*, vol. i (Hamburg, 1885; Fr. trans., 1888, vol. i, pp. 351–394). In America the most important work has been done by Kent (1763–1847), Wheaton (1785–1848), Halleck (1817–72), Woolsey (1801–89), Dana (1815–82), Wharton (1820–99), Stockton (1845–), and Moore (1861–). The decisions and opinions of eminent judges as rendered in important cases have added much to the subject—in England, Sir Leoline Jenkins (1623–85), Lord Mansfield (1705–93), and Lord Stowell (1745–1836); in the United States, Chief Justice Marshall (1755–1835) and Justice Story (1779–1845).

The modern method of developing and adjust-

ing the rules of international law is by means of conferences of the Powers. The first of these was at Paris in 1856, and its conclusions, commonly called the Declaration of Paris, formed the first step towards a definition and codification of the rules which has been followed in other conferences at Geneva (q.v.), London, The Hague (q.v.), and elsewhere.

INTERNATIONAL LAW IN GENERAL

Political Aspects. International law deals primarily only with sovereign states which are responsible for the acts of their subdivisions, colonies, and citizens. A sovereign state is also responsible to a certain extent for the actions of dependent states and those over which they have established a protectorate or suzerainty; the degree of responsibility depending upon the character of the dependency, protection, or suzerainty.

A sovereign state is a community of persons or of lesser states which has (a) an organized government and is permanently established for a political end, (b) is possessed of a definite territory, and (c) is independent of any external protection, suzerainty, or control. If these requirements are satisfied, the state exists, whether recognized or not by other sovereign states. Failure to recognize the existence of such a state would be an unfriendly act; but as the recognizing state is sovereign, recognition on its part cannot be exacted except by force.

The form of government is immaterial provided it be effective. But in case of any marked change of form, whether made peacefully or pursuant to a successful war or revolution, it is customary for the other Powers to recognize it officially before beginning or renewing diplomatic relations.

A sovereign state has certain inherent rights, such as (a) independence, (b) equality as respects other similar states, (c) absolute and exclusive jurisdiction over its own territory and over its own citizens when resident therein, (d) self-preservation, (e) determination of its own form of government, (f) freedom of navigation of the high seas (q.v.), etc. From the possession of certain rights by a sovereign state it naturally follows that it must discharge certain duties. Among these are (a) respect for the rights of others; (b) the maintenance of an orderly and efficient government which will guarantee to other states and their citizens the same privileges and protection which are extended; (c) good faith, courtesy, and the recognition of and compliance with the generally accepted rules of international law and comity. The mutual recognition of these rights and duties is the basis of international law.

At one time the rights of sovereign states herein mentioned and some others were regarded as absolute and exclusive of the rights of others, and this view is largely held at present by publicists and statesmen. But the improved means of communication and transportation have so extended commerce and business that the condition of the internal affairs of countries is a matter affecting the interests of the world at large. It is no longer a matter of indifference to nations whether one of them fails to maintain orderly government within its territory or exhibits a succession of short-lived administrations established, maintained, and over-

thrown by force of arms. Such a condition of affairs is a practical denial to orderly states of the same treatment of the citizens and commerce of those states as they themselves extend. To improve the objectionable conditions and to establish legal and stable government, other states have used force, diplomatic or of arms. Most neutrals suffer during war, nearly all do to some extent, though the gain in some instances is greater than the loss. Those neutrals which conceive an impending war to be hurtful to their interests or dangerous to their well-being have, when possessed of the power, sometimes brought such pressure to bear upon the states desiring to appeal to arms that war has been averted.

These interferences with the internal affairs or generally respected rights of sovereign or semisovereign states constitutes intervention (q.v.), of which Sir William Harcourt says: "It is a high and summary procedure which may sometimes snatch a remedy beyond the reach of law. Nevertheless it must be admitted that in the case of intervention, as in the case of revolution, its essence is illegality, and its justification is its success; of all things, at once the most unjustifiable and the most impolitic is an unsuccessful intervention." While in a measure true, this is an extreme statement from the modern point of view. In both cases the proper basis of justification is the degree of tolerability of the condition which is to be improved, the possibility of success, and a comparison of the results of success with the cost of life, property, etc., entailed by intervention.

Certain states, sovereign in most respects, have never been recognized as belonging to the great international group, chiefly from a lack of effectiveness of their governments, especially as regards protection of foreigners because of wide differences in laws and customs. From this condition Japan has emerged and China is endeavoring to emerge. Existing states of this type are Siam, Abyssinia, etc. Several small states of Europe are called neutralized states because their neutrality has been guaranteed by the Great Powers. Such are Switzerland, Belgium, and Luxemburg. Switzerland and Belgium possess armies, but only for the purpose of internal police and protection against invasion. (For the breach of neutrality in Belgium and Luxemburg in 1914, see WAR IN EUROPE.) Semisovereign states exercise full sovereignty except in certain matters defined by treaty with a Great Power or Powers. Such are Cuba, Panama, Morocco, and Persia. States existing under the protection of Great Powers have a very limited sovereignty. Egypt, Tunis, Zanzibar, and the little republics of Andorra and San Marino are examples.

Sovereign states which have been generally recognized as such are called *de jure* states. While a state is in the process of making by means of war, the revolutionists are called *insurgents* until they have established some form of government and control an area of territory in which they are able to give and do give the same protection to life and property as is afforded under like conditions by the authorities of sovereign states. They may then properly be recognized as *belligerents* and usually are so recognized if they obey the rules of international law. (See BELLIGERENT.) Whether recognized or not, they are *de facto* states. One of the most distinguished examples of a *de facto* state

which did not become *de jure* was the Confederate States of America.

Jurisdiction. Since each sovereign state is in theory independent of foreign control, its full jurisdiction extends throughout its own territory and no farther. This territory includes the land and water wholly within its borders, the marginal seas to a distance of 3 miles, also the air above and the earth beneath the areas so defined. Treaty, comity, particular conditions, usage, the power of modern guns, and the development of airships have modified this jurisdiction. Rivers and narrow channels forming natural boundaries are open to the navigation of both states, the actual boundary passing through the centre of the deepest or most practicable channel. In the case of rivers or channels originating in one state and flowing through others, the parts within each state are subject to its full jurisdiction; but comity, usage, and treaty have generally extended the use of the full length of such waterways to peaceful commerce, so that a refusal to permit such use would be regarded as a most unfriendly act. If, however, artificial channels or canals are constructed by a state, it may impose any conditions upon their use that it pleases, provided the improved channel or canal has not closed to use a preëxisting natural one. Bays and indentations of the coast, where the headlands are less than 6 miles apart, are regarded as belonging to a nation's territory; even where the headlands are farther apart, treaty, long-continued exercise of jurisdiction, and special conditions have given a quasi acquiescence in such jurisdiction.

The control of the marginal seas to a distance of 3 miles from the coast is based upon natural right (of self-protection), the possibility of enforcing jurisdiction, and the distance at which guns on ships or on shore could inflict damage. The range of guns has greatly increased since this rule was first generally accepted, and it is now modified. Full jurisdiction within the 3-mile limit remains; beyond that limit the jurisdiction does not extend, but other powers must not carry on operations of war at a distance within the range of their weapons, as such operations might injure neutrals.

There are certain restrictions upon the jurisdiction of states called *servitudes*. These relate chiefly but not necessarily to territorial rights and are almost without exception defined by treaty. Among these are the right of passage through channels or territory; the right to fish in foreign waters, to build a canal in foreign territory; the requirement that a port shall be free of import or export taxes, that certain territory shall remain neutral, that certain places shall not be fortified, etc.

Over the *high seas* (q.v.) no nation has any right of sovereignty. They are free to the commerce and warships of the world. Since all nations have an equal right to their unrestricted use, no nation engaged in war can interfere with, interrupt, or render dangerous the operations of neutral commerce on the high seas when carried on in accordance with international law; nor may neutrals restrict the lawful operations of belligerents.

Merchant ships upon the high seas are subject to the exclusive jurisdiction of the state that issues the evidence of nationality which carries with it the right to fly the national flag. Except in time of war, a merchant vessel of a

nation cannot be interfered with by the vessels or forces of another when upon the high seas. While within the territorial waters of a foreign state, such a vessel is subject to all the laws of that state; but the French rules, which exempt a foreign vessel from French jurisdiction unless a crime be committed on board which disturbs the public peace, are becoming widely accepted. Public vessels of a nation are not subject to the jurisdiction of any other state, whether on the high seas or in the territorial waters of that other state. As regards armed vessels, the exemption from jurisdiction is absolute and unqualified, but they must obey the local laws and rules of the port. In certain cases of unarmed vessels satisfactory evidence of their public character may be required. For securing greater safety at sea, certain international rules (see RULES OF THE ROAD AT SEA) for the navigation of vessels have been adopted. These must be rigorously obeyed by all vessels, public and private.

The art of aviation has brought about a new condition of affairs as regards the jurisdiction of the air and has rendered a definition of that jurisdiction of greatly increased importance. As the questions involved chiefly concern operations of war, the subject is treated under that head.

The jurisdiction of a sovereign state over its citizens or subjects is absolute when they are within its borders. When they are abroad, its jurisdiction is modified and subject to consideration of the sovereignty of the country in which they are located or traveling. Resident aliens and aliens traveling in a country are subject in all respects to its laws unless these laws are modified by treaty or usage when applied to aliens. Subjection to local laws implies access to local courts. Protection to aliens in peaceful and legal vocations or business is guaranteed, and this protection is practically the same as that given to resident citizens. But aliens may be excluded from the whole or from any part of the territory of a state. Aliens cannot be forced to enter the military or naval establishment of a country unless born and resident within that country, in which case the question of their status is not well defined and the usage is not uniform.

Citizens of a state resident or traveling abroad are entitled to the protection of their own government against unjust treatment, from arbitrary acts of oppression, or deprivation of rights or property, but not against penalties incurred by infraction of the laws of the country in which they may be. They cannot, however, expect a more favorable treatment than citizens or subjects of the country. See ALIEN.

A diplomatic officer resident or traveling abroad is entitled to certain immunities from foreign jurisdiction. These include inviolability of his person and of his official residence and offices, exemption from civil and commercial jurisdiction (local police regulations, customs duties and taxes, religious regulations, etc.), and general exercise of authority over his official suite and his immediate family. Consuls are not diplomatic agents and do not possess these immunities. Their official papers are, however, exempt from seizure, and comity and convention have considerably extended their privileges. As officers of foreign states, international comity requires that certain consideration be shown them and that they should not

be required to perform any duty or be subject to any treatment which will interfere with the proper discharge of their legitimate functions, so long as they conform with the local laws and treaty obligations. See DIPLOMATIC AGENTS; CONSUL, MERCANTILE.

Treaties. Treaties are contracts between states. They are not international law, though such of their provisions as receive general acceptance may become so. If any article of a treaty should contravene a well-established rule of international law, it would certainly be held as void by all but the contracting parties. See TREATY.

Measures Short of War. These include all measures for exerting pressure upon an offending state without declaring war. They are usually divided into two classes, retorsions and reprisals.

Retorsions are retaliations in kind. When any state has done certain acts which are regarded by another as prejudicial to its interests, it may retaliate by doing the same acts. Restrictions upon trade or commerce are frequently thus replied to.

Reprisals are any measures taken for the purpose of forcing an offending state to comply with its obligations or as a means of retaliation—these measures being taken without intending to declare or bring on war, though in many cases they do lead to a declaration of it by the other state. The following are some of the common forms of reprisal: (a) laying of special duties or taxes upon the commerce or domiciled citizens of the offending state (this is reprisal if it is not a retaliation in kind); (b) withdrawal or suspension of rights or privileges of such domiciled citizens; (c) sequestration or seizure of property of the offending state or of its citizens; (d) suspension of treaties or of certain parts of treaties; (e) suspension of commercial or other intercourse, partial or complete; (f) pacific blockade; (g) partial or temporary occupation of territory. See REPRISAL; RETORSION.

INTERNATIONAL LAW IN WAR

War is a contest between the armed forces of states. Revolutions or insurrections become war when the insurgents are recognized as belligerents. (See WAR.) These forces may operate on land, on the sea, under the surface of the sea, or in the air. The right to make war is one of the attributes of sovereignty and is theoretically defensible on the grounds of self-protection or self-interest.

When war has been declared, or has been recognized as existing, the relations of states to each are profoundly modified or changed. The contending parties become *belligerents* (see BELLIGERENT), and other states are known as neutrals. Formerly the citizens of opposing belligerent states were one and all held to be enemies, though this view is now greatly modified, as will be hereinafter explained. Treaties existing between belligerents are usually abrogated or suspended during war except as regards articles concerning the conduct of war. Treaties to which neutrals and belligerents are parties are modified to conform to existing conditions or suspended.

The possible area over which warlike operations are permissible are the territories of the belligerent states and the high seas. By agree-

ment, voluntary declaration, or through the coercion of other powers, the area of operations may be confined to a particular district or locality.

War may begin by hostile acts of states or a definite declaration or statement. The Second Hague Conference adopted the following rules as to the commencement of hostilities, and these were ratified by nearly all the Powers: "Art. I. The contracting powers recognize that hostilities between them must not commence without a previous and unequivocal warning, which shall take the form either of a declaration of war, giving reasons, or of an ultimatum with a conditional declaration of war.

"Art. II. The state of war should be notified to the neutral powers without delay, and shall not take effect in regard to them until after the receipt of a notification. Nevertheless, neutral powers cannot plead the absence of notification if it be established beyond doubt that they were in fact aware of the state of war."

Notwithstanding these rules the lack of inherent force in international law will probably lead to direct violation or evasion by subterfuge if a state considers its interests too deeply concerned to comply with its provisions. This is due in part to the rapidity with which modern troops and fleets may be mobilized and moved and the disastrous effects of delay or the great gains to be effected thereby. In the condition of affairs which commonly exists just previous to the outbreak of war the actions of both states or of their forces can be made an excuse for almost any proceedings short of general hostilities. The mobilization of the land or naval forces of a state for which no satisfactory explanation is given may be, and usually is, regarded as a hostile act by a possible adversary, and this act becomes still more hostile if the troops be directed towards or concentrate upon the frontier of this adversary. The invasion of the territory of another state is considered an act of war.

Land Warfare. The armed forces of a country consist of its army and navy. The Hague Convention of 1907 provides:

"Art. I. The laws, the rights, and the duties of war apply not only to the army but also to militia and volunteer organizations combining the following conditions: 1. Having at their head a person who is responsible for his subordinates. 2. Having a permanent distinctive sign, recognizable at a distance. 3. Openly bearing arms. 4. Conforming to the laws and customs of war in their operations. In countries where the militia or volunteer organizations constitute or form part of the army, they are comprised under the denomination of army.

"Art. II. The inhabitants of an unoccupied territory who, on the approach of an enemy, spontaneously take up arms in order to repel the invading troops, without having had time to organize in accordance with Article I, shall be considered as belligerents if they bear arms openly and respect the laws and customs of warfare."

Noncombatants are of two classes: (a) unarmed citizens or residents engaged in peaceful pursuits; (b) unarmed persons performing duties with the army or navy, but not part of the fighting force of an army or part of the crew of a vessel of war. The latter may be held as prisoners of war, the former may not, though any person possessing information, of which

the dissemination might be detrimental to the interests of a belligerent, may be temporarily detained if captured within a belligerent's jurisdiction. Noncombatants of the first class are entitled to the protection of the enemy's troops, as regards life, liberty, property, and occupation, as far as is practicable. (*Hague Conv.*, 1907.)

Enemy's troops which surrender or are captured are prisoners of war. An offer to surrender must be accepted. Prisoners of war must be treated humanely and have the same food, bed, and clothing as the troops of the captor. Their personal belongings, except arms, horses, and military papers, remain their property. They are not to be confined except in case of necessity. They may be employed on work not connected with war operations; but if so, they must be paid. Expenses of maintenance of prisoners are to be repaid by their governments at the close of the war. A bureau of information regarding prisoners of war must be established, and it shall be furnished with all information concerning them and keep all papers, valuables, etc., found on the field of battle or left behind by prisoners who escape, are paroled, exchanged, etc. Prisoners may be given disciplinary punishment for attempting to escape or for insubordination or infraction of the rules established for their government. Parole, which is an engagement not to bear arms against the captor during the continuance of hostilities unless duly exchanged, may be accepted from prisoners, but they cannot be forced to give it. Breach of parole is punishable by a military court. Persons who follow an army but are not connected with it, such as newspaper correspondents, sutlers, furnishers of supplies, etc., if held by the captor shall be treated as prisoners of war. In regard to the wills, death certificates, burial, etc., the same rules are followed as for soldiers of the captor's army. Sick and wounded are to be cared for in accordance with rules of the Geneva Convention (q.v.). (*Hague Conv.*, 1907.)

Belligerents are forbidden: (a) to use poison or poisoned weapons; (b) to kill or wound through treachery or after an enemy has laid down his arms and surrendered; (c) to declare that no quarter will be given; (d) to employ weapons, projectiles, or substances of such a nature as to cause unnecessary pain; (e) to make improper use of the flag of truce, national flag, insignia and uniform of the enemy, or distinctive signs of the Geneva Convention; (f) to seize or destroy enemy's property except when actually necessary; (g) to declare extinguished, suspended, or barred the rights and choses in action or the nationals of the adversary; (h) to compel the nationals of the adversary to take part in military operations against their country, even if in the service of the captor before the commencement of the war; (i) to bombard undefended cities, villages, dwellings, or buildings; to give up a city or place to pillage, sack, or plunder even if taken by assault. (*Hague Conv.*, 1907.)

Stratagems and other means to obtain information concerning the enemy and the topography of the country are permissible. Before beginning a bombardment, the commander of the attacking force shall give warning if possible except in case of attack by main force. During sieges and bombardments buildings devoted to the care of the sick and wounded, re-

religious worship, art, science, charity, and historical buildings and monuments will be spared as far as practicable if not used for a military purpose. These buildings shall be distinguished by the besieged by visible signs and the besieger informed of their character. (*Hague Conv.*, 1907.)

A spy is a person who attempts to get military information for the use of the enemy in a clandestine manner and by deception. Undisguised soldiers are not spies; nor are undisguised soldiers or civilians openly performing their duties, even if carrying dispatches. A spy caught in the act must not be punished without trial. A spy who escapes and rejoins his own army cannot, if recaptured, be punished for his offense.

Flags are carried to indicate the nationality of the troops to enemy and friend alike and for other purposes. The flag of truce (q.v.) is used to ask for a parley. A white flag is sometimes used as a sign of surrender.

Capitulations must take into account the rules of military honor and be agreed upon. An armistice (q.v.) suspends military operations by the parties to it over the territory and during the period agreed upon. Serious violations give the right to denounce it and resume hostilities; violation of clauses by individuals requires only their punishment.

A territory is considered as being occupied when actually under the authority of the hostile army and where that authority is capable of being exerted. The occupant shall take all measures necessary to restore and preserve order, life, property, and the rights to religious convictions and religious worship. Private property cannot be confiscated or taken except for public use, and then it must be paid for; looting is forbidden. Taxes, duties, and tolls may be collected for defraying the expenses of administration, but they should be laid and collected as nearly as practicable in accordance with previous custom. If other taxes are laid or contributions collected, they must be for the needs of the army or administration. All taxes must be established pursuant to a written order issued under authority of the commander in chief, and a receipt be given for all payments. Requisitions in kind and services can duly be levied for the needs of the army. Supplies must be paid for in cash as far as possible, a receipt given for the remainder, and the amounts due paid as soon as possible.

An army occupying a territory may seize only the specie, funds, collectible securities, arms, munitions of war, and other movable property of the state capable of being used in military operations. Private property, such as means of communication, transportation, munitions of war, etc., may be seized, but the owners must be indemnified for their use. Submarine cables connecting an "occupied" territory with a neutral territory shall not be seized or destroyed except in case of absolute necessity. If injured, they must be restored and the indemnities adjusted upon the conclusion of peace. Public buildings, real estate, and other fixed property of the state may be occupied by the captor as a usufructuary. The property of communes and of institutions devoted to religious worship, charity, instruction, or to arts and sciences, even when belonging to the government, shall be treated as private property. Seizure or destruction of such institutions, or historical

monuments, or works of art or science is prohibited. (*Hague Conv.*, 1907.)

War on the Sea. The naval forces of a state comprise the regular navy, the naval reserve, naval militia, volunteers, and others taken into the public service. While privateers are still permissible under international law, it is not likely that they will again be used by a great naval power.

The rules for land warfare already cited also govern naval warfare so far as they are applicable. The area in which naval operations may take place comprises the high seas and the territorial waters of the belligerents. The objects sought in naval warfare are the capture and destruction of the naval and military forces of the enemy, of various naval and military establishments, and of his maritime commerce; also to aid military operations and defend the national territory, property, and sea-borne commerce.

Public vessels of the enemy may be captured outside of neutral waters; their officers and crews become prisoners of war, except those which are exempted by the Geneva Convention. The vessel itself is a prize of war, no prize-court proceedings being necessary. Vessels owned by private citizens of belligerent states are subject to capture as enemy property when outside of neutral water, though the United States has always striven to make it a rule of international law that private property not contraband of war be exempt from capture. After a merchant vessel is captured she must be turned over to the jurisdiction of a prize court (q.v.) to determine the validity of the act, or she may give a ransom bond. (See RANSOM.) Belligerent vessels of war have the right to search all private vessels, belligerent or neutral, in order to determine their nationality and whether they are subject to capture or not. Neutral vessels may be captured and condemned as prizes for the following offenses: (a) carrying contraband of war to a port of the enemy; (b) entering or attempting to enter a blockaded port; (c) unneutral service; (d) forcible resistance to stoppage or search.

Neutral trade with the enemy is permitted in ports not blockaded provided the neutral vessels do not carry goods which are contraband of war. All goods may be divided into three classes, viz., (a) *contraband*, which are useful solely for war purposes, such as arms, ammunition, etc.; (b) *conditional contraband*, which are used for both war and peaceful purposes, such as coal, oil, provisions, money, etc.; (c) free goods, which are used only for peaceful purposes, such as raw materials, machinery necessary for agriculture and mining, furniture, etc. While the provisions of the Declaration of London have not been universally agreed to, its terms are in accordance with the generally accepted rules of international law, so that its definite lists of contraband, conditional contraband, and free goods are likely to guide the decisions of future prize courts (q.v.). (*Decl. of London*, 1909.)

Though the United States has always striven to secure the exemption of private property from capture, the rule has not yet been adopted. Enemy's goods on an enemy's vessel are subject to capture and condemnation, but enemy's goods on a neutral vessel are not subject to condemnation, nor are neutral goods on an enemy's vessel. (*Decl. of Paris*, 1856.)

Blockades (see BLOCKADE) may be either on the sea or on land and may be military, naval, or commercial. Most sea blockades are both naval and commercial. The following remarks apply to commercial blockades:

A (commercial) blockade is the investment of the coast or a portion of the coast by a naval force in such a manner as to prevent vessels from entering or leaving any port in the blockaded area without imminent danger of capture. Blockades must be established by proclamation to all states and to the local authorities, and a reasonable time allowed for neutrals to receive the information. Breach of blockade by a neutral merchant vessel renders her liable to capture and condemnation as a lawful prize. But if the vessel escapes to her destination, she is not afterward liable for her act. The cargo of a vessel condemned for breach of blockade is also subject to condemnation. All private vessels, whether belonging to a neutral or the enemy, should be turned over to a prize court for adjudication, but in very exceptional cases they may be destroyed. (Decl. of London, 1909.)

Submarine mines may be laid in any belligerent waters by either belligerent for the purpose of destroying the war vessels of the enemy, but not for the purpose of intercepting commercial shipping, though certain channels to a harbor may be closed by mines, hulks, or any form of obstruction. (Hague Conv., 1907.)

In regard to automatic submarine contact mines The Hague Convention of 1907 provides:

"Art. I. It is forbidden:

"1. To lay unanchored automatic contact mines, except when they are so constructed as to become harmless one hour after the person who laid them ceases to control them.

"2. To lay anchored automatic contact mines which do not become harmless as soon as they have broken loose from their moorings.

"3. To use torpedoes which do not become harmless when they have missed their mark.

"Art. II. It is forbidden to lay automatic contact mines off the coast and ports of the enemy, with the sole object of intercepting commercial shipping."

Another article provides that every precaution must be taken for the security of peaceful shipping and to notify neutrals of danger zones when the mines are no longer under surveillance. At the close of hostilities all existing mines must be removed by the state which placed them.

Unneutral Service. Unneutral service includes all acts by a neutral vessel, knowingly performed, which give aid to the enemy or assist him in carrying on the war. These include the carrying of troops or dispatches (not in the ordinary closed mails), or supplies for the enemy; or being in the exclusive employment of the enemy's government; or being under orders or control of an agent placed on board by that government; or taking an active part in the hostilities. Neutral vessels performing any of the services mentioned in the foregoing are therefore liable to capture and condemnation as lawful prizes.

Neutral States during War. It is the right of a state to remain neutral during war. It is its duty to observe that neutrality in its actions affecting belligerents. It is customary for the head of a neutral state to issue a proclamation of neutrality, informing its people of the exist-

ing war and cautioning them as to the obligations of neutrals and the penalties for breach of such obligations.

Neutral states must not (a) permit the use of their territory by belligerents or (b) aid belligerents in their operations. This aid includes the equipment and construction of vessels of war. But a neutral power is not called upon to prevent the export or transport, on the part of one or other of the belligerents, of arms, munitions of war, or, in general, of anything which can be of use to an army or a fleet. (Decl. of London, 1909.)

The fact of a neutral power resisting, even by force, attempts to violate its neutrality cannot be regarded as a hostile act. (Hague Conv., 1907.)

A neutral power is not called upon to forbid or restrict the use on behalf of the belligerents of telephone or telegraph cables or of wireless telegraph apparatus belonging to it or to companies or private individuals, or even to a belligerent, if erected before the beginning of hostilities and if it is open to all public messages. But a neutral power may restrict the use of these methods of communication provided the restriction is applied impartially to both belligerents. (Hague Conv., 1907.)

The transfer of a merchant vessel to a neutral flag must not be made for the sole purpose of evading capture as an enemy's ship. In order to be valid it must be unconditional, complete, and in conformity with the laws of the countries concerned, and in such manner that neither its control nor the profits of its employment shall remain in the same hands as before the transfer. If the transfer takes place 60 days before the outbreak of hostilities, the transfer is regarded as valid unless it can be proved that it was simply for the purpose of avoiding possible capture. If the vessel lost her belligerent nationality less than 60 days before hostilities began, and if the bill of sale is not on board, her capture gives no right to damages. Transfer to a neutral flag after the outbreak of hostilities is void unless it is proved that the transfer was not made in order to evade the consequences to which an enemy's vessel, as such, is exposed. There is absolute presumption that such transfer is void (1) if the transfer has been made during a voyage or in a blockaded port, or (2) if a right to repurchase or recover the vessel is reserved to the vendor, or (3) if the requirements of the municipal law governing the right to fly the flag under which the vessel is sailing have not been fulfilled. Consult Articles 55 and 56 of the *Declaration of London*.

Neutral states must not, in the absence of their own legislation to the contrary, permit belligerent war vessels to remain in one of their ports more than 24 hours, except on account of damage or stress of weather. If the war vessel refuses to go, it may be seized and with its officers and crew interned and held until the war is over. (Decl. of London, 1909.)

A belligerent vessel of war may only take, in a neutral port, sufficient supplies of fuel and provisions to enable it to reach a port of its own country. A prize may be brought into a neutral port, on account of unseaworthiness, stress of weather, or want of fuel or provisions, but must leave as soon as the circumstances justifying its entry are at an end. If it does not, and refuses to leave, the neutral power

must seize it, release its officers and crew, and intern the prize crew. (*Decl. of London, 1909.*)

Airships in War. As regards aviation, airships, and aërial war, no rules of importance have yet received international sanction; but many separate rules have been proposed, and many authorities have written on the subject. The consensus of opinion seems to be that: (a) the air above the territory of a country and of its territorial waters is under the exclusive jurisdiction of that country; (b) the air above neutral territory is neutral and not to be entered by belligerent airships without the consent of the neutral state beneath it, except through stress of weather, injury to machinery, lack of fuel to reach its own territory, etc.; (c) neutral states must not allow their territory or territorial waters to be used by belligerent airships in any manner which may assist their operation; (d) a belligerent state may make such rules as regards neutral aircraft entering its jurisdiction (see rule (a) above) as it may deem necessary for its own protection; (e) belligerent states may exclude neutral airships from the theatre of war to prevent disclosure of their movements to the enemy, whether this be their own territory, that of the enemy, or of a third power; (f) if a neutral airship is engaged in unneutral service, it may be captured if within territory (land or sea) in which such captures can be made and the facts submitted to a prize court for adjudication; (g) in case of capture of a neutral airship engaged in unneutral service its crew may be held as prisoners of war to prevent disclosure (to the enemy) of the information that may have been gained; (h) neutral airships communicating with besieged, invested, or blockaded places are liable to confiscation for breach of blockade, and the crew held as prisoners of war.

By declaration of the Second Hague Conference of 1907 it is prohibited to discharge projectiles and explosives from balloons or by other new methods of a similar nature. But public opinion has changed since that time, and in the great European War of 1914 both sides used aërial craft for bomb-dropping purposes.

It is manifest that airships should carry means of establishing their nationality, and that they should exhibit some distinguishing mark the absence of which would be evidence of unfriendliness; otherwise neutral or friendly airships might be destroyed by their friends.

Walker, *Manual of International Law* (ib., 1895); Rivier, *Principes du droit des gens* (2 vols., Paris, 1896); Charles Calvo, *Le droit international* (5th ed., 6 vols., ib., 1896); James Kent, *Commentaries* (14th ed., Boston, 1896); Freeman Snow, *International Law* (ed. by Stockton, Washington, 1898); T. A. Walker, *History of the Law of Nations* (London, 1899); T. J. Lawrence, *Principles of International Law* (3d ed., ib., 1900); Henry Wheaton, *Elements of International Law* (4th Eng. ed. by Atlay,

ib., 1904); Nys, *Le droit international* (4 vols., Brussels, 1904-06); L. F. L. Oppenheim, *International Law* (2 vols., London, 1905-06); J. B. Moore, *Digest of International Law* (8 vols., Washington, 1906); H. W. Halleck, *International Law* (4th ed., London, 1908); A. P. Higgins, *The Hague Peace and Other International Conferences* (Cambridge, 1909); Thomas Baty, *International Law* (London, 1909); W. E. Hall, *International Law* (6th ed., Oxford, 1910); C. H. Stockton, *Manual of International Law* (Annapolis, 1911). The most important and comprehensive works are those by Wheaton, Hall, Holtzendorff, Oppenheim, Calvo, Rivier, Heffter, Moore, and Nys. The short treatises by Snow, Stockton, and Woolsey are convenient for ordinary reference. The annual publications of the United States Naval War College and the *American Journal of International Law* are invaluable for consultation as to recent developments.

The Hague Peace Conference of 1907 and The London Naval Conference of 1909 cover in a general way nearly the whole field of international law as regards war. The Hague Conference adopted a series of conventions on the following-named subjects: (a) pacific settlement of international disputes; (b) respecting the limitations of the employment of force for the recovery of contract debts; (c) relative to the opening of hostilities; (d) respecting the laws and customs of war on land; (e) respecting the rights and duties of neutral powers and persons in case of war on land; (f) relative to the laying of automatic submarine contact mines; (g) respecting bombardment by naval forces in time of war; (h) adaptation to naval warfare of the principles of the Geneva Convention; (i) relative to certain restrictions with regard to the exercise of the right of capture in naval war; (k) concerning the rights and duties of neutral powers in naval war; (l) relative to the status of enemy merchant ships at the outbreak of hostilities; (m) relative to the conversion of merchant ships into warships; (n) relative to the creation of an international prize court. The Conference issued a declaration prohibiting the discharge of projectiles and explosives from balloons (and by inference from all aircraft), and it formulated an opinion and prepared a draft of a convention relative to the creation of a judicial arbitration court. Not all the conventions have been ratified by the Powers, nor were all signed by the delegates of every Power. Convention (k) was not ratified by the United States as regards one article; and conventions (l), (m), and (n) were not signed by the United States delegates and not ratified by the United States. The London Naval Conference of 1909 formulated the so-called "Declaration of London, 1909." This has not been ratified by the United States on account of some of its provisions. Nevertheless, it expresses, with a few exceptions, the generally accepted principles of international law as regards naval war with an authority far beyond that of occasional decisions by judges or of the opinions of the most distinguished international law writers. Full reports of these conferences may be found in the annual publications of the United States Naval War College for the years 1907 and 1908; The Hague Conferences of 1899 and 1907 are given by Higgins (see foregoing references) and by James Brown Scott (*The Hague Peace Conferences of 1899 and 1907,*

2 vols., Baltimore, 1909). See ALABAMA CLAIMS; CONQUEST; CONFLICT OF LAWS; EXTRADITION; HOSPITAL SHIP; PIRACY.

INTERNATIONAL PHOTOGRAPHIC CHART OF THE HEAVENS. See ASTROPHOTOGRAPHY.

INTERNATIONAL PRISON CONGRESS. The first prison conference was held in 1845 at Frankfort, followed by a second in 1857. These were largely attended by Europeans. After this, local associations were formed, but no international convention held. Count Sollenhub, of Russia, suggested to Dr. E. C. Wines, Secretary of the New York State Board of Charities, that the board call a congress. This was not deemed advisable, but shortly thereafter (1870) the first American prison congress was held, and President Grant was influenced to appoint Dr. Wines commissioner to arrange an international conference. The congress met in London in 1872. Meetings are now held at intervals of five years, the last having been at Washington in 1910. The programmes are arranged by a permanent committee, the International Prison Commission. The scope of the organization is wider than its name would indicate. All matters pertaining to crime and its repression fall within the field of the congress. At present the organization is divided into four sections: (1) criminal law; (2) prison administration; (3) prevention of crime; (4) crime among children and minors. Consult *Bulletins* and *Reports* of the congress.

INTERNATIONAL TRADE. Trade between nations or between distant regions has been a fruitful source of discussion among economic writers, and a subject which has often engrossed governmental attention to the exclusion of internal commerce, though it is a familiar fact that in modern times internal commerce is far more important to the welfare of the state. This apparently undue prominence in discussion and legislation was due not only to the fact that international trade caught the eye of the observer, while domestic trade withdrew itself from observation, but also to the fact that in early economic life foreign trade, as compared with home trade, was far more significant than it is in modern times.

This greater relative importance of international trade in its historical beginnings was due to the slight division of labor in the older economic order and to the relatively small areas of states. The soil of the neighborhood produced what was necessary for the simple wants of the inhabitants. Towns were rare and small, and artisans few in number. Most of the inhabitants were agriculturists, whose most pressing needs for manufacturing products were satisfied by the produce of the household. In short, the satisfaction of daily wants did not give rise to a "home trade" such as characterizes modern industrial society. To the uniformity of economic organization must be added the difficulty of internal communication as an obstacle to the development of any considerable interchange of commodities. Navigable rivers furnished the only means of internal transportation which were not attended with prohibitive costs. Only those nations with a favorable seacoast could develop any considerable commerce, and with it that diversification

of industrial pursuits upon which domestic trade rests. We may therefore say that foreign trade preceded domestic trade.

If we except the period of the Roman Empire, when such trade as existed became internal trade, because the known world became, as it were, one nation, the division of sovereignty before modern times was so great that most trade was foreign rather than domestic. When petty principalities or provinces of the same realm enjoyed their own customs regulations, much trade was "foreign" which in modern times would be domestic.

Largely to these considerations, as well as to the more showy character of foreign trade, its spectacular and romantic character, does this trade owe its prominence in economic discussion and in the attention of governments. Moreover, as such trade came into early notice as a means of raising revenue for the state, it thus became a matter of public concern.

It cannot be claimed that the contradictory and vacillating practice of mediæval rulers developed any well-defined theory of foreign trade. It was not until after the discovery of America and the commercial awakening that followed the influx of the American silver that the beginnings of a theory of trade appear in the writings of pamphleteers who have since been designated as the mercantile school. Thomas Mun, in his work upon *England's Treasure by Foreign Trade* (1664), states in a few words the wisdom of his time. "The ordinary means to encrease our wealth and treasure is by *Forraign Trade*, wherein wee must ever observe this rule: to sell more to strangers yearly than wee consume of theirs in value. By such a course the balance must be paid in coin, and the country enriched, while a contrary course would deplete its stock of the precious metals." The confusion of wealth and money is obvious and characterizes the whole thought of the period. As we shall see, it led to some extraordinary governmental measures to promote the flow of gold and silver into the nation and to check its outflow. It distorted the economic policy of the nations for generations and threw the entire public interest in foreign trade upon its capacity to attract specie. It carried with it the corollary that importations should be limited as far as possible and caused vexatious restrictions, high import duties, and frequent prohibitions of the importation of foreign commodities. Thus, in 1674 the total prohibition of the importation of French brandy was advocated in England, not only to encourage the consumption of domestic ale and beer, but also because it was considered undesirable to increase the consumption of French goods. Writings upon trade subjects are full of fears lest any nation should sell more to England than it bought from her, and the government was repeatedly urged to take measures against any nation which so offended against public policy. All writers did not, however, share this shortsighted view, and Mun stands out from his contemporaries by his perception that what is apparently lost by trade with one nation may be the means of gain, since the goods imported from it may be disposed of at great profit to some other nation. He is none the less quite convinced that the aggregate of exports and imports should show a decided balance in favor of the former. Another characteristic of the time is the preference given to trade in distant parts, as when Mun says: "Also wee ought to esteem

and cherish those trades which we have in remote or far countreys, for besides the encrease of shipping and mariners thereby, the wares also sent thither and received from thence are far more profitable unto the kingdom than by our trades near at hand." The great profits secured by those states which came to be depots of the Indian trade doubtless led Mun to take this view.

To these writers the entire advantage of foreign trade lay in exportation. Importation was at best a necessary evil. So far as individuals were concerned, it is true, the volume of business of both kinds was the measure of profitability, and traders were prone to encourage all commerce; but from the standpoint of the kingdom as a whole that trade was regarded as profitable which resulted in an importation of specie.

The Physiocrats (q.v.) riddled the pretensions of these writers and held up their policy to derision. Adam Smith demonstrated still more conclusively the weakness of their doctrine. He did not feel it necessary to insist that money and wealth were not synonymous terms, that an increase in the former was not the sole goal of statecraft. In his day England's stock of the precious metals was adequate to its needs and was therefore not an object of peculiar solicitude for the statesman, as it had been in earlier times. Adam Smith states in the following terms the advantages to different countries of international trade: "It carries out that surplus part of the produce of their land and labor for which there is no demand among them, and brings back in return for it something else for which there is a demand. It gives a value to their superfluities, by exchanging them for something else which may satisfy a part of their wants and increase their enjoyments. By means of it the narrowness of the home market does not hinder the division of labor in any particular branch of art or manufacture from being carried to the highest perfection. By opening a more extensive market for whatever part of the produce of their labor may exceed the home consumption, it encourages them to improve its productive powers and to augment its annual produce to the utmost, and thereby to increase the real revenue and wealth of the society." Trade enables a nation not only to obtain what it cannot produce itself, but also to carry its own production to the highest degree of perfection by reason of this outside demand. The advantage of trade lies in its effect upon home industry, and trade is represented as a mutual and not as a one-sided advantage. The home market is now recognized to be the most important, and foreign trade as subsidiary to it, as significant only in so far as it promotes a better division of labor and more productive employment of capital at home. The emphasis is shifted from the purely mercantile side, and the question shown to be a much larger one than a mere increase or decrease of specie.

If the mercantilists insisted that the entire advantage of foreign trade lay in exportation, while Adam Smith deemed the advantage mutual, later writers—as, e.g., John Stuart Mill—have gone so far as to declare that the importance to the nation of its international trade was measured by its imports. This is not, of course, a mere reversal of the mercantilist attitude, for the distinguished economist is far from contemplating the possibility of imports

without corresponding exports. But to him the imports of a nation represent a saving of energy, time, labor, and capital in the acquisition of goods. While the same goods, or many of them, could doubtless be produced at home, it would be at far greater expenditure of effort than that involved in producing the goods exported to pay for them. In following the history of economic thought on the subject of trade, we have passed from the period of a crude but ultra protectionism to one of free trade.

In the meantime new questions have arisen which call for attention. It needs no expert to perceive the advantage of trade between temperate and tropical countries. But in the trade of temperate countries among each other the advantage is not so apparent. It may, and does, happen that a country will import from another a commodity which it can produce at home at less labor cost than is expended upon its production in the country whence it is imported. If such is the case, it is clear that production does not always take place at the point of maximum advantage. It is assumed that within a given country production is carried on at the point of greatest advantage, because of the mobility of capital and labor. But between different nations there is not such perfect mobility, and production continues under varying circumstances of advantage and disadvantage. In domestic trade the costs of production, as a rule, determine prices and values; but in international trade there must be another rule. If England can produce a commodity A with 10 units of productive power, while a foreign country requires 12 units for the same commodity, England may buy of the foreign country, but certainly will not pay 12 units for the goods. The first question which arises is, Why does not England in these circumstances produce the commodity A? Simply because in the production of other commodities, B, C, D, etc., it enjoys still greater advantages over foreign countries. Its maximum productivity is gained by concentration on these other lines of production. In the case mentioned the costs of production for England and the foreign country may be stated as follows for like quantities of each commodity:

A.	England	10	units,	the	foreign	country	12	units.
B.	"	9	"	"	"	"	13	"
C.	"	8	"	"	"	"	14	"
D.	"	7	"	"	"	"	15	"

It is clear that it will be profitable for England to produce B, C, D for its own wants, and so much in excess thereof as it can persuade the foreign country to take, while it will pay the latter to concentrate its production upon A and supply so far as possible its needs for B, C, and D by importations from England. This shows the motive for an international trade under these circumstances. There is a further question as to the rate at which these articles will be exchanged.

International Values. As in the illustration given it is obvious that England will not pay the foreign country 12 units for A when it can produce A at home for the expenditure of 10 units, the question is how much the foreign country will obtain. If the demand in England for A is equal to the demand of the foreign country for D, the exchange will take place between those commodities. England will get its supply of A at the cost of producing D; the foreign country will get its supply of D at a cost of 12 productive units instead of 15 productive

units. The advantages of the trade are obvious, and the total production of the two countries concerned is greatly increased. If there were no demand in the foreign country for D, but on the other hand a large demand for C, the trade might be between those commodities, and the advantage, though less, might still be considerable. These simple illustrations allow us to state the rule of international value. It is that in international trade the price paid for the foreign article does not follow the costs of production of that article in the country in which it is produced, but rather the costs of production of the article exported in exchange for it. This rule is stated only as a tendency. Economists have devoted considerable attention to the actual equation of exchange. A single modification of the foregoing illustration will indicate the infinite variety of circumstances which modify in practice the tendency stated. Let us suppose that England needs a larger quantity of the commodity A than the foreign country does of D. To stimulate the demand for D, it must be offered at a lower price. So that on the new basis by the exchange of the produce of 11 units of productive power the foreign country gains the same goods as before. Its advantage in the acquisition of D is therefore 15 units — 11 units, or 4 units. On the other hand, England has gained a quantity of A corresponding to the expenditure of 9 units of her own productive power; her gain by the exchange is no longer 3 units, but only 2. In this manner an infinite variety of circumstances, such as cost of carriage, customs, exchange, may be introduced to modify the conditions of the problem.

History of International Trade. It has already been pointed out that the earliest trade was between widely distant nations rather than contiguous ones; that in the entire period which preceded the nineteenth century trade between different countries rested upon a pronounced difference in their products, rather than on such slight advantages of comparative cost as in modern times. Fundamental, moreover, for an understanding of the course of earlier trade is a proper appreciation of the costs of carriage and of the legal obstacles to trade imposed by the governments. These considerations affected in a high degree trade by land, and in lesser measure that by sea and along the navigable rivers.

The great physical contrast upon which early trade was founded was that of temperate and tropical countries, which in historic times was the contrast of West and East. This physical contrast was enhanced by a distinct historical development of the two regions, by the earlier progress of civilization and the arts among the people of the Orient. Hence a large part of the history of commerce is the history of trade with the East. The first trade routes were overland from Central Asia to the Mediterranean, whence the goods were carried by Phœnician and later by Greek traders to all parts of the Mediterranean Sea. In view of the heavy costs of transport, the goods which were so traded were of the richer sort—spices, silk, embroideries, fine linens, and the finer manufactures of the metals—sword blades, gold and silver utensils, and precious stones. To the difficulty of transporting the goods was added the difficulty of protecting them, which again forbade the commerce with bulkier commodities, whose size would be an embarrassment. Protected by the power of Imperial Rome, this commerce extended as far as India and

China, while Egypt was the granary of the Imperial city.

But with the break up of the Roman power commerce declined. Constantinople, indeed, maintained its relations with the East, and at a later period the Arabs, who controlled the southern Mediterranean from Egypt to Spain and had a firm footing in Sicily, carried on a considerable trade. But the Roman civilization on the Rhine, in Britain, and in Gaul, which had brought those countries into close connection with the Oriental world, had been destroyed, while Goths and Lombards subjected Italy to a ruder civilization than it had heretofore known. It was, however, in the Italian peninsula that commerce first arose in the Middle Ages. Venice, Genoa, Pisa, and Florence took up the trade between the East and the West, which in classic times had been in the hands of Greeks and Phœnicians. They claimed rights of trade in their settlements at Constantinople first with the Byzantine Empire and later, when Constantinople was taken by the Turks, with the Ottoman Empire. They opened trade with the Moslem monarchies of the Levant and through Egypt reached the trade of India and east Asia. These pretensions were supported by the naval power of the state, which protected the ships of its merchants. They carried the produce of the East and of Italy through the Strait of Gibraltar to Flanders and the Hanseatic towns. At the outset of this new development of maritime commerce it was harassed by pirates, but the strong hand of Venice put down this nefarious practice in the Mediterranean Sea, as the Hanseatic League crushed the Danish sea robbers.

With the advent of the Turks in Asia Minor and the final conquest of Constantinople, the old paths to the East were closed and the supremacy of the Italian states was doomed. New paths were sought to the East—Vasco da Gama discovered the passage to India around the Cape of Good Hope, and in a like quest Columbus revealed to Europe the Western Hemisphere. Portugal, Spain, Holland, England, in turn, succeeded to the commercial leadership. Commerce with these distant lands was not made free to all, but given over to the great commercial companies, of which the East India companies of Great Britain and Holland were the most conspicuous for their enduring results, the Mississippi Company in France and the South Sea Company in England most famous for their spectacular failure.

Of the various restrictions upon and encouragements to foreign trade, which little more than a century ago were so generally in vogue, prohibitive import duties, export duties, and export bounties, one only is of far-reaching significance to-day—duties upon imports. For the various questions to which they gave rise in their modern aspects, see COMMERCE; CUSTOMS DUTIES; FREE TRADE; PROTECTION; TARIFF; MERCANTILISM.

Consult: Adam Smith, *Wealth of Nations* (2 vols., Edinburgh, 1776; ed. by Edwin Cannan, 2 vols., London, 1904); J. S. Mill, *Principles of Political Economy* (2 vols., ib., 1848; ed. by Ashley, ib., 1909); J. E. Cairns, *Some Leading Principles in Political Economy Newly Expounded* (New York, 1900); C. F. Bastable, *Theory of International Trade* (4th ed., ib., 1903). The subject of international trade is discussed in all textbooks of economics, for a bibliography of which see POLITICAL ECONOMY.

INTERNATIONAL WORKINGMEN'S ASSOCIATION, often spoken of as **THE INTERNATIONAL**. An attempt to unite workingmen of all nations into an organization which should have for its purpose the protection, the coöperation, and the complete emancipation of the working classes. It was an international movement in harmony with the growing feeling of solidarity and common interests which was centralizing the national unions during the latter half of the nineteenth century. The founding of the International Workingmen's Association was occasioned by a visit of French workingmen to the International Exhibit in London in 1862. They came in contact with English trade unionists, recognized their common interests, and as a result a meeting of workingmen of all nations was held in London, Sept. 28, 1864. A provisional committee was appointed to draw up a constitution, which was drafted by Marx after Mazzini's ideas had failed to meet with approval. A general council with headquarters in London was appointed. Sixty delegates were present at the first congress in Geneva, in September, 1866, where an eight-hour day was approved and a system of education discussed. At Lausanne in 1867 Socialistic principles were first adopted, with the result that its English adherents, whose ideal was trade unionism, withdrew from the movement. At the third and most important congress at Brussels in 1868 the congress announced itself opposed to war, advocated a general strike in case of war, and declared itself in favor of state ownership of mines, land, and transportation facilities. Bakunin and other anarchists joined the fourth congress at Basel in 1869. In that year the Social Democratic party was founded in Germany, representing in politics the principles of the International. The Franco-Prussian War prevented the meeting of the fifth congress at Paris. In 1872 at The Hague congress the anarchists were expelled, and the general council removed to New York. A last congress, representing chiefly the anarchistic wing of the party, was held at Geneva in 1873. For some years this faction carried on a fiery agitation in the south of Europe, but with the death of Bakunin in 1876 it disintegrated, its members becoming the anarchistic Communists of to-day. The Marxist wing developed in other countries, as well as in Germany, into Social Democratic parties. Branches of both factions were formed in the United States, but were never firmly established. In the American movement the anarchistic faction showed the greater strength. This faction broke up into two rival associations, the International Working People's Association and the International Workmen's Association, the latter representing the more radical principles. While it existed, the International aided strikes of bronze workers in Paris (1867) and builders in Geneva (1868) and supported English trade unionists in their opposition to the importation of cheap labor. A number of journals were devoted to its cause.

Kelly, *Twentieth Century Socialism* (ib., 1910).

INTERNMENT OF VESSELS. See **INTERNATIONAL LAW**, **NEUTRAL STATES DURING WAR**.

IN'TERNODE (Lat. *internodium*, space between knots, from *inter*, between + *nodus*, knot). In botany, the portion of stem between two successive nodes (joints). It is the internodes which give length to the stem and stretch the nodes apart. Among the Pteridophytes the differentiation of the stem into nodes and internodes appears in the Equisetales (q.v.), while it is a feature of all seed plants. This differentiation means the restriction to the nodes of the power of producing lateral members. This gives to nodes a power which is not generally appreciated. The lateral members usually produced are leaves and branches, but if a node is placed in proper relation to the soil it will produce roots also. This means that the power to produce new plants is lodged in the node, and therefore a node is a reproductive structure. The significance of internodes, therefore, is a contributory one, merely spacing the nodes apart, so as to give the lateral members freedom for work and development. See **STEM**.

INTEROCEANIC SHIP RAILWAY. See **SHIP RAILWAY**.

IN'TERPAR/LIAMEN'TARY UNION FOR IN'TERNA'TIONAL AR'BITRA'TION.

An association of members of the supreme legislative bodies of the world, organized to promote the peaceful settlement of disputes between nations. It grew out of a parliamentary conference held in Paris in 1888. The first regular meeting took place at Paris in 1889. Since that year meetings have been held annually at various cities in Europe and America, excepting in years when, on account of international conflicts, as the Spanish-American and the Russo-Japanese wars, such meetings would have been unlikely to be productive of any results.

Any member of a national parliament or congress is eligible to membership; and a person once chosen a member of the union may retain his membership in that body after his membership in the parliament or congress has terminated. Until 1897 the United States sent no representative to the conference; in recent years, however, the American group in the union has taken a prominent part in its deliberations. It is one of the aims of the union to include in its membership a majority of the members of every national parliament or congress.

The business of the association at each regular meeting is under the general direction of a committee consisting of two delegates from each country. There is also a permanent executive committee which conducts the business of the association when the union is not in session.

At the meeting in 1894 the union declared in favor of a permanent court for international arbitration, and a committee was appointed to elaborate a project to this end. At the meeting in Brussels in 1895 the project of the committee was adopted, and it was then presented by the members of the union to their respective governments. Upon this project The Hague Tribunal, in its main outlines, is based. At the meeting of the union at St. Louis in 1904 resolutions were adopted urging the President of the United States to propose to the Powers the convening of a second peace conference at The Hague, to consider (1) the questions deferred by the first Hague Conference to a later date; (2) the negotiation of permanent arbitration treaties between the various powers; (3) the advisability

of establishing a permanent international congress of nations for the purpose of defining the rules of international law. In accordance with the suggestion of the union, the President directed the State Department to address a circular letter, proposing a second peace conference, to the governments signatory to The Hague Convention. At the meeting of the union in Brussels, 1905, the American group proposed the drafting of a model arbitration treaty, to be submitted to the Powers, and a commission was appointed to report on the project. At the meeting of the international council of the union in London in 1906 the form of such a treaty was adopted, amended, at the suggestion of W. J. Bryan, so as to provide that, in case there should arise between nations any disagreement not included in those which under the treaty must be submitted to arbitration, no resort to hostilities shall be had until the parties to the disputes shall have invited the formation of an international commission of inquiry or mediation.

IN'TERPELLA'TION. A method of European legislative procedure, whereby members of the legislature interrogate the ministers in regard to the policy and measures of the government. Its primary purpose is to force the chamber to pass judgment upon the policy of the cabinet. This form of interrogating the ministry occupies an important place in the parliamentary procedure of France and Italy and is also occasionally resorted to in other continental countries of Europe which have a purely parliamentary form of government. Any member of Parliament is free to bring forward an interpellation without regard to the wishes of the ministry. The legislative body fixes the day on which the ministry are to be interpellated on a given subject. The ministers then prepare their answers and make ready for a defense of their policy against the expected attack. Any member may reply to a minister, and a general debate may follow, as well as motions which may result in the resignation of the ministry. In France, of about 20 ministries which have resigned in consequence of an adverse vote in the Chamber of Deputies, 10 have done so on account of motions growing out of interpellations. Interpellations arouse more general interest than the debates on important measures, and one of the chief sources of a minister's strength is his skill in answering them. Ministers are not, however, obliged to answer interpellations when such an answer might prove prejudicial to the public interest, as in the case of diplomatic negotiations. It often happens that the ministry is glad to be interpellated, as a full disclosure of the government's policy may strengthen its position in the estimation of the chambers.

In Italy the method of interpellation exists in substantially the same form as in France. The rules of the Imperial German Reichstag also provide for interpellations; but since the Chancellor, to whom they are in theory addressed, has no seat in the Reichstag and never resigns on account of legislative disapproval, the interpellation is of little significance in German parliamentary procedure.

IN'TERPLEAD'ER. An equitable remedy, available to a person from whom two or more persons claim the same thing, debt, or duty, and who is reasonably in doubt as to which is the rightful claimant. The process was first employed by the courts of common law in England

to enable a depositary or bailee of a deed in escrow of whom the grantor and grantee each demanded delivery of the deed (one affirming and the other denying that the conditions of the escrow had been complied with) when sued by either to apply to the court for an order compelling the other claimant to appear and be substituted as defendant in his stead.

It was in the Court of Chancery, however, that the process was developed to cover claims of every nature, where the demands were identical. It became the practice to permit one who was harassed by two claimants demanding the same thing, debt, or duty, to file a bill in equity setting forth the facts and praying that the parties be compelled to interplead, i.e., to contest their claims before the court between themselves, and that the court decree which of them was justly entitled to the matter in controversy. This was permitted irrespective of whether actions had been commenced against the debtor or holder of the property or not. In this form the remedy exists in modern practice. The pleading by which the complainant brings the matter before the court must set forth the following facts: (1) that two or more persons make a claim against him; (2) that they claim the same thing, debt, or duty; (3) that he has no beneficial interest in the thing or obligation claimed; and (4) that he cannot determine without hazard to himself which is the rightful claimant. He must also show by affidavit that he is not in collusion with either party and must allege his willingness to perform his obligation to the proper party. He must therefore be entirely indifferent as to which claimant succeeds—in other words, be in the position of a stakeholder. Very abstruse questions of law often arise as to whether the parties are demanding the performance of the same obligation. For example, if a landlord and a person claiming title from an entirely different and independent source, both demand rent from a tenant, he cannot compel them to interplead, as he is under a duty to his landlord not to dispute his title. However, if a person claims to have derived his title from or through the landlord by purchase or otherwise and both demand rent, the tenant has grounds for relief, as they demand the same obligation, and he does not thereby dispute his landlord's original title.

The relief will not be granted where it appears that the applicant knows or should know which of the claims is just; but if there is a reasonable doubt, and if, with the means of knowledge at his command, he would be running a personal risk to decide between them, it is the settled practice to allow the remedy. See EQUITY; PLEADING; and consult the authorities there cited.

INTER'POLA'TION (Lat. *interpolatio*, from *interpolare*, to alter, from *interpolis*, *interpolus*, altered, from *inter*, between + *polire*, to polish). In mathematics, the process of finding terms intermediate between given terms of a series. From the law of the series the values of the intermediate terms may be computed, but it is often sufficient for practical purposes to approximate the intermediate terms by assuming a simpler relation. For example, given $\log 80 = 1.9030$, and $\log 90 = 1.9542$, the logarithm of 85 is approximately obtained by adding to 1.9031 one-half of the difference between 1.9542 and 1.9031, although the logarithms are in arithmetic progression only when the numbers are in

geometric progression. The method of interpolation is not only of use in pure analysis, but it is particularly valuable in problems of astronomy and other sciences, often saving laborious calculation. Thus, the position of the moon for any hour may be determined by interpolation from its computed positions for every 3, 6, or 12 hours, with sufficient accuracy for practical purposes. Methods of interpolation for astronomical problems are found in Lagrange's memoirs of 1783, 1792, 1793. Consult: H. L. Rice, *Theory and Practice of Interpolation* (Lynn, Mass., 1901); C. L. Doolittle, *Treatise on Political Astronomy as Applied to Geodesy and Navigation* (4th ed., New York, 1903); Otto Biermann, *Vorlesungen über Mathematische Näherungsmethoden* (Brunswick, 1905).

INTERPRETATION (Lat. *interpretatio*, explanation, from *interpretari*, to explain, from *interpres*, agent, interpreter), or **CONSTRUCTION**. The process of ascertaining, subject to the rules of law, the meaning of a speaker or a writer, or of parties to a legal instrument, as expressed in its spoken or written terms. Some authorities distinguish construction from interpretation; using the latter term to describe the process of finding out the true sense of any form of words, and applying the former to the process of ascertaining the legal effect of those words. According to these authorities, "the office of interpretation is analytic, that of construction is synthetic; the office of the one is to get at facts, that of the other to group these facts and determine their legal meaning; interpretation is exploration, construction is induction." Or, to put the distinction in another way, interpretation gives us the grammatical and logical signification of the words and sentences under consideration; while construction gives us their legal effect by "the familiar judicial process of applying the law to the facts of the case." In practice, however, the two terms are usually employed in the same sense, as denoting the process of ascertaining the true import of a document having legal consequences. Interpretation, as a separate branch of law, has its origin in the imperfections of language and the limitations of human understanding. How imperfectly and even bunglingly the average man expresses himself, not only in hurried memoranda, but in formal documents as well, is evidenced by the vast number of lawsuits brought to settle the meaning of such documents.

The legal process of interpretation is required, not only because of confused thinking and the careless use of language on the part of speakers and writers, but because of the frequent misapprehensions of hearers or readers, due to mental limitations. If a writing has legal consequences; e.g., if it is a constitution, or treaty, or statute, a will, a deed, or a contract, or if it contains an attack upon reputation or a right of property, provision is needed and has been made for determining which of various interpretations shall prevail. Speaking generally, that determination rests with a court of justice, in a legal action in which the written or spoken words are properly brought before it. If the form of words whose meaning is in doubt is a public writing, such as a provision of a statute, a treaty, or a constitution, the question of construction belongs exclusively to the judge. If it is a private writing, such as a contract, will, or deed, having peculiar expressions in it which have, in particular places or trades, a known

meaning attached to them, it is for the jury to say what the meaning of those expressions is; but it is still the function of the court to construe the instrument after the jury has determined the true meaning of such peculiar expressions. This legal rule is due in part to the fact that in olden times jurors were frequently unable to read or write, but in part also, and perhaps more largely, to considerations of policy. A learned English judge once declared that unless this rule was followed "there would be no certainty in the law; for a misconstruction by the court is the proper subject, by means of a bill of exceptions, of redress in a court of errors; but a misconstruction by the jury cannot be set right at all effectually." While the construction of a writing is ordinarily for the judge and not for the jury, libel cases form an exception to the rule. Whether a particular writing is such an attack upon reputation as to amount to a libel is for the jury to decide. In other words, the jury, and not the court, construe a writing which is alleged to be defamatory. Such at least is the doctrine at present followed in England in all cases of defamation, and in the United States in all criminal prosecutions for libel.

It is to be borne in mind that the object of interpretation is not to discover the intention of parties to a transaction by the use of any and every legitimate means. Its purpose is much more restricted. The problem for the interpreter is this: given certain language in which persons have professed to state their intention in a particular matter, what is the intention thus stated? It may be that the parties have used language so carelessly that it fails to express any definite intention. In such a case interpretation is fruitless. It must stop short of accomplishing its object for want of materials. "All latitude of construction," said Chief Baron Eyre in an oft-quoted decision, "must submit to this restriction; namely, *that the words may bear the sense which by construction is put upon them. If we step beyond this law, we no longer construe men's deeds, but make deeds for them.*" It is not the office of interpretation, then, to add anything to the text of a writing. Its function is only to discover and set forth what is in it. But a question arises at this point, upon which the authorities are not entirely in accord: What is to be deemed within and what without the text? It is sometimes said that judges and writers in answering this question range themselves in two schools of interpreters—a liberal and a literal school. The former declare that everything is in the text which a mind fully informed as to the circumstances in which the writing was made, "and doing no violence to the rules of language and the rules of construction, may reasonably find there." The latter insist upon limiting interpretation to the meaning of the text itself. Perhaps no better statement of the prevailing view on this point has been made than the following: "Interpretation is a process of reasoning from probabilities, a process of remedying by a sort of equitable jurisdiction the imperfections of human language and powers of using language, a process whose limits are necessarily indefinite, and yet continually requiring to be practically determined. It is not a mere operation requiring the use of grammar and dictionaries, a mere inquiry into the meaning of words."

So far as legal interpretation does make use of the rules of grammar and the laws of language, it does not differ from the process employed by every educated and intelligent listener or reader when engaged in discovering the meaning of a speaker or writer. But when this simple process does not suffice, the courts proceed under rules which have been laid down in the long course of judicial interpretation. Some of these rules owe their existence to peculiarities of legal procedure; but most of them have been evolved by the courts with a view to producing greater uniformity in the terms of legal writings, or to lessening and shortening litigation, or to securing consistency in the judicial process of construction.

The more important of these rules are as follows: 1. When the language of a writing is plain and unequivocal, there is no occasion for interpretation. Even though the court may believe that the language employed does not express the intent of the writer, it will not force upon words a meaning which they cannot fairly bear. When words admit of but one meaning, to put another upon them is not to construe a writing, but to alter it. In case of a statute it is not to interpret a law, but to make one. 2. The grammatical and ordinary sense of words is to be adhered to, unless that would lead to some absurdity, or some repugnance or inconsistency with the rest of the instrument, in which case the grammatical and ordinary sense of the words must be modified so far as may be necessary to avoid that absurdity or inconsistency but no further. Eminent English judges have called this the golden rule of construction. It is a corollary from this rule that when it appears, either from the instrument itself or from the circumstances attending its origin, that certain words are used in an abnormal or peculiar or technical sense, they shall be interpreted in such sense. 3. In construing any part of a writing regard should be had to the entire instrument. Other portions may throw much light upon the one under special investigation and greatly modify the meaning which it would bear as an independent clause. Every part of a writing should be brought into action in order to collect from the whole one uniform and consistent purpose, if that is possible. Accordingly, if one construction will give reasonable effect to every part of an instrument, while another would require the rejection of a part, the former will be preferred. 4. In the case of private writings, such as contracts and deeds, the language is to be construed most strongly against the party who is responsible for its use. Of course, this applies only to cases of ambiguity either in the words themselves or in their legal effect. Even then it will be applied only when other rules of construction fail, for it is deemed somewhat harsh and rigorous. 5. As between constructions otherwise equally balanced, preference is to be given to that which renders the instrument most fair and just and reasonable. 6. In construing doubtful language, the court is entitled to consider all the circumstances connected with the origin of the instrument. Proof of these circumstances is not excluded by any rule of evidence (q.v.). It is not offered to contradict or vary an instrument, but to put the court as nearly as possible in the place of the parties at the time they agreed upon this language as the formal expression of their intentions. 7. The construction put upon an ambigu-

ous instrument by the acts of the parties is entitled to great weight.

The literature of the subject is extensive.

Bibliography. The best theoretical treatment of the subject is found in F. V. Hawkins, *Principles of Legal Interpretation* (London, 1860); Lieber, *Legal and Political Hermeneutics* (ed. by Hammond, St. Louis, 1880); J. B. Thayer, *Preliminary Treatise on Evidence* (Boston, 1898). Among the latest and most valuable practical treatises are the following: Wigram and O'Hara, *Interpretation of Wills* (New York, 1872); Theodore Sedgwick, *Statutory and Constitutional Law* (ib., 1874); F. V. Hawkins, *Interpretation of Wills* (Philadelphia, 1885); L. A. Jones, *Construction of Commercial and Trade Contracts* (New York, 1886); Elphinstone, Norton and Clark, *Rules for the Interpretation of Deeds* (Philadelphia, 1889); J. G. Sutherland, *Statutes and Statutory Construction* (Chicago, 1891); Henry Harcastle, *Rules which Govern the Construction and Effect of Statutory Law* (London, 1900); Sir P. B. Maxwell, *Interpretation of Statutes* (4th ed., Toronto, 1905); Edward Beal, *Cardinal Rules of Legal Interpretation* (Boston, 1908); H. C. Black, *Handbook on the Construction and Interpretation of Laws* (2d ed., St. Paul, 1911).

INTERPRETER, MR. A character in Bunyan's *Pilgrim's Progress*, typifying the Holy Spirit.

INTERRACIAL MARRIAGE. See CROSS BREEDING IN MAN.

INTERREGNUM (Lat., period between reigns), THE GREAT. The name given to the period of German history between the death of Conrad IV, in 1254, and the election of Rudolph of Hapsburg, in 1273. It is often called the age of "first law" (*Faustrecht*). During this time Germany had no ruler who was generally recognized. William of Holland had been elected as an antiking, in 1247, by the opponents of Frederick II (q.v.). After Conrad's death William, with the aid of the confederation of Rhenish cities, succeeded in restoring order in a portion of Germany. His death, in 1256, led to greater confusion. Some of the electors, in 1257, chose Richard of Cornwall, the brother of Henry III of England; the other electors chose Alfonso X of Castile. Richard spent but little time in Germany; Alfonso never visited it. Neither one acquired any real power, and neither was crowned Emperor at Rome. When Richard died, in 1272, Alfonso's claims were set aside by common consent, and the Pope ordered the electors to proceed to a new election. This resulted (1273) in the choice of Rudolph. One of his first acts was to annul all laws passed by the rival kings since the death of Frederick II, in 1250. For this reason the Great Interregnum is sometimes made to include the years between 1250 and 1273. Consult Kempf, *Geschichte des deutschen Reiches während des grossen Interregnums* (Würzburg, 1893).

INTERROGATORIES (from Lat. *interrogatorius*, consisting of questions, from *interrogare*, to question, from *inter*, between + *rogare*, to ask). Questions in writing prepared for the examination of one or more witnesses in a judicial proceeding, to be taken out of court.

In the English and American law interrogatories are commonly employed in the following classes of cases: where the testimony of an aged or infirm witness is to be taken before trial, in order that it may be available in case of his

death; where a witness is out of the jurisdiction, and it is desirable to obtain his testimony or deposition, as it is called; and in connection with a bill of discovery (q.v.) in equity. In the first two classes of cases the practice is for the counsel desiring the testimony to obtain an order, or commission, from the court, directing that the examination be taken before some officer competent to administer an oath, and then to prepare his interrogatories and submit them to the opposite party or his counsel, who may prepare cross-interrogatories. In some jurisdictions the legal competency of the questions is settled by the court before the examination, and in others the objections of counsel are noted at the time of the examination and ruled upon at the trial. The commission and the interrogatories are then forwarded to the designated officer, who summons the witnesses on the day fixed, administers the oath, propounds the questions, reduces the answers to writing and transmits them, together with the order and interrogatories, to the court out of which the commission issued. Such examinations are subject to all the rules of evidence. The answers so reported to the court constitute, when read on the trial, legitimate evidence admissible under a recognized exception to the "hearsay rule."

Interrogatories are sometimes annexed to a libel (q.v.) in an action in admiralty, but this is not common practice. See DEPOSITION; EVIDENCE; HEARSAY.

IN'TERSTATE' COM'MERCE. A phrase designating commercial transactions between persons in different States of the United States. The absence of power to secure uniformity in commercial regulations was a source of weakness in the Articles of Confederation and was one of the causes of the adoption of the Constitution. Power is conferred upon Congress by the Constitution (Art. I, Sec. 8, cl. 3) "to regulate commerce with foreign nations and among the several states and with the Indian tribes." It was early held by the Supreme Court in the case of *Gibbons v. Ogden* (9 Wheaton, 1) in which Chief Justice Marshall elaborately discusses the clause, that the subject of congressional action is not limited to regulating traffic, the mere buying and selling or interchange of commodities, but that it comprehends also the means of transportation, and that therefore acts of the New York Legislature granting to Robert R. Livingston and Robert Fulton the exclusive right of navigating the waters of that State with steamboats were void. Congress may exercise control over highways, railroads, and navigable waters whenever they form avenues for commerce not wholly within a single State. This authority extends to rivers wholly within a single State, if such river together with other bodies of water forms a continuous route for commerce to other States or to foreign countries. That the United States has such an interest in these highways that it may secure an injunction to prevent the obstruction thereof was held *In re Debs* (158 U. S. Reports, 564), decided by the Supreme Court in 1894. Congress has power to authorize or regulate the erection of wharves, piers, and bridges, and while, in the absence of congressional action, the States may also make similar local regulations, the authority of Congress is paramount. Congress may make provision as to the means of transportation in regulating the building, equipment, and registration of vessels, their transfer by sale or mort-

gage, and in prescribing rules for navigation and the qualifications of pilots and engineers. Similarly, in the case of transportation by land between States, Congress may legislate as to the management of railway trains and the duties of employees thereon. By virtue of this power the Safety Act of 1893 was enacted, requiring the use of automatic couplers and continuous brakes upon railroads engaged in interstate commerce.

The carriage of passengers as well as of goods is held to be within the meaning of the clause, so that Congress may provide regulations for the security of passengers. Even the transmission of interstate messages by telegraph or telephone comes under the national authority.

Congress has no right to interfere with commerce carried on wholly within a State or with the manufacture of goods to be sold and consumed wholly within the State of manufacture. The statutory provisions enacted in 1906 for the federal inspection of animals before slaughtering, and of meat and meat products and the establishments in which meat and meat products are prepared, and for the destruction of such meat as is unsound or unfit for human food, are confined to establishments where the products are to be used in interstate or foreign commerce.

Congress cannot regulate contracts which merely relate to commerce. For this reason it has been held by the Supreme Court that fire, marine, and life insurance do not fall within the scope of interstate commerce, and this is a chief obstacle to the proposed federal control of insurance. It has been questioned whether the power to regulate commerce includes the power to prohibit it. The constitutionality of the Embargo Act of 1807, prohibiting all commerce with Great Britain and France, was sustained by the lower courts but never authoritatively passed upon by the Supreme Court. This court, however, decided in 1903 in the *Lottery Case* (188 U. S. Reports, 321) that lottery tickets are objects of commerce and that their transportation could be prohibited. Four out of nine justices of the court dissented from this decision.

The Sherman Anti-Trust Act, passed in 1890, is an important enactment under the commerce clause. It provides: "Every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade or commerce among the several States, or with foreign nations, is hereby declared to be illegal." While a combination relating merely to manufacture has been held not to be within the scope of this act, the statute is applicable where there are provisions in the agreement to destroy competition or enhance the price of articles upon sale between the States. An important decision under this statute is that of the *Northern Securities Company v. The United States* (193 U. S. Reports, 197), in which it was held in 1903 by a nearly evenly divided court that a combination of stockholders of the Great Northern and Northern Pacific Railway Companies, to form the Northern Securities Company as a holding corporation to own the majority of the stock of the two railroad companies, was an illegal combination in restraint of interstate commerce. For later judicial interpretations of this statute and for recent amendments, see TRUSTS.

For the provisions of the Interstate Commerce Act of 1887, as amended in 1906 by what is popularly known as the Railway Rate Bill, providing for the fixing by the Interstate Com-

merce Commission of rates for the transportation of persons or property, see RAILWAYS.

Congress is restricted in its power by being forbidden to lay any tax or duty on articles exported from any State (Constitution, Art. I, Sec. 10, cl. 5) and also by the provision that "no preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another; nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another" (Art. I, Sec. 9, cl. 5).

The power of Congress is exclusive of that of the several States wherever the matter regulated is of a national character or admits of or requires a uniform system of regulation, and in the absence of legislation it is to be presumed that Congress intended the common law to remain unchanged so that any State statutes on such subjects will be held void. A State cannot prohibit the exportation or importation of any article of commerce or the delivery within the State of such an article purchased without the State, nor can it impose a tax on the subject of sale of interstate commerce. A State cannot impose a tax upon immigrants, nor can a tax be imposed on a railroad upon freight brought within a State, nor can it levy a tax upon the gross receipts from the business of transportation with other States, for this is in effect a tax upon interstate commerce. It was held by the Supreme Court that the State of Iowa could not prohibit the sale of intoxicating liquors by an importer so long as such liquors remained in the original package and had not been mingled with the mass of property within the State. To counteract the effect of this decision the Wilson Act of 1890 was passed by Congress, providing that intoxicating liquors transported into any State shall upon arrival be subject to the laws of such State, enacted in the exercise of its police powers in the same manner as domestic liquors. Similar statutes have been enacted by Congress to render effective State laws as to game and oleomargarine. Consult: Cooley, *Principles of Constitutional Law* (Boston, 1898); Prentice, *The Federal Power over Carriers and Corporations* (New York, 1907); Interstate Commerce Commission, *The Act to Regulate Commerce (as Amended) and Supplementary Acts thereto* (Washington, 1911); Judson, *The Law of Interstate Commerce* (2d ed., Chicago, 1912).

INTERSTATE COMMERCE ACT. See RAILWAYS.

INTERSTATE COMMERCE COMMISSION. See RAILWAYS.

INTERVAL (Lat. *intervallum*, interval, from *inter*, between + *vallum*, wall). In music, the difference of pitch between any two sounds, or the distance on the stave from one note to another, in opposition to unison, which is two sounds exactly of the same pitch. From the nature of our system of musical notation, which is on five lines and the four intervening spaces, and from the notes of the scale being named by the first seven letters of the alphabet, with repetitions in every octave, it follows that there can be only six different intervals in the natural diatonic scale until the octave of the unison be attained. To reckon from C upward, we find the following intervals: C to D is a second; C to E is a third; C to F is a fourth; C to G, a fifth; C to A, a sixth; C to B, a seventh; and from C to C is the octave, or the beginning of a similar series. Intervals above the octave are

therefore merely a repetition of those an octave lower. A flat or a sharp placed before either of the notes of an interval does not alter the name of the interval, although it affects its quality; e.g., from C to G# is still a fifth, notwithstanding that the G is raised a semitone by the sharp. Intervals are classified as perfect, major, and minor. Perfect intervals are those which admit of no change whatever without destroying their consonance; these are the unison, fourth, fifth, and the octave. Intervals which admit of being raised or lowered a semitone are distinguished by the term *major* or *minor*, according as the distance between the notes of the interval is large or small. Such intervals are the third and sixth; e.g., from C to E is a major third, the consonance being in the proportion of 5 to 4; when the E is lowered a semitone by a flat, the interval is still consonant, but in the proportion of 6 to 5, and is called a minor third. The same description applies to the interval of the sixth from C to A and from C to Ab. The second and seventh are also distinguished as major and minor. If the upper tone of a major, or perfect, interval be raised, or the lower tone lowered a semitone, the interval becomes augmented; thus, c-e# or cb-e. By lowering the upper or raising the lower tone of a minor, or perfect, interval by a semitone, a diminished interval results; thus, c-bbb or c#-bb. Intervals are further distinguished as consonant and dissonant. Consonant intervals are those which can enter into the formation of a major or minor triad. They are the perfect unison, fourth, fifth, and octave and major and minor thirds and sixths. Thus, c, e, g, c' (1, 3, 5, 8) and c, f, a, c' (1, 4, 6, 8) are the tonic triads of C and F major respectively; whereas, with the third and sixth (e, a) flattened, they are the tonic triads of C and F minor respectively. Dissonant intervals are the major and minor seventh and all augmented and diminished intervals. Whenever they enter into a chord, that chord is a dissonance and requires resolution into consonance. The distinction between consonant and dissonant intervals is made according to the ratio of the number of vibrations between any interval and the fundamental tone.

(a) CONSONANT INTERVALS	(b) DISSONANT INTERVALS
Unison.....1:1	Major second.....8:9
Fourth.....3:4	Minor second.....15:16
Fifth.....2:3	Augm. second.....64:75
Octave.....1:2	Major seventh.....8:15
Major third.....4:5	Minor seventh.....5:9
Minor third.....5:6	Dimin. seventh.....75:128
Major sixth.....3:5	Augm. third.....512:675
Minor sixth.....5:8	Dimin. fourth.....25:32
	Augm. fourth.....18:25
	Dimin. fifth.....25:36
	Augm. fifth.....16:25

Consonant intervals satisfy the ear because of their simple ratios; dissonances give a feeling of unrest and desire for resolution because of their complex ratios. The mathematical relations of intervals are determined as follows: given the normal a', which is produced by a string vibrating 870 times per second (see DIAPASON), the octave above is produced by shortening the string by half its length. The number of vibrations will then be doubled, or 1740. This establishes the ratio between the prime and octave of 1 : 2. A string producing e" vibrates 1305 times. Thus, the ratio between

prime and fifth is as 780: 1305, or as 2: 3. The preceding table shows the ratios of the different intervals.

As the length of the vibrating string is in inverse ratio to the number of vibrations, the ratios of the above table need only be inverted to determine the length of the string for any given interval. See HARMONY; MUSIC.

IN'TERVEN'TION (Lat. *interventio*, interposition, a coming between, from *intervenire*, to come between, from *inter*, between + *venire*, to come). 1. In municipal law, an act or proceeding by which a person not originally a party to an action is admitted as such for the protection of a right or interest in the subject matter of the litigation, which will be materially affected by its determination. It has always been a well-established right under the civil law and was early introduced into the English procedure. In a few of the United States the right is confined to actions involving real or personal property, but in most jurisdictions no such limitation exists. A person may be thus admitted as a party plaintiff or defendant, by application to the court before the cause has proceeded to trial. See PLEADING; PARTIES.

2. In international law, the interference of one state in the affairs of another for the purpose of preventing injury to itself, or in behalf of some principle, person, or collection of persons. Intervention may assume several forms. Thus, it may be by verbal note delivered to the ambassador of the country against which the grievance exists; it may be by official notes publicly declared; it may take the form of an international congress or conference; or, finally, it may result in armed interference. It is the last form which is generally understood when reference is made to acts of intervention. Notable instances of intervention have been the invasion of Holland by the Prussians in 1787 to restore to his old position the Stadholder, who was a brother-in-law of the Prussian King; the interference of the Holy Alliance to thwart liberal movements and restore absolutism in Spain, Naples, Sicily, and Piedmont in the early part of the nineteenth century; the interference of Austria and Prussia in behalf of Louis XVI of France in 1791; and the intervention of France in Rome in 1849 to restore the temporal power of the Pope.

No general rule can be laid down to determine when intervention is justifiable. It is well settled that it is excusable as a measure of self-preservation. Thus, in Europe the policy of interference in behalf of the balance of power has been quite common. Any European state may be restrained from pursuing plans of acquisition of territory. Europe is regarded as a confederacy of states, and the balance of power is the guarantee of national existence against the designs of the more powerful states. This principle is not violated by territorial aggrandizements so long as the safety and liberty of neighboring states are not endangered. Notable instances of intervention under this head were that against Louis XIV to prevent him from seating his grandson on the throne of Spain; the coalitions against Napoleon; the interposition of the four Powers in 1840 in favor of the Sultan against Mehmet Ali of Egypt; and that of France and England in 1854 to preserve the integrity of the Turkish dominions against the designs of Russia. Concerted action or intervention by the Great Powers of Europe is some-

times resorted to in order to prevent a smaller state from following a particular line of conduct or to compel it to do a certain act. An instance of this form of intervention was the formal recognition of the independence of Belgium by the five Great Powers in 1830, when that country emancipated itself from Holland. With the development of modern civilization, humanitarian motives are often appealed to as a justification for interference where cruelty is inflicted by despotism or religious intolerance. Such cases must be carefully scrutinized, for the danger always exists that they may cover ambitious projects for territorial aggrandizement. But interventions on the ground of humanity have under exceptional circumstances certainly a moral if not a legal justification. Such was the intervention of Great Britain, France, and Russia in 1827, by which Greece was liberated from Turkey, and again in the interposition of the Great Powers in 1860 to stop the persecution and massacre of Christians of the Lebanon. The most important recent instance of intervention is that of the United States in Cuba in 1898, which may be referred in part to humanitarian feelings aroused by the cruelties attending the insurrectionary struggle against Spanish authority, in part to the destruction of American property, and the menace to American interests resulting from the possible acquisition of the island by another foreign power. See INTERNATIONAL LAW, and the authorities there referred to.

INTES'TACY (from Lat. *intestatus*, having made no will, from *in-*, not + *testari*, to make a will, from *testis*, witness). The condition resulting from one's dying with property undisposed of by last will and testament. By the present law of England and the United States there is no restriction upon the right of testamentary disposition. This has not always been the case, however, the right of disposing of one's property by will without restriction being a comparatively late acquisition in the evolution of society. Indeed, in Scotland, Louisiana, Quebec, and other States whose legal systems are based on that of the civil law, the power of testation is still limited by the right of children of the testator or other natural objects of his bounty to take by inheritance a certain definite share of his estate. See INOFFICIOUS TESTAMENT.

Intestacy may be complete, as where a person leaving property dies without leaving a valid will; or it may be partial, where a will does not dispose of the entire estate of the testator, either intentionally or through the lapse of a legacy, or the illegality of a specific devise. In either event the property undisposed of passes by the operation of the laws of descent (q.v.) and distribution (q.v.) to the heirs or next of kin of the decedent. See HEIR; INHERITANCE; TESTAMENT; WILL.

INTES'TINAL STA'SIS. See STASIS, INTESTINAL.

INTES'TINE (Lat. *intestinum*, neut. sing. of *intestinus*, internal, from *intus*, within, from *in*, in). The part of the digestive tract between the stomach and the anus. The small intestine includes the duodenum, the jejunum, and the ileum, and averages 22 feet, 6 inches in the male, 23 feet, 4 inches in the female. With the exception of the duodenum, the small intestine lies in general in the central part of the abdominal cavity, bounded by the large intestine on either side and above. The jejunum and

ileum are connected to the posterior abdominal wall by a reflection of the peritoneum, called the mesentery. The duodenum is about 10 inches long, 1½ to 2 inches in diameter, and curved like a horseshoe. The head of the pancreas is received into the curve. It is the part of the intestine which is continuous with the stomach at its pyloric extremity. The jejunum is described under its title. The jejunum and ileum vary much in the arrangement of their coils and there is little regularity in their position beyond that already stated. The term "ileum" is applied to the last three-fifths of the small gut. It ends at the ileocæcal valve, through which the contents of the small intestine escape into the head of the colon. The small intestine has four coats: serous or peritoneal, muscular, areolar or submucous, and mucous. The last is covered with minute prolongations called villi, and lined with columnar epithelium. There are few valvulæ conniventes, or folds of mucous membrane, in the ileum. Solitary glands alone or in aggregations (called Peyer's patches) are found in the lower part of the ileum. These are largely obliterated in typhoid fever.

The large intestine is divided into the cæcum; the ascending, transverse, and descending colon; the sigmoid flexure; and the rectum. It is so placed as to encircle the small intestine. The cæcum lies in the hollow of the right iliac region. From this point the colon rises to the liver, then crosses the abdominal cavity to the opposite side, passing below the stomach to the spleen; then, making a sharp turn, it descends to the left iliac fossa, where it forms a loop termed the sigmoid flexure (from its resembling the old Greek letter sigma); and finally, now termed the rectum, curves back to the head of the sacrum, thence curves backward to the anus. Attached to the cæcum, generally back of it, is a small, short, blind tube, about 3 to 4 inches long, opening into the gut, and termed the vermiform appendix (q.v.). The subdivisions of the large intestine are treated under their own titles. The constant motion of the intestine (peristalsis), by which its contents are conveyed along, is due to the contractions of the muscular fibres of the gut. See DIGESTION.

HISTOLOGY

The wall of the intestine is composed of four distinct coats, which from without inward are known as (1) the serous coat, (2) the muscular coat, (3) the submucous coat, and (4) the mucous coat or mucous membrane. These coats

SECTION OF SMALL INTESTINE OF A CAT.

a, mucous coat; b, submucous coat; c, muscular coat; d, d, Peyer's patch, cut crosswise.

present certain differences in structure in the two main divisions of the intestine, the small intestine and the large intestine.

The Small Intestine. The serous coat of the small intestine consists of a single layer of

epithelium or endothelium (forming the peritoneal surface) resting upon a thin layer of delicate connective tissue. Beneath this lies the muscular coat composed of (a) an outer portion in which the smooth muscles are disposed longitudinally to the long axis of the intestines and consequently known as the longitudinal muscular coat, and (b) an inner or circular coat in which the muscle cells are disposed transversely to the axis of the intestines. The two layers of muscle are separated by more or less connective tissue. The submucous coat consists of loosely arranged bundles of fibrous and elastic connective tissue, with a rich plexus of blood vessels, lymphatics, and nerves. Through the submucous coat are distributed, at varying intervals, circumscribed masses of lymphoid tissue or lymph nodules. These may occur singly (solitary glands, or follicles), lying in both submucosa and mucosa, and may even project

Longitudinal section of human small intestines, showing general relation of the folds constituting the valvulæ conniventes to the mucosa and submucous coat. The latter constitutes the fibrous core over which the mucosa with its villi and glands extends.

slightly from the free surface of the mucous membrane. Or else, instead of a single nodule, there may be a collection of nodules forming what is known as Peyer's patches, which are found mainly in the ileum. Usually from 20 to 30 nodules constitute a patch. Like the solitary nodules, they lie in both submucosa and mucosa and often project upward to the free surface of the intestine. Finally, the mucous membrane of the small intestine is thrown up into transverse or oblique folds, which involve also the submucous coat, and which are known as the valvulæ conniventes. In addition to this the mucous membrane over the valvulæ is studded with minute projections known as villi, which are characteristic of the small intestine. The mucous membrane consists of three coats, the epithelial coat, the stroma, and the muscularis mucosæ. The epithelial coat is composed of a single layer of columnar epithelium, which covers the surface of the mucous membrane. Distributed at intervals among the columnar epithelial cells are clear, transparent cells which, on account of their shape, are called goblet cells, or, because of their secretion, mucous cells. The epithelium rests upon a basement membrane, beneath which lies the stroma. The latter is composed of delicate connective tissue and more or less diffuse lymphoid tissue. It extends up into the villi and supports the vessels, nerves, and glandular structures. From the bottom of the depressions between the villi, glands extend down into the stroma. These are tubular glands, called the crypts of Lieberkühn, and extend down almost

slightly from the free surface of the mucous membrane. Or else, instead of a single nodule, there may be a collection of nodules forming what is known as Peyer's patches, which are found mainly in the ileum. Usually from 20 to 30 nodules constitute a patch. Like the solitary nodules, they lie in both submucosa and mucosa and often project upward to the free surface of the intestine. Finally, the mucous membrane of the small intestine is thrown up into transverse or oblique folds, which involve also the submucous coat, and which are known as the valvulæ conniventes. In addition to this the mucous membrane over the valvulæ is studded with minute projections known as villi, which are characteristic of the small intestine. The mucous membrane consists of three coats, the epithelial coat, the stroma, and the muscularis mucosæ. The epithelial coat is composed of a single layer of columnar epithelium, which covers the surface of the mucous membrane. Distributed at intervals among the columnar epithelial cells are clear, transparent cells which, on account of their shape, are called goblet cells, or, because of their secretion, mucous cells. The epithelium rests upon a basement membrane, beneath which lies the stroma. The latter is composed of delicate connective tissue and more or less diffuse lymphoid tissue. It extends up into the villi and supports the vessels, nerves, and glandular structures. From the bottom of the depressions between the villi, glands extend down into the stroma. These are tubular glands, called the crypts of Lieberkühn, and extend down almost

to the muscularis mucosæ. The glandular epithelium is columnar in type, lower than that on the surface of the mucous membrane, with which it is directly continuous. Numerous goblet cells are distributed among the columnar cells. In one portion of the small intestine much more elaborate glands are found. They are situated

Simple tubular glands of large intestines of dog; the epithelial elements lining the follicles have become very largely converted into goblet cells.

in the duodenum and are known as the glands of Brunner. They are compound tubular glands, whose acini are situated in the submucosa and whose ducts pass up between the crypts of Lieberkühn and empty between the villi. The muscularis mucosæ is the innermost layer of the mucous membrane. It is composed of smooth muscle cells, whose long axes correspond mainly to the long axis of the intestine. At certain points a more or less complete internal circular layer is present. See BRUNNER'S GLANDS.

Blood Vessels, Lymphatics, and Nerves. The larger arterial trunks pierce the serous and muscular coats, in which they give off branches, and form a rich network in the submucosa. From this network smaller branches are given off, which form a capillary anastomosis throughout the mucous membrane, extending up into the villi. From the capillaries arise veins which empty into the venous plexus of the submucosa, from which larger venous trunks pass outward, accompanying the arteries. The lymphatic system of the intestine is very extensive. Beginning as blind canals in the villi, the lymphatics pass downward to form a plexus in the deeper layers of the mucosa and in the submucosa. From this plexus larger lymphatic vessels pass outward to the mesenteric lymph glands. The nerves of the intestine are mainly nonmedullated fibres from the abdominal plexus of the sympathetic. Between the two muscular layers the nerve fibres form a rich plexus, known as the plexus of Auerbach. From this plexus fibres extend to the submucosa, where a second plexus, called the plexus of Meissner, is formed. In both plexuses microscopic groups of ganglion cells are found.

The Large Intestine. This differs from the small intestine in several important particulars. The mucous membrane is entirely devoid of villi, and its glands, which are of the simple tubular variety, open upon the surface of the mucosa. In the cæcum and colon the internal muscular coat is thinner than in the small intestine, and the external longitudinal muscle, instead of completely surrounding the gut, as in the small intestine, is collected into three flat bands. As these bands are shorter than the other layers which make up the intestinal wall, they are responsible for the sacculation which is so characteristic of the large intestine. In the rectum the serous coat is replaced by a fibrous coat, and towards the anus the circular muscular coat becomes thickened and is composed of voluntary muscle, forming the internal and sphincter muscle. Solitary lymph nodes occur throughout the large intestine. The collections of nodes known as Peyer's patches are, however, usually confined to the small intestine. The distribution of

blood vessels, lymphatics, and nerves is similar to that in the small intestine. See ALIMENTARY SYSTEM.

INTI, ēn'tê. The deified sun, worshiped by the Incas of Peru.

INTIM'IDA'TION (from ML. *intimidare*, to intimidate, from Lat. *in*, in + *timidus*, afraid, from *timere*, to fear). Literally, the act of putting one in fear. In law, specifically, the use of this means for the purpose of inducing a person to enter into an obligation or to pay money or to do or refrain from doing some other act. In general the act induced by intimidation may be repudiated, and any money paid or other property parted with under its influence may be recovered in a quasi-contract action. But such a contract or other transaction is not wholly void, but only voidable at the election of the intimidated party.

In England it is a statutory offense punishable as a crime to intimidate a person with a view to compel him to abstain from an act which he has a legal right to do, or to do an act which he has a legal right to abstain from doing. Intimidation is not, save in exceptional cases, an excuse for committing a crime.

To constitute intimidation the duress employed must consist in actual violence or unlawful imprisonment, or in threats of violence calculated to cause fear of life or bodily injury to the intimidated person or his or her husband or wife or child, or in threats of criminal proceedings.

With respect to the more subtle forms of coercion sometimes employed in trade and labor disputes—such as the boycott, strikes, and the like—there is often grave question whether they amount to unlawful intimidation or not. When the acts complained of as constituting intimidation are unlawful in themselves, regardless of the question of their coercive effect, there is no difference of opinion in the cases in holding that such acts, when they reasonably result in coercing a person from the exercise of his legal freedom of conduct, constitute unlawful intimidation; as where actual physical violence is threatened and overt acts are done in pursuance of the threat.

Where, however, the acts complained of result in intimidation because of the number of persons by whom they are done in concert or in accordance with a common plan of so affecting the business or affairs of plaintiff, but would be harmless or ineffectual without such combination, the decisions are at variance. For example, the courts are not agreed as to what is and what is not legal picketing, as it is called; as to the legality of notice posted in the meeting rooms of trade-unions affecting the standing of particular employers; as to the legality of stigmatizing a shop as a scab shop; of the manner that may be used in requesting other workmen to quit work; of notifying employers that they have nonunion men who must be discharged to prevent a strike; of the fining of members to compel them to strike, etc. Formerly the law was unjust in its discrimination against the performance of these acts by combinations of workmen or others, but these rules have been much modified both by statute and judicial decisions. Generally speaking, the courts of the United States and of some States, as Massachusetts and New Jersey, adhere more closely to the spirit of the old common-law rule than is done in some of the other States, as

New York and Illinois, where the effort of organized labor has been more effective in modifying it. The most general question that remains unsettled is as to whether it is lawful for a body of men to do in unison or in pursuit of a common purpose any act which it would be lawful for each member of the body to perform as an individual, or whether such acts so performed may under the given conditions amount to a conspiracy. Consult, for a statement of the latest development of the subject in Great Britain, the case of *Allen v. Flood, House of Lords Cases* (London), and, in the United States, *The National Protective Association v. Cummings, New York Court of Appeals Reports* (New York, 1902); *Beattie v. Coleman, New York Supreme Court Reports* (ib., 1903); Groat, *Attitude of American Courts in Labor Cases* (ib., 1911); Laidler, *Boycotts and the Labor Struggle* (ib., 1914). See CONSPIRACY; DURESS; TORT; STRIKES AND LOCKOUTS; BOYCOTTING; PICKETING.

INTINE, in'tin or in'tên (from Lat. *intus*, within). The inner and more delicate layer of wall of an aërial spore. The outer and heavier one is called the exine. The intine is also sometimes called the endospore, in which case the exine is called the exospore. In some cases, especially among water plants, a third spore coat is developed, and is called the perinium. This is a very conspicuous coat in the spores of *Equisetum* (q.v.). When the spore of an *Equisetum* matures, this perinium unwinds, as though it were composed of two spiral bands, thus exposing the exine or ordinary outer spore coat. See SPORE; EXINE.

INTONA'TION (from ML. *intonare*, to sing according to tones, from Lat. *in*, in + *tonus*, Gk. *τόνος*, *tonos*, tone; connected with Lat. *tendere*, Gk. *τείνειν*, *teinein*, Skt. *tan*, to stretch). In music, the production of tone either by an instrument or by the voice. It is of no importance in keyed instruments like the piano or organ, as the performer can strike only the proper key and is powerless if the instrument is not in tune. But the matter of intonation is of utmost importance in the voice and all string and wind instruments. Only a person having a finely trained ear is able to produce proper intonation. Hence we speak of pure and false intonation. In plain chant music the term denotes the opening phrase sung alone by the precentor (the celebrant of the mass), as *Gloria in exelsis Deo, Credo in unum Deum*.

INTOXICATING LIQUORS. All liquors which may reasonably be used as beverages and which contain enough alcohol to produce entire or partial intoxication if drunk in ordinary quantities. An exact definition of this term is important under all excise and prohibition statutes, but as many palatable mixtures containing alcohol are sold in evasion of such laws, no definite enumeration of such liquors is possible. The statutes of many States are broad enough to cover all preparations or compounds containing alcohol when they come within the above definition.

The courts in most jurisdictions will take judicial notice of the intoxicating character and effect of the well-known liquors, such as gin, whisky, brandy, etc., but will require proof of the intoxicating qualities of mixtures containing alcohol, such as cordials or the various commercial, or proprietary, tonics. An interesting discussion of the subject will be found in the

"Intoxicating Liquor Cases," reported in 25 Kansas Rep. p. 751. The law deals with intoxicating liquors in three ways: (1) by regulating and restricting the manufacture and sale thereof as a measure of public policy; (2) by imposing excise taxes and license fees for its manufacture and sale; and (3) by statutory protection of its purity. See EXCISE; LIQUOR TRAFFIC; LICENSE; PROHIBITION.

INTOXICA'TION (ML. *intoxicatio*, from *intoxicare*, to poison, from Lat. *in*, in + *toxicum*, from Gk. *τοξικόν*, *toxikon*, poison, originally that poison in which arrows were dipped, from *τοξικός*, *toxikos*, relating to a bow, from *τόξον*, *toxon*, bow). In medicine, poisoning by any agent; colloquially, a condition of impaired will and undermined control resulting from drinking alcoholic beverages. Intoxication is as correctly used of serious disturbance of mental and physical equilibrium by the use of opium, chloral, belladonna, cannabis indica, or by the ingestion of lead, as of the poisoning resulting from the use of liquor. Alcoholic intoxication may be acute, subacute, or chronic. Acute intoxication follows drinking a considerable quantity of liquor at once. Profound insensibility follows speedily, with stertorous breathing, purplish face, frothing at the mouth, weak pulse, and increasing coma. An active purge, such as croton oil, put on the root of the tongue or introduced into the rectum, together with hypodermic injections of strychnine, both used after the employment of the stomach pump, may be efficacious and save life. This form of intoxication is rarely seen. The subacute form is the usual drunkenness, of mild or serious type. It is the form observed in those who drink alcoholic beverages for the exhilaration they feel, or in those who drink till they are stupefied. Slight intoxication causes increased activity of the circulation and of nervous and mental processes, as well as in most cases derangement of the digestive apparatus. Heavy drinking results in delirium, staggering (due to cerebellar disturbance), loss of muscular power, and finally stupor. Vomiting, depression, and tremor appear when the person awakes or becomes conscious. An emetic, a cathartic, and a Turkish bath often rouse an intoxicated person when becoming drowsy, and prevent the occurrence of the coma which threatens. But after repeated indulgences these measures fail. Ammonia and strychnine are both very serviceable in treating the conditions existing after the patient is aroused from his unconsciousness. Habitual intoxication results in delirium tremens in some cases. (See DELIRIUM.) In others it leads to alcoholic insanity. (See INSANITY.) Serious organic diseases result from the use of alcohol, such as general neuritis, cirrhosis of the liver, cirrhosis of the kidneys with secondary heart disease, and arteriosclerosis, all of which are discussed under their proper titles. The will becomes undermined, judgment becomes impaired, and the idea of moral responsibility becomes diminished or lost. Intoxication from wood alcohol, often used as an adulterant of alcoholic drinks and patent medicines, is apt to produce blindness and frequently death.

Inebriety. This is the diseased mental condition resulting from the use of alcohol. There may have been an underlying neurasthenia, which has led the patient to seek some agent which will remove his weakness and lack of endurance. Repeated recourse to alcoholic stim-

ulation frequently results in inebriety in such a case. Heredity plays a prominent rôle in the causation of inebriety. Inebriety or insanity is found in the ancestry of about half the cases. Race has a certain influence. Denmark and Belgium suffer from the greatest amount of inebriety in the continental countries; Russia and Germany come next, and France, Sweden, Austria, and Switzerland follow. The Anglo-Saxon seems very susceptible to the disease. The Italian is singularly free from it, and the Spaniard has nearly as good a record. The Jewish people present an example of general freedom from inebriety wherever they are found. A hot, moist climate favors inebriety by reducing general nervous resistance. Exposure and occupation have also an evident influence. The mortality from alcoholism is stated by Norman Kerr to be 40,000 annually in Great Britain. He quotes Lankester as saying that one-tenth of the entire mortality in Great Britain is due to alcoholism.

Medicolegal Aspect. The tendency to commit crime is much greater in inebriates than in others, because of the weakening of the will and the lessened moral sense. It is held that intoxication is no excuse for commission of crime, and the criminal who remembers nothing of his acts committed while under alcoholic influence must pay the penalty due to his offenses. Consult: Kerr, *Inebriety* (Philadelphia, 1894); J. S. Billings, *Physiological Aspects of the Liquor Problem* (2 vols., Boston, 1903); B. G. Cutten, *Psychology of Alcoholism* (New York, 1907); H. S. Williams, *Alcohol, and how it Affects the Individual* (ib., 1909); J. W. A. Cooper, *Pathological Inebriety* (ib., 1913); F. Hare, *Alcoholism: Its Clinical Aspects and Treatment* (Philadelphia, 1913). See ALCOHOL, PHARMACOLOGY, TOXICOLOGY, AND THERAPEUTIC USE; ALCOHOLISM, and the authorities referred to thereunder; DIPSOMANIA.

INTRA, ên'trà. A manufacturing town in the Province of Novara, Italy, on Lago Maggiore (q.v.), between the mouths of the San Bernardino and San Giovanni rivers (Map: Italy, B 2). It has a school of trade and industry; manufactures, with its water power, cotton goods, hats, lumber, leather, and machinery. On its outskirts are many beautiful villas overlooking Lago Maggiore. Pop., 1901, 6902; 1911, 8036.

IN'TRAMERCU'RIAL PLANET. See VULCAN.

INTRANSIGEANTS, ân'trän'sê'zhän' (Sp. *intransigente*, uncompromising, from Lat. *in-*, not + *transigere*, to make a settlement, from *trans*, across + *agere*, to act). A term applied in European politics during the last half century to any ultraradical element. In Spain the name was given to a party of Red Republicans and Socialists who, after the declaration of the Republic in 1873, attempted to divide up the country into cantons and to introduce a communistic régime. They held Carthage for six months against the government, but were put down by the dictator Castelar and General Dominguez. The term had been used in France before this at the time of the Commune. *L'Intransigeant* is a newspaper established in Paris by Henri Rochefort (q.v.), the famous Radical politician.

INTRENCHED CAMPS. See FORTIFICATION.

INTRENCH'MENT (from *intrench*, from

in- + *trench*, from OF. *trencher*, *trancher*, Fr. *trancher*, to cut, from Lat. *truncare*, to lop, from *truncus*, trunk, from *truncus*, OLat. *truncus*, maimed). Any form of constructive defense work by which soldiers strengthen a position or fortify it against an enemy. See FORTIFICATION; TRENCH, MILITARY.

INTRODUCED SPECIES. Animals and plants brought into a country from a foreign land by the agency of man. In the settlement of North America from the Old World scores of species of plants, mostly noxious weeds, and hundreds of species of animals, largely parasitic or destructive to agriculture, have been introduced. Among plants, chicory, wild garlic, and the water hyacinth of Florida are examples of the great spread of introduced species. Domesticated animals may escape from captivity and become noxious. The wild pigs of our Southern States and the Galapagos Islands are examples. Goats have become wild in many places and have wrought great destruction. Thus the island of St. Helena, which is now a barren rocky desert, was formerly clad with forests. The change has been brought about in four centuries by goats. Cats that have become wild on islands have in many cases exterminated species of birds there. Rats and mice, in some cases previously imported from Asia, have been introduced into America from Europe and have spread everywhere, exterminating native species and conquering one another.

The European rabbit was introduced into Australia in 1864 for sporting purposes. By 1879 legislatures were enacting laws for its destruction, and recently an important industry has arisen in rabbit skins and canned rabbit meat. The setting free of Belgian hares in America is attended with dangers. (See RABBIT.) The mongoose of India was introduced into Jamaica in 1872 to rid the island of rats, whose depredations caused an annual loss of \$500,000. In 1882 the mongoose had caused such a diminution in the rats that the annual loss from rats was reckoned at about one-half the former amount; but the mongoose multiplied, and domestic animals and barnyard fowls were destroyed by it in vast numbers; next native vertebrates fell a prey, also bananas and other fruits. About 1890 the mongoose became recognized as the worst pest of the island and as doing vastly more harm than good. Of late years, however, the depredations of the animal have begun to diminish. (See MONGOOSE.) Other examples of imported animals which have wrought untold damage might be cited at great length. The English sparrow, the cabbage butterfly, the Hessian fly, the gypsy moth (in Massachusetts) are familiar examples elsewhere described in detail. The reason why introduced animals thrive to so extraordinarily a degree is because they are removed from their natural enemies, and those that might keep them down have not learned to do so. Usually, in time, enemies are acquired, as they have been by the English sparrow, and thus the balance in nature is restored. Consult Palmer, "The Danger of Introducing Noxious Animals and Birds," in *Year Book of Department of Agriculture* (Washington, 1898). See ACCLIMATIZATION; ISOLATION.

IN'TRODUC'TION (Lat. *introductio*, a leading in, from *introducere*, to lead in, from *intro*, within + *ducere*, to lead). In instrumental music, a shorter movement preceding the composition proper. According to the character and

length of the composition the introduction may be shorter or longer. In a polonaise, waltz, etc., the introduction generally consists of only a few bars. In works written in sonata form the introduction can assume great dimensions, as in Beethoven's *Second* and *Seventh Symphonies*. The thematic material upon which the introduction is built may be entirely original and independent of any themes in the following principal movement, as in the case of the two Beethoven symphonies. Then again the introduction may be constructed upon themes of the movement proper, as in the case of Schumann's *First Symphony*. As the introduction is invariably in a slow tempo, the themes of the allegro appear almost invariably in augmentation when used in the introduction. But it is by no means obligatory to begin every longer composition with an introduction. Of Beethoven's symphonies the third, fifth, sixth, eighth, and ninth begin without any introduction.

In dramatic music the term "introduction" has several meanings. In the older operas, which were divided into *numbers*, the introduction was the second number. It followed the overture and generally was a short instrumental passage leading into the opening chorus. But even Gluck sometimes united the overture with the introduction. Some operas have no overture, but only an introduction of greater or less extent. Such works as Verdi's *Otello* or *Falstaff* have, properly speaking, not even an introduction. Beginning with *Lohengrin*, Wagner abandoned the form of the overture and substituted an introduction which he usually calls "Vorspiel" (q.v.), although in *Tristan und Isolde* he employs the term "Einleitung." Besides the principal introduction at the beginning of his dramatic works, Wagner generally opens every act with an introduction of some length.

INTRO'IT (Lat. *introitus*, entrance). An antiphon sung or said at the beginning of the mass, varying with the season or festival. After the antiphon proper comes a verse from the Psalms, followed (except in requiem masses and in *Passiontide*) by the Gloria Patri and the repetition of the antiphon. By the Vatican Gradual of 1908 it is to be sung during the procession from the sacristy to the altar, and then read from the missal by the celebrant. The opening words of the introit are commonly used in ecclesiastical terminology to designate the proper mass of the day, and certain Sundays are even popularly known in the same way, as *Gaudete*, *Lætare*, *Quasimodo* Sunday, etc. This practice is very usual in mediæval documents and authors.

INTROMIS'SION (ML. *intromissio*, from Lat. *intromittere*, to send within, from *intro*, within + *mittere*, to send). In Scots law, the assumption of legal authority to deal with another's property. It is divided into legal and vicious intromission. Legal intromission is where the party is expressly or impliedly authorized, either by judgment or deed, to assume the management and control of another person's estate. Vicious intromission is where a person without legal authority interferes with a deceased person's estate, as by assuming to act as heir or as executor of a will. Such acts constitute a usurpation, but have a certain qualified validity and cannot be impeached collaterally. They correspond to the acts of an executor *de son tort* of English and American law. See EXECUTOR.

INTROSPEC'TION (from Lat. *introspicere*, to look within, from *intro*, within + *spicere*, *specere*, to look; connected with Gk. *σκέπτεσθαι*, *skeptesthai*, Skt. *spás*, *paś*, to look, OHG. *spehōn*, Ger. *spähen*, to spy). The specific method of psychology, as observation or inspection is the specific method of physical science; also termed SELF-OBSERVATION or "INNER PERCEPTION." The three names are characteristic of three different attitudes towards the study of mental phenomena, which we may term the rationalistic, the empirical, and the experimental. (1) Kant declared that a science of mind is impossible, for the reason, among others, that the method of psychology is impracticable: self-observation implies a change of the very facts which we desire to observe. If self-observation were, literally, the method of psychology, Kant's objection would be valid: there could be no ascertainment of mental uniformities, no science of mind; the more attentive the observer and the more systematic his use of the method, the scantier would be his harvest of facts; speculation would have free play. Hence the empirical school (2) substituted for self-observation the method—or, rather, the unmethodical employment—of inner perception (*innere Wahrnehmung*). Observation is planned and prepared for; perception, the noting of events and conditions as they appear, is a matter of happy accident. Now inner states and processes can be perceived or noted as well as outer; there is no self-contradiction involved in the phrase "inner perception"; but, at the same time, the loss of the plan and system implied by the term "observation" is a serious handicap to a science and must lead to inadequacy both of description and of theory. We find, accordingly, that the introspection or inner perception of the empirical psychologists has no claim to rank as a true scientific method. It makes the cardinal mistake of considering merely the most obvious aspect of mind—its cognitive function; it views mental processes always through the glass of meaning, of logical import; it tells us what mental events stand for, but not what they are. We should gain little knowledge of the anatomy of our bodies by a superficial cataloguing of the bodily functions as they are apparent in the occurrences of everyday life; indeed, we might go sadly astray in our attempt to translate function into the unknown language of structure. The same thing holds of mind as interpreted by the method of inner perception. (a) In the first place the method leads to an overemphasis of what James has called the "substantive" factors in the stream of thought and to an underemphasis of the "transitive" parts. We read of images and ideas and representations, but the "fringes" of these psychical entities, the elusive and yet essential processes which Spencer (still in logical terms) has denominated "feelings of relation," are left entirely out of account. The result of this error is that mind is pictured as if composed of discrete and sharply separable terms (the "sensations" or "ideas" which correspond to the simplest "bits of knowledge"), instead of being presented as what it really is, a shifting continuum, a tangle of ever-moving and ever-changing processes. (b) A second mistake to which inner perception is liable is that which has been called par excellence the "psychologist's fallacy." The psychologist is tempted to read himself, his own knowledge and attitude, into the mental process or group of mental processes

which he is considering. Instead of taking the mental stuff as it is, in the incompleteness and abstractness which are conditioned upon its detachment from context, he rounds it off and supplements it by his outside knowledge of this context. He is thus tempted into a twofold error. On the one hand—misled by the poverty of language, which ordinarily names a perception or idea by naming the object to which it refers, no matter what the mode or character of this reference may be—he is easily brought “to suppose that the thought, which is of the object, knows it in the same way in which he knows it, although this is often very far from being the case.” On the other hand, since he is himself familiar with all the relations in which the given mental process stands, he is apt to read an awareness of these relations into the process; he makes the process conscious of itself as he is conscious of it. The result is that we are furnished not with a description, but with a logical construction of mind; while, as there is no appeal from the logical construction to the facts, empirical psychology is full of quasi-logical controversies, that are not only long drawn out, but are in the nature of things incapable of psychological termination.

(3) We arrive at introspection proper only when we reach the point at which the experimental method is introduced into psychology. (See PSYCHOLOGY, EXPERIMENTAL.) This does not mean that there was no valid introspection before there was experiment; men are often better than their methods. Nor does it mean that all the results of experimental research are the fruits of an unimpeachable introspection; methods may be better than the men who use them. It means that, with the advent of experimental control, psychology was able to combine the attitude of inner perception with the plan and system of self-observation, and that this science thus acquired a method which is as accurate and reliable in principle as are the methods of the physical sciences. Experiment enables us so to regulate external conditions that a determinate mental occurrence may be induced at a determinate moment of time; it enables us, further, to prevent any modification of consciousness save by the occurrence under investigation. Given a state of concentrated attention (q.v.) on the part of the observer, the requisite degree of practice, and an adequate command of language wherewith to report the experience (see DISCRIMINATION, SENSIBLE), and there is no reason why a psychological introspection may not be as exact as an observation in chemistry or physics. The sole difference between inspection and introspection lies, in fact, in the determination (see DETERMINING TENDENCY) of the observer. And since, with practice, the psychological determination becomes habitual and unconscious, introspection need not itself be a mental process; so that there is no ground for the Kantian objection that it alters the process to be observed, as there is none either for the objection that introspection must always be retrospection, and is therefore exposed to the illusions of memory. Feeling (q.v.), it is true, appears to offer special difficulties to introspection, since it cannot be made the direct object of attention. But recent work has shown that, under the determination to report upon feeling, we may give attention to the sensory aspect of the situation, and that the feelings aroused will then touch off relevant reports.

Titchener, *Text-Book of Psychology* (ib., 1910); Otto Klemm, *History of Psychology* (ib., 1914); *American Journal of Psychology*, vol. xxiii (Worcester, 1912). See SOCIAL PSYCHOLOGY.

INTRU'SION (ML. *intrusio*, from Lat. *intrudere*, to thrust in, from *in*, in + *trudere*, to thrust; connected with OChurch Slav. *truzdati*, to torment, and probably with Goth. *priartan*, AS. *þrēotan*, OHG. *-driozan*, Ger. *-driessen*, to vex). In English law, an unlawful entry upon a freehold estate, not at the time in the actual seisin of the rightful owner, and with the view of ousting him of his estate. It could be effected in the interval between the death of a tenant in fee and the actual entry of the heir, or between the death of a tenant for life and the entry of the remainderman. Though not technically classed as a disseisin (q.v.), it had similar effects, vesting the seisin and title in the intruder. The usual remedy for an intrusion was by a writ of entry. The distinction between the several kinds of ouster (q.v.), dependent upon the time or manner in which it was effected, has generally been abolished in England and the United States, and the whole subject comprehended under the description of adverse possession and disseisin. In Scots law the term is employed in a looser sense to describe a trespass upon lands. See ADVERSE POSSESSION; DISSEISIN.

IN'TUBA'TION. The passage of a tube into the larynx between the vocal cords to keep the air passages open in cases of diphtheria, stricture, or other obstruction. The tubes used are those invented by Dr. Joseph O'Dwyer in 1883 and are made in graduated sizes for children of different ages. They are from 1½ to 3 inches long, with a flattened upper extremity to prevent slipping down beyond the larynx, an accident which is further guarded against by the fusiform shape of the tube. A special instrument is employed to introduce the tubes, and another similar device, an extractor, is used to withdraw them. The child is held during the procedure either in the upright or recumbent position. See TRACHEOTOMY.

IN'TUI'TION. See INSTINCT.

IN'TUI'TIONISM, or **IN'TUI'TIONALISM** (from *intuition*, from ML. *intuitio*, immediate cognition, from Lat. *intueri*, to look at, from *in*, in + *tueri*, to look). The name of the theory that our knowledge of at least some fundamental principles, whether of metaphysics or of ethics, is due to the fact that they present themselves to us as true in their own right and therefore need no proof of any sort. The view supposes that we have certain faculties for the immediate apprehension of these principles: we merely have to look at the statement of these principles to see that they are true; thus, our intellect is supposed immediately to apprehend the truth that two and two are four, and our conscience the truth that theft is wrong, or that action prompted by benevolence is better than action prompted by sensual appetites. In

ethics intuitionism is also used to designate the view that not only general principles are immediately apprehended, but the rightness or wrongness of each particular act. These views fail to recognize the fact that an unreasoned assurance of a truth may be the psychological outcome of forgotten processes of reasoning. See INDUCTION; KNOWLEDGE, THEORY OF.

IN'TUSSUSCEP'TION (from Lat. *intus*, within + *susceptio*, a taking up, from *suscipere*, to take up, from *sub*, under + *capere*, to take), or INVAGINATION OF THE INTESTINES. A displacement of a portion of the intestine into the part immediately below, just as the finger of a glove may be partly drawn within itself when the hand is withdrawn. This is a common form of intestinal obstruction occurring most frequently in infants and young children. The exciting *cause* is usually some irritant bringing about irregular and exaggerated intestinal peristalsis. Injudicious diet, the careless use of cathartics, and the presence of intestinal polyps are the common causative factors. The *pathological conditions* present are the invagination mentioned above, and more or less inflammation in the affected part of the intestine. The commonest site of the lesion is at the junction of the small and the large intestines. The involved portion of the intestine may measure anywhere from a few inches to as many feet. Unless promptly treated, death usually results in a short time from gangrene of the intestine, perforation, and general peritonitis. In adults the invaginated portion of the intestine may become gangrenous, separated, and passed per rectum. Such a termination is frequently followed by the formation of a contracting scar, resulting in a chronic form of obstruction. The symptoms are: violent abdominal pain, rather sudden in its onset; vomiting of stomach contents and of biliary and fecal matter; abdominal distention; the passage of bloody mucous per rectum; collapse; normal or subnormal temperature. Palpation reveals the presence of a tumor, described as "sausage-shaped"; by rectal examination the invaginated gut may in some cases be felt with the finger, or it may even protrude through the anal orifice. The *treatment* is purely surgical and should be prompt. A laparotomy is performed and the intestinal displacement corrected. The prognosis is not at all bad in cases operated on early. In neglected cases the disease is almost invariably fatal.

INTUSSUSCEPTION. A term applied by plant physiologists to that type of growth in which the new particles are laid down between the old particles that compose the cells or cell organs. It is used as the counterpart to growth by "apposition," in which the new particles are laid down on the outside of the growing structure. The first type was once supposed to distinguish growth in the organism from increment of nonliving bodies, but the distinction lacks validity. Growth of the starch grain or the cell wall in thickness is largely by apposition, while intussusception seems to play an important part in the growth of the protoplasm and of cell walls in area.

INULASE. See DIGESTION IN PLANTS.

IN'ULIN. A group of polysaccharides, displacing starch as important storage materials in the underground organs of many Compositæ, Campanulaceæ, and representatives of several other families of plants. It is especially abundant in *Inula helenium*, *Helianthus tuberosus*,

Anacyclus officinarum, *Arctium lappa*, and other species. Inulin forms a white powder similar in appearance to starch, but differing from it in certain important respects. It exists in cells as colloidal solutions, readily transformed to spherocrystals by the addition of absolute alcohol or glycerin. Upon hydrolysis by inulase or acid it produces *d*-levulose. It stains brown with iodine.

IN'UNDA'TION (Lat. *inundatio*, from *inundare*, to overflow, from *in*, in + *undare*, to rise in waves, from *unda*, wave; connected with OHG. *undea*, *unda*, AS. *ȳþ*, wave). Many large areas of low ground near rivers or the ocean are in danger of inundation from various causes. Of these inundations the most common, and probably also the most destructive, are the river floods that result from unusual rains or melting snows. Most rivers are subjected to rising and falling by these causes, and those that flow through flood plains or deltas may rise and overflow the bordering plains. The best-known instance of such river flooding is supplied by the Nile, which makes possible the existence of millions of people on the Nile oasis in the broad African desert. The rising of the waters begins in June in the lower Nile, the accumulation having taken weeks to flow down the river channel from the upper waters. It continues till September, and at Cairo, the water reaches a height of 25 feet above the normal river level. A vast tract of flood plain and delta is inundated, and this water makes agriculture possible in the desert and is the basis upon which the ancient Egyptian agriculture was founded. The sediment deposited by the floods fertilizes the land and is raising the level of the flood plain at a rate of over four inches a century.

The Mississippi also supplies an illustration of great river floods. An area of 30,000 square miles, inhabited by 1,000,000 people, is liable to floods. Low natural embankments, built by the floods and called natural levees, keep the river in its channel, excepting during very high water; and levees added by man are built from the Gulf to Cairo in the effort to hold the extraordinary floods. But even these artificial levees are sometimes ineffective. Crevasses 50 to 500 feet wide break through the levees, and a vast area is inundated. These great floods come usually between February and May and are caused by the coincidence of heavy rains or rapidly melting snows, or both, in the Missouri, Mississippi, and Ohio valleys. During the great floods the discharge of the Mississippi reaches 2,000,000 cubic feet per second and is far in excess of the capacity of the channel. The water level then rises 40 or 50 feet, and great destruction of life and property results. Great inundations by the Mississippi are recorded in 1828, 1844, 1849, 1850, 1853, 1859, 1863, 1867, 1870, 1874, 1882, 1884, 1890, 1892, 1893, 1897, 1903, and 1912. In the flood of March and April, 1912, the water spread over an area of 15,000 square miles and inflicted damage to the extent of \$45,000,000. See MISSISSIPPI RIVER and accompanying bibliography.

The most disastrous flood that has befallen the United States occurred in the Ohio valley during the last of March and the first part of April, 1913. It was brought about by the excessive rainfall in northern Indiana and Ohio, which amounted to from 6 to 10 inches in a period of five days. The damage to property was reckoned at about \$180,000,000 and the loss of

life at 415. Dayton, Ohio, was nearly destroyed by the rush of waters.

The Hoang-ho of China flows out of its mountainous course over a low alluvial fan delta which is rapidly growing out into the sea. The town of Putai, which was on the seacoast about 2000 years ago, is now over 40 miles inland. Not only is the alluvial fan delta growing outward, but upward, and when the river bed is built up above the level of the surrounding plain the course of the stream becomes exceedingly unstable and liable to shifting in time of flood. The river then sometimes bursts through levees fully 70 feet high, erected more than half a mile from the banks. It has shifted its course nine times in 2500 years, laying waste a region as large as Great Britain. Its mouth has changed position fully 200 miles by these shiftings. In the flood of 1887, which covered an area of 50,000 square miles, densely populated, 1,000,000 people were drowned, and still more lives were lost by the famine and disease that followed the disaster. The river has been used as a weapon of war as far back as the year 1209. Hundreds of thousands of people have thus been drowned by the turning of the river floods against them. Smaller river floods are of common occurrence and are frequently caused by ice jams, which form a temporary dam and hold the water back. The bursting of the dams of artificial ponds and lakes also causes destructive floods.

Inundations of the sea are far less widespread than those of rivers, because some coasts are too high, and others are not frequently visited by high sea or "tidal waves." The great number of river lowlands and the frequency of the causes of a rise in the river water make these river floods more general than those of the sea. But where low coasts are exposed to inundations of the sea, the results are terribly destructive, especially since the lowland coasts are usually densely populated. There are various causes of inundations by the sea; the simplest are illustrated by those countries which are actually below the level of the highest tides and are protected from inundation by sand-dune hills and dikes. The Netherlands offer the best illustration. This plain is the delta of the Rhine and Meuse and is open to floods from river and ocean, and parts of it lie well below the level of the sea. At various times the dikes, which were formerly less solidly constructed than at present, have given way, and large tracts have been submerged, causing a vast destruction of life and property. For example, in 1421 a flood destroyed 72 villages, and 100,000 people perished. During the Spanish wars the people voluntarily admitted the sea to protect their cities from the attacks of the Spaniards.

Even dry land several feet above sea level is subject to inundations by the sea when there is some unusual rise in the water, commonly called a "tidal wave," doubtless because it reaches its greatest height at high tide. The lowlands of the Netherlands, Denmark, and England have suffered from such floods when high winds have driven water upon the shore and piled it up at periods of unusually high tide. At such times the surface of the sea may rise 10 or 15 feet higher than the normal reach of the high tide. The West Indies, the Gulf coast, and the coast of the Middle Atlantic States are subject to such inundations during the passage of the fierce tropical hurricanes. The flooding is experienced

even as far north as New York and Boston; and the destruction at Galveston, Sept. 8, 1900, when thousands of lives were lost, was due to the passage of one of these hurricanes. The Sea Islands on the Georgia coast are occasionally flooded during these storms, and any low point along the coast south of New York is liable to such "tidal waves" at any time, but especially in August and the autumn months, when tropical hurricanes develop most commonly. High water followed the hurricane of Sept. 3-12, 1889, all the way from the West Indies to New Jersey. The rise in the level of the ocean during the passage of these storms is due to the combination of ordinary tides with the effect of the steady violent winds which drift the water before them and pile it up on the shelving shore. As illustrated in Galveston, this wave rises over ordinarily habitable land, undermining houses, and thus aiding in the destruction done by the winds themselves and the waves which these winds raise on the surface of the sea.

Far greater destruction of life is accomplished in the Pacific than in the Atlantic by these tropical storms, there called typhoons. The sea wave washes over low coral atolls. In the case of the Samoan hurricane of March 15, 1889, a typhoon washed ashore 21 vessels that were anchored in the harbor of Apia. Some 150 of the sailors on these vessels were drowned, and only two of the ships that were in the harbor were afloat after the hurricane. Typhoon waves advance on the low delta coasts of India and southern China. There has been case after case of destruction of life to the number of many thousands in the delta lowlands of Asia; and in at least one case, in 1876, it is estimated that 150,000 people were killed by such an inundation in the delta of the Ganges and Brahmaputra.

Finally, sea waves generated by earthquake shocks may inundate coastal lands. These, again, are best illustrated on the low, densely populated coasts of Asia, where earthquake shocks are numerous. The earthquake wave, caused by a jar along the seashore or on the sea bottom, disturbs the entire sea from surface to bottom. The wave is dome-shaped, though not very high, perhaps not over an inch or two. But it is so deep and broad that, advancing over the shallowing bottom towards the shore, it grows higher and higher, perhaps reaching a height of 100 feet. The wave rushes over the land with terrible force and destructiveness. The earthquake which destroyed Lisbon in 1755 was accompanied by a prodigious tidal wave. By the earthquake wave caused in 1883 during the eruption of Krakatoa in the Strait of Sunda, a water wave was generated which rose from 50 to 80 feet, upon the neighboring lowlands, drowning thousands of people, and carrying a large vessel inland a distance of a mile and a half, leaving it stranded 30 feet above sea level. By an earthquake wave, June 15, 1896, a part of the coast of Japan was devastated for a distance of 175 miles, 27,000 lives were lost, and 60,000 people made homeless. The Messina earthquake of 1908 was accompanied by waves which reached a height of 30 feet and submerged the low-lying portions of the coasts of Sicily and Italy. See EARTHQUAKE.

IN'UUS. See MACAQUE.

INVAGINATION OF THE INTESTINES.

See INTUSSUSCEPTION.

INVALIDES, ān'vā'léd', LES (Fr., invalids).

Wounded veterans of the French army, maintained at the expense of the state. The Hôtel des Invalides is an establishment in Paris where a number of these old soldiers are quartered. The institution was founded by Louis XIV in 1670. In 1811 it was reorganized; in 1832 its property was alienated and the institution made a charge upon the annual budget. The hôtel can accommodate 6000 men, but the actual number of inmates is now much smaller. The buildings of the Invalides comprise the hôtel proper, the chapel, and the dome. The hôtel is an immense edifice of many courts and wings, grandiose in plan but commonplace in detail, the work of Levau and Bruand. A considerable part of the ground story is devoted to the unsurpassed National Museum of Artillery and an Historic Museum, chiefly military, and certain other portions to various services of the Ministry of War. Through the vast central court, entered from the Place des Invalides through a lofty portal of ineffective design, one passes to the chapel of St. Louis, by Levau and J. H. Mansart. This is a dignified but cheerless edifice, in three aisles with galleries, vaulted in stone and hung with battle flags. Mass was formerly celebrated here daily with military pomp by such of the Invalides as were able to attend. Beyond and built against it, and fronting south, is the Dome des Invalides, built by J. H. Mansart in 1693 as a royal sepulchral chapel, the finest domed edifice in France. Over the intersection of the arms of a Greek-cross plan inscribed in a square, rises the central dome, about 70 feet in diameter. This is built in three shells—an inner shell of stone with a large oculus, an intermediate shell of stone, and an outer shell of wood covered with lead, surmounted by a spirelike lantern. In 1861 the remains of Napoleon Bonaparte were transferred to the crypt of the dome (remodeled for this purpose by Isabelle and Visconti), and laid in a sarcophagus of porphyry. A circular opening in the floor of the crossing exposes the tomb to view.

IN'VALIDING (from *invalid*, Fr. *invalide*, invalid, from Lat. *invalidus*, not strong, from *in-*, not + *validus*, strong, from *valere*, to be strong). In military phraseology a soldier is said to be invalided when he is sent home from abroad, as a result of climate, wounds, or other causes rendering him unfit for duty. In the United States he would be sent to a general hospital (see HOSPITAL), where it would be decided whether he remained in the army or be returned to civil life. English soldiers are sent to Netley Hospital for similar treatment and final disposition.

INVAR, in-vâr'. An alloy of nickel, 36 per cent, and steel, with 0.2 per cent of carbon, discovered by C. E. Guillaume, of the International Bureau of Weights and Measures, near Paris, useful in instruments for exact measurement and other scientific work, on account of its low coefficient of linear expansion practically negligible for most purposes. This alloy has found application for wires and tapes used in geodesy for the measurement of base lines with a high degree of accuracy, and also in the form of bars for standards of length and for comparators and similar instruments of precision. In the United States Coast Survey invar tapes have been used since 1905 with considerable success, as they permit of the rapid and economical measurement of base lines with greater accuracy than with the steel tapes or bars previously employed. These tapes resemble nickel rather than steel in their appearance, being soft, bending easily, and being much less elastic than steel. They do not oxidize as readily, and, while their tensile strength is less than steel, it is greater than is necessary for the measurement of base lines. The coefficient of expansion per unit length per degree Centigrade, in the specimen tested by the United States Geological Survey, varied from 0.000,000,37 to 0.000,000,44 as compared with 0.000,011,4 for a steel tape of similar use. See GEODESY.

Bibliography. Consult: C. E. Guillaume, *Recherches sur le nickel et ses alliages* (Paris, 1898); id., *Les applications des aciers au nickel* (ib., 1904); O. B. French, "Six Primary Bases Measured with Steel and Invar Tapes," in *United States Coast and Geodetic Survey, Report for 1907*, Appendix No. 4 (Washington, 1908).

INVA'RIABLE PLANE. In the solar system, a plane about which the planets' orbits perpetually oscillate, deviating from it only to a very small extent on either side. This plane passes through the centre of gravity of the solar system and is so situated that if all the planets be projected on it, and if the mass of each planet be multiplied into the area which is described by the planet's projected radius vector in any assumed unit of time, the sum of such products will be a maximum. The most recent determination of the position of the invariable plane is that of See, who finds that the inclination to the ecliptic, and the longitude of the ascending node, are 1.5855° and 106.1463° (epoch 1850), respectively. Such a plane is not peculiar to the solar system, but must exist in all systems where the bodies are acted on by their mutual attraction only. Consult Grant, *History of Physical Astronomy* (London, 1852).

INVA'RIANT. See FORMS.

INVAR TAPES AND WIRES. See GEODESY; INVAR.

INVA'SION (Lat. *invasio*, attack, from *in-*, *vadere*, to invade, from *in*, in + *vadere*, to go, connected with OHG. *watan*, Ger. *waten*, AS. *wadan*, Eng. *wade*). The act of entry into an enemy's territory as an act of war. In ancient and mediæval times, when an army invaded a country, pillage, devastation, and slaughter were the rule. It was not until the War of the Spanish Succession that Marlborough and Villars, by a system of contribution, introduced comparative humanity into the conduct of armies. The Prussians and Austrians during the wars of Frederick the Great were generally dependent upon regularly levied supplies. During

the Revolutionary War the British government declared it to be a right of war: (1) to demand provisions and raise contributions, enforceable, if necessary, by the sword; (2) to ravage territory where there was no other way to bring an enemy to engagement or terms; (3) to treat all rebels as enemies. The right to ravage has not been asserted or acted upon since by either country, except in the case of the burning of the capitol and other buildings at Washington by the British in 1814, which was an unjustifiable violation of the laws of war. Napoleon enforced the principle that war must pay for war, and after the battle of Jena the exaction required of Prussia was more than 100,000,000 francs. The levy of 5,000,000,000 francs on France by Prussia at the end of the Franco-Prussian War in 1870 was the price paid to the invaders. The violation of the neutrality of Belgium by Germany in 1914 (see WAR IN EUROPE) aroused the strongest indignation all over the world and led to the entrance of Great Britain into the conflict.

The rights of an invader in the country occupied by him are important, but these rights of belligerent occupation, which are confined to the districts actually dominated by the invading force, must be carefully distinguished from those of conquest. The invaders' military rule in general supersedes the civil authority. In relation to property a sharp distinction must be drawn between public and private property. As to the former also the invader's rights are held to differ with its character. Thus the contents of the Palatine libraries were carried off to Rome during the Thirty Years' War, and Napoleon filled the Louvre galleries from every capital of Europe; but the rule is now well established that public money, military stores, and public buildings are lawful sources of plunder; public estates may be occupied, and the rents and profits therefrom appropriated; telegraph and railway property pressed into service, and public edifices interfering with military operations destroyed; but property not contributing to the uses of war must remain intact. The removal by the Germans of the astronomical instruments from the Observatory of Peking during the recent expedition of the allies against the Chinese capital was a violation of this rule.

The attitude of an invader towards private persons and property has been clearly defined by international law. Pillage is strictly forbidden. Private persons taking no part in the conflict are to remain unmolested, but inhabitants of an invaded district aiding their country forfeit protection and are subject to military execution, though the interests of humanity are conserved by this distinction between soldier and non-combatant. Property movable and immovable is to remain uninjured. If needed by the hostile army, the invading general may require its sale at prices fixed by himself, or even on occasions require their contribution without payment; but marauding must be checked by discipline and penalties. Such forced contributions of food, forage, labor, wagons, railroad rolling stock, or other means of transportation are called requisitions. See CONTRIBUTION; CONQUEST; and also INTERNATIONAL LAW and the authorities there referred to.

INVECTA ET ILLATA (Lat. nom. pl., carried in and borne in). An expression of the civil law, found also in the law of Scotland, to denote all things which a tenant has brought

upon the premises, as his household furniture, tools, utensils, etc., and which are subject to the lien, or tacit mortgage, of the landlord for the rent of the premises. The English and American legal system in general recognizes no such lien, the landlord's remedies being confined to distress (q.v.) and to an action at law for the rent due.

INVECT'ED (from Lat. *invectus*, p.p. of *invehere*, to carry in, from *in*, in + *vehere*, to carry). In heraldry (q.v.), a partition line the reverse of engrailed.

INVEN'TION (Lat. *inventio*, finding out, from *invenire*, to find, from *in*, in + *venire*, to come). Literally, the act of making something not before made; also, the new thing produced. In patent law the term "invention" is specifically applied to any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, which when invented may under certain conditions be made the subject of the rights of a letter patent. In Great Britain the patent law expressly restricts such inventions to a "new manufacture," but the courts have construed this term so that it includes the four classes of inventions above named. Although it has been held that in the patent law "discovery" and "invention" are synonymous, in popular language and generally in legal literature the term "invention" has come to be used to designate a "patentable" invention or one that is "new" and useful.

To constitute an invention in this sense there must be a creating or origination of some useful thing that did not exist before, by means of an operation of the intellect. The extent of research and the simplicity or complexity of the result are of no importance, if the invention be new and useful and be something more than a construction following the beaten track of mechanical experience. Neither is any distinction made as to degree of usefulness or the amount of mechanical skill involved in the construction or making of the invention, so long as the usefulness or skill be not so slight as to make it negligible. It is no objection that the inventor was aided or assisted by ideas derived from others, so long as the final concrete product be something more and distinct from any one or all of these ideas or suggestions. The difficulty in drawing the line as to what is and what is not an invention is great. Mere simplicity is no objection and, indeed, may constitute the real excellence and newness of the invention. Neither is the use or application of old devices or machines an objection, for most patents are issued upon inventions based partly upon pre-existing inventions. A mere advance or extended application of an original invention, changed only in degree and doing substantially the same thing in the same way by the same means, but with better results, is not an invention. There must be a new idea grafted upon the old invention. By reason of the difficulty here referred to the law is liberally applied to protect everything that might be properly called new and useful. See PATENT, and consult the authorities there referred to.

INVENTION. A musical term applied by J. S. Bach to a collection of 15 short piano pieces for two voices. In the very verbose title of the original edition Bach explains that he uses the term in the sense of "musical idea" or "theme," and that the object of the pieces is to show a proper development after the theme has once

been "invented." The term has never been used by any other composer, nor again by Bach himself, who gave to a collection of 15 other pieces, identical in character and development, but for three voices, the title *Sinfonien*.

INVENTION OF THE CROSS. See CROSS, INVENTION OF THE.

INVENTORY (from Lat. *inventarium*, list, from Lat. *invenire*, to find, from *in*, in + *venire*, to come; connected with Gk. *βαλνειν*, *bainein*, Skt. *gam*, to go, and ultimately with Eng. *come*). A written instrument setting forth in the form of a systematic schedule all the goods, chattels, and other personal property of a person or estate, whether for use in a legal proceeding or for ordinary commercial purposes. The term and the legal practice connected with its use originated in the reform of the Roman law instituted by Justinian to relieve the heir of a deceased person from his personal liability. In order to relieve the heir, and at the same time to protect creditors and legatees, a law was enacted under which the heir was relieved of all liability for the debts and legacies of his ancestor, excepting in so far as the property inherited by him would enable him to discharge the same, provided that within a certain time he should duly prepare and file a written instrument containing a correct enumeration of all property, real and personal, left by the deceased. See HEIR.

Until about two centuries after the Norman Conquest the identification of heir and ancestor was as complete under the English law as it had been under the Roman. About that time, partly through the influence of the Roman law, the heir's liability was limited to the amount of property descending to him; executors or administrators superseded him for the purpose of administration of his ancestor's personal estate, and the Roman practice of making an inventory of the assets of the estate was introduced. This plan was probably adopted more for the practical advantage of compelling the personal representatives of the deceased to commit themselves at the outset as to the amount and character of property coming into their hands, than as a means of relieving the heir from liability, as that reform had apparently already been accomplished. The ecclesiastical courts assumed jurisdiction of estates, and inventories of the personal property were required to be filed in these courts, where they were open to the inspection of all persons interested therein. This practice is substantially followed to-day. The inventory usually contains a list of all the personal property of the decedent, with the appraised value set opposite each item, as well as a schedule of his debts and liabilities, the executor or administrator certifying by oath or affirmation that the whole is true to the best of his knowledge and belief. It is filed in the court having jurisdiction of decedents' estates and may be examined by the heirs, next of kin, legatees, and creditors of the deceased, who may object to it if anything is omitted or improperly entered. After the inventory is filed, the executor or administrator becomes accountable for the disposition or distribution of every item set forth therein, and it is therefore a most efficient means of insuring the honest administration of estates.

The term "inventory" is also properly employed to designate the lists of assets prepared by the trustees of bankrupts' or insolvents' es-

tates, and by guardians of infants or other legally incompetent persons, for the information of the court having jurisdiction over them and for the more convenient discharge of their fiduciary duties. See ESTATE; EXECUTOR.

IN'VERA'RAY. A royal and municipal borough, the county town of Argyllshire, Scotland, at the mouth of the Aray in Loch Fyne, 45 miles northwest of Glasgow (Map: Scotland, C 3). An obelisk commemorates the death of 17 Campbells, who were hanged here without trial, in 1685, for their adherence to Presbyterianism. Inveraray Castle, the seat of the dukes of Argyll, is close to the town. Fishing for herring is the chief occupation. Pop., 1901, 678; 1911, 533.
