tended for use as hotels previous to the war, which have been sold for other purposes but are not yet converted, can be redeemed at the selling price, without further compensation, for their transfer to persons who will use such buildings as hotels and guarantee to continue to make such use of them for not less than 10 years."—United States Department of Labor, *Monthly Labor Review*, May, 1920, pp. 1260-1270.—"The National Housing Conference held in Milan, Italy, some months ago [written in April, 1922]. . . . was called to consider how the housing shortage might be met and what steps would be taken to meet the situation caused by the shortage of skilled labor in the building trades in Italy. Three years have elapsed since the last annual congress held in Rome in 1918, from which resulted the Italian housing law of November 30, 1916, during which time the housing problem has become more and more acute and the necessity for those interested in housing reform in Italy getting together to discuss the subject became apparent. Those calling this conference were of the view that the solution of Italy's present housing problem would come through action by the municipalities themselves and through semi-public institutions known as Boards of Popular Building Construction. It was stated at the conference that, compared with the number of buildings produced by the Co-operative Societies and by private initiative, a very great increase in house production has come through the activity of these Boards of Popular Building Construction, acting in co-operation with municipalities. Although the cause of the Building Co-operative Societies was warmly advocated by a number of speakers at the Milan Conference, the Conference apparently did not go on record as believing that such an agency would be the most effective one in producing the much needed houses."—*Housing Betterment*, Apr., 1922, pp. 158-159. See also CITY PLANNING: Italy.

New Zealand.—"The 1916 census revealed the fact that the population of New Zealand was crowded into 32,000 dwellings. Since that time comparatively few new homes have been built and the population of the country has increased materially. The Board of Estimate in 1918 stated that there was a demand for at least 20,000 additional dwellings of four and five rooms each. The New Zealand Government has interested itself in the erection of homes for workers, and already the government has 155 homes under construction, and provision has been made for the erection of 700 more. Besides this the different municipalities are attempting to aid in the matter of more and better homes for the wage earner, with the result that the New Zealand Government, the municipal authorities of the Dominion, and private enterprises are expected to supply 5,000 homes within the next year or 18 months."—*American Architect*, Oct. 13, 1920, p. 485.—"Thirty-nine acres have been set aside on which to erect forty new homes in Taihape for the working people in that section, principally railway employees; and seventy acres at Taurarunui for the erection of homes on lots 70 by 100 feet. It is expected that at this place sixty or eighty houses will be erected. . . . A tract of land at Frankton has been divided into 180 lots on which homes are to be erected as soon as a sawmill, equipped with modern American automatic milling machinery, is completed. This scheme . . . includes the erection of a large number of workmen's homes. The New Zealand government has announced that it expects to construct 600 dwell-

ings for workmen in different parts of the Dominion, and it is intimated that an attempt will be made to construct these at as low a price as possible, even though it becomes necessary for the government to import some of the supplies."—United States Department of Commerce, *Reports*, Jan. 8, 1921, p. 142.

Norway.—"The first Compulsory Town Planning laws in Europe were put into effect in Norway 60 years ago. There were several big fires at that time and the early Commissions that rebuilt the towns were composed of shoe-makers and tailors who loved straight lines and sacrificed much of the personality of the towns. The Norwegian towns have gone in heavily for the municipal ownership of land; some have bought for 200 years ahead; some own all of the land immediately around the town and can control housing and speculation. They usually tax the land much more than the housing on it. . . . The Norwegian Housing and Town Planning Association . . . has been giving lectures all over Norway. . . . They have received an appropriation of 1500 pounds for their work and further sums locally. They do not hesitate to attack the Government in their propaganda, the result being that they are securing interest in town planning all over the country."—*Housing Betterment*, Feb., 1920, p. 36.—"In building our towns there has, . . . in the last few years, been a determined break with the old bad habit of building large tenement houses which have made our larger towns gloomy, ugly and unhealthy, spoiling both the effect of our beautiful landscape and the comfort and prosperity of the inhabitants. During the [World] War the building of houses for the masses has, in our towns—owing to the high cost of building—practically entirely been taken over by our town councils. Several of our municipalities have gone in very heavily for the buying of land, and rather heavily for house building. For instance, our capital, Christiania (260,000 inhabitants) has during the last three years—1916 to 1919—built 2,500 houses for a sum of 45,000,000 kroner netto (£2,500,000), . . . and planned the building of at least 1,000 new houses annually in the years to come. These houses built by the municipalities are either let direct at rents subsidized up to 50 per cent., or sold or let to public utility societies on the same basis. Building costs . . . are very high in our country, a good deal higher than in England. The municipal letting of houses has many drawbacks. We are therefore endeavoring, as far as possible, to hasten the formation of public utility societies for disposing of the houses in a way that safeguards against speculation. We are trying to form in every town of 8,000 to 10,000 inhabitants and upwards, one public utility society—a sort of municipality within the municipality, a building-municipality with the sole object of building and letting houses—which endeavours to absorb and organize building demand existing within the town: the demand being created by those who now or later on will form a family and found a home, those who are unsatisfactorily housed and wish to build a better home, those who have immigrated, and so forth. We hope thereby to carry building enterprise forward precisely by those who are most interested, and to enable the communal authorities, in recognition of the communal significance of this cause, to give these societies sufficient support with guaranteed loans, building loans, and capital to start, and in times such as these, sufficiently large subsidies to enable the societies to let the houses to their members for a rental within their means."

C. Gierlöf, *Housing in Norway* (*Garden Cities and Town Planning Magazine*, Mar., 1920).

Russia.—"Mr. Zakharoff describes housing conditions in Russia as follows: 'Only in the great Russian cities are hot water, elevators, gas for heating purposes, and sanitary devices to be found. In the towns the heights of houses is limited to five or six stories, and in Petrograd the greatest altitude is 77 feet. According to tradition, this arbitrary limitation was fixed by one of the czars, who forbade the townfolk to build their houses higher than his own living quarters—the Winter Palace. There is a great difference between the elaborate architecture of public buildings and the construction standards of the homes of the masses, where modern improvements and sanitary conditions particularly have been greatly neglected. In the villages Russian peasants live in wooden houses that are nothing more than huts. They are called *izba* and consist of one story, containing one or two large rooms with a big Russian stove. A stable is usually adjoining. The stove, besides its use for cooking, serves as a bed for the proprietor and his family. Through centuries the methods of hut construction have remained substantially unchanged. They are built from logs and covered with wooden or straw roofs. This kind of construction makes fires frequent. The damage to them by fire reaches 320,000,000 rubles a year. The ruble at pre-war exchange was equal to fifty cents. Before the war the Government sought to correct this hazardous situation. The *zemstvos* erected several small factories for the production of fire-proof material, and the Minister of Agriculture organized a series of popular lectures on the methods of fire-resisting construction. As soon as orderly conditions are restored in Russia, it is to be expected that steps will be taken to revamp "wooden Russia." . . . On December 11th, 1913, the Kingdom of Prussia passed a more or less complete town planning law, which was applied by the Germans in the rebuilding of a large part of the 34,000 buildings that had been destroyed up to that time in Russia.'"—*Housing Betterment*, Feb., 1920, pp. 22, 37.—"The London Daily Mail's Petrograd correspondent, in a dispatch, gives an outline of the projected law respecting housing as printed in the *Pravda*, according to which every person paying a rent below 1200 rubles is exempted from paying rent for the next six months. Lodgers renting rooms are also to be exempted, and evictions will not be permitted without a decision of the Revolutionary Court."—*Housing Betterment*, May, 1918, p. 53.

South America: Uruguay.—Argentina.—Brazil.—Peru.—"Even South America has not been free from the general situation of housing shortage and high rents which have affected all parts of the civilized globe. Uruguay last June enacted a new rent-control law limiting the maximum of rent that may be charged to that which prevailed on December 31st, 1919. The legislation is emergency legislation, as in New York, and is limited in its application to a 3-year period from the time of its enactment (June 20, 1921). One unique feature of this legislation is the provision that a landlord who attempts to collect a larger amount than the maximum imposed by law will incur a fine equivalent to 3 months' rent, the fine in question to be devoted to the state's funds for public relief. Provision is made for an appeal to a Rent Commission both on the part of the landlord and the tenant. The decisions of such Commissions are final and may not be revised for 12 months. The law contemplates

the appointment of such commissions in all important cities and towns. Uruguay has evidently modeled its legislation somewhat on that of New York and has adopted also the New York scheme for the stimulation of new building construction through tax exemption. New buildings begun after the promulgation of the law and completed during its 3-year term of operation will have 50% of the property tax remitted for a period of 10 years from the time they are completed. In addition, the builders of new dwellings built within the time prescribed may upon application have refunded to them all custom's duties paid on any building material used in their construction which may have been imported into the country. . . .

"The high cost of building materials since 1911, is said to be chiefly responsible for the slowing up of construction and a consequent shortage of housing facilities and increased rents. As a result of this situation, after 2 years' agitation and discussion of proposed legislation to cope with the rapidly rising cost of rent, the National Congress of Argentina in September of this year passed 3 measures designed to alleviate this situation. These laws follow to a considerable extent the New York laws. One of them provides that for a period of 2 years after the promulgation of the law the rent for houses, rooms and apartments for residential purposes throughout the Republic shall not be increased beyond the rate which prevailed on January 1, 1920, and that under certain prescribed conditions all legal proceedings for dispossessing tenants for non-payment of rent shall be stopped. Further details of the measures in question are as follows: One provision nullifies any clause in a lease which is designed to exclude children; another amendment regulates subletting; a third measure deals with the procedure to be followed in carrying out judgments of the court permitting eviction of tenants."—*Housing Betterment, Jan., 1922, pp. 54-56.*—"Startling living conditions as the result of high rents in Buenos Aires are disclosed in a report by Alejandro Bunge, director general of national statistics. Eighty of each hundred families occupy only one room, he says. Of this 80 per cent., 'nineteen families consist of four persons, twenty of five, eleven of six, four of eight, two of nine and one of seven persons, all living in one room in each case.'"—*American Architect, Sept. 20, 1920, p. 432.*—"Recent reports from Buenos Aires describe a plan which the municipal authorities of that city have recently inaugurated and embodied in an ordinance enacted by the Municipal Council which contains many unusual features, as a means of stimulating building construction of dwelling houses and meeting the housing shortage. The city will use such of its real estate as is unimproved or is occupied by old and inadequate structures as sites for the construction of modern houses. It will hand over such property for a period of 25 years, without any kind of annual rental or remuneration, to concessionaires, who will be required to erect houses thereon representing a minimum value of twice the value of the land occupied by such buildings. The buildings must conform to the municipal regulations, and must be for residential purposes only, except that the first floor may be used for business purposes. It is further required that the work of construction be begun and finished within specified periods. A deposit equal to 10% of the value of the building plot is required of the concessionaires and is returned to them when the building has been covered with a roof. Exemption from the usual building taxes and exemption for a period of five years from the pay-

ment of current rates, such as for lighting, road cleaning, etc., is granted; the latter, however, applying only to houses built in the years 1921, 1922, and 1923. The contracting parties may not charge rent exceeding an amount calculated to give a 9% return on the capital invested in the construction of the building. They are further required to attend to and pay the cost of upkeep of such buildings. At the end of the 25-year period the buildings pass into the control and ownership of the municipality without any indemnity to the concessionaires. In certain instances the municipality may administer the property for the last five years of the contract period."—*Housing Betterment, Jan., 1922, pp. 57-58.*

"The Federal and Municipal governments are taking action to relieve the shortage of houses in Rio de Janeiro. A bill has been introduced in the Chamber of Deputies, providing for a special bond issue of \$50,000,000 for the construction of houses for working people. In the municipal council a measure was presented providing that all workers' houses built in the next two years be free from the usual municipal taxes. The federal bill proposes the construction, under the municipal administration, of 20,000 houses in various districts of the capital wherever land is available. It is intended that the houses shall be sold to heads of working families, payment being spread over a period of 20 years. The bill also provides for the construction of two huge apartment houses, for families and for bachelors, respectively, with common kitchens and other communal installations, the rent being placed at a very low figure."—*American Architect, October 13, 1920, p. 484.*

"A Peruvian law, dated December 28, 1918, details a plan to build 100 workmen's dwellings, for sale to public employees of over five years' service receiving wages of not more than 15 libras (\$75), Peruvian gold. The executive department is to sell sufficient Government land in Lima to a financial institution—either the Savings Bank of Lima (*la Caja de Ahorros de Lima*) preferably, or a combination of the National Insurance Companies (*Compañías Nacionales de Seguros*) in Lima under the Mortgage Trust Company (*Credito Hipotecario del Peru*)—which will build the houses according to plans and estimates approved by the executive department. The price of the houses is stipulated as 'the value invested in land and construction.' They will be sold on terms of either 10 or 20 years, 5 per cent cash payment, and balance in monthly payments. These monthly payments will include, beside principal, 6 per cent interest per year, a fixed charge or commission of 1 per cent per year, and an aliquot part payment of a fire insurance premium. If the buyer desires to insure the property to his family, an aliquot part payment on life insurance is included in his monthly payments. The houses are sold on lease contracts, the titles not passing until full payment has been made; and until full title has been acquired, the buyer is not permitted to dispose of a house except through the institution that built it. Bonds may be issued by the building institution in the amounts and with the guaranties stipulated in existing laws on the subject. All contracts and procedure required by this law are free from the usual taxes and fees that are required for registration, stamps, papers, and incomes, and shall remain exempt from any such imposts laid in the future. The Government guarantees the capital invested in these 100 houses, the 6 per cent annual interest on the same, and the fixed charge of 1 per cent per year."—United

States Department of Labor (*Monthly Labor Review*, Oct., 1919, p. 283).

Switzerland.—“*La Vie Urbaine* publishes the following statement of the housing situation in Switzerland. ‘The effect of the War on the housing situation in Switzerland was identical with that observed in Holland. Together with a greatly increased demand for housing facilities on account of numerous refugees and wounded, came a suspension of construction due to the mobilization of the army. In addition, Switzerland by reason of its peculiar location geographically and politically, had to increase considerably its own governmental activities and at the same time provide quarters for the greatly enlarged staffs of the agencies of other governments. The natural consequence of this state of affairs was an all around increase of rents, and the disappearance of the normal percentage of “empties.” At Zurich, this difficulty was met in part by activities of a Housing Bureau (*Wohnungsnachweis*), under the Hygiene Department, which publishes regularly a bulletin giving statistics on current standard rentals and lists of vacancies. Since August, 1918, the declaration of empty apartments has been compulsory. Similar housing bureaus are to be found in many other Swiss cities, notably Bâle and Berne, where the organizations date from 1911 and 1910 respectively. Building is seen to be, here as elsewhere, the only way out, and the obstacles are the same, namely, the high cost of materials and labor, and the difficulties of financing. Municipal building is not unknown in Switzerland. The city of Lausanne has built and manages a certain number of workingmen’s dwellings. Some of these were built in 1904-1905, and are said to pay 4 to 5%; others built more recently (1917-1918) paying only 3%. These dwellings are provided with water, gas and electricity. The city bears the expense of water supply and of lighting the hallways of tenements. A recent development of importance in Switzerland is the organization of the *Union Suisse pour L’Amélioration du Logement*. This is a Society whose object is given as “Housing reform from social, hygienic, technical and economic viewpoints, with especial emphasis on encouraging the construction of pleasant healthful homes of substantial value.” It has an extensive program, including such items as the organization of expositions, conferences and competitions, the preparation of model codes, the establishment of a bureau of information and advice on housing problems, aid in procuring improved legislation, campaigns against land speculation, coöperation with other similar societies and the publication of periodicals.”—*Housing Betterment*, Apr., 1922, pp. 155-157.

United States: Fluctuation in construction.—Federal legislation.—“The beginning of the present housing shortage in the United States dates back to the year 1907, since which date less and less cubic feet of construction has been available per person. The low water mark was reached in November, 1918, when construction was but 4 per cent of normal. During the succeeding months construction gradually picked up and reached its maximum in October, 1919. Authorities agree that during the gradual slowing down of construction from 1907 to 1919, the United States fell behind at least one year in its building output and that it will take several years, under favorable conditions, to make this shortage good. . . . It was estimated by the United States Labor Department at the close of the war that the United States was in need of a million homes. General construction for the year 1919 was prob-

ably slightly above normal, being about 25 per cent above the average for the past five years, and totaling two and a half billion dollars for the territory east of the Mississippi and north of the Ohio river compared with an average of two billion in present day prices, for the past five years. Two-thirds of this construction was undertaken during the last half of the year. . . . Residential construction for the year 1919 in the territory east of the Mississippi and north of the Ohio Rivers (roughly, a billion dollars) was 36 per cent of the total in that area and included from 100,000 to 125,000 of the higher grades of residential buildings of all kinds. The revival of construction, however encouraging, does not seem yet to have relieved conditions or at the present rate to promise to do so, although, unlike the English situation, the conditions apparently are not growing worse. The work of the Housing Corporation was small in volume and had no appreciable effect upon the housing situation in general except to point the way in an admirable manner. It was not until March, 1918, that Congress authorized the Shipping Board to spend money for housing purposes. It was not until July, 1918, that the newly authorized Housing Corporation was permitted to spend the funds appropriated. The Act provided for emergency war housing and recommended the employment of the Supervising Architect. . . . There has been little criticism as to the quality or design of the permanent construction, except that it was too good. . . . For nearly eighty years the United States has followed a program that has never deviated from the idea that beneficiaries of legislation should be enabled to acquire property through their own labor. These laws have covered rural homes and culminated in the Farm Loan Bank Bill. . . . The first Redemption Law was enacted in 1841 and contained all the elements that made the later Homestead Law so notable. Subsequent enactments were as follows: Act of 1843 amending the Act of 1841 to prevent fraud; Act of 1853 extending preemption to reserved sections of railroad grants and allowing payments to be made in soldiers’ land-grant warrants; Act of 1854, granting all rights of preemption to bona fide settlers of railroad lands. The act of 1862, known as the Homestead Law, allowed every citizen over 21, who was the head of a family, to take up either 80 or 160 acres of surveyed public lands upon the payment of \$1.25 per acre, except in certain Southern states, where 40 to 80 were the limits. The conditions of the law required actual residence and certain work to be done for a prescribed period. . . . The Act of 1864 allowed soldiers to file proofs of claim if in service; the Act of 1866 put the exempted land in Southern states under the provisions of the Homestead Law; the Act of 1874, known as The Timber Culture Law, by which the homesteader obtained title at the end of three years, if for two years he had one acre planted with trees, for each sixteen acres of his holding. Other legislation is the Act of 1877, known as the Desert Land Act, relating especially to irrigable lands, the Act of 1878, relating to stone and timber lands, and the Kincaid Act of 1904, also relating to irrigable lands. The Farm Loan Act of July 17, 1916, made it possible for farmers to borrow money from a specially organized Federal banking institution for the purchase and development of farming lands, the necessary money to be obtained by the banks from the sale of tax-exempted bonds. The Calder, Nolen and Hill Bills provide for the lending of money to people who desire to build their own homes, the

money to be supplied through a Federal banking institution especially created for that purpose, the money to be procured by the banks through the public sale of bonds secured by real estate mortgages of the individual borrowers and guaranteed by the building and loan associations or other banking institutions with which the borrowers were doing business. . . . During the months of January, February, and March, 1919, the activity of the building industry was promoted through an educational campaign by the U. S. Department of Labor, and during the months of April, May, and June, the construction of public works was encouraged by the U. S. Department."—F. T. Miller, *Housing situation in England and the United States*, pp. 19-20, 25-26.

**United States: National Housing Association.**  
—Government housing during the World War.  
—Congressional inquiry.—One of the manifestations of the interest current in housing conditions in the United States prior to the World War was the founding in 1910, in New York, of the National Housing Association. The organization is supported by private funds, and publishes a quarterly, *Housing Betterment*. These are its purposes: 1. To improve housing conditions, both urban and suburban, in every practicable way; 2. To bring home to each community the importance of right housing conditions and the consequences of bad ones; 3. To study in various cities the causes of the drift of the population into the cities, and the methods by which the population may be distributed over larger areas; 4. To encourage the formation of improved housing associations where they do not exist, and to aid in the work of all such associations by advice and direction; 5. To act as a clearing house of information for such agencies, and to furnish advice and suggestions to those interested in housing reform, and generally to promote popular interest in the subject; 6. To aid in the enactment and enforcement of laws that will—*a.* Prevent the erection of unfit types of dwellings; *b.* Encourage the erection of proper ones; *c.* Secure their proper maintenance and management; *d.* Bring about a reasonable and practicable improvement of the older buildings; *e.* Secure reasonable, scientific and economic buildings laws; 7. To aid in defending such laws when once enacted, from the attacks of adverse interests, and in correcting them from time to time to suit changing conditions and meet new needs as they develop; 8. To train and equip workers for the various phases of housing reform work.

As soon as the effect of the World War in causing the concentration, often temporary, of industry in certain centers had become noticeable, it was evident that special effort would be necessary to provide dwellings for the increased number of workers in those centers, particularly in the case of the munition and shipbuilding industries. (See BOSTON: 1917-1919; WASHINGTON, D. C.: 1917-1920.) On October 9, 1917, a committee on housing was appointed by the Council of National Defense, with Otto M. Eidlitz as chairman. During that fall the United States Shipping Board set aside \$10,000,000 for the construction of houses at the Hog Island plant and undertook housing developments at other shipbuilding centers. An act of March 1, 1918, authorized the Emergency Fleet Corporation to acquire land, construct houses, and undertake similar business, and appropriated \$50,000,000 for that work. Later the sum of \$45,000,000 was added to that fund and A. Merritt Taylor was made housing director. Other work along this line was done for a while by the Hous-

ing Branch of the Ordnance Department, but was later taken over by the Bureau of Industrial Housing and Transportation. This bureau was formed within the Department of Labor in February; in June an appropriation of \$60,000,000 of which \$10,000,000 was reserved for housing in Washington, D. C., made possible its activity. Later the appropriation was increased by \$40,000,000. On July 9, 1918, the United States Housing Corporation was incorporated under the laws of the state of New York. Congress appropriated \$100,000,000 for its work. By September, building projects had been undertaken in sixty-five communities. After the signing of the armistice only the well advanced projects were completed. The housing corporation made its report December 3, 1918. "An important step looking toward the solution of the serious problem presented by the acute, nation-wide housing shortage was taken by the Senate on April 17 [1920] when it passed a resolution introduced by Senator Calder of New York (S. Res. 350) providing for the appointment of a Senate Committee to investigate and report upon it. . . . Vice-President Marshall . . . appointed the following Committee: Senator William M. Calder of New York, Chairman, and Senators Kenyon of Iowa, Walcott of Delaware, Edge of New Jersey and Gay of Louisiana."—*Housing Betterment*, May, 1920.

**United States: Industrial housing.—Company housing in bituminous coal fields.**—"The vast increase in the population of Akron, Ohio, during the last few years, has caused evil housing conditions, and has forced many of the employees of the Firestone Rubber and Tire Co. to sleep in unhealthy surroundings. To overcome this condition so far as possible, the company purchased a plot of ground, called it 'Firestone Park,' and proceeded to improve it and erect homes at reasonable purchase rates for its employees. Their scheme is worked out along these lines. The workers purchase the lots or houses by a payment of five per cent. with their order, after which they make monthly payments of one per cent. Out of this one per cent. the company pays interest on the investment, insurance and taxes. The houses are erected by a real estate company formed by the company as a subsidiary corporation, if the workers so desire, and are sold to them at a [price] . . . which is based on actual cost. Any persons other than employees desiring to make purchases are allowed to do so, but must pay ten per cent. more and also have to pay ten per cent. down with their purchase. This scheme enables the workers of this company to own their own homes. . . . The American Blower Company of Detroit, Mich., has undertaken to aid its employees to buy their own homes, through arranging to lend the difference between the amount that can be realized on a first mortgage and the cost of erecting the house. Suppose an employee was able to put up about 25 per cent. in cash, he may then borrow 60 per cent. from a Savings and Loan Society and the company will advance the remainder through the Society, making one mortgage cover the two loans. The loans are paid off on the usual building and loan rate of one per cent. a month, which is about equal to the rent the employee would be paying for his house in that city.

"The City of Cleveland, Ohio, is another city that has worked out a plan to help home buyers. A threefold combination of a bureau of the Chamber of Commerce, some local banks and building and loan associations has been made whereby the home builder will be assured that the home he

has purchased is 'up to specifications.' The Bureau which has been established for this purpose, composed of architects, engineers and construction experts, will pass upon all the plans for all homes and apartments, determining whether they are suitable in design and floor plan, in quality of material, in permanence of value and in neighborhood. This helps determine the amount to be loaned upon the buildings and acts as a guarantee to the mortgagee. If the plan proves successful it may be extended to office and factory buildings, and thus put a check on expensive building costs brought about by the superabundance of middlemen in building operations. A definite policy of making it easy for their employees to own their own homes is at the bottom of a simple plan followed by Eastman, Gardiner & Co., of Laurel, Miss. When an employee informs the company that he wishes to have a home of his own he is allowed to select a lot, and is given advice in regard to the building plans. Having selected a design, the company contracts for the erection of the house at an agreed price. When it is completed the home is turned over to the employee, who is given from three to five years to pay for it in monthly installments, with six per cent. interest. These houses are of attractive design, situated on a good sized piece of ground allowing ample room for gardens. In case of death or inability to continue payments, whatever money has been paid in is returned and the house reverts to the company. This plan has worked out to the entire satisfaction of everyone concerned, and practically all of the company's employees of the better paid class own their own homes."—W. G. Castle, *Solving the housing problem (Industrial Management, Dec., 1920)*.—"The Merchant Shipbuilding Corporation was early to recognize the economic fact that proper housing of mechanics is a necessity in the stabilizing of labor and industrial progress. No sooner had work begun on the great shipyard plant at Bristol than the Corporation began to lay plans for a comprehensive housing development to take care of the social needs of its workmen and their families. A building program was determined on which departs radically from that followed in many industrial developments where unsightly views of dwellings possessing no architectural merit, frequently not well planned, greet the eye, and often develop into slums in which the tenants have no pride in their homes or surroundings. . . . To avoid the waste and unsatisfactory results incident to construction of temporary barracks, frames and covering were erected for buildings which could, after their temporary occupancy by construction forces, be completed into substantial and permanent form for the shipbuilders who would follow. A general plan was then laid out providing for all usual and necessary community facilities, including schools, stores, restaurants, churches, playgrounds, and parks, as well as various types of buildings for housing bachelors and families of all classes of employees, from the common labor type to skilled mechanics, foremen, superintendents and executive forces. This plan has been consistently followed, and provides for an equitable and appropriate distribution of the various types of buildings. . . . This town is a splendid object lesson to large industrial communities as to what can and should be done to make their employees comfortable."—C. H. Pratt, *Bristol, Pennsylvania (Homes for Workmen, pp. 126, 131)*.—"An increase in population variously estimated at from 5,000 to 10,000, due to the labor demands of the New York Air Brake Company and the new gov-

ernment plant just completed,' is complicating the housing situation in Watertown. The initial efforts to meet the situation include a canvass of the residential districts to ascertain the whereabouts of vacant houses and of available rooming quarters. . . . Work . . . was started . . . by Charles E. Marshall, an Albany contractor, on 25 houses . . . near the new gun cartridge plant of the New York Air Brake Co. . . . An appropriation for improving the streets of this new residential section has been made by the Common Council."—*Housing Betterment, Dec., 1917, p. 67*.

In the latter part of 1916 the Bureau of Labor Statistics completed a comprehensive survey of housing by employers in the United States. This investigation comprised communities maintained by coal mining companies in Western Pennsylvania, West Virginia, Ohio, Indiana, Kentucky, Tennessee, Alabama, Colorado, and Wyoming and included almost exclusively the better types of communities. Certain facts stand out as a result of this study, namely: "1. The responsibility for the housing of a large proportion of the miners has been undertaken by the mine operators. The isolation of the average mining town, its dependence upon the one industry of mining, and frequently its impermanence and almost universal lack of local self-government, as well as the shifting character of the labor force, have compelled the mine owner to assume that responsibility. 2. The average company mining town has few of the amenities of ordinary community life. There is a dull uniformity in the appearance of the houses and an absence of trees and natural vegetation. Streets and alleys are open dirt roads almost without exception. Sidewalks are very rare. 3. The miner's house is without the ordinary inside conveniences found in the house of the city worker. Less than two per cent of the homes in the bituminous coal regions have inside toilets, and running water is rare. Stoves and grates are depended upon for heating. 4. The average house of the miner includes about four rooms, in which he must accommodate a family and frequently take in boarders when there is a housing shortage. 5. The rents of the miners' houses are comparatively low, most of them (12,343 out of 18,377, or 65.4 per cent) renting in 1916 for less than 8 dollars per month. The rent in some instances probably constitutes a subsidy to the wages of the miner who lives in a company house."—L. Magnusson, *Company housing in the bituminous coal fields (Monthly Labor Review, Apr., 1920)*.

United States: New York state legislation.—Housing conditions in New York City.—Lockwood Committee inquiry.—Results.—"Besides the action taken by the Federal government several of the states have in time past made efforts to aid people in securing homes. The State Land Bank Act of New York is an example of judicious legislation. This measure provided a means whereby the assets of the building and loan associations of the State were made available for new loans to be expended on dwellings. Although the bank had functioned but three years, at the outbreak of the war it had issued bonds to the extent of \$700,000, which had been taken up by savings banks as a gilt-edge investment for their funds. The imposition of a Federal Tax on the income of these bonds killed their use and prevented the sale of similar issues. Thus the war activities of the Federal government cut off this source of aid to the home builder. In the matter of municipal housing New York City has always been in the van. Although the word 'tenement' does not appear in the records until

1862, it is evident that the problems which the tenements represent run back for at least a century, as in 1827 the physicians of New York City complained of the crowding and unsanitary conditions existing in certain parts of the city. In 1834 Dr. John H. Griscoon issued a report on the housing conditions. In 1846 there was an attempt to inspire private enterprise to improve conditions through competitions in plans for model houses. Conditions, however, grew worse just prior to the Civil War, and at its close New York City experienced a building shortage as recorded in the *Record and Guide* of March 21, 1867. In parts of the city the rent of stores and offices rose 100 to 150 per cent, while 'as for dwellings, not more than one-fiftieth of the applicants can be supplied.' In 1885 an efficient tenement housing law was enacted, which, with later legislation, has made New York City the most healthful of great cities. During the past year special committees appointed by the State Legislature, the Governor of New York State and the Mayor of New York City, have been considering the housing shortage, but the action of none of them has so far increased the supply of housing."—F. T. Miller, *Housing situation in England and the United States*, p. 27.—"That rent profiteering should be regulated without hampering the ownership of property is the attitude taken by the Real Estate Board in New York, according to advices from the State capital. The legislative representative of this board is quoted as saying, 'The housing situation in New York City and in every city in the United States is acute. The high wages forced by organized labor has drawn heavily upon the country workers and has overcrowded the cities. In New York State alone there are over 25,000 vacant farm houses as a result of the drift toward the cities, whereas, in contrast, in New York City 200,000 apartments are needed to meet the demand.' Crowded conditions necessitated the construction of 50,000 apartments in 1919 and 1920 in New York City, yet last year only 1,183 new apartments were built. In 1915 there were 934,822 apartments in Greater New York; in 1919 there were 982,015, an increase of only about 48,000 in five years."—*American Architect*, Apr. 14, 1920, p. 470.—A housing and building inquiry was begun October 20, 1920, and continued in 1921, by the joint state legislative committee on housing, of which Senator Charles Lockwood was chairman, and Mr. Samuel Untermyer chief counsel. Among the evils disclosed by the investigation were extortion of money from contractors and of unreasonable dues from building workers, trust control of building material prices, and collusive bidding on a good many contracts for public buildings in New York City. Eventually several convictions were secured. "On December 20th, last, representatives of the Building Trades Unions in New York met with Samuel Untermyer, counsel for the Lockwood Committee, and agreed to most of the demands which the Committee had made on the unions in the interest of better conditions. . . . Following this action in New York, Attorney-General Daugherty in Washington on February 24th entered into an agreement with the representatives of the Bricklayers' International Union in the form of a 'consent decree' entered in the United States Court in New York. . . . The Federal Government was on the point of prosecuting the unions on charges of conspiracy to restrict production, to force payments of questionable fines and claims, intimidation of workmen to the end that they reduce their effort, and practices which amounted to boycotting makes of materials. The

chief features of this agreement may be summarized as follows: 1. There is to be no limit to the productive capacity of the individual workmen within the working day or any other time. 2. There is to be no limit upon the right of the employers to purchase their material wherever and whenever and from whomever they may choose, whether those materials be union-made or otherwise. 3. There is to be no favoritism shown by labor toward employer or trade associations and no discriminations are to be indulged in against the independent employer who may not be a member of such an organization. 4. The labor organization is not to be used, or permit itself to be used, by material men or contractors or subcontractors as an instrument for the collection of debts or enforcement of alleged claims. . . . In the meantime the New York legislature has given a new lease of life to the Lockwood Committee which was responsible for the enactment of the New York rent laws, and a chain of new legislation, 9 bills in all, has been passed at the session of the New York legislature which has recently ended [written in April, 1922]. Influenced by the Report of the Lockwood Committee and from statements that there are still needed in New York City 80,000 low-priced homes for 400,000 people, the legislature has responded . . . to the Committee's recommendations and has practically enacted into law all of the recommendations which had a direct bearing upon the rent control situation. . . . A series of very important measures have been enacted by the legislature, notwithstanding the fact that the Lockwood Committee did not introduce its measures until almost the closing days of the legislative session. Of the bills which passed, one of the chief ones was that permitting life insurance companies to invest 10% of their assets in the erection of buildings for dwelling purposes. This was intended primarily to enable the Metropolitan Life Insurance Company to invest \$100,000,000 in model dwellings, the rentals for which cannot exceed \$9 a room per month under the terms of the bill. While this measure has been very widely heralded by its sponsors, the Metropolitan Life Insurance Company has given no assurance that it will invest its funds in such a project, especially in view of the fact that the possibility of a profitable investment in New York City, at the maximum rentals fixed by law at the present time, with the prices that control for building labor and building materials, is extremely doubtful. A second measure enacted by the legislature was that extending the present emergency rent laws until February 15, 1924. Another extends the time within which new buildings in New York City may be erected and secure the benefits of tax exemption under the present tax exemption law. This time has been extended one year so that new dwellings erected before April first, 1923, may avail themselves of the tax exemption privileges, provided they comply with the other conditions of the tax exemption law."—*Housing Betterment*, Apr., 1922, pp. 179-181.—See also U.S.A.: 1921: Housing problem.

**HULDE**, basis of vassalage and the act of conferring (investiture) which established the real right of the man to the fief. See FEUDALISM: Continental growth.

**HULL, Isaac** (1775-1843), American naval officer, commanded the *Constitution* when she captured the *Guerrière* in 1812. See U.S.A.: 1812-1813; Indifference to the navy.

**HULL, William** (1753-1825), American general. Served in American Revolution and in the War of 1812; governor of Michigan Territory, 1805-1814. See U.S.A.: 1812 (June-October).

**HULL** (Kingston-upon-Hull), seaport in the East Riding of Yorkshire, England, at the confluence of the Hull and Humber.

1643.—Siege by the Royalists.—Hull, occupied by the parliamentary forces under Lord Fairfax, after their defeat at Adwalton Moor, was besieged by the Royalists under the earl of Newcastle, from September 2 until October 11, 1643, when they were driven off.—C. R. Markham, *Life of the great Lord Fairfax*, ch. 12.—See also WINCEBY FIGHT.

1893.—Dockers' strike. See LABOR STRIKES AND BOYCOTTS: 1893.

**HULL**, city on the Ottawa river in the province of Quebec, Canada. See CITY PLANNING: Canada.

**HULLS, Jonathan** (fl. 1737), English inventor. See STEAM NAVIGATION: Beginnings.

**HULLUCH**, town of France, about ten miles southeast of Bethune. It was attacked by the Germans in 1915. See WORLD WAR: 1915: II. Western front: i, 3; i, 5.

**HULSEMANN LETTER** (1850). See U. S. A. 1850-1851.

**HULST**, town in the Netherlands, about twenty miles northwest of Antwerp. In 1746 it was taken by the French. See BELGIUM: 1746-1747.

Battle of (1642). See GERMANY: 1640-1645.

**HUMANISM**. See CLASSICS: Renaissance; EDUCATION: Modern: 15th-16th centuries: Italy the center, etc.; Humanist aims in education; 17th century: Milton; ETHICS: 5th-15th centuries; EUROPE: Renaissance and Reformation: Various Italian humanists; Erasmus and the Reformation; UNIVERSITIES AND COLLEGES: 1348-1826; CHRISTIANITY: 11th-16th centuries; HISTORY: 22.

**HUMAYUN** (1508-1556), Mogul emperor of Delhi, succeeded his father, Baber, in 1530. Driven from India by the Afghan, Sher Shah, but regained his throne in 1555. See INDIA: 1399-1605.

**HUMBERT, Georges Louis** (1862- ), French general. See WORLD WAR: 1915: II. Western front: a, 7.

**HUMBERT I** (Italian Umberto) (Ranieri Carlo Emanuele Giovanni Maria Ferdinando Eugenio) (1844-1900), king of Italy, 1878-1900. See ITALY: 1870-1901; 1899-1900; ROME: Modern city: 1871-1907.

**HUMBLE PETITION AND ADVICE** (1656), petition drawn up by Parliament in England, providing for an upper house and offering Cromwell the title of king. See ENGLAND: 1654-1658.

**HUMBOLDT, Alexander, Baron von** (1769-1859), German traveler and naturalist. Contributed directly and indirectly to many branches of science and may be considered the founder of the science of physical geography; published his first important work, "Über die Basalte am Rhein, nebst Untersuchungen über Syenit und Basanit der Alten," 1790; accompanied by Aimé Bonpland, a distinguished French scientist, he explored Venezuela, Cuba, Peru, and Mexico, 1799; published "Voyage aux régions équinoxiales du Nouveau Continent," 1807; "Kosmos," in four volumes, 1845-1858.—See also PANAMA CANAL: 1800-1850.

**HUME, David** (1711-1776), English philosopher, political economist and historian. Wrote his chief work "Treatise upon Human Nature," in three books, during his first residence in France, 1734-1737; librarian to the faculty of law in Edinburgh, 1752-1757; served as secretary to General St. Clair and later to Lord Hertford, 1763-1766; under-secretary of state, 1767-1769. His fame during his lifetime rested upon his achievements as an historian rather than upon his philosophical works. Among his other writings are "Political Discourses," "Four Dissertations," and a "History of England."—See also HISTORY: 25; DEISM: English.

**HUMPERDINCK, Engelbert** (1854-1921), German composer. Studied with Hiller, Lachner and Rheinberger; assisted Wagner at Bayreuth, 1880-1881; taught in the conservatory of Barcelona, Spain, 1885-1886; Hoch conservatory, Frankfurt, 1890; produced his fairy opera "Hänsel und Gretel," at Weimer, 1893; became director of the Meisterschule, Berlin, 1900; produced "Die Königskinder" in Metropolitan Opera House, New York, 1910. See MUSIC: Modern: 1847-1921.

**HUMPHREY, Duke of Gloucester.** See GLOUCESTER, HUMPHREY, DUKE OF.

**HUMPHREY, J. Otis** (1850-1918), American jurist. See TRUSTS: United States: 1903-1906.

**HUNDRED.**—"The union of a number of townships for the purpose of judicial administration, peace, and defence, formed what is known as the 'hundred,' or 'wapentake'; a district answering to the 'pagus' of Tacitus, the 'hærrud' of Scandinavia, the 'huntari' or 'gau' of Germany. . . . The name of the hundred, which, like the wapentake, first appears in the laws of Edgar, has its origin far back in the remotest antiquity, but the use of it as a geographical expression is discoverable only in comparatively late evidences. The 'pagus' of the Germania sent its hundred warriors to the host, and appeared by its hundred judges in the court of the 'princeps.' The Lex Salica contains abundant evidence that in the fifth century the administration of the hundred was the chief, if not the only, machinery of the Frank judicial system; and the word in one form or other enters into the constitution of all the German nations. It may be regarded then as a certain vestige of primitive organisation. But the exact relation of the territorial hundred to the hundred of the Germania is a point which is capable of, and has received, much discussion. It has been regarded as denoting simply a division of a hundred hides of land; as the district which furnished a hundred warriors to the host; as representing the original settlement of the hundred warriors; or as composed of a hundred hides, each of which furnished a single warrior. The

question is not peculiar to English history, and the same result may have followed from very different causes as probably as from the same causes, here and on the continent. It is very probable, as already stated, that the colonists of Britain arranged themselves in hundreds of warriors; it is not probable that the country was carved into equal districts. The only conclusion that seems reasonable is that, under the name of geographical hundreds, we have the variously sized pagi or districts in which the hundred warriors settled. . . . The hundred-gemot, or wapentake court, was held every month; it was called six days before the day of meeting, and could not be held on Sunday. It was attended by the lords of lands within the hundred, or their stewards representing them, and by the parish priest, the reeve, and four best men of each township. . . . The

ALEXANDER VON HUMBOLDT

criminal jurisdiction of the hundred is perpetuated in the manorial court lect."—W. Stubbs, *Constitutional history of England*, v. 1, ch. 5, sect. 45.—"By the 13th century the importance of the hundred had much diminished. The need for any such body, intermediate between township and county, ceased to be felt, and the functions of the hundred were gradually absorbed by the county. Almost everywhere in England, by the reign of Elizabeth, the hundred had fallen into decay. It is curious that its name and some of its peculiarities should have been brought to America, and should in one state have remained to the present day. Some of the early settlements in Virginia were called hundreds, but they were practically nothing more than parishes, and the name soon became obsolete, except upon the map, where we still see, for example, Bermuda Hundred. But in Maryland the hundred flourished and became the political unit, like the township in New England. [q. v.] The hundred was the

militia district, and the district for the assessment of taxes. In the earliest times it was also the representative district. . . . The hundred had also its assembly of all the people, which was in many respects like the New England town-meeting. These hundred-meetings enacted by-laws, levied taxes, appointed committees, and often exhibited a vigorous political life. But after the Revolution they fell into disuse, and in 1824 the hundred became extinct in Maryland; its organization was swallowed up in that of the county. In Delaware, however, the hundred remains to this day."—J. Fiske, *Civil government in the United States*, ch. 4, sect. 1.—See also COURTS: Early Teutonic.

**HUNDRED DAYS.**—The period of Napoleon's recovery of power in France, on his return from the Isle of Elba, and until his overthrow at Waterloo and final abdication, is often referred to as the Hundred Days. See FRANCE: 1814-1815; 1815 (June-August).

**HUNDRED YEARS' WAR (1337-1453).** See FRANCE: 1337-1360; 1360-1380; 1415; 1420-1431; 1431-1453; EUROPE: Modern: Rise of the nation state, etc.

**HUNG-SIU-TS'EUEN, or Hung-Hsiu-Chuan (1812-1864),** Hakka schoolmaster, who was the leader of the Taiping rebellion. See CHINA: 1850-1864.

## HUNGARY

**Location.** — **Area.** — **Population.** — **Geographical features.** — **Natural resources.** — "Hungary stretches from about 16° E. to 24° E., and irregularly between 45° N. and 49° N. Astride the Danube—a river which carries twice as much water as the Nile—but entirely landlocked, Hungary remains essentially a continental area, controlling the main east and west water route of Central Europe."—A. R. H. Moncrieff, *New world of to-day*, v. 2, p. 257.—Before the World War, as an integral part of the former Dual Monarchy, it covered an area of 125,600 square miles; Hungary proper had 109,188 square miles and Croatia-Slavonia 16,421. By the provisions of the Treaties of Versailles and Trianon the new Hungary is reduced to one-third of its former area (35,184 square miles), and the reduction in population corresponds to that of territory. The population, according to the census of 1921, is 7,840,832 as compared with the pre-war figures of twenty-one millions; "but the mass of the population is now more or less strictly Hungarian. Budapest is still the largest town. . . . Hungary consists of three distinct areas: (1) In the south-east, forming the mass of the country, is the Great Hungarian Alföld, or plain, with an average elevation of not more than 350 ft. It is a well-watered area, being drained by the Danube and Theiss, running in curiously parallel courses from north to south, and receiving long tributaries from the west and east, on their right and left banks respectively. (2) The Bakony Wald, with the extension as far as Miskolcz, forms a region of highland, from 1000 to 1500 ft. high, running from south-west to north-east, between the Alpine Foreland and the Carpathians, and dividing the Great Alföld to the south-east from the Little Alföld to the north-west. The region is divided into two sections by the defile of the Danube, or the Hungarian Gate, where the river breaks through to the south-eastern plain. (3) The Little Alföld lies north-west of the Bakony Wald, and east of the Alps, and is bounded approximately by the Danube to the north. It lies at an elevation of 600 ft., with a very even surface, drained by the lesser tributaries of the Danube. Hungary was and remains essentially an agricultural country, a large proportion of the area being under tillage, and nearly 70 per cent of the population, before the war, finding occupation on the land. . . . The agricultural products consist chiefly of wheat and maize. . . . Owing to the restricted area, the Hungary of to-day will not produce to the same extent, but there will still be a surplus when internal affairs are more settled. Other products include flax, hemp, tobacco, and fruits. Of the total wine yield in Austria-Hungary before the war, 72 per cent was grown in Hungary; and

though the vineyards in the new area are very much reduced, a considerable quantity is still produced and can be exported. The wine-growing areas lie in the more northerly latitudes, on the south-eastward facing slopes, near Tokay and Soforon, and the Keskemet district, which is also famous for its fruits. The pusztas of Hungary offered special facilities for the rearing of cattle and horses. . . . It is estimated that the stock of cattle has been reduced by 62 per cent, of horses by 50 per cent, and of sheep by 67 per cent. The reduced number of sheep has resulted in a serious deficiency in the supply of raw material for the woollen industry. New Hungary has lost 86 per cent of her former area of forests and woods, the oak woods being reduced by 74 per cent, the other deciduous woods by 87 per cent, and the pine woods by 95 per cent. This loss of timber involves a considerable deficiency of raw material for furniture factories, paper-works, etc., and for fuel. The change in the distribution of mineral resources is of vital importance to the future of the kingdom. Hungary is poor in carboniferous coals, but contained extensive deposits of Tertiary lignites along the Carpathians and in Transylvania in the Zill valley. Within the new territory there exist only two coal-mines of any importance, at Salgo-Tarjan, and at Pecs. There are [also] certain deposits of lignite to the north and north-west of Budapest. . . . The supplies of salt, iron and other ores, and of crude oil, which old Hungary produced in sufficient quantity to allow of export, have been almost entirely lost. Of all the iron-ore deposits (to the north-east) there remains now but one, at Witkowitz, which was neither one of the richest nor one of the largest mining areas. While the pre-war output of pig-iron amounted to 2,000,000 tons per annum (of which 500,000 tons were exported), the iron and machine factories will, under the new conditions, be entirely dependent on imports for their supplies of iron-ore."—A. R. H. Moncrieff, *New world of to-day*, v. 2, pp. 257-258.—See also DANUBE: B.C. 5th-A.D. 15th centuries.

**Origin of the Hungarians or Magyars.**—"The Magyars, according to the finding of modern scholars, belong to the Finno-Ugrian branch of the Ural-Altai peoples. This question has already been decided by philologists, for unfortunately we have no data of an anthropological or racial character enabling us to approach the question from these points of view. The racial characteristics and exterior of the Hungarians of today would justify us in including them among

the Indo-Germanic peoples. The names for many common things are the same, philologically, as those we find in Finnish and other Finno-Ugrian languages. Natural phenomena, the elements, many common or uncommon (but indispensable) natural products, etc., have names in Finnish corresponding to those existing in Magyar. Proofs of this kind might be multiplied, but would be of little use to English readers. What is important is, that we now know pretty certainly *who* the Magyars were, though the presence of Turco-Tartar elements cannot be denied. Far more difficult to answer are the questions: Whence did the Magyars come? What drove them to settle in Hungary? Tradition is rife as to the spot whence 'the people of Arpad' started out on their journey to Europe. In the Caucasus, we are told, on the banks of the Kama stand the ruins of a town still called Madzsar. Round this town tradition has weaved the story of a great people who once dwelt there civilised and urbane, receiving emperors as their guests. They were of fine and noble manners and life and believers in one God. Mysteriously enough they went forth from the city, and no man has since dwelt within it, though its walls still stand and great part of the town itself, though overgrown with moss and grass. All that is told of its people is that they moved away to the east. Many travellers have endeavoured to find the original home of the Magyars on the slopes of the Ural range; but none has found it yet. And yet—the path of their wanderings from the valleys of the Kama and the Upper Volga, of the Petchora and the Ural, through Baskiria (or Greater Hungary), the district between the Volga and the Ural to the north of the Caspian Sea, to their second resting-place in *Lebedia* (830-889), can be traced pretty distinctly on the map. They had not yet taken to agriculture, and lived in tents. Consequently, when, in the last year of the ninth decade of the ninth century, the warlike Petchenegs attacked them as they had done in Baskiria, they struck their tents once more and wandered further westwards, to the district called *Etelköz*, situated between the Dnieper and the Szereth, and watered by the Bug, the Dniester, and the Pruth. Here they seem to have remained until the year 895, when they turned towards the Promised Land. Of these two stages in their wanderings westwards we have definite historical records. *Leo Grammaticus* informs us that, in 836, the Bulgarians appealed to the Magyars for aid against their Greek 'prisoners,' who were endeavouring to escape. In 860, *St. Cyril*, the Slav apostle, seems to have met—and to have been chivalrously treated by—some Magyars on his way to the Khagan of the Khazars. The Arabian writer *Ibn Rosteh* tells us that the 'Mazsgars' were 'Turks,' lived in tents on the shores of the Black Sea, and moved about in all directions to find suitable pasture for their cattle. They had about 20,000 mounted warriors, under the leadership of a certain 'Kende.' They had a large tract of wheat-producing ground. They worshipped idols. They ruled over their Slav neighbours, from whom they exacted tribute and whom they sold to Greek slave-merchants at Kark (Kherson).—A. B. Yolland, *Hungary*, pp. 12-14.—"The original abode of the Hungarians was in the country called Ugría or Jugoria, in the southern part of the Uralian mountains, which is now inhabited by the Voguls and Ostiaks, who are the eastern branches of the Finnish race. . . . Ugría is called Great Hungary by the Franciscan monk Piano Carpini [called the first noteworthy European explorer of the Mongol empire] who travelled in 1246 to the court of

the Great Khan. From Ugría the Hungarians were expelled by the Turkish tribes of Petchenegs and Chazars, and sought refuge in the plains of the Lower Danube, where they first appeared . . . between 829 and 842. They called themselves Magyars, but the Russians gave them the name of Ugri, as originating from Ugría; and this name has been corrupted into Ungri and Hungarians. Although it is difficult to believe that the present Magyars, who are the foremost people in Eastern Europe, are of the same race as the degraded Voguls and Ostiaks, this fact is not only attested by historical authority, and the unerring affinity of language; but, when they first appeared in the central parts of Europe, the description given of them by an old chronicler of the ninth century (quoted by Zeuss, p. 746) accords precisely with that of the Voguls and Ostiaks."—W. Smith (E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 55, note).—Not without interest is this speculation: "That a Majiar female ever made her way from the Ural Mountains to Hungary is more than I can find; the presumptions being against it. Hence it is just possible that a whole-blooded Majiar was never born on the banks of the Danube. Whether the other elements are most Turk or most Slavonic is more than I venture to guess."—R. G. Latham, *Ethnology of Europe*, ch. 11.—See also BALKAN STATES: Map showing distribution of nationalities.

Language of the Magyars. See PHILOLOGY: 20.

9th century.—Moravian kingdom of Svato-pluk. See MORAVIA: 9th century.

896.—Migration of Magyars to Europe and settlement in Hungary under Arpad.—"The Magyars . . . about the end of the 9th century . . . suddenly struck their tents, and pressed irresistibly forward to the very heart of Europe. . . . Immediately after crossing the eastern frontier (889), the Magyars elected for their chief Arpad, the son of Almos, who conducted them to the frontiers of Hungary. . . . The whole body under Arpad's guidance consisted of about a million, numbering among them about 200,000 warriors, and divided into seven tribes, each having its chief. The country which they prepared to take possession of, and the central part of which was then called Pannonia, was broken up into small parts, and inhabited by races dissimilar in origin and language; as Slavonians, Wallachians, a few Huns and Avars, as well as some Germans. . . . Arpad soon descended with his followers on those wide plains, whence Attila, four centuries before, swayed two parts of the globe. [Hence the Magyars were confounded with the Huns by Western peoples.] Most dexterous horsemen, armed with light spears and almost unerring bows, these invaders followed their leader from victory to victory, soon rendering themselves masters of the land [ancient Pannonia] lying between the Theiss and the Danube, carrying at the same time their devastations, on the one hand, to the Adriatic, and, on the other, towards the German frontiers. Having achieved the conquest, Arpad took up his residence on the Danubian isle, Csepel, though the seat of the court was Buda or Attelburg. . . . The love of their new dominion was far from curbing the passion of the Magyars for distant bloody adventure and plunder."—E. Szabad, *Hungary, past and present*, pt. 1, ch. 1.—See also BALKAN STATES: Races existing; EUROPE: Introduction to historic period; Migrations; RUMANIA: B.C. 5th century-A.D. 1241.

900-924.—Ravages in Italy. See ITALY: 900-924.

907-972.—Successors of Arpad.—Zoltan and Taksony.—“Arpad died in 907. It was the year in which the Magyars, at *Banhida*, routed the Bavarian hosts of Liutpold, who had invaded the country to avenge the inroads of 904. The delight caused by the brilliant triumph of their army was soon overshadowed by grief at the loss of the wise and statesmanlike prince whom they justly regarded as the ‘father of their country.’ . . . His youngest son, Zsolt [or Zoltan] (907-944), succeeded. . . . The Hungarians began that series of marauding expeditions into neighboring countries which is indelibly connected with the legendary exploits of *Budcsu*, *Lehel*, and *Botond*, and which, if not stopped in time, must have proved fatal to their existence as an independent nation. . . . Away they rode, westwards to Germany, plundering the fertile regions of Saxony and Thuringia, crossing the Rhine into France, pushing forwards as far as Bremen, carrying the terror of their name wherever they went. They penetrated—scattered bands of them—into Spain. . . . The reign of Val or Vaisz (944-947) was uneventful. He was a weak prince, with less individuality even than Zsolt, but Taksony (947-972)—apparently Zsolt’s second son—was of an entirely different character. The final blow to the Magyars’ lust of adventure—a blow that cured them effectually and led them to think more seriously of consolidating their own polity—was delivered during his reign.”—A. B. Yolland, *Hungary*, pp. 20-22.—The most daring deeds were undertaken by single chiefs, during the reign of Zoltan and his successor Taksony, which filled up the first part of the tenth century. The enervated and superstitious population of Europe thought the Magyars to be the scourge of God, directly dropped down from heaven; the very report of their approach was sufficient to drive thousands into the recesses of mountains and depths of forests, while the priests increased the common panic by mingling in their litanies the words, ‘God preserve us from the Magyars.’ . . . The irruptions of the Magyars were simultaneously felt on the shores of the Baltic, among the inhabitants of the Alps, and at the very gates of Constantinople. The emperors of the East and of Germany were repeatedly obliged to purchase momentary peace by heavy tributes; but Germany, as may be conceived from her geographical position, was chiefly exposed to the ravages of these new neighbours.”—E. Szabad, *Hungary, past and present*, pt. 1, ch. 1.—See also GERMANY: 911-936.

934-955.—Military prowess of Magyars.—Their power broken by Saxon princes.—Henry the Fowler and Otto the Great.—“The extraordinary successes which the Magyars obtained during the first thirty years of the tenth century were far more the result of their enemies’ divisions and ill-governance than of their own strength. The marvellous swiftness of their incursions made it hard to catch them; but if the eastern frontier of Germany and the passes of the Venetian Alps had been properly guarded by the systematic fortification of the chief strategical points, and if the mounted levies of all the frontier districts had been taught to act in unison, they could have been held back. Neither in Italy nor in Germany were these measures taken: the perpetual civil wars of the period 900-918 prevented any common action against the enemy. . . . Only once was a general levy of all Germany called out against the Magyars (910), and then it fought in three separate divisions many miles apart. . . . But their great

irruption into Venetia in 899, followed by an almost equally destructive raid into Bavaria in 900, was a complete surprise to the Christians, who had never suffered a serious invasion from the East since Charles the Great had crushed the Avars ninety years back. The moment which the Magyars chose for their invasion was an unhappy one for Italy and Germany. In the former country King Berengar was but lately freed from his first rival, Lambert of Spoleto, and was just about to start on his contest with a second pretender, Lewis of Provence (900-901). He was also much distracted by Saracen raids on Latium and Tuscany. In the German kingdom Lewis the Child wore the crown—he was a boy of no more than seven years old, the first minor who had worn the Carolingian crown. No strong regent governed for him, and the great vassals who had of late established themselves in the new duchies were about to plunge into a series of bloody and useless civil wars. . . . It was their rapid movement, far swifter even than that of the Danes, which alone made the Magyars formidable. The wide sweeps which some of their expeditions made far exceed in length any Viking raid. The most formidable of all were those of 924, 926, and 954. In the former they swept through Bavaria and Swabia, crossed the Rhine, ravaged Elsass and Lorraine, penetrated into Champagne, turned eastward again from the Ardennes and returned across Franconia to the Danube. In the second raid—a still more astonishing feat of horsemanship—they passed the Venetian Alps, swept over Lombardy (taking Pavia on their way), and then endeavoured to cross the Pennine Alps into Burgundy. Checked in the passes by Rodolf of Little Burgundy and Hugh, Count of Vienne, they turned south, and, taking a more unguarded route, burst into Provence and Septimania [southern France]. On their return journey Rodolf and Hugh cut off many of them, but the bulk seem to have got safely back to the Danube.”—C. Oman, *History of the art of war*, pp. 117, 119.

“The deliverance of Germany and Christendom was achieved by the Saxon princes, Henry the Fowler and Otho the Great, who, in two memorable battles, forever broke the power of the Hungarians.”—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 55.—“It was not till the advent of Henry the Fowler (or Henry the Builder, as contemporaries more wisely called him) that any check was set to the Magyars by either of the necessary expedients. Henry from his first accession showed himself a far more powerful prince than his unfortunate predecessors. . . . He set the whole population to work day and night to build . . . strongholds, and to construct houses inside them; these being finished he settled that each ninth man should dwell therein, and take care of the eight neighbouring houses which his companions were to occupy in time of war, while the eight were to pay the indweller in return one-third of the net products of their lands. . . . At first the new strongholds were little more than thinly-inhabited places of refuge, but ere long most of them became real towns. The founding of Merseburg, the easternmost and the most exposed bulwark of Saxony, deserves a special notice. Henry peopled it by sparing the life of every ‘strong thief’ that he caught, on condition that he should go to dwell at Merseburg and receive a grant of land in its environs. Strangely enough, this ‘legio collecta a latronibus,’ as the chronicler calls them, did very well in their new settlement, and, like Romulus’s robber band, made their city the centre of a

ARPAD TAKING POSSESSION OF HUNGARY  
(After painting by M. von Munkacsy)

strong community in a very few years. . . . When the [Magyar] invaders threw themselves on Thuringia, their smaller bands were cut to pieces by the local forces, who were now able to follow them at equal speed. Their main army was attacked by Henry himself, who had called up the cavalry of the neighbouring Franconian and Bavarian lands to join the Saxons and Thuringians. By showing only a small force, the levy of Thuringia alone, 'cum raro milite armato,' *i.e.*, with few mail-clad men, he enticed them to attack him. But when the whole German host suddenly displayed itself and charged, the Magyars broke and fled without staying to fight. A few were caught and slain, a good many were drowned in the Unstrut (which lay behind them), but the majority got off in safety and returned to Hungary. Such was the battle at Riade, which modern historians have generally called the battle of Merseburg, though it seems really to have been fought nearer to Erfurt than to the other city. Three years later Henry the Builder died, and was succeeded by his still more famous son, Otto the Great."—C. Oman, *History of the art of war*, pp. 120-121.

Twenty years after their defeat by Henry the Fowler (934) the Hungarians invaded the empire of his son, "and their force is defined, in the lowest estimate, at 100,000 horse. They were invited by domestic faction; the gates of Germany were treacherously unlocked, and they spread, far beyond the Rhine and the Meuse, into the heart of Flanders. But the vigour and prudence of Otho dispelled the conspiracy; the princes were made sensible that, unless they were true to each other, their religion and country were irrecoverably lost; and the national powers were reviewed in the plains of Augsburg. They marched and fought in eight legions, according to the division of provinces and tribes."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 55.—"The expedition of 954 was the most dreadful as it was the last, of all the great Magyar raids. In that year the invaders wasted first Bavaria, then Franconia: they crossed the Rhine near Wurms. Then the rebel Duke Conrad wickedly made a pact with them, and sent them guides to lead them to the lands of his private enemy, Reginald, Duke of Lower Lorraine. After harrying that duchy as far as Maestricht, they turned south, and suddenly descended the Meuse into France, where no one was expecting them. After burning every open village in the territories of Laon, Rheims, and Chalons, they swooped down on Burgundy. Here they met considerable resistance, but, forcing their way through the Burgundians, they dropped down into Italy, apparently by the Great St. Bernard, and finally hurried across Lombardy and over the Carnic Alps back to their own land. It was fortunate for Christian Europe that the Lechfeld victory was to fall into the next year, and that the wings of the Magyar vultures were to be forever clipped by Otto the Great (955). . . . The great Magyar invasions of 954 and 955 were a last rally of the plundering hordes, conscious that their prey was escaping them, and determined to try one more bold stroke before it was too late. The chroniclers record the fact that they had put every available horseman into the field, and that no such host had ever been seen before. We may compare the Hungarian army that marched on Augsburg in 955 to the Turkish army that marched on Vienna in 1683—it was the last desperate effort of a power conscious that its superiority was slipping from it. Nevertheless, King Otto had every

right to be proud of his victory on the Lechfeld on St. Lawrence's Day. His realm was still disturbed with the last throes of the great rebellion which he had put down in the previous year, and, as there were dangerous movements still working among the Slavs of the Lower Elbe and on the Lotharingian frontier, he had not been able to call out the full levy on his kingdom. There were hardly any Saxons, Thuringians, or Lotharingians, and very few Franconians with him. His army was composed of the cavalry of Bavaria and Swabia, with a thousand Franconians, and the same number of his Slavonic vassals the Bohemians, under their prince Boleslav. Hearing that Augsburg was besieged, and that its garrison was in great danger, Otto marched rapidly to its rescue, without waiting for further reinforcements. . . . On hearing of the king's approach, the Hungarians hastily raised the siege of Augsburg, and drew themselves up on the broad and level Lechfeld, a region very well adapted for the practice of their usual Parthian tactics. Otto, however, moved to meet them through broken ground which was unsuitable for their manoeuvres, and then camped by the side of the Lech. . . . The Magyars soon came in sight—a confused weltering mass of hundreds of small troops; the German chronicles say that they were a hundred thousand strong, and, however exaggerated the figure may be, they no doubt many times outnumbered Otto's host. Led by Duke Conrad, a lately pardoned rebel who had to win back his reputation for loyalty, the Franconian horse charged with such a fierce shock that the Magyars were completely routed, and fled in disorder to join their main body. Otto meanwhile, with his own division and the Bavarians, had been watching and containing the rest of the Magyars. When he saw the horde which had turned his flank crushed by Conrad, he hastily rearranged the disordered left wing, and ordered a general charge of his whole line. The Magyars, dismayed by the disaster which had befallen their detached corps, made a poor resistance. They were indeed wholly incapable of standing up to the Germans man to man: their horses were smaller, and very few of them wore any defensive armour. After letting fly a few volleys of arrows, they wheeled off and fled. . . . Three great chiefs who fell into Otto's hands were incontinently hung. So ended, as Witikind remarks, the greatest victory which Christendom had won over the heathen for two hundred years. . . . Since 933 Germany had found the raiders much less formidable than before, and the invasion of 955 was a desperate final rally. Just as in the history of the Ottoman assaults on Christian Europe we place the real moment of greatest danger during the siege of Vienna in 1529, not during that in 1683, so the most threatening time of the Magyar attack was undoubtedly in 933, when they had never yet received a check of importance, and not in 955, when they had already been met and turned back many times by Otto and Otto's generals. The danger, at any rate, was now wholly past. . . . In less than a generation after the Lechfeld the rôles of German and Magyar were wholly changed: the Christian is always advancing and the pagan recoiling. Otto, too, was able to cut a new 'march' out of the Pannonian lands which the Magyars had devastated and occupied in his grandfather's time. This was the new Bavarian Ostmark (073), destined to be famous under the name of Austria for many a future generation."—C. Oman, *History of the art of war*, pp. 119, 123-125.

972-1116.—Conversion of Magyars to Christianity.—Kingship conferred on the duke by the pope.—Annexation of Croatia and conquest of Dalmatia.—“Hungary was enclosed within limits which she was never again able to cross, and even within these limits the Magyars were not the only inhabitants; in almost every part they were surrounded by Slavs, whose language and laws were to exercise over them a lasting influence, and on the south-east they touched on that Romance or Wallachian element which, from the time of the Roman colonies of Trajan, had continued to develop there. Numerous marriages with these neighbours gradually modified the primitive type of the Magyars. . . . Geiza I. had married as his second wife [Sarolta] a sister of the duke of Poland, Mieczyslaw. She had been converted to Christianity, and, like Clotilde of France, this princess knew how to use her influence in favour of her religion. She persuaded her husband to receive the missionaries who came to preach the Gospel in the country of the Magyars, and Pilgrim, archbishop of Lorch, undertook the systematic conversion of the nation. The mention of him in the ‘Nibelungen Lied’ in connection with Etzel (Attila), king of the Huns [who died more than five hundred years before] is doubtless due to the memory of this mission. He sent priests from his diocese into Hungary, and in 974 he was able to announce to the pope 5,000 conversions. . . . The great Chekh apostle, St. Adalbert or Vojtech, bishop of Prague, continued the work begun by Pilgrim. About 994, he went to Gran (Esztergom), where the duke of Hungary then dwelt, and solemnly baptized the son of Geiza, to whom he gave the name of Stephen. Henceforth the court of the duke became the resort of knights from all the neighbouring countries, but especially from Germany, and these knights, entering into intimate relations with the native nobility, drew Hungary and the empire into still closer union. Prince Stephen, heir presumptive to the throne, married the princess Gisella, daughter of the duke of Bavaria, while one of the daughters of Geiza became the wife of the Polish duke Boleslaw, and another married Urseolus, doge of Venice. Through these alliances, Hungary obtained for itself a recognized place among European states, and the work begun so well by Geiza was completed by Stephen [the Pious (997-1038)], to whom was reserved the honour of establishing the position of his kingdom in Europe and of completing its conversion [to Latin Christianity, and not to the Orthodox or Uniate Greek]. . . . ‘Hungary became Catholic,’ says a Magyar historian, ‘not through apostolic teaching, nor through the invitation of the Holy See, but through the laws of king Stephen’ (Verböczy). . . . Stephen sent an ambassador to Rome, to treat directly with pope Sylvester [II], who graciously received the homage done by him for his kingdom, and, by a letter dated the 27th of March, 1000, announced that he took the people of Hungary under the protection of the Church. By the same brief he granted the royal crown to Stephen. . . . Besides this, he conferred on him the privilege of having the cross always borne before him, as a symbol of the apostolic power which he granted to him. The authenticity of this pontifical letter has indeed been disputed; but, however that may be, the emperor of Austria, king of Hungary, still bears the title of Apostolic Majesty. . . . Under

this great king, Hungary became a completely independent kingdom between the two empires of the East and West. . . . The laws of Stephen are contained in 56 articles divided into two books. His ideas on all matters of government are also to be found in the counsels which he wrote, or caused to be written, for his son Emerich. . . . The son for whom the great king had written his maxims died before his father, in 1031, and is honoured as a saint by the Church.”—L. Leger, *History of Austro-Hungary*, ch. 5.—Stephen “was destined to be one of the heroes of his nation. . . . [He] reigned altogether forty-two years—four years (997-1000) as prince and thirty-eight years (1000-1038) as ‘apostolic’ king. He was determined to continue the work of his father in consolidating the foundations of the Hungarian monarchy; but his zeal for the cause of Christianity was not based on merely political motives. . . . The closing years of Stephen’s reign were disturbed by rivalries and plots. He died on August 15, 1038, and was succeeded by his nephew, Peter, son of the doge Urseolus. The undisguised contempt of the new monarch . . . for the Magyars and his policy of conciliating his German and Italian friends by gifts of large estates created enormous dissatisfaction, even among those who had been loyal to Stephen. The very existence of the Church seemed jeopardised. His threat that he would reduce Hungary to the position of a vassal of the Roman Empire was the signal for open revolt. [Peter was driven out and] Samuel Aba, Stephen’s brother-in-law (1041-44) was elected King by the insurgents. The new monarch at once put the wicked counsellors of Peter to death; and the wretched creature fled for refuge to the Court of Henry III. Peter told the Emperor that the Christian faith was in danger in Hungary and that German influence was on the wane. Nothing more was needed to persuade the Emperor, who looked upon the spread of Christianity and the expansion of German power as the two main objects of his life, to invade Hungary. For two years the country had to suffer from the ravages of warfare, until in 1043, when Henry had penetrated as far as the Raba, Samuel craved for peace, which he obtained by the restoration of the territory acquired by Stephen (west of the Lajtha) and by gifts of incalculable wealth. This action of his was looked upon by many of the Hungarian nobles as disloyal and cowardly. Samuel heard of their disaffection and resolved to crush it by cruel treachery. Simulating a desire to accommodate their wishes, he invited fifty of the most prominent to meet him in a house at Csanád, where he had them surrounded and put to the sword. This act of wicked despotism merely added fuel to the flames of discontent. The flower of the Hungarian nobility rose against him. The Emperor took advantage of the internal discord to invade Hungary once more. At the battle of Ménfő (July 5, 1044) Samuel’s army was routed; the King himself was taken prisoner; the Emperor withdrew to Székesfehérvár, where he had Peter crowned. . . . The following year, at Whitsuntide, Peter invited the Emperor to his capital, where he took the oath of fealty to the Roman Empire, promising the payment of tribute and presenting Henry with the golden lance which symbolised the royal power of Hungary. Thus Peter reduced his country to the degrading position of a vassal state. . . . The whole nation rose in revolt against the man who had humiliated their pride; and, when the freemen despatched envoys to the exiled princes of the House of Árpád, Endre and Levente, who were in Russia,

they demanded the restoration of the ancestral faith. They had come to regard the Church, with her foreign priests, as a danger to their national existence. It was no difficult matter to impart their hatred to the masses, who dreaded the 'foreign intruders' and felt the burden of the tithes imposed on them by Stephen. Peter was taken prisoner; his eyes were put out; and he was cast into prison."—A. B. Yolland, *Hungary*, pp. 27, 40-41.—The Hungarians deposed Samuel Aba and elected Andrew, son of Ladislas the Bald (1046). Andrew was dethroned by his brother Bela in 1061. Both Andrew and Bela had bitter struggles with revived paganism, which was finally suppressed. "According to the Asiatic custom, which still prevails in Turkey, he was succeeded by his nephew Solomon. . . . This prince was only twelve years of age, and the emperor, Henry IV., took advantage of his youth to place him in a humiliating position of tutelage. . . . The enemies of Solomon accused him of being the creature of the Germans, and reproached him for having done homage to the emperor for a state which belonged to St. Peter. Pope Gregory VII, who was then struggling against the emperor [see PAPACY: 1056-1122], encouraged the rebels. 'The kingdom of Hungary,' he said, 'owes obedience to none but the Church.' Prince Geiza was proclaimed king in the place of Solomon, but he died without having reigned. He was succeeded by Ladislas the Holy (1077), who was able to make himself equally independent of emperor and pope. . . . The dying Ladislas chose his nephew Koloman as his successor. . . . The most important act of this reign [Koloman's, 1095-1116] was the annexation of Croatia. In 1090, St. Ladislas had been elected to the throne of Croatia, and he, on his death, left the government of it to his nephew Almos, who very soon made himself unpopular. Koloman drove him out of Croatia, and had himself proclaimed king. He next set about the conquest of Dalmatia from the Venetians, seized the principal towns, Spalato (Spljet), Zara (Zadir), and Trogir (Trau), and granted them full power of self-government. Then (1102) he had himself crowned, at Belgrade, king of Croatia and Dalmatia. From this time the position of Croatia, as regarded Hungary, was very much the same as the position of Hungary in regard to Austria in later times."—L. Leger, *History of Austro-Hungary*, ch. 5-6.—Koloman died in 1116. "The ferocity of his treatment of his brother and wife, due without doubt to the ravages of incipient madness brought on by bodily suffering . . . cannot overshadow . . . his greatness as a legislator and statesman, or the brilliance of his military exploits."—A. B. Yolland, *Hungary*, pp. 55-56.—See also BOSNIA: Origin of the name.

1116-1301.—German settlements in the Banat and Transylvania.—Golden Bull of Andrew II.—Invasion and frightful devastation by the Tatars.—End of the Arpad dynasty.—"Coloman was succeeded on the throne by his son Stephen [I], 1116-1131], who . . . was succeeded by Bela the Blind. The most important event of these reigns was the war with Venice about the possession of Dalmatia, and the annexation to the Hungarian crown of Rama, a part of Servia. In 1147, Geiza II. ascended the throne of St. Stephen. His reign was marked by several important events. Having entirely reduced Transylvania, he invited many Saxons and Flemish into his kingdom, some of whom settled in the Banat, in the south of Hungary."—E. Szabad, *Hungary, past and pres-*

*ent*, pt. 1, ch. 2.—Other "Flemish and Low-German settlers established themselves in Transylvania; who, under the name of Saxons, retain to this day the manners, customs, and institutions of their fatherland. By patience and industry, they have converted the land from a desert into a blooming region, with rich towns and prosperous villages, and have vigorously defended their liberties against all attacks."—G. Weber, *Outlines of universal history*, p. 195.—"In this principality the German settlers received from the king a separate district, being, besides, exempted from many taxes and endowed with particular privileges. . . . The following years of the 12th century, filled up by the reigns of Stephen III., Bela III., and Emerick, are marked by the continuance of the Venetian war, but present no incidents deserving of particular notice. More important was the reign of Andrew II., who ascended the throne in 1205. . . . Andrew, by the advice of the Pope, set out with a large army to the Holy Land [1216—see CRUSADES: 1216-1220], nominating the Ban, called Banko, viceroy of Hungary. While the Hungarian king spent his time in Constantinople, and afterwards in operations round Mount Tabor, Hungary became a scene of violence and rapine, aggravated by the careless and unconstitutional administration of the queen's foreign favourites, as well as by the extortions committed by the oligarchy on their inferiors. Receiving no support from the king of Jerusalem, Andrew resolved on returning home. On his arrival in Hungary, he had the mortification of finding, in addition to a disaffected nobility, a rival to the throne in the person of his son Bela. As the complaints of the nobles became daily louder, . . . the king resolved to confirm the privileges of the country by a new charter, called the Golden Bull [which somewhat resembles the English *Magna Carta* of 1215]. This took place in the year 1222. The chief provisions of this charter were as follows:—1st, That the states were henceforth to be annually convoked either under the presidency of the king or the palatine; 2d, That no nobleman was to be arrested without being previously tried and legally sentenced; 3d, That no contribution or tax was to be levied on the property of the nobles; 4th, That if called to military service beyond the frontiers of the country, they were to be paid by the king; 5th, That high offices should neither be made hereditary nor given to foreigners without the consent of the Diet. The most important point, however, was article 31st, which conferred on the nobles the right of appealing to arms in case of any violation of the laws by the crown. Other provisions contained in this charter refer to the exemption of the lower clergy from the payment of taxes and tolls, and to the determination of the tithes to be paid by the cultivators of the soil. [See also SUFFRAGE, MANHOOD: Hungary: 1222-1318.] Andrew died soon after the promulgation of the charter, and was succeeded by his son Bela IV. The beginning of this prince's reign was troubled with internal dissensions caused by the Cumans [an Eastern tribe which invaded Hungary in the latter half of the 11th century] who, after having been vanquished by St. Ladislaus, settled in Hungary between the banks of the Theiss and Marosch. But a greater and quite unexpected danger, which threatened Hungary with utter destruction, arose from the invasion of the Tartars. . . . Their leader Batu [Khan] . . . laid waste Poland and Silesia and poured with his innumerable troops into the heart of Hungary. Internal dissensions facilitated the triumph of the foe, and the battle fought on the banks of the

river Sajo (1241) terminated in the total defeat of the Hungarians. The Tartar hordes spread with astonishing rapidity throughout the whole country, which in a few weeks was converted into a chaos of blood and flames. [See also MONGOLIA: 1229-1294.] . . . The king Bela, in the meantime, succeeded in making his way through the Carpathian Mountains into Austria; but instead of receiving assistance from the arch-duke Frederick, he was retained as a prisoner. Having pledged three [western] counties of Hungary to Frederick, Bela was allowed to depart. . . . In the meantime Batu [Khan] was as prompt in leaving Hungary, in consequence of the death of the Tartar khan [Ogotai] . . . Bela was succeeded on the throne by his son Stephen, in the year 1270." The reign of Stephen was short. He was followed by Ladislaus IV, who allied himself with Rudolph of Hapsburg in the war which overthrew and destroyed Ottoacar or Ottocar, king of Bohemia (see AUSTRIA: 1246-1282). "The reign of this prince, called the Cuman, was, besides, troubled by most devastating internal dissensions, caused by the Cumans, whose numbers were continually augmented by fresh arrivals . . . from their own tribe as well as from the Tartars." Ladislaus, dying in 1290, was succeeded by Andrew III, the last Hungarian king of the house of Arpad. "This prince had to dispute his throne with Rudolph of Hapsburg, who coveted the crown of Hungary for his son Albert. The appearance, however, of the Hungarian troops before the gates of Vienna compelled the Austrian emperor to sue for peace, which was cemented by a family alliance, Andrew having espoused Agnes, daughter of Albert. . . . Nor did this matrimonial alliance with Austria secure peace to Hungary. Pope Nicholas IV. was bent upon gaining the crown of St. Stephen for Charles Martel, son of Charles d'Anjou of Naples, who put forward his claims to the Hungarian crown in virtue of his mother, Mary, daughter of king Stephen V.," transferring them at his death to Charles Robert, nephew of the king of Naples. Andrew III, the last Arpad, died in 1301.—E. Szabad, *Hungary, past and present*, pt. 1, ch. 2.

1301-1442.—House of Anjou and House of Luxemburg.—Conquests of Louis the Great.—Beginning of wars with the Turks.—House of Austria and the Jagellon dynasty.—On the extinction of the line of Arpad, in the male line of descent, by the death of Andrew III, in 1301, the crown was "contested by several competitors, and at length fell into the hands of the House of Anjou, the reigning family of Naples [see ITALY (Southern): 1343-1389]. Charles Robert, grandson of Charles II., King of Naples, by Mary of Hungary, outstripped his rivals [1310], and transmitted the crown to his son Louis, surnamed the Great [1342]. This prince [made Buda the capital]. . . . He conquered from the Venetians the whole of Dalmatia, from the frontiers of Istria, as far as Durazzo; he reduced the princes of Moldavia, Wallachia, Bosnia and Bulgaria to a state of dependence; and at length mounted the throne of Poland, on the death of his uncle, Casimir the Great [1370]. Mary, his eldest daughter, succeeded him in the kingdom of Hungary (1382). This princess married Sigismund of Luxemburg [afterwards emperor, 1411-1437—see GERMANY:

1347-1493], who thus [for a time] united the monarchy of Hungary to the Imperial crown. The reign of Sigismund in Hungary was most unfortunate. . . . He had to sustain . . . war against the Ottoman Turks; and, with the Emperor of Constantinople as his ally, he assembled a formidable army, with which he undertook the siege of Nicopolis in Bulgaria [see TURKEY: 1389-1403]. In his retreat he was compelled to embark on the Danube, and directed his flight towards Constantinople. This disaster was followed by new misfortunes. The malcontents of Hungary offered their crown to Ladislaus, called the Magnanimous, King of Naples, who took possession of Dalmatia, which he afterwards surrendered to the Venetians. Desirous to provide for the defence and security of his kingdom, Sigismund acquired, by treaty with the Prince of Servia, the fortress of Belgrade (1425), which, by its situation at the confluence of the Danube and the Save, seemed to him a proper bulwark to protect Hungary against the Turks."—C. W. Koch, *Revolutions of Europe, period 5*.—“Albert, afterwards the Emperor Albert II., was the first prince of the House of Habsburg that enjoyed the crowns of Hungary and Bohemia, which he owed to his father-in-law, the Emperor Sigismund, whose only daughter, Elizabeth, he had married. Elizabeth was the child of Barbara von Cilly, Sigismund's second wife, whose notorious vices had procured for her the odious epithets of the 'Bad,' and the 'German Messalina.' Barbara had determined to supplant her daughter, to claim the two crowns as her dowry, and to give them, with her hand, to Wladislaus, the young King of Poland, who, though 40 years her junior, she had marked out for her future husband. With this view she was courting the Hussite party in Bohemia: but Sigismund, a little before his death, caused her to be arrested; and, assembling the Hungarian and Bohemian nobles at Znaym, in Moravia, persuaded them, almost with his dying breath, to elect Albert as his successor. Sigismund expired the next day (Dec. 9th, 1437). Albert was soon after recognised as king by the Hungarian diet, and immediately released his mother-in-law Barbara, upon her agreeing to restore some fortresses which she held in Hungary. He did not so easily obtain possession of the Bohemian crown. . . . The short reign of Albert in Hungary was disastrous both to himself and to the country. Previously to his fatal expedition against the Turks in 1439, . . . the Hungarian diet, before it would agree to settle the succession to the throne, forced him to accept a constitution which destroyed all unity and strength of government. By the famous 'Decretum Alberti Regis,' he reduced himself to be the mere shadow of a king; while by exalting the Palatine [a magistrate next to the king in rank, who presided over the legal tribunals, and discharged the functions of the king in the absence of the latter], the clergy, and the nobles, he perpetuated all the evils of the feudal system. . . . The most absurd and pernicious regulations were now adopted respecting the military system of the kingdom, and such as rendered it almost impossible effectually to resist the Turks. . . . On the death of Albert, Wladislaus [Ladislaus] III., King of Poland [the second Polish king of the dynasty of Jagellon], was . . . elected to the throne of Hungary. . . . Albert, besides two daughters, had left his wife Elizabeth pregnant; and the Hungarians, dreading a long minority in case she should give birth to a son, compelled her to offer her hand to Wladislaus, agreeing that the crown should descend to their issue; but at the

same time engaging that if Elizabeth's child should prove a male, they would endeavour to procure for him the kingdom of Bohemia and the duchy of Austria; and that he should moreover succeed to the Hungarian throne in case Wladislaus had no issue by Elizabeth. . . . Scarcely had the Hungarian ambassador set off for the court of Wladislaus with these proposals, when Elizabeth brought forth a son, who, from the circumstances of his birth, was christened Ladislaus Posthumus. Elizabeth now repented of the arrangement that had been made; and the news having arrived that the archduke Frederick had been elected Emperor of Germany, she was induced to withdraw her consent to marry the King of Poland. Messengers were despatched to recall the Hungarian ambassadors; but it was too late—Wladislaus had accepted her hand, and prepared to enter Hungary with an army. . . . The party of the King of Poland, especially as it was headed by John of Hunyad, proved the stronger. Elizabeth was compelled to abandon Lower Hungary and take refuge at Vienna, carrying with her the crown of St. Stephen, which, with her infant son, she intrusted to the care of the Emperor Frederick III. (August 3rd, 1440). . . . In November 1442, Elizabeth and Wladislaus had an interview at Raab, when a peace was agreed upon, the terms of which are unknown; but it is probable that one of the chief conditions was a marriage between the contracting parties. The sudden death of Elizabeth, Dec. 24th, 1442, not without suspicion of poison, prevented the ratification of a treaty which had never been agreeable to the great party led by John of Hunyad, whose recent victories over the Turks gave him enormous influence."—T. 1442-1458.—Minority of Ladislaus Posthumus.—Regency of Hunyadi.—His defeat of the Turks and his death.—Matthias chosen king.—Peace between the factions was brought about by an agreement that "the Polish king should retain the government of Hungary until Ladislaus attained his majority; that he should be possessed of the throne in case the young prince died without issue; and the compact was sealed by affiancing the two daughters of Elizabeth to the King of Poland and his brother Casimir. The young Ladislaus was also acknowledged as King of Bohemia; and the administration during his minority vested in two Regents: Mainard, Count of Neuhaus, chosen on the part of the Catholics; and Henry Ptarsko, and after his death George Podiebrad, on that of the Hussites. The death of Wladislaus in the memorable battle of Warna [1444] again left Hungary without a ruler; and as Frederic III. persisted in retaining the young Ladislaus and the

crown of St. Stephen, the Hungarians entrusted the government to John Corvinus Huniades, the re-doubted defender of their country." In 1452, when the Emperor Frederic returned from Italy into Germany, "he found himself involved in a dispute with the Austrians, the Bohemians, and the Hungarians, in respect to the custody of the young Ladislaus. . . . As Ladislaus had now arrived at the age of thirteen, his subjects, but more particularly the Austrians, grew impatient of the detention of their sovereign at the imperial court. Whilst Podiebrad continued regent of Bohemia, and Huniades of Hungary, the affairs of Austria were directed by Frederic; and the unpopularity of his government caused a general anxiety for a change. But to give up the custody of his ward was contrary to the policy of the Emperor, and in the hope of silencing the Austrians he marched with a force against them. His enemies, however, proved too numerous; he was himself endangered by a siege in Neustadt; and compelled to purchase his deliverance by resigning the person of Ladislaus. The states of Austria, Bohemia, and Hungary then assembled at Vienna; Podiebrad and Huniades were confirmed in their regencies; and the administration of Austria, together with the custody of Ladislaus, was confided to his maternal great-uncle, Ulric, Count of Cilli. The resentment of Frederic does not appear to have been vehement; for in the following year [1453] he raised Austria to an arch-duchy, and by a grant of especial privileges placed the Duke of the province on a level with the Electors. After being crowned King of Bohemia at Prague, Ladislaus was invited by his Hungarian subjects to visit that kingdom. But the Count of Cilli, jealous of the power of Huniades, so far worked upon the young king's mind as to create in him suspicions of the regent's integrity. An attempt was made to seize Huniades by enticing him to Vienna; but he eluded the snare, exposed the treachery of Ulric, and prevailed on Ladislaus to visit his people. At Buda, an apparent reconciliation took place between the count and the regent; but Ulric still persisted in his design of ruining the credit of a man whom he regarded as a dangerous rival. In the moment of danger, the brave spirit of Huniades triumphed over his insidious traducer; the siege of Belgrade by the Turks [1456], under Mahomed II., threw Hungary into consternation; the royal pupil and his crafty guardian abandoned the Hungarians to their fate and precipitately fled to Vienna; whilst Huniades was left to encounter the fury of the storm. . . . The undaunted resistance of that renowned captain preserved Belgrade; the Turks, after a desperate struggle, were compelled to abandon the siege; their loss amounted to 30,000 men; and the Sultan himself was severely wounded [see TURKEY: 1451-1481]. The great defender did not long survive his triumph; dying, soon after the retreat of the enemy, of a fever occasioned by his extraordinary exertions. [John] Huniades left two sons, Ladislaus and Matthias Corvinus, who were as much the idols of their country as they were objects of jealousy to Ulric and the King. The latter, indeed, took care to treat them with every mark of external respect; but the injurious behaviour of the count provoked Ladislaus Corvinus to open violence; and, in a personal encounter, Ulric received a mortal wound. Enraged at the death of his favourite yet dreading the vengeance of the people, King Ladislaus resorted to treachery; and the brothers being lured into his power, the younger was beheaded as a murderer [1457]. Matthias was preserved from death by the menaces of the indignant Hungarians; the terrified monarch

fled with his prisoner to Prague; and being there attacked by a malignant disease, was consigned to a premature grave after suffering for only a few hours. The death of Ladislaus Posthumus plunged the Emperor into new difficulties. His succession to the Austrian territory was opposed by his brother Albert VI., whose hostility had long troubled his repose. The Bohemians rejected his claim to their throne, and conferred the crown on the more deserving Podiebrad [1458]. The Hungarians testified their regard for the memory of Huniades Corvinus by electing his son Matthias, who purchased his liberty from Podiebrad for 40,000 ducats. Thus baffled in his views, Frederic consoled himself with his retention of the crown of St. Stephen; and his pertinacity in respect to this sacred relique involved him in a war with the new King of Hungary."—R. Comyn, *History of the western empire*, v. 2, ch. 28.—Matthias Corvinus was king for thirty-two years.—See also AUSTRIA: 1438-1403; BOSNIA: 1453-1528.

1444.—Walachia taken from the Turks. See TURKEY: 1402-1451.

1471-1487.—Wars of Matthias with Bohemia, Poland, the emperor and the Turks.—Conquest and occupation of Austria.—Matthias of Hungary was now involved in wars with Bohemia and Poland; "his whole kingdom was agitated by intestine commotions; . . . a strong party of nobles breaking out into insurrection, . . . offered the crown to Casimir, prince of Poland. At the same time, the Turks having subdued Transylvania, and ravaged Dalmatia and Croatia, built the fortress of Szabatch on the Save, and from thence harassed Hungary with perpetual inroads. From these impending dangers, Matthias extricated himself by his courage, activity, and prudence. While he carried the war into Bohemia and Silesia, he awed, by his presence, his rebellious subjects, conciliated by degrees the disaffected nobles, expelled the Poles, and, by an important victory in the vicinity of Breslau, over the united armies of Poles and Bohemians, forced the two sovereigns, in 1474, to conclude an armistice for three years and a half. He availed himself of the suspension of arms to repel the Turks. He supported Stephen Bathori,

hospodar of Wallachia, who had shaken off the Ottoman yoke, by a reinforcement of troops, enabled him to defeat Mahomet himself [on the plain of Kenyer-Mesö, October, 1479], at the head of 100,000 men, and soon afterwards secured his frontiers on the side of the Danube by the capture of Szabatch. Having in consequence of these successes delivered his dominions from the aggressions of the Turks, he hastened to gratify his vengeance against the emperor, whose conduct had afforded so many causes of complaint. After instigating Matthias to make war on George Podiebrad, Frederic had abandoned him in the midst of the contest, had refused to fulfil his promise of investing him with the kingdom of Bohemia, had concluded an alliance with the kings of Poland and Bohemia [Casimir IV and his son, Ladislaus], and, on the 10th of June, 1477, formally conferred on Ladislaus the investiture of the crown." Matthias, as soon as he had freed himself from the Turks (1479), declared war against the emperor and invaded Austria. "Frederic, left without a single ally, was unable to make the smallest resistance, and in less than a month Matthias overran the greater part of Lower Austria, invested the capital, and either besieged or captured all the fortresses of the Danube, as far as Krems and Stein. Frederic fled in dismay to Lintz, and, to save his capital, was reduced to accept the conditions imposed by the conqueror," which included a promised payment of 100,000 ducats. This payment the shifty emperor evaded, when Matthias became involved anew, as he presently did, in hostilities with Bohemia and Poland. "Matthias, irritated by his conduct, concluded a peace with Ladislaus, by which he acknowledged him as king of Bohemia, and agreed that Moravia, Silesia, and Lusatia [which had been surrendered to him in 1475] should revert to the crown of Bohemia, in case of his death without issue. He then again invaded Austria; but his arms were not attended with the same rapid success as on the former invasion. . . . It was not till after a contest of four years, which called forth all the skill and perseverance of the warlike monarch and his most experienced generals, that they obtained possession of the capital [1485] and the neighbouring fortresses, and completed the subjugation of Lower Austria, by the capture of Newstadt, the favourite residence of the emperor. Frederic, driven from his hereditary dominions, at first took refuge at Gratz; and, on the approach of danger, wandered from city to city, and from convent to convent." After many appeals, he persuaded Albert, duke of Saxony, to take the field in his behalf; but Albert, with the small force at his command, could only retard the progress of the invader, and he soon concluded an armistice with him. "In consequence of this agreement, he [Albert of Saxony], in November, 1487, abandoned Austria, and Matthias was permitted to retain possession of the conquered territories, until Frederic had discharged his former engagement, and reimbursed the expenses of the war; should Matthias die before that period, these states were to revert to their sovereign."—W. Coxe, *History of the House of Austria*, v. 1, ch. 18.—"Matthias shone in the arts of peace as well as in those of war. A new university was founded by him in Buda, a library established, and the civilisation of the people promoted by the introduction from all quarters of men of learning and artists, printers and architects, gardeners, persons skilled in agriculture, and artificers. These advantages were again lost under his successors."—G. Weber, *Outlines of universal history*, p. 195.—See also AUSTRIA: 1471-1491.

1487-1526.—Death of Matthias.—Election of Wladislaw, or Ladislaus, of the Polish house of Jagellon.—Union of the crowns of Hungary and Bohemia.—Loss of the Austrian provinces.—Treaty of succession with Maximilian.—Insurrection of the Kurucs.—Loss of Belgrade.—Great Turkish invasion and ruinous battle of Mohacs.—End of Hungarian independence.—“When once the archduchy of Austria was conquered, Mathias, who was already master of Moravia and Silesia, had in his power a state almost as large as the Austria of the present time, if we except from it Galicia and Bohemia. But his power had no solid foundation. While the influence of the house of Austria had been increased by marriage, Mathias Corvinus had no legitimate heir. He made several attempts to have his natural son, John Corvinus, born in Silesia, recognized as his successor; but he died suddenly (1490) at the age of 50, without having arranged anything definitely for the future of his kingdom. . . . Hungary reached her highest point in the reign of Mathias Corvinus, and from this time we shall have to watch her hopeless decay. The diet, divided by the ambition of rival barons, could decide on no national king, and so turned to a foreigner. Wladyslaw II., of the [Polish] house of Jagellon, was elected, and thus a king of Bohemia and an old rival of Mathias, united the two crowns of St. Vacsav and St. Stephen—a union which had been so ardently hoped for by Mathias, and for which he had waged the miserable war against Bohemia. . . . The beginning of the new reign was not fortunate. Maximilian [son of the emperor Frederic] recovered the Austrian provinces, and John of Poland declared war against his brother, Wladyslaw, and obliged him to cede part of Silesia to him. Maximilian invaded the west of Hungary, . . . whence he only consented to retire after Wladyslaw had agreed to a treaty, which secured Hungary to the house of Austria, in case of Wladyslaw dying without children. This treaty, in which the king disposed of the country without consulting the diet, roused universal indignation. . . . Meanwhile, the Turks thronged round the southern frontier of the kingdom. Bajazet II. had failed to capture Belgrade in 1492, but he could not be prevented from forcing his way into the valley of the Save, and beating the Hungarian army, which was badly paid and badly disciplined. . . . Wladyslaw had one son, Louis. Surrounded by the net of Austrian diplomacy, he had affianced this son in his cradle to Mary of Austria, the sister of Charles V., and later on he undertook, in defiance of public opinion, to leave the crown to his daughter Anne, who was betrothed to Ferdinand of Austria, if Louis should die without heirs. . . . To add to the miseries of his reign, a peasant rising, a terrible Jacquerie, took place. . . . In 1513, [the chancellor] Cardinal Bacracz came from Rome, bringing with him the papal bull for a crusade against the infidels; whereupon the peasants armed themselves, as if they were about to march against the Turks, and then turned their arms against the nobles. This terrible insurrection is called in Hungarian history the insurrection of the Kurucs (Kouroutses, cruciati) crusaders. . . . The chief leader of the insurrection, the peasant Dosza, was one of the Szeklers of Transylvania. . . . Dosza was beaten in a battle near Temesvar, and fell into the hands of his enemies [led by John Zapolya, voivode of Transylvania and Stephen Batory]. Their vengeance was terrible. The king of the peasants was seated on a throne of fire, and crowned by the executioner with a red-hot crown.

He bore his frightful sufferings with a courage that astonished his adversaries. . . . The feeble Wladyslaw died in 1515, and the reign of the child-king, Louis II., may be summed up in two catastrophes, the loss of Belgrade and the defeat at Mohacs. The young king, married in his cradle, was corrupt and dissolute, and quite incapable of governing, and his guardians could not rise to the height of the occasion. The finances of the kingdom were in great disorder, and the leading barons quarrelled continually over the shreds of sovereignty still left. . . . This state of things was of the greatest use to the Turks, for while Hungary was sinking ever deeper into anarchy, Turkey was ruled by the great sovereign who was called Soliman the Magnificent. It was not long before he found a pretext for war in the arrest of one of his subjects as a spy, and assembled his troops at Sophia, captured Shabats [Szahatch], laid siege to Belgrade and took it, making it thenceforward a Mussulman fortress (1521). The key

LOUIS II

of the Danube was now in the hands of the Turks. . . . King Louis begged for help on every side. . . . The Austrian princes were ready to help him from interested motives; but even when joined with Hungary they were too feeble to conquer the armies of ‘the Magnificent.’ On the 25th of April, 1526, Soliman quitted Constantinople, bringing with him 100,000 men and 300 cannon, taking up arms not only against Hungary, but against the empire. One of the pretexes for his expedition was the captivity of Francis I.; he wished, he said, to save ‘the hey of France’ from the hands of the Germans and their allies the Hungarians. He crossed the Save near Osiek (Essek), captured Petervardin, and came up with the Hungarians at Mohacs, on the right bank of the Danube (August 26, 1526). The Magyar army was commanded by the king in person, assisted by Paul Tomory, archbishop of Kalocsa, one of the warlike bishops of whom Hungary gives us so many examples; by George Szapolyai, and by Peter Perenyi, bishop of Nagy-Varad (Great Varadin). Perenyi wished to treat with the Turks, in order to gain time for help to reach them from Croatia and Transylvania, but the impetuosity of Tomory

decided on immediate battle. . . . At first, it seemed as if the battle was in favour of the Magyars; but Soliman had commanded that the front ranks of his army should give way before the Hungarian cavalry, and that then the main body of his troops should close around them. When the Magyars were thus easily within reach, they were overwhelmed by the Turkish artillery and forced to retreat. They took refuge in some marshy land, in which many of them lost their lives. The king had disappeared; Tomory was slain; seven bishops, 22 barons, and 22,000 men were left upon the field. The road to Buda lay open before the invaders, and after having laid waste the whole country on their way, they reached the capital, where the treasures which Matbias Corvinus had collected in his palace and his library were either carried off or committed to the flames. . . . Then the tide of invasion gradually retired, leaving behind it a land covered with ruins. The independent existence of Hungary ended with Louis II.—L. Leger, *History of Austro-Hungary*, ch. 15.—See also AUSTRIA: 1496-1526.

1526-1567.—Election of John Zapolya to the throne.—Rival candidacy and election of Ferdinand of Austria.—Zapolya's appeal to the Turks.—Great invasion by Soliman.—Siege of Vienna.—Sultan master of the greater part of the country.—Progress of the Reformation.—Soliman's last invasion.—"Louis left no heir to the throne, while his wife Mary, archduchess of Austria, far from trying to possess herself of the helm of the state, was already on her way to Vienna, even before the results of the battle of Mohacs had become fully known. The vacant throne found thus an aspirant in John Zapolya, waivod of Transylvania and count of the Zips, who lay encamped with a mighty army at Szegedin, on his march to the plain of Mohacs. . . . The Diet, which met on the plain of Rakos (1526), proclaimed Zapolya king. . . . The day of coronation was soon fixed, the waivod receiving his royal unction at Weisenburg. Stephen Batory, the palatine, however, actuated by envy rather than ambition, first attempted to oppose to the new king the interests of the widow of Louis II. But the Austrian archduchess, unwilling to enter the field as a competitor for the crown, handed over her role to her brother Ferdinand I. of Austria, who was married to Anne, sister of the late Hungarian king. Ferdinand soon repaired to Presburg, a town beyond the reach of Zapolya's arms, where he was elected king of Hungary by an aristocratic party, headed by the palatine Batory, Francis Batthany, Ban of Croatia, and Nadasdy." After a fruitless conference between representatives of the rival kings, they proceeded to war. Zapolya was "master of the whole country, except some parts beyond the Danube," but he remained inactive at Buda until the Austrians surprised him there and forced him to evacuate the capital. "Not able to make head against the foreign mercenaries of Ferdinand. Zapolya was soon obliged to confine himself to the northern frontiers, till he left the kingdom for Poland, there to solicit help and concert measures for the renewal of the war (1528)." Receiving no encouragement from the king of Poland, Zapolya at length addressed himself to the great enemy of Hungary, the sultan Soliman. The Ottoman conqueror made instant preparations to enter Hungary as the champion of its native king. Thereupon "Zapolya organized

a small army, and crossed the frontiers. His army was soon swelled to thousands, and he had possessed himself of the greatest part of Upper, before Soliman began to pour down on Lower Hungary. . . . Proclaiming to the people that his army was not come to conquer, but to assist their elected native king, Soliman marched onwards, took Buda, Gran, and Raab, all of them shamelessly given up by Ferdinand's mercenaries, and moved on opposed to the walls of Vienna [1529]. Ferdinand, in his distress, invoked the assistance of Germany [see GERMANY: 1530-1532]; but his brother [the] emperor, as well as the Diet of Spire, engrossed with Luther and his followers, . . . were not forward to render their assistance. Vienna, however, though neglected by the German emperor, was momentarily saved by the advanced state of the season; for winter being at hand, the Turks, according to their usage at that season, took their way home." The besieging army of Turks is said to have numbered 250,000 men; while the river swarmed with 400 Turkish boats. Twenty fierce assaults were made upon the defenses of the city in as many days. The suburbs were destroyed and the surrounding country terribly ravaged. Before raising the siege, the baffled Turk massacred thousands of captives, under the walls, only carrying away into slavery the young and fair of both sexes. The repulse of Soliman is "an epoch in the history of the world."—E. S. Creasy, *History of the Ottoman Turks*, ch. 9.—"Zapolya, having taken up his position in Buda, ruled over the greatest part of Hungary; while Croatia submitted to Ferdinand. . . . A useless war was thus for a while carried on between the two rival sovereigns, in the midst of which Buda had to sustain a heavy siege conducted by General Rogendorf; but the garrison, though reduced so far as to be obliged to eat horseflesh, succeeded in repelling and routing the Austrian besiegers (1530)." Ferdinand now humbled himself to the sultan, beseeching his friendship and support, but in vain. The war of the rival kings went on until 1538, when it was suspended by what is known as the Treaty of Grosswardein, which conceded to each party possession of the parts of the country which he then occupied; which gave the whole to Zapolya if Ferdinand died without male issue, and the whole to Ferdinand if Zapolya died before him, even though Zapolya should leave an heir—but the heir, in this latter case, was to marry Ferdinand's daughter. This treaty produced immense indignation in the country. "That the never-despairing and ambitious Zapolya meant that step rather as a means of momentary repose, may safely be assumed; but the development of his schemes was arrested by the hand of death (1540), which removed the weary warrior from these scenes of blood, at the very moment when his ears were gladdened by the news that he had become the father of a son." Ferdinand now claimed the undivided sovereignty, according to the terms of the Treaty of Grosswardein; but the queen-dowager Isabella, wife of John Zapolya, maintained the rights of her infant son. She was supported by a strong party, animated and led by one George Martinussius, a priest of extraordinary powers. Both Ferdinand and Isabella appealed to the sultan, as to an acknowledged suzerain. He declared for young Zapolya, and sent an army to Buda to establish his authority, while another Turkish army occupied Transylvania. "Soliman soon followed in person, made his entry into Buda [1541], which he determined to keep permanently occupied during the minority of Sigismund." It remained the seat of a

Turkish pasha until 1686. "Transylvania owned the sway of Sigismund Zapolya, while Ferdinand, in spite of the crown of the German empire, recently conferred upon him, . . . was fain to preserve in Hungary some small districts, contiguous to his Austrian dominions. . . . In the year 1563, Ferdinand convoked his party at Presburg," and prevailed upon them to go through the form of electing his son Maximilian to the Hungarian throne. "Ferdinand soon after died (1564), leaving three sons. Of these, Maximilian succeeded his father in Austria; Ferdinand inherited the Tyrol; and Charles, the youngest son, got possession of Styria. Maximilian, who, in addition to his Austrian dominions, succeeded to the throne of Bohemia and to that of the German empire, proved as impotent in Hungary as his father had been. The Pasha of Buda ruled the greater part of Hungary proper; Sigismund Zapolya continued to maintain his authority in Transylvania. . . . The sectarian spirit, though somewhat later than elsewhere, found also its way into this land of blood, and Hungary was soon possessed of considerable bodies of Lutherans and Calvinists, besides a smaller number of Anabaptists and Socinians. . . . Calvin's followers were mostly Magyars, while Lutheranism found its centre point in the German population of Transylvania." In 1566, Maximilian, encouraged by some subsidies obtained from his German subjects, began hostilities against the Turks and against Sigismund in Transylvania. This provoked another formidable invasion by the great sultan Soliman. The progress of the Turk was stopped, however, at the fortress of Szigeth, by a small garrison of 3,000 men, commanded by Nicholas Zriny. These devoted men resisted the whole army of the Moslems for nearly an entire month, and perished, every one, without surrendering their trust. Soliman, furious at the loss of 20,000 men, and the long delay which their obstinate valor caused him, died of apoplexy while the siege went on. This brought the expedition to an end, and Maximilian "brought a new peace at the hands of Selim II., son of Soliman, for a tribute of 30,000 ducats (1567). Shortly after; Maximilian was also relieved of his rival, John Sigismund Zapolya, who died a sudden death."—E. Szabad, *Hungary, past and present*, pt. 2, ch. 1.

1567-1604.—Cession of the principality of Transylvania to the House of Austria, and consequent revolt.—Religious persecutions of Rudolph.—Successful rebellion of Botskai.—Continued war with the Turks.—"John Sigismund dying on the 16th of March, 1571, soon after the peace, all his possessions in Hungary reverted to Maximilian. The diet of Transylvania chose Stephen Bathori, who had acted with great reputation as the general and minister of John Sigismund; and Maximilian, although he had recommended another person, prudently confirmed the choice. . . . The new waivode was accordingly confirmed, both by Maximilian and the Turks, took the oath of fidelity to the crown of Hungary, and continued to live on terms of friendship and concord with the emperor. . . . Maximilian being of a delicate constitution, and declining in health, employed the last years of his reign in taking precautions to secure his dignities and possessions for his descendants. Having first obtained the consent of the Hungarian states, his eldest son Rhodolph was, in 1572, crowned king of Hungary, in a diet at Presburgh." Subsequently, the election of Rudolph by the Bohemian diet was likewise

procured, and he was crowned king of Bohemia on September 22, 1575. A few weeks later, the same son was chosen and crowned king of the Romans, which secured his succession to the imperial dignity. This latter crown fell to him the following year, when Maximilian died. Educated in Spain and by the Jesuits, the new emperor was easily persuaded to reverse the tolerant policy of his father, and to adopt measures of repression and persecution against the Protestants, in the Austrian provinces, in Hungary and in Bohemia, which could not long be endured without resistance. "The first object of Rhodolph had been to secure his dominions in Hungary against the Turks. In order to diminish the enormous expense of defending the distant fortresses on the side of Croatia, he transferred that country, as a fief of the empire, to his uncle Charles, duke of Styria, who, from the contiguity of his dominions, was better able to provide for its security. Charles accordingly constructed the fortress of Carlstadt [near Agram], on the Kulpa, which afterwards became the capital of Croatia, and a military station of the highest importance. He also divided the ceded territory into numerous tenures, which he conferred on freebooters and adventurers of every nation, and thus formed a singular species of military colony. This feudal establishment gradually extended along the frontiers of Slavonia and Croatia, and not only contributed, at the time, to check the incursions of the Turks, but afterwards supplied that lawless and irregular, though formidable military force . . . who, under the names of Croats, Pandours, and other barbarous appellations, spread such terror among the enemies of Austria on the side of Europe. . . . Notwithstanding the armistice concluded with the Sultan by Maximilian, and its renewal by Rhodolph in 1584 and 1591, a predatory warfare had never ceased along the frontiers." The truce of 1591 was quickly broken in a more positive way by Sultan Amurath, whose forces invaded Croatia and laid siege to Siseck. They were attacked there and driven from their lines, with a loss of 12,000 men. "Irritated by this defeat, . . . Amurath published a formal declaration of war, and poured his numerous hordes into Hungary and Croatia. The two following years were passed in various sieges and engagements, attended with alternate success and defeat; but the advantage ultimately rested on the side of the Turks, by the capture of Siseck and Raab. In 1595, a more favourable though temporary turn was given to the Austrian affairs, by the defection of the prince of Transylvania from the Turks. On the elevation of Stephen Bathori to the throne of Poland, his brother Christopher succeeded him as waivode of Transylvania, and, dying in 1582, left an infant son, Sigismund, under the protection of the Porte. Sigismund, who possessed the high spirit and talents of his family, had scarcely assumed the reins of government before he liberated himself from the galling yoke of the Turks, and in 1595 concluded an offensive alliance with the house of Austria. . . . He was to retain Transylvania as an independent principality, the part of Hungary which he still held, and Moldavia and Wallachia. . . . The conquests of both parties were to be equally divided. . . . By this important alliance the house of Austria was delivered from an enemy who had always divided its efforts, and made a powerful diversion in favour of the Turks. Sigismund signalised himself by his heroic courage and military skill; uniting with the waivodes of Moldavia and Wallachia, he defeated the grand vizir,

Sinan, took Turgovitch by storm, and drove the Turks back in disgrace towards Constantinople. Assisted by this diversion, the Austrians in Hungary were likewise successful, and not only checked the progress of the Turks, but distinguished their arms by the recovery of Gran and Vissegrad. This turn of success roused the sultan Mahomet, the son and successor of Amurath. . . . He put himself, in 1596, at the head of his forces, led them into Hungary, took Erlau, and defeating the Austrians under the archduke Maximilian, the lateness of the season alone prevented him from carrying his arms into Austria and Upper Hungary, which were exposed by the loss of Raab and Erlau. As Mahomet could not a second time tear himself from the seraglio, the war was carried on without vigour, and the season passed rather in truces than in action. But this year, though little distinguished by military events, was memorable for the cession of Transylvania to Rhodolph, by the brave yet fickle Sigismund, in exchange for the lordships of Ratibor and Oppelen in Silesia, with an annual pension." The capricious Sigismund, however, soon repenting of his bargain, reclaimed and recovered his Transylvanian dominion, but only to resign it again, in 1590, to his uncle, and again to repossess it. Not until 1602, after much fighting and disorder, was the fickle-minded and troublesome prince sent finally to retirement, in Bohemia. Transylvania was then placed under the government of the imperial general Basta. "His cruel and despotic administration driving the natives to despair, they found a chief in Moses Tzekeli, who, with other magnates, after ineffectually opposing the establishment of the Austrian government, had sought a refuge among the Turks. Tzekeli, at the head of his fellow exiles, assisted by bodies of Turks and Tartars, entered the country, was joined by numerous adherents, and, having obtained possession of the capital and the adjacent fortresses, was elected and inaugurated prince of Transylvania. His reign, however, was scarcely more permanent than that of his predecessor; for, before he could expel the Germans, he was, in 1603, defeated by the new waivode of Wallachia, and killed in the confusion of the battle. In consequence of this disaster, his followers dispersed, and Basta again recovered possession of the principality. During these revolutions in Transylvania, Hungary had been the scene of incessant warfare between the Austrians and the Turks, which exhausted both parties with little advantage to either. . . . Rhodolph had long lost the confidence of his Hungarian subjects. . . . He treated the complaints and remonstrances of his subjects with contempt and indifference; and the German troops being free from control, filled the country with devastation and pillage. While, however, he abandoned the civil and military affairs to chance, or to the will of his officers, he laboured to fetter his subjects with religious restrictions, and the most intolerant edicts were issued against the Protestants, in various parts of the kingdom. . . . The disaffected increasing in numbers, soon found a leader in Stephen Botskai, the principal magnate of Upper Hungary, uncle of Sigismund Bathori. . . . The discontents in Transylvania, arising from the same causes as the rebellion in Hungary, greatly contributed to the success of Botskai. . . . Being in 1604 assisted by a Turkish army, which the new sultan, Achmet, despatched into Transylvania, he soon expelled the Austrians, and was formally inaugurated sovereign. . . . But Botskai [Bocskay] was too disinterested or too prudent to accept the regal dignity [of Hungary, although the grand

vizier of the sultan proclaimed him king]. He acted, however, with the same vigour and activity as if he had a crown to acquire; before the close of the campaign he conquered all Upper Hungary, almost to the walls of Presburg; at the same time the Turks reduced Gran, Vissegrad and Novi-grad."—W. Coxe, *History of the House of Austria*, v. 2, ch. 38-42.

ALSO IN: J. H. M. D'Aubigne, *History of the Protestant church in Hungary*, ch. 12-20.

1595-1606.—Turkish war.—Great defeat at Cereses.—Peace of Sitvatorok.—"The disasters which the Turkish arms were now experiencing in Wallachia and Hungary made the Sultan's best statesmen anxious that the sovereign should, after the manner of his great ancestors, head his troops in person, and endeavour to give an auspicious change to the fortune of the war. . . . The Imperialists, under the Archduke Maximilian and the Hungarian Count Pfalfy, aided by the revolted princes of the Danubian Principalities, dealt defeat and discouragement among the Ottoman ranks, and wrung numerous fortresses and districts from the empire. . . . Mahomet III. left his capital for the frontier. . . . The display of the sacred standard of the Prophet, which now for the first time was unfurled over a Turkish army, excited . . . the zeal of the True Believers. . . . The Grand Vizier, Ibrahim Pacha, Hassan Sokolli Pacha, and Cicala Pacha, were the principal commanders under the Sultan. . . . Archduke Maximilian, who commanded the Imperialists, retired at first before the superior numbers of the great Ottoman army; and the Sultan besieged and captured Erlau. The Imperialists now having effected a junction with the Transylvania troops under Prince Sigismund, advanced again, though too late to save Erlau; and on October 23rd, 1596, the two armies were in presence of each other on the marshy plain of Cereses, through which the waters of the Cincia ooze towards the river Theiss." Repeatedly, the effeminate sultan wished to order a retreat, or to betake himself to flight; but was persuaded by his counsellors to remain on the field, though safely removed from the conflict. On the third day the battle was decided in favor of the Turks by a charge of their cavalry under Cicala. "Terror and flight spread through every division of the Imperialists; and in less than half an hour . . . Maximilian and Sigismund were flying for their lives, without a single Christian regiment keeping their ranks, or making an endeavour to rally and cover the retreat. 50,000 Germans and Transylvanians perished in the marshes or beneath the Ottoman sabre. . . . Mahomet III. eagerly returned after the battle to Constantinople, to receive felicitations and adulation for his victory, and to resume his usual life of voluptuous indolence. The war in Hungary was prolonged for several years, until the peace of Sitvatorok [November 11, 1606] in the reign of Mahomet's successor. . . . No change of importance was made in the territorial possessions of either party, except that the Prince of Transylvania was admitted as party to the treaty, and that province became to some extent, though not entirely, independent of the Ottoman Empire."—E. S. Creasy, *History of the Ottoman Turks*, ch. 12.

1606-1660.—Pacification of Vienna.—Rudolph relinquishes power and regalia to Mathias.—Gabriel Bethlem of Transylvania and the Bohemian revolt.—Participation and experience in the Thirty Years' War.—In 1606, the Archduke Mathias—who had lately been appointed to the governorship of Hungary, and who had been acknowledged, by a secret compact among the

members of the Hapsburg family as the head of their house—arranged the terms of a peace with Botskai. This treaty, called the "Pacification of Vienna," restored the religious toleration that had been practised by Ferdinand and Maximilian; provided that Mathias should be lieutenant-general of the kingdom; gave to Botskai the title of prince of Transylvania and part of Hungary; and stipulated that on the failure of his male issue these territories should revert to the House of Austria. "Botskai died in 1606, and was succeeded by Sigismund Rakoczi, who, however, soon abdicated in favour of Gabriel Bathori." At this time the plans of the Austrian family for taking the reins of power out of the feeble and careless hands of the Emperor Rudolph, and giving them to his more energetic brother, the Archduke Mathias, came to a head (see GERMANY: 1556-1609). Mathias "marched into Bohemia: and Rodolph, after a feeble resistance, found himself abandoned by all his supporters, and compelled to resign into the hands of Mathias Hungary, Austria and Moravia, and to guarantee to him the succession to the crown of Bohemia; Mathias in the meantime bearing the title of king elect of that kingdom, with the consent of the states. Rodolph at the same time delivered up the Hungarian regalia, which for some time past had been kept at Prague." Before his coronation, Mathias was required by the Hungarian diet to sign a compact, guaranteeing religious liberty; stipulating that the Hungarian chamber of finances should be independent of that of Austria, that all offices and employments should be filled by natives, and that the Jesuits should possess no real property in the country. The peace of the country was soon disturbed by another revolution in Transylvania. "Gabriel Bathori, who had succeeded Sigismund Bathori on the throne of the principality, had suffered his licentiousness to tempt him into insulting the wives of some of the nobles, who instantly fell upon him and murdered him; and in his place Gabriel Bethlem, a brave warrior and an able statesman, was unanimously elected, with the consent and approbation of the sultan. Under his government his dominions enjoyed a full measure of peace and tranquillity, and began to recover from the horrible devastations of preceding years. He did not, however, assume his dignity without dispute. Transylvania had been secured to the house of Austria on the death of Botskai, by the Pacification of Vienna, and Mathias was, of course, now anxious to enforce his rights, and he considered the present opportunity (1617) favourable, as the Turks were engaged in wars on the side of Asia and Poland. He therefore summoned a diet of the empire, to the throne of which he had succeeded in 1612 by the death of Rodolph. . . . But the diet refused all aid," and he was forced to conclude a peace with the sultan for the further period of twenty years. "No mention being made in it of Transylvania, the rights of Gabriel Bethlem were thus tacitly recognised. Mathias died soon after, in 1619, leaving his crown to his cousin, Ferdinand II." Then followed the renewed attempt of an imperial bigot to crush Protestantism in his dominions, and the Bohemian revolt (see BOHEMIA: 1611-1618; GERMANY: 1618-1620) which kindled the flames of the Thirty Years' War. Hungary and Transylvania were in sympathy with Bohemia. "Gabriel Bethlem entered Hungary in answer to the call of the Protestants of that country, at the head of a large army." "He was proclaimed king of Hungary, and obtained considerable advantages." But a treaty of peace was concluded at length, accord-

ing to which Gabriel surrendered the crown and royal title, receiving the duchies of Oppeln and Ratibor in Silesia, and seven counties of Hungary, together with Cassau, Tokay, and other towns. Ferdinand promised complete toleration to the Protestants, but was not faithful to his promise, and war was soon resumed. Bethlem "collected an army of 45,000 men, joined his forces with those of Mansfeldt, the general of the confederacy [the Protestant Union], after his victory over the imperialists at Presburg; and at the same time the bashaw of Buda entered Lower Hungary at the head of a large force, captured various fortresses in the district of Gran, and laid siege to Novigrad. They were opposed by two able generals, the famous Wallenstein and Swartzemberg, but without checking their progress. Wallenstein, however, followed Mansfeldt into Hungary, where the two armies remained for some time inactive in the presence of one another; but famine, disease, and the approach of winter at last brought the contest to a close. The king of Denmark had been defeated, and Gabriel Bethlem began to fear that the whole force of the Austrians would now be directed against him, and concluded a truce. The bashaw of Buda feared the winter, and followed his example; and Mansfeldt, finding himself thus abandoned, disbanded his soldiers. . . . The treaty of peace was again renewed, the truce with the Turks prolonged." Gabriel Bethlem, or Bethlem Gabor, died in 1629. "The Transylvanians elected George Rakotski to fill his place, and during nearly four years Hungary and Transylvania enjoyed the blessings of peace." Then they were again disturbed by attempts of Ferdinand to reduce Transylvania to the state of an Austrian province, and by hostile measures against the Protestants. The latter continued after the death of Ferdinand II (1637), and under his son Ferdinand III. Rakotski inspired an insurrection of the Hungarians which became formidable, and which, joining in alliance with the Swedes, then warring in Germany, extorted from the emperor a very favorable treaty of peace (1647). "At the same time Ferdinand caused his son of the same name, and elder brother of Leopold, to be elected and crowned king. During his short reign, the country was tranquil; but in 1654 he died, leaving his rights to Leopold. The reign of Leopold [1655-1697] was a period which witnessed events more important to Hungary than any which preceded it, or have followed it, save only the revolutionary years, 1848-1849. No monarch of the house of Austria had ever made so determined attacks upon Hungarian liberty, and to none did the Hungarians oppose a braver and more strenuous resistance. Nothing was left untried on the one side to overthrow the constitution; nothing was left untried on the other to uphold and defend it."—E. L. Godkin, *History of Hungary*, ch. 15-17. —See also GERMANY: 1624-1626; 1634-1639.

1660-1664.—Turkish attacks on Upper Hungary.—Battle of St. Gothard.—Liberation of Transylvania.—Twenty years' truce.—"Hostilities had recommenced, in 1660, between the Ottoman empire and Austria, on account of Transylvania. The Turk was suzerain of Transylvania, and directly held Buda and the part of Hungary on the west and south of the Danube, projecting like a wedge between Upper Hungary, Styria, and Vienna. George Rakoczi, Prince of Transylvania, having perished in combat against the Sultan, his suzerain, the Turks had pursued the House of Rakoczi into the domains which it possessed in Upper Hungary. The Rakoczis, and the new prince elected by the Transylvanians, Kemcni, invoked

the aid of the emperor. The Italian, Montecuculi, the greatest military chieftain in the service of the House of Austria, expelled the Turks from a part of Transylvania, but could not maintain himself there; Kemeni was killed in a skirmish. The Turks installed their protégé, Michael Abaffi, in his place, and renewed their attacks against Upper Hungary (1661-1662). The secret of these alternations lay in the state of feeling of the Hungarians and Transylvanians, who, continually divided between two oppressors, the Turk and the Austrian, and too weak to rid themselves of either, always preferred the absent to the present master. . . . Religious distrust also complicated political distrust; Protestantism, crushed in Bohemia, remained powerful and irritated in Hungary. The emperor demanded the assistance of the Germanic Diet and all the Christian states against the enemy of Christianity. . . . Louis XIV., at the first request of Leopold, supported by the Pope, replied by offers so magnificent that they appalled the Emperor. Louis proposed not less than 60,000 auxiliaries, half to be furnished by France, half by the Alliance of the Rhine; that is, by the confederates of France in Germany. . . . The Emperor . . . would have gladly been able to dispense with the aid of France and his confederates; but the more pressing danger prevailed over the more remote. The Turks had made a great effort during the summer of 1663. The second of the Kiouprouglis, the Vizier Achmet, taking Austrian Hungary in the rear, had crossed the Danube at Buda with 100,000 fighting men, invaded the country between the Danube and the Carpathians, and buried his Tartars to the doors of Presburg and Olmütz. Montecuculi had with great difficulty been able to maintain himself on the island of Schütt, a species of vast entrenched camp formed by nature in front of Presburg and Vienna. The fortified towns of Upper Hungary fell one after another, and the Germanic Diet, which Leopold had gone to Ratisbon to meet, replied with maddening dilatoriness to the urgent entreaties of the head of the Empire. The Diet voted no effective aid until February, 1664; but the Alliance of the Rhine, in particular, had already accorded 6,500 soldiers, on condition that the Diet should decide, before separating, certain questions relative to the interpretation of the Treaty of Westphalia. The Pope, Spain, and the Italian States furnished subsidies. Louis persisted in offering nothing but soldiers, and Leopold resigned himself to accept 6,000 Frenchmen. He had no reason to repent it. . . . When the junction was effected [July, 1664], the position of the Imperialists was one of great peril. They had resumed the offensive on the south of the Danube in the beginning of the year; but this diversion, contrary to the advice of Montecuculi, had succeeded ill. The Grand Vizier had repulsed them, and, after carrying back his principal forces to the right bank of the Danube, threatened to force the passage of the Raab and invade Styria and Austria. The Confederate army was in a condition to stand the shock just at the decisive moment. An attempt of the Turks to cross the Raab at the bridge of Kerment was repulsed by Coligni [commanding the French], July 26, 1664. The Grand Vizier reascended the Raab to St. Gothard, where were the headquarters of the Confederates, and, on August 1, the attack was made by all the Mussulman forces. The janizaries and spahis crossed the river and overthrew the troops of the Diet and a part of the Imperial regiments; the Germans rallied, but the Turks were continually reinforced, and the whole Mussulman army was

soon found united on the other side of the Raab. The battle seemed lost, when the French moved. It is said that Achmet Kiouprougli, on seeing the young noblemen pour forth, with their uniforms decked with ribbons, and their blond perukes, asked, 'Who are these maidens?' The 'maidens' broke the terrible janizaries at the first shock; the mass of the Turkish army paused and recoiled on itself; the Confederate army, reanimated by the example of the French, rushed forward and charged on the whole line; the Turks fell back, at first slowly, their faces towards the enemy, then lost footing and fled precipitately to the river to recross it under the fire of the Christians; they filled it with their corpses. The fatigue of the troops, the night that supervened, the waters of the Raab, swelled the next day by a storm, and above all the lack of harmony among the generals, prevented the immediate pursuit of the Turks, who had rallied on the opposite bank of the river and had preserved the best part of their cavalry. It was expected, nevertheless, to see them expelled from all Hungary, when it was learned with astonishment that Leopold had hastened to treat, without the approbation of the Hungarian Diet, on conditions such that he seemed the conquered rather than the conqueror. A twenty years' truce was signed, August 10, in the camp of the Grand Vizier. Transylvania became again independent under its elective princes, but the protégé of the Turks, Abaffi, kept his principality; the Turks retained the two chief towns which they had conquered in Upper Hungary, and the Emperor made the Sultan a 'present,' that is, he paid him 200,000 florins tribute."—H. Martin, *History of France: Age of Louis XIV.*, v. 1, ch. 4.

1668-1683.—Increased religious persecution and Austrian oppression.—Tekeli's revolt.—Turks again called in.—Kara Mustapha's great invasion and siege of Vienna.—Deliverance of the city by John Sobieski.—In Hungary, "the discontent caused by the oppressive Government and the fanatical persecution of Protestantism by the Austrian Cabinet had gone on increasing. At length, the Austrian domination had rendered itself thoroughly odious to the Hungarians. To hinder the progress of Protestantism, the Emperor Leopold, in the excess of his Catholic zeal, sent to the galleys a great number of preachers and ministers; and to all the evils of religious persecution were added the violence and devastations of the generals and the German administrators, who treated Hungary as a conquered province. The Hungarians in vain invoked the charters which consecrated their national liberties. To their most legitimate complaints Leopold replied by the infliction of punishments; he spared not even the families of the most illustrious; several magnates perished by the hands of the executioner. Such oppression was certain to bring about a revolt. In 1668 a conspiracy had been formed against Leopold by certain Hungarian leaders, which, however, was discovered and frustrated; and it was not till 1677, when the young Count Emmerich Tekeli, having escaped from prison, placed himself at the head of the malcontents, that these disturbances assumed any formidable importance. . . . Tekeli, who possessed much military talent, and was an uncompromising enemy of the House of Austria, having entered Upper Hungary with 12,000 men, defeated the Imperial forces, captured several towns, occupied the whole district of the Carpathian Mountains, and compelled the Austrian generals, Counts Wurmb and Leslie, to accept the

truce he offered." In 1681 the emperor made some concessions, which weakened the party of independence, while, at the same time, the Peace of Nimeguen, with France, allowed the House of Austria to employ all its forces against the rebels. "In this conjuncture Tekeli turned for aid towards the Turks, making an appeal to Mahomet IV.; and after the conclusion of the Turkish and Russian war in 1681, Kara Mustapha [the grand vizier] determined to assist the insurgents openly, their leader offering, in exchange, to acknowledge the suzerainty of the Porte. Tekeli sought also succour from France. Louis XIV. gave him subsidies, solicited the Sultan to send an army into Hungary, and caused an alliance between the Hungarians, Transylvanians, and Wallachians to be concluded against Austria (1682). The truce concluded in 1665 between Austria and Turkey had not yet expired [but the sultan was persuaded to break it]. The Governor of Buda received orders to support Tekeli, who took the title of King. . . . Early in the spring of 1683 Sultan Mahomet marched forth from his capital with a large army, which at Belgrade he transferred to the command of Kara Mustapha. Tekeli formed a junction with the Turks at Essek."—S. Menzies, *Turkey, old and new*, v. 1, bk. 2, ch. 9, sect. 3.—"The strength of the regular forces, which Kara Mustapha led to Vienna, is known from the muster-roll which was found in his tent after the siege. It amounted to 275,000 men. The attendants and camp-followers cannot be reckoned; nor can any but an approximate speculation be made as to the number of the Tartar and other irregular troops that joined the Vizier. It is probable that not less than half a million of men were set in motion in this last great aggressive effort of the Ottomans against Christendom. The Emperor Leopold had neither men nor money sufficient to enable him to confront such a deluge of invasion; and, after many abject entreaties, he obtained a promise of help from King Sobieski of Poland, whom he had previously treated with contumely and neglect. . . . The Turkish army proceeded along the western side of the Danube from Belgrade, and reached Vienna without experiencing any serious check, though a gallant resistance was made by some of the strong places which it besieged during its advance. [The court fled to Linz.] The city of Vienna was garrisoned by 11,000 men under Count Stahremberg, who proved himself a worthy successor of the Count Salm, who had fulfilled the same duty when the city was besieged by Sultan Solyman [1529]. The second siege of Vienna lasted from the 15th July to the 12th September, 1683, during which the most devoted heroism was displayed by both the garrison and the inhabitants. . . . The garrison was gradually wasted by the numerous assaults which it was called on to repulse, and in the frequent sorties, by which the Austrian commander sought to impede the progress of the besiegers. Kara Mustapha, at the end of August, had it in his power to carry the city by storm, if he had thought fit to employ his vast forces in a general assault, and to continue it from day to day, as Amurath IV. had done when Bagdad fell. But the Vizier kept the Turkish troops back out of avarice, in the hope that the city would come into his power by capitulation; in which case he would himself be enriched by the wealth of Vienna, which, if the city were taken by storm, would become the booty of the soldiery. . . . Sobieski had been unable to assemble his troops before the end of August; and, even then, they only amounted to 20,000 men. But he was joined by [Charles] the Duke of Lorraine and

some of the German commanders, who were at the head of a considerable army, and the Polish King crossed the Danube at Tulm, above Vienna, with about 70,000 men. He then wheeled round behind the Kalemberg Mountains to the north-west of Vienna, with the design of taking the besiegers in the rear. The Vizier took no heed of him; nor was any opposition made to the progress of the relieving army through the difficult country which it was obliged to traverse. On the 11th of September the Poles were on the summit of the Mount Kalemberg," overlooking the vast encampment of the besiegers. Sobieski "saw instantly the Vizier's want of military skill, and the exposure of the long lines of the Ottoman camp to a sudden and fatal attack. 'This man,' said he, 'is badly encamped: he knows nothing of war; we shall certainly beat him.' . . . The ground through which Sobieski had to move down from the Kalemberg was broken by ravines; and was so difficult for the passage of the troops that Kara Mustapha might, by an able disposition of part of his forces, have long kept the Poles in check, especially as Sobieski, in his hasty march, had brought but a small part of his artillery to the scene of action. But the Vizier displayed the same infatuation and imbecility that had marked his conduct throughout the campaign. . . . Unwilling to resign Vienna, Mustapha left the chief part of his Janissary force in the trenches before the city, and led the rest of his army towards the hills, down which Sobieski and his troops were advancing. In some parts of the field, where the Turks had partially entrenched the roads, their resistance to the Christians was obstinate; but Sobieski led on his best troops in person in a direct line for the Ottoman centre, where the Vizier's tent was conspicuous; and the terrible presence of the victor of Khoczim was soon recognised. 'By Allah! the King is really among us,' exclaimed the Khan of the Crimea, Selim Ghirai; and turned his horse's head for flight. The mass of the Ottoman army broke and fled in hopeless rout, hurrying Kara Mustapha with them from the field. The Janissaries, who had been left in the trenches before the city, were now attacked both by the garrison and the Poles and were cut to pieces. The camp, the whole artillery, and the military stores of the Ottomans became the spoil of the conquerors; and never was there a victory more complete, or signalled by more splendid trophies. The Turks continued their panic flight as far as Raab. . . . The great destruction of the Turks before Vienna was rapturously hailed throughout Christendom as the announcement of the approaching downfall of the Mahometan Empire in Europe."—E. S. Creasy, *History of the Ottoman Turks*, ch. 16.

1683-1687.—End of the insurrection of Tekeli.—Bloody vengeance of Austria.—Crown made hereditary in the House of Hapsburg.—The defeat of the Turks was likewise a defeat for the insurgent Tekeli, or Tököli, "whom they called the king of the Kurucz, and after it he found himself reduced to guerilla warfare. The victory over the Turks was followed by the capture of some of the chief Magyar towns . . . and in the end [1686] Buda itself, which was at last recovered after so long an occupation. . . . Kara Mustapha attributed his defeat to Tököli, and had his formerly arrested and imprisoned in Belgrade. His captivity put an end to the party of the king of the Kurucz . . . An amnesty was proclaimed and immediately afterwards violated. the Italian general, Caraffa, becoming the merciless executioner

of imperial vengeance. He established a court at Eperjes, and the horrors of this tribunal recall the most atrocious deeds of the Spaniards in the Low Countries. . . . After having terrorized Hungary, Leopold thought he had the right to expect every sort of concession. Notwithstanding persecution, up to this date the monarchy had remained elective. He was determined it should now become hereditary; and [at Pressburg] the diet of 1687, in conformity with the wishes of the sovereign, made the crown hereditary in the male line of the house of Habsburg."—L. Leger, *History of Austro-Hungary*, ch. 20.

**1683-1699.—Expulsion of the Turks.—Battle of Zenta.—Peace of Carlowitz.**—After the great defeat of the Turks before Vienna, their expulsion from Hungary was only a question of time. It began the same autumn, in October, by the taking of Gran. In 1684, the Imperialists under the duke of Lorraine captured Visegrad and Waitzen, but failed in a siege of Ofen (Buda), although they defeated a Turkish army sent to its relief in July. In 1685 they took Neuhausel by storm, and drove the Turks from Gran, which these latter had undertaken to recover. Next year they laid siege again to Ofen, investing the city on June 21, and carrying it by a final assault on September 2. "Ofen, after having been held by the Porte, and regarded as the third city in the Ottoman Empire, for 145 years, was restored to the sway of the Habsburgs." Before the year closed the Austrians had acquired Szegedin, and several lesser towns. The great event of the campaign of 1687 was a battle on the famous field of Mohacs, "a rout as decisive against the Turks as the earlier battle [of 1526] on the same spot had proved to the Jagellons." Transylvania and Slavonia were occupied and Erlau surrendered before the close of the year. In 1688, what seemed the crowning achievement of these campaigns was reached in the recovery of Belgrade, after a siege of less than a month. A Turkish army in Bosnia was destroyed; another was defeated near Nissa, and that city occupied; and at the end of 1689 the Turks held nothing north of the Danube except Temeswar and Grosswardein (Great Waradein); while the Austrians had made extensive advances, on the south of the river, into Bosnia and Servia. Then occurred a great rally of Ottoman energies, under an able grand vizier. In 1690, both Nissa and Belgrade were retaken, and the Austrians were expelled from Servia. But next year fortune favored the Austrians once more and the Turks were severely beaten, by Louis of Baden, on the field of Salankament. They still held Belgrade, however, and the Austrians suffered heavily in another attempt to regain that stronghold. For several years little progress in the war was made on either side; until Prince Eugene of Savoy received the command, in 1697, and wrought a speedy change in the military situation. The sultan, Mustapha II, had taken the Turkish command in person, "with the finest army the Osmanli had raised since their defeat at Mohacs." Prince Eugene attacked him, September 11, at Zenta, on the Theiss, and destroyed his army almost literally. "When the battle ceased about 20,000 Osmanli lay on the ground; some 10,000 had been drowned; scarcely 1,000 had reached the opposite bank. There were but few prisoners. Amongst the slain were the Grand Vizier and four other Viziers. . . . By 10 o'clock at night not a single living Osmanli remained on the right bank of the Theiss. . . . The booty found in the camp surpassed all . . . expectations. Everything had been left by the terror-stricken Sultan. There was the treasury-

chest, containing 3,000,000 piastres. . . . The cost of these spoils had been to the victors only 300 killed and 200 wounded. . . . The battle of Zenta, . . . regarded as part of the warfare which had raged for 200 years between the Osmanli and the Imperialists, . . . was the last, the most telling, the decisive blow." It was followed by a period of inaction, during which England and Holland undertook to mediate between the Porte and its several Christian enemies. Their mediation resulted in the meeting of a congress at Carlowitz, or Karlowitz, on the Danube, which was attended by representatives of the sultan, the emperor, the tsar of Russia, the king of Poland, and the republic of Venice. "Here, after much negotiation, lasting seventy-two days, was concluded, the 26th January, 1699, the famous Peace of Carlowitz. The condition that each party should possess the territories occupied by each at the moment of the meeting of the congress formed its basis. By the treaty, then, the frontier of Hungary, which, when the war broke out, extended only to within a short distance of the then Turkish towns of Gran and Neuhausel, was pushed forward to within a short distance of Temeswar and Belgrade. Transylvania and the country of Bacska, between the Danube and the Theiss, were yielded to the Emperor. To Poland were restored Kaminietz, Podolia, and the supremacy over the lands watered by the Ukraine, the Porte receiving from her in exchange, Soczava, Nemos, and Soroka; to Venice, who renounced the conquests she had made in the gulfs of Corinth and Ægina, part of the Morea, and almost all Dalmatia, including the towns of Castelnovo and Cattaro; to Russia, the fortress and sea of Azof." By the Peace of Carlowitz "the Ottoman Power lost nearly one-half of its European dominions, and ceased to be dangerous to Christendom. Never more would the discontented magnates of Hungary be able to find a solid supporter in the sultan."—G. B. Malleon, *Prince Eugene of Savoy*, ch. 2, 4.—The war in Hungary formed only a part of the War of the "Holy League" against the Turks. See **TURKEY: 1684-1696.**

ALSO IN: E. S. Creasy, *History of the Ottoman Turks*, ch. 17.

**1699-1718.—Revolt of Rakoczy and its suppression.—Treaty of Szathmar.—Recovery of the Banat and of Belgrade.—Final expulsion of the Turks.—Peace of Passarowitz.**—"The peace of Carlowitz, which disposed of the Hungarian territory without the will or knowledge of the Hungarian States, in utter contempt of repeatedly confirmed laws, was in itself a deep source of new discontent,—which was considerably increased by the general policy continually pursued by the Court of Vienna. Even after the coronation of Joseph I., a prince who, if left to himself, might have perhaps followed a less provoking line of conduct, Leopold, the real master of Hungary, did not relinquish his design of entirely demolishing its institutions. . . . The high clergy were ready to second any measure of the government, provided they were allowed full scope in their persecutions of the Protestants. . . . Scarcely had three years passed since the peace of Carlowitz was signed, when Leopold, just embarking in the war of the Spanish succession, saw the Hungarians suddenly rise up as one man in arms. . . . The head and soul of this new struggle in Hungary was Francis Rakoczy II., the son of Helen Zriny by her first husband, after the death of whom she became the wife of Tököli." Rakoczy entered the country from Poland, with a few hundred men, in 1703, and issued a proclamation which brought large

numbers to his support. The Austrian forces had been mostly drawn away, by the war of the Spanish succession, into Italy and to the Rhine, and during the first year of the insurrection the Hungarian patriot became master of the greater part of the country. Then there occurred a suspension of hostilities, while the English government made a fruitless effort at mediation. On the reopening of warfare, the Austrians were better prepared and more encouraged by the circumstances of the larger contest in which they were engaged; while the Hungarians were correspondingly discouraged. They had promises of help from France, and France failed them; they had expectations from Russia, but nothing came of them. "The fortune of war decidedly turned in favour of the imperialists, in consequence of which numerous families, to escape their fury, left their abodes to seek shelter in the national camp; a circumstance which, besides clogging the military movements, contributed to discourage the army and spread general consternation." In 1710 Rakoczy went to Poland, where he was long absent, soliciting help which he did not get. "Before his departure, the chief command of the troops was entrusted to Karoly, who, tired of Rakoczy's prolonged and useless absence in Poland, assembled the nobles at Szathmar, and concluded, in 1711, a peace known as the Treaty of Szathmar. By this treaty the emperor engaged to redress all grievances, civil and religious, promising, besides, amnesty to all the adherents of Rakoczy, as well as the restitution of many properties illegally confiscated. Rakoczy protested from Poland against the peace concluded by Karoly; but of what effect could be the censure and remonstrance of a leader who, in the most critical emergency, had left the scene of action in quest of foreign assistance, which, he might have foreseen, would never be accorded. . . . After the peace of Szathmar, Hungarian history assumes a quite different character." Revolts are at an end for more than a century, and "Hungary, without producing a single man of note, lay in a state of deep lethargy." In 1714, the Emperor Charles VI (who, as King of Hungary, was Charles III) began a new war against the Porte, with Prince Eugene again commanding in Hungary. "The sultan Achmet III., anticipating the design of the imperial general [to concentrate his troops on the Danube], marched his army across the Save, and, as will be seen, to his own destruction. After a small success gained by Palfy, Eugene routed the Turks at Peterwardein [August 13, 1716], and captured besides nearly all their artillery. Profiting by the general consternation of the Turks, Eugene sent Palfy and the Prince of Wurtemberg to lay siege to the fortress of Temesvar, which commands the whole Banat, and which was surrendered by the Turks after a heavy siege. By these repeated disasters the Mussulmans lost all confidence in the success of their arms; and in the year 1717 they opened the gates of Belgrade to the imperial army. The present campaign paved the way for the peace of Passarowitz, a little town in Servia,—a peace concluded between the Porte and the Emperor in 1718. In virtue of the provisions of this treaty, the Porte abandoned the Banat, the fortress of Belgrade, and a part of Bosnia, on the hither side of the Unna, promising besides the free navigation of the Danube to the people of the Austrian empire."—E. Szabad, *Hungary, past and present*, pt. 2, ch. 5-6.—See also TURKEY: 1714-1718.

1780-1790.—Irritations of the reign of Joseph II.—Illiberality of the Hungarian nobles.—"The reign of Joseph II. is described by the historians of Hungary and Bohemia as a disastrous time for the two countries. . . . With his philosophical ideas, the crown of Hungary was to him nothing more than a Gothic bauble, and the privileges of the nation only the miserable remains of an age of barbarism. . . . On the 7th of April, 1784, he ordered that the holy crown should be brought to him in Vienna and placed in the imperial treasury. To confiscate this symbol of Hungarian independence was, in the eyes of the Magyars, an attempt at the suppression of the nation itself, and the affront was deeply resented. Up to this time the official language of the kingdom had been Latin, a neutral tongue among the many languages in use in the various parts of Hungary. Joseph believed he was proving his liberal principles in substituting German, and that language took the place of Latin. . . . It is not wise to attack the dearest prejudices of a nation. The edict which introduced a foreign language was the signal for the new birth of Magyar. . . . At the time of the death of Joseph II. Hungary was in a state of violent disturbance. The 'comitat' of Pesth proclaimed that the rule of the Hapsburgs was at an end, and others threatened to do the same unless the national liberties were restored by the new sovereign. All united in demanding the convocation of the diet in order that the long-suppressed wishes of the people might be heard. The revolutionary wind which had passed over France had been felt even by the Magyars, but . . . in Hungary, the great nobles and the squirearchy who formed the only political element claimed, under the name of liberties, privileges which were for the most part absolutely opposed to the ideas of the Revolution of 1789. . . . Among the late reforms only one had found favour in the eyes of the Magyars, and that was toleration towards Protestants, and the reason of this was to be found in the fact that the small landowners of Hungary were themselves to a large extent Protestant; yet a democratic party was gradually coming into existence which appealed to the masses. . . . When France declared war against Francis II. the Magyar nobles showed themselves quite ready to support their sovereign; they asked for nothing better than to fight the revolutionary democrats of Paris. Francis was crowned very soon after his accession, and was able to obtain both men and money from the diet; but before long, the reactionary measures carried by Thugut his minister, lost him all the popularity which had greeted him at the beginning of his reign. The censorship of the press, the employment of spies, and the persecution of the Protestants—a persecution, however, in which the Hungarian Catholics themselves took an active part—all helped to create discontent."—L. Leger, *History of Austro-Hungary*, ch. 23, 28.

1825-1844.—Awakening of the national spirit.—Patriotic labors of Szechenyi.—Kossuth.—Steam navigation of the Danube.—Political agitation in Magyar language.—“Latin was the language of the diet, and of all legal and official documents, and German and French were alone used in good society. Szechenyi . . . rose in the diet of 1825, and, contrary to previous usage, made a speech in Magyar. His colleagues were surprised; the magnates were shocked; the nation was electrified. . . . The diet sat for two years, and during the whole of that period Szechenyi continued his use of the native language, in which he strenuously opposed the designs of the court, and was soon considered the leader of the opposition or liberal party, which speedily grew up around him. His efforts were so successful, that before the close of the session, Francis was compelled to acknowledge the illegality of his previous acts, formally to recognize the independence of the country, and promise to convoke the diet at least once in every three years. . . . He [Szechenyi] soon had the satisfaction of seeing the Hungarian language growing to general use, but he was still vexed to see the total want of unity, co-operation, and communion which prevailed amongst the nobles, owing to the want of a newspaper press, or of any place of reunion where political subjects could be discussed amongst men of the same party with freedom. . . . He next turned his attention to the establishment of steam navigation on the Danube. . . . He . . . rigged out a boat, sailed down the Danube right to the Black Sea, explored it thoroughly, found it navigable in every part, went over to England, studied the principles of the steam-engine as applied to navigation, brought back English engineers, formed a company, and at last confounded the multitude of sceptics, who scoffed at his efforts, by the sight of a steam-boat on the river in full work. This feat was accomplished in October, 1830. . . . In the interval which followed the dissolution of the diet, Szechenyi still followed up his plan of reform with unwearied diligence, and owing to his exertions, a party was now formed which sought not merely the strict observance of the existing laws, but the reform of them, the abolition of the unjust privileges of the nobles, the emancipation of the peasantry, the establishment of a system of education, the equal distribution of the taxes, the equality of all religious sects, the improvement of the commercial code and of internal communication, and though last, not least, the freedom of the press. . . . The next meeting [of the diet] in 1832, . . . proved in many respects one of the most important that had ever assembled. . . . The man who in future struggles was destined to play so prominent a part, during the whole of these . . . proceedings, was merely an intent and diligent looker-on. . . . He was a gentleman of noble origin, of course, but his whole fortune lay in his talents, which at that period were devoted to journalism—a profession which the Hungarians had not yet learned to estimate at its full value. He was still but thirty years of age, and within the diet he was known as a promising young man, although, amongst the world without, his name—the name of Louis Kossuth, which has since become a household word in two hemispheres—had never yet been heard. . . .

Whether from the jealousy of the government or the apathy of the Magyars, no printed reports of the parliamentary proceedings had ever yet been published. . . . To supply this defect, Kossuth resolved to devote the time, which would otherwise have been wasted in idle listening, to carefully reporting everything that took place, and circulated it all over the country on a small printed sheet. The importance of the proceedings which then occupied the attention of the diet caused it to be read with extraordinary eagerness, and Kossuth rendered it still more attractive by amplifying, and often even embellishing, the speeches. The cabinet, however, soon took the alarm, and although the censorship was unknown to the Hungarian law, prohibited the printing and publication of the reports. This was a heavy blow, but Kossuth was not baffled. He instantly gathered round him a great number of young men to act as secretaries, who wrote out a great number of copies of the journal, which were then circulated in manuscript throughout Hungary. The government was completely foiled, and new ardour was infused into the liberal party. When the session was at an end he resolved to follow up his plan by reporting the meetings of the county assemblies, which were then the scenes of fiery debates. . . . The government stopped his journal in the post-office. He then established a staff of messengers and carriers, who circulated it from village to village. The enthusiasm of the people was fast rising to a flame. A crisis was imminent. It was resolved to arrest Kossuth. . . . He was seized, and shut up in the Neuhaus, a prison built at Pesth by Joseph II. He was, however, not brought to trial till 1830, and was then sentenced to four years' imprisonment. The charge brought against him was, that he had circulated false and inaccurate reports; but the real ground of offence was, as everyone knew, that he had circulated any reports at all. . . . Kossuth, after his liberation from prison, had taken up his abode for a short period at a watering place called Parad, for the purpose of recruiting his shattered health, and for a time wholly abstained from taking any part in public affairs. On the first of January, 1841, however, a printer in Pesth, named Landerer, obtained permission to publish a journal entitled 'Pesthi Hirlap,' or the Pesth Gazette. He offered the editorship to Kossuth, who accepted it, but only on condition that he should be perfectly untrammelled in the expression of his opinions. . . . Kossuth . . . soon raised the circulation of his paper to 10,000 copies—an immense number in a country where the newspaper press had hitherto hardly had a footing. He made vigorous onslaughts upon the privileges of the noblesse, and pleaded the cause of the middle and lower classes unanswerably.”—E. L. Godkin, *History of Hungary*, ch. 21.—In the *Pesthi Hirlap* the novelist, Eötvös, spread his progressive ideas. At this time “the constitution of Hungary, which since the Middle Ages had been imposed on the Kings by the Magyar aristocracy, established a central assembly, the Diet, to govern the kingdom in harmony with the King and 55 local assemblies, one in each county (*comitat*). . . . The Diet which met in 1832 demanded a more completely Hungarian government: more frequent visits by the Emperor to Hungary, the holding of the Diet, not at Presburg, a German city on the border, but at Pesth, the Magyar capital, in the heart of the country,—also the use of Magyar as the official language in place of Latin. On national policy all the Magyars were agreed; on liberal reforms they were divided. A liberal party was organized,

which proposed to reform the constitution and society, as well as a conservative party which wished to maintain the old *régime* with an exclusively Magyar government. Society in Hungary was still organized as in the Middle Ages, divided into two classes unequal before the law: the nobles, the only full citizens, exempt from taxation of any kind, owing no military service but in the general call to arms (*insurrectio*); the peasants, tenants of the nobility, burdened with rents and *corvées*, paying all the taxes, furnishing all the recruits for the army, and possessing no political rights whatever. The nobles alone constituted the political nation; there were, however, a great many of them; many lived in the country, as poor and uneducated as the peasantry. The administration of the country belonged to the nobles. At certain intervals, all the nobles of the county met in *congregatio* to make *reparatio*, that is, to elect officers, judges, administrators, and financial employees. . . . A lively description of an election is given by one of the liberal chiefs, Eötvös, in 'The Village Notary,' a romance of customs [translated into English]."—C. Seignobos, *Political history of Europe since 1814*, pp. 406-408.

1825-1848.—Hungarian Reichstag.—March laws.—Constituent convention elected on plan of universal suffrage.—Imperial proclamation of May 16, 1848.—Kremsier constitution. See SUFFRAGE, MANHOOD: Hungary: 1222-1918.

1847-1849.—War of National Independence and its failure.—"The disputes between Hungary and the Vienna cabinet were of ancient date. Hungary aimed at the greatest possible independence from Austria—at a mere personal union in which even the army and the revenue should be dependent on the good-will of the Hungarian parliament. The Vienna cabinet, seeing in this the beginning of the dismemberment of the polyglot empire, sought, as far as possible, to evade the consequences of the Hungarian constitution. Louis Kossuth was regarded as the soul of the new opposition—a lawyer and journalist, who shone neither by reason of vast knowledge nor special endowments as a statesman, but, that which is of most weight in times of excitement, by the possession of an irresistible eloquence. Kossuth had been the chief agitator in the matter of the protective-union, by which the use of Austrian manufactures was interdicted for the benefit of native industry, so that even the richest families went clothed in coarse material. His importance increased when he was elected to parliament in 1846. There his position was like that of an officer in command of his regiment. On the 12th of November, 1847, Emperor Ferdinand opened the last parliament in Presburg with a speech from the throne in the Hungarian tongue, therein making a concession to the decision of the parliament that Hungarian was to be used as the official language instead of Latin. Out of gratitude Archduke Stephen was chosen Palatinus (viceroy) of Hungary by the parliament in place of his father, Joseph, recently deceased. After the February revolution [in France] the tone of the parliament became constantly bolder. Kossuth's speech of March 3d, calling for a constitution for all the various Austrian lands suggested the immediate aim of the Vienna revolution of March 13th; and when, on the 15th, a Hungarian deputation came to Vienna to lay before the emperor an address embodying the demands of the parliament, Kossuth was the lion of the day. As others have done under the same circumstances, the emperor promised everything. August 10th he closed the parliament in person, confirming its decisions with

regard to a separate ministry, universal suffrage in the election of delegates, union of Hungary and Transylvania, abolition of the freedom from taxation enjoyed by the nobility, and abrogation of all feudal burdens. The new Hungarian ministry, in which Count Louis Batthyani presided and Kossuth administered the finances, established itself in Pesth, where from that time the sessions of the Hungarian Reichstag were held. The first one held at that place was opened by Archduke Stephen, as sovereign representative of the emperor, July 5th, 1848. It consisted of the Table of Magnates, which was now called the Upper House, and the Table of Estates, or Lower House. It was a necessary consequence of the prevailing spirit that the first of these, formerly of over-weening importance, should sink into insignificance, while the latter came to the front or rather was pushed into that position by the Pesth students and the youth in general. These gentlemen, as was the case in Vienna, dictated the policy to be pursued, and already acted as though for them Austria no longer existed. They refused to assume a part of the Austrian national debt, and treated the Hungarian dependencies—Croatia, Slavonia, and the Military Frontier, with Transylvania—with the same disregard to their wishes which they had indignantly complained of in their own treatment by the Austrian government. This bore its fruit. A deputation of Magyars in Vienna demanded and obtained the union of these provinces with Hungary to form one great kingdom; but at the same time, in order to avert this threatened evil, a Croatian deputation was besieging the imperial cabinet with entreaties for complete separation from Hungary, and for the erection into a triple kingdom of Croatia, Slavonia, and Dalmatia, with the Military Frontier. This would at the same time have given these countries greater independence with reference to Austria. This jealousy of the various nationalities was used by the Austrian government for the purpose of checking, waging war upon, and putting down one by means of the other. Baron Jellachich, a Magyar hater, who was very popular at court, was named *Banus* [ban] of Croatia, and the government supported him in his preparations against Hungary. Although it removed him at the complaint of the Hungarian ministry, yet it restored him to office when the court espoused his cause. Jellachich set himself at the head of his troops and marched into Hungary as the champion of a united Austria, while in the south-east, in the Banate, the Servians and Frontiers-men were skirmishing with the Hungarian soldiers. To make head against present and prospective dangers, Kossuth carried through the Reichstag a levy of 200,000 national troops (*honveds*), and the issue of 42,000,000 *gulden* (\$21,000,000) paper-money (Kossuth-notes). Matters had become so complicated on all sides that only the sword could loose the knot. Archduke Stephen's attempts at mediation were vain. He laid down his office as *Palatinus*, and withdrew into a sort of voluntary exile on his hereditary estate of Scaumburg, on the Lahn. Batthyani left the ministry, and all the power was in the hands of Kossuth and the war party. To avoid hostilities, the court intrusted Count Lamberg, Batthyani's friend, with the chief command of all the Hungarian and Croatian forces, provisionally superseding Jellachich. When Lamberg reached Pesth he learned that the Reichstag had protested against his appointment. The populace suspected treason on the part of Austria, and on the 27th of September Lamberg was hacked to death by the mob with axes and clubs on the bridge of boats across

the Danube. This revolting murder and the feeble prosecution of the murderers called forth the imperial manifesto of October 3d, dissolving the Reichstag, pronouncing its acts invalid, except in so far as they had been confirmed by the emperor, placing all Hungary under martial law, and making Jellachich governor of Hungary and commander-in-chief of the Hungarian troops. The Hungarian Reichstag on its part declared the manifesto illegal and invalid, and Jellachich guilty of high treason. The committee of national defence, which had been in existence since the 22d of September, now resolved itself into a provisional government, with Kossuth as dictator. Jellachich was driven back to the Austrian frontier, and [war minister] Latour's endeavor to send him re-enforcements from Vienna resulted in the October revolution in that city and Latour's murder.

LOUIS KOSSUTH

Then Jellachich was recalled from Hungary to assist in subduing Vienna [which was in revolt], and was placed under the command of Prince Windischgráz. The latter, the conqueror of Prague and Vienna, seemed to be the right man to reduce Hungary to subjection. His programme was the indivisible Austrian empire, with the central government in Vienna. As the Emperor Ferdinand had in the most solemn manner granted concessions to Hungary which were inconsistent with this programme, his abdication took place on the 2d of December, and Francis Joseph ascended the throne in his stead. The Reichstag protested, and refused to acknowledge the new emperor until he had been crowned king of Hungary and sworn to the constitution. [To suppress Hungary] Windischgráz was put in command of more than 100,000 men, and on the 15th of December he began his advance with the main army along the upper Danube, while smaller divisions entered Hungary from Moravia, Galicia, Transylvania, and Styria, under Simonich, Schlick, Puchner, and Nu-

gent respectively. The plan was to surround the Hungarians completely and make a common movement on Pesth. To carry this out a resolute advance of the main army, and exact co-operation of all the divisions, were essential. Both requisites were wanting. Windischgráz drove the Hungarians back, and took the cities of Oedenburg, Presburg, and Raab. He demanded unconditional submission, and refused even to give audience to a deputation from the Reichstag. January 5th, 1849, he entered Buda-Pesth. The government and the Reichstag had shortly before removed to Debreczin, while the army had retreated southward. Windischgráz remained three precious months at Buda. . . . Schlick was repulsed by Görgei and Klapka. Puchner, with the 10,000 Russians he had called to his assistance, was chased out of Transylvania into Wallachia by the Polish Bem, who found allies in the Szeklians of Transylvania. In the Banate the Hungarians were also successful. Fortunately for the Austrians, Kossuth made a military and political blunder in appointing Dembinski, a Pole, commander-in-chief. He was not fit for the task; as a foreigner, the jealous Hungarian generals did not yield him ready obedience; and his appointment, by giving the war a new objective in Poland might bring Russia into the conflict. He advanced on Pesth, but was defeated at Kopolna on the 26th of February; then the army demanded his removal, and Kossuth had to yield. In contrast with this failure, Görgei, whose generalship threw that of all others into the shade, and who, with the exception of Kossuth, had the most popular name in Hungary, moved forward in the direction of Pesth with 50,000 men, and defeated Prince Windischgráz's forces between Gödöllo and Isaszeg on April 6th. The Olmütz cabinet now perceived that bombarding cities and conquering warlike nations were two wholly different matters. Windischgráz was recalled, and the command conferred on General Welden who was not one whit more capable. He evacuated Pesth, leaving in Buda a garrison commanded by the gallant General Henzi, a Switzer. Görgei received orders to storm Buda. Notwithstanding a courageous resistance on the part of General Henzi, who lost his life in the fight, the city was carried on the 21st of May. But the disagreement among the leaders of the revolution had already reached an alarming point. April 14th, as the Schwarzenberg ministry had published a constitution for all Austria, and so reduced Hungary to the level of the other provinces, Kossuth, against Görgei's wishes and advice, caused the Reichstag at Debreczin to declare 'the House of Hapsburg deprived of its dominion and banished from Hungary forever.' Hungary was now an independent state—a republic in the midst of the old monarchies—certain of being looked upon in any case as threatening danger to all its neighbors. Kossuth was named chief of the republic, as responsible governor-president of Hungary. He surrounded himself with a new ministry, in which the jealous Görgei was minister of war as well as commander-in-chief. The Reichstag was again transferred to Pesth. . . . There were two things which Kossuth's sentimental statesmanship had not taken into account—that Austria would become master in Italy so quickly, and that a second power might intervene. But owing to the participation of Poles in the Hungarian war for freedom, and to the neighborhood of the two countries, the latter contingency was a very probable one. No one doubted that, the independence of Hungary once achieved, Poland could no longer be held back. Hence Czar Nicholas did not hesitate for a moment to fulfil Francis Joseph's wish; and

at the same time he hoped by such a service to chain the youthful monarch securely to his policy, and, when occasion offered, require from him a service in return. With Russia's interference the matter was as good as decided. Hungary's further resistance was nothing but an heroic death-struggle. While Paskevitch with 80,000 Russians marched across the Carpathian mountains and advanced toward the upper Danube, other Russian divisions entered Transylvania from Bukovina and Wallachia, Jellachich reappeared in southern Hungary with a Servian-Croatian army, and Haynau crossed the Raab and moved on Komorn from the west. After several days' fighting, Görgei left General Klapka behind in Komorn, and fell back across the Theiss; and on the 12th of July Haynau entered the sister cities of Buda-Pesth. For the second time Kossuth had to leave the capital. The Reichstag and paper-money press, the latter of which had been busily at work in the mean time, were transferred to Szegedin, on the Theiss, and finally to Arad, on the Maros. On his retreat Görgei succeeded in inflicting a defeat upon the Russians under Rüdiger at Waizen. By masterly manœuvring he carried his army safely through the midst of the Russian forces to Arad. But neither Bem nor Dembinski could succeed in making head against their opponents. The former was defeated by the Russian General Lüders at Schässburg (July 31st) and other places, and driven out of Transylvania; and Haynau, advancing rapidly, defeated the latter at Szöreg and Temesvar (August 5th and 9th). The Hungarian troops were concentrated at Arad. Great indecision prevailed at head-quarters, and only a military dictatorship appeared to hold out some slight hope. Kossuth was obliged to lay down his office as governor on the 10th of August and Görgei assumed the dictatorship. On the 13th of August, with 23,000 men and 130 guns, he surrendered to the Russian General Rüdiger at Vilagos [20 miles northeast of Arad], with the knowledge and consent of Kossuth and the government. There was nothing more to be won [by him] yet the nation had expected a different conclusion. The hope of obtaining more favorable terms for his country, the wish, after so much had been done for military honor, to avoid useless bloodshed, dislike of the Polish generals and the republican government, which had several times been on the point of depriving him of the chief command—all these things had influenced Görgei to take this surprising step, about which he had already been for some time in negotiation with Paskevitch. Haynau's mortification that Görgei had surrendered to the Russians and not to him was not diminished by Prince Paskevitch's proud report to Czar Nicholas: 'Hungary lies conquered at the feet of your majesty.' Haynau could justly retort that it was the Austrian army which had in six battles brought the foe to the point of annihilation and effected the surrender of Görgei's corps. Görgei received a pardon for his own person merely, and from that time on lived for the most part in retirement at Klagenfurt. After the catastrophe of Vilagos all the fortresses capitulated; Komorn, where Klapka commanded, holding out until September 27th. The smaller detachments of troops surrendered, the *honveds* hurried home. Only about 5000 men, with Kossuth, Bem, Dembinski, and others, took refuge in Turkey, which afforded them an asylum in spite of the threats of Austria and Russia. Haynau inflicted a severe chastisement on those who remained behind or were captured. Courts-martial were set up in Pesth and Arad. Many of Hungary's best men were con-

demned to powder and lead, or to the gallows; among others Count Batthyani, the former prime-minister. The property of fugitives and condemned persons was confiscated. Many pined away in prison; several thousands were drafted into the Austrian army. The constitution was annulled, and Hungary treated like a newly-conquered country, as though it had forfeited all its former rights."—W. Müller, *Political history of recent times*, pp. 230-244.—See also AUSTRIA: 1848-1849.

1849-1859.—Completed emancipation of the peasantry.—Restoration of pure absolutism. See AUSTRIA: 1840-1859.

1856-1868.—Recovery of nationality.—Formation of the Austro-Hungarian monarchy.—In 1856 Francis Joseph, "proclaimed an amnesty against the political offenders, and in the following year he decreed the restoration of their estates, and further steps were taken to study the wishes of the Hungarians. In 1859 other concessions were made, notably as to provincial Governments in Hungary, and they were given free administration as to their educational and religious rites in the Magyar tongue. In 1860 the 'Curia Regia' were reinstated, and finally, in 1861, the whole Constitution was restored to Hungary and its dependencies, Transylvania, Croatia, and Slavonia [by the 'February Patent']."—L. Felbermann, *Hungary and its people*, ch. 5.—"No arrangement could be permanent in the Hapsburg dominions which was unsatisfactory to the Magyars, or Hungarians, the most militant element in the Empire. The Hungarians were unalterably opposed to the constitution of 1861 for by treating their country as a province it did not recognize what they claimed were the historic rights of Hungary as a separate nation. They even threatened revolution, but they were held in check by Francis Deák, the one-time associate of Louis Kossuth and now the trusted leader of the Hungarian people. What Deák desired was not independence, but complete autonomy which would allow Hungary to live her own national life and yet permit her to coöperate with Austria in matters which directly concerned them both; in short, an *intimate* alliance between the two countries. The Government at Vienna refused to concede to Hungary's demand, and there began a deadlock between the two which lasted for five years. But the crushing defeat of Austria in the Seven Weeks' War and the consequent loss of Venetia changed the mood of the Government. 'What does Hungary want?' now asked the Emperor of Deák. 'Only what she wanted before Sadowa,' was the reply. In 1867 the 'February Patent' was abrogated, and, instead, a new constitution, known as the *Ausgleich*, or Compromise, was promulgated. This famous document was the work largely of two Hungarians, Deák and Count Julius Andrassy, and of Emperor Francis Joseph and his Minister, Count Beust."—J. S. Schapiro, *Modern and contemporary European history*, pp. 425-426.—"It is significant that the clever manipulator who devised the *Ausgleich* in 1867, and who, therefore, was really the creator of the Dual Monarchy as such, namely, Count Beust, was not a native but a Saxon. He had, it is true, achieved considerable fame as the all-powerful premier of that tiny kingdom of Saxony which had unflinchingly been the steady and self-sacrificing friend and supporter of Austria, a friendship really worthy of a better cause. The fame, too, which he had ac-

quired reached far beyond the narrow boundaries of Saxony, and even of Germany and Austria. Count Beust was very ambitious; a man of original mind and of great fertility of resources. . . . When the Emperor Francis Joseph after the Peace of Prague looked around for a suitable man of talent to set up his house again and make it habitable, his choice fell on Beust. . . . [a statesman] unburdened with the traditions and historic claims, with the racial prejudices and predilections that, perhaps, unwittingly but none the less surely cling to every representative of any one group or race within Austria-Hungary. . . . He succeeded in his delicate and difficult task largely because he was a foreigner, a non-Austrian, one to whom no suspicion of wilful unfairness could reasonably attach."—W. von Schierbrand, *Austria-Hungary: Polyglot empire*, pp. 70-72.—By the agreement of 1867, the "Austro-Hungarian Dual Monarchy, as also described in the able 'Memoir' of Francis Deak, to which Sir Mountstuart E. Grant-Duff wrote a preface, is constituted as follows: I. The Common Ministry for the Austro-Hungarian monarchy consists of a Minister for Foreign Affairs, for War, and for Finance. II. In each half of the monarchy there is a separate Ministry of Worship, of Finance, Commerce, Justice, Agriculture, and National Defence, headed respectively by a Minister-President of the Council. III. The Lower House in the Austrian Reichsrath consists of 353 members, in the Hungarian Diet of 444, now chosen in both cases by direct election. IV. The Delegations, composed respectively of sixty members from each half of the monarchy, are elected annually from amongst their parliamentary representatives of the majority in each province by the members of the two Houses of the Austrian and Hungarian Legislatures. V. The two Delegations, who meet alternately at Vienna and Budapest, deliberate separately, their discussions being confined strictly to affairs of common interest, with regard to which the Delegations have the right to interpellate the Common Minister and to propose laws or amendments. In case of disagreement between the two Delegations the question of policy at issue is discussed by an interchange of written messages, drawn up in the official language—German or Hungarian—of the Delegation sending the message, and accompanied by an authorized translation in the language of the Delegation to which it is addressed. VI. If, after the interchange of three successive notes, an agreement between the two bodies is not arrived at, the question is put to the vote by ballot without further debate. The Delegates, of whom in a plenary session there must be an equal number present from each Delegation, vote individually, the Emperor-King having the casting vote. VII. By virtue of the present definition of common affairs, the cost of the diplomatic service and the army, except the Honvéds (militia), is defrayed out of the Imperial revenues, to which Hungary contributes a proportion of 30 per 100. VIII. With reference to the former, it is stipulated that all international treaties be submitted to the two Legislatures by their respective Ministries; with reference to the latter, that whilst the appointment to the military command of the whole army, as also to that of the national force of Hungary, is in the hands of the Sovereign, the settlement of matters affecting the recruiting, length of service, mobilization, and pay of the Honvéd army (the militia) remains with the Hungarian Legislature. IX. Those matters which it is desirable should be subject to the same legislation, such as customs, indirect taxation, cur-

rency, etc., etc., are regulated by means of treaties, subject to the approval of the two Legislatures. In cases where the two parties are unable to come to an agreement, each retains the right to decide such questions in accordance with their own special interests. X. In common affairs, the decisions arrived at by the Delegations (within the scope of their powers), and sanctioned by the Sovereign, become thenceforth fundamental laws; each Ministry is bound to announce them to its respective National Legislature, and is responsible for their execution."—L. Felhermann, *Hungary and its people*, ch. 5.—"The *Ausgleich* is renewable every ten years. . . . Austria, being both the more populous and the wealthier half of the Dual Monarchy, has heretofore had to pay, as her share towards the upkeep of joint institutions, such as the army and navy, the customs department, etc., two-thirds of the whole, leaving but one-third to Hungary. Even this has not satisfied Hungary, and there has always been necessary the greatest amount of patience and of self-control on the part of the delegations to come to a solution, especially as the press of the two countries has naturally taken sides for or against each debatable paragraph."—W. von Schierbrand, *Austria-Hungary: Polyglot empire*, p. 134.—"Since part of Austria is somewhat interested in industry and Hungary is preëminently agricultural, there has naturally been a conflict between the *differing economic interests* of the two. When it has been necessary to arrange a tariff or make commercial treaties, Austria has desired protection for her manufacturing, Hungary has sought to give greater aid to her farmers. In general the Dual Monarchy has solved this rather difficult problem by protecting both industry and agriculture. Whenever a new *Ausgleich* has been necessary, there has been a bitter, and in some cases prolonged, struggle between the two members to gain better terms for themselves. In these contests the advantage has usually been with Hungary, which is more highly centralized and united territorially, and is more completely controlled by her dominating statesmen."—R. L. Ashley, *Modern European civilization*, p. 387.—"Austria since 1867, owing to the terms of this *Ausgleich* which vouchsafed to that country, practically if not in express terms, the whole Hungarian market for industrial and commercial exploitation, has made enormous strides in manufacturing. . . . But in Hungary there had been from the start a strong and influential part of the nation wholly dissatisfied with the *Ausgleich*, not only from political motives, but from economic ones as well. This section, the chief-mouth-piece of which is the Independence Party, with men like the Karolyis, the Apponyis, the Batthyans, the Jusths, the Ugrons at the head, argued that this complete economic dependence of Hungary on Austria in all questions of industry and finance, worked not alone against complete separation—an ideal striven for by this party—but also against the future rise of Hungary as an industrially potent country. . . . To make this possible at all, the Hungarian government had to subventionise all these [her native] manufacturers; to grant them loans on easy terms; to pay premiums for finished products of a certain degree of excellence; to donate large sites; to abate taxes; to let in raw materials duty-free; to hold expositions and spend state money on advertising. . . . Thus, Austria, having adjusted her own production to suit the needs of Hungary, felt she was not treated equably when Hungary made every effort, even at great sacrifice, to make herself independent of Austrian industry."—W. von Schier-

brand, *Austria-Hungary: Polyglot empire*, pp. 131-133.—See also AUSTRIA: 1866-1867; AUSTRIA-HUNGARY.

1868.—Law of nationalities.—“In 1868 Hungary passed a law, proposed by Francis Deák, which guaranteed the ‘equal rights of nationalities’ within that kingdom. This law has been a dead letter, however, since Deák’s influence ceased. . . . In consequence, the subject races of Hungary always oppose Magyar rule and are ready to revolt against Hungarian oppression if there is possibility of success.”—R. L. Ashley, *Modern European civilization*, p. 388.—In spite of the efforts of Deák and Eötvös equal rights of nationalities were materially lessened through each succeeding ministry, until by the time of Bitto (Szlavy’s successor) the law had become entirely impotent.

1868-1890.—Equal rights of nationalities.—Nullified by Magyar politics.—Rule of Tisza.—“It would have been possible for the Magyars, after the restoration of the Hungarian Constitution under the Dual Settlement of 1867, to have built up a strong and elastic Transleithan polity based on the recognition of race individualities and equality of political rights for all. The non-Magyars would have accepted Magyar leadership the more readily in that they had been dragooned and oppressed by Austria during the period of reaction after 1849 as ruthlessly as the Magyars themselves. Deák and Eötvös, who were the last prominent Magyar public men with a Hungarian, as distinguished from a narrowly Magyar, conception of the future of their country, pleaded indeed for fair treatment of the non-Magyars, and trusted to the attractive force of the strong Magyar nucleus to settle automatically the question of precedence in the State. But in 1875, when Koloman Tisza, the father of Count Stephen Tisza, took office, these wise counsels were finally and definitely rejected in favour of what Baron Banffy afterwards defined as ‘national Chauvinism.’ Magyarization became the watchword of the State and persecution its means of action.”—*Hungary and the war* (Pamphlet, reprinted from *The Times* [London]).—“There can be no doubt that Deák and Eötvös were genuinely desirous of conciliating the nationalities and of assuring to their languages and customs as large a measure of liberty as seemed consistent with the political unity of the State. . . . Unhappily Eötvös was removed by death in 1871, and Deák, who [though he lived until 1876] regarded the *Ausgleich* as the completion of his life-work, steadily resisted all pressure to enter the political arena and only exercised a general influence upon Governmental policy. Thus each change of Ministry since 1869 marked a fresh step towards the accession of the Radicals to power. The short term of office of Joseph Szlavy (December, 1872 to March, 1874) was overshadowed by the financial crisis, and saddened by the virtual withdrawal of Deák from public life. . . . The approaching fusion of the Deákists with the Radical opposition involved among other things the adoption of a more Chauvinistic attitude towards the nationalities. The first blows were struck against the Slovaks—their academy (Matica Slovenska) and secondary schools, upon which all hope of progress in national culture depended, being especially signalled out for attack. . . . Even as early as August, 1867, the seven Slovak professors at the gymnasium of

Neusohl (which had flourished under the fostering care of Bishop Moyses) were dispersed to different schools, Slovak was declared a non-obligatory subject, and the equality of the three languages—Slovak, Magyar and German—was abolished; and thus within a few years the institution had been completely Magyarized. It was such incidents as this which made the Slovak and Roumanian leaders of that day so sceptical about the advantages of the much vaunted Law of Nationalities; for it was scarcely a good omen for its execution. . . . Not content with thus depriving the rising generation of Slovaks of the most necessary means of education, the Government determined if possible to nip in the bud the tender flower of Slovak literature. On April 6, 1875, the Matica Slovenska was provisionally suspended, and on November 12, Colo-

JOSEPH EÖTVÖS

man Tisza, who had just entered on his triumphal career as leader of the united Liberal Party, proclaimed its final dissolution. The entire funds of the society, amounting to £8,000 and including the Emperor-King’s own subscription, were arbitrarily confiscated; its buildings—to this day the second largest in the little town of Marton—were converted into Government offices. The unique Slovak museum and library was also seized, and after lying for many years in a caretaker’s attics, at length found their way to a Magyar gymnasium in a distant town. . . . The dissolution came as a thunderbolt upon the Slovaks; indeed, it is not too much to say that it reduced them to political impotence for a whole generation. The golden era of the Liberal Party in Hungary had begun; the fusion of the Deákists and the Left Center was an accomplished fact; and for fifteen years Coloman Tisza was far more truly dictator of Hungary than Kossuth or Deák had ever been.”—“Scotus Viator” (R. W. Seton-Watson), *Racial*

*problems in Hungary*, p. 161.—“From 1875 to 1890 Count Kalman Tisza was Prime Minister. His policies were those bequeathed by Deák, namely, to maintain the *Ausgleich* with Austria and the Magyar ascendancy in Hungary. There was growing up, however, a powerful movement known as the Independence Party, led by Francis Kossuth, the son of the great revolutionist, which boldly declared for ‘nationalism’ as against ‘dualism.’ It demanded, first, the economic independence of Hungary; and secondly, the complete Magyarization of the Hungarian army, by substituting the use of Magyar for German in all commands.”—J. S. Schapiro, *Modern and contemporary European history*, p. 439.—Tisza the Calvinist accomplished what neither Lutheran nor Catholic could achieve; he reconciled the rivalries of Protestant and Catholic and united them in the common cause of racial unity. This achievement, without which many of the successes of Andrassy and Kalnoky in the field of diplomacy would have been impossible, constitutes the elder Tisza’s real claim to greatness. He concluded with the king a tacit pact under which the Magyar government was to be left free to deal as it pleased with the non-Magyars so long as it supplied without murmur recruits and money for the joint army. Hence the Magyar Parliament became almost exclusively representative of the Magyar minority of the people. “Acting on the principle that in politics the end justifies the means. . . . [Tisza] secured the predominance of the Liberal Party by a far-reaching system of electoral corruption and administrative trickery. The Magyar population of the central plains remained consistently loyal to the ideals of Louis Kossuth; the Government had therefore to find a working majority in the non-Magyar districts, and as this could not be attained by natural means, it was necessary to resort to gerrymandering, unequal distribution, a highly complicated franchise, and voting by public declaration. These were the chief features of the revised Electoral Law of 1874. . . . In addition to the practical difficulties created by the letter of the law [to molest the non-Magyar] every imaginable violence and trickery was employed to secure the return of Government candidates, the whole administrative machine was placed at their service, and money was poured out like water.”—“Scotus Viator” (R. W. Seton-Watson), *Racial problems in Hungary*, p. 168.—“The nobility of Hungary from the first was the fighting portion of the nation. In award of the obligation to fight the battles of the country with all their sons and all their men, each of these members of a race of conquerors was given a freehold for himself and his descendants. The scions of these original nobles still form that part of the population who own the soil, and who mostly till it, too. The initial freehold has been shrinking in size; or rather, it has been divided and subdivided, share and share alike, among children and children’s children, each son bearing the name and title of his ancestors. Much church land, it is true, much land once belonging to the crown or to some municipality, has been acquired by these nobles in the course of centuries, thus doubling and trebling perhaps the mass of it in bulk. But, on the whole, each member of this primitive, soil-bound, vigorous and warlike lower nobility owns a small estate, be it only fifty or be it five hundred acres, that he cultivates and whence he draws his sustenance. . . . Of course, there are other elements in modern Hungary. There is not alone a powerful higher nobility, wealthy beyond the dreams of avarice and owning estates

so large that they can drive with a fast team all day long without leaving their own acres. There are now numerous prospering and populous towns and cities, with commerce and an industry steadily growing under the fostering care of Hungary’s statesmen. There are thousands of villages tenanted to-day by a free peasantry and rural labouring element more or less dependent on the nearest lords of the soil, whose serfs they were until the middle of the eighteenth century. But the rural nobility, the farmer-nobility, so to speak, is still the rock bottom of the nation.”—W. von Schierbrand, *Austria-Hungary: Polyglot empire*, p. 120.

1876-1909.—Infant protection and infant homes. See CHILD WELFARE LEGISLATION: 1876-1909.

1878-1890.—Tisza government.—Education acts of 1879 and 1883.—Law of National Defence.—Resignation of Tisza.—“A section of the new Liberal Party was still disposed to assure the loyalty of the nationalities by moderate concessions; but the ferment among the neighbouring races of Austria and of the Balkans provided Tisza with an excuse for severity, and nipped in the bud all counsels of tolerance. . . . The occupation of Bosnia and Herzegovina [1878] was regarded with strong disfavour by the great body of Magyar public opinion, and nothing shows more clearly the statesmanship and enormous influence of Count Julius Andrassy than the manner in which the parliamentary majority of Hungary and Austria were cajoled and manoeuvred into a forward policy in the northern Balkans. For the moment the Tisza Government suffered in popularity, and at the general elections the Premier was himself defeated at Debreczen. This untoward event had not, however, destroyed the general effect of the Tisza electoral system; the Government still controlled a majority of 77, and the masterful Tisza set himself to soothe the ruffled tempers of his countrymen by adopting a policy of active Magyarization. The conciliatory principles of Deák and Eötvös, which had already been abandoned in practice, were now set at almost open defiance. The Education Act of 1879, making the Magyar language an obligatory subject in all Hungarian primary . . . schools, and imposing quite a number of fresh qualifications on the teachers in non-Magyar schools, conflicts openly with the more liberal Act of 1868, and still more with the Law of Nationalities of the same year. . . . But the complaints of the nationalities fell upon deaf ears; the appeals of Mr. Mocsary for their fair treatment were like a voice in the wilderness, and the inclusion of a large section of the foreign press within the sphere of Tisza’s action prevented the outside world from learning the truth about the non-Magyar races. . . . In 1883 a Secondary Education Act was passed by the Hungarian Parliament, whose object and result was the final Magyarization of all state gymnasiums and ‘Realschulen,’ in direct violation of the Law of Nationalities of 1868 (§§ 17, 18). Even the few surviving non-Magyar secondary schools were placed under the strictest governmental control; the Magyar language and literature were made compulsory for all their pupils, who had to pass their final examinations in these subjects in the language itself. Elaborate clauses were included for the control of school-books, especially those on historical subjects, for the prevention of ‘unpatriotic’ teaching, for the removal of ‘dangerous individuals,’ and, if necessary, for the dissolution of non-Magyar secondary schools and the erection of state schools in their place.

... In one respect Tisza's position was stronger during the closing years of his long term of office; thanks to the brilliant finance of Széll and Wekerle, the deficit at last disappeared in 1889 from the Hungarian Budget, while Gabriel Baross earned a deservedly high reputation by his introduction of the railway 'zone system' and his reorganization of the Ministry of Commerce. But the intentional obscurity of the Ausgleich on the military question now began to bear its inevitable fruit; the Extreme Left, under the able leadership of Irányi, Charles Eötvös and Ugron emphasized with growing violence the need of an independent Hungarian army with Magyar language of command. . . . The new Law of National Defence brought forward by Tisza in January, 1889, roused intense feeling among large sections of the Magyar population, and it was only by means of his 'Mameluke' majority that the measure could be passed; indeed, even as it was, the obstacles to its passage might have proved insuperable, had not the tragic death of the Crown Prince silenced and distracted the hostile demonstrations. By the new law Hungary engaged herself for the next ten years to furnish the same contingent to the joint army as Austria, the numerical strength being determined by the Crown and any alteration being submitted to Parliament. The most unpopular provision of the new scheme was that by which all officers must pass a German examination, failure in which involves a year's delay. Tisza, of course, defended the absolute necessity of a single language of command in a joint army; while his opponents took up the highly plausible position that the armies of Prince Eugene and Napoleon were commanded in more than one language, without thereby suffering in discipline or efficiency. The army debates had completed the estrangement between Government and Opposition, and had roused personal jealousies and hatred to such a pitch that a victim was necessary if Parliamentary government was not to come to a standstill. . . . Early in March, 1890, Coloman Tisza resigned, after holding office for fifteen years; but his successor, Count Julius Szapary, remained little more than a dignified figurehead, while the so-called 'Tisza clique' preserved its old influence upon affairs, and perpetuated what the exiled Kossuth has bitterly described as a state of 'codified illegality.' The withdrawal of Tisza from an active share in politics coincided with a revival of Clericalism."—"Scotus Viator" (R. W. Seton-Watson), *Racial problems in Hungary*, pp. 171-177.

1890.—Infant Protection Act. See CHILD WELFARE LEGISLATION: 1876-1909.

1894-1895.—Hungarian ecclesiastical laws.—Conflict with the church.—Resignation of Count Kalnoky.—In the last month of 1894 royal assent was given to three bills, known as the ecclesiastical laws, which marked an extraordinary departure from the old subserviency of the state to the church. The first was a civil marriage law, which made civil marriage compulsory, leaving religious ceremonies optional with the parties, and which modified the law of divorce; the second annulled a former law by which the sons of mixed marriages were required to follow the father's religion, and the daughters to follow that of the mother; the third established a uniform state registration of births, deaths and marriages, in place of a former registration of different creeds, and legalized marriages between Christians and

Jews without change of faith. These very radical measures, after passing the lower house of the Hungarian legislature, were carried with great difficulty through the aristocratic and clerical upper house, and only by a strong pressure of influence from the emperor-king himself. They were exceedingly obnoxious to the church, and the papal nuncio became active in a hostility which the Hungarian premier, Baron Banffy, deemed offensive to the state. He called upon the imperial minister of foreign affairs, Count Kalnoky, to address a complaint on the subject to the Vatican. This led to disagreements between the two ministers which the emperor strove without success to reconcile, and Count Kalnoky, in the end, was forced to retire from office. The pope was requested to recall the offending nuncio, and declined to do so.

1896.—Celebration of the millennium of the kingdom.—The millennium anniversary of the kingdom of Hungary was celebrated by the holding of a great national exposition and festival at Buda-Pesth, from May 2 until the end of October, 1896. Preparations were begun as early as 1893, and were carried forward with great national enthusiasm and liberality, the government contributing nearly two millions of dollars to the expense of the undertaking.

1897-1910.—Magyars and non-Magyars.—Attempt to Magyarize Hungarian army.—Victory of policy of "dualism."—Austro-Hungarian bank.—In 1897 the decennial economic agreement came to an end, and the Independence Party decided to oppose its renewal. So strong was the obstruction to the measure organized by Kossuth that it came very near being rejected by the Hungarian Parliament. Another struggle took place in 1903 between 'dualism' and 'nationalism' over the question of the language of command in the army. Austria had voted her share of the army budget, but the Independence Party insisted on the use of Magyar in the Hungarian army as a condition of its being passed by the Hungarian Parliament. This was refused by Austria, and Kossuth's influence was sufficient to defeat the project and to overthrow the Hedervary Ministry which favored it. The matter was a serious one for the Dual Monarchy, and the Emperor-King stepped forward and declared that under no circumstances would he permit the unity of the Austro-Hungarian army to be broken and demanded that Hungary fulfill her part of the Compromise of 1867, and vote for the budget. Count Stephen Tisza, the new Prime Minister, finally succeeded in passing the army bill, but he found the opposition of the Independence Party very strong and the obstructionist tactics of Kossuth almost unbearable. Rioting frequently took place in the Hungarian Parliament, and a special police force had to be organized to keep the members in order. Parliament was dissolved, but the new election was a complete triumph for Kossuth, as his party won a sufficient number of seats to control the House. This brought about the most critical situation for the Dual Monarchy since 1848. Should Kossuth form a Ministry, backed as he was by popular support, the connection between Austria and Hungary might be sundered. Austria had recourse to the same remedy now as in 1848, namely, favoring the Slavs. The Emperor-King threatened to use his influence in favor of universal suffrage which would result in taking the control of the Hungarian Parliament from the Magyar and giving it to the non-Magyar races. The threat was sufficient. A Coalition Ministry was formed under Dr. Wekerle which decided to

uphold 'dualism.' The army budget was passed and the economic alliance renewed in 1907. . . . But the conflict between Hapsburg imperialism and Hungarian nationalism was irrepressible. It broke out afresh in 1910, when the question came up of renewing the charter of the Austro-Hungarian Bank, which unifies the financial relations between the two countries. The Coalition Ministry was disrupted by the Independence Party, which favored a separate national bank for Hungary. Obstruction and rioting again took place in Parliament, and more than once the parliamentary police had to be called in to eject riotous members. Finally, Count Khuen-Hedervary succeeded in forming a Cabinet which renewed the charter."—J. S. Schapiro, *Modern and contemporary European history*, pp. 439-440.

1907-1914.—Conflict over universal suffrage.—Plural Voting Bill defeated.—Lukacs electoral reform plan.—Tisza ministry.—For some years previous to the outbreak of the World War there was much conflict over the question of universal suffrage. Violent demonstrations occurred in the streets of Budapest during 1907 and 1908. The bitter fruits of the policy of Magyarization were gradually ripening; indignant protest against the unfair electoral law grew in volume. In November, 1908, Count Andrássy introduced a complicated bill granting manhood suffrage under conditions which made little, if any, change in the allocation of voting power, as the "Magyar State idea" was rigidly preserved. Under the elaborate provisions of this bill a million Magyar (or Magyarized) plural voters would have had 2,320,000 votes, while 2,800,000 non-Magyar voters would have disposed of only about 1,500,000 votes. While the effect would have been to more than double the number of voters, it was claimed that only Magyar and German representation would have been increased at the expense of the non-Magyar population. The powerful opposition arrayed against the scheme brought about its failure. "In 1912 the Lukacs Cabinet brought forward two plans for electoral reform. The first created *de novo* in the cities a class of representatives of the nation, chosen by universal suffrage, somewhat after the manner of the Badeni law of 1896 in Austria. . . . The Radicals were not in mood for this begging of the question and rejected it summarily. Lukacs' second project was more complicated. It based the franchise on taxes, intellect, profession, and social rank, with an infinite variety of qualifications in all of these categories. The Opposition now branded Lukacs as a traitor and on June 1 [1912] Kossuth, the son of the revolutionary hero, demanded a reform increasing the electorate . . . and guaranteeing the freedom of the vote by means of the secret ballot, except in communes with more than sixty per cent of their population illiterate. He linked franchise reform with the proposed military laws in such a way that, if one passed, the other must follow. The method by which the Magyar Junkers overcame the Liberal resistance to the army laws was characteristic.

The chief protagonist of the reactionaries was Stephen Tisza, the son of the great minister, Koloman Tisza. . . . An apostle of parliamentary violence, tenacious, without humour and without irony, severe on himself, implacable toward his adversaries, he had the political bigotry and the frightful seriousness of conviction of an inveterate Tory squire. He entirely lacked the equilibrium of intellect and talent which is necessary for a modern parliamentary leader. . . . He was the chief of all the retrograde Magyar forces, the irreconcilable foe of suffrage reform. The leaders of the various wings of the Liberal Opposition were Kossuth, Count Karolyi, Count Andrássy, and Dr. Wekerle, one of the shrewdest and most far-sighted of Magyar statesmen. As Liberal obstructionism against the suffrage and the army bills of 1912 continued, Tisza, the President of the Chamber, on June 4th refused the floor to the Opposition. In the disorder which ensued, he called for the vote on the military bill, passed it through all three readings, and left the chair. The square before the parliament house was filled with hussars and infantry, and Budapest was declared in a state of siege. The Government plainly intended to stifle in blood any further opposition. As the uproar continued in the afternoon session, Tisza ordered Justh, Karolyi, and a score of the other deputies removed by the police, whereat the rest of the Opposition left the hall in a body. The electoral reform of 1912 was at an end."—C. Seymour and D. P. Frary, *How the world votes*, v. 2, pp. 73-75.—On June 13, 1913, Stephen Tisza was again returned to power as prime minister. When the World War broke out a truce was arranged between Tisza and the Liberal opposition.—See also SUFFRAGE, MANHOOD: Hungary: 1222-1918.

1914.—Participation in the World War.—Fearing that the racial sympathies of the Serbo-Croats would lead them into the fold of a Greater Serbia, "the Magyars had been fully as much responsible as the German-Austrians for various tyrannical acts against the Yugoslav peoples, and the feud with Serbia was quite as much Hungary's quarrel as Austria's. Count Tisza, the Hungarian Premier, was one of the strongest personalities in the Empire, and he was highly esteemed both by his own King and by the German Emperor. He not only ruled Hungary with a firm hand, but had a great influence over the general policy of the Dual Monarchy—a greater influence, indeed, than that possessed by the Austrian Prime Minister, Count Stürgkh. Furthermore, there was little Socialism among the Magyars, whereas amongst the Germans there were large numbers of Social Democrats, and the latter adopted the same attitude towards the war [1914] as that taken by their comrades within the Hohenzollern Empire; that is, they believed the war necessary in national self-defence, but were opposed to all aggressive designs in the event of victory. . . . [For two years there was no opposition. Hungary's ex-

istence was at stake, and] Count Tisza's parliamentary position was unassailable; he possessed a considerable majority in the Lower House, and moreover the Opposition parties, including the Independence party led by Count Apponyi, gave the Government conditional support in all the necessary war measures."—*Annual Register*, 1915, pp. 228, 233.—"It was only in the midst of the war that the first Hungarian gun works (for heavy calibres) were inaugurated in the north-western part of the kingdom. Up to that time every rifle, every weapon, every siege gun used in the Hungarian army was of Austrian make; [the Skoda works at Pilsen, Bohemia, were supplemented by a branch factory in Hungary. Great arms factories were established on Cspel island and at Raab]."—W. von Schierbrand, *Austria-Hungary: Polyglot empire*, p. 131.—See also AUSTRIA-HUNGARY: 1914-1915.

1916.—Political parties.—"In July [1916] there were rather important developments in Hungarian politics. . . . Hitherto the Independence Party had unanimously given their support to the war policy of the Tisza Administration, and had temporarily abandoned the disputes about Hungary's relations with Austria and about Hungary's domestic affairs. . . . During the absence of Count Karolyi from the capital at the beginning of July, Counts Andrassy, Apponyi, and Zichy made an arrangement with the Premier by which one member of the Official Opposition should become a member of the so-called 'War Council,' a temporary deliberative body, and thus share with the Government some part of their responsibility for the conduct of the war. Now since Count Karolyi was not only one of the recognized leaders of the party but was actually its president, he was naturally excessively annoyed at this obviously improper action, and therefore on July 7 he formally and publicly severed his political connexion with the other leaders, and commenced to form a party of his own. . . . He had, however, never entirely agreed with the war policy of the Tisza Administration, and he now proposed to exercise his right to criticise it. . . . The Karolyi party desired to see a peace concluded immediately by negotiation, on the basis of a renunciation of all schemes of annexation by both groups of belligerents. . . . The new '48 party also advocated a general league of nations after the war, with obligatory arbitration for the settlement of international disputes. They further demanded, in common with the more docile section of the Opposition, a more democratic franchise, a separate Hungarian State Bank, and fiscal independence of Austria, and they proposed to press these demands, which the Apponyi party were not doing. A new item was a demand for a separate Hungarian Army, with a Hungarian Staff, with the Hungarian language used in words of command (this particular claim was not new), and controlled at least to some extent by the Hungarian Parliament."—*Annual Register*, 1916, pp. 250-251.

1916.—Accession of Charles I.—Ministerial changes. See AUSTRIA-HUNGARY: 1916-1917.

1917-1918.—Economic conditions.—Resignation of Tisza.—Wekerle as premier.—In 1917 Austro-Hungarian relations under the Ausgleich were once more called into question. "The output of Austria, in fact, in all industrial products has quadrupled in volume and value within the last fifty years past. Two-thirds of this output has gone to Hungary. In 1913 . . . the worth in money of these Austrian exports to Hungary mounted to about \$600,000,000 in American money. The whole industrial situation in Austria has

steadily adapted itself to this state of things. . . . [In Austria the problem of food supplies, also, had become pressing. The flow of trade was interrupted between Hungary and Austria.] Bitter feeling has been the result. It came to a head when during the war, at a time when Austria was cut off from all other sources of supply, and her population [had been] habituated for fifty years past to have Hungary sell her the large surplus of her crops,—Hungary failed in her customary role of provider."—W. von Schierbrand, *Austria-Hungary: Polyglot empire*, pp. 131, 133.—"The next act in the drama of Junker ascendancy was the resignation of Tisza from the premiership at the end of May 1917. Sharing . . . in the responsibility for Austria-Hungary's attack on Serbia, he had gone to war for the integrity of the millions of acres owned by a few hundred noble squires and a dozen bishops, as he had protected the electoral monopoly of those classes at the point of the bayonet. His fall was due to a recrudescence, even in war-time, of Hungarian Liberalism. A few months later Dr. Wekerle, the ablest financier of Hungary, who had stood aloof from politics since 1910 and had acquired a reputation as a Moderate became Premier with a program which included electoral reform. In this he had the support of the Emperor Charles, of a strong Parliamentary minority led by Apponyi, Andrassy, and Karolyi, moderate or liberal statesmen, and of a majority of the press."—C. Seymour and D. P. Frary, *How the world votes*, v. 2, p. 75.

1917-1918.—Electoral reform. See SUFFRAGE, MANHOOD: Hungary: 1222-1918.

1917-1918.—Breakdown of Dual Monarchy.—Opposition of subject-nationalities. See AUSTRIA-HUNGARY: 1917-1918.

1918.—End of World War.—Political turmoil.—Racial separatist claims.—National Council established.—Karolyi premier.—"The collapse of the Balkan front and Bulgaria's rapid capitulation [Sept. 30] produced a veritable panic in the official circles of the Monarchy. . . . There was hardly a supporter of the Dual System to be found in the whole Hungarian press, the Jingo of all shades supporting, out of fear, the programme of independence which the extreme Left advocated for pacifist reasons. The President of the Budapest Chamber of Commerce and the League of Hungarian Industrialists openly pronounced in favour of the Personal Union; and Count Tisza himself, fresh from an audience with the Monarch, declared in Parliament that the events of the past six weeks in Austria had shaken the bases upon which Hungary's relations with Austria had rested since 1867. . . . Charles had to insist upon Wekerle remaining in office, and allowed him to ease the situation by announcing the Crown's approval of the programme of Personal Union. Meanwhile the agitation of Count Michael Karolyi and his supporters grew daily in volume; and on 15 October the Independent leader, speaking in the Hungarian Delegation, did not hesitate to denounce it as a worn-out institution. His party co-operated more and more with the Radicals and Socialists, who under the existing class franchise were without representation in Parliament, but enjoyed growing prestige in the country. . . . The former consisted of a small group of intellectuals, led by Mr. Oszkar Jaszi, for years past a brave voice crying in the wilderness of Magyar jingoism for justice to the oppressed nationalities of Hungary. . . . The Socialists, whose influence was mainly confined to Budapest and a few large towns, were well equipped for concentrated political work and pos-

sessed in their party organ *Nepszava* a valuable weapon. Even before the war they inclined towards Marxism in its extreme and more rigid form, and by this time Bolshevik influence was rapidly gaining ground among them, through the medium of Magyar prisoners in Russia [notably Bela Kun]. . . . Karolyi set himself to outbid the Government by putting forward his own programme of 'Twelve Points,' its most essential features being complete independence and territorial integrity of Hungary, immediate peace negotiations by separate Hungarian delegates without regard for existing treaties, parliamentary control over peace and war, universal suffrage for both sexes, freedom for the nationalities 'on Wilsonian lines,' freedom of the press and of assembly, social and agrarian reform, recall of all Hungarian troops. . . . [On the other hand] Apponyi restated in terms of the old *régime* the demand for separation all along the line, and especially in the army. But already the Magyars were no longer alone in the field. Dr. Vaida put forward the Roumanian case in a bold and uncompromising speech, denying the right of the Magyars to quote Wilsonian doctrine and refusing to recognize the Parliament and Government of Budapest as in any way qualified to represent the Roumanians. . . . Father Juriga, amid growing interruption, put forward a similar claim of self-determination for the Slovaks, while the Magyarised Croat deputy, Mr. Ossoinak, insisted upon Fiume's special autonomous position. The Premier and other leading statesmen had an unanimous House behind them in denouncing the non-Magyar attitude but the whole foundation of their edifice was already slipping from under. . . . [For] President Wilson, in the most explicit language, modified his earlier pronouncements in favour of autonomy as a basis for peace, declared the Czecho-Slovak National Council to be a *de facto* Government, and recognised the justice of Jugoslav national aspirations. This Note was dated 18 October, but its electrifying effect upon the Western Slav world merely hastened on a process which had already begun. On 17-19 October the Jugoslav National Council, sitting in Zagreb, assumed the direction of the national policy, demanded the union of all Serbs, Croats and Slovenes in a single sovereign State and their representation as a single unit at the Peace Conference. . . . On the 21st a similar National Council (Narodni Vyor) in Prague proclaimed the absolute State independence of the Czecho-Slovaks. . . . On the 22nd the Germans of Austria followed suit. . . . On the 23rd, the Hungarian Parliament witnessed the novel spectacle of a Saxon deputy, Herr Rudolf Brandsch, demanding in the name of the two million Germans of Hungary much the same national and linguistic rights as those claimed by Slovaks and Roumanians. Count Apponyi for the last time worthily voiced the standpoint of the vanishing political order, by denying the reality of 'Czecho-Slovaks' extolling (for the benefit of Washington and London) the fictitious loyalty of the Slovak regiments to their Magyar oppressors and demanding the organisation of a new national army in defence of Hungary's frontiers. . . . Count Karolyi [rose] with a telegram announcing that a Croat line regiment at Fiume had revolted, disarmed the Magyar Honved garrison and placed the city under the control of the Jugoslav National Council in Zagreb [Agram]. . . . Amid general consternation a Cabinet Council was held, and almost immediately afterwards Dr. Wekerle informed the House of his resignation and advocated a Government of concentration from all the various parties. Its main aims, he de-

clared, must be (subject to the paramount consideration of peace) the protection of Hungary's frontiers and the immediate return of all Hungarian troops from abroad. . . . Charles arrived in Budapest [and] . . . soon found that Count Apponyi, the successor suggested to him by the retiring Premier, was not a possible candidate; and the idea of a non-party Cabinet under Mr. Barczy, the Mayor of Budapest, soon proved equally impracticable. The Independence Party chose this psychological moment [October 25] to found a Hungarian National Council. . . . Meanwhile Count Karolyi was engaged in negotiations with the Crown. The idea of a concentration of parties was viewed with great disfavour in the Radical and Socialist camp, where the dominant parliamentary clique was not unreasonably regarded as incorrigibly reactionary. Karolyi himself imposed two conditions for his co-operation—that a separate Foreign Minister for Hungary should at once be appointed, and that an offer of separate peace should be made by Hungary to the Entente. Though himself the son-in-law of Count Andrassy, he openly and vigorously opposed the latter's appointment to the Joint Foreign Ministry [as successor of Count Burian] and denounced him as the bulwark of Junkerdom in Hungary. He definitely declined to support any Cabinet in which the controlling power did not lie in the hands of his own party. . . . (28 October) the Czech National Council in Prague took over the civil administration of Bohemia and received the submission of the garrison and its commanders; and a day later the Croatian Parliament proclaimed by acclamation the complete independence of Croatia from Hungary. . . . The demonstrations in Budapest continued, and the news that the Government of Zagreb disposed unreservedly over the Croat regiments set a final light to the train. Count Karolyi and his National Council, after despatching telegrams of fraternal greeting to the Jugoslav Council in Zagreb and to the newly-constituted Slovak Council in St. Martin, issued a proclamation to the nation, pointing out that in Croatia and Bohemia the army had declared allegiance to the National Councils, and demanding the same for Hungary. . . . The troops crowded eagerly to the support of the National Council, which at once assumed control. By the morning of the 31st the garrison and police had joined them, the post offices and many public buildings were in their hands, and Count Karolyi had been proclaimed as Premier. In the course of the same morning Count Hadik resigned the office [of Premier] which he had held for forty-eight hours, and Charles, with a lack of ceremony worthy of a better cause, telephoned from Vienna his acceptance of Karolyi as Hungarian Premier.—"Rubicon," *New Europe*, Apr. 17, 1919, pp. 7-13.

1918 (November).—Assassination of Tisza.—Outbreak of revolution.—Archduke Joseph, "deputy of the crown."—Attempted racial conciliation.—Collapse and dissolution.—Armistice.—"People's Republic" proclaimed.—New Franchise Bill.—The revolution to establish a republic independent of Austria broke out October 31. "The very first day of the Revolution was marked by a significant outrage. Armed soldiers forced their way into the villa of Count Stephen Tisza and assassinated him in the presence of his wife and sister-in-law. 'I knew that would be my end,' were his last words. Such was the fate of the arch-reactionary whose force of will had so long dammed back the tide of reform in Hungary, and whose uncompromising nationalistic foreign policy combined with the ambitions of Berlin to

render the Great War possible. Tisza, it is but fair to add, had the courage of his convictions and never attempted to conceal his contempt for democracy. . . . The arrest of the general in command of Budapest further appeased the army, which was by this time in a state of disintegration. . . . A fresh crisis was provoked by Count Karolyi, on assuming office, taking the oath to the Archduke Joseph as deputy of the Crown. The Radicals and Socialists insisted that the oath was due rather to the National Council through which the new Cabinet had come into power; and already, on 2 November, the Premier notified the Council's Executive Committee that he and his colleagues had, at their own request, been released by the Crown from the necessity of taking oath at all, and that it was their intention to refer to a plebiscite the question whether Hungary should be a monarchy or a republic. On the same day the Archduke Joseph and his son created a profound sensation by appearing in person to take the oath of allegiance to the National Council.—"Rubicon," *New Europe*, Apr. 24, 1919, pp. 36-38.—"Joseph is the only member of the Hapsburg family that bears the Magyars sincere affection. . . . Throughout the war . . . he commanded one or more Hungarian army corps. He . . . endeared himself to the Magyars in every way. . . . With the late emperor and king [Francis Joseph] he was never a favourite. . . . As a soldier he . . . [had] shown no great qualities either as a strategist or tactician, but to compensate for that fully in the eyes of his Magyar soldiers he has throughout given evidence of reckless daring, of indomitable valour."—W. von Schierbrand, *Austria-Hungary: Polyglot empire*, p. 175.—"On the very eve of the *débâcle* [King] Charles himself surrendered the supreme command to the Magyar Field-Marshal Köves, on whose military prestige he relied, in true Hapsburg fashion, to cover the ignominy of complete surrender. Almost simultaneously came the resignations of Count Andrássy and Baron Spitzmüller, the Joint Ministers of Foreign Affairs and Finance [in Vienna]. The former, amid the growing anarchy, had filled the pitiable rôle of registering the successive steps by which the Hapsburg monarchy broke up into its component parts. His ambition to fill the office of his father was at last gratified—for ten eventful days: and the signature of 'Julius Andrássy' [father and son, respectively] stands at the beginning and the end of the Dualist Era. [In an improvised Magyar government] the new Cabinet rested on a coalition between the extreme Left of the Chamber—the Party of Independence (or 'of 1848'—so-called in memory of Louis Kossuth and the revolution of that year)—the Radicals . . . (for the most part professors or economic and historical specialists)—and the Socialist Party, which represented the unfranchised proletariat of the capital, but had not many roots in other parts of the country. . . . For the Radical leader, Dr. Oszkar Jaszi, a special Ministry of Nationalities was created, and the delicate task of maintaining relations with the non-Magyar races was thus entrusted to the one man who had had the courage to protest publicly against the brutality and corruption of the old Magyar régime. . . . In July, 1849, when the revolutionary Hungarian Parliament had withdrawn to Szeged and the armies of the Tsar were advancing in overwhelming numbers, Kossuth and his adherents promulgated a law guaranteeing the liberty and free development of all the non-Magyar nationalities. In 1918 the same belated procedure was adopted. . . . Mr. Jaszi was empowered to negotiate with them on the basis of

self-determination, but on the assumption that this was not incompatible with Hungary's territorial integrity, and that the appointment of new high sheriffs and the grant of a new parliamentary and municipal franchise could still arrest the headlong car of fate. He urged upon his colleagues the immediate, the whole-hearted acceptance of Czech and Jugoslav independence, in the hope that . . . Hungary would be able to save Transylvania and Slovakia. But on the very same day the Roumanians of Transylvania constituted a rival National Council at Cluj (Klausenburg), and proceeded to organise themselves on a national basis; while within a few days the advance guard of the Czech army had penetrated into the northern Slovak counties, and the Serbs on their side were occupying the rich plains of the Banat and the Backa."—"Rubicon," *Hungarian revolution (New Europe, Apr. 24, 1919)*.—"Count Karolyi was, of course, faced with a situation of extreme difficulty. . . . The original armistice concluded with General Franchet d'Espèrey at Belgrade on November 3, had been not unfavourable to Hungary, but it had caused discontent among the minor Allies of the Entente, and severe revisions of the terms of the armistice were afterwards imposed upon the Hungarian Government, and these revisions involved the occupation of great stretches of what had been Hungarian territory by the Rumanians, the Bohemians, and the Serbians. And in the meantime the autonomous province of Croatia had declared its independence of Budapest and its union with the new Jugo-Slav State. Thus it was a much-diminished Hungary over which Count Karolyi ruled; these losses of territory, or some of them, were resented by all Magyars without distinction of party—even by the Socialists. And there was another political danger of a different character. In Budapest, as in nearly all the other capitals of Europe, there was a small but very active Bolshevik faction. . . . There is no doubt that the summoning of a democratic Constituent Assembly would have been the most effective method of combating Bolshevism. But in this matter the Government were on the horns of a dilemma; they were unable to hold elections in the extensive districts occupied by Rumanians, Czechs, and Serbs, and they were at the same time unwilling to admit that these districts had ceased to be legitimate portions of the Hungarian realm. To postpone the elections played into the hands of the Bolsheviks; to hold the elections in Central Hungary only would raise the ire of all Magyar patriots."—*Annual Register, 1919, pp. 228-229*.—"The capitulation of the Monarchy having been signed on 3 November, and what was left of the . . . broken and demoralised army streaming homewards by every possible route—Count Karolyi and Mr. Jaszi went to Belgrade to negotiate with General Franchet d'Espèrey, as commander of the eastern front, the detailed application of an armistice to Hungary. . . . [He] was inveigled into accepting a military line so obviously at variance with geographical and racial requirements as to cry out for infringement by both parties. . . . The result was to leave a third of the Roumanian population to the tender mercies of the Magyars, while assuring to them direct access to the Szekely districts in south-eastern Transylvania—in other words, to facilitate so far as possible Magyar influence . . . , [and] to maintain a general state of ferment, instead of encouraging acquiescence in the new order, resting, as it inevitably must, upon broad racial divisions. On 10 November, then, the National Council in Budapest ratified the armistice on the terms thus laid down,

Count Karolyi having previously explained that, in response to his telegram of protest to Paris, General Franchet had received instructions from M. Clemenceau to limit himself strictly to military arrangements, 'to the exclusion of every other question.' While admitting that this was neither 'Yes' nor 'No,' Karolyi clung like a drowning man to the hope that the advance of Czech, Roumanian and Yugoslav troops would not be allowed to prejudice the question of Hungary's future frontiers. Meanwhile, to the indignation of many, he yielded to the Entente's further demand that Marshal Mackensen's armies should be disarmed on their way homewards from Roumania."—"Rubicon." *Hungarian revolution (New Europe, Apr. 24, 1919).*

"Nov. 16 at the plenary meeting of the Hungarian National Council, the body functioning temporarily as the Hungarian Parliament . . . [proclaimed]: 'I. Hungary is a People's Republic, free and independent of any other country. II. The Constitution of the People's Republic will be established by the Constituent National Assembly soon to be called and elected on the basis of the new suffrage. The Chamber of Deputies and the House of Magnates of the Hungarian Reichstag are dissolved and cease to exist. III. Until the Constituent National Assembly decrees to the contrary, the People's Government, under the Presidency of Michael Karolyi, exercises, with the support of the Executive Committee of the Hungarian National Council, the supreme powers of the State. IV. The People's Government is to create imperatively needed popular laws for the universal, secret, equal, direct suffrage, including that of women, for national, municipal, and communal elections; for the freedom of the press; for popular courts of justice, with jury trials; for the rights of association and assemblage, and for the supplying of the agricultural population with land and property.'"—*New York Times Current History, Mar., 1919, p. 487.*—Karolyi sent out a wireless message addressed "To All Civilized Nations," in which the new government requested recognition. It read in part: "The young Hungarian Republic turns to all the free peoples of the world with an appeal for support in the hard task of reorganizing Hungary. The sins of the former Governments make this work frightfully difficult. But the Hungarian Republic wants to reshape Hungary in the most complete and purest spirit of democracy based on President Wilson's points, and it is confident that the liberated forces of the people will find on this basis the possibility of joint, peaceful, and fraternal labor. Filled with this hope, the Hungarian Republic turns to all civilized nations today and asks them, in the name of the eternal solidarity of democracy, for their good wishes and their support in its great and holy endeavor."—*Ibid.*—"It was in vain that the new republican government of Count Karolyi fought frantically to save the territorial integrity of the state by offering the non-Magyar peoples the widest and most sweeping concessions, going even so far as to propose the transformation of Hungary into a federation of national cantons on the Swiss model. . . . Equally fruitless were the diplomatic or propagandist efforts to persuade the Allied Powers that Hungary had suddenly become a new creation, which could not be held responsible for the acknowledged sins of former rulers."—C. H. Haskins and R. H. Lord, *Some problems of the peace conference, p. 236.*—"On 23 November the text of the new franchise bill was made public: under it the old complicated arrangements were swept away bodily, the vote was conferred upon all men of twenty-one and

women literates of twenty-four; the ballot was introduced everywhere, and for the municipal franchise the single qualification of six months' residence was added. [See also SUFFRAGE, MANHOOD: Hungary: 1222-1918.] But no date was fixed for the new elections and signs of irresolution and internal dissension in the Cabinet became more and more evident."—"Rubicon," *Hungarian revolution (New Europe, May 1, 1919).*—See also AUSTRIA-HUNGARY: 1918.

1918-1919 (December-March).—Invasion by Rumania.—Rise of Bela Kun, Bolshevik.—Karolyi elected president.—Cabinet resignations.—Protest against armistice terms.—A provisional Rumanian Government was formed at Sibiu (Hermannstadt, Transylvania), under the presidency of Dr. Julius Maniu (2 December), and when Colonel Vix, head of the French Mission at Budapest, transmitted the Entente's orders for the evacuation of Slovakia, Count Karolyi in a proclamation to the nation declared that he only yielded to force, and insisted that only the Peace Conference could change boundaries which had survived for 1,000 years. On 22 December the new line was finally defined, as following the course of the Danube and Ipol, and then running from near the latter's source to the river Ung and thence northward to the Carpathian watershed. Once more the Government protested vigorously against this 'brutal and arbitrary proceeding,' in flagrant contradiction of all history, but accepted the inevitable. The position of the Government was rendered all the more critical because this coincided with a similar demand on the part of the Rumanians for the evacuation of Cluj (Kolozsvar), the Transylvanian capital. Attempts were made to represent this as a Roumanian defiance of the Entente; and hence the dismay was correspondingly great when Versailles authorised the Roumanian troops to cross the original line of the armistice and to occupy provisionally not only Cluj but also Satmar, Margitta, Maramures, Oradea Mare (Grosswardein) and Arad. In reality, this was the inevitable result of fixing an impossible line in the first instance. [See also RUMANIA: 1919: Rumania in Hungary.] . . . Count Karolyi, . . . amid the conflicting opinions of his followers, . . . endeavoured to give a lead by his speech of 23 December, in which he insisted upon the revolutionary character of his régime, defined his pacifism as 'a democratic radical policy deeply permeated with social ideas,' and did homage, though in rather general terms, to Kossuth's ideal of a Danubian confederation. The Communist group had just been heavily defeated in the Workers' Council, and this speech was intended as a challenge to the Right and a bid for the support of all progressive elements which stopped short of subversive aims. Count Batthyany and Mr. Bartha had already resigned office early in December, and they were now followed by Mr. Lovasz, who declared himself opposed to the Socialist design of land settlement, and who began to devote himself, obviously too late in the day, to the organization of a new *bourgeois* party. . . . On 30 December the appointment of Count Alexander Festetics as War Minister was interpreted as a move towards the Right, and led to communist disorders and mutiny in Budapest, during which Bela Kun, Lenin's right hand among the Magyar prisoners in Russia, first emerged as an active agitator. Early in January the same man provoked another outbreak at Salgotarjan, the only coal mines still left to the Magyars, where war profiteering had provoked ugly discontents. Within a few days a number of Russian Bolsheviks, masquerading as Red Cross officials,

were arrested by the authorities. . . . Attacks upon the Government grew in vehemence. . . . At the last moment, in order to avoid the open breach which the withdrawal of the Socialists would have produced, a complete political re-shuffle was decided upon. By an unanimous decision of the National Council Count Karolyi was on 10 January elected President of the Republic, and the task of forming a new Cabinet was assigned to Mr. Berinkey, a man standing outside the parties and hitherto entirely unknown in Hungarian political life. Even thus it took him a week of hard negotiation before the list could be made up, the Socialists insisting upon a thorough 'purge' of the party of independence as a condition of co-operation. Count Festetics resigned, denouncing the agitation of the communist Pogany as fatal to the very existence of the army; Lovaszky was openly discarded as little better than counter-revolutionary, while Dr. Jaszi withdrew from office, discouraged by the utter failure of his efforts to reconcile the non-Magyars. The new Cabinet took on a definitely Socialist tinge; the new War Minister, Mr. Böhm, favoured communist tendencies in the army, and the Minister of Education, Mr. Kunfi, not content with overriding the autonomy of Budapest University, abolished religious teaching in the schools and began to adopt an increasingly aggressive attitude towards the Church. Of the Radicals, Dr. Szende, the Minister of Finance, alone remained at his post. The history of the next two months is one of helpless drift. The elections were again postponed, ostensibly because so much Hungarian territory was in foreign occupation, but, in reality, because the Government was incapable of organising them amid the prevailing disorder, and because each of its rival groups was equally disinclined to trust to their result. The Socialists were at first opposed to the communists, and helped to put down the various attempts at fresh upheaval; but the extremer elements steadily gained in influence, until the President was reduced to his natural rôle of an eloquent but futile figurehead. On 20 February Bela Kun and his followers, imitating the procedure of the Spartacists in Berlin, raided the offices of the Socialist Party organ, *Nepszava*, and when arrested he freely admitted that he had brought with him from Russia 300,000 crowns in cash for purposes of agitation, and that his aim was to replace the People's Republic by a proletarian dictatorship on the Russian model."—"Rubicon," *Hungarian revolution (New Europe, May 1, 1919)*. "To this agitation, combined with the seriousness of food conditions in Budapest and throughout Hungary generally, was added a new factor, which proved to be the immediate reef on which the Government of Karolyi was wrecked—the Hungarian protest against the boundaries set by the Allies between Hungary and her neighbors, Rumania, Serbia, and Czechoslovakia, and the announced intention of the Allies to subject Hungary to military occupation. As early as Feb., 22, 1919, the Karolyi Government protested against the terms of the armistice, so far as they affected Hungary, in a long note addressed to Lieut. Col. Vix, head of the allied mission at Budapest. Its main issues may be summarized as follows:

"Railway and food administration had remained with the civil authorities in Hungary during the war, and had not passed into the hands of the military. The allied proposal to deliver certain parts of the railway system into the possession of the Allies was contrary to the explicit provisions of the terms of the armistice. Yet the Hungarian Government affirmed its desire to accomplish faithfully the duties imposed upon it, and declared itself

ready to submit to a control of the railway administration through the intermediary of the inter-allied commissions. The same disposition applied to the question of food supply."—*New York Times Current History, May, 1919, p. 285*.

The reply "was an order issued by the Allies that the Hungarians withdraw to the Rumanian boundary fixed by the Rumanian treaty of 1916. Again, on March 22, came the announcement that allied troops had occupied the greater part of Hungary, with the exception of Budapest and the surrounding districts, in order to suppress plundering bands of Bolsheviki. On the same day the world was startled by learning that Karolyi had surrendered the reins of power to the Bolsheviki and that Hungary, like Russia, had undergone a second and more radical revolution. Vienna dispatches declared that it was the establishment of the neutral zone on the Hungarian-Rumanian frontier, decided upon by the Peace Conference, which had precipitated the crisis. This zone was intended to make the Hungarians desist from attacking the Rumanians and to close the gap between Rumania and Poland. The Entente note defining this zone was dated March 19. The zone was fixed as a belt 140 miles long and forty miles wide, virtually shutting Hungary behind the Rivers Theiss, Szamos, and Maros, and including the towns of Grosswarden, Debreczen, and the entire country behind. The note required the withdrawal of the Hungarian troops behind the western boundary of the belt within ten days and authorized the Rumanians to advance to the eastern boundary. The civil government of the neutral zone was to be exercised by Hungarians, under allied control, but the important points would be occupied by allied troops."—*Ibid.*—It was promised that American, English, and French troops would occupy the frontiers. In place of this Rumanians, Serbs, and Czechs, following up their respective claims to various parts of Hungary, invaded that country, crossing the lines of demarkation made by General Franchet d'Espérey. Budapest became practically a frontier town, with the Czechs only thirty kilometers away.

1919 (March).—Second or Bolshevist revolution.—Soviet republic set up.—Surrender of Karolyi.—Proletariat rule.—Bela Kun, dictator.—Operations of the Hungarian army.—Mass demonstrations began the second revolution. "The actual explosion was imminent when the Entente note defining the neutral zone arrived, and Count Karolyi decided to withdraw from the Government. Karolyi turned the Government over to a Socialist-Communist Cabinet [March 21] and issued the following manifesto appealing to the proletariat of the world for support:

"The Entente Mission declared that it intended to regard the demarkation line as the political frontier. The aim of further occupation of the country is manifestly to make Hungary the jumping-off ground and the region of operations against the Russian Soviet army which is fighting on our frontier. The land evacuated by us, however, is to be the pay of the Czech troops, by means of whom the Russian Soviet army is to be overcome. As Provisional President of the Hungarian People's Republic, I turn, as against the Paris Peace Conference, to the proletariat of the world for justice and support.' The revolutionary Govern-

ment of Workers', Peasants', and Soldiers' Councils, to which Karolyi delivered the Hungarian rule, consisted of Alexander Gorbai, a workman, as Premier; Bela Kun, a former associate of Lenine and Trotzky, as Minister of Foreign Affairs; Joseph Pogany, a soldier and former President of the Soldatenrat, as Minister of War, and Herr Boehm, a former Cabinet Minister, who had become a radical, as Minister of Social Affairs. The dominating spirit of the group was Bela Kun, a former instructor in the law school of the Francis Joseph University at Klausenburg, Transylvania, and an associate of Lenine in Russia, where he had been a prisoner during the war."—*New York Times Current History, May, 1919, p. 288.*—"The Socialists as a whole were hardly prepared for this sudden accession to power. Most of them were Social Democrats who believed in an orderly social evolution and did not favor violent experiments. One of their number, however, Bela Kun, a faithful disciple of Lenin, saw his opportunity. . . . He at once leaped to the front as the directing personality of the new 'Dictatorship of the Proletariat.' He immediately infused a vigorous spirit of organization and order into the new government. . . . Lenin, . . . early advised the Hungarian Socialists to avoid the mistakes and excesses of the Russian Bolsheviks, and continued for a long while in constant communication by wireless with Bela Kun. . . . It was quite apparent at the start that Bela Kun was eager to conciliate the Entente. This was shown by his efforts to protect foreigners from the rigors of the new régime, and by his heavy-handed punishment of excesses committed by members of the Red Guard. It was also of special interest to note his evident eagerness to serve as an intermediary between Lenin and the Entente."—P. M. Brown, *New York Times Magazine, July 27, 1919.*—"It is of interest to note the nature of the great mass of legislation enacted immediately by the new Government. . . . The first important decree was to abolish the right of private property. Everything henceforth was to belong to the State. But there were important concessions and exceptions. In order not to antagonize the peasants it was recognized that small holders of land under cultivation were to be left unmolested. . . . The question of actual title to property was left in abeyance."—*Ibid.*—Bela Kun's government issued a proclamation on March 22, which reads in part as follows: "Legislative, executive, and judicial authority will be exercised by a dictatorship of the Workers', Peasants', and Soldiers' Councils. The Revolutionary Government Council will begin forthwith work for the realization of Communist Socialism. The council decrees the socialization of large estates, mines, big industries, banks, and transport lines, declares complete solidarity with the Russian Soviet Government, and offers to contract an armed alliance with the proletariat of Russia.' . . . Lenin stated that he had submitted the Hungarian greeting to the Bolshevik Congress at Moscow, which had received it with great enthusiasm. The first act of the new Government was to take possession of the offices of the Correspondence Bureau, the official news agency, in order to control all further news. . . . The newspapers, at first interrupted by a strike, soon resumed; there was no censorship; all official statements were published prominently. . . . [Already] commissioners for the City of Budapest had been appointed; officers of the municipality had tendered their resignations, but had been asked to remain at their posts. Financial Commissioner Varga had notified bank Directors that reliable bank employes would take up the direction of

affairs. The Hungarian Commission for Military Affairs . . . had issued an order instructing all soldiers to rejoin their units without delay, adding: 'If the soldiers do not do their duty, the Hungarian Soviet Government is doomed.'"—*New York Times Current History, May, 1919, p. 289.*—At first Rumanian troops in ten days advanced over 300 kilometres without once meeting with any serious opposition. The Red troops ran away. But six weeks after, the Hungarian Red Army advanced victoriously against Czechs and Rumanians, inflicting upon them heavy defeats. The Government of Bela Kun conjured up in six weeks a great, well organized, and disciplined army. "The Government mobilised the proletariat and obtained thus very excellent soldier material which had already proved extremely valuable in the war. It dissolved Soldiers' Councils, removed commanders elected by the men, and posted officers to the army—officers who . . . [were] well paid and whose powers of command are greater, if anything, to those possessed in the old Imperial and Royal Army. The most stringent discipline was instituted; jury courts were abolished, and the officer . . . [had] power of life and death. Professional officers . . . had to place their services at the disposal of the Government. . . . All temporary officers who were members of a trade union were compelled to report, and . . . a new order was issued which . . . [compelled] every former officer, without reference to his degree of fitness, to place himself at the disposal of the Government. . . . The Chief of the General Staff to Army Commander Böhm, the former Colonel Aurel Stromfeld, was probably the most brilliant General Staff officer of the Imperial and Royal Army. He worked out the plans of the offensive . . . against the Czechs. The Soviet Government found about 1,000 guns in Hungary. Although it lacked horses and transport material, it had formed, by the end of May, 100 batteries, amongst these a number of heavy batteries and two batteries of 30.5 howitzers. Large supplies of ammunition were stored in the Budapest Artillery Depot, and also in the Csepel munition factory. The making of munitions was immediately commenced. . . . Machine-guns were available in large numbers, and in addition, pilots from Wiener-Neustadt in considerable numbers served for good remuneration until they were captured. . . . The Magyar army [had] . . . thirty aeroplanes whose duty it [was] . . . to scatter among enemy troops manifestos of Bolshevik propaganda in all languages. At Szeged, where there [were] . . . 16,000 French colonial troops, communist manifestos, written in Arabic, [were] . . . dropped."—*New Europe, July, 1919, pp. 43-45.*—The Soviet forces were at once employed in the fertile regions of Slovakia and elsewhere, while negotiations were opened with the entente powers, in session at the Paris Peace Conference, which had sent General Smuts to Budapest on a diplomatic mission in April with proposals that were rejected by Bela Kun. "Meanwhile the Hungarian Reds won further successes. The North Hungarian town of Kaschau was taken after two days' fighting, on June 8. The Hungarians crossed the Danube at Gran and the River Neutra, menacing Pressburg between Budapest and Vienna north of the Danube. Some fighting continued in this region. The Czech armies were being reorganized under French officers. General Pelle, who in 1916 had been Joffre's chief of staff, was given supreme command. As the Hungarians had practically all the old Austrian Army's artillery, none of which had been surrendered, they were much better equipped than the Czechs. The President of Czechoslovakia,

Thomas Masaryk, . . . sent repeated telegrams to the Peace Conference for assistance."—*New York Times Current History*, July, 1919, p. 77.—The answer to the first note of the Allies (sent June 9) demanding the cessation of all Magyar attacks upon the Czechs was considered unsatisfactory, as it threw all the blame for Hungary's invasion of Slovakia upon the Czechs, made cessation of hostilities provisional on further negotiations, and proposed Vienna as a place for arbitration. In answer to the second ultimatum of the allied powers Bela Kun ostensibly agreed to withdraw his troops from Slovakia, but his real intention became manifest in the manner of withdrawal, which left a hastily organized Soviet republic established. Meanwhile the principal Hungarian armies were engaged in operations against the Rumanian forces on the Theiss, advancing upon Budapest.

1919-1920.—Fall of Soviet government.—Supreme council forces retirement of Archduke Joseph.—Huszar ministry.—Parties of the Right in the ascendant.—Admiral Horthy elected regent. — Simonyi-Semadam ministry. — Teleki, prime minister.—“After an ill-fated invasion of Rumania late in July, 1919, the Radical government established under the leadership of Bela Kun . . . came to an end. Its fall was hastened by the publication on July 26 of a statement by M. Clemenceau in behalf of the Peace Conference to the effect that the removal of the Hungarian blockade and the furnishing of food supplies were contingent upon the ousting of the Communist leader. The government of Bela Kun was succeeded by one composed of moderate socialists headed by Jules Peidl. The new government was at once paralyzed when, in defiance of the Supreme Council, the Rumanians occupied Budapest on August 5; two days later it was overthrown by a monarchist *coup d'état*, Archduke Joseph proclaiming himself Governor and appointing a coalition cabinet with Stephen Friedrich, a follower of Count Karolyi, as Premier, Martin Lovassy, Minister of Foreign Affairs, and Baron Sigismund Perenyi, Minister of Interior. In his accession to power the Archduke had the support of the monarchists and the peasantry, but was opposed by all the socialist and liberal groups. . . . Mr. Herbert Hoover, [too,] . . . declared before the Peace Conference on August 21, that the new countries of Central Europe were being terrorized by fear of the reestablishment of a Hapsburg dynasty. Largely as a result of Mr. Hoover's testimony the Supreme Council despatched an ultimatum to the Archduke, insisting upon his retirement, with which he complied on August 23. The Allies requested the Friedrich government to continue in office until a representative government could be formed; . . . Friedrich reorganized his cabinet and for the time being strengthened his control by securing the withdrawal of the Rumanian forces [in November] and holding the extreme radicals in check. He failed to convince the Supreme Council that his government was representative, or to accommodate himself to a genuine coalition ministry, and retired on November 18, after nominating Carl Huszar, a Christian Nationalist, as his successor. Huszar was at first strongly opposed by both the National Democrat and the Socialists, but these parties were finally placated by an agreement that general elections would be postponed till January and that the future form of the government should be decided by a plebiscite. The new coalition cabinet, in which Friedrich accepted the Ministry of War, was

officially recognized by the Entente as the *de facto* provisional government. To gain this recognition it agreed to maintain law and order, preserve popular liberties, hold elections without delay on a democratic basis and to abstain from aggressive action against neighboring states. In endeavoring to fulfil these obligations considerable criticism of the government's methods was expressed, and as a protest against what was alleged to be tyrannical interference with political and personal liberties the two representatives of the Social Democratic party withdrew from the cabinet. On December 27 it was officially announced that the military authorities had discovered a dangerous Communist plot for the destruction of the government. The general elections for the National Assembly, held on January 25, [1920] resulted in an overwhelming victory for the parties of the Right: the Christian National Union and the Small Landholders; the

ADMIRAL HORTHY

former secured 68 seats, the latter 71. The other seats were distributed as follows: Christian Socialists, 5; Christian Social Economic party, 4; National Democrats, 6; non-party, 3. The Assembly opened on February 16 and unanimously chose M. Rakovsky as its presiding officer. On March 1, [1920] it was announced that Admiral Nicholas Horthy had been elected Vicegerent (Lord Protector) by the National Assembly. Immediately following this election the Huszar ministry resigned, and on March 10, after the retiring Premier had declined renomination, M. Simonyi-Semadam, a Christian Nationalist and close personal friend of M. Huszar, formed a new government, whose program included measures of agrarian, financial and economic reform. Attempts to deal with the land question . . . met with bitter opposition from the aristocratic landowners. Reactionary terrorism, conducted by the 'Society of Awakening Hungarians' and by army officers . . . finally resulted in the overthrow of the cabinet on June 10. Anti-Semitic demonstrations have also been of frequent

occurrence."—E. D. Graper and H. J. Carman, *Political Science Quarterly*, 1920, *Supplement*, pp. 132, 133.—The peace treaty of Trianon was signed at Versailles, June 4, 1920 (see TRIANON, TREATY OF). "In July the Prime Minister [Simonyi-Semadam] resigned, and was succeeded in that office by Count Teleki. During the previous year allegations had been made by the extreme Socialists that after the fall of the Soviet Government in Budapest in August, 1919, there had been a general massacre. . . . The British Foreign Office . . . having instituted an inquiry into the matter, . . . the report of the official investigators was issued in May, 1920. The report found that after the re-establishment of Constitutional Government thirty Bolsheviks who had committed murder during the Bolshevik regime had been executed in accordance with the law of the land. It was also ascertained that before the Constitutional Government could make its authority effective, the public had in certain cases taken summary vengeance upon known Bolsheviks—nearly all Jews—for the excesses which they had committed when they were in power. And it was stated that about 370 Bolsheviks had been killed in this manner. It was found, however, that the Constitutional Government so far from taking any part in this vengeance, had put a stop to it as soon as they were able to assert their authority."—*Annual Register*, 1920, p. 227.

1920-1921.—"Little Entente" formed to restrain Hungary.—Ex-King Charles attempts a coup d'état.—"On July 20 (1920), Count Paul Teleki, the Transylvanian magnate who was former minister of foreign affairs, assumed the post of premier. When this new government took office both the Christian Nationalists and the Small Landholders supported it. Count Teleki ventured immediately into foreign policy by holding forth promises to the allies, to France particularly, against Soviet Russia. It was however suspected that the premier purposed primarily to strengthen the national army and as rumors of a royalist plot were [also] rife, the surrounding governments who had profited by the dissolution of the Austro-Hungarian Monarchy, were naturally alarmed and formed the so-called 'Little Entente' against the supposed menace of Hungarian aggression. [See JUGO-SLAVIA; 1920.] In the following March, 1921, it was reported on the other hand that Hungary had joined the Polish-Rumanian Alliance against Soviet Russia. Suddenly, on March 26, Charles seemed to confirm all rumors of the projected restoration by prematurely presenting himself in Western Hungary with the design of heading a royal rising. The *coup d'état* proved a fiasco. [Charles ventured to Budapest.] Only when the former ruler appeared in person and demanded that he yield supreme power to him was Horthy aware of a grave situation demanding quick action. 'I will not dispute your right to the throne,' he told Charles; 'but you must remember that I was elected Regent of Hungary and will abandon my place only in response to a constitutional act by the National Assembly.' Charles pleaded in vain, and was told that he must leave the country immediately."—*New York Times Current History*, May, 1921, p. 216.—"Charles's stay in Hungary lasted ten days, and in Budapest but a few hours. His interview with the regent occupied about three hours, at the end of which he decided to return to Bishop Mikeš's palatial home in Szombathely, near Steinamanger; there he marked time for more than a week. His final decision to leave the country came on April 5, when he was confronted with a flat refusal to permit him to stay any longer. The

Government itself cautioned him not to invite danger from the Entente and especially from countries of the Little Entente, i.e., Czechoslovakia, Rumania and Jugoslavia, which threatened war and actually mobilized their military. . . . Charles at last yielded to the demand that he leave the country. He did so on April 6, but before leaving issued the following proclamation:

"His Majesty leaves the country because of his conviction that the moment has not yet come for him to take over his right of governing. He cannot permit maintenance of his right to entail disturbances in the present state of peace. He leaves the land as the crowned King of Hungary.' . . . Charles's unexpected return to Hungary precipitated a Cabinet crisis. . . . On April 13 the Hungarian Government through the Swiss Legation in Vienna, informed the Swiss Federal Council that Hungary considered the former Emperor Charles as its lawful sovereign, and that only 'foreign influences' prevented the ex-Emperor from exercising his rights to authority. It requested the Swiss Government to permit Charles to reside permanently in Switzerland."—*Ibid.*, pp. 217-218, 216.—The Teleki cabinet fell on April 10 and was succeeded by a new ministry headed by Count Stephen Bethlen, who pleaded for coöperation of all classes and promised democratic legislation and freedom of the press. A drastic program of anti-Semitic legislation was adopted by the National Assembly, following a violent outbreak of anti-Jewish demonstrations.—See also JEWS; Austria-Hungary: 1918-1921.

1921-1922.—Charles's second attempt to seize the throne.—House of Hapsburg deprived of its hereditary rights.—Death of Charles.—Legitimist proclamation.—Ratification of peace treaty with United States.—Charles's second attempt to seize the throne was made October 22-24, 1921. Having made a surprise air flight with his wife, from Switzerland to the Burgenland, he was there joined by a small force of armed Royalists at whose head he marched on Budapest. Twelve miles from Budapest, the Royalists were met and defeated by government troops. The ex-king ordered his troops to surrender and was himself taken prisoner with ex-Queen Zita, while in flight toward Kormorn. The royal couple were first interned in the castle of Prince Esterhazy and later in the monastery of Tihany. A bill depriving the House of Hapsburg of its hereditary rights to the Hungarian throne was passed by the Hungarian National Assembly, November 6, 1921. The ex-king and emperor, Charles, died of pneumonia in his exile at Funchal, Madeira, April 1, 1922. "Although the Hungarian National Assembly had enacted a measure barring the House of Hapsburg from the Hungarian throne, a proclamation issued immediately after the death of Charles and signed by eighteen prominent Legitimist leaders, headed by Counts Apponyi and Andrássy, announced the succession to the Hungarian throne of Prince Otto, eldest son of Charles, and the regency of Queen Zita, pending Otto's coming of age. Cardinal Czernoch, the Prince Primate, endorsed the proclamation, but the government of Regent Horthy took no cognizance of it beyond taking measures to suppress any possible Legitimist *coup*. The frustrated attempt of Charles to regain the throne

was followed by a cabinet crisis, Count Bethlen and his cabinet resigning. Pending the selection of a new cabinet, however, the Bethlen government remained in office and after several weeks of uncertainty received a promise of support from the leaders of the Assembly, thus enabling it to retain its grip. During the winter the violent attacks against the Horthy régime continued and on February 15 a futile attempt was made to assassinate the Regent. The opposition to the government was in no way allayed by a new franchise bill reducing the electorate by about one-quarter and substituting open polling for the secret ballot, thus practically giving the government control over the elections. The general election held from May 28 to June 1 resulted in a large majority for the Horthy-Bethlen régime, the majority being composed exclusively of representatives of the countryside constituencies. Only three out of the eleven cabinet members were reelected. Socialists to the number of about twenty Legitimists elected a number of representatives, but the Free Electionists were practically eliminated. The government in a memorandum to the Reparations Commission reported that the damages suffered under the Rumanian occupation of 1919 amounted to 2,500,000,000 gold francs. A contract has been concluded between the Hungarian government and a French syndicate for the construction of an international free port at Budapest. The separate peace treaty between the United States and Hungary was ratified by the National Assembly on December 12. Following the exchange of ratifications Count Szechenyi . . . was appointed Hungarian Minister to the United States."—H. J. Carman and E. D. Graper, *Political Science Quarterly*, 1922, *Supplement*, p. 105.

HUNGARY, Constitution of: Development.—"The constitutional development of Hungary has frequently been compared with that of England; the parallel holds with respect to the character of their constitutional laws, for in Hungary as in England the constitution is not embodied in any one instrument, but is contained in numerous laws which may be altered by the regular legislative processes; however, in Hungary the constitution has been embodied in written laws to a much greater extent than in England. The most im-

portant of the earlier constitutional documents of Hungary is the *Bulla Aurea* of Andreas II, which was issued in 1222, and which bears a striking resemblance to the English *Magna Carta* of 1215. *Bulla Aurea* is now only of historical interest, but is of importance as one of the first steps in a long and continuous constitutional development. [See HUNGARY: 1116-1301.] Ferdinand I of Austria was chosen king of Hungary in 1526, after the Hungarian forces had been signally defeated by the Turks at the battle of Mohács. The Hapsburgs constantly endeavored to reduce Hungary to the position of a province of the empire, and to abolish its independent national institutions. However, by the Pragmatic Sanction, which was embodied in three Hungarian laws of 1722-23, the rights of Hungary were guaranteed. Notwithstanding the guaranty of Hungarian institutions the efforts to weaken or destroy them continued. Under Joseph II separate Hungarian institutions were almost completely ignored. In 1791, however, Leopold II approved Hungarian laws which undid all of the attempted reforms of Joseph. From 1791 to 1848 the development of Hungarian institutions was intermittent; from 1815 to 1825 the Diet was not summoned at all. After 1830 the liberal movement began to gain ground, and from 1832 to 1836 the Diet made many efforts to abolish the mediæval political and social organization of the country; these efforts proved fruitless because of the opposition of the members of the Table of Magnates, whose privileges would be lessened by any change. Reform measures were again rejected by the Magnates in the Diets of 1839 and 1842. But popular forces were gaining strength, and the increased national spirit of the Hungarians is shown by the fact that by 1844 Magyar had entirely displaced Latin as the official language. [See also HUNGARY: 1825-1844.] The revolutionary movement of 1848 enabled the liberal members of the Diet to carry their measures. Thirty-one laws, embodying among other things the Hungarian demands for a separate responsible ministry and for annual sessions of the Diet, were enacted and were approved by the Emperor on April 11, 1848. Under these laws Hungary became practically independent, united with Austria by a personal union. When the army began to obtain control of the revolutionary forces of the empire, the Emperor sought an excuse to break with the Hungarian government. Kossuth, now in control of Hungarian affairs, was also eager for a rupture; hostilities commenced, and after Austrian troops had been driven from Hungarian territory, independence of Austria was declared. The Austrian troops proved unequal to the task of subduing the Hungarians; Russian forces were sent to their aid, and the Hungarian revolution terminated with the surrender at Vilagos on August 13, 1849. After Vilagos Hungary was governed for ten years as a subject province; not until after the Italian war was any change made in its position. The Diploma of October 20, 1860, recognized the rights of the Hungarian Diet, but the Patent of February 26, 1861, established a central legislature at Vienna. Hungary refused to join in such a legislature or to be content with any arrangement which should not give her absolute control over her local affairs. For nearly five years the experiment of a central imperial legislature was tried, but it was seen to be a failure. In 1865 negotiations were entered into upon the basis of Hungary's right to an independent government, and the agreement of 1867 guarantees the 'laws, constitution, legal independence, freedom, and territorial integrity of Hungary and its subordinate countries.' The laws of 1848 again came into full

force, and the parliamentary institutions of the country were reestablished upon a firm basis. Under the terms of the agreement of 1867 Hungary was left to deal as it thought best with the races within its territory. With Croatia alone did Hungary find it necessary to make special terms. By a law of 1868, which has been several times amended, an arrangement was made between Hungary and Croatia similar in many respects to that between Austria and Hungary."—W. F. Dodd, *Modern constitutions*, v. 1, pp. 91-93.—See also HUNGARY: 1856-1868.

**HUNS:** Gothic account of.—"We have ascertained that the nation of the Huns, who surpassed all others in atrocity, came thus into being. When Filimer, fifth king of the Goths after their departure from Sweden, was entering Scythia, with his people, . . . he found among them certain sorcerer-women, whom they call in their native tongue Aliorumnas (or Al-runas), whom he suspected and drove forth from the midst of his army into the wilderness. The unclean spirits that wander up and down in desert places, seeing these women, made concubines of them; and from this union sprang that most fierce people (of the Huns) who were at first little, foul, emaciated creatures, dwelling among the swamps, and possessing only the shadow of human speech by way of language. . . . Nations whom they would never have vanquished in fair fight fled horrified from those frightful—faces I can hardly call them, but rather—shapeless black collops of flesh, with little points instead of eyes. No hair on their cheeks or chins gives grace to adolescence or dignity to age, but deep furrowed scars instead, down the sides of their faces, show the impress of the iron which with characteristic ferocity they apply to every male child that is born among them. . . . They are little in stature, but lithe and active in their motions, and especially skilful in riding, broad-shouldered, good at the use of the bow and arrows, with sinewy necks, and always holding their heads high in their pride."—Jornandes, *De Rebus Geticis* (quoted in T. Hodgkin, *Italy and her invaders*, bk. 1, ch. 1).

**First appearance in Europe.** See GOTHS: 376; **ASIA:** Earliest history; **EUROPE:** Introduction to historic period: Migrations.

433-453.—**Empire of Attila.**—After driving the Goths from Dacia, the terrible Huns had halted in their march westward for something more than a generation. They were hovering meantime, on the eastern frontiers of the empire "taking part like other barbarians in its disturbances and alliances. Emperors paid them tribute, and Roman generals kept up a politic or a questionable correspondence with them. Stilicho had detachments of Huns in the armies which fought against Alaric; the greatest Roman soldier after Stilicho,—and, like Stilicho, of barbarian parentage,—Aetius, who was to be their most formidable antagonist, had been a hostage and a messmate in their camps. . . . About 433, Attila, the son of Mundzukh, like Charles the Great, equally famous in history and legend, became their king. Attila was the exact prototype and forerunner of the Turkish chiefs of the house of Othman. In his profound hatred of civilized men, in his scorn of their knowledge, their

arts, their habits and religion, and, in spite of this, in his systematic use of them as his secretaries and officers, in his rapacity combined with personal simplicity of life, in his insatiate and indiscriminate destructiveness, in the cunning which veiled itself under rudeness, in his extravagant arrogance, and audacious pretensions, in his sensuality, in his unscrupulous and far-reaching designs, in his ruthless cruelty joined with capricious displays of generosity, mercy, and good faith, we see the image of the irreclaimable Turkish barbarians who ten centuries later were to extinguish the civilization of [eastern?] Europe. The attraction of Attila's daring character, and his genius for the war which nomadic tribes delight in, gave him absolute ascendancy over his nation, and over the Teutonic and Slavonic tribes near him. Like other conquerors of his race, he imagined and attempted an empire of ravage and desolation, a vast hunting ground and preserve, in which men and their works should supply the objects and zest of the chase."—R. W. Church, *Beginning of the Middle Ages*, ch. 1.—"He [Attila] was truly the king of kings; for his court was formed of chiefs, who, in offices of command, had learned the art of obedience. There were three brothers of the race of the Amales, all of them kings of the Ostrogoths; Ardaric, king of the Gepidæ, his principal confidant; a king of the Merovingian Franks; kings of the Burgundians, Thuringians, Rugians, and Heruli, who commanded that part of their nation which had remained at home, when the other part crossed the Rhine half a century before."—J. C. L. de Sismondi, *Fall of the Roman empire*, v. 1, ch. 7.—"The amount of abject, slavish fear which this little swarthy Kalmuck succeeded in instilling into millions of human hearts is not to be easily matched in the history of our race. Whether he had much military talent may be doubted, since the only great battle in which he figured was a complete defeat. The impression left upon us by what history records of him is that of a gigantic bully, holding in his hands powers unequalled in the world for ravage and spoliation. . . . Some doubt has recently been thrown on the received accounts of the wide extent of Attila's power. . . . The prince who felt China on his left, who threatened Persepolis, Byzantium, Ravenna in front, who ruled Denmark and its islands in his rear, and who ultimately appeared in arms on the soil of Champagne on his right, was no minor monarch, and had his empire been as deep as it was widespread, he might worthily have taken rank with Cyrus and Alexander. At the same time it is well to remember that over far the larger part of this territory Attila's can have been only an over-lordship, Teutonic, Slavonic, and Tartar chieftains of every name bearing rule under him. His own personal government, if government it can be called, may very likely have been confined nearly within the limits of the modern Hungary and Transylvania."—T. Hodgkin, *Italy and her invaders*, v. 2, bk. 2, ch. 2.—"As far as we may ascertain the vague and obscure geography of Priscus, this [Attila's] capital appears to have been seated between the Danube, the Theiss [Teys] and the Carpathian hills, in the plains of Upper Hungary, and most probably in the neighbourhood of Jazberin, Agria, or Tokay. In its origin it could be no more than an accidental camp, which, by the long and frequent residence of Attila, had insensibly swelled into a huge village."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 34.—See also RUMANIA: B.C. 5th century-A.D. 1241.

441-446.—**Attila's attack on the Eastern empire.**—Attila's first assault upon the Roman power

was directed against the Eastern empire. The court at Constantinople had been duly obsequious to him, but he found a pretext for war. "It was pretended that the Roman bishop of Margus had surreptitiously introduced himself into the sepulchre of the Hunnic kings and stolen from it the buried treasure. The Huns immediately fell upon a Roman town during the time of a fair, and pillaged everything before them, slaying the men and carrying off the women. To all complaints from Constantinople the answer was, 'The bishop, or your lives.' The emperor thought, and with reason, that to give up an innocent man to be massacred would be displeasing to Heaven, would alienate the clergy, and only appease for a moment the demands of his merciless enemy. He refused, though timidly and in vague terms. The Huns replied by scouring Pannonia, laying Sirmium, its capital, in ruins, and extending their ravages far south of the Danube to the cities of Naissa and Sardica, upon both of which they wrought the extremity of their vengeance. A truce of four years only increased their fury and aggravated its effects. The war was suddenly recommenced. This time they reached Thessaly, and renewed with a somewhat similar result the far-famed passage of Thermopylæ by the hordes of Xerxes. Two Roman armies were put to complete rout, and seventy cities levelled to the ground. Theodosius purchased the redemption of his capital by the cession of territory extending for fifteen days' journey south of the Danube, by an immediate payment of 6,000 pounds of gold, and the promise of 2,000 more as an annual tribute."—J. G. Sheppard, *Fall of Rome*, lect. 4.

451.—Attila's invasion of Gaul.—In the spring of the year 451 Attila moved the great host which he had assembled in the Hungarian plains westward toward the Rhine and the provinces of Gaul. He hesitated, it was said, between the Eastern and Western empires as the objects of his attack. But the East had found an emperor, at last, in Marcian, who put some courage into the state,—who refused tribute to the insolent Hun and showed a willingness for war. The West, under Valentinian III and his mother Placidia, with the Goths, Vandals, Burgundians and Franks in the heart of its provinces, seemed to offer the most inviting field of conquest. Hence Attila turned his horses and their savage riders to the West. "The kings and nations of Germany and Scythia, from the Volga perhaps to the Danube, obeyed the warlike summons of Attila. From the royal village in the plains of Hungary his standard moved towards the West, and after a march of seven or eight hundred miles he reached the conflux of the Rhine and the Neckar, where he was joined by the Franks who adhered to his ally, the elder of the sons of Clodion. . . . The Hercynian forest supplied materials for a bridge of boats, and the hostile myriads were poured with resistless violence into the Belgic provinces." At Metz, the Huns "involved in a promiscuous massacre the priests who served at the altar and the infants who, in the hour of danger, had been providently baptized by the bishop; the flourishing city was delivered to the flames, and a solitary chapel of St. Stephen marked the place where it formerly stood. From the Rhine and the Moselle, Attila advanced into the heart of Gaul, crossed the Seine at Auxerre, and, after a long and laborious march, fixed his camp under the walls of Orleans."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 35.—Meantime the energy of the unscrupulous but able Count Aëtius, who ruled the court and commanded the resources of the Western empire, had brought about a general combination of

the barbarian forces in Gaul with those of the Romans. It included, first in importance, the Goths of the kingdom of Toulouse, under their king Theodoric, and with them the Burgundians, the Alans, a part of the Franks, and detachments of Saxons, Armoricians and other tribes. There were Goths, too, and Franks and Burgundians in the host of the Hun king. The latter laid siege to Orleans and the walls of the brave city were already crumbling under his battering rams when the banners of Aëtius and Theodoric came in sight. Attila retreated beyond the Seine and took a position somewhere within the wide extent of what were anciently called the Catalaunian fields, now known as the Champagne country surrounding Chalons. There, in the early days of July, 451, was fought the great and terrible battle which rescued Europe from the all-conquering Tatar. The number of the slain, according to one chron-

ATTILA

icler, was 162,000; according to others 300,000. Neither army could claim a victory; both feared to renew the engagement. The Goths, whose king Theodoric was slain, withdrew in one direction, to their own territory; the Huns retreated in the other direction and quitted Gaul forever. The wily Roman, Aëtius, was probably best satisfied with a result which crippled both Goth and Hun. "This tendency [of development of cavalry at the expense of infantry] was only emphasised by the appearance on the Imperial frontier of the Huns, a new race of horsemen, formidable by their numbers, their rapidity of movement, and the constant rain of arrows which they would pour in without allowing their enemy to close. In their tactics they were the prototypes of the hordes of Alp Arslan, of Genghiz, and of Tamerlane. The influence of the Huns on the Roman army was very marked: profiting by their example, the Roman trooper added the bow to his equipment; and in the fifth century the native force of the empire had come to resemble that of its old enemy the

Parthian state of the first century, the choicer corps being composed of horsemen in mail armed with bow and lance. Mixed with these horse-archers fought squadrons of the Teutonic Foederati, armed with the lance alone. Such were the troops of Aëtius and Ricimer, the army which faced the Huns on the plain of Chalons. That decisive battle was pre-eminently a cavalry engagement. On each side horse-archer and lancer faced horse-archer and lancer—Aëtius and his Romans leagued with Theodoric's Visigothic chivalry—Attila's hordes of Hunnish light horse backed by the steadier troops of his German subjects, the Ostrogoths, Gepidæ, Heruli, Scyrri, and Rugians. The Frankish allies of Aëtius must have been the largest body of foot-soldiery on the field, but we hear nothing of their exploits in the battle. The victory was won, not by superior tactics, but by sheer hard fighting, the decisive point having been the riding down of the native Huns by Theodoric's heavier Visigothic horsemen (A.D. 450). It was certainly not the troops of the empire who had the main credit of the day."—C. Oman, *History of the art of war*, p. 21.—As for the battle, its latest historian says: "Posterity has chosen to call it the battle of Chalons, but there is good reason to think that it was fought fifty miles distant from Chalons-sur-Marne, and that it would be more correctly named the battle of Troyes, or, to speak with complete accuracy, the battle of Mery-sur-Seine."—T. Hodgkin, *Italy and her invaders*, v. 2, bk. 2, ch. 3.—"It was during the retreat from Orleans that a Christian hermit is reported to have approached the Hunnish king, and said to him. 'Thou art the Scourge of God for the chastisement of Christians.' Attila instantly assumed this new title of terror, which thenceforth became the appellation by which he was most widely and most fearfully known."—E. S. Creasy, *Fifteen decisive battles of the world*, ch. 6.—See also BARBARIAN INVASIONS: 423-455; EUROPE: Ancient: Roman civilization: Fall of Rome; Ethnology: Migrations: Map.

452.—Attila's invasion of Italy.—In the summer of 451 Attila, retreating from the bloody plain of Chalons, recrossed the Rhine and returned to his quarters in Hungary. There, through the following autumn and winter, he nursed his chagrin and his wrath, and in the spring of 452 he set his host in motion again, directing its march to the Julian Alps and through their passes into Italy. The city of Aquileia, then prominent in commerce, and prosperous and rich, was the first to obstruct the savage invasion. The defence of the city proved so obstinate that Attila was at the point of abandoning his siege, when a flight of storks, which his shrewdness construed favorably as an omen, encouraged the Huns to one more irresistible assault and the doomed town was carried by storm. "In proportion to the stubbornness of the defence was the severity of the punishment meted out to Aquileia. The Roman soldiers were, no doubt, all slain. Attila was not a man to encumber himself with prisoners. The town was absolutely given up to the rage, the lust, and the greed of the Tartar horde who had so long chafed around its walls. . . . When the barbarians could plunder no more, they probably used fire, for the very buildings of Aquileia perished, so that, as Jornandes tells us, in his time, a century later than the siege, scarcely the vestiges of it yet remained. A few houses may have been left standing, and others must have slowly gathered round them, for the Patriarch of Aquileia retained all through the middle ages considerable remains of his old ecclesiastical jurisdiction, and a large and somewhat stately

cathedral was reared there in the eleventh century. But the City of the North Wind never really recovered from the blow. . . . The terrible invaders, made more wrathful and more terrible by the resistance of Aquileia, streamed on through the trembling cities of Venetia." Patavium (modern Padua), Altinum and Julia Concordia, were blotted out of existence. At Vicenza, Verona, Brescia, Bergamo, Pavia and Milan, the towns were sacked, but spared destruction, and the inhabitants who did not escape were carried away into captivity. Many of the fugitives from these towns escaped the Huns by hiding in the islands and fens of the neighboring Adriatic coast, and out of the poor fishing villages that they formed there grew, in time, the great commercial city and republic of Venice. "The valley of the Po was now wasted to the heart's content of the invaders. Should they cross the Appennines and blot out Rome as they had blotted out Aquileia from among the cities of the world? This was the great question that was being debated in the Hunnish camp, and strange to say, the voices were not all for war. Already Italy began to strike that strange awe into the hearts of her northern conquerors which so often in later ages has been her best defence. The remembrance of Alaric, cut off by a mysterious death immediately after his capture of Rome, was present in the mind of Attila, and was frequently insisted upon by his counsellors." So, the grim Hun was prepared by his superstitions to listen to the embassy from Rome which met him at the Ticino, praying for peace. At the head of the embassy was the venerable bishop of Rome, Leo I—the first of the great popes. To his influence the pacific disposition into which Attila was persuaded has been commonly ascribed. At all events, the king of the Huns consented to peace with the Romans, and withdrew beyond the Danube in fulfilment of the treaty, leaving Italy a desert to the Appennines, but not beyond.—T. Hodgkin, *Italy and her invaders*, v. 2, bk. 2, ch. 4.—See also VENICE: 452.

ALSO IN: E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 35.

453.—Death of Attila and fall of his empire.—Attila died suddenly and mysteriously in his sleep, after a drunken debauch, some time in the early months of the year 453, and his death was the end of the "reign of terror" under which he had reduced half the world. "Immediately after his death, the Germans refused to submit to the divided rule of his sons. The army of Attila split up into two great camps; on the one side were the Gepidæ and Ostrogoths, with the majority of the Teutonic nations; on the other the Huns, the Alans, the Sarmatians or Slavonians, and the few Germans who still owned allegiance to the memory of Attila. A vast plain between the Drave and the Danube was selected to decide this vital struggle, known as the battle of Netad, which, though less famous in history, may perhaps claim equal importance with that of Chalons, as an arbiter of the destinies of civilization. . . . Fortune at first seemed to favour the Huns; but German steadfastness prevailed; Goths and Gepidæ scattered the less-disciplined bands of Asia; and Ardaric, the king of the latter tribe for the time, established himself in the royal residence of Attila, and assumed the leading position in the barbarian world."—J. G. Sheppard, *Fall of Rome*, lect. 4.—"Thirty thousand of the Huns and their confederates lay dead upon the field, among them Ellak, Attila's first-born. . . . The rest of his nation fled away across the Dacian plains, and over the Carpathian mountains to those wide steppes of South-

ern Russia in which at the commencement of our history we saw the three Gothic nations taking up their abode. Ernak, Attila's darling, ruled tranquilly under Roman protection in the district between the lower Danube and the Black Sea, which we now call the Dobrudscha, and which was then 'the lesser Scythia.' Others of his family maintained a precarious footing higher up the stream. . . . There is nothing in the after-history of these fragments of the nation with which any one need concern himself. . . . Dacia, that part of Hungary which lies east and north of the Danube, and which had been the heart of Attila's domains, fell to the lot of the Gepidae, under the wise and victorious Ardaric. Pannonia, that is the western portion of Hungary, with Sclavonia, and parts of Croatia, Styria and Lower Austria, was ruled over by the three Amal-descended kings of the Ostrogoths."—T. Hodgkin, *Italy and her invaders*, v. 2, bk. 3, ch. 1.

470-480.—**Invasions of India.** See INDIA: B.C. 231-A.D. 480; 480-648.

**Attila in Teutonic legend.**—"Short as was the sway of Attila (from 434 to 453), the terror it had inspired and the great commotion it had brought over the whole Teuton and Roman world, were not . . . soon forgotten. . . . The memory of the great chieftain hovered for a long time, like a bloody phantom, in the Roman annals and in the German sagas. . . . When we compare the historical Attila, before whose piercing glance Rome and Constantinople trembled, with Etzel of the Nibelungen Lied, we find that the latter bears but a slight resemblance to the former. It is true that Attila's powerful sway is still reflected in the Nibelungen Lied, as Kriemhild at her arrival in the land of the Huns is surprised at seeing so many nations submitted to his sceptre. Yet upon the whole Etzel plays in the German epic the part of a weak and sometimes even contemptible king, while glimpses of his real might can be detected only at rare intervals, fluttering as it were in the far-distant background of a by-gone time. . . . The Eddas and the Volsunga Saga bear the impress of the early Teutonic era, when the king was little more than the chosen leader in war; and the Northern people for a long time had in their political institutions nothing by which the conception of a great monarchy, or still less of a far-stretching realm like that of Attila, could be expressed."—G. T. Dippold, *Great epics of medieval Germany*, ch. 4.

**HUNS, White.**—"It was during the reign of this prince [Varahran V, king of Persia, 420-440] that those terrible struggles commenced between the Persians and their neighbours upon the northeast which continued, from the early part of the fifth till the middle of the sixth century, to endanger the very existence of the empire. Various names are given to the people with whom Persia waged her wars during this period. They are called Turks, Huns, sometimes even Chinese; but these terms seem to be used in a vague way, as 'Scythian' was by the ancients; and the special ethnic designation of the people appears to be quite a different name from any of them. It is a name the Persian form of which is 'Haithal,' or 'Haithelch,' the Armenian 'Hephthagh,' and the Greek 'Ephthalites,' or sometimes 'Nephthalites.' . . . All that we know of the Ephthalites is, that they were established in force, during the fifth and sixth centuries of our era, in the regions east of the Caspian, especially in those beyond the Oxus river, and that they were generally regarded as belonging to the Scythic or Finno-Turkic population, which, at any rate from B.C. 200, had

become powerful in that region. They were called 'White Huns' by some of the Greeks; but it is admitted that they were quite distinct from the Huns who invaded Europe under Attila. . . . They were a light-complexioned race, whereas the Huns were decidedly swart; they were not ill-looking, whereas the Huns were hideous; they were an agricultural people, while the Huns were nomads; they had good laws, and were tolerably well civilised, but the Huns were savages. It is probable that they belonged to the Thibetic or Turkish stock."—G. Rawlinson, *Seventh great oriental monarchy*, ch. 14.—"We are able to distinguish the two great divisions of these formidable exiles [the Huns], which directed their march towards the Oxus and towards the Volga. The first of these colonies established their dominion in the fruitful and extensive plains of Sogdiana, on the eastern side of the Caspian, where they preserved the name of Huns, with the epithet of Euthalites [Ephthalites], or Nephthalites. Their manners were softened, and even their features were insensibly improved, by the mildness of the climate and their long residence in a flourishing province; which might still retain a faint impression of the arts of Greece. The White Huns, a name which they derived from the change of their complexion, soon abandoned the pastoral life of Scythia. Gorgo, which, under the appellation of Carizine, has since enjoyed a temporary splendour, was the residence of the king, who exercised a legal authority over an obedient people. Their luxury was maintained by the labour of the Sogdians."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 26.—The White Huns were subjugated by the Turks. See TURKEY: 6th century.

1679.—Navigated by La Salle. See **CANADA: 1669-1687.**

**HURONS, NEUTRAL NATION, ERIES.**—“The peninsula between the Lakes Huron, Erie, and Ontario was occupied by two distinct peoples, speaking dialects of the Iroquois tongue. The Hurons or Wyandots, including the tribe called by the French the Dionondadies, or Tobacco Nation, dwelt among the forests which bordered the eastern shores of the fresh water sea to which they have left their name; while the Neutral Nation, so called from their neutrality in the war between the Hurons and the Five Nations, inhabited the northern shores of Lake Erie, and even extended their eastern flank across the strait of Niagara. The population of the Hurons has been variously stated at from 10,000 to 30,000 souls, but probably did not exceed the former estimate. The Franciscans and the Jesuits were early among them [see **JESUITS: 1542-1640**], and from their descriptions it is apparent that, in legends, and superstitions, manners and habits, religious observances and social customs, they were closely assimilated to their brethren of the Five Nations. . . . Like the Five Nations, the Wyandots were in some measure an agricultural people; they bartered the surplus products of their maize fields to surrounding tribes, usually receiving fish in exchange; and this traffic was so considerable that the Jesuits styled their country the Granary of the Algonquins. Their prosperity was rudely broken by the hostilities of the Five Nations; for though the conflicting parties

were not ill matched in point of numbers, yet the united counsels and ferocious energies of the confederacy swept all before them. In the year 1649, in the depth of winter, their warriors invaded the country of the Wyandots, stormed their largest villages, and involved all within in indiscriminate slaughter. The survivors fled in panic terror, and the whole nation was broken and dispersed. Some found refuge among the French of Canada, where, at the village of Lorette, near Quebec, their descendants still remain; others were incorporated with their conquerors, while others again fled northward, beyond Lake Superior, and sought an asylum among the wastes which bordered on the north-eastern lands of the Dacotah. Driven back by those fierce bison-hunters, they next established themselves about the outlet of Lake Superior, and the shores and islands in the northern parts of Lake Huron. Thence, about the year 1680, they descended to Detroit, where they formed a permanent settlement, and where, by their superior valor, capacity and address, they soon acquired an ascendancy over the surrounding Algonquins. The ruin of the Neutral Nation followed close on that of the Wyandots, to whom, according to Jesuit authority, they bore an exact resemblance in character and manners. The Senecas soon found means to pick a quarrel with them; they were assailed by all the strength of the insatiable confederacy, and within a few years their destruction as a nation was complete.”—F. Parkman, *Conspiracy of Pontiac*, ch. 1.—Idem, *Jesuits in North America*, ch. 1.—“The first in this locality [namely, the western extremity of the state of New York, on and around the site of the city of Buffalo], of whom history makes mention, were the Attioudarank, or Neutral Nation, called Kah-kwas by the Senecas. They had their council-fires along the Niagara, but principally on its western side. Their hunting grounds extended from the Genesee nearly to the eastern shores of Lake Huron, embracing a wide and important territory. . . . They are first mentioned by Champlain during his winter visit to the Hurons in 1615. . . . but he was unable to visit their territory. . . . The peace which this peculiar people had so long maintained with the Iroquois was destined to be broken. Some jealousies and collisions occurred in 1647, which culminated in open war in 1650. One of the villages of the Neutral Nation, nearest the Senecas and not far from the site of our city [Buffalo], was captured in the autumn of the latter year, and another the ensuing spring. So well-directed and energetic were the blows of the Iroquois, that the total destruction of the Neutral Nation was speedily accomplished. . . . The survivors were adopted by their conquerors. . . . A long period intervened between the destruction of the Neutral Nation and the permanent occupation of their country by the Senecas,”—which latter event occurred after the expulsion of the Senecas from the Genesee valley, by the expedition under General Sullivan, in 1779, during the Revolutionary War. “They never, as a nation, resumed their ancient seats along the Genesee, but sought and found a new home on the secluded banks and among the basswood forests of the Dó-syo-wá, or Buffalo Creek, whence they had driven the Neutral Nation 130 years before. . . . It has been assumed by many writers that the Kah-kwas and Eries were identical. This is not so. The latter, according to the most reliable authorities, lived south of the western extremity of Lake Erie until they were destroyed by the Iroquois in 1655. The Kah-kwas were exterminated by them as early as 1651. On Coronelli's

map, published in 1688, one of the villages of the latter, called 'Kahouagoga, a destroyed nation,' is located at or near the site of Buffalo."—O. H. Marshall, *Niagara frontier*, pp. 5-8, footnote.—"Westward of the Neutrals, along the South-eastern shores of Lake Erie, and stretching as far east as the Genesee river, lay the country of the Eries, or, as they were denominated by the Jesuits, 'La Nation Chat,' or Cat Nation, who were also a member of the Huron-Iroquois family. The name of the beautiful lake on whose margin our city [Buffalo] was cradled is their most enduring monument, as Lake Huron is that of the generic stock. They were called the Cat Nation either because that interesting but mischievous animal, the raccoon, which the holy fathers erroneously classed in the feline gens, was the totem of their leading clan, or sept, or in consequence of the abundance of that mammal within their territory."—W. C. Bryant, *Interesting archaeological studies in and about Buffalo*, p. 12.—H. R. Schoolcraft in his "Sketch of the History of the Ancient Eries," either identifies or confuses the Eries and the Neutral Nation.—See also IROQUOIS CONFEDERACY: Their conquests, etc.; CANADA: 1608-1611; 1615-1616; 1634-1652; 1640-1700.

**HUSCARLS.** See HOUSECARLS.

**HUSEIN.** See HOSAIN.

**HUSEIN IBN ALI** (1856- ), first king of the Hejaz. Member of Imperial Ottoman council; appointed sheriff of Mecca, 1908; after Arab revolt against the Turks, assumed the title of "Sultan of Arabia," 1916; proclaimed "King of the Hejaz" in the same year. See ARABIA: Political divisions; 1916; 1916 (June); 1919: King of Hejaz, etc.; WORLD WAR: 1916: VI. Turkish theater: c, 2; c, 3.

**HUSS**, or **Hus**, **John** (c. 1370-1415), Bohemian religious reformer. See BOHEMIA: 1405-1415; EUROPE: Renaissance and Reformation: Preliminary movements of Wycliffe and Huss.

**HUSSARS.**—Matthias, son of John Hunyadi, was elected king of Hungary in 1458. "The defence of the country chiefly engaged the attention of Matthias at the commencement of his reign. Measures of defence were accordingly carried on with the utmost speed, the most important of which was the establishment of regular cavalry; to levy which one man was enrolled out of every 20 families. This was the origin of the 'Hussar,' meaning in Hungarian the price or due of twenty."—E. Szabad, *Hungary, past and present*, p. 50.

**HUSSEIN HILMI PASHA.** See HILMI PASHA.

**HUSSEIN KEMAL PASHA**, Prince (c. 1850-1917), son of Khedive Ismail; succeeded Abbas Hilmi, khedive of Egypt, with the title of "sultan," 1914. See EGYPT: 1914; World War; 1917; WORLD WAR: 1914: IV. Turkey: h.

**HUSSEIN PASHA**, or **Hosain III** (1773-1838), dey of Algiers. See BARBARY STATES: 1830.

**HUSSITE WARS**, civil war of a political and religious character which broke out in Bohemia after the death of John Huss. See BOHEMIA: 1419-1434.

**HUSTINGS, COURT OF HUSTING.**—"The 'hygh and auneynt' Court of Husting of the City of London is of Anglo-Saxon, or, to speak more accurately, of Scandinavian origin, being a re-

markable memorial of the sway once exercised over England by the Danes and other Northmen. The name of the Court is derived from [hus], 'a house,' and [d(h)ing], a thing, 'cause,' or 'council,' and signifies, according to general acception, 'a court held in a house,' in contradistinction to other 'things,' or courts, which in Saxon times were usually held in the open air. . . . The term 'Husting' or, less correctly, 'Hustings' is commonly applied at the present day to open-air assemblies or temporary courts, usually held in some elevated position, for the purpose of electing members of Parliament in counties and boroughs, its strict etymological meaning being lost sight of. . . . [The Court of Husting] is the oldest court of record within the City, and at one time constituted the sole court for settling disputes between citizen and citizen."—R. R. Sharpe, *Introduction to calendar of wills, Court of Husting, London*.—The Hustings disappeared from elections in 1872.

**HUSZAR**, Carl (1882- ), Hungarian statesman. Served as premier, November, 1919-1920. See HUNGARY: 1919-1920.

**HUT SERVICE:** In World War. See Y. M. C. A.: World War activities: 1914: First social welfare organization.

**HUTCHINSON**, Anne (c. 1600-1643), American religious enthusiast. Involved in the Antinomian controversy; banished from Boston and settled in what is now Rhode Island, 1638. See MASSACHUSETTS: 1636-1638; RHODE ISLAND: 1638-1640; U.S.A.: 1607-1752.

**HUTCHINSON**, Thomas (1711-1780), last royal governor of Massachusetts. Became very unpopular during pre-revolutionary troubles in Boston, and was driven from the country in 1774. See U. S. A.: 1761; 1774 (May-July); 1774-1775.

**HUTIER**, Oskar von (1857- ), German general. Served in World War, 1914-1918. See WORLD WAR: 1918: II. Western front: a, 1; b, 1; c, 33; d; d, 2; d, 3; g, 5.

**HUTTEN**, Ulrich von (1488-1523), German humanist, poet and reformer. Served in the imperial army, 1513; sided with the Swabian League against Duke Ulrich of Württemberg. Among his more important works are: "Ars versificandi," "Nemo," and numerous satires. His greatest fame, however, rests on his probable contribution to the second part of the celebrated "Epistolae obscurorum virorum." See EDUCATION: Modern: 15th-16th centuries: Relation of Renaissance and Reformation.

**HUTTON**, James (1726-1797), Scottish geologist. Wrote the "Theory of the Earth" and other works on natural philosophy. See EVOLUTION: Historical development of the idea.

**HUTUKTU**, spiritual ruler of Mongolia, residing at Urga. He is termed the "Living Buddha," and corresponds in a measure to the Dalai Lama of Tibet. See MONGOLIA: 1911.

**HUXLEY**, Thomas Henry (1825-1895), English biologist. Contributed to practically every department of biology, and was an ardent advocate of Darwin's "Origin of Species." Among his most important books are: "Evidence as to Man's Place in Nature," 1863; "Anatomy of Vertebrated Animals," 1871; "Elementary Biology," 1875; "The Crayfish: An Introduction to the Study of Zoology," 1880, and "Collected Essays" in nine volumes, 1893-1894. He held many posts of honor and professorships in various colleges.—See also AGNOSTICISM; EDUCATION: Modern: 19th-20th centuries: Spencer, Huxley, etc.; ENGLISH LITERATURE: 1832-1890; EVOLUTION: Historical development of the idea.

**HUY**, fortified town in the province of Liège, Belgium, on the right bank of the Meuse, nineteen miles east of Namur.

1703.—Taken by Imperialists. See NETHERLANDS: 1702-1704.

1705.—Taken by French. See NETHERLANDS: 1705.

1914.—German atrocities. See WORLD WAR: Miscellaneous auxiliary services: X. Alleged atrocities, etc.: a, 3.

**HUYGENS**, Christian (1629-1695), Dutch astronomer, mathematician and physicist. See INVENTIONS: 16th-17th centuries: Time measurement; Instruments.

**HWANG-HO**, Hoang-Ho, or Huang-Ho (*Yellow river*), second largest river of China, rising in Central Asia. See CHINA: Geography of China proper.

**HWICCAS**, name borne by the West Saxons who first settled in Gloucestershire and Worcestershire when that region was conquered. They led a revolt against the West Saxon king Ceawlin, in which they were joined by the Britons, or Welsh. The battle of Wanborough, fought 591, drove Ceawlin from the throne.—J. R. Green, *Making of England*, pp. 129-208.—See also ENGLAND: 547-633.

**HYACINTHIA**, Feast of the.—“The feast of the Hyacinthia was held annually at Amyclæ [Lacedæmonia], on the longest day of the Spartan month Hecatombæus, corresponding to our June and July. . . . Hyacinthus, the beautiful youth slain accidentally by Apollo, was the chief object of the worship. He took his name from the flower, which was an emblem of death; and the original feast seems to have been altogether a mournful ceremony,—a lamentation over the destruction of the flowers of spring by the summer heat, passing on to a more general lament over death itself.”—G. Rawlinson, *History of Herodotus*, note, bk. 9, sect. 7.

**HYBLA**.—“There was a Sikel goddess Hybla, whom the Greeks looked on as the same with several goddesses of their own mythology, here with one, there with another. Three towns in Sicily were called after her, one in the southeastern part of the island, now Ragusa, another on the coast north of Syracuse, near the place where the Greek colony of Megara was afterwards planted. This gave its name to the Hyblaian hills not far off, famous for their honey; but there is no hill strictly called Mount Hybla. The third Hybla is inland, not far from Catania, and is now called Paterno.”—E. A. Freeman, *Story of Sicily*, p. 33.

**HYDASPES**, ancient name of the river Jelum, or Jhelum, in the Punjab, on the banks of which the Indian king Porus made a vain attempt to oppose the invasion of Alexander.—C. Thirlwall, *History of Greece*, ch. 53.

**HYDE**, Edward, 1st Earl of Clarendon. See CLARENDON, EDWARD HYDE.

**HYDE VS. CONTINENTAL TRUST COMPANY**. See U. S. A.: 1895 (April-May).

**HYDER ALI** (c. 1722-1782), Hindu ruler and warrior. His wars with England were among the most ferocious and bloody episodes of the British conquest of India. See INDIA: 1767-1769; 1780-1783.

**HYDERABAD**, or Haiderabad, principal native state of India, and important commercial region. It is ruled by a nizâm. The area is 82,698 square miles. In 1921 it had a population of 12,453,627. See INDIA: 1662-1748; Map.

1798.—Treaty with English. See INDIA: 1798-1805.

**HYDERABAD**, or Haiderabad, fortified city and district of the Sind province of Bombay in British India. See BOMBAY PRESIDENCY; SIND.

**HYDRAULUS**, or Hydraulic organ, early musical instrument. See INVENTIONS: Ancient and medieval; Wind instruments.

**HYDROPLANE**: Construction. See AVIATION: Development of airplanes and air service: 1910-1920.

**HY-IVAR**, sovereigns of island empire of Normans. See NORMANS: 8th-9th centuries: Island empire, etc.; 10th-13th centuries.

**HYKSOS**, shepherd kings of Egypt. See EGYPT: Hyksos; CANAAN; JEWS: Children of Israel in Egypt.

**HYLLEANS**.—“The Hylleans are never mentioned in any historical narrative, but always in mythical [Greek] legends; and they appear to have been known to the geographers only from mythological writers. Yet they are generally placed in the islands of Melita and Black-Corcyra, to the south of Liburnia.”—C. O. Müller, *History and antiquities of the Doric race*, v. 1, introduction.

**HYLLEIS**, Dorian clan descended from Hyllus, son of Heracles. See SPARTA: Constitution ascribed to Lycurgus.

**HYMANS**, Paul (1865- ), Belgian statesman. Member of Belgian mission to the United States, 1914; minister of foreign affairs, 1918-1920; representative at the peace conference, 1919. See BELGIUM: 1919; 1920; VERSAILLES, TREATY OF: Conditions of peace; WORLD WAR: 1914: I. Western front: x.

**HYMETTUS**, one of the noted mountains of Attica, “celebrated for its excellent honey, and the broad belt of flowers at its base, which scented the air with their delicious perfume.”—M. and R. P. Willson, *Mosaics of Grecian History*, p. 9.

**HYMN OF HATE**, poem by Lissauer expressing hatred of England, popular in Germany during the World War.

**HY-NIALS AND EUGENIANS**.—“As surnames were not generally used, either in Ireland or anywhere else, till after the 10th century, the great families are distinguishable at first only by their tribe or clan names. Thus, at the north we have the Hy-Nial race; in the south the Eugenic race, so called, from Nial and Eoghan, their mutual ancestors.”—T. D. McGee, *Popular history of Ireland*, v. 1, bk. 1, ch. 2.

**HYPATIA** (c. 370-415), mathematician and philosopher, born in Alexandria of Greek parentage. She became the head of the Neo-Platonic school in that city. Her large following aroused the hatred of the ecclesiastical leaders, and she was brutally murdered by a fanatical mob, led by priests and monks, with the criminal connivance of Cyril, bishop of Alexandria. See ALEXANDRIA: 413-415.

**HYPERBOREANS**, mythical people, supposed by the ancients to have dwelt beyond the north wind, and therefore to have enjoyed a perfect climate in the extreme north.

**HYPHISIS**, ancient name of the river Sutlej, in the Punjab.

**HYPHENATED AMERICANS**, term applied during the World War to those naturalized citizens who were suspected of acting in the interests of their former country. See AMERICANIZATION: Hypheism.

**HYPPOCHLORITE**: Use in treatment of wounds. See MEDICAL SCIENCE: Modern: 1914-1918.

**HYPOTHEC**, in Roman law, the right or security given by contract to a creditor over property of the debtor to satisfy a claim. See COMMON LAW: 1864.

**HYRCANIA, HYRCANIAN SEA.**—"The mountain-chain which skirts the Great Plateau [of Iran] on the north, distinguished in these pages by the name of Elburz, broadens out after it passes the south-eastern corner of the Caspian Sea till it covers a space of nearly three degrees (more than 200 miles). Instead of the single lofty ridge which separates the Salt Desert from the low Caspian region, we find between the 54th and 59th degrees of east longitude three or four distinct ranges, all nearly parallel to one another, having a general direction of east and west. . . . Here in Persian times was settled a people called Hyrcani; and from them the tract derived the name of Hyrcania (Vehrkana), while the lake [Caspian sea] on which it adjoined came to be known as 'the Hyrcanian Sea.' The fertility of the region, its broad plains, shady woods, and lofty mountains were celebrated by the ancient writers."—G. Rawlinson, *Five great monarchies: Persia,*

*ch. 1.*—"In the inscriptions of the Achæmenids their land [Hyrcania] is known as Varkana; the modern name is Jorjan. Here, according to the Greeks, the mountains were covered with forests of oaks, where swarms of wild bees had their hives; in the valleys vines and fig-trees flourished, and the soil down to the sea was so luxuriant that corn grew from the fallen grains without any special sowing."—M. Duncker, *History of antiquity, bk. 7, ch. 1.*—See also PARTHIA.

**HYRCANUS I,** or John Hyrcanus (175-104 B.C.), Maccabean high priest of the Jews, 135-105 B.C. See JEWS: B.C. 166-40.

**Hyrcanus II,** (d. 30 B.C.) last of the Maccabean princes of Judea, 78-40 B.C.

**HYSIAE, Battle of** (669 B.C.). See GREECE: B.C. 8th-5th centuries: Growth of Sparta.

**HYTHE,** market town of Kent, England, 67 miles southeast of London; one of the Cinque ports. See CINQUE PORTS.

## I

**IAMBLICUS** (died c. 330), Greek philosopher. See NEOPLATONISM.

**IANNINA.** See JANNINA.

**Pasha of.** See ALI PASHA.

**IAPYGIANS,** tribe of ancient Italy. See ITALY: Ancient: CEnotrians.

**IATRO-CHEMISTRY.** See CHEMISTRY: General: Iatro or medical chemistry.

**IAZYGES,** or Jazyges, a Sarmatian or Slavonic people who settled in Hungary about the first century A.D. See LIMIGANTES.

**IBEAA.**—"The territory secured by England in East Equatorial Africa as a result of the dismemberment of the Zanzibar domain has received the somewhat fantastic name of Ibea, a term formed by the initial letters, I. B. E. A. of the full title, Imperial British East Africa."—A. H. Keane, *Africa (Stanford's compendium of geography, v. 2, ch. 11).*

**IBERA, Battle at** (216 B.C.). See PUNIC WARS: First.

**IBERIANS: Eastern.**—"The Sapeires [of Herodotus] appear to be the Iberians of later writers. The name is found under the various forms of Saspeires, Sapeires, Sabeires, or Sabeiri, and Abeires, whence the transition to Iberes is easy. They . . . must evidently have inhabited the greater part of the modern province of Georgia. . . . There is reason to believe that the modern Georgians—still called 'Virk' by their neighbours—are their descendants."—G. Rawlinson, *History of Herodotus, bk. 7, appendix 1.*—See also ALARODIANS.—If these Iberians of the east were connected in race or origin of name with the Iberians of western Europe, the connection does not seem to have been traced. See TURKEY: 1063-1073.

**Western.**—"The numerous skulls obtained from Basque cemeteries possess exactly those characters which have been remarked . . . in the Neolithic tombs and caves in Britain and on the Continent, and may therefore be taken to imply that the Basque-speaking peoples are to be looked upon as a fragment of the race which occupied the British Isles, and the area west of the Rhine and north of the Alps, in the Neolithic age. . . . Nor can there be any reasonable doubt as to this small, dark-haired people being identical with the ancient Iberians of history, who have left their name in the Iberian peninsula [Spain] as a mark of their former dominion in the west. . . . In ancient times they were spread through Spain as far to the south as the Pillars of Hercules, and as far to the

north-east as Germany and Denmark. The Iberic population of the British Isles was apparently preserved from contact with other races throughout the whole of the Neolithic age. On the Continent, however, it is not so; a new set of men, differing in physical characteristics from them, make their appearance. . . . The new invader is identified by Thurnam and Huxley with the Celts of history. . . . These two races were in possession of Spain during the very earliest times recorded in history, the Iberians occupying the north-western region, and the Celts, or Gauls, extending in a broad band south of the Pyrenees along the Mediterranean shore. . . . In the north the Vascones then, as now, held the Basque provinces of Spain. The distribution of these two races in Gaul is similar to that which we have noted in Spain. . . . When Cæsar conquered Gaul, the Iberian Aquitani possessed the region bounded by the river Garonne, the Cevennes, and the Pyrenees. . . . An ethnological connection also between Aquitaine and Brittany (Armorica) may be inferred from the remark of Pliny, 'Aquitania Armorica ante dicta.' . . . Just as the Celts pushed back the Iberian population of Gaul as far south as Aquitania, and swept round it into Spain, so they crossed the channel and overran the greater portion of Britain, until the Silures, identified by Tacitus with the Iberians, were left only in those fastnesses which were subsequently a refuge for the Welsh against the English invaders."—W. B. Dawkins, *Early man in Britain, ch. 9.*—See also SPAIN: Aboriginal peoples; AFRICA: Prehistoric peoples; AQUITAINE: Ancient tribes; CELTIBERIANS; EUROPE: Introduction to historic period: Correlation of race, nationality and language; GAUL: Civilization; LIGURIANS.

**ICE AGE**, Polar. See **ANTARCTIC EXPLORATION**: Scientific observations.

**ICELAND**: Geography.—Area.—Resources.—Early history.—Iceland, an island in the North Atlantic, northwest of the Hebrides, "lies just on the edge of the Arctic Circle, 250 miles from Greenland and 600 miles from Norway. [See **BRITISH EMPIRE**: Map of the world.] It belongs geographically to the western hemisphere, but historically and politically to the eastern. . . . Iceland is of volcanic origin; its rocks are almost all igneous; and there are yet several active volcanoes, the chief of which is Hecla, over five thousand feet high. . . . Much of the island is perpetually covered with snow and ice—one jökul, the Vatna, having in itself an area of four thousand square miles. . . . The summers in Iceland are short, and warm considering the latitude; the winters are long and cold, yet tempered somewhat by the Gulf Stream. For four months in the year the stars do not shine, and for four months the sun does not shine. Thus the year in Iceland may be thought of as one long day—four months light, four months night, four months twilight."—E. U. Hoenshel, *Land of frost and fire*, pp. 19-20.—It has an estimated population, 1920, of 94,600, and an area of 39,709 square miles of which only one seventh is productive. The chief crops are hay, turnips, and potatoes. The principal occupation of the Icelanders is cattle and sheep-breeding. The total value of the fisheries in 1918 was estimated at 22,600,000 kronur, or approximately \$6,063,000. The capital and largest town is Reykjavik, with a population in 1920 of 17,976. Iceland is probably the only country with no debt, but with 1,000,000 kronur of savings in its exchequer. Women have been in possession of the municipal vote earlier in Iceland than any other country and they do not change their names when they marry.

"According to Decuil, Iceland [anciently known as Thule (see **THULE**)] was . . . discovered by Irish monks prior to 705. Are Frode [or Ari the Learned], the earliest Icelandic historian, who has written a very reliable work on the early history of Iceland, the 'Islandingabók,' says that at the time when the Norsemen first began to visit the island 'they found Christian men there whom they called *papa*, but they soon left because they did not wish to dwell among the heathens. They left Irish books, bells, and crosiers, from which one must judge that they were Irish.' The 'Landnámabók' also mentions these Irish monks, and

the name of the island of Papey, off the east coast, still brings to memory their stay in Iceland. . . . Are Frode says that Iceland was first settled in the days of Harald Haarfagre, 870 years after the birth of Christ, by people from Norway. According to Sturla's 'Landnámabók,' the Norseman Naddod first reached the island, having lost his way while on a voyage from Norway to the Faroe Islands. According to the 'Historia Norwegiae' and Hauk's 'Landnámabók' the Swede Gardar first discovered Iceland. But neither the story of Naddod, nor that of Gardar, can be regarded as anything but tradition."—K. Gjerset, *History of the Norwegian people*, p. 137.

Also in: T. Ellwood, *Book of the settlement of Iceland* (tr. from the original *Icelandic of Ari the Learned*).

870-1004.—**Norwegian immigration**.—Parliament established.—"The first Norwegian settler of Iceland was Ingolf Arnarson, about A.D. 874. When after the battle of Hafstríod, 872, Harald Fairhair became the undisputed King of all Norway and subjected its free chieftains to taxation, they preferred to emigrate. For sixty years a stream of men of the highest and best blood in Norway landed on the shores of Iceland. Chieftains took with them earth from below the temple altar in the motherland, and placed it in the new temple which they built in the new land. Each chieftain ruled his district or land-take (*land-nám*), as it was called. Iceland was settled in 870-930, partly direct from Norway, partly by Norsemen and Celts from the northern parts of the British Isles. . . . [See also **AMERICA**: 10th-11th centuries.] The chieftains, *Godar* (singular *Godi*), presided at temple feasts and sacrifices, and were, at the same time, the temporal and spiritual heads of the people. They sent Úlfljótt to Norway to make a Constitution for the Icelandic Commonwealth. He accomplished this in three years. In 930 a central Parliament for all Iceland, *Althing* or *Althingi*, was established at Thingvellir in Southwest Iceland, and a Law Speaker was appointed to 'speak the law.'—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, pp. 157-158.—"The Althing . . . lasted for several hundred years as the government of the land; it met for two weeks every summer at Thingvellir. While it was in session laws were made, cases tried, and sentences executed."—E. U. Hoenshel, *Land of frost and fire*, p. 26.—See also **THING**.—"In 964 the number of chieftaincies (*Godord*) was fixed at thirty-nine, nine for each of the four quarters into which the island was divided, except for the north quarter, which was allowed twelve chieftains instead of nine. The Althing, as a court of appeal, acted through four courts, one for each quarter. There was also a fifth court, instituted in 1004, which exercised jurisdiction in cases where the other courts failed. For legislative purposes the Althing acted through a Committee of 144 men, only one-third of whom, viz. the thirty-nine Godar, and their nine nominees, had the right to vote. These nine nominees were elected by the Godar of the south, west, and east quarters, three by each quarter in order to give each of them the same number of men on the Committee as the north quarter had."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, pp. 158-159.

981-1000.—**Introduction of Christianity**.—Function of the bishops.—Beginnings of a literature.—The first attempt at converting the Icelanders to Christianity was made by a native of the country, named Thorvald, known to history as Thorvald, the Far-travelled. After having spent

sometime in Viking raids he went to Germany where he made the acquaintance of a bishop named Frederick and by whom he was baptised and converted. Thorvald prevailed upon the bishop to undertake with him a journey to Iceland, in order to preach God's word; they reached Iceland in 981 and remained five years. "At the Althing in A.D. 1000 a debate took place about adopting Christianity as the religion of the country. Christian chieftains supported this proposal of the envoys of King Olaf Trygvason of Norway. To avoid civil war the heathens agreed to abide by the decision of the heathen Law Speaker as to whether the new or the old religion should prevail in Iceland. For three days and three nights the Speaker lay in his tent pondering over the two religions. On the fourth day he stood forth on the Law Mount and declared that the Icelanders were to be baptized and to be called Christians, the temples to be pulled down, but those who liked to sacrifice privately in their homes to the old gods might continue to do so, and some of the heathen customs were to be permitted. This met with acceptance as a wise political move; the hot springs in the neighbourhood were used for the baptism (i.e. immersion) as the men of Northern and Eastern Iceland stipulated that they should be baptized in warm water. . . . After the introduction of Christianity the two Bishops of Iceland were added to the *Lögretta*, over which the Law Speaker, the sole official of the Commonwealth, used to preside. It was his duty to recite aloud, in the hearing of all present at the Parliament, the whole law of Iceland, and to go through it in the course of the three years during which he held office. . . . As no laws were written down . . . he had to rely solely on his memory. . . . He was the living voice of the law, and his decisions were accepted as final."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, p. 160.—"With the liberation of the intellect there began to develop a literature. It was the age of the *Sagas*, (family legends and traditions) and of the *Eddas*, (productions similar to the *Sagas*, but more poetical)."—E. U. Hoenshel, *Land of frost and fire*, p. 26.—See also *EDDA*; SCANDINAVIAN LITERATURE: 9th-13th centuries.—"The first Bishop of Iceland, Isleif, was ordained at Bremen in 1056, and established the episcopal see at his family seat, Skálholt."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, p. 162.

ALSO IN: E. Magnusson, *Conversion of Iceland to Christianity, A.D. 1000* (*Saga Book of the Viking Club*, v. 2, p. 348).

12th-13th centuries. — Literature. — Political changes.—"In the twelfth and thirteenth centuries six Benedictine and five Augustinian monasteries were founded, all of them centres of learning and culture; a great part of the old Icelandic literature is supposed to have been written, or at least copied, in them. Two Benedictine monasteries in North Iceland, founded 1133 and 1155, were the earliest. The Icelandic monks wrote in Icelandic, and not in Latin, as all their brethren on the Continent did. . . . The Icelandic clergy were national, and many chieftains were learned men—both things unique in Europe at this time. . . . The two centuries and a half which followed the introduction of Christianity were the greatest period in the history of Iceland. A great literature sprung up in the twelfth and thirteenth centuries at a time when the rest of Europe had nothing better to show than dry annalists, with the single exception of the Provençal Troubadours. At the Courts of Norway, Sweden, Denmark, Dublin, and Orkney, Icelandic poets were the only

singers of heroic deeds. It was an outburst of literature such as the world had not seen since the downfall of Rome."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, pp. 161-162.—See also SCANDINAVIAN LITERATURE: 9th-13th centuries; MUSIC: Folk music and nationalism: Scandinavia.—Iceland had gradually become a place of refuge for rebellious Norwegian subjects. Many attempts were made to conquer it, but for many years they met with no success. The internal history of Iceland was mainly one of rivalries among chieftains. "The Constitution of the Commonwealth did not provide for any central authority which could enforce obedience to the laws and hold lawbreakers in check. By degrees the chieftaincies passed into the hands of a few great families. In consequence some chiefs became masters of large districts, and, like feudal lords, rode to the Althing with an armed body of retainers, numbered by hundreds. The old blood-feuds became little wars, and armies of more than a thousand men sometimes took the field. Continual civil wars raged throughout the first half of the thirteenth century, and some of the great families who had monopolized the chieftaincies were exterminated in them. Rome and Norway took the opportunity to assert their supremacy."—*Ibid.*, p. 163.—The factions were largely connected with the contests of Snorri, Thord, and Sieghvat, the three sons of Sturle Thordson, who had been "godar," or supreme magistrate, of several provinces. His sons had inherited his offices, but were unable to agree among themselves and the whole country was in confusion.

1262.—Union with Norway.—Treaty of Union.—"The Kings of Norway had always held that the Icelanders as Norwegian colonists ought to own their supremacy, though they had in vain tried to induce the Althing to hold this view. King Hakon Hakonsson (1217-63) began to summon Icelandic chieftains to Norway in order to settle their disputes as if he were their suzerain. He interfered, and set chief against chief. Sturla Sieghvatsson entered into a secret league with Hakon to conquer Iceland for him and hold it as his liegeman. He attacked chief after chief and sent them to Norway. . . . Through bribery and persuasion and by sending emissaries through the island the King brought about that the Icelandic Parliament passed a Treaty of Union [in 1262] with the Crown of Norway in which they accepted its supremacy."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, pp. 163-164.—"The Althing of 1262, in accepting the overlordship of the Norwegian King, did not thereby surrender the sovereignty of Iceland. The standpoint of its honest members was that, for the sake of greater order and security in their country, the rule of the King was necessary; but in accepting that rule they did not declare their land to be part of the Norwegian kingdom. They accepted the King of Norway as King of Iceland. A just recognition of that position would have made for the peace and prosperity of both countries, but governments in those days were imbued by the theory that the land was the King's and his to dispose of according to his pleasure, but throughout their history the citizens of Iceland declared against this principle, and their greatest leader, Jon Sigurdsson, refused to accept the idea that the Treaty of 1262 was an acknowledgement of annexation."—A. McGill, *Independence of Iceland*, p. 8.—"The treaty of union, as passed by the Althing, enacted that a jarl should represent the King of Norway in Iceland; that the Icelanders should keep their own laws and keep

the power of taxation in their hands; that they should have all the same rights as Norwegians in Norway; that at least six trading ships should sail from Norway to Iceland annually; that 'if this treaty, in the estimation of the best men (in Iceland) is broken, the Icelanders shall be free of all obligations toward the King of Norway.' This treaty is the Magna Charta, the charter of liberty of Iceland. It has sometimes been in abeyance, but has never been abolished. It has sometimes been disregarded by Denmark, when it wished to make Iceland a Danish province, but the people of Iceland have always taken a firm stand upon it."—J. Stefansson, *Iceland: Its history and inhabitants* (Smithsonian Institution, Annual report, 1906, pp. 201-202).

1262-1281.—Abolition of the provincial courts and the fifth Court of Appeal.—Norwegian code of law substituted for the Gragas.—"The settlement made in 1262, under which the legislative power in Iceland lay in the hands of the Althing and the King, might have worked out quite successfully had there been an honest intent behind the King's work. . . . In the Icelandic interpretation of the Gamli Sattmali the Althing had granted Haakon of Norway merely mandatory powers, regarding him as their king and their protector against the menace of any other nation. . . . Norway in her days of might . . . proceeded slowly but gradually to destroy every vestige of the independence of the commonwealth. The people of Iceland were in no fit condition to resist the encroachments for the long civil wars of the Sturlunga period [1160-1262] left the land a little out of breath. . . . On the coming into force of the union with Norway the four provincial Courts and the fifth Court or Court of Appeal were abolished and their place taken by the Logrjetta of thirty-six men. Many of these men were just in their dispensation of the law, but many were merely the creatures . . . of the Norwegian King. . . . In the work of denationalisation the church was not far behind the lawyers. Like a great many continental bishops, those of Iceland were more in the nature of temporal princes than pastors. . . . [The Kings of Norway] took advantage of the bishops' desire for power to seize still more of the constitutional prerogatives of the Icelandic Commonwealth, and when opportunity occurred they appointed to the two dioceses of Holar and Skalholt bishops who were Norwegians or Danes. . . . The revenues of the country were farmed out to tax-proctors, who in most cases were foreigners."—A. McGill, *Independence of Iceland*, pp. 9-11.—"The old code of laws (*Grágás*), elaborate as the Codex Justinianus, was replaced in 1271 by the Norwegian code of law. Two Lawmen were to govern the country and the *Lögretta* was limited to its judicial functions. The Althing did not favour the new code and a compromise code, called *Jónsbók*, after the Lawmen who brought it from Norway, was passed in 1281, with some changes. Iceland was divided into *sýslur*, counties administered by sheriffs (*sýslumenn*) appointed by the King. The estates of the greatest house in Iceland, the Sturlungs, were confiscated by the King."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, p. 165.

14th-18th centuries.—Transferred to Denmark.—Trade and piracy.—English influence.—Economic ruin and disaster.—A "step towards the provincialisation of Iceland was made in the year 1389, when Denmark and Norway came under the rule of Olaf. This event was viewed by the Icelanders as merely a change of masters, but to

the Norwegians it meant extinction."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, p. 12.—The three Scandinavian kingdoms of Norway, Sweden, and Denmark were joined in a union which did not endure. Its dissolution left Norway, with Iceland as a dependency, attached to Denmark, and that connection was maintained till 1814. Norway was then transferred from the Danish to the Swedish crown; but Iceland was still kept as a part of the dominion of the Danish king. "No person was allowed to trade with Iceland save through the royal monopolists; no person in Iceland or Greenland could purchase goods from any trader save the representatives of the monopoly. After the Danish Union misfortunes and calamities came thick on Iceland. While the country was always menaced by storms, volcanoes, and glaciers, it was also exposed to foreign war from the 15th century. The wealth of the Iceland seas has always been an attraction to the nations of Europe, and from 1400 the English merchants fished in those waters and carried on a piratical and clandestine trade with the interior."—A. McGill, *Independence of Iceland*, p. 12.—"The fifteenth century is looked upon as the darkest age of Icelandic history. Denmark confined all Iceland trade to the one port of Bergen in Norway, and the English trade with Iceland, which began about 1412, was carried on in defiance of edicts from Copenhagen. Soon the English buccaneers took the law into their own hands and arrested all Danish and Norwegian officials who tried to prevent their trade. The Icelanders seem to have taken the English side in these quarrels, and about 1430 the two Bishops of Iceland were both Englishmen. At one time Iceland was actually held by them, and they built a fort in the south of the island. A number of English words came into the Icelandic language, and are in it today."—J. Stefansson, *Iceland: Its history and inhabitants* (*Journal of transactions of Victoria Institute*, 1906).—"Several times did the English carry fire and sword into the island, but they were not always successful, for in 1434 they were overthrown and slaughtered in a battle of Skagafjorthur on the Arctic coast. More frequently, however, they were only too successful. . . . So serious did the English poaching become that the Danes, in order to maintain their effective suzerainty and trade monopoly, issued a strict embargo against the foreign traders. As a result of this the English merchants brought a petition before the Parliament of Henry VIII. demanding action against the Danes, otherwise the Kingdom would be undone. . . . Still more dangerous than the English poaching was the visitation of the Algerian pirates, whose prowess and exploits are strangely reminiscent of the founders of the Commonwealth of Iceland. In the year 1627 four ships left the coast of Barbary and captured 350 people in Iceland, while they destroyed much property. . . . When Frederick III. of Denmark ascended the throne he made up his mind to secure his hold upon Iceland still more firmly, and for that purpose deputed the Governor, Admiral Bjelke, to obtain the absolute allegiance of every Icelandic citizen. Under the menace of a Danish battleship the citizens took the required oath of allegiance. Having done so they were required to sign a document which the Dane produced, in which the signatories acknowledged the King of Denmark, his heirs and successors for ever, as absolute monarchs of Iceland, the Gamli Sattmali notwithstanding."—A. McGill, *Independence of Iceland*, pp. 12-13.—"The Hanseatic trade was succeeded by a Danish monopoly of trade

which completed the economic ruin of Iceland. . . . Small-pox carried off one-third of the population in 1707, a famine raged in 1759, and the volcanic eruptions of 1765 and 1783 laid waste large tracts of the island. Nature seemed in league with man to render Iceland uninhabitable."—J. Stefansson, *Iceland: Its history and inhabitants* (*Journal of transactions of Victoria Institute*, 1906).

17th-18th centuries.—Development of literature. See SCANDINAVIAN LITERATURE: 1600-1850.

18th century.—Skuli Magnusson, patriot.—National consciousness awakened.—Althing abolished.—Landsfyrdomur or the supreme court.—"The national movements in Europe reached the shores of Iceland, and a band of patriots began to struggle to win back the old freedom. Skuli Magnusson and Eggert Olafsson were the fore-runners in the eighteenth century."—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, p. 169.—"The people were poor and hard pressed; the Althing was useless; and the Danes had a firm control of their trade monopoly which was exploited to the utmost. Magnusson, . . . taught the people to rely upon themselves, to look less and less to the Danes for support in trade. He knew the commercial potentialities of the land such as few others did, and, whenever opportunity occurred, he restored native industries and undermined the monopoly. . . . Woollen mills were erected to spin the Iceland wool, better methods of agriculture were taught to the farmers, and the fishing industry was greatly improved by the importation of up-to-date smacks, nets and tackle. The labours of this great Icelander were cut short by his death in 1794, but the Danes felt the weight of what he had done. . . . In 1798, the Althing, useless as it was as a national assembly, was finally destroyed . . . and the Copenhagen Government felt they had achieved a great victory. . . . On the overthrow of the last sign of Icelandic sovereignty the country was ruled by a body of three judges called the Landsfyrdomur, or Supreme Court."—A. McGill, *Independence of Iceland*, pp. 16-18.

1830-1854.—Governed by Denmark.—Althing restored.—Jon Sigurdsson, father of the constitution.—Grant of free trade.—The Icelandic repeal movement began in 1830. The island had never been governed as a mere Province of Denmark, but always under its own laws. Its old representative assembly, the Althing, was suspended during most of the first half of the last century, but revived in 1843 as a merely consultative assembly. As such it voiced very steadily the claim of the Icelanders to more of autonomy and political distinctness than their Danish lord was willing to yield. "By 1845 they had removed their place of meeting from the lava-field beside the Oxera at Thingvellir to the modern town of Reykjavik, and in that place there began the final struggle, for at last Iceland had produced a man of the calibre of Skuli Magnusson. . . . It is impossible to exaggerate the importance of Jon Sigurdsson in his relation to modern Iceland; he was its creator and the father of its Constitution and independence. . . . He was born in 1811, . . . in the West quarter of Iceland of an old propertied family. . . . [He was] appointed secretary to the Bishop of Iceland [1830], the scholarly Steingrímur Jonsson, under whose influence the young man's studies took a definite inclination in the direction of the history and institutions of his native land. . . . He threw himself heart and soul into the national revolt when the Althing was restored, and though he had made his home in Copenhagen,

he visited Iceland sufficiently often to guide the revolt and to take up the important position of Speaker of the Assembly. . . . The trade monopoly was abolished in 1787, but only in name. . . . [Through Sigurdsson, the Danes opened] Iceland trade to all nations. This grant of Free Trade in 1854 was the first great step towards the final recognition of Icelandic sovereignty."—A. McGill, *Independence of Iceland*, pp. 19-21.

1851-1900.—Local government granted.—Constitution of 1874.—Political helotage.—"In 1851 a Bill was laid before the Assembly, offering a . . . measure of local government for parish affairs, but as far as the national demand was concerned the only status offered to Iceland was that of a large amt. or county. Sigurdsson urged the Assembly to reject the whole Bill without discussion, and to demand the full measure of home rule. . . . The Danes thereupon dismissed the National Assembly and threatened military action. . . . On the forced dissolution of the National Assembly of Iceland Jon Sigurdsson and all the members met and protested. . . . Their great speaker . . . fought the Danes with every constitutional weapon in his power. . . . For twenty years the passive resistance, the stubborn thwarting of the Danish Government continued, the Danes taking no step until 1871 when the Riksdag in Copenhagen defined the position of Iceland as an integral part of the Danish Kingdom, only of greater importance than the amt. of the Faroe Islands. . . . [In 1874] fell the Millennial Anniversary of the founding of the Commonwealth of Iceland, and to celebrate that event Christian IX. of Denmark landed on the island to participate in the celebrations. . . . [At this time] the Danes . . . recognised the essentially distinct nationality of the Icelanders by granting the Constitution of 1874. . . . There was no provision made for representation at the Copenhagen Parliament. Briefly the Constitution may be summarised as follows:—(1) The Althing received legislative powers. . . . (2) The Althing consisted of two houses, constituted as follows: The citizens elected 30 members, of whom 6, chosen by the 30, together with 6 nominated members formed the upper house. (3) The King was represented at Reykjavik by the Landhofstingi or Governor, who enjoyed a position analagous to that of the Viceroy of Ireland. (4) The affairs of Iceland were to be managed by the Danish Minister of Justice. . . . (5) The Landhofstingi had to keep an office in Copenhagen, and to bring Althing Bills to the Danish Government for approval. . . . At the close of every Althing session [the governor had] to get approval for the Bills of his Parliament. That approval, though nominally granted by the King, was really granted or withheld by the Danish Minister of Justice. . . . The result was that from 1874 till 1900 more than fifty Iceland Bills were vetoed by that Minister."—A. McGill, *Independence of Iceland*, pp. 22-24.—See also DENMARK: 1849-1874.

Also IN: J. Bryce, *Studies in history and jurisprudence*, ch. 3.

1898-1899.—Explorations. See ARCTIC EXPLORATION: Chronological summary: 1898; 1899.

1900-1915.—Revised constitution.—Women admitted to citizenship and the franchise.—"A change occurred in 1900 during the regime of the Liberals, when the Danish Government granted fresh concessions. . . . According to the revised Constitution the following changes were made:—(1) (a) The Minister for Iceland was to occupy himself solely with the affairs of Iceland, to be present at sessions of the Althing, and to be responsible to it in the first instance. He was

to be removable by vote of the Althing. He must be familiar with the Icelandic language, which practically meant that he must be a native of Iceland. (b) He was to reside in Reykjavik, but had an office in Copenhagen, which he used when taking to the King measures passed by the Althing, and to get the King's consent to proposed measures. . . . (c) All important measures were to be laid before the King at a Cabinet Council, and at those Councils the purely Danish Ministers have no voice in the decisions unless those measures also affected Denmark. . . . (2) The Althing was increased and the popular power was strengthened. (a) Thirty-four members were to be elected by the people at large according to Proportional Representation. (b) Of these 34 eight were chosen by the 34 to sit with six nominated members to form the upper house. . . . (3) The existence of the Ministry depended entirely on the confidence of the lower house, and the Minister for Iceland was similarly placed. . . . A still further amendment of the Constitution took place in 1915, when women were admitted to citizenship and the Franchise.—A. McGill, *Independence of Iceland*, pp. 25-26.

1908-1915.—Prohibition legislation.—In September, 1908, Iceland "voted on the question of prohibition. . . . The measure carried with a majority of 1,464 votes. Then they passed a law prohibiting the importation of intoxicants, such law to take effect on January 1, 1912, and prohibiting the sale after January 1, 1915. The following is quoted from their bill relative to ships doing business in her ports,—'All ships must have their liquors under seal from the time they are three miles from land, and the ships must not sell liquors to passengers inside this limit.'—E. U. Hoenshel, *Land of frost and fire*, p. 28.

1918.—Home rule granted.—Federative alliance with Denmark.—"Denmark has [1918] proclaimed the federative independence of Iceland. Hereafter these two northern states, with the respective populations of about 2,775,000 and 80,000, are by agreement to remain united as free and equal sovereign states until 1940, when at the will of the governments the federative constitution may be reframed or abrogated. The Icelanders, more separate from the Danes nationally and linguistically than the Norwegians from the Swedes, have of late been following the self-determinative tendency of the Northern peoples and have been giving the Danish government to understand that they, too, aspired to an autonomous condition. In fact, Iceland has, by virtue of her increasing trade with Britain . . . broken away economically and commercially from Denmark to the point of provoking Danish trade interests. But these have had to give way; and when the island people began clamoring for more general home rule and a flag of their own, if not absolute independence commissions were formed between the two countries which eventually drew up the confederate agreement that was ratified this summer [1918] by them both."—*Home rule for Iceland* (*American Review of Reviews*, Nov., 1918, p. 540).—"In accordance with this Federative Constitution, . . . Iceland declares itself a perpetually neutral country. This Federative Constitution goes into effect December 1, 1918."—*Nation*, Aug. 17, 1921, p. 171.—The new political status of Iceland can best be defined as that of an independent and sovereign state in intimate alliance with Denmark; and while Iceland has neither a naval nor military flag of her own, she possesses one for her merchant ships. In 1918 she acquired her own national arms. The following is the text

of the federative constitution or Act of Union:

"1. Denmark and Iceland are independent and sovereign states, united by a common King and by the agreement contained in this Union Act. The names of both countries are taken into the title of the King.

"2. The order of succession to the throne is that decreed by clauses 1 and 2 in the Succession to the Crown Act of 31st July, 1853. The succession cannot be altered except by the consent of both countries.

"3. Statutory provisions now in force in Denmark concerning the King's religion, and his coming of age, as well as those concerning the exercise of the Royal power while the King is ill, under age, or dwelling outside the boundaries of either kingdom shall also be valid in Iceland.

"4. The King must not be a regent of other countries without the consent of the Danish Rigsdag and the Icelandic Althing.

"5. Each country makes its own regulations concerning State grants to the King and the Royal family.

"6. Danish subjects enjoy in every respect the same rights in Iceland as Icelandic subjects born in that country, and vice versa. The subjects of each country are exempt from military service in the other. Both Danish and Icelandic subjects, wherever their domicile may be, have an equal right to fishing within the territorial waters of either country. Danish vessels have the same privileges in Iceland as Icelandic vessels, and vice versa. Danish and Icelandic products, material and intellectual, shall mutually in no respect be subjected to less favourable treatment than the material and intellectual products of any other country.

"7. Denmark has charge of Icelandic foreign affairs by permission of Iceland. In the (Danish) foreign office there shall be appointed in accordance with the wish of, and after consultation with, the Icelandic Government an advisor who is conversant with conditions in Iceland for the purpose of looking after its interests. Where there is no (Danish) diplomatic agent or *consul missus*, one shall be appointed by the wish of, and in concert with, the Icelandic Government, the expenses to be borne by Iceland. On the same conditions attaches expert in Icelandic matters shall be appointed to the already existing legations and consulates. Should the Icelandic Government choose to send abroad delegates to negotiate on specific Icelandic matters, this may be done after consultation with the Minister of Foreign Affairs. Treaties between Denmark and other countries already concluded and published are also valid in Iceland, in so far as they affect that country. International treaties which Denmark may make after the Royal sanction of this Union Act, are not binding for Iceland unless sanctioned by the proper Icelandic authorities.

"8. Denmark carries out the inspection of fisheries within the Icelandic territorial waters under the Danish flag until such time as Iceland may, wish, partly or wholly, to take the inspection into its own hands and at its own expense.

"9. The monetary system which hitherto has prevailed in both countries shall continue to do so while the Coinage Union of Scandinavia remains. Should Iceland wish to establish its own mint, it will be necessary to negotiate with Norway and Sweden whether money coined in Iceland is to be recognized as a legal tender in these countries.

"10. The Supreme Court of Denmark is invested with the highest judicial power for Iceland until

such time as Iceland may decide to establish a Supreme Court of Justice in the country itself. Until that time an Icelander shall be appointed to one of the seats in the Supreme Court (of Denmark), which provision shall be carried out next time a seat becomes vacant in the Court.

"11. In so far as Iceland's share in the expense resulting from the management of affairs dealt with in this section has not been specified in the above, it shall be fixed by an agreement between the respective Governments of both countries.

"12. Other matters than those mentioned above concerning both Denmark and Iceland, such as communications, commerce, the customs, maritime affairs, postal affairs, telegraphy and wireless telegraphy, administration of justice, weights and measures, and financial matters shall be settled by agreements concluded by the Governments of both countries.

"13. The sum of 60,000 kronur, which hitherto has been paid out of the Danish National Treasury to Iceland, and the expense which the Danish National Treasury has incurred by the maintenance of the Icelandic Government Office in Copenhagen, are to be discontinued. Financial prerogatives of Icelandic students at the University in Copenhagen are also to be cancelled.

"14. The Danish National Treasury pays down a sum of two million kronur for the establishment of two funds, each of one million kronur, with a view of furthering intellectual intercourse between Denmark and Iceland, promoting Icelandic researches and scientific activities, and for supporting Icelandic students. Of these funds one is allotted to the University in Reykjavik, the other to the University in Copenhagen. Further regulations respecting the management and use of these funds will be issued by the King according to proposition of the Government of each country after the respective universities have been consulted.

"15. Each country fixes its own rules as to the means of guarding the interests of itself and its subjects in the other country.

"16. A Danish-Icelandic Advisory Committee shall be formed, consisting of at least six members, of whom one-half shall be elected by the Danish Rigsdag, the other half by the Icelandic Althing. Every Bill concerning the further handling of matters spoken of in this Union Act, and such Bills concerning the private affairs of either country as also relate to the other country and the status and rights of its subjects, shall, by the Ministry concerned, be submitted to the Committee for consideration before it is introduced into the Rigsdag or Althing, unless there are exceptional obstacles in the way. It is incumbent upon the Committee to propose amendments to such clauses in the Bill as it considers derogatory to the interests of either country or its subjects. It is further the task of the Committee, either by the request of the Government or of its own accord, to prepare the drafting of Bills which aim at the co-operation of the two countries and a harmony in their legislation, as well as to take part in the co-operation for a uniform legislation for the Scandinavian countries. Further rules for the constitution and activities of the Committee will be made by the King in accordance with the propositions of the Governments of both countries.

"17. Should a dispute arise concerning the interpretation of the provisions of this Union Act which the Governments are unable to settle between themselves, the matter shall be referred to a court of arbitration consisting of four members, half of which number shall be elected by the

highest court of justice in each country respectively. This court of arbitration settles the dispute by the majority of votes. Should votes be equal the decision shall be given to an arbitrator, whom the Swedish and the Norwegian Governments are requested to nominate in turn.

"18. After the expiry of the year 1940 either the Rigsdag or the Althing may at any time demand that negotiations for the revision of this statute shall be inaugurated. If the negotiations do not lead to a renewed agreement within three years from the time the demand was launched, the Rigsdag and the Althing respectively may resolve that the agreement contained in this law be repealed. In order to make this resolution valid at least two-thirds of the members of each of the houses of the Rigsdag or the united Althing must have voted for it, and it subsequently must have been sanctioned by a plebiscite of the electors eligible to vote at elections to the legislative assembly of the country. If by this ballot it is proved that at least three-fourths of the votes cast have been in favour of a repeal of the Act, the Act is thereby annulled.

"19. Denmark notifies foreign powers that in conformity with the contents of this Union Act she has acknowledged Iceland as a Sovereign State, and simultaneously announces that Iceland declares herself perpetually neutral, and that she has no naval flag.

"20. This Union Act comes into force on the 1st of December, 1918."—A. McGill, *Independence of Iceland*, pp. 27-31.

1919.—Supreme Court established.—Althing membership.—"Iceland established its own supreme court October 6, 1919, and it has been acting since the beginning of last year. There are five justices—a chief justice and four associates. The other functions of government still performed by Denmark will in all probability gradually be taken over by the Icelandic authorities except where, for reasons of economy, it is found advisable to make use of the already well-established Danish governmental machinery. It would hardly pay Iceland for years to come to establish diplomatic and consular service. Internally the Government remains much the same as before the country became independent. . . . The Althing has at present forty members, twenty-six in the lower house and fourteen in the upper. Of these thirty-four are elected in the various constituencies by direct vote of men and women, Iceland having been one of the first countries to grant women suffrage, while six are elected by proportional representation from the whole country. These six are elected to the upper house. Both houses in joint session elect eight members from the lower house to the upper. Because Denmark had for years past been giving Iceland more and more rope in running its affairs, practical self-government in Iceland is actually more than two and a half years old. . . . It is doubtful whether anyone has become more prosperous through freedom, but everyone has become more contented, and the Government has shown itself fully capable of meeting all its domestic problems, most of which are of an industrial nature."—*Nation*, Aug. 17, 1921, p. 171.

1920-1922.—New constitution.—Ministry.—By the charter of May 18, 1920, Iceland has universal suffrage for all those over twenty-five years of age who have lived in the country for a specified length of time. The king shares the legislative powers with the Althing which consists of 42 members, 36 of whom are elected for four years from separate electoral districts and six (formerly

nominated by the king) for eight years by proportional representation from the whole country. The Althing is divided into an upper and lower house of 14 and 28 members respectively. In the upper house are the six members elected by proportional representation and eight elected by the whole Althing from its own body. All bills may be introduced in either house, except budget bills, which must first be laid before the lower house. The cabinet consists of three ministers, a prime minister and two secretaries of state. In 1922 the following ministry was appointed: Sigurdur Eggerz, president of the council; Klemens Jonsson, minister of trade and communications; Magnus Jonsson, minister of finance.

ICONOCLASTIC CONTROVERSY. —“Of the controversies that disquieted this age [the eighth century], the greatest and the most pernicious related to the worship of sacred images. Originating in Greece, it thence spread over the East, and the West, producing great harm both to the state and to the church. The first sparks of it appeared under Phillipicus Bardanes, who was emperor of the Greeks near the beginning of this century. With the consent of the patriarch John, in the year 712, he removed from the portico of the church of St. Sophia a picture representing the sixth general council, which condemned the Monothelites, whom the emperor was disposed to favour; and he sent his mandate to Rome, requiring all such pictures to be removed out of the churches. But Constantine, the Roman pontiff, not only protested against the emperor's edict, but . . . having assembled a council at Rome, he caused the emperor himself to be condemned as an apostate from the true religion. These first commotions, however, terminated the next year, when the emperor was hurled from the throne. Under Leo the Isaurian, a very heroic emperor, another conflict ensued; which was far more terrific, severe, and lasting. Leo, unable to bear with the extravagant superstition of the Greeks in worshipping religious images, which rendered them a reproach both to the Jews and the Saracens, in order to extirpate the evil entirely, issued an edict in the year 726, commanding all images of saints, with the exception of that of Christ on the cross, to be removed out of the churches, and the worship of them to be wholly discontinued and abrogated. . . . A civil war broke out; first

in the islands of the Archipelago and a part of Asia, and afterwards in Italy. For the people, either spontaneously, or being so instructed by the priests and monks, to whom the images were productive of gain, considered the emperor as an apostate from true religion. . . . In Italy, the Roman pontiffs, Gregory II. and Gregory III., were the principal authors of the revolt. . . . The Romans and the other people of Italy who were subjects of the Greek empire, violated their allegiance, and either massacred or expelled the viceroys of Leo. Exasperated by these causes, the emperor contemplated making war upon Italy, and especially upon the pontiff; but circumstances prevented him. Hence in the year 730, fired with resentment and indignation, he vented his fury against images and their worshippers, much more violently than before. For having assembled a council of bishops, he deposed Germanus, bishop of Constantinople, who favoured images, and substituted Anastasius in his place; commanded that images should be committed to the flames, and inflicted various punishments upon the advocates of them. The consequence of this severity was; that the Christian church was unhappily rent into two parties; that of the Iconoduli or Iconolatrae, who adored and worshipped images, and that of the Iconomachi or Iconoclastae, who would not preserve but destroyed them; and these parties furiously contended with mutual invectives, abuses, and assassinations. The course commenced by Gregory II. was warmly prosecuted by Gregory III., and although we cannot determine at this distance of time the precise degree of fault in either of these prelates, this much is unquestionable, that the loss of their Italian possessions in this contest by the Greeks, is to be ascribed especially to the zeal of these two pontiffs in behalf of images. Leo's son Constantine, surnamed Copronymus by the furious tribe of Image-worshippers, after he came to the throne, 741, trod in his father's steps; for he laboured with equal vigour to extirpate the worship of images, in opposition to the machinations of the Roman pontiff and the monks. Yet he pursued the business with more moderation than his father had done; and being aware that the Greeks were governed entirely by the authority of councils in religious matters, he collected a council of eastern bishops at Constantinople in the year 754, to examine and decide this controversy. By the Greeks this is called the seventh general council. The bishops pronounced sentence, as was customary, according to the views of the emperor; and therefore condemned images. . . . Leo IV., who succeeded to the throne on the death of Constantine, 775, entertained the same views as his father and grandfather. For when he saw, that the abettors of images were not to be moved at all by mild and gentle measures, he coerced them with penal statutes. But Leo IV. being removed by poison, through the wickedness of his perfidious wife Irene, in the year 780, images became triumphant. For that guilty woman, who governed the empire during the minority of her son Constantine, with a view to establish her authority, after entering into a league with Hadrian the Roman pontiff, assembled a council at Nice in Bithynia in the year 786, which is known by the title of the second Nicene council. Here the laws of the emperors, together with the decrees of the council of Constantinople, were abrogated; the worship of images and of the cross was established. . . . In these contests most of the Latins, —as the Britons, the Germans, and the French, took middle ground between the contending parties; for they decided, that images were to be

retained indeed, and to be placed in the churches, but that no religious worship could be offered to them without dishonouring the Supreme Being. In particular Charlemagne, at the suggestion of the French bishops who were displeased with the Nicene decrees, caused four Books concerning images to be drawn up by some learned man, and sent them in the year 790 to the Roman pontiff Hadrian, with a view to prevent his approving the decrees of Nice. In this work, the arguments of the Nicene bishops in defence of image-worship, are acutely and vigorously combated. But Hadrian was not to be taught by such a master, however illustrious, and therefore issued his formal confutation of the book. Charlemagne next assembled, in the year 794, a council of 300 bishops, at Frankfort on the Main, in order to re-examine this controversy. This council approved the sentiments contained in the Books of Charlemagne, and forbid the worship of images."—J. L. von Mosheim, *Institutes of ecclesiastical history*, v. 2, bk. 3, pt. 2, ch. 3.—See also PAPACY: 728-774.

**ICONOCLASTS OF THE NETHERLANDS.** See NETHERLANDS: 1566.

**ICTINUS** (fl. 450-430 B.C.), Greek architect. See ACROPOLIS OF ATHENS; PARTHENON: B.C. 445-431.

**ICTIS**, island off the coast of Britain, to which tin is said to have been brought from the main shore by natives to be sold to Greek merchants. Whether it was the isle of Thanet, at the mouth of the Thames, or the isle of Wight, or St. Michael's mount, is a disputed question.

**IDA**, famous mountain range in Asia Minor, and an ancient seat of worship. It was also the name of a famous mountain in Crete now called Psiloriti. See TROY; CRETE: Effect of position, etc.

**IDAHO: Geographical description.—Meaning of name.**—"The area of the state of Idaho is 84,313 square miles, lying between the 42d and 49th parallels of latitude and the 111th and 116th meridians of longitude. It is one of the largest States in the Union. . . . Idaho is over 480 miles in length from north to south. Its width, however, varies from 48 miles across the 'Panhandle' to 310 miles from Wyoming to Oregon, across the southern part of the State. . . . The surface of Idaho is extremely broken and mountainous. Its altitude ranges from about 700 feet above sea-level, at Lewiston, to over 12,000 feet at the summit of Mt. Hyndman. With the exception of the great sage-brush plains across southern Idaho and a few prairie stretches here and there, the State is covered with ranges of mountains and deep valleys. The Bitter Root range of the Rocky Mountains forms the northeast boundary. . . . A number of lofty peaks and buttes serve as prominent and picturesque landmarks. No other physical feature has so affected the history of the State as its mountains."—C. J. Brosnan, *History of the state of Idaho*, pp. 10-11.—The estimated population, 1920, was 431,866.—"The name Idaho comes from a Shoshoni exclamation 'E-da-how,' with the accent on the second syllable. It means 'Behold! the sun coming down the mountain.' It was used first in Colorado among the same tribe of Indians and was there applied by the first white men as a geographical term—Idaho Springs. There and later in the farther Northwest the sentimental

meaning 'Gem of the Mountains' was given as the meaning."—*Idaho: Its meaning and application* (*Washington Historical Quarterly*, v. 9, p. 71).

**Resources.**—Agriculture is the principal source of wealth in the state. In 1920, the number of farms was 42,106, with a total area of 8,375,873 acres, of which 4,511,680 acres were improved land; and the cereals, vegetables, and orchard fruits as the principal crops. There are three kinds of farming employed in the state: humid, irrigation, and dry. Except for the soils of North Idaho, the Nez Percés and Camas prairies, and the broad valleys of the Panhandle, the surface of the state is arid. In 1920 over 2,000,000 acres were under irrigation; and drainage projects costing \$1,706,462, providing drainage for 55,732 acres were under construction. The state also has an active live stock industry which, in 1920, had a total of 3,556,400 head. The state contains 18,682,031 acres of national forests; and has 260 lumber mills, one of which (Potlatch) is said to be the largest in the world. The mineral resources are second only to the agriculture. Lead constitutes about sixty per cent of the states total mineral production. The other mineral resources are, gold, zinc, copper, iron, coal, nickel, cobalt, mica, salt, and building stones. In 1920, the value of the mineral production was \$33,557,708.—See also U. S. A.: Economic map.

**1804-1811.—As part of the territory of Oregon.—Lewis and Clark.—Establishment of fur companies.**—"What is now the State of Idaho, at one time was a part of what was called the Northwestern Territory. . . . The territory included . . . first, the Northwestern, and later, Oregon Territory, and was all included in the Organic Act of Congress creating and organizing a territorial government called Oregon. It must also be borne in mind that the Territory of Oregon, as first organized, included at that time all of what is now the States of Oregon, Washington, Idaho, and a considerable portion of what are now the States of Montana and Wyoming."—J. Hailey, *History of Idaho*, preface, p. 1.—"In 1800 Spain ceded to France the Province of Louisiana, stretching between the Mississippi and the Rocky Mountains, and in December, 1803, the famous Louisiana Purchase was completed by President Jefferson. [See LOUISIANA: 1798-1803.] A few months previous to this, however, the President had secured a secret appropriation from Congress for the Lewis and Clark expedition to the Pacific. During 1804 and 1805 the Party under Lewis and Clark explored the Clark Fork, Clearwater, Snake, and Salmon River sources in the Rocky Mountains [Idaho], and the Columbia itself for 300 miles to where its broad waters sweep into the Pacific. This gave the United States our second strong claim to the Oregon territory."—C. J. Brosnan, *History of the state of Idaho*, p. 27.—"When the account of the Lewis & Clark expedition became known, great interest was aroused, especially among what was then the western frontier towns, one of the results being the formation of the Missouri Fur Company, which established a fort at what was called Fort Henry, in 1810, but which was soon abandoned. In 1811, William P. Hunt, and a party of sixty belonging to the Pacific Fur Company [of which John Jacob Astor was the head] arrived at Fort Henry. Moving westward on the 19th of October of that year, they proceeded down

the Snake river in fifteen canoes, but encountered so many dangers owing to the rapids, that at last it was decided to abandon the boats and to divide the party into two sections. Hunt, with his guides and eighteen men, to take the right bank, and the remainder under the leadership of a man named Crooks, to take the left. Thus they proceeded down the river in the hope of reaching the Columbia. . . . No record exists of the final end of those poor fellows [under Crooks] who were left to perish alone."—W. J. McConnell, *Early history of Idaho*, pp. 30-31, 33.—See also OREGON: 1808-1826.

1834-1860.—Early expeditions and settlements.

—Treaty with the Nez Percés Indians.—First discovery of gold.—"The next expedition to enter the future Idaho was that of Captain Bonneville, who with one hundred men in 1834, camped on Port Neuf river near where is now the city of Pocatello. In the same year Fort Hall was established by Nathaniel Worth, accompanied by a well equipped party of sixty men. The location was selected on the 14th day of June, 1834, on the east bank of Snake river, north of Port Neuf. . . . Among the important early settlements in Idaho was that made in 1836 by Rev. Henry Spaulding and family on Lapwai, a tributary of the Clearwater river. . . . They arrived at the foregoing place on November 29, 1836. . . . After a residence at that place of about one year, Spaulding concluded that a better location for his mission would be at the mouth of Lapwai Creek, near the bank of the Clearwater river, (called by the Indians Koos-koos-ki). . . . Among the things brought across the Rocky Mountain Divide by Rev. Spaulding and Dr. Whitman, who accompanied Spaulding, were a few seeds; a few kernels each of corn, wheat and oats; also a few apple and locust seeds. Preparing a small garden patch of fertile ground, he began patiently to plant and cultivate each species in order that he might in time be able to supply the Indians with seeds, hoping to induce them to become tillers of the soil. His efforts in this direction were crowned with a moderate degree of success. . . . Thus first began the civilization of the Nez Percé Indians; and the work accomplished in this direction by Rev. Spaulding, and his devoted Christian wife, was largely responsible for the friendly spirit with which those Indians received the whites when the discovery of placer gold caused such an increase in the population of their country."—W. J. McConnell, *Early history of Idaho*, pp. 33, 36-37.—"These Nez Percé Indians roamed over and claimed the greater part of what is now called North Idaho and a portion of what is now the north-eastern part of Oregon, commonly called the Wallowa Valley."—J. Hailey, *History of Idaho*, p. 28.—"The next established settlement within what are now the boundaries of Idaho was made by the Jesuit Fathers in 1853, on Cœur d'Alene river, at, or near, what is now the head of navigation on that stream. . . . Prominent among the early pioneers who penetrated the vast . . . were the missionaries sent by the Church of Latter Day Saints, commonly called 'Mormons.' They came [June 15, 1855] to what is now Idaho for the purpose of locating and establishing a settlement among the Bannock and the Shoshone Indians near Salmon river. . . . In the fall of 1857 a large addition was made to the membership of the Lemhi colony. . . . Arrangements were at once made for the building of a new fort, or stockade, four or five miles below Fort Lemhi, thereby increasing the acreage and the strength of the colony, and also giving room for new arrivals."—W. J. Mc-

Connell, *Early history of Idaho*, pp. 40, 42-43, 51.—"Until the year 1855, there had been no serious trouble between the Indians and the whites, except the Whitman massacre. There had been some individual trouble at various times but all had been settled without any great difficulty. In 1855 they began to grow restive. Governor Stevens of Washington Territory, who was also ex-officio Superintendent of Indian Affairs, went immediately to the Nez Perce country and with the assistance of William Craig and a few other practical men, called the Indians together and made a treaty with them on the 1st of June, 1855. This treaty set apart what is known as the Nez Perce Reservation for the Indians and in consideration of the Indians ceding to the United States the remainder of the land they claimed, the United States was to make them certain annual payments in the way of annuities, establish an agency and Indian schools, to continue for a number of years. At this time the agreement appeared to be satisfactory, but there was one branch of this tribe who made their home in the Wallowa Valley, headed by a brave and wonderfully sagacious chief named Joseph. This chief claimed that he did not sign the treaty, that his home was in the Wallowa Valley in Oregon, and he would not consent to leave that place and remove to the reservation selected for him and his people. The other Nez Perce tribes kept the treaty in good faith."—J. Hailey, *History of Idaho*, p. 28.—"The first record we have of the discovery of gold in this district [Lemhi] was that made by a French Canadian on the Pend d'Oreille river in 1852, which did not prove of sufficient importance to attract much attention. Two years later gold was discovered by General Lauder, while he was exploring a route for a military road from the Columbia river to Fort Bridger. From 1852 onward placer mining was conducted in a desultory manner on various streams in what is now Shoshone county, Idaho. But it was not until the discovery of gold in 1860 by a party under the leadership of Captain E. D. Pierce, that a great mining boom began to assume proportions large enough to attract attention."—W. J. McConnell, *Early history of Idaho*, p. 55.

1848.—Embraced in Oregon Territory. See OREGON: 1846-1855.

1858-1867.—Cœur d'Alene Indians attack Colonel Steptoe.—Inauguration of the mining era.—"It had been the boast of the Cœur d'Alenes and the Spokanes that they had never shed the blood of a white man. In the early spring of 1858, however, because of white men passing through the country, there was some restlessness among the northern tribes. Colonel E. J. Steptoe, who was in command at Fort Walla Walla, Washington, set out with a command of 150 men to examine into the affairs in the neighborhood of the Hudson's Bay Company's post at Fort Colville and to investigate the murder of two miners by a party of Palouse Indians. This was a feeble band of Indians and Steptoe considered his command large enough to overawe them. However, after crossing the Snake River, he found himself facing a force of fully 1,200 savages, hideous in their war-paint. They were from the Cœur d'Alene, Palouse, Spokane, and Yakima tribes. He saw that it would be impossible to go on in the face of this hostile force and started to withdraw, but the Indians opened fire on the rear-guard, and the fight began and continued through the day. A series of charges and counter-charges was kept

up with loss to both sides. Darkness found Steptoe's men exhausted, with their ammunition almost gone and the number of wounded increasing. A consultation of the officers was held and they decided to retreat during the night, if possible, as another day's fighting would undoubtedly result in the destruction of the entire force. Accordingly they left their supplies and two howitzers and stole away during the night. . . . Active preparations were begun to put a large force in the field to punish the Indians. Colonel George Wright was sent to take charge of the expedition. He left Fort Walla Walla in August, 1858, crossed the Snake River, and after a march of nearly 100 miles over a forbidding country, during which they were twice attacked, came upon a large body of Indians who were awaiting his attack. . . . During this march, in order to prevent further depredations on the part of the Spokanes, he rounded up all of their horses, drove them out on the plains about 20 miles east from where Spokane now stands and slaughtered the entire herd to the number of 800. Until very recently a large mound of whitened bones marked this spot. The Spokanes were helpless without their horses and were compelled to surrender. . . . Colonel Wright assembled some 400 of the Cœur d'Alenes at their mission on the Cœur d'Alene River and imposed his own terms, which were that they should give up the men who began the attack on Steptoe, restore all property taken from the whites, permit white men to go through their country unharmed, and give a chief and four men, with their families, as hostages. The Indians stood in such great fear of Wright that they accepted the terms without a murmur."—C. J. Brosnan, *History of the state of Idaho*, pp. 129-131.—In the summer of 1860 Captain E. D. Pierce, a miner who had prospected in California and British Columbia, made his epoch-making discovery of gold on Canal Gulch of Oro Fino Creek, a tributary of the Clearwater. Although the first pan of dirt mined by a member of his little prospecting-party yielded only about three cents worth of gold, yet this discovery inaugurated the mining era which was destined to bring Idaho Territory into political existence less than three years later. . . . In March [1861], one of the prospectors returned to civilization with \$800 worth of gold-dust to sell. . . . From the California mines, . . . came a rush of miners overland to the Clearwater country. In April, 1861, 300 miners were in the new diggings and a month later the number had increased to a thousand. As the spring advanced, the excitement increased and all available steamers from Victoria and San Francisco were chartered for the purpose of hurrying the gold-crusaders toward the new Eldorado. . . . Parties of prospectors scoured the country to the southward and in the summer of 1861 located rich diggings in the gulches and creeks of the Elk City district, situated on the South Fork of the Clearwater. North of the Salmon and southwest of Elk City lay the astonishingly rich placer-camp of Florence which was discovered in the autumn of 1861. In August, 1862, a few miles south of the Salmon, James Warren discovered the more permanent but superficially less productive Warren's Diggings. The Florence placers were doubtless the most picturesque as well as superficially the richest of all the famous Idaho camps. . . . In the richness of its surface gravels it rivalled the most famous California placers in their palmiest days. The yield from a pan of dirt was often measured in terms of dollars instead of cents. One pan of gravel from Baboon Gulch yielded \$500. . . . In the spring of 1862 gold-dust

was weighed by the pound. . . . The Salmon River discoveries proved that the gold-fields of the future Idaho were extensive as well as rich. Consequently, the throng of prospectors which had later entered Idaho mainly from California and the Pacific Northwest, now began to pour into the Salmon River country from both east and west. Upon this far-famed mining-district there now converged streams of prospectors from Missouri, Minnesota, 'Pike's Peak,' as well as from California and the modern Inland Empire. In the summer of 1862 some eastern prospecting parties bound for the Salmon River mines, were diverted from their course and made important gold discoveries in the present western Montana. It was the golden gravel-bars of these Salmon mines that not only laid secure foundations for Idaho, but stimulated the peopling of Montana as well. . . . In the late summer of 1862 a little band of prospectors under the leadership of George Grimes and Moses Splawn discovered gold in the Boise Basin. . . . The Boise Basin rivalled in richness the most famous California placers. . . . In May, 1863, in what is now Owyhee County, a party of miners led by Michael Jordan prospected the little stream later known as Jordan Creek, and found gold in paying quantities. . . . The Owyhee mineral district soon showed indisputable evidences of permanency and began to attract heavy investments of outside capital. Only a few years after the original discovery the output of this famous district ran far into the millions and its rich and picturesquely named mines could be numbered by the score. . . . In 1866 a party of Montana prospectors discovered rich placer-diggings in what shortly afterward became Lemhi County. Five thousand miners soon rushed to this district. In 1868, about 12 miles from Salmon City, a Gold-bearing quartz-ledge was found. Soon other valuable placer and quartz claims were located. While the mineral district embraced within the present Lemhi County was rich, there were no bonanzas uncovered, such as characterized the discoveries at Florence, the Boise Basin, or Owyhee. In 1867 Salmon City was laid out by the future United States Senator Shoup and some associates. It became the county seat of Lemhi County and an important supply-centre for the adjacent mining-camps."—*Ibid.*, pp. 80-92, 94-97. See also U. S. A.: 1865-1885.

1863-1864.—Emigration from other states.—Organic Act creating Idaho Territory.—Appointment of officials.—First election.—Adoption of civil and criminal codes.—During the summer of 1863 large wagon trains of emigrants from Missouri and Arkansas arrived in Idaho. They consisted of entire families of men, women and children, and would have been a desirable acquisition to the population of any country. . . . As a rule they brought with them good teams and wagons and such household goods as were portable. Their advent marked the arrival of the first feather-beds into the territory."—W. J. McConnell, *Early history of Idaho*, pp. 180-190.—"The rapid development of the part of Washington Territory now known as Idaho and Montana, due to the incoming of the gold maddened hordes who scattered to the various camps distributed over a vast area of country, made the enforcement of law so far away from Olympia, the then capital and seat of government, almost impossible. Hence it was deemed advisable to create a new territory out of eastern Washington, which was to include all the new mining districts."—*Ibid.*, p. 83.—"On March 3, 1863, Congress passed the Organic act creating and organizing the Territory of Idaho, taking in all that portion of Washington west of the Rocky

Mountains save and except that portion which now constitutes the present State of Washington, and also taking in a large tract east of the Rocky Mountain range. The eastern boundary is described as follows; Beginning at a point on the 40th parallel of latitude at the 27th degree of longitude west of Washington, thence south along said degree of longitude to the northern boundary of Colorado Territory. This eastern boundary of Idaho appears to have extended over on the east side of the Rocky Mountain range and taken in quite a large strip of what was then known as the Louisiana purchase."—J. Hailey, *History of Idaho*, p. 26.—See also DAKOTA TERRITORY: 1862-1865.—"In accordance with the provisions of the act creating Idaho Territory, on the 10th day of March, 1863, or one week after its approval, the President appointed the following officers: Governor, W. H. Wallace; Secretary, W. B. Daniels; Chief Justice, Sidney Edgerton; Associate Justice, Alex. C. Smith; Associate Justice, Samuel C. Parker. On the thirteenth of the same month he appointed D. S. Payne United States marshal. The position of United States attorney remained vacant until February 29, 1864, on which date C. C. Hough was appointed to that office. The first territorial offices were established in Lewiston, no territorial capital having been named in the organic act. . . . On September 22nd, 1863, Governor Wallace issued a proclamation calling for an election to be held throughout the Territory on the 31st day of October of that year (1863), naming the officers to be elected, including a delegate to congress and members of the first Territorial legislature, which afterwards convened by executive order in Lewiston, on December 7th, 1863. . . . The first election in Idaho resulted in a victory for the Republicans. They elected a delegate to congress and a majority of both houses of the legislative assembly. Governor Wallace was a candidate of the Republicans for delegate to congress and was elected, thus causing a vacancy in the Governor's office. . . . In the interim W. B. Daniels, Secretary of the Territory, became the acting governor, following the resignation of W. H. Wallace. . . . The first territorial legislature was convened in Lewiston, Idaho, on December 7th, 1863. . . . The organic act which created the Territory of Idaho failed to provide that the laws of the Territories, from which the new Territory was created, should continue in force, until such time as the legislative assembly of Idaho could enact Civil and Criminal Codes. Hence there was a period during the first year of Idaho's territorial existence, extending from April 3rd, 1863, until the first legislative session had met and enacted laws, when we had neither Civil nor Criminal Acts, and were entirely dependent upon the general laws of the United States, which were inadequate to meet all conditions. Consequently the first legislative assembly was confronted with conditions requiring prompt and speedy measures. The first district court to be held in the Territory was to be convened on January 5th, 1864, less than one month from the first day of the legislative session. . . . The members of the first legislature . . . [passed] an act adopting the Common Law of England."—W. J. McConnell, *Early history of Idaho*, pp. 111-114, 152.

1864-1868.—Caleb Lyon appointed governor.—**Legislation.**—"Caleb Lyon, of Lyonsdale, New York, was appointed Governor of Idaho Territory, February 26, 1864, to fill the vacancy caused by the resignation of Governor Wallace. . . . The Second Session of the Idaho Territorial Legislature convened in Lewiston November 14, 1864, for a

forty-day session, as limited by the Act of Congress which created the territory. The House of Representatives was composed of thirteen members, five of whom were elected from Boise county, two from Idaho, two from Nez Perce, two from Owyhee and one from Shoshone county. The Council consisted of seven members, one from Alturas county, two from Boise county, one from Idaho county, one from Nez Perce, one from Owyhee and one from Shoshone county. The work of the second session of the Idaho legislature was devoted, largely, to amending and repealing the acts of the first session, but, in addition, several measures were enacted into laws. The act creating Ada county was passed by this session, and approved December 22, 1864. Another important act was passed providing for taxing foreign miners. It will be remembered that, up to the time of this enactment, no surveys of the public domain had been made by the United States government, and consequently no patents had been issued. Therefore there was no real property to be taxed. Hence the revenue necessary to carry on the government was provided very largely by collecting licenses from all sources possible, and the additional revenue derived from taxing alien miners four dollars a month, was an important item. Section X. of the act provided that it 'should be construed to apply only to such persons as are inhibited from becoming citizens of the United States, by the laws thereof.' The fact was that the law was designed to affect Mongolians alone, and prevent or check their influx to the placer mines. . . . The Third Session of the Legislative Assembly of the Territory of Idaho convened in Boise City December 4, 1865, and adjourned January 12, 1866. . . . The Fourth Session of the Idaho Territorial Legislature convened December 3rd, 1866. . . . [In 1866 David Ballard was appointed governor for the term ending in 1870.] During the years 1867-1868, a noticeable change had occurred in the types of new arrivals in the Territory, many of whom consisted of families who brought with them their household goods, and were prepared to make permanent homes. Especially was this apparent in the Payette and Boise valleys and their tributaries. The original locators having, in many instances returned to their former homes, their locations were occupied by the new arrivals, who, in most cases, intended to found lasting homes. The Union Pacific and the Central Pacific railroads were nearing completion, and this fact, no doubt, had an influence in diverting immigration to South Idaho. The vote cast for Delegate to Congress in 1868 revealed that the voting population had decreased during the previous two years. This was due to the fact that, while many permanent settlers had arrived during this time, a large number of placer miners had departed for their former homes, while others had abandoned the territory in search of new fields. The fifth session of the Territorial Legislature which convened in Boise City on Dec. 7th, 1868, was composed with one exception of new members; they were a conservative body, and while they enacted but few laws, they adjourned at the end of the session without having done any harm. The same tribute may be paid to the members of the Sixth Session which assembled on the 8th day of December, 1870. The Seventh Session began its labors on the second day of December, 1872, and adjourned on the 10th day of January, 1873. Its membership being composed of men who intended to remain permanently in Idaho, they were careful in the enactment of laws to avoid any unnecessary increase in taxes."—W. J. McConnell, *Early his-*

tory of Idaho, pp. 288, 301-302, 325, 344, 349-351.

ALSO IN: C. E. Rose, *Civil government of Idaho, 1864-1873.—Demarcation of boundary lines.*—"The following year [1864] the new Territory of Idaho lost a portion of its original area to form the new Territory of Montana. [See Montana: 1864-1876.] The boundaries of Idaho as organized were partly natural; that is, formed by rivers or mountain chains, and partly artificial, or parallels of latitude or meridians of longitude. The latter never having been indicated by markings on the earth's surface, controversies frequently arose as to the jurisdiction of the courts in the various territories contiguous to Idaho. For the purposes of taxation and the settlement of disputed matters before the courts, it became important that a demarcation of Idaho's artificial boundaries should be made. Accordingly, in 1873, Congress made an appropriation of \$10,800 to establish the western boundary of Idaho, or that portion lying east of the Territory of Washington not already established by nature. The Secretary of the Interior was directed to definitely mark on the earth's surface by conspicuous monuments, accurately established, this portion of Idaho's boundary. To execute this work, the then Secretary of the Interior, Columbus Delano, appointed . . . [R. J. Reeves], then a resident of Olympia, Washington Territory. . . . [He] was instructed to begin at the intersection of the Snake and Clearwater Rivers, as said intersection existed at the time of the organic act in 1863, and to mark a line on the earth's surface from that initial point running due north to the forty-ninth parallel of north latitude, this being the boundary between British possessions and the United States. [The demarcation was established in 1873.]"—R. J. Reeves, *Marking the Washington-Idaho boundary (Washington Historical Quarterly, July, 1908)*.

1866-1890.—Territorial governors.—The territorial governors and their terms of office for the period covering 1866 to 1890 are as follows: David D. Ballard, 1866-1870; Thomas W. Bennett, 1871-1875; D. P. Thompson, 1875-1876; Mason Brayman, 1876-1880; John B. Neil, 1880-1883; John N. Irwin, 1883; William M. Bunn, 1884-1885; Edward A. Stevenson, 1885-1889; George L. Shoup, 1889-1890.

1869-1878.—Indian war.—Battle of Clearwater.—Uprising of the Bannocks.—Treaty with the Bannocks, 1869.—"In 1877 the Indian Bureau at Washington decided to force the Wallowa band of Nez Perces to go on the Lapwai Reservation in Idaho. This order was sent to Agent Monteith at Lapwai and to General Howard at Portland. They called a general solemn council of the non-treaty bands at Lapwai in May, 1877. . . . This council, . . . lasted three days. . . . On the third day Too-hul-hul-suit, the holy chief, or 'tu-at,' defiantly declared that he would not go on the reservation. For this he was arrested and placed in the guard-house by General Howard. The Indians, already in a disgruntled state of mind, were highly incensed over the arrest of their religious leader. Joseph and Whitebird were successful, for the time, in restraining the Indians from any violent outbreak, and agreed to go on the reservation within thirty days. On June 14, 1877, the final day set for the period in which the Wallows must go on the Lapwai Reservation, some Indians from the non-treaty bands began a horrible series of murders and outrages on men, women, and children in the lower Salmon River country. In response to urgent appeals for protection, General Howard

sent Captain Perry with two cavalry companies to the scene of the disorders. On the morning of June 17, Captain Perry's force and a small volunteer company from Mt. Idaho entered Whitebird Canyon at whose head the Indians were encamped. Four miles from the entrance of the canyon, Perry's troops . . . were attacked by nearly the entire hostile force of over 300 Indian warriors. The hostiles assaulted Perry's men simultaneously from the front and from both sides of the canyon and succeeded in splitting the troops into two detachments—one under Theller and Parnell, and one under Perry. Parnell's little company was forced into a side ravine and nearly wiped out. Lieutenant Theller and 18 brave comrades were caught in the trap and killed. Perry retreated by the main canyon. After running the gauntlet of a withering fire from the infuriated savages, the two broken detachments finally succeeded in effecting a junction on the mesa near the entrance to the canyon. . . . On June 22 General Howard took charge of the campaign in person, and in early July had managed to assemble a force of between 500 and 600 troops. After a search . . . he finally located Joseph's braves in a wild forest southeast of Kamiah. The two days' battle which was fought here (July 11-12) was signalized by the fiercest kind of fighting. . . . Joseph's entire band was massed against the united army of General Howard. . . . The first day's battle was indecisive. . . . On the second day, Howard decided to capture the Indian position by a charge. . . . The Indians were overwhelmed by this assault . . . and fled across the Clearwater. . . . On July 17, Joseph began his sensational retreat over the Lo Lo Trail. . . . On July 28, only eleven days after they had begun their flight from Idaho, the Nez Perces were nearing, without mishap, the Montana end of the Lo Lo Trail. After the battle of the Clearwater, General Howard halted for a few days in the Kamiab country in order to provide security to the settlers in his rear. On July 27 he began his memorable 1,300 mile pursuit after his elusive antagonist. Realizing that Joseph had by this time a start of fully 150 miles, General Howard telegraphed General W. T. Sherman, . . . to send an intercepting force to capture Joseph. . . . Surprised by Gibbon's brave but smaller army at Big Hole River, he [Joseph] shook himself loose from his pursuers and passed through the Lemhi Valley, Camas Meadows, and Lake Henry regions in southeastern Idaho. By a night attack at Camas Meadows Joseph succeeded in stampeding and capturing General Howard's mule herd. The Nez Perces then proceeded eastward into Wyoming through the Yellowstone Park. . . . By making a feint southward through Wyoming, Joseph succeeded in decoying Colonel Sturgis from his blockade of the 'bottle-neck' pass at Heart Mountain and struck northward through Montana for Canada and freedom. On September 13, at Canyon Creek, Sturgis failed again to stop Joseph, who now seemed to have a clear field northward. On September 17, Colonel Nelson A. Miles, who was stationed near the mouth of Tongue River in eastern Montana, received an order from General Howard to intercept the Indians. On the following day he began the march which resulted in the capture of Chief Joseph at Bear Paw Mountain on October 4, 1877."—C. J. Brosnan, *History of the state of Idaho*, pp. 135-138, 140.—"It is an injustice to charge the Indian war of 1877 to the Nez Perce Indians as a Tribe. The contest was precipitated by Chief Joseph and his band; and while it is true they were Nez Perce Indians, yet their tribal organization was separate and dis-

tinct; Joseph being their chief. The Nez Perces proper were always friendly to the whites, and so remained during the Chief Joseph imbroglio. The Indian outbreak of 1877, was succeeded the following year, 1878, by an uprising of the Bannock Indians, who being eventually joined by renegade remnants of other tribes, after leaving Camas Prairie the scene of their first murderous attack, spread over the country westward and to the south glutting their savage instincts with murder and rapine; crossing Snake River they swept through Owyhee county into Oregon, extending their depredations as far west as John Day Valley. Although pursued almost from their start by both volunteer and regular soldiers, the movements of the Indians were so rapid and erratic, that it was difficult to force them into a general engagement, although several desperate skirmishes were fought, in which many of the Indians, as well as several soldiers were killed, finally to avoid capture or annihilation they scattered into small bands and taking to the hills and mountains made their way back as best they could to the protection of their reservation. The Bannock war with all its attendant horrors, cost of suppression, destruction of property, and loss of life, was precipitated by an error made by a clerk or stenographer in transcribing the treaty, which was written and ratified by the U. S. Senate Feb. 16, 1869, and provided that, 'It is agreed that whenever the Bannocks desire a reservation to be set apart for their use, or whenever the President of the United States shall deem it advisable for them to be put upon a reservation, he shall cause one to be selected for them in their present country, which shall embrace reasonable portions of the Port-Neuf and Kansas Prairie countries.' There being no such prairie as 'Kansas Prairie' and Camas Prairie being one of the most valuable possessions of the Bannock Indians, it is reasonable to suppose that it was agreed in the treaty that the Indians should be allowed to retain a part of their Camas ground, but the clerk who transcribed the Treaty had probably never heard of the blue flowered lily of the north-western states called 'Camas,' and being familiar with the name 'Kansas' wrote in 'Kansas Prairie,' when it was the intent of the treaty makers that the Bannocks should be allowed to retain a reasonable portion of Camas prairie. Those whose duty it was to see that the treaty was carried out, should have performed that duty, and prevented the settlers from encroaching upon the ground where the Indians were accustomed to harvest their annual crop of camas, but no protection was given to the treaty rights of the Bannocks, and when they discovered their harvest being destroyed by the white man's hogs, forbearance ceased to be a virtue, and they appealed to the only arbiter they knew, the God of Battle. . . . During the year 1879, central Idaho, including the Salmon river country, was afflicted with what proved to be but a miniature Indian war, but insignificant as were its proportions it cost the lives of many persons, and required the employment of several companies of regular soldiers accompanied and aided by volunteer scouts, to suppress and capture the 'hostiles,' which was finally accomplished. The Indians who were engaged in this outbreak were what were known as 'Sheep Eaters,' a small aggregation composed of Shoshones, Bannocks and renegades from other tribes. . . . The task of overtaking and capturing them was an arduous one. The regular troops detailed to make the capture were reinforced by a body of Umatilla Indian scouts, and a company of citizen scouts under the command of Colonel

Orlando Robbins, than whom no better trailer or fighter could have been chosen."—W. J. McConnell, *Early history of Idaho*, pp. 362-366.

1870-1901.—Mining development.—Gold hunter stampedes.—Coeur d'Alenes.—Desperadoes and vigilance committees.—"Between 1870 and 1880, important quartz-fields were discovered in what is now Custer County. In that remote region girded by the towering Sawtooth Mountains on the west, nature had with a lavish hand distributed her precious ore-beds. Near Bonanza, in 1875, was located the famous Charles Dickens mine. . . . Among the important mining-towns established in this district was Bonanza, which was founded in 1879. Challis, the future county-seat, was laid out the following year. During the late sixties and early seventies the menacing attitude of the Indians of southern Idaho greatly retarded mining development in the Wood River country. In the summer of 1879, soon after the successful termination of the Bannock War, some prospectors discovered rich quartz-ledges in this district. . . . This once inhospitable region, the abode of prowling savages, was almost overnight dotted with camps and mining-claims. In May, 1883, a branch of the Oregon Short Line reached Hailey and in the following year was extended northward to Ketchum. The arrival of railroad facilities greatly accelerated the prosperity of these already flourishing camps. Prominent capitalists, among them Jay Gould, came here and gathered a golden harvest from Idaho's newest treasure-house. In 1881 Hailey was made the seat of government for this mineral district and became a social, political, and financial centre. It was named in honor of John Hailey, the historian and pioneer transportation man of Idaho, who owned the land on which the town was built. . . . One of the wildest stampedes in the history of mining was the rush to the Coeur d'Alenes in the early months of 1884. Into a country without trails or roads, save the old Mullan Military Road, covered with a dense growth of cedar and fir, in the dead of winter, through deep snow, hurried thousands of excited gold-hunters. Once again did Idaho's gulches, creeks, and ravines prove treasure-laden, for some of the lucky argonauts succeeded in finding good-sized quantities of the precious 'pay-dirt.' These first placer finds, however, were but the prelude to the great mining drama that was soon to be enacted in this region. On a tributary of the South Fork of the Coeur d'Alene River, in the latter part of the year 1884, the first quartz 'strike' was made in the famous lead-silver belt of this district. At Wardner, in the following year (1885), the marvellously rich Bunker Hill and Sullivan mine was located. This mine has been an astonishingly heavy and steady producing property and, through its association with the problems of the relation of capital and labor, has connected Idaho in a large way with the outside world. In July, 1901, near the town of Burke, occurred the discovery of the great Hercules mine, 'The Wonder of the Camp.' The Hercules is as famous for its steady productivity as for the quality of its output. To-day it is producing the finest ore in the Coeur d'Alenes. . . . Our gold-fields had scarcely become known to the world before bands of desperadoes who had made crime a profession in California and Nevada, came flocking to the newest Idaho camps. Their chief business was robbing stages, stealing horses and cattle, and murdering miners. So well organized were these roughs that if a judge, jury, or miners' meeting

attempted to punish one of their number, other members of the 'gang' could be counted upon to wreck a brutal vengeance upon the men who presumed to bring the ruffian to justice. Finally these outlaws became so numerous and powerful in some of the camps that the miners found it necessary to form themselves into Vigilante Committees. The peculiar feature of the Vigilante procedure was that it first tried the criminal in secret, and arrested him afterward. The punishment that followed conviction was swift, sure, and generally terrible. Since there were no jails, these convicted outlaws usually left the camp 'at the end of a rope.' The mysteriousness and severity of the Vigilante tribunals overawed the most desperate criminals, and they usually began to conduct themselves decently or fled to districts where the strange sign of the Vigilantes was not in evidence. As soon as local and Territorial laws became effective, the career of these 'popular tribunals' was, of course, at an end."—C. J. Brosnan, *History of the state of Idaho*, pp. 97-98, 100, 115-116.—"The decade including 1871 and 1880 was perhaps the most trying period in the history of Idaho Territory; up to 1870 the chief industry was placer mining, and the number of men employed in that enterprise, together with those in the towns and camps supported directly by the miners provided an excellent market for all kinds of farm produce raised in the valleys. It seldom requires many years to exhaust the wealth of the average placer mining camp, and while the placer mines discovered in Idaho were no doubt more than average in extent and productiveness, yet hundreds of the best producing claims were exhausted within the first five years after their discovery; hence each succeeding year added to the melancholy of the situation, until eventually, and that too within ten years after the discovery of Boise Basin, hundreds of cabins on the hill-sides and in the gulches were left tenanted and alone among the whispering pines. While it is true that many valuable properties continued to produce sufficient gold dust to justify the employment of a large number of men for many years later . . . yet the great rush had come and gone between the years 1863 and 1870, and those who remained were required to adjust themselves to the changed condition."—W. J. McConnell, *Early history of Idaho*, pp. 357-358.

ALSO IN: H. H. Bancroft, *History of Washington, Idaho, and Montana*.

1874-1875.—Eighth Session of the legislature.—Legislation.—"The Eighth Session of the Idaho Legislature convened at the capital on the 7th day of December, 1874, and adjourned on the 15th day of January, 1875. . . . One of the prominent incongruities of the early business management of Idaho Territory is found in the fact that the Legislature while providing for the collection of revenue to conduct the various departments of its government, left to the County Commissioners the duty of fixing the per cent. which the Tax Collector should retain out of all taxes collected as a recompense for his services in collecting the same. . . . The Eighth Session of the Territorial Legislature enacted a new revenue law which was approved January 15, 1875."—W. J. McConnell, *Early history of Idaho*, pp. 355-356.

1880-1889.—Railroad development.—George L. Shoup elected governor.—Constitutional convention.—Adoption of new constitution.—Admitted to the union.—"The years following 1880, and including 1889, witnessed the most extensive and permanent improvements yet made within the Territory, railroad building being extensively prose-

cut during those years. During that era the Oregon Short Line, the Utah Northern, and the Wood River and the Boise branches were completed; also the Northern Pacific, and the Moscow branch of the O. R. & N. A line of railroad had also been built into Wardner and Wallace, giving impetus to the development of the Ceur d'Alene mines, the permanency and value of which had already been determined. New and prosperous towns sprung into existence like magic, while the old and fossilized marts of trade took on new life. Each succeeding month brought new arrivals of men and women who brought their household goods and were prepared to make Idaho their future home. School houses were built [the University at Moscow established, 1880], churches erected, and a spirit of peace and prosperity prevailed. The Indians which had caused so much trouble were assigned to their respective reservations, and confidence in the future of Idaho had arrived to remain. . . . On April 2, 1889, the Territorial Governor, Hon. E. A. Stevenson, issued a proclamation requesting the people to elect delegates to a constitutional convention to meet in Boise City at noon, the fourth day of July of that year. This meeting was to be held for the purpose of framing a constitution for the proposed state of Idaho and the proclamation prescribed the qualifications and apportionment of members, who were to total seventy-two. The proclamation thus issued was not authorized by law, and consequently the county commissioners could not appoint election officers, or use public funds to pay them for their services; nor was there any provision to pay the per diem and mileage of the delegates. The foregoing call failed in its purpose of convening a constitutional convention, and Hon. George L. Shoup, who was appointed April 3, 1889, to succeed Governor Stevenson to the office of Governor of Idaho Territory, issued another call on May 11, 1889. Governor Shoup's call was slightly different from the one issued by Governor Stevenson and resulted in the choosing of delegates to a convention to be assembled at Boise City July 4, 1889—at the same time and place named in the former call. . . . A constitutional election was held November 5, 1889, at which election the constitution was ratified by an almost unanimous vote. The citizens of Idaho were then in a position to ask the congress of the United States to admit Idaho as one of the Union of States; a bill was accordingly prepared and introduced entitled 'An Act to Provide for the Admission of the State of Idaho into the Union.' Hon. George L. Shoup who was then governor of the territory, ex-Governor Stevenson, James McNab and the writer, W. J. McConnell, went to Washington as a volunteer delegation to aid our then delegate, Hon. Fred T. Dubois, in securing the passage of the admission act. . . . The bill was passed and received the approval of the president July 3, 1890."—W. J. McConnell, *Early history of Idaho*, pp. 369-372, 384.—See also U.S.A.: 1889-1890.

1883-1907.—Mormon franchise.—Shoup, first state governor.—Other governors.—Adoption of Woman Suffrage.—In 1883, a law was passed depriving professed polygamists the right of franchise; but the anti-Mormon restrictions were removed, 1893, when the Mormon Church renounced polygamy. "On July 3, 1890, in accordance with a provision in the Admission Act, Territorial Governor Shoup became the chief executive of the newly admitted commonwealth. At the special election held October 1, 1890, he was continued in the governorship and to him belongs the distinc-

tion of having been the last Territorial and the first State governor of Idaho."—C. J. Brosnan, *History of the state of Idaho*, p. 171.—The state governors and their terms of office covering the period, 1891-1907 are as follows: Norman B. Wiley, 1891-1892; William J. McConnell, 1893-1897; Frank Steuenberg, 1897-1901; Frank W. Hunt, 1901-1903; John I. Morrison, 1903-1905; Frank R. Gooding, 1905-1907. On December 11, 1896, an amendment of the constitution of Idaho, extending the suffrage to women, was submitted to the then voters of the state, and carried by 12,126 against 6,282. Though carried by a large majority of the votes given on the suffrage issue, it did not receive a majority of the whole vote cast on other questions at the same election; but the supreme court of the state decided that the amendment had been adopted.—See also SUFFRAGE, WOMAN: United States: 1851: 1920.

1892-1908.—Miners' strikes.—Murder of ex-governor Steuenberg.—Trial and acquittal of the defendants.—Haywood.—"Idaho, like other mining States, has had her share of industrial troubles. The first outbreak occurred in the Cœur d'Alene mining district, in 1892. Trouble over wages led to a strike. New men were brought in. This gave rise to acts of violence. A mill was blown up and federal troops had to be called in to restore order. From then until 1899 there were various acts of lawlessness in the Cœur d'Alene district. Men were killed on little or no provocation and the towns were terrorized. The climax came in the destruction of the Bunker Hill and Sullivan Mill by dynamite, in 1899. Governor Steuenberg was forced to call for federal troops. Several hundred miners were arrested and confined for a time in a stockade which at one time had been used for cattle. The prisoners called this the 'bull pen.' Paul Corcoran, a leader, was tried and sentenced to prison for a term of years. Order was finally restored, but feeling ran high and many threats were uttered against the governor. Six years afterward, when Governor Steuenberg was entering his home at Caldwell, on the evening of December 30, 1905, a bomb which had been fastened to his gate was exploded and caused his death. Harry Orchard was arrested for this crime and confessed that he had placed the bomb which killed the former governor. His confession also implicated Charles H. Moyer, the president of the Western Federation of Miners, William D. Haywood, secretary and treasurer, and George A. Pettibone, a member of the executive committee, under instructions from all of whom Orchard claimed he had been acting. Orchard also freely confessed that he had committed a number of other serious crimes. Haywood, and Pettibone were separately tried for the murder (May, 1907, to January, 1908). At these trials, Orchard acted as chief witness for the State. Both trials, however, resulted in the acquittal of the defendants and soon afterward the State dropped the prosecution against Moyer."—C. J. Brosnan, *History of the state of Idaho*, pp. 194-195.

1908-1912.—Irrigation project.—Forest fires.—Amendments ratified.—Governors.—The Minadoka reclamation project of the United States government, in 1908, opened up 120,000 acres of land in Idaho for settlement and improvement. The most disastrous forest fires in the history of the state occurred in 1910; these fires raged in the Cœur d'Alene region, several towns were almost entirely destroyed and many lives lost. In 1911, the Sixteenth Amendment (income tax) was ratified. In 1912, a constitutional amendment pro-

vided for the initiative, referendum, and recall (see INITIATIVE AND REFERENDUM: Development in the United States); statutes relating to the state's bonded indebtedness were submitted and carried; also an amendment providing for an increased membership in the legislature. In 1909, James H. Brady was elected governor for the term ending 1911; and in 1911 he was succeeded by James H. Hawley.

1913.—Legislation.—The seventeenth amendment was ratified providing direct election of senators; the mother's pension act was passed; commission government was provided for in cities over 15,000; the blue sky law was passed, and an act granting the eight-hour day.

1913-1916.—Governors.—Legislation.—In 1913, John M. Haines was elected governor for the term ending 1915. In 1915, Moses Alexander was elected governor. An attempt was made to pass an alien land law similar to that of California, and a prohibition act was passed. In 1916, the United States Supreme Court rendered a decision which denied the right of an individual to possess liquor when the state forbids it.

1917-1921.—New departments created.—Legislation.—Part played in the World War.—Administrative consolidation.—Effort to create a new state of Lincoln.—Elections.—In 1917, a Department of Reclamation was created to insure greater control of the water supply, the department to include commissioners of reclamation, and a director of water resources; water legislation was codified; and the definition of powers made clearer. (See also CONSERVATION OF NATURAL RESOURCES: United States: 1918.) Another enactment was the Workingmen's Compensation. In 1918, the Teachers' Retirement Fund was established. During the World War the state furnished 19,016 men, or .51 per cent of the Expeditionary Forces. In 1919, the federal prohibition amendment was ratified; D. W. Davis elected governor; and a Department of Law Enforcement was created. The object of the department is to enforce all the penal and regulatory laws of the state in the same manner and with like authority as the sheriff of the county. Such a department is somewhat in line with a state police and argues the need of a constabulary similar to that of Pennsylvania and New York. A law was enacted centralizing all the activities of the state into nine departments; the heads of these departments appointed by the governor and subject to his removal. This is considered one of the most far reaching acts in the line of administrative readjustment yet passed by any of the states. "Under this new system state government becomes a great business, and good men can be drafted to become general managers or heads of departments because their intellect and energy can be developed and results shown. The system's success largely hinges on the department heads. . . . Their salaries are small and will be until the public recognizes the value of the men. . . . Under this system there is no stated time for a term of office, and when the public realizes what it means, the good men will stay. . . . Most of these men are experts in their line and therefore dependable, so that office-holding is a higher occupation in Idaho than ever before."—D. W. Davis, *How administrative consolidation is working in Idaho* (*National Municipal Review*, Nov., 1919).—In 1921 an effort was made to secure legislation on a resolution to divide the state; its main object was the creation of a new state, "Lincoln," out of northern Idaho, eastern Washington, and possibly western Montana.

IDES, name for the 13th or 15th day of the month in Roman chronology. See CHRONOLOGY: Julian era.

IDLE, Battle of the (617), fought between the East English, or East Angles, and the Northumbrians. The former were victorious.

**IDOLATRY AND IMAGE WORSHIP.**—Origin and development.—Idolatry, the worship of images or other objects believed to be superhuman in themselves or inhabited by superhuman spirits, apparently marks a definite step in the development of primitive religions. Not until the deities have become possessed of distinct and individual personalities does the custom of idol-making appear, though it does not necessarily follow immediately. To make a protecting spirit more concrete or perhaps to placate one he fears, man forms an image of the god as he pictures him. At first the object, whatever it may be, merely symbolizes an idea,—harvest, victory, disease, or other forms of good or evil,—but gradually it comes, in the mind of the worshiper, to assume divinity and divine powers in itself. Idolatry marks an upward step in religious development, and is not found among the most primitive peoples. It has been a vital part of the religions of some of the highest civilizations—Egypt, Greece, and the Orient. At the same time it is conspicuously absent from Judaism, Christianity, and Mohammedanism, and has been allowed to gain an entrance, at certain periods, only through the influence of heathen religions and against the direct teachings of prophets and founders. Thus it might be said that, while idolatry marks a rise from a primitive stage, still higher development involves its decline.—See also RELIGION: Universal elements.

**Influence on Judaism.**—"The old Testament is full of testimony to the fact that the people of Yahweh, even while recognizing itself as such a people, was at times open to the allurements offered either by the indulgence or the ritualistic abstinence fostered by the native cults about it. . . . The earlier material in the Book of Judges proves that in ancient times the people indulged in practises which were not merely debased forms of Yahweh worship, but were lapses into practise of Canaanitic cults. . . . Political development opened a new way for the infiltration of worship of other deities. . . . The large harem of Solomon . . . [with its women worshiping many different gods] was only one of the causes of the erection of sanctuaries to other gods. More significant is the domestication in Israel of the Phenician Ash-toreth, the Moabitic Chemosh, and the Ammonitic Moloch, under whose protection the capital was placed. . . . In the eighth century, through the development which brought Mesopotamian powers into the West, a new stream of foreign religious customs began to cut its channel into Israel. New deities . . . were borne on this stream and the worship of the stars was included. . . . The worship of the sun and of the signs of the zodiac came into prominence, as well as that of the 'Queen of Heaven.' Tammuz, the Babylonian Adonis, and Philistine and Egyptian deities found entrance. While the reformation of Josiah removed the emblems of these cults, the cult itself was not destroyed but continued, not merely in Samaria but in Jerusalem itself, until the exile, in syncretistic union with the cult of Yahweh. The persistent strength of the religion of Yahweh in the midst of these assaults was manifested in the opposition of prophecy, contending for

the unity of that deity. . . . While externally the Babylonian exile drew a boundary line between the idolatrous tendencies of the earlier people and the post-exilic iconoclastic type, there are many signs among the exiles of relapse into the old idolatry and of lapses into newer forms. . . . The Maccabean epoch revealed a last mighty flaring up of the idolatrous inclination as the prelude to a period of martyrdom and victory for Israelitic faith. Greek religion found ready entrance and firm standing-ground among the Jews. . . . Not only was there sent a contribution to the great official feast of the Melkart-Heracles of Tyre, but in Jerusalem a sanctuary was consecrated to Olympian Zeus and . . . there arose in the city before the gates altars to Greek deities. . . . This time it was not the living word of prophecy which armed the opposition to these doings, but for the first time the written word."—P. Kleinert, *Idolatry* (*New Schaff-Herzog encyclopedia of religious knowledge*, v. 5, pp. 443-444).

**Image worship in Christianity.**—"The primitive Christian Church was utterly averse to anything like image-worship. Its early connection with image-hating Judaism and its bitter contest with an image-loving paganism made its attitude clear and unequivocal, and its manifold use of such symbols as the cross, the lamb, the fish, the dove, etc., involved nothing contradictory. There was, however, an inherent tendency toward image-worship in the Gnosticism of the 2d and 3d centuries, and images challenging the worship of the faithful sprang up everywhere. Edessa pretended to possess an authentic portrait of Christ; similar pictures of the Virgin were found in many places; the sufferings of the martyrs were painted, and the paintings looked upon with an admiration and awe which had nothing to do with their artistic merits. Although the Synod of Elvira, 306, forbade the introduction of images in the churches, they crept in nevertheless, and when in the 4th and 5th centuries the great uneducated mass of the people was admitted into the Christian community, the images were retained and defended as a means of teaching that kind of people who needed teaching the most and could not read. In the 6th century the worship was fully developed. It became common use to kneel down or prostrate one's self before the images, to kiss them, to light tapers and burn incense in front of them, to deck them out with costly clothings and ornaments of jewelry—nay, it even became customary to make pilgrimages to certain famous images which were considered to be peculiarly efficacious. Thus, between Judaism on one side and Mohammedanism on the other, image-worship gradually assumed the aspect of being a characteristic and essential element of Christianity, and the charge of idolatry was raised from both sides."—*Concise dictionary of religious knowledge*, p. 398.

**8th-9th centuries.**—Contest in the Eastern Church.—"In the Eastern Church this occasioned a long and bloody contest. The Byzantine emperor and the army were iconoclasts; the Byzantine empress and the monks were iconodoulists. . . . Under Irene a synod of Nicæa, 787, condemned the iconoclasts, and decreed what kind of honor and veneration was due to the images of Christ, the Virgin, the angels, the martyrs, etc.; and under Theodora a synod of Constantinople, 842, made image-worship an orthodox dogma of the Eastern Church."—*Ibid.*

—See also ICONOCLASTIC CONTROVERSY.

**Practice and theory in Roman church.**—"In the Western Church the policy of the popes with respect to this question was very curious and

very characteristic. . . Adrian I. accepted the decrees of the Synod of Nicæa, which legitimized not only the use, but also the worship of images. The Frankish Church, however, was strongly opposed to the introduction of images, and the decrees of the synod and the decision of the pope were first refuted in the *Libri Carolini*, and then formally condemned by the Synod of Paris, 825, the popes succeeded in making image-worship first a general practice in the Western Church and then, by the Council of Trent, also a recognized principle. In a carefully worded chapter (Sess. xxv., cf. Schaff, *Creeds*, p. 201 sq.), the present doctrine of the Roman Catholic Church upon the point is thus clearly stated: 'The images of Christ, of the Virgin Mother of God, and of the other saints, are to be had and retained particularly in temples, and that due honor and veneration are to be given them; not that any divinity or virtue is believed to be in them, on account of which they are worshipped; or that anything is to be asked of them; or that trust is to be reposed in images, as was of old done by the Gentiles, who placed their hope in idols; but because the honor which is shown them is referred to the prototypes which those images represent; in such wise that by the images we kiss, and before which we uncover the head and prostrate ourselves, we adore Christ and we venerate the saints whose similitude they bear.'—*Ibid.*, pp. 398-399.

**ILKHANS**, Mongol rulers of western Asia. See PERSIA: 1258-1393.

**ILLINOIA**, Proposed state of. See NORTHWEST TERRITORY OF UNITED STATES: 1784.

**ILLINOIS: Geographic description**.—Illinois, popularly known as the "Prairie State," is a north central state of the United States. It is bounded on the north by Wisconsin; on the east, by Lake Michigan and Indiana; on the southeast and south, by the Ohio river which separates it from Kentucky; and on the southwest and south, by the Mississippi river, which in its turn separates it from Missouri and Iowa. The organization of the Illinois territory into a state, by the Enabling Act of Congress, 1818, extended its jurisdiction to the middle of Lake Michigan and the Mississippi river, thereby giving the state a total area of 56,665 square miles, including 622 square miles of water. The estimated population, 1920, was 6,485,280.

**Resources**.—Illinois, near the center of the humid region of the United States, has a climate highly favorable for agricultural pursuits. In 1910, there were 237,181 farms with an area of 31,977,513 acres, of which 27,294,517 acres were improved lands. The chief crops are hay, potatoes, tobacco and the cereals: maize, wheat, oats, barley, rye, and buckwheat. According to the 1921 estimate, the live-stock industry had a total of 9,216,000 head of which 1,324,000 were horses; 146,000 mules; 1,028,000 cows, 1,244,000 other cattle, 889,000 sheep, and 4,585,000 swine. In the United States, Illinois ranks third for mineral output. The chief mineral product is bituminous coal, the productive field having an area of 42,900 square miles. The 1920 output was 80,401,786 long tons. The state also yields petroleum, natural gas, zinc, limestone, Portland cement, and clay products.—See also U.S.A.: Economic map.

**Aboriginal inhabitants**. See ILLINOIS AND MIAMIS; IROQUOIS CONFEDERACY: Their conquests.

**1673**.—Traversed by Marquette and Joliet. See CANADA: 1634-1673.

**1679-1682**.—La Salle's fort and colony. See CANADA: 1669-1687.

**1679-1735**.—French occupation. See CANADA: 1700-1735.

**1700-1750**.—"Illinois country" under the French.—"For many years the term 'Illinois country' embraced all the region east of the Upper Mississippi as far as Lake Michigan, and from the Wisconsin on the north to the Ohio on the south. The extent of the Illinois country under the French varied but little from the extent of the present State of Illinois. At a later date, its limits on the east were restricted by the 'Wabash country,' which was erected into a separate government, under the commandant of 'Post St. Vincent,' on the Wabash River. . . The early French on the Illinois were remarkable for their talent of ingratiating themselves with the warlike tribes around them, and for their easy amalgamation in manners and customs, and blood. . . Their settlements were usually in the form of small, compact, patriarchal villages, like one great family assembled around their old men and patriarchs."—J. W. Monette, *History of the discovery and settlement of the valley of the Mississippi*, v. 1, pp. 181-183.—See also LOUISIANA: 1719-1750.

1751.—Settlements and population.—“Up to this time, the ‘Illinois country,’ east of the Upper Mississippi, contained six distinct settlements, with their respective villages. These were: 1. Cahokia, near the mouth of Cahokia Creek, and nearly five miles below the present site of St. Louis; 2. St. Philip, forty-five miles below the last, and four miles above Fort Chartres, on the east side of the Mississippi; 3. Fort Chartres, on the east bank of the Mississippi, twelve miles above Kaskaskia; 4. Kaskaskia, situated upon the Kaskaskia River, five miles above its mouth, upon a peninsula, and within two miles of the Mississippi River; 5. Prairie du Rocher, near Fort Chartres; 6. St. Geneviève, on the west side of the Mississippi, and about one mile from its bank, upon Gabarre Creek. These are among the oldest towns in what was long known as the Illinois country. Kaskaskia, in its best days, under the French régime, was quite a large town, containing 2,000 or 3,000 inhabitants. But after it passed from the Crown of France, its population for many years did not exceed 1,500 souls. Under the British dominion the population decreased to 460 souls, in 1773.”—J. W. Monette, *History of the discovery and settlement of the Mississippi valley*, v. 1, pp. 167-168.—“The population of the French and Indian villages in the district of the Illinois, at the period of which we write, is largely a matter of conjecture and computation. Father Louis Vivier, a Jesuit missionary, in a letter dated June 8, 1750, and written from the vicinity of Fort Chartres, says: ‘We have here whites, negroes, and Indians, to say nothing of the cross-breeds. There are five French villages, and three villages of the natives within a space of twenty-five leagues, situate between the Mississippi and another river called (Kaskaskia). In the French villages are, perhaps, eleven hundred whites, three hundred blacks, and sixty red slaves or savages. The three Illinois towns do not contain more than eight hundred souls, all told.’ This estimate does not include the scattered French settlers or traders north of Peoria, nor on the Wabash. It is stated that the Illinois nation, then dwelling for the most part along the river of that name, occupied eleven different villages, with four or five fires at each village, and each fire warming a dozen families, except at the principal village, where there were three hundred lodges. These data would give us something near eight thousand as the total number of the Illinois of all tribes.”—J. Wallace, *History of Illinois and Louisiana under the French rule*, ch. 16.

1763.—Cession to Great Britain. See SEVEN YEARS’ WAR: Treaties.

1763.—King’s proclamation excluding settlers. See NORTHWEST TERRITORY OF UNITED STATES: 1763.

1763-1783.—English control.—Taken from British by George Rogers Clark.—“The proclamation of 1763 failed to extend English law to the west, nor did the crown ever take such action. We may therefore lay down the general principle that although with the change of sovereignty the public law of England was substituted for that of France, the private law of the province remained unchanged. The British government then was obliged to govern its new subjects in this region according to the laws and customs hitherto prevailing among them; any other course would manifestly be illegal. The commanding general of the army in America and his subordinates, who were embarrassed by the presence of this French settlement for which no provision had been made by the ministry, and

who found it necessary to assume the obligation of enforcing some sort of order in that country, had no power to displace any of the laws and customs of the French inhabitants. . . . It is apparent from the foregoing considerations that the government of the Illinois people was *de facto* in its nature. It had no legal foundations. Every act of the military department was based on expediency. Although in general this course was accepted by the home authorities, all officials concerned were aware that such a status could not continue indefinitely. Nevertheless it did continue for about a decade, during which time the inhabitants were at the mercy of some six or seven different military commandants. In 1774, however, Parliament passed the Quebec act, which provided, among other things, for the union of all the western country north of the Ohio River, which but for the cataclysm of the American Revolution would have secured civil government for the whole region. [See CANADA: 1763-1774.] . . . In 1774 came the opportunity to make a final disposition of the Illinois French. During the period under consideration events had so shaped themselves in the neighboring colony of Canada that the ministry was under the necessity of reorganizing the government of that province. The proclamation of 1768 had extended English law to Canada with the result that the French inhabitants were subjected to many hardships. Their grievances were now to be taken into consideration by the government, and as the solution of the western and Canadian problems seemed to be closely connected, the two questions were taken up at the same time. General Gage was summoned home in 1773, and was directed to bring with him every paper relating to the West which might tend to ‘explain as well the causes as the effects’ of the abuses and disorders in Illinois. As a result of his recommendations and of the investigations of the ministry the Quebec Act of 1774 was enacted, according to the provisions of which the entire Northwest was included within the limits of the province of Quebec. In the instructions issued to the governor of Canada in January, 1775, we find provisions for the government of Illinois. It was to be governed from Quebec, and a lieutenant-governor or superintendent was to reside at Kaskaskia, at which place also a lower court of King’s Bench was to be established to cooperate with the superior courts of the province in general. These arrangements were not put into execution, however, because of the outbreak of the American Revolution, which absorbed the whole attention of both the home government and Canada. As early as January, 1774, the detachment of troops had been ordered to leave Fort Gage, and the allowance to commanding officer discontinued. From this time on little or no attention was paid to western affairs. Illinois was left in the hands of a Frenchman named Rocheblave, who acted as agent for the government from 1776 to 1778. His best efforts to save the country to Great Britain were, however, in vain. As the government had ignored his call for troops, an American army under George Rogers Clark easily effected the conquest of Illinois, and the whole Northwest in 1778.—C. E. Carter, *Great Britain and the Illinois country*, pp. 25, 161-163.—See also U.S.A.: 1778-1779: Clark’s conquest.

1765.—Possession taken by the English.—“The French officers had, since the peace, been ready loyally to surrender the country to the English. But the Illinois, the Missouri, and the Osage tribes

would not consent. At a council held in the spring of 1765, at Fort Chartres, the chief of the Kaskaskias, turning to the English officers, said: 'Go hence, and tell your chief that the Illinois and all our brethren will make war on you if you come upon our lands.' . . . But when Fraser, who arrived from Pittsburg, brought proofs that their elder brothers, the Senecas, the Delawares and the Shawnees, had made peace with the English, the Kaskaskias said: 'We follow as they shall lead.' 'I waged this war,' said Pontiac, 'because, for two years together, the Delawares and Shawnees begged me to take up arms against the English. So I became their ally, and was of their mind'; and, plighting his word for peace, he kept it with integrity. A just curiosity may ask how many persons of foreign lineage had gathered in the valley of the Illinois since its discovery by the missionaries. Fraser was told that there were of white men, able to bear arms, 700; of white women, 500; of their children, 850; of negroes of both sexes, 900. The banks of the Wabash, we learn from another source, were occupied by about 110 French families, most of which were at Vincennes. Fraser sought to overawe the French traders with the menace of an English army that was to come among them; but they pointed to the Mississippi, beyond which they would be safe from English jurisdiction [France having ceded to Spain her territory on the western side of the river]. . . . With Croghan, an Indian agent, who followed from Fort Pitt, the Illinois nations agreed that the English should take possession of all the posts which the French formerly held; and Captain Stirling, with 100 men of the 42d regiment, was detached down the Ohio, to relieve the French garrison. At Fort Chartres, St. Ange, who had served for fifty years in the wilderness, gave them a friendly reception; and on the morning of the 10th of October he surrendered to them the left bank of the Mississippi. Some of the French crossed the river, so that at St. Genevieve there were at least five-and-twenty families, while St. Louis, whose origin dates from the 15th of February 1764, and whose skillfully chosen site attracted the admiration of the British commander, already counted about twice that number, and ranked as the leading settlement on the western side of the Mississippi. In the English portion of the distant territory, the government then instituted was the absolute rule of the British army, with a local judge to decide all disputes among the inhabitants according to the customs of the country, yet subject to an appeal to the military chief."—G. Bancroft, *History of the United States*, v. 3, pp. 151-152.

1765-1774.—Early years of English rule.—"Just before and during the first years of the English domination, there was a large exodus of the French inhabitants from Illinois. Such, in fact, was their dislike of British rule that fully one-third of the population, embracing the wealthier and more influential families, removed with their slaves and other personal effects, beyond the Mississippi, or down that river to Natchez and New Orleans. Some of them settled at Ste. Genevieve, while others, after the example set by St. Ange, took up their abode in the village of St. Louis, which had now become a depot for the fur company of Louisiana. . . . At the close of the year 1765, the whole number of inhabitants of foreign birth or lineage, in Illinois, excluding the negro slaves, and including those living at Post Vincent on the Wabash, did not much exceed two thousand persons; and, during the entire period of British possession, the influx of

alien population hardly more than kept pace with the outflow. Scarcely any Englishmen, other than the officers and troops composing the small garrisons, a few enterprising traders and some favored land speculators, were then to be seen in Illinois, and no Americans came hither, for the purpose of settlement, until after the conquest of the country by Colonel Clark. All the settlements still remained essentially French, with whom there was no taste for innovation or change. But the blunt and sturdy Anglo-American had at last gained a firm foot-hold on the banks of the great Father of Rivers, and a new type of civilization, instinct with energy, enterprise and progress, was about to be introduced into the broad and fertile Valley of the Mississippi. . . . Captain Thomas Stirling began the military government of the country on October 10, 1765, with fair and liberal concessions, calculated to secure the good-will and loyalty of the French-Canadians, and to stay their further exodus; but his administration was not of long duration. On the 4th of the ensuing December, he was succeeded by Major Robert Farmer, who had arrived from Mobile with a detachment of the 34th British infantry. In the following year, after exercising an arbitrary authority over these isolated and feeble settlements, Major Farmer was displaced by Colonel Edward Cole, who had commanded a regiment under Wolfe, at Quebec. Colonel Cole remained in command at Fort Chartres about eighteen months; but the position was not congenial to him. . . . He was accordingly relieved at his own request, early in the year 1768. His successor was Colonel John Reed, who proved a bad exchange for the poor colonists. He soon became so notorious for his military oppressions of the people that he was removed and gave place to Lieutenant-Colonel John Wilkins, of the 18th, or royal regiment of Ireland, who had formerly commanded at Fort Niagara. Colonel Wilkins arrived from Philadelphia and assumed the command September 5, 1768. He brought out with him seven companies of his regiment for garrison duty. . . . One of the most noticeable features of Colonel Wilkins' administration was the liberality with which he parceled out large tracts of the domain over which he ruled to his favorites in Illinois, Philadelphia, and elsewhere, without other consideration than requiring them to re-convey to him a certain interest in the same. Lieutenant-Colonel Wilkins' government of the Illinois country eventually became unpopular, and specific charges were preferred against him, including a misappropriation of the public funds. He asked for an official investigation, claiming that he was able to justify his public conduct. But he was deposed from office in September, 1771, and sailed for Europe in July of the following year. Captain Hugh Lord, of the 18th regiment, became Wilkins' successor at Fort Chartres and continued in command until the year 1775. . . . On the 2d of June, 1774, Parliament passed an act enlarging and extending the province of Quebec to the Mississippi River so as to include the territory of the Northwest. . . . Who was the immediate successor of Captain Lord in command of the Illinois, is not positively determined."—J. Wallace, *History of Illinois and Louisiana under the French rule*, ch. 20.

1784.—Included in the proposed states of Assenisipia, Illinois, and Polypotamia. See NORTHWEST TERRITORY OF UNITED STATES: 1784.

1785-1786.—Partially covered by the western land claims of Massachusetts and Connecticut, ceded to the United States. See U. S. A.: 1781-1786.

1795.—Control gained by the United States of territory around site of Chicago. See CHICAGO: 1673-1804.

1809.—Detached from Indiana and organized as distinct territory. See INDIANA: 1800-1818.

1809-1839.—Territorial appointees.—First and second sessions of the territorial legislature.—Legislation.—Changing capitals.—“February 3, 1809, Congress passed an act dividing the Indiana Territory into two separate governments, and establishing the Territory of Illinois. President Madison appointed John Boyle, an Associate Justice of the Court of Appeals of Kentucky, Governor of the Territory, but he declined, and Ninian Edwards, Chief Justice of the same Court, was appointed in his stead. Nathaniel Pope was appointed secretary; Alexander Stuart, Obadiab Jones and Jesse B. Thomas, Judges; Benjamin H. Boyle, Attorney-General. This composed the Territorial Government. Under the Ordinance of 1787, and the act of Congress February 3, 1809, the Governor and Judges constituted the law-making power of the Territory, and as such they met for the first time at Kaskaskia, June 13, 1809, and their first act was to resolve that the laws of Indiana Territory, in force prior to March 1, 1809, which applied to the government of the Territory, should remain in full force and effect. The duration of the session was seven days, in which thirteen acts were passed. The second session of the Council was held in 1810, at which fourteen acts were passed, and the third and last session was held in 1811, at which five acts were passed. Among the laws enacted were some from the Georgia, Kentucky, Pennsylvania and South Carolina statutes. In May, 1812, Congress passed an act authorizing the formation of five Legislative districts in the Territory which were to be apportioned by the Governor, and from each of which was to be elected a member of the Legislative Council, who should hold the office four years; the number of Representatives to be elected was not to be less than seven nor more than twelve, until the number of ‘free male, white inhabitants’ should equal six thousand, and after that time the number was to be governed by the Ordinance of 1787. The office of Representative was for two years. Governor Edwards called the first election for Councilmen and Representatives for October 8, 9 and 10, 1812. . . . Illinois has had three capitals—Kaskaskia, Vandalia and Springfield. When Kaskaskia became the seat of government it was also the county seat of Randolph county. There were then but two counties in the Territory, Randolph and St. Clair. The first session of the Territorial Legislature was convened November 25, 1812—and the first Legislature of the State, October 5, 1818. In 1820, the seat of government was removed to Vandalia; there were then nineteen counties. The first session of the Legislature convened there December 4, 1820. The Capital was removed to Springfield in 1839, at which time there were seventy-two counties. The first session of the Legislature convened there December 9, 1839.”—D. W. Lusk, *Eighty years of Illinois, politics and politicians, anecdotes and incidents*, pp. 2-3, 13 of the appendix.

1818-1830.—First government of Illinois as a state.—Council of revision.—In 1818, Illinois was admitted into the Union. (See INDIANA: 1800-1818; WISCONSIN: 1805-1848.) “The constitution

of 1818 and the laws under which the people of the state lived for the first ten years of its existence afford an interesting elaboration and commentary on certain phases of the general life of the people already described. Such material, of course, has to be used cautiously; the passage of a law by no means implies that the condition toward which it is apparently directed prevailed to any considerable extent. Without some such study, however, the picture of early Illinois would be incomplete. . . . The government of Illinois in its constitution and in its tendency for the first fifteen or twenty years after 1818 was a government by the legislature. The observer is impressed not only by the extent of the power exerted by the general assembly in comparison with that exercised by the judiciary and the executive, but by its assumption of the choice of local officers which are now by almost universal practice chosen by individual communities. The legislature by the terms of the constitution was to meet biennially; there were to be between one-third and one-half as many senators as representatives. In practice the first and second general assemblies consisted of fourteen senators and twenty-nine representatives; there was a slight increase thereafter until 1831. The representatives were elected annually for each assembly and the senators for terms of four years, half of the senate retiring every two years. In addition to its powers of legislation the assembly enjoyed the usual powers in impeachment, counted the votes in gubernatorial elections, elected members of the supreme court, appointed the auditor, attorney-general, state treasurer, state printer, and other necessary state officers. By a two-thirds vote it could submit to the voters the question of calling a convention to amend the constitution. The senate could pass on the governor's nominee for secretary of state and had a similar voice in the selection of other officers created by the constitution without a specific provision for their election. On the legislative department the constitution grafted a very curious body, almost indeed a third house—the council of revision. The origin of this institution was generally traced to a similar one in New York, and when it became unpopular Elias Kent Kane was usually charged by his enemies with responsibility for it. The council was composed of the governor and the justices of the supreme court; its duty was to examine all laws passed by the house and senate and to return such as it disapproved, which last could be passed over its veto by a majority of the members in each house. In practice the institution prevented some useless legislation by calling to the attention of the legislature technical defects in laws passed; but the council's vetoes of laws on grounds of public policy or of unconstitutionality were apt to be futile or merely irritating, because legislators in early Illinois were rarely absent during the session and the majority of members elected in each house required to pass a bill over the veto of the council was usually only one or two greater than the vote by which it originally passed. Furthermore, the supreme court in deciding cases involving the constitutionality of state laws was continually embarrassed by the fact that the justices in the council of revision had already passed on them. This function of the justices undoubtedly heightened the political character, already too apparent, of the early Illinois judiciary.”—T. C. Pease, *Frontier state*, pp. 33-34.

1818-1861.—Governors.—The governors of the state and their terms of office covering this period

were as follows: Shadrach Bond, 1818-1822; Edward Coles, 1822-1826; Ninian Edwards, 1826-1830; John Reynolds, 1830-1834; Joseph Duncan, 1834-1838; Thomas Carlin, 1838-1842; Thomas Ford, 1842-1846; Augustus C. French, 1846-1853; Joel A. Matteson, 1853-1857; William H. Bissell, 1857-1860; and John Wood, 1860-1861.

**1831-1837.—Slavery controversy.—Gag rule passed.**—"The slavery question in Illinois remained in a state of quiescence for at least a decade after the decision of the convention struggle. The black laws remained and even increased in severity; the shameful kidnapping of free blacks out of the state went on in defiance of legislation, aided in some sections by a proslavery public opinion which was prone to sooth itself with the excuse of the kidnappers: that they recovered runaway slaves for their masters and therefore were merely vindicators of a just property right. On the other hand the underground railroad had its obscure beginnings as the escaping Negroes found sympathy and assistance at an increasing number of doors; there were always communities in the state where the slave was safe from his hunters. Little interest in the antislavery movement was publicly evidenced. In 1831 a Presbyterian layman of Bond county—that source of much propaganda in early Illinois—William M. Stewart by name, put forth a vigorous protest against the toleration of slavery by the churches. On January 9, 1831, an antislavery meeting at Shoal Creek, Bond county, made a vigorous protest against buying, selling, or holding slaves, declaring that the participation of its members in these things was a disgrace to the Presbyterian church. Along with the protest came the establishment of a local colonization society. During the next year or two the colonization movement attracted more notice, especially as it came to be contrasted favorably with abolition. The increased activity of the abolitionists and the gag rules began to bring the subject of slavery under wider discussion. The *Sangamon Journal*, *Alton Spectator*, and *Chicago American* were all strongly anti-abolition in their utterances. The *Alton Telegraph*, on the other hand, denounced the gag and interference with the right of petition in round terms. It is rather hard to define the attitude of the Illinois representatives in the national house of representatives on the subject. They voted for the gag resolutions designed to cut off abolition petitions in 1836; but on motions and petitions involved in Adams' diplomatic fencing with his adversaries, the delegation, Zadoc Casey particularly, occasionally voted with him. In Illinois the general assembly in the session of 1837 passed the resolutions unanimously; but in the house, Abraham Lincoln, Andrew McCormick, Gideon Minor, John H. Morphy, Parven Paulin, and Dan Stone cast their votes in the negative. Before the end of the session, Abraham Lincoln and Dan Stone recorded on the Journals of the house their formal protest against the resolutions. Declaring their belief that abolition agitation tended to increase rather than diminish the evils of slavery, they pronounced the peculiar institution founded on injustice and bad policy; and they based their dissent to the abolition of slavery in the District of Columbia, not on the lack of power on the part of congress to do away with slavery there, but on the fact that congress should act only on the petition of the people of the district. In view of the increasing rage against abolitionism rising in the state and even more in the country at large, the men who signed this document took

their political future in their hands."—T. C. Pease, *Frontier state*, pp. 363-364.

**1832.—Black Hawk War.**—"In 1830 a treaty was made with the tribes of Sacs and Foxes, by which their lands in Illinois were ceded to the United States. They were nevertheless unwilling to leave their country. . . . Black Hawk, a chief of the Sacs, then about 60 years of age, refused submission, and the next year returned with a small force. He was driven back by the troops at Rock Island, but in March, 1832, he reappeared, at the head of about 1,000 warriors,—Sacs, Foxes, and Winnebagos,—and penetrated into the Rock River valley declaring that he came only to plant corn. But either he would not or could not restrain his followers, and the devastation of Indian warfare soon spread among the frontier settlements. . . . The force at Rock Island was sent out to stay these ravages, and Generals Scott and Atkinson ordered from Buffalo with a reinforcement, which on the way was greatly diminished by cholera and desertions. The Governor of Illinois called for volunteers, and an effective force of about 2,400 men was soon marched against the enemy. Black Hawk's band fled before it. General Whiteside, who was in command, burned the Prophet's Town, on Rock River, and pursued the Indians up that stream. . . . The Indians were overtaken and badly defeated on Wisconsin River; and the survivors, still retreating northward, were again overtaken near Bad Axe River, on the left bank of the Mississippi. . . . Many of the Indians were shot in the water while trying to swim the stream; others were killed on a little island where they sought refuge. Only about 50 prisoners were taken, and most of these were squaws and children. The dispersion was complete, and the war was soon closed by the surrender or capture of Black Hawk, Keokuk, and other chiefs."—W. C. Bryant and S. H. Gay, *Popular history of the United States*, v. 4, ch. 12.

**1840-1846.—Settlement and expulsion of Mormons.** See MORMONISM: 1830-1846; 1846-1848.

**1848.—Construction of Illinois and Michigan canal.** See CANALS: American canals: Illinois and Michigan.

**1858.—Senatorial election contest of Lincoln and Douglas.** See U. S. A.: 1858.

**1861-1865.—Participation in Civil War.**—"In the war for the preservation of the Union Illinois was one of the first to respond to the call for men. This again was but natural. It was the home of Lincoln. The people knew the issues. They loved Lincoln and believed in his cause. They responded to his call with every man that could shoulder a gun. Before the struggle was over Illinois gave 259,092 men to the cause of the Union. At that time our population was only 1,712,920. This response was only exceeded by three States, which were much older. New York, with a population of 3,880,595, furnished 448,850 men; Pennsylvania with a population of 2,906,208, furnished 337,936 men; and Ohio, with a population of 2,339,481, furnished 313,180 men. Illinois furnished more men in excess of her quota than did any other Northern State. She furnished 14,596 more men than her quota, while New York furnished 58,298 less than her quota, and Pennsylvania furnished 47,433 less than her quota, and Ohio but 6,858 more than her quota. The records show that during the Civil War there were less men paid commutation for military service from

Illinois than from any other State except Kansas, which of course furnished comparatively few soldiers. During the entire period of the war there were but 55 from Illinois that paid commutation. There were 28,171 from Pennsylvania, 13,197 from New York, 6,479 from Ohio, 5,318 from Massachusetts, and 2,007 from Maine that did so."—Speech of E. E. Denison, *Congressional Record*, July 26, 1916.

ALSO IN: A. C. Cole, *Centennial history of Illinois*, v. 3.

1861-1870.—Constitutional convention.—Defeat of constitution.—Provisions concerning negroes.—"Among the more important acts of the Twenty-second General Assembly was the passage of a law providing for a constitutional convention to frame a new constitution. The election for delegates took place in November, 1861. The convention was composed of seventy-five members, forty-five of whom were Democrats, twenty-one Republicans, seven Fusionists, and two doubtful. . . . The convention assembled on the 7th of January, 1862. . . . This body assumed, in a very large degree, both the powers of the Legislature and convention, and among other extraordinary acts, passed an ordinance appropriating \$500,000 for the benefit of the sick and wounded soldiers of Illinois. Bonds were to be issued on which to raise the money, to bear ten per cent. interest, but Gov. Yates gave no heed to this act, or any other of a like nature, believing, as he did, that the duty of the convention was confined simply to the framing of a new constitution. The constitution framed provided for biennial State elections for all State officers, and legislated out of office the Governor and other State officers, and fixed the time for electing a new State Government for November, 1862. The constitution was submitted to a vote of the people the following June. There were two articles submitted separately; one concerning banks and currency, and the other relating to negroes and mulattoes. The latter we reproduce: 'Article 18. Sec. 1. No negro or mulatto shall migrate to or settle in this State, after the adoption of this Constitution. Sec. 2. No negro or mulatto shall have the right of suffrage or hold office in this State. Sec. 3. The General Assembly shall pass all laws necessary to carry into effect the provisions of this article.' The vote for the constitution was 126,730; against, 151,254. Majority against the constitution, 24,515. . . . It was contended by some of the leading Democratic lawyers that the article relating to negroes and mulattoes became a part of the constitution of 1848, but the question had not been passed upon by the courts when the constitution of 1870 was adopted."—D. W. Lusk, *Eighty years of Illinois, politics and politicians, anecdotes and incidents*, pp. 142-144.

1861-1901.—Governors.—The governors of Illinois and their terms of office for this period were as follows: Richard Yates, 1861-1865; Richard J. Oglesby, 1865-1869; John M. Palmer, 1869-1873; Richard J. Oglesby, 1873; John L. Beveridge, 1873-1877; Shelby M. Cullom, 1877-1883; John M. Hamilton, 1883-1885; Richard J. Oglesby, 1885-1889; Joseph W. Fifer, 1889-1893; John Peter Altgeld, 1893-1897; and John Riley Tanner, 1897-1901.

1865.—Economic results of Civil War.—Canal transportation.—Growth of factories.—"Modern industry in Illinois is built upon the foundations laid in the tumultuous era of civil strife. The transportation phase was marked by the extension to a point of greater adequacy of rail and water communication. During the war water

transportation again became the great hope of all Illinoisians; they expected to revolutionize transportation facilities by improving the navigation of the Mississippi, Illinois, and Rock rivers and by building a ship canal to the Mississippi. They urged federal aid for the accomplishment of their ends and justified it as necessary to the efficient transportation of supplies and to the triumph of the federal arms. All projects found only local support, however, except as they connected themselves with the proposed ship canal. At first this meant merely the enlarging of the Illinois and Michigan canal so as to end the prevailing low water problems and permit the passage of ships of large draught between the Great Lakes and the Mississippi. The disunion crisis further emphasized the need, in order to reverse the course of trade and direct the products of the upper Mississippi eastward instead of toward the gulf. When war closed the Mississippi below Cairo the need became more definite. In the legislative session of 1861 the general assembly authorized an investigation of the possibility of an enlarged canal; when a favorable report was made appeals were sent to congress for federal aid. The constitutional convention of 1862 unanimously adopted a formal memorial to congress; other memorials were sent in, including one from the Chicago Board of Trade. In February, 1862, Colonel F. P. Blair, Jr., of the committee on military affairs of the house, reported a bill for the enlargement of the canal so that gunboats and other vessels drawing six feet of water might pass from the Mississippi to the lakes. By this time the matter was squarely before congress. Representative Arnold from the Chicago district, a member of the committee on roads and canals, assumed the leadership of the Illinois delegation and made a favorable report to the house. In July, however, the project was killed on a test vote in which the eastern members lined up against the representatives of the west. Governor Yates, not to be thus silenced, then pressed the matter upon the attention of the President; in November he went to Washington for a joint interview in the company of Congressman Arnold. The war department was directed to examine into the practicability of the undertaking; meantime, the canal project was again pressed upon the attention of congress. Eastern selfishness, the canal advocates claimed, was giving force to the movement for the separation of the western from the eastern states and the formation of a northwestern confederacy. Even republican leaders declared that governmental policy was destroying the value of the agricultural products of the west, while manufactured articles from the east doubled and quadrupled in price. This discrimination could be removed by a restoration of the natural exchange of commodities by easy channels of commerce; and the canal was, therefore, a political as well as a military necessity. Governor Yates at the suggestion of western business and farming interests went so far as to send a commission to Canada to arrange for a Canadian route to the seaboard. . . . Industrially, Illinois on the eve of the Civil War showed many frontier survivals; another decade, however, worked out a revolution that brought the state to the threshold of modern industrialism. The extended transportation system was one of the greatest factors in stimulating this progress; the other factors proceeded from the war itself. The war, in bringing high prices for grain and livestock, in bestowing protective duties that far surpassed the rosiest dreams of infant industry, gave a remarkable impetus to

manufacturing industries. Cook county, in 1860, had only 469 manufactories; another decade and this number had more than tripled. In the same period the manufacturing establishments of the state had increased from 4,268 to 12,597 with the value of manufactured products rising from \$57,580,886 to \$205,620,672. The number of operatives employed in the state increased from 5,593 to 82,979. These figures tell the story of a revolution which, after having broken out in England a century before, had irrepressibly swept on and on until it reached the prairies of Illinois. The focusing point of the manufactures as well as of the railroads was Cook county. In 1870, although it contained just one-ninth of the establishments in the state, it listed about one-half of the employees; the industries, therefore, were not only more numerous but were organized on a larger scale. Chicago became a center for the manufacture of iron products, which received special protection under the tariff schedules; in 1860 there were 26 iron works in the city which increased in the decade to over a hundred, including about one quarter of the capital invested in manufacturing. The large output of farm implements and machinery reflected the demand of the agricultural population of the northwest. . . . Wood works to supply the building trades were second in importance followed by combined wood and iron establishments. Brick, stone, metal, and terra cotta works, together with leather plants, and textile factories were important in the industrial development of the city."—A. C. Cole, *Era of the Civil War*, pp. 354-355.

1865-1871.—Legislation for relief of Chicago.—State management of Illinois and Michigan canal.—"On the 8th of October, 1871, a fire broke out in Chicago, which laid that city in ashes and rendered thousands of its citizens helpless and homeless, and the cry for help, immediate help, went forth broadcast throughout the land. [See CHICAGO: 1871.] Two days after, Governor Palmer issued his proclamation convening the Legislature in special session on the 13th of October. . . . The Constitution of 1870 had forbidden all special legislation, and there were grave doubts in the minds of many members as to the power of the Legislature to pass, constitutionally, effective laws for the relief of the city; but the Governor issued a stirring message, and clearly pointed out the way. In 1865, the Legislature had passed an act providing for the completion of the Illinois and Michigan Canal upon the plan adopted by the State in 1836, and entrusted the work to the city of Chicago, under certain conditions, restricting, however, the expenditure to \$2,500,000, which was, ultimately, to be paid, principal and interest, by the State. In this work Chicago had expended the amount limited by the act of 1865, and at this session the General Assembly appropriated a sum sufficient to pay to Chicago the principal and interest, which amounted, in exact figures, to \$2,955,340, on the payment of which the canal was surrendered to the management of the State. This measure brought relief to the stricken city."—D. W. Lusk, *Eighty years of Illinois, politics and politicians, anecdotes and incidents*, pp. 225-226.

1870.—New constitution.—Board of railroad commissioners.—The second constitution of the state had been adopted in 1848. Replacing this, a new constitution was adopted in 1870; this forbade the creation of special corporations by law. At the same time a state board of railway commissioners was created.

1870.—Proportional representation adopted.

See PROPORTIONAL REPRESENTATION: United States. 1870-1871.—Establishment of system of rates for railways.—Unconstitutionality. See RAILROADS: 1870-1876.

1880.—Origin and reason for formation of National Farmers' Alliance. See NATIONAL FARMERS' ALLIANCE; U. S. A.: 1866-1877.

1892-1893.—World's Columbian exposition at Chicago. See CHICAGO: 1892-1893.

1895.—Creation of industrial arbitration board. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1899.—First juvenile court in Chicago. See CHILD WELFARE LEGISLATION: 1899-1921.

1900.—Supreme court decisions concerning distribution and ownership of news. See PRINTING AND THE PRESS: 1865-1917.

1901-1921.—Governors.—The governors of the state and their terms for the period 1901-1922, are as follows: Richard Yates, 1901-1905; Charles S. Deneen, 1905-1913; Edward F. Dunne, 1913-1917; Frank O. Lowden, 1917-1921; and Len Small, since 1921.

1902.—Care of deaf and blind children. See CHARITIES: United States: 1874-1902.

1910.—Mining investigation commission.—"It is the opinion of one, who by his official position and practical achievements is recognized to be among the chief mine experts in this country, that the appointment of the Illinois Mining Investigation Commission and the results of its work may prove to be epoch-making in the progress of the mining industry in America. He bases this opinion upon the fact that this is the first government commission invested with full authority and scope to investigate and promote both the industrial and human interests involved in mining; and further that miners and operators are for the first time officially in joint conference and action regarding their common interests in the industry. Other committees and commissions have been limited in scope to special inquiries and specific legislative revisions. Joint conferences over wages, hours and other items of trade agreements are regularly held. But this commission only approaches the all comprehensive functions of the English royal commissions on mining. The federal and state governments have long maintained and greatly developed agricultural departments and experiment stations, railway, waterway, and commerce commissions, but mining has been left to find its own fortuitous way, unaided either by consistent legislation or by any authoritative basis for co-operation in promoting the community of interests which operators, miners and the public have in working the mines. Yet mining involves the lives and safety of a million and a half underground workers and an annual production valued at two billion dollars [1910]: Coal mining employs 700,000 men and produces 500,000,000 tons of coal a year. In Illinois, the coal miners number 70,000 and produce 50,000,000 tons a year. To keep pace with the demand for fuel, the production of coal increased from one ton per capita in 1880 to six tons per capita in 1908. . . . Illinois has done well to set the type of thorough inquiry into the conditions and prospects of mining."—G. Taylor, *Epoch in American mining (Survey, Jan. 29, 1910)*.

1911-1912.—Senator Lorimer's election declared invalid.—"In 1911 occurred . . . the investigation of the charges that in 1910 Senator Lorimer, of Illinois, secured his seat through bribery. An investigation was conducted by the senate, which decided that, although money had been spent, about \$100,000, the beneficiary had

not spent it, and should keep his seat. The verdict did not satisfy the people, who believed that an election secured by bribery should be vacated, even though the man elected had not furnished the money. The party organization in Illinois, with which Lorimer was closely identified, supported Taft, and this caused the president's opponents to say that he associated with the Illinois bribers. The charges against the senator were renewed and in 1912 his election was declared invalid."—J. S. Bassett, *Short history of the United States*, p. 842.

**1911-1917.—Workmen's Compensation Act.—Some of its provisions.**—"The capstone was placed upon . . . [the] protective arch of labor legislation which had been building during the previous generation by the passage in 1911 of the workmen's compensation act. . . . The passage of the act followed a long agitation and discussion of the subject, in which effective service was rendered by Professor Charles R. Henderson of the University of Chicago and his coworkers. . . . The first workmen's compensation act of 1911 applied only to certain designated employments, but the new law of 1913 as amended in 1917 has enlarged the list and introduced other improvements. Certain extra hazardous employments are enumerated to which the act applies automatically, such as building, excavating, electrical work, transportation, mining, manufacturing of explosives, and similar dangerous businesses. Employers engaged in other industries may elect to come within the provisions of the act. In the case of accidents to employees of all such employers, resulting in death or disability, certain fixed compensations are provided. The administration of the law is intrusted to an industrial board. For the calendar year 1915 the total amount paid as compensation in 16,869 accidents amounted to \$1,292,735. . . . Provision is made for apprenticing children until they arrive at the age of sixteen. Barbers and horseshoers must secure certificates of registration from boards of examiners created for this purpose. Convict labor shall not be employed so as to compete with free labor; but convicts may be employed in manufacture of road material and machinery and under certain circumstances may be employed on the public roads. Eight hours shall constitute a legal day's work, where there is no agreement to the contrary. The wages of a head of a family to the amount of fifteen dollars per week shall be exempt from garnishment; this was an increase from eight dollars. The pay of mechanics and miners shall constitute a first lien upon property for materials or service furnished. Wages shall be paid in bankable currency, in full on pay day, and in the case of corporations for pecuniary profit such pay days shall be at least semimonthly."—E. L. Bogart and J. M. Mathews, *Centennial history of Illinois*, v. 5, pp. 187-189.

**1913.—Woman suffrage.—Public utilities commission.—Unemployment commission.—Ratification of sixteenth and seventeenth amendments.**—"The partial right to vote was granted to women by the legislature; because of the constitutional difficulty of submitting a full suffrage amendment to the people, the women were given only the right to vote for presidential electors and for all state and local officers whose election was now limited to men by the state constitution. A bill establishing a state public utilities commission was passed after a keen contest between "home rule" and state control advocates; Governor Dunne and the Chicago representatives favored provision for a part of the commission to be devoted en-

tirely to Chicago, but this feature was eliminated by the legislature. A state commission was created to study the causes and effects of unemployment. The sixteenth, or income tax, amendment to the Federal constitution was ratified by Illinois on March 1 and the seventeenth, providing for direct election of senators, on February 13.

**1916.—Manufacturers' Association.**—"The Illinois Manufacturers' Association is about 20 years old. It numbers between 2,000 and 3,000 members. It reaches out from the great city by the lake down through the State of Illinois. The requirement for membership in that organization, as I understand it, is that the person seeking membership be a manufacturer, no matter how small, and most of them are small manufacturers, and they pay an annual fee of \$25. The organization exists, as I understand it, for the purpose of promoting the manufacturing industries of the great State of Illinois, for the purpose of looking after credits, better transportation, better and more efficient business methods, and for the purpose of developing and promoting the industries of Illinois. Not long ago representatives of this great organization visited the Republics of South America, promoting there the trade interests of the United States and calling attention to the goods we manufacture in the State of Illinois. Since this organization was perfected and commenced its work Illinois has forged rapidly to the front as a manufacturing State, until to-day [1916] we are the third State in the Union in point of manufactures. Five hundred thousand skilled workmen are employed in the factories of Illinois, more than in any other State except New York and Pennsylvania, and we pay out to the wage earners in those factories in Illinois over \$300,000,000 per year. No State has increased as fast as has Illinois the wages of the men who work in her factories. To-day in 20,000 manufacturing establishments distributed through the great State I have the honor to represent in part here we turn out every year over \$2,000,000,000 worth of manufactured products. Farming lands in Illinois are worth to-day more per acre than in any other State in the Union, and Illinois is our greatest agricultural State."—H. T. Rainey, *Congressional Record*, Apr. 27, 1916.

**1916.—Budget system.**—"Power of legislature in taxation of personal property. See BUDGET: Illinois budget system; STATE GOVERNMENT: 1913-1921.

**1917.—State administration.**—"Illinois surprised itself in the passage, by the practically unanimous vote of both houses of the legislature, of the act consolidating the civil administration of the state government in nine departments. . . . The act abolishes or consolidates no less than 128 boards and commissions and 300 official positions or jobs having salaries aggregating \$400,000, and combines all their functions in the nine departments of finance, agriculture, labor, mines and minerals, public works and buildings, public welfare, public health, trade and commerce, registration and education. At the head of each department there will be a director, assistant director and other officials with functions specialized in accordance with its work. In addition to these paid officials an unpaid advisory and non-executive board is provided for each of six departments. All these appointive positions are to be filled by the appointments of the governor, with the consent of the Senate for a period of four years. The classified civil service is protected by a provision that nothing in the act shall be construed to amend, modify or repeal the state civil service

law and by another requiring that every civil service employee in the classified list at the time this act takes effect shall be assigned to a position having so far as possible duties equivalent to his former office or employment. While those connected with the branches of work that have been consolidated in the several departments will be thus protected, those whose functions have been abolished may be dropped. The extent and outworking of the changes thus introduced are well illustrated in the newly created Department of Public Welfare. It will combine not only the State Board of Administration hitherto controlling all the state charitable institutions and the State Charities Commission, but also the separate boards hitherto managing the several penal and reformatory institutions which have never been under any centralized control or supervision, except the governor's authority over his appointees and their management. The purchasing and contracting function, however, is hereafter to be exercised for all departments by the Department of Public Works and Buildings. The director, at a salary of \$7,000, and an assistant director at \$4,000, an alienist, criminologist, physical supervisor, superintendent of pardons and paroles at \$5,000 each, constitute the staff of the Department of Public Welfare appointed by the governor, who in turn holds the director responsible for the appointments of the wardens, superintendents and other officials not included in the classified civil service. All these executive officers are supplemented by an advisory and non-executive Board of Public Welfare Commissioners composed of five persons. Its functions are to investigate the condition and management of the whole system of charitable, penal and reformatory institutions of the state, including jails and almshouses, not only upon request but at its own initiative; likewise to inquire into the equipment, management and policies of all institutions and organizations, charitable and correctional. It is authorized, at request and on its own initiative, to report and recommend to executive officers of the department, the governor and the General Assembly, and also to collect and publish annually statistics relating to insanity and crime. The Department of Labor combines the prerogatives hitherto exercised by the commissioners of labor, the management of the free employment offices, the inspection of private employment agencies, the state factory inspectors, the Board of Arbitration and Conciliation and the Industrial Board, which has operated the workmen's compensation act. In addition to the director and assistant director of labor, a chief factory inspector, superintendent of free employment offices, chief inspector of private employment agencies and five industrial officers are provided, besides an advisory board of five members for the state free employment offices and a similar board for each local free employment office established by the state. On these boards two members represent labor, two the employing interests and one the general public. The other departments are organized with similar regard to their functions. The department of finance, however, is given very large powers to unify, standardize and direct the bookkeeping, accounting and reporting of the several departments and to prepare a state budget, including exhaustive statements of revenues and expenditures for the two years preceding those covered by the budget. Each department, office and institution is required to file estimates of receipts and expenditures for the ensuing two years, accompanied by a written statement giving facts and explanation of reasons for each item of

expenditure requested. The state budget thus prepared is to be submitted to the governor and recommended by him to the general assembly."—*Illinois' reorganized state service (Survey, Mar. 10, 1917)*.

1918.—Part played in World War.—The total number of men furnished by Illinois during the World War was 251,074, or 6.68 per cent of the entire expeditionary forces. When the government asked the farmers of the country to increase their wheat acreage, fourteen per cent of the total winter-wheat increase came from Illinois.

1918.—Organization of labor party. See LABOR PARTIES: 1918-1921.

1919.—Outline of blue sky law. See BLUE SKY LAWS: Illinois law.

1919-1920.—Amendments ratified.—Waterway from Great Lakes to Gulf.—The state ratified the eighteenth (prohibition) amendment, January 14, 1919, Illinois, which had been the first to ratify the amendment abolishing slavery, was also the first to ratify the woman suffrage amendment, June 10, 1919. Interests in the state for some years had favored a deep water canal. When Chicago completed the drainage canal as far as Lockport, it was with a view to a deep canal to St. Louis, constructed by the government. The law provided that the drainage canal would be enlarged and transferred to the government when the latter improved the Illinois and Desplains rivers. It was estimated that a fourteen foot cut from Lockport, the end of the drainage canal, to the mouth of the Illinois river would cost \$23,500,000.

1920-1921.—Constitutional convention.—Conflict of interests.—Long recess.—"The Illinois constitutional convention, after nearly a year of floundering, has taken a long recess, leaving the people of the state, who expected so much from this body, in doubt as to whether it will ever submit anything that will meet with the approval of the voters. The convention met in January, 1920, and was in session most of the time until July, when it took a recess until November. After reconvening, and remaining in session for a few weeks, another recess was taken until September, 1921. . . . The subjects arousing the most controversy were those of revenue, limitation of Chicago's representation in the legislature, and the initiative and referendum. Many citizens of Illinois confidently expected that the convention would authorize a provision for the classification of property for purposes of taxation. The majority refused, however, to give sanction to this idea, but voted to leave in the constitution the requirement for the taxation of all property according to the rule of uniformity. The draft as approved in committee of the whole does stipulate, however, that there may be an income tax on intangible property as a substitute for other forms of taxation of such property. There is provision also for a graduated, progressive income tax with the proviso that the highest rate shall not be more than four times the lowest rate. At the time the delegates were elected, the *Hearst* newspapers of Chicago were instrumental in securing a popular vote on the question as to whether the proposed new constitution should contain initiative and referendum provisions. The vote on this question was favorable in the state at large, including Chicago. The proposition failed to carry, however, in the part of the state outside of Chicago. When the principle of the initiative and referendum was rejected several members left saying they would not return, and the *Hearst* papers announced that the convention was dead. After bitter debate, the

majority of the committee of the whole voted for drastic limitations upon Chicago's representation in both houses of the state legislature. Thereupon some of the Chicago members withdrew; others resigned committee memberships and announced that they would perform no more work so long as the attitude of the convention should remain what it was upon the question of limiting Chicago's representation. The Chicago members, while contending for the principle of equality of representation in both houses of the legislature, stood willing to accept as a compromise some limitation in one house. While the convention contains some able advocates of the short ballot principle, the majority of the body is opposed to any move in favor of a shorter ballot. The provision concerning counties, as tentatively approved, though awkward in form, holds out hope for substantial progress in county government. After repeating various restrictions of the existing constitution that interfere with intelligent legislative action regarding counties, the proposal stipulates that notwithstanding such provisions the legislature may enact laws uniform as to classes of counties for the organization and government of counties, which shall become effective when approved on local referendum. The convention approved the idea of giving Chicago broad constitutional home rule powers, with the right to frame and adopt its own charter. However, it refused to give home rule charter making powers to other cities of the state. There are provisions intended to authorize the consolidation of the governments of Chicago and Cook county, but it is doubtful whether in their present form they will serve their purpose. There are provisions about zoning and excess condemnation that are held to be fairly satisfactory. One interesting provision approved by the committee of the whole is that intended to give cities additional borrowing powers for the acquisition of local public utilities. The present constitution limits debts to 5 per cent of the assessed valuation of the taxable property. The proposal in question aims to authorize an additional indebtedness for municipal ownership purposes of 15 per cent of the value of the real estate. This additional debt-incurring power is accompanied by the condition, however, that the rates charged by municipally owned utilities shall be high enough to make the property self-sustaining."—*Notes and events (National Municipal Review, Feb., 1921, pp. 104-105)*.—This constitution was rejected by the voters.

ILLINOIS AND MIAMIS.—"Passing the country of the Lenape and the Shawanoes, and descending the Ohio, the traveller would have found its valley chiefly occupied by two nations, the Miamis or Twightwees, on the Wabash and its branches, and the Illinois, who dwelt in the neighborhood of the river to which they have

given their name, while portions of them extended beyond the Mississippi. Though never subjugated, as were the Lenape, both the Miamis and the Illinois were reduced to the last extremity by the repeated attacks of the Five Nations; and the Illinois, in particular, suffered so much by these and other wars, that the population of ten or twelve thousand, ascribed to them by the early French writers, had dwindled, during the first quarter of the eighteenth century, to a few small villages."—F. Parkman, *Conspiracy of Pontiac, ch. 1*.—See also ALGONQUIAN FAMILY; CANADA: 1669-1687.

ILLUMINATI, name of secret society in Germany during the eighteenth century. See ROSICRUCIANS.

ILLYRIA, ILLYRIANS.—Illyria is the region extending from northwestern Greece and the eastern shores of the Adriatic to the Danube. "Northward of the tribes called Epirotic lay those more numerous and widely extended tribes who bore the general name of Illyrians, bounded on the west by the Adriatic, on the east by the mountain-range of Skardus, the northern continuation of Pindus, and thus covering what is now called Middle and Upper Albania, together with the more northerly mountains of Montenegro, Herzegovina, and Bosnia. Their limits to the north and northeast cannot be assigned. . . . Appian and others consider the Liburnians and Istrians as Illyrian, and Herodotus even includes under that name the Eneti or Veneti at the extremity of the Adriatic Gulf. . . . The Illyrians generally were poor, rapacious, fierce and formidable in battle. They shared with the remote Thracian tribes the custom of tattooing their bodies and of offering human sacrifices: moreover, they were always ready to sell their military service for hire, like the modern Albanian Schkipetars, in whom probably their blood yet flows, though with considerable admixture from subsequent immigrations. Of the Illyrian kingdom on the Adriatic coast, with Skodra (Scutari) for its capital city, which became formidable by its reckless piracies in the third century B.C., we hear nothing in the flourishing period of Grecian history."—G. Grote, *History of Greece, v. 3, pt. 2, ch. 25*.—See also ALBANIA: Early history; Name and the people; BALKAN STATES: Races existing.

## IMMIGRATION AND EMIGRATION

Migration.—“Emigration and immigration, as we understand them, are phenomena of modern life. Of course, from the beginning of human history there have been migrations of men. In early times these consisted of movements of whole tribes in a career of conquest and differed radically from emigration which is a movement of individuals. A second sort of migration began with the discovery of America and of the new route to India around the Cape of Good Hope and may be called colonization. The newly discovered countries were utilized at first merely for the purpose of booty and afterwards for the establishment of trading posts or factories. . . . The value of these colonies was almost entirely commercial. The planters received their capital and supplies from the home country and naturally disposed of their products and made their purchases there. . . . The colony was no real outlet for surplus population. A second class of colonies differed radically from these. They were the agricultural colonies or plantations where people came for the purpose of settling and cultivating the soil. These persons expatriated themselves with the intention of making their permanent home in the new country. They did not intend merely to trade with the natives or to superintend servile labor, but to build up a community which should be self-supporting and which should after a while enjoy the same civilization as the mother country. . . . It is not too much to say that the colonial expansion of the seventeenth and the eighteenth century changed the whole aspect of the world. . . . The extension of colonies established the world commerce and

brought the products of the whole earth to the inhabitants of Europe; it magnified the scale of things tenfold. Even when the colonies in America rebelled against England and Spain and established themselves as independent nations, the results were not lost. The trade still remained, and also the language, customs and habits of life. The civilization of the new world was simply a new European civilization and the expansion of Europe still went on. It is true that it was no longer an expansion of particular nations. The wanderers from Europe, if they went to the United States or to South America, gave up their home connection. But they still went principally to a country where either their language was spoken or the people were of a kindred race. . . . [But with the separation of the colonies from the parent countries, the political aspect of this movement of peoples changed.] The state which sends out its citizens is no longer transplanting them to another part of its own dominion, but is giving them up to a foreign nation. The migrations of the nineteenth century are not colonization, but emigration. This new movement is peculiar to the nineteenth century and has grown in intensity until it has become an important phenomenon of social life.”—R. Mayo-Smith, *Emigration and immigration*, pp. 12-15.

European problems of emigration.—The question of immigration is of vital importance, and as much to the self-governing dominions of the British empire as to the other nations of the new world. Conversely, emigration is a problem which has had to be faced and grappled with by the

older nations which have supplied the populations which now commence to teem in the new world, and provide the heterogeneity which is one of the most vexing problems that confront modern statesmen. "In the past fifty years [written in 1905] about nine million natives of the United Kingdom have emigrated to foreign lands, over two-thirds of these having gone to places other than British colonies. Add to these the three million foreigners who have tarried in the United Kingdom for more or less time and then departed, and we have a total emigration from the British Isles alone of about twelve million people. . . . Last year about 50,000 emigrants went to South Africa, about the same number went to Australia, and 75,000 were added to the population of Canada. . . . The emigration from France has been barely a quarter of a million people in fifty years, and the annual exodus is now less than six thousand. These people go to the United States or to Argentina. France is deeply concerned, however, in emigration matters, owing to the fact that her territory is a great highway for those coming from countries to the east and to the south. . . . Germany is largely in the same category as France, and her interest in emigration as an international question is along much the same lines. Last year Germany lost less than 25,000 of her native-born through emigration, but a quarter of a million people from countries to the east and south crossed her territory, and embarked from German ports for other lands. [See also GERMANY: 1881-1913.] There is no immigration into Spain, but 60,000 of her citizens left that country last year to take up their residence elsewhere. Most of these people went to Brazil, Uruguay, and Argentina, and by their going created a dearth of labour in many agricultural districts to the end that production was checked or made unprofitable. . . . [In 1904] Italy recorded a movement of 530,000 people from her territory, and while perhaps 40 per cent. of these returned after a short absence, the net loss to her population represents a serious blow to her commerce and industry. Nearly half a million people moved out of Russia . . . [in the same year] and from this movement has arisen the serious problem . . . [which confronted England] in immigration matters, and which . . . [was] shared to a certain extent by the United States. . . . The Government of Italy maintains a close supervision over departing emigrants, attempts to restrain the soliciting of transportation business, and will not allow the conduct of emigrant traffic to countries not desirable as places of residence for Italian citizens. While avowedly restrictive in its intent, the Italian law is far from effective in keeping people at home; for the cause of the emigration lies deeper in the economics of the country. . . . For years England has been a sort of clearing-house for undesirable emigration to the United States from many countries. Many emigrants rejected for passage at Continental ports found it easier to get to England than to return to their homes. The enormous alien and British emigrant traffic from British ports has resulted in the refuse being left upon British soil. The greater number of deportations from the United States are returned to England, even though they may have come originally from other foreign countries. The effect of this upon British population is almost indescribable. Charitable institutions, prisons, and hospitals are crowded with aliens, and some of the trades are so burdened with this low grade of labour that the British workman is driven out. . . . The European countries of the Continent have given forth over 20,000,000 of their popu-

lation to contribute to the building up of the North American communities. In earlier years the movement was from Germany, Scandinavia, Denmark, Holland, and France, and a majority of the emigrants were of a class welcome in any part of the world, especially where thrift, industry, and intelligence were needed to develop a new country. As opportunity for other than manual work grew less in the United States, as the arable free land disappeared and, indeed, as the supply of the adventurous, intelligent emigrants became exhausted in the countries of origin, the movement subsided, but only for a short time. The people of other nations, such as Italy, Austria-Hungary, and Russia, discovering that it was easy to get to America, and learning that conditions were far more favourable there than at home, then began to move. . . . At first, little was done in Europe to put a stop to the tremendous loss of population which was threatened, except to demand that every citizen should perform his military service before leaving. Emigrant traffic had in the mean time become a most profitable business. Great fleets of vessels were operated by reason of it, and competition for passengers reached the point where it became absolutely necessary, in the interests of humanity as well as public policy, to put some restraint upon the energy and enterprise of the ticket-sellers, and to check, if possible, the exodus of labourers. Police regulations were found entirely inadequate to cope with the situation. In 1860 France adopted a law which required a license for the conduct of emigration business, and imposed some regulation upon shipping in the interest of the emigrant. In 1876 Belgium adopted a law containing the same provisions as the French measure, but more elaborate as to detail. . . . In 1888 Switzerland enacted a law which . . . has served as a model for the law-makers of other countries in framing similar legislation. Indiscriminate ticket-selling was stopped by providing for a limited number of agencies. . . . To urge a Swiss citizen to emigrate was made a crime under the law, and many similar provisions were rigorously enforced, to the end that emigration should be free from any artificial stimulus. . . . An agent is forbidden to forward any person without a passport and identification paper, or any person who cannot be admitted to the country of destination. . . . The Swiss law was drawn with the purpose of making emigration difficult for Swiss citizens. It was also framed so as not to interfere with the large and profitable emigration movement across Switzerland from other countries, but in such a manner as to hold those who handled it responsible for every action detrimental to the Swiss people. Heavy bonds were exacted, and severe fines and penalties were provided, for all violations of the law or Government regulations. . . . Up to 1897 Germany controlled emigration more by police regulation than in any other way. The performance of military service was the test of the right of a German citizen to leave his country. Thousands of emigrants evaded the law, and thus voluntarily exiled themselves. It was not until the great mass of German emigration recorded of the past fifty years had crossed the border, that the German Government took cognizance of the possibility of holding this movement in check, and devised a measure dealing with the question in a more scientific manner. . . . In brief, the law forbids the emigration of a German citizen who has not fulfilled the requirements of his military obligation, places the regulation of emigration agencies under special Government officials appointed for that purpose, and affords every

emigrant sailing from a German port full protection and safety through shipping regulations, and fines and penalties for agents who fail to live up to contracts made for transportation. . . . The emigration of German citizens has decreased of late years, so much so that . . . [about 1905 only between 30,000 and 40,000 were] leaving the country annually. American statistics would indicate a larger movement than this, but many German-speaking residents of other European countries . . . [were] accredited to the German Empire by reason of racial origin. . . . In 1901 [a new] Italian emigration law went into effect. Over 2,000,000 citizens had left that country for the United States in the preceding twenty-five years, and some sections of Southern Italy had become almost depopulated through this exodus. Bad economic conditions were responsible for the beginnings of this movement, but encouragement from those who had emigrated, and the activity of ticket agents in persuading others to follow, increased the departure from year to year, until something in the nature of a crisis was reached. For many years money has been sent from the United States to Italy to assist emigration. . . . [In 1904] nearly 25,000,000 dollars was remitted by Italians in America, and most of this money was for the purpose stated. The Italian emigration law is drawn with the intent of meeting all of these conditions so far as is possible. . . . The Italian law to all intents and purposes puts the business of emigrant transportation into the hands of the Government. . . . The business is under constant and minute inspection by Government officials with almost unlimited power. No citizen can lawfully emigrate without the Government being fully aware of his intention and giving permission for him to go. Agents are not allowed to solicit business or to advertise. Emigrants can only go to countries where conditions meet with the approval of the Italian Government. . . . In 1903 the Government of Hungary, a country which . . . [suffered] almost equally with Italy a great loss of population through emigration, put into force a restrictive law. . . . In the other Northern European countries, Holland, Denmark, and Scandinavia, emigration is carefully watched and controlled by Government authorities, to the end that the laws of the respective countries shall be observed in the matter of departures, and the emigrants themselves fully protected in their dealings with transportation agents and ship-owners. In Spain and Portugal the regulation of emigration is largely a police function, the enforcement of military service being almost the sole reason for any restraint upon the outward movement of population. . . . England is [1905] the only European country in which immigration restriction has become an economic necessity, and is, in consequence, a live political issue. On the other hand, notwithstanding the great loss to the population annually through emigration, England is practically the only European country which does not . . . place considerable restraint upon citizens contemplating departure."—J. D. Whelpley, *Problem of the immigrant*, pp. 11-14, 18, 26-39.

ALSO IN: K. L. Roberts, *Why Europe leaves home*.

Extent of European emigration from 1894 to 1921.—"For twenty years up to the outbreak of war, [there was] an exodus from Europe on an enormous scale. Emigrants from the United Kingdom to the United States were only half the number of Italians, Austro-Hungarians, or Russians. The total average annual immigration into

the United States for the decade preceding the war exceeded a million, the United Kingdom's proportion being between 9 and 10 per cent, or nearly 100,000 per annum. It must be added that the emigration from . . . [England] was greater than ever, but the British Dominions, by dint of advertised inducements to settlers, had succeeded in diverting the stream of emigration to their own shores. Taking the year 1912-13, Canada, the Argentine, and Brazil were attracting emigrants in considerable numbers. The total received by these countries and the United States together was nearly 2,000,000 persons. 'It is probable that emigrants from Russia, Austria-Hungary, and the Balkans did not fall far short of 800,000, whilst Italy, Spain, and Portugal contributed about 700,000. The number of persons who emigrated westwards from the United Kingdom was about 250,000, mostly to Canada. In the same year the Argentine Republic admitted 166,000 Spaniards, 81,000 Italians, 7,000 Austro-Hungarians, 3,000 British, and 66,000 of other nationalities; a total of 323,000. Brazilian immigration consisted of 112,000 Spaniards and Portuguese, 32,000 Italians, 1,000 from the United Kingdom, and 35,000 unclassified immigrants, a total of 180,000. Canada was favoured by 139,000 Americans who crossed the border, and 263,000 Europeans, being 151,000 from the United Kingdom, 22,000 Austro-Hungarians, 21,000 Russians, 17,000 Italians and 52,000 unclassified—a total of 402,000 persons. . . . A marked change occurred in the destination of British migrants after the year 1900. 'Whereas in the period 1891-1900 only 28 per cent went to the British Dominions and the remainder to foreign countries, principally the United States, in the period from 1901-1912, 63 per cent migrated to places within the Empire. In 1913 this proportion increased to 78 per cent.' . . . The emigrants from Europe are usually classified into groups. . . . These emigrants were from Russia (excluding Finland), Germany, Austria-Hungary, Switzerland, Holland, Belgium, France, Serbia, Montenegro, Bulgaria, and Rumania. With the exception of the small numbers from Holland, Belgium, France, and Switzerland, all had to pass through or evade the Control Stations. . . . The excess of emigrants over immigrants last year was 118,938, compared with 172,747 in 1920, and 241,997 in 1913. More remarkable are the comparative figures for the first half of 1922, when, despite schemes introduced by the Imperial and Dominion Governments to assist emigration and land settlement, the excess was only 22,000, compared with 61,375, and 157,779 respectively in the corresponding periods of 1921 and 1913."—D. W. Caddick, *Effect of emigration on shipping prosperity* (*Manchester Guardian Commercial*, Nov. 16, 1922).

Post-war regulation of European emigration.—"The peace treaties have had a profound effect upon emigration policies. . . . Before the war, [World War] if the emigrant could meet the prescribed standards of immigration countries, he proceeded with little formality, after his own fashion, to the country of his choice. Now he is hampered and delayed, if not forbidden to leave, by his native country. He is inspected and disinfected, if not denied entry, by transit countries. He is accepted or rejected, according to a new and strange valuation, by immigration countries. For this attention he pays a high tax to each Government. . . . The conception of the emigrant, so exclusively as a possible economic asset or liability, to be made the object of calculating competition between States, has greatly intensified the problem for emigration countries,

like Russia, the Baltic States, Poland, Austria, Hungary, Czechoslovakia, Jugoslavia, Italy, Rumania, or Bulgaria. Each of these countries other than Russia and Italy, is at the same time an emigration, immigration, and transit country. . . . The new European policies are the 'outgrowth of the hard experiences of the war. Governments, careless of man-power, have learnt the value of its intelligent conservation, so the protection of the emigrant everywhere assumes new importance. That he may wander away at will, not to be heard from again, to enrich another country, is unthinkable. Instead appear regulations that prohibit in every form the recruiting of settlers and of workers, and the stimulation of emigration. Agencies of steamship lines are abolished, and advertising prohibited. . . . Idle is the boast of new countries that they intend to 'skim the cream of Europe' to advance their prosperity. . . . Official information offices, labour contracts, and a more precise knowledge of the situation make such undertaking impossible, except the Government itself is a party to them. . . . No steamship line may sell tickets unless it guarantees his safety, comfort, and care, according to nationalist specifications, during the entire journey. Convoys are required to accompany emigrants over the rail journey. Disinfection plants and lodging-houses must be maintained according to prescribed standards. Conditions on board vessels, their arrangement, outfitting, and provisioning must be satisfactory. Emigrants may no longer work for their passage. Doctors, commissioners, and observers are detailed on board to see that the regulations are enforced and heavy penalties are imposed for violations. . . . There seems to be a new sense of the dignity of the emigrant, due probably to his improved position since the war. With the equalization of classes, the better distribution of such wealth as exists and of land, and with increased political power of the peasants such things as the steerage and an Ellis Island are coming to be regarded as aspects of barbarism. . . . Before the war the direct and positive benefits of emigration accrued largely to the country of destination. It selected the strong and the fit, rejected the weak, deported the failures, and profited by a head tax, visé charges, and the cash on hand required of the immigrant—to the extent of many hundreds of thousands of pounds a year. Each adult emigrant was raised, educated, and fitted for his work in the new country at no cost whatever to it—an enormous saving. . . . The emigrant now pays to his native country, in fees and taxation, for the privilege of leaving, quite as much as he does to the country he enters. To balance the emigrants' account, nationals of immigration countries are heavily taxed to travel in Europe. Steamship lines, through various assessments on their emigration business, are a profitable source of income. . . . The exchange of emigrant traffic for trade privileges has been effected between certain countries. . . . It is, therefore, not surprising to find emigration countries reaching the conclusion that indiscriminate mass emigration is a wasteful and short-sighted way to solve their internal racial and economic problems. So the Russian famine has not been followed by an inundation of Europe, because forbidden by Russia and obstructed by neighbouring countries. So, also, widespread unemployment has not filled the quotas of immigrants permitted to enter the United States from countries in which it is most prevalent; nor has Austria, in her great need, turned to emigration as a remedy."—F. Kellor, *Emigration policies of the*

*chief European states (Manchester Guardian Commercial, Nov. 16, 1922).*

Italian emigration.—"Emigration from Italy belongs among the extraordinary movements of mankind. In its chief lineaments it has no like. Through the number of men it has involved and the courses it has pursued, through its long continuance on a great scale and its rôle in other lands, it stands alone. . . . It is certain that the modern emigration of Italians was well under way long before the official collection of statistics was undertaken. . . . Duval gives occasional figures for the transoceanic emigration of this earlier period. . . . In the years 1835-1842, he says, 7894 Sardinians arrived at Montevideo; in 1856, 2738 Sardinians sailed for Buenos Aires; in June, 1860, there were 12,755 Italians in Algeria; and so forth. In these years, as the American figures show, few Italians came into the United States. When Correnti, in 1858, published a compilation of many sorts of Italian statistics, he estimated that some 30,000 Italians were living in South America. 'In these last months an Italian colony was venturesomely planted in Mexico, a mere sapling on the shore of a turbulent sea.' Italian laborers, he said, were in Switzerland, Belgium, and England. In France there were 63,000, chiefly seamen, soldiers, and workmen 'many of them among the most intelligent silk workers of the Lyons mills.' . . . In Italy this early emigration appears not to have roused much attention. Serious enough problems of other sorts pressed for solution. Besides, the impulse, though imminent, was yet to come, which would swell the streamlet to the proportions of a flood. From 1860 on, our knowledge begins to be more precise. Leone Carpi, perhaps fairly to be regarded as the first Italian to study broadly the emigration of his people, wrote, 'Numerous provinces which before 1860 made no contribution to the stream sent contingents, from 1861 to 1869, which were annually larger.' . . . Indeed, by the end of this decade (if not earlier, for no figures apply before 1869) more than a hundred thousand Italians per year were quitting their country, and the proportion to her population was already such as to place Italy beside Germany as a land of emigration. . . . The total number of recorded emigrants for the thirty-one years 1876-1914 is about fourteen million. In both the overseas emigration and the European a great growth has taken place. The quinquennium 1886-90 marks a turning point; while the total emigration increased much, that into Europe changed slightly, and for the first time in its career was surpassed by the American current. . . . In the quarter century that has since elapsed, the emigration into America has apparently remained in excess of that into Europe. In 1901 there was a sharp bound in the movement. The new level was virtually maintained until 1905, when another bound occurred, chiefly in the overseas emigration; and in 1913 the new level was in turn exceeded. . . . The new exodus was still proceeding when the shock came of the outbreak of the European war. Promptly, on August 6, 1914, a royal decree suspended the emigration of all men of military age. . . . What with the restrictions upon the issuance of passports, the dangers to navigation, and the suspension of the steamship service, the great movement of Italian emigration, caught almost at its zenith, was violently brought to a stop. Consider now the figures for emigration into the principal countries of Europe. . . . Austria-Hungary, France,

Switzerland, Germany. . . . Into each of these countries emigration has been much greater than into any other country of Europe. For each it averaged about 54,000 persons a year in 1901-05. From 1876 to 1885 the emigration into European countries was greatest into France; from 1886 to 1900, greatest into Austria-Hungary. Before 1900 the emigration into Hungary was about half that into Austria; since, it has run one-tenth to one-fourth. Emigration into France reached its lowest point in 1896; so sensitively does the barometer of emigration register a period of strained relations. In 1901 the emigration into France suddenly sprang to a new level, which it has maintained. From the middle eighties to 1905 the average annual emigration into Switzerland has, roughly speaking, doubled with each quinquennium; in subsequent years this emigration has been greater than that into any other country of Europe. Since 1890 emigration into Germany has progressed similarly, but not to such heights. . . . In the last thirty years Italian emigration has become increasingly of a temporary nature. Note the high percentage of emigrants returned from the United States in 1897-1901 as compared with 1892-96, when economic conditions were so radically different; and note the astonishing rate in the years after 1906."—R. F. Foerster, *Italian emigration of our times*, pp. 3-6, 8-9, 34.—See also LATIN AMERICA: 1890-1914.

Japanese emigration problem.—"The history of Japanese emigration began only a few decades ago. . . . Because of the geographical proximity and alluring temptations that the vast uncultivated lands and rich natural resources presented, Australia was the place which early attracted the Japanese. A few hundreds of them began to migrate to several colonies, chiefly to Queensland, New South Wales, and Victoria. But they soon found the conditions exceedingly uncomfortable, owing to the hostile feeling already prevalent there against the Asiatics. The Canadian census of 1901 shows that 4074 persons born in Japan were in the Dominion at that time; 4415 were in the Province of British Columbia, the rest being scattered in the . . . [other western Provinces]. After that year the number of Japanese immigrants coming to Canada gradually increased, and when the United States placed restrictions on the influx of Japanese from Hawaii, and the latter began to seek entrance into Canada, the number grew considerably and . . . it was estimated that in 1907 the Japanese domiciled in Canada had reached eight thousand. . . . [Objection to their rapid increase was raised in Canada which was met by Japan agreeing to limit the number of passports to Canada to 400 annually.] Canada's treatment of the Asiatic races lawfully admitted has been marked by leniency. She has extended to the Orientals the privilege of naturalization and of securing homesteads. . . . The number of Japanese coming to the United States has decidedly increased in recent years, especially since the war, the annual number reaching the ten thousand mark. This would certainly be alarming were it not for the correspondingly large number of Japanese who returned every year [amounting in 1920 to 90% of the total emigration for that year to the United States]."—T. Iyenaga and K. Sato, *Japan and the California problem*, pp. 64-65, 67-68, 98.—"According to the report of the Department of Foreign Affairs, the Japanese residing abroad, exclusive of those in China and Hongkong, which are returned at about 350,000, numbered 270,300 at the end of June 1916, but the actual number must have reached about 400,000 as no small

number leave Japan as stowaways. . . . [In] the South Seas [group, which] . . . comprises Singapore, Malay Peninsula, Java, Sumatra, Philippines, etc. . . . some 18,000 Japanese reside, employed in rubber plantations. . . . They own or lease 30,000 *cho* of land. . . . [In the Hawaiian islands] the emigrants number nearly 100,000, which are about one half of the total population in the islands. . . . Nearly 90,000 Japanese emigrants reside in the United States and 14,000 in the Dominion of Canada, most of them being engaged in farming, fishery or lumbering. . . . [In Latin America] the emigrants number 3,000 in Mexico, 7,000 in Peru, 30,000 in Brazil and 3,000 in Argentine and other countries. [See also LATIN AMERICA: 1890-1914.] . . . [In Australasia], including those employed at nickel mines in New Caledonia, the Japanese . . . number nearly 12,000."—*Japan Year Book, 1921-1922*, pp. 35-36.

### ARGENTINA

1854-1914.—Early immigration.—"It was . . . in the Santa Fé province, that modern agricultural colonization began in the nineteenth century. It goes back to the foundation (in 1854) of the colony of Esperanza, west of Santa Fé. . . . European immigrants—Swiss, French, and Piedmontese—had settled there."—P. Denis, *Argentine republic*, pp. 190, 191.

1914-1922.—Proportion of foreigners in 1914.—Immigration after the World War.—"Foreigners were, in 1914, 30 per cent. of the total population. The proportion of foreigners to the total population is one of the indications by which we can best follow the advance of colonization. As soon as it relaxes in any region, the number of immigrants diminishes. . . . In 1914 the proportion of foreigners at Buenos Aires rose to 340 per 1,000 (development of the maize region and the southern wheat area). It sank at Santa Fé (350 per 1,000), in spite of considerable immigration in the southern maize-growing departments. At the same time there was a great influx of foreign population in the province of Cordoba (200 per 1,000) and in the area of the Central Pampa (360 per 1,000)."—P. Denis, *Argentine republic*, pp. 263-264.—"Argentina is [written in 1920] receiving large numbers of Italians, Spaniards, and Frenchmen, now totaling several millions of population. They have full liberty to engage in any business and to acquire property. Free land is also given to newcomers. Naturalized citizens are exempted from military service for ten years. . . . In the course of three months more than 600 families with some capital from Central Europe have settled in the country. If the stream of immigrants from Germany, Austria, and the Balkan States is strong, that from Italy is not less so. An Italian vessel which recently came into port brought some 800 Italian immigrants, of whom no less than 250 had sufficient money to acquire their own land. Before the war, immigrants arrived without any other means than their will to work. Today, in addition to this, they come provided with capital for acquiring allotments and land, which enables them to settle with their families."—F. Kellor, *Immigration and the future*, pp. 78-79.—"The temporary immigrants come partly from Europe. Not only is the stream of immigration to Argentina fuller during the months which precede the harvests, while the stream of re-emigration to Europe is greatest in the autumn, but it is not a rare thing for Italians to go every year to Argentina merely to stay there during the harvest, when wages

are high. This seasonal immigration from Italy is of long standing; it is mentioned by Daireaux in 1889."—P. Denis, *Argentine republic*, p. 266.—See also ARGENTINA: Population.

ALSO IN: W. A. Hirst, *Argentine*, pp. 131-138.—United States Immigration Commission, 1907.

### AUSTRALIA

1878-1901.—State-aided immigration.—"There has been a steady immigration movement to the British colonies of Australasia since the earliest days of their settlement. Previous to the formation of the Australian Commonwealth in 1901, however, the extent of immigration from overseas is not definitely shown, because the various colonies did not distinguish between trans-oceanic immigration and the constant movement of population that went on among the colonies. . . . In 1788, 1,030 persons settled in New South Wales, the parent colony of Australia, and since that beginning immigration has been a very important factor in the growth of the population. . . . [The rate of increase between 1831 and 1841 was very high, due to the] policy of state-aided immigration, which was vigorously pursued during that period. The rapid growth between 1851 and 1861 was largely due to the discovery of gold in Victoria and the consequent heavy immigration to that colony. Later the large gains in the populations of Queensland and Western Australia were also mainly the results of the large immigration attendant upon gold discoveries. . . . [During the 11 years ending 1901 there was a] decided decline in 'net immigration.' Western Australia alone seemed to continue to attract a large number of immigrants, the excess arrivals in that State from 1891 to 1900 being 118,592. . . . The policy of assisting immigration has been vigorously pursued by the several colonies of Australasia for a greater part of the time since the early days of their settlement. This practice was practically discontinued in Victoria in 1873, in South Australia in 1886, and in Tasmania in 1891. In 1887 it was discontinued in New South Wales, but with certain reservations which enabled that colony to assist a limited number of immigrants during the period 1888 to 1899."—*Immigration situation in other countries (Reports of Immigration Commission, 1910-1911, Senate Documents, v. 22, no. 761)*.—See also AUSTRALIA: 1787-1840, to 1821-1845; NEW SOUTH WALES: 1831-1855; WESTERN AUSTRALIA.

ALSO IN: R. E. Mills, *Colonization of Australia*.

1901-1910.—"White Australia" policy.—Literacy test for Asiatics.—For half a century prior to confederation, "the most vital phase of the Australian immigration situation . . . [was] the exclusion of Asiatics. The colonies have fought this immigration by entrance fees and fines, limitations of the number of passengers to a given tonnage of ships, educational tests, and absolute prohibition. There were Chinese in Queensland as early as 1848, but the number of persons of that race in all Australia was inconsiderable up to the rush to the Victorian gold fields in 1851. The influx of Chinese at that time was the immediate cause of the adoption of a vigorous exclusion by all the colonies. In 1855 Victoria enacted a law providing that no ship should bring more than 1 Chinese to each 10 tons of its tonnage and that a shipmaster must deposit £10 with the collector of customs for each Chinaman brought. South Australia, New South Wales, and Queensland soon afterwards enacted similar

legislation. Under these laws the exclusion of the Chinese became so effective that after several years they were repealed in Victoria and New South Wales. In 1880, however, the Chinese movement again became the subject of even more drastic legislation. New South Wales, Victoria, South Australia, and Tasmania decreed that every Chinaman must pay an entrance tax of £10 and that a ship might bring only 1 person of that race to every 100 tons of its tonnage. Queensland in 1884 raised the entrance fee to £30 and allowed 1 to 50 tons. . . . In 1888, . . . the colonies conferred and agreed to adopt more stringent measures. New South Wales fixed the entrance fee for Chinese at £100 each and permitted ships to bring only 1 Chinese to each 300 tons of the tonnage. The restrictions in the other colonies were made almost equally severe. [See also RACE PROBLEMS: 1855-1907.] . . . In the few years preceding the federation the colonies adopted the policy of imposing upon all immigrants an educational test in a European language. This measure proved an effectual barrier to the Asiatics, and the same provision was embodied in the Commonwealth immigration restriction act of 1901, which, slightly amended, is still operative. . . . Kanakas, black laborers, recruited from the Pacific Islands, were introduced in Queensland about 1865. . . . The traffic grew and the greater part of the field work on the sugar plantations of that colony was done by the Kanakas. . . . In 1901 the Commonwealth Parliament passed the Pacific Island laborers' act, which aimed to abolish the employment of Kanakas. It provided that only a limited number of Pacific Islanders should be admitted to the Commonwealth before March 31, 1904, and that after that date none would be permitted to enter. No contract could be made with those already in the Commonwealth after December 31, 1906. Any Pacific Islander found in the Commonwealth after the latter date would be liable to deportation. . . . Since the federation in 1901 immigration has become a national question and its regulation has been within the Commonwealth. The immigration policy of the Commonwealth, however, is similar to that pursued by the separate colonies, which in general was the exclusion of Asiatics and Pacific Islanders, and the preservation and development of a 'white Australia.' . . . In order to induce settlers to take up unoccupied land the government allows them to purchase the freehold by the payment of small half-yearly installments upon liberal terms. Advances for improving their holdings are also made in all the States except Tasmania. . . . From 1900 to 1905 no assistance was given by that colony, but the practice was resumed in 1906. Queensland and Western Australia have continually pursued the policy of assisted immigration. . . . Some of the States . . . induce immigration by paying the passage wholly or in part of persons desiring to settle on the land or to engage in farm or dairy work, or work of a similar nature. Such assistance is also afforded to domestic servants and to other persons who can satisfy the agents-general of the Commonwealth in London that they would make desirable settlers for Australia. . . . Recent immigration [written in 1910] to Australia is mainly British, 82.1 per cent of the 301,207 persons . . . being of that nationality. Moreover, British immigration to Australia increased rapidly during the period considered. In 1902 it was 35,330, and in 1908 it had increased to 64,374. No other nationality comes in any considerable numbers; the French being second with 10,976 during the seven years considered;

the Germans third with 9,098. . . . Of the British, . . . only a little more than one-fourth are recorded as coming to Australia from the United Kingdom; the remainder being from New Zealand and other British colonies. . . . At one period New South Wales voted £5,000 for the dispatch to Great Britain and Ireland of agents for the purpose of inducing immigration, and also during the later periods of assisted immigration, the propaganda was confined to British sources. Another factor in determining the character of Australian immigration has been the great distance and the cost of transportation."—*Immigration situation in other countries (Reports of Immigration Commission, 1910-1911, Senate Documents, v. 22, no. 761)*.—See also RACE PROBLEMS: 1903-1908.

1909-1921.—Land policy.—Continued "White Australia" policy.—Asiatic immigration.—Speaking at a dinner in his honor, given in London in 1909, after his return from five years of service as governor-general of Australia, Lord Northcote, said: "There is plenty of land all through Australia for men who are willing to go there, . . . plenty of land available for close settlement. If the great landowners are disinclined to sell their holdings—and I quite acknowledge that a great deal of the best land in Australia is in comparatively few hands—at all events the State Governments have very large reserves of land; and by the application of irrigation and other methods of scientific farming they could compete on even terms at least with these squatters, and . . . turn these waste lands into fertile country fit for settlers." In 1911 Australia had a smaller population than New York City. "The Commonwealth needs population badly, but future immigrants must be . . . white. It was only the other day that Australia's inhabitants reached the five-million mark. [According to the 1921 census she had a total population of 5,436,794; of these about 37,300 were non-European.] . . . In addition, there are estimated to be over 30,000 Australian aboriginals, excluding the natives of Papua and German New Guinea, over which the Commonwealth was given a mandate at Versailles. . . . Labor is Australia's problem. [In 1919, the increase of population by immigration was 160,000. The decrease during the World War had been at least 260,000.] At present [1921] ex-service men are coming in goodly numbers from England, under an assisted payment scheme of immigration, especially to West Australia. . . . It is asserted that there are parts of Australia which will never be successfully developed, except by colored labor. This argument is applied to the part of the Commonwealth north of the Tropic of Capricorn; in that section, and further north, sugar is most largely cultivated. Some years back these sugar fields were worked by indentured Kanaka labor from the South Sea Islands. Their pay was so small, the mortality so high, and attendant abuses so rife, despite more or less close Government supervision, that the people of Australia rose up against what was termed the 'slave trade.' Notice was given to planters that after a specified time the 'White Australia' policy, as it is now called, would be introduced by the Government, and colored labor would be abolished. . . . In the State of Queensland Chinese aliens are not allowed to employ aboriginals or half-castes, while a Northern Territory ordinance . . . does not permit any Asiatic to employ an Australian aboriginal. In Papua a recruiting license is not issued to any person who is not a European, i.e., a white man. The Queensland Land act of 1910 (Section 7) prohibits the subleasing of any land to any

alien who fails to pass a dictation test. In the Northern Territory an Asiatic cannot acquire the 'fee-simple' of land. In South Australia Asiatics are disqualified from being lessees of irrigation lands. Queensland's Mining act of 1889 . . . disqualifies persons 'who, by lineage, belong to any of the Asiatic, African or Polynesian races,' from holding a business license, mineral lease or miner's homestead lease, or from being the mortgagee of a miner's homestead lease. No Asiatic is allowed in the Northern Territory . . . to take a right on a new goldfield, or . . . for working on a new goldfield, unless the discoverer is an Asiatic; nor is an Asiatic allowed to have any interest in a dredging lease. Queensland, . . . formerly received more Asiatics than any other of the Australian States. The immigrants were employed mainly in the pearling industry, and in gold and tin mining. They and their descendants still work in these industries, but since the adoption of the 'White Australia' policy no Japanese or Chinese, whatever their status, are allowed to enter Australia with a view to permanent residence. . . . Bona fide Japanese students, merchants or tourist travelers . . . [are] admitted on production of passports issued by the Government in Japan for twelve months only, which period . . . [may] be prolonged if the officials . . . [are] satisfied that the bearer of the passport . . . is genuinely engaged in overseas trade. With this exception, the disabilities placed in the way of Japanese immigration to Australia may be summed up in the phrase 'complete exclusion,' . . . The same arrangement holds good for Chinese, except that visitors must have their passports visé by the British Consul at the port of embarkation. . . . There never were many Japanese in Australia. . . . [In 1901 the total of Japanese] was 3,593, Queensland having 2,257 and West Australia 867 of that total. Since the coming of the 'White Australia' there has been a gradual diminution. . . . In 1915 the number had dropped to 2,636. After this there was a gradual increase, according to a return . . . supplied by the Commonwealth authorities, which gave the number on June 30, 1920, as 3,006. . . . More than half of these . . . [were] admitted temporarily under indentures as divers in the pearling industry. In June last [1920] 1,800 came under that heading, while 138 were merchants, admitted under temporary passports."—J. A. Burke, *Australia's laws against Asiatics (New York Times Current History, Mar., 1921)*.—"The law provides, furthermore, that Asiatic immigrants may be required to pass a test at any time within two years after they have entered the Commonwealth. Even for the reception of those Asiatics who have been lawfully admitted [written in 1921], some of the States . . . do not allow them the right of owning or leasing land. . . . The Commonwealth of Australia does not extend the right of naturalization to Asiatics."—T. Iyenaga and K. Sato, *Japan and the California problem*, pp. 66-67.—See also RACE PROBLEMS: 1904-1913.

## BRAZIL

1817-1919.—Nature of immigration.—Nationalities.—"The story of colonization in Brazil is unique in the annals of the human movement across the world that has been going on ever since man began to multiply and to seek elbow-room; it is one of the phenomena of exodus. . . . It was the result of a studied policy, inaugurated by the Emperors of Brazil, and carried on to the present day by the Federal Government

and certain of the separate States; experiments in various kinds of people were made on a concerted plan, the colonies were grouped, in many cases isolated, retained their language and customs, still produce the food to which they were accustomed in the home land, and only become assimilated as their populations leave them or touch in time the fringe of others. . . . The first official, deliberate importation of colonists of blood foreign to Brazil or Portugal began in 1817, when Dom João brought in Swiss settlers. . . . [The venture was unsuccessful, and the authorities then turned to Germany for recruits. Colonies of Germans were formed in Rio Grande do Sul and Santo Caterina between the years 1825 and 1850, and in 1852 state-aided colonies of Germans were settled in Rio Grande do Sul, Santa Caterina, Paraná, Minas Geraes and São Paulo. For about fifty-two years Germany was the best recruiting ground for Brazil. About 1852, however] German colonizing in arranged shipments had come to an end; any additional German colonists came singly. The German Government . . . passed a law to forbid emigration to Brazil. . . . With organized German settlement checked, Brazil during the eighteen fifties turned her attention to the mother country, and brought in Portuguese . . . [who were settled in the warmer provinces of Maranhão, Para, Rio de Janeiro and Bahia. These colonies were not strikingly successful until joined by other colonists, for the Portuguese who are artisans rather than agriculturists, melted from the lonely settlements and found jobs in the coast cities. In the years immediately preceding and for some time after abolition of slavery, numbers of immigrants were brought over from Europe to work on the *metayer* system. Bavarians, Holsteiners, French, Alsations, Dutch, Tyrolese, and even Mongolians and Icelanders are mentioned among the immigrants of this period. The larger number were employed on coffee plantations, where, as might have been expected, the *metayer* system broke down]. It was after the dwindling of the flow of German incomers about 1860 that a steady stream of Italians was directed towards Brazil. Their wooing was in a great measure due to the systematized efforts of the coffee-growers of São Paulo state, and, after the establishment of the republic in 1889, of the state authorities. . . . From the year 1820 to the end of 1915, a total of one million, three hundred and sixty-one thousand, two hundred and sixty-six Italians have officially entered Brazil as immigrants. With their children born in Brazil they total well over two millions today, greatly out-numbering any other entering race. Their colonization has been a marked success, due not only to their personal characteristics, but to the just treatment given them by the authorities. There was a time, soon after the abolition of slavery, when the *colonos* brought in to fill labour gaps complained of the relations between themselves and the *fazendeiros*; realizing that the existence of friction and subsequent scandals would defeat their object, the São Paulo Government put machinery into working order, known as the *Patronato Agrícola* which adjusted differences, looked into social conditions, and took in hand the work of giving medical care and schooling to immigrants. The Italian has remained upon coffee fazendas, acquired land and coffee trees of his own or taken up commercial work in the towns, rather than remained in *nucleos*; he has identified himself with the modern progress of South Brazil, taken up manufacturing, built himself some of the most

splendid and extravagant houses in São Paulo city. . . . The year of greatest immigration in Brazil is said to have been that of 1801 when out of a total of nearly two hundred and seventy-six thousand, about one hundred and sixteen thousand were Italians; their influence upon prosperity in São Paulo may be estimated by the fact that more than one million out of the State's three million population are of Italian blood. No other state has so systematized immigration, perhaps because none had the pressing need and the immediate rewards to offer, as has São Paulo; she no longer pays passages on steamships, but she maintains free hotels in Santos and São Paulo city, where five meals a day are given, good airy rooms, baths, etc., and where immigrants are lodged for a week or until work is found. . . . Poles and Russians came in notable quantities in the late 1870's and early 1880's, settling in the Paraná uplands as well as in *nucleos* in São Paulo. At the end of the century there were two thousand Russo-Germans from the Volga, farming land on methods of their own in the neighbourhood of Curitiba; an obstinate folk, they . . . shared all goods on the Russian communistic plan, and . . . bodies of them deserted the *nucleos* and demanded to be sent back to Russia. . . . The system under which land is made over to colonists demands more explanation than space permits; São Paulo, briefly, only sanctions the establishments of *nucleos* near a railway line or navigable river, with an eye to marketing. . . . Nobody can obtain a lot unless he has a wife and family, but sons twenty-one years old can also obtain grants while bachelors; payments are made on easy terms, generally at the end of each harvest for five successive years. . . . When the male head of a family dies before payments are complete, the widow and family are handed clear titles if three quarters of the debt has been liquidated, and if ability to continue work is demonstrated; if not, the family is sent back to Europe at State expense. . . . One of the interesting recent experiments of São Paulo was the cession of some twelve million acres of coastal land to a Japanese company with the object of creating an agricultural colony with Oriental brains and labour. The organizing syndicate, with the approval of the Japanese Government, was formed in Tokio in 1913, used Japanese capital, emigrants and ships. . . . Studied preparations and soil experiments were made before any colonists were carried over. . . . Besides the members of this agricultural colony there are at least another eight or ten thousand Japanese in Brazil, chiefly house servants. . . . Apart from the serious, long-continued work of the São Paulo authorities to win labour from abroad, there is still a remarkable amount of support given to immigration by the Federal Government. . . . In 1915, when entries from abroad were checked on account of the war in Europe there were still immigrants from Portugal to the number of 15,000, 6,000 Italians, nearly as many Spanish, 600 Russians and 500 'Turco-Arabs.' . . . [From 1820 to the end of 1915, 3,250,285 listed immigrants entered Brazil, including 1,361,200 Italians, 976,386 Portuguese, 468,583 Spaniards, 122,830 Germans, 103,683 Russians, 78,543 Austrians, 52,434 Turk-Arabs, 28,072 French, 22,005 English, 15,608 Japanese, 10,713 Swiss, 5,435 Swedes, 4,727 Belgians. Additional official lists] give another 200,000 of 'diversas' nationalities and a margin must also be allowed for persons who did not enter as immigrants."—L. E. Elliott, *Brazil, today and tomorrow*, pp. 50, 59, 60, 66-73.—"According to the

annual report of the Government of the State of São Paulo, Brazil, [in 1919] 17,418 immigrants entered the State through the port of Santos. Of these 12,220 were 'voluntary' immigrants and 5,198 were 'subsidized' immigrants. It should be noted that all immigrants who are considered voluntary immigrants by reason of the fact that they have made the journey to Santos at their own expense are entitled to a refund of their traveling expenses, provided that they go to work on the coffee plantations. It is reported that 4,394 immigrants, of whom 4,332 were voluntary immigrants, came to the State of São Paulo by rail. The statistics do not show the number of emigrants from the State, but their number must have been considerable, because all steamers leaving Santos and Buenos Aires for European ports carried a full list of steerage passengers.—United States Department of Labor, *Monthly Labor Review*, Dec., 1920, pp. 218-219.—See also BRAZIL: 1906: Status, etc.; LATIN AMERICA: 1910.

### CANADA

1763-1867.—United Empire (U. E.) Loyalists.—Early movements.—The French settlement of Canada is more properly spoken of as colonization than as immigration, and therefore, the history of Canadian immigration begins after the Peace of Paris, 1763. "Though Canada had received great numbers of emigrants from the United Kingdom [after the Peace], these were few in comparison with the crowds of men and women who entered this territory after the war [of the American Revolution] broke out. The extent of this complex movement is but imperfectly understood. It is known, however, that [beginning in 1783] the Loyalist migration into British territory flowed in two great streams, one by sea to Nova Scotia and the other overland to Canada. [See CANADA: 1782-1784.] . . . The actual settlement of the Loyalists forms in itself an important chapter of colonial history, but the welcoming of these refugees from the south to the sparsely populated lands of Canada is to be remembered most for its effect on succeeding generations of emigrants. We must remember that, until the arrival of the Loyalists, most of the lands situated more than a few miles from the chief waterways were uninhabited, uncultivated, and more or less forbidding. But the Loyalists went in of sheer necessity and formed, as it were, the nucleus for later settlers. Thus, it is not too much to say that they laid the foundation for the westward extension of Canada as we know it to-day. [Three other early immigration movements deserve slight mention.] In 1785, the men of Glengarry, Canada, induced a party of five hundred Scotch Glengarries to come and join them. . . . Among the earliest organizers of colonization schemes in the nineteenth century may be placed Lord Selkirk. This Scotchman banded together a number of thrifty farmers of his own race who had given up their highland territories, and escorted them to Prince Edward Island, where they were comfortably located [1803-1804] on a settlement vacated by the French. . . . What money was necessary came either from Lord Selkirk or was derived from sales, held in the Old Country, of the settlers' stock. . . . So great was the success of Selkirk's first attempt at colonization that he made plans for a second scheme in 1811, [and assayed an attempt to open up the North West, which proved to be abortive]. . . . Closely following the schemes of Selkirk came that of Colonel Talbot, a member of the Lieutenant-Governor's staff in Can-

ada. From various parts of the United Kingdom, but specially from Scotland, he collected some two thousand men, women, and children, probably during the year 1813, and settled them at Port Talbot on Lake Erie. To this nucleus of settlers he annually added other emigrants, until in 1823 it was reported that he had under his control no less than twelve thousand souls. The financial burden of his undertaking was probably borne jointly by the British Government and the Canadian Legislature, the former finding the passage money, and the latter providing the food supplies."—P. Davis, *Immigration and Americanization*, pp. 98-99, 101-103.

"There must have been a steady increase in the population not only by birth rate but by immigration, for when the Act of Union in 1867 . . . [was passed] the population of . . . [the four] provinces for 1861, upon which the act of Union was based, was 3,090,561. . . . From the small number of 60,000 inhabitants in 1763, when Canada passed under the British flag, the population had grown in just one hundred years to over three millions, that is about doubling itself every twenty years. . . . The major source of increase in Ontario was not so much the birth rate but rather immigration from the British Isles and parts of Europe. In fact it was the steady increase in the population of Upper Canada which rendered more and more acute the internal strife between 'the Canadas,' which issued in the Report of Lord Durham in 1838 urging the union of the two provinces. . . . [These early immigrants encountered many hardships and adventures in the wilds, which it now seems difficult to realize.] The conditions of hardship and distress did not wait for the immigrant to settle on the land. They found him on his voyage from Europe. The passage occupied on the average six weeks, and frequently extended to eight or nine weeks. The ships were overcrowded, more emigrants being taken than the space and provisions warranted and than the law allowed. Vessels were chartered for emigration by persons whose sole object was to make money, and who made a trade of evading the provisions of the Passengers' Act. This was the case in many vessels coming from Ireland, the number of persons on board being greater than that allowed by the Law. . . . The condition of the emigrants upon arrival need not be detailed. The inspecting physician at Quebec often found himself at a loss for words to describe their state. But, he declares, 'with few exceptions, the state of the ships was quite abominable.' . . . Another inspecting physician reported: 'The poorer class of Irish, and the English paupers sent by parishes, were, on the arrival of vessels in many instances, entirely without provisions, so much so, that it was necessary immediately to supply them with food from shore. This destitution, or shortness of provisions, combined with dirt and bad ventilation, had invariably produced fevers of a contagious character, and occasioned some deaths on the passage; and from such vessels numbers, varying from twenty to ninety to each vessel, had been admitted to hospital with contagious fevers immediately on their arrival.' . . . This is quite sufficient, perhaps more than sufficient, to indicate the conditions surrounding immigration in the period from 1830 to 1850. But despite all these hardships the tide was moving westward in great strength. In 1831, 50,254; 1832, 51,746; 1833, 21,752; 1834, 30,935; 1835, 12,527; 1836, 27,728; 1837, 22,500; 1838, 4,992; for the eight years, a total of 222,704, an average of over 27,000 per annum. The distracted state of the

country evidently accounts for the small number in 1838, but both before and after the report of Lord Durham things began to improve."—W. G. Smith, *Study in Canadian immigration*, pp. 39-40, 42, 45, 47, 48, 51.—See also IRELAND: 1847-1860.

1867-1910.—Immigration policy.—Immigration law.—Juvenile immigration.—Following Confederation, immigration into Canada steadily increased, especially after the opening up of the North West. "Canada affords an interesting example of a country with a definite immigration policy based on local needs and conditions, and an immigration law sufficiently broad and flexible to permit the effective carrying out of that policy. The Canadian policy is based on the purpose of the government to promote the immigration of settlers for the newly opened agricultural regions of the western Provinces and not of such classes of immigrants as tend to congregate in towns and cities. The United States, the United Kingdom, and certain northern and western countries of continental Europe are regarded by Canada as the sources most likely to furnish the class of immigrants desired, and in them the Government carries on a systematic and usually successful propaganda to promote or direct immigration to the Dominion. No effort is made to promote immigration from southern and eastern European countries, and while immigrants from such countries are not specifically excluded by the Canadian immigration law, they are not . . . desired unless it is clearly shown that they do not intend to become city dwellers. . . . With the opening up of the great areas of agricultural lands in the western Provinces of the Dominion and the extension of the propaganda referred to, immigration increased until Canada is now one of the great immigrant-receiving countries of the world. During the period July 1, 1900, to March 31, 1909, a total of 1,244,597 immigrants were admitted to the Dominion. . . . The chief sources of Canadian immigration are the United States and the United Kingdom, the former having furnished 393,908, or 31.6 per cent, and the latter 502,264, or 40.4 per cent of the total number of immigrants admitted to the Dominion during the period referred to. During the same period Canada expended more money in promoting immigration from the United States than from the United Kingdom, the amounts being respectively \$1,662,000 and \$1,445,000. From 1901 to 1909, inclusive, 71.2 per cent of the total European immigration to Canada originated in those northern and western countries where the Canadian propaganda is carried on. . . . The large immigration from the British Isles to the Dominion is chiefly responsible for this result, but even where continental European immigration alone is considered, Canada receives relatively fewer immigrants from southern and eastern Europe than does the United States. . . . The movement of population from Canada to the United States is one of early origin, but immigration to Canada from the States is largely a development of recent years, having grown from 2,412 in 1897 to 59,926 in 1909 and 103,984 in the Canadian fiscal year ending March 31, 1910. . . . The Canadian immigration law [1910] is admirably adapted to carrying out the immigration policy of the Dominion. Under its terms no immigrants are specifically denied admission solely because of their race or origin, or because of the purpose for which they have come to Canada, but the discretion conferred upon officials charged with the administration of the law does make such discrimination entirely possible. . . . Canada divides the emigrating races of the

transoceanic world into three general groups, as follows: First, natives of the United Kingdom and of northern and western continental Europe; second, southern and eastern Europeans; third, the races of the Orient. . . . Every effort is made to induce persons of the first class to settle in Canada. Those of the second group, although admitted in rather large numbers, are not solicited, and . . . more or less effective obstacles are placed in their way. Those of the third class are practically prohibited from coming by the Chinese immigration act, and by barriers erected under various provisions of the immigration law. . . . During the nine years mentioned 78.4 per cent of the immigration to Canada consisted of races or peoples from the north and west of Europe and from the United States, 18.9 per cent of races or peoples from the south and east of Europe, and only 1.7 per cent was from Asiatic countries. What proportion of the immigration of favored classes was induced by Canada's efforts, and how many persons of the classes not favored were prevented from coming because of the indifferent attitude of Canada, or by the barriers erected against them, can not, of course, be determined. . . . During the fiscal years 1905 to 1909 . . . 71.2 per cent of European immigration to Canada was from the northern and western countries. . . . British immigration, however, was largely responsible for the preponderance of northern and western Europeans in the movement to Canada, for . . . 74.6 per cent of the continental immigrants to the Dominion came from southern and eastern Europe and Syria. . . . The immigration of poor and homeless British children to Canada began many years ago, and is now encouraged and supervised, but not otherwise assisted, by the Dominion government. This juvenile immigration is chiefly recruited from the orphan or industrial homes of the British Isles. The children are sent to Canada by charitable and religious organizations, and are there distributed through various philanthropic homes and agencies. . . . It is estimated that during the . . . fifty years [preceding 1909] nearly 60,000 juvenile immigrants . . . [were] transported to Canada from the British Isles. . . . In addition to [this] . . . juvenile immigration, . . . Canada annually receives a considerable number of British, and particularly English, immigrants, who, by private charity or state aid, have been sent from the mother country. Until [1908] . . . the Canadian government had practically no part in the selection of such immigrants abroad, and as a result many were rejected at Canadian ports or deported after landing. . . . [But] on April 18, 1908, there became effective an order in council which prohibited the landing in Canada of any person whose passage had been paid wholly or in part by any charitable organization or out of public moneys unless the emigration to Canada of such person had been approved by the Canadian emigration authorities in London."—*Immigration situation in Canada* (Reports of the Immigration Commission, 61st Congress, 2nd Session, Document no. 469, pp. 9-10, 15, 18, 25-26).—See also RACE PROBLEMS: 1003-1908.

1904.—Hostility of organized labor towards Asiatic immigration.—Imposition of head tax on Chinese immigrants.—Its effects. See RACE PROBLEMS: 1880-1906; 1903-1908.

1909-1919.—Character and extent of immigration.—Difficulties of assimilation.—Statistics of Asiatic immigration.—Immigration law of 1919.—"In comparison with the number of immigrants for the period 1901-09, when 1,244,597 entered, the number for the next decade is even greater.

... Nine and a half years, ending October 31, 1918, are involved [during which], there came into Canada 2,040,358 people, an average of 214,775 per annum. . . . Prior to the summer of 1918, for a period of ten years, people were coming into our midst at the rate of about a thousand a day, and being somehow absorbed into the body politic. . . . [As a rule the foreign speaking immigrants have been in a very decided minority, but in 1913 they numbered 111,579 out of a total of 402,432 and in 1914 133,079 out of 384,978. In these figures] there is included a rapid increase in the German immigrants, 5,525 for the fiscal year 1914 ending March 31, more than twice the number for 1911 (2,530); a falling off in Austrian from 7,891 to 3,147, also in Galician from 3,553 to 1,698; a great increase in Hebrew (Russian) from 4,188 to 9,622; a tremendous increase in Italian from 8,359 to 24,722; a great increase in Polish-Austrian from 1,065 to 4,319; and a still greater increase in Russian from 6,621 to 24,485; and Ruthenian from 2,869 to 18,372; while the immigration from the United States actually diminished from 121,451 to 107,530. . . . From April 1, 1914, to March 31, 1915, there entered Canadian ports Austrians 502, Bulgarians 4,048, Germans 2,470, Hebrew-Austrians 160, Hungarians 218, Polish Austrians 1,272, Polish Germans 7, Turks 187; a total of 8,864. . . . Taking the first Canadian division as 33,000 officers and men who spent the winter of 1914-15 in England and in February proceeded to France—for every four soldiers who went out of our doors, one alien from enemy countries came in. . . . Not a large percentage of the total immigration enters as farmers or farm labourers, for since the total immigration, of the classes specified, for the period 1910-1918 is 2,009,190, and the total number entering as farmers or farm labourers is 682,175, the proportion is only 34 per cent., general labourers 26 per cent., mechanics 15 per cent., clerks and traders 5 per cent., miners 2 per cent., domestics 5 per cent., unclassified 13 per cent. . . . According to a special report of the census and statistics office in 1915 the foreign-born population of Canada in 1911 was given as 752,732 or 10.4 per cent. of the total population of 7,206,643, and this is worthy of a more minute analysis. If we go back to the beginning of the present century the total population of Canada, as given by the census of 1901, was 5,371,315. Of that number, 86.98 per cent., or 4,671,815, were stated to be Canadian born. In 1911, on the other hand, the total population was given as 7,206,643, and of that number only 77.98 per cent., or 5,619,682 were Canadian born. Hence in one decade the tide of immigration had reduced the percentage of Canadian-born from 86.98 per cent., to 77.98 per cent. Further, in 1901 the foreign-born population of 278,788 constituted but 5.19 per cent., but in 1911 the 773,247 foreign-born constituted 10.45 per cent. of the total. During the decade, then, the foreign-born population had increased from 278,788 to 773,247 or 177.4 per cent., while the total population had increased in the same period from 5,371,315 to 7,206,643,—an increase of 34.17 per cent. . . . [The World War affected immigration to such an extent that, from 400,000 in 1913, the numbers were reduced to 80,000 in 1918.] Taking the years 1871 and 1911 for purposes of comparison, the number of Canadian-born population about doubled; those from British Islands actually show a decrease up to 1901, and in 1911 only show an increase of about a half more than the number in 1871; those from British possessions increased three times, so that the total British born

increased from 3,388,835 to 6,433,396—that is, barely doubled. But those from Europe increased a little over fourteen times and those from the United States increased about four and one-half times. It becomes quite evident that during the last four decades the rapid increase in the population is due more to the influx from Europe and the United States than from any other source. And the total change from the population of 1871 to that of 1911 is influenced largely by people coming from the ends of the earth, composed of many races, speaking varieties of languages and dialects, and practising different customs. . . .

"While the Canadianization of the foreign-born is difficult enough in the cities of the East, it is much more acute both in urban and rural sections of the West. . . . While it is difficult to devise ways and means by which this may be avoided, or its results mitigated, the fact that there are colonies of Hutterites, Mennonites, Doukobors, Ruthenians, Scandinavians, Germans, Mormons, and others, scattered throughout the Western Provinces renders the work of bringing these people into the activities of public-spirited citizens well-nigh impossible. . . . And these colonies are not few nor small. Three of them have populations exceeding 60,000 persons, large numbers of whom cannot speak English at all and few speak it with any fluency. . . . One of the first difficulties in considering the extent and influence of immigration into Canada from Asia is the lack of adequate statistics. The census of 1901 reported in the Dominion 4,674 persons who were born in Japan, and 4,515 of these were in the province of British Columbia. Of Chinese there were 16,792 and the most of them were also in British Columbia. Since the total population of that province at that time was 178,657, the approximately twelve per cent. proportion of Asiatics was significant and also so unsatisfactory that in 1900 British Columbia passed an Immigration Act which practically excluded all Asiatics. In the following year, 1901, the Act was disallowed by Earl Minto, then Governor-General of Canada. . . . The province passed a similar Act in 1902, 1903, 1904 and finally in 1905, but all were disallowed. The Acts in succession rejected all illiterates, for the provisions of 1902 and 1903 required that an immigrant entering Canada should be able to read, and those of 1904 and 1905 required that the immigrant should also be able to write at dictation 'in the characters of some language of Europe a passage of fifty words in length in an European language.' . . . The rapidly-developing Hindu immigration received such a sudden check in 1909 as to practically eliminate that source, while Japanese were reduced to about one-fourth of the number of the preceding year. . . . Since [1910] . . . the stream has been only slowly regathering headway, while the Chinese . . . showed steady increase until the period of the Great War [33,036 arrived after 1900]. The wave from India increased in three years from forty-five to 2,623, while the whole population of the province [of British Columbia] had not yet reached 350,000. [See also INDIA: 1905-1922; RACE PROBLEMS: 1904-1913; 1913-1921.] Since 1900 about 18,000 Japanese have entered Canada, but the census of 1911 showed that only 9,021 gave their nationality as Japanese though during 1900-11 alone about 7,588 had landed. Yet 9,021 in 1911 is a considerable increase over 4,738 in 1901. But in 1911 out of those 9,021 there were 6,660 males of twenty-one years and over, of whom only 1,491 were naturalized and 5,208 alien. . . . Despite the fact that legislation on this con-

tinant has been adverse to the Chinese, . . . according to the census of 1911 there were in Canada 27,774."—W. G. Smith, *Study in Canadian immigration*, pp. 115, 117-120, 138, 140, 145-147, 156, 157, 159, 163, 165-166.—"The experience of the last decade showed the need for many improvements; so a new law was passed in 1919. This law in many ways reads like the United States law and includes many of its provisions, such as the literacy clause and the exclusion of certain classes of immigrants."—J. W. Jenks and W. J. Lauck, *Immigration problem*, p. 266.—See also CANADA: 1908-1919; 1913-1919.

1920.—Restriction of immigration.—"During the winter of 1920-1921, when the industrial depression which had been sweeping over the world struck Canada . . . [in order to restrict immigration] the amount of money needed in the case of a man over eighteen years of age was raised to the sum of \$250. In case he had a family, he himself had to have \$250, the other members of his family over eighteen, \$125 each and \$50 was required for each child five to eighteen years of age. Under certain conditions exemptions were granted to these requirements."—J. W. Jenks and W. J. Lauck, *Immigration problem*, p. 270.—An agreement with Japan, of 1908, puts a check on Japanese immigration, by limiting the number to 400 yearly. Hindus are excluded by means of a provision in the Canadian immigration law which requires that immigrants must come to the Dominion by a continuous journey from the country of which they are natives and upon through tickets purchased in that country. There are no steamship lines operating between India and Canada.

Immigration of Hindus. See KENYA COLONY.

ENGLAND

1881-1901.—European immigration.—No question of the restriction of immigration arose in Great Britain until the end of the nineteenth century. Large numbers of immigrants had been received into the country at various times, as for instance the Flemings who introduced woolen manufacture in the fourteenth century. Large numbers of French Huguenots arrived as early as Elizabeth's reign, and again after the revocation of the Edict of Nantes. A certain number of Germans from the Palatinate settled in England in the eighteenth century. But these people were easily absorbed into the population, and after the first strangeness of their appearance wore off were scarcely noticed. It was otherwise with the newcomers of the late nineteenth century, who, unlike their earlier predecessors were for the most part extremely poor, and were prone to settle in colonies in the very poor sections of the large cities. "For the sake of convenience the statistics of the alien inhabitants of the United Kingdom may now be set out. The following figures indicate their growth since 1881:—

	Total population	Aliens	Increase
1881.....	34,884,848	135,640	.....
1891.....	37,732,922	219,523	83,883
1901.....	41,458,721	286,925	67,402

The distribution is unequal, England and Wales having 247,758 of the total in 1901; this represented 7.6 per 1,000 of the population, compared with 6.8 in 1891 and 4.5 in 1881. The vast majority are of European nationality, some 20,000

only, of whom 18,311 were Americans, being non-European in England and Wales in 1901. . . . The main increase was in the Russians and Poles, who in England and Wales numbered 14,468 in 1881, increasing to . . . 82,844 in 1901. There is no religious census in the United Kingdom, but it is certain that the majority of the Russians and Poles are Jews. The total alien population was composed of 174,786 males and 112,139 females in 1901. . . . Children born in England of foreign parents domiciled here are British. . . . The uneven distribution of the aliens in England, [is] the cause of the whole problem. . . . Nearly half of the alien population in 1901 was to be found in six Metropolitan boroughs, and Manchester, Liverpool and Leeds. In London the aliens represented 30 per 1,000 of the population, in Manchester 22 per 1,000, and only in eleven other towns and cities did they exceed 10 per 1,000. London had over half the Russians and Poles, 53,537, no fewer than 42,032 being on Stepney; over half the Germans, 27,427; over half the Austrians, 6,189; just about half the French, 11,264; nearly half the Italians, 10,889; but less than a quarter of the Americans, 6,244. In the East End Borough of Stepney, which includes in its boundaries the oft-mentioned districts of Whitechapel, Spitalfields, Mile End, St. George's-in-the-East, Limehouse and Wapping, were to be found 54,310 of the 135,377 foreigners in the Metropolis; this represented 182 per 1,000 of the population, so that, despite the perpetual cry of Stepney being a 'foreign city' over four-fifths were native. In 1881 there were 15,998, or 57 per 1,000 in Stepney, and in 1891, 32,284, or 113 per 1,000."—M. J. Landa, *Alien problem and its remedy*, pp. 58-61..

1905-1909.—Aliens Act.—Restrictions on admission of aliens.—New policy.—Until 1905, England offered practically an open door to the aliens who sought either a permanent home or a temporary residence on her island soil. But some years before that date a growing criticism of such unconditioned hospitality was begun. A select committee of the House of Commons "to inquire into the laws existing in the United States and elsewhere on the subject of the immigration of destitute aliens, and the extent and effect of such immigration into the United Kingdom" reported in 1889 that "the alien population was not numerous enough to create alarm," and that it was "not prepared to recommend restrictive legislation at present," but saw "the possibility of such legislation becoming necessary in the future." In 1902, a royal commission was appointed, "to inquire into—(1) the character and extent of the evils which are attributed to the unrestricted immigration of aliens, especially in the Metropolis; (2) the measures which have been adopted for the restriction and control of alien immigration in foreign countries and in British colonies." The commission produced an elaborate report in 1903. Reviewing the hospitality of the past, it found that the migrant aliens of former generations had made the English people "their debtors"; but they were of a different stamp from the immigrants of the present movement, which "may be said to have begun about 1880, and is drawn mainly from the Jewish inhabitants of Eastern Europe." The causes of this exodus have been partly economic and partly due to oppressive measures; and the result of the commission's investigation of it was the expressed opinion that "in respect of certain classes of immigrants, especially those arriving from Eastern Europe, it is necessary in the interests of the state generally, and

of certain localities in particular, that the entrance of such immigrants into this country and their right of residence here should be placed under conditions and regulations coming within that right of interference which every country possesses to control the entrance of foreigners into it. Such regulations should, in our opinion, "be made in order to prevent so far as possible this country being burdened with the presence of 'undesirable aliens' and to provide for their repatriation in certain cases. But we think that the greatest evils produced by the presence of the alien immigrants here are the overcrowding caused by them in certain districts of London, and the consequent displacement of the native population. We therefore think that special regulations should be made for the purpose of preventing aliens at their own will choosing their residence within districts already so overcrowded that any addition to dwellers within it must produce most injurious results. On this point the commission recommended specifically that if it be found that the immigration of aliens into any area has substantially contributed to any overcrowding, and that it is expedient that no further newly-arrived aliens should become residents in such area, the same may be declared prohibited area.

"We are also of opinion that efforts should be made to rid this country of the presence of alien criminals (and other objectionable characters)." An act embodying substantially the recommendations of the commission passed Parliament in 1905. Both the act and the administration of it have been criticised since, as lacking stringency. "To begin with, the regulation of alien immigration is confined, practically, to the traffic between the United Kingdom and ports in Europe or within the Mediterranean Sea. . . . A foreigner may enter this country unchallenged—if he comes from an 'extra-European' port (with some exceptions); if he is a cabin passenger; if he is an exempted second-class passenger; if he is a transmigrant; if he is a passenger in a ship containing fewer than 21 'alien steerage passengers.' Then also, though nominally a subject for inspection, he is not called upon to satisfy the full requirements of the Act, if he is proceeding to a destination outside the United Kingdom; if he holds a return ticket; if he is a seaman; if he is fleeing from religious or political persecution."—*Times* (London), Feb. 9, 1909.—See also **Jews**: England: 1885-1905.

1914-1919.—**Alien Restriction Bill**.—Alien law.—Restriction of immigration was provided for by the Aliens Restriction Bill, 1914, and otherwise practically effected during the World War. In December, 1919, a new alien law received the royal assent which largely continued all the war restrictions and added others, such as limiting the proportion of aliens that might be employed to 10 per cent of the total employees of any person, firm or company in business. But no alien who was member of a trade union was to suffer in any way for taking part in a strike.

## FRANCE

1870-1919.—Effect of immigration.—"With her stationary population and her finely organized industries, France, in the years before the war, had become an outstanding country of immigration. Belgians have long poured over the northern border and for decades led all migrants into France. Luxemburgers, Germans, Swiss, Spaniards in large numbers have penetrated for varying distances into the interior. Yet in nearly every field of labor, the

Italians, in recent years, have held a place second to no other foreign nationality. In agriculture and forestry, occupying many immigrants, they have been about 40 per cent; Belgians and Spaniards together, the next largest groups, not much exceeding them. In manufacturing, their chief sphere, they have again been 40 per cent. In transportation they have been nearly two-thirds of all foreigners; in trade more than one-third; in domestic service, a little less than one-third, Germans and Belgians following closely. . . . For fifty years [prior to 1919] a diminution of all kinds of agricultural workers has taken place in France. The rural exodus, whatever its compensations, has caused deep concern to the nation; and a rural immigration from neighboring countries has brought only partial alleviation. Among the arriving helpers, the Italians have been second to no other, and probably have been, in number, three-quarters of all. . . . To the Alpes-Maritimes some 15,000 a year have come, from Liguria and Piedmont, Umbria and Tuscany. Five or six thousand, mainly women and children, have sufficed for the winter's work entailed by a production of 100,000 hectoliters of olives. Some have later been used for gathering, successively, violets, roses, jasmines, and other flowers, destined to adorn the toilettes of the women of Paris and Berlin. Working in gangs in the autumn and winter, others have prepared the soil for the flowers, and have returned home in the spring. . . . In Var, especially in the harvest season, the Italians have become more and more numerous, the men being employed in digging and the vintage, the women in flower-gardening and in gathering vegetables. After some years of effort they have often bought or rented bits of land, cultivating upon their own account while at the same time hiring out to others. . . . In that other littoral department of the old Province, Bouches-du-Rhône, the Italians have been the successors of the mountain folk who once came for the harvest from Aude and Hérault. Many have become permanent residents. Digging, and draining marshes—standing in the water and toiling at all hours—helping in the harvests, they have made themselves almost essential for much of this work. For the vintage they have come by trainloads. 'To them,' says a French witness, 'we owe the transformation of the Camargue into a wine country—a veritable agricultural *tour de force*.' In the hilly parts, they have gathered olives, and in the oil factories they have been welcomed as a convenient substitute for French labor. To Aude and Hérault, also to Gard, many thousands have come. Though the Spaniards have been the chief vintagers, the Italians, by their arduous labor in grading, drainage, and irrigation, have rendered great services to the viticulture of Languedoc. They have partly taken the place of workers who disappeared during the phylloxera crisis a quarter century ago. . . . While dealing with the South of France, it cannot be amiss to consider the strange situation of Corsica. To this department, subject to an unremitting emigration of its own sons, many thousands of Italians have come annually for a six months' stay, spreading in gangs over the island. Perhaps as many as 25,000 have taken up permanent residence. Since the native population has no love for toiling in the fields the sad truth emerges that the cultivation of Corsica is almost entirely the work of foreigners. . . . In the Basses-Alpes and Vaucluse numerous Italians have found employment. The Piedmontese long migrated into the East of France, even as far as the Nièvre, to carry on the exacting forestry operations of the Côte-d'Or,

as well as the general work of agriculture; but they have now ceased to come, preferring the South. In the Savoies, the heavy Italian immigration of former years has been declining. . . . [In Marseilles the Italian colony before the World War numbered 125,000. In Paris there were 34,000. There were large colonies in Toulon, Lyons and other cities. It is however in the Briey district that their presence is most strongly felt.] The Briey district—to describe it as it was before the German invasion of 1914—has been nearly everything that Marseilles has not been. Composed of men workers, never women, of men regarding themselves as only temporarily in France, it is a community that has grown with astonishing rapidity, and wholly in recent years. . . . What has been rare in France, the great expansion of the population of a department, happened in Meurthe-et-Moselle. Cities sprang up as if by magic. Tranquil villages burst their bounds and became bustling centers of life. . . . But they were not French cities: they resembled rather the mining towns of our own American West. For the French countryfolk held aloof from them, and the miners who came from the coal fields were few. Natives of France were presently (it was claimed) only a fifth of the workers; 15 per cent more were of various nationalities, and all the rest—nearly two-thirds of all—were Italians. In the entire department of Meurthe-et-Moselle, there had been in 1901 only 6000 of these immigrants. Early in 1910, an estimate put them at 30,000. By the middle of 1913, they were 46,755 in a foreign population of 74,073, representing some eighteen nationalities. To these might be added some 1500 living in the department of the Meuse, because it belongs to the same industrial area.”—R. F. Foerster, *Italian emigration of our times*, pp. 130-133, 138-139.

### GERMANY

1850-1919.—Immigration of workers.—Before the World War Germany was a country of immigration rather than of emigration, owing to the rapid development of her industry. Sometimes this immigration was to the manufacturing centers; sometimes it replaced the agricultural workers who had been drawn into the towns. In 1871 there were only 206,755 foreigners within the German Empire; in 1890 the number had risen to 433,254, in 1900 to 778,773, and in 1910 to 1,259,880. Meanwhile emigration was declining. The number of emigrants in 1880 was 221,000, the highest point ever reached; in 1913 it was only 25,843.”—United States Department of Labor, *Monthly Labor Review*, Dec., 1919, pp. 375-376.—“Although the Italians, bent on settlement or trade, have migrated into Germany for twenty centuries, the modern immigrants are successors of the old only in point of time. Their coming has a new origin, a new character. . . . As early as 1860 some hundreds of Italians worked in the mines of Westphalia. In South Germany there were a larger number. . . . In the West, the industrial heart of the country, they increased rapidly. . . . After 1805, and again after the depression of 1901-1902, a great and sudden addition to their numbers took place, and finally in 1906-07, a high point was reached which has not since been exceeded. . . . [In 1880, 7,841 were counted; in 1910, 104,204.] But the figures all refer to December, when many, if not most, of the Italians were again at home with their families. Of those present in Germany in the summer . . . an estimate of 175,000 for recent pre-war years would

not err far from the truth. . . . The industrial census of 1907 found no less than 121,000 Italians, mainly unskilled workers, engaged in manufacturing, mining, and building. In mining and smelting there were 23,000, constituting 3.7 per cent of their kind in Germany. In stone and earthwork there were over 30,300, who formed 5.7 per cent of all those of their occupation. In the building trades were 57,400. . . . In two respects, the immigration of Italians into Germany has been strikingly unlike that into France. It has not colonized in the great cities. Berlin and Cologne have not been centers, like Marseilles and Paris, where Italians have settled to reside and work, spending winters as well as summers. . . . In Germany, as in France, the women and children of the Italians have halted mainly in the South, in parts nearest to their own country. . . . In Upper and Lower Bavaria and in Swabia, there have been perhaps a thousand furnaces, where from the end of March to the second half of September, 12,000 to 15,000 Italians have in recent years found employment, constituting half or two-thirds of the whole labor force. . . . It is into the west of Germany, above all other sections, that the Italians have gone . . . [to work in the coal and iron mines, the textile and other factories]. All these together, and a network of railways and navigable streams, have constituted the magnet which before the war drew more than a hundred thousand Italians a year to Westphalia, Rhenish Prussia, and Lorraine. . . . Before 1850, the local population was sufficient to work the coal mines of the Ruhr. With an enlarged scale of exploitation and the establishment of iron mills, workers were drawn from the farms, from remoter sections of Germany, and from foreign lands. . . . It is not, however, the few thousands of coal miners who have made of the Ruhr and the lower Rhine the region—after Lorraine—where the Italians have most congregated. The 50,000-100,000 unskilled or low-skilled laborers, largely Venetians and Lombards, who in each of the last fifteen summers before the war came to these states, did their work of excavation, loading, unloading, and the like in manifold connections.”—R. F. Foerster, *Italian emigration of our times*, pp. 151-158.—“During the last three decades large numbers of Poles have migrated to the industrial districts of Western Prussia. At the census of 1890, 28,391 Polish-speaking people were counted in the Rhenish province and Westphalia. By 1900 they had increased to 113,869 and by 1910 to 247,028.”—J. E. Barker, *Thoughts on the future of Poland* (*Polish Review*, Jan., 1918).

### LATIN AMERICA

1890-1914.—European immigration.—Its influence. See LATIN AMERICA: 1890-1914; 1910; 1910-1914.

### NEW ZEALAND

1870-1890.—Effects of the discovery of gold on immigration. See NEW ZEALAND: 1870-1890.

1901-1920.—Emigration from Great Britain and Australia.—Cessation of immigration assistance.—“Immigration to New Zealand in recent years has been largely a movement of population from Australia, although a considerable number from the United Kingdom have been admitted annually. . . . Three-fourths of the immigration to New Zealand from 1901 to 1908, inclusive, was from Australia, 17.2 per cent was from the United Kingdom, and only 6.6 per cent

from all other countries. . . . During the period of 1901-1908 the immigration movement to New Zealand was composed of 180,470 males and 91,420 females, indicating that the movement was largely one of individuals rather than families. . . . In common with Australia, New Zealand has experienced an oriental immigration problem, and in 1907 the Dominion Parliament passed an act which required 'that any Chinese proposing to land in the Dominion shall be able to read a printed passage of not less than 100 words in the English language.' This provision was incorporated in the immigration restriction act of 1908 [and applies to all Asiatics]. . . . The policy of assisted immigration was discontinued by the Government of New Zealand in 1890, and since that time there has been no free immigration. However, the Government still continued to arrange with the shipping companies for reduced fares for desirable settlers."—*Immigration situation in other countries (Reports of the Immigration Commission, 61st Congress, 3rd Session, 1910-1911, Senate Document, v. 22, no. 761, pp. 188-189)*.—An immigration law passed in 1920 is intended to exclude Asiatics, Bolsheviki and other persons regarded as undesirable. The framers of the law had to face certain difficulties arising from the relation of the Dominion to the British Empire as a whole chiefly because of the fact that the Hindus are British subjects, a complication which also applies to some Chinese. The problem of the Japanese has never been pressing in New Zealand; but the New Zealanders, who have in effect adopted the Australian "white" policy desire to keep out all Asiatics, not only because by reason of racial and religious differences they are not easily absorbed; but because their standard of living is low, and on the whole their presence tends to create social problems. The poll tax on Chinese and the literary test referred to above had proved comparatively efficacious until early in 1920 when the entrance of upwards of 475 Chinese and about 175 Hindus provoked a law which practically provides for complete exclusion.—See also RACE PROBLEMS: 1904-1913.

### SOUTH AFRICA

1860-1918.—European immigration.—Asiatic immigration problem.—"South Africa has never attracted a large immigration. Most of those who have gone as immigrants have been from the British Isles. Only in one year since 1903 has immigration gone over the 50,000 mark. In 1913, 14,251 immigrants entered the Dominion; in 1914, 9,047; in 1915, 5,158; in 1916, 3,846; in 1917, 2,079; in 1918, 4,565 new arrivals. During the ten years [prior to 1918] there has been a tendency for Russians, Belgians, Germans and Scandinavians to go to South Africa. In common with Canada and Australia, South Africa has given State-aided passage. This is limited almost entirely to family domestics and the wives and the families of Europeans settled in the country. South Africa's immigration law places no serious obstacles in the way of white immigrants. They must, however, be people of good health and character and have visible means of support. Each individual must have £20 in his possession. . . . The Minister of the Interior, under the Act of 1913, is empowered to certify as prohibited immigrants, persons or classes of persons whose presence from economic or other reasons is considered undesirable. This in many ways is an elastic clause, very similar to the Canadian law, which gives the executive part of the government a free hand

to meet emergencies arising through the immigration of undesirable groups or races. Very full powers are given to the immigration authorities, not only at the port entry, but also at places within the dominion and on the border. The numbers of people excluded from year to year has not been very large and has consisted mostly of East Indians. . . . South Africa and the various provinces which make up the Dominion have had very serious difficulties with the Asiatics. The most serious difficulties have centered in Natal and the Transvaal. In 1911, there were 152,309 Asiatics in the Dominion, of whom 149,791 were East Indians, 133,439 of whom resided in Natal. Indentured Indians were brought into Natal in 1860 in order to meet the needs of labor in that province. This policy was followed with some interruptions until 1911, when it was stopped. . . . In 1895 an annual tax of £3 was put upon each Asiatic. Later restrictions culminated in riots. Still later this tax was abandoned. . . . Transvaal has also had serious difficulties. The first law passed against Asiatics was in 1885, which required them to register and pay a tax of £25 within eight days of their arrival in the republic. This was later reduced to £3. . . . As a result of these difficulties, the Transvaal placed all Asiatics under certain political disabilities in respect to the franchise and also debarred them from holding land. The Orange Free State . . . has succeeded in practical exclusion. This State also requires registration. The Cape of Good Hope also restricts the Asiatic. In 1904, the Cape passed a Chinese Exclusion Act, later a law requiring the registration of all Asiatic male adult residents. In 1913, a dominion law was passed prohibiting the admission from overseas of any more Asiatics, except wives and young children of those already domiciled there. South Africa also restricts Asiatics now resident there to the provinces of which they are resident."—J. W. Jenks and W. J. Lauck, *Immigration problem*, pp. 287-290.—See also RACE PROBLEMS: 1903-1908; SOUTH AFRICA, UNION OF: 1896-1897 (May-April).

### SWITZERLAND

1872-1919.—Rôle of immigration in economic development.—"When the St. Gothard tunnel was started, in 1872, Italian laborers undertook the work of construction and, nine years later, saw it completed. In 1880, there was a winter population of 41,500 [immigrant Italians]. . . . In the years 1890-1900, amid revival of construction work, they resumed their coming, and in the last winter of the century 95,000 were present. . . . Growing industrialization and an ever-swelling tourist business, demanding the construction of factories, power works, railway lines, and hotels, had made of Switzerland one of the great labor markets of Europe. The half million and more foreigners discovered by the census of 1910 were nearly 15 per cent of the population; in some cantons they were 30 or 40 per cent. So, for this mountainous Old-World land, immigration has had the same proportional importance as for the United States. In the previous decade, in fact, foreign settlers and births in the foreign stock had increased the population more than half as much as it was increased by Swiss stock. The Germans and the Italians together comprised in 1910 four-fifths of the foreigners and were about equally represented, numbering more than 200,000 each. Italian citizens

alone were about 6 per cent of the entire population. . . . In Geneva they were over 21,000, exceeded only by the French. . . . In no other country of Europe is Italian immigrant stock so large a factor. . . . It is an extraordinary situation. In the economic development of modern Switzerland, more and more during the last thirty or forty years, these immigrants have played a remarkable rôle. In construction work alone, their prime field, they had, when the industrial census was taken, a contingent of 65,000 in a total of 85,000 foreigners, and were actually one-third of all the workers employed, of whatever nationality, including the Swiss. In manufacturing, there were 20,000 more. In the two industries together, Italian wage earners numbered 77,500. The 44,000 of these employed in railway work, on roads and bridges and on elevated and underground structures, were certainly a great majority of all engaged in such work in the country."—R. F. Foerster, *Italian emigration of our times*, pp. 171-172, 174.

### UNITED STATES

1790-1869.—Estimated immigration from 1790 to 1820.—Nationality of early immigrants.—Commencement of official returns.—Causes of migratory movement.—"A distinction has been made, and with reason, between those who took part in building the political framework of the thirteen colonies and of the Federal Union, and those who have arrived to find the United States Government and its social and political institutions in working operation. The former class have been called colonists, the latter are immigrants proper. In discussing the immigration question, this distinction is important; for it does not follow that . . . those who have built up a complicated framework of nationality have no rights as against others who seek to enjoy the benefits of national life without having contributed to its creation. The number of persons in the country at the date of the Revolutionary War is not accurately known. . . . The first census of the United States, in 1790, gave the total population as 3,929,214; but, as has been pointed out by Professor F. B. Dexter, this number does not include Vermont or the territory northwest of the Ohio River, which, he says, would make the total over 4,000,000. The first records of immigration begin with the year 1820, and, although the number of immigrants who arrived in the United States from the close of the Revolutionary War to 1820 is not certain, it is estimated by good authorities at 250,000. It is difficult to ascertain the number of immigrants from the various countries in the early part of the nineteenth century. The number from Great Britain increased from 2081 in 1815, to 34,787 in 1819, after which it diminished to 14,805 in 1824. In the year 1820, out of a total immigration of 8385, the United Kingdom furnished 6024. Germany was second with 968; France third with 371; and Spain fourth with 139. The total immigration from the other parts of North and South America was 387. . . . After the birth of the United States as a separate nation, colonization in the earlier sense ceased entirely. European nations could no longer send out their own citizens and form communities directly dependent upon themselves and subject to their own jurisdiction. The immigration of the nineteenth and twentieth centuries, therefore, differs widely in character from the colonization of the seventeenth and eighteenth centuries. With the year 1820 the official history of immigration to the United States begins; for it was then that collectors of customs at our ports

were first obliged to record the arrival of passengers by sea from foreign countries. The record included numbers, ages, sexes, and occupations. Before 1850 no distinction at all was made between travellers intending to return and immigrants intending to remain. Although still comparatively small, immigration increased from 8385 in 1820 to 22,633 in 1831. The first marked rise took place in 1827 and 1828, following the commercial depression in England in those and in the previous year. From 1831, with the exception of the period 1843-1844, numbers continued steadily to advance until they reached totals of 104,565 in 1842, and 310,004 in 1850. The most striking annual increases were from 114,371 in 1845 to 154,416 in 1846, and 234,968 in 1847. These sudden movements of population were chiefly due to hard times in Europe, and especially in Ireland, a cause which, with the Revolution of 1848 in Germany, continued to operate until 1854, when a total of 427,853 was reached—a figure not again attained until nearly twenty years later. With the year 1854 the tide began to beat less fiercely; immigration decreased steadily until, during the first two years of the Civil War, it was below 100,000. But in 1863, a gradual increase once more set in and in 1869, 352,768 persons landed. During the whole of this period the only immigration of importance came from Europe and from other parts of America. Immigration from Asia, which began in 1853, consisted in the largest year, 1854, of 13,100 persons. In 1869 the ethnic composition of immigration commenced in a marked way to change, and considerations which apply to the earlier years do not necessarily hold for those from 1870 to the present time. For this reason the period is made to end with 1869."—P. F. Hall, *Immigration and its effect upon the United States*, pp. 3-7.—"The decade of the twenties was one of great industrial activity on the part of the American people. Manufactures increased. The Erie Canal was completed, others were commenced, and there was a fever of excitement about them. The first railroads were projected, and vied with the canals in arousing public enthusiasm. There was a vast movement of population westward, and the Ohio River was a busy thoroughfare. All of these enterprises aroused a demand for labor, which . . . the native population would not readily supply. By the middle of the decade the stream of immigration had begun to respond, so that in 1825 the number of arrivals for the year reached the ten thousand mark for the first time since statistics had been collected. By the end of the decade the number had more than doubled . . . and in the year 1842, 104,565 [arrived and for] the first time the hundred thousand mark had been reached. Such an enormous increase in immigration as this could not fail to have its effect upon the social life of the nation, and to attract widespread attention. Coupled with the changing nature of industry, it brought many new problems before the American people—congestion, tenement house problems, unemployment, etc. . . . Yet during the twenties it seems that the immigrants were, on the whole, in good favor. . . . The hard manual labor on the construction enterprises of the period was mainly performed by Irish laborers, who flocked over in great numbers, constituting the largest single element in the immigration stream, amounting to probably nearly half of the entire number. It was believed by many Americans, as well as by foreign travelers and observers, that the canals and railroads could never have been built without these sturdy Irishmen."—H. P. Fairchild, *Immigration*, pp. 62-63.—See also JEW:

United States: 17th-18th centuries; IRELAND: 1847-1860; U.S.A.: 1865-1872.

1835-1915. — Immigration legislation. — "In earlier days neither the Federal Government nor State governments had passed any laws to protect the United States against the immigration of undesirable persons of whatever kind. Even the energetic action of those promoting the so-called 'Native American' or 'Know Nothing' movements, from 1835 to 1860, resulted in no protective legislation. Indeed, these movements were largely based on opposition to the immigration of Catholics rather than to that of persons undesirable for other reasons. In 1836 the Secretary of State was requested to collect information respecting the immigration of foreign paupers and criminals. In 1838 the Committee on the Judiciary of the House of Representatives was instructed to consider the expediency of providing by law against the introduction into the United States of vagabonds and paupers deported from foreign countries. Moreover, a bill, presented on the recommendation of the Committee, proposed a fine of \$1,000, or imprisonment for from one to three years, for any master who took on board his vessel, with the intention of transporting to the United States, any alien passenger, who was an idiot, lunatic, one afflicted with any incurable disease, or one convicted of an infamous crime. The bill, however, was not considered. The early 'Native American' movement had been local, confined to New York City at first, afterwards spreading to Philadelphia, but in 1852 the secret oath-bound organization that took the name of the American Party, the members of which were popularly called the Know Nothings, came into national politics, and for a few years exerted not a little power, carrying nine State elections in 1855. Later, in something of a reaction against this 'Know Nothing' movement, which finally proposed only the exclusion of foreign paupers and criminals, there was a definite effort made to encourage immigration. In 1864, on the recommendation of President Lincoln, a bill encouraging immigration was passed. In 1866 a joint resolution condemned the action of Switzerland and other nations in pardoning persons convicted of murder and other infamous crimes on condition that they would emigrate to the United States, and in 1868 the encouraging act was repealed. Some of the States had provided for the collection of money to support immigrants who had become public charges; but these laws were finally declared unconstitutional by the United States Supreme Court, and in 1882 the first Federal Immigration Law was approved. This forbade convicts, except political offenders, lunatics, idiots, and persons likely to become public charges, to land."—J. W. Jenks and W. J. Lauck, *Immigration problem*, pp. 42-44.—In 1885 "a law forbidding the importation of contract labor was passed. It made no provision, however, for inspection or the deportation of contract laborers. The defect . . . was remedied [in 1887] by an amendment giving the Secretary of the Treasury the right to enforce its provisions, [and in 1888] another amendment provided for the deportation within a year of any immigrant landed contrary to the law of 1885."—*Selected articles on immigration, in Debaters' Handbook* (M. K. Reely, comp.), p. 63.—"During the following years there was considerable agitation for further restriction or regulation, which culminated in 1888 in the selection of the 'Ford Committee' by the House of Representatives. In the testimony before the committee it was shown that sometimes immigrants coming

by steamer to Quebec, within forty-eight hours of their arrival, applied for shelter in the alms houses of the State of New York, and like cases of gross abuse existed by the thousands. No further legislation, however, was enacted until 1891, when a bill was passed which added to the excluded classes persons suffering from a loathsome or dangerous contagious disease, and polygamists, but from that time on there has been an earnest effort to protect the United States against such undesirable immigrants. . . . Under the law of 1891 the office of Superintendent of Immigration was authorized, and for the first time Federal control of immigration was completely and definitely established. . . . Notwithstanding the new law, however, the question of immigration continued to receive attention in Congress, and was extensively agitated throughout the country; a strong movement for restriction being developed, owing to the industrial depression, 1890-1896, and the general curtailment of employment. [See also U.S.A.: 1896-1897.] Extensive investigations were also conducted by joint committees of Congress and by the Industrial Commission, but with the exception of an amendment to an appropriation act in 1894, raising the head tax on immigrants from 50 cents to \$1.00, no immigration legislation was enacted until 1903. . . . The final report of the Industrial Commission, containing recommendations relative to immigration legislation, was submitted to Congress on February 20, 1902, and shortly afterwards a bill was introduced in the House which was substantially in accord with the recommendations made.\* The principal object of the bill was to codify in concise form all immigration legislation previously enacted, from the act of March 3, 1875, to the act of 1894, and to arrange the legislation in regular order and sequence according to the specific subjects dealt with in the bill. When the Industrial Commission bill was before the House, an amendment was added providing for the exclusion of all persons over 15 who were unable to read the English language or some other language, excepting the wives, children under 18 years of age, and parents and grandparents of admissible immigrants. . . . Besides eliminating the educational test, and raising the head tax from \$1 to \$2, the Senate also added provisions making it unlawful for any person to assist in the unlawful entry or naturalization of alien anarchists, all of which amendments were accepted by the House. . . . From the act just mentioned until the act of February 20, 1907, Congress did not enact any laws of general importance affecting immigration. On February 14, 1903, the Department of Commerce and Labor was established, and the Commissioner-General of Immigration was placed under the jurisdiction and supervision of that department. . . . A bill introduced by Senator Dillingham of Vermont, which provided for some important administrative changes in the immigration act of 1903, was reported from the Senate committee, March 29, 1906. . . . The head tax on immigrants was now to be \$5 instead of \$2, as formerly; imbeciles, feeble-minded persons, unaccompanied children under 17 years of age, and persons 'who are found to be and are certified by the examining surgeon as being mentally or physically defective, such mental or physical defect being of such a nature as may affect the ability of such aliens to earn a living,' were added to the excluded classes; the provision of the existing law excluding prostitutes was amended to include 'women or girls coming into the United States for the purpose of prostitution, or for any other

immoral purpose'; steamship companies were required to furnish lists of outgoing passengers; and the creation of a division of distribution in the Bureau of Immigration was authorized. In the Senate the bill was amended by the insertion of a literacy test which provided for the exclusion from the United States of 'all persons over 16 years of age and physically capable of reading, who can not read the English language or some other language; but an admissible immigrant or a person now in or hereinafter admitted to this country may bring in or send for his wife, his children under 18 years of age, and his parents or grandparents over 50 years of age, if they are otherwise admissible, whether they are able to read or not.' . . . [In the amended bill the head tax was reduced from \$5 to \$4.]—J. W. Jenks and W. J. Lauck, *Immigration problem*, pp. 331-335.—In 1913 a bill providing a literacy test, passed by both houses, was vetoed by President Taft, whose example was followed by President Wilson, when a bill to the same effect was introduced and passed in 1915.

1862-1913.—**Regulation of Asiatic immigration.**—"The Chinese began to come to California in the early 50's. At first they were welcomed, but when their competition began to be felt, restrictive legislation was demanded. Various [California] state laws were passed; . . . in 1855 a tax of \$55 was imposed on every Chinese immigrant. A state law prohibited all Chinese or Mongolians from entering the state. [This law which was passed in 1858], continued until 1876 when a decision of the Supreme Court of the United States rendered all state legislation unconstitutional and made the regulation of immigration a national function. [A treaty made in 1868 (Burlingame Treaty) denied rights of naturalization to Chinese but declared that] 'Chinese subjects visiting or residing in the United States shall enjoy the same privileges, immunities, and exemptions in respect to travel or residence as may there be enjoyed by the citizens or subjects of the most favored nations.' Following on agitation and the veto by President Hayes of a bill to limit the carriage of Chinese, by steamship lines, a new treaty was made with China in 1880. [See RACE PROBLEMS: 1880-1906.] . . . [In] 1882 a Chinese exclusion . . . [bill] providing that immigration of Chinese laborers should be suspended for . . . ten years, . . . was approved and became a law. [See LABOR LEGISLATION: 1864-1920.] . . . [Before the ten years Exclusion Act expired, on failure to ratify a treaty proposed by China, Congress passed a bill providing for exclusion of Chinese laborers, and in 1892] a law was passed continuing the law of 1882 for another ten years. [This Act provided for registration of all in the United States, and for deportation in case of non-registration within a year. (See U.S.A.: 1892: Chinese Exclusion Act.)] . . . [In] 1894 a new treaty was agreed to at the request of China. It provided for exclusion of all Chinese laborers for a term of ten years. Those going back were allowed to return here provided they had a wife, child, or parent, or property worth \$1000 in the United States. Registration was still required. This treaty covered practically the same ground as existing legislation . . . [all of which was reenacted by an Act of 1902 and again in] 1904 upon the refusal of China to continue the treaty of 1894. . . . [The Act of 1904 also extended] all legislation to insular possessions. . . . In 1906 the question of similar legislation against the immigration of Japanese came up. Bills introduced into Congress providing for an extension of Chinese Exclusion Act to embrace

the Japanese failed to pass, [and] the matter was finally settled by the passport provision in the general immigration law of 1907. [In] 1911, a treaty of commerce and navigation was entered into with Japan, of which the first article reads as follows:

"The subjects or citizens of each of the high contracting parties shall have liberty to enter, travel, and reside in the territories of the other, to carry on trade, wholesale and retail, to own or lease and occupy houses, manufactories, warehouses, and shops, to employ agents of their choice, to lease land for residential and commercial purposes, and generally to do anything incident to or necessary for trade, upon the same terms as native subjects or citizens, submitting themselves to the laws and regulations there established. They shall not be compelled, under any pretext whatever, to pay any charges or taxes other or higher than those that are or may be paid by native subjects or citizens. The subjects or citizens of each of the high contracting parties shall receive, in the territories of the other, the most constant protection and security for their persons and property and shall enjoy in this respect the same rights and privileges as are or may be granted to native subjects or citizens, on their submitting themselves to the conditions imposed upon the native subjects and citizens."—*Selected articles on immigration*, in *Debaters' Handbook* (M. K. Reely, comp.), pp. 267-270.—See also CALIFORNIA: 1900-1920; JAPAN: 1905-1914; RACE PROBLEMS: 1904-1909; 1913-1921.

ALSO IN: R. L. Buell, *Development of the anti-Japanese agitation in the United States (Political Science Quarterly, Dec., 1922)*.

1870-1910.—**Increase of immigration.—Effect of economic conditions.—Changed character and nationality of immigrants.**—"In the period from 1870 to 1905, immigration increased more than two fold. In 1870 the total immigration was 387,203 [see U.S.A.: 1870]; in 1903 it had reached the enormous number of 857,046, and, in 1905, the still more significant figure of 1,026,499. Directly after 1870 a time of industrial and commercial depression began, culminating in the panic of 1873. The barometer of immigration, always sensitive to such changes in the industrial atmosphere, began to fall, though there was no rapid movement until the panic was well under way. In fact, immigration increased to 459,803 in 1873; but it fell in the following year to 313,339 and then steadily diminished to 138,469 in 1878. [See also U.S.A.: 1880; Tenth census.] After this it very suddenly increased again, and in 1882 it reached 788,902—the largest immigration of any year except 1903, 1904, and 1905. A part of this sudden increase in 1882 and the two subsequent years, must be ascribed to the promulgation of the 'May Laws' by Russia, which caused large numbers of Hebrews to emigrate. Thus, immigration from Russia, exclusive of Poland and Finland, was nearly four times as great in 1882 as in 1881, and by 1890 was more than seven times as great. But, in addition to these special causes, there seems to have been a general advance all along the line of nations. One reason for this may have been the enactment by Congress of the first general immigration act of August 3, 1882, and the fear that this might be the forerunner of further restrictive legislation, a fear which has undoubtedly operated during the last two or three years. After 1882 numbers again diminished, making another low point of 334,203 in 1886. [See also U.S.A.: 1890.] Then an increase took place until the total reached 570,663 in 1892. In 1893 came the epidemic of cholera

in the East and quarantine regulations at various ports, followed by a period of commercial depression lasting from 1804 to 1808. As a result of these causes, immigration fell off largely, touching a minimum of 229,299 in 1808. [See also U.S.A.: 1900 (June).] From that year it rose by rapid strides to 648,743 in 1902; to 857,046 in 1903; to 812,870 in 1904; and to 1,026,499 in 1905. The total for 1905 was an increase of 26 per cent. over that of 1904; 58 per cent. over that of 1902; and 349 per cent. over that of 1808. The record for a single day seems to have been reached on May 7, 1905, when 12,000 immigrants entered New York inside of twelve hours. . . . It appears that the total immigration to the United States from the close of the Revolutionary War to 1905 was not far from twenty-three millions, a movement of population unprecedented in history. This was divided by decades as follows:

1821 to 1830 .....	143,439
1831 to 1840 .....	599,125
1841 to 1850 .....	1,713,251
1851 to 1860 .....	2,598,214
1861 to 1870 .....	2,314,824
1871 to 1880 .....	2,812,191
1881 to 1890 .....	5,246,613
1891 to 1900 .....	3,687,564
1901 to 1905 (five years) ....	3,833,076

Total, 1821-1905 ..... 22,948,297."

—P. F. Hall, *Immigration and its effects upon the United States*, pp. 7-9.—"The year 1905 broke all previous records in the history of immigration to the United States, the number of immigrants recorded for the twelve months ending June 30 being 1,026,499. But the numerical strength of the movement was not its most serious aspect: the character of immigration . . . [had] undergone radical changes in the past few years. . . . In 1905 the Slavic and Iberian countries of eastern and southern Europe furnished nearly three-fourths of the total. . . . The very high rate of illiteracy among immigrants from southeastern Europe, together with racial, social, religious, and political distinctions of a fundamental character, render them less assimilable, and therefore less desirable, than immigrants from northern Europe. . . . The general prosperity of America is undoubtedly the most important cause of immigration, for most of the immigrants come at the inducement of friends and relatives who have preceded them. Steamship agents testified in 1901 that from 40 to 55 per cent. of those who come to our shores have their passage prepaid by friends in this country; if to this be added those to whom money is sent from this side for the purchase of tickets abroad, the proportion taking passage at the expense of their friends would amount to about two-thirds of the whole. The facility of transportation and the activity of steamship agents are powerful aids to emigration, but they do not, in the long-run, determine its direction. Religious persecution, or rather anti-Semitism, which is a compound of religious persecution and race antagonism, is still [1905] an active cause of emigration from Russia, Austria-Hungary, and Roumania. These persecutions began in Russia about 1880 and continued for two or three years, when they ceased to some extent, but were renewed in 1891 and . . . continued off and on until 1907. In three months of 1900 more than 20,000 Jews left Roumania, in a most helpless and pitiable condition; and many of them had to be assisted to emigrate by the agents of the Baron Hirsch

Fund. . . . The most serious social problem presented by the immigration of recent years is the tendency of the foreign-born to congregate in the slums of the larger cities: in 1900, while making up only a little over one-eighth of the total population of the United States, they formed one-fourth of the total population of the cities and a much larger proportion in many places; thus the foreign-born formed 47 per cent. of the population of Fall River, 39 per cent. of Duluth, 37 per cent. of New York, 35 per cent. of Boston, 34 per cent. of San Francisco and Chicago. The tendency to congregate in the large cities is particularly marked among the Russians, Poles, Italians, and Irish. This accumulation of colonies in the great cities is the principal obstacle to the assimilation of immigrants which is the great desideratum. If they could be distributed more evenly throughout the country, the process of Americanization would go on much faster."—J. H. Latane, *America as a world power (American Nation Series, v. 25, pp. 285-291)*.

"Immigration from southern Italy commenced in 1871, but until 1877 less than a thousand a year arrived [in the United States]. . . . By 1880, the tales of returned immigrants had fired the imagination of those at home, and 5,000 a year sailed for America, while the decade 1906-1916 shows an enormous total of 2,109,974 Italians who have come here during these years, the largest numbers in 1907 and 1914, and the smallest number in 1916, because of the war. Of these two million Italians who have entered the country, 333,231 are Northern Italians and all the rest are from southern Italy and Sicily. Italians may now be found in every state of [the] Union and even in Alaska, Hawaii, and the Philippine Islands. The greatest concentration of Italian population is in the states of New York, Pennsylvania, New Jersey, Massachusetts, Illinois, California, Connecticut, Ohio, Rhode Island and Louisiana. New York City, with all its other race elements, contains approximately 600,000 Italians, making it, after Naples, the largest Italian city in the world."—A. Mangano, *Sons of Italy*, pp. 37-38.—"Migrating as families the Hebrews from eastern Europe are pretty evenly divided between the sexes. Their illiteracy is 26 per cent., about the average. Artisans and professional men are rather numerous among them. They come from cities and settle in cities—half of them in New York. . . . The first stream of Russo-Hebrew immigrants started flowing in 1882 in consequence of the reactionary policy of Alexander III. It contained many students and members of scholarly families, who stimulated intellectual activity among their fellows here and were leaders in radical thought. . . . Besides the Russian Jews we are receiving large numbers from Galicia, Hungary, and Roumania. The last are said to be of a high type, whereas the Galician Jews are the lowest. . . . In the '80's numerous rural colonies of Hebrews were planted, but, despite much help from outside, all except the colonies near Vineland, New Jersey, utterly failed. In New York and New England there are more than a thousand Hebrew farmers, but most of them speculate in real estate, keep summer boarders, or depend on some side enterprise—peddling, cattle trading or junk buying—for a material part of their income. The Hebrew farmers are said to number in all 6000."—E. A. Ross, *Old world in the new*, pp. 145-147.—See also JEWS: Rumania: 1856-1902; United States: 10th century.—"With the coming of the eighties the original contingent of Bohemians and Poles began to be overlaid by a much larger

volume of newcomers differing in various important respects from the old. In the first place, the later Slavic immigrants were largely of nationalities previously little represented in America. Since up to 1899 the American immigration data are classified only by 'country of last permanent residence' and not by nationality, it is not possible to get any precise measure of this change in the make-up of the Slavic stream. Neither can the beginning of the movement to America among the newer immigrant nationalities—Slovaks and Ruthenians, Slovenians and Croatsians, Bulgarians, Serbians and Russians—be dated in any hard and fast way. Apparently, as already said, the impulse spread from the Poles in Germany eastward to their brothers in Galicia in the latter part of the seventies, and to the Poles in Russia somewhat later. The Slovaks began to come in considerable numbers in the early eighties, and the Ruthenians at about the same time. . . . The South Slavs began to come to America somewhat later. . . . It was not till about 1892 that the movement became noticeably important among them. . . . It was not till toward the middle of the nineties that Croatsians, and especially Croatsians from the country back of the coast, began coming in numbers. Serbians and Bulgarians are still more recent comers, numerous only since 1902 or so, but growing rapidly. As to Russians, of 66,000 in the . . . years (1899 to 1909 inclusive), over nine-tenths came after 1902 and over two-thirds in the . . . year [1906-1909]. . . . The Teutonic element of the older immigration, to which the Bohemian was very similar, was not looking primarily for wage jobs, but for independence, especially the independence of the farm owner. The same was largely true of the British immigrants, English, Welsh, and Scotch. Besides, neither belonged, in any sense, to the class of cheap labor. The Irish alone were not enough to supply the demand for 'hands,' and French-Canadians, while an important element in New England, have not been numerous elsewhere. Italians and Slavs, proving most available, were consequently called in to meet the want. . . . Historically, the American origin of the more recent immigration, so far as such a movement can have a specific origin, seems to have been the desire of certain Pennsylvania anthracite mine owners to replace the employes that they found hard to deal with, and especially the Irish, with cheaper and more docile material. . . . In a number of places these raw recruits of industry seem to have been called in as the result of a strike, and there probably were plenty of instances of sending agents abroad to hire men or of otherwise inducing labor to immigrate either under contract or with an equivalent understanding. These proceedings were, of course, perfectly legal up to 1885, when the law forbidding the importation of labor under contract was passed. [See LABOR LEGISLATION: 1862-1920.] . . . An interesting account of the coming of the first Poles to the Connecticut valley farms of Massachusetts tells how here, as in Pennsylvania, the influx was in direct response to a demand on the part of employers: It was about twenty years ago [written in 1920] that the Poles were first brought to the Connecticut Valley. In the particular section under consideration, the farmers could not hire men and boys to work on their farms, or girls and women to assist in the household work. The demand was pressing. Charles Parsons of Northampton, who has since died, then a pushing, aggressive farmer, conceived the idea of going to New York and Castle Garden and there securing enough of the strong and

sturdy immigrants to meet the demand for farm and domestic labor. . . . The character of the later Slavic influx naturally produced a territorial distribution quite different from that of the older movement. The new immigrants, guided in the main by the chances of good wages rather than of cheap land, rapidly found their way to the points where there was a demand for their undaunted though unskilled labor. Once within the country, no contract labor law impeded the employers' agents, and men were drafted off to different places according as hands were needed in mine, coke oven, rolling mill, lumber camp, or, less typically, factory. Consequently, while the immigrants of the preceding period had mainly gone to the farming country lying north and west of Chicago, these later comers, answering primarily the call for labor in mines and related industries, found their center of gravity in Pennsylvania, and spread thence through the industrial districts, especially the industrial districts of the middle West, and above all to the various mining and metal-working centers throughout the country."—P. Davis, *Immigration and Americanization*, pp. 115, 156-157, 159, 161-162.—"While the Bohemians and the Moravians, thanks to a great intellectual awakening, have come nearly abreast of the Germans, the bulk of the Slavs remain on a much lower plane of culture. In ignorance and illiteracy, in the prevalence of superstition . . . in the subservience of the common people to the upper classes, in the low position of woman, in the subjection of the child to the parent, in coarseness of manner and speech, and in low standards of cleanliness and comfort, a large part of the Slavic world remains at the level of our English forefathers in the days of Henry the Eighth. According to mother-tongue, there were in this country in 1910, 941,000 Poles, 228,000 Bohemians and Moravians, 165,000 Slovaks from the southern slopes of the Carpathians, 123,000 Slovenes from the head of the Adriatic, 78,000 Croatsians and Dalmatians, 56,000 Russians, 40,000 Bulgarians, Servians, and Montenegrins, 30,000 Slavonians, 25,000 Ruthenians, to say nothing of 140,000 Lithuanians and Letts, who insist that they are a race apart. All told, there are 2,000,000 Slavs among us, and, if we heed the estimates of the leaders of the Slav groups, we should reckon at least 3,000,000. No doubt, between five and six per cent. of the whites in this country are of Slavic blood. Of the Slav arrivals since 1899 nearly three-fourth are males. Among the immigrants from the Balkans, the men are from ten to twenty times as numerous as the women. Thirty-two per cent. have been illiterates, the proportion ranging from 1.7 per cent. among the Bohemians to 53.4 per cent. among the Ruthenians. Excepting the Bohemians, few of them have had any industrial experience or bring any valuable skill. It is as if great numbers of the English of the sixteenth century had suddenly appeared among us. . . . When, about fifteen years ago, [written in 1914] the great Slav invasion began, the American frontier was remote, shrunken, and forbidding. The newcomers were not in quest of cheap land, with independence, so much as of paying jobs from which they might hoard 'big money' and return well off to their homes. They gravitated, therefore, to the mining, metal-working, and packing centers, where there is a demand for unlimited quantities of raw labor, provided always it be cheap. . . . What irony that these peasants, straight from ox-goad and furrow, should come to constitute, so far as we can judge from official figures, three-fifths of the force in sugar

refining, two-fifths of the force in meat-packing, three-eighths of the labor in tanneries and in oil refineries, one-third of the coal-miners and of the iron- and steel-workers, one-fourth of the workers in carpet-mills, and one-fifth of the hands in the clothing trade! On the other hand, they are but one-seventh of the labor force in the glass-factories and in the cotton-mills, one-ninth of the employees in copper-mining and smelting (who are largely Finns), one-twelfth of our railway labor, and only a handful in the silk and woolen industries."—E. A. Ross, *Old World in the new*, pp. 123-125.—See also WISCONSIN: 1832-1920.

1886-1914.—Aid to immigrants. See LEGAL AID: Origins; United States: Historical retrospect.

1897.—Immigration Bill vetoed by President Cleveland. See U. S. A.: 1896-1897.

1906.—Naturalization Act.—Amended in 1909, 1910, 1913 and 1918. See NATURALIZATION: United States.

ing this number with the very much greater number of those who are influenced by the economic motive, it is scarcely too much to say that at the present time the influence which is bringing so large a number of immigrants is the economic motive rather than any other. This economic motive, too, has to do primarily with the improvement of the living conditions of the immigrant, and not with an escape from a condition of threatened starvation. In the 40's, at the time of the potato famine in Ireland, many of the thousands who came to . . . [the United States] were in serious danger of absolute starvation if they remained at home. [See also IRELAND: 1840-1860.] . . . The effect of emigration upon the European countries has both an evil and a beneficial aspect. . . . The removal from the labor force of the nation at the period of greatest ambition and energy, if not of skill, of hundreds of thousands of their workers, can not but be detrimental, pro-

1907-1917.—Economic causes governing immigration.—Factors inducing immigration.—Immigration from southern and eastern Europe.—Transient immigration.—“So much sympathy was later aroused, especially during the revolutionary days of 1848 in Europe, for those who, struggling for a constitutional government in their home countries, failed and were obliged to emigrate, in order to escape political punishment, that this motive for immigration seems to most of us a force with greater influence than it, in fact, has exerted. It is probably the fact that, with the exception of the Pilgrim Fathers, possibly the Palatines, some of the Scotch-Irish in the early part of the eighteenth century [see U.S.A.: 1607-1752], and here and there a relatively few political refugees, the great mass of immigrants throughout the entire course of our history have come to this country influenced primarily by the economic motive, a desire to better their living conditions. Even with the Palatines and the Scotch-Irish, the economic motive was often prominent. . . . Taking them, . . . in the mass, and compar-

vided those workers leave to become citizens of the new country. In a very large percentage of instances, however, especially in later days, the emigrant, after a period of a few years abroad, returns to his home country with added financial means, and what is perhaps of still greater importance, a far wider outlook upon life and business methods. Frequently, too, he is inspired with new ambition and hope, which makes him much more efficient than he could have been had he remained at home. . . . In the large majority of cases, doubtless, the immediate inducement to the emigrants to leave home and sail for America comes in the form of personal letters from friends or members of their own families already in the United States. It is thus that they learn of the much higher wages which seem to them more than satisfactory. Such letters are, of course, of great interest in a country village. Often they are by no means kept in the family, but pass from hand to hand till a large proportion of the villagers have seen them, and in consequence have felt the lure of the new and prosperous land.

On the other hand, the influence of industrial depression in the United States is in the same manner felt almost as quickly, and the tide of emigration recedes. . . . In large sections of Italy, Sicily, and Austria-Hungary, in almost every village, will be found some of the returned emigrants who, after a few years of prosperous work in the United States, have returned with means which seem to the uncultured peasant ample, and with a social status much improved. The living example of such a man is perhaps a stronger influence toward leading his neighbors to emigrate to the United States than any letter, tho it is perhaps not so frequently a moving cause. . . . [Prior to the World War many considered] the means taken by the transportation companies a chief cause of emigration. These great companies who . . . [derived] an income from the transportation of emigrants. . . . [advertised] their business throughout the countries from which most emigrants come. Altho under the laws of most countries they . . . [could] not enlarge at length upon the prosperous conditions of the new country, or upon the comforts and delights of travel, but must merely make announcement of their sailings and accommodations and prices, nevertheless the agents of these companies by the hundreds . . . [invaded] the country districts, especially of southern Europe, and by skilful argument, and even perhaps by enthusiastic descriptions of the delights and comforts and satisfactions of a home life in America, . . . [stimulated] many more to come than otherwise would be possible. . . . A good authority stated that two of the leading steamship lines had 5,000 or 6,000 ticket agents in Galicia alone. . . . The steerage business is of great importance to all the lines operating passenger ships between those countries and the United States, and the keen competition stimulates greatly their efforts. . . . In Hungary members of the Immigration Commission were shown letters written by such agents to persons instructing them how to leave the country without the consent of the Government and indicating routes to be followed by which they might avoid the control stations. Records were seen of hundreds of cases of these secret agents who had been convicted, fined or imprisoned for thus soliciting emigration contrary to law, but the work is profitable and continues. . . . In earlier days . . . some European countries assisted their paupers or criminals to emigrate to the United States. . . . Such action is contrary to law, and the people would be promptly debarred, if discovered. Canada and some of the South American countries are ready to receive certain selected immigrants who are assisted to come, and Canada pays a bonus to thousands of ticket agents for directing emigrants to Canada who will go upon farms or into domestic service; but no such movement is permitted by the United States. It may be noted, however, that persons are allowed to engage abroad and bring into the United States domestic servants for their own families. . . . Besides the influence brought directly to bear in Europe, an indirect influence is also exerted by the immigrant banks, ticket agencies and other similar enterprises conducted mainly by immigrants for immigrants in the United States. It is the chief business of these institutions to exchange money, send money abroad, sell steamship tickets, and do other kinds of business that directly concern the immigrant. . . . 'Our earlier immigration records did not take account of the aliens leaving United States ports, but beginning with 1907 such a record has been kept and the figures for the

year 1908 are available. Inasmuch as in the fall of 1907 there was an industrial crisis followed by a period of depression, the return movement during the year 1908 was doubtless greatly stimulated, while on the other hand the immigration during the earlier part of 1907 was also very large. The European emigration, including the Syrians, into the United States in the year 1907 shows 22.7 per cent. of the old immigration and 77.3 per cent. of the new, whereas the difference between the immigrants of these two classes leaving the United States in the year 1908 was still more striking, those of the old immigration numbering only 8.9 per cent., while the new formed 91.1 per cent. These facts would seem to show that the races of peoples composing the older immigration are much more largely permanent residents, whereas a very large proportion of the newer immigrants are merely transient dwellers who come here for a few years to acquire a competence and then return to their home country. From the reports of the United States Commissioner-General of Immigration, which have, on the whole, been confirmed by the separate investigations of the Immigration Commission, it appears that taking a number of years in succession, 1908, 1909, 1910 (the later figures of 1911-1914 indicate the same tendencies), the number departing for every one hundred admitted varies greatly among the different races, and the distinction between the new immigration and the old in this regard is very striking. Not less than 56 per cent. and over of the North Italians and South Italians, Magyars, Turks, Croatsians, Slovenians and Slovaks were returning to Europe in those years, whereas of the Hebrews and the Irish only 8 per cent. and 7 per cent., respectively, returned. If we classify the data regarding the aliens admitted and departed, so as to indicate separately the old and the new immigration, it is found that the number departing for every one hundred admitted of the old immigration is only 16, while of the new immigration it is twice as much, 38."—J. W. Jenks and W. J. Lauck, *Immigration problem*, pp. 10-12, 14-15, 20-23, 37-38.—"Numerically . . . [the Slovak] exceeds the Czech emigration. In 1905 it attained its maximum—52,368 emigrants in a single year. The causes are to be found in the political regime in Hungary. The Slovaks were subjected to political and cultural oppression; they had no rights of citizenship, they were not even allowed their language, and they were kept down to a low level of culture; in consequence they were the victims of economic and social exploitation . . . Czech emigration is distinguished in several respects from Slovak. The emigrants from Bohemia were, and still are, for the most part skilled workers, craftsmen, and the educated middle-class. Many Czech emigrants have taken up farming in America and have earned repute as farmers. They have settled principally in Iowa, Dakota, Nebraska, Kansas, Oklahoma, and Texas. A considerable number of Czechs are also employed in tobacco and glass factories, and enjoy the reputation of good technical workers, owing to their considerable technical and general knowledge, brought from their old home, famous for its Czech glass. The Czechs are also known as good tailors and watchmakers, and their wives as good lacemakers and knitters. . . . A further distinction between the Czech and Slovak emigration is found in the almost unvarying intention of the Czech to settle permanently in America, while a certain percentage of the Slovak emigrants desire only to save a little money in America and return home with it. . . . To appreciate the

significance to their homeland of the reimmigration of the Slovaks it is necessary to realise the conditions ruling in the Slovak country. . . . The returning 'American'. . . puts up a neat, clean cottage, and this and his more rational methods of cultivation are observed by the neighbors, who gradually copy his example. So the level of existence of the Slovak rural population is gradually raised by voluntary improvement. . . . Two features stand out in the development of European emigration since 1918. Immediately after the war there was a considerable inflow of American settlers of European birth into Europe, mainly into the newly-formed European States. Seven thousand seven hundred and thirteen emigrants, for instance, returned to Czechoslovakia in 1920, though the movement was reversed already in 1921. In that year, according to the report of the General Immigration Commissioner, the number of Czech settlers in America increased by 25,126 persons."—G. Habrman, *Czecho-Slovak emigration to America* (*Manchester Guardian Commercial*, Nov. 16, 1922).

1910-1920.—Illiteracy among immigrants.—Americanization.—In 1910 there was "some 13,000,000 foreign-born whites in the United States, 3,000,000 of whom were ten years of age and over and were unable to speak, read, or write the English language. Over 2,500,000 of these were twenty-one years of age and over. Of these 2,500,000, over 1,500,000 were illiterate, and only 35,614 of the total 2,500,000 were in school. In other words, but a fraction over 1 per cent were undergoing any systematic training in the rudiments of Americanization. Commissioner of Education Claxton thus sums up the situation: . . . Nearly 50 per cent of the foreign-born population were males of voting age, but only 4 in every 1,000 attended school to learn our language and citizenship. Over 4,000,000 additional aliens were admitted between 1910 and 1915."—H. C. Hill, *Americanization movement* (*American Journal of Sociology*, May, 1919, p. 611).—The Federal Government had already taken steps to meet the problem, and combat the peril of maintaining so large a population in ignorance of the ideals upon which the government was built. "In 1906 Congress created a bureau which has a definite contact with the entire foreign population of the country over eighteen years of age. . . . In nearly twenty-two hundred communities throuthout the entire nation, wherever foreigners are found, the public schools are opening their doors to work in concert with the federal government in providing the way for the Americanization of the entire foreign population of the United States. This relationship is the result of carefully workt-out plans, initiated by the federal government in 1914, thru the Bureau of Naturalization. . . . In April, 1914, this undertaking on a national scale was proposed in recognition of reactions in various parts of the country which were the direct outgrowth of the administration of the naturalization law by the federal government, commencing in 1906, for the first time in its history. In 1908 and 1909 classes were formed in various localities by the public schools to teach citizenship responsibilities as a result of the denials of petitioners for naturalization who were found too ignorant to be admitted to citizenship by highly conscientious members of the state and federal judiciary. Some of these classes were organized at the direct instance of representatives of the Bureau of Naturalization, while others grew out of the interest in the foreigner felt by many patriotic individuals who had devoted much of their lives to the study

of the immigrant problem. . . . The policy of the Bureau of Naturalization since its organization in 1906 has been to facilitate the naturalization of the candidates for citizenship. As we have more and more become acquainted with his aims and ambitions, his hopes and despairs, his difficulties, his trials, his tribulations, we have broadened our viewpoint, and the facilities which the Bureau of Naturalization now offers as compared with those during the first ten years are as different, probably, as America differs from some of the rigidity of former European countries."—R. F. Crist, *Federal plan of Americanization work with the foreign-born* (*National Education Association, Addresses and proceedings of 57th Annual Meeting, June 28-July 5, 1919, pp. 471, 472, 474*).—This was the status of affairs in 1920, when the Dillingham Act provided a momentary check to the flow of European immigration.—See also AMERICANIZATION; EDUCATION; Modern developments; 20th century; Evening schools: United States; NATURALIZATION: United States.

1917.—Burnett Act.—Literacy test.—Effect of act on Asiatic immigration.—The Burnett Act, 1917, "provides that in case of aliens who are debarrd for physical or mental reasons and whose disability might have been detected by the transportation company through a competent medical examination at the time of embarkation, the transportation company shall pay the sum of \$200 and in addition a sum equal to that paid by such alien for his transportation from the initial point of departure indicated in his ticket to the port of arrival and such sum shall be paid to the alien on whose account it is assessed. In consequence of these and the preceding regulations, the transportation of diseased aliens has become so unprofitable that the steamship companies have provided, at the leading foreign ports, a medical inspection similar to that made in the United States. . . . On February 1, 1917, the House of Representatives passed the Burnett immigration bill over the veto of President Wilson, and four days later it became a law through like action on the part of the Senate, thus ending a struggle for the restriction of immigration which had continued with greater or less intensity for more than twenty years. . . . One of several important, or even radical features of the new law, the literacy test, or strictly speaking the reading test, is the best known and undoubtedly the most important and far-reaching provision of the measure. . . . [This test refuses admission to] all aliens over sixteen years of age, physically capable of reading, who can not read the English language, or some other language or dialect, including Hebrew or Yiddish: *Provided*, That an admissible alien, or any alien heretofore or hereafter legally admitted, or any citizen of the United States, may bring in or send for his father or grandfather over fifty-five years of age, his wife, his mother, his grandmother, or his unmarried or widowed daughter, if otherwise admissible, whether such relative can read or not; and such relative shall be permitted to enter. . . . Altho the reading test is the most discust feature of the new law its effect in the long run may be of less moment than the effect of the so-called latitude and longitude clause of the law, which awkwardly, but doubtless effectually, closes the door against pretty much all Asiatic immigration not already barred by the Chinese Exclusion Law and Treaty and the 'gentlemen's agreement' with Japan. What is perhaps of equal importance, it provides for the exclusion of the Japanese in the event that the gentlemen's agreement should become inoperative. . . . Briefly stated the restricted

area described in the provision . . . includes India, Siam, Indo-China, Afghanistan, parts of Russian Turkestan and Arabia on the continent of Asia, and New Guinea, Borneo, Sumatra, and Java as well as many lesser islands. The Philippines and Guam, and a large part of China, are also within the described area, but of course the islands named are 'possessed by the United States' and accordingly are not affected, while the people of China are not under the ban because immigrants from that country are already debarred, in a technical sense by treaty, altho practically this is accomplished under the Chinese Exclusion Law. . . . In addition to illiterates and natives of the restricted area in Asia, the new law makes several more or less important additions to the classes who were denied admission to the United States under previous acts. These new debarred classes include persons of constitutional psychopathic inferiority, persons afflicted with chronic alcoholism, vagrants, persons who advocate or teach the unlawful destruction of property, or who are affiliated with any organization which so advocates or teaches, and stowaways, except that otherwise admissible stowaways may be admitted by the Secretary of Labor. . . . The new law fixes the 'head tax' at \$8.00 on every alien entering the United States, excepting children under sixteen years of age who accompany their father or their mother. In the previous law the tax was \$4.00 on every alien without reference to age."—J. V. Jenks and W. J. Lauck, *Immigration problem*, pp. 45, 423, 425, 432-433, 435-436, 442.—The administrative fine was increased to \$200.

1920.—Stand taken by American Federation of Labor on question of Asiatic immigration. See AMERICAN FEDERATION OF LABOR: 1920.

1920.—Immigration as shown by census statistics. See U. S. A.: 1921: First results of 1920 census.

1920-1921.—Efforts to check immigration.—During the World War the country generally became alarmed at the large number of the population who were alien at heart if not in fact. Efforts were made in Congress to pass legislation which would check immigration. Of the bills introduced the Johnson Bill was intended to provide for the protection of the citizens of the United States by the temporary suspension of immigration. . . . According to the original bill, the period of immigration suspension, for all but blood relations of United States citizens, was to be two years. But after considerable discussion the House by a vote of 293 to 41 passed the bill with two amendments; one limiting the period of immigrant exclusion to one year instead of two, and the other allowing brothers and sisters of aliens now resident here to enter the country. . . . [The Sterling Bill was introduced] to create an immigration board . . . to consist of 'five members, including the Secretary of Labor, who shall be a member *ex officio*, and four members appointed by the President of the United States by and with the advice and consent of the Senate.' . . . [More important was the] Dillingham Bill . . . to limit the immigration of aliens of any nationality to the United States in any fiscal year to five per cent of the number of persons of such nationality resident in the United States. [The introducer of the Box Bill proposed to suspend immigration to June 30, 1951, and provide for the Americanization of aliens by the creation of] a 'Board of Americanization and Naturalization, which shall consist of a chairman and four associate members, who shall be appointed by the President, by and with the advice and consent of the Senate, not more

than three of whom shall be members of the same political party.' The duties of the board, looking to the assimilation and ultimate naturalization of our aliens, . . . [were] also defined. [Two other bills were the] King Bill to suspend immigration to the United States for six months [and the] Overman Bill . . . to prohibit immigration for a period of five years."—*Foreign Born, Feb., 1921*, pp. 104-105.—"In December 1920 the House of Representatives passed . . . [the Johnson Bill, which, as amended] provided for suspending practically all immigration for a period of 14 months. . . . The Senate, however, was more conservative, and after extended hearings adopted in a modified form the Dillingham per centum limit plan as a substitute for total suspension, and eventually this prevailed. This per centum limit plan was first proposed by Senator Dillingham in 1913 in a bill which provided that the number of aliens of any nationality who might be admitted to the United States in any fiscal year should be limited to 10 per cent of the number of persons of such nationality who were resident in the United States, according to the census of 1910. At the time it was presented this bill represented a rather extreme attitude of restriction, but how materially sentiment changed during and after the war is reflected in the fact that when the idea was finally incorporated into law the limit was fixed at 3 instead of 10 per cent as originally proposed. The Senate bill prevailed, almost unanimously, but Executive approval was withheld, resulting in a 'pocket veto,' which obviously reflected President Wilson's opposition to immigration restriction. . . . The measure was again introduced in the special session which followed President Harding's inauguration, passed both Houses almost without opposition, and became a law on May 19, 1921. The principal provisions of the per centum limit act are as follows:—1. The number of aliens of any nationality who may be admitted into the United States in any fiscal year shall be limited to 3 per cent of the number of foreign-born persons of such nationality resident in the United States as shown by the census of 1910; and not more than 20 per cent of the annual quota of any nationality may be admitted in any month. 2. Nationality is determined by country of birth. . . . 3. In effect the law is applicable only to immigration from Europe, Persia, Africa, Australia, New Zealand, the territory formerly comprising Asiatic Turkey, and certain islands of the Atlantic and Pacific Oceans. Immigration from countries of the New World and the major part of Asia is, generally speaking, not within the scope of the Act."—W. W. Husband, *Immigration under the new American law* (*Manchester Guardian Commercial*, Nov. 16, 1922).

1920-1921.—Anti-Japanese law in California.—Japanese population in the West.—"Amendment, California Alien Land Law, adopted November 2, 1920.—An Act relating to the rights, powers and disabilities of aliens and of certain companies, associations and corporations with respect to property in this state, providing for escheats in certain cases, prescribing the procedure therein, requiring reports of certain property holdings to facilitate the enforcement of this act, prescribing penalties for violation of the provisions hereof, and repealing all acts or parts of acts inconsistent or in conflict herewith. *The people of the State of California do enact as follows:* Section 1. All aliens eligible to citizenship under the laws of the United States may acquire, possess, enjoy, transmit and inherit real property, or any interest therein, in this state, in the same manner

and to the same extent as citizens of the United States, except as otherwise provided by the laws of this state. Section 2. All aliens other than those mentioned in section one of this act may acquire, possess, enjoy and transfer real property, or any interest therein, in this state, in the manner and to the extent and for the purpose prescribed by any treaty now existing between the government of the United States and the nation or country of which such alien is a citizen or subject, and not otherwise. . . . Section 4. Hereafter no alien mentioned in section two hereof and no company, association or corporation mentioned in section three hereof, may be appointed guardian of that portion of the estate of a minor which consists of property which such alien or such company, association or corporation is inhibited from acquiring, possessing, enjoying or transferring by reason of the provisions of this act. The public administrator of the proper county, or any other competent person or corporation, may be appointed guardian of the estate of a minor citizen whose parents are ineligible to appointment under the provisions of this section. . . . Section 7. Any real property hereafter acquired in fee in violation of the provisions of this act by any alien mentioned in section two of this act, or by any company, association or corporation mentioned in section three of this act, shall escheat to, and become and remain the property of the State of California. The attorney general or district attorney of the proper county shall institute proceedings to have the escheat of such real property adjudged and enforced in the manner provided by section four hundred seventy-four of the Political Code and title eight, part three of the Code of Civil Procedure. Upon the entry of final judgment in such proceedings, the title to such real property shall pass to the State of California."—*Present-day immigration (Annals of the American Academy of Political and Social Science, Jan., 1921, pp. 13-15)*.—See also CALIFORNIA: 1920.—The census bureau in 1921 announced that Japanese farmers settled almost exclusively in the far western states. California led with 5,152, Washington had 699, Colorado, 321, and Oregon, 224.

1921.—Operation of Dillingham Act.—Criticism.—"The Dillingham Act embodies a plan for 'Rationing' immigration according to nationality. It limits the number of aliens admissible during the next fiscal year [1920-1921] to 3 per cent. of the number of the particular nationality in each case resident in the United States at the time of the 1910 census. There is a further provision that not more than 20 per cent. of any particular quota may be admitted during a single month. Exceptions are made in favour of Government employees with their families and servants, visitors for pleasure or business, other persons merely going through the United States as a convenient route, one-year residents of Canada, Newfoundland, Cuba, Mexico, or Central or South America, and children (if under eighteen years of age) of American citizens. . . . The problem was to check immigration from Eastern and South-Eastern Europe especially. A specific discrimination against nationals of particular countries might have led to troublesome diplomatic complications. As soon as it was discovered that the same purpose could be served by a percentage limitation based on the returns of the 1910 census, a quite innocent and unobjectionable solution was ready to hand. It was estimated that the quota of Eastern and Southern European countries would amount to only about 153,000 persons as against a pre-war annual average of 738,000. Italy would be allowed to send only 40,000, in-

stead of 221,000, as in the last year before the war; Greece, 3,000, as against 26,000; and what was formerly known as Turkey, 2,800, as against 31,000. Though the Dillingham Act was one of the most popular measures of recent years—the records of the Senate, it is said, would have to be searched for a long time to find another Bill passed by seventy-eight Ayes to one No—it did not escape criticism. The percentage limit, it was pointed out, was a purely arbitrary one, not based on any principle of reasonable selection, and not attempting to take into account either the needs of American industry or the conditions prevailing in the countries from which the immigrants came. . . . The steamship companies were naturally loud in their protests. They foresaw that their passenger services would inevitably be dislocated. Vessels employed in carrying Italians, Poles, and Greeks . . . would have to be transferred to other routes, or run without profit, or laid up. In the event of their bringing in immigrants from a country whose monthly quota had been exceeded, they would be faced with the alternative of either carrying the rejected aliens back to the port of embarkation and bearing the entire cost of the double voyage, or of maintaining them on board at the port of arrival until they could be included in the next month's quota. The actual working of the Dillingham Act has amply justified the prediction that its operation would cause endless trouble and confusion. At the beginning there were frequent difficulties through insufficient notice of the new law having been given in the countries of origin. By June 6th an excess of 1,367 immigrants over Italy's monthly quota of 3,224 had already reached New York and Boston, and three times as many more were reported to be on their way. At the end of July a steamer carrying 550 Greeks, as well as 150 Americans who were much 'disgruntled' by the delay, was kept waiting for three days outside New York for the opening of the August list. Weeks before the end of 1921, several countries had already exhausted the whole of their quota for the year ending June next, yet new arrivals were still seeking entrance. Just before Christmas the Secretary of Labour issued an order releasing 1,150 excess immigrants, then being detained at Ellis Island for deportation, that they might spend the festive season with their friends in America, but only under bond to leave at the end of ninety days. Needless to say, there have been many cases of acute individual hardship, especially where aliens had broken up their homes and sold most of their belongings before starting for America, trusting that the visa of the American consul on their passports would ensure their admission."—H. W. Horwill, *America's new immigration policy (Contemporary Review, Apr., 1922, pp. 472-473)*.

1922.—Extension of the Dillingham Per Centum Immigration Act.—"The Act of May 19, 1921, expired by limitation on June 30, 1922, but under a joint resolution approved May 11, 1922, its operation was extended to June 30, 1924. The joint resolution further amended the law by imposing on transportation companies a fine of \$200 for each alien brought to the United States in violation of the Act, and, as an additional penalty, it is required that the offending company shall refund the passage money of each alien unlawfully brought in excess of the quota. The original Act imposed no penalty for its violation, and it is certain that a considerable part of the difficulties which have arisen during the past year would have been avoided had violations of the law resulted in monetary loss to the carriers concerned. Under

the original Act aliens were exempt from the quota provision after one year's residence in a country of the New World, but as amended a five years' residence is now required. This amendment was prompted by the fact that several thousand Europeans, who because of quota limitations and other obstacles could not come to the United States, emigrated to Cuba, Mexico, and South America with the obvious intention of . . . [entering the country] at the expiration of one year. . . . The administration of the quota law during its initial year developed many problems: . . . [but] the per centum limit law has accomplished the purpose for which it was obviously enacted with a degree of success which few anticipated. . . . While the countries of Southern and Eastern Europe, including Asiatic Turkey . . . have in the main exhausted, and in several instances exceeded, the quotas allotted to them, the opposite is true of nearly all of the countries of Northern and Western Europe, which, for the purpose of this discussion, include the British Islands, Scandinavia, Germany, Belgium, the Netherlands, Switzerland, and France. . . . It is interesting to note that the older sources of immigration, in Northern and Western Europe, . . . exhausted less than one-half of their quotas during the fiscal year, [1922] while on the other hand Russia is the only country of Southern and Eastern Europe for which any considerable part of a quota remained on June 30. In other words, the movement of the year [1922] from the older sources . . . [was] apparently a perfectly normal one, although considerably smaller than it was prior to the World War, but it is impossible to say how many aliens would have come from Southern and Eastern Europe and Turkey had it not been for the limitation afforded by the Per Centum Limit Act."—W. W. Husband, *Immigration under the new American law (Manchester Guardian Commercial, Nov. 16, 1922)*.

**IMPEACHMENT:** England.—Revival of right.—In the English Parliament of 1620-1621

(reign of James I), "on the motion of the Ex-Chief Justice, Sir Edward Coke, a committee of inquiry into grievances had been early appointed. The first abuse to which their attention was directed was that of monopolies, and this led to the revival of the ancient right of parliamentary impeachment—the solemn accusation of an individual by the Commons at the bar of the Lords—which had lain dormant since the impeachment of the Duke of Suffolk in 1449. Under the Tudors impeachments had fallen into disuse, partly through the subservience of the Commons, and partly through the preference of those sovereigns for bills of attainder, or of pains and penalties. Moreover, the power wielded by the Crown through the Star Chamber enabled it to inflict punishment for many state offences without resorting to the assistance of Parliament. With the revival of the spirit of liberty in the reign of James I, the practice of impeachment revived also, and was energetically used by the Commons in the interest alike of public justice and of popular power."—T. P. Taswell-Langmead, *English constitutional history*, ch. 13.

**IMPERATOR.**—"There can be no doubt that the title *Imperator* properly signifies one invested with *Imperium*, and it may very probably have been assumed in ancient times by every general on whom *Imperium* had been bestowed by a *Lex Curiata*. It is, however, equally certain, that in those periods of the republic with the history and usages of which we are most familiar, the title *Imperator* was not assumed as a matter of course by those who had received *Imperium*, but was, on the contrary, a much valued and eagerly coveted distinction. Properly speaking, it seems to have been in the gift of the soldiers, who hailed their victorious leader by this appellation on the field of battle; but occasionally, especially towards the end of the commonwealth, it was conferred by a vote of the Senate. . . . But the designation *Imperator* was employed under the empire in a manner and with a force altogether distinct from that which we have been considering. On this point we have the distinct testimony of Dion Cassius (xliii. 44, comp. liii. 17), who tells us that, in B.C. 46, the Senate bestowed upon Julius Cæsar the title of *Imperator*, not in the sense in which it had hitherto been applied, as a term of military distinction, but as the peculiar and befitting appellation of supreme power, and in this signification it was transmitted to his successors, without, however, suppressing the original import of the word. . . . *Imperator*, when used to denote supreme power, comprehending in fact the force of the titles *Dictator* and *Rex*, is usually, although not invariably, placed before the name of the individual to whom it is applied."—W. Ramsay, *Manual of Roman antiquities*, ch. 5.—See also **ROME: Republic: B.C. 45-44.**

**Final signification of the Roman title.**—"When the Roman princes had lost sight of the senate and of their ancient capital, they easily forgot the origin and nature of their legal power. The civil offices of consul, of proconsul, of censor, and of tribune, by the union of which it had been formed, betrayed to the people its republican extraction. Those modest titles were laid aside; and if they still distinguished their high station by the appellation of Emperor, or *Imperator*, that word was understood in a new and more dignified sense, and no longer denoted the general of the Roman armies, but the sovereign of the Roman world. The name of Emperor, which was at first of a military nature, was associated with another of a more servile kind. The epithet of *Dominus*, or *Lord*, in its primitive signification, was expressive, not of the authority of a prince over his subjects, or of a commander over his soldiers, but of the despotic power of a master over his domestic slaves. Viewing it in that odious light, it had been rejected with abhorrence by the first Cæsars. Their resistance insensibly became more feeble, and the name less odious; till at length the style of 'our Lord and Emperor' was not only bestowed by flattery, but was regularly admitted into the laws and public monuments."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 13.—See also **ROME: Republic: B.C. 31-A.D. 14.**

**INDENTURE**, military taxation. See MILITARY ORGANIZATION: 15.

**INDENTURED SERVANTS**.—"Unskilled laborers for the exploitation of the resources of North America have always been in keen demand. Negro slavery played little part in the earlier days. . . . [Then], white persons bound to service for a term of years performed the hard work of field, forest, and farm. . . . These were indentured or indented servants, so called from the name of the contract. They were of various classes,—free willers, redemptioners, convicts."—E. Channing, *History of the United States*, v. 2, p. 367, footnote.—"At the beginning of the Revolution servants by indenture were still being advertised for sale. These included free persons, whom necessity forced into temporary bondage, as well as banished convicts. Thus, in 1753, it was announced that the *Greyhound* had arrived at the Severn, Maryland, 'with 90 persons doomed to stay seven years in his Majesty's American plantations.' Two years later the same newspaper informed the public that 'more than 100 seven-year passengers have arrived at Annapolis.' Criminals were transported to the same colony as late at least as 1774."—G. E. Howard, *Preliminaries of the Revolution*, pp. 20-21.—See also REDEMPTIONERS.

**INDEPENDENCE DAY**, anniversary of American Declaration of Independence, adopted July 4, 1776. See U. S. A.: 1776 (July): Authorship, etc.

**INDEPENDENCE HALL**, popular name of the old State House of Pennsylvania, on Chestnut Street, Philadelphia. Here the second Continental Congress met, May 10, 1775; Washington was chosen commander-in-chief of the Continental Army; and the Declaration of Independence was adopted, July 4, 1776. "The State House, 'Independence Hall,' was planned in 1729 and completed, except as to wings and tower, five years later. . . . The State House has witnessed many important scenes. . . . Here, in 1781, the captured standards of the army of Cornwallis were brought by a cavalry escort and formally carried into the building and laid before Congress. Here Lincoln raised a flag on Washington's Birthday, 1861, and four years later his body was carried here to lie in state. . . . The Constitution was debated, agreed to, and signed, in this building; and Franklin, who had watched and taken part in the proceedings with intense anxiety, breathed a deep sigh of relief and said, gravely, that in the vicissitudes and anxieties of day after day he had looked at the representation of the sun on the back of the chair used by Washington, the presiding officer (the same chair that had been used by Hancock); and he had wondered, day by day, whether it was a rising or a setting sun, but now he knew that it was a rising sun. The State House is a beautiful building, alike in its mass effects and in its smallest details, in the views of it from the exterior or in rooms within. Its façade is exactly centered, and similarly winged and arcaded at right and left. . . . The view through the arches of the room of the

Supreme Court, into and across the Hall of the Signing, defined by those three pilastered arches, is astonishingly effective. At the foot of the wonderful stairs now stands the Liberty Bell, upon which may still be read the Bible verse which long before the Revolution was cast upon it by its makers: 'Proclaim liberty throughout all the land, unto all the inhabitants thereof.' . . . On the second floor is a great banquet hall, . . . occupying the entire length of the building. . . . The Hall of the Signing—about such a room such details ought to be known—is thirty-nine feet and six inches wide, by forty feet and two inches long, with a height of nineteen feet and eight inches; the intent having apparently been to have it precisely forty by forty by twenty. . . . On July 2 Congress voted formally for independence. On the third and fourth the precise form of statement was debated. And on the 'Fourth' the form written out by Jefferson, with some merely minor alterations, was accepted. Thus did the 'Fourth' begin. But nobody except Congress then knew it! The public could know little as to precisely what was going on, for the meetings were secret. After all, it was at that early period still to be deemed treason, and the delegates could not afford to be heedless of that fact. On the eighth of July the Declaration was read formally to the people, from a platform beside the State House, and the Liberty Bell rang out its peal, and all the bells of the city echoed it."—R. Shackleton, *Book of Philadelphia*, pp. 70, 71-74, 77.

**INDEPENDENT TREASURY**, United States, term applied in United States public finance to a system, established in 1846, of directly holding and disbursing public money without employing the agency of banks. Under this procedure the treasury, on receiving the public revenue deposits the money in the vaults of the treasury at Washington, or in the various sub-treasuries distributed over the country. "If we examine carefully the legislative career of the Independent Treasury we will find that it falls naturally into three distinct periods; first, the period of inception brought on by the struggle over the old second United States Bank and the distress following the panic of 1837; second, its final establishment after numerous attempts in 1846 and its functioning from that date to the present [1921]; and lastly the recent attack following the enactment of the Federal Reserve law and the ultimate abolition of the Independent Treasury. . . . Since its establish-

ment in 1846, the history of the Sub-Treasury has fallen into three distinct periods. For the first fifteen years of its history, the 'divorce of the bank and state' was nearly complete. During the Mexican War the Sub-Treasury system worked well and managed government finances far more satisfactorily than finances were managed in the War of 1812. In 1857 came a panic, and, although the banks failed and caused the Government great embarrassment, still the Government had its money in its own hands and was able to pay its debts without trouble or delay. The success of this achievement caused Congress to amend the law in 1857 so as 'to require all disbursing officers to discontinue the use of banks for the deposit of public moneys in their charge and to deposit in some Sub-Treasury.' With the beginning of the Civil War the system entered upon its second period of development. The necessities of the war forced Chase to apply to the banks for a loan of \$50,000,000 in July of 1861. This was the first step leading to the decline of the Sub-Treasury. . . . The Federal Reserve Law was enacted December 23, 1913, and among the provisions was the statement that 'the moneys held in the general fund of the Treasury . . . upon the direction of the Secretary of the Treasury be deposited in the Federal Reserve Banks, which banks, when required by the Secretary of the Treasury, shall act as fiscal agents of the United States.' At the following session of Congress the advisability of discontinuing the Independent Treasury arose for discussion. . . . An amendment to the Legislative Executive and Judicial Appropriation Bill to eliminate the Independent Treasury was rejected after a brief debate by a vote of 13 to 32. In 1916, . . . the committee in charge of the appropriations incorporated in the legislative bill a section authorizing and directing the Secretary of the Treasury 'to report to Congress at the beginning of its next session which of the Sub-Treasuries, if any, should be continued after the end of the fiscal year 1917.' . . . [According to this report] the cost of maintaining the nine Sub-Treasuries was \$535,004.63; their total transactions, \$4,525,063,111.82. Thus, the cost of these institutions, treating the system as a whole, declared the Secretary [McAdoo], was only one-hundredth of 1 per cent. on the total transactions involved, 'an insignificant sum compared with the business done, the important service rendered and the conveniences afforded to the public.' . . . The general or current fund of the Treasury might in the discretion of the Secretary be deposited in the Federal Reserve Banks, the reserve or trust funds of the Government, viz., gold coin and bullion and silver dollars held in trust by the Government against outstanding gold and silver certificates and greenbacks were not included. The gold coin and bullion held against gold certificates now amounted to more than two billion dollars, and a considerable part of this was deposited in the Sub-Treasuries. This, in the opinion of the Secretary should not be committed to the custody of the Federal Reserve Banks, as they were private corporations, but 'should be in the physical control of the Government itself.' 'These trust funds could not be imposed upon the Federal Reserve Banks without legislation. It could only be accomplished by negotiation and agreement, involving, necessarily, compensation for the service rendered.' . . . The effect of this report was felt in both the House and Senate. In the former, Glass of Virginia reiterated the Secretary's advice, and, in the latter, Hitchcock and Reed joined hands to support the administration. The result was that Congress

passed the appropriation in 1917 providing for the maintenance of the Sub-Treasuries. . . . However, on January 26, 1918, the Bureau of Efficiency submitted a report on the work performed by the Sub-Treasuries, which the Bureau had been required to make by the legislative, executive and judicial appropriation act of 1917. . . . The Bureau recommended that all of the nine Sub-Treasuries be abolished within six months after the end of the war. It estimated that the direct annual saving to the Government would be \$450,000, which it presented as a conservative figure. The report covered in detail every function of the Sub-Treasury, including the custody of the Treasury funds, the maintenance of coin exchanges, fiscal transactions and the redemptions of paper currency. As regards the first duty the Bureau advocated the retention of the trust funds by the Treasurer in the mints and assay offices, the coin exchanges by the Federal Reserve Banks, and the redemption of paper currency by the Redemption Department at Washington at a saving of \$125,000 a year to the Government. To the Bureau, each of the duties and functions of the Sub-Treasuries could be handled with the same or greater effectiveness by the Federal Reserve Banks, the Treasury at Washington, the mints or other Government agencies. This report sounded the ultimate death-knell of the Sub-Treasury system. . . . On March 8, 1918, [the House] voted to abolish the Sub-Treasuries. The Senate, however, restored the Sub-Treasuries to the bill, perhaps, due to the pressure exerted by those interested in the patronage angle of the argument. In 1919, the Bureau again advised their extermination, and now, with the close of the war, the prestige acquired by the Federal Reserve system and the rise of reconstruction problems that overshadowed all others the fight was quickly brought to a close. On February 25, 1920, the Committee on Banking and Currency reported such a bill to the House, and on the 17th of May the bill passed the House and on the 19th the Senate. On the 24th the President signed the measure authorizing the Secretary of Treasury 'to transfer any or all of the functions performed ["by the Sub-Treasuries after July 1, 1921"] to the Treasurers of the United States or the mints or assay offices of the United States . . . or to utilize any of the Federal Reserve Banks acting as depositories or fiscal agents of the United States.'"—R. **INDEPENDENTS, or Separatists:** Their origin and opinions.—"The Puritans continued members of the church, only pursuing courses of their own in administering the ordinances, and it was not till about the middle of the reign of Elizabeth that the disposition was manifested among them to break away from the church altogether, and to form communities of their own. And then it was but a few of them who took this course: the more sober part remained in the church. The communities of persons who separated themselves were formed chiefly in London: there were very few in the distant counties, and those had no long continuance. It was not till the time of the Civil Wars that such bodies of Separatists, as they were called, or Congregationalists, or Independents, became numerous. At first they were often called Brownist churches, from Robert Brown, a divine of the time, who was for a while a zealous main-

tainer of the duty of separation."—J. Hunter, *Founders of New Plymouth*, pp. 12-13.—"The peculiar tenet of Independency . . . consists in the belief that the only organization recognised in the primitive Church was that of the voluntary association of believers into local congregations, each choosing its own office-bearers and managing its own affairs, independently of neighbouring congregations, though willing occasionally to hold friendly conferences with such neighbouring congregations, and to profit by the collective advice. Gradually, it is asserted, this right or habit of occasional friendly conference between neighbouring congregations had been mismanaged and abused, until the true independency of each voluntary society of Christians was forgotten, and authority came to be vested in Synods or Councils of the office-bearers of the churches of a district or province. This usurpation of power by Synods or Councils, it is said, was as much a corruption of the primitive Church-discipline as was Prelacy itself. . . . So, I believe, though with varieties of expression, English Independents argue now. But, while they thus seek the original warrant for their clews in the New Testament and in the practice of the primitive Church . . . they admit that the theory of Independency had to be worked out afresh by a new process of the English mind in the 16th and 17th centuries, and they are content, I believe, that the crude immediate beginning of that process should be sought in the opinions propagated, between 1580 and 1590, by the erratic Robert Brown, a Rutlandshire man, bred at Cambridge, who had become a preacher at Norwich. . . . Though Brown himself had vanished from public view since 1590, the Brownists, or Separatists, as they were called, had persisted in their course, through execration and persecution, as a sect of outlaws beyond the pale of ordinary Puritanism, and with whom moderate Puritans disowned connexion or sympathy. One hears of considerable numbers of them in the shires of Norfolk and Essex, and throughout Wales; and there was a central association of them in London, holding conventicles in the fields, or shifting from meeting-house to meeting-house in the suburbs, so as to elude Whitgift's ecclesiastical police. At length, in 1592, the police broke in upon one of the meetings of the London Brownists at Islington. . . . There ensued a vengeance far more ruthless than the Government dared against Puritans in general. Six of the leaders were brought to the scaffold. . . . Among the observers of these severities was Francis Bacon, then rising into eminence as a politician and lawyer. His feeling on the subject was thus expressed at the time: 'As for those which we call Brownists, being, when they were at the most, a very small number of very silly and base people here and there in corners dispersed, they are now (thanks be to God), by the good remedies that have been used, suppressed and worn out, so as there is scarce any news of them.' . . . Bacon was mistaken in supposing that Brownism was extinguished. Hospitable Holland received and sheltered what England cast out."—D. Masson, *Life of John Milton*, v. 2, bk. 4, sect. 1-2.—"The name 'Brownist' had never been willingly borne by most of those who had accepted the distinguishing doctrine of the heresiarch to whom it related. Nor was it without reason that a distinction was alleged, and a new name preferred, when, relaxing the offensive severity of Brown's system, some who had adopted his tenet of the absolute independence of churches came to differ from him respecting the duty of avoiding and denouncing dissentients from it as rebellious,

apostate, blasphemous, antichristian and accursed. To this amendment of 'Brownism' the mature reflections and studies of the excellent Robinson of Leyden conducted him; and with reference to it he and his followers were sometimes called 'Semi-separatists.' Such a deference to reason and to charity gave a new position and attractiveness to the sect, and appears to have been considered as entitling Robinson to the character of 'father of the Independents.' Immediately on the meeting of the Long Parliament [1640], 'the Brownists, or Independents, who had assembled in private, and shifted from house to house for twenty or thirty years, resumed their courage, and showed themselves in public.' During this period of the obscurity of a sect which, when arrived at its full vigor, was to give law to the mother country, the history of the progress of its principles is mainly to be sought in New England. . . . Their opponents and their votaries alike referred to Massachusetts as the source of the potent element which had made its appearance in the religious politics of England."—J. G. Palfrey, *History of New England*, v. 2, bk. 2, ch. 2.—See also ENGLAND: 1638-1640; PURITANS: In distinction from Independents, etc.

1604-1617.—Church at Scrooby and its migration to Holland.—"The flimsiness of Brown's moral texture prevented him from becoming the leader in the Puritan exodus to New England. That honour was reserved for William Brewster, son of a country gentleman who had for many years been postmaster at Scrooby." After King James' Hampton Court Conference with the Puritan divines, in 1604, and his threatening words to them, nonconformity began to assume among the churches more decidedly the form of secession. "The key-note of the conflict was struck at Scrooby. Staunch Puritan as he was, Brewster had not hitherto favoured the extreme measures of the Separatists. Now he withdrew from the church, and gathered together a company of men and women who met on Sunday for divine service in his own drawing-room at Scrooby Manor. In organizing this independent Congregationalist society, Brewster was powerfully aided by John Robinson, a native of Lincolnshire. Robinson was then thirty years of age, and had taken his master's degree at Cambridge in 1600. He was a man of great learning and rare sweetness of temper, and was moreover distinguished for a broad and tolerant habit of mind too seldom found among the Puritans of that day. Friendly and unfriendly writers alike bear witness to his spirit of Christian charity and the comparatively slight value which he attached to orthodoxy in points of doctrine; and we can hardly be wrong in supposing that the comparatively tolerant behaviour of the Plymouth colonists, whereby they were contrasted with the settlers of Massachusetts, was in some measure due to the abiding influence of the teachings of this admirable man. Another important member of the Scrooby congregation was William Bradford, of the neighbouring village of Austerfield, then a lad of seventeen years, but already remarkable for maturity of intelligence and weight of character, afterward governor of Plymouth for nearly thirty years, he became the historian of his colony; and to his picturesque chronicle, written in pure and vigorous English, we are indebted for

most that we know of the migration that started from Scrooby and ended in Plymouth. It was in 1606—two years after King James's truculent threat—that this independent church of Scrooby was organized. Another year had not elapsed before its members had suffered so much at the hands of officers of the law, that they began to think of following the example of former heretics and escaping to Holland. After an unsuccessful attempt in the autumn of 1607, they at length succeeded a few months later in accomplishing their flight to Amsterdam, where they hoped to find a home. But here they found the English exiles who had preceded them so fiercely involved in doctrinal controversies, that they decided to go further in search of peace and quiet. This decision, which we may ascribe to Robinson's wise counsels, served to keep the society of Pilgrims from getting divided and scattered. They reached Leyden in 1609, just as the Spanish government had sullenly abandoned the hopeless task of conquering the Dutch, and had granted to Holland the Twelve Years Truce. During eleven of these twelve years the Pilgrims remained in Leyden, supporting themselves by various occupations, while their numbers increased from 300 to more than 1,000. . . . In spite of the relief from persecution, however, the Pilgrims were not fully satisfied with their new home. The expiration of the truce with Spain might prove that this relief was only temporary; and at any rate, complete toleration did not fill the measure of their wants. Had they come to Holland as scattered bands of refugees, they might have been absorbed into the Dutch population, as Huguenot refugees have been absorbed in Germany, England, and America. But they had come as an organized community, and absorption into a foreign nation was something to be dreaded. They wished to preserve their English speech and English traditions, keep up their organization, and find some favoured spot where they might lay the corner-stone of a great Christian state. The spirit of nationality was strong in them; the spirit of self-government was strong in them; and the only thing which could satisfy these feelings was such a migration as had not been seen since ancient times, a migration like that of Phokaians to Massilia or Tyrians to Carthage. It was too late in the world's history to carry out such a scheme upon European soil. Every acre of territory there was appropriated. The only favourable outlook was upon the Atlantic coast of America, where English cruisers had now successfully disputed the pretensions of Spain, and where after forty years of disappointment and disaster a flourishing colony had at length been founded in Virginia."—J. Fiske, *Beginnings of New England*, ch. 2.

1617-1620.—Preparations for the exodus to New England.—"Upon their talk of removing, sundry of the Dutch would have them go under them, and made them large offers"; but an inborn love for the English nation and for their mother tongue led them to the generous purpose of recovering the protection of England by enlarging her dominions. They were 'restless' with the desire to remove to 'the most northern parts of Virginia,' hoping, under the general government of that province, 'to live in a distinct body by themselves.' To obtain the consent of the London

Company, John Carver, with Robert Cushman, in 1617, repaired to England. They took with them 'seven articles,' from the members of the church at Leyden, to be submitted to the council in England for Virginia. These articles discussed the relations which, as separatists in religion, they bore to their prince; and they adopted the theory which the admonitions of Luther and a century of persecution had developed as the common rule of plebeian sectaries on the continent of Europe. They expressed their concurrence in the creed of the Anglican church, and a desire of spiritual communion with its members. Toward the king and all civil authority derived from him, including the civil authority of bishops, they promised, as they would have done to Nero and the Roman pontifex, 'obedience in all things, active if the thing commanded be not against God's word, or passive if it be.' They denied all power to ecclesiastical bodies, unless it were given by the temporal magistrate. . . . The London Company listened very willingly to their proposal, so that their agents 'found God going along with them'; and, through the influence of 'Sir Edwin Sandys, a religious gentleman then living,' a patent might at once have been taken, had not the envoys desired first to consult 'the multitude' at Leyden. On the 15th of December, 1617, the pilgrims transmitted their formal request, signed by the hands of the greatest part of the congregation. . . . The messengers of the pilgrims, satisfied with their reception by the Virginia company, petitioned the king for liberty of religion, to be confirmed under the king's broad seal. But here they encountered insurmountable difficulties. . . . Even while the negotiations were pending, a royal declaration constrained the Puritans of Lancashire to conform or leave the kingdom; and nothing more could be obtained for the wilds of America than an informal promise of neglect. On this the community relied, being advised not to entangle themselves with the bishops. 'If there should afterward be a purpose to wrong us,' thus they communed with themselves, 'though we had a seal as broad as the house-floor, there would be means enough found to recall or reverse it. We must rest herein on God's providence.' Better hopes seemed to dawn when, in 1619, the London Company for Virginia elected for their treasurer Sir Edwin Sandys, who from the first had befriended the pilgrims. Under his presidency, so writes one of their number, the members of the company in their open court 'demanded our ends of going; which being related, they said the thing was of God, and granted a large patent.' As it was taken in the name of one who failed to accompany the expedition [Mr. John Wincomb], the patent was never of any service. And, besides, the pilgrims, after investing all their own means, had not sufficient capital to execute their schemes. In this extremity, Robinson looked for aid to the Dutch. He and his people and their friends, to the number of 400 families, professed themselves well inclined to emigrate to the country on the Hudson, and to plant there a new commonwealth under the command of the stadholder and the states general. The West India company was willing to transport them without charge, and to furnish them with cattle; but when its directors petitioned the states general to promise protection to the enterprise against all violence from other potentates, the request was found to be in conflict with the policy of the Dutch republic, and was refused. The members of the church of Leyden, ceasing 'to meddle with the Dutch, or to depend too much on the Virginia company,' now trusted to their own resources and the aid of private

friends. The fisheries had commended American expeditions to English merchants; and the agents from Leyden were able to form a partnership between their employers and men of business in London. The services of each emigrant were rated as a capital of £10, and belonged to the company; all profits were to be reserved till the end of seven years, when the whole amount, and all houses and land, gardens and fields, were to be divided among the share-holders according to their respective interests. The London merchant, who risked £100, would receive for his money tenfold as much as the penniless laborer for his services. This arrangement threatened a seven years' check to the pecuniary prosperity of the community; yet, as it did not interfere with civil rights or religion, it was accepted. And now, in July, 1620, the English at Leyden, trusting in God and in themselves, made ready for their departure."—G. Bancroft, *History of the United States*, v. 1, pt. 1, ch. 12.

INDEX NUMBERS.—"An index number [as used in economics] is constructed by combining several items, each of which is a ratio between the price of a certain article at a particular date under consideration . . . and the price of the same article at the period taken as base or standard."—R. H. I. Palgrave, *Dictionary of political economy*, v. 2, p. 385.—"Because of the fact that values of

commodities as well as of money itself are constantly changing, it is not always easy to measure with precision the variations in the purchasing power of money. The best expedient is that suggested by Evelyn in 1708, by Lowe in 1822, by Scrope in 1833, and by Porter in 1836, but elaborated by Jevons in 1863, and known as the index number. Here the price of an article at a given time, or its average price during a given period, is taken as a basis and called 100. If at the next selected date the price has risen one-tenth, it would be assigned the figure 110. By choosing a number of different articles and taking the average of the figures as they vary from the base line of 100, we reach the index number. The percentage of change in the value of money is obviously not the same as the percentage of change in the general price level. If general prices double, that is, if the index number increases from 100 to 200, each unit of money will buy only half as much as before, or, in other words, the value of money will fall one-half. A rise of prices of 15 per cent, or a change in the index number from 100 to 115, during one year means that the purchasing power of 100 cents at the end of the year is  $\frac{100}{115}$  or 86.95 per cent

of its purchasing power at the beginning. This is equivalent to a loss of 13.05 per cent. A rise of 15 per cent in the general price level thus equals a fall of 13.05 per cent in the value of money. The change in the index number shows that alteration in the price level; the change in the reciprocal of the index number shows the change in the value of money. The utility of the index number depends partly on the number and choice of commodities, partly on the kind of average employed."—E. R. A. Seligman, *Principles of economics*, pp. 461-462.—See also PRICE CONTROL.

## INDIA

Name.—"To us . . . it seems natural that the whole country which is marked off from Asia by the great barrier of the Himalaya and the Suleiman range should have a single name. But it has not always seemed so. The Greeks had but a very vague idea of this country. To them for a long time the word India was for practical purposes what it was etymologically, the province of the Indus. When they say that Alexander invaded India, they refer to the Punjab. At a later time they obtained some information about the valley of the Ganges, but little or none about the 'Deccan.' Meanwhile in India itself it did not seem so natural as it seems to us to give one name to the whole region. For there is a very marked difference between the northern and southern parts of it. The great Aryan community which spoke Sanscrit and invented Brahminism spread itself chiefly from the Punjab along the great valley of the Ganges; but not at first far southward. Accordingly the name Hindostan properly belongs to this northern region. In the South or peninsula we find other races and non-Aryan languages. . . . It appears then that India is not a political name, but only a geographical expression like Europe or Africa."—J. R. Seeley, *Expansion of England*, pp. 221-222.—"The name 'Hindustan' . . . is not used by the natives as it has been employed by writers of books and map-makers in Europe. . . . The

word really means 'the land of the Hindus'; the northern part of the Peninsula, distinguished from the 'Deccan,' from which it is parted by the river Narbada. . . . The word 'Hindu' is of Zend (ancient Persian) origin, and may be taken to denote 'river-people,' so named, perhaps, from having first appeared on the line of the Indus, q.d., 'the river.'"—H. G. Keene, *Sketch of the history of Hindustan*, p. 1.—"Sinde, India, and Hindustan are various representatives of the same native word. 'Hindu' is the oldest known form, since it occurs in one of the most ancient portions of the Zendavesta. The Greeks and Romans sometimes called the river Sindus, instead of Indus."—G. Rawlinson, *Five great monarchies: Persia*, ch. 1, note.

Geographical description.—Climate.—"India is a great three-cornered country, stretching southward from mid-Asia into the ocean. Its northern base rests upon the Himalaya ranges; the chief part of its western side is washed by the Arabian Sea, and the chief part of its eastern side by the Bay of Bengal. But while thus guarded along the whole length of its boundaries by nature's defences, the mountains and the ocean, it has on its north-eastern and on its north-western frontiers two opposite sets of gateways which connect it with the rest of Asia. On the north-east it is bounded by the wild hill-regions between Burma

and the Chinese Empire of Tibet; on the north-west by the Muhammadan States of Afghanistan and Baluchistan; and two streams of population of widely diverse types have poured into India by the passes at these north-eastern and north-western corners. India extends from the eighth to the thirty-sixth degree of north latitude,—that is, from the hot regions near the equator to far within the temperate zone. . . . The length of India from north to south, and its greatest breadth from east to west, are both about 1900 miles; but it tapers with a pear-shaped curve to a point at Cape Comorin, its southern extremity. To this compact dominion the English have added Burma, or the country on the eastern shores of the Bay of Bengal. The whole territory thus described contains over  $1\frac{1}{2}$  millions of square miles. . . . India is made up of four well-defined tracts. The first includes the Himalayan mountains, which shut India out from the rest of Asia on the north; the second stretches southwards from their foot, and comprises the plains of the great rivers which issue from the Himalayas; the third tract slopes upwards again from the southern edge of the river-plains, and consists of a high three-sided tableland, dotted with peaks, and covering the southern half of India; the fourth is Burma on the east of the Bay of Bengal. . . . [Of these four divisions] the Himalayas not only form a double wall along the north of India, but at both ends send out hilly offshoots southwards, which protect its north-eastern and north-western boundaries. . . . They send down the rainfall from their northern as well as from their southern slopes upon the Indian plains. . . . Of the three great rivers of India,—the two longest—namely, the Indus and the Brahmaputra—take their rise in this trough lying on the north of the double wall of the Himalayas; while the third, the Ganges, receives its waters from their southern slopes. . . . The wide plains watered by the Himalayan rivers form the second of the four regions. . . . [of] India. They extend from the Bay of Bengal on the east to the Indian Ocean on the West, and contain the richest and most densely-crowded provinces of the Indian Empire. . . . Having thus glanced at the leading features of the Himalayas on the north, and of the great river plains at their base, I come now to the third division of India, namely, the three-sided tableland which covers the southern half of the peninsula. This tract, known in ancient times as The Deccan, or 'The South' (*dakshin*), comprises the Central Provinces, Berar, Madras, and Bombay, and the native territories of the Nizam, Mysore, Sindhia, Holkar, and other feudatory princes. It slopes upwards from the southern edge of the Gangetic plains. . . . Burma, which the English have incorporated into the Indian Empire, [represents the fourth division of British India. It] consists mainly of the valley of the Irawadi, and a strip of coast along the east side of the Bay of Bengal. . . . Rice and timber form the staple exports of Burma, and rice is also the universal food of the people."—W. H. Hunter, *Brief history of the Indian people*, pp. 17-19, 21-22, 27, 30.—"Peninsular India or the Deccan . . . [the heart of ancient Indian civilization] is geologically distinct from the Indo-Gangetic plain and the Himalaya. . . . Three or four hundred miles below Bernares we reach the eastern limit of Hindustan. Imperceptibly it merges into Bengal. . . . The air is now languorous and vapour-laden, the vegetation luxuriant and tropical. The firm, grey plain of wheat and millets and sugar-cane dotted with clumps of park-like trees gives place to rice swamps and

bamboos, palm and plantain. The Ganges after its junction with the Brahmaputra becomes a sea. The whole country is now a network of creeks and streams. The boat takes the place of the bullock-cart, the waterways are the roads. In this torrid, steamy, prolific region life is easy, wants are few. It is the home of a vast and ever-increasing population. . . . To the south of the Ganges the country loses its flat and alluvial character, and rises in a series of rough tablelands towards peninsular India. In many parts it is a mere mass of valleys and stony hills. In the fertile plains between the Ganges and the Himalaya man and his works are never out of sight. But these rough uplands to the south are thinly inhabited. . . . To the west extend the two large central regions known as central India and Rajputana, which for the most part are parcelled out among native states. In central India the plateau country is at its best. As it trends southwards to the Vindhya hills it broadens out into rolling downs of great fertility. In old days was the famous kingdom of Malwa, long a centre of ancient Hindu civilization. The splendour of its capital Ujjain was the favourite theme of Hindu poets. West of central India the hills and deserts of Rajputana stretch for leagues till they merge in the great Indian desert. Rajputana is the land of the Rajput clans, into which they were driven from the fertile plains of Hindustan by the Muhammadan armies. Here amid the hills and sandy wastes they founded new homes, and were never completely subjugated. . . . The Vindhya hills are the northern boundary of peninsular India or the Deccan. A confused mass of forest-clad hills, they bar the approaches to the central tablelands of the peninsula. . . . The topography of the Deccan is altogether different from that of northern India. The vast plain that stretches from the Indus to Calcutta invited easy conquest and empire-building; its fertile alluvial soil and unfailing rivers make it a hive of industry and the home of a dense population. The Deccan, as a whole, is a broken and rocky country. It lent itself to the establishment of separate states, and gave protection to the weak against the strong. Accordingly its history is extremely confusing. It is a record of many contemporaneous dynasties, engaged in endless wars of aggression or defence. The Deccan, or India south of the Vindhya, may be described as a 'tableland of very irregular and broken surface, with a general slope from west to east. On either side it is buttressed by the hills known respectively as the western and eastern Ghats. . . .

"In so extensive a region there is room for many climates. . . . In Malabar there is the perpetual summer of the tropics with the heat and moisture of a forcing house. In the Punjab there are extremes of cold and heat. For most of the years its plains are brown and arid, scorched in summer with fiery winds like the blast of a furnace; in winter they are clothed in a mantle of green crops, while the climate is that of a Riviera winter. In central India there are well-defined seasons of heat and cold with no great extremes. Heat and moisture predominate in Bengal and make it one of the dampest and greenest countries of the earth. Still greater contrasts could be found if the Himalayan region and the deserts of Sind were included in the account. The Himalayas themselves exhibit every gradation of cold and heat, of luxuriance and sterility, of loveliness and desolation. In Hindustan the rainfall averages thirty to forty inches a year, increasing toward the east. In Bengal a rainfall of fifty to sixty

inches is common, and in eastern Bengal this is exceeded."—T. W. Holderness, *Peoples and problems of India*, pp. 26-29, 14, 15.—See also ASIA: Influence of geography, etc.; KHYBER PASS; PUNJAB.

**Population.**—The Indian census of 1901 showed a total population in British territory of 231,085,000, against 221,266,000 in 1891; in native states 63,181,000, against 66,050,000 in 1891; total for all India, 294,266,000, against 287,317,000 in 1891. The native states had declined in population to the extent of nearly 3,000,000, showing greater severity in those states of the effects of famine and disease. In several provinces, however, of the British territory, a decrease of population appeared: Berar declining from 2,897,000 in 1891 to 1,491,000 in 1901; Bombay (British presidency) from 15,957,000 to 15,330,000; central provinces from 10,784,000 to 9,845,000; Aden from 44,000 to 41,000; Coorg from 173,000 to 170,000. Of the native states the greatest loss of population was suffered in Rajputana, which sank from 12,016,000 to 9,841,000; in Central India, where the numbers fell from 10,318,000 to 8,501,000; and in the Bombay states, which were reduced in population from 8,059,000 to 6,891,000. The provinces in British India which showed the greatest percentage of gain were Upper and Lower Burma, Assam and Sind. These figures may be contrasted with the census of 1921 which "showed a remarkable drop in the rate of increase in comparison with previous decades, due mainly to the influenza scourge of 1918, resulting in over 6,000,000 deaths. The provisional figures are:—Total population, 310,075,132—*viz.*, British Territory, 247,138,396; Indian States, 71,936,736; being an increase of 3,205,218 in British Territory and 713,518 in Indian States, or 1.2 per cent. increase since 1911. Males in British Territory, 126,941,215; females, 120,197,181. Males in Indian States, 37,114,976; females, 34,821,760. There is thus an excess of over 9,000,000 males in all India."—*Annual Register*, 1921, pp. 272-273, 275-277.

**People.**—Ethnic types.—Religious divisions.—**Castes.**—The population of India may be classified according to ethnic type, religious beliefs, and political status; race, religion, and political development enter continually into the problem of governing the people as one nation. Therefore these divisions must be borne in mind in studying their history, and in forming a judgment upon the occurrences of today. In addition to these general categories, which embrace the whole of the population, there is the special question of caste among the Hindus, which adds some thousands of divisions and sub-divisions to the elements of disunion. "Our earliest glimpses of India disclose two races struggling for the soil. The one was a fair-skinned people, which had lately entered by the north-western passes,—a people who called themselves Aryan, literally of 'noble' lineage, speaking a stately language, worshipping friendly and powerful gods. These Aryans became the Brahmans and Rajputs of India. The other race was of a lower type, who had long dwelt in the land, and whom the lordly newcomers drove back into the mountains, or reduced to servitude on the plains. The comparatively pure descendants of these two races are now nearly equal in numbers; the intermediate castes, sprung chiefly from the ruder stock, make up the mass of the present Indian population. . . . The victorious Aryans called the early tribes Dasyus, or 'enemies,' and Dasas, or 'slaves.' The Aryans entered India from the colder north, and prided

themselves on their fair complexion. Their Sanskrit word for 'colour' (varna) came to mean 'race' or 'caste.' The old Aryan poets, who composed the Veda at least 3,000 and perhaps 4,000 years ago, praised their bright gods, who, 'slaying the Dasyus, protected the Aryan colour'; who, 'subjected the black-skin to the Aryan man.' They tell us of their own 'stormy deities, who rush on like furi-

WEALTHY HINDU WOMAN  
Showing mode of wearing jewels

ous bulls and scatter the black-skin.' Moreover, the Aryan, with his finely-formed features, loathed the squat Mongolian faces of the Aborigines. One Vedic poet speaks of the non-Aryans as 'noseless' or flat-nosed, while another praises his own 'beautiful-nosed' gods. . . . Nevertheless all the non-Aryans could not have been savages. We hear of wealthy Dasyus or non-Aryans; and the Vedic hymns speak of their 'seven castles' and 'ninety forts.' The Aryans afterwards made alliance with non-Aryan tribes; and some of the most powerful kingdoms of India were ruled by non-Aryan kings. . . . Let us now examine these primitive peoples as they exist at the present day. Thrust back by the Aryan invaders from the plains, they have lain hidden away in the mountains, like the remains of extinct animals found in hill-caves. India thus forms a great museum of races, in which we can study man from his lowest to his highest stages of culture. . . . Among the rudest fragments of mankind are the isolated Andaman islanders, or non-Aryans of the Bay of Bengal. The Arab and

early European voyagers described them as dog-faced man-eaters. The English officers sent to the islands in 1855 to establish a settlement, found themselves in the midst of naked cannibals; who daubed themselves at festivals with red earth, and mourned for their dead friends by plastering themselves with dark mud. . . . The Anamalai hills, in Southern Madras, form the refuge of many non-Aryan tribes. The long-haired, wild-looking Puluars live on jungle products, mice, or any small animals they can catch; and worship demons. Another clan, the Mundavers, have no fixed dwellings, but wander over the innermost hills with their cattle. They shelter themselves in caves or under little leaf sheds, and seldom remain in one spot more than a year. The thick-lipped, small-bodied Kaders, 'Lords of the Hills,' are a remnant of a higher race. They live by the chase, and wield some influence over the ruder forest-folk. These hills abound in the great stone monuments (kistvaens and dolmens) which the ancient non-Aryans erected over their dead. The Nairs, or hillmen of South-Western India, still keep up the old system of polyandry, according to which one woman is the wife of several husbands, and a man's property descends not to his own sons, but to his sister's children. This system also appears among the non-Aryan tribes of the Himalayas at the opposite end of India. In the Central Provinces, the non-Aryan races form a large part of the population. In certain localities they amount to one-half of the inhabitants. Their most important race, the Gonds, have made advances in civilisation; but the wilder tribes still cling to the forest, and live by the chase. . . . The Maris fly from their grass-built huts on the approach of a stranger. . . . Farther to the north-east, in the Tributary States of Orissa, there is a poor tribe, 10,000 in number, of Juangs or Patuas, literally the 'leaf-wearers.' Until lately their women wore no clothes, but only a few strings of beads around the waist, with a bunch of leaves before and behind. . . . Proceeding to the northern boundary of India, we find the slopes and spurs of the Himalayas peopled by a great variety of rude non-Aryan tribes. Some of the Assam hillmen have no word for expressing distance by miles or by any land-measure, but reckon the length of a journey by the number of plugs of tobacco or pan which they chew upon the way. They hate work; and, as a rule, they are fierce, black, undersized, and ill-fed. . . . Many of the aboriginal tribes, therefore, remain in the same early stage of human progress as that ascribed to them by the Vedic poets more than 3,000 years ago. But others have made great advances, and form communities of a well-developed type. These higher races, like the ruder ones, are scattered over the length and breadth of India, and I must confine myself to a very brief account of two of them,—the Santals and the Kandhs. The Santals have their home among the hills which abut on the valley of the Ganges in Lower Bengal. They dwell in villages of their own, apart from the people of the plains, and number about a million. Although still clinging to many customs of a hunting forest tribe, they have learned the use of the plough, and settled down into skilful husbandmen. Each hamlet is governed by its own headman, who is supposed to be a descendant of the original founder of the village. . . . Until near the end of the last century, the Santals lived by plundering the adjacent plains. But under British rule they settled down into peaceful cultivators. . . . The Kandhs, literally 'The Mountaineers,' a tribe about 100,000 strong, inhabit the steep and forest-covered ranges

which rise from the Orissa coast. Their idea of government is purely patriarchal. The family is strictly ruled by the father. The grown-up sons have no property during his life, but live in his house with their wives and children, and all share the common meal prepared by the grandmother. The head of the tribe is usually the eldest son of the patriarchal family. . . . The Kandh system of tillage represents a stage half way between the migratory cultivation of the ruder non-Aryan tribes and the settled agriculture of the Hindus. . . . Whence came [the] primitive peoples, whom the Aryan invaders found in the land more than 3,000 years ago, and who are still scattered over India, the fragments of a prehistoric world? Written annals they do not possess. Their traditions tell us little. But from their languages we find that they belong to three stocks. First, the Tibeto-Burman tribes, who entered India from the north-east, and still cling to the skirts of the Himalayas. Second, the Kolarians, who also seem to have entered Bengal by the north-eastern passes. They dwell chiefly along the north-eastern ranges of the three-sided tableland which covers the southern half of India. Third, the Dravidians, who appear, on the other hand, to have found their way into the Punjab by the north-western passes. They now inhabit the southern part of the three-sided tableland as far down as Cape Comorin, the southernmost point of India. As a rule, the non-Aryan races, when fairly treated, are truthful, loyal, and kind. Those in the hills make good soldiers; while even the thieving tribes of the plains can be turned into clever police. The non-Aryan castes of Madras supplied the troops which conquered Southern India for the British; and some of them fought at the battle of Plassey, which won for us Bengal. The gallant Gurkhas, a non-Aryan tribe of the Himalayas, now rank among the bravest regiments in our Indian army, and lately covered themselves with honour in Afghanistan."—W. W. Hunter, *Brief history of the Indian people*, ch. 2-3.—"It has sometimes been supposed that the Dravidians were the aborigines of India; but it seems more probable that these are rather to be sought among the numerous primitive tribes, which still inhabit mountainous districts, and other regions difficult of access. Such, for example, are the Gonds, found in many different parts of India, who remain even to the present day in the stone age of culture, using flint implements, hunting with bows and arrows, and holding the most rudimentary forms of religious belief. The view that the Dravidians were invaders, who came into India from the north-west in prehistoric times, receives support from the fact that the Brahui language, spoken in certain districts of Baluchistan, belongs to the same family as the Dravidian languages of Southern India; and it is possible that it may testify to an ancient settlement of the Dravidians before they invaded India. In any case, Dravidian civilization was predominant in India before the coming of the Aryans. Many of the Dravidian peoples now speak Aryan or other languages not originally their own; but they still retain their own languages and their characteristic social customs in the South, and in certain hilly tracts of Central India; and there can be no doubt that they have very greatly influenced Aryan civilization and Aryan religion in the North. Their literatures do not begin until some centuries after the Christian era, but the existence of the great Dravidian kingdoms in the South may be traced in Sanskrit literature and in inscriptions from a much earlier period."—E. J. Rapson, *Ancient India*, pp. 28-29.—"Mr. Thurston holds that the

jungle tribes of Southern India 'are the microscopic remnants of a pre-Dravidian people.' Robert Sewell writes, 'At some very remote period the aborigines of Southern India were overcome by hordes of Dravidian invaders and driven to the mountains and desert tracts, where their descendants are still to be found.' This dark, short and broad-nosed race is termed Pre-Dravidian by the Anthropologists.—R. Chanda, *Indo-Aryan races*, pt. 1, p. 8.—The leading ethnic types are: the Turko-Iranian, the Indo-Aryan, the Aryo-Dravidian, or Hindustani, the Mongolo-Dravidian or Bengali, the Mongoloid type, the Dravidian type. "The *Turko-Iranian* [is] represented by the Baloch, Brahui and Afghans of Baluchistan and the North-West Frontier Province. . . . [It was] probably formed by a fusion of Turk and Persian elements, in which the former predominate. Stature above mean; complexion fair; eyes mostly dark, but occasionally grey. . . . The *Indo-Aryan* . . . [occupies] the Punjab, Rajputana, and Kashmir, and . . . has as its characteristic members the Rajputs, Khattris, and Jats. This type . . . approaches most closely to that ascribed to the traditional Aryan colonists of India. The stature is mostly tall; complexion fair; eyes dark; hair on face plentiful; head long; nose narrow and prominent, but not specially long. . . . The *Scytho-Dravidian*, comprising the Maratha Brahmans, the Kunbis, and the Coorgs of Western India . . . [is] clearly distinguished from the Turko-Iranian by a lower stature, a greater length of head, a higher nasal index, a shorter nose, and a lower orbito-nasal index. . . . The *Aryo-Dravidian*, or *Hindustani*, [is] found in the United Provinces, in parts of Rajputana, and in Bihar, and [is] represented in its upper strata by the Hindustani Brahman, and in its lower by the Chamar. [It is] probably the result of the intermixture, in varying proportions, of the Indo-Aryan and Dravidian types. The head-form is long, with a tendency to medium; the complexion varies from lightish brown to black; the nose ranges from medium to broad, being always broader than among the Indo-Aryans; the stature is lower than in the latter group. . . . The higher representatives of this type approach the Indo-Aryans, while the lower members are in many respects not very far removed from the Dravidians. . . . The *Mongolo-Dravidian* or *Bengali* type of Lower Bengal and Orissa, . . . [comprises] the Bengal Brahmans and Kayasths, the Muhammadans of Eastern Bengal, and other groups peculiar to this part of India. [It is] probably a blend of Dravidian and Mongoloid elements, with a strain of Indo-Aryan blood in the higher groups. The head is broad; complexion dark; hair on face usually plentiful; stature medium; nose medium, with a tendency to broad. This is one of the most distinctive types in India. . . . Within its own habitat the type extends to the Himalayas on the north and to Assam on the east, and probably includes the bulk of the population of Orissa; the western limit coincides approximately with the hilly country of Chota Nagpur and Western Bengal. . . . The *Mongoloid* type of the Himalayas, Nepal, Assam, and Burma [is] represented by the Kanets of Lahal and Kulu, the Lopchas of Darjeeling and Sikkim; the Limbus, Murmis, and Gurungs of Nepal, the Bodo of Assam and the Burmese. . . . The *Dravidian* type . . . [extends] from Ceylon to the valley of the Ganges, and . . . [pervades] Madras, Hyderabad, the Central Provinces, most of Central India, and Chota Nagpur. [It is] probably the original type of the population of India, now modified to a varying extent by the admixture

of Aryan, Scythian, and Mongoloid elements. . . . This race, the most primitive of the Indian types, occupies the oldest geological formation in India, the medley of forest-clad ranges, terraced plateaux, and undulating plains which stretches, roughly speaking, from the Vindhya to Cape Comorin. On the east and west of the peninsular area the domain of the Dravidian is conterminous with the Ghats, while farther north it reaches on one side to the Aravallis, and on the other to the Rajmahal Hills."—*Imperial Gazetteer of India*, v. 1, pp. 292-296.—See also *DRAVIDIAN RACES; ARYANS; TURANIAN RACES AND LANGUAGES; PHILOLOGY: 4.*

ALSO IN: W. W. Hunter, *Brief history of the Indian peoples.*

"Racial distinctions are . . . less prominent than differences of religion, by which, in some cases accentuated, they may in other cases be concealed. . . . Within the limits of India proper Hinduism has become the ruling cult, and indeed—comparatively small sects, such as the Parsis, apart—it is commonly assumed to be the faith of all who are not Mohammedans. This impression is incorrect. Hinduism has no pretensions to dogmatic rigidity; it is not so much a faith as a system of society; and, indeed, can only be defined as an acceptance of Brahmin supremacy in all matters spiritual and ceremonial, and of the caste system which, under Brahmin ascendancy, fetters with ritual prejudice every action of man's life. But the hill tribes and the lowest classes of the plains population, so far from being ministered to by Brahmans, are treated by them as too degraded to be approachable. Those that need the services of a priesthood support special 'black Brahmans' of their own. Moreover these people are, in greater or less measure, free from the food scruples that complicate Hindu life. Hinduism in matters of belief is the most tolerant of religions, and has gradually drawn within itself a host of tribal or local creeds. But it is intolerant in respect of ceremonial purity, and has not cast its net over classes who are so degraded as to eat what it pleases them. The border line is not precisely defined; but these classes (which may conveniently be called the 'coolie castes') probably comprise at least fifty millions. They live in social degradation; but the country would do badly without them. It looks to them for its supply of field and casual labour and for the working of its factories, mines and tea-gardens. . . . Moreover, we should exclude from the Hindu community sects which have formally seceded from its regulations, and having proselytized from various castes, have substituted new for ancient caste distinctions. The most important of these sects is that of the Sikhs, which numbers 3,014,446, mostly belonging to the Punjab. . . . Hindus, properly so-called, may be reckoned . . . at about 56 per cent. of the population. But the name merely gives an appearance of unity to a most heterogeneous association of humanity, divided not only by rigid distinctions of caste but by wide differences of race, appearance, dress, language and ceremonial. . . . The Mohammedans [who number about 21 per cent. of the population] are a more closely knit society. Their religion is definite and dogmatic, and in India its solidarity has hardly been disturbed by schism. . . . Beyond doubt a very large proportion of the Mohammedan community is of purely Indian origin and is Mohammedan by conversion only. Conversion is still proceeding, and owing perhaps to a more liberal diet and less artificial marriage law, Mohammedans are increasing more rapidly than Hindus. During the . . . decade [1901-1911] their

numbers rose by nearly 7 per cent., whilst amongst Hindus . . . [of all castes] the rate of increase was 5 per cent. only. . . . The Native Indian Christian population has more than doubled in the course of the last generation, and during the past ten years [written in 1913] its number has increased by 34 per cent. . . . The Parsis . . . number only 100,100, but they contribute to the industrial, commercial and public life of India in an infinitely greater measure than to its population. . . . Hinduism has but little unifying force. Indeed the caste system which it has evolved is a means of isolating from one another groups of mankind. . . . A man is born into a caste and can never leave it [nor marry outside it]. He can eat with no one but a caste-fellow, and the kinds of food he can eat are strictly limited by the distinctive scruples of his caste. His food must be cooked by a caste-fellow unless he employs a Brahmin, and there are hundreds of low castes whose members refuse even Brahmin cookery; nay more, cooked food other than sweetmeats is polluted for him by the touch—even by the shadow—of any one who is not a caste-fellow. He can take water from the hands of men of lower castes, but only of certain specified castes. These food taboos complicate daily life to an almost incredible degree and altogether prevent the growth of . . . good fellowship. . . . There are between two and three thousand castes in India, and there are so many kinds of Hindu humanity. Each caste has a government of its own, its affairs being regulated by a committee (*panchayet*), which can punish the disobedient by fine or excommunication. . . . Very low down the scale lie the un-Hinduised multitudes which we have grouped together as 'coolies': they have castes of their own, but are regarded as outcasts by those above them and live in the most amazing contempt. They inhabit separate quarters of the village; they may not draw water from the village well; their touch is polluting; on the western coast they are even prohibited from approaching a high-caste man within a defined distance. At the head of the scale stand the Brahmins, numbering [according to the census of 1911] fifteen and a half millions. . . . They constitute a hereditary priesthood and hold the monopoly of communicating between man and the gods. With the gods they live in close communion; a Brahmin will set aside some portion of his meal for the god, and summon him to partake by blowing a little shell trumpet. . . . A Brahmin, however poor, is held in reverence, and is commonly addressed as 'Maharaj' (Your Highness). To insult him is a crime; to offer him violence a sacrilege. Under native rule he enjoyed the most liberal 'benefit of clergy'; and at the present time a Hindu jury can hardly be brought to convict him of a crime that is punishable with death. In the earliest Sanskrit writings—the Vedas—the Brahmins are mentioned, but as appointed ministers not as hereditary priests. They appear, however, to have striven from very early days to form themselves into a separate in-breeding class. . . . Brahmin influence and writings accordingly exalted purity of blood as well as ceremonial purity. For several centuries they were opposed by the antagonistic propaganda of Buddhism, in which the equality of mankind was a cardinal doctrine. But while Buddhism was still a popular creed—in the third century of our era—Brahmin views on the organisation of society were published in a remarkable Sanskrit work known as the *Institutes of Manu*. It recognises a long series of castes, headed

by the Brahmins. [See also HINDU LITERATURE; VEDAS.] Immediately below the Brahmins two castes—of military men (*Kshatriyas*) and of business men (*Vaishyas*)—presumably including Aryan or semi-Aryan families of social repute, are permitted to share with the Brahmins the title of 'twice-born' and the privilege of wearing a sacred thread. Of vastly inferior position are castes further down the scale. . . .

"With the triumph of Brahminism the people submitted to be unalterably classified on a system which limited their freedom but flattered their self-respect. Marriages have been limited within the caste for at least twelve centuries, and it has become possible often to tell a man's caste by his features. . . . Communities that were united by tribal relationship, or by a similarity of occupation, became castes. Many of the lowest Indian castes represent aboriginal tribes; a still larger number are linked to particular occupations. There is indeed a separate caste for almost every occupation or profession, although its members do not all follow the craft of their caste. Doctors, barbers, weavers, carpenters and blacksmiths may none of them intermarry. . . . How far are these crystallised conditions yielding to the solvent influence of the West? Food scruples are undoubtedly giving way. For many years, Hindus who, venturing upon a voyage to Europe, have there adopted Western habits of life, have submitted on their return to humiliating ceremonies of purification, and, abandoning china and glass, knives and forks, have reverted to Hindu manners and a vegetarian diet. But they are now much less ready to renounce comfort that has once been experienced, and have become sufficiently numerous to hold their own and to influence others. Educated Indians now commonly eat in European fashion and of European dishes—nay more, will sit at table with Europeans and eat with them. And amongst the lower classes the rules of diet are becoming more elastic, owing in great measure to the infractions that cannot be avoided during railway travel. Few scruples remain against biscuits, soda-water and tea. But the stronghold of caste is not in particularity of diet but in the limitation of cross marriage, and in this respect, if one looks below the surface, the marriage fields appear to be actually narrowing. New castes are even now arising; a subdivision of a caste will decide to enhance its social importance by prohibiting the remarriage of its widows, by marrying its children in infancy, by abstaining from some article of food, or even by renouncing the cultivation of some particular crop. It forms itself into a caste and will no longer inter-marry with its former caste-fellows. This is, however, in the lower levels of society. In the higher ranks there has also been manifest of recent years a reactionary spirit which displays bitter hostility to Western influences, and is willing to appeal to any superstition that may help to exclude them. But the vigilance of this spirit is evidence in itself of an inclination towards reform. Cases of caste inter-marriage, or of inter-marriage between Hindus and Mohammedans, are still of the very rarest occurrence. They are indeed illegal unless the parties formally abjure their religion. Even so one of the most prominent leaders of the Arya Samāj [a society formed primarily with the object of social reform] has recently ventured to marry out of caste, and there are men of influence who admire his temerity. A proposal so to modify the marriage law as to legalize mixed marriages without question of religion has lately [written in 1913] received surprisingly strong support amongst

the elected,—and independent,—members of the Viceroy's Legislative Council, and had the Government decided to accept the reform its decision would clearly not have been distasteful to the leaders of advanced opinion, although it might have been suspected by the masses and have been condemned as a scandal by reactionary orators. There have been revolts in the past against Brahmin restrictiveness. Within the last six centuries the brotherhood of mankind has been the standard of several popular movements. [The Brahma Samaj in Bengal, and the Arya Samaj in the Punjab have been active in late years.] But the sectarians have generally ended by conforming to the system they condemned: they have formed themselves into a caste, or a series of castes. Such has been the fate of the Lingayets of Madras, of the disciples of the reformer Kabir, who, at the time Luther was urging the Protestant revolt in Europe, proclaimed in India that before God all men were equal. But the new movement is supported by something more substantial than feelings of philanthropy. A suspicion is forcing its way that in-and-in-breeding has cost India much vitality, and that if she desires to meet Europe on equal terms, she must widen the area within which marriage is permissible. This ambition touches the self-esteem of the upper classes, and may overpower the resisting force of religion or custom. . . . Such, then, is Indian society, minutely and antagonistically subdivided by differences not only of religion, but of breed. Across these differences lie others, of language and of dress, which, while smoothing in no way the more vital distinctions, give a uniform stamp to the people of a locality." —J. B. Fuller, *Empire of India*, pp. 125-127, 129-135.—"It is well known that many members of the depressed classes improve their socio-economic position by embracing Christianity. . . . The Indian Christian community has been doubled in the last three decennial periods ending with the census of 1911, and now represents about 1¼ per cent of the entire population; and this is due far less to natural increase than to the constant accession to its ranks of members of the depressed classes. Further, since 1911 there has been a developing tendency to mass movements towards Christianity, one of the perplexing problems of the missionary bodies being to make due provision for the reception and education of whole villages desiring enrolment."—A. Khan, *India in transition*, p. 250.—See also BRAHMANISM; CASTE SYSTEM; ASIA: Unity of Asiatic civilization; European influences, etc.: 5; JAINISM; MYTHOLOGY: Indian: Unparalleled length of life: Eastern area; RELIGION: B.C. 1000.

Emigration of Hindus to East Africa. See KENYA COLONY.

Languages and writing.—The linguistic survey of India records 147 distinct languages. Of these seventy-nine are roughly classed as of the Thibeto-Chinese family, and are spoken among the semi-Mongolian people from Thibet to Burma. Fourteen belong to the Dravidian family, and include the four literary languages of southern India. A good many of the other tongues in the list are those spoken by aboriginal tribes or isolated groups of invaders here and there. The characteristic and most widely spread languages of India belong to the Aryan or Indo-European family. "The language of all the earliest records of India, whether literary or inscripational, is Indo-European in character. . . . A standard or literary language appears first in the Hymns of the Rig-veda, . . . [written in] 'Vedic' Sanskrit, . . . the language of

priestly poets who lived in the region now known as Southern Afghanistan, the North-Western Frontier Province, and the Punjab. . . . After the Vedic period, Aryan civilization extended itself in a south-easterly direction over the fertile plains of the Jumna and Ganges, which became subsequently not only the chief political and religious centre of Brahmanism but also the birthplace of its rival religions, Jainism and Buddhism. It was in this region that the priestly treatises, known as 'Brahmanas,' and the great epic poems, the Mahabharata and the Ramayana, were composed."—E. J. Rapson, *Ancient India*, pp. 9-10.—"Any account of the races or languages of India would be incomplete without mention of the influence that the spread of the English language is exerting over the population generally. . . . It is safe to say that the English language and what it stands for is the most powerful force acting to-day in India in the direction of social and national unity. It has been said that the languages of southern India are as unintelligible in Lahore as they would be in London, and that a native of Calcutta or Bombay is as much a foreigner in Delhi or Peshawar as an Englishman is a foreigner in Rome or Paris. But . . . the English-speaking Indian . . . is not a foreigner in any part of India where English is spoken. One of the novel features of modern Indian life is the frequent holding of Pan-Indian congresses for the discussion of political, social, industrial, religious and other subjects. These assemblies, which bring together the most prominent men from all parts of India, would be impossible were it not for the common basis provided by the English language. . . . But we must not exaggerate the extent to which a knowledge of English, or indeed any book knowledge at all, is at present possessed by the population. In a population of three hundred million possibly a million and a half persons can read and speak English, and of these many know it very imperfectly. It is the tendency that is important, and the tendency is for English to spread."—T. W. Holderness, *Peoples and problems of India*, pp. 79, 80, 83.

"For many centuries past India has possessed a bewildering variety of forms of writing; but comparison of the older records enables us to trace back almost all this multiplicity of scripts to a single original, the ancient Brahmi characters. Some coins of the fourth century B.C. and the inscriptions containing the Edicts of Asoka (third century B.C.) are the oldest Brahmi writings known to us, but their characters have already a long history behind them. As most of the Brahmi letters agree with the Northern Semitic characters of the early part of the ninth century B.C., it seems likely that Hindu traders, about 800 B.C., borrowed North-Semitic letters to write their own language, and that then Hindu scholars arranged and developed them into alphabetical systems suitable to express the requirements of Sanskrit speech. One of these systems was the *Brahmi*, which in time became the parent of nearly all the later scripts of India and their offspring."—L. D. Barnett, *Antiquities of India*, p. 225.—See also PHILOLOGY: 4; 16; HINDU LITERATURE; SANSKRIT.

Political divisions.—Native states.—"India is divided into two classes of territories; first, Provinces under British rule; second, States under Native Chiefs. The population of the whole amounted in 1901 to over 204 millions, or more than double the number estimated for the Roman Empire in the height of its power. But the English, even more than the Romans have respected the rights of Native Chiefs who are willing to

govern well. Such Chiefs still rule on their own account nearly one-third of the area of India, with over 62 millions of subjects, or more than a quarter of the whole Indian people. The British territories, therefore, comprise about two-thirds of the area of India, and over three-quarters, or more than 231 millions, of its inhabitants. . . . The British possessions are distributed into . . . Provinces. Each has its own Governor or head; but all are controlled by the supreme Government of India. . . . The Viceroy [or governor-general] of India is appointed by the King of England; so also are the Governors of Madras and Bombay. The heads of the other Provinces are chosen for their merit from the Anglo-Indian services, almost always from the Civil Service, and are nominated by the Viceroy, subject in the case of the Lieutenant-Governorships to the approval of the Secretary of State. The King of England is Emperor of India, and is spoken of both officially and commonly in India as 'the King-Emperor.'"

—W. W. Hunter, *Brief history of the Indian people*, pp. 38-39.—"British India for administrative purposes is divided into 15 provinces, each with its separate Local Government or administration. In eight of the provinces—the three Presidencies of Madras, Bombay and Bengal, the United Provinces of Agra and Oudh, the Punjab, Bihar and Orissa, the Central Provinces, and Assam—the Local Government consists of a Governor, an executive Council of not more than four members, and two or more Ministers. In one province—Burma—the Local Government consists, pending further legislation, of a single individual—the Lieutenant-Governor assisted by a secretariat and headquarter staff, but Burma is to be brought into line with the other Provinces. The remaining six provinces are directly administered by Chief Commissioners, who are technically mere agents of the Central Government of India."—*Indian Year Book*, 1922, p. 16.—"The easiest way of understanding the organisation of a province is to think of it as composed of districts, which in all provinces, except Madras, are combined, in groups of usually from four to six, into divisions, under a commissioner. The average size of a district is 4,430 square miles. . . . Many are much bigger. Mymensingh district holds more human souls than Switzerland, Vizagapatam district, both in area and population, exceeds Denmark. . . . The district, which is a collector's charge, is the unit of administration, but it is cut up into sub-divisions under assistants or deputy collectors, and these again into revenue collecting areas of smaller size. . . . The district officer has a dual capacity; as collector he is head of the revenue organisation, and as magistrate he exercises general supervision over the inferior courts and, in particular, directs the police work. In areas where there is no permanent revenue settlement, he can at any time be in touch, through his revenue subordinates, with every inch of his territory. This organisation in the first place serves its peculiar purpose of collecting the revenue and of keeping the peace. But, because it is so close-knit, so well-established, and so thoroughly understood by the people, it simultaneously discharges easily and efficiently an immense number of other duties."—*Montagu-Chelmsford Report*, paragraphs 122-3.—H. V. Lovett, *History of the Indian nationalist movement*, p. 18, footnote.

"The census report of 1901 estimates the aggregate area of the native states at 679,392 square miles, or 38 per cent. of the 1,776,597 square miles which make up the Indian Empire, the population of which is 62,461,549, out of 294,361,056 in-

habitants of India, in which are not included the inhabitants of the Shan States of Burma, the Khasia and Jaintia Hills, Manipur and Bhutan, while the area and population of Nepal have not been properly ascertained. The native states thus comprise more than a third of the area and support considerably less than a quarter of the population. . . . [In 1921, the area of the native states was estimated at 709,555 square miles, out of a total of 1,802,629, while the population was 71,936,736 out of a total of 319,075,132. According to government usage India means British India], together with any territories of any native chief under the suzerainty of . . . [the Crown] exercised through the Governor-General, or through any officer subordinate to him. This suzerainty, in the case of 175 states, is exercised directly by the Government of India, and in the case of 500 through provincial governments. Sir William Lee Warner explains that the generally accepted view is that suzerainty is divisible between the British Government and the ruling chief, and that, of its attributes, the right to make war or peace and the right of foreign negotiation lies with the Government, while the right to make laws and administer justice resides in the ruling chief. No chief can therefore be properly described as independent. . . . The size of the native states varies from that of Hyderabad, which is rather larger than Great Britain, to petty possessions of twenty square miles. The fact that in some parts of India, as in Bombay, native states are extremely numerous, amounting to 354 in number, whereas in other parts, like Madras, there are only five, is accounted for by the conditions existing at the time the British power was consolidated. In the south the Nizam of Hyderabad, the Nawab of the Carnatic, the Sultan of Mysore, and the Maharaja of Travancore had swept away or bound up into one unit many petty chiefships and small states before the British power was established. In Bombay, on the other hand, the power of the Peshwa had been weakened and territories were changing rulers up to the time when the Marhattas were overthrown by the English, and the latter power recognised the *status quo* and confirmed the holders of the moment in their otherwise precarious possessions. Most of the native states, however, are of modern origin, the most ancient being those included in Rajputana. Central India, on the contrary, is chiefly occupied by Marhatta chieftains, who were not attracted by the deserts of the Rajputs. . . . Mysore may be regarded as a revival by the favour of the British of an ancient Hindoo principality. Travancore and Cochin are old-world Hindoo states, which existed, as they are now, before the struggle between the French and English in the south. The Mogul emperors had not been satisfied with suzerainty over the numerous native states which existed in their day. What they desired was dominion, in the quest of which they were led to destroy the Mohammedan kingdoms of the Deccan, which, had they been preserved, might have warded off the fatal onslaught of the Marhattas. The latter, in turn, simply desired to levy as blackmail the fourth part of the revenue of all weaker powers, and they evolved no real policy in regard to the native states before the ruin of the confederacy on the field of Panipat in 1761. In South India, warfare with the French and local intrigue led to the like relations with the native princes, but with the fall of Tipoo Sultan at Mysore, the Nizam and the British became united in a lasting alliance. Bengal had

become part of British India with the grant of the Dewani or fiscal administration in 1765, and Oudh was for a time the buffer state between it and the Mahrattas. The establishment, by the Treaty of Bassein in 1802, of British influence at Poona led to war with Sindhia and Bhonsla, which was followed by a breach with Holkar, and subsequently with the Peshwa, and by the suppression of the Pindaris, at the conclusion of which, in 1818, Rajputana, Gwalior, Indore, and Nagpur were brought under the British Protectorate. The war of 1814-1816 left Nepal independent as to its internal administration, but under the control of the Government of India in respect of its foreign relations. . . . At first the British policy was to restore conquered territory, merely retaining sufficient for their own purposes and for the payment of expenses, but since the phantom Emperor fell under the control of the Mahrattas they ceased to acknowledge his authority and, in the time of Lord Hastings, adopted the policy of maintaining that the British held the suzerainty of India. Between 1813 and the Mutiny, most of the existing treaties were concluded with native states. . . .

"It is now clearly established that the rights of chiefs as rulers will be respected, but that the British Government alone shall act for them in dealings with foreign powers and with other native states, that the inhabitants of such states are subjects of their own rulers, and that rulers and subjects are alike exempt from the laws of British India. The internal peace of the native states is also secured, and they are forbidden to employ, without permission, subjects of other European nations; while their subjects, when outside their own territory, become practically British subjects. As states which cannot make war on other states in the same position as themselves, or on foreign powers, need no army, in most treaties the military forces which they may maintain are restricted, and a provision is inserted to the effect that no factories may be erected for the production of guns and ammunition. Native states are, on the contrary, bound to render assistance to the Imperial forces. Since the time of Lord Dufferin several of the larger units have maintained Imperial service troops which number nearly 20,000 men in all. These are under the inspection of British officers, and when placed at the disposal of the British Government are available for use in the same manner as British forces, though they belong to the states and are recruited from its subjects. . . . In spite of the internal independence guaranteed to the states the paramount authority claims and exercises the right to interfere to correct serious abuses, or even to administer for the time being, when sufficient reason arises. Thus the late Gaekwar of Baroda was deposed, and other instances of similar action are not wanting. The powers of the Governor-General in native states are exercised through political officers, generally called Residents, who are the sole channel of communication, and the political service is recruited from the Indian Civil Service and from the Indian army."—J. D. Rees, *India, the real India*, pp. 149-154.—"In these [native] states there is a more or less regular system of administration modelled on the system existing in British districts. Usually there is a prime minister, who in Hindu states is called the *diwan*, and in Muhammadan states the *wazir* or some equivalent name. There are other ministers in charge of different departments, a supreme court of justice, and district officers. The ministers and judges are some-

times Indians borrowed from the public service of a British province, and such men bring with them the principles and methods of modern government. Under their guidance the largest states have adopted in a more or less modified and simplified form the penal code of British India, the procedure codes and some of the substantive laws. Experiments in representative institutions have also here and there been made, though they are not allowed to go far. In Mysore and Travancore a representative assembly is convened for a few days every year, is addressed by the diwan, is permitted to talk on public questions, and is then dismissed. In Baroda a beginning has been made with a legislative council. But the dominant note in native states is the absolutism of the ruler. . . . Though he may choose to rule by deputies, at any time he may elect to put them aside and to take up the reins: while some of the ablest princes of India have always kept the detailed administration of their states in their own hands."—T. W. Holderness, *People and problems of India*, pp. 184, 185.—See also BRITISH EMPIRE: Character of British rule in India and Egypt.

Local self-government.—"The subject of local self-government in India is of so great importance that it demands treatment at greater length. At the basis of all local government in India lies the village. . . . The village has its own organisation and rules, and its own officials. The villages according to Baden-Powell's division may be divided into two main classes: the *ryotwari* village, the head of which is the *patel* or *reddi* or hereditary headman; and the joint or landlord village of the United Provinces and the North-West generally, the head of which is the village *panchayat* or group of heads of the leading families. The *panchayat* in many villages has been superseded by an individual such as the *lumbardar*, with whom the local government can have direct dealings. . . . The Indian village is an essential part in Indian administration. The officials . . . whatever they may be, have direct dealings with Government, and are as a rule paid small salaries. They are responsible for the local maintenance of law and order, for the collection of revenue, for giving information regarding crops, diseases and other items of local interest. The village never evolved what we now call municipal government. Both in Hindu and Mohammedan India the village chief official was a direct agent of the central government. Local self-government in the sense that we now speak of municipalities as self-governing institutions is not indigenous to India, [but] the village, with its peculiar type of government, is indigenous to India. It is one of the most permanent institutions in India. In the words of Lord Metcalfe: 'The village communities are little republics, having nearly everything they can want within themselves, and almost independent of foreign relations. They seem to last where nothing else lasts. Dynasty after dynasty tumbles down; revolution succeeds revolution; Hindu, Pathan, Mughal, Maratha, Sikh, English, are all masters in turn, but the village communities remain the same. . . . If a country remain for a series of years the scene of continued pillage and massacre, so that the village cannot be inhabited, the scattered villages nevertheless return whenever the power of peaceable possession revives. A generation may pass away, but the succeeding generation will return.' . . . Local self-government of the modern

type, both urban and rural, is vastly different from the indigenous village government. It is the result of British ideas of government and as such exotic to India. The Presidency towns, under Royal Charter, possessed some type of municipal government from the earliest days of the Company. Municipal administration on a larger scale was attempted in 1842 when an Act was passed, applicable to Bengal, to enable the inhabitants of 'any place of public resort or residence to make better provision for purposes connected with public health and sanitation.' In 1850 an Act was passed making the Bengal principle operative over the whole of India. Both Acts were permissive, . . . [and] under the 1850 Act a large number of municipalities were formed with more success. The Commissioners, however, were mostly nominated. The elective principle was not yet tried. The real starting point of municipal government is in the Resolution, passed in 1870, by Lord Mayo's Government which declared that: 'Local interest, supervision and care are necessary to success in the management of funds devoted to education, sanitation, medical charity, and local public works. The operation of this Resolution in its full meaning and integrity will afford opportunities for the development of self-government, for strengthening municipal institutions, and for the association of Natives and Europeans to a greater extent than heretofore in the administration of affairs.' New municipal acts followed, extending the democratic principle. The most extensive policy of local self-government was adopted by Lord Ripon's Government. In the Resolutions of 1881 and 1882 and the Acts of 1883 and 1884 the prevailing principles of local self-government were laid down. The constitution, powers and functions of local bodies were much altered. The principle of election was extended, and freedom from official control was made real by establishing sounder financial bases for the municipalities and allowing the election of unofficial chairmen. A similar evolution marked rural self-government. Although it started later, rural self-government has extended widely. The principles governing it are substantially the same as those governing urban self-government. . . . One of the most important things in the policy of the Government of India from 1882 downwards has been the insistence on local self-government as a training school for a wider responsibility. In Lord Mayo's Resolution of 1870 this idea, as I have shown, was brought to light, but it is in the 1882 Resolution of Lord Ripon's Government that we have its first clear expression. This Resolution says: 'It is not primarily with a view to improvement in administration that this measure is put forward and supported. It is chiefly desirable as an instrument of political and popular education. . . . [If] the officers of Government only set themselves, as the Governor-General in Council believes they will, to foster sedulously the small beginnings of the independent political life, if they will accept loyally and as their own the policy of the Government, and if they come to realise that the system really opens to them a fairer field for the exercise of administrative tact and directive energy than the more autocratic system which it supersedes, then it may be hoped that the period of failures will be short, and that real and substantial progress will very soon become manifest.' The same ideas have been repeated in subsequent Resolutions, the most recent of them of May 1918, which presents the current policy thus: . . . 'The object of local self-government is to train the people in the management of their own local affairs and that polit-

ical education of this sort must, in the main, take precedence of considerations of departmental efficiency.'—R. N. Gilchrist, *Indian nationality*, pp. 197-200, 202-203.

**Agriculture.—Dependence of population.—Backward methods.—Efforts toward improvement.**—"India is pre-eminently an agricultural country. Of its total population 72 per cent. are engaged in pasture and agriculture, viz., 69 per cent. in ordinary cultivation and 3 per cent. in market gardening, the growing of special products, forestry and the raising of farm stock and small animals. The 217 million persons supported by ordinary cultivation comprise nearly 8 million [Indian] landlords, 167 million cultivators of their own or rented land, over 41 million farm servants and field labourers and less than a million estate agents and managers and their employes."—*Indian Year Book*, 1922, p. 457.—"The size of an average holding varies from half an acre in densely populated parts of the country to eight acres in less congested parts. Taking the mean of the two extremes, the average size of the Indian farm—if one may call it by that name—does not exceed four acres. As the holder of this four-acre-farm supplies both capital and labour, the usual custom is for the whole family to find their vocation in, and derive their living from, the management of the holding. . . . The fencing off of the land is a thing almost unknown in India, because under the present system [of sub-divisions] the size and scope of an average farm are so limited that it is hardly worth while going to the trouble and expense of erecting and maintaining fences. . . . The systematic rearing of such economic beasts as cattle, horses, sheep, and pigs is a thing almost unknown in India. . . . The reason for our livestock deficiency is to be found in our conservatism as to material progress, our lack of education, and our religious scruples. . . . The need for agricultural research—chemical, bacteriological, mycological, phytogenetical, etc.—is very urgent indeed in a country like India, where the number of problems awaiting solution must be practically without limit. At the present time [1920] India possesses only one Agricultural Research Institute of any consequence—namely, the one at Pusa—and let us not shrink from recalling the fact that the foundation of this one place was made possible by the munificence of an American millionaire."—N. N. S. Gupta, *Agricultural development of India (Asiatic Review, July, 1920)*.—"In India crops can be cultivated all the year round. During the fiercest heat of the dry months you may see, clustered about the wells, patches of small millet—oases in a desert—which, so long as they are watered, can defy the hot wind. Vegetation luxuriates in the warm moisture of the rainy season that follows. The night frosts of the Northern India cold weather do not injure—or greatly retard—the growth of young wheat. It is possible, then, to take two crops off the ground within the year, if they be crops of rapid growth, requiring no more than five or six months between sowing and harvest; so, by double-cropping his land, a cultivator may practically double the area of his holding. In Northern India wheat often follows a crop of maize or indigo, and in Southern India rice follows rice within the year. When a crop requires more than half a year to come to maturity, a second crop may be gathered by sowing it amidst the growing plants. Pulse, for instance, may be sown in standing rice, and rape in standing cotton. In this way nearly an eighth of the area under tillage

is cropped twice within the year. . . . [Agriculture has been greatly retarded by caste prejudice and custom. Few of the Rajput and Brahma castes will cultivate their own land, much of which is badly farmed by hired labor.] A larger variety of crops is cultivated in India than in any other country of the world. There are fourteen cereals, of which rice and millet are most characteristic of the Indian climate, since, if uncultivated by man, they could survive in a wild condition and indeed are represented in the wild flora of the country. . . . [Maize has been introduced from America. Wheat, barley and oats are grown in the north. Sugar cane, pulse, rape, cotton, flax, jute, hemp, tobacco and the opium poppy, tea, coffee, indigo are important crops. Indigo and opium however have decreased in value,—indigo since the introduction of the blue aniline dye; opium in accordance with the agreement with China.] The cultivators have much to learn and to reform. Certain of them, generally low caste men, work their fields with the industry and skill of the best market-gardeners. But, on the whole, the land produces much less than should be expected of it, subdivided as it is into very small holdings. . . . The Indian cultivator turns the smallness of his holding to no such practical advantage [as the farmer of Japan], and farms three or four acres in the methods that he would follow with a holding of tenfold this area. His implements are of the lightest; but he works them with cattle power. Good cultivators recognise the advantage of selecting their seed, and reserve for this purpose the finest heads of maize, and the first pickings of cotton. But the generality sow the seed that first comes to hand, often obtaining it on loan. . . . Manure is not preserved, and sewage will not be handled. That some Indian cultivators will move outside the ring of their traditions, if tempted by a clear advantage, is proved by the widespread adoption of such exotics as tobacco and potatoes. . . . But there are only a few castes that will adopt improvements that cost labour; and the most disheartening fact to those who look for progress is the failure of the many to learn from the skill and industry that are daily displayed by a few of their neighbours. For a generation and more the State . . . has maintained experimental farms and published their results. But it is only within . . . [this century] that these departments have been equipped with an effective staff of European technical advisers, have been provided with funds that are in any way adequate, and have been able to look to agricultural colleges for the training of the subordinate staff they require. So far no extensive practical results have been obtained.—indeed, alongside of the government farms, you may see cultivators pursuing their ancient methods, changed in no respect by the example. But it must be admitted that the results of experiments have not always been trustworthy: research must precede efforts at conversion, and Indian conditions offer much that is strange to the agricultural science and practice of the West. Iron ploughs of European patterns have in some localities been purchased in hundreds: so also have simple water-lifts: in the Madras presidency there are . . . [a large number of] irrigating pumps worked by oil engines. The wooden roller and pestle mills used from time immemorial for the crushing of sugar-cane are being driven out of use by a light iron mill. But these improvements only touch the surface of what is possible, and widespread reform cannot be expected until an idea gains currency that to raise better crops is meritorious, and may even be considered fashionable.

Such an opinion appears to be arising in Western India—the Bombay presidency and the Central Provinces—and perhaps also in the Punjab. The experiments of the Agricultural Departments are watched with interest: visits by their European experts are welcomed: pure seed is in rapidly increasing demand, and seed farms and nurseries are being established by private enterprise. At the Poona Agricultural College in the Bombay presidency there are students who have come to learn farming for use on land of their own.”—J. B. Fuller, *Empire of India*, pp. 44, 52, 325-327.—See also COÖPERATION: India; EDUCATION, AGRICULTURAL: India; FOOD REGULATION: 1914-1915.

Finance.—Land revenue.—“The British Parliament has no control over the Indian revenues, except that no money can be spent on military operations beyond the frontier without the consent of both Houses of Parliament. A financial statement is placed before the House of Commons every year, but a proposition only that such accounts are in order is put to the vote. The salary of the Secretary of State and the expenses of his establishment are now paid from the revenues of the United Kingdom. . . . When the management of Indian affairs was transferred from the Company to the Crown, the Government of India took over the debts of the Company, amounting to 107 crores [which included the cost of suppressing the mutiny]; and this sum has been increased for several reasons so that in 1914 the debt of India stood at 411 crores . . . [of which] 19 crores represented ordinary or unproductive debt. The annual interest on the latter was only a crore, and on the productive debt about 13 crores, so that India's total interest charges then amounted to about 14 crores. On the other hand, railways and irrigation works which had been financed from the public debt yielded in that year a return of nearly 23 crores, which left a margin of nine crores of clear profit to the country, after meeting the interest charges of the entire debt.’ . . . [The revenues of India are chiefly derived from customs and excise; forests, on which there is a small profit; income tax; land revenue, opium, railways and irrigation, spoken of above, posts and telegraphs, on which there is also a small profit, which can be used for improvements, and the salt tax. Customs duties are of increasing importance.] In 1860, imports were taxed at the rate of ten per cent, and in some cases an even higher duty was levied. In subsequent years the duty was reduced, and in 1875 it stood at five per cent. Proposals originating from the Home Government were then made to abolish the tax almost entirely, and were met by strenuous opposition from India. The Viceroy, Lord Northbrook, resigned rather than abolish the duties, and Lord Lytton succeeded him. The new Viceroy, by the help of his Finance Member, Sir John Strachey, was able to make a start in the new policy by reducing the cotton duties, although he had to overrule the majority on his Council. The total abolition of the import duties followed, except those on salt and liquor which were retained to counter-balance the excise duties levied within the country on these articles. . . . [The salt tax, which has been in existence from remote times, is the only tax which is imposed upon all the classes of the people. In 1907 it was reduced to one rupee per maund of 85 pounds, but in 1916 was again raised to one rupee four annas.

This tax is much disliked, and is looked upon as a source of grievance by the people.] *The Income Tax* was first of all imposed in 1860. Since then it has been abolished and restored; and it is still in force. It is not imposed on incomes derived from agriculture or the tenure of land. Moreover, it is graduated in such a way that the rich pay on a higher scale than those who are only moderately well off, the poor being exempt altogether. . . . [Opium, which is a government monopoly, is of rapidly decreasing value as a source of revenue. It is also produced in large quantity in some of the native states. This opium, known as Malwa opium, is subject to a heavy export duty. The land revenue, which may be looked upon either as a rental, or as a direct tax upon the land, according to the point of view, is the most important source of Indian revenue, as it has been since before the beginning of the written history of the country.] In the laws of Manu it is seen that a proportion of the gross produce from the land was due to the State. In early times this revenue was paid in kind, and represented the amount of grain which the rulers considered their fair share of the crops. . . . Under the rule of the Moguls the system of land revenue became regularized. . . . Land revenue henceforward was to be paid in cash rather than in kind. . . . A calculation was made from the prices of the last ten years, and one-third of the average crop was considered the right proportion due to the State. As the Muhammadan Empire fell into decay, the collection of land revenue became disorganized. The evil system of farming out the privilege of collecting the revenues became customary. These revenue farmers were in some instances the Hindu chiefs whom the Muhammadan rulers wished to conciliate, or else individuals having some claim on the State, either by their position or by past services. They were known in Bengal as Zemindars, and in Oudh and Gujarat as Talukdars. As time went on, 'the Zemindars did just as they pleased, and made the villagers pay whatever they demanded, or whatever they could extract from them.' The actual amount paid by the Zemindars from the proceeds into the Treasury depended very largely on the bargain they had been able to make with the Government."—G. Anderson, *British administration in India*, pp. 120, 132, 127, 128, 134, 135.—See also below: 1912-1922.—In charge of a district was a Mamlatdar under whom were the zamindars, in charge of a varying number of villages, in which they dealt with the *patels* or head men, who in turn decided the amount to be paid by the individual ryots or peasant cultivators. Later the office of Mamlatdar was let out to the highest bidder, who farmed his district to collectors. Darakdars, or inspectors, were employed in many districts to prevent mal-practice; but even so, the unfortunate cultivators were subjected to oppression. Under British control, an effort has evidently been made to arrange an equitable system of collecting the land revenues, in approximate accordance with the usage to which the people of each province were accustomed. In new districts, brought under cultivation by irrigation, the officials have had a freer hand. Thus, the land system of India is extremely complicated. In Bengal, where the permanent system is in operation, no change has been made since the settlement. This also applies to districts in the provinces of Madras and part of the United Provinces where the settlement maintains. The larger portion of the land in Madras and Bombay is cultivated by peasant proprietors, with whom the government enters into individual agreements, under the tenure known as

ryotwari. Speaking of this tenure, the commission which was appointed to enquire into the cause of famine in 1880 stated that: The ryot "holds his land in proprietary right, subject to the payment of the assessed revenue which is fixed for a period of thirty years. He has the option of resigning his entire holding, or any individual field, at the end of the agricultural year. His improvements cannot be made a ground for increasing his assessment at the time of the periodical assessment. He can sell, mortgage, or let his land to any one without requiring the consent of the Government, and at his death the land descends to his children according to the rules of inheritance."

"A general term for land-holders of position superior to that of cultivator is zamindar," and settlements on this system are known as "zamindari." They prevail in Bengal, the United Provinces, the Punjab, and the Central Provinces. These two forms of settlement are sharply distinguished in official literature. But, in substance, they tend to approach one another. Under a zamindari settlement the units of assessment—the revenue-paying estates—are generally very much larger than under a ryotwari settlement. But by the subdivisions of inheritances, their size is constantly diminishing. On the other hand, the free transfer of land, which is generally permitted leads to the amalgamation by purchase of ryotwari holdings. Again, as a general rule, zamindari revenue-payers are rent-receivers, not cultivators, while ryotwari revenue-payers are cultivators, not rent-receivers. But zamindars commonly farm a part of their estates, and sometimes the whole of them; and ryotwari [in the north, where the zamindari system is in operation the ryot is simply a cultivating tenant] holdings are sublet on an exceedingly extensive scale. From the fiscal point of view, an important point of difference is that zamindari holdings include much unassessed waste land that lies in and about their cultivated areas [which is non-productive of revenue] (although it may pay rent to the zamindar when taken up for reclamation). . . . In a ryotwari village, a cultivator who takes up waste land pays upon it forthwith."—J. B. Fuller, *Empire of India*, pp. 337, 338.—It is stated that, generally speaking, the land tax or rental is from five to ten per cent. of the gross produce, in ryotwari districts, and falls under fifty per cent. of the net income in zamindari districts. Permanent settlements are not in favor with officials, because the settlement being fixed on the basis of an average year, it tends to be too heavy in a bad season, in an agricultural country, where poverty is the rule, and where the people are too easily content with little to strive to lay by enough to tide them over a season of drought. In permanent settlement districts, therefore, a system of suspensions and remissions is in force to raise the burden from the peasantry in bad seasons. In these districts also laws are enforced against rack renting by zamindari landlords, an evil which was prevalent until the passage of legislation to prevent it.

B.C. 2000-600.—Immigration and conquests of the Aryans.—Vedism.—Brahmanism.—Hinduism.—“The immigration of the Aryas into India took place from the west. They stand in the closest relation to the inhabitants of the table-land of Iran, especially the inhabitants of the eastern half. These also call themselves Aryas, though among them the word becomes Airya, or Ariya, and among the Greeks Arioī. The language of the Aryas is in the closest connection with that of the Avesta, the religious books of Iran, and in very close connection with the language of the monuments of Darius and Xerxes, in the western half of that region. The religious conceptions of the Iranians and Indians exhibit striking traits of a homogeneous character. A considerable number of the names of gods, of myths, sacrifices, and customs, occurs in both nations, though the meaning is not always the same, and is sometimes diametrically opposed. Moreover, the Aryas in India are at first confined to the borders of Iran, the region of the Indus, and the Panjab. Here, in the west, the Aryas had their most extensive settlements, and their oldest monuments frequently mention the Indus, but not the Ganges. Even the name by which the Aryas denote the land to the south of the Vindhya, Dakshinapatha (Deccan), i.e., path to the right, confirms the fact already established, that the Aryas came from the west. From this it is beyond a doubt that the Aryas, descending from the heights of Iran, first occupied the valley of the Indus and the five tributary streams, which combine and flow into the river from the north-east, and they spread as far as they found pastures and arable land, i.e., as far eastward as the desert which separates the valley of the Indus from the Ganges. The river which irrigated their land, watered their pastures, and shaped the course of their lives they called Sindhu (in Pliny, Sindus), i.e., the river. It is, no doubt, the region of the Indus, with the Panjab, which is meant in the Avesta by the land hapta hindu (hendu), i.e., the seven streams. The inscriptions of Darius call the dwellers on the Indus Idhus. These names the Greeks render by Indos and Indoi. . . . Products of India, and among them such as do not belong to the land of the Indus, were exported from the land about 1000 B.C., under names given to them by the Aryas, and therefore the Aryas must have been settled there for centuries previously. For this reason, . . . we may assume that the Aryas descended into the valley of the Indus about the year 2000 B.C., i.e., about the time when the kingdom of Elam was predominant in the valley of the Euphrates and Tigris, when Assyria still stood under the dominion of Babylon, and the kingdom of Memphis was ruled by the Hyksos. . . . [In the Rig-veda, written about 2000 B.C.], the Indus is especially the object of praise; the ‘seven rivers’ are mentioned as the dwelling-place of the Aryas. This aggregate of seven is made up of the Indus

itself and the five streams which unite and flow into it from the east—the Vitasta, Asikni, Iravati, Vipāca, Çatadru. The seventh river is the Sarasvati, which is expressly named ‘the seven-sistered.’ The land of the seven rivers is, as has already been remarked, known to the Iranians. The ‘Sapta sindhava’ of the Rigveda are, no doubt, the hapta hendu of the Avesta, and in the form Harahvaiti, the Arachotus of the Greeks, we again find the Sarasvati in the east of the table-land of Iran. As the Yamuna [Jumna] and the Ganges are only mentioned in passing . . . and the Vindhya mountains and Narmadas are not mentioned at all, the conclusion is certain that, at the time when the songs of the Aryas were composed, the nation was confined to the land of the Panjab, though they may have already begun to move eastward beyond the valley of the Sarasvati. We gather from the songs of the Rigveda that the Aryas on the Indus were not one civic community. They were governed by a number of princes (raja). Some of these ruled on the bank of the Indus, others in the neighbourhood of the Sarasvati. They sometimes combined; they also fought not against the Dasyus only, but against each other.”—M. Duncker, *History of antiquity*, v. 4, bk. 5, ch. 1-2.—“Vedism was the earliest form of the religion of the Indian branch of the great Aryan family. . . . Brahmanism grew out of Vedism. . . . Brahmanism was rather a philosophy than a religion, and in its fundamental doctrine was spiritual Pantheism. Hinduism grew out of Brahmanism. . . . Yet Hinduism is distinct from Brahmanism, and chiefly in this—that it takes little account of the primordial, impersonal Being Brahmā, and wholly neglects its personal manifestation Brahmā, substituting, in place of both Brahmā and Brahṃā, the two popular personal deities Siva and Vishnu.”—M. Williams, *Religious thought and life in India*, pt. 1, ch. 1, and introduction.—See also ARYANS; BRAHMANISM; RELIGION: B.C. 1000; VEDAS.

B.C. 600-327.—Rise of Buddhism in the empire of Magadha.—Invasion of Darius.—Extensive commerce.—“The history of India begins, for an orthodox Hindu, more than three thousand years before Christ, with the war between the sons of Pandu and the sons of Kuru, as described in the Mahabharata, a vast epic about eight times the bulk of the Iliad and Odyssey combined, and in parts of great antiquity. Another huge epic, the Ramayana, which probably is less ancient, relates the story of Rama, prince of Kosala (Oudh), and is also regarded by Hindus as a storehouse of historical facts. Many attempts, all alike unsuccessful, have been made to distil history from the Indian epic poems, but modern criticism now generally acknowledges the fact that bardic lays cannot be made the basis of sober history. . . . [However] most of the leading problems in Indian chronology have been successfully attacked and solved with the aid of . . . synchronisms; and it is now possible to give an outline of the main facts in chronological order from 600 B.C. to A.D. 650. . . . The oldest historical traditions seem to be those embodied in the Jain and Buddhist scriptures, parts of which may have been composed as early as the fifth century B.C. [when Buddha lived and taught]. . . . The early traditions give us glimpses of India in the sixth and seventh centuries B.C. The country, as far as it was occupied

by the more advanced tribes, especially those commonly called Aryan, was even then a civilized land, in a condition far removed from barbarism. We hear of sixteen great powers or principal states in Northern India, besides smaller kingdoms and tribal republics. Cities and towns were numerous, and well equipped with the necessaries and luxuries of life. Some of the places mentioned in the most ancient stories, such as Benares and Broach (Bharoch), are important cities to this day. Others, famous in the olden time, are now ruinous heaps, and of some the very name and site have been forgotten. Taxila, for instance, which was celebrated as one of the greatest cities of the East in the time of Alexander, was not only the capital of a kingdom two centuries earlier, but a seat of learning, to which scholars of all classes flocked for instruction in every branch of knowledge then within the reach of a student. Its site is now marked by lines of shapeless mounds, scattered among the villages near Rawalpindi. Sravasti, the splendid city where Buddha lived and taught for many years, lies buried in jungle on the borders of Nepal. Herodotus, who wrote towards the close of the fifth century B.C., gives the first important notice of India by a foreign observer. He did not visit the country personally, and doubtless derived his information from Persian sources. Darius, the son of Hystaspes (521-485 B.C.), having consolidated his power as master of the Persian empire, sought to extend it over part of India. [See also PERSIA: B.C. 521-493.] He obtained the necessary information by dispatching Scylax of Caryanda on a voyage of exploration down the rivers of the Punjab and Sind. The explorer, starting from a town named Kaspatyros, somewhere near Attock, in due course reached the sea, and, crossing it westward, 'arrived in the thirtieth month at that place [on the coast of the Red sea] where the King of Egypt dispatched the Phœnicians to sail round Libya.' Unfortunately no more detailed account has been preserved of this adventurous voyage, which anticipated the achievement of Alexander and Nearchus. Darius then attacked India and annexed to his empire the provinces west of the Indus, and possibly part of the Punjab. At the time of Alexander's invasion [in 327 B.C.] the Indus was the boundary between the Persian dominions and independent India. The Indian conquests were organized as the Twentieth Satrapy, the richest and most populous province of the empire. . . .

"All traditions agree in assigning a prominent position from very early times to the kingdom of Magadha, or Bihar, on the Ganges. Both the Jain and Buddhist religions arose either in that kingdom or on its borders. . . . [Gautama Buddha was probably born there, and it was from there that his doctrines later spread throughout India and beyond its borders], and Brahmanical Hinduism from time immemorial has always possessed a stronghold in the neighbouring city of Benares. The followers of all the leading Indian sects were thus equally interested in Magadha and the surrounding states. But the prominence assigned to Magadha is not due solely to the position it occupied in the history of religion. It was undoubtedly a powerful kingdom from a very early date. The most ancient dynasty in the Puranic lists which can lay claim to historic reality is that said to have been founded by Sisunaga, about the end of the seventh century. Bimbisara, the fifth monarch of this line of Magadhan kings, is famous in Buddhist story as the friend and patron of Gautama Buddha, the Sakya sage, the founder of the system which we call Buddhism. This unfor-

tunate prince was deposed, imprisoned, and ultimately starved to death by his son and successor, Ajatasatru, early in whose reign Buddha died, probably in the year 487 B.C. . . . [No other paramount power existed, and the state of the country seems to have been that of chronic warfare. Nevertheless, by the fourth century the Indians appear to have been well advanced in civilization, and to have carried on an extensive commerce. Also, all of India was included in this commerce, and in spite of its size the peoples of the north and south were known to each other.] But hardly anything definite is known about this early period; and detailed historical narrative does not become possible until the accession of Chandragupta Maurya, the first paramount sovereign or emperor of India, in 321 B.C."—*Imperial Gazetteer of India, v. 2, pp. 270-274.*—Such then was the political state of India when Alexander reached its borders.—See also BUDDHISM: Early spread of teachings.

B.C. 327-312.—European discovery.—Conquests in India by Alexander the Great.—Influence of Greeks.—Rise of empire of Chandragupta.—"The year B.C. 327 marks an important era in the history of India. . . . The great empire of Magadha was apparently falling into anarchy, but Brahmanism and Buddhism were still expounding their respective dogmas on the banks of the Ganges. At this juncture Alexander of Macedonia was leading an army of Greeks down the Cabul river towards the river Indus, which at that time formed the western frontier of the Punjab [see MACEDONIA: B.C. 330-323]. . . . The design of Alexander was to conquer all the regions westward of the Indus, including the territory of Cabul, and then to cross the Indus in the neighbourhood of Attock, and march through the Punjab in a south-easterly direction, crossing all the tributary rivers on his way; and finally to pass down the valley of the Ganges and Jumna, via Delhi and Agra, and conquer the great Gangetic empire of Magadha or Pataliputra between the ancient cities of Prayaga and Gour. . . . After crossing the Indus, there were at least three kingdoms in the Punjab to be subdued one after the other, namely;—that of Taxiles between the Indus and the Jhelum; that of Porus the elder between the Jhelum and the Chenab; and that of Porus the younger between the Chenab and the Ravee. . . . When Alexander had fully established his authority in Cabul he crossed the Indus into the Punjab. Here he halted some time at the city of Taxila [Taxiles, the king, having submitted in advance], and then marched to the river [Hydaspes, the modern] Jhelum, and found that Porus the elder was encamped on the opposite bank with a large force of cavalry and infantry, together with chariots and elephants. The decisive battle which followed on the Jhelum is one of the most remarkable actions in ancient story. . . . Porus fought with a valour which excited the admiration of Alexander, but was at last wounded and compelled to fly. Ultimately he was induced to tender his submission. . . . The victory over Porus established the ascendancy of Alexander in the Punjab. [It] not only decided the question between himself and Porus, but enabled him to open up a new communication with Persia, via the river Indus and the Indian Ocean. He sent out woodmen to cut timber for ship-building in the northern forests, and to float it down the Jhelum; and he founded two cities, Bukephalia and Nikæa, one on each side of the Jhelum. . . . Whilst the fleet was being constructed, Alexander continued his march to the Chenab, and crossed

that river into the dominions of Porus the younger, [who fled at his approach, and whose kingdom was made over to the elder Porus, his uncle]. Alexander next crossed the Ravee, when he was called back by [a revolt in his rear, which he suppressed]. But meantime the Macedonians had grown weary of their campaign in India. . . . They . . . resisted every attempt to lead them beyond the Sutlej; and Alexander, making a virtue of necessity, at last consulted the oracles and found that they were unfavourable to an onward movement. . . . He returned with his army to the Jhelum, and embarked on board the fleet with a portion of his troops, whilst the remainder of his army marched along either bank. In this manner he proceeded almost due south through the Punjab and Scinde. . . . [But he had not lost his determination to found an Indian empire, and left behind him colonies and trading posts, and a port at the mouth of the river.] At last he reached the Indian Ocean, and beheld for the first time the phenomena of the tides; and then landed his army and marched through Beloochistan towards Susa, whilst Nearchos conducted the fleet to the Persian Gulf, and finally joined him in the same city. . . . Alexander had invaded the Punjab during the rainy season of B.C. 327, and reached the Indian Ocean (in September, 325 B.C.). . . . Meantime Philip remained at Taxila as his lieutenant or deputy, and commanded a garrison of mercenaries and a body-guard of Macedonians. When Alexander was marching through Beloochistan, on his way to Susa, the news reached him that Philip had been murdered by the mercenaries, but that nearly all the murderers had been slain by the Macedonian body-guards. Alexander immediately despatched letters directing the Macedonian Eudemos to carry on the government in conjunction with Taxiles, until he could appoint another deputy; and this provisional arrangement seems to have been continued until the death of Alexander in B.C. 323. The political anarchy which followed this catastrophe can scarcely be realized. . . . India was forgotten. Eudemos took advantage of the death of Alexander to murder Porus; but was ultimately driven out of the Punjab with all his Macedonians by an adventurer who was known to the Greeks as Sandrakottos, and to the Hindus as Chandragupta [312 B.C.].—J. T. Wheeler, *History of India: Hindu, Buddhist and Brahmanical*, ch. 4.

B.C. 312.—Chandragupta.—Mauryan empire.—Spread of Buddhism and its Brahmanic absorption.—After the death of Alexander, not only was India forgotten by Europe, but India proceeded to forget Alexander and his deeds. Not a single allusion to him is found in any Indian writing. Within two years of his death, Macedonian authority was at an end, save only a small district held by Eudamos for a few years. "The leader of the revolt against the foreigners was an able adventurer, Chandragupta [Maurya] by name [a kinsman of the reigning king of Magadha, whose displeasure he had incurred, and from whose wrath he was a fugitive during Alexander's invasion of the Panjab]. . . . Chandragupta, having collected, during his exile, a formidable force of the warlike and predatory clans on the north-western frontier, attacked the Macedonian garrisons, immediately after Alexander's death, and conquered the Panjab. He then turned his victorious arms against his enemy the king of Magadha. . . . [He dethroned and slew the king, exterminated the

royal family and seized the throne. This tyrant, for such he proved to be, overran and subjugated the Northern States, probably as far as Narbada], so that the dominions of Chandragupta, the first historical paramount sovereign or emperor in India, extended from the Bay of Bengal to the Arabian sea. [While Chandragupta was engaged in building this empire, Seleukos Nikator, who began to reign about 312 B.C., determined to recover Alexander's Indian conquests, and in pursuance of his project crossed the Indus in 305 B.C.] When the shock of battle came, the hosts of Chandragupta were too strong for the invader, and Seleukos was obliged to retire and conclude a humiliating peace. Not only was he compelled to abandon all thought of conquest in India, but he was constrained to surrender a large part of Ariana to the west of the Indus. . . . [The Hindu Kush mountains] in this way became the frontier of Chandragupta's provinces of Herat and Kabul on the South, and the Seleukid province of Bactria on the North."—V. A. Smith, *Early history of India*, pp. 115, 116, 117, 118.—Soon after the conclusion of the treaty of peace Seleukos sent as his envoy to Chandragupta's court an officer named Megasthenes. "To this circumstance we owe the first authentic account of Indian manners, customs, and religious usages by an intelligent observer who was not a native, and this narrative of Megasthenes, preserved by Strabo, furnishes a basis on which we may find a fair inference that Brahmanism and Buddhism existed side by side in India on amicable terms in the fourth century B.C. There is even ground for believing that King Chandragupta himself was in secret a Buddhist, though in public he paid homage to the gods of the Brahmans; at any rate, there can be little doubt that his . . . [grandson] Asoka did for Buddhism what Constantine did for Christianity—gave an impetus to its progress by adopting it as his own creed. [See also below: B.C. 273-161.] Buddhism, then, became the state religion, the national faith of the whole kingdom of Magadha, and therefore of a great portion of India. . . . What then is Buddhism? It is certainly not Brahmanism, yet it arose out of Brahmanism, and from the first had much in common with it. Brahmanism and Buddhism are closely interwoven with each other, yet they are very different from each other. Brahmanism is a religion which may be described as all theology, for it makes God everything, and everything God. Buddhism is no religion at all, and certainly no theology, but rather a system of duty, morality, and benevolence, without real deity, prayer or priest. . . . Brahmanism and Buddhism [in India] appear to have blended, or, as it were, melted into each other, after each had reciprocally parted with something, and each had imparted something. At any rate it may be questioned whether Buddhism was ever forcibly expelled from any part of India by direct persecution, except, perhaps, in a few isolated centres of Brahmanical fanaticism."—M. Williams, *Hinduism*, ch. 6.—See also BRAHMANISM; BUDDHISM.

B.C. 273-161.—Reign of Asoka.—Missionary efforts.—Greco-Bactrian kingdoms.—Chandragupta was succeeded in 297 B.C. by his son, Bindusara, of whom little is known. The contrary, however, is true of Asoka, the son of Bindusara, who ascended the throne in 273, or 272 B.C. The peace of this great monarch was disturbed by only one war, when he conquered the little state of Kalinga, near the mouth of the Godavari. It is related that the miseries caused by this war affected him so greatly that he declared that ambition should never again lead him to inflict such

wrongs. Soon after this, he came under the influence of Buddhist teaching and became a convert to Buddhism. On the completion of his conversion [he] . . . took measures, which proved very effective, to diffuse and propagate Buddhist doctrine throughout his dominions and those of his friendly neighbours. . . . He also set forth the main principles of the doctrine in pithy documents composed in the vernacular dialects, which were inscribed on rocks in the frontier, and on monolith pillars in the home provinces [from which a fairly comprehensive account of his life and work has been obtained]. An active proselytizing propaganda by means of special agents was organized, in addition to the system of instruction by officials. Missionaries were dispatched to Ceylon, to the independent Chola and Pandya kingdoms in the extreme South, and to all tributary states on the frontiers, as well as to the Hellenistic kingdoms of Syria, Macedonia, Epirus, Egypt, and Cyrene. . . . Popular interest in the royal teaching was further secured by the provision at government expense of material comforts for man and beast. The high roads were marked with milestones, and shaded by avenues of trees. Camping grounds were furnished with wells, mango-groves, and resthouses for travellers. Hospitals were founded, and medicinal herbs, wherever they were lacking, were freely imported and planted. The severity of the penal code was mitigated, and on each anniversary of the coronation prisoners were liberated. In these ways, and by a watchful supervision over public morals Asoka demonstrated the sincerity of his faith, and secured an astonishing amount of success in his efforts to propagate the system of Buddha. The form of Buddhism which he introduced into Ceylon has remained almost unchanged to this day in the island, and has thence spread over Burma and Siam [See also CEYLON: Earliest history.] In India conversion proceeded at a very rapid rate, and good progress was made among the mountaineers and nomads to the north and northwest. . . . By his efforts Buddhism, which had hitherto been a merely local sect in the valley of the Ganges, was transformed into one of the great religions of the world—the greatest, probably, if measured merely by the number of adherents. This is Asoka's claim to be remembered; this it is which makes his reign an epoch, not only in the history of India, but in that of the world."—*Imperial Gazetteer of India*, v. 2, pp. 284-285.—See also BUDDHISM: Early spread of the teachings.—"After the time of Alexander the Great the Greeks made no important conquests in India. Antiochos, the grandson of Seleukos, entered into a treaty with the famous Buddhist king, Asoka, the grandson of Chandra Gupta, in 256 B.C. The Greeks had founded a powerful kingdom in Bactria, to the north-west of the Himalayas. During the hundred years after the Indo-Greek treaty of 256 B.C. the Greco-Bactrian kings sent invading hosts into the Punjab; some of whom reached eastwards as far as Muttra, or even Oudh, and southwards to Sind and Cutch. between 181 and 161 B.C. But they founded no kingdoms; and the only traces which the Greeks left in India were their science of astronomy, their beautiful sculptures, and their coins. Some of the early Buddhist statues, after 250 B.C., have exquisite Greek faces; and the same type is preserved in the most ancient carvings on the Hindu temples. By degrees even this trace of Greek influence faded away; but specimens of Indo-Greek sculptures may still be found in the museums of India."—W. W. Hunter, *Brief history of the Indian peoples*, p. 89.

B.C. 240-A.D. 1290.—Résumé of the more important Hindu dynasties.—Towards the close of Asoka's reign the Maurya kingdom included part of peninsular India, Nepal and Bengal to the mouth of the Ganges, Sind, Kashmir, part of Baluchistan, and most of Afghanistan. This kingdom dwindled away after Asoka's death in 231 B.C. The Maurya was succeeded in the north in 184 B.C. by the Sunga dynasty which lasted 112 years, and was followed by the Kanva dynasty, overthrown in 27 B.C. by the Andhra kings. They were succeeded by the Kshaharata satraps in the west about 236 A.D. At the same time that the Andhra dynasty held sway in the center and south, there existed in the north the Kushan dynasty which lasted until 225 A.D., followed by a period of confusion. The Gupta dynasty, lasted from 320 to about 470 A.D.; the period of White Huns from 470 to 565; and the Chalukya dynasty in the Deccan, from 550 to 1126. The three ancient kingdoms of the South or Deccan were the Pandyas, Cholas and Cheras. Authentic records of the dynasties of the Pandyas and Cheras do not begin until the end of the 12th and the beginning of the 14th century respectively. The Chola dynasty lasted from 860 to about the end of the 13th century.

B.C. 231-A.D. 480.—Rise of Andhra kingdom.—Break-up of Bactrian kingdom.—Invasion by Menander.—Sakas, Andhras and Kalingas.—Kushand power.—Gupta empire.—Hindu renaissance.—"The reign of Asoka, which lasted for some forty years, ended in 231 B.C. After his death, the Maurya empire, which had endured for ninety years and three generations of kings, crumbled to pieces. The valleys of the Kistna and Godavari were formed, about 220 B.C., into an independent kingdom, known by the name of Andhra, which waxed great with remarkable rapidity, and soon spread across the central table-land of India from the Bay of Bengal to the Western Ghats. The home provinces seem to have passed at once under the sway of Dasaratha, Asoka's grandson, whose descendants continued to claim the imperial titles and rule Magadha, with perhaps some neighbouring districts, until 184 B.C. The last of them was then assassinated by his commander-in-chief, Pushyamitra, who seized the vacant throne, and founded the dynasty of the Sungas, to which tradition assigns a duration of one hundred and twelve years."—*Imperial Gazetteer of India*, v. 2, p. 285-286.—In the meantime the Bactrian kingdom, north of the Hindu Kush enjoyed a large "measure of autonomy and profited greatly by the increase of trade between India and the west. In 250 B.C. it became independent. . . . The mountain passes of Sarikol, part of the coast and the Indus valley fell into their hands, and an empire was founded which endured for a century and a half. During this period, the Bactrian kingdom was broken up by the barbarians [Sakas]. And so the Greeks settled down to their kingdom in the Panjab [Punjab], to enact the last phase in the gallant but fruitless drama of the invasion of Alexander. . . . But the subjects of the kingdom of Sagala became slowly but surely absorbed in the native population. . . . Of only one of the Indo-Greek princes can we relate anything which may be termed definitely personal. This is the great Menander, whose fame has survived in the Buddhist dialogues, the *Questions of Milinda*, and of whom we have just so much information as to make us wish we knew more of the mighty king who was probably the last independent Greek monarch in history."—H. G. Rawlinson, *Indian historical studies*, pp. 48-49.—Pushyamitra had barely "secured his position, when he was threat-

ened by two great enemies from without—Menander (Milinda of Buddhistic tradition), from across the northwestern frontier and Karavela, the Kalingaraja from the south. Having [about 155 B.C.] laid waste the country as far east as even Saketa (possibly that in Oudh) and besieging Madhyamika (near Chitor in Rajaputana), Menander retired and no other European afterwards attempted the conquest of India from the land side . . . nor any at all up to the days of Vasco-de-Gama.”—K. Aiyangar, *Ancient India*, p. 12.—This could not be said of Asiatic peoples, who again and again have invaded and overrun parts of India from the north-west. Some of these invaders had already made their appearance, and may have begun to filter into the country under pressure from behind. “In the meantime there had appeared on the borders of India a formidable foe who soon overthrew the whole of the Græco-Bactrian kingdoms. These were the Sakas, a section of the great Turki, or Scythian, race. Their original settlements had been in Eastern Turkestan. Thence they were driven out, about 160 B.C., by the so-called Yuenchi [or Yue-chi], another section of the same race. They migrated to India, probably across the passes of the Karakorum Range, and through the valleys of the Indus. Having reached India, one portion marched west into Afghanistan. . . . The other portion of the invading Sakas occupied the Punjab, and gradually extended their conquest over the whole of the territory once belonging to Menander, *i.e.*, Sindh, Gujrat and Malwa. . . . [But, to return for a moment to the remnant of the great Mauryan empire, it appears that about 72 B.C. a minister of the Sunga emperor], a Brahman of the Kanva family, usurped the imperial power. For forty-five years he and his descendants, known as the Kanvayana dynasty, ruled the [Mauryan] empire. . . . [Some time later the Andhra king] seized the paramount power, [and] with this event the First Indian Empire became extinct. The central portion, Bihar and Oudh, now sank to the position of an insignificant province, while in the west, south, and east respectively, the great kingdoms of the Sakas, Andhras, and Kalingas took its place. Of the subsequent fortunes of the central portion nothing definite is known until the rise of the Second Indian Empire of the Guptas in the next period. From the confused account in the *Puranas* only this much may be concluded, that the unhappy country was torn by a succession of internal contests of rival factions belonging to different castes and tribes. Of the fortunes of the Kalinga kingdom also nothing is known, . . . till about 610 A.D.”—A. F. R. Hoernle and H. A. Stark, *History of India*, pp. 43-45.—Collateral with the dying Mauryan power, a great new power had risen in the northwest. The Sakas had been followed by the Yue-chi, who forced them out of Bactria, and after they had overrun that country, the Kushan clan of the Yue-chi found its way into India. The most powerful chief of this people united the tribes about 45 A.D., and succeeded in founding an empire known as Kushana. This man, who is commonly called Kadphises I, established intercourse with the Romans. One of his successors, Kadphises II, failed in a war with China, and was compelled to pay tribute; but his wars in India were more successful, and his kingdom probably stretched as far as Benares. Kanishka, the most famous of the dynasty, [about 125 A.D.] left monuments and inscriptions which prove that he carried his empire all over north western India, and perhaps as far south as the Vindhya mountains, which stopped so many conquerors. “Medicine, Architecture and Sculpture

attained a high degree of perfection during the period of the Kushana empire. At Kanishka's court there flourished the great physician Charaka, whose *Samhita* or general text-book on Medicine is still considered a standard work in India. No less renowned is the *Samhita* or general text-book of the great surgeon Susruta, which is said to have been revised and enlarged by Nagarjuna. Under the influence of Greek teachers of Art, and in the service of the new Buddhism, there arose in Afghanistan and the Punjab the famous Gandhara School of Architecture and Sculpture. It built magnificent *Chaityas* or temples, and *Viharas* or monasteries, and decorated them with numberless statues of the Buddhist pantheon, and scenes from its mythology. A similar school of a more Indian style flourished in Central India, where the still existing ruins of Bharhut, Sanchi, Amravati, Nasik and other places, testify to the skill and enterprise with which the Buddhist artists built their religious monuments with stone, or carved them out of the living rock.”—A. F. R. Hoernle and H. A. Stark, *History of India*, pp. 53-54.—This power seems to have utterly collapsed about 226 A.D. Farther south the “Great Satrapy” or kingdom of Saurashtra was established sometime in the second century by a remnant of the Sakas who had settled in Gujerat. It included Gujerat and Malwa, and lasted down to the end of the fourth century. “It was in the region set over against Malva that the next great Indian Power comes into being. A certain officer, possibly of the Andhras, by name or title, Gupta, had a petty province in and about Kosambi south-west of Allahabad. . . . [His] grandson Chandragupta . . . became the founder of a dynasty. . . . [About 308 A.D.] Chandragupta married a Licchavi princess of Vaisali, which gave him such influence and, what is more, such powerful aid that he was able easily to make himself the ruler of what was ancient Magadha. He not only beat back the advancing tide of Kshetrapsa [Saurashtra] aggression in central India, but also uprooted the power of these Saka rulers, [and thereby extended his power to the Arabian sea, and brought his people in touch with Alexandrian commerce]. Having made himself so far successful, he founded an era in A.D. 310, known as the Gupta era. Chandragupta's reign was devoted to securing what under the Mauryas was Magadha. Having been happily so successful in this, he had also the discernment to join with him in this work of empire building his eldest son Samudragupta, [poet, musician, patron of literature, and] the Napoleon of India. Samudragupta [who succeeded his father about 330] well deserves the comparison. . . . He seems to have early conceived . . . the idea of uniting the whole of India into one empire, and this idea he began to put into practice with all the uncompromising zeal begotten of confidence in his capacity. Leaving in the extreme east, Kamarupa (Assam), Davaka (middle) and Samatata (the Delta) independent allies upon his eastern frontier, he conquered the whole of Hindustan excepting the Punjab. . . . This done he started on a career of conquest to the south. Starting from Patna, he passed rapidly through the Mahanadi valley down the east coast, coming up to Kanchi in the south where the Pallavas had already made themselves secure. Taking a turn to the north-west, he passed through the Maharashtra country and Khandesh and entered his territory again. From the eleven kingdoms he passed through, he exacted allegiance but otherwise left them autonomous.”—S. K. Aiyangar, *Ancient India*, p. 10.—Samudragupta's personal dominions “extended from the Hooghly on the east to the

Jumna and Chambal on the west; and from the foot of the Himalayas on the north to the Narmada on the south. Beyond these wide limits, the frontier kingdoms of Assam and the Gangetic delta, as well as those on the southern slopes of the Himalayas, and the free tribes of Rajputana and Malwa, were attached to the empire by bonds of subordinate alliance; while almost all the kingdoms of the south had been overrun by the emperor's armies and compelled to acknowledge his irresistible might. The empire thus defined was by far the greatest that had been seen in India since the days of Asoka, six centuries before, and its possession naturally entitled Samudragupta to the respect of foreign powers. We are not, therefore, surprised to learn that he maintained diplomatic relations with the Kushan king of Gandhara and Kabul, and the greater sovereign of the same race who ruled on the banks of the Oxus, as well as with Ceylon and other distant islands."—V. A. Smith, *Early history of India*, pp. 271-272.—Samudragupta "transferred his capital from Pataliputra, or Patna, to Kausambi. There he set up a pillar, now standing in Allahabad, on which he engraved a record of his conquests. . . . Gujarat and Bengal were afterwards added to the empire by his son Chandra Gupta II (375-413 A.D.). This we know from a record on the Iron Pillar at Delhi, which was incised after his death in memory of his exploits. It will thus be seen that, as to its geographical limits, the Gupta Empire nearly rivaled that of the Mauryas. But over a very large portion the rule of the Guptas was only indirect, or even nominal. Their effective rule never extended beyond that part of Northern India which we call Hindustan. The states of the Deccan, such as the Kalachuri and Pallava, were only feudatory, and those of the northeast, Bengal and Assam paid only a nominal tribute. In the countries, however, which were under the direct rule of the Guptas, the administration, according to the testimony of the contemporary Chinese pilgrim Fahian, rivalled in excellence that of the great Asoka. . . . [The last great Gupta emperor was Skandagupta, who began to reign in 455. Even in his time the empire was shaken by revolts.] Fragments of the Kushana Empire, mainly consisting of foreign tribes, who occupied what is the modern Sindh and adjacent parts, had been brought into nominal subjection by Chandra Gupta II. It was these semi-independent tribes that caused the decadence of the Gupta Empire. The most active among them were the Pushyamitras [who were possibly the] . . . Maitrakas, who, as their name shows, had, in the course of time, become Indianised. Subsequently, . . . [the Maitrakas] succeeded in forming the independent kingdom of Valabhi; but in their first attempt they failed, for Skanda Gupta, soon after his accession, about 455 A.D., signally defeated them together with their barbarian allies; and thus reestablished the already tottering Gupta Empire."—A. F. R. Hoernle and H. A. Stark, *History of India*, pp. 56-57, 58.

"The golden age of the Guptas, glorious in literary, as in political, history, comprised a period of a century and a quarter (330-455 A.D.), and was covered by three reigns of exceptional length. [The period has been called the Periclean age of India, and the Hindu renaissance. The government appears to have been mild and firm, and the people free and prosperous. Then as now the revenue was chiefly derived from the land. Science flourished. Many claim that the best work in Indian literature was done at this period. Painting, sculpture and architecture attained a degree of excellence which was never afterwards reached.

Skandagupta saved India for a time] but, about 465 A.D., a fresh swarm of nomads poured across the frontier, and occupied Gandhara, or the north-western Panjab. . . . A little later, about 470, the Huns advanced into the interior, and again attacked Skandagupta in the heart of his dominions. He was unable to continue the successful resistance which he had offered in the earlier days of his rule, and was forced at last to succumb to the repeated attacks of the foreigners. . . . When he passed away, [about 480], the empire perished, but the dynasty remained, and was continued in the eastern provinces for several generations."—V. A. Smith, *Early history of India*, pp. 289, 291-293.

B.C. 100-A.D. 828.—Scythian and Arab invasions.—"The Greek or Bactrian expeditions into India ended more than a century before Christ; but a new set of invaders soon began to pour into India from the north. These came from Central Asia, and, for want of a more exact name, have been called the Scythians. They belonged to many tribes, and they form a connecting link between Indian and Chinese history. As the Aryan race in the west of Asia had, perhaps 3000 years before Christ, sent off branches to Europe on the one hand, and to India on the other; so the Scythians, who dwelt to the east of the old Aryan camping-ground in Asia, swarmed forth into India and China. These Scythic inroads went on during a great period of time. Buddha himself is said by some to have been a Scythian. But they took place in very great force during the century preceding the birth of Christ. They were the fore-runners of a long series of inroads which devastated Northern India more than a thousand years later, under such leaders as Changiz Khan and Timur, and which in the end founded the Mughal empire. About the year 126 B.C., the Tartar or Scythian tribe of Su are said to have driven out the Greek dynasty from the Bactrian kingdom, on the north-west of the Himalayas. Soon afterwards the Scythians rushed through the Himalayan passes and conquered the Greco-Bactrian settlements in the Punjab. About the beginning of the Christian era, they had founded a strong monarchy in Northern India and in the countries just beyond. Their most famous king was Kanishka, who summoned the Fourth Buddhist Council about 40 A.D. . . . The Scythian monarchies of Northern India came in contact with the Buddhist kingdom under the successors of Asoka in Hindustan. The Scythians themselves became Buddhists; but they made changes in that faith. The result was . . . that while the countries to the south of India had adopted the Buddhist religion as settled by Asoka's Council in 244 B.C., the Buddhist religion as settled by Kanishka's Council in 40 A.D. became the faith of the Scythian nations to the north of India, from Central Asia to Japan. . . . The Scythians are believed to have poured into India in such numbers as to make up a large proportion of the population in the north-western frontier Provinces at the present day. . . . However this may be, it is clear that many Scythian inroads took place into India from the first century B.C. to the fifth century A.D. . . . During that long period several Indian monarchs won fame by attempting to drive out the Scythians. The best known of these is Vikramaditya, King of Ujjain in Malwa, in honour of whose victories one of the great eras in India, or systems of reckoning historical dates, is supposed to have been founded. It is called the *Samvat* era, and begins in 57 B.C. Its reputed founder is still known as Vikramaditya Sakari, or Vikramaditya the enemy of the Scyth-

ians. . . Vikramaditya is merely a royal title, meaning "A very Sun in Prowess," which has been borne by several kings in Indian history. But the Vikramaditya of the first century before Christ was the most famous of them—famous alike as a defender of his country against the Scythian hordes, as a patron of men of learning, and as a good ruler of his subjects. . . . About a hundred years later, another valiant Indian king arose against the Scythians. His name was Salivahana; and a new era, called the *Saka* or Scythian, was founded in his honour in 78 A.D. These two eras—the *Samvat*, beginning in 57 B.C., and the *Saka*, commencing in 78 A.D.—still form two well-known systems of reckoning historical dates in India. . . . During the next five centuries, three great Indian dynasties maintained the struggle against the Scythians. The Sah kings reigned in the north-west of Bombay from 60 to 235 A.D. The Gupta kings reigned in Oudh and Northern India from 319 to 470 A.D., when they seem to have been overpowered by fresh hosts of Huns or Scythians. The Valabhi kings ruled over Cutch, Malwa, and the north-western districts of Bombay from 480 to after 722 A.D. . . . The Valabi dynasty seems to have been overthrown by the early Arab invaders of Sind in the eighth century A.D."—W. W. Hunter, *Brief history of the Indian peoples*, pp. 90-93.—The first of these Arab invasions was made in 711 A.D., under the authority of the caliph of Bagdad. "Within a hundred years after . . . [the death of Mohammed, 632], his followers had invaded the countries of Asia as far as the Hindu Kush. Here their progress was stayed, and Islam had to consolidate itself, during three more centuries, before it grew strong enough to grasp the rich prize of India. But, almost from the first, the Arabs had fixed eager eyes upon that wealthy country. Fifteen years after the death of the prophet, Usman sent a sea-expedition to Thana and Broach on the Bombay coast (647? A.D.). Other raids towards Sind took place in 662 and 664, with no permanent results. In 711, however, the youthful Kasim advanced into Sind, to claim damages for an Arab ship which had been seized at an Indian port. After a brilliant campaign, he settled himself in the Indus valley; but the advance of the Musalmans depended on the personal daring of their leader, and was arrested by his death in 714 A.D. The despairing valour of the Hindus struck the invaders with wonder. One Rajput garrison preferred extermination to submission. They raised a huge funeral pile, upon which the women and children first threw themselves. The men then bathed, took a solemn farewell of each other, and, throwing open the gates, rushed upon the besiegers and perished to a man. In 750, the Rajputs are said to have expelled the Muhammadan governor, but it was not till 828 A.D. that the Hindus regained Sind."—W. W. Hunter, *Indian empire: Its peoples, history and products*, p. 321.

A.D. 1st century.—Invasion of Java. See JAVA: Early history.

480-648.—Hun invasions.—Harsha empire.—On the break up of the Gupta empire, immense numbers of Huns invaded northern India, and by their cruelty terrorized and oppressed the people for about three quarters of a century before they were overthrown by a confederacy of princes under the king of the ancient state of Magdha. "The barbarian invasions of the fifth and sixth centuries, although slurred over by the Indian authorities, constitute a turning-point in the history of northern and western India, both political and social. The political system of the Gupta period was completely broken up, and new kingdoms were formed.

No authentic family or clan traditions go back beyond the Hun invasions. All genuine tradition of the earlier dynasties has been absolutely lost. The history of the Mauryas, Kushans, and Guptas, so far as is known, has been recovered laboriously by the researches of scholars, without material help from living tradition. . . . [Little has been learned of the state of India throughout the sixth century. Something is known of the Valabhi kingdom, which was established in the Surashttra peninsula at the end of the fifth century, and brought western India under its control for a time. About the middle of the century the Chalukya clan established a kingdom in the Bijapur district, Bombay, which in the seventh century became the leading power in the Deccan. Beyond these facts, and the Hun invasions the history is very obscure and it is evident that there was little peace in the land. However,] "the embarrassing lack of material for the history of the latter half of the sixth century is no longer felt when the story of the seventh has to be told. . . . Harsha or Kanouj, the able monarch who reduced anarchy to order in northern India, and reigned for forty-one years, as Asoka had done, is not merely a name in a genealogy. His personal characteristics and the details of his administration, as recorded by men who knew him intimately, enable us to realize him as a living person who achieved greatness by his capacity and energy. . . . Harsha, or Harsha-wardhana, [606-647] was the younger son of . . . [the] Raja of Thanesar, the famous holy town to the north of Delhi, who had won considerable military successes. . . . [After his death by assassination] his younger son, Harsha, then only sixteen or seventeen years of age, was constrained by his nobles to accept the vacant throne, and to undertake the difficult task of bringing northern India into subjection and tolerable order."—V. A. Smith, *Oxford history of India*, pp. 163-165.—The reign of Harsha is one of the bright spots in Indian history. An excellent description of the country during his reign has been left by Hiuen Tsiang, a Chinese pilgrim who visited his court in 643, and travelled throughout the whole of India. According to this writer, the one hundred and eighteen nations, which had comprised India in the time of Megasthenes, had been reduced to seventy. "The territories west of the Indus, including Gandhara, had become subject to the king of Kapisa or Northern Afghanistan, and part of the Punjab was under the dominion of Kashmir. North of the Narbada river all, or nearly all the states, . . . seem to have recognized the suzerainty of Harsha, and even the king of distant Assam obeyed his orders and attended in his train. The king of Valabhi in the far west was his son-in-law, and also helped to swell the crowd of twenty tributary princes. For the efficient control of his extensive dominions Harsha seems to have relied . . . upon his personal supervision. . . . He was continually on the move, except during the rainy season, so that his camp was his capital. . . . Criminals . . . were few in number, and only occasionally troublesome. The ordinary punishment was imprisonment, which meant, as now in Tibet, that the prisoners 'are simply left to live or die, and are not counted among men.' But certain crimes regarded as heinous, including breaches of filial piety, were liable to punishment by amputation of the nose, ears, hands, or feet, or by banishment to the wilds. Minor offences were expiated by fine. . . . Torture was not employed to extract evidence, but an absurd system of ordeals by water, fire, poison, or weight was much favoured as an infallible method of ascertaining the truth. Hiuen Tsiang agreed with his predecessor Fa-hien

[a Chinese chronicler of the reign of Chandragupta II] in judging the taxation to be light and the revenue administration lenient. He noted with satisfaction that every man could keep his worldly goods in peace, and till the ground for his own subsistence. The normal rent of the crown lands was one-sixth of the gross produce. Officials were paid by assignments of land (*jagir*); and the 'fixed salaries' mentioned by Fa-hien probably meant the same. Labour on public works was duly paid for, compulsory service not being exacted. . . . Hiuen Tsiang repeats the statement made by Fa-hien that gold and silver coins were not known, and adds that commerce was conducted by barter. . . . In reality, both silver and copper coins were commonly used in Northern India from 500 or 600 B.C.; and during the centuries of the Kushan and Gupta domination large issues of gold coin were struck, specimens of which still exist in hundreds. In the time of Harsha the coinage of gold had ceased, or

country into disorder, which was aggravated by famine. . . . The experiences of the third and sixth centuries were repeated, and a rearrangement of kingdoms was begun, of which the record is obscure. It is impossible to say exactly what happened in most of the provinces for a considerable time after his disappearance from the scene. [After his death, there was no unity in India until in the twelfth century the Delhi sultans brought a number of important provinces under their rule.] The disorder following upon Harsha's death . . . may be regarded . . . as forming the transition from Early to Medieval India, during which the hordes of foreign invaders were absorbed into the Hindu body politic and a new grouping of states was gradually evolved. The transitional period was marked by the development of the Rajput clans, never heard of in earlier times, which begin from the eighth century to play a conspicuous part in the history of northern and western India. They

FORT OF RAI PATHORA, DELHI

Built before the coming of the Mohammedan kings

become very rare, but silver pieces resembling those of the Guptas were minted in quantity. . . . Buddhism generally exhibited signs of decay, but was still strong in the Punjab, Kashmir, and the neighbouring states on the northwestern frontier. In the Gangetic valley the adherents of orthodox Hinduism formed a decided majority, while Jains were numerous in Eastern Bengal and at Vaisali. An epoch is marked by the death in A. D. 648 of Harsha, the last native paramount sovereign of northern India."—*Imperial Gazetteer of India*, v. 2, pp. 300-301.

647-1310.—Rajput period.—Turmoil in upper India.—Kingdoms of the south.—Chola dynasty.—"The Chalukya kingdom in the Deccan, founded, . . . in the middle of the sixth century, was raised to a paramount position by its king, Pulakesin II, the contemporary of Harsha. The northern monarch, impatient of a rival, attacked Pulakesin about A. D. 620, but was defeated, and obliged to accept the Narbada as his southern frontier. So far as is known that defeat was Harsha's only failure. . . . [He died in 646, or 647, and] the withdrawal of his strong arm threw the whole

become so prominent that the centuries from the death of Harsha to the Muhammadan conquest of Hindostan, extending in round numbers from the middle of the seventh to the close of the twelfth century, might be called with propriety the Rajput Period. Nearly all the kingdoms were governed by families or clans which for ages past have been called collectively Rajputs. . . . [The term Rajput] merely denotes a tribe, clan, sept, or caste of warlike habits, the members of which claimed aristocratic rank. . . . Gradually, however, the operation of complicated caste rules concerning intermarriage during many centuries has produced an extensive network of blood-relationship between the clans, which have become castes. . . . [During this period, states and kingdoms rose and fell, and were seldom at peace with one another. But in spite of constant warfare, the rulers maintained princely courts] and the arts of peace were cultivated with success. Stately works of architecture, enriched lavishly with sculptures often of high merit, were erected in almost every kingdom; and learned men, writing for the most part in the Sanskrit language, enjoyed liberal and intelligent patronage from

princes who not unfrequently wielded the pen as well as the sword. Hindi, Bengali, Gujarati, and the other languages now spoken gradually attained the dignity of recognized existence, and the foundations of vernacular literatures were laid. . . . In the ninth and tenth centuries the Gurjara-Pratiharas (Parihars) became the leading power in north-western India. Bengal came under the sway of the Palas, apparently an indigenous dynasty, for more than four centuries; while Malwa, Gujarat, and several other kingdoms obtained a large share of wealth and power. . . . The Tamil realms of the Far South formed a world of their own, its isolation being complete, save for frequent wars with the kings of the Deccan and Ceylon and for extensive foreign trade. The ancient state of the Pandyas, Cholas, and Cheras were overshadowed for a long time, especially in the seventh century, by the Pallavas. . . .

"The normal limits of the territories of the three ancient ruling races of the Tamil country [in the south] were defined by immemorial tradition and well recognized, although the actual frontiers of the kingdoms varied continually and enormously from time to time. The Pandya kingdoms, as defined by tradition . . . comprised the existing Districts of Madura and Tinnevely with parts of the Travancore State. The Chola country, according to the most generally received tradition . . . include Madras with several adjoining Districts, and a large part of the Mysore State. The Chera or Kerala territory consisted in the main of the rugged region of the Western Ghats to the south of the Chandragiri river, which falls into the sea not far from Mangalore, and forms the boundary between the peoples who severally speak Tulu and Malayalam. No such traditional limits are attributed to the dominions of the Pallavas, although their early habitat, the Tondainadu, comprising the districts near Madras, was well known. They held as much territory as they could grasp. [They were paramount in the south from the middle of the sixth to the middle of the eighth century when power began to slip from their grasp. About the end of the ninth century the Cholas replaced them, and held the ascendancy for more than three hundred years.] The administration of the Chola kingdom was highly systematized and evidently had been organized in very ancient times. . . . The whole fabric of the administration rested upon the basis of the village, or rather of unions of villages. . . . Each *kurram* or union managed its local affairs through the agency of an assembly (*mahasabha*), which possessed and exercised extensive powers subject to the control of the royal officers (*adhikarin*). The assembly was elected by an elaborate machinery for casting lots, and the members held office for one year. Each union had its own local treasury, and enjoyed full control over the village lands, being empowered even to sell them in certain contingencies. Committees were appointed to look after tanks, gardens, justice, and other departments. A certain number of *kurram* or unions constituted a District (*nadu*), a group of Districts formed a *kottam* or Division, and several Divisions formed a province. The kingdom was divided into six provinces. . . . The theoretical share of the gross produce claimed by the state as land revenue was one-sixth, but petty imposts in great variety were levied, and the total demand has been estimated as four-fifteenths. . . . The lands were regularly surveyed, and a standard measure was recorded. Details concerning the military organization are lacking. A strong fleet was maintained. Irrigation works were constructed on a vast scale and of good design. The embank-

ment of the artificial lake at Gangaikonda-Cholapuram, for instance, was sixteen miles in length, and the art of throwing great dams or 'ancicuts' across the Kaveri (Cauvery) and other large rivers was thoroughly understood. Various public works of imposing dimensions were designed and erected. . . . It seems that forced labour was employed on such works. The principal roads were carefully maintained. The particulars thus briefly summarized give an impression that the administrative system was well thought out and reasonably efficient. The important place given to the village assemblies assured the central government of considerable popular support, and individuals probably submitted readily to the orders of their fellow villagers who had the force of public opinion behind them. The system appears to have died out along with the Chola dynasty early in the fourteenth century, and ever since that distant time has been quite extinct."—V. A. Smith, *Oxford history of India*, pp. 167, 169-170, 174, 181, 206, 211-213.

977-1290.—Under the Ghaznavide and Mameluke empires.—Slave dynasty.—The disunion in India during the Rajput period left the north an easy prey to Musulman invasion, although for a time it was practically unmolested. "It was not to be wondered at if the Arabs made no wide or lasting Indian conquests in the early ages of the Musulman era. At a time when they were engaged with the Christian Empires of the East and the West, when they were spreading the power of the crescent from the borders of Khorasan to the Pillars of Hercules, the warriors of Islam had perhaps but little temptation to undertake further adventure. Certain it is that beyond the confines of Makran and a part of Sindh (occupied less than a hundred years after the Hijra) the Arab conquests did not spread in India. It was Nasir-ud-Din Sabuktigin—certainly a Merv captive and popularly believed a scion of the Sassanian dynasty that once ruled Persia—by whom the first Muslim invasion of Hindustan was made in durable fashion. His master, Alptigin, having fled from the oppression of the Samani dynasty of Bukhara in 962, had founded a principality at Ghazni. Sabuktigin acquired his favour, and was able, soon after his death, to acquire the succession in 977. He established his power in the Punjab; and his armies are said to have penetrated as far as Benares. On his death, 997, his son, the celebrated Sultan Mahmud, succeeded to the Empire extending from Balkh to Lahore, if not to Hansi. (See TURKEY: 999-1183.) During a reign of over thirty years he invaded Hindustan twelve times, inflicting terrible carnage on the Hindus, desecrating their idols, and demoralising their temples. Mathura, Kanauj, Somnath; to such distant and divergent points did his enterprises reach. [See also MILITARY ORGANIZATION: 33.] Mahmud died, 1030, and was buried at Ghazni, where his monument is still to be seen. For about one hundred years the dynasty continued to rule in the Punjab and Afghanistan, more and more troubled by the neighbouring tribe of Ghor, who in 1187 took Lahore and put an end to the Ghaznavide dynasty. A prince of the Ghorians—variously known, but whose name may be taken as Muhammad Bin Sam—was placed in a sort of almost independent viceroyalty at Ghazni. In 1191 he led an army against Sirhind, south of the Sutlaj river. Rai Pithaura, or Pirthi Rai, a chief of the

Chauhans (who had lately possessed themselves of Delhi), marched against the invaders and defeated them in a battle where Bin Sam had a narrow escape from being slain. But the sturdy mountaineers would not be denied. Next year they returned [and defeated Pithaura]. The towns of Mirat and Delhi fell upon his defeat; and their fall was followed a year later by that of Kanauf and Benares. The Viceroy's brother dying at this juncture, he repaired to his own country to establish his succession. He was killed in an expedition, 1206, . . . and the affairs of Hindustan devolved upon . . . Kutb-ud-din Aibak, a Mameluke, or Turkish slave, who had for a long time been his faithful follower. One of the Viceroy's first undertakings was to level to the ground the palaces and temples of the Hindus at Delhi, and to build, with the materials obtained by their destruction, a great Mosque for the worship of Allah. . . . From 1192 to 1206, the year of Bin Sam's death, Kutb-ud-din Aibak ruled as Viceroy. But it is recorded that the next Emperōr—feeling the difficulty, perhaps, of exercising any sort of rule over so remote a dependency—sent Aibak a patent as 'Sultan,' accompanied by a canopy of state, a throne and a diadem. Becoming Sultan of Hindustan, the distinguished and fortunate Mameluke founded what is known as 'the Slave dynasty.' . . . Aibak died at Lahore, in 1210, from an accident at a game now known as polo. He was contemporaneous with the great Mughul leader Changiz Khan, by whom, however, he was not molested. The chief event of his reign is to be found in his successful campaigns in Behar and Northern Bengal. . . . The Musulman power was not universally and firmly established in the Eastern Provinces till the reign of Balban (circ. 1232). At the death of Aibak the Empire was divided into four great portions. The Khiljis represented the power of Islam in Bihar and Bengal; the North-West Punjab was under a viceroy named Ilduz, a Turkoman slave; the valley of the Indus was ruled by another of these Mamelukes, named Kabacha; while an attempt was made at Delhi to proclaim an incompetent lad, son of the deceased, as Sultan. But the Master of the Horse, a third Mameluke named Altimsh, was close at hand, and, hurrying up at the invitation of influential persons there, speedily put down the movement. . . . Altimsh, having deposed his feeble brother-in-law, became Suzerain of the Empire. His satraps were not disposed to obedience; and bloody wars broke out, into the details of which we need not enter. It will be sufficient to note that Ilduz was defeated and slain A.D. 1215. Two years later Kabacha came up from Sindh, and seems [to] have enlisted some of the Mughul hordes in his armies. These formidable barbarians, . . . were now in force in Khorasan, under Changiz in person, assisted by two of his sons. [See MONGOLIA: A.D. 1153-1227.] They drove before them the Sultan of Khwarizm (now Khiva), and occupied Afghanistan. The fugitive, whose adventures are among the most romantic episodes of Eastern history, attempted to settle himself in the Panjab; but he was driven out by Altimsh and Kabacha in 1223. Two years later Altimsh moved on the Khiljis in the Eastern Provinces, occupied Gaur, their capital; and proceeding from thence made further conquests south and north at the expense of the Hindus. In 1228 he turned against Kabacha, the mighty Satrap of Sindh, who was routed in battle near Bakkhar, where he committed suicide or was accidentally drowned. In 1232-3 the Sultan reduced Gwalior (in spite of a stout resistance on the part of the Hindus under Milak Deo), slaying 700 prisoners at

the door of his tent. In 1234 he took the province of Malwa; where he demolished the great temples of Bhilsa and Ujain. In the following year this puissant warrior of the Crescent succumbed to the common conqueror, dying a natural death at Delhi [or Delhi] after a glorious reign of twenty-six (lunar) years. . . . His eldest son, who had conducted the war against the Khiljis, had died before him, and the Empire was assumed by a younger son, Rukn-ud-din Firoz. . . . [In 1241] Lahore was taken by the Mughols with terrific carnage. Troubles ensued; Delhi was besieged by the army that had been raised for its defence

KUTAB MINAR, DELHI

Built about 1207, with chapters of the Koran carved on its shaft

against the Mughols: in May 1242 the city was taken by storm and the new Sultan was slain. His successor, Ala-ud-din I., was a grandson of Altimsh, incompetent and apathetic as young men in his position have usually been. The land was partitioned among Turkish satraps, and overrun by the Mughols, who penetrated as far as Gaur in Bengal. Another horde, led by Mangu, grandson of Changiz, and father of the celebrated Kiblai Khan, ravaged the Western Punjab. The Sultan marched against them and met with a partial success. This turned into evil courses the little intellect that he had [and] a plot was organised for his destruction. Ala-ud-din was slain, and his uncle Nasir-ud-din was placed upon the vacant throne in June 1246. Nasir's reign was long, and,

so far as his personal exploits went, would have been uneventful. But the risings of the Hindus and the incursions of the Mughols kept the Empire in perpetual turmoil. [Nasir was succeeded by his minister Ulugh Khan Balban, a ruthless man of whom it was said that 'fear and awe of him took possession of all men's hearts,' and whose fierce revenge on hapless Hindu rebels made his name a byword. He died in 1286, and was succeeded by his grandson, Kaikobad.] . . . This unfortunate young man was destined to prove the futility of human wisdom. Educated by his stern and serious grandfather, his lips had never touched those of a girl or a goblet. His sudden elevation turned his head. He gave himself up to debauchery, caused his cousin Khusrū to be murdered, and was himself ultimately killed in his palace at Kilokhari, while lying sick of the palsy. With his death (1290) came to an end the Mameluke Empire of Hindustan."—H. G. Keene, *Sketch of the history of Hindustan*, v. 1, pp. 20-22, 25-30, 35-36.—See also MONGOLIA: Map of Mongolian empires.

1290-1398.—From Afghans to Moguls.—Tughlak sultans.—Invasion of Timur or Tamerlane.—"In 1290 the last Sultan of the Afghan slave dynasty was assassinated, and a Sultan ascended the throne at Delhi under the name of Jelal-ud-din. He was an old man of seventy, and made no mark in history; but he had a nephew, named Ala-ud-din, who became a man of renown, [and who presently acquired the throne by murdering his uncle]. When Ala-ud-din was established on the throne at Delhi he sent an army to conquer Guzerat. [This conquest was followed by that of Rajputana.] Meanwhile the Moghuls [Mongols] were very troublesome. In the previous reign the uncle of Ala-ud-din had enlisted 3,000, and settled them near Delhi; but they were turbulent, refractory, and mixed up with every rebellion. Ala-ud-din ordered them to be disbanded, and then they tried to murder him. Ala-ud-din then ordered a general massacre. Thousands are said to have been put to death, and their wives and children were sold into slavery. Ala-ud-din [Mohammed I] was the first Muhammadan sovereign who conquered Hindu Rajas in the Deccan and Peninsula. . . . Ala-ud-din sent his general Malik Kafur to invade these southern countries, ransack temples, and carry off treasure and tribute. The story is a dreary narrative of raid and rapine."—J. T. Wheeler, *Short history of India*, pt. 2, ch. 1.—"These expeditions . . . put an end to the old Southern Empire of the Hindus. They raised Muhammad I's reign and the First Muhammadan Empire to the zenith of their glory. The latter empire now rivalled that of the Guptas by embracing nearly the whole of India; but, as was the case with the Gupta Empire, its sway was neither effective nor enduring. South India acknowledged it only so long as she was overawed by the imperial troops, and the outlying provinces, such as Bengal, respected it hardly more than in name. Muhammad I, whose master-mind alone held the empire together, died of dropsy in 1316 A.D. [Some say he was murdered by Kafur.] After him, under his profligate and faithless son Mubarak, there ensued a general breakdown, both internal and external, which culminated in 1320 A.D. in the extraordinary usurpation of the throne by Mubarak's favourite, the utterly depraved and low-caste Hindu, Khusrū. A reaction was not long delayed. Ghiyasuddin Tughlaq, the governor of the Punjab, came to the rescue, and defeated and executed the usurper in the same year. Seeing

that the Khalji House had been exterminated by the usurper, Tughlaq himself was called to the throne by the nobles and officers of state. According to Ibn-Batuta he was a Karauna, *i.e.*, of mixed Turki and Indian descent, and he thus became the founder of the Karauna or Tughlaq-shahi dynasty which reigned for nearly a century (1320-1414 A.D.). It gave to India, in Muhammad II, the son of Tughlaq (1325-1351 A.D.), the most striking figure among the rulers of the first Muhammadan Empire. He was a man of high culture, great intellect, and indomitable will. His conduct was full of contradictions, acts of extravagant generosity alternating with others of incredible cruelty. Ibn-Batuta, the Arab traveller, who visited his court in 1333 A.D., tells us that 'at his gate there might always be seen some faqir whom he had enriched, or the corpse of some one whom he had slain.' His mind was that of a genius with a strain of madness. The most striking administrative acts of his reign were the attempted removal, in 1339 A.D., of the capital from Delhi to the more centrally situated Devagiri [in the Deccan] which he re-named Daulatabad, and the attempted enrichment, in 1327 A.D., of the national exchequer by the introduction of a brass token currency. Both ideas were excellent in conception. Muhammad II rightly saw that a vast and imperfectly welded empire such as his required a central capital and a well-filled treasury. But the projects were enforced with so little foresight and brought so much suffering on the people, that they utterly failed and had to be abandoned. When he recognized their failure, Muhammad II was honest enough to frankly abandon them. But the mischief was done; nor could he repair it by the confirmation of his sovereignty which he secured, in 1340 A.D., from the Khalifah of Egypt. It resulted in the ruin of the magnificent empire which he had inherited from his father. Bengal in 1339 A.D., and the Deccan in 1347, declared themselves independent; and when Muhammad II died in 1351 A.D., Oudh, Malwa, Gujarat and Sindh were in revolt. The further disintegration of the empire was for a time averted by the long and prosperous reign of his cousin, Firuz III (1351-1388 A.D.). This mild and pious sovereign made no attempt to recover the lost provinces, but applied himself, with the help of his wise wazir, Maqbul Khan, to the better development of those that still remained to him. His chief measures for this purpose were the abolition of certain oppressive taxes, the construction of the still-existing Great Jumna Canal and other irrigation works, the reclamation of waste lands [see also CONSERVATION OF NATURAL RESOURCES: India: 1350-1630], and the founding of new towns, colleges, *serais* and other public buildings. On the other hand, the mildness of his rule, combined with his system of granting whole provinces in fief to successful courtiers, directly contributed to the final break-up of the empire, which ensued soon after his death in 1388 A.D. His sons and grandsons, six of whom reigned after him, were unable to maintain their authority over the viceroys of Oudh, Malwa, Gujarat, and the Western Marches. Between 1394 and 1401, these, one after the other turned their fiefs into independent kingdoms. They thus reduced the imperial possessions so much that these hardly comprised more than the home province of Delhi that is the Doab and Rohtak. The general turmoil of the time reached its climax in the fearful invasion of Timur, [or Tamerlane the Great], the celebrated Mughal leader, who captured Delhi in December 1398 A.D. The invasion lasted only six months; but the incredible devastation which Timur left in his track,

earned for him the name of "the Scourge of God."—A. F. Hoernle and H. A. Stark, *History of India*, pp. 96-99.—See also TIMUR.

14th-18th centuries.—Characteristics of Moslem architecture. See ARCHITECTURE: Oriental: India: Moslem architecture.

chi, Huns and others, the Moslems did not allow themselves to be absorbed into the Hindu race and religion. Fortified by the possession of a sacred book, which the other invaders did not have, and by the purity of their theistic doctrine as opposed to the polytheism of the Hindus, they

CHAIN ARMOR DATING FROM TIME OF MOGUL DOMINATION

1351-1767.—Administration of Sultans.—Social conditions under Moguls.—Without exception, the Sultans were fierce bigots, and even though some of them were interested in literature, and were flattered by the presence of learned men, whom they patronized, they were utterly intolerant, and spared no means, no matter how cruel or repressive, to convert the Hindus to Mohammedanism. Unlike their predecessors the Sakas, Yue-

held stoutly to their faith in the unity of God. They looked upon themselves as superior to the people whom they had vanquished, and as far as possible kept themselves from social contact with a race whom they looked upon as inferior. Though small in number, especially at the beginning, the Mohammedan invaders were able to keep the Hindu population in check by the superiority of their armies as a fighting machine.

Moreover, as dwellers in a cool climate, they had more stamina, and their stronger diet provided them with greater energy than their vegetarian opponents, who were further debilitated by living in a warm climate. Besides, the Mohammedan hosts were not only still further armed, and made careless of life by the belief that death in battle ensured them immediate entrance to paradise, but like the Spaniards in South America were spurred to a fierce, careless courage by the knowledge that retreat through a hostile nation was impossible, and that the smallest sign of failure would have encouraged swarms of the enemy who surrounded them to rise against them. This knowledge perhaps added to the pitilessness with which they oppressed the subject peoples. "Bengal, after it had been overrun by a few parties of horsemen at the close of the twelfth century, remained for ages under the heel of foreign chiefs who were sometime Afghans, and the province never escaped from Musalman rule until it passed under British control. The wars with Bengal of which we read during the period of the Sultanate were concerned only with the claim preferred by Delhi to receive homage and tribute from the Muslim rulers of Bengal. Those rulers, in their turn, often seem to have left Hindu Rajas undisturbed in their principalities, subject to the payment of tribute with greater or less regularity. Indeed the same practice necessarily prevailed over a large part of the Muslim dominions. Some sort of civil government had to be carried on, and the strangers had not either the numbers or the capacity for civil administration except in a limited area. The Sultans left no fruitful ideas or valuable institutions behind them."—V. A. Smith, *Oxford history of India*, p. 258.—Under the rule of both the Sultans and the Moguls, the lot of the Hindus was not always a happy one. Writing of the Moguls, an Indian historian says: "A non-Muslim . . . cannot be a citizen of the State; he is a member of a depressed class; his status is a modified form of slavery. He lives under a contract (*zimma*) with the State: for the life and property that are grudgingly spared to him by the commander of the faithful he must undergo political and social disabilities, and pay a commutation-money (*jaziya*). In short, his continued existence in the State after the conquest of his country by the Muslims is conditional upon his person and property being made subservient to the cause of Islam. . . . As the learned Quazi Mughis-ud-din declared to Alauddin Khalji, in accordance with the teaching of the books on Canon Law:—"The Hindus are designated in the Law as "payers of tribute" (*kharaj-guzar*); and when the revenue officer demands silver from them, they should, without question and with all humility and respect, tender gold. If the officer throws dirt into their mouths, they must without reluctance open their mouths wide to receive it. By these acts of degradation are shown the extreme obedience of the *zimmi*, the glorification of the true faith of Islam, and the abasement of false faiths. God himself orders them to be humiliated. . . . The rule for Hindus is "Either death or Islam." . . . Every device short of massacre in cold blood was resorted to in order to convert heathen subjects. In addition to the poll-tax and public degradation in dress and demeanour imposed on them, the non-Muslims were subjected to various hopes and fears. Rewards in the form of money and public employment were offered to apostates from Hinduism. The leaders of Hindu religion and society were systematically repressed, to deprive the sect of spiritual instruction, and their religious gather-

ings and processions were forbidden in order to prevent the growth of solidarity and a sense of communal strength among them. No new temple was allowed to be built nor any old one to be repaired. . . . Muslim polity formed 'the faithful' into a body with no other profession than war. As long as there were any fresh lands to conquer and any rich *kafirs* to plunder, all went well with the State. The dominant body prospered and multiplied rapidly; even arts and industries, literature and painting of a certain type were fostered. But when the tide of Muslim expansion reached its farthest limit and broke in vain on the hills of Assam and Chatgaon, or the arid rocks of Maharashtra, there was nothing to avert a rapid downfall. The State had no economic basis, and was not able to stand a time of peace. Repose was fatal not only to its growth but to its very life. . . . The enormous areas of land sequestered by the king as religious and service grants, nourished thousands of Muslim families in a life of slothful ease, while every succeeding generation turned their competence into deepening squalor. The vast sums spent by the State in maintaining pauper houses and in scattering alms during Ramzan and other holy days and joyous ceremonies, were a direct premium on laziness. It was more lucrative and comfortable to be a *faqir* at the capital than to earn an honest living as a cultivator, subject to the caprices of the seasons and the worse caprices of the revenue underlings and officials on tour. Thus a lazy and pampered class was created in the empire, who sapped its strength and were the first to suffer when its prosperity was arrested. . . . At the same time that the ruling class was placed on an unsound non-economic basis, the treatment of the subject people prevented the full development of the resources of the State by them. . . . With every generous instinct of the soul crushed out of them, with intellectual culture merely adding a keen edge to their sense of humiliation, the Hindus could not be expected to produce the utmost of which they were capable; their lot was to be hewers of wood and drawers of water to their masters, to bring grist to the fiscal mill, to develop a low cunning and flattery as the only means of saving what they could of the fruits of their own labour. . . . The barrenness of the Hindu intellect and the meanness of spirit of the Hindu upper classes are the greatest condemnation of Muhammadan rule in India."—J. Sarkar, *History of Aurangzib*, v. 3, pp. 286-288, 290, 296-297.—"On the poor . . . the incidence of the tax [poll tax, which was imposed only on Hindus] was 6 per cent of the gross income; on the middle class it ranged from 6 to  $\frac{1}{4}$  p.c., and on the rich it was always lighter even than  $2\frac{1}{2}$  per thousand. . . . It could never be less than Rs  $3\frac{1}{2}$  on a man, which was the money-value of nine maunds of wheat flour at the average market price of the end of the 16th century. (*Ain*, i. 63). The State, therefore, at the lowest incidence of the tax, annually took away from the poor man the full value of one year's food as the price of religious indulgence."—*Ibid.*, p. 307.—Under the great Akbar the Hindus fared better than at any other time throughout the Moslem period. "The regulations for the collection of the revenue enforced by Akbar were well calculated to prevent fraud and oppression, and, on the whole, they worked well for the benefit of the people; but it has been said of them, and with truth, that 'they contained no principle of progressive improvement, and held out no hopes to the rural population, by opening paths by which it might spread

into other occupations, or rise by individual exertions within its own."—J. W. Kaye, *Administration of the East India Company*, pt. 1, ch. 2.—On the death of the titular head of the Sur family "Akbar found himself, nominally, at least, lord paramount of northern India from the Himalaya to the Narbada river, and from sea to sea. But there was much to be done before the gallant boy could call himself really master of that wide and fertile land. What may have been the condition of the people at the time of his accession, can only be inferred from the nature of his subsequent reforms. The elaborate administrative machinery of Sher Shah must have incurred rust and decay; and the inhabitants would suffer all the more because of the few years of good government and the return of war. Again had come rapacity and negligence, and the devastations of lawless soldiers; the drums and trappings of armed hosts, and the smoke of arson from wrecked and plundered homes. Happily for the people of Hindustan, longer times of peace were now at hand. . . . What the Emperor could do single-handed was to provide for the welfare of the current generation. He could not propagate his Theism without using foul means and causing hypocrisy, and from this he refrained. But in administrative measures he could at least follow the path of Sher Shah and restore the good old times of that wise and great ruler. . . . Such measures could not but benefit his subjects, however powerless for permanent reform. It is only by embodying in the form of statute the needs and aspirations of the community that a government can enter into permanent organic union with the governed; and no such embodiment could take place in Hindustan at that time. The idea of law, as then conceived by the people of India, was inconsistent with legislation by any man or governing body. It is true that Sher Shah is credited with some amount of crude legislation; but, for want of institutions and ideas it could take no root. Hindu and Muslim alike, the people believed that each class had been born under a special provision of positive injunctions, revealed by the Deity—much like what are now called 'laws of Nature,' in so far that they could not be altered by any authority of man. In such conditions there could be no human legislation, nor any State-enactments by which social evolution could be registered or advanced. The wisest and most benevolent reformer, in possession of the most unquestioned sovereignty, could only issue salutary ordinances, valid for the duration of his reign. And this Akbar did, to a remarkable degree. . . . To the north of the Narbada at least, the work of integration and good government was begun, the exertions of the administrator completing the work of the soldier, both inspired by the magnetism of an earnest and benevolent master. The next great task of Akbar was the destruction of the overweening power of the Muslim Church, but this, when effected, proved a doubtful advantage: after the great Emperor was gone his successors ruled unchecked by any organised body, and more and more scope was found for the abuses of despotism, only corrigible by the brutal remedies of regicide and rebellion. . . . Akbar sympathised with the Hindus, of whom Abul Fazl—no doubt reflecting his master's view—often speaks kindly, and with esteem. The cultivators and farmers were not only protected but helped. Their assessments were to be undisturbed for nineteen years . . . but no marauding chiefs or usurping barons intercepted the payments charged upon the land in lieu of taxation. . . . Under the rule of Salim, who as-

sumed the title of Jahangir before his accession, the empire continued to feel the momentum of Akbar's rule, and fairly preserved its equipoise. . . . Each province, again, was subdivided into counties and fiscal unions, in the administration of which a like quality generally prevailed. Law suits of Muslims were disposed of by learned men, acting under the supervision of a Chief Justice; but Hindus had their causes heard and determined by a Brahman, who doubtless applied the Hindu law. . . . The celebrated diplomatic agent of James I. of England, Sir Thomas Roe—who was at the court from 1614-1618—has left a record which shows how little justice was really done, and how much crime was committed, under the specious pretences of this reign. . . . Under Shah-Jahan the equilibrium of the empire continued. . . . [Shah-Jahan left] a reserve of coin and a bullion which, without precious stones, was valued by the cautious Bernier at £24,000,000 of modern money. Nor had this surplus been obtained at the cost of undue exaction from the people. . . . Tavernier thought [well] of Shah-Jahan's paternal rule. Bernier, who knew European countries, and who had travelled in Persia, testifies to the superior size of the Indian cities, the general cultivation of the land, and the efficiency of the police in the reign of Shah-Jahan; nor was any sign of decay apparent when the new reign began. . . . The Emperor Alamgir was an exceptional man, with very little of the Mughal either in character or in blood. For the first years of his reign he mainly left public affairs to the tracks in which they had long been wont to run. According to the testimony of Manucci, the administration of justice was much cared for; and, although the bulk of a community may be fortunate enough to keep out of the law courts, yet there is no Eastern country in which the substitution of the king's jurisdiction for civil disorder is not a potent test of good government. . . . During the latter part of his reign the empire consisted—nominally at least—of no less than twenty great provinces. And the land revenue was estimated at thirty *krors*; exclusive of other items. Elphinstone is of opinion that the new taxes produced a heavy loss to the state: the imposts may have been collected—at what cost in popular welfare and content can only be conjectured; but only a part of the money found its way to the Treasury. . . . It is impossible not to be struck with the parallel that he presents to his European contemporary, Louis XIV. of France. . . . The imposition of the Hindu capitation-tax was an act closely resembling the revocation of the Edict of Nantes; it was so far worse that it oppressed the vast majority of the population, and caused a universal contempt of law. Political nihilism may be said to have then become the feeling of three-fourths of the Indian community. Of the condition of the people we are left to judge from conjecture. The sturdy races of the Punjab and Hindustan maintained their self-governed townships—the 'little republics' of Megasthenes—troubled doubtless by wild beasts and human marauders. But the yeomen were stout of heart and provided with sharp swords and spears, well able to take their own parts, and to do a certain amount of cattle-stealing and plunder on their own account. . . . Provided, by the contempt of their foreign rulers, with their own code, and able to enforce awards by an unusually strong force of public opinion, and by the terrors of ex-communication, the Hindus were a law to themselves. But the correctional courts would always be active; a proverb of their own time was to

the effect that 'swift injustice was better than tardy justice.' . . . Even the revenue administration was pervaded with this pedantry. In . . . 'The Institutes of Aurangzeb' (Alamgir) . . . will be found an abstract of the system which, in his religious fervour, the Emperor substituted for the humane and judicious scheme of Akbar. The capitation-tax alone made a difference to a Hindu of about cent-per-cent.; and thus the tax was resented by the population as a duplication of their burdens no less than as a standing badge of conquest."—H. G. Keene, *History of India*, v. 1, pp. 107, 111, 113-114, 116, 127, 139, 140.

1398-1399.—Timur's invasion of the Punjab. See TIMUR.

1399-1605.—Sayd and Lodi dynasties.—Founding of the Mogul empire by Babar and Akbar.—Organization of a stable and civilized empire by Akbar.—"The invasion of Taimur . . . dealt a fatal blow to an authority already crumbling. The chief authority lingered indeed for twelve years in the hands of the then representative, Sultan Mahmud. It then passed for a time into the hands of a family which did not claim the royal title. This family, known in history as the Saiyid dynasty, ruled nominally in Northern India for about 33 years, but the rule had no coherence, and a powerful Afghan of the Lodi family took the opportunity to endeavour to concentrate power in his own hands. The Muhammadan rule in India had indeed become by this time the rule of several disjointed chiefs over several disjointed provinces, subject in point of fact to no common head. Thus, in 1450, Delhi, with a small territory around it, was held by the representative of the Saiyid family. Within fourteen miles of the capital, Ahmad Khan ruled independently in Mewat. Sambhal, or the province now known as Rohilkhand, extending to the very walls of Delhi, was occupied by Darya Khan Lodi. . . . Lahore, Dipalpur, and Sirhind, as far south as Panipat, by Behlul Lodi. Multan, Jaunpur, Bengal, Malwa, and Gujarat, each had its separate king. Over most of these districts, and as far eastward as the country immediately to the north of Western Bihar, Behlul Lodi, known as Sultan Behlul, succeeded on the disappearance of the Saiyids in asserting his sole authority, 1450-88. His son and successor, Sultan Sikandar Lodi, subdued Behar, invaded Bengal, which, however, he subsequently agreed to yield to Allah-u-din, its sovereign, and not to invade it again; and overran a great portion of Central India. On his death, in 1518, he had concentrated under his own rule the territories now known as the Punjab; the North-western Provinces, including Jaunpur; a great part of Central India; and Western Bihar. But, in point of fact, the concentration was little more than nominal." The accession of his son Ibrahim Lodi was followed by civil war which resulted in calling in the Tatar or Mongol conqueror, Babar, a descendant of Timur. Babar had crossed the Indian border in 1505, but his first serious invasion was in 1510, followed, according to some historians, by a second invasion the same year; the third was in 1520; the fourth occurred after an interval of two or three years. On his fifth expedition he made the conquest complete, winning a great battle at Panipat, fifty-three miles to the north-west of Delhi, on April 24, 1526. Ibrahim Lodi, son and successor of Sikan-

dar Lodi, was killed in the battle, and Delhi and Agra were immediately occupied. "Henceforth the title of King of Kabul was to be subjected to the higher title of Emperor of Hindustan." Babar was in one sense the founder of the Mogul (synonymous with Mongol) dynasty—the dynasty of the great Moguls, as his successors were formerly known. He died in 1530, sovereign of northern India, and of some provinces in the center of the peninsula. (See Bengal.) But "he bequeathed to his son, Humayun, . . . a congeries of territories uncentred by any bond of union or of common interest, except that which had been concentrated in his life. In a word, when he died, the Mughal dynasty, like the Muhammadan dynasties which had preceded it, had shot down no roots into the soil of Hindustan."—G. B. Malleson, *Akbar*, ch. 4-5.—Humayun succeeded Babar in India, "but had to make over Kabul and the Western Punjab to his brother and rival, Kamran. Humayun was thus left to govern the new conquest of India, and at the same time was deprived of the country from which his father had drawn his support. The descendants of the early Afghan invaders, long settled in India, hated the new Muhammadan hordes of Babar even more than they hated the Hindus. After ten years of fighting, Humayun was driven out of India by these Afghans under Sher Shah, the Governor of Bengal."—W. W. Hunter, *Brief history of the Indian peoples*, ch. 10.

"Sher Shah . . . assumed the empire at Delhi, 25th January, 1542, being about sixty years of age; and the rest of his brief career was devoted to the establishment of the unity which he had long ago perceived to be the great need of his country. Though a devout Muslim he never oppressed his Hindu subjects. His progresses were the cause of good to the people instead of being—as is too often the case in India—the occasions of devastation. He laboured ceaselessly for the protection of the public: 'it behoves great men,' he said, 'to be always working.' He divided the land into 116,000 fiscal unions, in each of which he placed five officials, one of whom was an Hindu accountant, and one a judicial officer, whose duty was to mediate between the servants of the crown and the members of the community. A new digest of civil and penal law was substituted for the narrow code of Islam. The lands were assessed, for one year at a time, the assessment being based on a measurement of the cultivation and an appraisalment of the various crops. No official was allowed to remain in the same place for more than two years. All districts but those on the frontiers were deprived of arms. A royal highway, planted on either side with trees and patrolled by police, ran from the shores of the Bay of Bengal to the banks of the river Jehlam. Three other great roads traversed the empire; one from Agra to Burhanpore on the border of the Deccan, a second crossed Rajputana, and a third led from Lahore to Multan: daily posts carried letters along these roads from place to place. The rural population was still sparse, and the tillage depended on a scanty supply of labour; for which reason the government was the more urgently required to care for the comfort and content of the peasantry. Even in a hostile country the people should not be molested: 'if we drive away the agriculturist,' said the Shah, 'all our conquests can be of but little profit.' It is a welcome task to take note of such things as a break in the long annals of rapine and slaughter, and we can do so without hesitation; for the acts of Sher Shah are attested by his enemies, writing when he was dead, and when his

dynasty had passed away for ever."—H. G. Keene, *History of India*, v. 1, pp. 98-99.—Sher Shah "was killed while storming the rock fortress of Kalinjar (1545). His son succeeded. But, under Sher Shah's grandson, the third of the Afghan house, the Provinces revolted, including Malwa, the Punjab, and Bengal. Humayun returned to India, and Akbar [the son of Humayun], then only in his thirteenth year, defeated the Afghan army after a desperate battle at Panipat (1556). India now passed finally from the Afghans to the Mughals. Sher Shah's line disappears; and Humayun, having recovered his Kabul dominions, reigned again for a few months at Delhi, but died in 1556. . . . Akbar the Great, the real founder of the Mughal Empire as it existed for two centuries, succeeded his father at the age of fourteen. . . . His reign lasted for almost fifty years, from 1556 to 1605, and was therefore contemporary with that of . . . Queen Elizabeth (1558-1603). His father, Humayun, left but a small kingdom in India, scarcely extending beyond the Districts around Agra and Delhi. . . . The reign of Akbar was a reign of pacification. . . . He found India split into petty kingdoms, and seething with discordant elements; on his death, in 1605, he bequeathed it an empire. The earlier invasions by Turks, Afghans, and Mughals, had left a powerful Muhammadan population in India under their own Chiefs. Akbar reduced these Musalman States to Provinces of the Delhi Empire. Many of the Hindu kings and Rajput nations had also regained their independence; Akbar brought them into political dependence upon his authority. This double task he effected partly by force of arms, but in part also by alliances. He enlisted the Rajput princes by marriage and by a sympathetic policy in the support of his throne. He then employed them in high posts, and played off his Hindu generals and Hindu ministers against the Mughal party in Upper India, and against the Afghan faction in Bengal. . . . His efforts to establish the Mughal Empire in Southern India were less successful. . . . Akbar subjugated Khandesh, and with this somewhat precarious annexation his conquests in the Deccan ceased, . . . [but he] not only subdued all India to the north of the Vindhya mountains, he also organized it into an empire. He partitioned it into Provinces, over each of which he placed a governor, or viceroy, with full civil and military control."—W. W. Hunter, *Brief history of the Indian peoples*, ch. 10.—Akbar "improved the system of land-assessment, or rather he improved upon the improvements instituted by Shir Shah. He adapted an uniform and improved system of land-measurement, and computed the average value of the land, by dividing it into three classes, according to the productiveness of each. This computation being made, one-third of the average produce was fixed as the amount of tax to be paid to the state. But as this was ordinarily to be paid in money, it was necessary to ascertain the value of the produce, and this was done upon an average of the nineteen preceding years, according to local circumstances; and if the estimate was conceived to be too high, the tax-payer was privileged to pay the assessment in kind. . . . The judicial regulations of Akbar were liberal and humane. Justice, on the whole, was fairly administered. All unnecessary severity—all cruel personal punishments, as torture and mutilation, were prohibited, except in peculiar cases, and capital punishments were considerably restricted. The police appears to have been well organised. . . . He prohibited . . . trials by ordeal, [child marriages, and the slaughter of

animals for sacrifice]; he suppressed the barbarous custom of condemning to slavery prisoners taken in war; and he authoritatively forbade the burning of Hindoo widows, except with their own free and uninfluenced consent. [He abolished the taxes on infidels and pilgrims; he employed Hindus as well as Mohammedans.] . . . That something of the historical lustre which surrounds the name of the Emperor Akbar was derived rather from the personal character of the man than from the great things that he accomplished, is, I think, not to be denied. His actual performances, when they come to be computed, fall short of his reputation. But his merits are to be judged not so much by the standard of what he did, as of what he did with the opportunities allowed to him, and under the circumstances by which he was surrounded. Akbar built up the Mogul Empire, and had little leisure allowed him to perfect its internal economy."—J. W. Kaye, *Administration of the East India Company*, pt. 1, ch. 2.—See also FEUDALISM: Feudal system in Asia.

1498-1580.—Coming of Europeans.—Century of Portuguese settlement and monopoly of trade.—While the great Moguls were building up and consolidating their empire, the enterprising adventurers of Europe, led by fabulous tales of the wealth of India, were inspired to begin that remarkable course of discovery and conquest which made them the lords of the trade-routes and the undeveloped lands of the world. As in Japan and elsewhere the Portuguese were the first to establish trade with India, and, for a century, their monopoly was undisputed. In May, 1498, Vasco da Gama, the Portuguese navigator, reached Calicut, on the southwest (Malabar) coast, being the first European to traverse the ocean route to India, around the Cape of Good Hope. (See PORTUGAL: 1463-1498.) He met with a hostile reception from the natives of Malabar; but the next voyager from Portugal, Alvarez Cabral, "who came out the following year, was very favourably received, being allowed to establish a factory on the mainland and to appoint a 'factor' (or consul, as we say now) to represent Portugal there. This factor seems to have had some difficulties with the natives, chiefly owing to his own high-handed actions, which resulted in the murder of himself and the destruction of the factory. Alvarez Cabral therefore sailed up to Cochin, and was received with great friendliness by the chiefs of that part of the country, who allowed him again to set up agencies at Cochin and at Cananore. But the vengeance of the ruler of Malabar pursued them; and the Portuguese, together with their native allies, had to fight desperately for their safety. They were almost exhausted with the struggle when in 1504 large reinforcements were sent from Portugal, bombarded Calicut, the capital of Malabar, and established the name and fame of the Portuguese as an important power in India generally. A regular maritime trade with India was now firmly set on foot, but the Portuguese had to struggle hard to maintain it. The Mohammedans of India called in the aid of Egypt against them, and even the republic of Venice joined these enemies, in hopes of crushing this new rival to their ancient trade. In 1508 a powerful expedition was sent out from Egypt against

the newcomers, a tremendous battle took place, and the Portuguese were defeated. But by a desperate effort Almeida, the Portuguese viceroy, collected all his forces for a final blow, and succeeded in winning a magnificent naval victory which once and for all firmly established the Portuguese power in India. Two years afterwards Almeida's rival and successor, Alfonso de Albuquerque, gained possession of Goa (1510), and this city became the centre of their Indian dominion, which now included Ceylon and the Maldivé Islands, together with the Malacca and Malabar coasts. In 1511 the city of Malacca was captured, and the city of Ormuz in 1515. The next few years were spent in consolidating their sovereignty in these regions, till in 1542 the Portuguese colonists practically regulated all the Asiatic coast trade with Europe, from the Persian Gulf . . . to Japan. . . . For nearly sixty years after this date the king of Portugal, or his viceroy, was virtually the supreme ruler—in commercial matters at any rate—of the southern coast of Asia. The Portuguese were at the climax of their power in the east. The way in which Portuguese trade was carried on is an interesting example of the spirit of monopoly which has, invariably at first and very often afterwards, inspired the policy of all European powers in their efforts of colonisation. The eastern trade was of course kept in the hands of Portuguese traders only, as far as direct commerce between Portugal and India was concerned; but even Portuguese orders were shut out from intermediate commerce between India and other eastern countries, i. e., China, Japan, Malacca, Mozambique, and Ormuz. This traffic was reserved as a monopoly to the crown; and it was only as a great favour, or in reward for some particular service, that the king allowed private individuals to engage in it. The merchant fleet of Portugal generally set sail from Lisbon, bound to Goa, once a year about February or March. . . . This voyage generally took about eighteen months, and, owing to the imperfect state of navigation at that time, and the lack of accurate charts of this new route, was frequently attended by the loss of several ships. Immense profits were, however, made by the traders. On arriving back at Lisbon the Portuguese merchants, as a rule, did not themselves engage in any trade with other European countries in the goods they had brought back, but left the distribution of them in the hands of Dutch, English, and Hansa sailors who met them at Lisbon. . . . The colonial empire of Portugal, so rapidly and brilliantly acquired, came to a disastrous close. It lasted altogether hardly a century. The avarice and oppressions of its viceroys and merchants, the spirit of monopoly which pervaded their whole policy, and the neglect both of the discipline and defences necessary to keep newly-acquired foreign possessions, hastened its ruin. By 1580 the Portuguese power in the east had seriously declined, and in that year the crown of Portugal was united to that of Spain in the person of Philip II. The Spaniards neglected their eastern possessions altogether, and engaged in wars with the Dutch which had the effect, not only of wasting a great portion of their own and the Portuguese fleet, but of positively driving the Dutch into those very eastern seas which the Portuguese had once so jealously kept to themselves. Only Goa and Diu and a few other small stations remained out of all their magnificent dominion."—H. de B. Gibbins, *History of commerce in Europe*, bk. 3, ch. 1, sect. 94-97.—See also COMMERCE: Era of

geographic expansion: 15th-17th centuries: Leadership of the Portuguese.

1600-1702.—Beginnings of English trade.—Chartering of the English East India Company.—Early footholds in Hindustan.—Founding of Madras, Bombay and Calcutta.—Three presidencies.—Administration of the East India Company.—"For some time it appears to have been thought by other European Powers, that the discovery of the passage round Africa by the Portuguese gave them some exclusive claim to its navigation. But after the year 1580 the conquest of Portugal by Spain, and the example of the Dutch who had already formed establishments not only in India but the Spice Islands, aroused the commercial enterprise of England. In 1599 an Association was formed for the Trade to the East Indies; a sum was raised by subscription, amounting to 68,000*l.*; and a petition was presented to the Crown for a Royal Charter. Queen Elizabeth wavered during some time, apprehending fresh entanglements with Spain. At length, in December 1600, the boon was granted; the 'Adventurers' (for so were they termed at that time) were constituted a body corporate, under the title of 'the Governor and Company of Merchants of London trading into the East Indies.' By their Charter they obtained the right of purchasing lands without limitation, and the monopoly of their trade during fifteen years, under the direction of a Governor, and twenty-four other persons in Committee, to be elected annually. [See also EAST INDIA COMPANY, BRITISH.] . . . In 1609, the Charter of the new Company was not only renewed but rendered perpetual,—with a saving clause, however, that should any national detriment be at any time found to ensue, these exclusive privileges should, after three years' notice, cease and expire. It does not seem, however, that the trade of the new Company was extensive. Their first voyage consisted of four ships and one pinnace, having on board 28,742*l.* in bullion, and 6,860*l.* in goods, such as cloth, lead, tin, cutlery, and glass. Many other of their voyages were of smaller amount; thus, in 1612, when they united into a Joint Stock Company, they sent out only one ship, with 1,250*l.* in bullion and 650*l.* in goods. But their clear profits on their capital were immense; scarcely ever, it is stated, below 100 per cent. During the Civil Wars the Company shared in the decline of every other branch of trade and industry. But soon after the accession of Charles II. they obtained a new Charter, which not only confirmed their ancient privileges but vested in them authority, through their agents in India, to make peace and war with any prince or people, not being Christians, and to seize within their limits, and send home as prisoners, any Englishmen found without a licence. It may well be supposed that in the hands of any exclusive Company this last privilege was not likely to lie dormant. . . . The period of the Revolution was not so favourable to the Company as that of the Restoration. A rival Company arose, professing for its object greater freedom of trade with the East Indies, and supported by a majority

in the House of Commons. It is said that the competition of these two Companies with the private traders and with one another had well nigh ruined both. . . . An Union between these Companies, essential, as it seemed, to their expected profits, was delayed by their angry feelings till 1702. Even then, by the Indenture which passed the Great Seal, several points were left unsettled between them, and separate transactions were allowed to their agents in India for the stocks already sent out. Thus the ensuing years were fraught with continued jarrings and contentions. . . . After the grant of the first Charter by Queen Elizabeth, and the growth of the Company's trade in India, their two main factories were fixed at Surat and Bantam. Surat was then the principal sea-port of the Mogul Empire, where the Mahometan pilgrims were wont to assemble for their voyages towards Mecca. Bantam, from its position in the island of Java, commanded the best part of the Spice trade. But at Surat the Company's servants were harassed by the hostility of the Portuguese, as at Bantam, by the hostility of the Dutch. To such heights did these differences rise that in 1622 the English assisted the Persians in the recovery of Ormuz from the Portuguese, and that in 1623 the Dutch committed the outrage termed the 'Massacre of Amboyna,'—putting to death, after a trial, and confession of guilt extorted by torture, Captain Towerson and nine other Englishmen, on a charge of conspiracy. In the final result, many years afterwards, the factories both at Bantam and Surat were relinquished by the Company. Other and newer settlements of theirs had, meanwhile, grown into importance.—In 1640 the English obtained permission from a Hindoo Prince in the Carnatic to purchase the ground adjoining the Portuguese settlement of St. Thomé, on which they proceeded to raise Fort St. George and the town of Madras. . . . In a very few years Madras had become a thriving town.—About twenty years afterwards, on the marriage of Charles II. to Catherine of Braganza [1661], the town and island of Bombay were ceded to the King of England as a part of the Infanta's dowry. For some time the Portuguese Governor continued to evade the grant, alleging that the patent of His Majesty was not in accordance with the customs of Portugal; he was compelled to yield; but the possession being found on trial to cost more than it produced, it was given up by King Charles to the East India Company, and became one of their principal stations. Nor was Bengal neglected. Considering the beauty and richness of that province, a proverb was already current among the Europeans, that there are a hundred gates for entering and not one for leaving it. The Dutch, the Portuguese, and the English had established their factories at or near the town of Hooghly on one of the branches—also called Hooghly—of the Ganges. But during the reign of James II. the imprudence of some of the Company's servants, and the seizure of a Mogul junk, had highly incensed the native Powers. The English found it necessary to leave Hooghly, and drop twenty-five miles down the river, to the village of Chuttanuttee. Some petty hostilities ensued, not only in Bengal but along the coasts of India. . . . So much irritated was Aurungzebe at the reports of these hostilities, that he issued orders for the total expulsion of the Company's servants from his dominions, but he was appeased by the humble apologies of the English traders, and the earnest intercession of the Hindoo, to whom this commerce was a source of profit. The English might even have resumed

their factory at Hooghly, but preferred their new station at Chuttanuttee, and in 1698 obtained from the Mogul, on payment of an annual rent, a grant of the land on which it stood. Then, without delay, they began to construct for its defence a citadel, named Fort William, under whose shelter there grew by degrees from a mean village the great town of Calcutta. . . . At nearly the same period another station,—Tegnapatam, a town on the coast of Coromandel, to the south of Madras,—was obtained by purchase. It was surnamed Fort St. David, was strengthened with walls and bulwarks, and was made subordinate to Madras for its government. Thus then before the accession of the House of Hanover these three main stations,—Fort William, Fort St. George, and Bombay,—had been erected into Presidencies, or central posts of Government; not, however, as at present, subject to one supreme authority, but each independent of the rest. Each was governed by a President and a Council of nine or twelve members, appointed by the Court of Directors in England. Each was surrounded with fortifications, and guarded by a small force, partly European and partly native, in the service of the Company. The Europeans were either recruits enlisted in England or strollers and deserters from other services in India. Among these the descendants of the old settlers, especially the Portuguese, were called Topasses,—from the tope or hat which they wore instead of turban. The natives, as yet ill-armed and ill-trained, were known by the name of Sepoys,—a corruption from the Indian word 'sipahi,' a soldier. But the territory of the English scarcely extended out of sight of their towns."—Lord Mahon, *History of England*, v. 4, ch. 39.—"Endeavouring to achieve peace and security, first for their commerce and then for their territories, constantly seeking for a permanent frontier, the East India Company as constantly lost it in receding vistas, until at last they found themselves supreme over the whole of India south-east of the Punjab. Such rapid extension would have been impracticable had not their rule been generally welcome, for reasons explained by Abbé Dubois, a French missionary who worked in Southern India early in the last century [nineteenth century]: 'Nevertheless,' he wrote, 'the justice and prudence which the present rulers display in endeavouring to make these people less unhappy than they have been hitherto; the anxiety they manifest in increasing their material comfort; above all, the inviolable respect which they constantly show for the customs and religious belief of the country and, lastly, the protection they afford to the weak as well as to the strong, to the Brahman, to the Pariah, to the Christian, to the Muhammadan; all these have contributed more to the consolidation of their power than even their victories and conquests.'"—H. V. Lovett, *History of the Indian nationalist movement*, pp. 3-4.

1605-1658.—Jahangir and Nur Jahan.—Shah Jahan and the Taj Mahal.—Seizure of the throne by Aurangzeb.—"Selim, the son and successor of Akbar, reigned from the year of his father's death until 1627, having assumed the title of Jahangir, or 'Conqueror of the World'; that is to say, he reigned, but he did not govern. Before he came to the throne, he fell in love with a poor Persian girl," whom his father gave in marriage to one of his officers. "On his advent to the throne, Jahangir . . . managed to

get the husband killed, and took the widow into his harem. He subsequently married her, and she ruled, not him alone, but the whole empire. . . . [She was first called Nur Mahal, 'Light of the Harem,' then Nur Jahan, 'Light of the World.'] It was during this reign, in 1615, that the first English ambassador, Sir Thomas Roe, arrived in Hindustan from James I.; and proceeding to Ajmere, where Jahangir was staying at the time with his court, he made him several presents, amongst which, we are told, a beautiful English coach gave the Emperor the most satisfaction. He received the ambassador with great distinction, showed him marked attention at all public receptions, and granted a firmān to the English to establish a factory at Surat. . . . The later years of Jahangir's reign were disturbed by family intrigues, in which the Empress Nur Jahan took a prominent part, endeavouring to secure the succession for her son-in-law; but after the death of the Emperor, his oldest living son, Shah Jahan, pensioned and forced the Empress into retirement . . . and . . . 'dispatched all the males of the house of Timour, so that only himself and his children remained of the posterity of Baber, who conquered India.' In some respects the reign of Shah Jahan was unfortunate. He lost his Afghan dominions, and gained but little by his invasions of the Dekhan, which were carried on by his rebellious son and successor, Aurungzeb; but in another direction he did more to perpetuate the glory of the Mughal dynasty than any other emperor of his line. Amongst other handsome buildings, he erected the most beautiful the world has ever possessed. . . . This was the well-known Taj Mahal at Agra, a mausoleum for his favourite Empress Arjamund, known as Mumtaz-i-Mahal [of which name, according to Elphinstone, Taj Mahal is a corruption], 'the Exalted One of the Seraglio.' . . . When Shah Jahan had attained his 66th year (according to some writers, his 70th), he was seized with a sudden illness, the result of his debauched life, and as it was reported that he was dead, a civil war broke out amongst his sons for the possession of the throne. These were four in number, Dara (the oldest), Shuja, Aurungzeb, and Murad (the youngest); and in the conflict Aurungzeb, the third son, was ultimately successful. Two of the brothers, Dara and Murad, fell into the power of the last-named and were put to death by his orders. Shuja escaped to Arracan, and was murdered there; and as for the Emperor, who had recovered, Aurungzeb confined him in the fort at Agra, with all his female relatives, and then caused himself to be proclaimed in his stead [1658]. Towards the close of Shah Jahan's life [which came to an end in 1666], a partial reconciliation took place between him and his son, who, however, did not release him from his confinement."—J. Samuelson, *India, past and present*, pt. 1, ch. 7.

1660-1720.—Prosperity of British East India Company.—"The company enjoyed during the greater part of the reign of Charles II, a prosperity to which the history of trade scarcely furnished any parallel and which excited the wonder, the cupidity and the envious animosity of the whole capital (London). . . . The taste for spices, the tissues and the jewels of the East became stronger day by day. . . . During the twenty-three years that followed the Restoration the value of the annual imports [into England] from that

rich and popular district (the Delta of the Ganges) increased from £8000 to £3,000,000. . . . The gains of this fast growing trade] were almost incredible. . . . The profits were such that in 1676 every proprietor received as a bonus a quantity of stock equal to that which he held. On the capital thus doubled were paid, during the five years, dividends amounting to an average of 20 per cent. annually."—T. B. Macaulay, *History of England*, v. 5, pp. 155, 156.—In the decade, 1710-1720, the actual export of bullion by the East India Company averaged £4,344,000.

1662-1748.—Struggle of Aurungzeb with Mahrattas.—Mahratta empire.—Development of Sikhs into independent nation.—Invasion of Nadir Shah.—Sack of Delhi and great massacre.—Anarchy as prelude to British intervention.—"Aurungzebe had reigned five years before he succeeded in destroying all his kinsmen. . . . About that time, in the year 1662, a new and extraordinary power in Southern India began to attract attention. The Mahrattas appear to have been nothing more than the Hindoo peasantry [descendants of an ancient people, settled in Maharashtra from early times], scattered throughout some of the mountainous districts of the Mahomedan kingdoms of Ahmednuggur, Bejjapoor and Golconda, and united into a body only by the prejudices of caste, of which their rank was the lowest, that of Sudra. In the confusion incidental to the constant wars in which these states were engaged, some of the head men of their villages set up for themselves, and one of them, Shahji Borla, became powerful enough to play a conspicuous part at the time of the annexation of Ahmednuggur to the Mogul empire. His son Sevaji, setting out from this vantage ground, strengthened his hands by the silent capture of some hill forts in Bejjapoor, and eventually raising the standard of revolt against that government, introduced a spirit of union amidst the scattered masses of his people, and may thus be considered the founder of the Mahratta empire. In 1662 he commenced his predatory expeditions into the Mogul territory. [In 1664 he plundered and destroyed Surat], and in ten years he found himself at the head of a regular government with the title of Rajah, and strong enough to encounter and defeat the imperial forces in a field battle. This was the critical moment in the progress of the Mogul empire. Aurungzebe was called away for two years by the chronic disturbances beyond the Indus; his strength was wasted by the ceaseless wars of the Deccan; and being goaded to madness by the casual insurrection of some Hindoo devotees in the centre of his dominions, he replaced the capitation tax on infidels, and fulminated other decrees against that portion of his subjects of such extravagant intolerance that they at length looked upon the progress of their co-religionists, the Mahrattas, with more longing than alarm. In 1679, the western portion of Rajahstan was in arms against the empire, and continued in a state of hostility more or less active during the whole reign. Even the emperor's eventual successes in the Deccan, in overthrowing the kingdoms of Bejjapoor and Golconda, contributed to his ruin; for it removed the check of regular government from that distracted portion of the country, and . . . threw into the arms of the Mahrattas the adventurous and the desperate of the population. Sevaji died, and successors of less

talent filled the throne of the robber-king; but this seems to have had no effect upon the progress of the inundation, which now bursting over the natural barriers of the peninsula, and sweeping away its military defences, overflowed Malwa and a portion of Guzerat. Aurungzebe fought gallantly and finessed craftily by turns; . . . and thus he struggled with his destiny even to extreme old age, bravely and alone. He expired in his 89th year, the 50th of his reign, on the 21st of February, 1707.—L. Ritchie, *History of the Indian empire*, v. 1, bk. 1, ch. 5.—“On the death of the Mughal emperor, Aurangzeb, in 1707, Southern India gradually became independent of Delhi. In the Deccan proper, the Nizam-ul Mulk founded a hereditary dynasty, with Haidarabad for its capital, which exercised a nominal authority over the entire south. The Karnatik, or the lowland tract between the central plateau and the Bay of Bengal, was ruled by a deputy of the Nizam, known as the Nawab of Arcot, who in his turn asserted claims to hereditary sovereignty. Farther south, Trichinopoli was the capital of a Hindu Raja; Tanjore formed another Hindu kingdom under a degenerate descendant of the Maratha leader, Sivaji. Inland, Mysore was gradually growing into a third Hindu State; while everywhere local chieftains, called *palegars* or *nayaks*, were in semi-independent possession of citadels or hill-forts. These represented the feudal chiefs or fief-holders of the ancient Hindu kingdom of Vijayanagar; and many of them had maintained a practical independence, subject to irregular payments of tribute, since the fall of that kingdom in 1565.”—W. W. Hunter, *Brief history of the Indian peoples*, pp. 177-178.—“From the death of Aurangzeb to the close of the eighteenth century the history of India is among the blackest in the annals of modern times. For all effective purposes the Mogul Empire had passed away. Hence Nadir Shah or Ahmed Shah Abdali could ravish the beautiful provinces of the North, kill Hindu and Moslem alike, and fritter away wealth and resources they could not but abuse. The tragedy of the triangular rivalry and bloodshed of Sikh, Hindu, and Moslem, so useless and insensate, in the Punjab, has never been painted by a capable historian in the dark colours it deserves. The Kings of Oudh, incompetent and ever looking to foreign alliances for support, destroyed the unity of a province designed by nature to be the right arm of the Empire. Disunited Bengal was the theatre of internecine war until the East India Company, obtaining the Dewani, established absolute and, at that time, by no means too benevolent rule. The southern half of India was degenerating into a vast jungle with the Pindari and the Mahratta ravaging provinces and states in all directions.”—Agba Khan, *India in transition*, p. 73.—See also MILITARY ORGANIZATION: 33.—“During the next twelve years after the death of Aurungzebe, no fewer than five princes sat upon the throne, whose reigns, without being distinguished by any great events, exhibited evident indications of the gradual decline of the empire. During that period the Sikhs, originally a sect of Hindoo dissenters, whose peculiarity consisted in their repudiation of all religious ceremonies, having first been changed into warriors by persecution, began to rise by the spirit of union into a nation; but so weak were they at this time that in 1706 the dying energies of the empire were sufficient almost for their extirpation. [See also SHIKHS.] . . . Mahomed Shah succeeded to the throne in 1719. The Mahratta government was by this time completely consolidated, and the great fam-

ilies of the race, since so celebrated, had begun to rise into eminence: such as that of the Peshwa, the official title of a minister of the Rajah; of Holkar, the founder of which was a shepherd; and of Sindia, which sprang from a menial servant. . . . A still more remarkable personage of the time was Asof Jah, whose descendants became the Nizams [regulators or governors—the title becoming hereditary in the family of Asaf, at Hyderabad] of the Deccan. . . . While the empire was . . . rent in pieces by internal disturbances, a more tremendous enemy even than the Mahrattas presented himself from without. A revolution had taken place in Persia, which seated a soldier of fortune upon the throne; and the famous Nadir Shah, after capturing Candahar, found it necessary, according to the fashion of conquerors, to seize upon the Mogul territories, Ghizni and Cabul, and when at the latter city to continue his march into Hindostan. In 1739, he arrived at Kurnaul, within 70 miles of Delhi, and defeated the emperor in a general engagement. . . . The two kings then proceeded to Delhi after the battle, where Nadir, in consequence, it is said, of an insurrection of the populace, set fire to the city and massacred the inhabitants to a number which has been variously estimated at from 30,000 to 150,000. He then proceeded to the main business of his invasion, robbing first the treasury and afterwards the inhabitants individually, torturing or murdering all who were suspected of concealing their riches, and at length returned to his own dominions, having obtained a formal cession of the country west of the Indus, and carrying with him in money and plate at least twelve millions sterling, besides jewels of great value, including those of the Peacock Throne [the throne of the Great Mogul, made solidly of gold and adorned with diamonds and pearls,—the enamelled back of the throne being spread in the form of a peacock's tail.—*Tavernier's travels* (tr. and ed. by V. Ball), v. 1, bk. 2, ch. 8.—From this period to the death of the Emperor Mahomed Shah, in 1748, the interval was filled up with the disturbances which might be expected.”—L. Ritchie, *History of the Indian empire*, v. 1, bk. 1, ch. 5.—The Asaf or Asof Jah mentioned above had become in 1721, the prime minister of the Emperor Muhammad Shah. “In a little more than three years he had thrown up in disgust an office which the levity of the young monarch hindered him from discharging to his satisfaction; and had repaired to the Deccan, where he founded the State which still subsists under the name of ‘The Nizam's Dominions’ [or Hyderabad]. Nominally, it was the Subab [province] erected on the ruins of the old Musalman kingdoms; but in the decline of the Empire it became a hereditary and quasi-independent province, though the ruler never took the royal title, but continued to retain the style of an Imperial Viceroy, as ‘Nizam-ul-mulk,’ which his descendant still bears.”—H. G. Keene, *Madhava Rao Sindhia*, ch. 1.—“The different provinces and viceroyalties went their own natural way; they were parcelled out in a scuffle among revolted governors, rebellious chiefs, leaders of insurgent tribes or sects, religious revivalists, or captains of mercenary bands. The Indian people were becoming a masterless multitude swaying to and fro in the political storm, and clinging to any power, natural or supernatural, that seemed likely to protect them. They were prepared to acquiesce in the assumption of authority by any one who could show himself able to discharge the most elementary functions of government in the preservation of life and property. In short, the people were scat-

tered without a leader or protector; while the political system under which they had long lived was disappearing in complete disorganization. It was during this period of tumultuary confusion that the French and English first appeared upon the political arena in India."—A. Lyall, *Rise of the British dominion in India*, ch. 4, sect. 1-2.

1665-1743.—Commercial undertakings of the French.—Settlement at Pondicherry.—"Many expeditions to India had been made [by the French] earlier than the time of Colbert's East India Company, chartered in the year 1665. The first French ships, of which there is any record, that succeeded in reaching India, were two despatched from one of the ports of Brittany in 1601. These ships were, however, wrecked on the Maldivé Islands, and their commander did not return to France for ten years. Voyages were undertaken in 1616, 1619, and again in 1633, of which the most that can be said is that they met with no great disaster. The attempt to found settlements in Java and Madagascar, which was the object of these voyages, completely failed. The first operations of the French East India Company were to establish factories in Hindostan. Surat, a large commercial city at the mouth of the Taptee, was fixed upon for the principal depot. The abuses and lavish waste of the officers entrusted to carry out Colbert's plans, brought the company to an end in five years. An attempt in 1672 to form a colony at Trincomalee, on the north-east coast of Ceylon, was frustrated by the hostility of the Dutch. Afterwards the French made an attempt on Meliapor or Thomé, belonging to the Portuguese. They were soon expelled, and the survivors sought refuge at Pondicherry [1674], a small town which they had purchased on the same coast of the Carnatic. In 1693, Pondicherry was taken by the Dutch, who improved the fortifications and general condition of the town. At the peace of Ryswick, in 1697, the settlement was restored to the French. For half a century Pondicherry shared the neglect common to French colonies, and owed more to the probity and discretion of its governors than to the home government. M. Martin, and subsequently Dumas, saved the settlement from ruin. They added to the defences; and Dumas, being in want of money for public purposes, obtained permission from the King of Delhi to coin money for the French settlers. He also procured the cession of Karikal, a district of Tanjore. On the other hand, several stations and forts had to be given up."—J. Yeats, *Growth and vicissitudes of commerce*, pt. 3, ch. 7.—See also FRANCE: 1661-1683.

1679-1823.—Decline caused by economic conditions in Europe.—"The Indians have in all ages maintained an unapproached and almost incredible perfection in their fabrics of cotton—some of their muslins might be thought the work of fairies or insects, rather than of men," said Baines in 1835, when Indian fabrics were still being made. The Arabian traveller of the ninth century says: 'In this country, India, they make garments of such extraordinary perfection, that nowhere else is there like to be seen,—sewed

and woven to such a degree of fineness, they may be drawn through a ring of moderate size.' Marco Polo (thirteenth century) says: 'The Coast of Coromandel and especially Masulipatam, produce the finest and most beautiful cottons to be found in any part of the world.' . . . Indian commerce was extensive from the Christian era to the end of the eighteenth century. For many hundred years, Persia, Arabia, Syria, Egypt, Abyssinia and all the eastern parts of Africa were supplied with cottons and muslins from the markets of India. Owing to the beauty and cheapness of Indian fabrics, the manufacturers of Europe were apprehensive of being ruined by their Indian competitors. The Dutch traders and the East India Company imported large quantities of these cotton goods in the seventeenth century. As early as 1679, a loud outcry was raised in England against the admission of Indian fabrics, which 'were ruining our ancient woollen manufactures.' We quote from a pamphlet of the period: The woollen trade 'is much hindered by our own people who do were many foreign commodities instead of our own; . . . instead of green sey that was wont to be used for children's frocks, is now used *painted and Indian stained and striped calicoes*; . . . and sometime is used a *Bangale* brought from India, both for lynyngs to coats and for petticoats too. . . . It would be necessary to lay a very high impost on all such commodities as these are.' A writer of 1696 laments the misfortune of Indian muslins and silks becoming the general wear in England. In 1708 Daniel Defoe wrote: . . . 'The general fansie of the people runs upon East India goods to that degree that the *chintes* and *painted calicoes*, before only made use of for carpets, quilts, etc., and to clothe the children and ordinary people, become now the dress of our ladies; and such is the power of a mode as we saw persons of quality dressed in Indian carpets, which but a few years before their chamber maids would have thought too ordinary for them; the chintz was advanced from being upon their floors to their backs, and even the Queen herself at this time was pleased to appear in China silks and calicoe; . . . it crept into our houses; our closets, and bed chambers; curtains, cushions, chairs and beds themselves were nothing but calicoes or Indian stuffs, and in short, almost everything that used to be made of wool or silk, relating either to the dress of our women or the furniture of our house, was supplied by the Indian trade.' Defoe's complaint was not of an evil existing in 1708 when he wrote, but of one a few years earlier, for the prohibition of Indian goods had taken place in 1700, by Acts 11 and 12 of William III, Cap. 10. The introduction of Indian silks and printed calicoes for domestic use as either apparel or furniture was forbidden under penalty of £200 on the wearer or seller, and as this did not prevent the use of Indian goods, other acts were passed at later date. This 'evil' of the consumption of Indian manufacture did not disappear by 1728, and other countries of Europe were making similar efforts to penalise the import and use of Indian fabrics. Baines says: 'Not more than a century ago, the cotton fabrics of India were so beautiful and cheap that nearly all the governments of Europe thought it necessary to prohibit or load them with heavy duties, to protect their own manufactures.'"—L. Rai, *England's debt to India*, pp. 123-127.

"India has always been predominantly agricultural, but even centuries ago her handicrafts ranked high among the industries of the world.

It was the fine linens and prints, the jewels and embroideries of eighteenth century India, that enabled the East India Company to pay its bondholders average profits of 117 per cent. for the first eighty years of its existence and to sell shares of stock issued at 100 for as high as 500. Rivalry among European traders to secure a footing in India was occasioned, not by her raw produce but by the variety and value of her manufactures. Dyeing, rug making, fine embroidery, metal work, damascening of arms, carving, paper making, and the jeweler's art all flourished, and a considerable proportion of the population were employed in these industries until the close of the eighteenth century. In 1787 the city of Dacca exported muslin to England to the value of \$1,500,000. By 1817, her exports had dropped to zero. This incredibly abrupt strangling of a great industry had two causes—the natural instinct of Englishmen in the first flush of colonial adventure to develop home industries at the cost of this far-away dependency, and the unfortunate coincidence for India of the invention of power looms and the factory system at just this moment. Lancashire and Manchester mills were young and could demand protection as infant industries. The tariffs imposed were practically confiscatory. Henry St. George Tucker, a director of the East India Company, made the statement in 1823 that Indian silks and silk and cotton mixtures had already been excluded from the British markets, and that 'by the operation of a duty of 67 per cent. and also owing to the effect of superior British machinery, the cotton fabrics of India, hitherto her staple product, have not only been displaced, but we are exporting cotton into India. India is thus reduced from the state of a manufacturing to that of an agricultural country.' British goods imported into India were taxed only 3½ per cent. In a few years and through a process of crowding out her peasant weaver, instead of exporting fabrics to England, India was not even weaving enough to supply her own needs. English factories were able to undersell the hand-woven linens and muslins of India."—F. B. Fisher, *India's silent revolution*, pp. 34-36.—See also COMMERCE: Era of geographic expansion: 16th-17th centuries.

1743-1752.—Struggle of French and English for supremacy in the Deccan.—Clive against Dupleix.—Founding of British empire.—"England owes the idea of an Indian empire to the French, as also the chief means by which she has hitherto sought to realize it. The war of the Austrian succession had just broken out [1743] between France and England. [See AUSTRIA: 1743.] Dupleix, the governor of the settlements of the French East India Company, proposed to the English company a neutrality in the eastern seas; it was rejected. The English probably repented of their presumption when they saw Captain Peyton, the commander of a squadron of three liners and a frigate, after an indecisive engagement with the French admiral, Labourdonnais, take flight to the Bay of Bengal, leaving Madras, then the most flourishing of the English settlements, defenceless. Dupleix and Labourdonnais were the first of that series of remarkable Frenchmen who, amidst every discouragement from home, and in spite of their frequent mutual disensions, kept the French name so prominent in India for more than the next half century, only to meet on their return with obloquy, punishment, even death. Labourdonnais, who was Admiral of the French fleet, was also Governor of Mauritius, then called the Isle of France. He had disciplined

a force of African negroes. With French troops and these, he entered the narrow strip of coast, five miles long, one mile broad, which was then the territory of Madras, bombarded the city, compelled the fort (which had lost five men) to surrender. But his terms were honourable; the English were placed on parole; the town was to be given up on payment of a moderate ransom (1746). Dupleix, however, was jealous; he denied Labourdonnais' powers; broke the capitulation; paraded the Governor and other English gentlemen in triumph through Pondicherry. In vain did Admiral Boscawen besiege the latter place; time was wasted, the trenches were too far, the rains came on; Boscawen raised the siege, crippled in men and stores; was recalled by the news of the peace of Aix-la-Chapelle, and, to close his career of misfortune, lost several ships and 1,200 men on the Coromandel coast (1748-9). News of the treaty of Aix-la-Chapelle, however, produced a very temporary cessation of hostilities, Madras being restored, with fortifications much improved. The English fortunes seemed at their lowest in India; the French rising to their full height. Dupleix conceived the bold plan of interfering in the internal politics of the country. Labourdonnais had disciplined the negro; Dupleix disciplined the native Indian. . . . Labourdonnais had beaten off the so-called Nawab of the Carnatic, when he attempted to take Madras; the event produced an immense sensation; it was the first victory obtained for a century by Europeans over the natives of India. Dupleix was strong enough to be reckoned a valuable ally. But on the English side a young man had appeared who was to change the whole course of events in the East. Robert Clive, an attorney's son from Market Drayton, born in 1725, sent off at eighteen as a writer to Madras—a naughty boy who had grown into an insubordinate clerk, who had been several times in danger of losing his situation, and had twice attempted to destroy himself—ran away from Madras, disguised as a Mussulman, after Dupleix's violation of the capitulation, obtained an ensign's commission at twenty-one, and began distinguishing himself as a soldier under Major Lawrence, then the best British officer in India."—J. M. Ludlow, *British India*, lect. 7.—"Clive and others who escaped [from Madras] betook themselves to Fort St. David's—a small English settlement a few miles south of Pondicherry. There Clive prepared himself for the military vocation for which nature had clearly destined him. . . . At Fort St. David's the English intrigued with the native chiefs, much as the French had done, and not more creditably. They took sides, and changed sides, in the disputes of rival claimants to the province of Tanjore, under the inducement of the possession of Devi-cottah, a coast station at the mouth of the Coleroon. There was no great honour in the results, any more than in the conception, of this first little war. We obtained Devi-cottah; but we did not improve our reputation for good faith, nor lessen the distance between the French and ourselves in military prestige. But Dupleix was meantime providing the opportunity for Clive to determine whether the Deccan should be under French or English influence. . . . The greatest of the southern princes, the Nizam al Mulk, Viceroy of the Deccan, died in 1748; and rivals rose up, as usual, to claim both his throne and the richest province under his rule—the Carnatic. The pretenders on one side applied to the French for assistance, and obtained reinforcements to the extent of 400 French soldiers and 2,000 trained sepoy. This aid secured

victory; the opposing prince was slain; and his son, the well-known Mohammed Ali, 'the Nabob of Arcot' of the last century, took refuge, with a few remaining troops, at Trichinopoly. In a little while, the French seemed to be supreme throughout the country. Dupleix was deferred to as the arbiter of the destinies of the native princes, while he was actually declared Governor of India, from the Kistna to Cape Comorin—a region as large as France, inhabited by 30,000,000 of people, and defended by a force so large that the cavalry alone amounted to 7,000 under the command of Dupleix. In the midst of this dominion, the English looked like a handful of dispirited and helpless settlers, awaiting the dis-

could make their position worse; and they caught at every chance of making it better. Clive offered to attack Arcot, the capital of the Carnatic, in the hope that this would draw away the besiegers from Trichinopoly; and the offer was accepted. The force consisted of 200 British and 300 native soldiers, commanded, under Clive, by four factors and four military men, only two of whom had ever been in action. Everything was against them, from numbers and repute to the weather; but Clive took Arcot [Sept. 11, 1751], and (what was much more difficult) kept it. The garrison had fled in a panic; but it was invested by 10,000 men before the British had repaired half its dilapidations and deficiencies, or recruited their

posal of the haughty Frenchman. Their native ally had lost everything but Trichinopoly; and Trichinopoly itself was now besieged by the Nabob of the Carnatic and his French supporters. Dupleix was greater than even the Mogul sovereign; he had erected a column in his own honour, displaying on its four sides inscriptions in four languages, proclaiming his glory as the first man of the East; and a town had sprung up round this column, called his City of Victory. To the fatalistic mind of the native races it seemed a settled matter that the French rule was supreme, and that the English must perish out of the land. Major Lawrence had gone home; and the small force of the English had no commander. Clive was as yet only a commissary, with the rank of captain, and regarded more as a civilian than a soldier. He was only five-and-twenty. His superiors were in extreme alarm, foreseeing that when Trichinopoly was taken, the next step would be the destruction of Madras. Nothing

numbers, now reduced to 320 men in all, commanded by four officers. For fifty days, amidst fatigue, hunger, and a hundred pressing dangers, the little band sustained the siege. . . . A series of victories followed, and men and opinion came round to the side of the victors. There was no energy at headquarters to sustain Clive in his career. . . . In his absence, the enemy appeared again before Fort George, and did much damage; but Clive came up, and 100 of the French soldiers were killed or taken. He uprooted Dupleix's boasting monument, and levelled the city to the ground, thereby reversing the native impression of the respective destinies of the French and English. Major Lawrence returned. Dupleix's military incapacity was proved, and his personal courage found wanting as soon as fortune deserted him. Trichinopoly was relieved, and the besiegers were beaten, and their candidate prince put to death. Dupleix struggled in desperation for some time longer before he gave up the contest; and Clive

had his difficulties in completing the dislodgement of the French. . . . He did it; but nearly at the sacrifice of his life. When the British supremacy in the Deccan was completely established, he returned [1752] in bad health to England. . . . He left behind him Dupleix, for whom a summons home in disgrace was on the way."—H. Martineau, *History of British rule in India*, ch. 6.

1747-1761.—Durani power in Afghanistan.—Conflict of Afghans and Mahrattas.—Great defeat of the latter at Panipat.—Fall of shattered Mogul empire.—State of affairs which invited British conquest.—On the death of Nadir Shah, who was murdered in 1747, his Afghan kingdom was acquired by a native chief, Ahmed Abdalee, who, first a prisoner and a slave to Nadir Shah, had become one of the trusted officers of his court and army. "Ahmed Abdalee had acquired so great an ascendancy among the troops that upon this event [the death of Nadir Shah] several commanders and their followers joined his standard; and he drew off toward his own country. He fell in with and seized a convoy of treasure, which was proceeding to the camp. This enabled him to engage in his pay a still larger body of his countrymen. He proclaimed himself king of the Afghans; and took the title of Door-dowran, or pearl of the age, which being corrupted into Dooranee [or Durani], gave one of their names to himself and his Abdallees. He marched towards Candahar, which submitted to his arms; and next proceeded to Cabul . . . and this province also fell into the hands of the Afghans." Lahore was next added to his dominions, and he then, in 1747, invaded India, intent upon the capture of Delhi; but met with sufficient resistance to discourage his undertaking, and fell back to Cabul. In 1748, and again in 1749, he passed the Indus, and made himself master of the Punjab. In 1755-6 he marched to Delhi, which opened its gates to him and received him, prettendly as a guest, but really as a master. A plague breaking out in his army caused him to return to his own country. He "left his son Governor of Lahore and Multan; disordered by revolutions, wasted and turbulent. A chief . . . incited the Seiks [Sikhs] to join him in molesting the Dooranees; and they gained several important advantages over their principal commanders. They invited the Mahratta generals, Ragonaut Raow, Shumsheer Bahadur, and Holkar, who had advanced into the neighbourhood of Delhi, to join them in driving the Abdallees from Lahore. No occupation could be more agreeable to the Mahrattas. After taking Sirhind, they advanced to Lahore, where the Abdalee Prince made but a feeble resistance and fled. This event put them in possession of both Multan and Lahore. . . . The whole Indian continent appeared now about to be swallowed up by the Mahrattas. . . . Ahmed Shah [the Abdali or Durani] was not only roused by the loss of his two provinces, and the disgrace imprinted on his arms, but he was invited by the chiefs and people of Hindustan, groaning under the depredations of the Mahrattas, to march to their succour and become their King. . . . For some days the Dooranees hovered round the Mahratta camp; when the Mahrattas, who were distressed for provisions, came out and offered battle. Their army, consisting of 80,000 veteran cavalry, was almost wholly destroyed; and Duttah Sindia, their General, was among the slain.

A detachment of horse sent against another body of Mahrattas, who were marauding under Holkar in the neighbourhood of Secundra, surprised them so completely that Holkar fled naked, with a handful of followers, and the rest, with the exception of a few prisoners and fugitives, were all put to the sword. During the rainy season, while the Dooranee Shah was quartered at Secundra, the news of this disaster and disgrace excited the Mahrattas to the greatest exertions. A vast army was collected, and . . . the Mahrattas marched to gratify the resentments, and fulfil the unbounded hopes of the nation. . . . They arrived at the Jumna before it was sufficiently fallen to permit either the Mahrattas on the other side, or the Dooranees, to cross. In the meantime they marched to Delhi, of which after some resistance they took possession; plundered it with their usual rapacity, tearing away even the gold and silver ornaments of the palace; proclaimed Sultan Jewan Bukht, the son of Alee Gohur [or Shah Alam, absent son of the late nominal emperor at Delhi, Alungeer II, who had recently been put to death by his own vizir], Emperor; and named Sujah ad Dowlah, Nabob of Oude, his Vizir. Impatient at intelligence of these and some other transactions, Ahmed Shah swam the Jumna, still deemed impassable, with his whole army. This daring adventure, and the remembrance of the late disaster, shook the courage of the Mahrattas; and they entrenched their camp on a plain near Panniput. The Dooranee, having surrounded their position with parties of troops, to prevent the passage of supplies, contented himself for some days with skirmishing. At last he tried an assault; when the Rohilla infantry . . . forced their way into the Mahratta works, and Bulwant Raow with other chiefs was killed; but night put an end to the conflict. Meanwhile scarcity prevailed and filth accumulated in the Mahratta camp. The vigilance of Ahmed intercepted their convoys. In a little time famine and pestilence raged. A battle became the only resource [January 7, 1761]. The Abdalee restrained his troops till the Mahrattas had advanced a considerable way from their works; when he rushed upon them with so much rapidity as left them hardly any time for using their cannon. The Bhaow was killed early in the action; confusion soon pervaded the army, and a dreadful carnage ensued. The field was floated with blood. Twenty-two thousand men and women were taken prisoners. Of those who escaped from the field of battle, the greater part were butchered by the people of the country, who had suffered from their depredations. Of an army of 140,000 horse, commanded by the most celebrated generals of the nation, only three chiefs of any rank, and a mere residue of the troops, found their way to Deccan. The Dooranee Shah made but little use of this mighty victory. After remaining a few months at Delhi, he recognized Alee Gohur as Emperor, by the title of Shah Aulum II.; and entrusting Nujeeb ad Dowlah with the superintendence of affairs, till his master should return from Bengal, he marched back to his capital of Cabul in the end of the year 1760 [1761]. With Aulumgeer II. the empire of the Moguls may be justly considered as having arrived at its close. The unhappy Prince who now received the name of Emperor, and who, after a life of misery and disaster, ended his days a pensioner of English merchants, never possessed a sufficient degree of power to consider himself for one moment as master of the throne."—J. Mill, *History of British India*, v. 2, bk. 3, ch.

4.—“The words ‘wonderful,’ ‘strange,’ are often applied to great historical events, and there is no event to which they have been applied more freely than to . . . [the English] conquest of India. . . . But the event was not wonderful in a sense that it is difficult to discover adequate causes by which it could have been produced. If we begin by remarking that authority in India had fallen on the ground through the decay of the Mogul Empire, that it lay there waiting to be picked up by somebody, and that all over India in that period adventurers of one kind or another were founding Empires, it is really not surprising that a mercantile corporation which had money to pay a mercenary force should be able to compete with other adventurers, nor yet that it should outstrip all its competitors by bringing into the field English military science and generalship, especially when it was backed over and over again by the whole power and credit of England and directed by English statesmen. . . . England did not in the strict sense conquer India, but . . . certain Englishmen, who happened to reside in India at the time when the Mogul Empire fell, had a fortune like that of Hyder Ali or Runjeet Singh and rose to supreme power there.”—J. R. Seeley, *Expansion of England, course 2, lect. 3.*

1755-1757.—Capture of Calcutta by Suraj-ud-Dowlah.—Tragedy of Black Hole.—Clive's recovery of fort and settlement.—Clive remained three years in England, where he sought an election to Parliament, as a supporter of Fox, but was unseated by the Tories. On suffering this disappointment, he re-entered the service of the East India Company, as governor of Fort St. David, with the commission of a lieutenant-colonel in the British army, received from the king, and returned to India in 1755. Soon after his arrival at Fort St. David, “he received intelligence which called forth all the energy of his bold and active mind. Of the provinces which had been subject to the house of Tamerlane, the wealthiest was Bengal. No part of India possessed such natural advantages both for agriculture and for commerce. . . . The great commercial companies of Europe had long possessed factories in Bengal. The French were settled, as they still are, at Chandernagore on the Hoogley. Higher up the stream the Dutch traders held Chinsurah. Nearer to the sea, the English had built Fort William. A church and ample warehouses rose in the vicinity. A row of spacious houses, belonging to the chief factors of the East India Company, lined the banks of the river; and in the neighbourhood had sprung up a large and busy native town, where some Hindoo merchants of great opulence had fixed their abode. But the tract now covered by the palaces of Chowringhee contained only a few miserable huts thatched with straw. A jungle, abandoned to water-fowl and alligators, covered the site of the present Citadel, and the Course, which is now daily crowded at sunset with the gayest equipages of Calcutta. For the ground on which the settlement stood, the English, like the other great landholders, paid rent to the government; and they were, like other great landholders, permitted to exercise a certain jurisdiction within their domain. The great province of Bengal, together with Orissa and Bahar, had long been governed by a viceroy, whom the English called Aliverdy Khan, and who, like the other viceroys of the

Mogul, had become virtually independent. He died in 1756, and the sovereignty descended to his grandson, a youth under twenty years of age, who bore the name of Surajah Dowlah. . . . From a child Surajah Dowlah had hated the English. It was his whim to do so; and his whims were never opposed. He had also formed a very exaggerated notion of the wealth which might be obtained by plundering them; and his feeble and uncultivated mind was incapable of perceiving that the riches of Calcutta, had they been even greater than he imagined, would not compensate him for what he must lose, if the European trade, of which Bengal was a chief seat, should be driven by his violence to some other quarter. Pretexts for a quarrel were readily found. The English, in expectation of a war with France, had begun to fortify their settlement without special permission from the Nabob. A rich native, whom he longed to plunder, had taken refuge at Calcutta, and had not been delivered up. On such grounds as these Surajah Dowlah marched with a great army against Fort William. The servants of the Company at Madras had been forced by Dupleix to become statesmen and soldiers. Those in Bengal were still mere traders, and were terrified and bewildered by the approaching danger. . . . The fort was taken [June 20, 1756] after a feeble resistance; and great numbers of the English fell into the hands of the conquerors. The Nabob seated himself with regal pomp in the principal hall of the factory, and ordered Mr. Holwell, the first in rank among the prisoners, to be brought before him. His Highness talked about the insolence of the English, and grumbled at the smallness of the treasure which he had found; but promised to spare their lives, and retired to rest. Then was committed that great crime, memorable for its singular atrocity, memorable for the tremendous retribution by which it was followed. The English captives were left at the mercy of the guards, and the guards determined to secure them for the night in the prison of the garrison, a chamber known by the fearful name of the Black Hole. Even for a single European malefactor, that dungeon would, in such a climate, have been too close and narrow. The space was only twenty feet square. The air-holes were small and obstructed. It was the summer solstice, the season when the fierce heat of Bengal can scarcely be rendered tolerable to natives of England by lofty halls and by the constant waving of fans. The number of the prisoners was 146. When they were ordered to enter the cell, they imagined that the soldiers were joking; and, being in high spirits on account of the promise of the Nabob to spare their lives, they laughed and jested at the absurdity of the notion. They soon discovered their mistake. They expostulated; they entreated; but in vain. The guards threatened to cut down all who hesitated. The captives were driven into the cell at the point of the sword, and the door was instantly shut and locked upon them. Nothing in history or fiction, not even the story which Ugolino told in the sea of everlasting ice, after he had wiped his bloody lips on the scalp of his murderer, approaches the horrors which were recounted by the few survivors of that night. They cried for mercy. They strove to burst the door. Holwell who, even in that extremity, retained some presence of mind, offered large bribes to the gaolers. But the answer was that nothing could be done without the Nabob's orders, that the Nabob was asleep, and that he would be angry if anybody woke him. Then the prisoners

went mad with despair. They trampled each other down, fought for the places at the windows, fought for the pittance of water with which the cruel mercy of the murderers mocked their agonies, raved, prayed, blasphemed, implored the guards to fire among them. The gaolers in the mean time held lights to the bars, and shouted with laughter at the frantic struggles of their victims. At length the tumult died away in low gaspings and moanings. The day broke. The Nabob had slept off his debauch, and permitted the door to be opened. But it was some time before the soldiers could make a lane for the survivors, by piling up on each side the heaps of corpses on which the burning climate had already begun to do its loathsome work. When at length a passage was made, twenty-three ghastly figures, such as their own mothers would not have known, staggered one by one out of the charnel-house. A pit was instantly dug. The dead bodies, 123 in number, were flung into it promiscuously and covered up. . . . One Englishwoman had survived that night. She was placed in the harem of the Prince at Moorsshedabad. Surajah Dowlah, in the mean time, sent letters to his nominal sovereign at Delhi, describing the late conquest in the most pompous language. He placed a garrison in Fort William, forbade Englishmen to dwell in the neighbourhood, and directed that, in memory of his great actions, Calcutta should thenceforward be called Alinagore, that is to say, the Port of God. In August the news of the fall of Calcutta reached Madras, and excited the fiercest and bitterest resentment. The cry of the whole settlement was for vengeance. Within forty-eight hours after the arrival of the intelligence it was determined that an expedition should be sent to the Hoogley, and that Clive should be at the head of the land forces. The naval armament was under the command of Admiral Watson. Nine hundred English infantry, fine troops and full of spirit, and 1,500 sepoyes, composed the army which sailed to punish a Prince who had more subjects than Lewis XV. or the Empress Maria Theresa. In October the expedition sailed; but it had to make its way against adverse winds, and did not reach Bengal till December. The Nabob was revelling in fancied security at Moorsshedabad. He was so profoundly ignorant of the state of foreign countries that he often used to say that there were not ten thousand men in all Europe; and it had never occurred to him as possible, that the English would dare to invade his dominions. But, though undisturbed by any fear of their military power, he began to miss them greatly. His revenues fell off. . . . He was already disposed to permit the company to resume its mercantile operations in his country, when he received the news that an English armament was in the Hoogley. He instantly ordered all his troops to assemble at Moorsshedabad, and marched towards Calcutta. Clive had commenced operations with his usual vigour. He took Budgebudge, routed the garrison of Fort William, recovered Calcutta, stormed and sacked Hoogley. The Nabob, already disposed to make some concessions to the English, was confirmed in his pacific disposition by these proofs of their power and spirit. He accordingly made overtures to the chiefs of the invading armament, and offered to restore the factory, and to give compensation to those whom he had despoiled. Clive's profession was war; and he felt that there was something discreditable in an accommodation with Surajah Dowlah. But his power was limited. . . . The promises of the

Nabob were large, the chances of a contest doubtful; and Clive consented to treat, though he expressed his regret that things should not be concluded in so glorious a manner as he could have wished. With this negotiation commences a new chapter in the life of Clive. Hitherto he had been merely a soldier carrying into effect, with eminent ability and valour, the plans of others. Henceforth he is to be chiefly regarded as a statesman; and his military movements are to be considered as subordinate to his political designs."—T. B. Macaulay, *Lord Clive (Essays)*.

1757.—Treachorous conspiracy against Suraj-ud-Dowlah.—Overthrow at the battle of Plassey.—Counterfeit treaty with Omichund.—Elevation of Mir Jafar to the subahdar's throne.—The unsatisfactory treaty entered into with Suraj-ud-Dowlah had been pressed upon Clive by the Calcutta merchants, who "thought the alliance would enable them to get rid of the rival French station at Chandernagore. The Subahdar gave a doubtful answer to their proposal to attack this settlement, which Clive interpreted as an assent. The French were overpowered, and surrendered their fort. Surajah Dowlah was now indignant against his recent allies; and sought the friendship of the French officers. Clive, called by the natives 'the daring in war,' was also the most adroit, and,—for the truth cannot be disguised,—the most unscrupulous in policy. The English resident at the Court of Moorsshedabad, under Clive's instructions, encouraged a conspiracy to depose the Subahdar, and to raise his general, Meer Jaffier, to the supreme power. A Hindoo of great wealth and influence, Omichund, engaged in this conspiracy. After it had proceeded so far as to become the subject of a treaty between a Select Committee at Calcutta and Meer Jaffier, Omichund demanded that a condition should be inserted in that treaty, to pay him thirty lacs of rupees as a reward for his service. The merchants at Calcutta desired the largest share of any donation from Meer Jaffier, as a consideration for themselves, and were by no means willing that £300,000 should go to a crafty Hindoo. Clive suggested an expedient to secure Omichund's fidelity, and yet not to comply with his demands—to have two treaties drawn; a real one on red paper, a fictitious one on white. The white treaty was to be shown to Omichund, and he was to see with his own eyes that he had been properly cared for. Clive and the Committee signed this, as well as the red treaty which was to go to Meer Jaffier. Admiral Watson refused to sign the treacherous document. On the 10th of May, 1757, Clive stood up in his place in the House of Commons, to defend himself upon this charge against him, amongst other accusations. He boldly acknowledged that the stratagem of the two treaties was his invention;—that admiral Watson did not sign it; but that he should have thought himself authorised to sign for him in consequence of a conversation; that the person who did sign thought he had sufficient authority for so doing. 'He (Clive) forged admiral Watson's name,' says lord Macaulay. . . . The courage, the perseverance, the unconquerable energy of Clive have furnished examples to many in India who have emulated his true glory. Thank God, the innate integrity of the British character has, for the most part, preserved us from such exhibitions of 'true policy and justice.' The English resident, Mr. Watts,

left Moorshedabad. Clive wrote a letter of defiance to Surajah Dowlah, and marched towards his capital. The Subahdar had come forth from his city, as populous as the London of a century ago, to annihilate the paltry army of 1,000 English, and their 2,000 Sepoys disciplined by English officers, who dared to encounter his 60,000. He reached the village of Plassey with all the panoply of oriental warfare. His artillery alone appeared sufficient to sweep away those who brought only eight field pieces and two howitzers to meet his fifty heavy guns. Each gun was drawn by forty yoke of oxen; and a trained elephant was behind each gun to urge it over rough ground or up steep ascents. Meer Jaffier had not performed his promise to join the English with a division of the Subahdar's army. It was a time of terrible anxiety with the English commander. Should he venture to give battle without the aid of a native force? He submitted his doubt to a Council of War. Twelve officers, himself amongst the number, voted for delay. Seven voted for instant action. Clive reviewed the arguments on each side, and finally cast away his doubts. He determined to fight, without which departure from the opinion of the majority, he afterwards said, the English would never have been masters of Bengal. On the 22nd of June [1757], his little army marched fifteen miles, passed the Hooghly, and at one o'clock of the morning of the 23rd rested under the mangoe-trees of Plassey. As the day broke, the vast legions of the Subahdar,—15,000 cavalry, 45,000 infantry,—some armed with muskets, some with bows and arrows, began to surround the mangoe-grove and the hunting-lodge where Clive had watched through the night. There was a cannonade for several hours. The great guns of Surajah Dowlah did little execution. The small field-pieces of Clive were well served. One of the chief Mohammedan leaders having fallen, disorder ensued, and the Subahdar was advised to retreat. He himself fled upon a swift camel to Moorshedabad. When the British forces began to pursue, the victory became complete. Meer Jaffier joined the conquerors the next day. Surajah Dowlah did not consider himself safe in his capital; and he preferred to seek the protection of a French detachment at Patna. He escaped from his palace disguised; ascended the Ganges in a small boat; and fancied himself secure. A peasant whose ears he had cut off recognised his oppressor, and with some soldiers brought him back to Moorshedabad. In his presence-chamber now sat Meer Jaffier, to whose knees the wretched youth crawled for mercy. That night Surajah Dowlah was murdered in his prison, by the orders of Meer Jaffier's son, a boy as blood-thirsty as himself."—C. Knight, *Popular history of England*, v. 6, ch. 14.

ALSO IN: G. B. Malleson, *Founders of the Indian empire: Clive*, ch. 8-10.—Idem, *Lord Clive (Rulers of India)*.—Idem, *Decisive battles of India*, ch. 3.—E. Thornton, *History of British empire in India*, v. 1, ch. 4.

1757-1772.—Clive's administrations in Bengal.—Decisive war with Mogul emperor and nawab of Oudh.—English supremacy established.—"The battle of Plassey was fought on June 23, 1757, an anniversary afterwards remembered when the Mutiny of 1857 was at its height. History has agreed to adopt this date as the beginning of the British Empire in the East. But the immediate results of the victory were comparatively small, and several years passed in hard fighting before even the Bengalis would admit the superiority of the British arms. For the moment,

however, all opposition was at an end. Clive, again following in the steps of Duplex, placed Mir Jafar upon the Viceregal throne at Murshidabad, being careful to obtain a patent of investiture from the Mughal court. Enormous sums were exacted from Mir Jafar as the price of his elevation. . . . At the same time, the Nawab made a grant to the Company of the zamindari or landholder's rights over an extensive tract of country round Calcutta, now known as the District of the Twenty-four Parganas. The area of this tract was 882 square miles. In 1757 the Company obtained only the zamindari rights—i. e., the rights to collect the cultivator's rents, with the revenue jurisdiction attached [see below: 1785-1793]. The superior lordship, or right to receive the land tax, remained with the Nawab. But in 1759, this also was granted by the Delhi Emperor, the nominal Suzerain of the Nawab, in favour of Clive, who thus became the landlord of his own masters, the Company. . . . Lord Clive's claims to the property as feudal Suzerain over the Company were contested in 1764; and on the 23d June, 1765, when he returned to Bengal, a new deed was issued, confirming the unconditional jagir to Lord Clive for ten years, with reversion afterwards to the Company in perpetuity. . . . In 1758, Clive was appointed by the Court of Directors the first Governor of all the Company's settlements in Bengal. Two powers threatened hostilities. On the west, the Shahzada or Imperial prince, known afterwards as the Emperor Shah Alam, with a mixed army of Afghans and Mahrattas, and supported by the Nawab Wazir of Oudh, was advancing his own claims to the Province of Bengal. In the south the influence of the French under Lally and Bussy was overshadowing the British at Madras. The name of Clive exercised a decisive effect in both directions. Mir Jafar was anxious to buy off the Shahzada, who had already invested Patna. But Clive marched in person to the rescue, with an army of only 450 Europeans and 2,500 sepoy, and the Mughal army dispersed without striking a blow. In the same year, Clive despatched a force southwards under Colonel Forde, which recaptured Masulipatam from the French, and permanently established British influence throughout the Northern Circars, and at the court of Haidarabad. He next attacked the Dutch, the only other European nation who might yet prove a rival to the English. He defeated them both by land and water; and their settlement at Chinsurah existed thenceforth only on sufferance. From 1760 to 1765, Clive was in England. He had left no system of government in Bengal, but merely the tradition that unlimited sums of money might be extracted from the natives by the terror of the English name. In 1761, it was found expedient and profitable to dethrone Mir Jafar, the English Nawab of Murshidabad, and to substitute his son-in-law, Mir Kasim, in his place. On this occasion, besides private donations, the English received a grant of the three Districts of Bardwan, Midnapur, and Chittagong, estimated to yield a net revenue of half a million sterling. But Mir Kasim soon began to show a will of his own, and to cherish dreams of independence. . . . The Nawab alleged that his civil authority was everywhere set at naught. The majority of the Council at Calcutta would not listen to his complaints. The Governor, Mr. Vansittart, and Warren Hastings, then a junior member of Council, attempted to effect some compromise. But the controversy had become too hot. The Nawab's officers fired upon an English boat, and forthwith

all Bengal rose in arms [1763]. Two thousand of . . . sepoy were cut to pieces at Patna; about 200 Englishmen, who there and in other various parts of the Province fell into the hands of the Muhammadans, were massacred. But as soon as regular warfare commenced, Mir Kasim met with no more successes. His trained regiments were defeated in two pitched battles by Major Adams, at Gheriah and at Udha nala; and he himself took refuge with the Nawab Wazir of Oudh, who refused to deliver him up. This led to a prolongation of the war. Shah Alam, who had now succeeded his father as Emperor, and Shuja-ud-Daula, the Nawab Wazir of Oudh, united their forces, and threatened Patna, which the English

LORD CLIVE

had recovered. A more formidable danger appeared in the English camp, in the form of the first sepoy mutiny. This was quelled by Major (afterwards Sir Hector) Munro, who ordered 24 of the ringleaders to be blown from guns, an old Mughal punishment. In 1764, Major Munro won the decisive battle of Baxar [or Buxar], which laid Oudh at the feet of the conquerors, and brought the Mughal Emperor as a suppliant to the English camp. Meanwhile, the Council at Calcutta had twice found the opportunity they loved of selling the government of Bengal to a new Nawab.—*Imperial Gazetteer of India, v. 4, pp. 389-393.*

In 1765 Clive (now Baron Clive of Plassey) returned to India as governor of Bengal. He found that, during his absence, the officials of the Company had been guilty of injustice and rapacity. The Company's servants transferred their goods from place to place duty free, while the country merchants were taxed and were ruined while the Company's servants, native as well as English, reared great fortunes. "It is to the credit of Warren Hastings [who was then a member of the council] that he consistently pro-

tested against the claims of the Company's servants to carry on their private trade duty free, and deplored the ruin that was thus caused to the people of Bengal . . . while the entire inland trade of Bengal was thus disorganized by the Company's servants and their agents in every important district, the methods by which they secured the manufactures . . . are fully described by William Bolts, an English merchant who saw things with his own eyes. . . . 'It may with truth be now said that the whole inland trade of the country, as at present conducted, and that of the Company's investment for Europe in a more peculiar degree, has been one continued scene of oppression; the baneful effects of which are severely felt by every weaver and manufacturer in the country, every article produced being made a monopoly; in which the English, with their Banyans and black Gomastahs [native clerks] arbitrarily decide what quantities of goods each manufacturer shall deliver, and the prices he shall receive for them. . . . Upon the Gomastah's arrival at the Auring, or manufacturing town, he fixes upon a habitation which he calls his Cutcherry; to which, by his peons and hircarabs, he summons the brokers, called *dallals* and *pykars*, together with the weavers, whom, after receipt of the money despatched by his masters, he makes to sign a bond for the delivery of a certain quantity of goods, at a certain time and price, and pays them a certain part of the money in advance. The assent of the poor weaver is in general not deemed necessary; for the Gomastahs, when employed on the Company's investment, frequently make them sign what they please; and upon the weavers refusing to take the money offered, it has been known they have had it tied in their girdles, and they have been sent away with a flogging. . . . A number of these weavers are generally also registered in the books of the Company's Gomastahs, and not permitted to work for any others, being transferred from one to another as so many slaves, subject to the tyranny and roguery of each succeeding Gomastah. . . . The roguery practised in this department is beyond imagination; but all terminates in the defrauding of the poor weaver; for the prices which the Company's Gomastahs, and in confederacy with them the Jachendars (examiners of fabrics) fix upon the goods, are in all places at least 15 per cent., and some even 40 per cent. less than the goods so manufactured would sell in the public bazaar or market upon free sale. . . . Weavers, also, upon their inability to perform such agreements as have been forced upon them by the Company's agent, universally known in Bengal by the name of Mutchulcahs, have had their goods seized and sold on the spot to make good the deficiency; and the winders of raw silk, called *Negoads*, have been treated also with such injustice, that instances have been known of their cutting off their thumbs to prevent their being forced to wind silk. . . . The ryots, who are generally both land-holders and manufacturers, by the oppressions of Gomastahs in harassing them for goods are frequently rendered incapable of improving their lands, and even of paying their rents; for which, on the other hand, they are again chastised by the officers of the revenue, and not infrequently have by those harpies been necessitated to sell their children in order to pay their rents, or otherwise obliged to fly the country.' . . . [Complaints began to reach England, and Warren Hastings wrote in strong terms to the Company:] 'I beg leave to lay before you a grievance which calls loudly for redress.

... I mean the oppression committed under the sanction of the English name.' ... [He goes on to accuse the company's servants, and to inveigh against the use of the English flag to cover not only their own oppression but that of their native agents, and to complain of the insolence of the sepoys to the population.] It is due ... to the East India Company to state that they set their faces against ... exactions recovered under the name of presents, and condemned also the internal trade carried on by their servants in Bengal. In 1765 they sent out orders against the receipt of presents, and despatched Clive once more to put a stop to the internal trade of their servants, which they had already prohibited. The orders had already arrived in Bengal, and the covenants to be signed by the Company's servants were shortly expected. ... Lord Clive had an arduous duty to perform. The Company's affairs were in a bad way; their servants were corrupt; their subjects were oppressed. ... His letter to the court of Directors, from Calcutta; dated 30th. September 1765, is one of the most memorable documents ... in Indian affairs. In this letter Lord Clive described the state of affairs as he found them. ... 'Upon my arrival, I am sorry to say, I found your affairs in a condition so nearly desperate as would have alarmed any set of men whose sense of honour and duty to their employers had not been estranged by the too eager pursuit of their own advantage. The sudden, and, among many, the unwarrantable acquisition of riches, had introduced luxury in every shape and in the most pernicious excess. These two enormous evils went hand in hand together through the whole Presidency, infecting almost every member of each Department; every inferior seemed to have grasped at wealth that he might be able to assume that spirit of profusion which was now the only distinction between him and his superior. ... It is no wonder that the lust of riches should readily embrace the proffered means of its gratification, or that the instruments of your power should avail themselves of their authority, and proceed even to extortion in those cases where simple corruption could not keep pace with their rapacity. Examples of this sort, set by superiors, could not fail of being followed in proportional degree by inferiors; the evil was contagious, and spread among the civil and military, down to the writer, the ensign, and the free merchant. ... The sources of tyranny and oppression, which have been opened by the European agents acting under the authority of the Company's servants, and the numberless black agents and sub-agents acting also under them, will, I fear, be a lasting reproach to the English name in this country.'—R. C. Dutt, *Economic history of India under early British rule*, v. 1, pp. 21, 25-27, 33-37.—'Two landmarks stand out in his [Clive's] policy. First, he sought the substance, although not the name, of territorial power, under the fiction of a grant from the Mughal Emperor. Second, he desired to purify the Company's service, by prohibiting illicit gains, and guaranteeing a reasonable pay from honest sources. In neither respect were his plans carried out by his immediate successors. But the beginning of ... [British] Indian rule dates from this second governorship of Clive, as ... [British] military supremacy had dated from his victory at Plassey. Clive landed, advanced rapidly up from Calcutta to Allahabad, and there settled in person the fate of nearly half of India. Oudh was given back to the Nawab Wazir, on condition of his paying half a million sterling towards

the expenses of the war. The Provinces of Allahabad and Kora, forming the greater part of the Doab, were handed over to Shah Alam himself, who in his turn granted to the Company the diwani or fiscal administration of Bengal, Behar, and Orissa, and also the territorial jurisdiction of the Northern Circars. A puppet Nawab was still maintained at Murshidabad, who received an annual allowance from ... [the company] of £600,000. Half that amount, or about £300,000 ... [was] paid to the Emperor as tribute from Bengal. Thus was constituted the dual system of government, by which the English received all the revenues and undertook to maintain the army; while the criminal jurisdiction, or nizamat, was vested in the Nawab. In Indian phraseology, the Company was diwan and the Nawab was nizam. The actual collection of the revenues still remained for some years in the hands of native officials. ... Lord Clive quitted India for the third and last time in 1767. Between that date and the governorship of Warren Hastings, in 1772, little of importance occurred in Bengal beyond the terrible famine of 1770, which is officially reported to have swept away one-third of the inhabitants. The dual system of government, established in 1765 by Clive, had proved a failure. Warren Hastings, a tried servant of the Company, distinguished alike for intelligence, for probity, and for knowledge of oriental manners, was nominated Governor by the Court of Directors, with express instructions to carry out a predetermined series of reforms. In their own words, the Court had resolved to 'stand forth as diwan, and to take upon themselves, by the agency of their own servants, the entire care and administration of the revenues.' In the execution of this plan, Hastings removed the exchequer from Murshidabad to Calcutta, and appointed European officers, under the now familiar title of Collectors, to superintend the revenue collections and preside in the courts. Clive had laid the territorial foundations of the British Empire in Bengal. Hastings may be said to have created a British administration for that Empire.—*Imperial Gazetteer of India*, v. 4, pp. 389-394.

1758-1761.—End of French domination in India.—Battle of Wandiwash.—'In 1758 the fortunes of the French in India underwent an entire change. In April a French fleet [which had been sent out at the outbreak of the Seven Years' War] arrived at Pondicherry. It brought a large force under the command of Count de Lally, who had been appointed Governor-General of the French possessions in India. ... No sooner had he landed at Pondicherry than he organised an expedition against Fort St. David; but he found that no preparations had been made by the French authorities. There was a want alike of coolies, draught cattle, provisions, and ready money. But the energy of Lally overcame all obstacles. ... In June, 1758, Lally captured Fort St. David. He then prepared to capture Madras as a preliminary to an advance on Bengal. He recalled Bussy from the Dekhan to help him with his Indian experiences; and he sent the Marquis de Conflans to succeed Bussy in the command of the Northern Circars. [A strip of territory on the Coromandel coast, which had been ceded to the French in 1752 by Salabat Jang, nizam of the Deccan, was so called; it stretched along 600 miles of seaboard, from the Carnatic frontier northwards.] ... The departure of Bussy from

the Northern Circars was disastrous to the French. The Raja of Vizianagram revolted against the French and sent to Calcutta for help. Clive despatched an English force to the Northern Circars, under the command of Colonel Forde; and in December, 1758, Colonel Forde defeated the French under Conflans [at Condore, or Kondur, December 9], and prepared to recover all the English factories on the coast which had been captured by Bussy. Meanwhile Count de Lally was actively engaged at Pondicherry in preparations for the siege of Madras. He hoped to capture Madras, and complete the destruction of the English in the Carnatic; and then to march northward, capture Calcutta, and expel the English from Bengal. . . . Lally reached Madras on the 12th of December, 1758, and at once took possession of Black Town. He then began the siege of Fort St. George with a vigour and activity which commanded the respect of his enemies. His difficulties were enormous. . . . Even the gunpowder was nearly exhausted. At last, on the 16th of February, 1759, an English fleet arrived at Madras under Admiral Pocock, and Lally was compelled to raise the siege. Such was the state of party feeling amongst the French in India, that the retreat of Lally from Madras was received at Pondicherry with every demonstration of joy. The career of Lally in India lasted for two years longer, namely from February, 1759, to February, 1761; it is a series of hopeless struggles and wearying misfortunes. In the Dekhan, Salabut Jung had been thrown into the utmost alarm by the departure of Bussy and defeat of Conflans. He was exposed to the intrigues and plots of his younger brother, Nizam Ali, and he despaired of obtaining further help from the French. Accordingly he opened up negotiations with Colonel Forde and the English. Forde on his part recovered all the captured factories [taking Masulipatam by storm, April 7, 1759, after a fortnight's siege], and drove the French out of the Northern Circars. He could not however interfere in the domestic affairs of the Dekhan, by helping Salabut Jung against Nizam Ali. In 1761 Salabut Jung was dethroned and placed in confinement; and Nizam Ali ascended the throne at Hyderabad as ruler of the Dekhan. In the Carnatic the French were in despair. In January, 1760, Lally was defeated by Colonel Coote at Wandiwash, between Madras and Pondicherry. Lally opened up negotiations with Hyder Ali, who was rising to power in Mysore; but Hyder Ali as yet could do little or nothing. At the end of 1760 Colonel Coote began the siege of Pondicherry. Lally . . . was ill in health and worn out with vexation and fatigue. The settlement was torn by dissensions. In January, 1761, the garrison was starved into a capitulation, and the town and fortifications were levelled with the ground. A few weeks afterwards the French were compelled to surrender the strong hill-fortress of Jingi, and their military power in the Carnatic was brought to a close. [On the return of Count Lally to France] he was sacrificed to save the reputation of the French ministers. . . . He was tried by the parliament of Paris. . . . In May, 1766, he was condemned not only to death, but to immediate execution."—J. T. Wheeler, *Short history of India*, pt. 3, ch. 2.—"The battle of Wandewash, . . . though the numbers on each side were comparatively small, must yet be classed amongst the decisive battles of the world, for it dealt a fatal and decisive blow to French domination in India."—G. B. Malleson, *History of the French in India*, ch. 12.

ALSO IN: G. B. Malleson, *Decisive battles of India*, ch. 4.

1767-1769.—First war with Hyder Ali.—Exhaustion of East India Company's resources.—"At this period, the main point of interest changes from the Presidency of Bengal to the Presidency of Madras. There, the English were becoming involved in another war. There, they had now, for the first time, to encounter the most skilful and daring of all the enemies against whom they ever fought in India—Hyder Ali. He was of humble origin, the grandchild of a wandering 'fakir' or Mahomedan monk. Most versatile in his talents, Hyder was no less adventurous in his career; by turns a private man devoted to sports of the chase, a captain of free-booters, a partisan-chief, a rebel against the Rajah of Mysore, and commander-in-chief of the Mysorean army. Of this last position he availed himself to dethrone and supplant his master. . . . Pursuing his ambitious schemes, Hyder Ali became, not merely the successor of the Rajah, but the founder of the kingdom of Mysore. From his palace at Seringapatam, as from a centre, a new energy was infused through the whole of Southern India. By various wars and by the dispossession of several smaller princes, he extended his frontiers to the northward, nearly to the river Kistna. His posts on the coast of Malabar, Mangalore especially, gave him the means of founding a marine; and he applied himself with assiduous skill to train and discipline his troops according to the European models. The English at Madras were roused by his ambition, without as yet fully appreciating his genius. We find them at the beginning of 1767 engaged, with little care or forethought, in a confederacy against him with the Nizam and the Mahrattas. Formidable as that confederacy might seem, it was speedily dissipated by the arts of Hyder. At the very outset, a well-timed subsidy bought off the Mahrattas. The Nizam showed no better faith; he was only more tardy in his treason. He took the field in concert with a body of English commanded by Colonel Joseph Smith, but soon began to show symptoms of defection, and at last drew off his troops to join the army of Hyder. A battle ensued near Trincomalee, in September, 1767. Colonel Smith had under him no more than 1,500 Europeans and 9,000 Sepoys; while the forces combined on the other side were estimated, probably with much exaggeration, at 70,000 men. Nevertheless, Victory, as usual, declared for the English cause. . . . [The] victory at Trincomalee produced as its speedy consequence a treaty of peace with the Nizam. Hyder was left alone; but even thus proved fully a match for the English both of Madras and of Bombay. . . . He could not be prevented from laying waste the southern plains of the Carnatic, as the territory of one of the staunchest allies of England, Mahomed Ali, the Nabob of Arcot. Through such ravages, the British troops often underwent severe privations. . . . At length, in the spring of 1769, Hyder Ali became desirous of peace, and resolved to extort it on favourable terms. First, by a dexterous feint he drew off the British forces 140 miles to the southward of Madras. Then suddenly, at the head of 5,000 horsemen, Hyder himself appeared at St. Thomas's Mount, within ten miles of that city. The terrified Members of the Council already, in their mind's eye, saw their country-houses given up to plunder and to flame, and were little inclined to dispute whatever might be asked by an enemy so near at hand. Happily his terms were not high. A treaty was signed,

providing that a mutual restoration of conquests should take place, and that the contracting parties should agree to assist each other in all defensive wars. In the career of Hyder Ali, this was by no means the first, nor yet the last occasion, on which he showed himself sincerely desirous of alliance with the English. He did not conceal the fact, that, in order to maintain his power and secure himself, he must lean either on them or on the Mahrattas. . . . In this war with Hyder, the English had lost no great amount of reputation, and of territory they had lost none at all. But as regards their wealth and resources, they had suffered severely. Supplies, both of men and of money, had been required from Bengal, to assist the government at Madras; and both had been freely given. In consequence of such a drain, there could not be made the usual investments in goods, nor yet the usual remittances to England. Thus at the very time when the proprietors of the East India Company had begun to wish each other joy on the great reforms effected by Lord Clive, and looked forward to a further increase of their half-yearly Dividend, they were told to prepare for its reduction. A panic ensued. Within a few days, in the spring of 1760, India Stock fell about sixty per cent."—Lord Mahon, *History of England*, ch. 67.

1770-1773.—Famine in Bengal.—Break-down of Company's government.—North's Regulating Acts.—Reorganization of Company.—"In 1770 Bengal was desolated by perhaps the most terrible of the many terrible famines that have darkened its history, and it was estimated that more than a third part of its inhabitants perished. Yet in spite of all these calamities, in spite of the rapidly accumulating evidence of the inadequacy of the Indian revenues, the rapacity of the proprietors at home prevailed, and dividends of 12 and 12½ per cent., as permitted by the last Act, were declared. The result of all this could hardly be doubtful. In July, 1772, the Directors were obliged to confess that the sum required for the necessary payments of the next three months was deficient to the extent of no less than 1,203,000l., and in August the Chairman and Deputy Chairman waited on the Minister to inform him that nothing short of a loan of at least one million from the public could save the Company from ruin. The whole system of Indian government had thus for a time broken down. The division between the Directors and a large part of the proprietors, and between the authorities of the Company in England and those in India, the private and selfish interests of its servants in India, and of its proprietors at home, the continual oscillation between a policy of conquest and a policy of trade, and the great want in the whole organisation of any adequate power of command and of restraint, had fatally weakened the great corporation. In England the conviction was rapidly growing that the whole system of governing a great country by a commercial company was radically and incurably false. . . . The subject was discussed in Parliament, in 1772, at great length, and with much acrimony. Several propositions were put forward by the Directors, but rejected by the Parliament; and Parliament, under the influence of Lord North, and in spite of the strenuous and passionate opposition of Burke, asserted in unequivocal terms its right to the territorial revenues of the Company. A Select Committee,

consisting of thirty-one members, was appointed by Parliament to make a full inquiry into the affairs of the Company. It was not, however, till 1773 that decisive measures were taken. The Company was at this time absolutely helpless. Lord North commanded an overwhelming majority in both Houses, and on Indian questions he was supported by a portion of the Opposition. The Company was on the brink of ruin, unable to pay its tribute to the government, unable to meet the bills which were becoming due in Bengal. The publication, in 1773, of the report of the Select Committee, revealed a scene of maladministration, oppression, and fraud which aroused a widespread indignation through England; and the Government was able without difficulty, in spite of the provisions of the charter, to exercise a complete controlling and regulating power over the affairs of the Company. . . . By enormous majorities two measures [North's Regulating Acts] were passed through Parliament in 1773, which mark the commencement of a new epoch in the history of the East India Company. By one Act, the ministers met its financial embarrassments by a loan of 1,400,000l. at an interest of 4 per cent., and agreed to forego the claim of 400,000l. till this loan had been discharged. The Company was restricted from declaring any dividend above 6 per cent. till the new loan had been discharged, and above 7 per cent. till its bond-debt was reduced to 1,500,000l. It was obliged to submit its accounts every half-year to the Lords of the Treasury; it was restricted from accepting bills drawn by its servants in India for above 300,000l. a year, and it was obliged to export to the British settlements within its limits British goods of a specified value. By another Act, the whole constitution of the Company was changed, and the great centre of authority and power was transferred to the Crown. . . . All the more important matters of jurisdiction in India were to be submitted to a new court, consisting of a Chief Justice and three puisne judges appointed by the Crown. A Governor-General of Bengal, Behar, and Orissa, was to be appointed at a salary of 25,000l. a year, with four Councillors, at salaries of 8,000l. a year, and other presidencies were made subordinate to Bengal. The first Governor-General and Councillors were to be nominated, not by the East India Company, but by Parliament; they were to be named in the Act, and to hold their offices for five years; after that period the appointments reverted to the Directors, but were subject to the approbation of the Crown. Everything in the Company's correspondence with India relating to civil and military affairs was to be laid before the Government. No person in the service of the King or of the Company might receive presents, and the Governor-General, the Councillors, and the judges were excluded from all commercial profits and pursuits. By this memorable Act the charter of the East India Company was completely subverted, and the government of India passed mainly into the hands of the ministers of the Crown. The chief management of affairs was vested in persons in whose appointment or removal the Company had no voice or share, who might govern without its approbation or sanction, but who nevertheless drew, by authority of an Act of Parliament, large salaries from its exchequer. Such a measure could be justified only by extreme necessity and by brilliant success, and it was obviously open to the gravest objections from many sides. . . . Warren Hastings was the first Governor-General: Barwell, Clavering, Monson,

and Philip Francis were the four Councillors."—W. E. H. Lecky, *History of England in the eighteenth century*, v. 3, ch. 13.

1773-1785.—Administration of Warren Hastings, first governor-general of India.—Execution of Nuncomar.—Rohilla War.—Quarrel with Chait Singh and annexation of Benares.—The Begums of Oudh.—“The Governor-General was not at once the potential personage he has since become. The necessity of ruling by a Dictator (a dictator on the spot, though responsible to superiors at home) had not yet become obvious; and the Governor-General had no superiority in council, except the casting vote in case of an equal division. Whether he could govern or not depended chiefly on whether he had a party of two in the council. Two out of the four, with his own casting vote, were enough; and without it, he was not really governor. This is not the place in which to follow the history of the first general council and its factions, apart from the consequences to British interests. It must suffice to say that at the outset, three out of four of the council (and those the new officials from England) were opposed to Hastings. . . . The internal administration of Bengal under Clive’s ‘double system’ was managed by the Nabob’s prime-minister. This functionary had a salary of 100,000. a year, and enjoyed a high dignity and immense power. One man who aspired to hold the office in Clive’s time was the great Hindoo, Nuncomar, . . . eminent in English eyes for his wealth, and his abilities, and much more in native estimation for his sanctity as a Brahmin, and his almost unbounded social power. . . . The Maharajah Nuncomar was a great scoundrel—there is no doubt of that; and his intrigues, supported by forgeries, were so flagrant as to prevent his appointment to the premiership under the Nabob. Such vices were less odious in Bengal than almost anywhere else; but they were inconvenient, as well as disgusting, to the British; and this was the reason why Clive set aside Nuncomar, and appointed his rival competitor, Mohammed Reza Khan, though he was highly reluctant to place the highest office in Bengal in the hands of a Mussulman. This Mussulman administered affairs for seven years before Hastings became Governor-General; and he also had the charge of the infant Nabob, after Surajah Dowla died. . . . [The Directors had for some time been dissatisfied] with the proceeds of their Bengal dominions. Nuncomar planted his agents everywhere; and in London especially; and these agents persuaded the Directors that Mohammed Reza Khan was to blame for their difficulties and their scanty revenues. Confident in this information, they sent secret orders to Hastings to arrest the great Mussulman, and everybody who belonged to him, and to hear what Nuncomar had to say against him. [The governor-general obeyed the order and made the arrests,] but the Mussulman minister was not punished, and Nuncomar hated Hastings accordingly. He hid his time, storing up materials of accusation with which to overwhelm the Governor at the first turn of his fortunes. That turn was when the majority of the Council were opposed to the Governor-General, and rendered him helpless in his office; and Nuncomar then presented himself, with offers of evidence to prove all manner of treasons and corruptions against Hastings. Hastings was haughty; the councils were tempestuous. Hastings prepared to resign, though he was aware that

the opinion of the English in Bengal was with him; and Nuncomar was the greatest native in the country, visited by the Council, and resorted to by all his countrymen who ventured to approach him. Foiled in the Council, Hastings had recourse to the Supreme Court [of which Sir Elijah Impey was the chief justice]. He caused Nuncomar to be arrested on a charge brought ostensibly by a native of having forged a bond six years before. After a long trial for an offence which appeared very slight to Bengalee natives in those days, the culprit was found guilty by a jury of Englishmen, and condemned to death by the judges.”—H. Martineau, *British rule in India*, ch. 9.—“It may perhaps be said that no trial has been so often tried over again by such diverse authorities, or in so many different ways, as this celebrated proceeding. During the course of a century it has been made the theme of historical, political, and biographical discussion; all the points have been argued and debated by great orators and great lawyers; it has formed the avowed basis of a motion in Parliament to impeach the Chief-Justice, and it must have weighed heavily, though indirectly, with those who decided to impeach the Governor-General. It gave rise to rumours of a dark and nefarious conspiracy which, whether authentic or not, exactly suited the humour and the rhetoric of some contemporary English politicians. . . . Very recently Sir James Stephen, after subjecting the whole case to exact scrutiny and the most skilful analysis, after examining every document and every fact bearing upon this matter with anxious attention, has pronounced judgment declaring, that Nuncomar’s trial was perfectly fair, that Hastings had nothing to do with the prosecution, and that at the time there was no sort of conspiracy or understanding between Hastings and Impey in relation to it. Nothing can be more masterly or more effective than the method employed by Sir James Stephen to explode and demolish, by the force of a carefully-laid train of proofs, the loose fabric of assertions, invectives, and ill-woven demonstrations upon which the enemies of Hastings and Impey based and pushed forward their attacks, and which have never before been so vigorously battered in reply. . . . It may be accepted, upon Sir James Stephen’s authority, that no evidence can be produced to justify conclusions adverse to the innocence of Hastings upon a charge that has from its nature affected the popular tradition regarding him far more deeply than the accusations of high-handed oppressive political transactions, which are little understood and leniently condemned by the English at large. There is really nothing to prove that he had anything to do with the prosecution, or that he influenced the sentence. . . . Nevertheless when Sir James Stephen undertakes to establish, by argument drawn from the general motives of human action, the moral certainty that Hastings was totally unconnected with the business, and that the popular impression against him is utterly wrong, his demonstration is necessarily less conclusive. . . . On the whole there is no reason whatever to dissent from Pitt’s view, who treated the accusation of a conspiracy between Impey and Hastings for the purpose of destroying Nuncomar, as destitute of any shadow of solid proof. Whether Hastings, when Nuncomar openly tried to ruin him by false and malignant accusations, became aware and made use in self-defence of the fact that his accuser had rendered himself liable to a prosecution for forgery, is a different question, upon which also no evidence exists or is likely to be forthcoming.”—A. Lyall, *Warren Hast-*

ings, ch. 3.—“James Mill says, ‘No transaction perhaps of his whole administration more deeply tainted the reputation of Hastings than the tragedy of Nuncomar.’ A similar remark was made by William Wilberforce. The most prominent part too in Nuncomar’s story is played by Sir Elijah Impey. . . . Impey, in the present day, is known to English people in general only by the terrible attack made upon him by Lord Macaulay, in his essay on Warren Hastings. It stigmatises him as one of the vilest of mankind. ‘No other such judge has dishonoured the English ermine since Jeffries drank himself to death in the Tower.’ ‘Impey, sitting as a judge, put a man unjustly to death, in order to serve a political purpose.’ ‘The time had come when he was to be stripped of that robe which he had so foully dishonoured.’ These dreadful accusations I, upon the fullest consideration of the whole subject, and, in particular, of much evidence which Macaulay seems to me never to have seen, believe to be wholly unjust. For Macaulay himself I have an affectionate admiration. He was my own friend, and my father’s, and my grandfather’s friend also, and there are few injunctions which I am more disposed to observe than the one which bids us not to forget such persons. I was, moreover, his successor in office, and am better able than most persons to appreciate the splendour of the services which he rendered to India. These considerations make me anxious if I can to repair a wrong done by him, not intentionally, for there never was a kinder-hearted man, but because he adopted on insufficient grounds the traditional hatred which the Whigs bore to Impey, and also because his marvellous power of style blinded him to the effect which his language produced. He did not know his own strength, and was probably not aware that a few sentences which came from him with little effort were enough to brand a man’s name with almost indelible infamy. . . . My own opinion is that no man ever had, or could have, a fairer trial than Nuncomar, and that Impey in particular behaved with absolute fairness and as much indulgence as was compatible with his duty. In his defence at the bar of the House of Commons, he said, ‘Conscious as I am how much it was my intention to favour the prisoner in everything that was consistent with justice; wishing as I did that the facts might turn out favourable for an acquittal; it has appeared most wonderful to me that the execution of my purpose has so far differed from my intentions that any ingenuity could form an objection to my personal conduct as bearing hard on the prisoner.’ My own earnest study of the trial has led me to the conviction that every word of this is absolutely true and just. Indeed, the first matter which directed my attention to the subject was the glaring contrast between Impey’s conduct as described in the State Trials and his character as described by Lord Macaulay. There is not a word in his summing-up of which I should have been ashamed had I said it myself, and all my study of the case has not suggested to me a single observation in Nuncomar’s favour which is not noticed by Impey. As to the verdict, I think that there was ample evidence to support it. Whether it was in fact correct is a point on which it is impossible for me to give an unqualified opinion, as it is of course impossible now to judge decidedly of the credit due to the witnesses, and as I do not understand some part of the exhibits.”—J. F. Stephen, *Story of Nuncomar*, pp. 2-3, 186-187.—Sir John Strachey, in his work on “Hastings and the Rohilla War,” examines in detail one of the chief charges made

against the conduct of Warren Hastings while Governor-General. The Rohilla charge was dropped by Burke and the managers, and was therefore not one of the issues tried at the impeachment; but it was, in spite of this fact, one of the main accusations urged against the Governor-General in Macaulay’s famous essay. Macaulay, following James Mill, accuses Warren Hastings of having hired out an English army to exterminate what Burke called “the bravest, the most honourable and generous nation on earth.” According to Macaulay, the Vizier of Oudh coveted the Rohilla country, but was not strong enough to take it for himself. Accordingly, he paid down forty lakhs of rupees to Hastings, on condition that the latter should help to strike down and seize his prey. Sir John Strachey shows beyond a shadow of doubt that the whole story is a delusion. “The English army was not hired out by Hastings for the destruction of the Rohillas; the Rohillas, described by Burke as belonging to the bravest, the most honourable and generous nation on earth, were no nation at all, but a comparatively small body of cruel and rapacious Afghan adventurers, who had imposed their foreign rule on an unwilling Hindoo population; and the story of their destruction is fictitious.” The northwest angle of the great strip of plain which follows the course of the Ganges was possessed by a clan which fifty years before had been a mere band of Afghan mercenaries, but which was now beginning to settle down as a dominant governing class, living among a vastly more numerous subject-population of Hindoos. This country was Rohilkhand, the warrior-horde the Rohillas. It must never be forgotten that the Rohillas were no more the inhabitants of Rohilkhand than were the Normans fifty years after the Conquest the inhabitants of England. But the fact that the corner of what geographically was a barrier-State for the Company was held by the Rohillas, made it necessary to keep Rohilkhand as well as Oudh free from the Mahrattas. Hence it became the key-note of Warren Hastings’ policy to help both the Rohillas and the Vizier of Oudh to maintain their independence against the Mahrattas. In the year 1772, however, the Mahrattas succeeded in crossing the Ganges, in getting into Rohilkhand, and in threatening the Province of Oudh. Hastings encouraged the Vizier and the Rohilla chiefs to make an alliance, under which the Rohillas were to be reinstated in their country by aid of the Vizier, the Vizier obtaining for such assistance forty lakhs,—that is, he coupled the Rohillas and the Vizier, for defence purposes, into one barrier-State. If the Rohillas had observed this treaty, all might have been well. Unhappily for them, they could not resist the temptation to break faith. They joined the Mahrattas against Oudh, and it was after this had occurred twice that Hastings lent assistance to the vizier in expelling them from Rohilkhand. Instead of exterminating the Rohillas, he helped make a warrior-clan, but one generation removed from a “free company,” recross the Ganges and release from their grip the land they had conquered.

“The year 1781 opened for Hastings on a troubled sea of dangers, difficulties, and distress. Haidar Ali was raging in the Carnatic, Goddard and Camac were still fighting the Marathas, and French fleets were cruising in the Bay of Bengal. [See below: 1780-1783.] . . . It was no time for standing upon trifles. Money must be raised

somehow, if British India was to be saved. Among other sources of supply, he turned to the Rajah of Banaras [or Benares]. Chait Singh was the grandson of an adventurer, who had ousted his own patron and protector from the lordship of the district so named. In 1775, his fief had been transferred by treaty from the Nawab of Oudh to the Company. As a vassal of the Company he was bound to aid them with men and money in times of special need. Five lakhs of rupees—£50,000—and two thousand horse was the quota which Hastings had demanded of him in 1780. In spite of the revenue of half-a-million, of the great wealth stored up in his private coffers, and of the splendid show which he always made in public, the Rajah pleaded poverty, and put off compliance with the demands of his liege lord. . . . Chait Singh had repeatedly delayed the payment of his ordinary tribute; his body-guard alone was larger than the force which Hastings required of him; he was enrolling troops for some warlike purpose, and Hastings' agents accused him of secret plottings with the Oudh Begums at Faizabad. . . . The Rajah, in fact, like a shrewd, self-seeking Hindu, was waiting upon circumstances, which at that time boded ill for his English neighbours. The Marathas, the French, or some other power might yet relieve him from the yoke of a ruler who restrained his ambition, and lectured him on the duty of preserving law and order among his own subjects. . . . It has often been argued that, in his stern dealings with the Rajah of Banaras, Hastings was impelled by malice and a desire for revenge. But the subsequent verdict of the House of Lords on this point, justifies itself to all who have carefully followed the facts of his life. . . . As a matter of policy, he determined to make an example of a contumacious vassal, whose conduct in that hour of need added a new danger to those which surrounded the English in India. A heavy fine would teach the Rajah to obey orders, and help betimes to fill his own treasury with the sinews of war. . . . Chait Singh had already tried upon the Governor-General those arts which in Eastern countries people of all classes employ against each other without a blush. He had sent Hastings a peace-offering of two lakhs—£20,000. Hastings took the money, but reserved it for the Company's use. Presently he received an offer of twenty lakhs for the public service. But Hastings was in no mood for further compromise in evasion of his former demand. He would be satisfied with nothing less than half a million in quittance of all dues. In July, 1781, he set out, with Wheeler's concurrence, for the Rajah's capital. . . . Traveling, as he preferred to do, with a small escort and as little parade as possible, he arrived on the 16th August at the populous and stately city. . . . On his way thither, at Baxar, the recusant Rajah had come to meet him, with a large retinue, in the hope of softening the heart of the great Lord Sahib. He even laid his turban on Hastings' lap. . . . With the haughtiness of an ancient Roman, Hastings declined his prayer for a private interview. On the day after his arrival at Banaras, the Governor-General forwarded to Chait Singh a paper stating the grounds of complaint against him, and demanding an explanation on each point. The Rajah's answer seemed to Hastings 'so offensive in style and unsatisfactory in substance'; it was full, in fact, of such transparent, or, as Lord Thurlow afterwards called them, 'impudent' falsehoods, that the Governor-General issued orders for placing the Rajah under arrest. Early the next morning, Chait Singh was quietly arrested

in his own palace. . . . Meanwhile his armed retainers were flocking into the city from his strong castle of Ramnagar, on the opposite bank. Mixing with the populace, they provoked a tumult, in which the two companies of Sepoys guarding the prisoner were cut to pieces. With unloaded muskets and empty pouches—for the ammunition had been forgotten—the poor men fell like sheep before their butchers. Two more companies, in marching to their aid through the narrow streets, were nearly annihilated. During the tumult Chait Singh quietly slipped out of the palace, dropped by a rope of turbans into a boat beneath, and crossed in safety to Ramnagar. . . . If Chait Singh's followers had not shared betimes their master's flight across the river, Hastings, with his band of thirty Englishmen and fifty Sepoys, might have paid very dearly for the sudden miscarriage of his plans. But the rabble of Banaras had no leader, and troops from the nearest garrisons were already marching to the rescue. . . . Among the first who reached him was the gallant Popham, bringing with him several hundred of his own Sepoys. . . . The beginning of September found Popham strong enough to open a campaign, which speedily avenged the slaughters at Banaras and Ramnagar, and carried Hastings back into the full stream of richly-earned success. . . . The capture of Bijgarh on the 10th November, closed the brief but brilliant campaign. The booty, amounting to £400,000, was at once divided among the captors; and Hastings lost his only chance of replenishing his treasury at the expense of Chait Singh. He consoled himself and improved the Company's finances, by bestowing the rebel's forfeit lordship on his nephew, and doubling the tribute hitherto exacted. He was more successful in accomplishing another object of his journey up the country."—L. J. Trotter, *Warren Hastings*, ch. 6.—"It is certain . . . that Chait Singh's rebellion was largely aided by the Begums or Princesses of Faizabad. On this point the evidence contained in Mr. Forrest's volumes ["Selections from Letters, Despatches and other State Papers in the Foreign Department of the Government of India," edited by G. W. Forrest] leaves no shadow of reasonable doubt. In plain truth, the Begums, through their Ministers, the eunuchs, had levied war both against the Company and their own kinsmen and master, the new Wazir of Oudh. Some years before, when the Francis faction ruled in Calcutta, these ladies, the widow and the mother of Shuja, had joined with the British Agent in robbing the new Wazir, Asaf-ud-daula, of nearly all the rich treasure which his father had stored up in Faizabad. Hastings solemnly protested against a transaction which he was powerless to prevent. The Begums kept their hold upon the treasure, and their Jaghirs, or military fiefs, which ought by rights to have lapsed to the new Wazir. Meanwhile Asaf-ud-daula had to govern as he best could, with an empty treasury, and an army mutinous for arrears of pay. At last, with the suppression of the Benares revolt, it seemed to Hastings and the Wazir that the time had come for resuming the Jaghirs, and making the Begums disgorge their ill-gotten wealth. In accordance with the Treaty of Chunar, both these objects were carried out by the Wazir's orders, with just enough of compulsion to give Hastings' enemies a handle for the slanders and misrepresentations which lent so cruel a point to Sheridan's dazzling oratory, and to one of the most scathing passages in Macaulay's most popular essay. There are some points, no doubt, in Hastings' character and career about which honest men may still

hold different opinions. But on all the weightier issues here mentioned there ought to be no room for further controversy. It is no longer possible to contend, for instance, that Hastings agreed, for a handsome bribe, to help in exterminating the innocent people of Rohilkhand; that he prompted Impey to murder Nand-Kumar; that any desire for plunder led him to fasten a quarrel upon Chait Singh; or that he engaged with the Oudh Wazir in a plot to rob the Wazir's own mother of vast property secured to her under a solemn compact, 'formally guaranteed by the Government of Bengal.'—L. J. Trotter, *Warren Hastings and his libellers* (*Westminster Review*, Mar., 1801).

1780-1783.—Second war with Hyder Ali (Second Mysore War).—British position in India jeopardized.—Decisive action by Warren Hastings.—“The brilliant successes obtained by the English over the French in Hindostan at the beginning of the war had made all direct competition between the two nations in that country impossible, but it was still in the power of the French to stimulate the hostility of the native princes, and the ablest of all these, Hyder Ali, the great ruler of Mysore, was once more in the field. Since his triumph over the English, in 1760, he had acquired much additional territory from the Mahrattas. He had immensely strengthened his military forces, both in numbers and discipline. . . . For some years he showed no wish to quarrel with the English, but when a Mahratta chief invaded his territory they refused to give him the assistance they were bound by the express terms of the treaty of 1760 to afford, they rejected or evaded more than one subsequent proposal of alliance, and they pursued a native policy in some instances hostile to his interest. As a great native sovereign, too, he had no wish to see the balance of power established by the rivalry between the British and French destroyed. . . . Mysore was swarming with French adventurers. The condition of Europe made it scarcely possible that England could send any fresh forces, and Hyder Ali had acquired a strength which appeared irresistible. Ominous rumours passed over the land towards the close of 1779, but they were little heeded, and no serious preparations had been made, when in July, 1780, the storm suddenly burst. At the head of an army of at least 90,000 men, including 30,000 horsemen, 100 cannon, many European officers and soldiers, and crowds of desperate adventurers from all parts of India, Hyder Ali descended upon the Carnatic and devastated a vast tract of country round Madras. Many forts and towns were invested, captured, or surrendered. The Nabob and some of his principal officers acted with gross treachery or cowardice, and in spite of the devastations native sympathies were strongly with the invaders. . . . Madras was for a time in imminent danger. A few forts commanded by British officers held out valiantly, but the English had only two considerable bodies of men, commanded respectively by Colonel Baillie and by Sir Hector Munro, in the field. They endeavoured to effect a junction, but Hyder succeeded in attacking separately the small army of Colonel Baillie, consisting of rather more than 3,700 men, and it was totally defeated [September 10], 2,000 men being left on the field. Munro only saved himself from a similar fate by a rapid retreat,

abandoning his baggage, and much of his ammunition. Arcot, which was the capital of the Nabob, and which contained vast military stores, was besieged for six weeks, and surrendered in the beginning of November. Velore, Wandewash, Permacoil, and Chingliput, four of the chief strongholds in the Carnatic, were invested. A French fleet with French troops was daily expected, and it appeared almost certain that the British power would be extinguished in Madras, if not in the whole of Hindostan. It was saved

WARREN HASTINGS

by the energy of the Governor-General, Warren Hastings, who, by extraordinary efforts, collected a large body of Sepoys and a few Europeans in Bengal, and sent them with great rapidity to Madras, under the command of Sir Eyre Coote, who had proved himself twenty years before scarcely second in military genius to Clive himself. I do not propose to relate in detail the long and tangled story of the war that followed. . . . It is sufficient to say that Coote soon found himself at the head of about 7,200 men, of whom 1,400 were Europeans; that he succeeded in relieving Wandewash, and obliging Hyder Ali to abandon for the present the siege of Velore; that the French fleet, which arrived off the coast in January, 1781, was found to contain no troops, and that on July 1, 1781, Coote, with an army of about 8,000 men, totally defeated forces at least eight times as numerous, commanded by Hyder himself, in the great battle of Porto Novo. . . . The war raged over the Carnatic, over Tanjore, in the Dutch settlements to the south of Tanjore, on the opposite Malabar coast, and on the coast of Ceylon, while at the same time another and independent struggle was proceeding with the Mahrattas. . . . The coffers at Calcutta were nearly empty, and it was in order to re-

plenish them that Hastings committed some of the acts which were afterwards the subjects of his impeachment. . . . By the skill and daring of a few able men, of whom Hastings, Coote, Munro, and Lord Macartney were the most prominent, the storm was weathered. Hyder Ali died in December, 1782, about four months before Sir Eyre Coote. The peace of 1782 withdrew France and Holland from the contest, and towards the close of 1783, Tippoo, the son of Hyder Ali, consented to negotiate a peace, which was signed in the following March. Its terms were a mutual restoration of all conquests, and in this, as in so many other great wars, neither of the contending parties gained a single advantage by all the bloodshed, the expenditure, the desolation, and the misery of a struggle of nearly four years."—W. E. H. Lecky, *History of England in the 18th century*, v. 5, ch. 14.—"The centre and heart of the English power lay in Bengal, which the war never reached at all, and which was governed by a man of rare talent and organizing capacity. No Anglo-Indian government of that time could carry on a campaign by war loans, as in Europe; the cost had to be provided out of revenue, or by requiring subsidies from allied native rulers; and it was Bengal that furnished not only the money and the men, but also the chief political direction and military leadership which surmounted the difficulties and repaired the calamities of the English in the western and southern Presidencies. And when at last the Marathas made peace, when Hyder Ali died, and Suffren [the French admiral], with all his courage and genius, could not master the English fleet in the Bay of Bengal, there could be no doubt that the war had proved the strength of the English position in India, had tested the firmness of its foundation. . . . With the termination of this war ended the only period in the long contest between England and the native powers, during which our position in India was for a time seriously jeopardized. That the English dominion emerged from this prolonged struggle uninjured, though not unshaken, is a result due to the political intrepidity of Warren Hastings. . . . Hastings had no aristocratic connexions or parliamentary influence at a time when the great families and the House of Commons held immense power; he was surrounded by enemies in his own Council; and his immediate masters, the East India Company, gave him very fluctuating support. Fiercely opposed by his own colleagues, and very ill obeyed by the subordinate Presidencies, he had to maintain the Company's commercial establishments, and at the same time to find money for carrying on distant and impolitic wars in which he had been involved by blunders at Madras or Bombay. These funds he had been expected to provide out of current revenues, after buying and despatching the merchandise on which the company's home dividends depended; for the resource of raising public loans, so freely used in England, was not available to him. He was thus inevitably driven to the financial transactions, at Benares and Lucknow, that were now so bitterly stigmatized as crimes by men who made no allowance for a perilous situation in a distant land, or for the weight of enormous national interests committed to the charge of the one man capable of sustaining them. When the storm had blown over in India, and he had piloted his vessel into calm water, he was sacrificed with little or no hesitation to party exigencies in England; the Ministry would have recalled him; they consented to his impeachment; they left him to be baited by the Opposition and to be ruined

by the law's delay, by the incredible procrastination and the obsolete formalities of a seven years' trial before the House of Lords."—A. Lyall, *Rise of the British dominion in India*, ch. 11, sect. 2.

1784.—Pitt's India Act.—In England, the East India Company had become a bone of contention. There had always been intense jealousy of its trade monopoly; numerous complaints were still justly made of its administration; the conscience of the country was roused by the large fortunes accumulated by officials of the company, and questions were asked about the methods used in making them. On all sides it began to be realized that the government of so great an empire should not be left to a trading company, which must always be tempted to put payment of dividends before good government, and that at least some change of system needed to be made. Two bills introduced by Fox failed in 1783, and caused his downfall. (See ENGLAND: 1783-1787.) He was followed by William Pitt the Younger, who was more successful. In 1784, Pitt brought in a bill for the regulation and management of the Company's affairs, which was passed, and which, with an explanatory Act passed in 1786, provided for the government of India until 1853 when the East India Company was finally deprived of all political power. The Act of 1784 created a commission or board of control in England, composed of six privy councillors, including a secretary of state, and the chancellor of the exchequer. This board had the superintendence and control over all the British territorial possessions in the East Indies, and was fully authorized to "superintend, direct and control, all acts, operations and concerns" relating to the government, civil or military, in India. Copies of all papers "relating to the civil or military government, or revenues" were to be forwarded to the board, and the court of directors was required to pay "due obedience to such orders and directions as they shall receive from the Board, touching the civil or military government and revenues of the British territorial possessions in the East Indies." The chief government of India was to consist of the governor of Bengal, who was appointed governor-general, and three councillors, and each of the other presidencies was likewise to be governed by a governor and three councillors, of whom the commander-in-chief of the presidency was to be one, unless the commander-in-chief of the company's forces in India could be present. The governor-general and governors had the casting vote in their respective councils, so that no governor could again be flouted by his council as Warren Hastings had been. The company had the right of appointment, but the king had the right to recall any of these officials, and no resignation was valid unless made in writing. The right to make war or peace, without the consent of the governor-general and council was taken from the other presidencies. Courts of justice, either in India or Great Britain were declared competent to try offences committed by subjects in native territories, in other words, native territories were not out of the jurisdiction of the British courts, when an offence was committed by a British subject. The receipt of "presents" was declared to be extortion. Elaborate precautions were taken to prevent the amassing of great private fortunes by servants of the Company, which was directed to introduce economy, and was required

to present a list of the civil and military establishments to Parliament within fourteen days of the opening of every session. The power of the governors was increased in 1793 by an amending Act, which gave to both the governor-general and the governors the right in extraordinary cases to act against the written advice of their councils. The Act of 1784 placed the control of the government of India in the hands of Parliament, while the charter trading rights of the company were not interfered with, beyond placing it out of the powers of their servants and agents to oppress. On the other hand the responsibility of the governor-general was enlarged, and his power enhanced, while the power of his council to thwart him was taken away.

1785-1793.—Extent of British rule at close of Hastings' administration.—Decline of Mogul empire.—Rise of Mysore.—Cornwallis's administration.—Third Mysore War (Tippu Sahib) "Permanent Land settlement" in Bengal.—"When Warren Hastings left India, the Mogul Empire was simply the phantom of a name. The warlike tribes of the north-west, Sikhs, Rajpoots, Jats, were henceforth independent; but the Rohillas of the north-east had been subdued and almost exterminated. Of the three greatest Soobahs or vice-royalties of the Mogul empire, at one time practically independent, that of Bengal had wholly disappeared, those of Oude and the Deccan had sunk into dependence on a foreign power, were maintained by the aid of foreign mercenaries. The only two native powers that remained were, the Mahrattas, and the newly-risen Mussulman dynasty of Mysore. The former were still divided between the great chieftaincies of the Peshwa, Scindia, Holkar, the Guicowar, and the Boslas of Berar. But the supremacy of the Peshwa was on the wane; that of Scindia, on the contrary, in the ascendant. Scindia ruled in the north; he had possession of the emperor's person, of Delhi, the old Mussulman capital. In the south, Hyder Ali and Tippoo [son of Hyder Ali, whom he had succeeded in 1782], Sultan of Mysore, had attained to remarkable power. They were dangerous to the Mahrattas, dangerous to the Nizam, dangerous, lastly, to the English. But the rise of the last-named power was the great event of the period. . . . They had won for themselves the three great provinces of Bengal, Behar, and Orissa, besides Benares,—forming a large compact mass of territory to the north-east. They had, farther down the east coast, the province of the Northern Circars, and farther still, the jagheer [land grant], of Madras; on the west, again, a large stretch of territory at the southern extremity of the peninsula. The two Mussulman sovereigns of Oude and Hyderabad were their dependent allies; they administered the country of the Nawab of the Carnatic, besides having hosts of smaller potentates under their protection. . . . The appointed successor to Hastings was Lord Macartney [governor of Madras]. . . . He lost his office, however, by hesitating to accept it, and going to England to urge conditions. [Lord Cornwallis, so well known in the history of the United States, was appointed in his place.] . . . The great military event of Lord Cornwallis's government was the third Mysore war. It began with some disputes about the petty Raja of Cherika, from whom the English had farmed the customs of Tellicherry, and taken, in security for advances, a district called Randaterra, and by Tippoo's attack upon the lines of the Raja of Travancore, an ally

of the English, consisting of a ditch, wall, and other defences, on an extent of about thirty miles. Tippoo was, however, repelled with great slaughter in an attack on the town (1789). Hearing this, Lord Cornwallis at once entered into treaties with the Nizam and the Peshwa for a joint war upon Mysore; all new conquests to be equally divided, all Tippoo's own conquests from the contracting powers to be restored. After a first inconclusive campaign, in which, notwithstanding the skill of General Meadows, the advantage rather remained to Tippoo, who, amongst other things, gave a decided check to Colonel Floyd (1790), Lord Cornwallis took the command in person, and carried Bangalore by assault, with great loss to both parties, but a tremendous carnage of the besieged. However, so wretched had been the English preparations, that, the cattle being 'reduced to skeletons, and scarcely able to move their own weight,' Lord Cornwallis, after advancing to besiege Seringapatam, was forced to retreat and to destroy the whole of his battering-train and other equipments; whilst General Abercrombie, who was advancing in the same direction from the Malabar coast, had to do the same (1791). A force of Mahrattas came in, well appointed and well provided, but too late to avert these disasters. The next campaign was more successful. It began by the taking of several of the hill-forts forming the western barrier of Mysore. . . . On the 5th Feb., 1792, however, Lord Cornwallis appeared before Seringapatam, situated in an island formed by the Cauvery: the fort and outworks were provided with 300 pieces of cannon; the fortified camp, outside the river, by six redoubts, with more than 100 pieces of heavy artillery. Tippoo's army consisted of 6,000 cavalry and 50,000 infantry, himself commanding. This first siege, which is celebrated in Indian warfare, continued with complete success on the English side till the 24th. 10,000 subjects of Coorg, whom Tippoo had enlisted by force, deserted. At last, when the whole island was carried and all preparations made for the siege, Tippoo made peace. The English allies had such confidence in Lord Cornwallis, that they left him entire discretion as to the terms. They were,—that Tippoo should give up half of his territory, pay a large sum for war expenses, and give up two of his sons as hostages. The ceded territory was divided between the allies, the Company obtaining a large strip of the Malabar coast, extending eastward to the Carnatic. . . . Meanwhile, on the breaking out of war between England and the French Republic, the French settlements in India were all again annexed (1792). Lord Cornwallis now applied himself to questions of internal government. Properly speaking, there was no English Government as yet. Mr. Kaye, the brilliant apologist of the East India Company, says, of Lord Cornwallis, that 'he gathered up the scattered fragments of government which he found, and reduced them to one comprehensive system.' He organized the administration of criminal justice, reorganized the police. He separated the collection of the revenues from the administration of justice, organizing civil justice in turn. . . . He next proceeded to organize the financial system of the Company's government. . . . Hence the famous 'Permanent Settlement' of Lord Cornwallis (22nd March, 1793)."—J. M. Ludlow, *British India*, v. 1, lect. 9.—"In 1793 the so-called Permanent Settlement of the Land Revenue was introduced. We found in Bengal, when we succeeded to the Government, a class of middle-men, called Zemindars [Zamindars—see also TALUKDARS], who collected the land revenue and the

taxes, and we continued to employ them. As a matter of convenience and expediency, but not of right, the office of zemindar was often hereditary. The zemindars had never been in any sense the owners of the land, but it was supposed by Lord Cornwallis and the English rulers of the time that it would be an excellent thing for Bengal to have a class of landlords something like those of England; the zemindars were the only people that seemed available for the purpose, and they were declared to be the proprietors of the land. It was by no means intended that injustice should thus be done to others. Excepting the State, there was only one great class, that of the ryots or actual cultivators, which, according to immemorial custom, could be held to possess permanent rights in the land. The existence of those rights was recognised, and, as it was supposed, guarded by the law. . . . There has been much dispute as to the exact nature of the rights given to the zemindars, but every one agrees that it was not the intention of the authors of the Permanent Settlement to confiscate anything which, according to the customs of the country, had belonged to the cultivators. The right of property given to the zemindars was a portion of those rights which had always been exercised by the State, and of which the State was at liberty to dispose; it was not intended that they should receive anything else. The land revenue, representing the share of the produce or rental to which the State was entitled, was fixed in perpetuity. The ryots were to continue to hold their lands permanently at the 'rates established in the purgannah'; when the amount of these rates was disputed it was to be settled by the courts; so long as rents at those rates were paid, the ryot could not be evicted. The intention was to secure to the ryot fixity of tenure and fixity of rent. Unfortunately, these rights were only secured upon paper. . . . The consequences at the present time are these:—Even if it be assumed that the share of the rent which the State can wisely take is smaller than the share which any Government, Native or English, has ever taken or proposed to take in India, the amount now received by the State from the land in Bengal must be held to fall short of what it might be by a sum that can hardly be less than 5,000,000. a year; this is a moderate computation; probably the loss is much more. This is given away in return for no service to the State or to the public; the zemindars are merely the receivers of rent; with exceptions so rare as to deserve no consideration, they take no part in the improvement of the land, and, until a very few years ago, they bore virtually no share of the public burdens. The result of these proceedings of the last century, to the maintenance of which for ever the faith of the British Government is said to have been pledged, is that the poorer classes in poorer provinces have to make good to the State the millions which have been thrown away in Bengal. If this were all, it would be bad enough, but worse remains to be told. . . . 'The original intention of the framers of the Permanent Settlement (I am quoting from Sir George Campbell) was to record all rights. The Canoongoes (District Registrars) and Putwarees (Village Accountants) were to register all holdings, all transfers, all rent-rolls, and all receipts and payments; and every five years there was to be filed in the public offices a complete register of all land tenures. But the task was a difficult one; there was delay in carrying it out. . . . The Putwarees fell into disuse or became the mere servants of the zemindars;

the Canoongoes were abolished. No record of the rights of the ryots and inferior holders was ever made, and even the quinquennial register of superior rights, which was maintained for a time, fell into disuse.' . . . The consequences of the Permanent Settlement did not become immediately prominent. . . . But, as time went on, and population and wealth increased, as cultivators were more readily found, and custom began to give way to competition, the position of the ryots became worse and that of the zemindars became stronger. Other circumstances helped the process of confiscation of the rights of the peasantry. . . . The confiscation of the rights of the ryots has reached vast proportions. In 1793 the rental left to the zemindars under the Permanent Settlement, after payment of the land revenue, is supposed not to have exceeded 400,000.; according to some estimates it was less. If the intentions of the Government had been carried out, it was to the ryots that the greater portion of any future increase in the annual value of the land would have belonged, in those parts at least of the province which were at that time well cultivated. It is not possible to state with confidence the present gross annual rental of the landlords of Bengal. An imperfect valuation made some years ago showed it to be 13,000,000. It is now called 17,000,000., but there can be little doubt that it is much more. Thus, after deducting the land revenue, which is about 3,800,000., the net rental has risen from 400,000. in the last century to more than 13,000,000. at the present time. No portion of this increase has been due to the action of the zemindars. It has been due to the industry of the ryots, to whom the greater part of it rightfully belonged, to the peaceful progress of the country, and to the expenditure of the State, an expenditure mainly defrayed from the taxation of poorer provinces. If ever there was an 'unearned increment,' it is this."—J. Strachey, *India, lect. 12.*

1785-1795.—Impeachment and trial of Warren Hastings.—"On his return to England [in 1785], Warren Hastings was impeached by the House of Commons for the [Rohilla War, fines imposed on Chait Singh, and the Begum of Oudh] and other alleged acts of oppression. He was solemnly tried by the House of Lords, and the proceedings dragged themselves out for seven years from the date when Edmund Burke made his great opening speech (1788-1795). They form one of the most celebrated State trials in English history, and ended in a verdict of not guilty on all the charges. Meanwhile the cost of the defence had ruined Warren Hastings, and left him dependent upon the generosity of the Court of Directors,—a generosity which never failed."—W. W. Hunter, *Brief history of the Indian peoples, p. 190.*—"The trial had several beneficial results. It cleared off a cloud of misconceptions, calumnies, exaggerations, and false notions generally on both sides; it fixed and promulgated the standard which the English people would in future insist upon maintaining in their Indian administration; it bound down the East India Company to better behaviour; it served as an example and a salutary warning, and it relieved the national conscience. But the attempt to make Hastings a sacrifice and a burnt-offering for the sins of the people; the

process of loading him with curses and driving him away into the wilderness; of stoning him with every epithet and metaphor that the English language could supply for heaping ignominy on his head; of keeping him seven years under an impeachment that menaced him with ruin and infamy—these were blots upon the prosecution and wide aberrations from the true course of justice which disfigured the aspect of the trial, distorted its aim, and had much to do with bringing it to the lame and impotent conclusion that Burke so bitterly denounced.”—A. Lyall, *Warren Hastings*, ch. 9.

1798-1805.—Administration of Marquis Wellesley.—First formulation of an imperial policy in India.—Steps in making British power supreme among native rulers.—Treaty with the nizam.—Overthrow and death of Tippu, sultan of Mysore.—War with the Mahrattas.—Assaye and Laswari.—Territorial acquisitions.—“The period of Sir John Shore's rule as Governor-General, from 1793 [when he succeeded Cornwallis] to 1798 [after which he became Lord Teignmouth], was uneventful. In 1798, Lord Mornington, better known as the Marquis of Wellesley, arrived in India, already inspired with imperial projects which were destined to change the map of the country. Mornington was the friend and favourite of Pitt, from whom he is thought to have derived his far-reaching political vision, and his antipathy to the French name. From the first he laid down as his guiding principle, that the English must be the one paramount power in the peninsula, and that Native princes could only retain the insignia of sovereignty by surrendering their political independence. The history of India since his time has been but the gradual development of this policy, which received its finishing touch when Queen Victoria was proclaimed Empress of India on the 1st of January, 1877. To frustrate the possibility of a French invasion of India, led by Napoleon in person, was the governing idea of Wellesley's foreign policy. France at this time, and for many years later, filled the place afterwards occupied by Russia in the minds of Indian statesmen. Nor was the danger so remote as might now be thought. French regiments guarded and overawed the Nizam of Haidarabad. The soldiers of Sindhia, the military head of the Marhatta Confederacy, were disciplined and led by French adventurers. Tipu Sultan of Mysore carried on a secret correspondence with the French Directorate, allowed a tree of liberty to be planted in his dominions, and enrolled himself in a republican club as ‘Citizen Tipu.’ The islands of Mauritius and Bourbon afforded a convenient half-way rendezvous for French intrigue and for the assembling of a hostile expedition. Above all, Napoleon Buonaparte was then in Egypt, dreaming of the conquests of Alexander, and no man knew in what direction he might turn his hitherto unconquered legions. Wellesley conceived the scheme of crushing for ever the French hopes in Asia, by placing himself at the head of a great Indian confederacy. In Lower Bengal, the sword of Clive and the policy of Warren Hastings had made the English paramount. Before the end of the century [British] power was consolidated from the seaboard to Benares, high up the Gangetic valley. . . . In 1801, the treaty of Lucknow made over to the British the Doab, or fertile tract between the

Ganges and the Jumna, together with Rohilkhand. In Southern India, . . . [the British] possessions were chiefly confined, before Lord Wellesley, to the coast Districts of Madras and Bombay. Wellesley resolved to make the British supreme as far as Delhi in Northern India, and to compel the great powers of the south to enter into subordinate relations to the Company's government. The intrigues of the Native princes gave him his opportunity for carrying out this plan without breach of faith. The time had arrived when the English must either become supreme in India, or be driven out of it. The Mughal Empire was completely broken up; and the sway had to pass either to the local Muhammadan governors of that empire, or to the Hindu Confederacy represented by the Marhattas, or to the British. Lord Wellesley determined that it should pass to the British. His work in Northern India was at first easy. The treaty of Lucknow in 1801 made . . . [the British] territorial rulers as far as the heart of the present North-Western Provinces, and established [their] . . . political influence in Oudh. Beyond those limits, the northern branches of the Marhattas practically held sway, with the puppet emperor in their hands. Lord Wellesley left them untouched for a few years, until the second Marhatta war (1802-1804) gave him an opportunity for dealing effectively with their nation as a whole. In Southern India, he saw that the Nizam at Haidarabad stood in need of his protection, and he converted him into a useful follower throughout the succeeding struggle. The other Muhammadan power of the south, Tipu Sultan of Mysore, could not be so easily handled. Lord Wellesley resolved to crush him, and had ample provocation for so doing. The third power of Southern India—namely, the Marhatta Confederacy—was so loosely organized, that Lord Wellesley seems at first to have hoped to live on terms with it. When several years of fitful alliance had convinced him that he had to choose between the supremacy of the Marhattas or of the British in Southern India, he did not hesitate to decide. Lord Wellesley first addressed himself to the weakest of the three southern powers, the Nizam of Haidarabad. Here he won a diplomatic success, which turned a possible rival into a subservient ally. The French battalions at Haidarabad were disbanded, and the Nizam bound himself by treaty not to take any European into his service without the consent of the English Government,—a clause since inserted in every engagement entered into with Native powers. Wellesley next turned the whole weight of his resources against Tipu, whom Cornwallis had defeated, but not subdued. Tipu's intrigues with the French were laid bare, and he was given an opportunity of adhering to the new subsidiary system. On his refusal, war was declared, and Wellesley came down in viceregal state to Madras to organize the expedition in person, and to watch over the course of events. One English army marched into Mysore from Madras, accompanied by a contingent from the Nizam. Another advanced from the western coast. Tipu, after a feeble resistance in the field retired into Seringapatam, and, when his capital was stormed, died fighting bravely in the breach (1799). Since the battle of Plassey, no event so greatly impressed the Native imagination as the capture of Seringapatam, which won for General Harris a peerage, and for Wellesley an Irish marquissate. In dealing with the territories of Tipu, Wellesley acted with moderation. The central portion, forming the old state of Mysore, was restored to an infant representative of the Hindu Rajas,

whom Haidar Ali had dethroned; the rest of Tipu's dominion was partitioned between the Nizam, the Marhattas, and the English. At about the same time, the Karnatic, or the part of South-Eastern India ruled by the Nawab of Arcot, and also the principality of Tanjore, were placed under direct British administration, thus constituting the Madras Presidency almost as it has existed to the present day. . . . The Marhattas had been the nominal allies of the English in both their wars with Tipu. But they had not rendered active assistance, nor were they secured to the English side as the Nizam now was. The Marhatta powers at this time were five in number. The recognised head of the confederacy was the Peshwa of Poona, who ruled the hill country of the Western Ghats, the cradle of the Marhatta race. The fertile Province of Guzerat was annually harried by the horsemen of the Gaekwar of Baroda. In Central India, two military leaders, Sindhia of Gwalior and Holkar of Indore, alternately held the pre-eminence. Towards the east, the Bhonsla Raja of Nagpur reigned from Berar to the coast of Orissa. Wellesley laboured to bring these several Marhatta powers within the net of his subsidiary system. In 1802, the necessities of the Peshwa, who had been defeated by Holkar, and driven as a fugitive into British territory, induced him to sign the treaty of Bassein. By this he pledged himself to the British to hold communications with no other power, European or Native, and granted . . . districts for the maintenance of a subsidiary force. This greatly extended the English territorial influence in the Bombay Presidency. But it led to the second Marhatta war, as neither Sindhia nor the Raja of Nagpur would tolerate the Peshwa's betrayal of the Marhatta independence. The campaigns which followed are perhaps the most glorious in the history of the British arms in India. The general plan, and the adequate provision of resources, were due to the Marquis of Wellesley, as also the indomitable spirit which refused to admit of defeat. The armies were led by Sir Arthur Wellesley (afterwards Duke of Wellington) and General (afterwards Lord) Lake. Wellesley operated in the Deccan, where in a few short months, he won the decisive victories of Assaye [September 23, 1803] and Argaum [November 28], and captured Ahmednagar. Lake's campaign in Hindustan was equally brilliant, although it has received less notice from historians. He won pitched battles at Aligarh [August 20] and Laswari [November 1, 1803], and took the cities of Delhi and Agra. He scattered the French troops of Sindhia, and at the same time stood forward as the champion of the Mughal Emperor in his hereditary capital. Before the end of 1803, both Sindhia and the Bhonsla Raja of Nagpur sued for peace. Sindhia ceded all claims to the territory north of the Jumna, and left the blind old Emperor Shah Alam once more under British protection. The Bhonsla forfeited Orissa to the English, who had already occupied it with a flying column in 1803, and Berar to the Nizam, who gained fresh territory by every act of complaisance to the British Government. . . . The concluding years of Wellesley's rule were occupied with a series of operations against Holkar, which brought little credit on the British name. The disastrous retreat of Colonel Monson through Central India (1804) recalled memories of the convention of Wargaum, and of the destruction of Colonel Baillie's force by Haidar Ali. The repulse of Lake in person at the siege of Bhartpur (Bhurlpore) is memorable as an instance of a British

army in India having to turn back with its object unaccomplished (1805). Bhartpur was not finally taken till 1827. Lord Wellesley during his six years of office carried out almost every part of his territorial scheme. In Northern India, Lord Lake's campaigns brought the North-Western provinces (the ancient Madhyadesa) under British rule, together with the custody of the puppet emperor. The new Districts were amalgamated with those previously acquired from the Nawab Wazir of Oudh into the 'Ceded and Conquered Provinces.' This partition of Northern India remained till the Sikh wars of 1844 and 1847 gave us the Punjab."—W. W. Hunter, *Brief history of the Indian peoples*, ch. 13.

1805-1816.—Reversal of Lord Wellesley's imperial policy.—Sepoy revolt at Vellore.—Strengthening northwestern frontier.—Influence established with Ranji Singh and the Sikhs.—Conquest of the Mauritius.—Gurkha War.—"The retreat of Monson was not only a disastrous blow to British prestige, but ruined for a while the reputation of Lord Wellesley. Because a Mahratta freebooter had broken loose in Hindustan, the Home authorities imagined that all the Mahratta powers had risen against the imperial policy of the Governor-General. Lord Wellesley was recalled from his post, and Lord Cornwallis was sent out to take his place, to reverse the policy of his illustrious predecessor, to scuttle out of Western Hindustan, to restore all the ceded territories, to surrender all the captured fortresses, and to abandon large tracts of country to be plundered and devastated by the Mahrattas, as they had been from the days of Sivaji to those of Wellesley and Lake. Before Lord Cornwallis reached Bengal the political outlook had brightened. . . . But Lord Cornwallis was sixty-seven years of age, and had lost the nerve which he had displayed in his wars against Tippu; and he would have ignored the turn of the tide, and persisted in falling back on the old policy of conciliation and non-intervention, had not death cut short his career before he had been ten weeks in the country. Sir George Barlow, a Bengal civilian, succeeded for a while to the post of Governor-General, as a provisional arrangement. He had been a member of Council under both Wellesley and Cornwallis, and he halted between the two. He refused to restore the conquered territories to Sindia and the Bhonsla, but he gave back the Indore principality to Holkar, together with the captured fortresses. Worst of all, he annulled most of the protective treaties with the Rajput princes on the ground that they had deserted the British government during Monson's retreat from Jaswant Rao Holkar. For some years the policy of the British government was a half-hearted system of non-intervention. . . . The Mahratta princes were left to plunder and collect chout [a blackmail extortion, levied by the Mahrattas for a century] in Rajputana, and practically to make war on each other, so long as they respected the territories of the British government and its allies. . . . All this while an under-current of intrigue was at work between Indian courts, which served in the end to revive wild hopes of getting rid of British supremacy, and rekindling the old aspirations for war and rapine. In 1806 the peace of India was broken by an alarm from

a very different quarter. In those days India was so remote from the British Isles that the existence of the British government mainly depended on the loyalty of its sepoy armies. Suddenly it was discovered that the Madras army was on the brink of mutiny. The British authorities at Madras had introduced an obnoxious head-dress resembling a European hat, in the place of the old time-honoured turban, and had, moreover, forbidden the sepoys to appear on parade with earrings and caste marks. India was astounded by a revolt of the Madras sepoys at the fortress of Vellore, about eight miles to the westward of Arcot. . . . The garrison at Vellore consisted of about 400 Europeans and 1,500 sepoys. At midnight, without warning, the sepoys rose in mutiny. One body fired on the European barracks until half the soldiers were killed or wounded. Another body fired on the houses of the British officers, and shot them down as they rushed out to know the cause of the uproar. All this while provisions were distributed amongst the sepoys by the Mysore princes, and the flag of Mysore was hoisted over the fortress. Fortunately the news was carried to Arcot, where Colonel Gillespie commanded a British garrison. Gillespie at once galloped to Vellore with a troop of British dragoons and two field guns. The gates of Vellore were blown open; the soldiers rushed in; 400 mutineers were cut down, and the outbreak was over. . . . In 1807 Lord Minto succeeded Barlow as Governor-General. He broke the spell of non-intervention. . . . Lord Minto's main work was to keep Napoleon and the French out of India. The north-west frontier was still vulnerable, but the Afghans had retired from the Punjab, and the once famous Runjeet Singh had founded a Sikh kingdom between the Indus and the Sutlej. As far as the British were concerned, the Sikhs formed a barrier against the Afghans; and Runjeet Singh was apparently friendly, for he had refused to shelter Jaswant Rao Holkar in his flight from Lord Lake. But there was no knowing what Runjeet Singh might do if the French found their way to Lahore. To crown the perplexity, the Sikh princes on the British side of the river Sutlej, who had done homage to the British government during the campaigns of Lord Lake, were being conquered by Runjeet Singh, and were appealing to the British government for protection. In 1808-9 a young Bengal civilian, named Charles Metcalfe, was sent on a mission to Lahore. The work before him was difficult and complicated, and somewhat trying to the nerves. The object was to secure Runjeet Singh as a useful ally against the French and Afghans, whilst protecting the Sikh states on the British side of the Sutlej, namely, Jhind, Nabha, and Patiala. Runjeet Singh was naturally disgusted at being checked by British interference. It was unfair, he said, for the British to wait until he had conquered the three states, and then to demand possession. Metcalfe cleverly dropped the question of justice, and appealed to Runjeet Singh's self-interest. By giving up the three states, Runjeet Singh would secure an alliance with the British, a strong frontier on the Sutlej, and freedom to push his conquests on the north and west. Runjeet Singh took the hint. He withdrew his pretensions from the British side of the Sutlej, and professed a friendship which remained unbroken until his death in 1839; but he knew what he was about. He conquered Cashmere on the north, and he wrested Peshawar from the Afghans; but he refused to open his dominions to British trade, and he was jealous of the last of any attempt to enter his territories. . . . Mean-

while the war against France and Napoleon had extended to eastern waters. The island of the Mauritius had become a French depot for frigates and privateers, which swept the seas from Madagascar to Java, until the East India Company reckoned its losses by millions, and private traders were brought to the brink of ruin. Lord Minto sent one expedition [1810], which wrested the Mauritius from the French; and he conducted another expedition in person, which wrested the island of Java from the Dutch, who at that time were the allies of France. The Mauritius has remained a British possession until this day, but Java was restored to Holland at the conclusion of the war. [See also JAVA: 1795-1816; VIENNA, CONGRESS OF.] . . . Meanwhile war clouds were gathering on the southern slopes of the Himalayas. Down to the middle of the 18th century, the territory of Nipal had been peopled by a peaceful and industrious race of Buddhists known as Newars, but about the year 1767, when the British had taken over the Bengal provinces, the Newars were conquered by a Rajput tribe from Cashmere, known as Ghorkas [Gurkhas]. The Ghorka conquest of Nipal was as complete as the Norman conquest of England. The Ghorkas established a military despotism with Brahmanical institutions, and parcelled out the country amongst feudal nobles known as Bharadars. . . . During the early years of the 19th century the Ghorkas began to encroach on British territory, annexing villages and revenues from Darjeeling to Simla without right or reason. They were obviously bent on extending their dominion southward to the Ganges, and for a long time aggressions were overlooked for the sake of peace. At last two districts were appropriated to which the Ghorkas had not a shadow of a claim, and it was absolutely necessary to make a stand against their pretensions. Accordingly, Lord Minto sent an ultimatum to Khatmandu, declaring that unless the districts were restored they would be recovered by force of arms. Before the answer arrived, Lord Minto was succeeded in the post of Governor-General by Lord Moira, better known by his later title of Marquis of Hastings. Lord Moira landed at Calcutta in 1813. Shortly after his arrival an answer was received from the Ghorka government, that the disputed districts belonged to Nipal, and would not be surrendered. Lord Moira at once fixed a day on which the districts were to be restored; and when the day had passed without any action being taken by the Ghorkas, a British detachment entered the districts and set up police stations. . . . The council of Bharadars resolved on war, but they did not declare it in European fashion. A Ghorka army suddenly entered the disputed districts, surrounded the police stations, and murdered many of the constables, and then returned to Khatmandu to await the action of the British government in the way of reprisals. The war against the Ghorkas was more remote and more serious than the wars against the Marhattas. . . . Those who have ascended the Himalayas to Darjeeling or Simla may realise something of the difficulties of an invasion of Nipal. The British army advanced in four divisions by four different routes. . . . General David Ochterlony, who advanced his division along the valley of the Sutlej, gained the most brilliant successes. He was one of the half-forgotten heroes of the East India Company. . . . For five months in the worst season of the year he carried one fortress after another, until the enemy made a final stand at Maloun on a shelf of the Himalayas. The Ghorkas made a desperate attack on the British

works, but the attempt failed; and when the British batteries were about to open fire, the Ghorka garrison came to terms, and were permitted to march out with the honours of war. The fall of Maloun shook the faith of the Ghorka government in their heaven-built fortresses. Commissioners were sent to conclude a peace. Nipal agreed to cede Kumaon in the west, and the southern belt of forest and jungle known as the Terai. It also agreed to receive a British Resident at Khatmandu. Lord Moira had actually signed the treaty, when the Ghorkas raised the question of whether the Terai included the forest or only the swamp. War was renewed. Ochterlony advanced an army within fifty miles of Khatmandu, and then the Ghorkas concluded the treaty [1816], and the British army withdrew from Nipal. The Terai, however, was a bone of contention for many years afterwards. Nothing was said about a subsidiary army, and to this day Nipal is outside the pale of subsidiary alliances; but Nipal is bound over not to take any European into her service without the consent of the British government."—J. T. Wheeler, *India under British rule*, ch. 3.—Gurkha volunteers soon began to enter the Company's army. Since then they have been among the most trusted of the Indian soldiers, and did notable service in the World War.

1813-1835.—Development of education.—Before 1813 "only a few spasmodic efforts had been made to provide facilities for the education of the people. The Calcutta Madrasa had been started in 1781 for the teaching of Muhammadans, and in 1792 the Sanskrit College at Benares had been founded by Jonathan Duncan. The chief object of these institutions was to train up a number of Indians sufficiently versed in Hindu and Muhammadan law to satisfy the requirements of the judicial administration; and therefore the courses of study were strictly Oriental. At the beginning of the nineteenth century a few of the rulers began to realise the duty of educating the people entrusted to their care. . . . [In 1813] when the Company's charter was renewed, a lakh of rupees (£10,000) was set apart 'for the revival and promotion of literature, and the encouragement of the learned natives of India, and for the introduction and promotion of a knowledge of the sciences among the inhabitants of the British territories.' But it was not until 1823 that the Governor-General in Council resolved that 'there should be constituted a general committee of public instruction for the purpose of ascertaining the state of public education. . . . As a result of this resolution committees were formed in the large centres of population, whose policy apparently was to publish Sanskrit and Arabic books rather than to encourage and supervise the establishment of schools and colleges. . . . Certain events then occurred which rendered necessary a reconsideration of its educational policy by the British Government in India. In the first place, Christian missionaries had settled in some numbers in the Madras Presidency and, to a lesser extent, in Bengal and elsewhere. These men introduced into the country a study of the English language and of Western learning. Perhaps the most remarkable of these was Alexander Duff . . . [who] in no way neglected the vernaculars, . . . for no boy in his school was allowed to begin English until he could read with ease his own vernacular. Success was immediate; and by his experiment Duff proved both the possibility and the wisdom of using the English lan-

guage as a medium of instruction."—G. Anderson and M. Subedar, *Development of Indian policy*, v. 2, pp. 103, 104.

1815-1922.—Religious and moral development.—Hindu reform societies.—Effect on nationalism.—The modern theistic movement, which may be described as an attempt to reform Hinduism from within, was begun in 1815 by Ram Mohun Roy, who also supported the beginning of modern education in India. He was a Bengal Brahmin, who studied Greek and Hebrew, in order that he might compare the Christian religion with Hinduism. In 1815 he founded the Brahmo Somaj, and in 1819 wrote a tract on the "Precepts of Jesus the Guide to Peace and Happiness." He devoted himself to the movement, and even crossed the sea to England in protest against the Brahmanical prohibition against "crossing the dark water." Since that time the fear of sea voyages has disappeared, and many high caste Hindus travel every year to Europe and America. Ram Mohun Roy died in England in 1833, and after his death the reform movement almost fell into desuetude. In 1843, however, another society sprang up under the guidance of Debendra Nath Tagore, and with this society the Brahmo Somaj united. Reorganization was effected by Chesub Chunder Sen, who was looked upon as so holy a man by his followers that after his death a section of the society elevated him into a Mahatma. The other section followed Protap Chunder Mozumdar, who raised the trend of thought current in the society to a very high standard. While the membership of the Brahmo Somaj is small, not greatly exceeding 5,000, its influence is very great. It is sympathetic to western thought and to Christianity, and seeks to modify caste prejudice and drive out the grosser forms of superstition. Opposed to the western trend of thought, which is so apparent in the ideals of the Brahmo Somaj, the Arya Somaj, which was founded in 1875 by Doyanand Saraswati, is also devoted to the reform of Hinduism. It seeks to overthrow the caste system, is opposed to child marriage, to the rule which prohibits the re-marriage of widows, and is much in favor of general education, including the education of women. It also opposes the pantheism of Hinduism, and upholds the doctrine of theism, which it declares is found in its purity in the Vedas, and needs no borrowing from the Christian faith. Nevertheless, the Arya Somaj, like the Brahmo Somaj has been profoundly affected by Christian principles, which are very gradually, but none the less surely spreading their influence over every shade of Indian thought. Theosophy, a form of philosophy which was founded in 1875, in the United States by Madame H. P. Blavatsky, a Russian, and Colonel Olcott, an American, was transferred to India in 1879 and has gained a great hold there. It is of great importance in the history of the last few years because of the influence exerted by Annie Besant, an Englishwoman who succeeded Colonel Olcott in the leadership of the society, and who started the cry of Home Rule, or India for the Indians. The theosophic society, like the Arya Somaj owes much of its expansion to the stress which it lays on the early history and literature of Hindustan. Both societies are greatly in favor with the nationalist party, especially with the wing known as the Extremes, who belong to either in large numbers. The theosophic society professes psychism very strongly. Politically, all three societies are important out of all proportion to their numbers, especially the Arya Somaj and in a measure the Theosophic Society, because of the food which they provide

for national aspirations, and national pride in the achievements of a long past age.

1816-1819.—Alliances with native princes.—Suppression of the Pindaris.—Overthrow of Mahrattas.—Last of the Peshwas.—“For some time past the Pindaris, a vast brotherhood of mounted freebooters, who were ready to fight under any standard for the chance of unbounded plunder, had been playing a more and more prominent part in the wars of native princes. As Free Lances, they had fought for the Peshwa at Panipat, had shared in the frequent struggles of the Sindhias and Holkars in Hindustan and Southern India, and made war on their own account with every native prince whose weakness at any moment seemed to invite attack. . . . From the hills and glens of Central India thousands of armed ruffians sallied forth year after year in quest of plunder, sparing no cruelty to gain their ends, and widening the circle of their ravages with each new raid, until in 1811 the smoke of their camp-fires could be seen from Gaya and Mirzapur. . . . To thwart Maratha intrigues and punish Pindari aggressions was the Governor-General's next aim. In spite of hindrances offered by his own council and the Court of Directors, he set himself to revive and extend Lord Wellesley's policy of securing peace and order throughout India by means of treaties, which placed one native prince after another in a kind of vassalage to the paramount power that ruled from Fort William. . . . By means of a little timely compulsion, the able and accomplished Elphinstone baffled for a while the plots which the Peshwa, Baji Rao, and his villainous accomplice, Trimbakji Danglia, had woven against their English allies. The treaty of June, 1817, left Lord Hastings master of Sagar and Bundalkhand, while it hound the Peshwa to renounce his friend Trimbakji, his own claims to the headship of the Maratha League, to make no treaties with any other native prince, and to accept in all things the counsel and control of the Company's Government. Hard as these terms may seem, there was no choice, averred Lord Hastings, between thus crippling a secret foe and depriving him of the crown he had fairly forfeited. Meanwhile Lord Hastings' fearless energy had already saved the Rajputs of Jaipur from further suffering at the hands of their Pathan oppressor, Amir Khan, and forced from Sindia himself a reluctant promise to aid in suppressing the Pindari hordes, whose fearful ravages had at length been felt by the peaceful villagers in the Northern Sarkars [and who destroyed what they could not carry away]. In the autumn of 1817 Hastings took the field at the head of an army which, counting native contingents, mustered nearly 120,000 strong, with some 300 guns. From east, west, north, and south, a dozen columns set forth to hunt down the merciless ruffians who had so long been allowed to harry the fairest provinces of India. In spite of the havoc wrought among . . . [the] troops by the great cholera outbreak of that year, and of a sudden rising among the Maratha princes for one last struggle with their former conquerors, . . . [British] arms were everywhere successful against Marathas and Pindaris alike. The latter, hunted into the hills and jungles of Central India, found no safety anywhere except in small bodies and constant flight . . . and the famous robber-league passed into a tale of yore. Not less swift and sure was the punishment dealt upon the Maratha leaders who joined the Peshwa in his sudden uprising against the British power. His late submission had been nothing but a mask for renewed plottings. Elphinstone, however, saw through the

mask which had taken in the confiding Malcolm. Before the end of October an English regiment, summoned in hot haste from Bombay, pitched its camp at Kirki, about two miles from Puna, beside the small Sepoy brigade already quartered there. In the first days of November Baji Rao began to assume a bolder tone as his plans grew ripe for instant execution. On the 5th, a body of Marathas attacked and destroyed the Residency, which Elphinstone had quitted in the nick of time. A great Maratha army then marched forth to overwhelm the little garrison at Kirki, before fresh troops could come up to its aid from Sirur. Elphinstone, however, who knew his foe, had no idea of awaiting the attack. Colonel Burr at once led out his men, not 3,000 all told. A brilliant charge of Maratha horse was heavily repulsed by a Sepoy regiment, and the English steadily advancing drove the enemy from the field. A few days later General Smith, at the head of a larger force, advanced on Puna, occupied the city, and pursued the frightened Peshwa from place to place. The heroic defence of Karigaum, a small village on the Bhima, by Captain Staunton and 800 Sepoys, with only two light guns, against 25,000 Marathas during a whole day, proved once more how nobly native troops could fight under English leading. Happily for Staunton's weary and diminished band, Smith came up the next morning, and the desponding Peshwa continued his retreat. Turn where he would, there was no rest for his jaded soldiers. Munro with a weak force, partly of his own raising, headed him on his way to the Carnatic, took several of his strong places, and drove him northwards within reach of General Smith. On the 10th February, 1818, that officer overtook and routed the flying foe at the village of Ashti. Babu Gokla, the Peshwa's staunchest and ablest follower, perished in the field, while covering the retreat of his cowardly master. For some weeks longer Baji Rao fled hither and thither before his resolute pursuers. But at length all hope forsook him as the circle of escape grew daily narrower; and in the middle of May the great-grandson of Balaji Vishwanath yielded himself to Sir John Malcolm at Indor, on terms far more liberal than he had any reason to expect. Even for the faithful few who still shared his fortunes due provision was made at his request. He himself spent the rest of his days a princely pensioner at Bithur, near Cawnpore; but the sceptre which he and his sires had wielded for a hundred years passed into English hands, while the Rajah of Satara, the long-neglected heir of the house of Sivaji, was restored to the nominal headship of the Maratha power. Meanwhile Appa Sahib, the usurping Rajah of Berar, had no sooner heard of the outbreak at Puna, than he, too, like the Peshwa, threw off his mask. On the evening of the 24th November, 1817, his troops, to the number of 18,000, suddenly attacked the weak English and Sepoy force of 1,400 men with four guns, posted on the Sitabaldi Hills, outside Nagpur. A terrible fight for eighteen hours ended in the repulse of the assailants, with a loss to the victors of more than 300 men and twelve officers. A few weeks later Nagpur itself was occupied after another fight. Even then the Rajah might have kept his throne, for his conquerors were merciful and hoped for the best. But they hoped in vain. It was not long before Appa Sahib, caught out in fresh intrigues, was sent off a prisoner towards Allahabad. Escaping from his captors, he wandered about the country for several years, and died at Lahor a pensioner on the bounty of Ranjit Singh. The house of Holkar had also paid the penalty of its rash resistance to

our arms. . . . On the 6th January, 1818, the young Holkar was glad to sign a treaty which placed him and his heirs under English protection at the cost of his independence and of some part of his realm. Luckily for himself, Sindia had remained quiet, if not quite loyal, throughout this last struggle between the English and his Maratha kinsfolk. Thus in one short and decisive campaign, the great Maratha power, which had survived the slaughter of Panipat, fell shattered to pieces by the same blow which crushed the Pindaris, and raised an English merchant-company to the paramount lordship of all India. The last of the Peshwas had ceased to reign, the Rajah of Berar was a discredited fugitive, the Rajah of Satara a king only in name, while Sindia, Holkar, and the Nizam were dependent princes who reigned only by sufferance of an English Governor-General at Calcutta. The Moghal Empire lingered only in the Palace of Delhi; its former viceroy, the Nawab of Audh, was our obedient vassal; the haughty princes of Rajputana bowed their necks, more or less cheerfully, to the yoke of masters merciful as Akbar and mightier than Aurangzib. Ranjit Singh himself cultivated the goodwill of those powerful neighbours who had sheltered the Sikhs of Sirhind from his ambitious inroads. With the final overthrow of the Marathas a new reign of peace, order, and general progress began for peoples who, during a hundred and fifty years, had lived in a ceaseless whirl of anarchy and armed strife. With the capture of Asirgarh in April, 1810, the fighting in Southern India came to an end."—L. J. Trotter, *History of India*, bk. 5, ch. 2-3.

1818-1845.—Development of British policy.—"It was not until the long struggle between the Mahratta and the British powers came to an end in 1818 that there was any real opportunity of evolving an Indian policy. Hitherto, the British in India had been employed for the most part in defending their territory against attacks from outside and in establishing the rule of law and order without which progress of any kind was impossible. But, after the battle of Kirkee, a long period of peace ensued such as had not been known in India for centuries, and which was not seriously interrupted until the outbreak of the first Sikh war in 1845. . . . It was during this period that the British rulers in India applied themselves to the formulation of an Indian policy, which was remarkable not only for its insight but also as being the work of a number of men who combined the gifts of statecraft and scholarship. . . . It happened that there were also in England statesmen who were anxious to bring forward measures of reform which had long been delayed by years of warfare. The similarity between the history of the two countries has been emphasised by Mr. Romesh Chander Dutt in the following words: . . . 'Never was there any period when Europe and India made more real progress within the lifetime of one generation than during the twenty years which succeeded the Napoleonic wars and the last Mahratta wars. Castlereagh . . . was succeeded as leader in the House of Commons by the noble-minded Canning, . . . [whose appointment] . . . marks a turning-point in English history, and is the first official recognition of that Liberalism which was growing in England. . . . The same spirit of reform, and the same desire to promote the happiness of the people, marked the policy of England and of India during this progressive

age. . . . To try to read Indian history apart from English history would be an endeavour to understand a result without knowing the cause. The same moving force determined events in both countries; the extension of privileges to the people of India during this period is the counterpart of the Reform Act in England; and Munro, Elphinstone, and Bentinck were inspired by the same reforming spirit as Canning, Grey, and Lord John Russell. It was during this period of peace that British rulers applied themselves to the arduous task of beneficent government and to the formation of what may be called an Indian policy. The great figures of that age were men such as Bentinck and Munro, Mountstuart Elphinstone and Metcalfe, who . . . discarded at once all ideas of denationalising India by the imposition of Western conceptions of religion and social polity. Even in the maintenance of law and order and in the general administration of the country they proceeded slowly and cautiously. They refrained as far as possible from abrupt innovations, but sought rather to establish a system which departed little from Indian traditions and under which the Indians would be able to develop in accordance with their past history and to maintain their own customs and religious beliefs. The path which they determined to tread was perilous indeed. There was the danger, on the one hand, of internal discontent and, on the other, of censure by the Court of Directors in London or by the English inhabitants of Calcutta. The British rulers of those days, however, rose above the difficulties which surrounded them and reached a very high level of statesmanship. They maintained peace; they established a workable system of orderly government; they cared for the material needs of the country; but at the same time they kept almost intact the old social and religious organisation of the people. On the other hand, they were quite prepared to eradicate customs which were manifestly evil and inhuman. When the happiness of the people was at stake, they did not shrink from bold measures. . . . Patience and forbearance on the one hand and courage and determination on the other were the leading characteristics of their policy. M. Chailley, an astute critic of British rule in India, has explained the nature of that policy as it appeared to him. . . . 'The Government [he said] must have the will and the power to free itself from European prejudices, and to repudiate, if found to be mistaken, administrative and political doctrines which it has hitherto accepted. It must discard commonplace solutions, and must be prepared to abandon what seems to be a straight road in favour of untried paths . . . to abandon the habit of continual intervention; to wait, it may be for long, until it can intervene expeditiously. It must keep silent while men act and events occur, must remain apparently inactive, and must let itself be suspected and attacked. . . . It must know that a law is faulty, and yet resist the temptation to alter it; it must bear for a time with untrustworthy or incapable officials. And yet it must not allow non-intervention to become a fixed rule; it must seize the fitting opportunity for inaugurating desirable changes. It will realise that the subject peoples are firmly attached to their old customs and institutions; that they find our civilisation cold and repellent, and that they must be led to it very gradually, gently, and patiently by evolution from their own traditions. Their eyes cannot be opened forcibly; they must be persuaded to see for themselves. I do not say that the English have been the first or the only people to see the necessity for a native policy of this

description; nor, again, that they have made no mistakes in treading this perilous ground—their history abounds with such. But they have practised as well as theorised; they have carried out a definite native policy, as I understand the term, at intervals for over a century, and continuously during the last fifty years.”—G. Anderson and M. Subedar, *Development of an Indian policy*, v. 2, pp. 1-5, 9.

1822.—William Carey and the Calcutta Christian Juvenile Society. See *Y. M. C. A.*: 1625-1844.

1823-1833.—First Burmese War.—English acquisition of Assam and Arakan.—Beginning of British control of Burma.—Abolition of *Suttee* and *Thuggee*.—Abolition of trade monopoly of East India Company.—Changes in administration.—“On Hastings’ retirement, in 1823, the choice of the authorities fell upon Lord Amherst. The new Governor-General reached India at a time when the authorities in London had a right to expect a long period of peace. In fact, both in Hindostan and in the Deccan, the victories of Hastings had left the Company no more enemies to conquer. Unfortunately, however, for the prospects of peace, nature, which had given India an impenetrable boundary on the north, had left her with an undefined and open frontier on the east. On the shores of the Bay of Bengal, opposite Calcutta, a struggle had raged during the eighteenth century between the inhabitants of Ava and Pegu. The former, known as Burmans or Burmese, had the good fortune to find a capable leader, who rapidly ensured their own victory and founded a Burmese Empire. The successful competitors were not satisfied with their own predominance in Pegu—they conquered Aracan, they overran Asam, and they wrested from Siam a considerable territory on the Tenasserim coast. The conquest of Aracan brought the Burmese to the confines of the Company’s dominions in Chittagong. The conquered people disliking the severe rule of the conquerors, crossed the frontier and settled in British territory. Many of them used their new home as a secure basis for hostile raids on the Burmese. . . . The river Naf ran for a portion of its course between the possessions of the British in Chittagong and those of the Burmese in Aracan. With the object of preventing the repetition of outrages, which had occurred on the river, a small British guard was stationed on a little island, called Shaporee, near its mouth. The Burmese, claiming the island as their own, attacked the guard and drove it from the post. It was impossible to ignore such a challenge. The island was reoccupied; but the Governor-General, still anxious for peace, offered to treat its occupation by the Burmese as an action unauthorised by the Burmese Government. The Burmese Court, however, instead of accepting this offer sent an army to reoccupy the island; collisions almost simultaneously occurred between the British and the Burmese on other parts of the frontier, and in February 1824 the first Burmese war began. . . . If the war of 1824 may be excused as inevitable, its conduct must be condemned as careless. No pains were taken to ascertain the nature of the country which it was requisite to invade, or the strength of the enemy whom it was decided to encounter. . . . Burma is watered by two great rivers, the Irawaddy and the Salwen. . . . In its upper waters the Irawaddy is a rapid stream; in its lower waters it flows through alluvial plains, and finds its way through a delta with nine mouths into the Bay of Bengal. On one of its western mouths is the town of Bassein, on one of its east-

ern mouths the great commercial port of Rangoon. The banks of the river are clothed with jungle and with forest; and malaria, the curse of all low-lying tropical lands, always lingers in the marshes. The authorities decided on invading Burma through the Rangoon branch of the river. They gave Sir Archibald Campbell, an officer who had won distinction in the Peninsula, the command of the expedition, and as a preliminary measure, they determined to seize Rangoon. Its capture was accomplished with ease, and the Burmese retired from the town. But the victory was the precursor of difficulty. The troops dared not advance in an unhealthy season; the supplies which they had brought with them proved insufficient for their support; and the men perished by scores during their period of forced inaction. . . . When more favourable weather returned with the autumn, Campbell was again able to advance. Burma was then attacked from three separate bases. A force under Colonel Richards, moving along the valley of the Bramaputra, conquered Assam; an expedition under General Morrison, marching from Chittagong, occupied Aracan; while Campbell himself, dividing his army into two divisions, one moving by water, the other by land, passed up the Irawaddy and captured Donabue and Prome. The climate improved as the troops ascended the river, and the hot weather of 1825 proved less injurious than the summer of 1824. . . . The operations in 1825-6 drove home the lesson which the campaign of 1824-5 had already taught. The Burmese realised their impotence to resist, and consented to accept the terms which the British were still ready to offer them. Assam, Aracan, and the Tenasserim Coast were ceded to the Company; the King of Burma consented to receive a Resident at his capital, and to pay a very large sum of money—1,000,000l.—towards the expenses of the war. . . . The increasing credit which the Company thus acquired did not add to the reputation of the Governor-General. . . . The Company complained of the vast additions which his rule had made to expenditure, and they doubted the expediency of acquiring new and unnecessary territory beyond the confines of India itself. The ministry thought that these acquisitions were opposed to the policy which Parliament had laid down, and to the true interests of the empire. It decided on his recall. . . . William Bentinck, whom Canning selected as Amherst’s successor, was no stranger to Indian soil. More than twenty years before he had served as Governor of Madras. . . . Bentinck arrived in Calcutta in difficult times. Amherst’s war had saddled the Government with a debt, and his successor with a deficit. . . . Retrenchment in the opinion of every one qualified to judge, was absolutely indispensable, and Bentinck, as a matter of fact, brought out specific instructions to retrench. . . . In two other matters . . . Bentinck effected a change which deserves to be recollected with gratitude. He had the courage to abolish flogging in the native Indian army; he had the still higher courage to abolish *suttee*. . . . In Bengal the *suttee*, or ‘the pure and virtuous woman,’ who became a widow, was required to show her devotion to her husband by sacrificing herself on his funeral pile. . . . Successive Governors-General, whose attention had been directed to this barbarous practice, had feared to incur the unpopularity of abolishing it. . . . Cornwallis and Wellesley, Hastings and Amherst, were all afraid to prohibit murder which was identified with religion, and it was accordingly reserved to Bentinck to remove the reproach of its existence. With the consent of his Council, *suttee* was declared illegal. The

danger which others had apprehended from its prohibition proved a mere phantom. The Hindoos complied with the order without attempting to resist it, and the horrible rite which had disgraced the soil of India for centuries became entirely unknown. For these humane regulations Bentinck deserves to be remembered with gratitude. Yet it should not be forgotten that these reforms were as much the work of his age as of himself. . . . One other great abuse was terminated under Bentinck. In Central India life was made unsafe and travelling dangerous by the establishment of a secret band of robbers known as Thugs. The Thugs mingled with any travellers whom they met, disarmed them by their conversation and courtesy, and availed themselves of the first convenient spot in their journey to strangle them with a rope and to rob them of their money. The burial of the victim usually concealed all traces of the crime; the secrecy of the confederates made its revelation unlikely; and, to make treachery more improbable, the Thugs usually consecrated their murders with religious rites, and claimed their god as the patron of their misdoings. Bentinck selected an active officer, Major Sleeman, whom he charged to put down Thuggee. Sleeman's exertions were rewarded by a gratifying success. The Thugs, like all secret societies, were assailable in one way. The first discovery of crime always produces an approver. The timid conspirator, conscious of his guilt, is glad to purchase his own safety by sacrificing his associates, and when one man turns traitor every member of the band is anxious to secure the rewards and immunity of treachery. Hence the first clue towards the practices of the Thugs led to the unveiling of the whole organisation; and the same statesman, who had the merit of forbidding suttee, succeeded in extirpating Thuggee from the dominions over which he ruled. Social reforms of this character occupy the greater portion of the history of Bentinck's government. In politics he almost always pursued a policy of non-intervention. The British during his rule made few additions to their possessions; they rarely interfered in the affairs of Native states. . . .

"The privileges which the East India Company enjoyed had from time to time been renewed by the British Parliament. The charter of the Company had been extended for a period of twenty years in 1773, in 1793, and in 1813. But the conditions on which it was continued in 1813 were very different from those on which it had been originally granted. Instead of maintaining its exclusive right of trade, Parliament decided on throwing open the trade with India to all British subjects. It left the Company a monopoly of the China trade alone. The Act of 1813 of course excited the strenuous opposition of the Company. The highest authorities were brought forward to prove that the trade with India would not be increased by a termination of the monopoly. Their views, however, were proved false by the result, and the stern logic of facts consequently pointed in 1833 to the further extension of the policy of 1813."—S. Walpole, *History of England from 1815*, v. 5, ch. 25.—"The Charter Act of 1833 like that of 1813, was preceded by careful inquiries into the administration of India. It introduced important changes into the constitution of the East India Company and the system of Indian administration. The territorial possessions of the Company were allowed to remain under their government for another term of twenty years; but were to be held by the Company 'in trust for His Majesty, his heirs and successors, for the service of the Government of India.' The Company's

monopoly of the China trade and the tea trade was finally taken away. The Company was required to close up their commercial business and to wind up their affairs with all convenient speed. Their territorial and other debts were charged on the revenues of India, and they were to receive out of those revenues an annual dividend at the rate of £10, 10s. per cent on the whole amount of their capital stock (i.e., £630,000 a year), but this dividend was to be subject to redemption by Parliament on payment of £200 sterling for every £100 stock, and for the purpose of this redemption a sum of £2,000,000 was to be paid by the Company to the National Debt commissioners and accumulated with compound interest until it reached a sum of £12,000,000. The Company while deprived of their commercial functions retained their administrative and political powers under the system of double government instituted by previous Acts, and in particular continued to exercise their rights of patronage over Indian appointments. The constitution of the Board of Control was modified, but as the powers of the Board were executed by its president, the modifications had no practical effect. . . . The superintendence, direction, and control of the whole civil and military government were expressly vested in a governor-general and councillors who were to be styled 'the Governor-General of India in Council.' This Council was increased by the addition of a fourth ordinary member, who was not to be one of the Company's servants and was not to be entitled to act as member of Council except for legislative purposes. It need hardly be stated that the fourth member was Macaulay. . . . Hitherto, the Governor-General in Council could issue regulations which, subject to registration by the Supreme Court, were binding on Bengal; and the Governments of Madras and Bombay had similar powers for those presidencies respectively. Lord William Bentinck stated his opinion officially that there should be one legislative authority for the whole of India. Moreover, the free admission of Europeans into the country—and especially beyond the limits of the Presidency towns into the Mufassal—which was contemplated under the Act was incompatible with the old system of conflicting regulations. It seemed necessary, therefore, to unite all the functions of legislation in one central government, [and] the Governor-General in Council . . . became the sole legislative authority in India."—G. Anderson and M. Subedar, *Development of an Indian policy*, v. 2, pp. 25, 26, 27, 28.—See also ENGLAND: 1832-1833.

1835-1922.—Educational policy.—Introduction of English as medium of instruction in secondary schools.—Primary schools.—Lord William Bentinck's administration was marked by a decision, on the subject of education, which has had a far-reaching effect on the history of India. Since 1813, when provision had been made for some form of education, a controversy had been going on over the means of instruction to be used. On the one hand, those who favored oriental scholarship desired Sanscrit and Arabic to be taught; on the other it was argued that English would be

the best and most useful medium, because it would enable the natives of the country to share in its administration. Lord William Bentinck and Macaulay, (who was at that time a member of the council) threw all their influence on the side of English; Macaulay's famous Minute carried the day, and a resolution in Council, dated March, 1835, gave instructions for the use of the English language in the schools for the education of the better classes, which were to receive aid from the government. "It was, indeed, a hazardous experiment, fraught with dangerous possibilities. It is scarcely possible to exaggerate its importance. Lord Morley has given his opinion that the establishment of universities was a far more momentous event and one almost deeper than the transfer to the Crown. There is no department to-day in Indian administration which causes more discussion and arouses such feelings of controversy as the subject of education."—G. Anderson and M. Subedar, *Development of an Indian policy*, v. 2, pp. 125, 126.—For many years, very few Moslems availed themselves of the new system, but continued to patronize the Muhammedan schools where the Koran was the chief subject of study and this also has had an effect on history which can scarcely be estimated since it shut them out of official life. It was not until they awoke, very tardily, to the fact that the Hindus had obtained a strong hold on the official life of the country that they availed themselves in any number of modern educational advantages. In 1844, Lord Hardinge issued a resolution announcing that in making first appointments preference would be given to men who had been educated in government schools, and of this provision the Bengalis took full advantage. "Very little was done [at first] for the improvement of elementary education. The authorities shrank before the magnitude and difficulty of the task, and declared that education must be left to filter downwards to the great mass of the population. Indigenous rural schools or *pathshalas* [already] existed in large numbers, but the teachers were incompetent and miserably paid, and the instruction was of the rudest description. In the North-Western Provinces, . . . a government school was established in each *tahsil*, and from that centre surrounding indigenous schools were supervised. . . . [In Bombay] a number of vernacular schools, supported partly by the state and partly by the people, grew up under the control of a Board of Education, and indigenous schools were inspected and encouraged. . . . [In 1854 a dispatch gave instructions for the establishment of provincial departments of public instruction for] the institution of Universities at the Presidency towns: the establishment of training institutions for teachers; the maintenance and increase of the existing Government colleges and high schools, . . . the establishment of new schools between the elementary and high schools; the multiplication and improvement of vernacular schools, indigenous and other, for elementary education; and the introduction of a system of grants-in-aid of schools maintained by private persons or bodies. . . . [In 1857, in pursuance of the instructions contained in this dispatch, the universities of Calcutta, Madras and Bombay were founded.] By 1861 the new system was in general working order. . . . [Although it made considerable progress, for a long time, it had little effect on the national life. Primary education did not keep pace with the extension of what may be called secondary education.] In 1871 there were in all India about 518,000 pupils in primary schools, while the pupils in secondary schools num-

bered 206,000. . . . Between 1781 and 1882 a remarkable development took place. In the latter year more than 2¼ million pupils were receiving instruction in 90,000 public institutions. The number of primary pupils had more than quadrupled, as against an increase of 8 per cent. among pupils in the secondary stage. . . . A commission was appointed in 1882 to review the [system]. . . . Shortly after this the management of Government schools was, in large measure, made over to municipalities and District boards under Lord Ripon's scheme of local self-government. The progress since 1881-2 has been considerable; but the rate of development in primary education, which occurred in the preceding decade has not been maintained. . . . [In the early years of this century the work was greatly hindered by plague and famine. Yet in 1901-1902] compared with 1881-2 the number of pupils in primary schools had increased by 40 per cent., and of pupils in secondary schools by 180 per cent., the rate of progress of primary education having again fallen below that of higher instruction. . . . Since 1882 the condition and progress of the education system have been passed under periodic review. . . . [The review of 1898 led to an enquiry, which was followed by a conference with Indian educationalists and administrators, and vigorous measures of reform were instituted. A director-general of education was sent out from England; a commission was instituted to report on the state of university education] and an expert committee travelled through India to investigate and advise on the system of technical education. . . . [The report made by the committee is of great political importance, for Lord Curzon's instructions to carry its recommendations into effect was followed by an outburst of nationalist feeling.] The special obligation of the Government towards the vernacular education of the masses, which was declared by the Court of Directors in 1854 . . . [was endorsed in 1882 and reaffirmed with each review]. But practice has fallen behind the precept. At the end of 1901-2 only about one-sixth of the boys of school-going age (calculated at 15 per cent. of the total male population) were following the primary course in public institutions. The percentage . . . [varied] from 23 and 22 in Bengal and Bombay to 9 and 8 in the United Provinces and the Punjab. Several causes have contributed to the slow growth of primary instruction. [The fact must be faced that while the higher castes were, almost from the first, awake to the advantages of the new education, the mass of the agriculturists were not ready to demand it. Furthermore, the idea of the importance of educating the mass of the "common people" was a plant of slow growth, especially in India, where the "common people" are represented by the poorer agriculturists, the lower castes and the out castes, who not only had not hitherto been offered instruction at any time throughout the ages, but who, as a body, are only just beginning to see why it should be thrust upon them. In addition to this, a large proportion of the funds available for education has been applied to secondary and higher education. Moreover, the education of the lower castes has been until quite recently, and in most cases still is, a matter of great difficulty. It is only of late years that the presence of low caste children began to be tolerated in schools attended by, or taught by members of the higher castes. Their presence there was a contamination, and where they were received, they sat on a verandah or on a lower level of the floor, and laid their books and exercises at the feet of the instructor. Special

schools have been maintained in some places for their benefit; much has been done in Christian missionary schools to raise the status of these unfortunates, and lately the prejudice against the admission of low caste children to public schools has begun to wear away, and their presence is more frequent. Only a small proportion of the primary schools is under the direct management of the government. By far the larger number are native schools, belonging to private individuals. They are, however, obliged to conform to certain regulations and requirements of the department of education, in order to receive government aid. The salaries paid to the teachers in these schools are miserably small, and consequently the best men are not attracted to the teaching profession. In 1913, J. Bampfylde Fuller stated that in Bengal, Madras and Bombay almost a third of the boys of school-going age were being instructed, in Burma about a fourth, and in the Punjab and the United Provinces less than a fifth. Primary education is of course most developed in towns.] . . . The mass of the peasantry are still utterly illiterate. In Upper India one frequently comes across villages with only one or two men who can sign their names; in Bengal and in Southern and Western India matters are better, but everywhere ignorance is a prominent characteristic of the cultivating class. During recent years considerable improvements have been made in the character of the village schools, and the subjects and methods of instruction have been brought into greater harmony with the conditions and requirements of peasant life. . . . Female education in India has to encounter peculiar difficulties. The demand for school instruction for girls is of recent origin, and social customs in regard to child-marriage and the seclusion of women of the well-to-do classes hinder its growth. The Government did not take up the subject until 1840, when Lord Dalhousie informed the Bengal Council of Education that henceforth its functions were to embrace female education, and the first girls' school recognized by Government was founded shortly afterwards by a committee of native gentlemen. The dispatch of 1854 directed that female education should receive the frank and cordial support of Government, as by 'this means a far greater proportional impulse is imparted to the educational and moral tone of the people than by the education of men.' The Education Commission of 1882 advised that female education should receive special encouragement and be treated with special liberality. The Government accepted this view; and state funds are more freely used, and state management more largely resorted to, for this object than is considered desirable in the case of the education of boys. The adoption of this attitude has resulted in a considerable development of the public instruction of girls, although it still lags far behind that of their brothers. . . . When the state assumed the responsibility for the education of the people of India, it had to face a position to which no European country can furnish a parallel. The population was as large as that of all the European states that had then adopted an educational system; it presented at least as many differences of creed, language, race, and custom; and it was to receive an instruction essentially foreign in its higher branches."—*Imperial Gazetteer of India*, v. 4, pp. 412, 413-417, 420, 422, 424, 431-432, 447.—"The total number of literate persons has risen during the decade [1911-1921] from 15.7 to 18.6 millions or by 18 per cent. The number of literate males has increased by 15 and that of literate females by 61 per cent. The propor-

tion who are literate per thousand males has risen from 98 to 106 and the corresponding proportion for females from 7 to 10. If persons under 15 years of age be excluded, the proportions are 138 and 149 for male and 8 and 13 for females. The great improvement in the proportion of literate females is most encouraging. . . . The total number of females over 15 years of age who can read and write is now a million and a quarter compared with less than half a million twenty years ago. . . . In recent years, legislation has been approved by certain of the provincial legislative councils whereby municipalities are empowered to impose a system of compulsory primary education within their areas. Primary Education Acts have now been passed in Bombay, Bengal, Madras, the United Provinces, the Punjab, Bihar and Orissa and the Central Provinces. The main characteristic of these bills is that the adoption of compulsion is left to the local bodies. Compulsory education is to be free in Bombay, the United Provinces and the Punjab, but in other provinces remission of fees is provided for under certain conditions. Parents and employers preventing children from complying with the Acts are liable to be fined, but provision is made for the exemption from the operation of the Acts of particular classes or communities. Additional taxation is also provided for. The Bengal Act goes somewhat further than the other Acts in requiring all municipalities to undertake at once a survey of the condition of primary education in municipal areas. . . . In 1917, the Government of India made a recurring grant of 30 lakhs [of rupees] for the improvement of training facilities and for increased pay to teachers. . . . The Reforms Act of 1919 has altered the conditions of educational administration in India. Education is now a 'transferred' subject, and is, in each Province, under the charge of a 'Minister.' There are, however, some exceptions to this new order of things. The education of Europeans is a 'Provincial reserved' subject, *i.e.*, it is not within the charge of the Minister of Education; and to the Government of India is still reserved . . . university legislation generally."—*Indian Year Book*, 1922, pp. 449, 457.—See also ASIA: European influences, etc.

1836-1845.—First Afghan War and its catastrophe.—Conquest and annexation of Sind.—Threatened trouble with the Sikhs.—"With the accession of Lord Auckland, Bentinck's successor, began a new era in Anglo-Indian history, in which the long-sown seeds of fresh political complications . . . began to put forth fruit. All danger from French ambition had passed away; but Russian intrigue was busy against us. We had brought the danger on ourselves. False to an alliance with Persia, which dated from the beginning of the century, we had turned a deaf ear to her entreaties for help against Russian aggression, and had allowed her to fall under the power of her tyrant, who thenceforth used her as an instrument of his ambition. The result of our selfish indifference appeared in 1837, when Persia, acting under Russian influence, laid siege to Herat, which was then under Afghan rule. While Herat was still holding out, the Shah was at last threatened with war, and raised the siege. Then was the time for Auckland to destroy the Russian danger once for all, by making a friend of the power which seemed to be the natural barrier against invasion from the north-west. After a long series of revolutions, Dost Mahomed, the representative of the now famous tribe of Baruckzyes, had established himself upon the throne, with the warm approval of the majority of the people; while Shah Sooja,

the leader of the rival Suddozyes, was an exile. [See also AFGHANISTAN: 1803-1838.] The ruling prince did not wait for Auckland to seek his friendship. He treated the Russian advances with contempt, and desired nothing better than to be an ally of the English. Auckland was urged to seize the opportunity. It was in his power to deal Russia a crushing blow, and to avert those troubles which . . . [later harassed] British statesmen. He did not let slip the opportunity. He flung it from him, and clutched at a policy that was to bring misery to thousands of families in England, in India, and in Afghanistan, and to prove disastrous to the political interests of all three countries. . . . Those who are least interested in Indian history are not likely to forget how the Afghan mob murdered the British Envoy and his associates; how the British commander, putting faith in the chiefs of a people whom no treaties can bind, began that retreat from which but one man escaped to tell how 16,000 had perished; how poor Auckland, unmanned by the disaster, lacked the energy to retrieve it; how the heroic Sale held out at Jellalabad till Pollock relieved him; how Auckland's successor, Lord Ellenborough, dreading fresh disasters, hesitated to allow his generals to act till, yielding to their indignant zeal, he threw upon them the responsibility of that advance to Cabul which retrieved the lost prestige of . . . arms [see AFGHANISTAN: 1838-1842; [the British] 1842-1869]. Thus closed the first act of a still unfinished drama. After celebrating the triumph of the victorious army, Ellenborough sent Charles Napier to punish the Ameers of Scinde, who, emboldened by the retreat from Cabul, had violated a treaty which they had concluded with the British Government. The result of the war was the annexation of the country [see SIND]: but the whole series of transactions is only remembered now as having given rise to the dispute on the question of the guilt of the Ameers between Napier and James Outram. Less talked of at the time, but historically more important, was Ellenborough's reconstitution of the British relations with the Sindia of the day. Political disturbances had for some time agitated that prince's court, while his army had swollen to a dangerous size, and, like the Sikh army since Runjeet Singh's death, which had taken place a few years before, had passed beyond the control of the civil power. In these two armies Ellenborough saw a danger which might disturb the peace of Hindostan. He foresaw that the Sikh soldiers, released from the stern discipline of Runjeet Singh, would soon force a government which they despised to let them cross the Sutlej in quest of plunder. Two years later his character as a prophet was vindicated; and, if he had not now, in anticipation of the invasion which then took place, disbanded the greater part of Sindia's army, and over-awed the remainder by a native contingent under the command of British officers, the Sikhs would probably have joined their forces with the Mahrattas. . . . But the Directors took a different view of their Governor-General's conduct of affairs. In June, 1844, all India was astonished by the news that Ellenborough had been recalled. He had helped to bring about his own downfall, for in the controversies with his masters in which he, like some of the ablest of his predecessors, had found himself involved, he had shown an unfortunate want of discretion; but, though by bombastic proclamations and a theatrical love of display he had sometimes exposed himself to ridicule, many of his subordinates felt that in him they had lost a vigorous and able ruler. Sir Henry

Hardinge, who was raised to the peerage before the close of his administration, succeeded to the office of Governor-General, and waited anxiously for the breaking of the storm which his predecessor had seen gathering. The Sikhs, the Puritans of India [see SIKHS], who were not strictly speaking a nation, but a religious brotherhood of warriors called the Khalsa, were animated by two passions equally dangerous to the peace of those around them, a fierce enthusiasm, half military, half religious, for the glory of their order, and an insatiable desire for plunder. By giving them full scope for the indulgence of these passions, and by punishing all disobedience with merciless severity, Runjeet Singh had governed his turbulent subjects for forty years: but, when he died, they broke loose from all control; and the weak Government of Lahore found that they could only save their own capital from being plundered by the Khalsa army by sending it to seek plunder in British territory. Thus began the first Sikh war."—T. R. E. Holmes, *History of the Indian mutiny*, ch. 1.

ALSO IN: L. Griffin, *Ranjit Singh*.—L. J. Trotter, *Earl of Auckland*, ch. 4-13.

1845-1849.—Sikh wars.—Conquest and annexation of the Punjab.—"Until his death, in 1839, Ranjit Singh was ever loyal to the engagements which he had entered into with Metcalfe in 1809. But he left no son capable of wielding his sceptre. Lahore was torn by dissensions between rival generals, ministers, and queens. The only strong power was the army of the Central Committee of Generals or *khalsa*, which, since our disaster in Afghanistan, burned to measure its strength with the British Sepoys. Ranjit Singh's European generals, Avitabile and Court, were foolishly ousted by the Sikh commanders, and the supreme military command was vested in a series of *panchayats* or elective committees of five. In 1845, the Sikh army, numbering 60,000 men, with 150 guns, crossed the Sutlej and invaded British territory. Sir Hugh Gough, the Commander-in-Chief, together with the Governor-General, hurried up to the frontier. Within three weeks, four pitched battles were fought, at Mudki, Ferozshah, Aliwal, and Sohraon. The British loss on each occasion was heavy; but by the last victory, the Sikhs were fairly driven back into the Sutlej, and Lahore surrendered to the British. The British, however, declined to annex the prostrate province; but appointed a Sikh Protectorate. By the terms of peace . . . then dictated, the infant son of Ranjit, Dhulip Singh, was recognised as Raja; the Jalandhar Doab, or tract between the Sutlej and the Beas, was added to the British territory; the Sikh army was limited to a specified number; Major Henry Lawrence was appointed Resident, to assist the Sikh Council of Regency, at Lahore; and a British force was sent to garrison the Punjab on behalf of the child-Raja. The Governor-General, Sir H. Hardinge, received a peerage, and returned to England in 1848."—W. W. Hunter, *Indian empire*, pp. 481-482.—"Shortly afterwards the Punjab was again in commotion. Sikh government under British protection had failed to keep the peace. The army of the Khalsa had disappeared, but the old love of license and plunder was burning in the hearts of the disbanded soldiery. The Sikh governor of Multan revolted; two Englishmen were murdered. A British force besieged the rebels in Multan. It was joined by a Sikh force in the service of the Council of Regency commanded by Shere Singh. So far the revolt at Multan was regarded as a single outbreak which would be soon suppressed by the capture of the fortress. In reality it was the beginning of a general insurrec-

tion. Shere Singh, who commanded the Sikh force in the besieging army, suddenly deserted the British force and joined his father Chutter Singh, who was already in open rebellion. The revolt was secretly promoted by the queen mother, and spread over the Punjab like wildfire. The old soldiers of the Khalsa rallied round Shere Singh and his father. The half-and-half government set up by Lord Hardinge was unable to cope with a revolution which was restoring the old anarchy. In November, 1848, Lord Gough advanced against the rebel army. Then followed the famous campaign between the Chenab and Jhelum rivers about 100 miles to the north of Lahore. In January, 1849, Lord Gough fought the dubious battle of Chillianwallah, near the spot where Alexander the Great crossed the Jhelum and defeated the army of Porus. Meanwhile Multan surrendered, and the besieging force joined Lord Gough. In February the Sikh army was utterly defeated at Gujerat."—J. T. Wheeler, *Indian history*, ch. 11.—"Gujrat was essentially a forenoon battle, with the whole day before the combatants to finish their work. It commenced with a magnificent duel of artillery; the British infantry occupying post after post as they were abandoned by the enemy; and the British cavalry breaking up the Sikh masses and scattering them by pursuit. Of the sixty Sikh guns engaged, fifty-three were taken. Lord Dalhousie resolved to make the victory a final one. 'The war,' he declared, 'must be prosecuted now to the entire defeat and dispersion of all who are in arms against us, whether Sikhs or Afghans.' General Gilbert hurried out with a pursuing force of 12,000, horse, foot and artillery, the day after the battle. In the breathless chase which followed across the plains of the Punjab to the frontier mountain-wall, the Sikh military power was destroyed for ever. On the 12th of March, 1849, General Gilbert received the submission of the entire Sikh army at Rawal Pindi, together with the last forty-one of the 160 Sikh cannon captured by the British during the war. While the Sikh army heaped up their swords and shields and matchlocks in submissive piles, and salaamed one by one as they passed disarmed along the British line, their Afghan allies were chased relentlessly westwards, and reached the safety of the Khaibar Pass panting, and barely twenty miles in front of the English hunters. The horsemen of Afghanistan, it was said, 'had ridden down through the hills like lions and ran back into them like dogs.' The question remained what to do with the Punjab. The victory of Sobraon in 1846 gave to Lord Hardinge the right of conquest: the victory at Gujerat in 1849 compelled Lord Dalhousie to assert that right. Lord Hardinge at the end of the first Punjab war in 1846, tried . . . an intermediate method of ruling the province by British officers for the benefit of the infant prince [Maharajah Dhalip Singh]. This method had failed. . . . In determining the future arrangements for the Punjab, Lord Dalhousie had as his advisers the two Lawrences. Sir Henry Lawrence, the former Resident at Lahore, hurried back from his sick-leave in England on the breaking out of the war. He was of opinion that the annexation of the Punjab might perhaps be just, but that it would be inexpedient. His brother John, afterwards Lord Lawrence, who had also acted as Resident, although as much averse in general principle to annexation as Henry, was convinced that, in this case, annexation was not only just, but that its expediency was 'both undeniable and pressing.' Lord Dalhousie, after a full review of the efforts which had been made to convert the Sikh nation into a friendly power without annexation, decided that

no course now remained to the British Government but to annex. . . . The annexation of the Punjab was deliberately approved of by the Court of Directors, by Parliament, and by the English nation."—W. W. Hunter, *Marquess of Dalhousie*, ch. 3.—Maharaja Dhalip Singh, who was given a pension of £40,000 a year became an adherent of the Christian religion, and lived in England as a country gentleman for many years. After his marriage, however, he went heavily into debt, and when the India office refused to make further advances he repudiated his faith and attempted to return to the Punjab. He was prevented from doing this and after some time made his peace. He died in Paris in 1893.—See also MILITARY ORGANIZATION: 33.

1848-1856.—Lord Dalhousie's minor annexations.—Lapse of dependent native states.—Case of Nana Sahib.—"In applying the doctrine of lapse to the Hindu chieftoms, on default of natural successors or of an heir legally adopted with the sanction of the Ruling Power, Lord Dalhousie merely carried out the declared law of the case, and the deliberately formulated policy of the Government of India, years before he arrived in the country. In so doing, however, Lord Dalhousie became the unconscious but effective instrument by which the old India of Lord Wellesley at the beginning of the century was prepared for its conversion, in 1858, into the new India of the Queen. . . . The fundamental question was whether . . . the government of a dependent State, in absence of natural heirs, should be allowed to pass like mere private property to an adopted son. The Court of Directors had at one time permitted the adoption of a successor in special cases to a principality on failure of natural heirs. It declared, however, in 1834, that such an 'indulgence should be the exception, not the rule.' . . . As the evils of the old system of government by sham royalties further developed themselves, the Government of India determined in 1841 to enforce a more uniform policy. . . . What Lord Dalhousie did, therefore, was not to invent a new principle of Indian law, but to steadily apply an old principle. . . . The first case in which this principle came to be applied, shortly after Lord Dalhousie's arrival, was the Native State of Satara. That Maratha principality had been constituted by the British Government on the general break up of the Maratha power in 1818, and confirmed to the 'sons and heirs, and successors' of the recipient in 1819. In 1839 the reigning prince was deposed for misconduct by the British Government in the exercise of its Suzerain rights. By the same rights the British Government then set up the brother of the deposed prince on the throne. . . . [This Raja] applied for permission to adopt a son. The British Government deliberately withheld the permission; and in the last hours of his life the Raja, in 1848, hastily adopted a son without the consent of the Government. Lord Dalhousie [one of the greatest of the governors-general] with the advice of the Court of Directors, declared in this case that the territory of Satara had lapsed, on the death of the raja, by failure of heirs, to the power which deposed, and it was annexed, accordingly, to the British dominions. Under kindred circumstances the native states of Sambalpur, on the south-western frontier of lower Bengal, and Jhansi,

a fragment of the Maratha dominions in Northern India, were absorbed.] The same principle of lapse on failure of heirs was applied by Lord Dalhousie to several other dependent States. Jaitpur in Bundelkhand, Baghat a petty hill Chiefdom of 36 square miles in the Punjab, Udaipur on the Western frontier of Lower Bengal, and Budawal in Khandesh, passed under direct British rule from this cause. The fort and military fief of Tanjore were annexed after Lord Dalhousie's departure from India, but practically on the grounds set forth by his government. . . . By far the largest accession of territory made during Lord Dalhousie's rule, to the British dominions on the failure of heirs, was the great central tract of India known as Nagpur. This Maratha principality as now constituted into the Central Provinces, and after various rectifications of frontier, has an area of 113,279 square miles. . . . The territories annexed by Lord Dalhousie in 1854 make nearly four-fifths of the present Central Provinces. . . . It is difficult to find any ground for the charge which Mr. Kaye brought in 1865 against Lord Dalhousie, for 'harshness' towards the man afterwards known as the infamous Nana Sahib [see below: 1857 (May-August)]. As this charge, however, is still occasionally repeated, and as it has even been suggested that Lord Dalhousie was to some extent responsible for the Mutiny of 1857, in consequence of his action towards Nana Sahib in 1851, I must briefly state the facts. In 1781, the Peshwa of the Marathas, completely beaten in the field, threw himself on the generosity of the British. Sir John Malcolm, then the Governor-General's Agent in the Deccan, assured him of his protection, and engaged that he should receive an allowance of £80,000 a year for his support. . . . There could not be the slightest pretension that it was ever anything more than a personal annuity; and from first to last all mention of heirs is carefully excluded. The records show that the ex-Peshwa, Baji Rao, was well aware of this. Baji Rao lived until 1851, leaving to his adopted son, Nana Sahib, an immense fortune admitted to amount to £280,000 and believed by the Government of the North-western Provinces to greatly exceed that sum. The Government of India at once acknowledged the adopted son's title to this splendid heritage, and out of its own beneficence added to it the Jaghir, or grant of land, on which his father had resided in the North-Western Provinces. But the pension, paid out of the tax-payers' pockets, lapsed upon the death of the annuitant.—W. W. Hunter, *Marquess of Dalhousie*, ch. 6-7.—Duke of Argyll, *India under Dalhousie and Canning*.

1852.—Second Burmese War.—Annexation of Pegu.—“While Lord Dalhousie was laying out the Punjab like a Scotch estate, on the most approved principles of planting, road-making, culture, and general management, the chance of another conquest at the opposite extremity of his vice-kingdom summoned him to Calcutta. The master of a trading barque from Chittagong, who was charged unjustly with cruelty to a pilot, had been fined £100 by the authorities of Rangoon, and the captain of a brig had in like manner been amerced for alleged ill-treatment of his crew. To support a claim for restitution, two English ships of war had been sent to the mouth of the Irrawadi. . . . Mis-understandings arose on some inexplicable point of etiquette; [the British commodore seized a royal yacht which lay in the river; the angry Burmese opened fire on his ships from their forts; and,] with an unprecedented economy of time and trouble in the discovery or making of plausible pretexts, a second war with Burmah was thus begun. A long catalogue of affronts, wrongs, and

injuries, now for the first time poured in. . . . The subjects of the 'Golden Foot'. . . must make an official apology for their misbehaviour, pay ten lacs compensation, and receive a permanent Resident at Rangoon. If these demands were not met within five weeks, further reparation would be exacted otherwise, and as there was no fear that they would, preparations were made for an expedition. . . . The Governor-General threw himself with enthusiasm into an undertaking which promised him another chance of gratifying, as his biographer says, his 'passion for imperial symmetry.' He resolved 'to take in kingdoms wherever they made a gap in the red line running round his dominions or broke its internal continuity.' There was a gap in the ring-fence between Arracan and Moulmein, which Pegu would fill. The logical inference was clear, the duty of appropriation obvious. Let us have Pegu. Ten millions of silver happening just then to lie in the coffers of Fort William, how could they be better invested than in a jungle on the sea coast, inhabited by quadrupeds and bipeds after their various kinds, alike unworthy of being consulted as to their future destiny? . . . In April, Martaban and Rangoon were taken with trifling loss. Operations being suspended during the rainy season, the city of Prome was not attacked till October, and after a few hours' struggle it fell, with the loss of a single sepoy on the side of the victors. There was in fact no serious danger to encounter, save from the climate; but that unflinching ally fought with terrible effect upon the side of Ava. . . . On the 20th December, 1852, a proclamation was issued, which, after reciting undisputedly the ineffably inadequate pretext for the war, informed the inhabitants that the Governor in Council had resolved that the maritime province of Pegu should henceforth form a portion of the British territories in the East, and warning the King of Ava, 'should he fail to renew his former relations of friendship with the British Government, and seek to dispute its quiet possession of the province, the Governor-General would again put forth the power he held, which would lead to the total subversion of the Burman State, and to the ruin and exile of the King and his race.' But no depth of humiliation could bring the Sovereign or his Ministers to acknowledge the hopelessness of defeat or the permanency of dismemberment. . . . Twenty years have passed, and no treaty recognising the alienation of Pegu has yet [in 1872] been signed.—W. M. Torrens, *Empire in Asia: How we came by it*, ch. 24.

1853.—Last charter of the Company.—“The last of the Charter Acts was passed in 1853 during the rule of Lord Dalhousie. It was fairly clear that the days of the Company were numbered in that the Charter was not renewed, as had been the case in the past, for a period of twenty years, but 'only until Parliament shall otherwise provide.' The power of the Crown was increased by the provision that six of the Directors should be appointed by the Crown and that 'the right of patronage to Indian appointments was taken away from the Court of Directors and directed to be exercised in accordance with regulations framed by the Board of Control. These regulations threw the Covenanted Civil Service open to general competition.' The Government of India was relieved from the direct control over Bengal by the appointment of a Lieutenant-Governor for that province, who was to exercise powers similar to those of the Lieutenant-Governor of the North-Western Provinces. The most important departure introduced by the Act

of 1853 was the extension of the Council of the Governor-General for the purpose of making laws and regulations. . . . The Law Member, originally had not the right to sit and to vote at ordinary meetings of the Council, but only at meetings which were concerned with matters of legislation. This principle was now extended by the inclusion of the Chief Justice of Bengal, a puisne judge, and a member nominated by each of the local governments of Bengal, Madras, Bombay and the North-Western Provinces. A very considerable degree of independence was allowed in the direction of asking questions and criticising the actions of the Executive, of which the new members took full advantage, with the result that these privileges were curtailed by the Act of 1861. . . . The full privileges were given to the Law Member in the Act of 1853."—G. Anderson and M. Subedar, *Development of an Indian policy*, v. 2, pp. 147, 148, and footnote.—See also CIVIL SERVICE REFORM: Great Britain: 1832-1855.

1857.—Outbreak of the Sepoy Rebellion or "Indian Mutiny."—Relation of India to British government.—Causes of outbreak.—By 1857 the East India Company found a vast empire upon its hands. The possessions of the Company had assumed very nearly the present bounds of British India, and a tradition and technique of Anglo-Indian government had been established. But plainly the responsibility had become too great for a mercantile corporation to handle. How soon the British government would have found it possible to abrogate the rights of the Company it is hard to say. The outbreak of the Sepoy Rebellion hastened the end of the Company's rule, and brought about the assumption of full authority by the crown. "The introduction of the Enfield rifle in place of the old-fashioned musket provided the spark which fired the powder and caused the actual explosion of the Mutiny. Certain of the sepoys, many of whom were high-caste Brahmmins, believed that in biting the cartridges they would lose caste, and that this was part of a deliberate plan engineered by the British Government to convert them forcibly to Christianity. . . . [Sir William Hunter states that as a matter of fact beef tallow had been used in "culpable ignorance" of the religion of the sepoys. Immediate measures were taken to prevent the greased cartridge paper from reaching the Indians; but rumors had gone abroad, and no assurance could quiet their disturbed minds.] For months past there had been rumblings of the impending storm. Fires were taking place in cantonments all over northern India; vague prophecies foretelling the downfall of British power after the completion of a hundred years' supremacy were retold; a proclamation speaking of a restored Muhammadan Empire was found on the walls of the Jumma Masjid at Delhi; and chapátis were being carried from village to village, for reasons unknown to any Englishman. With the authorities there was a general feeling of uneasiness; with the sepoys a strange moodiness alternating with uncontrollable excitement. . . . The actual outbreak of mutiny took place at Meerut, where a policy of unnecessary irritation was combined with a complete lack of decision. . . . In the days immediately subsequent to the capture of Delhi there was an ominous calm, characterised by incendiary outbreaks

and restless uneasiness on the part of the sepoys, and by ill-timed apathy in some and vigorous action in other places on the part of the British. Unfortunately, Lord Canning had not the means as yet of sending any considerable relief from Calcutta, and, owing to transport and other difficulties, it was some time before the army from the north-west could start on its march to Delhi. In consequence, during the early days of June, the position became well-nigh desperate. In the north-west provinces and Oudh outbreaks became of so serious a nature that, with the exception of fortresses such as Agra, Allahabad and Lucknow, if the latter could be termed a fortress, the whole country was lost for a while. In the Punjab, however, the position was reversed to some extent, there being only sporadic outbreaks, as at Nowsheera, Jullundur, and Sialkot, which were vigorously suppressed."—G. Anderson and M. Subedar *Expansion of British India*, v. 1, pp. 103, 116-117, 121, 157.

"The various motives assigned for the Mutiny appear inadequate to the European mind. The truth seems to be that Native opinion throughout India was in a ferment, predisposing men to believe the wildest stories, and to rush into action in a paroxysm of terror. Panic acts on an Oriental population like drink upon a European mob. The annexation policy of Lord Dalhousie, although dictated by the most enlightened considerations, was distasteful to the Native mind. The spread of education, the appearance at the same moment of the steam-engine and the telegraph wire, seemed to reveal a deep plan for substituting an English for an Indian civilisation. The Bengal sepoys especially thought that they could see further than the rest of their countrymen. Most of them were Hindus of high caste; many of them were recruited from Oudh. They regarded . . . reforms on Western lines as attacks on their own nationality, and they knew at first hand what annexation meant. They believed it was by their prowess that the Punjab had been conquered, and that all India was held. The numerous dethroned princes, or their heirs and widows, were the first to learn and to take advantage of this spirit of disaffection and panic. They had heard of the Crimean war, and were told that Russia was the perpetual enemy of England. . . . Munificent pensions had supplied the funds with which they could buy the aid of skilful intriguers. They had much to gain, and little to lose, by a revolution. In this critical state of affairs, of which the Government had no official knowledge, a rumour ran through the cantonments that the cartridges of the Bengal army had been greased with the fat of pigs,—animals unclean alike to Hindu and Muhammadan. No assurances could quiet the minds of the sepoys. Fires occurred nightly in the Native lines; officers were insulted by their men; confidence was gone, and only the form of discipline remained. In addition, the outbreak of the storm found the Native regiments denuded of many of their best officers. The administration of the great empire to which Dalhousie put the corner-stone, required a larger staff than the civil service could supply. The practice of selecting able military men for civil posts, which had long existed, received a sudden and vast development. Oudh, the Punjab, the Central Provinces, British Burma, were administered to a large extent by picked officers from the Company's regiments. Good and skilful commanders remained; but the Native army had nevertheless been drained of many of its brightest intellects and firmest wills at the very crisis of its fate."—W. W. Hunter, *Brief history of the Indian peoples*, ch. 15.—"The annexation of Oudh had nothing to do with the Mutiny in the first place, though that

measure certainly did add to the number of our enemies after the Mutiny commenced. The old government of Oudh was extremely obnoxious to the mass of . . . native soldiers of the regular army, who came from Oudh and the adjacent province of Behar, and with whom the Mutiny originated. These men were the sons and kinsmen of the Hindu yeomen of the country, all of whom benefited more or less by annexation; while Oudh was ruled by a Muhammadan family which had never identified itself with the people, and whose government was extremely oppressive to all classes except its immediate creatures and followers. But when the introduction of the greased cartridges had excited the Native Army to revolt, when the mutineers saw nothing before them short of escape on the one hand or destruction on the other, they, and all who sympathised with them, were driven to the most desperate measures. All who could be influenced by love or fear rallied round them. All who had little or nothing to lose joined their ranks. All that dangerous class of religious fanatics and devotees who abound in India, all the political intriguers, who in peaceful times can do no mischief, swelled the numbers of the enemy, and gave spirit and direction to their measures. India is full of races of men, who, from time immemorial, have lived by service or by plunder, and who are ready to join in any disturbance which may promise them employment. Oudh was full of disbanded soldiers who had not had time to settle down. Gaols furnished thousands of desperate men let loose on society. The cry throughout the country, as cantonment after cantonment became the scene of triumphant mutiny was, 'The English rule is at an end. Let us plunder and enjoy ourselves.' The industrious classes throughout India were on . . . side, but for a long time feared to act. On the one side they saw the few English in the country shot down or flying for their lives, or at the best standing on the defensive, sorely pressed; on the other side they saw summary punishment, in the shape of the plunder and destruction of their houses, dealt out to those who aided. . . . But when we evinced signs of vigour, when we began to assume the offensive and vindicate our authority, many of these people came forward and identified themselves with our cause."—Lord Lawrence, *Speech at Glasgow, 1860* (quoted by Sir O. T. Burne, in "*Clyde and Strathmairn*," ch. 1).—"The India of the East India Company's days ended with the Mutiny. Lord Roberts has pointed out that this was a military revolt, but that the revolt would not have taken place had there not been considerable discontent through that part of the country from which the Hindustani sepoy chiefly came, and had not powerful persons borne the British a grudge. He states that the discontent was largely due to the antagonism of the Brahmans to our innovations and to Western education, which was sapping their influence. He points out that . . . [the British] had spread among the ruling chiefs uncertainty and discontent; that . . . [they] had recently annexed Oudh and Jhansi, and had informed the titular King of Delhi that on his death his title would cease and his court would be removed from the Imperial city. It is also important to notice that for various reasons, the more sensitive Hindu and Muhammadan classes had conceived the idea that their religions were losing their exclusive privileges and were being steadily undermined. The proclamations issued from Delhi and Lucknow appealed to the multitude with the cry of religion in peril. The arena of the Mutiny was the United Provinces of Agra and Oudh, which then included Delhi, and a large part of Central India. There was little

fighting anywhere else, and no popular trouble in Bengal proper, although there was some fighting in Bihar. Unlike the Punjab, neither Agra nor Oudh had been disarmed. In the Agra Province there were very few British troops, and those few either were drawn off to the siege of Delhi or were themselves for the first four or five months hopelessly beleaguered. At Agra itself the Lieutenant-Governor was, until after the fall of Delhi, supported against 42,000 rebel soldiers by one company's regiment of 655 effectives and one battery of six guns manned by Indian drivers. . . . Here is a contemporary description of ordinary district occurrences away from the great centres of population: 'The villages and towns generally side with some neighbouring potentate, or more generally they side with no one at all. They are delighted at being relieved from all government whatsoever, and instantly set to work fighting among themselves. Every man of enterprise and a little influence collects his clan and plunders all the weaker villages round him.'—H. V. Lovett, *History of the Indian nationalist movement*, pp. 12-14.

1857 (May).—Outbreak at Meerut.—Seizure of Delhi by mutineers.—Massacre of Europeans.—Explosion of magazine.—"The station of Meerut, some 40 miles north-east of Delhi, was one of the very few in India where adequate means existed for quelling an outbreak of native troops. There was a regiment of English Dragoons, a battalion of the 60th Rifles, and a strong force of Horse and Foot Artillery, far more than sufficient to deal with the three native regiments who were also quartered in the cantonment. . . . Eighty-five men of the 3rd N. C., who had refused to take their cartridges, had . . . [been court-martialed and] sentenced to long terms of imprisonment. The sentence was carried out with impressive solemnity. On a morning [May 9] presently to become historical—the heavens sombre with rolling clouds—the brigade assembled to hear their comrades' doom—to see them stripped of their uniform and secured with felons' manacles. The scene produced intense emotion. Resistance was impossible. There were entreaties, tears, imprecations, as the prisoners were marched away to jail. Discipline had been vindicated by a terrible example. The next day was Sunday. In the evening, as the European Rifle-men were gathering for Church, a sudden movement took place in the native quarters. The Cavalry dashed off to the jail to rescue their imprisoned companions. The two Infantry regiments, after a moment's wavering, threw in their lot with the mutineers. Then ensued a scene such as, unhappily, became too familiar in Upper India within the next few weeks. Officers were shot, houses fired, Europeans—men, women, and children, wherever found, were put to the sword. A crowd of miscreants from the jail, suddenly set free, made a long night of pillage. Meanwhile, paralysed by the sudden catastrophe, the English General of the Division and the Brigadier of the Station forebore to act, refused to let their subordinates act, and the Sepoys who had fled, a disorganised mob, in different directions, soon found themselves gathering on the march for Delhi. In the early morning at Delhi, where courts and offices had already begun the day's work, a line of horsemen were descried galloping on the Meerut road. They found their way into the city, into the presence of the King; cut down the European officials, and, as they were

gradually reinforced by the arrival of fresh companions, commenced a general massacre of the Christian population. A brave telegraph clerk, as the mutineers burst in upon him, had just time to flash the dreadful tidings to Lahore. Before evening, the native regiments fired upon their officers and joined the mutineers. After weary hours of hope for the help from Meerut which never came, the British officers in command were compelled to recognise that the only chance of safety lay in flight. Ere the day closed, every European who had risen that morning in Delhi, was dead, or awaiting death, or wandering about the country in the desperate endeavor to reach a place of safety. A day dark with disaster was, however, illumined by the first of those heroic acts which will make the siege of Delhi immortal. The insurgents had their first taste of the quality of the race whose ascendancy they had elected to assail. Lieutenant Willoughby, the officer in charge of the Magazine, and eight gallant companions, resolved, early in the day, that, if they could not defend their invaluable supply of ammunition, they would destroy it, though its destruction would almost certainly involve their own. For hours they defended their stronghold against an overpowering crowd of assailants. The train was laid; the sergeant who was to fire it stood ready; Willoughby took a last look out upon the Meerut road; the assailants were swarming on the walls. The word was spoken: a vast column of flame and smoke shot upward. Two thousand of the assailants were blown into the air [and five of the defenders perished, while Willoughby and three of his companions escaped]. The thunder of that explosion announced to the mutineers that one great object in the seizure of Delhi had escaped their grasp."—H. S. Cunningham, *Earl Canning*, ch. 5.

1857 (May-August).—**Situation at Delhi.—Siege of English at Cawnpore.—Surrender and massacre.—Siege of Lucknow.**—"A few days of inactivity allowed the flame to blaze up beyond possibility of immediate extinction. The unchallenged occupation of the Mughal capital by rebel sepoys and badmashes [worthless fellow] was followed by risings and massacres in almost every station within range of the example; and from Ferozpur, Bareilly, Moradabad, Shahjahanpur, Cawnpur, and numerous other places came harrowing tales of massacre, suffering, and heroism. When this terrible news reached army head-quarters, it was received with a perhaps natural incredulity. Nevertheless, a force was hastily assembled at Ambala; and with the troops thus mobilised, General Anson, then Commander-in-Chief, made preparations to march against the renowned city of the Mughal. The little force had hardly started, however, when its leader died of cholera (May 27th). It was not until the 1st of June that General Barnard, who had succeeded temporarily to the chief command, advanced in earnest against the now jubilant rebels. Meanwhile, a small body of troops under Brigadier Archdale Wilson marched out from Meerut, after a disastrous delay; and the combined force, amounting to about 3,000 Europeans and one battalion of Gurkhas, fought its way onwards till it reached the outskirts of the city on the 8th of June, 1857. We may now refer to the three great points—Delhi, Cawnpur, and Lucknow, round which the Mutiny was, so to speak, centred during the earlier period of the revolt; namely, from May, 1857, till the arrival in India of Sir Colin Campbell in August of that year. The modern city of Delhi was

founded by the Emperor Jahangir in 1631. Situated on the right bank of a branch of the Jumna river it was, as it still is, surrounded by a high wall some seven miles in extent, strengthened by bastions and by a capacious dry ditch. The British force held the elevated ground known as the Ridge, which extends two miles along the northern and western faces of the city—a position taken up some centuries before by Timur Shab and his Tartar hordes when advancing to attack old Delhi. At intervals along the Ridge stood the Flagstaff Tower, the Observatory, a large mansion called Hindu Rao's house, and other defensible buildings. The space between the city and the Ridge was thickly planted, for the most part with trees and shrubs; in the midst of which might be seen numerous mosques and large houses, and the ruins of older buildings. It soon became evident that the position held by the British force on the Ridge was a false one; and the question arose whether the city might not be taken by a coup de main, seeing that it was impossible either to invest it or to attempt a regular siege with any chance of success. A plan of assault, to be carried out on the 12th of June, was drawn up by a young Engineer officer and sanctioned. Had this assault been delivered the city would in all likelihood have been taken and held. . . . But owing to a series of accidents, the plan fell through—a miscarriage the more to be regretted because the early recapture of the city would in all human probability have put a stop to further outbreaks. As matters stood, however, the gallant little force before Delhi could barely hold its own. It was an army of observation perpetually harassed by an active enemy. As time went on, therefore, the question of raising the siege in favour of a movement towards Agra was more than once seriously discussed, but was fortunately abandoned. On July 5th, 1857, General Barnard died, worn out with fatigue and anxiety. He was succeeded in command by General Archdale Wilson, an officer who, possessing no special force of character, did little more than secure the safe defence of the position until the arrival of Brigadier Nicholson from the Punjab, August 14th, 1857, with a moveable column of 2,500 men, Europeans and Sikhs. And here we may leave Delhi, for the moment, deferring till later any further details of the siege. The city of Cawnpur, situated on the south bank of the river Ganges, 42 miles south-west of Lucknow and 270 miles from Delhi, lies about a mile from the river in a large sandy plain. On the strip of land between the river and the town, a space broken by ravines, stretched the Civil Station and cantonments. A more difficult position to hold in an extremity cannot well be conceived, occupied as it was by four disaffected Sepoy regiments with but Sixty European artillerymen to overawe them. There was, moreover, an incompetent commander. Realising after the disasters at Meerut and Delhi that his native garrison was not to be trusted, Sir Hugh Wheeler threw up a make-shift entrenchment close to the Sepoy lines. Commanded on all sides, it was totally unfitted to stand a siege. But a worse mistake was to follow. Alarmed as time went on at his growing difficulties, Sir Hugh Wheeler at length asked the notorious Nana Sahib [see above: 1848-1856], who lived a few miles off at Bithur, to assist him with troops to guard the Treasury. For some months previously this arch-traitor's emissaries had been spreading discontent throughout India, but he himself had taken care to remain on good terms with his European neighbours. He now saw his opportunity. Cawnpur, delivered into his hands by the misplaced confi-

dence of its defenders, was virtually in his keeping. Of European succour there was no immediate hope. The place was doomed. The crash came three days before General Barnard's force reached Delhi. With the exception of a few devoted natives who remained faithful to their salt, the whole Sepoy force on the 5th of June rose in revolt, opened the doors of the jail, robbed the treasury, and made themselves masters of the magazine. The Nana cast aside all further pretence of friendship and, joined by the mutinous troops, laid siege to the entrenchment already mentioned, which with culpable military ignorance had been thrown up in one of the worst positions that could have been chosen. The besieging army numbered some 3,000 men. The besieged could only muster about 400 English soldiers, more than 70 of which number were invalids. For twenty-one days the little garrison suffered untold horrors from starvation, heat, and the onslaughts of the rebels; until the General in command listened to overtures for surrender, and the garrison marched out on the 27th of June, to the number of about 450 souls, provided with a promise of safeguard from the Nana, who would allow them, as they thought, to embark in country boats for Allahabad. Tantia Topi, who afterwards became notorious in Central India, superintended the embarkation. No sooner, however, were the Europeans placed in the boats, in apparent safety, than a battery of guns concealed on the river banks opened fire, while at the same time a deadly fusillade of musketry was poured on the luckless refugees. The Nana at length ordered the massacre to cease. He celebrated what he called his glorious victory by proclaiming himself Peshwa or Maratha Sovereign, and by rewarding his troops for their 'splendid achievements,' while the wretched survivors of his treachery, numbering about 5 men and 206 women and children, were taken back to Cawnpur and confined in a small building for further vengeance and insult. On the 15th of July came the last act of this tragedy. The Nana, having suffered a crushing defeat at the hands of Brigadier Havelock's force within a day's march of Cawnpur, as will presently be recorded, put the whole of his prisoners to death. The men were brought out and killed in his presence, while the women and children were hacked to pieces by Muhammadan butchers and others in their prison. Their bodies were thrown into what is now known as the 'Cawnpur Well.' Lucknow, at the time of the Mutiny, was in population, in extent, and in the number and importance of its principal buildings, one of the foremost cities of India. . . . The Residency stood on a hill gently sloping towards the river, and was an imposing edifice of three stories. Near it were the iron and stone bridges over the river. . . . At the outbreak of the Mutiny the Sepoy regiments were stationed in various localities within the city; while the 32nd Foot, the only European regiment on the spot, was quartered in a barrack about a mile or so from the Residency. As was the case elsewhere, so it happened at Lucknow. While the population and native garrison were seething with sedition, the British authorities were hampered by ignorance of popular feeling, by the want of European troops, and by divided counsels. So, by the end of May, 1857, the rebellion in Oudh became an accomplished fact, although matters went on with comparative smoothness in Lucknow itself. At length, after a serious disaster at Chinhat, the British garrison was forced to withdraw to the Residency and its adjacent buildings; and on the 1st of July commenced the famous investment of this position by the rebel forces. The position was ill adapted for defence; for the lofty windows

of the Residency itself not only allowed free access to the enemy's missiles, but its roof was wholly exposed. On the opposite side of the street, leading from the Bailey Guard Gate, was the house of the Residency Surgeon, Dr. (now Sir Joseph) Fayer. It was a large but not lofty building with a flat roof which, protected by sand bags, afforded a good cover for our riflemen, and with a tyekhana, or underground story, that afforded good shelter for the women and children. But as a whole, the defences of the Residency were more formidable in name than in reality, and were greatly weakened by the proximity of high buildings from which the rebels without danger to themselves poured an unceasing fire. The siege had an ominous commencement. On July 4th the much-beloved Sir Henry Lawrence, the Resident, died of a wound received two days before from an enemy's shell that had fallen into his room. Brigadier Inglis succeeded him in command; and for three months the heroic garrison of about 1,700 souls held their weak position, amid inconceivable hardships and dangers, against thousands of the rebels who were constantly reinforced by fresh levies. It was well said in a general order by Lord Canning that there could not be found in the annals of war an achievement more heroic than this defence."—O. T. Burne, *Clyde and Strathknairn*, ch. 2.

Also IN: J. W. Kaye, *History of the Sepoy War in India*, v. 3, bk. 9, ch. 1-3.—Lord Roberts, *Forty-one years in India*.—G. O. Trevelyan, *Cawnpore*.—T. R. E. Holmes, *History of the Indian mutiny*, ch. 8-10.—Lady Inglis, *Siege of Lucknow*.

1857 (June-September).—Siege, storming and capture of Delhi.—Murder of the Mogul princes.—During the four months that followed the revolt at Delhi on the 11th of May, all political interest was centred at the ancient capital of the sovereigns of Hindustan. The public mind was occasionally distracted by the current of events at Cawnpore and Lucknow, as well as at other stations which need not be particularised; but so long as Delhi remained in the hands of the rebels, the native princes were bewildered and alarmed; and its prompt recapture was deemed of vital importance to the prestige of the British government, and the re-establishment of British sovereignty in Hindustan. The Great Mogul had been little better than a mummy for more than half a century; and Bahadur Shah was a mere tool and puppet in the hands of rebel sepoys; but nevertheless the British government had to deal with the astounding fact that the rebels were fighting under his name and standard, just as Afghans and Mahrattas had done in the days of Ahmad Shah Durani and Mahadaji Sindai. To make matters worse, the roads to Delhi were open from the south and east; and nearly every outbreak in Hindustan was followed by a stampede of mutineers to the old capital of the Moghuls. Meanwhile, in the absence of railways, there were unfortunate delays in bringing up troops and guns to stamp out the fires of rebellion at the head centre. The highway from Calcutta to Delhi was blocked up by mutiny and insurrection; and every European soldier sent up from Calcutta was stopped for the relief of Benares, Allahabad, Cawnpore, or Lucknow. But the possession of the Punjab at this crisis proved to be the salvation of the empire. Sir John Lawrence, the Chief Commissioner, was called upon to perform almost superhuman work:—to maintain order in a newly conquered province; to suppress mutiny and disaffection amongst the very sepoy regiments from Bengal who were supposed to garrison the country; and to send reinforcements of troops and guns, and supplies of all descriptions, to the siege of

Delhi. Fortunately the Sikhs had been only a few short years under British administration; they had not forgotten the miseries that prevailed under the native government, and could appreciate the many blessings they enjoyed under British rule. They were staunch to the British government, and eager to be led against the rebels. In some cases terrible punishment was meted out to mutinous Bengal sepoy within the Punjab; but the imperial interests at stake were sufficient to justify every severity, although all must regret the painful necessity that called for such extreme measures. . . . The defences of Delhi covered an area of three square miles. The walls consisted of a series of bastions, about sixteen feet high, connected by long curtains, with occasional martello towers to aid the flanking fire. . . . There were seven gates to the city, namely, Lahore gate, Ajmir gate, Turkoman gate, Delhi gate, Mori gate, Kabul gate, and Kashmir gate. The principal street was the Chandni Chouk, which ran in a direct line from the Delhi gate to the palace of the Moghuls. . . . For many weeks the British army on the Ridge was unable to attempt siege operations. It was, in fact, the besieged, rather than the besiegers; for, although the bridges in the rear were blown up, the camp was exposed to continual assaults from all the other sides. On the 23rd of June, the hundredth anniversary of the battle of Plassy, the enemy made a greater effort than ever to carry the British position. The attack began on the right from the Subzi Mundi, its object being to capture the Mound battery. Finding it impossible to carry the battery, the rebels confined themselves to a hand to hand conflict in the Subzi Mundi. The deadly struggle continued for many hours; and as the rebels came up in overwhelming numbers, it was fortunate that the two bridges in the rear had been blown up the night before, or the assault might have had a different termination. It was not until after sunset that the enemy was compelled to retire with the loss of a thousand men. Similar actions were frequent during the month of August; but meanwhile reinforcements were coming up, and the end was drawing nigh. In the middle of August, Brigadier John Nicholson, one of the most distinguished officers of the time, came up from the Punjab with a brigade and siege train. On the 4th of September a heavy train of artillery was brought in from Ferozepore. The British force on the Ridge now exceeded 3,000 men. Hitherto the artillery had been too weak to attempt to breach the city walls; but now fifty-four heavy guns were brought into position and the siege began in earnest. From the 8th to the 12th of September four batteries poured in a constant storm of shot and shell; number one was directed against the Kashmir bastion, number two against the right flank of the Kashmir bastion, number three against the Water bastion, and number four against the Kashmir and Water gates and bastions. On the 13th of September the breaches were declared to be practicable, and the following morning was fixed for the final assault upon the doomed city. At three o'clock in the morning of the 14th September, three assaulting columns were formed in the trenches, whilst a fourth was kept in reserve. The first column was led by Brigadier Nicholson; the second by Brigadier Jones; the third by Colonel Campbell; and the fourth, or reserve, by Brigadier Longfield. The powder bags were laid at the Kashmir gate by Lieutenants Home and Salkeld. The explosion followed, and the third column rushed in, and pushed towards the Juma Musjid. Meanwhile the first column under Nicholson escalated the breaches near the Kashmir gate, and pushed along the ramparts

towards the Kabul gate, carrying the several bastions in the way. Here it was met by the second column under Brigadier Jones, who had escalated the breach at the Water bastion. The advancing columns were met by a ceaseless fire from terraced houses, mosques, and other buildings; and John Nicholson, the hero of the day, whilst attempting to storm a narrow street near the Kabul gate, was struck down by a shot and mortally wounded."—J. T. Wheeler, *Short history of India, pt. 3, ch. 25*.—"The long autumn day was over, and we were in Delhi. But Delhi was by no means, ours. Sixty-six officers and 1,100 men—nearly a third, that is, of the whole attacking force—had fallen; while, as yet, not a sixth part of the town was in our power. How many men, it might well be asked, would be left to us by the time that we had conquered the remainder? We held the line of ramparts which we had attacked and the portions of the city immediately adjoining, but nothing more. The Lahore Gate and the Magazine, the Jumma Musjid and the Palace, were still untouched, and were keeping up a heavy fire on our position. Worse than this, a large number of our troops had fallen victims to the temptation which, more formidable than themselves, our foes had left behind them, and were wallowing in a state of bestial intoxication. The enemy, meanwhile, had been able to maintain their position outside the town; and if only, at this supreme hour, a heaven-sent General had appeared amongst them, they might have attacked our camp, defended as it was mainly by the sick, and the maimed, and the halt. . . . Never, perhaps, in the history of the Mutiny were we in quite so perilous a position as on the night which followed our greatest military success. General Wilson, indeed, proposed, as might have been expected of a man in his enfeebled condition of mind and body, to withdraw the guns, to fall back on the camp and wait for reinforcements there; a step which, it is needless to point out, would have given us all the deadly work to do over again, even if our force should prove able to maintain itself on the Ridge till reinforcements came. But the urgent remonstrances of Baird Smith and others, by word of mouth; of Chamberlain, by letter; and, perhaps, also, the echoes which may have reached him from the tempest-tossed hero who lay chafing against his cruel destiny on his deathbed, and exclaimed in a wild paroxysm of passion, when he heard of the move which was in contemplation, 'Thank God, I have strength enough left to shoot that man,' turned the General once more for his purpose. On the following day, the 15th, vast quantities of the intoxicating drinks, which had wrought such havoc amongst our men, were destroyed by General Wilson's order, and the streets literally ran with rivers of beer, and wine, and brandy. Meanwhile, the troops were sleeping off their drunken debauch; and on the 16th active operations were resumed. On that day the Magazine was taken, and its vast stores of shot and shell, and of all the 'material' of war, fell once more into the hands of their proper owners. By sapping gradually from house to house we managed, for three days more, to avoid the street-fighting which, once and again, has proved so demoralising to Englishmen; and, slowly but surely, we pressed back the defenders into that ever-narrowing part of the city of which, fortunately for themselves, they still held the bolt-holes. Many of them had already begun, like rats, to quit the sinking vessel. And now the unarmed population of the city flocked in one continuous stream out of the open gates, hoping to save their lives, if nothing else, from our avenging swords. On the 19th, the palace

of the Moguls, which had witnessed the last expiring flicker of life in an effete dynasty, and the cruel murder of English men, and women, and children, fell into our hands; and by Sunday, the 20th, the whole of the city—in large part already a city of the dead—was at our mercy. But what of the King himself and the Princes of the royal house? They had slunk off to the tomb of Humayoun, a huge building, almost a city in itself, some miles from the modern Delhi, and there, swayed this way and that, now by the bolder spirits of his army who pressed him to put himself at their head and fight it out to the death, as became the descendant of Tamerlane and Baber, now by the entreaties of his young wife, who was anxious chiefly for her own safety and that of her son, the heir of the Moguls; and now, again, by the plausible suggestions of a double-dyed traitor of his own house who was in Hodson's pay, and who, approaching the head of his family with a kiss of peace, was endeavoring to detain him where he was till he could hand him over to his employer and receive the price of blood, the poor old monarch dozed or fooled away the few hours of his sovereignty which remained, the hours which might still make or mar him, in paroxysms of imbecile vacillation and despair. The traitor gained the day, and Hodson, who could play the game of force as well as of fraud, and was an equal adept at either, learning from his craven-hearted tool that the King was prepared to surrender on the promise of his life, went to Wilson and obtained leave, on that condition, to bring him into Delhi. The errand, with such a promise tacked on to it, was only half to Hodson's taste. 'If I get into the Palace,' he had written in cool blood some days before, 'the house of Timour will not be worth five minutes' purchase, I ween.' . . . After two hours of bargaining for his own life and that of his queen and favourite son, the poor old Priam tottered forth and was taken back, in a bullock-cart, a prisoner, to his own city and Palace, and was there handed over to the civil authorities. But there were other members of the royal family, as Hodson knew well from his informants, also lurking in Humayoun's tomb. . . . With a hundred of his famous horse Hodson started for Humayoun's tomb, and, after three hours of negotiation, the three princes, two of them the sons, the other the grandson of the King, surrendered unconditionally into his hands. . . . Their arms were taken from them, and, escorted by some of his horsemen, they too were despatched in bullock-carts towards Delhi. With the rest of his horse [100 sowars] Hodson stayed behind to disarm the large and nerveless crowd, who, as sheep having no shepherd, and unable, in their paralysed condition, to see what the brute weight even of a flock of sheep might do by a sudden rush, were overawed by his resolute bearing. This done, he galloped after his prey and caught them up just before the cavalcade reached the walls of Delhi. He ordered the princes roughly to get out of the cart and strip,—for, even in his thirst for their blood, he had, as it would seem, an eye to the value of their outer clothes,—he ordered them into the cart again, he seized a carbine from one of his troopers, and then and there, with his own hand, shot them down deliberately one after the other. It was a stupid, cold-blooded, three-fold murder. . . . Had they been put upon their trial, disclosures of great importance as to the origin of the Mutiny could hardly fail to have been elicited. Their punishment would have been proportioned to their offence, and would have been meted out to them with all the patient majesty of offended law."—R. B. Smith, *Life of Lord Lawrence*, v. 2, ch. 5.—

1857-1858 (July-June).—General Havelock's campaign.—Sir Colin Campbell's campaign.—Relief of Lucknow.—Substantial suppression of mutiny.—"Meanwhile the greatest anxiety prevailed with regard to our countrymen and countrywomen at Lucknow and Cawnpore. The Indian government made every effort to relieve them; but the reinforcements which had been despatched from England and China came in slowly, and the demands made for assistance far exceeded the means at the disposal of the government. . . . The task of relieving the city was entrusted to the heroic General Havelock, who marched out with a mere handful of men, of whom only 1,400 were British soldiers, to encounter a large army and a whole country in rebellion. At Futtehpore, on the 12th of July, he defeated a vastly superior force, posted in a very strong position. After giving his men a day's rest, he advanced again on the 14th, and routed the enemy in two pitched battles. Next morning he renewed his advance, and with a force of less than 900 men attacked 5,000 strongly entrenched, and commanded by Nana Sahib. They were outmanœuvred, outflanked, beaten and dispersed. But for this signal defeat they wreaked their vengeance on the unfortunate women and children who still remained at Cawnpore. On the very day on which the battle occurred, they were massacred under circumstances of cruelty over which we must throw a veil. The well of Cawnpore, in which their hacked and mutilated bodies were flung, presented a spectacle from which soldiers who had regarded unmoved the carnage of numerous battle-fields shrank with horror. Of all the atrocities perpetrated during this war, so fruitful in horrors, this was the most awful; and it was followed by a terrible retribution. It steeled the hearts, and lent a furious and fearless energy to the arms, of the British soldiery. Wherever they came, they gave no quarter to the mutineers; a few men often frantically attacked hundreds, frantically but vainly defending themselves; and never ceased till all had been bayoneted, or shot, or hewn in pieces. All those who could be shown to have been accomplices in the perpetration of the murders that had been committed were hung, or blown from the cannon's mouth. Though the intrepid Havelock was unable to save the women and children who had been imprisoned in Cawnpore, he pressed forward to Lucknow. But the force under his command was too small to enable him to drive off the enemy. Meanwhile Sir J. Outram, who was now returning from the Persian war, which had been brought to a successful conclusion, was sent to Oude as chief commissioner, with full civil and military power. This appointment was fully deserved; but it had the effect, probably not thought of by those who made it, of superseding Havelock just as he was about to achieve the crowning success of his rapid and glorious career. Outram, however, with a generosity which did him more real honour than a thousand victories would have conferred, wrote to Havelock to inform him that he intended to join him with adequate reinforcements; adding: 'To you shall be left the glory of relieving Lucknow, for which you have already struggled so much: I shall accompany you only in my civil

capacity as commissioner, placing my military service at your disposal, should you please, and serving under you as a volunteer.' Thus Havelock, after gaining no fewer than twelve battles against forces far superior in numbers to the little band he originally led, was enabled at length, on the 25th of August, to preserve the civilians, the women, and children of Lucknow from the impending horrors of another massacre, which would no doubt have been as fearful as that of Cawnpore. The Highlanders were the first to enter, and were welcomed with grateful enthusiasm by those whom they had saved from a fate worse than death. However, the enemy, recovering from the panic which the arrival of Havelock and his troops had caused, renewed the siege. Sir Colin Campbell, who had assumed the command of the Indian army, had determined to march to the relief of Lucknow. He set out from Cawnpore on the 9th of November, but was obliged to wait till the 14th for reinforcements, which were on the way to join him, and which raised the force under his command to 5,000—a force numerically far inferior to that which it was to attack. On the 17th of November the relief of Lucknow was effected. The music of the Highland regiments, playing 'The Campbells are coming,' announced to their delighted countrymen inside the city that the commander-in-chief himself was with the relieving force. Little time, however, was allowed for congratulations and rejoicings. The ladies, the civilians, and the garrison were quietly withdrawn; the guns, which it was thought not desirable to remove, were burst; and a retreat effected, without affording the enemy the slightest suspicion of what was going on until some hours after the town had been evacuated by its defenders. The retreating force reached Dil-hasha on the 24th, without having sustained any serious molestation. There the gallant Havelock sank under the trials and hardships to which he had been exposed, and yielded up the life which was instrumental in preserving so many others from the most terrible of deaths. While Sir Colin Campbell was engaged in effecting the relief of Lucknow, intelligence reached Cawnpore that a large hostile army was making towards it. General Windham, who commanded there, unacquainted with the number or the position of the approaching force, marched forth to meet it, in the hope that he should be able to rout and cut up the advanced guard before the main body of the enemy could come to its assistance. But in this expectation he was disappointed. Instead of having to deal with the van, he engaged with the whole rebel army, and his little force, assailed on all sides, was obliged to retire. He at once despatched a letter to the commander-in-chief, requesting him to hasten to his assistance; but it was intercepted by the enemy. Fortunately Sir Colin Campbell though ignorant of the critical position of his subordinate, came up just at the moment when the danger was at its height. This was on the 28th of November. He was, however, in no haste to attack the foe, and was content for the present merely to hold them in check. His first care was for the safety of the civilians, the women, and the children, which was not secured till the 30th; and he continued to protect them till the 5th of December, when they were all safely lodged at Allahabad. The enemy, unaware of the motive of his seeming inaction, imputed it to fear, and became every day more confident and audacious. On the 6th he at length turned fiercely on them, completely defeated them, and seized their baggage; he then dispersed and drove away another large force, under the command of Nana Sahib, which was watching the en-

agement at a little distance. The army entered the residence of Nana Sahib at Bithoor, and took possession of much treasure, which had been concealed in a well. Nearly the whole of the enemy's artillery was captured; and the army, being overtaken as they were in the act of crossing into Oude, great numbers of them were destroyed. Of course, for the moment Lucknow, being no longer garrisoned, had fallen into the hands of the insurgents; but they were not long permitted to retain it. Strong reinforcements arrived, and the Indian government was enabled to send a force against Lucknow sufficient to overwhelm all resistance; and on the 15th of December this important city was in the undisputed possession of the British troops. This final recovery of the capital of Oude decided the reconquest of that country. A struggle was, indeed, maintained for some time longer; innumerable battles were fought; and the final subjugation of the country was effected in the month of June, 1858."—W. N. Molesworth, *History of England*, v. 3, ch. 2.

1858-1863.—Governor-general's proclamation. —Termination of rule of East India Company. —Government transferred to crown.—"By a singular circumstance, when the mutiny was suppressed in 1858, the Governor-General, who in the previous year had been condemned for leniency which was thought ill-timed, was destined to receive censure for harshness which was declared unnecessary. On the eve of the fall of Lucknow, he drew up a proclamation confiscating the lands of all the great landowners in Oudh. Exceptions were, indeed, made to this sweeping decree. Landowners who could prove their loyalty were promised exemption from it, just as rebels who unconditionally surrendered, and whose hands were not stained with British blood, were offered pardon. There is no doubt that Canning, in drawing up this proclamation, relied on the exceptions which it contained, while there is equally no doubt that the critics who objected to it overlooked its parentheses. But its issue was made the basis of an attack which well-nigh proved fatal to the Governor-General's administration. The chances of party warfare had replaced Palmerston with Derby; and the Conservative minister had entrusted the Board of Control to the brilliant but erratic statesman who, fifteen years before, had astonished India with pageant and proclamation. . . . Ellenborough thought proper to condemn Canning's proclamation in a severe despatch, and to allow his censure to be made public. For a short time it seemed impossible that the Governor-General who had received such a despatch could continue his government. But the lapse of a few days showed that the minister who had framed the despatch, and not the Viceroy who had received it, was to suffer from the transaction. The public, recollecting the justice of Canning's rule, the mercy of his administration, almost unanimously considered that he should not have been hastily condemned for a document which, it was gradually evident, had only been imperfectly understood; and Ellenborough, to save his colleagues, volunteered to play the part of Jonah, and retired from the ministry. His retirement closes, in one sense, the history of the Indian Mutiny. But the transactions of the Mutiny had, almost for the first time, taught the public to consider the anomalies of Indian government. In the course of a hundred years a Company had been suffered to acquire

an empire nearly ten times as large and as populous as Great Britain. It was true that the rule of the Company was in many respects nominal. The President of the Board of Control was the true head of the Indian Government, and spoke and acted through the Secret Committee of the Court of Directors. But this very circumstance only accentuated the anomaly. If the President of the Board of Control was in fact Indian minister, it was far simpler to make him Indian minister by name, and to do away with the clumsy expedient which alone enabled him to exercise his authority. Hence it was generally decided that the rule of the Company should cease, and that India should thenceforward become one of the possessions of the crown. . . . A great danger thus led to the removal of a great anomaly, and the vast Indian empire which Englishmen had won was thenceforward taken into a nation's keeping."—S. Walpole, *History of England*, v. 5, ch. 27.—The act "for the better government of India," which was passed in the autumn of 1858, "provided that all the territories previously under the government of the East India Company were to be vested in her Majesty, and all the Company's powers to be exercised in her name. One of her Majesty's principal Secretaries of State was to have all the power previously exercised by the Company, or by the Board of Control. The Secretary was to be assisted by a Council of India, to consist of fifteen members, of whom seven were to be elected by the Court of Directors from their own body, and eight nominated by the Crown. The vacancies among the nominated were to be filled up by the Crown; those among the elected by the remaining members of the Council for a certain time, but afterward by the Secretary of State for India. The competitive principle for the Civil Service was extended in its application, and made thoroughly practical. The military and naval forces of the Company were to be deemed the forces of her Majesty. A clause was introduced declaring that, except for the purpose of preventing or repelling actual invasion of India, the Indian revenues should not, without the consent of both Houses of Parliament, be applicable to defray the expenses of any military operation carried on beyond the external frontiers of her Majesty's Indian possessions. Another clause enacted that whenever an order was sent to India directing the commencement of hostilities by her Majesty's forces there, the fact should be communicated to Parliament within three months, if Parliament were then sitting, or, if not, within one month after its next meeting. These clauses were heard of more than once in later days. The Viceroy and Governor-General was to be supreme in India, but was to be assisted by a Council. India now has nine provinces, each under its own civil government, and independent of the others, but all subordinate to the authority of the Viceroy. In accordance with this Act the government of the Company, the famed 'John Company,' formally ceased on September 1st, 1858; and the Queen was proclaimed throughout India in the following November, with Lord Canning for her first Viceroy."—J. McCarthy, *History of our own times*, v. 3, ch. 36.—"Queen Victoria's Proclamation of November 1st, 1858, which is frequently referred to by educated Indians as the Magna Charta of their liberties, declared that the rights, dignity, and honour of Indian ruling princes were to be preserved as Her Majesty's own, and that, so far as might be, all Her Majesty's subjects, of whatever race and creed, were to be freely and impartially admitted to offices in the public service, the

duties of which they might be qualified by their education, ability, and integrity duly to discharge. The peaceful industry of India was to be stimulated; works of public utility and improvement were to be promoted; and the Government was to be administered for the benefit of all Her Majesty's subjects resident in India. 'In their prosperity will be our strength, in their contentment our security, and in their gratitude our great reward.'"—H. V. Lovett, *History of the Indian nationalist movement*, p. 15.

1864-1893.—Progress of British India under the crown.—Viceroys and their contributions to upbuilding of British India.—Famine relief.—Conquest of Burma.—Strengthening of northwestern frontier.—Material and political progress.—The transfer of the government from the East India Company to the crown marked the commencement of a new era in the history of India. It was the prelude of greater political unity than had hitherto been possible, and the growth of a stronger feeling of nationality than had existed for centuries. "In spite of a hundred checks and many errors, in spite of individual acts of harshness and injustice that no impartial student can deny, Britain raised India to the status of a great empire. As centuries of disorder and division had led to ultimate union under Akbar, so the generations of disaster and disintegration that followed the decay of the Mogul Empire led by imperceptible degrees to the union of India under Great Britain. [Progress in this respect, however, was at first slow, and in the first quarter of a century was almost imperceptible.]"—Aga Khan, *India in transition*, pp. 73-74.—The first viceroy, Lord Canning, was succeeded by Lord Elgin, in 1862 but Elgin only lived until November, 1863. Lord Elgin was succeeded in 1864 by Sir John Lawrence, "the saviour of the Punjab. The chief incidents of his rule were the Bhutan war, followed by the annexation of the Dwars (*Dooars*), a submontane strip on the North-Eastern frontier of Bengal, in 1864, and the terrible Orissa famine of 1866. In a later famine in Bundelkhand and Upper Hindustan in 1868-1869, Lord Lawrence laid down the principle, for the first time in Indian history, that the officers of the Government would be held personally responsible for taking every possible means to avert death by starvation. An inquiry was conducted into the status of the peasantry of Oudh, and an Act was passed with a view to securing them in their customary rights. After a period of fratricidal war among the sons of Dost Muhammad, the Afghan territories were concentrated in the hands of Sher Ali, who was acknowledged as Amir by Lord Lawrence. A commercial crisis took place in 1866, which seriously threatened the young tea industry in Bengal, and caused widespread ruin at Bombay. Sir John Lawrence retired in January 1869. . . . Lord Mayo succeeded Lord Lawrence in 1869, and urged on the material progress of India. . . . Lord Mayo reformed several of the great branches of the administration, created an Agricultural Department, and introduced the system of Provincial Finance. The impulse to local self-government given by the last measure has done much, and will do more, to develop and husband the revenues of India, to quicken the sense of responsibility among the English administrators, and to awaken political life among the people. Lord Mayo also laid the foundation for

the reform of the salt duties. He thus enabled his successors to abolish the old pernicious customs-lines which had for long walled off Province from Province, and strangled the trade between British India and the Feudatory States. He developed the material resources of the country by an immense extension of roads, railways, and canals. He carried out the beneficent system of public works which Lord Dalhousie had inaugurated. Lord Mayo's splendid vigour defied alike climate and the vast tasks which he imposed on himself. He anxiously and laboriously studied with his own eyes the wants of the farthest Province of the empire. But his life . . . was cut short by the hand of an assassin, in the convict settlement of the Andaman Islands, in 1872. . . . His successor was Lord Northbrook, whose ability found prominent scope in the department of finance. During his viceroyalty, a famine which threatened Lower Bengal in 1874 was successfully averted by a vast organization of State relief. The Maráthá Gáekwár of Baroda was dethroned in 1875 for misgovernment, and for his attempt to poison the British Resident at his Court. But his dominions were continued to a child of his race. . . . Lord Lytton followed Lord Northbrook in 1876. On January 1, 1877, Queen Victoria was proclaimed Empress of India at a *darbár* [public ceremony] of unparalleled magnificence, held on the historic 'ridge' overlooking the ancient Mughal capital of Delhi. But while the princes and high officials of the country were flocking on this gorgeous scene, the shadow of famine was darkening over Southern India. The monsoons of 1876 had failed to bring their due supply of rain, and the season of 1877 was little better. This long-continued drought stretched from the Deccan to Cape Comorin, and subsequently invaded Northern India, causing a famine more widely spread than any similar calamity known in Indian history. Despite vast importations of grain by sea and rail, despite the most strenuous exertions of the Government, which incurred a total expenditure on this account of 11 millions sterling, the loss of life from actual starvation and its attendant train of diseases was lamentable. The deaths from want of food, and from the diseases incident to a famine-stricken population, were estimated at 5¼ millions. . . . The years 1882 and 1883 will be memorable for these great measures. By repealing the Vernacular Press Act, he set free the native journals from the last restraints on the free discussion of public questions. His scheme of Local Self-Government has opened a new era of political life to the natives of India. At the same time, by the appointment of an Education Commission, with a view to the spread of popular instruction on a broader basis, he has sought to fit the people for the safe exercise of the rights which he has conferred. He also laid the foundations for the great measure of land-legislation for Bengal which was passed into law under his successor, Lord Dufferin. In 1882, Lord Ripon's Finance Minister, Sir Evelyn Baring, took off the import duties on cotton goods, and the whole Indian import duties were, with a few exceptions, abolished. . . . The Earl of Dufferin succeeded as Viceroy, 1884. . . . Towards the end of 1885 the persistent misconduct of King Thebau in Upper Burma, his ill-treatment of British subjects, and his rejection of all conciliatory offers, led to an army being sent against him, under General Prendergast. The King was dethroned and removed to India. On the 1st January, 1886, his territories were annexed, and soon afterwards were constituted a British province together with Lower Burma un-

der a Chief Commission. [See BURMA: 1824-1886.] . . . Under Lord Lansdowne's rule (with Sir Frederick, afterwards Lord, Roberts as his Commander-in-Chief) the defences of the North-western frontier of India were strengthened, and the Passes from Afghánistán secured against any possible invaders. At the same time, the Native chiefs were allowed to take a more important position than before in the armies of India. A number of them had come forward with offers of money and troops to aid in the defence of the country. Under Lord Lansdowne these offers were accepted. Many of the Feudatories now maintain regiments, carefully drilled and armed, which in time of war would serve with the troops of the British Government. These regiments, kept up free of cost to the British Government, are a free-will offering to it from the loyalty of the Native princes, who have greatly prospered under British rule. They served with distinction in China in 1900. The institution by Lord Curzon of the Imperial Cadet Corps for young Indian chiefs and nobles, without necessarily leading to a military career may give additional force and interest to the association of the British and Native troops. While the Native princes are thus zealous to aid the Sovereign Power, the people and races in the British provinces have been learning the first lessons of local self-government. Municipal Councils and District Boards have, during the past forty years, been gradually created throughout India. Their members consist chiefly of Native gentlemen, many of whom are elected by their fellow citizens. These Municipal Councils and District Boards now manage many branches of the Local Administration. Their legal powers and their practical ability to do good work are increasing. At the same time, a 'National Congress' of delegates from all parts of India has since 1886 been held each December in one of the provincial capitals, such as Calcutta, Madras, Bombay, and Allahábád. This Congress discusses plans for opening a larger share in the work of legislation and in the higher branches of the executive administration, to natives of India. In 1892 the British Parliament passed an Act which increased the number of the members of the Legislative Councils, and introduced a stronger non-official element. Under that Act the Local Governments in India worked out a system of electing members to the Legislative Councils in accordance with the needs and conditions of each province. The year 1893 will be memorable for the first general election of representative members to the Indian Legislative Councils. Side by side with this political movement, efforts (which to a partial extent were embodied into legislation by Lord Lansdowne) are being made to reform certain evils in the social and domestic life of the Hindus, arising out of the customs of child-marriage and of the enforced celibacy of Hindu widows. The whole tendency of these efforts, under the guidance of the social reformer Mr. Malabari, is to protect young Indian girls and to improve the status of Indian women."—W. W. Hunter, *Brief history of the Indian peoples*, pp. 231-237.—See also BURMA: 1824-1886; 1886-1890.

1885-1922.—**National Congress.**—The National Congress was founded in 1885 by Allan Octavian Hume, a retired member of the Indian civil service, who had been home secretary for the government of India. "The policy of Lord Lytton's Government (1876-80) had aroused discontent in the country. The imposition of the Vernacular Press Act, commonly known as the Black Act, and the . . . Second Afghan War were the subject of much adverse criticism. . . . It was recognised in all quarters that the people should organise themselves by way of a conference to ventilate their grievances." Correspondence was passing among the Indian leaders of thought in the different provinces as to the formation of such a conference on a sound and permanent footing. The viceroyalty of Lord Ripon (1880-84) gave the necessary stimulus and encouragement. . . . Progress was so far made as to formulate the programme of a first meeting in Poona which at the time was the seat of great political activity. The Christmas week of 1885 was resolved upon for the inauguration of the Conference, . . . [but owing to an outbreak of cholera the first assembly was held in Bombay under the auspices of the Bombay Presidency Association. . . . As to the fundamental principles of the Congress they are:—*Firstly*, the fusion into one national whole of all the different and discordant elements that constitute the population of India; *Secondly*, the gradual regeneration along all lines, mental, moral, social and political of the nation thus evolved; and *Thirdly* the consolidation of union between England and India by securing the modification of such of the conditions as may be unjust or injurious to the latter country. . . . [It was on these fundamental principles that the Congress carried out its work] till 1907 when an extreme faction of delegates deliberately chose to raise a split in the united camp. At the Congress held in Surat in that year the session had to be abandoned owing to the violent outbreak of the factional spirit of those who since have been known as 'Extremists,' in contrast with the overwhelming majority of those entertaining sober views who are called 'Moderates;' but if the proceedings were for the time abandoned, it was not without the leading men immediately organising themselves on the spot to take ways and means for the holding of future congresses and for the purpose of framing a written constitution of which the most important part was the creed of the Congress, . . . [which] may be repeated here: . . . 'The objects of the Indian National Congress are the attainment by the people of India of a system of Government similar to that enjoyed by the self-governing members [of the empire]. These objects are to be achieved by constitutional means by bringing about a steady reform of the existing system of administration and by promoting national unity, fostering public spirit and developing and organising the intellectual, moral, economic and industrial resources of the country.' For some years following 1907 efforts were made to heal the split and these were without avail until 1916. . . . But the union then effected was purely superficial; the difference between the Moderates

and the Extremists was fundamental; the Extremists captured the machinery of the Congress and . . . in September 1920 the Congress passed entirely under the domination of Mr. Gandhi. . . . In the hot weather following . . . the report of the Hunter Committee on the disturbances in the Punjab was published. This aroused very bitter hostility in India. In order to deal with these and other political questions which had developed, a special session of the Indian National Congress was held at Calcutta in September under the presidency of Lala Lajpat Rai. This Congress was dominated by the influence of Mr. G. K. Gandhi who launched his non-co-operation programme and received the assent of a majority of the delegates. . . . [The non-co-operation programme included surrender of titles and nominated posts, refusal to attend government functions, withdrawal of children from government schools and colleges, boycott of British law courts, of recruiting, and of foreign goods, refusal to run for seats on the councils, and Swadeshi. The Congress held in the following December affirmed these recommendations, changed the constitution to a claim for *Swarajya* or full independence, which it claimed within one year, and called for non-violence, non-co-operation and Hindu-Muslim unity.] The activities of the non-co-operators were directed for the first three months of the year mainly on the boycott of law courts and Government controlled schools. . . . [A large number of students left the schools and colleges. It is stated that about 900 lawyers suspended practice and about 2,600 arbitration courts were started.]—*Indian Year Book*, 1922, pp. 686-687, 689.

1887.—**Baluchistan made part of British India.** See **BALUCHISTAN**: 1876-1887.

1893-1914.—**Suspension of free coinage of silver.—Gold standard reserve.**—In June, 1893, the Indian government, with the approval of the British cabinet, stopped the free coinage of silver, with a view to the introduction of a gold standard. The government, it was announced, while stopping the coinage of the declining metal for private persons, would continue on its own account to coin rupees in exchange for gold at a ratio then fixed at sixteen pence sterling per rupee. "The closing of the mints of British India to the coinage of silver coins of full-debt-paying power is the most momentous event in the monetary history of the present century. It is the final and disastrous blow to the use of silver as a measure of value and as money of full-debt-paying power, and the relegation of it to the position of a subsidiary, or token metal. It is the culmination of the evolution from a silver to a gold standard which has been progressing with startling rapidity in recent years. . . . The remarkable series of events which have characterized, or made manifest, this evolution from a silver to a gold standard are nearly all condensed in the brief period of twenty years, and are probably without a parallel in ancient or modern monetary history. . . . With the single exception of England, all Europe forty years ago had the silver standard, not only legally but actually—silver coins constituting the great bulk of the money of actual transactions. To-day, not a mint in Europe is open to the coinage of full-debt-paying silver coins, and the gateways of the Orient have been closed against it. Twenty years ago one ounce of gold exchanged in the markets of the world for fifteen and one-half ounces of silver; to-day, one ounce of gold will buy nearly thirty ounces of silver. . . . There is a general

impression that silver has been the money of India from remote generations. This is a fallacy. It has not been a great many years since India adopted the silver standard. The ancient money of the Hindoo was gold, which in 1818 was supplemented by silver, but gold coins remained legal tender until 1835, when silver was made the sole standard of value and legal tender money in British India, and gold was demoted. . . . During the last fifty odd years, India has absorbed vast quantities of silver."—E. O. Leech, *Doom of silver* (*Forum*, Aug., 1893).—"A fund styled the *Gold Standard reserve* was created in 1900, when, after six years' inactivity since the closing of the mints, the coinage of new rupees began again on a large scale. It was decided that the net profits of coinage should not be spent as revenue but formed into this Reserve and held in England in the form of sterling securities. In 1906 the *silver branch* of the Gold Standard Reserve was created. It is held in India and consists of rupees, (maximum limit 6 crores), so that when a sudden demand for rupees arises through the needs of the export trade, the Government may issue rupees from this Reserve, while the sterling equivalent of the amount is added to the London portion of the Reserve. Thus any dangerous depletion of the Paper Currency Reserve and temporary shortage of rupees in India is avoided. In 1907 it was decided to invest half the net profit of future coinage in the capital expenditure on railways. This was done for two years only, and then forbidden till the sterling assets of the Reserve should exceed 25 millions. . . . In 1912 it was decided to hold a portion of this fund in the form of a 'very liquid' or *cash* gold Reserve in England not exceeding 5 millions sterling, because, during the monetary crisis of 1908 the Secretary of State had had to sell his securities in a hurry and at a loss in order to cash the Sterling bills. In 1914, in accordance with the recommendations of the Chamberlain Commission, the silver branch of the Gold Standard Reserve was abolished, by being converted into gold."—J. Sarkar, *Economics of British India*, pp. 296-297.

1894.—*Waziri War*.—A fierce attempt to interrupt the demarcation of the Afghan boundary was made by the Waziris. The escort of 5,000 troops, consisting mainly of Sikhs and Gurkhas, was desperately attacked in camp at Wano, November 3. The attack was repulsed, but with heavy loss on the British side. It became afterwards necessary to send three strong columns into the country, under Sir William Lockhart, in order to carry out the work.

1895 (March-September).—*Defense and relief of Chitral*.—*British frontier advanced*.—At the extreme northwestern limit of British-Indian dominion and semi-dominion, under the shadow of the lofty Hindu-Kush mountains, lies a group of quasi-independent tribal states over which the amir of Afghanistan claimed at least a "sphere of influence" until 1893. In that year the amir and the government of India agreed upon a line which defined the eastern and southern frontier of Afghanistan, "from Wakhan to the Persian border," and agreed further as follows: "The Government of India will at no time exercise interference in the territories lying beyond this line on the side of Afghanistan, and his Highness the Amir will at no time exercise interference in the territories lying beyond this line on the side of India. The British Government thus agrees to his Highness the Amir retaining Asmar and the valley above it, as far as Chanak. His Highness agrees, on the other hand, that he will at no

time exercise interference in Swat, Bajaur, or Chitral, including Arnawai or Bashgal valley." Under this agreement, the Indian government prepared itself to be watchful of Chitral affairs. The little state was notoriously a nest of turbulence and intrigue. Its rulers, who bore the Persian title of mehtar, signifying "Greater," can never have expected to live out their days. Changes of government were brought about commonly by assassination. The reigning prince, Nizam-ul-Mulk, owed his seat to the murder of his father, Aman-ul-Mulk, though not by himself. In turn, he fell, on New Year's day, 1895, slain at the instigation of his half-brother, Amir-ul-Mulk, who mounted the vacant chair of state. The usurper was then promptly assailed by two rivals, one of them his brother-in-law, Umra Khan, a mountain chieftain of Bajaur, the other an uncle, Sher Afzul, who had been a refugee at Kabul. On the news of these occurrences at Chitral, the government of India sent thither, from Gilgit, its political agent, Surgeon-Major Robertson, with a small escort, to learn the state of affairs. The result of Dr. Robertson's attempt to settle matters was an alliance of Umra Khan and Sher Afzul in a desperate attempt to destroy him and his small force of native troops, which had five English officers at its head. The latter took possession (March 1) of the fort at Chitral, a structure about eighty yards square, walled partly with wood, and so placed in a valley that it was commanded from neighboring hills. In this weak fortification the little garrison held off a savage swarm of the surrounding tribes during forty-six days of a siege that is as thrilling in the story of it as any found in recent history. The first reinforcements sent to Dr. Robertson, from near Gilgit, were disastrously beaten back, with the loss of the captain in command and fifty of his men. As speedily as possible, when the situation was known in India, an army of about 14,000 men was made ready at Peshawar, under the command of Major-General Sir Robert Low, and relieving columns were pushed with great difficulty through the Malakand pass, then filled deep with snow. A smaller force, of 600 men, under Colonel Kelly, fought its way from Gilgit, struggling through the snows of a pass 12,000 feet above the level of the sea. Colonel Kelly was the first to reach Chitral, which he did on April 20. The besiegers had fled at his approach. The beleaguered garrison was found to have lost forty killed and seventy wounded, out of its fighting force of about 370 men. Sher Afzul was caught by the khan of Dir, who led 2,000 of his followers to the help of the British. Umra Khan escaped to Kabul, where he was imprisoned by the amir. Shuja-ul-Mulk, a younger brother of Amir-ul-Mulk was declared mehtar. The question whether British authority should be maintained in Chitral or withdrawn was now sharply debated in England; but Lord Salisbury and his party, coming into power at that moment, decided that the advanced frontier of Indian Empire must be held. The young mehtar was installed in the name of the maharaja of Kashmir as his suzerain, and the terms under which his government should be carried on were announced at his installation (Sept. 2, 1895) by the British agent, as follows:

"The general internal administration of the country will be left in the hands of the Mehtar and of his advisers. The Government of India do not intend to undertake themselves the management of the internal affairs of Chitral, their concern being with the foreign relations of the State, and with its general welfare. It, how-

ever, has to be remembered that Shuja-ul-Mulk is only a boy, and that, at an age when other boys are engaged in education and amusement, he has been called upon to hold the reins of State. Bearing this fact in mind, the Government of India recognise the necessity of his receiving some help during the time of his minority, and it has consequently been decided to leave at Chitral an experienced Political Officer upon whom the Mehtar may always call for advice and assistance, while it is proposed to appoint three persons, Raja Bahadur Khan, the Governor of Mastuj, Wazir Inayat Khan and Aksakal Fateh Ali Shah, to give him help, instruction and advice in the management of his State and in the laws and customs of the people. Ordinarily the entire country will be governed in accordance with their experience and judgment; but nevertheless the Assistant British Agent, if he thinks it necessary to do so, may, at any time, ask the Mehtar to delay action recommended by his three advisers, until the opinion of the British Agent at Gilgit has been obtained, whose decision shall be final and authoritative.

"The desirability of abolishing traffic in slaves is a matter to which the Government of India attach much importance, and that they have lately interested themselves with some success in procuring the release of Natives of Kashmir and her dependencies, including Chitralis, who are held in bondage in Chinese Turkistan. It is in accordance therefore with the general policy of the Government of India that in Chitral also all buying and selling of slaves, whether for disposal in the country or with the intention of sending them abroad, should be altogether prohibited. Any such selling of slaves is therefore from this time forward absolutely illegal."—Great Britain, *Parliamentary Publications: Papers by Command*, 1896 (C-8037).

1895 (April).—Report of opium commission.—"The long-deferred publication of the report of this commission was made in April, and the report was signed by eight out of nine members of the commission. The commissioners declared that it had not been shown to be necessary, or to be demanded by the people, that the growth of the poppy and the manufacture of opium in British India should be prohibited. Such a prohibition, if extended to the protected States, would be an unprecedented act of interference on the part of the paramount Power, and would be sure to be resisted by the chiefs and their people. The existing treaties with China in regard to the importation of Indian opium into that country had been admitted by the Chinese Government to contain all they desired. The evidence led the commissioners to the conclusion that the common use of opium in India is moderate, and its prohibition is strongly opposed by the great mass of native opinion."—*Annual Register*, 1895, pp. 337-338.

1897-1898.—Frontier wars.—From the early summer of 1897 until the close of the year the British troops were engaged in suppressing uprisings on the Afghan frontier, first among the Afghans, and then among the Afridis who had been subsidized by the government as guardians of the Khyber Pass. The final results of the campaign are thus summarized in the political reports: "British troops traversed the country of the tribes, inflicting severe loss on the tribesmen; who were ultimately reduced to submission; they paid large fines in money and arms, and friendly relations

have been restored."—Great Britain, *House of Commons Reports and Papers*, 1900, No. 13.

1899-1901.—Famine.—Lord Curzon's report.—Lord Curzon, who had been appointed in 1898 to succeed Lord Elgin, found himself faced with one of the worst famines in history, and for a time all the energies of the government were concentrated in an almost unparalleled system of famine relief. In reporting to the Legislative Council at Simla on the experience, in October 1900, Lord Curzon said: "In a greater or less degree, nearly one-fourth of the entire population of the Indian continent came within the range of the relief operations. The loss occasioned may be roughly put in this way. The annual agricultural production of India and Burma averages in value between 300 and 400 crores of rupees [the crore being ten millions, and the rupee equivalent to about one-third of a dollar]. On a very cautious estimate the production of 1899-1900 must have been at least one-quarter, if not one-third, below the average, or at normal prices 75 crores, or £50,000,000 sterling. If to this be added the value of some millions of cattle, some conception may be formed of the destruction of property which great drought occasions. There have been many great droughts in India, but no other of which such figures could be predicted as these. . . . If a special characteristic can be attributed to our campaign of famine relief in the past year, it has been its unprecedented liberality. There is no parallel in the history of India or any country of the world to the total of over 6,000,000 persons who, in British India and the native States for weeks on end, have been dependent upon the charity of the Government. The famine cost ten crores in direct expenditure, while 238 lakhs were given to landholders and cultivators on loans and advances, besides loans to native States. . . . There has never been a famine when the general mortality has been less, when the distress has been more amply or swiftly relieved, or when the Government and its officers have given themselves with more whole-hearted devotion to the saving of life and the service of the people. It is impossible to tell the actual mortality, but there has apparently been an excess of mortality over the normal of 750,000. Cholera and smallpox have accounted for 230,000, which is probably below the mark, so that the excess in British India has equalled 500,000 during the year. To say that the greater part of these died of starvation or even of destitution would be an unjustifiable exaggeration, since many other contributory causes have been at work."

1902-1907.—Military reforms of Lord Kitchener.—"When he reached India, Lord Kitchener [who was made commander-in-chief in 1902] found that the army united great merits with grave defects. It did not provide that offensive power that could properly have been expected from its numbers and its cost. It did not exploit all the martial races which were available for its services, and it used others, softer in texture and of little service in real war. The distribution of the army was defective, and . . . [not in] accord with railroad facilities and a changed strategic situation. It was not self-supporting in material of war, and the armament of the troops, though improving, was still much behind the times. There was scarcely a single military requisite that had been completely supplied to the four poorly organized divisions which formed the field army, and scarcely any preparations had been made for maintaining the army in the field. The content of the Indian army had not been assured

by adequate provision for its material well-being. Lastly, the higher administrations of the army was laborious in operation and inefficient in results owing to a system of dual control. . . . Lord Kitchener's plans for the redistribution and the reorganization of the Army received . . . [the unswerving support of the Viceroy until] unfortunate differences of opinion arose on the question of the Military Department which caused a grave crisis and arrested for long the execution of reforms. . . . [By] the settlement finally made, the question of the Military Department was . . . laid at rest. . . . [The Commander-in-chief in India was placed in charge of the] Army Department which was invested with all the powers and duties of the old Military Department, excepting only those relating to supply, which were confided to a separate department, whose chief became an ordinary member of the Governor-General's Council. . . . The compromise worked well. . . . [But the experience of three more years showed the lack of necessity for the Supply Department, which was] abolished, and its duties distributed among the Head-quarters Staff. . . . [Lord Kitchener's plan, which began to take shape in the autumn of 1904,] was to redistribute the troops according to the requirements of the defence of India, to train all arms together at suitable centres, and to give larger powers to division commanders. Decentralization of work and devolution of responsibility, were the keynotes of this as of all Lord Kitchener's reforms. . . . The idea was to secure complete and thorough training for war in recognized war formations, to enable the whole of the nine divisions in which he proposed to arrange the army to take the field in a high state of efficiency, while leaving behind them sufficient troops [three independent brigades] for the support of the civil power in the repression of rebellion. . . . The Sepoy . . . greatly benefited during Lord Kitchener's tenure of the command-in-chief. Thanks to the wise generosity of Lord Morley and his council, the pay of all the ranks has been much improved while a higher pension scale, [better clothing allowances, and other emoluments] increased the popularity of the service. . . . Grass and dairy farms have been established all over India, and the Medical service has been very successful in reducing the waste in the army from disease. It . . . [was] the object of Lord Kitchener, as it was the object of Lord Lawrence, not only to make the Indian army formidable, but to make it safe. The principle of maintaining the artillery mainly in the hands of Europeans has not been departed from, and there are now fewer native batteries in existence than when Lord Kitchener arrived in India. . . . It is recognized now that Lord Kitchener had no aim in view but that of military efficiency; that he wisely decentralized much work that was formerly congested; that he doubled the fighting power of the army and made it available in a shorter time; that he upset no cherished tradition that was worth cherishing; and that he left the Indian army stronger, better trained, better paid, and more contented than he found it."—Military correspondent of the Times, *Essays*, pp. 136-137, 140-141.

1903.—Lease of Nasrabad from Khan of Kalat. See BALUCHISTAN: 1903-1014.

1903 (January).—Durbar at Delhi.—"The Imperial durbar was held on the 1st of January, 1903, to proclaim formally the coronation of King Edward VII., Emperor of India, and Lord Curzon, with remarkable success, carried out his plan to make the occasion one of extraordinary splendor. It brought together for the first time

all of the native princes of India, who, in the presence of each other, renewed their pledges of loyalty and offered their homage to the throne. No spectacle of greater pomp and splendor has ever been witnessed in Europe or Asia or any other part of the world since the days of the Moguls. . . . Lord Curzon has been criticised severely in certain quarters for the 'barbaric splendor and barbaric extravagance of this celebration,' but people familiar with the political situation in India and the temper of the native princes have not doubted for a moment the wisdom which inspired it and the importance of its consequences. . . . The Emperor of India, by the durbar, recognized those racial peculiarities, and not only gratified them but made himself a real personality to the native chiefs instead of an abstract proposition. It swept away jealousies and brought together ruling princes who had never seen each other until then. It broke down what Lord Curzon calls 'the water-tight compartment system of India.' 'Each province,' he says, 'each native state, is more or less shut off by solid bulkheads from its neighbors. The spread of railways and the relaxation of social restrictions are tending to break them down, but they are still very strong. Princes who live in the south have rarely ever in their lives seen or visited the states of the north. Perhaps among the latter are chiefs who have rarely ever left their homes. It cannot but be a good thing that they should meet and get to know each other and exchange ideas. To the East there is nothing strange, but something familiar and even sacred,' continued Lord Curzon, 'in the practice that brings sovereigns together with their people in ceremonies of solemnity. Every sovereign in India did it in the old days; every chief in India does it now; and the community of interest between the sovereign and his people, to which such a function testifies and which it serves to keep alive, is most vital and most important.' And the durbar demonstrated the wisdom of those who planned it. The expense was quite large. The total disbursements by the government were about \$880,000, and it is probable that an equal amount was expended by the princes and other people who participated."—W. E. Curtis, *Modern India*, pp. 264-265.

1905.—Earthquakes in the Punjab and United Provinces.—One of the most terrific of earthquakes occurred in Northern India on the 4th of April, 1905. Its most violent and destructive effects were in the Kangra District of the Punjab, and its neighborhood; but the area of shock extended over several thousand square miles. The finally ascertained and estimated loss of human life was no less in number than 373,000. The villages destroyed numbered 400. As for the destruction of property, including houses, bridges, irrigation works, cattle, and crops, it was beyond computation.

1905-1910.—Growth of discontent.—Partition of Bengal.—Outbreak of political crime.—Discontent and unrest began to ferment in India long before the administration of Lord Curzon, which is generally given as the period when they first began to show themselves. In fact there were indications of their presence in the late nineties. "At Poona, the Peshwa's former capital, Bal Gangadhar Tilak, 'the father of Indian unrest,' became prominent in the nineties and carried on an increasingly violent anti-British campaign until his trial and imprisonment for sedition in 1908. His punishment was not an autocrat reprisal for an academic offence: his newspapers were directly responsible for assassina-

tion. The movement spread from the Deccan to Bengal, where Lord Curzon's educational reforms tended to remove university control from incompetent hands. The storm broke in the year following the Act for that purpose, and the projected partition of the province was made its pretext. . . . Here again a violent newspaper campaign produced a crop of shootings and bomb outrages. Constructively the agitation took two forms, a demand for 'swaraj' or self-government, and an advocacy of 'swadeshi' or the promotion of home industries by the boycott of British manufactures. Mingled with these political considerations was a great deal of religious fervour which leavened the whole."—J. A. Williamson, *Short history of British expansion*, p. 502.—"The so-called partition of Bengal was not originally planned by the Viceroy [Lord Curzon]. The discussion about the rearrangement of certain provincial boundaries had begun among his subordinates in 1901, but no definite proposal was made until two years later, in 1903, when the Lieutenant-governor of Bengal propounded a certain plan for lightening the intolerable burden resting upon his shoulders."—V. A. Smith, *Oxford history of India*, p. 774.—"No one has ever seriously denied that the old province of Bengal, Bihar and Orissa was, by reason of its magnitude, an impossible and, because impossible, a sadly neglected charge. The Supreme Government had been slow to realise that times had altered since 1785, when Warren Hastings, reviewing his eventful administration, wrote that the submissive character of the people of this province, the fewness of their wants, 'the abundant sources of subsistence and of trafficable wealth which may be drawn from the natural productions, and from the manufactures, both of established usage and of new institutions, left little to the duty of the magistrate; in effect nothing but attention, protection, and forbearance.' No soldiers of the Indian Army had been drawn from Bengal, and Bengalis had taken no share in the rebellion of 1857. But as prosperity and population increased, as English education spread, administration became more complex, and the character of the educated classes stiffened and altered. The charge of 78,000,000 of people, including the inhabitants of the largest and most Europeanised city in the East, was far too onerous for one provincial administration; and, after considerable deliberation and consultation, [and public discussion] Lord Curzon decided to divide the old province and Assam into the new provinces of Western Bengal, Bihar and Orissa, and Eastern Bengal and Assam. Administratively, this was the best arrangement. It afforded most promise of opening up and developing the rich, difficult, and populous water districts of Eastern Bengal. But it split Bengal proper into two, and gave Muhammadans a decided majority in the Eastern Province. It was, therefore, strongly opposed by the Congress leaders at Calcutta, the centre of Hindu legal, educational, and political activities. They proclaimed that a foreign government wished to insult and efface Bengali nationality. When the partition was carried out, they enlisted ardent support from sympathisers all over India, proclaimed a boycott of European goods, to be effected by the aid of students and schoolboys, and organised a violent agitation on a widespread and elaborate scale. Many of them were moved by a new kind of sentiment. The achievements of Japan had profoundly affected Indian political thought. Their plans took time to develop, and were largely suspended during the visit of the Prince and Princess of Wales, which passed off successfully in the cold season of 1905-6. Before the Congress of

1905 met at Benares, Lord Curzon had left India, and the Unionist Ministry in England had been followed by [a liberal government]. . . . No viceroy has ever played a part larger than the part played by Lord Curzon. His influence on all branches of administration was vigorous and beneficial; he placed the arrangements for the security of the North-West frontier on a stable footing; he set an example of industry and devotion. . . . But we can see now that his bold and confident nature led him to underrate the combination between the opposition to the Partition of Bengal and the new spirit which had arisen in India. The loosening of control which was certain to follow on his departure; the number and bitterness of his enemies, their eagerness and the anxiety of those who resented British rule to seize any opportunity of misinterpreting all government measures, the plastic material which lay ready to their hands; all these were factors of so far undiscovered potency."—H. V. Lovett, *History of the Indian nationalist movement*, pp. 57-60.—"In England a Liberal government came into power at the close of 1905, and Lord Morley, a life-long radical and a deep student of history, took office as secretary for India. His policy was one of repression of unconstitutional violence, whether in word or deed, accompanied by concession to all legitimate aspirations to reform."—J. Williamson, *Short history of British expansion*, p. 502.—During his administration unrest, fed by secret societies, and encouraged by the continued vilification by the native press of the British administration, continued to increase.—"In the Punjab, after half a century of tranquil loyalty, the disturbance broke out in 1907. The province had suffered the interests of certain classes. These misfortunes gave point to the general movement of revolt against western influence shared with the rest of India. 'Arya (i.e. India) for the Aryans' became as elsewhere a popular cry, and seditious books and newspapers its methods of exposition. [In 1909 it was hoped that the Indian Councils Act would allay discontent and provide a means of political education; but these hopes were vain.] The deportation of Lajpat Rai, a prominent ring-leader, checked the agitation, and by 1910 the more violent manifestations of discontent had temporarily subsided throughout India. During all this period the Indian princes had been firmly on the side of the government; some of them indeed had been as bitterly attacked as the British officials. The Mohammedans also had kept aloof from sedition, and of the Hindu population the vast majority had been unaffected. Nevertheless the importance of such movements is not to be estimated by the number of persons taking part in them. Most revolutions have been carried out by minorities."—*Ibid.*—"The nature of the dangers to which the State was exposed in February, 1910, is indicated sufficiently by the following extract from Sir Herbert Risley's speech in the Legislative Council: 'We are at the present moment confronted with a murderous conspiracy, whose aim it is to subvert the Government of the country and to make British rule impossible by establishing general terrorism. Their organization is effective and far-reaching; their numbers are believed to be considerable; the leaders work in secret and are blindly obeyed by their youthful followers. The method they favour at present is political assassination; the method of Mazzini in his worst moods. Already they have a long score of murders or attempted murders to their account. There were two attempts to blow up Sir Andrew Fraser's train, and one of the type with which we are now unhappily familiar, to shoot him on a public occasion. Two attempts

were made to shoot Mr. Kingsford, one of which [in April, 1908] caused the death of two English ladies. Inspector Nanda Lal Banerji, Babu Ashutosh Diswas, the Public Prosecutor at Alipore, Sir William Curzon-Wyllie [July 1909, in London], Mr. Jackson, and . . . Deputy-Superintendent Shams-ul Alum have been shot in the most deliberate and cold-blooded fashion. Of three informers two have been killed, and on the third vengeance has been taken by the murder of his brother in the sight of his mother and sisters. Mr. Allen, the magistrate of Dacca, [December 1907] was shot through the lungs and narrowly escaped with his life. Two picric acid bombs were thrown at His Excellency the Viceroy at Ahmedabad, and only failed to explode by reason of their faulty construction. Not long afterwards an attempt was made with a bomb on the Deputy Commissioner of Umballa. These things are the natural and necessary consequences of the teachings of certain journals. They have prepared the soil in which anarchy flourishes; they have sown the seed and are answerable for the crop. This is no mere general statement; the chain of causation is clear. Not only does the campaign of violence date from the change in the tone of the Press, but specific outbursts of incitement have been followed by specific outrages. . . . Serious attempts to undermine the loyalty of the Indian army have been made, and the execution of a considerable number of the leading conspirators has been absolutely necessary. The anarchist crimes continued in the time of Lord Hardinge of Penshurst, who succeeded Lord Minto in 1910. Lord Hardinge, whose previous service had been in the Foreign Office, is grandson of the Governor-general who conducted the first Sikh war. A bomb attack made on the Viceroy at Delhi wounded him and killed an attendant who was immediately behind Lord Hardinge on the elephant. The criminals escaped."—V. A. Smith, *Oxford history of India*, pp. 774-775, 780-781.

1905-1916.—Growth of coöperative movement.—Agricultural banks. See COÖPERATION: India.

1905-1922.—Basis for nationalist movement.—Various Indian points of view.—Causes of unrest.—"The Hon. C. Y. Chintamani, in his address to the Provincial Conference at Jhansi, Oct. 8, 1916 [said]: 'The mass of the population is poor, very poor. A state of destitution, accompanied by disease and debt, is the normal condition of the bulk of the people. A comparative study of the aggregate annual national income, expenditure and savings of the peoples of different countries, would reveal a painful state of things in India. John Bright said that if a country possessing a most fertile soil and capable of bearing every variety of production, found the people in an extreme state of suffering and destitution, there was some fundamental error in the government. The observation was made of India. The Duke of Argyll, Secretary of State for India under Gladstone, recorded his opinion, "of chronic poverty and permanent reduction to the lowest level of subsistence such as prevail among the vast population of rural India, we have no example in the Western world." In a paper on the wealth of the Empire, read before the British Association in 1903, the aggregate annual income of the United Kingdom (whose population is less than our United Provinces) was put at 1,750,000,000 pounds and that of India at 600,000,000 pounds, roughly, 30 rupees [about \$10.00] per head per annum.' The general survey of the Empire led Sir Robert Giffen to consider 'how vast must be the economic gulf separating the people of the United Kingdom from India

when we find that 42,000,000 of people in the United Kingdom consume in food and drink alone an amount equal to the whole income of 300,000,000 Indians. Unless relieved from their state of semi-starvation, the Indian problem and difficulty remain 'untouched.' He further pointed out the anomaly of Britain requiring of India and India alone, a substantial military expenditure, though the wealth of the self-governing colonies is so enormously greater than that of India. This though the Indian army is freely used for imperial and general purposes, and is not employed exclusively for local defence."—L. Rai, *England's debt to India*, pp. 330-331.—Yet, another Indian can say: "The present organisation [of government] has been a work of steady and systematic endeavour, altered and improved by increasing experience and in accordance with the changing conditions and circumstances of the country, and the following summary takes cognisance of only those prominent achievements of administration, by no means exhaustive, which distinguish the English from any previous rule. A system of public services, for the most part based on recognised tests of qualifications has been established, which furnishes capable men for the duties of the numerous departments of the State. It is free from nepotism, influence, or partiality in selection. For the defence of the Indian Empire and preservation of international peace, a thoroughly equipped army . . . is maintained, its maritime defence being undertaken by the British Navy. This provision has made the whole country on all its vast frontier free from aggression by land and sea, and absolutely immune from any danger of internal disturbances and internecine conflicts. A sense of complete security, unknown in previous times, prevails now in every corner of the Indian Empire. The finances of the country are the care not only of an organised Department, but the Supreme and subordinate governments are bound by well-defined rules to regulate the income and expenditure of every province and district. Budgets are prepared and publicly discussed in Councils, allocations are made for works of public utility such as railways and canals, besides disbursements for the current expenditure of the official services, and educational and medical institutions. During the last 35 years there has been a steady expansion of the finances, without increase in the rates of internal taxation and without large borrowings. Apart from the debt incurred for reproductive works, such as railways and irrigation, the interest on which does not fall on the tax-payer, as it is paid out of their large net profits, the public debt of India to-day (1914) is only about £12,750,000. In the period under calculation, large expenditure on famine relief and protective railways, and irrigation and public works, was met from the current revenues. In the last fifty years both the income and expenditure have increased more than threefold. . . . The judicial system of India is another and perhaps the most excellent feature of British rule. Its very credit with the people, that which has reconciled them most to it, is the confidence they have in the English sense and methods of justice. The Penal Codes and Codes of Civil and Criminal Procedure, comprehensive, intelligible, and adapted to the conditions of the people, by which the administration of justice is generally regulated, are superior to those of many other countries, and surpassed by none. Other enactments and regulations suited to the social requirements of certain classes of people, and peculiar tribes, as well as laws relating to municipalities and other public bodies have long since been formulated and are constantly promoted or modified. The competence

and character of the judges and officials entrusted with judicial functions are as a rule unimpeachable. As in the judiciary, so in the Legislative bodies, the people have been by Acts of Parliament allowed for years past a fair share of the seats, a share which is being enlarged periodically in response to their aspirations. The net-work of railways and canals, stupendous engineering works such as bridges, roads, and reservoirs, public buildings for hospitals, universities, schools and museums of varying dimensions, with which cities and towns are provided, are not only monuments of British genius, but proofs of that tranquillity, that progress of trade and commerce, and that multiplication of the resources of the country which have followed in the wake of British rule. The trigonometrical, topographical, geological, archæological, and cadastral surveys; scientific experiments in agriculture, the preservation of forests, increase in cultivation, the introduction of staples unknown in previous years such as tea, coffee, and cinchona; drainage systems in towns, sanitation throughout villages and expert medical help for the women confined in zenanas and behind the purdah,—all these and numerous other ever multiplying and expanding accessories to the physical and material improvement of a nation would not have been possible unless initiated or fostered by a government imbued with a real sense of its obligations to a people whose fortunes and destiny it is in its power to make or to mar. . . . There are immense tracts which for want of water had always remained uncultivated. To remedy these drawbacks, than which scarcely anything can be conceived more disastrous to a people whose livelihood depends on the soil, a highly efficient and expanding scheme of irrigation has been wisely pursued by Government for years past. It had the sanction of pastimes, for Hindu and Mahomedan rulers had inaugurated similar projects in their time. But the construction was not on so extensive a scale, nor had it the same element of expansion and efficiency, and certainly not the same aid of engineering skill, as are contained in the British system of irrigation. Under the East India Company up to 1858 about half a dozen projects had been begun, a couple of them being partly open, which supplied water to a million-and-a-half acres. Since then and up to 1914, at a cost of £45,500,000 no less than 34,914,000 acres of land have been brought under irrigation, ensuring to cultivators an income of fifty-four million pounds from the crops raised by it. The inception, the method of construction, and the result of such an undertaking, at all events on so stupendous a scale, were made possible under British administration.”—M. M. Bhowmaggree, *Verdict of India*, pp. 28-34.—“I admit a wave of extremism is passing throughout the land. Moderate views are at a discount, and those holding them are abused and jeered at, and have been roughly ousted from the Congress and other representative institutions. But no sane person amongst the extremists would like to see British rule in India subverted, for he realises that even if such a thing were feasible it would be neither for the good of the country nor for himself. . . . Somehow it is commonly believed that while the war was in progress there was an eager disposition shewn to make concessions to the aims and aspirations of the people, whereas now a certain amount of coldness and indifference are being exhibited, and considering the sacrifices India has made in a variety of ways, the people came to entertain expectations which may have been extravagant in some quarters, as to being liberally requited; and they now fear that a bitter disappointment is in store for

them. The extremists, whose aims were higher and more definite, are sullen and irritated at finding that the prospect is very gloomy and remote of the principle of self-determination being applied to India. . . . While crores of rupees [ten million rupees to a crore] have been appropriated for the extension of railways, which it is supposed, and perhaps wrongly, will mainly serve a military purpose, even a paltry sum is not available for free and compulsory education, on which, good many believe, depends the advancement of the country. [See above: 1835-1922.] . . . Religious frenzy exceeds by far political excitement, and it is no forced conclusion that to it may be ascribed some of the deplorable events that have recently occurred. Second to religious frenzy, but a very close second, is hero-worship. Mr. Gandhi . . . is recognised as a hero and there are people who would go to any length for him. Either of these two impulses, if misdirected, is capable of producing much mischief, but if both these are combined and political excitement is superadded, Heaven only help us. . . . I do not for a moment contend that the educated leaders are entirely exonerated from blame. They were engaged in an agitation against what they considered an iniquitous Act [Rowlatt Sedition Act] passed by Government. A most excellent occupation, but it imposes certain obligations. . . . The *Civil and Military Gazette* writes: ‘The true explanation of the trouble is more palpably to be found in the spirit of unrest due to reaction after the stress of war and the hardship it has entailed and is still entailing. . . . The Rowlatt Bills have formed a convenient stalking horse but the course of events hitherto shows clearly that if they had not been available some other pretext would have been forthcoming. Racial animosity, Mahomedan feeling about the downfall of Turkey, the prevailing high prices everywhere, vague political ideas about self-determination may all be considered as contributory causes, and the Rowlatt Bills have been used as a handle mainly by irreconcilables whose almost openly avowed creed has always been dislike of the British Raj.’ This is quite true, and if to this be added . . . other reasons . . . it will afford an explanation of the general unrest pervading the Punjab in common with other parts of India.”—A. Nundy, *Present situation*, pp. 8-11, 17.

“In the forefront we must place the fact that until the summer of 1914 there was a white and European solidarity vis-à-vis Asia and Africa which, though officially unrecognized, was yet the foundation of European policy in the widest sense of the term. A small but suggestive point of nomenclature illustrates my meaning. The British governing classes and the white mercantile community were referred to throughout India as ‘Europeans,’ and the general line of differentiation as between the governors and the governed was shown by the terms ‘European’ and ‘Native,’ or latterly the more acceptable cognomen ‘Indian.’ . . . The German, French or Italian trader or missionary had social union with the British rulers and business men, carrying inherent privileges that made them members of the same governing European family. But the Great War has broken up that solidarity. The German and Austrian missionary and trader has been interned in India or repatriated, and all and sundry have watched the humiliation of these fallen members of the white race. The most remote villagers have heard of the sepoys who have fought hand to hand with the fairest inhabitants of Europe. The long-maintained racial line of demarcation has been largely replaced by that of allegiance to Sovereign and

flag. . . . To foreigners and onlookers India may be a conquered country, yet British rule was extended (with Indian help) so insidiously and so gradually, it has lasted so long and the work of conquest and administration has from the first been carried on by British heads and Indian hands to such an extent, that the average Indian does not look upon himself as belonging to a conquered people, or on his country as dominated by foreigners. He has awakened to the reality only when he has tried to visit the British self-governing Dominions, which have now agreed to a more liberal-minded policy. . . . Again, a fundamental change has come over the Indian outlook on public affairs. . . . Twenty-five years ago the average Indian Moslem looked upon himself as a member of a universal brotherhood, sojourning in a land in which a neutral Government, with a neutral outlook, kept law and order and justice. His political and communal pride was satisfied by the fact that his co-religionists in Turkey, Persia, Morocco, and (nominally at least) in Egypt enjoyed independence and national sovereignty. While his allegiance was to Queen Victoria, his political self-respect was satisfied by the existence of the Sultans at Constantinople and Fez, and of the Shah and Khedive at Teheran and Cairo. . . . So strong are the world forces of this generation that states and societies which have stood still for centuries have now been overthrown by the strong currents of European and American activity. The net result is that the Indian Mahomedan, instead of holding but the outposts of Islam in the East, sees around him nothing but Moslem societies in a far greater state of decay than his own. . . . Under these circumstances, he necessarily looks upon India more and more as the hope of his political freedom and as the centre that may still raise the other Mahomedan countries to a higher standard of civilisation. Another point to be remembered is that while, under the old conditions, the Mahomedans were doomed to be nothing but a one-fifth minority in an overwhelmingly Brahmanical India, to-day, as the forces of disruption gain strength in Western Asia, it is not improbable that the South Asiatic Federation of to-morrow, of which India must be the centre and the pivot, will contain not only the 66½ millions of Indian Moslems, but the thirty or forty millions more Muslims inhabiting South Persia, Mesopotamia, Arabia, and Afghanistan. If we turn from numbers to surface of territory, the Islamic provinces of South Asia will be almost as great in extent as the India of yesterday. Hence there is little danger of the Mahomedans of India being nothing but a small minority in the coming federation. No doubt these considerations, again, are sub-conscious and semi-conscious; but they are potent. The Indian Moslem of to-day is no more haunted by the fear of being a powerless minority; nor has he constantly to look for his sentimental satisfaction to the Islamic States outside India. . . . Turning our gaze from the Moslems to the vast Hindu population, we find among its educated members the feeling that the great conflict announced as a war for liberty and freedom, for the protection of self-development in small countries, such as Belgium and Serbia, carries for the Allies the implication that political freedom is the heritage of every nation, great or small. The principles that render the Allied cause just in Europe are of universal application, *mutatis mutandis*, and lead to the deduction that India, too, must be set on the path of self-government. . . . I do not lose a due sense of proportion when I say that one of the

deeper causes, if not of discontent or disaffection, at any rate of the distrust of England and Englishmen that appeared on the surface in India in recent years was the strained relationship between Indians and their white fellow-subjects in East Africa. A rankling sense of injustice was aroused by the reservation of the best lands for Europeans, and by a succession of ordinances and regulations based on an assumption of race inferiority."—Aga Khan, *India in transition*, pp. 18-20, 22-25, 110.

"When India was conquered, . . . every free Indian subject of the Crown soon became entitled to the private civil rights of an Englishman, except so far as his own personal law, Hindu or Muslim or Parsi or Jain, might modify those rights; and if there was any such modification, that was recognized for his benefit rather than to his prejudice. . . . Accordingly we have in India the singular result that . . . every Indian subject is eligible to any office in the gift of the Crown anywhere, and to any post or function to which any body of electors may select him. He may be chosen by a British constituency a member of the British House of Commons. Two natives of India (both Parsis) have already been chosen, both by London constituencies, to sit in the British House. . . . Neither birth, nor colour, nor religion constitutes any legal disqualification. This was expressly declared as regards India by the India Act of 1833, and has been more than once formally declared since, but it did not require any statute to establish what flowed from the principles of British law."—J. Bryce, *Roman and the British empires*, pp. 46-47.—Unfortunately, Indians took this to mean that his accession to the civil rights of an Englishman gave him equal rights throughout the dominions with any other British subject. The fact that the dominions themselves did not look upon the matter in this light, but classed the Indian with other Asiatics, and framed their immigration laws to exclude him, came as a shock to his growing self-consciousness, and sense of personal if not national pride. Attempts to force the dominions to receive him as an equal were looked upon as an infringement on the right of legislation, as well as the right to welcome and exclude whom they would. Consequently, the claim to equality made matters worse, and in every case reacted against the Indian. The trouble in South Africa centered chiefly around Natal, where a head tax of £3 was imposed on Indians, and around the Union Immigration Act of 1913, which restricted the family of an immigrant to the wife and child of a monogamous marriage. This law was held to bar even one wife who had been married according to the rites of a religion which permitted polygamy. The South African controversy is responsible for the leadership of M. K. Gandhi. As a young man, after he had been called to the English bar, he went out to South Africa to defend the case of the Indians. The treatment which he received there, and especially in the Transvaal, determined him to throw in his lot with his fellow countrymen. He accepted their leadership, started a newspaper, began educational work, and generally tried to raise the status of the Indians. In 1914 the Indian Relief Act was passed to overcome the marriage difficulty, and an agreement was entered into between General Smuts, then Minister of the Interior, and Gandhi, with regard to Indian traders in the Transvaal. In British East Africa, now Kenya Colony, the controversy was chiefly confined to the question of the right of Indians to hold land in the colony. The dispute slumbered during the World War, but later broke out with

added virulence over the allotment of land to British ex-soldiers, and a plan for the segregation of the races. The trouble in British Columbia was quite a different phase of the Indian question, and was closely related to the labor movement and immigration laws. The province, which already had a Sikh population of 4,000, passed a law prohibiting the entry of any Asiatic who had not made a continuous voyage from his place of domicile. This law was invoked in 1914 to keep out a ship-load of Sikhs, who claimed to have made a continuous voyage in a specially chartered ship. The provincial authorities asserted on the contrary, that the claim could not be sustained, and that the majority of the passengers had been picked up at various places along the route, and from outside of India, and despite an appeal to the Dominion authorities, the greater number were forced to return. This incident caused a serious riot in India. The whole question roused such intense feeling in India that in 1914, Lord Hardinge suggested a system of emigration by passports, to be issued in India, and reciprocity agreements to govern all Indian emigration. The suggestion was favorably received on all sides. At the Imperial Conference in 1918, the right of India to pass such restrictions on immigration from any country in the British comity of nations as might be imposed by that country on Indians was recognized. In 1921, the Imperial Conference, by resolution, drew attention to the disabilities imposed on Indians resident in other parts of the empire, and expressed a desire that such disabilities should be removed. South Africa declined to comply with the resolution, because the large number of Indians resident in the Union created a peculiar situation there, but Canada and Australia have passed legislation to cover the point. Additional friction had been created in the Transvaal in 1919 by disputes over "trade rights," land ownership, and "vested rights," the latter of which had been a subject of arrangement between Smuts and Gandhi. A commission appointed to enquire into the controversy recommended, among other suggested solutions, a system of voluntary repatriation of the Hindus, and a large number returned to India, carrying with them a strong sense of injustice, intensified by the effort made to keep them on a footing of inferiority, which added fuel to the fire of unrest already in existence there. The commission found that the fear of an Asiatic menace was largely unfounded, and it was claimed that the danger of unassisted emigration from India, in the present state of industrial needs at home, was very problematical. The question of social equality arising out of racial feeling is one of the most deep seated causes of political unrest in India, because it is rooted in the conflicting civilizations of East and West. Comparatively large numbers of Indians travel, for the purpose of education or otherwise, to Great Britain, the continent of Europe and America, where they outwardly at least conform to western usages, and find their nationality no bar to social intercourse. They attend the great schools, enter the universities, and adopt professions. But when they return to India, these educated Indians claim that they are subjected to the indignity of being treated as social inferiors, by higher civil servants, if they are in government service, or even by men of their own rank. The same claim is made by men who have been educated in Indian universities, and have entered one of the professions, or become enrolled among the very large number of Indian civil servants, who crowd all the departments of the administration, except in the very highest ranks. These men, and other edu-

cated Indians, complain of the "arrogance and pride" of their British colleagues; who on their side point out that they are rarely or never invited to the houses of Indians; that in most cases the difference in point of view, of social customs, and household arrangements and family life makes the admission of Indians to anything beyond formal intercourse almost impossible.

1907-1921.—All-India Moslem League.—Mohammedan loyalty to the British government.—New factor in Indian politics.—Rapprochement between Moslems and Hindus.—Khalifat Association.—"On December 30th . . . [1907] a Mahomedan Conference, in session at Dacca, the capital of the newly-created Province of Eastern Bengal, departing absolutely from its traditions, openly discussed the question of the protection of Mahomedan interests from a political standpoint, and finally carried unanimously a motion for the formation of an 'All-India Moslem League' to promote among the Mahomedans of India feelings of loyalty to the British Government, and to remove any misconceptions that may arise as to the intentions of Government with regard to any of its measures; to protect and to advance the political rights and interests of the Mahomedans of India, and respectfully to represent their needs and aspirations to Government, and to prevent the rise among Mahomedans in India of any feelings of hostility towards other communities, without prejudice to the other objects of the League. A strong Provisional Committee was formed, with power to add to its number, and the joint secretaries appointed were the Nawabs Vicar-ul-mulk and Mohsin-ul-mulk, two of the most important members of the Mahomedan community in India and men of great intellectual capacity. The Committee was charged to frame a constitution within a period of four months, and further to convene a meeting of Indian Mahomedans at a suitable time and place to lay the constitution before such meeting for final approval and adoption. The Rubicon has been crossed; the Mahomedans of India have forsaken the shades of retirement for the political arena; henceforth a new factor in Indian politics has to be reckoned with."—E. E. Lang, *All-India Moslem League (Contemporary Review, Sept., 1907)*.—"In India, Moslems continued for a long while in sullen and inactive subjection to the British crown. They refused, . . . to take advantage of the modern education, by means of which the Hindus forged ahead. Jealousy of the Hindus and their predominance led the Moslems to give steady support to the British Government, that by its aid they might be able to hold their own against the encroachments of the Hindus. The first Mohammedan leaders adhered to a programme of loyalty to the British and development under their ægis. The leaders following Sayid Ahmad Khan were Justice Amir Ali, president of the London-All India Moslem League; Ali Khan, president of the Central League; His Highness Aga Khan, chief of the Bohrah sect of Ismieliyahs of Bombay; and the Prince of Arcot in Southern India. This All-India Moslem League, intended to include all sects, has provincial leagues and a council in London designed to act upon the Imperial Government. It has developed ardour and enthusiasm and manifested considerable activity. It wishes to make a common

language for all Indian Moslems, possibly the Urdu. The government, in a reform scheme, gave representation to the people in the Legislative Council and in other official bodies. Moslems took advantage of these privileges and became members of the High Councils. In order to be prepared for their new status, they are seriously seeking modern education and making progress. Of late many influences have combined to arouse the political aspirations of the Moslem people. The Pan-Islamic influences of the Sultan, hajjis, and dervishes, the active press, the critical condition of the Moslem world, and the rapid influx of new political ideas have caused a sudden change. A new party has been formed which is strongly nationalistic. It is composed, for the most part, of lawyers, editors, and teachers of the younger generation. They have forced the adoption by the Moslem Leagues of a programme calling for 'political and religious unity with Turkey and the outer Islamic world,' and for the freedom of Islamic races and countries from the rule of alien and Christian governments. This thesis is one upon which theoretically modernists and Pan-Islamists, politicians and dervishes, editors and Ulama can agree. But later the Nationalists, undeterred by the resignation of their old leaders, and by the anarchistic tendencies and outbreaks of the Hindus, reached an understanding with the Hindu National Congress, sinking their religious differences and giving adhesion to the motto, 'India for the Indians' (*International Review of Missions*, 1914, p. 34). The newly organized League passed resolutions severely disapproving of the course of the British Government concerning Turkey and Persia in 1910. The state of feeling was becoming more embittered. Everything was critically regarded. An example of this was seen just before the war. In order to open a new street, a fountain which was used for ablutions was removed. This was declared to be an insult to Islam and was made the occasion of riot and loss of life. The fountain was rebuilt by the government on a new level. The *rapprochement* of Moslems and Hindus and adjustment of their programmes does not indicate any widening of religious outlook, but simply a temporary sinking of them for political purposes. Indeed, the attitude of both races is reactionary, rejecting the idea of the superiority of Christian civilization, except in physical science and its applications, and exalting the worth of all things Indian. It opposes the movement of Neo-Islam to graft European law and ideas on Islam, but rather would renew confidence in the old religion as in all things of their own."—S. G. Wilson, *Modern movements among Moslems*, pp. 229, 230.—"The political leaders [of the Mohammedans] had fallen into line in the Indian National Congress and the All-India Moslem League during the 1916 and 1917 sessions, when they united in demanding Home Rule for India, and they had united since then in rejecting as totally inadequate the scheme of reforms foreshadowed in the Montagu-Chelmsford Report. But not till towards the conclusion of the war did the Mahomedan Extremists discover a special grievance for their own community in the peace terms likely to be imposed upon a beaten Turkey. . . . The agitation was at first very artificial, for the bulk of Indian Mahomedans had until recent years known very little about and taken still less interest in Turkey, and their loyalty had never wavered during the war. . . . But the long delay on the part of the Allies in formulating their Turkish peace terms allowed time for the movement to grow and to carry with it the more fanatical element amongst Indian Mahomedans. The Govern-

ment of India tried in vain to allay Mahomedan feeling by receiving deputations from the *Khilafat* [Khalifat] Association founded to prosecute an intensified campaign in favour of Turkey, and professing its own deep anxiety to procure what it called 'a just peace with Turkey.' . . . The greatest success which the *Khilafat* agitators achieved was when Mr. Gandhi allowed himself to be persuaded by them that the movement was a splendid manifestation of religious faith, as he himself described it to me. For, once satisfied that the cause which they had taken up was a religious cause, he was prepared to make it his own without inquiring too closely into its historical or political justification. . . . Whilst Mahomedans proved their emancipation from narrow sectarianism by joining the *Satyagraha* movement of passive resistance in spite of the Hindu character impressed upon it by its sanscrit name, it was, he declared, for Hindus to show that they, too, could rise above ancient prejudice and resentment by throwing themselves heart and soul into the *Khilafat* movement. Both movements were to be demonstrations of the 'soul-force' of India, to be put forth in passive resistance according to his favourite doctrine of *Ahimsa*, the endurance and not the infliction of suffering."—V. Chirol, *India, old and new*, pp. 173, 174.

1908-1909.—Passage of the Indian Councils Bill by British parliament.—Popular representation in legislative councils introduced.—Appointment of native member of viceroy's executive council.—The great project of reform in the government of India which Lord Morley, as secretary for India in the British administration, brought before Parliament in December, 1908, embodied fundamentally in what was known during the discussion of it as the Indian Councils Bill, had its origin more than two years before that time, not in the councils of the British ministry, but in those of the government of India. "They included the appointment of one Indian member each to the viceroy's executive council and to the executive councils of Bengal, Madras and Bombay, and of two Indian members to the secretary of state's council in London. The Act also greatly extended the size and scope of the legislative councils, that for the whole Indian Empire being raised to a maximum of sixty members, and those for the provinces being in general considerably more than doubled. On all these councils except that of the governor-general the non-official members became a majority, and the number of those elected was multiplied by four. The electorates were arranged so as to give representation to various classes, industrial interests and religions, and not on a flat qualification as in Europe. The legislative councils received enlarged powers of criticizing government proposals, both financial and general, but the executive retained the right to disregard their advice should it see fit. The reform was therefore in the direction of representative, but not by any means of responsible, government. A Press Act followed to give effect to the complementary repressive side of the Morley policy."—J. A. Williamson, *Short history of British expansion*, p. 593.—A fortnight after the passage of the bill, Lord Morley exercised the authority of the Crown, and appointed Satyendra Prasanna Sinha, advocate general of Bengal, as the first native member of the executive council.

1911.—Reversal of partition of Bengal.—“In one respect the good result [of the partition of Bengal] was complete and permanent. The agitation that had sprung up over Lord Curzon’s partition of Bengal had taken the rest of India entirely by surprise. No one had hitherto supposed that the population was sentimentally attached to the idea of being included in one compartment of British administration rather than another; and to find such a rearrangement as that carried out by Lord Curzon giving rise to a great popular grievance was a revelation. . . . It is certain that no sentiment of the kind was in existence when . . . Bengal [was taken over], nor for long afterwards. . . . Still, a standing agitation was an undesirable feature in Indian public life; and the Government of India, in addressing Lord Crewe, made no secret of the fact that, in proposing their changes, one of their principal motives was to allay the ill-feeling that had been set up by the partition among the Bengali population. From this point of view let it be said the measure was entirely successful. The Bengalis hailed the announcement with delight. Their leaders were naturally exultant at having prevailed after they had practically given up hope; when His Majesty the King visited Calcutta a few weeks after the Durbar, he was received with a rapturous demonstration of loyalty. So carried away were the Bengalis by the turned tide of sentiment that not a murmur was heard against the fresh partition that was introduced hand in hand with the revocation of the old—the separation of Behar and Orissa, and their amalgamation into a new Province at the expense of Bengal. [The Bengalis were reunited: Behar, Chota, Nagpur and Orissa were united to form a province, and Assam became another.]

“The framing of the 1911 scheme was thus essentially a vindication of Lord Curzon’s policy. . . . Lord Curzon rightly judged that, if the business were not tackled then, it would force itself upon the Government in a few years at latest; and, reluctant as the Government of India must have been in 1911 to launch out on another redistribution, it was obliged to accept his conclusion.”—*India under Lord Hardinge* (*Quarterly Review*, July, 1916).

1912-1922.—Industrial revolution.—Growth of export trade.—Influence of railways.—Effect of World War upon finance.—Duties on cotton and other imports.—“The outstanding characteristic dominating all the aspects of India’s economic life during the last three decades has been that the country has been passing through an industrial revolution, similar in many respects to the one which took place in England during the early part of the last century, and later in the other countries of Western Europe. During this period, India has been in a state of transition from the old archaic economic order to the new and reorganised order, typified by that prevailing in England. Though the transformation is still in its earlier stages, the change, which has already taken place, is most striking. In 1802, when the first signs of this industrial revolution were just beginning to be perceptible, the late Mr. Ranade, the pioneer economist in India, described the economic condi-

tions of the country in the following words: ‘With us an average individual man is, to a large extent, the very antipodes of the Economical man. The Family and the Caste are more powerful than the Individual in determining his position in life. Self-interest in the shape of the desire of Wealth is not absent, but it is not the only nor the principal motor. The Pursuit of Wealth is not the only ideal aimed at. There is neither the desire nor the aptitude for free and unlimited competition except within certain predetermined grooves or groups. Custom and State Regulation are far more powerful than Competition, and Status more decisive in its influence than Contract. Neither Capital nor Labour is mobile, and enterprising and intelligent enough to shift from place to place. Wages and Profit are fixed and not elastic and responsive to change of circumstances. Population follows its own Law, being cut down by disease and famine, while Production is almost stationary.’ . . . Twenty years later, Sir Theodore Morison writes, ‘Production upon Western lines has hardly been attempted for more than the life-time of one generation, but within that short space it has made a most promising beginning, and in the last twenty-five years the progress achieved has been amazingly rapid.’ During this period, the railway mileage nearly doubled, and both he and Prof. Radhakamal Mukerji show how the development of the railways broke down the economic isolation and self-sufficiency of the village. ‘Rural society is no longer solely dependent upon its own resources for supplying its needs. Secure of access to the large European markets, the cultivator no longer dreads that a bumper harvest will so glut his petty local mart that his produce cannot be sold at all. . . . The substitution of money for barter and payment in kind is a familiar symptom of the transition from the old to the new economic order; it is now in full operation in India.’ . . . ‘Thus the sudden introduction of competition into an economic unit which had from time immemorial followed custom has wrought a mighty change.’ The growing tendency to migrate to the trade and industrial centres has been another feature of this economic transformation. . . . During 1909-10 to 1913-14, the quinquennium preceding the outbreak of the war, India’s foreign sea-borne trade expanded somewhat rapidly, and the expansion was most marked in 1912-13 and 1913-14. . . . The demands of . . . [foreign] industrial populations for foodstuffs and raw materials produced in any part of the world benefited agricultural countries like India. . . . [The outbreak of the World War was followed by a financial crisis.] However, the stability of the Indian exchange was maintained, owing to the measures taken by the Government. . . . During 1915-16 the effects of the crisis brought about by the outbreak of the war disappeared substantially, the trade adjusted itself to some extent to the new conditions, and a sort of war equilibrium, although an unstable one, was established. . . . During 1916-17 the famine in tonnage became . . . serious, and at the close of the year the freights rose to 14 times their pre-war level. The rates from Bombay to London at the end of 1916-17, as compared with those at the close of 1915-16, rose by 90 per cent, and the rates from Calcutta 60 per cent; the rates to the Far East also increased. . . . The demand for Indian produce and manufactures for war purposes became keen, and developed in intensity during the following years of the war without any consideration of their prices. As the export of these articles possessed a supreme im-

portance from the point of view of the conduct of the war, the Government of India had to take special measures to facilitate these exports, and exported a large value of these articles on its own account. In regard to the import trade, Japan and the U. S. A. began . . . to secure the custom entirely lost by Germany and Austria, and to an appreciable extent by the United Kingdom on account of her concentration upon the war. Hence, the value of India's overseas trade in 1916-17 showed a substantial increase as compared with that in 1915-16. . . . At the beginning of this century, 20 per cent of India's exports were taken by the United Kingdom, 25 per cent by Continental Europe, 24 per cent by the Far East, 7 per cent by the U. S. A., and the remaining 15 per cent by other countries. By 1914 the share of the United Kingdom had fallen to 24 per cent, and that of Continental Europe had increased to 29 per cent, the Far East took 17 per cent, mainly owing to a large decrease in the export of opium and cotton yarns to China, the U. S. A. 9 per cent, and other countries 21 per cent. Germany, which stood third in the list of India's customers in 1900, taking . . . [£5,000,000] of Indian produce, attained the second rank in 1914, next only to the United Kingdom, importing £17.5 million of India's produce. . . . Till the closing decades of the 19th century, although a freedom of trade prevailed since 1813, the other nations did not make any special efforts to develop direct trade relations with India, and the United Kingdom carried on a considerable entrepot trade in Indian produce. . . . The situation, however, began to change from the closing decades of the last century. . . . Germany, which had . . . commenced a rapid industrial advance by 1800, led the way, and was followed by Japan, which redoubled her activities in this direction after the Russo-Japanese war. The U. S. A. and France also made similar endeavours, which, however, were not in any degree comparable with those made by Germany and Japan. The two former countries, to a considerable extent, remained content to deal with India through London, and to utilise the available English services. . . . Mercantile houses for conducting the import and export business were established by Germany, Japan and Austria at the chief Indian ports, Calcutta, Bombay, Karachi, Madras and Rangoon. It is true that the main object in organising these houses was to push the wares of the respective countries in the Indian market, but the houses directed their attention also to the export trade, and it should be noted that before the war India continued to export more to these countries than to import from them. . . . From the beginning of this century up to the commencement of the war, India's import trade, like her export trade, showed a tendency towards a diversion from the United Kingdom to Continental Europe, especially Germany, [to] the U. S. A. [and] Japan. . . . In 1800-1900 the share of the United Kingdom in India's import trade was 69 per cent, while those of Germany, the U. S. A. and Japan were quite small. . . . By 1913-1914 the share of the United Kingdom had fallen to 64 per cent, while those of Germany, Japan and the U. S. A. had increased to 6.9, 2.6 and 2.6 per cent respectively. . . . [Germany also, with cheaper goods, aided by national organizations gained a foothold in the bazaars, and was rapidly increasing her bazaar trade.] During the war goods of Germany were entirely eliminated from the Indian market. They were, however, replaced not by those of the United Kingdom but by those of Japan and the

U. S. A., which, in addition, enormously increased their exports to India, and secured a substantial part of the market exclusively held by the United Kingdom before the war. . . . The war made them realise fully the value of the Indian market, and a new spirit began to pervade their organisations. It could be translated into practice, chiefly because both these countries, Japan from the first, and the U. S. A. from 1917, enjoyed all the privileges of being Allies, without the handicaps and difficulties, which the European Allies had to contend with. . . . Both Japan and the U. S. A. sent commercial travellers and inquiry agents, who travelled in all the parts of India, studying the Indian requirements. . . . Both the countries established a number of export and import houses, with branches in the important seaport towns [while Japan established retail stores in all large Indian towns]. . . . The U. S. A. and Japan, . . . have made material inroads into the staple trades of the United Kingdom with India, the former into the metallurgical and the latter into the textile trades. . . . The competition of the U. S. A. and Japan has revolutionized the buying methods in India. Before the war, the United Kingdom possessed a virtual monopoly of the Indian market in many articles, and could depend upon getting at home all the orders of the Indian dealers and the managing agents of the various industries, as they had buying connections with the United Kingdom only. But, during the war, the connections with her had to be abandoned, or became considerably weakened, while similar connections with Japan and the U.S.A. were formed and strengthened, and these two countries are doing their best to foster them. . . .

"The industrial movement was not very successful before the war, and even the so-called swadeshi movement for the support of the indigenous industries died away in a comparatively short time. Thus, at the outbreak of the war, India's industries were few in number, and consisted of textile factories for the working up of a part of the home-grown supplies of cotton and jute, and to a less extent, of wool and silk; railway workshops, collieries, and a few engineering works at the chief ports, obtaining all their supplies of steel from other countries; a small number of flour and paper mills; a few tanneries producing chiefly half-tanned leather for export; some rice and oil mills. [Hand looms provided employment for about two million people in weaving.] Pig iron was being produced in fairly large quantities by the Bengal Iron and Steel Company for some years before, but its efforts to manufacture steel had been unsuccessful; while the Tata Iron and Steel Company had commenced operations only in 1912, and was contending with numerous difficulties. Moreover a large proportion of these factories, with the notable exception of the cotton factories, were owned and managed by non-Indians. . . . During the war India's industrial position underwent a remarkable change. To-day, there is a considerable industrial activity in the country, . . . the direct result of the war. . . . During the war all the military requirements of cotton textiles in the East were supplied by the Indian mills. . . . Further, the war has left the mills in a strong financial position, large extensions have been planned, and are being carried out. Some mills have already employed highly trained chemists, and are developing their bleaching and dyeing processes in a very scientific way. A beginning has also been made in the manufacture of textile machinery and mill stores in India. . . .

The jute industry enjoyed a continuous and unprecedented prosperity during the war, and underwent a substantial expansion owing to the large demands on the part of the Allies. . . . The development of the iron and steel industry during the war was remarkable. . . . While the Tata Iron and Steel Company was struggling with considerable difficulties in the production of steel in 1914, by the end of the war, its production of steel reached the figure of 17,000 tons per month, and the rolling mills produced 120,000 tons of rails and smaller sections yearly. . . . Thus, the position of the Company has been revolutionized by the war, . . . [while other iron and steel companies have expanded their plants, or founded new ones]. The development of Indian industries during the war was largely due to the stimulus afforded by the wide activities and the large purchases of the Indian Munitions Board. This Board was created at the beginning of 1917 as a Department of the Government of India . . . [to provide for the] immediate supply of the requirements of the Allied armies in the eastern theatres of war. . . . It also promoted the development of Indian industries in several ways, such as the direct purchase in India of all the articles required by the army, the civil departments, and the railways; the diversion, wherever possible, . . . of all the orders of private importers for articles from the United Kingdom and other countries, to manufacturers in India; the grant of assistance to individuals or firms in India, who wished to import plant or machinery, and to engage . . . [foreign] technical experts and skilled labor . . . in order to establish new industries or to expand the existing ones; and the collection and dissemination of industrial information through an Intelligence Branch, and . . . assistance to individuals or firms prepared to establish new industries in the country. . . . The war converted the budgeted Central surplus of £1.2 million for 1914-15 into a deficit of £1.8 million, and in the budget for 1915-16, a deficit of £2.8 million was anticipated. It was decided to meet these deficits by temporary borrowing, and no additional taxation was resorted to. . . . In the budget for 1916-17, however, it was decided to obtain larger revenues from the customs and the consequential changes in the excise duties on liquors, an increase of the income-tax and an enhancement of the salt duty. The general import tariff since 1894 had been at the rate of 5 per cent ad valorem. It was now raised to 7½ per cent ad valorem, except in the case of sugar, . . . which was raised to 10 per cent. The list of articles free from duty was materially curtailed, but some of the articles withdrawn from the list were to pay a duty of 2½ per cent only. . . . The special rates of duty charged upon the import of certain articles, such as arms, liquor and tobacco, were raised . . . [but] the duty of 3½ per cent on the import of cotton manufactures was left unchanged. Since 1806 the import of cotton twists and yarns had been free of duty, while a duty of 3½ per cent had been imposed on woven goods of all kinds, whether imported or manufactured in Indian mills. This position was left untouched. Lastly, an export duty on two important staples, tea and jute, was imposed. . . . The reduction in the import of sugar during the war stimulated the Indian sugar industry. . . . The export duties on tea and jute were satisfactory, as both these industries were specially prosperous during the war. Further, jute could well bear this duty on account of the fact that India possesses a monopoly of this product. . . . The de-

cision to leave the position of the cotton manufactures unchanged gave rise to a long public controversy. Before 1882, there was a small import duty for revenue purposes on all imported goods. The establishment of cotton factories in India in 1877 led the House of Commons to pass a resolution to the effect that 'In the opinion of this House, the duties now levied upon the cotton manufactures imported into India, being protective in their nature, are contrary to sound commercial policy and should be repealed without delay.' Another similar resolution was passed in 1879, and in 1882 all import duties, including those on piecegoods, were abolished. . . . In 1896, the state of Indian finances rendered it necessary to re-impose the import duties, and the Secretary of State, as a result of the pressure exerted by the House of Commons, levied a countervailing excise duty of 3½ per cent on all cloth manufactured in India by steam power. . . . This position continued till 1916, when as mentioned above, although the import duties were raised in all other directions, the duty on cotton goods was left alone. . . . The Finance Member explained that the Government of India had not failed to represent its view that the import duties on cotton goods also should be substantially raised, while the cotton excise duties should be left alone, and should be abolished, when financial circumstances became more favourable. But His Majesty's Government replied that, 'the raising of this question at the present time would be most unfortunate, as it would provoke a revival of old controversies, at a time when they specially desire to avoid all contentious questions both in India and England, and might prejudice the ultimate settlement of the large issues raised by the war. His Majesty's Government feel that the fiscal relationship of all parts of the Empire as between one another and the rest of the world must be reconsidered after the war, and they desire to leave the question raised by the cotton duties to be considered then, in connection with the general fiscal policy, which may be thought best for the Empire, and the share, military and financial, that has been taken by India in the present struggle.'—S. G. Panandikar, *Economic consequences of the war for India*, pp. 27-29, 35-36, 38, 40, 41, 65-67, 68-69, 74-75, 81, 86, 101-106, 109-111, 223, 225-228.—See also TARIFF: 1919-1920: World-wide tariff tendency.

1914-1918.—Part played in World War.—'By the end of the second year of the war, nearly 80,000 British officers and men, and 210,000 Indian officers and men, all fully trained and equipped, had been despatched overseas. From the very first day, it was the policy of the Government of India to give readily to the Home Government of everything it possessed, whether troops or war materials. August 1914 found the Indian Army at war strength, the magazines full, and the equipment complete to the prescribed standard. . . . After the starting of operations in Mesopotamia, India's own needs became pressing, and the results of her previous sacrifices were severely felt. Some of her best troops had been taken; there had been a heavy drain on all supplies. . . . As a natural result, the Indian military machine showed signs of breaking down under the strain. The Report of the Mesopotamia Commission

proved how inadequate was the 'frontier war' standard in face of the crushing burden placed upon it by unforeseen circumstances. But by the time that Report was published, the Indian Headquarters Staff had been strengthened, the military machine had adapted itself to the new situation, and as a result of the brilliant campaign of Sir Stanley Maude, Baghdad was captured and a series of heavy defeats were inflicted upon the Turks. . . . The efforts made by India in the war of man-power have greatly surpassed all expectations. At the outbreak of the war, there were some 80,000 British officers and men in India, and some 230,000 Indian ranks, combatants and non-combatants. During the war, the Government of India recruited on a voluntary basis over 800,000 combatants, and more than 400,000 non-combatants, giving a grand total of about 1.3 million men. . . . In order to secure the rally of all India's resources to the Empire's assistance, a War Conference was held at Delhi from April 27th to 20th, 1918. Certain Ruling Chiefs were asked to attend, as well as all the non-official members of the Imperial Legislative Council. The Central Government also invited the Provincial Governments to send delegates of all shades of opinion. The object of the Conference was to invite the co-operation of all classes, first, in sinking domestic dissensions and in bringing about a cessation of political propaganda during the present crisis; secondly, in concerting measures for the successful prosecution of the war, with special reference to man-power and the development of Indian resources; and thirdly, in cheerfully bearing the sacrifices demanded for the achievement of victory. . . . The response of the Conference was immediate. The lead given by the English officials was heartily followed by the English and Indian non-officials. Committees were appointed on man-power and on resources, which made recommendations with the object of furnishing increased provisions of men, munitions and money. . . . The impetus which the Delhi Conference, and the organisations set up in consequence of it, gave to the war effort of India, was very remarkable. In man-power, in particular, the results surpassed all expectations. . . . It must not, however, be forgotten that British India is far from furnishing the only recruiting ground for the Indian army. . . . In 1914, twenty-seven Indian States had contingents of Imperial Service Troops, and these were without exception offered for service overseas in the first weeks of the war. . . . All these have been on active service in France, in Mesopotamia, in Salonica, in Egypt, in East Africa, and on the North-West Frontier and on duty in India. The States were later invited to allow their troops to be incorporated during the war in the regular army. . . . Special mention must be made of the assistance rendered to the Empire by . . . [its] ally Nepal. More than one-sixth of the total population belonging to the martial classes between the ages of 18 and 35 . . . [was] given to the colours. . . . It is not only in man power that India has made a great effort during the war. In view of her poverty, her financial contributions have been very considerable. There are rigid limits to the taxable capacity of India, leaving out of consideration the fact that three-quarters of the population depends upon agriculture, and hence upon the incidence of the monsoon, for its means of livelihood. As a result of these two factors, the expansion of direct taxation, a primary element in the war finance of Great Britain and her Dominions, has been very difficult in India. Despite

this disadvantage, the financial assistance which India . . . rendered in the war has been substantial. In the first place comes expenditure in the way of military services. The cost of military expeditions sent outside India does not normally fall upon the Indian Exchequer; but in compliance with a request made by the Government of India, it was decided that India should continue to pay the normal pre-war cost of maintaining those of her troops sent overseas, while the extra expenditure involved was met by the Imperial Government. That this burden . . . [was] no light one, is proved by the fact that the net expenditure on military services . . . [rose] from about £20 millions in 1912-13 to about £30 millions in 1917-18. Nor was India content with rendering this assistance, considerable as it is in light of the fact that her annual revenue for the . . . [six pre-war years] averaged less than £100 millions. In September 1918, . . . the non-official members of the Imperial Legislative Council accepted by a large majority a proposal that India should take over as from April 1st, 1918 the normal cost of 200,000 more men than she was then paying for. The effect of this decision was to raise the number of troops, for the normal cost of which India . . . [was] responsible, from the ordinary peace strength of 160,000, to the substantial figure of 360,000. At the same time, it was agreed that from April 1st, 1919 the normal cost of 100,000 men more should be taken over. Fortunately, as it turned out, the cessation of hostilities rendered this unnecessary. It was estimated that these charges would work out to a grand total of £45 millions, but owing to the fact that the war terminated more speedily than was anticipated, the actual cost to India up to the end of the period under review was some £12 millions [which was raised by a war loan].—L. 1917-1919.—Monetary crisis.—Loans by United States.—In 1917-1919 the government of India was compelled to coin 700 million rupees, to cover the absorption which was taking place with monotonous regularity. "At the beginning of 1918, the silver position was very grave. The Secretary of State continued to purchase as much silver as possible to provide for the coinage of this huge quantity of rupees, but the decrease in the world output of silver, combined with a jealous economy of gold and silver reserves among the Allies and the neutral countries, not only induced a very high price, but also made it impossible to obtain more than a limited quantity in the open market. Meanwhile, the absorption of rupees in India was proceeding with a monotonous

regularity. At the end of March 1918, the silver balances available had been brought down to about Rs. 100 millions. . . . As an emergency measure arrangements had been made for the temporary opening of a branch of the Royal Mint in Bombay for the purpose of converting into currency the stocks of gold held in India. As this was not yet in a position to commence operations, a distinctive Indian gold coin, namely a Gold Mohur or 15 rupee piece, was meanwhile coined and put into circulation. . . . [Bad news from France in April 1918 brought a run on the currency office.] The Controller of Currency scraped together every rupee that could be spared from other parts of India, and the run gradually abated. Every obtainable ounce of silver was poured into the mints, which worked night and day. Yet by the end of the first week of June, the rupee reserve had diminished to a little more than Rs. 40 millions. Meanwhile special measures had been taken to obtain from the United States of America a release of some portion of that country's immense silver reserve. In February 1918, the United States Government arranged to sell India 6 million ounces of silver. When the crisis became more acute in April, they offered another 2 million ounces and by the speedy passing of a Bill subsequently known as the Pittman Act, made it possible to withdraw silver certificates and to borrow from the Treasury the greater part of its dollar reserve of 375 million ounces of fine silver. Early in June 1918 . . . the United States Government consented to let us have 200 million ounces of silver on generous terms. . . . By the beginning of July 1918, American shipments of silver began to arrive in large quantities, and during the succeeding months, a position of relative safety was gradually reached. By the end of September, the stock of rupees had risen to more than Rs. 120 millions."—L. F. R. Williams, *India in the years 1917-1918*, pp. 78-79.

1918-1920.—Home Rule for India.—Montagu-Chelmsford proposals.—Indian counter-proposals.—Passage of government of India Act (1919).—In 1918 Lord Chelmsford, then viceroy, and E. S. Montagu, Secretary of State for India, had been appointed to make a report which would embody proposals for administrative and legislative concessions, which might safely be granted to India, as a token of appreciation of India's participation in the war. "The object of Mr. Montagu's visit was to determine, on the spot and in consultation with the Viceroy, what steps should be taken in the direction of establishing in India government responsible to the peoples of the various provinces."—H. V. Lovett, *History of the Indian national movement*, p. 151.—"The Report was accorded a mixed reception—more mixed in India than in England. The more conservative section of the British community in India condemned the proposals as being likely to undermine British authority in the dependency. On the other hand, some British residents thought well of the scheme, and, moreover, averred that progress along some such lines as those laid down by the distinguished authors was inevitable in

the near future. In England the Report was for the most part very favourably received. The most remarkable effect of the issue of the Report was, however, that it completely split the Indian Nationalist Party into two sections. A group of moderate politicians, led by Sir Ragendra N. Mookerjee, Sir Krisna Gupta, Mr. Surendranath Banerjee and others, accepted the Report. But a group of extremists, led by Mr. Tilak, and including the majority of the prominent members of the . . . Indian National Congress [and also including Mrs. Annie Besant] . . . demanded that the British Government should permit a much further and more rapid advance towards the ideal of self-government. In the result, the Moderates felt compelled to withdraw from the Indian National Congress, in which body they were evidently in a weak minority. . . . A session of the Congress was held in Bombay in August, and another session was held at Delhi at the end of December. The Moderates held a separate Congress at Bombay in November under the presidency of Mr. Banerjee. The extremists declared that complete responsible government ought to be bestowed upon the separate provinces at the end of six years, and upon Hindustan as a whole at the end of fifteen years. At the Delhi Congress a resolution was passed appointing Mr. Tilak, Mr. Gandhi, and Mr. H. Imam as delegates of India to the Paris Peace Conference, the idea being that India should appeal to the Allied and Associated Powers as a whole, over the head of the London Government. The Congress also claimed the right of self-determination for India, with the immediate grant of full provincial autonomy. . . . At the beginning of the year much discussion arose concerning reform in Burma. In the Montagu-Chelmsford Report it was proposed that Burma should be excluded from the scheme of reform on the ground that the people of Burma were entirely distinct ethnographically from those of India proper. . . . At the end of January a Conference of Ruling Princes of India was held at Delhi. The object of the Conference was to consider the relations of the native States to the Government of India under the Montagu-Chelmsford Reform Scheme, and about forty princes attended the Congress. . . . The subject which gave rise to the longest discussion was the proposal in the Reform Scheme to divide the native States into two categories, those possessing 'full powers' of internal government and those not having such powers. The Report proposed the institution of a Council of Princes, which might be called by the Viceroy to deliberate conjointly with the proposed Council of State (practically the Upper House of the Indian Legislature). . . . [The proposal for the council of the princes received general support. In the following December the question of membership in the council was announced by the government.] It was stated that the rulers of all States entitled to a permanent dynastic salute of eleven guns or over would be entitled as a right to membership of the council. The lesser States would receive proportionate representation. The regulation in regard to salutes would include about eighty princes, but it was proposed to confer a similar honour upon a number of other princes, bringing the total . . . to over a hundred."—*Annual Register*, 1919, pp. 256-259; 261.—"On November 17, 1919, the Joint Committee of Lords and Commons appointed to consider the Government of India Bill presented its report. The amendments it proposed to the bill were accepted *en bloc* by the Coalition Government, without the alteration of

even a comma. The bill so amended passed the House of Commons on December 5 and, being approved by the House of Lords, became a law before the Christmas holidays [*i.e.* Dec. 23, 1919]. This fact lends special weight to the report of the committee, in which are discussed not only the provisions of the bill but also the principles which should guide Parliament, the Secretary of State, the Government of India and the provincial governments under the new constitution. Though the constitution is avowedly a transitional one, and though, with a changed Government at Whitehall, its years may be even fewer than its authors anticipate, the report is yet a historical document of the first magnitude."—B. Houghton, *Reform in India (Political Science Quarterly, Dec., 1920)*.—"During the autumn [of 1919] a committee headed by Lord Selborne had continued to take testimony relative to the measure. Among others, representatives of the Moderate party of India, the Indian National Congress, the All-Indian Moslem League, the National Home Rule League, the Madras Labor Union and the non-Brahmans of Madras, were heard. Opposed to the bill were the British in India who desired to continue their monopoly of privilege; the non-Brahmans who feared the development of an oligarchy of the priestly caste; the extreme nationalists, who regarded it as at best a weak compromise; and, finally, those who, while believing in democracy, felt that the people of India were not sufficiently trained for self-government. In discussing the measure before the House of Commons Mr. E. S. Montagu, Secretary of State for India, stated explicitly that it did not pretend to give to India a constitution that would be permanent. It was transitional—a bridge between government by the agents of Parliament and government by the representatives of the peoples of India. Its object, he declared, was to start India upon the road to responsible self-government by transferring to the people's representatives in India certain functions of government, reserving other functions to be handed over gradually as the people became capable of assuming responsibility. Lord Sinha, Under Secretary for India, voiced the same opinion."—H. J. Carman and E. D. Graper, *Political Science Quarterly, 1920, Supplement, pp. 103-104*.—See also BRITISH EMPIRE: League of Nations.

1919.—Promulgation of anti-sedition bills.—Protests and disturbances.—Amritsar incident.—Hunter Commission.—"In January 1919 the Government of India announced their intention of proceeding with the legislation recommended by the Sedition Committee on the opening of the February sessions of the Imperial Legislative Council. They published two draft Bills to be permanent in operation which embodied the Committee's recommendations. One Bill included the alterations proposed in the permanent law. The other, which was by far the more important, detailed the emergency legislation. . . . Outside the Council, Extremist leaders and journalists spared no pains to incite bitter agitation. They were joined, unfortunately, by Mr. Gandhi, who sent to the Press a pledge signed by numerous persons of his way of thinking, declaring that if the Sedition Bills became law they would 'civilly refuse to obey these laws and such other laws as a committee to be hereafter appointed might think fit.' They further affirmed that in this struggle they would 'faithfully follow the truth and refrain from violence to life, person, or property.' This, however, was going too far for

the Moderates. It was pointed out at once in a leading Moderate paper that the principle involved in the pledge was extremely dangerous and might lead anywhere, and on March 15th the Moderate leaders at Delhi issued a manifesto expressing disapproval of passive resistance. They did not, however, alter their own attitude toward the Bill, and the Extremist agitation continued. . . . While preparations were thus sedulously made for certain trouble, Mr. Gandhi, at the head of his committee of disciples, proclaimed a general closing of shops and suspension of business activity for March 30th. Subsequently he altered the day to April 6th; but on the former date occurred the first of a succession of tragedies more grievous in their nature and results than any that had befallen India since the days of the Mutiny. . . . The people of Delhi had been attentive to the recent controversial debates, and from subsequent occurrences it would seem that care was taken to intensify the impressions which they had received. The Legislative Council had broken up, and the heads of the Government of India had left Delhi, when on the morning of March 30th the shops of the city were closed as a protest against the passage of the Sedition Bill. Some shopkeepers who opened were induced to close again, and crowds in the streets exerted themselves to persuade drivers of cars to take their vehicles home, leaving passengers to walk. About 1.30 p.m. a crowd assembled outside the railway station, and some members thereof entered and attempted to prevent the railway contractor who was supplying food to third-class passengers from carrying out his duties. He was told that he must recognise the *hartâl* (stoppage of business). On refusing, he was assaulted. Two of his assailants were arrested; [riots followed; the military were called in; eight men were killed and twelve or thirteen were wounded]. Three days later a poster was discovered in the city inciting to murder. For some days shops were closed. Railway traffic, too, was obstructed. These incidents were the prelude to disturbances in other cities of India. . . . In Calcutta riots resulted in loss of life and injury to police officials. There, however, all was speedily over, and no disturbance occurred anywhere else in Bengal, the province which was the main cause of the anti-sedition legislation, but for which there would have been no such law-making. . . . The disturbances at Amritsar . . . [in the Punjab was] still more serious. Two leading lawyer agitators . . . [were] deported on the morning of . . . [April] 10th by order of the Local Government. This led to an immediate suspension of business. A mob collected and attempted to enter the civil lines, where they at once attacked the telegraph office. It was necessary to fire before they could be turned back. Sections then went to the railway goods shed and murdered a European guard. In the city they burnt and plundered the National Bank, murdering the British agents in charge thereof. They sacked another bank, murdered the agent, burnt the town hall and the Indian Christian Church, attacked buildings, and violently assaulted other Europeans, including two ladies. But for the action of some loyal Indians they would have done more. They destroyed telegraph wires and tore up railway lines. Some degree of order was restored; but the country round was greatly disturbed, and on the 13th, in Amritsar, a prohibited meeting was attended by a large crowd. This was dispersed by rifle fire with heavy casualties. Martial law was declared in Lahore and Amritsar on the 15th. But disorder

had spread to other towns and to villages adjoining towns. Wires were cut; railway lines were breached; two churches were burnt; Government property was attacked; Europeans were assaulted. By the 17th martial law was in working order in four districts. Afterwards it was extended to a wider area. By degrees order was re-established."—V. Lovett, *History of the Indian nationalist movement*, pp. 202, 206-209, 214-215.—In addition to the outbreaks at Amritsar and Lahore others had occurred on April 10th at Ahmedabad; on the 11th at Bombay; on the 12th at Viramgam and Kasur, and on the 14th at Gujranwala. "A great deal of discussion was caused both in India and in England by the severity with which General Dyer had suppressed the rioting in Amritsar on April 13. General Dyer had subsequently been deprived of his command, and the Imperial Government appointed a committee under the Chairmanship of Lord Hunter to investigate the whole question of the disturbances. The incident which had caused special criticism was the manner in which General Dyer fired upon a crowd which had collected in a space known as the Jallianwala Bagh in Amritsar on April 13. The Hunter Committee, comprised, besides the Chairman, four other British members, and three Indian members. The English members presented a majority Report which condemned General Dyer's actions, and the Indians presented a minority Report which condemned General Dyer in more severe terms. It transpired that the crowd in the Jallianwala Bagh, though very large and riotous (it numbered about 15,000 persons), and although assembled contrary to a public proclamation, was unarmed. In order to disperse this crowd General Dyer, in command of a small force, fired ball cartridge into the mob without giving the people a preliminary warning to disperse. He continued to fire for ten minutes, and about 370 persons were killed and about three times that number were wounded. The British Government and the Government of India agreed with the Hunter Committee in holding that force was used with undue severity. General Dyer on his side said that in the very critical situation then existing, it was necessary to make an impression not only in Amritsar but in the Punjab generally. The impression made in India by the Amritsar incident was undoubtedly very bad, and many moderate Indian politicians were estranged from the ruling race. But among the British community in India General Dyer had many sympathizers."—*Annual Register*, 1920, pp. 273-274.—As it was decided that General Dyer could not again be profitably employed, he was retired from the army.

1919 (May-August).—War with Afghanistan. See AFGHANISTAN: 1919.

1919-1922.—Sikh unrest.—"The agitation connected with the Rowlatt Act in 1919 and the subsequent Jallianwala Bagh tragedy affected the Sikhs, but not as much as it did other communities. On the other hand, the enquiry made by the Hunter Committee, and the flood of recriminative oratory which was poured forth during and after that enquiry, swept many of the educated Sikhs off their feet. In spite of this, up to the end of 1920 the mass of the Sikhs still kept apart. . . . [But, the fact that the rewards actually granted for services in the World War did not come up to expectation caused great dissatisfaction, and] is one of the causes of their sudden falling away. . . . The Muslim community had in past years kept entirely aloof from this anti-British agitation just as the Sikhs were doing, but the defection of the Ali brothers and their following

gave some ground for the allegations that the Muslims had joined the Hindus to form a national party. That party could not be truly national until the Sikhs joined it. For this reason, and also because the defection of the Sikhs would be a very serious blow to the British Government, introducing as it would an element of weakness into the Indian Army, a very intense campaign was opened against Sikh loyalty in 1920. . . . [It was aided by agitation on the subject of temple services. The] question of the removal from shrines of bad Mahants had been agitated for some time, but . . . in view of the reforms the Government was not willing to consider legislation till the new Councils had come into being. The more hot-headed among the Sikhs became impatient. Towards the middle of 1920 a band of them seized a part of the Golden Temple. . . . The self-formed committee of management very soon assumed powers over all Gurdwaras and called itself the *Shromani Gurdwara Parbandhak Committee*, which may be translated 'The Honourable General Committee for the Management of Gurdwaras.' . . . Volunteers were called for, and bands of men were formed to take possession of other Gurdwaras, the Mahants of which were deemed to be objectionable. These bands of men were called Akalis, . . . 'belonging to the Immortal.' . . . [Their duties were to eject Mahants, and take possession of gurdwaras and their treasures.] To help the Akalis to reform the shrines, or to help the Mahants to retain them, would have seemed like interference in the religious belief of one or other of these factions. Government, therefore, kept apart from the dispute, leaving it to the Mahants' party, or to the Akalis, to take such legal action as they wished. . . . [Unrest grew meantime, and] towards the end of 1920 a stormy meeting of the Sikh League, a purely political body, was held at Lahore. The upshot was a decision that the Sikhs should throw in their lot with the Hindus and Muslims. . . . [This decision affected mainly the town Sikhs.] In January, 1921, a famous shrine at Tarn Taran, near Amritsar, was taken in spite of resistance, and there was bloodshed, two men being killed. . . . The position was now becoming very difficult, and a solution was being sought by which the genuine religious aspirations of the Sikh, who formed the rank and file of the movement might be satisfied, [when an attack was made at Nankana. The mahant who had been forewarned was prepared, and 130 men were entrapped and slain.] . . . Effective military measures were taken by Government to prevent further seizures of shrines, and a Bill was hastily drawn up by which an enquiry could be made as to the property in shrines and an *ad interim* committee of management could be appointed. That Bill was rejected by the Sikh leaders. The control of the movement was now entirely political. . . . The movement was no longer a purely provincial movement, it was an all-India movement. The Sikhs were now being directed by outsiders . . . and these men wanted time. . . . It is a misuse of language to call this state of affairs a religious agitation. . . . The first signs of discontent were visible as far back as 1907, and were due to outside influence. At the end of 1913 a regular campaign against Sikh loyalty was begun. This movement had its headquarters in America, and ended in the abortive conspiracy of 1915 (the Ghadr conspiracy). Then came the attack of the Hindu Congress and the Muslim League, which captured the Sikh political organisation at the end of 1920. From the ground thus gained the joint forces, now completely unmasked, are attacking British rule in India."—

1921.—Changes in administration by Government of India Act.—Summary of act.—“Great changes were made in the system of government in British India by the Government of India Act, 1919, which, together with the rules framed under it—almost as important in their provisions as the Act itself—came into general operation in January 1921. The Act was the outcome of . . . [the Montagu-Chelmsford enquiry and report on Indian constitutional reform, supplemented by the reports] of two Committees which toured India in the winter of 1918-19, and which issued their Reports in the spring of 1919. A third Committee was appointed during the latter year to make recommendations for the modification of the system of administration of Indian affairs in the United Kingdom, and issued their Report while the Government of India Bill was under examination by a Joint Select Committee of both Houses of Parliament. The Joint Select Committee in their turn issued an exhaustive Report on the Bill, which was passed in a form practically identical with that recommended by the Joint Committee, and received the Royal Assent on the 23rd December 1919. . . . [Under the act in Madras, Bombay, Bengal, the United Provinces of Agra and Oudh, the Punjab, Bihar and Orissa,] the executive Government is a dual organism [dyarchy] which owes its unity to the Governor. One half of ‘the organism consists of the Governor and his executive Council, all of whom are appointed by the King. This body is responsible for the administration of those subjects which are ‘reserved.’ The other half of the executive organism is the Governor acting with the advice of Ministers who are appointed by him, hold office during his pleasure, and must be elected members of the Provincial Legislative Council. To the Governor acting with Ministers is entrusted the administration of ‘transferred’ subjects. . . . The framers of the Act of 1919 had a twofold object in view. Their primary object was to devise a plan which would render possible the introduction by successive stages of a system of responsible government in British India. . . . No attempt was made . . . to limit the field open to the Indian Legislature, which still retains a concurrent (though not an overriding) power of legislation for the affairs of the provinces in general . . . but the rules under the Act provide specifically for the exercise of this right in certain specified provincial matters, and the theory upon which the Act proceeds assumes that a convention will be established and rigorously observed which will confine intervention by the Indian Legislature in provincial affairs to matters so specified. . . . The ‘revenues of India’—or, rather, their sources—are definitely divided

between the Central and Provincial Governments; the Provincial Governments have now almost complete control over the administration of their ‘allocated’ revenues, and their right, subject in certain cases to the Governor-General’s sanction, to initiate new taxation measures is formally recognised. It was found impossible to devise any scheme of allocation of revenues between the Central and Provincial Governments which did not leave the former with a deficit. This deficit is to be met in part by an annual contribution from seven of the eight Governors’ provinces, the province of Bihar and Orissa, . . . having been exempted. . . . The first steps towards responsibility were to transform the Provincial Legislative Council into a body of sufficient size and with a sufficiently large elected majority . . . (70 per cent. as a minimum) to represent adequately public opinion in the province, and to create an electorate. The first franchise rules have given the vote to about 5,000,000 of the adult male population, and have enabled the Legislative Council of any ‘Governor’s province’ to extend the franchise to women. . . . The electorates in each province are arranged for the most part on a basis which is designed to give separate representation to the various races, communities, and special interests into which the diverse elements of the Indian population naturally range themselves. . . . Of the 94 constituencies in Bengal, all but nine (those representing the University and Commerce and Industry) are arranged on a territorial basis, *i.e.*, each constituency consists of a group of electors, having the prescribed qualifications which entitle them to a vote in a constituency of that class, who inhabit a particular area. The normal area for a ‘Muhammadan’ or ‘non-Muhammadan’ constituency is a district . . . of rural constituencies, . . . [or] a group of adjacent municipal towns. Some large towns form urban constituencies by themselves, and the City of Calcutta provides eight separate constituencies, six ‘non-Muhammadan’ and two ‘Muhammadan.’ . . . Throughout the electoral rules there runs a general classification of the various kinds of constituencies into two broad categories, those which are designed to represent special interests, such as Landholders, Universities, Planters or Commerce being described as ‘special’ constituencies, and those which are based on a racial distinction—Muhammadan, European, Sikh, etc.—being known as ‘general’ constituencies. . . . The qualifications for electors (and consequently for candidates) vary in detail from province to province. . . . Generally speaking, both in rural and urban areas the franchise is based on a property qualification. . . . Although the Legislative Councils . . . had steadily acquired a more and more representative character and a large share of the normal functions of a legislative assembly as generally understood. . . . The most important changes made by the Act of 1919 in the powers of the Provincial Councils were—(i) the power to vote (and consequently to withhold) supplies; (ii) a greatly enhanced freedom of initiation in the matter of legislation; and (iii) power to frame their own rules of procedure in matters of detail, subject to the Governor’s concurrence. A further right . . . [to be acquired] after four years from the time of their commencement is the right [of the Councils] to elect their own President. At the outset the President . . . [was to be] nominated by the Governor, but from the start every Council . . . [had] an elected Deputy President. The Governor (who formerly was *ex-officio* President of his Legislative Council) no longer has any di-

rect connection with its proceedings. The first-named of these newly acquired powers is of sufficient importance to require a detailed explanation of its scope, which can best be given in the terms of the Act itself. '72D.—(1) The provisions contained in this section shall have effect with respect to business and procedure in governors' legislative councils. (2) The estimated annual expenditure and revenue of the province shall be laid in the form of a statement before the council in each year, and the proposals of the local government for the appropriation of provincial revenues and other moneys in any year shall be submitted to the vote of the council in the form of demands for grants. The council may assent, or refuse its assent, to a demand, or may reduce the amount therein referred to either by a reduction of the whole grant or by the omission or reduction of any of the items of expenditure of which the grant is composed:—Provided that—(a) the local government shall have power, in relation to any such demand, to act as if it had been assented to, notwithstanding the withholding of such assent or the reduction of the amount therein referred to, if the demand relates to a reserved subject, and the governor certifies that the expenditure provided for by the demand is essential to the discharge of his responsibility for the subject; and (b) the governor shall have power in cases of emergency to authorise such expenditure as may be in his opinion necessary for the safety or tranquillity of the province, or for the carrying on of any department; and (c) no proposal for the appropriation of any such revenues or other moneys for any purpose shall be made except on the recommendation of the governor, communicated to the council. . . . [From this subsection (c)] (i) contributions payable by the local government to the Governor-General in Council; and (ii) interest and sinking fund charges on loans; and (iii) expenditure of which the amount is prescribed by or under any law; and (iv) salaries and pensions of persons appointed by or with the approval of His Majesty or by the Secretary of State in Council; and (v) salaries of judges of the high court of the province and of the advocate-general [are excepted]. If any question arises whether any proposed appropriation of moneys does or does not relate to the above heads of expenditure, the decision of the governor shall be final. . . .

"The rules under the act prescribe a list of 20 subjects which are transferred to the administration of the Governor acting with Ministers, the more important of which are Local Self-Government, Medical Administration, Public Health, Education (with certain reservations), Public Works, Agriculture, Excise, and Development of Industries. The 'reserved' subjects comprise all those in the list of 'provincial' (as distinct from 'central') subjects which are not transferred. . . . No change has been made by the Act of 1919 in the machinery and methods of administration by the Governor in Council; decisions are taken at the Council Board, as before, by a majority vote, and the Governor is entitled, as before, to overrule such a vote in certain specified circumstances if he disagrees with it. For such decisions the Governor in Council remains, as before, responsible to the Secretary of State and Parliament, and on questions of legislation and supply he has the power of enforcing them despite opposition by a majority of the Legislative Council. But, the whole spirit of the Act and the existence of a large non-official elected majority in every Provincial Legislative Council is an im-

portant factor in determining the policy to be pursued by the official half of the Government in its administration of reserved subjects. A further and not less important factor is the existence in the Government, side by side with the Executive Council, of two or more Ministers appointed from the elected members of the legislature, who, though they are not charged by law with, and in fact are legally absolved from, any responsibility for decisions on matters outside the transferred sphere, . . . are expected, to make their opinions felt by their colleagues in the Executive Council. But these factors . . . are not intended to obscure the responsibility to Parliament in the last resort of the Governor in Council for the administration of reserved subjects and the right of His Majesty's Government, and of the Secretary of State as a member thereof, to lay down and require the observance of any principles which they regard as having the support of Parliament, and, in the last resort, of the British electorate. . . . With regard to transferred subjects the position is very different. Here there has been an actual transfer of control from the British elector and the British Parliament to the elector and the Legislative Council in the Indian province. The provincial subjects of administration are grouped into portfolios, and . . . each Minister is directly responsible for the administration of those particular transferred 'departments' which are included in his portfolio. But his responsibility lies, . . . to the Provincial Legislative Council of which he is an elected member and from which he is selected by the Governor as commanding or likely to command the support of the majority of that body. He holds office during the Governor's pleasure, but his retention of office is contingent on his ability to retain the confidence not only of the Governor, but also of the Legislative Council, upon whose vote he is directly dependent for his salary. Further, the control of the Legislative Council over transferred subjects, both as regards supplies and legislation, is almost entirely free from restrictions. . . . The Governor, who is not, of course, subject to removal from office by the Legislative Council, is charged personally with responsibility for the peace and tranquillity of his province, and would be entitled, and indeed bound, to recommend the removal of a department from the transferred list if he found the legislature bent on pursuing a policy in its administration which, in his judgment, was incompatible with the maintenance of peace and tranquillity; yet the powers of control vested in the Legislative Council over the transferred sphere are undoubtedly great. . . . The terms of the Act leave the apportionment of the provincial revenues between the two halves, of the executive for the financing of reserved and transferred subjects respectively to be settled by rules, merely providing that rules may be made 'for the allocation of revenues or moneys for the purpose of such 'administration' i.e., 'the administration of transferred subjects by the Governor acting with Ministers.' Probably the best description available of the method adopted by the rules for the settlement of this matter is the recommendation of the Joint Select Committee whose proposals have been followed with one modification only to enable the Governor to revoke at any time, at the desire of his Council and Ministers an 'order of allocation' or to modify it in accordance with their joint wishes. . . . The only concrete changes made in the constitution of the Central Government are the removal of the statutory bar to the appointment of more than six members of the

Governor-General's Executive Council (which, however, has had the far-reaching consequence that three of the eight members of the Council are now Indians), and the reconstitution in a much more enlarged, representative and independent form of the central legislature. . . . This body was, in origin, like all other legislative bodies in India, the Governor-General's Executive Council with the addition of certain 'additional members' appointed to assist the Executive Council in the formulation of legislation. Despite its steady growth in size and influence, and despite the introduction of the elective system, the existence of 'additional members,' who . . . under Lord Morley's Act greatly preponderated in numbers . . . the Executive Councilors, still persisted up to the passing of the Act of 1910. That Act, however, has entirely remodelled the 'Indian Legislature,' as it is now called, which has become, like the Legislative Council in a Governor's province a legislature with all the inherent powers ordinarily attributed to such a body save such as are specifically withheld by the terms of the Act. It consists of two Chambers. The Upper Chamber, or 'Council of State,' contains 60 members, of whom 34 are elected, . . . and 26 nominated, of whom not more than 20 may be officials. The Lower Chamber, or 'Legislative Assembly,' consists of 144 members, of whom 104 are elected (including as in the case of the Council of State, one Berar member, who, though actually elected, is technically a nominee). Of the 40 nominated members, 26 are required to be officials. The members of the Governor-General's Executive Council are not *ex-officio* members of either Chamber, but each of them has to be appointed a member of one or other Chamber, and can vote only in the Chamber of which he is a member. Any member of the Executive Council, may, however, speak in either Chamber. The President of the Upper Chamber is a nominee of the Governor-General. . . . The normal lifetime of each Council of State is five years, and of each Legislative Assembly three years; but either Chamber, or both simultaneously, may be dissolved at any time by the Governor-General. . . .

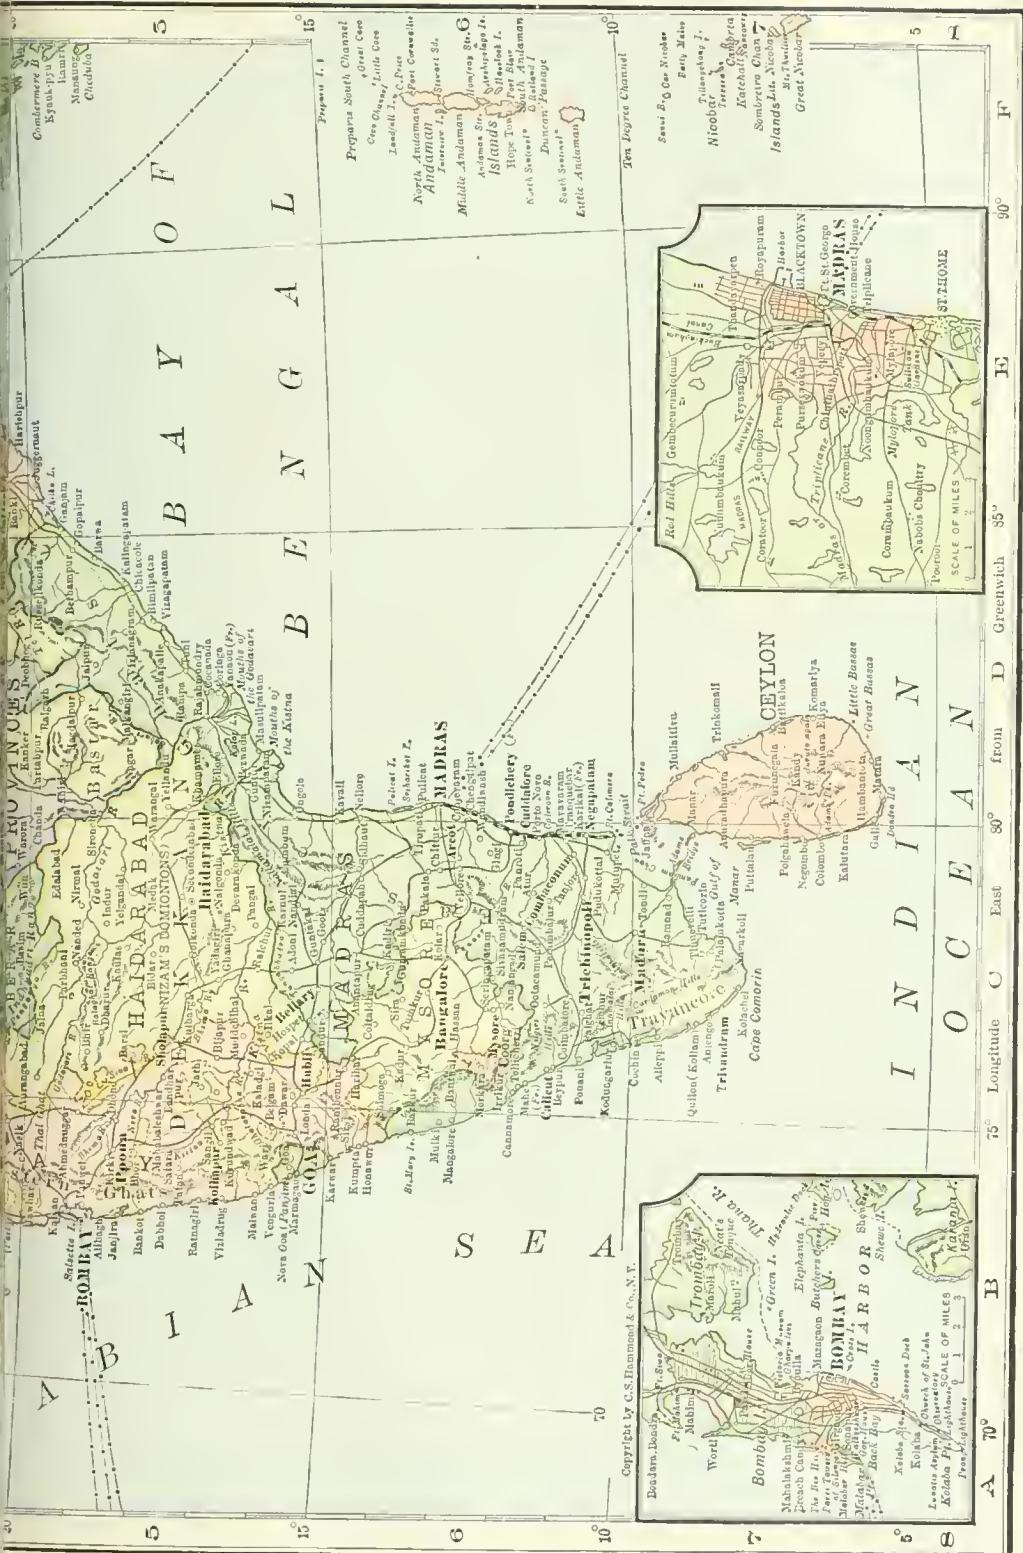

"The method of election for both Chambers is direct, and although the number of electors is considerably smaller than for the Provincial Councils it is a great advance on the very restricted and for the most part indirect franchise established under the Act of 1909. . . . Generally speaking, the electoral scheme for the Lower Chamber is on the same model as that for the Provincial Councils already described, except that, *firstly*, the property qualification for voters (and consequently for candidates) is higher in order to obtain manageable constituencies, and past service with the colours is not *per se* a qualification for the franchise, and *secondly*, that the constituencies necessarily cover a considerably larger area than constituencies for the Provincial Council. The distribution of seats in both Chambers, and the arrangement of constituencies, are on a provincial basis; that is, a fixed number of the elective seats in each Chamber is assigned to representatives of each province, and these representatives are elected by constituencies covering an assigned area of the province. . . . The general result of the first franchise arrangements under the Act is thus that there is in each province a body of electors qualified to vote for, and stand for election to, the Provincial Council, and that a selected number of these voters are qualified to vote for and stand for election to those seats in the Legislative Assembly which are assigned to the province. The

qualifications for candidature for the Legislative Assembly are the same in each province, *mutatis mutandis*, as for candidature for the Provincial Council, except that in all provinces, so long as the candidate can show that he resides somewhere within the province, no closer connection with his particular constituency is insisted upon. The franchise for the Council of State differs in character from that for the Provincial Council and the Legislative Assembly. The concern of the framers of the Act and rules was to secure for the membership of this body a character as closely as possible approximating to a 'Senate of Elder Statesmen' and thus to constitute a body capable of performing the function of a 'true revising Chamber.' With this object, in addition, and as an alternative to a high property qualification—adopted as a rough and ready method of enfranchising only persons with a stake in the country—the rules admit as qualifications certain personal attributes which are likely to connote the possession of some past administrative experience or a high standard of intellectual attainment. Examples of these qualifications are past membership of either Chamber of the Legislature as now constituted, or of its predecessor, or of the Provincial Council the holding of high office in local bodies (district boards, municipalities and corporations), membership of the governing bodies of Universities, and the holding of titles conferred in recognition of Indian classical learning and literature. . . . The powers and duties of the Indian legislature differ but little in character within the 'central' sphere from those of the provincial Councils within their provincial sphere, and it has acquired the same right of voting supplies for the Central Government. But as no direct attempt has yet been made to introduce responsible government at the centre, the step in that direction having been avowedly confined to the provinces, and as consequently the Executive Government of India remains legally responsible as a whole for the proper fulfilment of its charge to the Secretary of State and Parliament, it follows that the powers conferred on provincial Governors to disregard an adverse vote of the Legislative Council on legislation or supplies are, as conferred on the Governor-General in his relationship with the Indian Legislature, less restricted in their operation than in the provinces; that is to say, they cover the whole field and are not confined in their application to categories of subjects. . . . The Act makes no structural changes in the part played by the India Office in the administration of Indian affairs. Slight alterations have been effected in the number and tenure of office of the members of the Secretary of State's Council, and some relaxations have been made in the statutory rigidity which formerly bound their procedure and that of the Office in general. But provisions now exist which will undoubtedly as time goes on have a material effect on the activities of the Office as it is now constituted. A High Commissioner for India has been appointed for the purpose of taking over, as the direct agent of the Government of India, that portion of India Office functions which is of the nature of agency, as distinct from administrative supervision and control. . . . Concurrently with this change, it is now possible to defray from British revenues the salaries of the Secretary of State and of the Parliamentary Under Secretary, and that portion of the cost of salaries of India Office staff and general maintenance which is attributable to the exercise of its administrative as distinct from purely agency functions. In due course the ap-

portionment to British estimates will be the cost of the India Office as it exists after the transfer of functions to the High Commissioner has been completely effected; then the salaries of the High Commissioner and his staff will be the only expenses in the United Kingdom chargeable to Indian revenues. . . . The Governor-General and the 'Executive' members of his Council are appointed by the Crown. No limit of time is specified for their tenure of office, but custom has fixed it at five years. There are seven Executive Members of Council. These Members hold respectively the portfolios of Land Revenue and Agriculture, the Home, the Finance and the Education Departments. The Law Member has charge of the Legislative Department, and a member with English official experience has charge of the Commerce and Industry Department. The Viceroy acts as his own member in charge of Foreign affairs. Railways are administered by a Board of three members, whose chairman has the status of a Secretary, and are under the general control of the Commerce and Industry Department. The Commander-in-Chief may also be and in practice always is, an 'extraordinary' member of the Council. He holds charge of the Army Department. The Governors of Madras, Bombay and Bengal become 'extraordinary' members if the Council meets within their Presidencies. . . . In regard to his own Department each Member of Council is largely in the position of a Minister of State, and has the final voice in ordinary departmental matters. But any question of special importance, and any matter in which it is proposed to over-rule the views of a Local Government, must ordinarily be referred to the Viceroy. . . . The keynote of the scheme is effective provincial autonomy and the establishment of an immediate measure of responsibility in the Provinces all of which are raised to the status of Governors in Council. This demanded a sharp division between Imperial and Provincial functions. . . . [The chief subjects reserved to the Government of India are] defence of India, and all matters connected with His Majesty's Naval, Military, and Air Forces in India, or with His Majesty's Indian Marine Service or with any other force raised in India, other than military and armed police wholly maintained by local Governments; [naval and military works, external relations, immigration and emigration; relations with states in India, political charges; railways, aircraft, waterways; shipping and navigation; lighthouse service; quarantine service and ports; posts; telegraphs and telephones; customs and revenues; currency and coinage; public debt; savings department; audit departments; civil, criminal and ecclesiastical law and police; commerce, banking, insurance, trading companies and associations; control of production and supply; development of industries; control of opium, petroleum and explosives; arms and munitions; mineral development; scientific research and surveys and technical and professional training; patents and copyright; census and statistics; all India services; territorial changes, other than inter-provincial; the Public Service Commission.]—S. Reed, ed., *Indian Year Book*, 1922, pp. 15-25.

1921-1922.—Inauguration of new government.—Esher report.—Khalifat agitation.—Moplah revolt.—Gandhi's leadership.—Non-coöperation.—"Inauguration of the new government, in accordance with the Montagu-Chelmsford reports, met with determined opposition from Nationalists under the leadership of M. Gandhi, anti-English agitator and a disciple of Tolstoy. At the Indian National Congress, held September 8, Gandhi's

program of passive resistance to the British was framed to include gradual withdrawal of children from schools and colleges owned, aided or controlled by the government; gradual boycott of British courts by lawyers and litigants and the establishment of private arbitration courts by them for settlement of disputes; refusal on the part of the military, clerical and laboring classes to offer themselves as recruits for service; withdrawal of Indians from Government service and positions of honor under the government; withdrawal by candidates of their candidature for elections to the Reformed Councils and refusal on the part of the electorate to vote for any candidates; and boycott of British goods. This plan, although it failed to meet with the success anticipated by its sponsor, intensified anti-British feeling. . . . Distrust of England was further aroused by the report of the Esher Committee, appointed in 1919 to inquire into the administration and organization of the Indian army. This committee's conclusions, apart from measures devised to grant liberal and sympathetic treatment to all ranks in the Indian army, to remove existing grievances and create new services, included the important recommendation that the ultimate authority of the Indian army be taken away from the authorities in India and transferred to the British chief of staff. The report was interpreted by the Indians as a scheme whereby the British government may use the Indian army to further its imperialistic adventures in the Near and Middle East. Despite all obstacles the new government was organized, appointment of governors being made in August. Sir William Meyer entered upon his duties as first High Commissioner for India on October 1, 1920."—*Political Science Quarterly*, 1920-1921, *Supplement*.—"The elections held in November and December, 1920, under the new constitutional scheme, passed off far more successfully than had been anticipated. Taking the ten legislative bodies collectively (two Chambers of the Indian Legislature and the eight provincial Councils) there were 774 seats to be filled by election and 1,957 candidates stood for them. There were contested elections for 535 of the 774 seats and for these 535 seats 1,778 candidates were forthcoming. In all Provinces the dearth of candidates was most marked in Mohammedan constituencies, particularly in the towns, and this was specially noticeable in the Bombay Presidency and in the Punjab. This must be attributed to the boycott which was largely advocated and adopted by Mohammedans as a protest against the Turkish peace terms. The Non-Brahmins were unexpectedly successful in the Madras Presidency, and the landholders secured a large proportion of the open seats in the Councils in which their apprehensions had been specially expressed—Bengal, the United Provinces, and Bihar and Orissa. In the formation of the new Provincial Governments, notable incidents were the appointment of Mr. Surendranath Banerjee as Minister in the Government of Bengal and of Lala Harkishan Lal as Minister in the Punjab. [Lord Sinha had been appointed governor of Bihar and Orissa.] The Provincial Legislative Councils were opened in January, and the All-India Legislative Assembly and Council of State and also the newly-constituted Chamber of Princes were opened by the Duke of Connaught in Delhi early in February. [See also DELHI: 1921.] His Royal Highness conveyed the greetings of His Majesty the King to the Princes of the Indian States and to all his subjects in India on the reaching of another epoch inaugurated by the Act of 1919, an Act designed to satisfy the growing desire of his Indian subjects for representative institutions and to make a definite step on the road

to self-government. The Duke of Connaught made a personal appeal to British and Indians to bury along with the dead past the mistakes and misunderstandings of the past and to work together to realise the hopes arising from that day.

"Non-co-operation with Government as a political force made rapid progress. Prosecutions in the cases of incitements to violence were instituted by Government with greater freedom, but attempts were made to redress genuine grievances. The 'repressive' laws and Press Acts were referred to a non-official Committee of the Legislature. The movement manifested itself in various forms—strikes, campaigns against the use of foreign cloth, an increase of racial feeling, a more virulent Khalifat agitation, attempts to seduce the police and the

MAHATMA GANDHI

army from their allegiance, and various outbreaks of mob violence. . . . Many disturbances, with serious loss of life, took place at various places in July. The Moplah rebellion, mentioned below, and the regrettable incidents connected with the reception of the Prince of Wales on November 17 at Bombay were followed by an increasing disregard for authority and necessitated drastic measures by Government, who authorised the application of the Seditious Meetings Act. In reply to a demand for a Round-Table Conference, put forward by the 'Moderates,' Lord Reading insisted on the necessity of the discontinuance of the unlawful activities of the non-co-operation party. . . . Mr. Gandhi announced that he reserved the right to continue during a Conference preparations for civil disobedience, etc., whilst putting forward conditions which the Government were asked to accept. The President, Sir Sankaran Nair, withdrew and Moderate opinion was . . . alienated. In August troops and po-

lice who were giving assistance to the district magistrate in Malabar, while he was making arrests of dangerous leaders, were attacked heavily at Tirurangadi by armed bodies of Moplahs. The cause of the outbreak was the excited state of religious fanaticism which had been aroused among the Moplahs who look upon all non-Moslems as Kafirs and have a great reverence for the Sultan as Khalif. The non-co-operation and Khalifat agitators had reached Malabar and carefully prepared the ground for the purpose of creating an atmosphere favourable to violence in the district. Some Europeans and many Hindus were murdered, Government offices were burnt and looted, records were destroyed, Hindu temples were sacked, the houses of Europeans and Hindus were burnt, and many Hindus were forcibly converted to Islam—all leading to a total collapse of civil Government and the possibility of famine in one of the most fertile tracts of South India. The crime and disorder ensuing on the outbreak necessitated the promulgation of martial law and severe military measures against the rebels. Up to December 9 the total number of Moplah casualties since the outbreak were: killed, 1,826; wounded, 1,500; captured 5,474; voluntary surrenders, 14,241. At the end of the year the rebels actively resisting were practically confined to two main gangs under chief leaders in the hills, with an estimated total of 700, and about seven scattered dacoit gangs in the north-eastern portion of the area, all of whom were fugitive and closely hunted. . . . On February 23 the Council of State adopted a Resolution recommending that the Government of India be granted full fiscal autonomy subject to the provisions of the Government of India Act. A Committee was appointed (with Sir Ibrahim Rahintulla as President) to examine, with reference to all the interests concerned, the tariff policy of the Government of India, including the question of adopting the principle of Imperial preference. . . . The Prince of Wales, . . . reached India on November 17. He landed at Bombay, where the general reception by the populace was enthusiastic, but in the Indian quarter there was serious rioting, traceable to the activities of the non-co-operators, and to intimidation by Gandhi's agents and Khalifat volunteers. In Poona the Prince was joyfully received, but at Allahabad and Ajmere the population remained indoors. The *hartal* declared on the day of the Prince's arrival at Calcutta was partially successful, but it soon broke down."—*Annual Register, 1921, pp. 275-277.*

The Moplah rebellion was in 1921 the most serious result of the nationalist movement under the leadership of M. R. Gandhi. Gandhi continued to advocate Tolstoy's passive resistance to the law, and non-co-operation to which he added civil disobedience to authority, without violence, and swadeshi. He went about making bonfires of foreign cloth, and both on the platform and through the native journals endeavored to press his doctrines home to the people, and to undermine the authority of the British. In this latter effort he was greatly assisted by the wrath of the Moslem leaders over the treaty of Sèvres. "Non-co-operation was launched by Gandhi in 1920 to obtain adequate redress for what he believed to be two great wrongs—the Amritsar slayings and the Turkish treaty. In other words, besides his own national grievance, Gandhi took up the cause of the Mohammedans. His program called for the voluntary renunciation of British titles held by Indians, for refusal to volunteer for army service in Mesopotamia, for the boycott of British courts, schools and public functions; for non-co-operation in political life. It called on the Hindu people to refuse

to buy British cloth, and to return to the old spinning wheel of the time of the Vedas. Gandhi himself went from place to place making bonfires of great piles of foreign cloth. Various lieutenants of his were arrested and imprisoned; Gandhi himself, until now, had gone untouched. The policy of the Indian Government, as explained by Mr.

ing warned Gandhi that they would be arrested if they persisted in this preaching of sedition. Gandhi promised that he would persuade them to keep within the law. Subsequently they were arrested and tried on long-standing sedition charges. Gandhi still remained immune, while the 'die-hards' in the British Commons were clamoring for his

MADAME GANDHI

Teaching native women to weave as part of non-coöperative policy of her husband

Montagu and other Indian officials, has been to let the whole movement of non-co-operation fall of its own weight. Those seeing the effect might say that it has proved itself to be a lighter-than-air machine. Soon after Lord Reading took over the Viceregal power, he and Gandhi had an interview, which resulted in no agreement. When the Ali brothers [two of the Mohammedan leaders] grew violent in their public addresses, Lord Read-

arrest, and for the resignation of Montagu, to whom they assigned responsibility for this dangerous policy of allowing the chief instigator and trouble maker to go untouched."—*New York Times Current History*, Apr., 1922, pp. 6-7.—"Lajpat Rai, one of Gandhi's lieutenants and also Gandhi's son received prison sentences [in December, 1921]. By resolution of the Indian National Congress on December 29 Gandhi was given sole

executive authority over all Nationalists' activities in India. Early in February, in what practically amounted to an ultimatum to the Viceroy, he offered to postpone mass civil disobedience on condition that the Viceroy liberate all political prisoners within a week and restore liberty of association and freedom of the press. In reply the Viceroy declined to discuss, much less to accept, the proposal and intimated that sterner rule would be introduced. Meanwhile arrests and rioting continued. On February 4 the police post at Chauri was stormed by Nationalist volunteers and seventeen officials were killed; by the middle of the month the situation was so menacing in Madras that all Europeans were enrolled as special constables by order of the government. Mob fury and violence horrified Gandhi and on February 14, the Executive (Working) Committee of the Indian National Congress, in a statement deploring mob spirit and mob methods, suspended civil disobedience and instructed local committees to advise cultivators to pay their tax obligations. That the congressional resolution was not strictly obeyed was evident from the serious outbreak at Assam on February 20, from the continued intimidation of tax-collectors and the burning of crops in the Calcutta region, from the increasing hostility to British officials over large areas in the United Provinces and Behar, from the growing bitterness of the Sikhs, and from the rebellious attitude displayed by the Khalifatists in the Punjab. Alarmed by the course of events, the government on March 10 caused the arrest of Gandhi on the charge of sedition; he was subsequently sentenced to prison for a term of six years. . . . It is of political interest to note that the princes or native rulers of India stand almost solidly for British rule and against Gandhi and his movement."—*Political Science Quarterly*, 1922, *Supplement*, pp. 79-80.—A letter written by Gandhi from prison gives an excellent picture of the social and economic ideas held by this remarkable man. "If British rule were replaced tomorrow by Indian rule based on modern methods, India would be no better, except that she would be able then to retain some of the money that is drained away to England; but then India would become only a second or fifth nation of Europe or America. East and West can only really meet when the West has thrown overboard modern civilization almost in its entirety. They can also seemingly meet when the East has also adopted modern civilization, but that meeting would be an armed truce. Medical science is the concentrated essence of black magic. Quackery is infinitely preferable to what passes for high medical skill. Hospitals are the instruments that the devil has been using for his own purpose, in order to keep his hold in the kingdom. They perpetuate vice, misery, degradation and real slavery. If there were no hospitals for venereal diseases, or even for consumptives, we should have less consumption and less sexual vice among us. India should wear no machine-made clothing, whether it comes out of European mills or Indian mills. India's salvation consists in unlearning what she has learned during the past fifty years. The railways, telegraphs, hospitals, lawyers, doctors and such like have all to go, and the so-called upper classes have to learn to live religiously and deliberately the simple peasant life, knowing it to be a life giving true happiness. There was true wisdom in the sages of old having so regulated society as to limit the material condition of the people; the rude plow of perhaps 5,000 years ago is the plow of the husbandman today. Therein lies salvation. People live long under such conditions, in comparative peace, much greater than Europe has enjoyed

after having taken up modern activity."—*New York Times Current History*, Sept., 1922, pp. 1066-1067.—His absence from political activity tended to produce a greater degree of quiet than India had for some time enjoyed. Gandhi's chief weapon, Mohammedan dissatisfaction with the treatment of the Turk and uneasiness over the disposition of the political nemesis of E. J. Montagu, Secretary of State for India, who was requested to resign from office in consequence of having published a telegram which he had received from the Viceroy on the subject.—See also ENGLAND: 1922 (February-April).

"Recrudescence of racial antagonism . . . imported fresh difficulties into the whole scheme of constitutional evolution embodied in the Statute of 1919. Gandhi's original campaign was directed mainly against the Reforms themselves, and it completely failed. Non-Cooperation tried to kill them in the womb by boycotting the elections to the new Councils and terrorising all those who ventured to take part in them whether as electors or as candidates. It failed to do so, and it failed on the whole equally in its attempts to boycott the Law Courts of a Satanic Government and the Government schools and colleges and every form of Government service. Its appeal to the Western educated classes fell, in fact, almost entirely flat, and it was, indeed, only because it fell . . . so flat that it turned in desperation, but only too successfully, to the ignorant masses. The savage outbreaks which attended this new form of Non-Cooperation propaganda still further estranged the Indian Moderates, of whom many had themselves had a taste of Non-Cooperation violence during the elections. They knew that, if Non-Cooperation had its way, not only would the new representative institutions of which they had gained control be swept away, but that the whole country would be plunged into anarchy. Some of them, too, were now intimately associated under the Reforms scheme with the government and administration of the country, and were acquiring not only experience but some sense of responsibility with the possession for the first time of substantial political power. Thanks to the Reforms, there seemed, therefore, every reason to hope that, face to face with an agitation which the Moderates could not deny to be largely revolutionary, the 'politically-minded' classes would not be deterred by their old antagonism to a bureaucracy, no longer by any means dominant and, for the most part, genuinely anxious to work with them, from rallying wholeheartedly to the side of Government. Such hopes, it must, however, be admitted, were only partially fulfilled. The large Indian majority in the new popular Assemblies were ready to acknowledge that law and order must be maintained or restored. But they began to haver over the methods to be employed for that purpose. They jibbed at the old word 'repression,' though they did not deny that Non-Cooperators were in many cases actual, as well as potential, law-breakers, and that, if the law is to be maintained, law-breakers must be repressed. They deprecated rather than opposed. They were swayed by sentiment rather than by reason. . . . The first Indian Legislative Assembly elected under the new constitution has been confronted at Delhi in two successive years with the worst budgets on record, one showing a deficit of £18,000,000 and another a deficit of £22,000,000, and both involving heavy increases of taxation. If this were merely bad State finance, Indians might not have more reason to grumble than other people whose public finances are not always wisely administered. But what the Indians see and resent is that both the deficits put together represent less

than the loss inflicted upon India by a disastrous currency and exchange policy for which Government must bear the blame, even if it originated in Whitehall rather than in Delhi. Worse still, that policy was adopted on the recommendations of a special commission of inquiry against the whole weight of Indian evidence and the protests of the one Indian member who recorded his objections in a prophetic minute of dissent from the unanimous views of his eminent European colleagues. It was an attempt to take advantage of the artificial rise in the price of silver during the war in order to 'stabilise' the rupee at the exchange rate of 2s. After a temporary boom which sent the rupee up to 2s. 10d., the rupee proceeded to fall continuously, . . . and [in 1922 was] slightly below the old level of 1s. 4d. Not only did the Indian Exchequer suffer enormous losses on its own exchange operations, but the whole trade of India was paralysed, and, when Indian merchants, threatened in many cases with ruin, appealed to Government for compensation or help, . . . [they] were told that Government disclaimed all responsibility. . . . All this was, of course, grist to the Non-Cooperation mill, and conservative Indian merchants—*Bunnias* of Bombay and *Marwaris* of Calcutta—were easily persuaded to believe in the bitterness of their hearts that India's loss had filled the pockets of European financiers. . . . Add to these financial considerations the growing demand for the Indianisation of the Indian army, hitherto essentially a British fighting machine for which the Indians only furnish the raw material whilst executive command and administrative control remain entirely in British hands. This demand is partly the outcome of racial feeling, partly the expression of revived national consciousness. Many Indians realise that they cannot aspire to dominion self-government until they can protect as well as govern themselves. How, they ask, can they protect themselves until their army has been Indianised in the same measure as the Government and administration are already being rapidly Indianised? . . . Military expenditure is, it is true, a 'reserved' subject upon which, according to the latest opinion of the Law Officers of the Crown, the Viceroy himself has no authority to allow the Indian Legislature to vote in the present stage of constitutional evolution. But the powers which the Legislative Assembly already enjoys in regard to the granting or refusal of supplies when they involve increased taxation . . . are wide enough to enable it to bring very great pressure to bear indirectly upon Government. . . . [When the budget for 1922] showed the warning to have gone unheeded, it went much further. It cut down the estimate right and left, and if it did not perhaps always show wisdom in the selection of the items to be reduced, its action was none the less effective as a protest against extravagance, not only in the military but in every department. In the same spirit it rejected all increase in the salt tax and in the excise duty on Indian-made cotton cloth—both specially detested imposts—and it reduced other increases of taxation, though the Finance Member defended them as the only chance of restoring a budget equilibrium of which even then he could not guarantee the stability. The prolonged discussions, sometimes very heated, ended in a compromise both as to curtailed supplies and taxation, which [left] . . . the Government of India to face an uncovered deficit of over £9,000,000, though the profits (about £2,000,000) on the paper currency . . . [were] to be utilised for revenue purposes—a financial expedient of very doubtful

orthodoxy. It was agreed also that a Commission, . . . should overhaul public expenditure and methods of administration with a view to drastic retrenchment. . . . Under the Act of 1919, the Viceroy might of course have exercised the power still vested in him to restore the budget as presented by Sir Malcolm Hailey over the Assembly's head. . . . Lord Reading . . . realised, however, that this would have meant a conflict with the Indian Legislatures, not only in Delhi, but in the provinces where the local Governments are faced with equally acute difficulties in making both ends meet, and such a conflict would have grievously compromised the prospects of constitutional evolu-

RABINDRANATH TAGORE  
Poet, essayist and scholar

tion and done just what Non-Cooperation had tried and failed to do. It would have wrecked the new Legislatures and driven the Moderates back into the arms of the Extremists at the very moment when the latter had been badly worsted. Moreover, opposition to the budget had been by no means confined to Indians, and the elected European members of the Assembly, representing the great commercial communities, had been scarcely less critical than Indian colleagues. Even apart from the danger of a political conflict, Lord Reading's own judgment as a business man may well have told him that the Assembly, however unpalatable its action at the moment, had in reality done good service to India. . . . The limits of taxation in the old directions, when India was almost exclusively an agricultural country, have probably been reached. But India is becoming also a great industrial country; and, just as the war which compelled Government thoroughly to explore for the first time her immense natural resources, gave a vigorous impetus to their development for industrial and commercial purposes, the pressure of financial necessity may now compel Government to reconsider the incidence and distribution of taxation on lines better adapted to the new sources of wealth that are opening out. Less easy to justify is the demand put forward

for an acceleration of the stages of constitutional evolution which were laid down in the Act of 1919. It is doubtless meant chiefly as a counterblast to the Non-Cooperation demand for immediate *Swaraj* with a complete severance, explicit or implicit, of the British connexion; and unfortunately some Indian Moderates are more inclined to disarm popular impatience by yielding to clamour than to go on plodding away at the wearisome task of educating their electorates. . . . Equally unwise, too, seems the agitation for the more rapid Indianisation of the public services, of which one effect is to intensify the growing reluctance of young Englishmen to seek an Indian career. The fall in the value of the rupee and the enormous rise in the cost of living in India are in themselves sufficiently serious obstacles to recruitment into the Indian public services in [Great Britain]. . . . Add to these all the unpleasant reports as to the hostile atmosphere which Europeans have now to face, the eagerness of many British officials to avail themselves of the opportunity given to them of retiring at once on proportional pensions if they dislike the reforms, and the difficulty in the way of any guarantees for fixity of tenure, for prospects of promotion, and even for future rates of pay and pension when the domain of Indian self-government shall have expanded as it is bound to expand and may possibly expand very quickly, and one can understand, even if one deplures it, the fact that young Englishmen no longer care to enter for any branch of the Indian administration. The paucity—one might almost say the absence—of candidates for the Indian services at our chief Universities is already creating an alarming situation to which the more thoughtful Indians will, one must hope, speedily awaken. For even those who are now trying to force the pace admit that India cannot for a long time dispense with European assistance. Nor does she wish to do so. Yet there is a real danger that the supply from this country will have dried up long before there are enough Indians equipped to take the place of Englishmen."—V. Chirol, *Outlook in India* (*Quarterly Review*, July, 1922).

INDIAN TRAILS. See NEW YORK: Aboriginal inhabitants; TRAILS.

INDIANA, one of the middle western states of the United States, bounded on the north by Michigan; on the east by Ohio; on the south by Kentucky, from which it is separated by the Ohio river; on the west by Illinois. It has a total area of 36,354 square miles; an estimated population, 1920, of 2,930,390. It is known as the "Hoosier State." The traditional belief in Indiana is that the word "Hoosier" was first put in print by John Finley, in his poem "The Hoosier's Nest."

Resources.—Indiana, largely agricultural, has an area of 20,948,981 acres of which, 17,393,982 are improved land. The principal crops are tobacco, fruits, vegetables, and cereals. In 1921, the livestock industry had a total of 4,776,850 head, which consisted of 591,289 horses, 534,865 other cattle, 724,313 milch cows, 591,289 sheep, 2,238,618 swine, and 06,476 mules. The chief mineral products are coal, clay, cement, and stone. The coal-fields have an area of 6,500 square miles with an output, 1917, of 30,420,000 short tons, valued at \$11,000,000. The varied and extensive manufacturing industries turned out products, 1919, valued at \$1,901,846,000.—See also U. S. A.: Economic map.

1790-1795.—Indian War.—Disastrous expeditions of Harmar and St. Clair.—Wayne's decisive victory. See NORTHWEST TERRITORY OF UNITED STATES: 1790-1795.

1800.—Territory of Indiana organized. See NORTHWEST TERRITORY OF UNITED STATES: 1788-1802.

1800-1818.—Successive partitions of the territory.—Michigan and Illinois detached.—Admitted as state.—“Indiana Territory as originally organized [in 1800] . . . included the county of Knox, upon the Wabash, from which has sprung the State of Indiana; the county of St. Clair, on the Upper Mississippi, or Illinois River, from which has sprung the State of Illinois; and the county of Wayne, upon the Detroit River, from which has sprung the State of Michigan. [See also MICHIGAN: 1800-1802.] . . . At this time, the inhabitants contained in all of them did not amount to more than 5,640 souls. . . . By successive treaties, the Indian title was extinguished gradually to all the country lying upon the waters of the White River, and upon all the lower tributaries of the Wabash, upon the Little Wabash, the Kaskaskia, and east of the Mississippi, below the mouth of the Illinois. [See also MISSOURI: 1803-1812.] Thus, before the close of the year 1805, nearly all the southern half of the present State of Indiana, and one third of the State of Illinois, was open to the advance of the enterprising pioneer. . . . In 1807, the Federal government, in like manner, purchased from the Indians extensive regions west of Detroit River, and within the present State of Michigan, far beyond the limits of the white settlements in that quarter. Meantime, the settlements formerly comprised in Wayne county, having increased in inhabitants and importance, had been erected into a separate territorial government, known and designated as the ‘Territory of Michigan.’ On the 1st of July, 1805, the territory entered upon the first grade of territorial government, under the provisions of the ordinance of 1787; and William Hull, formerly a lieutenant in the Revolutionary army, was made the first governor. . . . Detroit . . . was made the seat of the territorial government. . . . By the close of the year 1808, the Indiana Territory east of the Wabash had received such an increase in numbers that it was desirable to assume the second grade of territorial government. Having a population of 5,000 free white males, Congress, with a view to a future state government, by an act approved February 3d, 1800, restricted its limits, and authorized a territorial Legislature. . . . The Indiana Territory, from this time, was bounded on the west by a line extending up the middle of the Wabash, from its mouth to Vincennes, and thence by a meridian due north to the southern extremity of Lake Michigan. On the north, it was bounded by the southern line of the Michigan Territory. That portion west of the Wabash was erected into a separate territorial government of the first grade, known and designated as the ‘Illinois Territory.’ The inhabitants of the Indiana Territory soon began to augment more rapidly. . . . In 1810 the people had increased in numbers to 24,500, and in the newly-erected Territory of Illinois there was an aggregate of 12,300 persons.” In 1811, the Indian tribes were crushed at the battle of Tippecanoe. In 1816 “it was

ascertained that the Indiana Territory possessed a population which entitled it to an independent state government. Congress authorized the election of a convention to form a state Constitution [and], the new ‘State of Indiana’ was formally admitted into the Union on the 10th of April, 1816.” (See also MISSISSIPPI: 1817.) Two years later, on December 3rd, 1818, the Territory of Illinois was similarly transformed and became one of the states of the Union.—J. W. Monette, *Discovery and settlement of the Mississippi valley*, v. 2, bk. 5, ch. 16.

1816.—First constitution.—Democratic features.—Education.—“There was nothing novel in the constitution. The political theory of these men was somewhat more democratic than that advocated by Jefferson. The constitution as finally adopted was a judicious compound of the constitutions of Ohio, Kentucky, and the United States. The first article, which was a bill of rights, restated the fundamental maxims of English government in almost the exact words of the Ohio law. Article II, dealing with the separation of powers, which is an exact copy of article I of the Kentucky constitution, divided the powers into executive, legislative, and judicial. There is only one different word—‘Indiana’ is used in place of ‘Kentucky.’ Article III, dealing with the legislative department, is a copy almost verbatim of the Ohio constitution. The date for state election is the first Monday of August, in preference to the Ohio [constitution], but senators were to serve three years, plainly a compromise between the two year term of Ohio and the four year term of Kentucky. The qualifications of representatives, 21 years of age, and senators, 25 years of age, were lower than in either State. Both had to be taxpayers, the same as in Ohio. The voting qualifications were expressed in the same words as in the Ohio law, the voter being required to be 21 years old, and one year a resident. Judged from our time, there were remarkably few officers to be chosen at public election. They were the members of the General Assembly, governor, lieutenant governor, associate circuit judges, sheriffs and coroners; the coroner and lieutenant governor being merely emergency offices to fill possible vacancies. Only three offices were thus filled by popular election, legislator, governor and sheriff. In harmony with the spirit of the times, nearly all power was placed in the hands of the General Assembly. The governor had only a suspensive veto, which could be overcome by a majority of each House. He appointed a few officers, principally judges of the supreme court, but always by and with the advice and approval of the Senate. All circuit judges, and the secretary, auditor and treasurer of State were chosen by the General Assembly. The most notable innovation in the Indiana constitution was Article IX, dealing with the subject of education. It has been noted that all the material differences between the Indiana and other constitutions were in favor of a wider democracy [in Indiana]. Ohio had taken a short, halting step in the direction of public education, but the Indiana convention is entitled to the distinction of having first recognized the governmental obligation of educating all its citizens. Of all the sections of the constitution the one requiring that the General Assembly provide by law for a general system of education,

ascending in a regular scale, from township schools to a State university, wherein tuition shall be gratis and equally open to all, was most democratic, and forward looking. It took a century to put this article into successful operation."—L. Esarey, *History of Indiana from its exploration to 1850*, pp. 219-220.—The constitution excluded slavery, although a law forbidding the immigration of negroes and mulattoes remained in force until after the Civil War. In 1825, Indianapolis was made the capital.

1831-1876.—**Extensive public improvements undertaken.—Bankruptcy.**—Growth of railroads.—“Governor Noble [1831-1837] was an advocate of extensive public improvements, having been elected on a platform declaration to that effect. He early began the construction of the Wabash and Erie Canal, for the promotion of which Congress had given, in 1827, a large and valuable grant of land. This canal was to connect Lake Erie with the Wabash River, . . . and in 1836, a general system of internal improvements having been agreed upon consisting of canals, railroads, and turnpikes, covering almost the entire state, bonds were issued and sold, and contracts let. . . . It was thought . . . that the revenues to be derived from the railroads and canals would not only pay for their construction, but would build up such a surplus in the treasury of the state as to relieve the people of . . . taxation. The improvements undertaken consisted of 1289 miles of roads, railroads, and canals at an estimated cost of \$19,914,424. . . . The states' indebtedness by 1841 had been pushed up to . . . \$18,469,146. The total of roads and canals completed up to that time amounted to only two hundred and eighty one miles. . . . It very soon became apparent that the state had overestimated its financial resources, and before a halt could be called had involved itself beyond its ability to pay. And to make matters worse, the pall of the great panic of 1837 descended upon the whole country, at the very time of the state's greatest embarrassment. All the works had to be abandoned. . . . The state found itself unable to pay even the interest, much less to proceed further with the improvements. It finally entered into compromise agreements with its creditors, relieving itself of a part of the debt and reducing the interest charges. The creditors were permitted to take over the unfinished improvements in part satisfaction of their claims, the balance being paid in new bonds or treasury notes. As a rule, the improvements were not completed by their new owners, and the state's vast expenditures were practically for naught. . . . The securities in the nature of bonds and certificates of stock, to possession of which the state was entitled under the compromise settlement, were not all surrendered, and afterwards attempts were made to exact payment of them. . . . In 1873, after years of agitation, . . . an amendment to the constitution was adopted prohibiting the legislature for all time from paying any of these compromised debts, particularly that of the Wabash and Erie Canal. Of all the vast projects undertaken by the state, the Madison and Indianapolis railroad alone was fully completed, its completion being accomplished by the assignee company to which the state surrendered it. It was the first railroad built to Indianapolis, its entrance into that city signaling the year 1847.”—E. E. Moore, *Century of Indiana*, pp. 127-129.—“In 1852 the state sold out its interest, and the road became entirely a private venture. Private building was so stimulated by this enterprise, that by 1850 there were seven roads with a total of 228 miles of track in the state.

In 1854 Indianapolis was the center from which lines ran to Madison, Terre Haute, Lafayette, Peru, and Bellefontaine, while most of the other important cities were reached by connecting lines. Indianapolis had become a real railway center with the first Union Station in the country opened in 1853, thru the efforts of Chauncey Rose, Oliver H. Smith, and John Brough. In this decade the railway expansion was enormous, for in 1860 there had been completed 2,163 miles. Altho the proportionate increase has never since been as large, the building has gone steadily forward until today, with thirty-four operating and eleven terminal companies having over seventy-two hundred miles of main stem and over twelve thousand miles of track, Indiana is one of the best equipped states in the country for the ready marketing of its products. Across the commonwealth from east to west run the great New York Central, Pennsylvania, Baltimore and Ohio, Grank Trunk, and Erie systems, with many feeders and ramifications. These roads give direct and rapid service to the markets of the eastern coast. They, together with numerous other roads, like the Chicago, Indianapolis, and Louisville, the Chicago and Eastern Illinois, the Wabash, and the Chesapeake and Ohio, are so placed as to make direct routes from almost every section of the state to Chicago. From many regions there are lines to St. Louis and to the large cities of Ohio and Kentucky. It is indeed, fortunate for the state to be situated on the main lines of trans-continental traffic and to be convenient to large markets. One of the great contributions of Indiana to the art of railroading has been mentioned. But there is another Hoosier invention as important as the Union Depot, namely the Belt Railroad which was conceived by J. F. Richardson and constructed on the credit of Indianapolis in 1876. This invention results in great economy in the interchange of traffic, and gives manufacturers opportunity to ship from their own spur tracks over any road entering the city. The idea of the belt line has been widely copied thruout the country.”—C. C. North, *Social and economic survey*, p. 76.

1837-1900.—**Education.—Training of teachers.** See EDUCATION: Modern: 19th century: United States: Evolution of public school system.

1851.—**New constitution ratified.**—“The convention had suggested that the new constitution be submitted to the people for ratification or rejection at the approaching August election. The General Assembly affirmed this suggestion February 14, 1851, and the governor's proclamation followed immediately, directing the election officers to carry the order into effect. There was no organized opposition to the ratification. Both parties favored the new Constitution. At the ensuing election every county gave an affirmative majority but Ohio. Starke county cast a unanimous vote for the constitution. The total vote was 113,230 for, and 27,638 against ratification, a majority of 85,592 out of a total vote of 140,868. The vote for the exclusion of the colored persons was substantially the same, being an affirmative vote of 113,828 out of a total vote of 135,701. Three counties, Lagrange, Randolph and Steuben, voted against negro exclusion. The new constitution went into operation November 1, 1851. The General Assembly elected in August, 1851, met as directed by the old constitution. The first general election under the new constitution was held in October, 1852, the old officers holding until the newly elected ones were qualified and took their positions according to law. There was no jar in the operations of the State government during the change.”—L.

Esarey, *History of Indiana from its exploration to 1850*, p. 460.

1861-1865.—Part played in Civil War.—Treasonable secret societies.—Indiana had a large proportion of southerners among its citizens, but its answer to Lincoln's first call was 208,000 men, besides 50,000 in a home legion. In June, 1863, the state was invaded by Confederate troops (see U. S. A.: 1863 [July: Kentucky]), and there were many later attempts to raid the state and to provoke uprisings among the disloyal inhabitants. Distinguished among the "war governors" was O. P. Morton, whose problems, besides those of raising and equipping troops, involved great difficulties with unsympathetic men at home. The "Knights of the Golden Circle," were especially active in Indiana in 1864. "From the beginning of the war there had been some opposition in Indiana, and as the struggle dragged on and the fate of the Union continued to hang in the balance, the disloyal spirit grew bolder. It found its chief expression in the secret societies known as the Knights of the Golden Circle, the American Knights, and the Sons of Liberty. . . . The Knights of the Golden Circle first merged into the American Knights because of the exposure of their ritualistic work and treasonable designs, and the American Knights in turn were superseded by the Sons of Liberty for the same reason. . . . [At its most flourishing period the order possessed in Indiana] a numerical strength of perhaps twenty thousand. . . . In a speech delivered after the close of the war Governor Morton described the activities of the Sons of Liberty in this state and the final breaking up of the order. He said: 'They claimed in 1864 to have forty thousand members in the state, were lawless, defiant, plotting treason against the United States and the overthrow of the state government. In some counties their operations were so formidable as to require the militia to be kept on a war footing, and throughout 1863, and until the final explosion of the organization in August, 1864, they kept the whole state in uproar and alarm. In 1864 . . . they matured a plan for a general uprising in the city of Indianapolis.' . . . [The plan was discovered some three weeks before the time fixed, and was abandoned.] . . . The trials before a military tribunal of the leading conspirators for their participation in the plans of insurrection began at Indianapolis, September 22, 1864. The charge against them was that of conspiracy in organizing secret societies for the purpose of overthrowing the government, seizing the arsenal, releasing confederate prisoners, cooperating with rebels, inciting insurrection, and resisting the draft. Harrison H. Dodd, a leading organizer and official in the order, and in whose possession a large quantity of arms, consigned from New York as 'Sunday School books,' was found, escaped after arrest and fled to Canada. J. J. Bingham, editor of the *Indianapolis Sentinel*, turned state's evidence and escaped trial; three of the others were condemned to death, and one to imprisonment for life. But owing to a doubt which arose as to the jurisdiction of the military commission trying them, and the further fact that the war was over and a cessation of violence was desired by everybody, none of the sentences were very fully carried out."—E. E. Moore, *Century of Indiana*, pp. 163-164, 166-168.—This order had extensive membership in several other states. See KNIGHTS OF THE GOLDEN CIRCLE; U. S. A.: 1864 (October).

1868-1916.—Pivot state in national elections.—Governors during this period.—Since the Civil War, Indiana has usually been regarded by political

leaders as a doubtful state. It has frequently had candidates on the national tickets of the two leading parties. In 1868, Schuyler Colfax, Republican, was elected vice president. "The year 1876 . . . was a year of unusual political animation in both state and nation. Governor Thomas A. Hendricks was the democratic candidate for Vice President on the ticket with Presidential Candidate Samuel J. Tilden, of New York. The republican candidates were Rutherford B. Hayes of Ohio, and William A. Wheeler of New York. The democratic candidate for governor was James D. Williams. To oppose him the republicans first nominated Godlove S. Orth, who later withdrew from the ticket, and was succeeded by Benjamin Harrison. Mr. Williams was a farmer, who had served in the legislature and in Congress, and was charged with carrying his demands for economy in public expenditures to the extreme of penuriousness. The opposition did not overlook this in their campaign criticisms, and in addition held him up to ridicule by calling him 'Blue Jeans' because of his plain homespun clothing. . . . His friends and partisans adopted the epithet of 'Blue Jeans' as a rallying cry, and answered the republican attacks by calling Harrison the aristocratic or silk-stocking candidate. Williams was elected along with the entire democratic state ticket. The democrats likewise secured a majority in the state senate, the republicans winning the house of representatives. The state also gave a majority to the democratic national ticket, and excitement ran high during the long and bitter dispute which followed as to which party had won the Presidency. [See U. S. A.: 1876-1877.] . . . Governor Williams assumed office in January, 1877, and died November 20, 1880. Lieutenant Governor Isaac P. Gray became acting governor for the few weeks remaining of the term. . . . The republicans were successful in the election of 1880, and their candidate, Albert G. Porter, became the next governor. The national contest of that year commanded much special interest in Indiana because of the candidacy of W. H. English for Vice President on the ticket with General Hancock. Their successful republican opponents were James A. Garfield of Ohio, and Chester A. Arthur of New York. . . . In the campaign of 1884 Thomas A. Hendricks of Indiana was again the democratic candidate for Vice President, Grover Cleveland of New York being at the head of the ticket. Their republican opponents were James G. Blaine and John A. Logan. The opposing candidates for governor were Isaac P. Gray, democrat, and William H. Calkins, republican. Gray was formerly a republican, having been lieutenant governor under Governor Baker (1860-1873); he was elected lieutenant governor a second time in 1877, under Governor Williams, democrat, and upon the death of his chief in 1880 succeeded him as acting governor. As a result of the election in 1884 he became governor, winning by a plurality of 7302 votes. The democrats were successful in the national election also, Cleveland and Hendricks becoming President and Vice President. . . . Lieutenant Governor Mahlon D. Manson resigned his office in 1886 to accept a federal position, and thereby precipitated a peculiar situation and contest. At the session of 1885 Senator A. G. Smith was chosen president *pro tem*. It so happened that a United States senator was to be elected at the session of 1887, and Governor Gray was an aspirant for the honor. Smith and his friends claimed that his election as president *pro tem* in 1885 would hold good in the session of 1887, giving him the right of succession to the governorship if that office should become vacant

through the election of Governor Gray to the United States Senate, the office of lieutenant governor being already vacant. The prospect of such an outcome proved injurious to Gray's candidacy, as the leaders in the party were not favorable to the elevation of Smith to the governorship. After much discussion and many legal opinions it was decided that a lieutenant governor should be chosen by the people, at the regular election to be held in 1886. There is a statute providing for succession to the governorship in case of the death, resignation or disability of both the governor and lieutenant governor, but no provision either in the constitution or the laws for filling a vacancy in the lieutenant governor's office. All parties placed candidates in the field, and R. S. Robertson, a republican, received a majority of the votes. As stated, the senate was democratic, and at the session of 1887 that body refused to recognize Robertson, or permit him to exercise the duties of his office by presiding over its sessions. . . . The house of representatives, being republican, espoused Robertson's cause, and administered to him the oath of office as lieutenant governor. But it was all to no purpose. The senate continued to ignore him, and the house in retaliation boycotted the senate, denying to it all official recognition. . . . On the 25th of November, 1885, Vice President Hendricks died at his home in Indianapolis. . . . Again in 1888 the people of Indiana had reason to feel a special interest in the national campaign. Not only was the state represented on the ticket of the Republican party by one of her distinguished sons, the Hon. Benjamin Harrison, but he headed it as a candidate for the Presidency. President Grover Cleveland, seeking reelection, was his democratic opponent. The republicans were successful and Harrison was elected, the result being received in Indiana with great acclaim. General Alvin P. Hovey, the republican candidate for governor, was also elected, but the democrats were successful in returning a majority in each house of the general assembly. . . . Governor Hovey assumed the duties of his office in January, 1889, and died November 23, 1891. Lieutenant Governor Ira J. Chase at once assumed the office as acting governor, serving out the unexpired term. Differing in politics, contests between the executive and legislative branches of the state government were inevitable. During the session of 1889 Governor Hovey was stripped of nearly all of his official patronage, and out of the contentions and litigation which followed a supreme court decision finally resulted, making the state geologist and chief of the bureau of statistics elective officers. Previously they had been appointive by the governor. . . . In 1892 the democratic party again came into power in both state and nation. President Harrison went down in defeat in his race for reelection, ex-President Grover Cleveland being his successful competitor. Even Indiana, Harrison's own state, helped swell the democratic pluralities against him, and elected Claude Matthews governor. . . . The republican party regained its ascendancy in nearly all the Northern states at the election in 1896. William McKinley was elevated to the Presidency, and James A. Mount became governor of Indiana. . . . The republican successes began in Indiana with the state election of 1894, when majorities were won in both houses of the general assembly for the first time since 1872. The entire congressional delegation was captured by the republicans at this election. . . . Colonel Winfield T. Durbin, republican, was elected governor at the November election in 1900, defeating Hon. John W. Kern, the democratic candidate. The four

years of Governor Durbin's term were signalized by a continuation of the period of industrial growth and general prosperity that dated from 1897. It was a sound and economical business administration, marked by large payments on the fast dwindling state debt."—E. E. Moore, *Century of Indiana*, pp. 187-189, 191-196, 198, 200, 203.—In 1904, Charles W. Fairbanks, Republican, was elected vice president on the ticket with Theodore Roosevelt. In 1908, John W. Kern, Democrat, was nominated for vice president. In 1912, and again in 1916, Thomas R. Marshall, Democrat, was elected vice president on the ticket with Woodrow Wilson. In 1916, Charles W. Fairbanks was again nominated by the Republicans, but was defeated in the elections.

1894-1897.—Legislation.—Hammond strike.—Board of Labor Commissioners.—In 1894, an anti-trust law and a factory inspection law were passed, and primary education was made compulsory. In this year it became necessary for Governor Matthews to send a small force of state militia to Hammond to quell disorders growing out of the great Pullman car strike. As a result of the strike a board of labor commissioners was created, in 1897, to act as a permanent tribunal of arbitration.

1897-1909.—Legislation.—Gerrymandering.—Codification Commission created.—"In 1897 a new legislative apportionment law was passed, the first since 1885 that was not attacked in the courts. The law of 1885 was bitterly complained of as a democratic gerrymander. In 1893 the same party enacted another law, which was so flagrantly unjust that the supreme court declared it unconstitutional. In 1895 the republicans took a hand at the gerrymandering business, and their law was condemned by the courts. Then they passed a fairer measure in 1897, which stood. Under the constitution the state is to be redistricted every six years, so in 1903, at the end of the six-year period, the republican legislature passed another gerrymander bill which the supreme court nullified on the grounds of unconstitutionality. Profiting by the lesson the legislature of 1905, also republican, enacted another law that proved to be more satisfactory, and was allowed to stand. Some effort was made to redistrict the state again in 1909, but the two houses of the general assembly were of opposite political faith and could not agree upon the terms of a bill. . . . In 1903, complying with an act of the General Assembly, Governor Durbin appointed a commission to codify the laws of the state relating to public and private corporations, and highways and drainage, and such other laws as the commission might deem advisable. The commission made its report to the legislature of 1905, and most of its recommendations were accepted and enacted into law."—E. E. Moore, *Century of Indiana*, pp. 201, 204.

19th century.—Charities.—Care of deaf and blind children. See CHARITIES: United States: 1853-1908; 1874-1902.

1905-1907.—Misappropriation of state funds.—Investigations.—Public depository law.—"In the early fall of 1905 Governor Hanly demanded the resignation of Auditor of State David E. Sherrick, and that he make restitution to the state of an alleged shortage in his accounts. The demand was later complied with, Sherrick returning funds misappropriated, principal and interest, amounting to \$156,367.31. The governor then caused him to be indicted and prosecuted for

embezzlement. He was convicted and sentenced to state prison, but after a brief confinement the judgment of the court passing sentence was reversed on an error, or some defect in the indictment, and his release ordered. Adjutant General John R. Ward was next forced to resign because of overdrafts in his accounts, which he endeavored to explain on the ground of clerical errors. He made restitution of \$1510.44. Daniel E. Storms, secretary of state, was shortly afterwards confronted with a demand for an accounting. He resisted for a time, but later resigned under pressure from the governor, correcting irregularities in his accounts to the amount of \$8139.85. The governor had experts examine the books of all these officers, and when the work was completed they were directed to examine the accounts and records of former state auditors, back to the year 1872. The result was that claims were made against former officials of misappropriations of fees and insurance taxes, and moneys from other sources, amounting, together with interest and penalties accruing thereon, as follows:

Former Auditor James H. Rice (1883-1887) .....	\$108,877.74
“ “ Bruce Carr (1887-1891) .....	75,988.24
“ “ J. O. Henderson (1891-1895) .....	101,158.65
“ “ A. C. Daily (1895-1899) .....	26,034.51

A discrepancy of \$347.50 was found in the accounts of former Auditor M. D. Manson (1879-1881), which appeared to have been an honest error. Rice and Carr were both dead, their estates insolvent, and suits on their bonds barred by the statute of limitations. Suits were instituted against Henderson and Daily. The Daily case was carried to the supreme court upon appeal, and the judgment of the Boone County circuit court, which was favorable to the state, reversed. In the complaint it was alleged that the defendant, Daily, while auditor of state, had collected and . . . retained certain insurance taxes, which, together with interest and penalties thereon, amounted to the sum sued for. The supreme court decision was to the effect that the collection of such taxes was not a part of the auditor's official duties; that he had no right to make such collections, either as an official or an individual; that the money was not paid to him under the authority of the state; that such payment was not ratified by the state, and that in his hands the money did not become the property of the state; that, therefore, the state had no legal right to the money so collected and paid, and could not sue for it. Nor was the payment of taxes to the state by the insurance companies accomplished by such payment to the auditor. The law plainly directs that the taxes shall be paid into the treasury of the state, and not to the auditor, and of this fact foreign insurance companies, and the courts, are bound to take notice. The companies were plainly liable to payment of their taxes over again, but the state had no legal right of recovery against Daily. The Henderson case was allowed to wait the issue of the Daily suit, and a compromise settlement was finally agreed upon whereby the state accepted a refund of \$10,000, and the suit was dismissed. The insurance companies, or a majority of them, paid their taxes over again rather than risk forfeiture of their licenses to write further business in the state, but they paid under protest, expecting to seek a remedy in the courts. In his biennial message to the General Assembly in 1907 the governor reported that the total recoveries of

misappropriated funds up to that time amounted to \$189,460.41. . . . Nothing quite so sensational as these disclosures had occurred in the political life of the state for many years. They gave rise to a demand for stricter supervision of public offices, which was responsible to a large degree for the enactment of a Public Depository Law at the session of 1907. Another purpose of this law was to break up what had come to be known as 'political banking.' The law has proved itself of great value, not only in the enforcement of better business methods in the care and handling of public funds, state, county, and municipal, but by securing to the taxpayers the interest on such funds."—E. E. Moore, *Century of Indiana*, pp. 209-212.

1906.—**Founding of Gary.**—"Some years ago the South Chicago plant of the Illinois Steel Company was so hemmed in by the works of other concerns that the only possibility for expansion lay in creating new land by filling in the lake. Therefore the company poured its slag into the water. After a while, when it had made enough dry ground to warrant construction, the corporation applied for a building permit. Mayor Dunne, however, not only refused to sanction the plans but even commenced suit to recover the land for the city of Chicago, asserting that the alteration of the waterfront without permission was illegal. This situation was one of the most potent reasons for founding what is in many ways the most wonderful of American municipalities, Gary. When the Illinois Steel Company chose the site for its new plant, Gary consisted mostly of sand dunes and railroad tracks, for this strip of lake shore lay on the route of the trunk lines between Chicago and the Atlantic seaboard. In order to make room for the plant three of these roads had to be moved, and incidentally their tracks were elevated for miles in order that the citizens of the future metropolis might go about in safety. A subsidiary corporation, the Gary Land Company, which was responsible for planning the town and for disposing of the lots, made the streets broad, and sought to insure the permanency of the pavements by the construction of alleys with conduits to carry such utilities as water, sewers, gas, electricity, and telephone wires. Both comeliness and utility were emphasized. Lots were made large enough that the houses might be set back thirty-five feet from the walks, parks were planned, and a considerable number of dwellings were erected for the employees of the corporation. While paternalism was consistently avoided, an attempt was made to give the 'Hunkies' 'white men's houses to live in.' The city grew marvelously. Rich black loam was brought from the distant prairies and spread over the sand to form a basis for lawns and flower beds. Frequently a family would move into a house within twenty-four hours of the erection of its frame. One church, begun after lunch, was used for a congregational supper that evening, and for a preaching service the next morning. In spite of the wonderful activity of the Gary Land Company in providing housing, there was for a time desperate overcrowding among the unskilled workers. For example, in 1900, three years after the birth of the city, an investigator found four hundred twenty-eight persons inhabiting one hundred forty-two rooms in thirty-eight houses. Of course this rapid growth of population greatly increased the value of the land. Since the Gary Land Company recognized the social dangers from speculation it consummated sales only after the prospective purchaser offered satisfactory assurance that

he intended permanently to occupy and to use his ground. So it happened that building lots were offered on reasonable terms. Unparalleled as was the achievement of building this city, it was but an incidental part of the erection of the enormous steel plant. An artificial harbor has been created with almost a mile of twenty-two foot channel nearly a hundred yards wide, and a turning basin two hundred fifty yards in diameter. Since the investment in one of the lake steamers is so precarious that it is necessary to have the vessel in motion every possible minute during the season of navigation, the speed of taking on and of discharging cargo is of tremendous importance. So the ore is unloaded by ten ton grab-buckets. This ore, unless it is stored for winter use, is conveyed rapidly to the blast furnaces, and is carried on tracks that never turn at right angles thru all the processes of manufacture to the delivery spur tracks, with a minimum of reheatings. In this plant nothing is experimental, every device has previously proven its economy. Every by-product is utilized. The company, which is ruthless in its requirements of its employees, has nevertheless developed a systematic plan of accident prevention that has succeeded in largely reducing the number of mishaps. The Illinois Steel Company has not remained the only industry in the city, for the American Bridge Company, the American Steel Company, the National Tube Company, the American Locomotive Company, and the American Car and Foundry Company are among a number of very large concerns that have located plants at Gary. Even now the city has a few factory sites that are free to persons who can give proper guarantee of success. The European war has been the occasion of a great development of the preparation of munitions at several points close to Gary. The reasons for the deliberate choice of Gary for a manufacturing center are not far to seek. In the first place, land was to be had for a song, because the sand was well nigh useless for agricultural purposes. Second, since the area was traversed by all the large railways of what is known as the trunk line class, the two and four track lines between Chicago and the eastern seaboard at Boston, New York, Philadelphia, and Baltimore, competition in respect to service was assured. Moreover, the place is convenient to Chicago with its wonderful transportation facilities. Third, Gary is the strategic meeting point of the raw materials that are necessary for the manufacture of steel. Coke can be secured from Pennsylvania, coal is obtained from Indiana and Illinois, lime is quarried in Indiana, and iron ore can be brought by swift steamers from the Minnesota mines on Lake Superior. Finally Gary is situated close to the center of population, and is therefore at the heart of the market for products of all kinds, including steel."—C. C. North, *Social and economic survey*, pp. 56-58.

1909-1910.—Political upheavals.—"The tariff legislation of 1909 . . . had the effect of creating such differences of views within the ranks of the republican party, that it remained an issue, and played an important part in the 'off-year' elections of 1910. A number of representatives and senators in Congress had stood out for a more pronounced reduction in duties than characterized the finished measure when presented for their votes, and claiming a non-fulfillment of platform pledges, continued their opposition. Then the republicans and their tariff measures, whether justly or not, were charged with responsibility for the era of 'high cost of living' which had pre-

vailed for a period of years, and in Indiana it is extremely doubtful if the party's evasion of the temperance question improved its situation. The election resulted in substantial gains for the democrats throughout the whole country, giving them control of the national house of representatives. In Indiana the party made practically a 'clean sweep,' electing all of its candidates for state offices, a majority in both branches of the legislature, and twelve out of the thirteen members of Congress to which the state was entitled. The result also led to the retirement of United States Senator Albert J. Beveridge, and the election of the Hon. John Worth Kern to succeed him."—E. E. Moore, *Century of Indiana*, p. 265.

1910-1916.—Agitation for constitutional convention.—Since 1910, there has been continued agitation for the amendment of the state constitution. In 1914, a conference was held to consider the advisability of a constitutional convention, and out of this conference grew an organization of voters, the Constitutional Convention League. In spite of the efforts of this league the legislature refused to call a convention. The matter was finally submitted to the voters by referendum in 1916, but the proposal met with defeat.

1911-1918.—Legislation and politics.—Dynamite conspiracy.—Election prosecutions.—Prohibition.—Woman suffrage.—During the year 1911, acts were passed providing child labor laws; laws regulating the sale of cold storage products and drugs sold for prescription; medical inspection in schools; a minimum wage for teachers; play grounds for children; measures to prevent infant blindness; and the establishment of night schools in larger towns and cities. A stringent employers' liability act was also passed. In February 1912, fifty officials of the Association of Bridge and Structural Ironworkers were arrested, on evidence secured by William J. Burns and evidence given by Ortie McManigal, who figured in the *Los Angeles Times* case, and were put on trial in Indianapolis, October 1, charged with conspiracy, to carry dynamite on trains in interstate commerce. Evidence tending to show that the ironworkers had for six years systematically dynamited structures built by non-union labor was submitted. On October 22, the judge ruled that the conspiracy had been proved and on December 28, thirty-eight of the defendants were found guilty and sentenced to the federal prison, Leavenworth, Kansas, for terms varying from one to seven years. In 1913, the Tenement House Bill was passed; public utilities commission created; and an inheritance tax law passed, which recognized the progressive, or graduated principle. Federal amendment XVII was ratified providing for the direct election of senators. Vocational education was promoted in the passage of a bill to encourage industrial and agricultural training in the schools, the state to furnish money for the pay roll equal to that provided by each county introducing the subjects. During 1917, the Federal Grand Jury returned indictments against the mayor and 127 minor officials of the city of Indianapolis and other towns of the state charging them with election frauds in 1914. All were convicted and sentenced to terms ranging from one to five years. In 1917, the state prohibition amendment was ratified; state suffrage was granted to women; and James Putnam Goodrich was elected governor for the term ending 1921. In 1918, Eugene V. Debs was nominated by the Socialists for member of Congress but refused the nomination.

1918-1921.—Part played in World War.—Legislation.—Constitutional amendments.—The state furnished 106,581 men during the World War or 2.83 per cent of the entire American expeditionary force. In proportion to the population the state furnished more volunteers (25,148) than any other. In 1919, the federal prohibition amendment was ratified. In the first of two special sessions of the legislature held in 1920 the federal woman suffrage amendment was ratified; at the second session changes in the election laws were made to enable women to vote. Of the thirteen constitutional amendments that came up for ratification at the special election, September, 1921, none was adopted. In 1921, Warren T. McCray was elected governor for the term ending 1925.

1919.—Absence of regulation of working hours for women. See CHILD WELFARE LEGISLATION: 1919.

1920-1921.—City planning.—“In Indiana, the movement for city planning is practically statewide. In Indianapolis, Terre Haute, South Bend, Elkhart, Fort Wayne, Muncie, Marion, Anderson, Mishawaka, there is definite city-planning interest manifested. In Marion and Elkhart a city plan, or at least some phases of it, are being prepared. In Indianapolis and Terre Haute there is a city-plan committee, and in most of the other cities there is a city-plan committee of the Chamber of Commerce. All this interest is now (1921) being crystallized in an effort to pass a city-planning and zoning bill at the present session of the legislature. The Indianapolis committee is known as the Committee of One Hundred, and was appointed by the president of the Chamber of Commerce.”—*National Municipal Review*, Feb., 1921, p. 108.

INDIANS, American: Name.—“As Columbus supposed himself to have landed on an island at the extremity of India, he called the natives by the general appellation of Indians, which was universally adopted before the true nature of his discovery was known, and has since been extended to all the aboriginals of the New World.”—W. Irving, *Life and voyages of Columbus*, v. 1, bk. 4, ch. 1.—“The Spanish writers from the outset, beginning with Columbus in his letters, call the natives of America, Indians, and their English translators do the same. So, too, Richard Eden, the earliest English writer on American travel, applies the name to the natives of Peru and Mexico. It is used in the same way, both in transla-

tions and original accounts, during the rest of the century, but it is always limited to those races with whom the Spaniards were in contact. In its wider and later application the word does not seem to have established itself in English till the next century. The earliest instance I can find, where it is applied to the natives of North America generally in any original work, is by Hakluyt. In 1587 he translated Laudonnière's ‘History of the French Colony in Florida,’ and dedicated his translation to Sir Walter Raleigh. In this dedication he once uses the term Indian for the natives of North America. Heriot and the other writers who describe the various attempts at settlement in Virginia during the sixteenth century, invariably call the natives ‘savages.’ Perhaps the earliest instance where an English writer uses the name Indian specially to describe the occupants of the land afterwards colonized by the English is in the account of Archer's voyage to Virginia in 1602. This account, written by James Rosier, is published in Purchas (vol. iv. b. viii.). From that time onward the use of the term in the wider sense becomes more common. We may reasonably infer that the use of it was an indication of the growing knowledge of the fact that the lands conquered by the Spaniards and those explored by the English formed one continent.”—J. A. Doyle, *English in America: Virginia, etc., appendix A*.

Statistics of population.—Reservations.—In 1920 there were in North and South America 27,000,000 Indians, including half-breeds. Of this number there were (according to figures available in 1910) 336,337 in the United States (exclusive of Alaska). The following table shows that, contrary to popular belief, the Indian population is not decreasing but increasing:

1880.....	322,534
1890.....	248,253
1900.....	237,106
1910.....	265,683
1920.....	336,337

In 1919 there were 164,783 full-blooded Indians in the United States, exclusive of the Five Civilized Tribes; 133,193 Indians who spoke English; 91,331 who read and wrote English; 196,841 who wore citizens' clothing; 86,462 who were citizens; 9,738 who voted; and they possessed \$680,408,869 worth of property, with a total income of \$72,696,431. Of the mixed blood Indian, the following crossings occur in order of their frequency: White and Indian, Negro and Indian, White, before Indian, and in Alaska some Chinese and Japanese with Indians. The largest proportion of full blood Indians live at present in Nevada, Utah, Colorado, Arizona, New Mexico, Mississippi and Iowa.—Based on *United States report of the commissioner of Indian affairs to the secretary of the interior, June 30, 1920*.—The following states contain Indian reservations: Arizona, California, Colorado, Florida, Idaho, Iowa, Kansas, Michigan, Minnesota, Montana, Nebraska, Nevada, New Mexico, New York, North Carolina, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wisconsin, Wyoming. The total area covered by these reservations is 72,660,316 acres.

Tribes.—The following is a list of American aboriginal tribes, which are further discussed under their specific names:

Abnakis	Algonquian Family
Adais	Alleghans
Adirondacks	Andesians
Agniers	Apache Group

Apalachee Indians	Natchesan Family
Athapascan Family	Nez Percés
Attacapan Family	Otomis
Beothukan Family	Pontiac's Wars
Blackfeet or Siksikas	Pampas Tribes
Caribs	Patagonians
Cherokees	Piman Family
Chibchas	Powhatan Confederacy
Chimakuan Family	Pueblos
Chimarikan Family	Pujunan Family
Chinookan Family	Quiches
Chontals and Popolocas	Quororatean Family
Chumashan Family	Sacs
Coahuiltecan Family	Salinan Family
Coajiro	Sastean Family
Copehan Family	Seminoles
Costanoan Family	Senecas
Eskimo	Shawanese
Esselenian Family	Shoshonean Family
Flatheads	Siouan Family
Guck	Skittagetan Family
Hidatsa	Stockbridge Indians
Horicons	Susquehannas
Hurons	Takilman Family
Illinois	Tanoan Family
Iroquois Confederacy	Tarasans
Kalapooian Family	Timuquanan Family
Karankawan Family	Tonikan Family
Keresan Family	Tonkawan Family
Kulanapan Family	Totonacos
Kiowan Family	Tupi
Kitunahan Family	Uchean Family
Koluschan Family	Wailatpuan Family
Kusan Family	Wakashan Family
Mariposan Family	Washoan Family
Mayas	Wishoskan Family
Mingoes	Yanan Family
Modocs	Yukian Family
Moquelumnan Family	Yuman Family
Muskhogeans	Zapotecs
Musquito	Zunian Family

Methods of classification: Physical, cultural and linguistic.—The chief objective of anthropology in the New World is to discover the origin and condition which have produced the Indian and his culture. This will put the science in all its branches to a supreme test. At present we are still far from a solution but this much has been ascertained: there is among the Indians an essential unity of physical type and tremendous diversity of culture. In the face of such a problem it is difficult to arrange these people into systematic homogeneous groups. Two principles of classification have however been employed generally by anthropologists; they are the cultural and the linguistic classification. Any classification based on physical characteristics would for general purposes be futile for the differences are such as would be obvious only to a trained somatologist. The cultural classification is based on the ethnological conception of the culture area with its culture center. A culture area is a continuous region where there exist the same cultural traits bearing the same interrelations to each other so as to produce a culture having a fairly homogeneous aspect. In every region of this kind there is a culture center, a place from which this particular culture radiates and where the cultural type is purest. On any map the lines dividing such culture areas must of necessity be arbitrary. As a matter of fact there are always intermediate or marginal tribes at all the boundaries of culture areas and these tribes generally exhibit the interesting phenomenon of possessing features from both the cultures with which they come in contact. An excellent example of

this are the Indians of Puget Sound who have borrowed features of culture from the Indians of British Columbia and from the Salish tribes of the interior. Of such culture areas there are fifteen in America, nine in North America and six in Central and South America. Each of these areas will be dealt with separately. The other classification is on the basis of linguistics. There have been distinguished fifty-six different linguistic stocks in America. It appears that the divisions by linguistic affiliation do not follow the culture area boundaries. In one culture area, the Southwest, there are eight distinct linguistic stocks represented.—See also ANTHROPOLOGY: Linguistics.

Primitive music.—Mythology.—Tribal customs. See MUSIC: Primitive; First music; American Indian; MYTHOLOGY: American Indians; HIAWATHA; CLANS; SACHEM; TOTEMS.

Cultural areas in North America: PLAINS AREA.—In the Plains (the prairie region west of the Mississippi) there are in all thirty-one tribal groups of which eleven are typical of the culture area. These are: the Assiniboin, Arapaho, Blackfeet [see BLACKFEET], Cheyenne, Comanche, Crow, Gros Ventre [see HIDATSA], Kiowa, Kiowa-Apache, Sarsi, and Teton-Dakota. In this section of the country there is a conspicuous absence of agriculture among the typical tribes. The Plains Indians depended on the hunt for food, the buffalo or bison being the principal source of meat. There was a very limited use of berries and roots and no fishing. The hunting of the buffalo, especially after the introduction of the horse, forced the Plains Indians to lead a nomadic life. Their entire household economy was well adapted to this mode of life. Their house was the tepee, a movable skin tent constructed on a tripod of poles supporting other poles to form a cone. The covering was made of buffalo skin prepared and sewed by the women. Skin bags, called parfleches, were used for storing meat and other food supplies in place of pottery and basketry which were totally absent. All these things are easily transported with the aid of the travois which before the introduction of the horse were drawn by dogs. Clothing was made of buffalo and deer skins and decorated with porcupine quill embroidery, later replaced by bead work. As can be seen from the repeated mention of skins, the buffalo was very important in the life of the Plains tribes not only as food but also in supplying material for clothing and shelter. The social organization of these people was the simple band or local group as was found generally in the hunting areas of the New World. Such a group was usually under the leadership of a competent individual, who was often leader of the communal buffalo hunt or war party. The Plains Indians observe the Sun Dance, a great festival for the entire tribe. "In historic times, these tribes ranged from north to south in the heart of the area. . . . On the eastern border were some fourteen tribes having most of the positive traits enumerated above and, in addition, some of the negative ones, such as a limited use of pottery and basketry; some spinning and weaving of bags; rather extensive agriculture; alternating the tipi with larger and more permanent houses covered with grass, bark, or earth; some attempts at water transportation; tending not to observe the sun dance, but to substitute maize festivals, shamanistic performances, and the *midéwin* of the Great Lakes tribes. These tribes are: the Arikara, Hidatsa [q.v.], Iowa, Kansa, Mandan, Missouri, Omaha, Osage, Oto, Pawnee, Ponca, Santee-Dakota, Yankton-Dakota, and the Wichita."—C. Wissler, *American Indian*, p. 208.

PLATEAU AREA.—“The Plateau area joins the Plains on the west. It is far less uniform in its topography, the south being a veritable desert while the north is moist and fertile. To add to the difficulties in systematically characterizing this culture, arising from lack of geographical unity, is the want of definite information for many important tribes. Our readily available sources are Teit's Thompson, Shuswap, and Lillooet; Spinden's Nez Perce; and Lowie's Northern Shoshone; but there is also an excellent summary of the miscellaneous historical information by Lewis. . . . The

cases basket caps for women; blankets of woven rabbitskin; the sinew-backed bow prevailed; clubs, lances, and knives, and rod and slat armor were used in war, also heavy leather shirts; fish spears, hooks, traps, and bag nets were used; dressing of deerskins highly developed, but other skin-work weak, . . . while wood work was more advanced than among the Plains tribes it was insignificant as compared to the North Pacific Coast area . . . stone work was confined to the making of tools and points, battering and flaking, some jadeite [a valuable form of jade] tools; work in bone,

CULTURAL AREAS IN NORTH AMERICA

material traits may be summarized as: extensive use of salmon, deer, roots (especially camas), and berries; the use of a handled digging-stick; cooking with hot stones in holes and baskets; the pulverization of dried salmon and roots for storage; winter houses, semi-subterranean, a circular pit with a conical roof and smoke hole entrance; summer houses; movable or transient, mat or rush-covered tents and the lean-to, double and single; the dog sometimes used as a pack animal; water transportation weakly developed, crude dug-outs and bark canoes being used; pottery not known; basketry highly developed, coil, rectangular shapes, imbricated technique; twine weaving in flexible bags and mats; some simple weaving of bark fiber for clothing; clothing for the entire body usually of deerskins; skin caps for the men, and in some

metal, and feathers very weak. Of the non-material traits the most distinctive are: decorative art simple and inconspicuous, rather inclining towards the Plains type on the one hand and that of the North Pacific Coast tribes on the other; lack of definite tribal organization and band distinctions; a weak but still definite social distinction based upon personal wealth, with at least a modern use of the 'potlatch' ceremony; hence, there are no striking general ceremonies or ritualistic societies as in the preceding area; puberty ceremonies rather prominent and related to the general belief in personal guardians; mythology largely a record of the 'trickster type.'—C. Wissler, *American Indian*, pp. 209-210.—See also NEZ PERCÉS.

CALIFORNIA AREA.—“In California we have a marginal or coast area, which Kroeber divides into

four sub-culture areas. However, by far the most extensive is the central group to which belongs the typical culture. . . . Its main characteristics are: acorns, the chief vegetable food, supplemented by wild seeds, roots and berries are scarcely used; acorns made into bread by a roundabout process; hunting mostly for small game and fishing where possible; houses of many forms, but all simple

gens or clan forms; political solidarity almost lacking; no formal social ranking, but some tendency to recognize property distinctions; ritualism, fetishism, and religious symbolism almost lacking; well developed puberty ceremonies for girls and a kind of secret initiation for men; a mourning ceremony in which gifts are burned; a tendency to maintain a series of dances in a fixed order; a semi-under-

WHITE BIRD, OF THE NESPELIME TRIBE, STATE OF WASHINGTON

shelters of brush or tule, or more substantial conical lean-to structures of poles; the dog was not used for packing, and there were no canoes, but used rafts of tule for ferrying; no pottery, but high development of basketry, both coil and twine; bags and mats very scanty; cloth or other weaving of twisted elements not known; clothing was simple, and scanty, feet generally bare; the bow, the only weapon, usually sinew-backed; work in skins very weak; work in wood, bone, etc., weak; metals not at all; stone work not advanced; no picture writing; designs only upon baskets and not symbolic; social organizations simple without

ground or earth-covered house for ceremonies, a sweat house and the sleeping place of adult males; shamanism conspicuous, but absence of fasting and other inducing methods; regalia not elaborate, feather head bands most general; creation and culture origin myths prevail, a dignified creator, but in addition coyote tales."—C. Wissler, *American Indian*, p. 212.

NORTH PACIFIC COAST AREA.—"Ranging northward from California to the Alaskan peninsula we have an ethnic coast belt, known as the North Pacific Coast area. This culture is rather complex and presents highly individualized tribal varia-

tions; but can be consistently treated under three sub-divisions; (a) the northern group, Tlingit, Haida, and Tsimshian; (b) the central group, the Kwakiutl tribes and the Bellaçoola; and (c) the southern group, the Coast Salish, the Nootka, the Chinook [see CHINOOKAN FAMILY], Kalapooian [see KALAPOOIAN FAMILY], Waiilatpuan [see WAILLATPUAN FAMILY], Chimakuan, and some Athapascan tribes. The first of these seem to be the type and are characterized by: the great dependence upon sea food, some hunting upon the mainland, large use of berries; dried fish, clams, and berries are the staple food; cooking with hot stones in boxes and baskets; large rectangular gabled houses of upright cedar planks with carved posts and totem poles; travel chiefly by water in large, sea-going dug-out canoes, some of which had sails; no pottery nor stone vessels, except mortars; baskets in checker, those in twine reaching a high state of excellence among the Tlingit; coil basketry not made; mats of cedar bark and soft bags in abundance; the Chilkat, a Tlingit tribe, specialized in the weaving of a blanket of goat hair; there was no true loom, the warp hanging from a bar, and weaving with the fingers, downward . . . clothing rather scanty, chiefly of skin, a wide basket hat (only one of the kind on the continent and apparently for rain protection); feet usually bare, but skin moccasins and leggings were occasionally made; for weapons the bow, club, and a peculiar dagger, no lances; slat, rod, and skin armor; wooden helmets, no shields; practically no chipped stone tools, but nephrite or green stone used; wood work highly developed. splitting and dressing of planks, peculiar bending for boxes, joining by securing with concealed stitches, high development of carving technique; work in copper may have been aboriginal, but, if so, very weakly developed; decorative art is conspicuous, tending to realism in carved totem poles, house posts, etc.; some geometric art on baskets, but woven blankets tend to be realistic; each family expresses its mythical origin in a carved or painted crest; the tribe of two exogamic divisions with maternal descent; society organized as chiefs, nobles, common people, and slaves; a kind of barter system expressed in the potlatch ceremony in which the leading units of value are blankets and certain conventional copper plates; a complex ritualistic system by which individuals are initiated into the protection of their family guardian spirits, those so associated with the same spirit forming a kind of society; mythology characterized by the Raven legends."—C. Wissler, *American Indian*, pp. 213-214.

ESKIMO AREA.—"The chief résumés of Eskimo culture have been made by Boas, who divides them into nine or more groups, as follows: the Greenland Eskimo; the Eskimo of southern Baffin Land and Labrador; the Eskimo of Melville Peninsula, North Devon, North Baffin Land, and the north-west shore of Hudson Bay; the Sagdlirmiut of Southampton Island; the Eskimo of Boothia Felix, King William Land, and the neighboring mainland; the Eskimo of Victoria Island and Coronation Gulf; the Eskimo between Cape Bathurst and Herschel Island, including the mouth of the Mackenzie River; the Alaskan Eskimo; and the Yuit of Siberia. When we consider the fact that the Eskimo are confined to the coast line, and stretch from the Aleutian Islands to eastern Greenland, we should expect lack of contact in many parts of this long chain to give rise to many differences. While many differences do exist, the similarities are striking, equal, if not superior, in uniformity to those of any other culture area.

However, our knowledge of these people is far from satisfactory, making even this brief survey quite provisional. The mere fact that they live by the sea, and chiefly upon sea food, will not of itself differentiate them from the tribes of the North Pacific Coast; but the habit of camping in winter upon sea ice and living upon seal, and in the summer, upon land animals, will serve us. Among other traits the kayak and 'woman's boat,' the lamp, the harpoon, the float, woman's knife, bowdrill, snow goggles, the trussed-bow, and dog traction, with the sled, are almost universal and, taken in their entirety, rather sharply differentiate Eskimo culture from the remainder of the continent. The type of winter shelter varies considerably, but the skin tent is quite universal in summer, and the snowhouse, as a more or less permanent winter dwelling prevails east of Point Barrow. Intrusive traits are also present: basketry of coil and twine is common in Alaska; pottery also extended eastward to Cape Parry; the Asiatic pipe occurs in Alaska and the Indian pipe on the west side of Hudson Bay; likewise, some costumes beaded in general Indian style have been noted west of Hudson Bay. All Eskimo are rather ingenious workers with tools, in this respect strikingly like the tribes of the North Pacific Coast. In Alaska, where wood is available, the Eskimo carve masks, small boxes, and bowls with great cleverness. . . . From our limited knowledge it appears that the great central group from Banks Island on the west to Smith Sound in North Greenland is the home of the purest traits; here are snowhouses; dogs' harnesses with single traces; rectangular stone kettles; and the almost entire absence of wooden utensils; a simple order of social and political life in which the unit is the family; a political chief, in the sense known in Indian culture, not recognized; shamanism [cult of the medicine man] rather prominent and comparable to that found in Siberia; great elaboration of taboos and a corresponding requirement of confession; almost no ritualistic ceremonies, but at least one yearly gathering in which masked men impersonate gods; temporary exchange of wives at the preceding; mythology simple and centering around the goddess of the sea animals. Between Greenland and Labrador the differences are small, and apparently due more to modern European influences than to prehistoric causes. The limited study of archaeological specimens by Dall, Solberg, and Boas suggests much greater cultural uniformity in the prehistoric period, a conclusion apparently borne out by the collections made by Stefansson on the north coast. While this is far from conclusive, it is quite consistent with the view that the chief intrusive elements in Eskimo culture are to be found west of the Mackenzie River."—C. Wissler, *American Indian*, pp. 215-216. —See also *ESKIMO; ALASKA: Natives*.

MACKENZIE AREA.—"Skirting the Eskimo area from east to west is a great interior belt of semi-arctic lands, including the greater part of the interior of Canada. Hudson Bay almost cuts it into two parts, the western or larger part occupied by the Déné tribes, the eastern by Algonkins [see ALGONQUIAN FAMILY], Cree, Montagnais, and Naskapi. The fauna, flora, and climate are quite uniform for corresponding latitudes and are reflected to some extent in material culture, so that we should be justified in considering it one great area, if the less material traits did not show definite distinctions. . . . It is believed that the Déné tribes fall into three culture groups. . . . Of these three groups, the southwestern is the largest and occupies the most favorable habitat. From

the writings of Father Morice, a fairly satisfactory statement of their cultures can be made, as follows: All the tribes are hunters of large and small game, caribou are often driven into enclosures, small game taken in snares and traps; a few of the tribes on the headwaters of the Pacific drainage take salmon, but other kinds of fish are largely used; large use of berries is made, they are mashed and dried by a special process; edible roots and other vegetable foods are used to some extent; utensils are of wood and bark; no pottery; bark vessels for boiling with and without use of stones; travel in summer largely by canoe; in winter by snowshoe; dog sleds used to some extent, but chiefly since trade days, the toboggan form prevailing; clothing of skins; mittens and caps; no weavings except rabbitskin garments, but

A BLACKFOOT MOUNTAIN CHIEF

fine network in snowshoes, bags, and fish nets, materials of bark fiber, sinew, and babiche; there is also a special form of woven quill work with geometric designs; the typical habitation seems to be the double lean-to, though many intrusive forms occur; fish-hooks and spears; limited use of copper; work in stone weak; social organization simple, but yet showing forms of maternal clans, property distinctions, etc., reminding one of the North Pacific area; the hospitable exchange of wives; shamanism very prominent, but no good evidence of ritualism. . . . In discussing this area, some writers have commented upon the relative poverty of distinctive traits and the preponderance of borrowed, or intrusive ones. For example, the double lean-to is peculiarly their own, though used slightly in parts of the Plateau area; but among the southwestern Déné we frequently find houses, like those of the Tsimshian, among the Babine and northern Carrier; while the Sekanais and southern Carrier use the underground

houses of the Salish; and among the Chipewyan, Beaver, and most of the eastern group, the skin or bark-covered tipi of the Cree is common. Similar differences have been noted in costume and such social traits as clans and property distinctions in the west. . . . Such borrowing of traits from other areas is, however, not peculiar to the Déné and while it may be more prevalent among them, it should be noted that our best available data are from tribes marginal to the area. It is just in the geographical center of this area that good data so far fail us. Therefore, the inference is that there is a distinct type of Déné culture, and that their lack of individuality has been over-estimated."—C. Wissler, *American Indian*, pp. 217-219.

EASTERN WOODLANDS AREA.—"With a few unimportant exceptions, the tribes of the northeast were of one or other of two linguistic families, the Algonquian [see ALGONQUIAN FAMILY], and the Iroquoian [see IROQUOIAN CONFEDERACY]. The former occupied by far the greater territory, and in the history of the United States played decidedly the more important role. The Algonquian stock stretched from the Athapascan frontier in British America around the southern shore of Hudson Bay, included the interior of Labrador, and sweeping south covered the territory of the Great Lakes and all the eastern part of Canada and the eastern states as far south as Tennessee. Its most westerly extension is the Blackfoot tribe, which lies along the base of the Rocky Mountains at about the forty-ninth parallel, and is isolated by a body of Siouan peoples on its eastern border. The most considerable break in the continuity of this Algonquian occupation was made by the strong and important Iroquoian tribes who surrounded lakes Erie and Ontario, extended down the St. Lawrence River on both banks to about the site of Quebec, and occupied the greater part of New York state and eastern Pennsylvania. A Southern branch of the Iroquois had its seat in eastern Tennessee, northern Georgia, and parts of Virginia and the Carolinas. [See NEW YORK: Aboriginal inhabitants.] In the north the westward limit was reached by the Blackfoot described above, who, in their adaptation to the environment of the plains, have assumed the culture which is typical of that area. The general western limit of the Algonquians was marked by the Siouan tribes at the Mississippi Valley. The southern barrier was formed by the Muskogean family in the gulf states and a number of small groups of different affinities along the Atlantic seaboard in Virginia and the Carolinas. In its most northerly extension the Algonquian family is still checked by the Eskimo, who occupy the shore of Labrador and formerly crossed the strait of Belle Isle into Newfoundland. A small and unimportant stock found in Newfoundland and known as the Beothukan is now extinct; little is known of them, but such linguistic evidence as can be obtained points to their independence. [See also BEOTHUKAN FAMILY.] In the far north the Cree are the leading tribe of the Algonquian family; while to the south and west of them stretches the large Ojibwa division, broken up into numerous bands, but centring in a general way about the Great Lakes. In the east the Micmacs of Nova Scotia and New Brunswick are prominent, while in New England a number of tribes of Algonquian lineage, such as the Abnaki [q. v.], Mohegan, Massachusset, Narraganset, Pequot, Wampanoag, and others, occupied the territory to the exclusion of all other families. The Mohegan, of the lower Hudson, and the Delaware (Lenapé) [q. v.], of the Delaware Valley, brought the stock to the region of Chesapeake Bay. In Virginia were the

Powhatan and related groups [see POWHATAN CONFEDERACY], and in Tennessee the Shawnee marked the southern limit of Algonquian occupation. A branch of the Shawnee is known to have pushed its way as far south as the Savannah River, but was later driven north, where it joined the Delaware. [See also SHAWANESE.] The main tribes of the central Algonquians besides the Ojibwa, mentioned above, were the Sauk and Fox, two tribes originally independent but to-day practically one [see SACS], the Illinois [q. v.], Kickapoo, Menominee, Ottawa [see PONTIAC'S WARS], Pottawotomi and numerous others of less importance. . . . Physically, the Algonquians are among the best of the aborigines, tall and strong, moderately dolichocephalic in head type, with the prominent nose and projecting malar bones which are regarded as char-

acteristic of the American natives. The mouth and lips are not as coarse as in the northwest, nor even on the plains, and the general facial effect is somewhat finer than in those regions. The skin is brown, with a very slight coppery tone. The Algonquians were, as a rule, woodland people, with the culture, life, and craft which such residence brings about; but the wide differences in latitude between the seats of the northern and southern branches of the eastern Algonquians naturally brought about differences in their manner of life. Taking the largest tribe of the stock, the Ojibwa, as a type of the northern group, we find that they paid but little attention to agriculture and were essentially a hunting and fishing people, adding to the provision thus obtained such wild vegetable food as their country afforded. The wild rice was and is of such overwhelming importance to the Ojibwa that its annual harvest might be considered the central interest in their industrial life. They also understood how to make sugar from the sap of the maple and had knowledge of many edible fruits and seeds. The tendency to organize secret

societies, which has been noticed in the stocks previously discussed, has found its expression among the Ojibwa in the Midé society, a religious organization of elaborate rules and ritual which practically controls the religious life and ceremonials of the tribe. As we range south among the Algonquian groups the most striking change is the increasing attention paid to agriculture. From New England down it was generally and quite extensively practised, maize, squash, and tobacco being the chief products. The typical dwelling of the eastern Indians was a small hut built of saplings set firmly in the ground and bent together at the tops, forming a rounded frame. Through this were woven split poles and flexible branches, and the whole was covered in with leaves, reeds, bark, or brush. These were the so called 'wigwams,' and in

MOCCASINS MADE BY SIOUX INDIANS

acteristic of the American natives. The mouth and lips are not as coarse as in the northwest, nor even on the plains, and the general facial effect is somewhat finer than in those regions. The skin is brown, with a very slight coppery tone. The Algonquians were, as a rule, woodland people, with the culture, life, and craft which such residence brings about; but the wide differences in latitude between the seats of the northern and southern branches of the eastern Algonquians naturally brought about differences in their manner of life. Taking the largest tribe of the stock, the Ojibwa, as a type of the northern group, we find that they paid but little attention to agriculture and were essentially a hunting and fishing people, adding to the provision thus obtained such wild vegetable food as their country afforded. The wild rice was and is of such overwhelming importance to the Ojibwa that its annual harvest might be considered the central interest in their industrial life. They also understood how to make sugar from the sap of the maple and had knowledge of many edible fruits and seeds. The tendency to organize secret

the northeastern section were usually set in groups; the villages thus formed were sometimes surrounded by a palisade of poles driven into the ground. Summer dwellings were often nothing more than carelessly made shelters of brush."—L. Farrand, *Basis of American history*, pp. 148-152.

SOUTHEASTERN AREA.—"The Southeastern area is conveniently divided by the Mississippi River, the typical culture occurring in the east. . . . We have the Muskogean [q. v.], and Iroquoian tribes (Cherokee [q. v.], and Tuscarora) [see IROQUOIS CONFEDERACY: Tribes of the south], as the chief groups, also the Yuchi, Eastern-Siouan [see SIOUAN FAMILY], Tunican, and Quapaw. The Chitmachan and Attacapa [see ATTACAPAN FAMILY], differ from the others chiefly in the greater use of aquatic foods. The Caddoan tribes had a different type of shelter and were otherwise slightly deflected toward the Plains culture. We have little data for the Tonkawa [see TONKAWAN FAMILY], Karankawa [see KARANKAWAN FAMILY], and Carrizo, but they seem not to have been agriculturists and some of them seem to have lived in tipis like the Lipan, being

almost true buffalo Indians. These thus stand as intermediate and may belong with the Plains or the Southwestern area. The Biloxi of the east, the extinct Timuqua, and the Florida Seminole [see SEMINOLES] are also variants from the type. They were far less dependent upon agriculture and made considerable use of aquatic food. The Timuqua lived in circular houses and, as did the Seminole, used bread made of coonty roots (*Zamia pumila*), the method of preparation suggesting West Indian influence. The eating of human flesh is also set down as a trait of several Gulf Coast tribes. Our typical culture then may be found at its best among the Muskogean, Yuchi, and Cherokee. The following are the most distinctive traits; great use of vegetable food and intensive agriculture; raised maize, cane (a kind of millet), pumpkins, melons, tobacco, and after contact with Europeans, quickly took up peaches, figs, etc.; large use of wild vegetables also; dogs eaten, the only domestic animal, but chickens, hogs, horses, and even cattle, were adopted quickly; deer, bear, and bison in the west were the large game, for deer the stalking and surround methods were used; turkeys and small game were hunted and fish taken when convenient (fish poisons were in use, suggesting South America); of manufactured foods—bear's oil, hickory-nut oil, persimmon bread, and hominy are noteworthy; houses were generally rectangular with curved roofs, covered with thatch or bark, also often provided with plaster walls reinforced with wicker-work; towns were well fortified with palisades; dugout canoes; costume was moderate, chiefly of deerskins, robes of bison, etc., shirt-like garments for men, skirts and toga-like upper garments for women, boot-like moccasins for winter; some woven fabrics of bark fiber, and fine netted feather cloaks; some buffalo-hair weaving in the west, weaving downward with the fingers; fine mats of cane and some cornhusk work; baskets of cane and splints, the double or nested basket and the basket meal sieve are special forms; knives of cane, darts of cane and bone; blowguns in general use; good potters, coil process, paddle decorations, skin dressing by slightly different method from elsewhere (macerated in mortars) and straight scrapers of hafted stone; work in stone of a high order, but no true sculpture; little metal work ceremonial houses, or temples, for sun worship in which were perpetual fires; these, and other important buildings set upon mounds; elaborate planting and harvest rituals, especially an important ceremony known as the 'busk'; the kindling of new fire and the use of the 'black drink'; a clan system with society composed of chiefs and four grades of subjects; chiefs regarded as under the sacred influence of the Sun God, reminding us of Peru; political systems developed with strong confederacies; strong development of the calumet procedure; shamanism prominent."—C. Wissler, *American Indian*, pp. 222-223.—See also ALABAMA: 1835-1838.

**SOUTHWEST AREA.**—The Southwest area can best be dealt with when it is divided into two groups: the sedentary people of the Pueblo towns, and the nomadic. The nomadic people belong to four linguistic stocks, the Athapascan, Piman (see PIMAN FAMILY), German and Shoshonean. (See SHOSHONEAN FAMILY.) These people do not show a great uniformity in material culture. The eastern lands in common with the Plains use the skin covered tepee of their neighbors. To the west the dome-shaped house of bent poles and thatch is common. The Navajo live in earth covered lodges in winter; during the summer they camp with only a brush shelter. The nomadic people make extensive use of

wild vegetable products. The piñon nuts, Mesquite, amole, agave (century plant) and several species of cacti are the most important foods. The Eastern Apache went to the Plains for buffalo. Further west there were communal hunts for Elk, and men went out singly for antelopes and deer, generally stalking the animal. The Navajo raise sheep for wool and food. The clothing of the most eastern tribes again resembles in cut that of their Plains neighbors but the material is generally buckskin instead of buffalo. The dress of the women of the Mescalero and Western Apache consists of two pieces, an upper garment with an opening for the head and two large square pieces that fall in front and behind to the hips; the skirt reaches from the waist to the knees and both garments had generous fringes of buckskin. The Pima man still wears only a scanty breech cloth in summer and in winter he adds a deer skin shirt and a rabbit skin robe. The Navajo men wear full length trousers of buckskins or white cotton which they obtain from American stores. The upper garment is a jacket preferably of velveteen. A handkerchief or colored strip of cloth is worn about the head to confine the hair. Both men and women of the Navajo wear much silver jewelry of native manufacture. The pottery of the nomadic peoples as compared with that of the pueblos is very inferior in appearance and variety but well adapted to the limited household uses to which it is put. Their artistic skill is, however, displayed in their basketry. Burden or carrying baskets, storage baskets, water jars and trays are the most common varieties. The baskets are both twined and coiled. The designs are geometric and the colors at present have become very gaudy through the introduction of aniline dyes. The baskets to be used for water jars are coated with peñon pitch to make them water tight. Sheep were introduced into the Southwest in the 16th century and the Navajo were the only nomadic people who took up pastoral life. The wool is woven into the famous Navajo blankets. This weaving is done by the women at a simple loom. Other industries of the people are beadwork and the Navajo silver work. Turning to the features of non-material culture we find a surprisingly elaborate ceremonial development. These ceremonies are very important in the lives of the people and are very well preserved. However, the religious beliefs may differ from tribe to tribe, the deities and myths are almost identical. The greatest power is the sun; earth and moon come next. Thunder is feared but clouds and rain are less important here than among the pueblo people. Esdganadlebi is one of the personal gods who is supposed to have survived the flood; her grandson, Yin ai yes gani is the culture hero who makes the world safe for the people by destroying all the monsters. The political organization as in most parts of America is very loose. A chief is elected in every village and the leader of the hunting band is also important. The Western Apache and Navajo are divided into clans, and members of the same clan are not permitted to marry one another but must go outside their group to find a mate. This condition is technically known as exogamy. Among these people, descent is reckoned in the female line, children belonging to their mother's clan. The Pima, however, have paternal descent. Many of the nomads have only the simple family organization, and families are joined together in bands. The sedentary people of the Southwest have a different material culture but there are many links that make them one with their nomadic neighbors. Their mode of dwelling is one of the most complex styles of architecture

developed in the New World. The modern villages are of two types: a large square or rectangular building terraced back from all four sides, and long parallel rows of houses terraced back from the street. The houses are made of adobe bricks. While the men sometimes build the walls, the women always do the plastering. Each pueblo is provided with a kiva or underground chamber which is the men's club-room. There they work, make their ceremonial objects and gossip. Women are never permitted to descend the ladder leading to the kiva. Here also some of the altars are built and ceremonies performed. For food these people rely on the crops they produce. The chief vegetables are: corn, squash, beans, wheat and other small grains. Agriculture was well developed here because the land is far from fertile and the methods worked out by these people are well adapted to their needs. Hunting is by no means neglected and they have access to the same game as the nomadic peoples. The chief feature of the preparation of food is the grinding of the grains into flour of which various dishes are baked, as pike or paper

mother. They are under special protection of a mythical ancestor who is worshiped. Some characteristic clan names are: Sun, sky, white bead, turquoise, arrow, firewood, parrot, hawk, bear, deer, frog, lizard. The women have equal, if not superior, property rights with the men. They own the houses and share in the crops. Only horses can be disposed of without a wife's consent. Each pueblo has a governor, a council and a war chief. The duties of the first officer are principally religious. The religious ceremonies often take the form of dramas in which the activities of supernatural beings and animals are imitated by actors wearing masks. The greater numbers of ceremonies are intended to bring rain and to aid in fertilizing the crops.—See also APACHE GROUP; PUEBLOS.

**Cultural areas in Mexico and Central America: AZTEC AREA.**—"In Mexico and Central America appear a great number of Indian tribes, representing numerous linguistic stocks and all degrees of development. Some of them reached the highest stages of culture known to have existed on the western continent. Many other more primitive

INDIAN POTTERY FROM NEW MEXICO  
(American Museum of Natural History, New York)

bread, and tortillas or pan cakes. The clothing seen at Taos, Picuris, Pesos is again like that of the Plains. The material is buckskin. The women's dress usually consists of one long garment. The old men's dress of the other pueblos is an apron or kilt with tassels at each corner. A robe of some sort is worn generally when not at work; then a breech cloth is considered sufficient. The woolen blankets of the Hopi are very beautiful and appeal more to some people than the elaborate designs of the Navajo. Embroidered cotton dresses were also made in some pueblos, Acoma principally. Pottery is highly developed among the Pueblo people. Through excavations, their pottery has been studied for centuries preceding the Spanish conquest and a historical sequence worked out. The pottery is decorated with free-hand painting and the designs are both geometric and realistic. The pottery of each pueblo has distinctive features that can be easily recognized by the student. The pottery of Santa Clara is a glossy black produced by confining the smoke at the time of firing. Hopi pottery has a characteristic background of yellow. Hopi and Zorin basketry is perhaps not as fine as that of the nomads. At Hopi, in contrast to the Navajo, the men do the weaving and each bridegroom must provide a trousseau for his bride. The pueblo clans reckon descent through the

tribes are little known and of small historical importance; of the more significant groups the best known are doubtless the Nahua or Aztec, among the different tribes of which, some living as far south as Nicaragua and Costa Rica, the most noted composed the famous Aztec confederacy. This confederacy, with certain conquered tribes which it held in subjection, is what has been called the 'empire of Montezuma.' It was composed of three towns with the territories belonging to each: Tenochtitlan or Mexico, Tezcuco, and Tlacopan. Mexico or Tenochtitlan was the head of the confederacy and the seat of government. . . . The most important of the remains are found on the sites of ancient cities, and the architecture of the buildings themselves is one of the most important features. The great ruins of the Nahua group include Tula, Teotihuacan, Xochicalco, Tepeotlan, Cholula, and Tenochtitlan, now the city of Mexico. Though this city was destroyed at the time of the conquest, a vast number of objects were buried beneath the soil on which the new city arose, and many of these have recently been brought to light. In the Huastecan and Totonacan regions are the ruins of Papantla, Cuetla, Tusapan, and Cempoalla. The ruins on Monte Alban in Oaxaca are the most stupendous in all Mexico, and are supposed to represent the seat of the ancient capital of the Za-

potec. Mitla, in the same district, is a noted example of ancient architecture, and in some ways the most remarkable in America. Here stones of many tons have been brought from quarries on the neighboring mountains, and all have been fitted together with the utmost nicety and precision. Here, as in many other places, complicated carved designs are found, covering whole faces of buildings, and all accomplished with nothing better than tools of stone or possibly of hardened copper."—L. Farland, *Basis of American history*, pp. 188-190.—See also MEXICO: Aboriginal peoples; AMERICA: 1517-1518; CENTRAL AMERICA: Population; HAITI, REPUBLIC OF: Aborigines.

MAYA AREA.—"In the Maya regions are remains of hundreds of towns remarkable for their size and elaborate sculptures. Among the most important may be mentioned Palenque, Menché, Tikal, Labna, K'uh Uxmal, Chichen Itza, Quirigua, and Copan.

been simply the war-chief of the Aztec confederation, holder of an elective office, from which the chief could be deposed for misconduct—a common provision among Indian tribes, but not ordinarily compatible with hereditary monarchy. The clan was still the basis of the social structure, and the method of choosing chiefs and councillors was quite similar to that found among the Iroquois. Land was the property of the clan, and was assigned to the individual, who could hold it only as long as he cultivated it properly. The tribes conquered by the confederacy were required to pay tribute, which was collected by certain officials of the league and distributed between its members, Mexico getting two-fifths. The tributary tribes were also required to furnish warriors, in case of need, at the demand of the confederacy. Among these peoples agriculture was still fundamental, but manufactures and trade were also considerably de-

DETAIL OF PYRAMID OF THE SUN, MEXICO

One feature common to most of these ruins is the presence of pyramids, frequently of immense size, and usually surmounted by buildings. In Yucatan the pyramids are usually built, or at least faced, with stone, while among the Nahuas they were constructed of adobe brick. The pyramid of Cholula, originally crowned by a temple which was destroyed by Cortés, was fourteen hundred and forty feet square at the base and one hundred and seventy-seven feet high. The civilization, however, which is represented by these ancient ruins is not to be regarded as anything radically different from that we have met farther north, but rather as a development along the same lines, with modifications due to a more complex organization. There are many points in common with the Pueblo culture of the southwest: we still find the peace-chief, with his councillors, and the war chief, though the occupants of these positions have become more conspicuous because of the increasing complexity and material prosperity of a higher state of culture. Montezuma, for example, is now known to have

veloped. Certain towns and regions became noted for particular products, and regular markets under governmental supervision were held in specified places. Great skill was displayed in the carving of wood, shells, and precious stones, and in gold and silver work. The products and art of the different regions were usually quite distinctive, especially in the better grades of pottery, which was often beautifully ornamented. The religious system may also be regarded as a higher development of that found among the northern tribes. The mythology had become more systematized and the power of the priesthood had increased. The endeavor to propitiate the gods and to cause them to grant favoring rains and abundant crops is still most in evidence; but in connection with other interests and industries many new deities with their associated ceremonies and priesthoods had been introduced. The religious rites were elaborate and prescribed with minuteness, and animal and even human sacrifices were not uncommon. Systems of picture-writing or hieroglyphics had also been de-

veloped. Among the Nahua there were numerous books, a few of which have been preserved and are still very imperfectly understood. These works, commonly called 'codices,' were painted on prepared paper or skins; some of them seem to be religious calendars, others historical records. The Maya had a somewhat different system of writing, of which there are a number of specimens on the monuments and a few codices. [See also AZTEC AND MAYA PICTURE WRITING]. Some of these also, especially those relating to the calendar, have been partially deciphered. A third kind of inscription has recently been found in Zapotec ruins, but nothing has been accomplished in the way of interpretation. In many places wall paintings are found, which frequently remind one strongly of certain figures in the codices, which, like the figures in the sculptures, throw much light upon the dress, ornaments, and even the implements and weapons of the people. In general it may be said that the culture of these peoples, especially of the Nahua and Maya, was much higher than that found farther north, but still a development indigenous to the country and based upon elements held in common with many other American tribes."—L. Farrand, *Basis of American history*, pp. 190-193.—See also MAYAS; YUCATAN; Geographical description.

**Cultural areas in South America: CHIBCHA AREA.**—"On the southern frontier of the old Maya territory we meet such peoples as the Lenca and Xicacque of less intense culture, but still manifesting many of the fundamental traits of the Nahua center. Yet when near the boundary of Costa Rica, we find wilder tribes with cultures suggesting South America. Just across the line we meet with the Chibcha-speaking Talamanca and the Chiriqui. From here down through the Isthmus we seem to find an increasing number of such traits as poisoned arrows, fish poisons, hammocks, and palisaded villages, all highly characteristic of South American cultures. In fact, the whole isthmian country from the lower part of Nicaragua down is a marginal part of the Chibcha culture area, centering about Bogotá, Columbia. . . . The dominating stock was the Chibcha, whose culture may be taken as the type. Like all Andean peoples, they were agricultural, producing maize, potatoes, manioc, beans, and squashes; no domestic animals for transportation; irrigation systems highly developed; salt was made on a large scale and traded to outlying tribes; cotton was raised and weaving highly developed; fine dyeing; no stone buildings, cane and thatch the rule, walls of wattle, plastered with clay; roads and suspension bridges; no copper, but great skill in gold work, in fact, the center of the art for the New World; a clan organization, or maternal descent; a kind of caste system; one tribe, the Panche, is credited with exogamous clans; no evidence of books or calendar systems; human sacrifices to the sun as an incident in sacrifices of all kinds; an infinite number of local shrines where some power was assumed to be manifest to which offerings were made; five sacred lakes; an organized priesthood with a single head; ceremonial footraces; coca chewing instead of tobacco and great use of chicha; but some tobacco was used both as snuff and for smoking in stone pipes; a mythical white man who was the culture hero called Bochica; a deluge myth; an Atlas idea of the world; a fairly compact political organization; tribute or taxes in gold and cloth chiefly; a commercial system with markets, and a kind of currency."—C. Wissler, *American Indian*, pp. 229-230.—See also CHIBCHAS; COLOMBIA: Inhabitants.

**INCA AREA.**—"The approximate northern border

of the Inca area is near the equator, in the highlands of Ecuador, and its southern limits somewhere in the Atacama desert of Chile. It is remarkably narrow, following the coast belt of elevated Andean country. . . . The dominating stock languages are the Quechua and Aymara, having northern and southern distributions respectively. . . . The truly upland groups are rather sedentary and agricultural, some maintaining temples and organized priesthods. The Janacicos (Chiquitan) and Canichanan had palisaded villages as in eastern Brazil; the former a gentile organization and made good pottery, but the latter were considered cannibals. Cannibalism in fact, is charged to a large number of these groups. In the north, in what is now Ecuador, were the Cañarian, who by their high development of gold work take a position intermediate to the Chibchan center; but their inland neighbors, the Jivaran, are more like the wild Amazon tribes. The chief characters pertaining to Inca culture are: an organized government based upon gentile groups; the supreme authority resting in a council who appointed from a hereditary group a war chief, or Inca. . . . agriculture advanced, maize, manioc, peppers, potatoes, fertilization with guanaco and other manures, elaborate irrigation systems; domestication of the llama, with the dog, guinea pig, birds, and monkeys as pets; some fishing on the coast and hunting in the interior; spinning and weaving highly developed, cotton cultivated, vicuna wool, elaborate designs and rich dyes; pottery carried to a high state of development, both in form and design, most unique form, the whistling jar; gold, silver, and copper mined, smelted and skilfully worked; true bronze was made by use of tin; tools and mechanical appliances simple, digging-stick and spade for farming, no hoe; no saws, drilling by rolling in hands; architecture massive, but plain and severe; a system of roads; stone, and suspension bridges; some water travel by balsa; an organized army and fortifications; no writing, but the quipu as a counting device [see QUIPU]; sun worship, an organized priesthood; a mythical white man founder called Viracocha; a deluge myth; human sacrifices rare, but offerings of animals common; a series of gens gods, or *huacas*; religious orders of virgins; a sacred shrine on Lake Titicaca; conventional confessions of sins to a priest; two important ceremonies, the new-fire with the banishment of disease and the sun festival."—C. Wissler, *American Indian*, p. 232.—See also PERU: Paternal despotism of the Incas; Empire of the Incas; 1200-1527; 1550-1816; CHILE: Aborigines.

**PAMPEAN AREA.**—"The typical culture is found among the Guaycuruan (Abipones, etc.), Araucanian, Puelchean, and Calchaquian stocks. Engulfed by them are such tiny groups as the Lulean and Allentiacan. On the south we note the Chonoan of the Pacific Coast, who seem to have resembled the Alikulufan, Onan, and Yahganian farther south. The eastern slope of Patagonia was occupied by the Tsonekan (Tehuelche). Such of these as occupy the coast line live largely upon sea food. The culture of the typical group reminds one of the North American Plains area. The Spanish colonists introduced horses and cattle and very quickly the natives became horse Indians, hunting wild cattle. As such, they were nomadic and in the main did not till the soil but in some cases did raise a little maize, etc., just as did some of the intermediate Plains area tribes of North America. All of the central group seem to have worn some cloth, but developed work in skins more extensively; the weapons were the lance, bola, and lasso. A skin boat suggesting the bull-boat

of the Plains area was used for fording rivers; warriors rode into battle naked; dead were placed upon platforms, but the bones were afterward buried; smokers mixed tobacco with wood shavings, as in North America. In the historic period the natives of this area developed an intense horse culture. In many respects this complex was like the horse culture of the North American plains, because it was acquired from the same foreign source. . . . Habitation vary a great deal, but still are simple affairs of skin or mats supported by a ridge pole, in many cases without smoke holes. A common form is a kind of skin-covered lean-to. Infants are secured on a board or frame, as in North America. . . . Among the more primitive tribes the men wear aprons and a robe, the latter giving way to a cotton breechcloth among the Araucans. The footwear consists of a kind of skin boot with long trailing hair from which we get the name Patagonia (duck feet). This boot has an open toe so that the toe stirrup can be used. Yet the prevailing tendency of the area as a whole was to go barefoot. As we go south in the area, the culture becomes more primitive until at last we reach the Fuegians, who are a seashore people. Still they have much in common with the horse-using tribes of the mainland and are often taken as the surviving remnant of the older population in the area. It is clear that in the period of horse culture the Araucan, Puelchean, Guaycuruan, and Calchaquian tribes were the most strongly developed. The former had a kind of confederacy based upon the family group and had the dual peace and war chiefs observed in the area of higher culture; great value was placed upon oratory. They practised some agriculture and weaving. Shamanism was not well organized, but each local group had at least one such official. Eyebrows and face hair were plucked out, but the lip plug of the Brazilian tribes was not worn. The Abipones, at least, were composed of social castes and had four gentile groups placed in the four directions, reminding us of North American cultures. The Araucans were clearly intermediate to the Inca center, as indicated by the large use of Chicha, tendency toward agriculture, the domestication of sheep and the wearing of wool in later times, great developments of animal and human sacrifices with features closely paralleling those of the North. The Fuegians and other stocks skirting the western and southern coast were not horse Indians, but developed the use of canoes; built fires in them upon clay hearths, went almost nude even in winter; lean-to shelters; bola not used, but the bow and spear; water-tight baskets; iron pyrites used for fire-making; dogs trained for hunting and even to drive fish by swimming. Some early accounts credit the Chonoans with weaving blankets from dog hair, reminding us of the Salish stock of the northern continent. . . . For the Japura River, or the northeastern section of the area, we have Whiffen's account of the Witto and Boro, whose culture, together with that of their immediate neighbors, may be characterized as follows; live by hunting, fishing, and agriculture; raise manioc, tobacco, and coca, and to a much less extent maize, yams, pumpkins, peppers, sugar-cane, etc.; fields cleared by fire and dug up by digging-stick, no hoe; no tame animals, even dogs rare; all animal life eaten, the monkey being the most nearly staple; honey prized, some tame bees; cassava bread and the 'pepper pot,' the chief support; manioc squeezed by rolling in a mat; coca chewed and mimora seeds snuffed; tobacco used for ceremonial drink only; curare and other poisons; blowgun, throwing spear, bows, paddle clubs; fish

caught by poison, also with hooks, nets, traps, and a trident spear; clay eaten; cannibals, eat prisoners; drum signalling; drums in pairs, male and female, phallic decorations; palm fiber rolled on thigh and hammocks made; pottery; basketry; no metal, little stone, tools of wood; dug-out canoes, sprung into shape when hot from burning out; trees felled by holes and wedging; large wooden mortars for coca, tobacco, and maize; habitations and fields shifted often; whole community in one house, large and square, four posts inside, thatched, no smoke hole; clearing around house, but all concealed in jungle by maze-like path; no clothing except bark breechcloth for men; combs of palm splints for women; human tooth necklaces; ornamental ligatures, nose pins, leg rattles, elaborate body paint; palaver with a kind of black drink of tobacco for all important undertakings of war or peace; the couvade; women not permitted to join in serious ceremonies and not to see boy's initiations, not allowed to join a cannibal feast; personal names not spoken, even true names of mythical characters are whispered; shamanism (*paye*) important, tricks crude except 'voice throwing,' sucking for disease, but detecting evil spirits the chief function of a shaman; two serious harvest ceremonies, manioc and pineapple; boys cruelly whipped in puberty ceremonies; ordeals of stinging ants; many social dances; formal recital of one's grievances and a kind of riddle dance; pan pipe, flute, castanet, drum, gourd rattle; each house group exogamous, paternal descent; monogamy, each house has a chief, all adult males the council; many tales resembling European folklore and many animal tales reminding one of African lore; sun and moon venerated; grave burial."—C. Wissler, *American Indian*, pp. 233, 235-237, 239.—See also PAMPAS TRIBES; PATAGONIANS AND FUEGIANS.

AMAZON AREA.—"In Guiana we find most of these same traits, but what seems to be a higher culture, since here we have cotton cultivated and spun and the typical cassava squeezer. The Arawak peoples also have a clan organization, maternal descent. None of the Guiana peoples see coca, but smoke tobacco, cigar fashion; the signal drum is absent. The house is similar in form but smaller, the tendency being to form villages; yet as we go in from the coast the transition to the large community house is rapid. On the south of the Amazon we find the higher culture among the Tupi of the Brazilian coast. The new traits are: smoking tobacco in stone pipes, palisaded villages, fine stone tools, urn burial; but otherwise the culture compares concisely with that of the Arawak and Carib of Guiana. A few small stocks have similar culture, but on the interior plateaus were the Tapuya (the Botocudo, etc.), who stand some what apart from their neighbors. All reports considered, these tribes are of low culture and notorious cannibals. They were non-agricultural, did not work stone and made little pretense of weaving. . . . Turning again to the Amazon area, including the Tupi, we have remarkable uniformity in the following from north to south and east to west; agriculture; canoes; hammocks; pottery; blowgun; a thatched post-supported house with gables; sword clubs; leg and arm binding; certain types of feather-work; human bone flutes; calabash rattles; use of honey and wax; cannibalism; certain kinds of dance masks; couvade; ceremonial whipping of boys, and women barred from ceremonials. This is truly a formidable list. There are a few traits with partial distribution; thus, on the south side of the Amazon we frequently find the lip plug in contrast to the north, though it has a close analogy in Guiana. Again, on the south, urn burial is fre-

quent, on the north, grave burial. Coca chewing and tobacco drinking are found in the west, tobacco smoking in the east, pipes in Brazil, and cigars in Guiana. Also, in eastern Brazil we have the pellet bow and the palisaded village. These, however, do not negate the unity of Amazon culture. . . . The picture of the culture areas given above has no date—it is so to speak a cross section of time and any map placing all the known Indian tribes could not pretend to represent the continent at any specific period in its history.”—C. Wissler, *American Indian*, pp. 240-241.—See also CARIBS; TUPI.

**Linguistic characteristics.—Classification.**—“In older treatises of the languages of the world, languages have often been classified as isolating, agglutinating, polysynthetic, and inflecting languages. Chinese is generally given as an example of an isolating language. The agglutinating languages are represented by the Ural Altaic languages of northern Asia; polysynthetic languages, by the languages of America; and inflecting languages, by the Indo-European and Semitic languages. The essential traits of these four groups are: That in the first, sentences are expressed solely by the juxtaposition of unchangeable elements; in the agglutinating languages, a single stem is modified by the attachment of numerous formative elements which modify the fundamental idea of the stem; in polysynthetic languages, a large number of distinct ideas are amalgamated by grammatical processes and form a single word, without any morphological distinction between the formal elements in the sentence and the contents of the sentence; and in the inflecting languages, on the other hand, a sharp distinction is made between formal elements and the material contents of the sentence, and stems are modified solely according to the logical forms in which they appear in the sentence. . . . American languages have also been designated as incorporating languages, by which is meant a tendency to incorporate the object of the sentence, either nominal or pronominal, in the verbal expression. . . . A more thorough knowledge of the structure of many American languages shows that the general designation of all these languages as polysynthetic and incorporating is not tenable. We have in America a sufficiently large number of cases of languages in which the pronouns are not incorporated, but joined loosely to the verb, and we also have numerous languages in which the incorporation of many elements into a single word hardly occurs at all. Among the languages treated here, the Chinook may be given as an example of lack of polysynthesis. There are very few, if any, cases in which a single Chinook word expresses an extended complex of ideas, and we notice particularly that there are no large classes of ideas which are expressed in such form that they may be considered as subordinate. An examination of the structure of the Chinook grammar will show that each verbal stem appears modified only by pronominal and a few adverbial elements, and that nouns show hardly any tendency to incorporate new ideas such as are expressed by our adjectives. On the other hand, the Athapascan and the Haida and Tlingit may be taken as examples of languages which, though polysynthetic in the sense here described, do not readily incorporate the object, but treat both pronominal subject and pronominal object as independent elements. Among the languages of northern North America, the Iroquois alone has so strong a tendency to incorporate the nominal object into the verb, and at the same time to modify so much its independent form, that it can be considered as one of the character-

istic languages that incorporate the object. To a lesser extent this trait belongs also to the Tsimshian, Kutenai, and Shoshone. It is strongly developed in the Caddoan languages. All the other incorporating languages treated here, like the Eskimo, Algonquian, and Kwakiutl, confine themselves to a more or less close incorporation of the

DAKOTA INDIAN WOMAN

(American Museum of Natural History, New York)

pronominal object. In Shoshone, the incorporation of the pronominal object and of the nominal object is so weak that it is almost arbitrary whether we consider these forms as incorporated or not. If we extend our view over other parts of America, the same facts appear clearly, and it is not possible to consider these two traits as characteristics of all American languages. On the other hand, there are certain traits that, although not common to all American languages, are at least frequent, and which are not less characteristic than

the tendency to objective incorporation and to polysynthesis. The most important of these is the tendency to divide the verb sharply into an active and a neutral class, one of which is closely related to the possessive forms of the noun, while the other is treated as a true verb. We might perhaps say that American languages have a strong tendency to draw the dividing line between denominating terms and predicative terms, not in the same way that we are accustomed to do. In American languages many of our predicative terms are closely related to nominal terms, most frequently the neutral verbs expressing a state, like *to sit, to stand*. These, also, often include a considerable number of adjectives. On the other hand, terms expressing activities—like *to sing, to eat, to kill*—are treated as true predicative terms. The differentiation of these two classes is generally expressed by the occurrence of an entirely or partially separated set of pronouns for the predicative terms. Beyond these extremely vague points, there are hardly any characteristics that are common to many American languages. A number of traits, however, may be enumerated which occur with considerable frequency in many parts of America. The phonetic systems of American languages differ very considerably, but we find with remarkable frequency a peculiar differentiation of voiced and unvoiced stops,—corresponding to our, *b p; d t; g, k*,—which differ in principle from the classification of the corresponding sounds in most of the European languages. An examination of American vocabularies and texts shows very clearly that all observers have had more or less difficulty in differentiating these sounds. Although there is not the slightest doubt that they differ in character, it would seem that there is almost everywhere a tendency to pronounce the voiced and unvoiced sounds with very nearly equal stress of articulation, not as in European languages, where the unvoiced sound is generally pronounced with greater stress. This equality of stress of the two sounds brings it about that their differences appear rather slight. On the other hand, there are frequently sounds, particularly in the languages of the Pacific coast, in which a stress of articulation is used which is considerably greater than any stresses occurring in the languages with which we are familiar. These sounds are generally unvoiced; but a high air-pressure in the oral cavity is secured by closing the glottis and nares, or by closing the posterior part of the mouth with the base of the tongue. The release at the point of articulation lets out the small amount of strongly compressed air, and the subsequent opening of glottis and nares or base of tongue produces a break in the continuity of sound. . . . These traits are not by any means common to all American languages, but they are sufficiently frequent to deserve mention in a generalized discussion of the subject. . . . There are in America 169 linguistic stocks. Fifty-six in North America, 29 in Central America and 84 in South America. The most widely distributed of these linguistic stocks are the Algonquian, which occupied all of New England, Eastern Canada up to Hudson Bay and the United States around the Great Lakes and as far south as the Ohio River; the Athapaskan languages are spoken from Alaska through the Canadian Rockies; by some small groups in California and also in the Southwest; the Siouan languages are spoken through the prairies of the United States and by an isolated group in the Carolinas. Wiskhogeon was spoken in Georgia, Alabama, Mississippi, Tennessee, Louisiana. There is a curious phenomenon in the distribution of these linguistic stocks, namely that on the Atlantic coast there is

great uniformity of language when compared with the tremendous diversity of languages on the Pacific coast. From Puget Sound to Lower California there are no less than 20 distinct languages spoken in the narrow coasted line west of the countries. The same is true for South America although there the greater diversity occurs further inland but still on the coast side of the continent."—F. Boas, *Handbook of American languages* (Bureau of American Ethnology, Bulletin no. 40, pp. 74-77).—See also ANTHROPOLOGY: Linguistics.

**Origins of American Indian.**—Theories of origin.—Asiatic affinities.—Development at time of migration to America.—Racial characteristics.—Geological evidence.—Cultural origins.—“For the American anthropologist no subject is of more interest than that of the racial affinity and the place or places of origin of the American aborigines. Ever since the discovery of the new continent and its peoples these questions have occupied many minds, but have not as yet been brought to the point of final answer. Numerous opinions were advanced, but they were almost wholly the results of speculation, fettered on one side by lack of scientific research and on the other by various traditions. When Columbus discovered the New World he and his companions imagined, as is well known, that they had reached the Indies, and the people met were naturally taken for natives of those regions. Later, as the true nature of the new land became better known, speculation concerning the newly discovered race took other directions, and some of the notions developed proved disastrous to the Indians. History tells us that many of the early Spaniards, up to Las Casas' time, reached the conclusion that, as no mention was made concerning the American people in Hebrew traditions, they could not strictly be regarded as men equivalent to those named in biblical accounts, and this view, before being counteracted, led directly or indirectly to much enslavement and destruction of the native Americans. Later, the origin of the Indians was sought in other parts of the world, and the seeming necessity of harmonizing this origin with biblical knowledge led to many curious opinions. One of these, held by Gomara, Lerius, and Lescarbot, was to the effect that the American aborigines were the descendants of the Canaanites who were expelled from their original abode by Joshua; another, held especially by McIntosh, that they were descended from Asiatics who themselves originated from Magog, the second son of Japhet; but the most widespread theory, and one, the remnant of which we meet to this day, was that the American Indians represented the so-called Lost Tribes of Israel. [See also AMERICA: Theory of a land bridge.] During the course of the nineteenth century, with Leveque, Humboldt, McCulloch, Morton, and especially Quatrefages, we begin to encounter more rational hypotheses concerning the Indians, although by no means a single opinion. Lord Kaimes, Morton, and Nott and Glidden professed the belief that the American natives originated in the new world and hence were truly autochthonous; Grotius believed that Yucatan had been peopled by early Christian Ethiopians, according to Mitchell the ancestors of the Indians came to this country partly from the Pacific Ocean and partly from northeastern Asia; the erudite Dr. McCulloch believed that the Indians originated from parts of different peoples who reached America over lost land from the west ‘when the surface of the earth allowed a free transit for quadrupeds.’ Quatrefages viewed the Americans as a conglomerate people, resulting from the fossil race of Lagoa Santa, the race of Parana, and

probably others in addition to which he believed there had been settlements of Polynesians; and Pickering thought that the Indians originated partly from the Mongolian and partly from the Malay. The majority of the authors of the last century, however, including Humboldt, Brerewood, Bell, Swinton, Jefferson, Latham, Quatrefages, and Peschel inclined to the belief that all the American natives, excepting the Eskimo, were of one and the same race and that they were the descendants of immigrants from North-eastern Asia, particularly of the 'Tartars' or Mongolians. The most recent writers, with one marked exception, agree entirely that this country was peopled throughout by immigration and local multiplication of people; but the

menced, has developed numerous secondary, sub-racial, localized structural modifications, these modifications cannot yet be regarded as fixed, and in no important features have they obliterated the old type and sub-types of the people. We are further in a position to state that notwithstanding the various secondary physical modifications referred to, the American natives, barring the more distantly related Eskimo, present throughout the Western Hemisphere numerous important features in common, which mark them plainly as parts of one stem of humanity. These features are: . . . 6. The mouth is generally fairly large, the lips average from medium to slightly fuller than in whites, and the lower facial region

PREHISTORIC CLIFF DWELLINGS, MESA VERDE, NATIONAL PARK, COLORADO

locality, nature, and time of the immigration are still much mooted questions. Some authors incline to the exclusively north-eastern Asiatic origin; others, such as Ten Kate and Rivet, show a tendency to follow Quatrefages in attributing at least some parts of the native American population to the Polynesians; Brinton held that they came in ancient times over a land connection from Europe; and Kollmann, basing his belief on some small crania, believes that a dwarf race preceded the Indian in America. . . . What can be stated in the light of present knowledge concerning the American native with a fair degree of positiveness is that: 1. There is no acceptable evidence, nor any probability, that men originated on this continent; 2. Man did not reach America until after attaining a development superior to that of late Pleistocene man in Europe, and after having undergone advanced and thorough stem, and even racial and tribal, differentiation; and 3. While man, since the peopling of the American continent was com-

shows throughout a medium degree of prognathism, standing, like the relative proportions of the nose, about midway between those in the whites and those characteristic of the negroes. The chin is well developed, not seldom square. The teeth are of medium size when compared, with those of primitive man in general, but perceptibly larger when contrasted with those of the cultured white American or European; the upper incisors of the Indian present an especially important feature; they are characteristically shovel-shaped, that is, deeply and peculiarly concave on the buccal side. The ears are rather large. 7. The neck, as a rule, is of only moderate length, and in health is never thin; the chest is somewhat deeper than in average whites; the breasts of the women are of medium size, and generally more or less conical in form. There is a complete absence of steatopygy; the lower limbs are less shapely and especially less full than in whites; the calf in the majority is small. 8. The hands and feet, as a rule, are of

relatively moderate or even of small dimensions, and what is among the most important features distinguishing the Indian, the relative proportions of his forearms to arms and those of the distal parts of the lower limbs to the proximal (or, in the skeleton, the radio-humeral and tibio-femoral indices) are in general, throughout the two parts of the continent, of much the same average value, which value differs from that of both the whites and the negroes, standing again in an intermediary position. This list of characteristics, which are, broadly speaking, shared by all American natives, could readily be extended, but the common features mentioned ought to be sufficient to make clear the fundamental unity of the Indians. The question that necessarily follows is: 'Which, among the different peoples of the globe, does the Indian as here characterized most resemble?' The answer, notwithstanding our imperfect knowledge, can be given conclusively. There is a great stem of humanity which embraces people ranging from yellowish-white to dark brown in color, with straight black hair, scanty beard, hairless body, brown, often more or less slanting eye, prevalently mesorhinc nose, medium alveolar prognathism, and in many other essential features much like the American native; and this stem embracing several sub-types and many nationalities and tribes, occupies the eastern half of the Asiatic continent and a large part of Polynesia. . . . As to Polynesian migrations within the Pacific, such were, so far as can be determined, all relatively recent, having taken place when America doubtless had already a large population and had developed several native cultures. It is, however, probable that after spreading over the islands, small parties of Polynesians have accidentally reached America. If so, they may have modified in some respects the native culture; but physically, being radically like the people who received them (barring their probably more recent negro mixture), they would readily blend with the Indian and their progeny could not be distinguished. In a similar way small parties of whites may have probably reached the continent in the east. They, too, may have introduced some cultural modifications, but they would necessarily consist of men only and of parties small in number, which would in the course of time blend thoroughly with the Indian."—A. Hrdlicka, *Peopling of America* (*Journal of Heredity*, Feb., 1915). —"Through a study of the various finds of human remains in North America for which geological antiquity has been claimed, it is seen that, irrespective of other considerations, in every instance where enough of the bones is preserved for comparison the somatological evidence bears witness against the geological antiquity of the remains and for their close affinity to or identity with those of the modern Indian. Under these circumstances but one conclusion is justified, which is that thus far on this continent no human bones of undisputed geological antiquity are known. This must not be regarded as equivalent to a declaration that there was no early man in this country; it means only that if early man did exist in North America, convincing proof of the fact from the stand-point of physical anthropology still remains to be produced. Referring particularly to the Nebraska 'loess man,' the mind searches in vain for solid ground on which to base an estimate of more than moderate antiquity for the Gilder Mound specimens. The evidence as a whole only strengthens the above conclusion that the existence on this continent of a man of distinctly primitive type and of exceptional geological antiquity has not as yet been proved. There may be discouragement in these repeated

failures to obtain satisfactory evidence of man's antiquity in America, but there is in this also a stimulus to renewed, patient, careful, scientifically conducted and checked exploration; and, as Professor Barbour says in one of his papers on the Nebraska find, 'the end to be attained is worth the energy to be expended.' A satisfactory demonstration of the presence of a geologically ancient man on this continent would form an important link in the history of the American race, and of mankind in general. The Missouri and Mississippi drainage areas offer exceptional opportunities for the discovery of this link of humanity if such really exists."—A. Hrdlicka, *Skeletal remains suggesting or attributed to early man in North America*, p. 98. —"Repeated efforts have been made to show that all the higher culture complexes of the New World were brought over from the Old, particularly from China or the Pacific Islands. Most of these writings are merely speculative and may be ignored, but some of the facts we have cited for correspondences to Pacific Island culture have not been satisfactorily explained. Dixon has carefully reviewed this subject, asserting in general that among such traits as blowguns, plank canoes, hammocks, lime chewing, bead-hunting cults, the man's house, and certain masked dances common to the New World and the Pacific Islands, there appears the tendency to mass upon the Pacific side of the New World. This gives these traits a semblance of continuous distribution with the Island culture. Yet it should be noted that these traits, as enumerated above, have in reality a sporadic distribution in the New World and that there are exceptions. On the other hand, there is no great *a priori* improbability that some of these traits did reach the New World from the Pacific Islands. Satisfactory proof of such may yet be attained, but such discoveries would not account for New World culture as a whole. Then there is abundant data to show that the Polynesians are recent arrivals in the Pacific; in fact, Maya culture must have been in its dotage long before they were within striking distance of the American coast. . . . Hence, the general condition for any interpretation of Old and New World relations is the full recognition that their great culture centers were well isolated by a complex chain of wilder hunting peoples and that direct contact between the two was impossible without modern means of transportation. Only such traits could, therefore, filter through from one to the other as were assimilated by these more primitive tribes. When we consider their great number and the diversity of their speech, we realize that Mexico was completely isolated from China in agriculture, metal work, and similar arts, but not necessarily so in simple traits like the sinew-backed bow. The proof of independent development thus rests largely in chronological and environmental relations."—C. Wissler, *American Indian*, pp. 356, 359.—On December 20, 1922, Dr. Louis B. Dixon read a paper before the American Association for the Advancement of Science in which he said "that a study of the earliest Indian skulls indicated that some were descended from blacks or negroids, others from primitive Australian stock, others from whites resembling the Nordics and others from Mongol or Turkish strains, all of whom crossed the Bering Straits in prehistoric time." This paper caused a sensation at the meeting.—See also AMERICA: Prehistoric.

Development of Indians previous to Spanish invasion.—Methods of establishing chronology.—"In speaking of America we generally refer to pre-Spanish conditions as pre-historic. And from the time of the Spanish invasions we have written

records, for almost every one of the early Spanish expeditions was written up by one of its members and contains some very useful ethnological data. To return to prehistoric times—it is very important to understand that the chronology which is applied to prehistoric Europe is of no use in America. The sequence of Paleolithic, Neolithic, Bronze, Iron holds only for Europe, but this does not mean that the New World is so young that no deeply stratified remains can be found. After spending much time in trying to find parallels to the European chronology some younger anthropologists have tried to analyze the situation. It has been found in the Mammoth Cave region of Kentucky and again near Trenton, N. J., that there existed an earlier culture without polished stone and pottery. It is only through such finds that ultimately the history of American culture can be built up. Of course the method has the shortcomings of all archaeological method, it can only deal with things that do not decay. [See also AMERICA: Prehistoric; ARCHAEOLOGY: Importance of American field; EASTER ISLAND.] There are a few historical facts that give us initial dates for the series. History in the Southwest begins with the Spanish exploration of the territory about 1540. Subsequent events give us other definite points, but for the remaining nine-tenths, or more, of the sequence presented in the table, we have no such time data. Yet, we do have sources from which these intervals can be estimated in terms of the known tenth. Nelson's diagram presents the steps from one culture to the next as if equal; but this is not his intention or belief. It is common historical knowledge that the evolution of culture and, in fact, all organic things, has been accelerating with time. The tabulation of a few epoch-making events in Old World culture with the dates assigned thereto makes this clear. . . . It appears that it took much longer to pass from flint chipping to fire and again to painting, than from iron to steam power and the more recent inventions. Thus not only the presence of acceleration is made evident, but its rate of progression is indicated. In the regions where pottery, the chief index of culture is lacking very little can be said about earlier culture. This is especially true on the North Pacific Coast and on the Plains. From other cultural evidences we know that the Plains Indians were not as nomadic before the introduction of the horse as afterwards. Another piece of real archaeological work has been done in the older cultures of the Ohio Valley where some very crude stone implements were found. In Mexico and Yucatan several archaeological Strata have been identified, although comparatively the data now at hand is insufficient; it is still hoped that from these prehistoric remains the oldest culture in America can be discovered."—C. Wissler, *Anthropological papers*, v. 18, pp. 3-7.

**Development of Indian history after the appearance of Europeans.**—Apart from anthropology, ethnology and philology, the important facts in Indian history are inextricably bound up with the course of events in the life of the races which dispossessed them, and their fundamental contributions are those which influenced and furthered European development. Perhaps the most important single culture-factor contributed by the Indians was the pathway westward. The advance of the European colonists was along the trails, water ways, trade routes and camping-sites of the red men. The trail grew into a road and the road became a railway. Although the English were much less affected than the French by the civilization of the races with which they came into con-

tact, traffic with the Indians necessarily had its effect on the social and political conditions of the colonists. They received many valuable lessons in the art of delicate negotiations and skillful statecraft, and some of the alliances entered into with their aboriginal neighbors had far-reaching consequences on their history. With the gradual encroachment on the hunting grounds of the Indian by the white man (which in the nature of things began with his first appearance), Indian history is made up of nearly four hundred years of intermittent warfare.

1860-1865.—Massacres of western pioneers.—War of Sioux Indians (1862).—"Kit" Carson's victory over Navahos.—"A generation ago every American boy knew of Sitting Bull and Geronimo and was full of their bloody exploits on the war-trail. A youth of the present generation [1921], when asked about living Indians, will name such 'chiefs' as Thorpe or Bender, and will tell you of how they won championships at Olympic meets or mowed down batsmen in world series. Between the two attitudes of mind lies a wonderful transformation, not only in the status of the Indian race but in the whole of the great West."

—P. L. Haworth, *United States in our own times*, p. 100.—"The steady westward march of population was accompanied by the inevitable Indian massacres, which had characterized similar movements from the earliest days of American frontier building. During the second year of the [Civil] war the Sioux Indians killed eight hundred men, women, and children in Minnesota, and destroyed property to the value of \$5,000,000. [See DAKOTA TERRITORY: 1862-1865.] Escaping punishment here, they pillaged in the Valley of the Missouri, where they laid in wait for immigrant bands, who were obliged to move under military escort."—E. D. Fite, *History of the United States*, p. 404.—"In the far southwest the Navahos, a fierce tribe of the Athabascan family, who had long been accustomed to attacking the white settlements of New Mexico, continued their forays after the territory had passed into the possession of the United States in 1849. They were finally subdued by 'Kit' Carson in 1863. . . . In all these encounters with the red men in the sixties and seventies the whites, under Generals Hancock, Custer, Sheridan and Miles, of

Civil War fame, resorted, perhaps of necessity, to great cruelty, and despite their depredations much sympathy for the Indians was aroused throughout the nation. General Miles has left it as his testimony that he had never known an Indian war in which the whites were not the aggressors."—*Ibid.*, p. 405.—See also OKLAHOMA: 1860-1865.

1864-1877.—Wars in Oregon Territory. See OREGON: 1861-1878.

1865.—West an "Indian country."—"At the close of the Civil War the population of the region beyond the Mississippi, excluding the older States of Iowa, Missouri, Arkansas, Texas, and parts of Minnesota and Louisiana—constituting about two-thirds of the United States proper—was only a million and a half; and vast areas existed that were peopled only by nomadic savages who won a livelihood by slaying the swarming buffaloes. . . . It is hard for Americans of this generation [1921] to realize that for years after the Civil War most of the Far West continued to be 'Indian country,' and that travellers who crossed the Great Plains and the mountains beyond ran imminent risk of leaving their bones bleaching in the buffalo-grass and of having their scalps swing in the smoke of wigwams—even in times of so-called 'peace.' In the West, as formerly in the East, the history of how the aborigines were conquered and dispossessed is a long and complicated story of encroachments upon the Indian's lands, of warfare, of treaties 'made to be broken,' a story that does little credit to Americans and their government. However, in the words of Chittenden: 'It was the decree of destiny that the European should displace the native on his own soil. No earthly power could prevent it.'—P. L. Haworth, *United States in our own times*, pp. 100-101.

1865-1876.—Wars with Modocs, Comanches, Nez Percés, Arapahoes, and Kiowas.—Cheyenne War (1868).—Custer and battle of Washita river.—Peace commission.—Exploitation of Indian by government agents.—Board of Indian Commissioners created.—"However, the Indians were not altogether blameless in most of the scores of petty wars that occurred in the quarter-century following 1865. Despite attempts to idealize the red men, their normal existence was a state of warfare. . . . At the close of the Civil War the whole Western Frontier was ablaze, and nearly every important tribe from the Canadian border to the Red River of the South was on the war-path. In the Indian campaigns of that year about \$40,000,000 was expended, yet very few hostiles were either killed or captured. The next quarter-century witnessed wars with the Modocs [1872-1873. See also MODOCS], Comanches [1874-1875. See also SHOSHONEAN FAMILY; KIOWAN FAMILY], Nez Percés [1877. See also NEZ PERCÉS], Arapahoes, Kiowas, and other tribes, in the course of which many hundreds of 'contacts' occurred between troops and hostiles, but the tribes that caused the most persistent trouble were the Apaches of the arid Southwest and the great Sioux confederacy of the upper Missouri country. . . . In 1868 the warlike Cheyennes swept through western Kansas like a devastating storm, and in a single month killed or captured over eighty men, women, and children, while again and again they wiped out gangs of workmen employed in the construction of the new railroad to the Pacific. The fate of the captured women and girls was particularly revolting, and the stories of how some of them were finally rescued exceeds in adventurous interest most fiction. General Sheridan, of Winchester fame, personally took the field against the Cheyennes and other bands, but it was generally easy for the hostiles to

evade the troops, for the Indians depended mostly upon game for food and were mounted upon swift ponies that were usually able to out-travel the slow-going horses of the troopers, while, when hard pressed, a band could easily scatter and later meet again at an appointed rendezvous. Sheridan, in fact, found the task of catching his enemy so difficult that he compared it to 'chasing the *Alabama*.' In September a thousand hostiles under Chief Roman Nose made the mistake of attacking a band of fifty scouts intrenched on a sandy island in the Arickaree fork of Republican River, and were beaten off after a desperate struggle, largely because of the determined resourcefulness of Colonel George A. Forsyth. Near the end of the year General George A. Custer, with the Seventh Cavalry, carried out a winter campaign when the snow was deep and the Indian ponies were weak from lack of proper food. By good management he surprised Black Kettle's band of Cheyennes and Arapahoes in camp along the Washita River, killed more than a hundred warriors, took many prisoners, almost a thousand ponies, also hundreds of buffalo-ropes and bows, arrows, and other savage paraphernalia. The surviving Cheyennes and Arapahoes made peace soon after. In the previous spring peace had been concluded with the Kiowas, Apaches, Sioux, and certain other tribes by what was known as the Peace Commission. [See also DAKOTA TERRITORY: 1866-1870]. By these treaties the Indians conceded certain rights of transit through their country, but reservations were set apart for their use, and the Bozeman Trail in the Powder River country was given up by the whites."

—P. S. Haworth, *United States in our own times*, pp. 102-105.—See also U. S. A.: 1866-1876.—"Even after the tribes accepted the guardianship of the government they were often mistreated by rapacious Indian agents and contractors. For years an 'Indian Ring' preyed upon the reservation Indians, cheating them in the amount and quality of the supplies they were supposed to receive. The blankets given them were likely to be of shoddy, the cattle fed to the wards of the nation were apt to be leaner than Pharaoh's kine, and many of the supplies for which the government paid never reached the red men at all. More than one bloody outbreak was due to dissatisfaction and hunger caused by such cheating. As already related, some of the facts regarding this 'ring' came to light in the impeachment proceedings against Secretary of War Belknap, but a thorough investigation of the abuses was never made, partly because certain politicians were anxious to preserve the existing state of affairs. Furthermore, unscrupulous white men encroached upon the Indians' lands, stole their horses, slaughtered the game upon which they depended for food, debauched their squaws, cheated them in trades, sold them 'firewater,' and taught them all the vices of civilization but few of the virtues."—*Ibid.*, p. 101.—"Under President Grant a Board of Indian Commissioners was created, and in general better Indian agents were appointed, but dishonesty still lurked in the Indian Bureau, and the Indians were still often cheated in the matter of supplies. Furthermore, encroachments on the Indians' lands continued, with much killing of the game upon which the aborigines largely depended for subsistence. In 1874-76 the discovery of gold in the Black Hills, on the Sioux reservation, precipitated a great rush of prospectors to that region and helped to bring on the last great Indian war."—*Ibid.*, p. 105.

1886.—Apaches under Geronimo conquered.—“In the far Southwest the Apaches, an offshoot from the Athapascan family of the far Canadian northland, indulged in frequent bloody forays against scattered ranches and prospectors, and displayed unsurpassed cunning and a pitiless ferocity that spared neither sex nor age. Although less

of the western tribes began to hold ‘ghost dances,’ and their medicine men were constantly prophesying the coming of a Messiah who would destroy the white men and bring back the buffalo herds. The delusion gained such a foothold that a widespread outbreak seemed imminent. The Sioux became especially uneasy, and it was known that Sitting Bull was once more engaged in stirring them up. Indian policemen were sent to arrest him, but some of his followers defended him, and Sitting Bull was slain (December 15, 1890). A couple of weeks later a considerable attack took place at Wounded Knee, but the Sioux suffered heavily, and this defeat and the energetic action of General Nelson A. Miles sufficed to bring to an end what proved to be the last of our many Indian wars. The submission of the Plains tribes to the inevitable was due almost as much to the disappearance of the buffaloes as to the campaigns of the soldiers. These mighty, shaggy, lumbering beasts were to these red men what manna was to

GROUP OF APACHE INDIANS

(American Museum of Natural History, New York)

numerous than the Sioux, they dwelt in a more difficult country, full of mountain and desert fastnesses, while, when hard pressed, they were often able to escape over the border into Mexico. Thither they were frequently followed by American forces, while Mexican troops co-operated against the common foe. Such Indian leaders as Cochise, Victorio, Juh, and Geronimo won fame in these outbreaks, while on the side of the white man the most noted names were those of Generals Crook and Miles. It was not until 1886 that the final outbreak was suppressed. In that year the Chiricahua Apaches, the most incorrigible of all, with their leader Geronimo, were deported to Florida and Alabama, where they were subjected to military imprisonment, being subsequently transferred to Fort Sill, Oklahoma, on the Kiowa reservation. At the last-mentioned place they engaged in successful farming, and developed an ability to make money and to save it.”—P. L. Haworth, *United States in our own times*, p. 111.

1888-1890.—“Ghost-dances” and Sioux uprising.—Death of Sitting Bull.—“About 1888 many

the Children of Israel during their sojourn in the Wilderness—and more, for from them the Indians obtained not only most of their food, but also clothing, bowstrings, harness for ponies and dogs, and skins for lodges. While the buffaloes were plentiful it was generally easy for bands on the war-path to evade the slow-moving soldiers, but when the herds of ‘Plains cattle’ disappeared, the old system of warfare became impossible. Lack of food was the main factor that forced Sitting Bull and his band to return from Canada.”—P. L. Haworth, *United States in our own times*, pp. 108-109.

1893-1899.—Negotiations and agreements with Five Civilized Tribes.—Work of Dawes Commission.—In his annual Message to the Congress of the United States, December 7, 1896, President Cleveland made the following reference to the work of a commission created in 1893, for nego-

tiating with what are known as the Five Civilized Tribes of Indians: "The condition of affairs among the Five Civilized Tribes, who occupy large tracts of land in the Indian Territory and who have governments of their own, has assumed such an aspect as to render it almost indispensable that there should be an entire change in the relations of these Indians to the General Government. This seems to be necessary in furtherance of their own interests, as well as for the protection of non-Indian residents in their territory. A commission organized and empowered under several recent laws is now negotiating with these Indians for the relinquishment of their courts and the division of their common lands in severalty, and are aiding in the settlement of the troublesome question of tribal membership. The reception of their first proffers of negotiation was not encouraging, but through patience and such conduct on their part as demonstrated that their intentions were friendly and in the interest of the tribes the prospect of success has become more promising. The effort should be to save these Indians from the consequences of their own mistakes and improvidence and to secure to the real Indian his rights as against intruders and professed friends who profit by his retrogression. A change is also needed to protect life and property through the operation of courts conducted according to strict justice and strong enough to enforce their mandates. As a sincere friend of the Indian, I am exceedingly anxious that these reforms should be accomplished with the consent and aid of the tribes and that no necessity may be presented for radical or drastic legislation."—*United States, messages and documents (Abridgment, 1896-1897)*.

The Act of March 3, 1893, by which the commission was created, set forth its character, its duties and its powers, as follows: "The President shall nominate and, by and with the advice and consent of the Senate, shall appoint three commissioners to enter into negotiations with the Cherokee Nation, the Choctaw Nation, the Chickasaw Nation, the Muscogee (or Creek) Nation, the Seminole Nation, for the purpose of extinguishment of the national or tribal title to any lands within that territory now held by any and all of such nations or tribes, either by cession of the same or some part thereof to the United States, or by the allotment and division of the same in severalty among the Indians of such nations or tribes, respectively, as may be entitled to the same, or by such other method as may be agreed upon between the several nations and tribes aforesaid, or each of them, with the United States, with a view to such an adjustment, upon the basis of justice and equity, as may, with the consent of such nations or tribes of Indians, so far as may be necessary, be requisite and suitable to enable the ultimate creation of a State or States of the Union which shall embrace the lands within said Indian Territory. . . . Such commissioners shall, under such regulations and directions as shall be prescribed by the President, through the Secretary of the Interior, enter upon negotiation with the several nations of Indians as aforesaid in the Indian Territory, and shall endeavor to procure, first, such allotment of lands in severalty to the Indians belonging to each such nation, tribe, or band, respectively, as may be agreed upon as just and proper to provide for each such Indian a sufficient quantity of land for his or her needs, in such equal distribution and apportionment as may be found just and suited to the circumstances; for which purpose, after the terms of such an agreement shall have been arrived at, the said commis-

sioners shall cause the land of any such nation, or tribe, or band to be surveyed and the proper allotment to be designated; and, secondly, to procure the cession, for such price and upon such terms as shall be agreed upon, of any lands not found necessary to be so allotted or divided, to the United States; and to make proper agreements for the investment or holding by the United States of such moneys as may be paid or agreed to be paid to such nation, or tribes, or bands, or to any of the Indians thereof, for the extinguishment of their [title?] therein. But said commissioners shall, however, have power to negotiate any and all such agreements as, in view of all the circumstances affecting the subject, shall be found requisite and suitable to such an arrangement of the rights and interests and affairs of such nations, tribes, bands, or Indians, or any of them, to enable the ultimate creation of a Territory of the United States with a view to the admission of the same as a State in the Union."

A subsequent Act, of March 2, 1895, authorized the appointment of two additional members of the commission; and an Act of June 10, 1896, provided that "said commission is further authorized and directed to proceed at once to hear and determine the application of all persons who may apply to them for citizenship in any of said nations, and after said hearing they shall determine the right of said applicant to be so admitted and enrolled. . . . That the said commission . . . shall cause a complete roll of citizenship of each of said nations to be made up from their records, and add thereto the names of citizens whose right may be conferred under this act, and said rolls shall be, and are hereby, made rolls of citizenship of said nations or tribes, subject, however, to the determination of the United States courts, as provided herein."

A further Act of Congress, known as the Curtis Act, June 28, 1898, ratified, with some amendments, an agreement made by the commission with the Choctaws and Chickasaws, in April, 1897, and with the Creeks in September of that year, to become effective if ratified by a majority of the voters of those tribes at an election held prior to December 1, 1898. In the annual report, for 1899, made by the commission (of which the Hon. Henry L. Dawes, of Massachusetts, is chairman, and which is often referred to as "the Dawes Commission,") the following account of results is given: "A special election was called by the executives of the Choctaw and Chickasaw nations to be held August 24, and the votes cast were counted in the presence of the Commission to the Five Civilized Tribes at Atoka, August 30, resulting in the ratification of the agreement by a majority of seven hundred ninety-eight votes. Proclamation thereof was duly made, and the 'Atoka agreement,' so called, is therefore now in full force and effect in the Choctaw and Chickasaw nations. Chief Ispashecher of the Creeks was slow to call an election, and it was not until November 1, 1898, that the agreement with that tribe was submitted in its amended form for ratification. While no active interest was manifested, the full-bloods and many of the freedmen were opposed to the agreement and it failed of ratification by about one hundred and fifty votes. . . . The Cherokees now began to realize the sensations of 'a man without a country,' and again created a commission at a general session of the national council in November, 1898, clothed with authority to negotiate an agreement with the United States. The earlier efforts of this commission to conclude an agreement with that tribe were futile, owing to the disinclination of the

Cherokee commissioners to accede to such propositions as the Government had to offer. The commission now created was limited in its power to negotiate to a period of thirty days. The United States Commission had advertised appointments in Mississippi extending from December 10, 1898, to January 7, 1899, for the purpose of identifying the Mississippi Choctaws, a duty imposed upon the commission by the act of June 28, 1898, but on receiving a communication from the chairman of the Cherokee Commission requesting a conference it was deemed desirable to postpone the appointments in Mississippi and meet the Cherokee Commission, which it did on December 19, 1898, continuing negotiations until January 14, 1899, producing the agreement which is appended hereto. In the meantime the Creeks had, by act of council, created another commission with authority to negotiate an agreement with the United States, and a conference was accorded it immediately upon conclusion of the negotiations with the Cherokees, continuing to February 1, 1899, when an agreement was concluded. The agreement with the Cherokees was ratified by the tribe at a special election held January 31, 1899, by a majority of two thousand one hundred six votes, and that with the Creeks on February 18, 1899, by a majority of four hundred eighty-five. While these agreements do not in all respects embody those features which the commission desired, they were the best obtainable, and the result of most serious, patient, and earnest consideration, covering many days of arduous labor. The commissions were many times on the point of suspending negotiations, there having arisen propositions upon the part of one of the commissions which the other was unwilling to accept. Particularly were the tribal commissioners determined to fix a maximum and minimum value for the appraisement of lands, while this commission was equally vigorous in its views that the lands should be appraised at their actual value, excluding improvements, without limitations in order that an equal division might be made. The propositions finally agreed upon were the result of a compromise, without which no agreement could have been reached. The desirability, if not the absolute necessity, of securing a uniform land tenure among the Five Tribes leads the commission to recommend that these agreements, with such modifications and amendments as may be deemed wise and proper, be ratified by Congress. . . . The Choctaw and Chickasaw governments, in a limited way, are continued, by agreement, to March 4, 1906, and certain of their laws are therefore effective within the territory of those tribes. A similar condition exists as to the Seminoles, with which an agreement was concluded at the close of the year 1897. To supply needed laws to replace various tribal statutes which had by Congress been made inoperative, the laws of Arkansas pertaining to certain matters have been extended over Indian Territory. The Federal laws have been made to apply to still other subjects, and officials under the Interior Department are charged with the enforcement of rules and regulations governing still further matters, and so on. So complicated and complex a state of affairs does this system of jurisprudence present that the people are dazed and often unable to determine what is law and who is authorized to enforce it. Indeed, none other than an able lawyer can reasonably hope to understand the situation, and even he must be content to look upon certain phases of it as not being susceptible of solution. Conditions are not yet ripe for the immediate installation of a Territorial or State government. 'Tis

a consummation devoutly to be wished,' but wholly impracticable at this time for various reasons, not the least of which is found in the fact that there are four non-citizens in Indian Territory to every citizen. The non-citizen does not own a foot of soil, save as provisions have recently been made for the segregation and sale of town sites, and with a voice in legislation, the non-citizen would soon legislate the Indian into a state of innocuous desuetude. On the other hand, it would be manifestly unjust and at ill-accord with the spirit of our institutions to deny the right of franchise to so great a number of people, in all respects otherwise entitled to enjoy that prerogative. Another very serious obstacle to the establishment of a territorial form of government is the lack of uniform land tenures. The commission indulges in the hope and belief that at no great distant date some method may be devised whereby the lands of all the Five Tribes may be subjected to a uniform tenure. It will be seen that the legislative feature of the popular form of government is not possible at this time, and while legislation by Congress for all the petty needs of the Territory is impracticable in the highest degree, the more urgent requirements of the people must be met by this means for the present. The judicial branch is well represented by the United States courts. . . . The commission, in conclusion, most earnestly urges the importance of adequate appropriations for pushing to an early completion the work contemplated by the various laws and agreements under which a transformation is to be wrought in Indian Territory. The all-important and most urgent duty now devolving upon the Government of the United States incident to the translation of conditions among the Five Tribes is the allotment of lands in severalty, and the most pressing and essential preliminary steps toward that end are the completion of citizenship rolls, the appraisement of lands, and the subdivision of sections into forty-acre tracts, all of which have been already discussed in detail in this report. The commission believes that the enrollment of citizens is progressing as rapidly as the nature of the work will permit, and unless some unforeseen obstacle arises to prevent, the rolls in four of the nations will be completed and delivered to the Secretary during the fiscal year ending June 30, 1900, and very material progress made in the fifth."—*Sixth Annual Report of the Commission to the Five Civilized Tribes, 1899, pp. 66-67, 9-29.*

1898.—*Outbreak in northern Minnesota.*—An alarming outbreak of hostility on the part of some of the Indians of the Leech Lake Reservation in northern Minnesota occurred in October, 1898, provoked, as was afterwards shown, by gross frauds and abuses on the part of certain of the officials with whom they had to deal. They had been shamefully defrauded in the sale of their timber lands, which the government assumed to undertake for their benefit; but the immediate cause of trouble appeared to be a scandalous practice on the part of deputy marshals, who made arrests among them for trivial reasons, conveyed prisoners and witnesses to the federal court at St. Paul, in order to obtain fees and mileage, and left them to make their way home again as they could. The outbreak began on the arrest of a chief of the Pillager band of Chippewas, on Bear Island. He was to be taken to St. Paul as a witness in a case of alleged whiskey-selling; but his followers rescued him. The marshal, thereupon, called for military aid, and a company of U. S. infantry was sent to the Reservation. They were ambuscaded by the Indians and suffered a loss of 5 killed and 16

wounded. The Pillager band was joined by Indians from neighboring tribes, and all in the region were dangerously excited by the event, while the whites were in great dread of a general Indian war. But reinforcements of troops were promptly sent to the scene, and peace was soon restored,—measures being taken to remedy the wrongs of which the Indians complained.—See also MINNESOTA: 1898-1899.

1901-1902.—Citizenship for the Five Civilized Tribes.—End of tribal autonomy.—By an act of March 3, 1901, all Indians of the Five Civilized Tribes were made citizens of the United States. The last of the proceedings for ending the autonomy of the Five Civilized Tribes, making them citizens of the United States and dividing their tribal lands among them individually, was finished in the summer of 1902, by the Cherokee Council, which ratified agreements already accepted by the other four tribes. (See also OKLAHOMA: 1898-1902.) According to William Dudley Foulke, who investigated the circumstances, the Creek nation has suffered grievous frauds in the final settlement of their land affairs, by the operation of the Curtis Act, in the matter of the sale of town sites. Foulke's account of the case is given in an article entitled "Despoiling a Nation," published in *The Outlook*, January 2, 1908.

1906.—Reservations in Wyoming. See WYOMING: 1906.

1908.—Under jurisdiction of Oklahoma. See OKLAHOMA: 1907-1908.

1913.—Work of commissioner of charities.—Indian orphans defended against exploiters of their land. See OKLAHOMA: 1913.

1918-1919.—Part played in World War.—"It is not necessary in establishing the patriotic and heroic part of the Indians in the World War to make such unwarrantable statements as that they purchased over \$60,000,000 worth of Liberty bonds. I feel that their actual investment of \$25,000,000 in this way is a magnificent showing. No one questions the war-time evidence of the Indian's Americanism or that it carries great weight in the plea for his citizenship. . . . A bill approved by this bureau, which became a law in October, 1919, provides that Indians who served in the Military or Naval Establishments of the United States during the war against Germany, and who have been honorably discharged, may be granted full citizenship by courts of competent jurisdiction."—*United States report of the commissioner of Indian affairs to the secretary of the interior*, June 30, 1920, pp. 8-9.

1919.—Industrial life.—"Because of economic necessity the Indian now appreciates the importance of finding work without loss of time and near home. The value of vocational training in Indian schools is reflected in the increased efficiency of pupils, many of whom are taking their places in the business and industrial life of their community side by side with their white brothers. Many Indians have been placed in automobile factories, and reports indicate that they make good workmen. Indians are employed on the railroads in many capacities, ranging from engineer to shopmen. Thousands work on farms on and adjacent to reservations. Increased acreage in cotton will furnish work for the Indians of the Southwest. The annual colony of student workers in the beet fields of Colorado and vicinity was maintained from June to October, 1919. In Box Butte County, Nebr., at least 700,000 bushels of potatoes were harvested as the work of one community of Indians. A few Indians are active Y. M. C. A. and Y. W. C. A. field workers. A number are

lawyers, physicians, and clergymen in many denominations. Some are in social club work at their homes. There are many clerks in Government and private offices, and teachers in Government, public, and other schools. There are Indian superintendents of Indian schools and supervisory officers in Indian field work."—*United States report of commissioner of Indian affairs to the secretary of the interior*, June 30, 1920, p. 19.—In the lists which give the occupations of Indians in the United States we find every conceivable sort of work: bankers, brokers, chauffeurs, civil

WAMPUM BELTS

(American Museum of Natural History, New York)

and mining engineers, stock raisers, dairymen, and owners of log and timber camps. Among the women we find farm and dairy laborers, dress-makers, saleswomen, laundresses, and clerical workers. In 1919, there were 1,223 reported as basket makers, 160 pottery makers and 4,028 weavers. One may readily ask how the Indians happen to choose such occupations and how they are prepared for them. In 1879 under the influence of Capt. R. H. Pratt an industrial training school for Indians was founded at Carlisle, Pa. Its aims are to familiarize the Indian boy and girl with the conditions of life among white people and to teach them the arts and crafts of white civilization. In 1914 there were 955 students and 44 instructors. The object of Carlisle and of the discipline used on the reservations is to make the Indian self-supporting and to educate him for citizenship. The people in Indian Service are so poorly paid that many of them are often forced to leave it to secure more remunerative employment.

1920.—Existing schools and education.—"The peak of attendance in Indian schools was reached in 1915, when 26,128 Indian children were enrolled, and there has been a gradual yearly decrease since then, both in attendance and the num-

ber of Government schools. Under new rules governing enrollment, published in my last annual report, the following schools were abolished: The Otoe, Ponca, and Shawnee Schools in Oklahoma; the Cushman School, Tacoma, Wash.; the Southern Ute School, Ignacio, Colo.; the Siseton, Yankton, and Hope Schools, South Dakota, and Martin Kenel School, North Dakota; the Oncida School, Wisconsin; the White Earth School, Minnesota; the Kickapoo School, Kansas; as well as a number of Government day schools in many localities. These reductions do not mean that Indian children are deprived of facilities for their education. Whenever one of our schools is abandoned its place is taken by the public and private school, thus merging the child of the Indian into the same educational processes as that of the whites. In 1913 there were enrolled in public and private

work, while the women have confined themselves largely to household duties. This is well exemplified by the fact that last year [1919] 36,459 Indians cultivated 702,126 acres of land, producing crops worth \$11,037,589, as compared with 28,051 Indians who cultivated 558,503 acres in 1912, producing crops worth \$3,250,288. Moreover, by the constantly growing use of modern agricultural machinery, improved methods, etc., the Indians have made distinct industrial gains, and have also won the respect of their white neighbors by their habit of sustained industry and the acquisition of improved homes. . . . It is our chief purpose in every way possible to induce and assist the Indian to live upon and cultivate his allotment and thus by his own efforts and industry arrive at the satisfactions of an independent home life and a station of progressive influence in the community.

HOPI WOMAN GRINDING CORN, WALPI, ARIZONA

schools 25,988, and at present about 29,123 Indian children. This figure, however, does not show all the Indian children who are attending schools, other than Government, but only those of whom reports are made. [Out of 88,420 children, the total number attending schools was 61,800.]—*United States report of commissioner of Indian affairs to the secretary of the interior, June 30, 1920, p. 13.*—See also EDUCATION: Modern developments; 20th century: General education: United States: North American Indians; Religious bodies, etc.

1920.—Review of agricultural developments.—**Land tenure.**—Government aid and instruction.—**Live-stock improvement.**—“Agriculture is the basis of prosperity among the whites, and is even more essential to Indian welfare. The early explorers of this country found the Indians cultivating the soil, although the women did most of the work, the men being engaged in hunting and fishing when not on the warpath. However, as the Indians have advanced under the tutelage of the Government, the men have gradually assumed this

But this is not always practicable, and is then supplemented by the leasing policy of the bureau which works a fortunate advantage to the Indian, because in many cases he does not have the means to develop his land agriculturally and place upon it improvements in buildings, fencing, and other physical essentials. . . . Where Indians are competent they are permitted to manage their own leases and to handle the funds derived therefrom. There were in round numbers 40,000 agricultural leases executed, covering about 4,500,000 acres of Indian lands; and the increased rentals which have been obtained by the revenue from leases will amount to a little over \$8,000,000. . . . The American Indian is not the same problem he was a generation ago. Of this there can be no doubt, in view of existing conditions on the reservations where stand the gravestones of Custer and his band, or among the tribes that joined in the atrocities of Geronimo. Children of chieftains who once trained for war are now occupied with vocations of peace. Indian welfare has become largely a social and economic question. The Indian's

progress in self-support justifies the broader policy of making him a producer beyond his needs and an important contributor to the world's supplies. He is, in fact, fulfilling this expectation in many ways, but perhaps in nothing more encouragingly than by his activities in stock-raising.

"An interesting chapter could be written on the Indian as a crop grower, with his tillage of nearly a million acres and his general use of modern farm implements and methods; but his larger opportunities are in live stock, to which the greater part of most of the reservations is better adapted than to farming. . . . A systematic survey of the reservation ranges was made by experienced Indian Service stockmen, which disclosed conditions requiring constructive action, such as the correction of overstocked ranges, the maintenance of grazing areas at normal carrying capacity, water development to increase capacity, winter feeding and protection, the selection of suitable breeds, and the revision of lease contracts accordingly. . . . Altogether the most important future problem is a greatly enlarged water supply. Millions of acres of practically unused reservation land could, and should, be utilized for grazing with proper water conservation and development. Much has recently been accomplished, but very much more should be done. Liberal appropriations are required, and should be made by Congress. . . . Indians, as a rule, have had very little to start with, except their allotments of land, and great assistance has been given them in long-time loans from both tribal moneys and appropriations made by Congress for that purpose, termed 'reimbursable funds.' . . . There has been expended on the Crow Reservation in Montana about \$82,000 in reimbursable funds for individual Indians, of which approximately 95 per cent. has been repaid. The Indians of the Standing Rock Reservation have been operating under this plan for several years with remarkable enterprise and success, and it has become the yearly practice for the superintendent to negotiate regular steer purchases for the Indians as individuals. Nearly 50,000 Indians are now engaged in stock raising, and their live stock increased in value from less than \$23,000,000 in 1912 to approximately \$40,000,000 in 1919. The character of the Indian's land and his native instincts point to his successful future as a stock grower; but, while he loves animal life and is the natural friend of the herd and flock, he has needed sympathetic instruction and protection. He has not understood the comparative values of quality and quantity, but has placed too much merit in numbers alone. . . . In all phases of stock raising the Indian Service is placing the Indians' activities in line with the most advanced practice of the live-stock industry. . . . The younger Indians in large numbers have for some years received excellent vocational training in our Government schools, where the course in agriculture is made prominent, and through intelligent application, energy, and ambition are adding modern methods and leadership to the live-stock business on all the reservations. . . . The year's fiscal operations for the Five Civilized Tribes were the largest in their history, involving the handling of \$47,668,996.02, including receipts and disbursements of all classes of funds. Indian money belonging to individual Indians was expended for their maintenance, farms, buildings, live stock, and equipment in the sum of \$1,966,758."—*United States report of commissioner of Indian affairs to the secretary of the interior, June 30, 1920, pp. 21-23, 27-28, 30.*

1920.—Oil and gas in reservations of Five Civilized Tribes.—"During the year [1919-1920]

about 3,500 oil and gas mining leases of restricted lands and 1,700 assignments were disposed of. . . . The income of restricted Indians from their oil and gas leases amounted to \$4,774,556.31. Although there was considerable activity in development work during the year, the production fell off. Owing to the fact that the price of oil was the highest ever received in Oklahoma, the Indians received a larger revenue from their leases than in the preceding year. . . . The Osage Reservation, under which the oil and gas is reserved to the tribe until 1931, unless otherwise provided by Congress, comprises approximately 1,500,000 acres, of which 680,000 acres on the east side were leased for oil under a blanket lease authorized by Congress, which expired March 16, 1916. On June 30, 1919, new leases had been made covering approximately 1,433,848 acres for gas and 470,804 for oil."—*United States report of the commissioner of Indian affairs to the secretary of the interior, June 30, 1920, pp. 31-33.*

1920.—Facts on Oklahoma Indians.—"The Choctaw word 'Oklahoma' is destined to hold a prominent, permanent, and honored place among the many Indian terms that are written into the annals of every State in the Union. Its meaning is at once suggestive of the large Indian population within the prosperous Commonwealth of that name, now considerably more than double that of any other State, and of which the Five Civilized Tribes are an important local factor, since they embrace more than five-sixths of their race in Oklahoma. Prior to 1830, these tribes, composed of the Choctaw, Chickasaw, Cherokee, Creek, and Seminole Indians, occupied different sections of the Southern States east of the Mississippi River. They are of the old Iroquoian and Muskogean families, who in earlier times produced many valiant leaders in war, besides others of notable inventive and literary genius, and to-day they fill with credit various important places of trust and furnish men of distinction in the highest councils of the Nation. These Indians had made considerable progress in communal activities before accepting, under treaties, lands west of the Mississippi and, after removal, re-established their tribal government, held and owned in common the land within their respective nations, and controlled their own affairs largely independent of the Federal Government. But their productive acres were attractive, and their practice of leasing them admitted large numbers of whites, many of whom were desirable settlers, but among them were adventurers and fortune hunters who introduced conditions beyond the control of tribal governments and made it necessary for Congress to take steps for the correction of lawless tendencies. In 1803, therefore, the Dawes Commission was appointed, having in view a gradual transition from tribal government and communal estates to the allotment of land in severalty, the development of individual competency as a basis for citizenship, and the establishment of law and order as an essential to statehood. To this end the securing of agreements with the Five Tribes, the preparation of a complete roll of their members, the survey and allotment of their extensive real property, and the adjustment of some 10,000 contests between claimants, became an immense task covering practically one-third of all the Indians in the United States. The passage of over 200 laws by Congress relating to these Indians is suggestive of the scope of their

large interests and the difficulty of administering them.

"On the final rolls of these tribes were 101,506 persons, of whom 26,774 were classified as full bloods. They had a little less than 20,000,000 acres of land, of which nearly 16,000,000 acres were allotted to enrolled members, and about 150,000 acres reserved for town sites, schools, churches, and other purposes. Sales of town lots have been made from more than 300 town sites for approximately \$5,000,000. The sales of unallotted tribal land have occurred entirely within the last decade. . . . These have been held each year and are now practically completed, covering over three and a half million acres for considerably more than \$20,000,000. In addition the sale of Choctaw and Chickasaw lands containing coal and asphalt deposits has brought nearly two millions, and leases and royalties for the mining of these deposits about five millions more. During the last seven years nearly 2,000,000 acres of unallotted tribal lands have been sold, the tribal affairs of the Cherokee and Seminole Nations practically closed, and the Creek, Chickasaw, and . . . Choctaw tribal relations are fast approaching dissolution. Following the disposition of tribal property and the termination of tribal affairs our administrative work in eastern Oklahoma relates chiefly to restricted Indians who, by my order of August 6, 1919, removing unconditionally restrictions on all allottees of one-half Indian blood, now number only 21,213. Their allotments comprising 2,638,819 acres are restricted as to alienation and subject to governmental supervision. The distribution of tribal funds, including payments in equalization of allotments made to the Five Civilized Tribes, now exceeds \$26,000,000. These Indians have also shared in the recent marvelous returns from oil and gas in the great Oklahoma districts, and up to 1919 there had been collected for the benefit of their individual members from leases and royalties approximately \$32,000,000. Income from other sources to that date swells their receipts of individual moneys to \$60,000,000. . . . Here we had in a sovereign State thousands of Indians who had received full United States citizenship, but whose lands and other property were still held under the protecting arm of the Government. . . . A more liberal practice was begun with reference to Indians who were qualified to look after their business affairs. This tentative plan brought encouraging results and largely decided . . . the 'Declaration of Policy' of April 17, 1917, which provides that a broad, liberal policy shall henceforth prevail to the end that every Indian of 21 years or over, as soon as ascertained to be as competent to transact his own business as the average white man, shall be given full control of his lands and funds and thus cease to be a ward of the Government. This policy was further greatly enlarged by the subsequent declaration to give a fee patent to, or release from United States control in other ways, every allottee (21 years of age and competent) who had at least one-half white blood. Under these broader policies, the total number of Indians released from Government supervision has reached nearly 21,000, Oklahoma sharing a large percentage. In the years prior to 1913 somewhat over 6,000 fee patents had been issued, and from that year to the date of the new policy about 3,542 fee patents were issued, approximately 9,500. It will be seen that under this liberal procedure many more Indians have been released from Government control since 1917 than were released in all prior years."—*United States report of the commissioner of Indian affairs to the*

*secretary of the interior, June 30, 1920, pp. 38-40.*

1920.—*Troubles in New Mexico.*—"One of the troublesome matters of long standing has been the disputes between the Pueblo Indians of New Mexico and the encroaching whites and Mexican squatters who have located on Indian lands and claim title or the right to remain thereon. . . . These Indians have lost considerable through the encroachments of the white settlers and adverse decisions of the courts. Notwithstanding the appointment of special attorneys for these Indians, but little seems to have been accomplished in removing the transgressors and quieting the titles to their lands. During the past [1919] year a plan was formulated whereby the Department of Justice will cooperate to remove the squatters and quiet title in the Indians. A number of suits have recently been filed, not only for the purpose indicated, but to settle the rights of the Indians to the use of water from irrigation ditches constructed by them years ago and which the whites have appropriated. In addition to the foregoing steps for the relief of these Indians a draft of legislation has been prepared for submission to the Congress which, in effect, would, if enacted, place the affairs of the Indians of the State of New Mexico under more direct governmental supervision and prevent further alienation of their lands."—*United States report of the commissioner of Indian affairs to the secretary of the interior, June 30, 1920, pp. 54-55.*

1922.—*Bursum Bill.*—"An event of historic importance in the long history of the relations of the United States with the Red Indians took place . . . in New Mexico . . . Nov. 5 [1922], when 120 delegates from the 20 pueblos met in solemn council to protest against the injustice of the Bursum Indian Bill. . . . Briefly, the situation is this: The Pueblo Indians of New Mexico hold patented land grants, bestowed upon them by the Spanish crown, confirmed subsequently by the Republic of Mexico, and by the American government for the most part by act of Congress in 1858. These original grants in most instances were approximately 17,000 acres including irrigable, non-irrigable, and grazing lands. Conflicting with these patented Indian grants are certain valid Spanish and Mexican grants, made by Spanish and Mexican governors and officials; squatter occupations made prior to 1848 under the Mexican and Spanish governments, and subsequent occupations based upon Indian deeds or alleged Indian deeds. In addition to these there are the more recent encroachments upon Indian lands of squatters who are without any title whatsoever. So far as the law is concerned, the Indians are left without legal redress by the terms of the bill; they are simply deprived (should the bill pass the House) of all the acres of land now in the possession of non-Indian claimants, and of all water rights in excess of present usage on irrigated and cultivated fields, with no possibility of recovering water rights which have been seized and held by non-Indian settlers during the last four years."—*Bursum Bill (Christian Science Monitor, Nov. 29, 1922, p. 9).*—In New Mexico it is considered necessary for a white man to possess at least twelve acres in order to make a living. Already many of the Indians have been crowded back until they have but one acre per capita, and the rest have not more than two and a half.

1923.—*Report of Department of the Interior.*—A tabulation completed Mar. 19, 1923, by the Department of the Interior gives the number of distinct Indian tribes or remnants of Indian tribes in the United States at 371, with a total Indian population of 340,917. The report shows that

50,000 Indians are engaged in farming and in raising crops for their own support, while 50,000 Indian families have abandoned their teepees and live in houses. The government is educating 59,500 Indians: 19,000 children go to boarding schools, 5,500 to day schools, and 35,000 to the public schools. In addition, 6,420 Indian children are enrolled in mission schools at the various reservations. There are also 78 hospitals and sanitoriums maintained for the Indians.

**INDICTIONS.**—The indiction "was a cycle of 15 years, used . . . by the Romans, for appointing the times of certain public taxes; as appears from the title in the Code, 'De tributo indicto.' It was established by Constantine, A.D. 312, in the room of the heathen Olympiads; and was used in the acts of the General Councils, Emperors, and Popes."—W. Hales, *New analysis of chronology, v. 1, bk. 1*.—"The indictions . . . are separately reckoned as indiction 1, indiction 2, &c., up to 15; when they recommence with indiction 1. . . . Doubt exists as to the commencement of the indictions; some writers assigning the first indiction to the year 312; the greater number to the year 313; others to 314; whilst some place it in the year 315. In 'L'Art de vérifier les Dates,' the year 313 is fixed upon as that of the first indiction. There are four descriptions of indictions. The first is that of Constantinople, which was instituted by Constantine in A.D. 312, [?] and began on the 1st of September. The second, and more common in England and France, was the Imperial or Cæsarean indiction, which began on the 24th of September. The third kind of indiction is called the Roman or Pontifical, from its being generally used in papal bulls, at least from the ninth to the fourteenth century; it commences on the 25th of December or 1st of January, accordingly as either of these days was considered the first of the year. The fourth kind of indiction, which is to be found in the register of the parliaments of Paris, began

in the month of October. . . . After the 12th century, the indiction was rarely mentioned in public instruments. . . . But in France, in private charters, and in ecclesiastical documents, the usage continued until the end of the 15th century."—H. Nicolas, *Chronology of history, pp. 6-7*.—See also **CHRONOLOGY: Medieval cycle**.

**INDIGENT POOR.** See **CHARITIES**.

**INDIGO.** See **CHEMISTRY: Practical application: Dyes: Synthesis of natural color**.

**INDIRECT TAX.** See **TAXATION: Direct and indirect taxes**.

**INDIVIDUALISM.**—This philosophy "recognizes without stint the full, free, and equal right of every citizen to the unimpeded use of all his energies, activities, and faculties, provided only he does not thereby encroach upon the equal and correlative right of every other citizen."—G. Allen, *Individualism and socialism*.—This "philosophy [is] similar to that of the anarchists in that both start from the same premise that individual rights and freedom of action is the important thing. The two . . . [philosophies], however, part company in respect to their attitude towards the legitimacy of the State. The anarchist denies that the State has any right to be and that the individual is, therefore, justified in opposing it as an unwarrantable interference with his rights. [See also **ANARCHISM: 1839-1894**.] The individualist holds that this might be true if men were perfect and always acted with justice in their relations with each other. Inasmuch, however, as men are not perfect, they hold that some exterior control is essential. They thus justify government as a necessary evil. In doing so they logically hold that this evil should be reduced to the lowest possible term. They hold thus to the principle that that government is the best that governs the least. . . . In applying this philosophy individualists have sought to draw a distinction between what they term the essential and the non-essential functions of government. Admitting that some government is necessary, but looking upon that government almost as an evil, they have sought to determine, largely by *a priori* reasoning, those functions which modern conditions render essential that governments should perform. These they term the essential functions of government: all other functions actually performed by government are non-essential, and, in their opinion, should be reduced to the lowest possible term, if not wholly eliminated. The chief of these so-called essential functions are: the enactment and enforcement of law, the administration of justice, the maintenance of order, the protection of life and property and the safeguarding of the community from foreign aggression. The essential functions of government, in a word, are those of the law giver and administrator, the policeman and the soldier. These functions they hold all governments should perform. All other functions they hold to be not only non-essential, but ones which the government should not attempt to perform. . . . [This doctrine] dominated political thought during the latter part of the eighteenth and the first part of the nineteenth centuries [in England and America], and exerted a profound influence upon governmental action. It counted Herbert Spencer among its most distinguished adherents. In his 'Coming

Slavery,' 'Social Diseases and Worse Remedies,' and other writings, Spencer vigorously combated the idea that the government should interfere in any way for the promotion of the general welfare of the people. To him and his followers all legislative and governmental action having for its purpose the determination of labor conditions in factories and mines, with a view to the prevention of the monstrous abuses that were crushing out the lives of little children and reducing labor in general to the condition of mere brutes, were fundamentally wrong in principle. To them these laws represented an unjustifiable interference with individual liberty. The same was true of laws having for their purpose the protection of the public health and indeed all efforts to improve living conditions through governmental action. This attitude towards government was but one phase of the general emphasis that was laid at that time upon the idea of natural law, the idea that human conduct was subject to a so-called natural law, and that, as far as possible, human conduct should be left to the uncontrolled working of this law. In the biological field it found its expression in the principles of evolution, that progress is achieved through the slow workings of natural law of selection, . . . through the life and death struggle of individuals, the selection of the fit and the elimination of the unfit through this process. In the economic field it furnished the basis for the great school of 'laissez faire,' or the Manchester school, as it was known in Great Britain, that led to the opinion that industrial conditions, the ownership of property and economic conditions generally, should be determined by the free play of economic forces; that competition, the working of the natural law of supply and demand should be the factors regulating economic life; that it was a mistake for the government to interfere in any way with the free working of these natural laws. It was this philosophy that furnished the strongest argument for the establishment of free trade, the destruction of trade monopolies, and other restrictions hampering the free development of commerce and industry."—W. F. Willoughby, *Government of modern states*, pp. 171-174.—See also COLLECTIVISM; ECONOMICS: 20th century; EDUCATION: Medieval: 9th-15th centuries; Scholasticism.

**INDO-ARYANS.** See INDIA: People.

**INDO-CHINA.**—Indo-China is a French possession in Asia, consisting of the colony of Cochin-China, the protectorates of Cambodia, Annam, Tonkin and Laos; Kwang-Chau-Wan, leased from Chian, and Battambang, ceded by Siam in 1907. It is bounded by China on the north; by the Gulf of Tongking and the China sea on the east and south; by Burma on the northwest; and by the Gulf of Siam on the southwest. (See ASIA: Map.) The total area is about 310,344 square miles, and the population in 1914 was about 16,000,229. The chief exports are rice, fish, pepper, hides, coal, cotton, rubber and sugar, while the principal imports are tin, cotton tissues and cotton thread.

**Geography.** — **Primitive races.** — **Territorial government.**—"Before the arrival of the French, Cochin-China comprised the whole of the coast lands from Tonkin nearly to the foot of the Pursat hills in South Camboja. . . . From the remotest times China claimed, and intermittently exercised, suzerain authority over Annam, whose energies have for ages been wasted partly in vain efforts to resist this claim, partly in still more disastrous warfare between the two rival states."—A. H. Keane, *Eastern geography*, pp. 99, 103.—

The "term Annam (properly An-nan) appears to be a modified form of Ngannan, that is, 'Southern Peace,' first applied to the frontier river between China and Tonkin, and afterwards extended not only to Tonkin, but to the whole region south of that river after its conquest and pacification by China in the third century of the new era. Hence its convenient application to the same region since the union of Tonkin and Cochin-China under one dynasty and since the transfer of the administration to France in 1883 is but a survival of the Chinese usage, and fully justified on historic grounds. [See also ANNAM.] Tonkin (Tongking, Tungking), that is, 'Eastern Capital,' a term originally applied to Ha-noi when that city was the royal residence, has . . . been extended to the whole of the northern kingdom, whose true historic name is Yüeh-nan. Under the native rulers Tonkin was divided into provinces and subdivisions bearing Chinese names, and corresponding to the administrative divisions of the Chinese empire. . . . Since its conquest by Cochin-China the country has been administered in much the same way as the southern kingdom. From this State Tonkin is separated partly by a spur of the coast range projecting seawards, partly by a wall built in the sixteenth century and running in the same direction. After the erection of this artificial barrier, which lies about 18° N. lat., between Hatinh and Dong-koi, the northern and southern kingdoms came to be respectively distinguished by the titles of Dang-ngoai and Dang-trong, that is, 'Outer' and 'Inner Route.' The term Cochin-China, by which the Inner Route is best known, has no more to do with China than it has with the Indian city of Cochin. It appears to be a modified form of Kwe-Chen-Ching, that is, the 'Kingdom of Chen-Ching,' the name by which this region was first known in the 9th century of the new era, from its capital Chen-Ching. Another although less probable derivation is from the Chinese Co-Chen-Ching, meaning 'Old Champa,' a reminiscence of the time when the Cham (Tsiam) nation was the most powerful in the peninsula."—*Ibid.*, pp. 98-99.—"In the south-eastern extremity of Cochin-China, and in Camboja, still survive the scattered fragments of the historical Tsiam (Cham, Khiam) race, who appear to have been at one time the most powerful nation in Farther India. According to Gagelin, they ruled over the whole region between the Menam and the Gulf of Tongking. . . . Like the Tsiams, the Cambojans, or Khmers, are a race sprung from illustrious ancestry, but . . . [by 1881 they were] reduced to about 1,500,000, partly in the south-eastern provinces of Siam, partly forming a petty state under French protection, which is limited east and west by the Mekong and Gulf of Siam, north and south by the Great Lake and French Cochin-China. During the period of its prosperity the Cambojan empire overshadowed a great part of Indo-China, and maintained regular intercourse with Cisgangetic India on the one hand, and on the other with the Island of Java. The centre of its power lay on the northern shores of the Great Lake, where the names of its great cities, the architecture and sculptures of its ruined temples, attest the successive influences of Brahmanism and Buddhism on the local culture. . . . The term Camboja itself (Kampushea, Kamp'osha) has by some writers been wrongly identified with the Camboja of Sanskrit geography. It simply means the 'land of the Kammen,' or 'Khmer.' . . . On the eastern slopes, and in the lower Mekong basin, the dominant race are the Giao-shi (Giao-kii) or Annamese, who are of doubtful origin, but resemble the Chinese more

than any other people of Farther India. Affiliated by some to the Malays, by others to the Chinese, Otto Kanze regards them as akin to the Japanese. According to the local traditions and records they have gradually spread along the coast from Tongking southwards to the extremity of the Peninsula. After driving the Tsians into the interior, they penetrated about 1650 to the Lower Mekong, which region formerly belonged to Camboja, but is now properly called French Cochinchina. Here the Annamese, having driven out or exterminated most of the Cambojans, have long formed the great majority of the population.—E. Reclus, *Earth and its inhabitants: Asia, v. 3, ch. 22.*—"The half-civilized races who inhabit the mountains and uplands of Indo-China are known by different names among their neighbours. The Birmans call them 'Karens,' the Laotians, 'Kha,' the Cambodians, 'Stieng,' or 'Pnong,' the Annamites, 'Man,' or 'Moï.' 'Moï,' which can be translated by 'savage,' is perhaps the most convenient label for the whole complex of these primitive folk. . . . They are to be found scattered between the eleventh and the twentieth degrees of latitude, from the frontiers of China to the boundaries of Cambodia and Cochinchina."—H. Baudesson, *Indo-China and its primitive people, pp. 3-4.*—"Tonkin and Cochinchina, the deltas of the Red River and of the Mekong, . . . were united in the first years of the [nineteenth] century under the rule of the Emperor Gia Long, and are inhabited chiefly by Annamites. Their social order is the same, and it has been little disturbed by the partition of the empire since the coming of the French. It is essentially democratic, with self-governing communes as its basis. This Annamite commune is important, because it is the unit of administration and the responsible agent of the government for the collection of taxes, the raising of troops, and the execution of the law. It offers the unvarying framework of society for each advance of the population into unoccupied districts. Its honors and duties belong to the notables, who are inscribed on the tax rolls. The higher notables form the communal council, and elect one of their number mayor. As soon as their choice is accepted by the government the mayor represents the commune in all questions raised by the central administration; he carries out the laws, is chief of police, and guardian of the tax rolls. Cambodia also belongs to Indo-China, and lies on the Mekong, above Cochinchina. It is the feeble remainder of an ancient kingdom, and yet its people affect to despise the encroaching Annamites, claiming their own origin in an earlier, perhaps an Aryan, emigration. Their social organization also differs from that of Annam. When the French protectorate began they did not have the commune. Instead of a lettered aristocracy reaching the higher official positions nominally through severe competitive examinations, they had a semifeudal nobility. And administrative affairs were centralized instead of being left to local authorities. The problem of government which the French must solve in all this region has been determined quite as much by the way they came into their power as by the structure of the society they found."—H. E. Bourne, *French colonial experiment (Yale Review, May, 1899).*

**B.C. 218-A.D. 1886.—Native rule.—French penetration and conquest.**—"Almost the first distinctly historic event was the reduction of Lu-liang, as Tonkin was then called, by the Chinese in 218 B.C., when the country was divided into prefectures, and a civil and military organization established on the Chinese model. . . . Early in

the ninth century of the new era the term Kwe-Chen-Ching (Cochin-China) began to be applied to the southern, which had already asserted its independence of the northern, kingdom. In 1428 the two States freed themselves temporarily from the Chinese protectorate, and 200 years later the Annamese reduced all that remained of the Champa territory, driving the natives to the uplands, and settling in the plains. This conquest was followed about 1750 by that of the southern or maritime provinces of Camboja since known as Lower (now French) Cochinchina. In 1775 the King of Cochinchina, who had usurped the throne in 1774, reduced Tonkin, and was acknowledged sovereign of Annam by the Chinese emperor. But in 1798 Gia-long, son of the deposed monarch, recovers the throne with the aid of some French auxiliaries, and in 1802 reconstitutes the Annamese empire under the Cochinchinese sceptre. From this time the relations with France become more frequent. . . . After his death in 1820 the anti-European national party acquires the ascendancy, the French officers are dismissed, and the Roman Catholic religion, which had made rapid progress during the reign of Gia-long, is subjected to cruel and systematic persecution. Notwithstanding the protests and occasional intervention of France, this policy is persevered in, until the execution of Bishop Diaz in 1857 by order of Tu-Duc, third in succession from Gia-long, calls for more active interference. Admiral Rigault de Genouilly captures Tourane in 1858, followed next year by the rout of the Annamese army at the same place, and the occupation of the forts at the entrance of the Donnai and of Gia-diñh (Saigon), capital of Lower Cochinchina. This virtually established French supremacy, which was sealed by the treaty of 1862, ceding the three best, and that of 1867 the three remaining, provinces of Lower Cochinchina. It was further strengthened and extended by the treaty of 1863, securing the protectorate of Camboja and the important strategical position of 'Quatre-Bras' on the Mekong. Then came the scientific expedition of Mekhong (1866-1868), which dissipated the hopes entertained of that river giving access to the trade of Southern China. Attention was accordingly now attracted to the Song-koi basin, and the establishment of French interests in Tonkin secured by the treaties of peace and commerce concluded with the Annamese Government in 1874. This prepared the way for the recent diplomatic complications with Annam and China, followed by the military operations in Cochinchina and Tonkin [see FRANCE: 1875-1889], which led up to the treaties of 1883 and 1884, extending the French protectorate to the whole of Annam, and forbidding the Annamese Government all diplomatic relations with foreign powers, China included, except through the intermediary of France. Lastly, the appointment in 1886 of a French Resident General, with full administrative powers, effaced the last vestige of national autonomy, and virtually reduced the ancient kingdoms of Tonkin and Cochinchina to the position of an outlying French possession."—A. H. Keane, *Eastern geography, pp. 103-104.*

**1787-1891.—French attempts to assume control.—Conflict with native rulers.—Increasing control of native government by French.**—"Three times they [the French] were prevented by a crisis in Europe from establishing themselves [in Indo-China]. In 1787 a treaty was actually signed at Versailles, with the son of Gia Long, which offered the port of Tourane in full property for assistance in driving from the throne a successful usurper. Pigneaux de Béhaine, a missionary

bishop, who negotiated the arrangement, hoped it would lead to the restoration of French prestige in the East, compromised by the disasters in India. In a memorandum which he addressed to the ministry, he argued that such a possession would enable France to gain so large a share of the China trade that the profits of the English would be greatly diminished, and that 'from this as a base it would be easy to prevent them from extending their empire to the East.' The failure of the governor of Pondicherry [centre of French authority in India] to further the plans of the ministry injured the success of the scheme, and finally the Revolution made such distant action impossible. Again in March, 1847, two ships arrived at Tourane, sent by Louis Philippe, to top the persecution of the missionaries, and to demand guarantees for the security of other Frenchmen. An outbreak followed, and the French destroyed the native fleet. But the fall of the Orleanist monarchy early the next year gave no time to take advantage of this incident. Once more in 1858-9, when the expedition under Rigault de Genouilly had seized Tourane and Saigon, Napoleon's Italian campaign intervened, and Tourane was abandoned, though Saigon was successfully defended against heavy attacks. . . . [The] treaty . . . made at Hué, June 6, 1884, . . . with some modifications, has formed the basis of French power in Tonkin-Annam ever since. The negotiators of the treaty were greatly influenced by the notion that Annamite misgovernment in Tonkin had made the name of Annam so hated that it was feasible to bring Tonkin almost directly under French rule. And so the connection with the court of the emperor was practically severed, and the native provincial authorities placed under the control of French residents and assistant-residents. The protectorate in its older form still continued in Annam, except that the customs service passed into the hands of the French, and a French resident-general was permitted to live, with his escort, within the citadel at Hué. But even these radical measures did not bring peace to Tonkin, and until peace returned nothing could be done to develop the country's resources. In fact not even any roads were built, except in the outskirts of the towns, and these chiefly to furnish an exercise ground for the officials. Until 1891 the military expenses were the principal item in the account. In 1887 they amounted to fifty million francs out of a total of sixty-two; in 1889 they were thirty-seven million out of forty-nine; and in 1891, twenty-two out of thirty-nine. So bad was the state of affairs that when Governor-General Lanessan visited Hanoi in 1891 he could see from his windows smoke rising from burning villages just across the Red River. Nor was the condition of Cambodia much better. For many years after the treaty of 1863, the protectorate had remained merely nominal. If the terms of the treaty were closely adhered to the French resident could not legally interfere in the internal administration of the country. And the men who successively occupied the position failed to gain ascendancy enough in the court of King Norodom to compensate for the legal weakness of their situation. . . . When the resident, to strengthen his position, tried to take a seat in the council of ministers, the king resisted stubbornly, but all the while he was covertly using the guarantee his throne received from the protectorate to render himself absolute. His court became more luxurious, and since his revenue did not increase, his officers, the mandarins, were not paid, and were forced to pillage the people. Roads and bridges, no longer repaired, soon almost disappeared. From this desperate situation M. Thomson, the governor

of Cochin-China, attempted to rescue the country by the treaty of June 17, 1884, negotiated under the guns of French ships. The remedy was too drastic; it attempted to revolutionize Cambodian society from top to bottom. Furthermore it was justly believed to be an ill-concealed device for annexing Cambodia to Cochin-China, dictated by officials eager to extend their jurisdiction. It is not astonishing that Cambodia, from king to peasant, was profoundly stirred by such an attack upon traditional privileges and national susceptibilities. Insurgent bands appeared everywhere. The peaceful inhabitants, impartially afraid of the French, fled to the forests. In less than two years the country looked like a desert. Finally the resident was authorized to inform King Norodom that the treaty might be considered a dead letter, though it was not to be abrogated. Possibly the resistance of the Cambodians would not have been so obstinate had not the French government by its hesitancy showed that it was not sure of its policy. Though the treaty was made in the spring of 1884, the law approving it was not passed until July 17, 1885, and the decree providing for its promulgation was not issued until January 9, 1886. Furthermore, it was only in 1891, when Lanessan came out as governor-general, that the treaty was thoroughly put in force."—H. E. Bourne, *French colonial experiment* (Yale Review, May, 1899).

1893-1921.—Cost of French administration.—Stagnant state of colony before 1895.—Reform.—Prosperity.—“At first there appeared to exist no reasonable ground for any hope that France was destined to be more successful in Indo-China than she had been elsewhere. Frenchmen showed no desire to emigrate to the Colony or to invest their capital in its industries. Such interest in its affairs as found expression from time to time in the French Press rested almost entirely upon political considerations; and the French people at large were too much occupied with the dazzling prospect of extending French influence in Africa to spare a moment's thought for the unexciting task of developing the resources of territory already under their flag in Asia. In the early nineties the actual state of French Indo-China was sufficiently discouraging. During the eight years 1887-95 France had been called upon to cover deficits in the Local Budgets to the extent of forty millions of francs—an amount which brought the total cost of the Colony to the mother country in the thirty-five years which had elapsed since Admiral Rigault de Genouilly destroyed the forts of Saigon to the enormous sum of 750 millions of francs, roughly to £30,000,000. In 1896 it became necessary to raise an Indo-Chinese loan of eighty millions of francs in order to discharge pressing obligations and to meet the cost of important public works of which the Colony stood in urgent need. In the domain of administration the conditions were most unsatisfactory. Very few of the French officials possessed a competent knowledge of the native languages; the Civil Service was recruited largely under a system of direct transference from the Home Service and by the temporary appointment of military and naval officers, with the result that many important posts were filled by men who not only had no special familiarity with the people and the institutions of Indo-China, but were completely ignorant of the general principles of colonial government. The few men who were really competent to formulate the policy and to direct the administration of the local Government were frequently passed over by the Colonial Office in order that places might be found for the relatives and friends of persons having strong political influence in Paris. Perhaps the

most significant symptom of the mismanagement of the Colony's affairs was that the people had lost confidence in the administration of justice and had practically ceased carrying up important civil disputes for settlement by the Courts. In the year 1893 Tonkin, in which civil government had been in operation for seven years, was still in a state of disorder and was patrolled by military columns; in Annam and in Cambodia the French Protectorate was merely nominal, and no French administration existed; Laos had just been acquired; and Cochin-China, the only Province in which there was any effective civil establishment, was beginning to agitate for separation from the Colony. To complete this sketch of French Indo-China as it was in 1893 (and I may mention that my facts are taken exclusively from French sources) it is only necessary to add that a stagnant local trade was almost entirely in the hands of foreigners, and that, of the external commerce of the Colony, the share of France was less than one fifth. . . . The administrative reforms effected since 1895 . . . have the chief claim on our attention, for they represent, both in regard to their operation and the manner in which they were introduced, a new and highly significant element in the colonial expansion of France. In December, 1896, M. Paul Doumer was appointed Governor-General of Indo-China. He found the office one of comparative insignificance; he left it five years later one of the most important and active posts within the gift of the French Government. Shortly after his arrival in the Colony he formulated a programme of reforms, of which the principal items were: 1. The improvement of the financial situation of Indo-China, and the creation of a financial policy suited to the country and its needs. 2. The pacification of Tonkin. 3. The organization of a Government-General. 4. The completion and the reform of the administrations of the Protectorates. 5. The extension of the influence of France and the development of its interests in the Far East, particularly in the countries adjoining the Colony—that is, in Siam and China."—A. Ireland, *Far Eastern tropics*, pp. 146-151.—"It is not enough to say that French Indo-China is to-day one of the most important Colonies of France, that it has attained a degree of prosperity which the most ordinary prudence in the direction of its affairs should suffice to increase from year to year; in order to do justice to the remarkable progress which has been made in the past decade, emphasis must be laid on the fact that there is no record of any Colony whose whole character has been so completely changed in so short a time. The commercial changes, though interesting in themselves, are the least important of those which have taken place, and they may be briefly dismissed. The value of the total exterior commerce of the Colony increased from 162 millions of francs in 1893 to 400 millions in 1902. Of these sums, the share of France increased from 30 millions, or less than one fifth, to 148 millions, or more than one third. It is true that a certain proportion of these increases may be attributed to the importation from France on Government account of large quantities of material for Public Works; but, on the other hand, the exports of the Colony doubled in value in the ten years under review, and the value of the exports to France increased very nearly fourfold. In the same period the value of the coasting trade rose from 54 millions of francs to 156 millions."—*Ibid.*, pp. 140-150.—Imports in 1920 were £21,940,000, exports, £23,620,000. In 1921 there were 1,265 miles of railways, two thirds being owned by the government.

**INDUSTRIAL RELATIONS COMMISSION.**—The commission was created by act of Congress, August 23, 1912. It consisted of three employers, three representatives of labor, and three representing the general public, all of whom were appointed by President Wilson. "The term of the commission . . . [was] three years and at least one report . . . [had to] be made to Congress within the first year, one within the second year, and a final report not later than three years after the approval of the act. The Department of Commerce and Labor . . . [was] authorized to cooperate with the commission in any manner and to whatever extent the Secretary of Commerce and Labor . . . [might] approve. Its duties [were defined by section four of the act] as follows: 'The commission shall inquire into the general condition of labor in the principal industries of the United States including agriculture, and especially in those which are carried on in corporate forms; into existing relations between employers and employees; into the effect of industrial conditions on public welfare and into the rights and powers of the community to deal therewith; into the conditions of sanitation and safety of employees and the provisions for protecting the life, limb, and health of the employees; into the growth of associations of employers and of wage-earners and the effect of such associations upon the relations between employers and employees; into the extent and results of methods of collective bargaining; into any methods which have been tried in any state or in foreign countries for maintaining mutually satisfactory relations between employees and employers; into methods for avoiding or adjusting labor disputes through peaceful and conciliatory mediation and negotiations; into the scope, methods, and resources of existing bureaus of labor and into possible ways of increasing their usefulness; into the question of smuggling or other illegal entry of Asiatics into the United States or its insular possessions, and of the methods by which such Asiatics have gained and are gaining such admission, and shall report to Congress as speedily as possible with such recommendations as said commission may think proper to prevent such smuggling and illegal entry. The commission shall seek to discover the underlying causes of dissatisfaction in the industrial situation and report its conclusions thereon.'—*Commission on industrial relations (American Labor Legislation Review, Oct., 1912).*—The members of the commission were appointed June 26, 1913. "The chairman was Frank P. Walsh. . . . Representing the pub-

lic, besides Mr. Walsh, were Professor John R. Commons, . . . and Florence J. Harriman. The labor men were John B. Lennon, . . . Austin B. Garretson, . . . and James O'Connell. . . . The three labor men were recognized as of the conservative wing of the labor movement, the radicals not being represented at all. The members representing manufacturers were Harris Weinstock, . . . S. Thurston Ballard, . . . and Richard H. Aishton. . . . The methods used by the Commission were numerous. They held hearings in all parts of the country, and heard men and women on all sides of every question that came up for public discussion. For instance, at the time of the outbreak of the Bayonne strike, the Commission sent two investigators to the scene of the trouble, who took testimony from all sides. In Texas, testimony was taken on the condition of the farmers; in other parts of the south, child labor was investigated. In Colorado the situation that led to Ludlow was gone into thoroughly, and . . . John D. Rockefeller, Jr., was quizzed in Washington and New York. The matter of the great 'foundations' was investigated; in New York, the leaders of the Socialist Party, the I. W. W., and the American Federation of Labor were asked their opinions of their various methods of solving the social problem. The debate between Morris Hillquit and Samuel Gompers was one of the high spots of the investigation. The Commission submitted three reports. The main report was written by Director of Investigations, Basil M. Manly, and was signed by Commissioners Walsh, Lennon, O'Connell and Garretson; in addition to the report, there were supplemental statements by Walsh, by Garretson, and a third, signed by Lennon and O'Connell. The minority report of Commons and Mrs. Harriman, was signed by Weinstock, Ballard and Aishton. There were dissenting opinions on various of the points by Weinstock, Aishton and Ballard."—*American Labor Year Book, 1916, p. 270.*

These reports may be summed up as follows: "The wealth of the United States, the Commission found, increased in the years 1890 to 1912, from 65 to 187 billions, or 188 per cent. This increase was not generally spread over the whole of the population but was localized within the capitalist class. The aggregate income of the workers in manufacturing, mining and transportation increased in the years 1880-1909 95 per cent, or from 2,516 millions to 4,916 millions. The increase in population must be taken into account. The incomes of two thirds of the families of the American working class were less than \$750 a year; the incomes of nearly one third of the families were under \$500 annually. These figures are based upon what Manly calls 'the most exhaustive investigation ever made.' The report decided that the least figure upon which an American family can live in anything approaching decency is \$700 per year. . . . The summary of the distribution of wealth in the country is as follows: (1) One third of the adult male workers earn less than \$10 per week; between two thirds and three fourths earn less than \$15, and only about one tenth earn \$20 per week or more. (2) One half of the women workers earn less than \$6 per week. (3) There are forty four families with annual incomes of \$1,000,000 or more. (4) The rich 2 per cent of the people own 60 per cent of the national wealth. (5) The middle class, 33 per cent of the people, own 35%. (6) The poor 65 per cent of the population own 5% of the national wealth. The unit of the family is breaking up, the investigators found; 79 per cent of

the fathers of working class families earned less than \$700 per year. 'In brief, only one fourth of these families could have supported their families on the barest subsistence level without the earnings of other members of the family, or income from outside sources.' Thirty per cent of the families kept boarders in order to eke out their incomes. In 77 per cent of the families two or more persons occupied each a sleeping room; in 37 per cent, three or more; and in 15 per cent, four or more. The condition of children, if taken as an index of the welfare of the people, shows an alarming situation. Children whose fathers earn less than \$10 per week, died during the first year at the rate of 256 per thousand. Those whose fathers earned \$25 or more per week died at the rate of only 84 per thousand. Thus, children of the very poor die at three times the rate as compared to that of the children of the moderately well off. In six of the largest cities of the country, from 12 to 20 per cent of the children are noticeably underfed and ill nourished. In four industrial towns studied by the Bureau of Labor Statistics, more than 75 per cent of the children quit school before reaching the seventh grade. In the families of the working class, '37 per cent of the mothers are at work and consequently unable to give the children more than scant attention. Of these mothers, 30 per cent keep boarders and 7 per cent work outside the home.' In agriculture, the situation is similar. In 1910, 37 per cent of the farms in the country were tenant operated, an increase of 32 per cent in 20 years. The conditions of the tenant farmers are considered hopeless. They have no future before them. They are badly nourished, uneducated, and exploited. The causes of industrial unrest, therefore, are summed up as follows: (1) Unjust distribution of wealth and income. (2) Unemployment and the denial of an opportunity to earn a living. (3) Denial of justice in the creation, in the adjudication and the administration of law. (4) Denial of the right to form effective organizations. . . . In the great basic industries, the workers are unemployed at least one fifth of the time, and at times there are armies of men, numbering hundreds of thousands, who are unable to find work, or who have been so beaten down by circumstances that they can no longer do efficient work. This unemployment arises from two great causes, the inequality of the distribution of income, and the denial of access to the land and tools of production except under prohibitive circumstances. Another point that causes discontent among workers is the denial of justice to the workers. 'Many witnesses, speaking for millions of workers as well as for themselves, have asserted with the greatest earnestness that the mass of workers are convinced that laws necessary for their protection against the most grievous wrongs cannot be passed except after long and exhausting struggles; that such beneficent measures as become laws are largely nullified by the unwarranted decisions of the courts; that the laws which stand upon the statute books are not equally enforced; and that the whole machinery of the Government has frequently been placed at the disposal of the employers for the oppression of the workers; that the Constitution itself has been ignored in the interest of the employers, and that constitutional guaranties erected principally for the protection of the workers have been denied to them and used as a cloak for the misdeeds of corporations.' . . . An examination of the evidence, says the report, shows that every one of the charges is fully justified. Large num-

bers of instances are given to show the correctness of this statement, with the corroboration of leading authorities. The Commission found also that the right of the workers to organize was frequently abridged, and that very often men had to sell their birthrights before being permitted to engage in any occupation. Chairman Walsh, in a supplementary report, says: 'We find the basic cause of industrial dissatisfaction to be low wages; or, stated in another way, the fact that the workers of the nation through compulsory and oppressive methods legal and illegal, are denied the full product of their toil. We further find that unrest among the workers in industry has grown to proportions that already menace the social good will and the peace of the nation. Citizens numbering millions smart under a sense of injustice and of oppression, born of the conviction that the opportunity is denied them to acquire for themselves and their families that degree of economic well being necessary for the enjoyment of those material and spiritual satisfaction which alone make life worth living.' The statement of Commissioner Garretson and the one signed by Commissioners Lennon and O'Connell are supplemental to the main report, and agree in the main with it. Mr. Walsh dissents from the Commons-Harriman report because it 'does not comply with the law creating the Commission.' That report is mainly an argument and recommendations, but it contains no findings as to social and industrial conditions. Many of the statements in the main report with regard to corporate control over politics are endorsed, and others added. But certain practices of unions, admitted and alleged, are condemned; such as violence, intimidation, graft, etc. 'We condemn the conditions found in Colorado, which show the control of corporations over labor and politics, and we find there a system that has taken hold throughout the country.' The other reports are merely supplementary and complementary to the main dissenting report.—*American Labor Year Book*, 1916, pp. 270-274.—'The chief remedies advocated in the Manly report were an inheritance tax, confiscating all fortunes in excess of \$1,000,000, exemption of land improvements from taxation, depriving the courts of the power to declare laws unconstitutional, and prosecution by the Federal Trade Commission of all cases of unfair treatment of labor. The minority report, written by Prof. John R. Commons and signed by him, by Mrs. J. Borden Harriman and in large part by the three employer members of the Commission, emphasized the necessity of working out a method for the enforcement of existing labor laws before placing new laws on the statute books. This method was said to be found in the administration of all state or Federal labor laws through industrial commissions advised by councils representing both employers and employees. A supplementary report by the three employer members of the Commission emphasized the wrongs committed by the unions. All three reports agreed in acknowledging the necessity for labor organizations.'—*American Year Book*, 1915, p. 436.

**INDUSTRIAL REVOLUTION: Definition.**—Material and social phases.—'By the Industrial Revolution we mean that great transformation which has been brought about during the past one hundred and fifty years, by discoveries and inventions which have altered fundamentally all the methods of production and distribution of the means of life, and consequently revolutionised all the economic functions of society. . . . The Industrial Revolution has two

phases: one material, the other social; one concerning the making of things, the other concerning the making of men. A man's work and the conditions under which it is performed are tremendous factors in determining his character. Though the Industrial Revolution opened the way for the production of the means of life without the consumption of all human energy, man, startled and stunned by the sudden changes in the methods of working and living, was unable to organize his life so that all might share in the benefits of the new inventions. The Industrial Revolution, with its factory system, and its increased facilities for intercourse, wrought wonderful changes in the social organism. It brought with it long hours, overwork, over-crowding, and other evils. It called into existence suddenly the factory towns, with their want of corporate life, their vile sanitary conditions, and filthy hovels. Men were forced rapidly into new relations, in which the old formulæ, maxims, and moralisings became useless and void. [See also LABOR REMUNERATION: Development of wages system.] The old economic order and basis of life were swept away, and in the confusion—"the wreck of matter and crush of world"—it seemed as if man had become utterly powerless to adjust himself to the new conditions, to conquer and control them as he had the forces of Nature. For a while after this industrial convulsion, and the demolition of the old order, man seemed paralysed. Economists, moral teachers, and social leaders groped in darkness amid confusion. Man had become a machine—a producer of things, a commodity to be bought and sold. His character, his powers of love and joy and admiration, his desire for freedom from misery, pain, and wretchedness, were made secondary to the production of marketable commodities. . . . [These] bitter wrongs . . . called forth the scathing denunciations of Carlyle, Kingsley, and Ruskin."—C. Beard, *Industrial revolution*, pp. 1-3.—See also EUROPE: Modern: Industrial revolution.

England: Primary causes.—Development of mechanical technique.—Commercial changes.—Influence of coal on metal and other industries.—Resultant changes in various industries.—“No single formula can adequately describe the complexity of forces and reactions that gave the movement its profound significance. There were changes in the relation between industry and agriculture, readjustments in the textile trades brought about by the rise of the cotton industry, technical developments in the metal industries which gave the whole group of metal trades a more important place in industrial society. None of these transformations were sudden: there were many reciprocal influences, so that particular inventions were at once cause and effect. The development of a mechanical technique was of the utmost importance in both textile and metal industries, but the older writers simplified unduly when they ascribed such exclusive importance to single inventions. It is well known to-day that no great mechanical achievement is the result of a single invention, though some brilliant conceptions will frequently direct endeavor so fruitfully into certain channels that we think currently in terms of the controlling patent or invention. But every great accomplishment is really the achievement of a group of inventors, and consists of a series of inventions. In the period of the Industrial Revolution mechanical achievement was relatively slower than it is to-day. The struggle

of inventors was more desperate, and relatively less fruitful in results. It is therefore peculiarly important to think in terms of protracted mechanical endeavor when studying the rise of the modern mechanical technique of the textile and metal industries. The inventive efforts of the period were stimulated by commercial changes and by the realization of the importance of mineral deposits whose significance had been well-nigh overlooked. Commercial changes were relatively more important in creating the new cotton industry: the iron and coal deposits were the direct incentive to the fundamental metallic inventions. In seeking so-called primary causes for the Industrial Revolution one may conceivably choose any one of three: the mechanical achievement; the commercial changes; or physiographic factors that were in a sense the basis of both the commercial change and the development of the mineral industries. It is wiser, perhaps, to abandon the search for a single cause, recognizing that the interplay of factors was in reality essential. The commercial changes that underlay the industrial transformation were not specifically associated with England; they might have stimulated industrial development in France. [See COMMERCE: Commercial Age: 1766-1921.] The intensity and importance of the changes in England were due to the unusual conjunction of factors making for change in a number of related industries. All the factors favorable to change were present in England, and the conjunction of factors did not occur in any other country. The development of trade with India had brought to Europe the fine cotton fabrics that had been known casually to the ancient world, but almost entirely unknown to the middle ages. These cottons appealed strongly to the consuming public and made their way rapidly. The woolen, linen, and silk industries all suffered from the competition with these new fabrics and attempts were made to restrict the use of cottons by protective legislation. The restriction was carried farther in England than on the Continent, and, though some measure of success was obtained at first, the failure was the more complete in the end. The protective barrier erected for the benefit of the woolen industry fostered the growth of a domestic cotton industry which found an element of advantage in the climate of which no one had been aware. The cotton industry was thus a new industry in every sense, and because it was new it was wholly free from the restrictive influences of craft customs and legislative regulation. It was free to adopt any forms of organization that might be convenient and suitable. The growth of the cotton industry was the occasion of many changes in the textile trades; changes in the relative importance of the various textile products, changes in the forms of organization, and changes in the technique of production. The changes in the metal industries were largely the outcome of the attempt to use coal as fuel. The forests were being seriously depleted by the demand for charcoal, and early in the seventeenth century it was clearly recognized that the iron industries must needs decline unless other fuel were found and made available. There was coal in abundance. At some of the iron workings coal was bedded with the iron and was a necessary but unimportant by-product. There was thus a strong incentive to use coal. The early experiments of Dudley were a direct outcome of such circumstances. The difficulties were great: mechanical and metallurgical. Successful utilization of coal would be possible only in an entirely transformed iron industry; an in-

dustry with much more mechanical equipment and more exact metallurgical knowledge. The great achievements of the Industrial Revolution were made possible by several generations of patient endeavor in the metal industries. . . . As a result of these changes the metal industries became much more significant than they had been for centuries. The full effects of the change have appeared only in the last half of the nineteenth century, but they are undoubtedly a result and should be regarded as a part of the Industrial Revolution. In 1700 the metal industries were of very subordinate importance in all European countries. The textile group was by far the most significant of the general groups now utilized in classification, and among the textiles the woolen industries (i.e., both woolen and worsted) were far in the lead. The cotton industry was of subordinate importance, almost negligible. The leather industries were probably more important than metals in France and in England, and though in Germany the metals were in all probability a greater factor in general industrial development we have no grounds for supposing that metals outranked leather even in Germany. The relative position of the different industries in 1700 represents the culmination of the general factors in industrial development that became notable in the twelfth and thirteenth centuries. Throughout the long period of five centuries the textile industries had grown in importance as specialized occupations. All three branches of the old textile trades had shared in the prosperity, though in many ways the woolen industry had undergone the most considerable transformation. The development of the silk industry was, however, a notable feature of economic growth in Italy and France; comparable in magnitude and character of technical advance to the development of the woolen industries in northern France, Flanders, and England. The Industrial Revolution brought a twofold dislocation: the rise of the new cotton industry resulted in the subordination of all the other branches of the textile manufacture to cottons—cotton was king; the reorganization of the metal trades gave them an entirely new place in the social order, raising them from a relatively low rank to substantially coördinate importance with the textile trades. The changes in the textile trades took place very early in the course of the general movement, the rise of the metal trades to their new position took place only in the latter half of the nineteenth century."—A. P. Usher, *Industrial history of England*, pp. 251-255.—See also INVENTIONS: 18th century: Industry.

England: Inventions in textile industry.—"On the eve of the revolution, the increased demand for English-manufactured goods was still supplied by the antiquated methods of domestic industry. Although foreign trade had increased enormously, industrial organization remained the same as it had been for more than two centuries. Cotton and woolen cloth were still produced in the scattered cottages of domestic weavers and weaver-farmers who still used the hand-card, the old-fashioned spinning-wheel, and the cumbersome hand-loom. Primitive conveyances were used to collect the finished goods from the domestic shops in the hamlets and towns, and to deliver them at the seaports. The extent to which the increased demand for manufactured goods pressed upon these

inadequate methods of production is revealed by a study of the process of cloth making in its details. The raw material of the textile industry, whether it be wool from sheep, the boll of the cotton, or the crushed stems of flax, is a tangled mass of fibers. The first requisite is to straighten out the threads of this fiber by combing or carding. This process was done by hand under the domestic system. The second step is spinning. This involves drawing out the fibers which the first step has separated, until they form a slender cord, meanwhile twisting the fiber-cord sufficiently to cause the separate fibers to take hold upon one another, thus making a thread of greater strength. This process was done either on the old high wheel, whirled by hand and wound on the spindle, or on the old-fashioned spinning-wheel, operated by the treadle, while the material was drawn out by hand, and twisted and wound upon the flyer. The third step was weaving. For this process it was necessary to select firmly threads for the 'warp' upright threads, and soft, or loosely spun threads for the 'woof,' or 'weft.' This was wrapped on a shuttle, and thrown by hand between the two diverging planes of warp-threads. The weaving process was followed by processes of finishing, fulling, shearing, and dyeing, according to the kind of cloth desired. In order to keep a continuous supply of material flowing through the successive steps in these processes of manufacture, it was necessary to secure a close articulation of the various stages. It was just here that the system broke down as a means of supplying the growing commercial plans, for spinners could not keep the weavers supplied with enough thread to permit their meeting increased orders for cloth. Under the domestic organization of industry, spinning was done by women and younger children in the home with the antiquated spinning-wheel. The rate at which they could produce sufficient thread to keep the weaver constantly busy, required a ratio of about six spinners to one weaver. Naturally this proportion of labor was not always found, and it was frequently necessary to hunt up outside help to relieve the pressure upon the spinners. This necessitated delays and inconveniences. The lack of adjustment between the supply of spun material and demand for it on the part of weavers, was still further accentuated by the invention of Kay's drop-box and flying-shuttle in 1738. . . . So keenly felt was this need for better spinning processes, that the Royal Society offered a prize for the invention of a machine that would spin several threads at the same time. Although this reward was never claimed a series of brilliant mechanical inventions appeared shortly after the middle of the eighteenth century, and as soon as the manufacturing difficulties which we have enumerated were overcome, production increased by leaps and bounds. . . . It is hardly possible to exaggerate the importance of these inventions [in the textile trades], for they 'explain the world in which we live, with its busy cities, its gigantic factories filled with complicated machinery, its commerce and vast fortunes, its trade-unions and labor parties, its bewildering variety of plans for bettering the lot of the great mass of the people.' . . . Inventions were first introduced in cotton manufacture, and applied to the spinning process, which we have observed was already out of adjustment with the weaving process. In 1770 James Hargreaves, a Lancashire weaver, patented the 'spinning-jenny,' a machine which he had completed in 1764. . . . But shortly afterwards, a new and more effective spinning device was brought to perfection by Richard Arkwright.

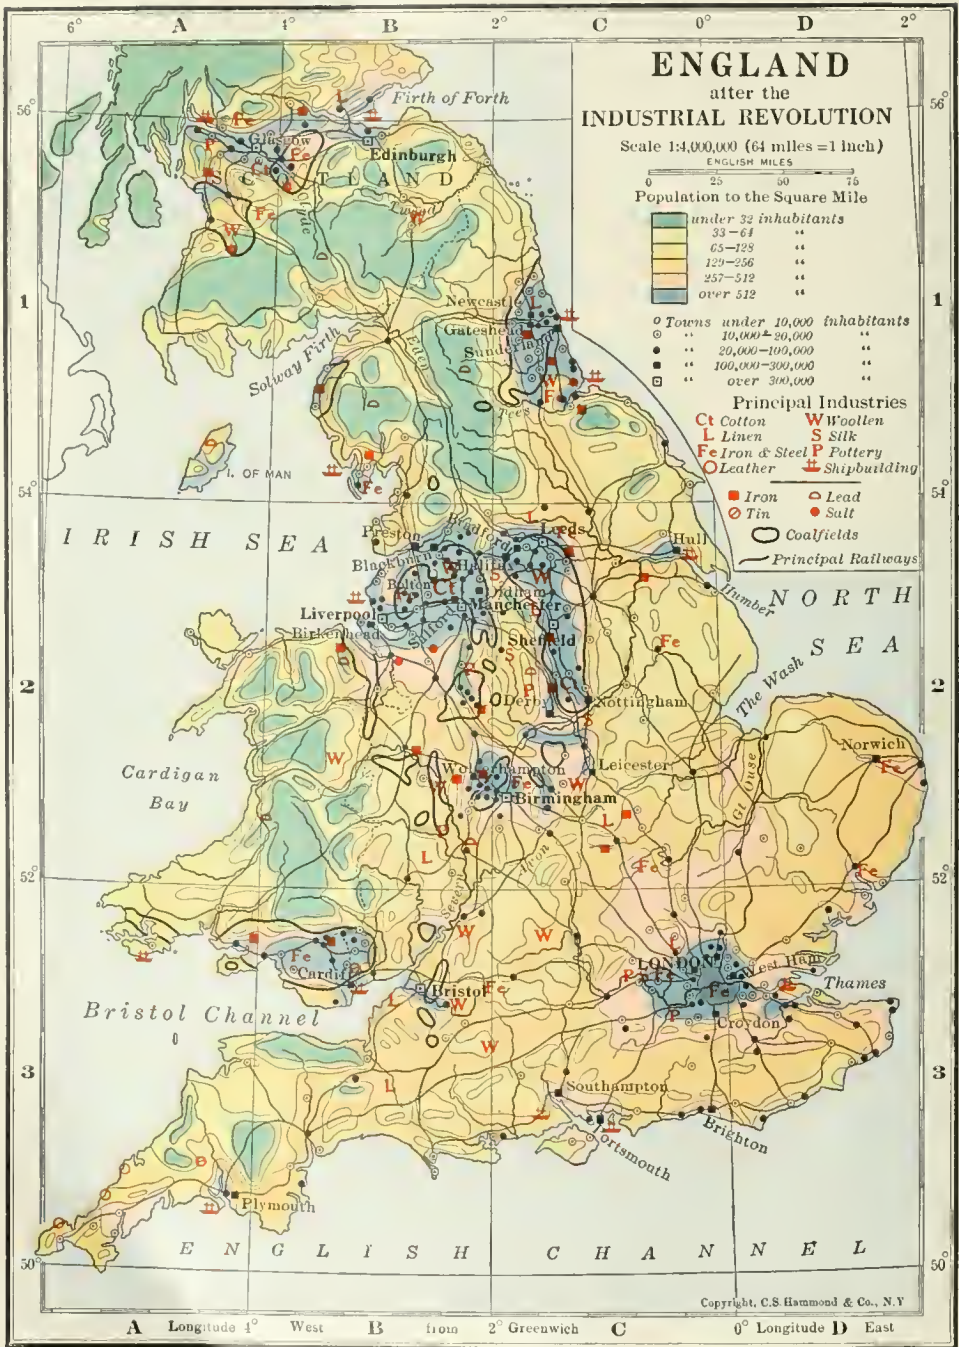

[See INVENTIONS: 18th century: Industry.] . . . Finally, in 1779, Samuel Crompton succeeded in combining the principles of the Arkwright and Hargreaves machines, and produced the 'mule,' which spun very fine cotton thread and made the manufacture of muslins possible. . . . The mechanism has now been improved to such an extent that twelve thousand spindles may be worked at once by one spinner. By 1811 there were more than four and a half million spindles worked by 'mules' in English factories. The comparatively sudden, and remarkably powerful stimulus given to English textile industry by these inventions, was accelerated by the invention of the cotton-gin in 1792, a device which opened up for commercial uses an enormous supply of raw cotton which had hitherto been unsatisfactorily cleaned by hand methods. It will be observed that these inventions affected the spinning process and increased the output of spun materials, yet no corresponding improvement had been made in the weaving process. Consequently the weavers now lagged behind, and were not able to utilize the greatly increased supply of thread to meet the demand for cloth goods, for Kay's shuttle had been the last advance in the weaving process. It was not until 1785 that a Kentish clergyman, Cartwright, patented his 'power-loom,' a machine which performed the same sort of service for the weaving process that the spinning inventions had performed for the spinning process. Although the principle was right, the machine caused the disappearance of domestic hand-weavers, as the other inventions had abolished the hand-spinners, and soon the factory system was in full operation. At first, water-power was used to operate these heavy-running mechanisms. But this sort of power was not always sufficient, or available, and the discovery of some other source of motive power was necessary before the revolution in manufacturing processes could be completed. This need was finally met by Watt's steam engine, patented in 1769, but not introduced into factory manufacture until 1785. During the fifteen year period, 1788-1803, the cotton trade trebled itself, due to the introduction of these improved industrial processes. But it should be noted that mechanical inventions were first introduced into cotton manufacture, only subsequently into woolen manufacture, and then irregularly into other manufacturing processes—that is, improvements were not introduced into all fields at once. Nevertheless, the industrial revolution proceeded, on the whole, with a rapidity quite remarkable, in view of the comparative absence of innovations in industry during mediæval and ancient times."—F. S. Chapin, *Historical introduction to social economy*, pp. 171-177.

**England: Factory system.—Its social evils.**—Capital was "needed to make this new machinery available. It was much too expensive for the old cottage weavers to buy and use. Capital had, therefore, to be brought into manufacturing which had been previously used in trade or other employments. Capital was in reality abundant relatively to existing opportunities for investment, and the early machine spinners and weavers drew into partnership moneyed men from the towns who had previously no connection with manufacturing. Again, the new industry required bodies of laborers working regular hours under the control of their employers and in the buildings where the machines were placed and the

power provided. Such groups of laborers or 'mill hands' were gradually collected where the new kind of manufacturing was going on. Thus factories, in the modern sense, came into existence—a new phenomenon in the world. These changes in manufacturing and the organization of labor came about earliest in the manufacture of cotton goods, but the new machinery and its resulting changes were soon introduced into the woolen manufacture, then other textile lines, and ultimately into still other branches of manufacturing, such as the production of metal, wooden and leather goods and, indeed, into nearly all forms of production. Manufacturing since the last decades of the eighteenth century is therefore usually described as being done by the 'factory system,' as contrasted with the domestic system and the gild system of earlier times. The introduction of the factory system involved many changes; the adoption of machinery and artificial power, the use of a vastly greater amount of capital, and the collection of scattered laborers into great strictly regulated establishments."—E. P. Cheyney, *Introduction to the industrial and social history of England*, p. 183.—"Scarcely any evil associated with the factory system was entirely a new evil in kind. In many domestic industries the hours were long, the pay was poor, children worked from a tender age, there was overcrowding, and both home and workshop were rendered less desirable from the combination of the two under a single roof. In many, not in all, for there were home workers who were very prosperous, and in his halcyon days the hand-loom weaver was in the enviable position of a man who had something valuable to sell and could make very comfortable terms for himself. [See also AGRICULTURE: Modern: British Isles: 17th-18th centuries.] But the home worker at the worst, even in cases where to those who examine the economic forces on which his livelihood depended, he seems to have been at the end of a shorter chain than he realised, was in many respects his own master. He worked long hours, but they were his own hours; his wife and children worked, but they worked beside him, and there was no alien power over their lives; his house was stifling, but he could slip into his garden; he had spells of unemployment, but he could use them sometimes for cultivating his cabbages. The forces that ruled his fate were in a sense outside his daily life; they did not overshadow and envelop his home, his family, his movements and habits, his hours for work and his hours for food. What the new order did in all these respects was to turn the discomforts of the life of the poor into a rigid system. Hours were not shortened, the atmosphere in which they worked was not made fresher or cleaner, child labour was not abolished. In none of these respects was the early factory better than the home, in some it was worse. But to all the evils from which the domestic worker had suffered, the Industrial Revolution added discipline, and the discipline of a power driven by a competition that seemed as inhuman as the machines that thundered in factory and shed. The workman was summoned by the factory bell; his daily life was arranged by factory hours; he worked under an overseer imposing a method and precision for which the overseer had in turn to answer to some higher authority; if he broke one of a long series of minute regulations he was fined, and behind all this scheme of supervision and control there loomed the great impersonal system. . . . It was not only the life of the men that was swallowed up in the factory. Women and children were shut out

from the daylight as well. The home life of Lancashire is described as follows at the end of our time. The factory woman has had no time, no means, no opportunities of learning the common duties of domestic life. 'Even if she had acquired the knowledge, she has still no time to practise them. In addition to the twelve hours' labour is an additional absence from home in the going and the returning. Here is the young mother absent from her child about twelve hours daily. And who has the charge of the infant in her absence? Usually some little girl or aged woman, who is hired for a trifle and whose services are equivalent to the reward. Too often the dwelling of the factory family is no home; it sometimes is a cellar, which includes no cookery, no washing, . . . no decencies of life, no invitations to the fireside.' This point had been put in a letter to the Home Office from a Manchester correspondent as early as 1800. 'The people employed in the different manufactures are early introduced into them, many at five and six years old, both girls and boys, so that when the former become Women they have not had any opportunity of acquiring any habits of Domestic economy or the management of a family. . . . The greater part of the Working and lower class of people have not wives that can dress a joint of meat if they were to have it given them. The consequence is that such articles become their food that are the most easily acquired, consequently their general food now consists of bread and cheese.' The writer goes on to mention that in a family known to him, 24s. out of 26s. or 28s. a week earned by its members are spent on bread.—J. L. and B. Hammond, *Town labourer*, pp. 18-19, 23-24.

England: Effect on agriculture. See AGRICULTURE: Modern: British Isles: 17th-18th centuries; Late 18th to early 19th centuries.

England: Mining inventions.—Increase in the use of iron and coal.—Rise of urban population.—'The smelting of iron by means of coke and coal and the use of steam made mining much more important, and also aided in the work by clearing the mines of water, by boring new shafts, and by raising the bawn coal from the pits. With the increased demand for coal, shafts had to be made deeper, and the dangers associated with mining increased. The explosions from fire-damp caused attention to be paid to ventilation; the danger of naked lights led finally to the invention of the Davy lamp in 1815. [See INVENTIONS: 19th century: Artificial light.] Working on a large scale now commenced on all the coal-fields, whereas a century earlier the only coal-fields extensively worked were those of the Tyneside, where the sea afforded an easy export of the coal to London. Now that coal was important for manufactures as well as for house fuel, larger quantities were required, for the new industries naturally developed in the coal areas, and the coal output was trebled by the end of the century. In 1800 more than ten million tons were raised. One of the most important uses of coal was in the iron industry, which now became associated with those areas which produced both coal and iron ore. . . . Iron-smelting had been declining during the first half of the century, and pig-iron was being imported; but in 1815 the export of

iron reached 91,000 tons. In 1765 Anthony Bacon obtained a ninety-nine years' lease of the mineral rights in the Merthyr Tydvil area, and laid the foundations of the great South Wales iron industry; the Darbys at Coalbrookdale, and Roebuck at Carron, improved their works considerably; and great developments also took place in South Yorkshire and in the Black Country of South Staffordshire. Iron began to be used for almost all ordinary purposes. Iron pots and pans had been cast at Coalbrookdale as early as 1709, and John Wilkinson of Bersham, one of the first of the great British ironmasters, added many further improvements. He and Darby were jointly interested in the first iron bridge which was built over the Severn at Broseley and opened in 1779; Rennie was responsible for the construction of an iron bridge over the Thames at Southwark in 1815. Iron was also employed in the construction of ships, the first iron vessel being launched in 1790. One difficulty in the use of iron articles was the lack of accuracy in their construction. Watt found it difficult at first to get the cylinders of his new engines bored correctly. This led to improvements in engineering. Bramah invented the hydraulic press; Maudsley, the most famous of all these early engineers, produced the slide rest for holding tools firmly to the lathe; Whitworth secured uniformity in the pitch of screws; Nasmyth perfected the steam-hammer, which did away with much heavy manual labour. Most important of all these engineering triumphs was the standardisation of the various parts of a machine, that is, the making of each separate part true to a standard pattern, so that all the copies of each part of a machine should be exactly alike. If a part of a machine was broken before this change was made, a new part had always to be specially constructed to replace it, and while this part was being made the machine was at a standstill; after the parts were made to a standard pattern it was possible to order, and be supplied with, a new part which could be inserted in the machine without delay. . . . Other trades also benefited by the new developments. The increase in exports stimulated the shipbuilding and shipping trades. The tonnage of the shipping of the United Kingdom increased by over 60 per cent. between 1793 and 1813. [See also COMMERCE: Commercial Age: 1766-1921.] The new factories and the new towns with their teeming population of artisans furnished employment to large numbers of bricklayers, carpenters, and other members of the building trades; and to the makers of building materials. The effect of these changes and developments soon became visible upon the face of the country. It was much easier to take the raw materials to the areas of cheap power production than *vice versa*, and this led to a rapid growth of population in what had formerly been the backward areas north of the Trent. Both slopes of the Pennines were in touch with important coal-fields and had an ample supply of water. The dampness of the Lancashire climate was an additional advantage to cotton-spinners, and this area became the seat of the cotton industry. The West Riding and the west of England could both count upon local coal supplies and thus retained the woollen industry, which was already leaving the eastern counties because they lacked the necessary fall of water for the use of water-power, and were devoid of coal. Iron and hardware developed on the Northumberland, South Yorkshire, South Staffordshire, and South Wales coal and iron fields. Silk went to Cheshire, and framework knitting to the Midlands, where subdivision of

labour gave silk hosiery to Derby and woollen hosiery to Leicester. The coal-fields of Scotland also became busy hives of industry. There was not only a great transference of labour to fresh areas of the country, but also a remarkable increase in the total population of the country. It is not easy to say exactly how great this increase was, for no census was taken in these days. The population of England in 1760 was probably less than 7,000,000; in 1821, it had risen to just over 12,000,000. The rate of increase of population in the first half of the eighteenth century was probably never more than 18 per cent., but in the second half the rate of increase was 57 per cent. The fastest rate of increase was between 1801 and 1811, when the population increased at the rate of 21½ per cent. This increase took place chiefly in the larger towns; the rural population, which in 1811 had been 35 per cent. of the whole population of the country, sank by 1831 to 28 per cent. Many towns developed with startling rapidity, especially those like Sheffield, Birmingham, Manchester, and Leeds, which had never been incorporated and therefore hampered by gild restrictions. While the total population of the country as a whole rose about 30 per cent. between 1801 and 1821, and the population of London 40 per cent., the population of Liverpool, Glasgow, and Bradford actually increased by 75 per cent.—F. W. Tickner, *Social and industrial history of England*, pp. 535-538.

See also INVENTIONS: 19th century: Industry.

France.—“France was the first of continental countries in which the great modern industrial transition—the introduction of machinery, the widespread displacement of the handicraft system, the rise of the factory—took place. Yet even there the transformation was much belated. Despite the fact that French commerce increased more rapidly during the eighteenth century than did English, and at the close of the century surpassed the English in volume, France not only failed to achieve in the eighteenth century that reconstruction of manufactures which lent distinction to England, but did not experience even the beginnings of the transformation until the following century was somewhat advanced. The advantage in respect to available capital, skilled labour, fuel supply, industrial liberty, and stability of political conditions lay wholly with England. The first cotton mill, it is true, was set up in France in 1785, and during the Consulate and the Empire persistent attempt was made to extend the utilisation of spinning and weaving machinery; but much the larger portion of textile manufacturing prior to 1825 was carried on under the strongly entrenched household, handicraft system. In 1834 there were only 5,000 mechanical looms in all France. But thereafter advance was rapid, and in 1846 the number was 31,000. Similarly, in the metal industries there was some attempt at modernization in the days of Napoleon, but the first rolled iron plates were not produced in France until 1819; and it was only after 1830 that coke-smelting, puddling, and other improvements in iron manufacture were widely introduced. In 1830 there were in the country 29 blast furnaces employing coke and 379 employing charcoal. Not until 1864 did the number of coke furnaces (220) surpass that of charcoal furnaces (210). In 1810 there were in France only some fifteen or sixteen steam-engines, all employed in pumping. In 1830 there were 625; in 1839, 2,450; in 1850, 5,322; in 1860, 14,513. Extensive application of steam-power came first in mining

and in metal works, and only very slowly in the manufacture of textiles. Against the introduction of machinery substantially the same sort of protest was made that had been voiced in England, but with scarcely more effect. After 1825-30 the transition set in upon an extended scale, and if the French industrial revolution can be dated from any fairly specific point, the years mentioned would probably be as accurate as any that could be indicated. An important factor in the inauguration of the new era was the removal, in 1825, of the prohibition upon the export of machinery from England, with the result that French manufacturers after that date were able more readily to obtain mechanical appliances from England and to copy them for their own use. In many instances, of course, these appliances had been brought in clandestinely before the embargo was raised, the more by reason of the fact that, in pursuance of her protective policy, France had been playing into England's hand by imposing on imported machinery duties running up to 100 per cent. About 1825-30 came the beginning of large-scale production of iron, and at the same time the output of coal was much increased. France is not rich in minerals, and the development of the heavier forms of manufacture has on this account always been relatively slow. Coal is found only in a few districts, principally in the north, and in geological formations more broken and more expensive to work than in England. Iron is more abundant, especially since the discovery of the rich basin of Brey in Lorraine. But coal and iron are not found side by side, as they are in England, and there has been discovered no cheap mode of conveying the one to the other. Notwithstanding these disadvantages, iron resources were developed rapidly after 1825, and to such an extent that by 1840 the country was obliged to eke out the inadequate coal supply by importations from England and Scandinavia. By 1825 the recovery from the shock of the Revolution and the Napoleonic wars was reasonably complete, and the general prosperity of the land gave a strong impetus not only to the metal industries but also to the manufacture of textiles and of finer wares. French industry has inclined always, as it does to-day, toward the production of articles for mass consumption. On that account, in part, machines never so completely displaced hand labour, or the factory system the handicraft system, as beyond the Channel. None the less, the general results of the revolution—the depression of handicraft industry, the reduction of wages, the cheapening of manufactured commodities, the differentiation of capital and labour, and the stimulation of organisation (although contrary to law) on the part of the labouring classes—followed substantially the lines already marked out in England.”—F. A. Ogg, *Economic development of modern Europe*, pp. 214-216.

Germany.—“In Germany, or rather in the Germanies, the Industrial Revolution was even more backward than in France. While the Continent had, been disturbed by wars (1793-1815), English manufacturers had been perfecting their machinery until now they could undersell German producers. The first political result of the Industrial Revolution in Germany was, therefore, a demand for a protective tariff. Each little state placed duties on imported manufactures, in order to encourage domestic industry. There were so many German states, however, that this multiplicity of customs duties seriously interfered with commerce. Hoping to overcome this difficulty, Prussia in 1818 established a uniform tariff for all

parts of the Prussian kingdom, with a 10 per cent duty on manufactured goods, and 20 per cent on colonial products. Prussia then invited other German states to adopt the same regulations and to unite their customs administrations with hers. After much hesitation most of the German states joined with Prussia, and on 1 January, 1834, the *Zollverein*, or Customs Union, went into effect between Prussia, Saxony, Bavaria, and fourteen other German states. Hanover, Baden, Nassau, Brunswick, Luxemburg, and Frankfort-on-Main entered the union later; Austria remained outside. German merchants might now trade as freely within the *Zollverein* as though Germany were a united nation, and still German manufacturers were protected against their British and French competitors by the common customs tariff. [See *TARIFF*: 1833; *GERMANY*: 1817-1840.]

... Under the auspices of the *Zollverein*, German industry increased by leaps and bounds, and machine-production rapidly took the place of hand-labor. In the years 1836-1840 the raw cotton annually used by German manufacturers amounted only to 185,000 cwts.; fifteen years later more than 500,000 cwts. were being spun every year. And the spinning machines were so improved that in 1852 each spindle was working twice as rapidly as in 1836. The industrial class increased in numbers; the bourgeoisie grew richer and more powerful; and by 1848 the middle class in Germany was following the example of the middle class in France and England, in demanding a voice in the government. The effect of the Industrial Revolution in Germany was primarily to unify the country, and then to bring about political reform."—C. J. H. Hayes, *Political and social history of modern Europe*, v. 2, pp. 95-96.

Italy.—"In 1770 Italy was, like Germany, divided into a number of . . . little states. The industry and commerce which had made the Italian cities great in the Middle Ages had fallen a prey to misgovernment and war. Annexed to France for a few years, Italy came out of her period of captivity little better off than when she entered it. It was not until 1800, when some of the northern states were united under a single ruler, that any great improvement took place. In 1870, when the whole peninsula was at last united under Victor Emmanuel II, modern Italy came into being. [See *ITALY*: 1867-1870; 1870-1901.] The new agricultural methods which England had adopted a century before were introduced by some of the larger landowners, factories sprang up, and railroads were built. Steamboats disturbed the quiet canals of Venice, Milan became a railroad center and factory city, and Naples a busy port. Romance and robbers gave place to the commonplace security of a modern state. Italy has one serious handicap—she has very little coal. Coal is desirable for many industries, but cheap coal and plenty of it is necessary for the manufacture of steel and iron goods. . . . Machines and railroads, high buildings and steamships, are all made of steel, and to import these things places a heavy tax on the wealth of a country, for the freight on them is a serious item in addition to the profits which the country producing them adds to their cost. For this reason Italy has not developed as fast industrially as her northern neighbors. The manufacture of silk and cotton goods are her most important in-

dustries outside of agriculture."—E. L. Osgood, *History of industry*, p. 312.

Japan. See *ASIA*: European influences, etc.: 2.

Russia.—"In Russia, all the eastern half of Europe, the Industrial Revolution began a hundred years after it commenced in Great Britain. This was not because the Russians lacked the materials for industrial development, since they, like the Chinese, had abundance of coal and iron and they had one of the largest supplies of petroleum in the world. Their backwardness was owing to comparatively low civilization, their unwillingness to take up manufacturing, and their lack of aptitude and skill. In Russia almost all the people, generation after generation, had done little more than carry on a rude agriculture; few of them had any education or any industrial training, so that it was not easy for Russian capitalists to find skilled and industrious workmen, and what they could produce was often not to be made so cheaply or well as it could be in Great Britain or the German Empire. They were also immensely hampered by vast distances and lack of railroads and good transportation. Nevertheless, in the latter half of the nineteenth century, the Industrial Revolution began in Russia. Factories were established and artisans trained and gathered together, mostly in the western parts bordering on Germany and Austria-Hungary, and the center of Russian industrial life was in what had been the old Kingdom of Poland. In the early years of the twentieth century Petrograd, Lodz, and Warsaw had their tall chimneys, their slums, their proletariat, together with the dark, strange problems which the Industrial Revolution had brought to western Europe long before. . . . Especially under the guidance of Count Sergyey Witte, who became Minister of Finance in 1893, a large industrial development went forward. The Dual Alliance had just been made between Russia and France, and a great amount of capital was loaned by the French. Rapid increase of the Russian agricultural population, obliged to support itself upon holdings of land not sufficiently large, drove increasing numbers of Russian peasants to the cities in search of work. Tariffs were levied to protect new industries, factories multiplied, and the population of the cities rapidly increased. Railroads were constructed or extended, until Russian mileage exceeded that of any European country; though, because of the large distances within the empire, railway facilities continued to be more inadequate than in any other great country of Europe."—E. R. Turner, *Europe*, pp. 110-120, 428.—See also *EUROPE*: Modern: Russia in the nineteenth century.

United States: Cotton gin.—First factory.—Manufacturing centers.—"For a time no response to [the English industrial revolution] . . . was seen in American industry. There was from colonial days a good deal of manufacturing of the old kind, ironware, hats, shoes, nails, and farm implements being some of the notable products. The lack of capital, the profits of agriculture, and the ability of British manufacturers to undersell served to delay the introduction of the new system. But in spite of the difficulties, some advance was made. In 1793, the year Whitney invented the cotton gin, Samuel Slater, in partnership with Moses Brown, set up at Pawtucket, Rhode Island, the first successful cotton factory in the United States. It was supplied with machinery of the British design, and its example was imitated in many other

places, although the enterprises struggled along with many drawbacks."—*Short history of the United States*, p. 349.—See also U.S.A.: 1793: Whitney's cotton-gin.—"With the stimulus given to manufacturing by the embargo and the war [of 1812] the Industrial Revolution began. Machinery was introduced into manufacturing, and the factory system was set up. Some of the machines were invented here, some were imitations of the machines long in use in England, and some were English machines with improvements by American inventors. As it was against the law for anyone to send machines out of England or even a drawing of a machine, many of the machines produced here were constructed by workmen from memory, with the help of only such rough sketches as they had been able to smuggle out of England. Steam engines were employed to run the machinery, better spinning machines were introduced or invented, roller printing of cottons was substituted for hand printing, and power looms were set up. The number of machines in use increased very rapidly, and the quantity of goods kept pace with this increase. In 1808 there were only eight thousand spindles employed in the manufacture of cotton yarn; in 1815 there were five million. At the same time that machinery was introduced the factory system came in, just as it had in England. To Francis C. Lowell belongs the honor of establishing the first complete factory in this country. In 1814 he brought all the processes of spinning and weaving under one roof in his factory at Waltham, Massachusetts. His example was soon followed by others. Such industrial establishments as this required large investments of capital, and we find that by 1815 fifty million dollars had been invested in the manufacture of textiles alone. The labor for these factories came in part from the craftsman class in the cities and in part from the sons and daughters of the farmers. The conditions were much better than they had been in the early factories in England, and the pay was much higher. Although the wages paid did not equal what a skilled craftsman could earn under the handicraft system, they were much better than those usually paid unskilled labor. A large proportion of the factories centered in New England at such places as New Bedford, Lowell, Lawrence, Holyoke, and Fall River. There were two reasons for this: in the first place, many of the factories still used water power, and this the streams of the New England states were amply able to supply; in the second place, many of the men who invested in these manufacturing enterprises were New England merchants, and they naturally located their plants in the neighborhood of their homes. Another great manufacturing center was Philadelphia. In and about this city much industry had been carried on under the old systems, and these same establishments were transformed to meet the new methods of production. . . . Our industrial establishments increased in number and in size. One industry after another was taken out of the home and into the factory. The domestic system, except as an adjunct to the factory, ceased to exist in the more settled parts of the country. A long series of labor-saving machines imported from abroad or invented here improved the quality of our goods, increased the quantity of the output, and reduced the cost of production."—E. L. Osgood, *History of industry*, pp. 372-375.—See also CONNECTICUT: 1818-1820; U.S.A.: 1897: Industrial revolution.

General results.—Enormous growth of wealth.—Rise of classes.—Factional interests.—One of the consequences "of the industrial revolution has been the enormous growth of wealth in the modern world [and the creation of the state known as Capitalism (q. v.)]. While this wealth has not been adequately shared by the labouring classes or even by the masses generally, a larger portion of human society has been emancipated from all fear of want than ever before in human history. In other words, the enormous wealth of modern times has stimulated luxury and self-indulgence in some classes of society almost beyond belief. . . . [Another consequence has been our modern form of social life.] Finally, our industrial system has tended . . . to generate antagonism between economic classes. Class conflicts have been an increasingly disturbing factor in our social order. Class interest has become . . . a warry of contending factions. Worse still, a tradition of class hatred has been growing up within Western nations, sedulously fostered by some of the non-privileged, and often unwisely stimulated by the privileged. Thus a gulf, not only in actual conditions of life, but also in feeling, has been developing between the socially more fortunate and socially less fortunate—a gulf which the sympathy and understanding necessary for social solidarity finds it difficult to bridge. The tradition of the solidarity of class threatens to strangle the tradition of the solidarity of humanity."—C. A. Ellwood, *Social problem*, pp. 81-83.—See also EUROPE: Modern: Industrial revolution; Revolutionary period.

INDUSTRIAL WORKERS OF THE WORLD.—The beginnings of this labor organization may be traced from a meeting of radical labor leaders, among whom T. J. Haggerty and Clarence Smith were the most prominent, in Chicago in 1904. Early in the next year preparations were made for the summoning of a more general and representative body and the first convention was held in Chicago, June, 1905. Here their official name, usually abbreviated to I. W. W., was adopted and a platform drawn up. From the first, the problem of internal harmony in the new labor body presented itself and a number of delegates led by Daniel de Leon founded a rival organization at Detroit. It was evident that the chief inspiration of the original movement came from the west and that the western miners constituted its backbone. However, that powerful body, the Western Federation of Miners, already occupied this field and the rivalry between the two organizations was destined to constitute much of their later history. The second convention (1906) brought eighty-three delegates representing 60,000 members. A struggle at once began between the "revolutionary camp" and the "reactionaries", whereupon the revolutionists abolished the office of president, putting a revolutionist in the chair. A new executive board was elected and on adjournment "the old officials seized the general headquarters, and with the aid of detectives and police held the same, compelling the revolutionists to open up new offices."

Constitution.—"The constitution itself has un-

dergone very few changes since it was drawn up in 1905. Perhaps the most radical change was made at the Tenth Annual Convention, in 1916. Originally the whole structure and plan of the organization could be summed up as follows: The unit of organization was the local union, and in each district or territory where five local unions existed a district council was formed. An unlimited number of locals, with a minimum membership of 3,000, however, could form a National Industrial Union. Two or more National Industrial Unions formed a department. The Constitution to-day, as changed at the Tenth Annual Convention, provides that the unit of organization is an industrial union. Each industrial union is to have its own by-laws to cover its own industry and to organize branches in its own industry. Their jurisdiction has no limit. Five or more branches in any given locality may form an industrial union district council, this to serve practically the same purpose as the former local district council, and might be compared to a Central Labor Council of the A. F. of L. [American Federation of Labor]. However, the component parts are more closely allied. Although the constitution provides for industrial departments, up to the present time, no such department has been formed. The constitution also calls for a General Recruiting Union, which takes in workers in industries not having enough members to form an industrial union of their own. The officers provided for by the Constitution are General Secretary-Treasurer, and a General Executive Board composed of seven members. These are all the national officers provided for. Each Industrial Union provides for its own officers somewhat on the same general plan; a general secretary-treasurer and an Organization Committee of five members. Each branch of an industrial union elects its secretary and a local Organization Committee. However, the regular officials in the different industrial unions may differ slightly. Some of the outstanding features of the constitution are that none but wage workers are eligible to membership; also that no officer of the I. W. W. may run for any political office without permission granted through a referendum of the entire organization; and a free transfer system—that is, any member belonging to one industrial union is allowed to transfer into any other industrial union without paying an additional fee. The Constitution also fixes the initiation fee at a maximum of \$5.00. Provisions are also made for the monthly dues, the per capita to be paid to General Headquarters and the disposition to be made thereof, together with other minor matters in connection therewith."—*American Labor Year Book, 1919-1920, pp. 196-197.*—See also AMERICAN FEDERATION OF LABOR; LABOR ORGANIZATION.

Relation to other political and economic organizations.—"It can be stated that the I. W. W. stands by itself in its relation to other political and economic organizations inasmuch as it recognizes the class struggle and is revolutionary in character. While not recognizing the necessity for political action, it is non-political rather than anti-political. The I. W. W. is not definitely opposed to political action, but it does not recognize it as a fundamental factor in the class struggle."—*American Labor Year Book, 1919-1920, p. 197.*

Organization and membership.—"The organization is now [1920] composed of twelve industrial unions, the General Recruiting Union, and a few locals that have not been formed into industrial unions as yet. The General Recruiting Union,

with twelve branches, has about 4,000 members. The Metal Mine Workers' Industrial Union No. 800, with approximately five open branches and a large number of field delegates, has about 15,000 members. The headquarters of this industrial union is at Butte, Mont. The Construction Workers' Industrial Union No. 573, with the same number of branches, and headquarters at Chicago, Ill., has a membership of about 5,000. The Agricultural Workers' Industrial Union No. 400 has but a few branches. However, as this industrial union is comprised of migratory workers, a large number of delegates travel from place to place and very few stationary branches are formed. There are three central points and the headquarters is at Chicago. This union has approximately 6,000 members. The Lumber Workers' Industrial Union No. 500, with headquarters at Portland, Ore., was at one time the strongest branch of the I. W. W. Before the persecutions, starting in the fall of 1917, the membership totalled between forty and fifty thousand. The advent of the Four L's, a government organization organized by the Spruce Production Corps of the United States Army, made great inroads through the use of various tactics. The arrest of everyone found carrying an I. W. W. card followed. However, at the present time, the rate of increase in the membership of No. 500 is greater than the decrease, and the membership is now estimated at 20,000. The Metal and Machinery Workers' Industrial Union No. 300, with headquarters at Chicago, composed largely of skilled mechanics, never exceeded at any time two to three thousand members. Many unskilled workers from the large steel mills and manufacturing plants, which began laying off men as soon as the armistice was signed and war contracts cancelled, are now coming into this union, and the Metal and Machinery Workers' Industrial Union promises to become a very powerful factor in the future of the I. W. W. Their membership can safely be estimated at 4,000. There are approximately 2,000 railroad men organized into the Railroad Workers' Industrial Union No. 600, the headquarters of which union is also at Chicago. The growth of this union is very rapid considering the conservative element employed in this industry. The Hotel, Restaurant, and Domestic Workers' Union, an industry which is largely organized by the A. F. of L., is also making good progress. The membership of this union is estimated at 1,000 and is composed mostly of household workers and of some of the lower paid workers in hotels and restaurants. The Marine Transport Workers' Union No. 100 on the Atlantic Coast, and No. 700 on the Pacific Coast, have fluctuated widely in membership. The increase in membership in this industry during the last month or two has been remarkable and the future holds great promise. The membership of each union is about 2,000. The Ship Builders' Union on the Pacific Coast was formed during the war and is largely a war industry. The membership of this union numbered about 1,000 before the closing of the hall in Seattle. The present membership is hard to estimate, but the reports show that it has not fallen off to any great extent. A large number of new members have been taken in since the close of the war. Textile Workers' Industrial Union No. 1000, with headquarters at Paterson, N. J., has a membership of about 1,000. Great strides have been made in this industry recently, several new branches having been formed in the New England states. The latest addition to the industrial unions of the I. W. W.

is the Printing and Publishing Workers' Industrial Union No. 1200, recently organized in New York City. There are perhaps six or eight local unions that have never been transferred to industrial unions. This is largely due to the fact that the persecutions and arrests started about the time that reorganization was taking place. The largest of these is Local 8, of Marine Transport Workers, in Philadelphia. This local has a membership of 5,000. The other locals, mainly in the North-east, have a total membership of about 2,000, and are comprised largely of marble workers, bakers, rubber workers, and some textile workers."—*American Labor Year Book, 1919-1920, pp. 195-196.*

Recent tendencies.—"The mutual hostility between the Western Federation of Miners and the I. W. W. has not lessened since 1907. This antagonism has been most acute in the Arizona, Nevada and Montana mining camps. . . . It is not unnatural that there should be increasing friction between the two organizations, inasmuch as the Western Federation has become on the whole more conservative, while the I. W. W. has grown constantly more revolutionary. In June, 1910, the W. F. M. voted for affiliation with the American Federation of Labor and the alliance was finally consummated in May, 1911. 'What the mine owners failed to do by force,' declares the I. W. W., 'they have accomplished through Civic Federation methods.' . . . The bitterness between the two organizations was most acute in the Butte (Mont.) mining fields. The situation reached a dramatic climax in the summer of 1914 when, on June 13, the Union Hall of Butte Miners' Union No. 1 (W. F. M.) was dynamited. . . . The most recent conflict between the I. W. W. and the Mine Workers was in the anthracite region around Scranton, Pennsylvania [April, 1916]. . . . The ninth I. W. W. convention, which met in Chicago, Sept. 21, 1914, was not an important one. It was in session less than a week and there were not more than twenty-five delegates present. . . . The European war had broken out less than two months before this convention met and the delegates did not fail to adopt a resolution against war. [See U.S.A.: 1917-1919: Effect of the war.] . . . Only two constitutional amendments of importance were passed at the ninth convention. One was a further development of the machinery of the referendum and constituted a victory for the decentralist boosters of the 'rank and file.' The other amendment expressed in more specific terms than ever before the attitude of the organization toward agreements between employers and employees. It replaced the former blanket prohibition with a clause which specifically defines the kinds of agreement which *must* be avoided, and, inferentially, permits the making of agreements which are free from the objectionable features specified. . . . No convention was held in 1915. The tenth convention met at Chicago in the latter part of November, 1916. . . . There were in attendance about 25 delegates, including three members of the General Executive Board and the General Secretary. The delegates were almost entirely from the East and Middle West, only one coming from the Pacific Coast. The editor of *Solidarity*, commenting upon the character of the convention, says that 'the tenth convention is remarkable as denoting the decline of the "soap-boxers" as the dominant element.' 'The dominant tone,' he says, 'was constructive rather than controversial and the general demand was for such constitutional and other changes as would make

for greater efficiency in the work of the organization,' and he approvingly quotes one delegate as exclaiming, 'The I. W. W. is passing out of the purely propaganda stage and is entering the stage of constructive organization.'—P. F. Brissenden, *I. W. W.: A study of American syndicalism, pp. 318-319, 324-325, 329-330, 338.*—"Several of the individual States, . . . [of the United States] have passed so-called 'criminal syndicalism' laws and the United States Senate on May 6, 1918, passed a so-called anti-*sabotage* bill which the newspapers declared was aimed at the I. W. W. The State laws referred to are quite generally understood to be directed against that organization. None of these statutes, however, mentions the I. W. W. by name. . . . So-called 'criminal syndicalism' or *sabotage* laws have been enacted by the States of Idaho, Minnesota, North Dakota, Montana, South Dakota, and Nebraska. In the State of Washington a 'syndicalism bill,' and in Arizona a '*sabotage*' law, were passed by the State legislatures in 1918 but were vetoed by the governor in each case. . . . [In 1918] the Industrial Workers of the World, as represented by more than one hundred of its members and officials, was on trial for its life in Chicago. The indictment charged the defendants with conspiring to hinder and discourage enlistment and in general to obstruct the progress of the war with Germany. The specific number of crimes alleged to have been intended runs up to more than seventeen thousand. . . . On August 17 the case went to the jury which, after being out fifty-five minutes, returned a verdict of 'guilty, as charged in the indictment.' On August 30 Judge K. M. Landis imposed sentence. W. D. Haywood and fourteen others were sentenced to twenty years imprisonment and \$20,000 fine each. Thirty-three others were given six years and fined \$5,000 each on the first count; ten years and \$5,000 each on the second count; two years and \$10,000 each on the third count; and ten years and \$10,000 each on the fourth count. Thirty-three others were given five years and fines of \$5,000 apiece on each of counts 1 and 2 and \$10,000 each on counts 3 and 4. Twelve more were sentenced to one year and one day, with fines of \$5,000 each on the first and second counts and \$10,000 each on the third and fourth counts. Two of the defendants were given ten-day sentences. All sentences run concurrently. The fines imposed aggregate \$2,570,000 and costs. . . . The activities of the I. W. W. are by no means confined to the United States and Canada. The organization has been gradually extending its propaganda in most English-speaking countries. This study is primarily concerned with the I. W. W. in the United States. But in any case it would be impossible to present any adequate record of its work in other countries because of the difficulty of getting at the facts of the situation. The announcements from the Chicago headquarters make reference to four foreign jurisdictions, viz.: its British, New Zealand, Australian and South African 'administrations.' It is unlikely that the 'British Administration' amounts to anything. The writer has happened upon vague references to an 'I. W. W. local' in London, but has not been able to either disprove or verify them. It is in the British colonies of South Africa and Australia that the I. W. W. has made headway with its propaganda and organizing work. After the outbreak of the European War the I. W. W. in Australia became the object of no little attention on the part of the government because of their anti-militarist agitation. Finally in Australia several of the

Wobblies were arrested, tried and convicted on charges of high treason. . . . Some idea of the nature and seriousness of that propaganda may be had from the meagre reports which have reached this country. A writer in the *Sunset Magazine* says that the striking coal miners 'had Australia at their mercy. . . . In vain did the government plead with the strikers for coal to start troop and wheat ships. . . . As a last resort, the leaders . . . were arrested. . . . The Industrial Workers of the World, the militant aggressive organization whose doctrine of a general rebellion is rapidly spreading through the "paradise of labor," demanded the release of the miners [and] threatened to burn down Sydney if their demands were not complied with. They made good. Night after night the incendiary work went on in Sydney. . . . Terrorized by the handful of industrial rebels, the commonwealth was forced to yield. The strike leaders were finally released [and] the demands of the strikers were granted.' A month later the *New York Times* published some special correspondence on the subject. It appears that in October, 1916, charges were preferred against 15 I. W. W.s in New South Wales. These charges involved, according to this report, treason and wholesale arson in Sydney, amounting to \$1,250,000. The chief issue involved was the conscription policy of the government, to which the I. W. W. was opposed. They were brought to trial on October 10th. The warrant against them charged that they were preaching *sabotage* by means of surreptitious pamphlets and openly upon the streets. Further, the warrant alleged, says the *Times* correspondent, "that they plotted rebellion against the King; that they conspired to burn down buildings in Sydney, . . . endeavored to put force or restraint upon the Parliament of New South Wales, [and that] they endeavored to intimidate and overawe Parliament.' Their anti-war campaign at last became so obnoxious to the government that the House of Representatives, in December, 1916, passed a statute, called 'The Unlawful Associations Act,' which practically made it a criminal offense to be a member of the I. W. W.; . . . the apparent intention of the authorities being to arrest all prominent I. W. W. speakers and hold them for the duration of the war. In Australia as in the United States there were prior to the war two I. W. W. organizations in existence: a political I. W. W. and a non-political I. W. W. In that country, however, the political group (counterpart of the Detroit wing in the United States) has been by all odds the more influential. Although both these groups were pretty well smothered by the war and the *Unlawful Associations Act*, the I. W. W. industrial union idea made its appearance in another form in the summer of 1918. In July of that year representatives of some of the most powerful unions of New South Wales held a conference in Sydney. This so-called 'Industrial Conference Board' drew up a constitution for an organization on the I. W. W. model, adopted the I. W. W. preamble almost word for word, and launched 'The Workers Industrial Union of Australia.'"—P. F. Brissenden, *I. W. W.: A study of American syndicalism*, pp. 344-345, 7-8, 339-343.—"In many respects the 11th Annual Convention of the I. W. W., held at Chicago May 5-16, 1919, was the most remarkable in the history of the organization. Emerging from two years of systematic persecution, the I. W. W. held its most successful convention, with more delegates present, with a greater spirit of solidarity; and formulated a more thorough and concrete plan of organization than

was possible in previous conventions. . . . Some of the more important matters decided at the Convention are as follows: . . . The official adoption of the universal delegate system is already in operation. This is a system of organizing that originated with the I. W. W. and is typical of its democratic spirit. This system makes it possible to organize the workers in the most hostile territory or industry. The idea is to make every member of the I. W. W. a job delegate or organizer. The job delegates receive no pay but are empowered to initiate new members and collect dues. Travelling delegates are members under pay who travel from job to job to consult with job delegates and keep them supplied with literature, due books, etc. When this system is perfected, every member will carry universal credentials and will, therefore, be enabled to initiate a worker into his respective industrial union. A resolution was passed barring any member addicted to intoxicating liquors from holding office in the organization. The Convention voted that no officer should hold office for two consecutive years. This means that if a member holds office for one year, he must return to his work before being eligible again to office. It also voted that paid officials could not act as delegates to the general convention. The policy of papers published by any subdivision of the organization is to be controlled by the General Executive Board, and no I. W. W. paper is authorized to accept commercial advertising. The Convention went on record as being opposed to any member or group of members taking part in or helping to build up any labor organization outside of the I. W. W. This does not prevent a member from holding a membership in any labor body and in no way interferes with his political beliefs."—*American Labor Year Book*, 1919-1920, pp. 198-199.—See also CENTRALIA RIOTS.

Publications.—"The I. W. W. press is an important factor in the organization. . . . [Formerly] there were seven foreign language papers in the field and two English papers. . . . Attempts were made to keep them in the field as long as possible, and all sorts of subterfuge was resorted to in order to get them out at all. However, at the present time, although third-class mailing privilege is all that is allowed, the papers are being started up again and we have eight foreign papers in the field and four English papers namely: Swedish, *Nya Varlden*; Spanish, *La Nueva Solidaridad*; Hungarian, *Felszabadulos*; Russian, *Golos Truzenika*; Jewish, *Der Industrial Arbeiter*; Italian, *Il Nuovo Proletario*; English, *The New Solidarity*; \**The One Big Union Monthly*, *The Industrial Unionist*, Seattle, Wash.; *The Rebel Worker*, New York; *Der Klassenkampf*, Jewish. In addition to these papers, four pamphlets dealing directly with the Chicago trial, have been published since the close of the trial."—*American Labor Year Book*, 1919-1920, pp. 194-195.

**INITIATIVE AND REFERENDUM**: Definition.—"The referendum has been described as a condition precedent to the taking effect of a law; the initiative is a condition precedent to the referendum. The referendum, itself in the nature of a contingency, is made to depend upon a contingency, and that is the filing with representative local officials of a petition signed by a definite number of persons, asking that the citizens residing within a given district shall have the opportunity to say yea or nay on the proposition that it shall be governed by the terms of a certain local by-law which the State legislature has proposed. Thus a prescribed number of signatures from ten to several thousand, according to the size of the district, its population, the desire to encourage or discourage the taking of the vote, the whims of the legislatures and other controlling influences and circumstances, must be secured in a locality before the election can be held. Sometimes the requirement is for a petition signed by a definite number of persons, as ten freeholders, one hundred qualified voters, two hundred resident taxpayers, etc. Again the law may require a certain percentage of the whole number of qualified electors registered within the district, or of the electors voting at the last election as 10 per cent, 15 per cent, 20 per cent, 25 per cent; or the literal condition may be one-tenth, one-fourth, one-third, two-fifths, three-fifths, a majority or even three-fourths of the legal voters. The legislature instead of enacting the law, requiring the referendum to be taken on a certain fixed date, on regularly recurring dates, or on the motion of local judges, commissioners, mayors and boards, places upon the shoulders of the people themselves the responsibility of deciding when the time has come for an election on the subject. The prohibition of special legislation in recent years and the restriction of the State legislatures' activities, in respect to localities, to 'general laws' have exerted a powerful influence to forward this development. . . . The initiative occurs in connection with propositions to incorporate cities and villages, to 'advance' or 'reduce' their grade, to organize levee districts and irrigation districts, to loan the public credit and issue bonds, to levy taxes for special purposes, to change city and county boundary lines, to remove county seats, to make the

enclosure of various species of live stock obligatory, to prohibit the manufacture or traffic in alcoholic liquors, to sell public lands and to enact a great variety of by-laws and enforce many different regulations having to do with local management."—E. P. Oberholzer, *Referendum in America*, pp. 369-371.

**Criticism.**—"The initiative and referendum depend on popular action, but the proportion of the people who act and in particular cases rule is never a majority. They are instruments of minority rule and usually of the rule of a very small minority. The ordinary mechanism of initiative operates so as to give to a small percentage of the voters the right to force the electorate either to accept or reject a specific legislative measure. . . . At its highest the vote on a proposed law is rarely over eighty per cent, not of the registered vote, but of the vote for governor, while it frequently falls below twenty-five per cent. The average is about sixty per cent. Hence the provision which has sometimes been used, that a proposed law shall not be considered adopted unless it receives a majority of all the votes cast at the election, makes the whole system practically inoperative and is vigorously opposed by the advocates of the initiative and the referendum. . . . In any event the great weakness of the initiative in its ordinary form consists in its failure to work sufficiently in favor of the popular political education. Measures submitted by this method to popular vote cannot in the very nature of the case receive that thorough ventilation and discussion which tends to inform and illuminate popular opinion."—H. D. Croly, *Progressive democracy*, pp. 306-307.—"The question is whether this system is one that ought to approve itself to the public for general adoption. It is argued that, in this way, subterranean influences of corrupt character can be avoided because the whole electorate can not be corrupted. It is argued that in this way prompt action is secured in deference to popular will, and that legislation, beneficial to the public and avoiding or abolishing special privilege, can not be obstructed or prevented by the hugger-muggering of political bosses acting under the inspiration of corrupt corporate managers. I do not mean to say that in the early use of such a device as this upon legislation, the results may not seem to be more directly under the control of the people than under the representative system when it was being used and abused by corrupt methods. However, the ease with which the so-called pure democracy can be turned to the advantage of the corruptionist has yet to be shown."—W. H. Taft, *Popular government*, p. 50.

**Early development and growth in Switzerland.**—The initiative and referendum are essentially Swiss institutions. "A popular vote under the name Referendum was known in the valleys of Graubünden and Wallis as early as the 16th century. Here existed small federations of communities who regulated certain matters of general concern by means of assemblies of delegates from each village. These conventions were not allowed to decide upon any important measure finally, but must refer the matter to the various constituencies. If a majority of these approved, the act might be passed at the next assembly. This primitive system lasted till the French invasion of 1798, and was again established in Graubünden in 1815. The word Referendum was also used by the old federal diets, in which there were likewise no comprehensive powers of legislation. If not already instructed the delegates must vote

'ad referendum' and carry all questions to the home government. The institution as now known is a product of this century. It originated in the canton of St. Gallen in 1830, where at the time the constitution was undergoing revision. As a compromise between the party which strove for pure democracy and that desiring representative government, it was provided that all laws should be submitted to popular vote if a respectable number of voters so demanded. Known at first by the name Veto, this system slowly found its way into several of the German-speaking cantons, so that soon after the adoption of the federal constitution five were employing the optional Referendum. Other forms of popular legislation were destined to find wider acceptance."

—B. Moses, *Federal government of Switzerland*, p. 119.—"Laws passed by the cantonal legislature may or must be referred to the people (referendum), who then have the right to reject or accept them, who, in other words, become the law-makers, their legislature being simply a kind of committee to help them by suggesting measures and by drafting them. The referendum is of two kinds, optional and obligatory. The optional referendum requires that a law must be submitted to popular vote if a certain number of the voters petition for it. The proportion varies in the different cantons, ranging from a twelfth to a fifth of all the voters. The obligatory referendum requires, as the name implies that all laws, or certain kinds of laws, shall be submitted without the need of petition. The obligatory form is the more democratic, requiring, as it does, a direct popular vote on every law. The initiative, on the other hand, enables a certain number of voters to propose a law or a principle of legislation and to require that the legislature submit the proposal to the people, even though it is itself opposed to it. If ratified the proposal becomes law. . . . By . . . [the initiative and referendum] Switzerland has more nearly approached democracy than has any other country. This system has been mainly developed since 1848, though its beginnings may be found earlier. Its growth constitutes the most important feature of Swiss political history in the last half century. It has been adopted wholly or in part in all of the representative cantons, with the exception of Freiburg. It has also been introduced into the federal government. In 1874 the federal constitution was revised, and at that time the federal referendum was established, and since 1891 a kind of federal initiative exists, that is, the people have the right to initiate constitutional amendments, not ordinary laws, but, as no sharp line separates the two, the power is practically unrestricted."—C. D. Hazen, *Europe since 1815*, pp. 588-590.—See also SUFFRAGE, MANHOOD: Switzerland: 1848-1874; 1874-1921.

**Development in United States.**—The referendum was adopted by some of the states before the idea of the initiative had reached America. "The New York constitution of 1821 was referred to the electorate, and it further provided that amendments should likewise be submitted to the voters after having received legislative approval. By the middle of the nineteenth century the doctrine of the constitutional referendum was fairly fixed, and most of the constitutions since 1850, excepting those of Delaware (1897), Mississippi (1890), South Carolina (1895), and Virginia (1902), have been approved by popular vote. . . . The doctrine of popular referendum was also early extended to several important matters besides constitutions and amendments. . . . The leg-

islature of New York, in 1849, submitted the proposition of establishing free schools to the decision of the electors; and the question of woman suffrage was laid before the voters of Massachusetts in 1895. . . . It was not such a long step, therefore, from these and similar practices, to the adoption of a complete system of initiative and referendum, whereby the voters may initiate any measure or require the referendum on any legislative Act."—C. A. Beard, *American government and politics*, pp. 461-463.—"The nineteenth century closed with the initiative and referendum entrenched in the Constitution of only one State, South Dakota, but with a pertinacious agitation in progress in all parts of the Union. [See SOUTH DAKOTA: 1880-1912.] The ferment, of which the Farmers' Alliance movement was a prominent manifestation, and which came to influence and alter the entire form and character of the Democratic party, set forward on every side the work of the advocates of direct legislation. . . . Investigators in the field of comparative politics were pointing curious fingers at the initiative and referendum in Switzerland. It was made clear by such writers as Mr. Bryce and Woodrow Wilson that our political practice provided cases of popular law-making quite as interesting to the world. . . . The initiative and the referendum, to which has now been added the recall, *i.e.*, the removal of a public officer by vote of the people and the election of his successor [see RECALL], were in the hands of the 'reformer' at the end of the century. . . . and the movement is still in progress [written in 1912]. . . . Following South Dakota the people of Utah, on November 6, 1900, adopted an amendment to their Constitution which had been proposed by the legislature. It was arranged that the legal voters of the State, . . . may initiate legislation, and . . . 'require any law' passed by the legislature, unless it may have been by a two-thirds vote of the members of each house, to be submitted to the people. On similar terms the initiative and the referendum were authorized in 'legal subdivisions' of the State. . . . Meanwhile Oregon, the State in which the most enthusiasm for direct legislation has been evidenced and the most experience with it has been gained, was busily engaged in the work of changing its Constitution. The initiative and referendum amendment passed two successive legislatures, those of 1899 and 1901, and was adopted by the people on June 2, 1902, by a vote of 62,024 to 5,668. [See OREGON: 1902-1915.] Here as in South Dakota the legislative power of the State is vested in a bi-cameral representative assembly, but the people 'reserve to themselves' the right to propose and enact laws, and to call for a vote upon laws which have been enacted by the representative body. They may also initiate constitutional amendments, thus introducing a new feature into the general scheme for direct popular government in America. . . . The progress of the referendum was arrested in 1903, for in both Massachusetts and Missouri, in which States constitutional amendments were pending, the friends of the system met with defeat. . . . On the other hand, . . . a constitutional amendment was adopted by the people of Nevada [1904], introducing the referendum into the practice of that State. Ten per cent of the voters may call for the submission of 'any law or resolution made by the legislature.' A majority of those voting can approve or annul the measure. . . . Montana, another State imbued with the spirit of the frontier, instituted the reform in 1906. Here the people

may originate legislation, 'except as to laws relating to appropriations of money and except as to laws for the submission of constitutional amendments and except as to local or special laws as enumerated in Article V, Section 26.' The referendum may be invoked on acts which the legislature has passed, 'except as to laws necessary for the immediate preservation of the public peace, health, or safety,' and appropriation bills and those classes of special legislation excepted by the clause relating to the initiative. . . . By statutory legislation not founded upon constitutional authority the right of the initiative and referendum has been extended to towns and cities in Montana."—E. P. Oberholzer, *Referendum in America*, pp. 391, 396-397, 413-415.

"In 1907 the twin institutions, again travelling eastward, found lodgment in Maine. That year a constitutional amendment establishing them passed the State Legislature, and the next year was ratified by the people. The Initiative was instituted for the proposal of laws, but not for constitutional amendments, which were specifically exempted, upon petition of twelve thousand voters; the Referendum on legislative acts, by petition of ten thousand. It was provided that all acts of the Legislature, except those pertaining solely to its business, making appropriations therefor, or for the payment of salaries fixed by law, and measures of immediate urgency, shall be held for ninety days after the Legislature's adjournment, subject to the Referendum, which must be called for within that time. A measure proposed by the Initiative if passed by the Legislature without change is to stand enacted, without submission. But if such measure be not adopted it is then to be submitted, either alone, or together with one of the Legislature's drafting as an alternate choice. The Legislature may on its own motion enact measures conditioned upon their ratification by a Referendum vote. In all cases a majority of those voting only is necessary for approval. The use of both Initiative and Referendum was at the same time also extended to cities, with the requirement that the local ordinance establishing them be first approved by a majority vote of the citizens."—E. M. Bacon and M. Wyman, *Direct elections and law-making by popular vote*, pp. 41-42.—See also MAINE: 1875-1909.—"Oklahoma entered the Union in 1907, and its very long Constitution contained many radical provisions, the initiative and the referendum among the number. [See OKLAHOMA: 1907-1916.] . . . The legislature, as it was directed to do in the Constitution, has laid down rules for making the system effective. These are similar to the rules which are in use in Oregon, though some variant provisions are to be noted. The arguments are printed and distributed at the sole expense of the State. While in Oregon and Montana no limitation is placed upon the length of the arguments, except what is provided by the requirement that the private committees and organizations presenting them shall pay the cost of printing, Oklahoma stipulates that the statements shall not exceed 2,000 words on either side. . . . In Missouri, where the people had defeated a constitutional amendment in relation to the initiative and the referendum in 1904, the legislature revived the subject in 1907. The amendment when it was submitted this time—in November, 1908—was approved. Laws and constitutional amendments may be initiated by eight per cent of the legal voters 'in each of at least two-thirds of the Congressional districts in the State.' Submission of laws enacted by the legislature may be demanded within ninety days

by five per cent of the voters drawn from at least two-thirds of the Congressional districts, or the legislature, if it wish, may refer any law to the people on its own motion. Exception is made for 'laws necessary for the immediate preservation of the public peace, health or safety, and laws making appropriations for the current expenses of the State government, for the maintenance of the State institutions and for the support of public schools.' The system is made operative by legislation enacted in 1909. [See MISSOURI: 1912-1914.] . . . A new Constitution for the State of Michigan was adopted by the people in November, 1908. It contains some provisions which authorize a considerable enlargement of the popular share in law-making in that State, though it is doubtful if they will have practical use. Article V, Section 38, of the new Constitution provides: 'Any bill passed by the legislature and approved by the Governor, except appropriation bills, may be referred by the legislature to the qualified electors, and no bill so referred shall become a law unless approved by a majority of the electors voting thereon.' The people are also given a conditional right of initiative respecting constitutional amendments. . . . In 1910 the people of Arkansas adopted a constitutional amendment introducing the initiative and the referendum into the legislative system of that State. The plan in the main follows that which is in use in Oregon. . . . In 1910 the initiative and the referendum were adopted in great haste in Colorado. At an extra session the legislature, on September 2, [1910] referred a constitutional amendment to the people who approved it in November. . . . This amendment introduces the system in its favorite form. The initiative may be invoked by eight per cent of the legal voters on the subject of both laws and constitutional amendments; the referendum by five per cent of the legal voters. The referendum petition must be presented within a period of ninety days following the adjournment of the legislature. It may apply to entire acts or to items and parts of acts. The legislature itself may refer an act to the people. Exceptions are made for 'laws necessary for the immediate preservation of the public peace, health or safety, and appropriations for the support and maintenance of the department of State and State institutions.' Cities, towns and municipalities are vested with similar powers. Ten per cent can order the referendum and fifteen per cent can propose any measure in the local districts. The Arizona convention of 1910, in framing a constitution for the new State, whose admission to the Union has been sought at Washington [Arizona was admitted to the Union in 1912], adopted provisions on the subject of the initiative and referendum [passed, 1911].—E. P. Oberholtzer, *Referendum in America*, pp. 415-416, 422-425.—In 1911 California and New Hampshire adopted the initiative and referendum with some limitations. (See CALIFORNIA: 1911; 1920.) "Idaho in 1912 adopted a constitutional amendment authorizing the legislature of that state to establish the initiative and referendum, but up to the present time [1920] no legislation has been enacted in Idaho [because the self-enacting clause was omitted in the amendment]. Idaho may, therefore, be excluded from this list."—Illinois Legislative Reference Bureau, *Constitutional Convention Bulletin*, no. 1, pp. 80-81.—Nebraska, in 1912, adopted the initiative for statutes and for constitutional amendments and also the referendum. Ohio established the same reforms that

year, and in 1918 extended the referendum to federal amendments. Washington was another state that adopted the referendum, in 1912, and the initiative for statutes only. During the campaign of 1912, the initiative and referendum became important issues. Colonel Roosevelt came out in favor of them in his speech to the Ohio constitutional convention, and planks on the subject were embodied in the Progressive party platform of that year. The proposal for initiative and referendum was submitted to the voters of Mississippi in 1912 and failed, but was finally passed in 1914. North Dakota adopted them both in a limited form in 1914 and revised and extended the law in 1918. "Massachusetts [1918] provides for an indirect initiative both as to laws and constitutional amendments. . . . [It] has the most numerous limitations upon the use of the referendum. . . . The referendum is excluded from use with respect to a series of rights granted by the declaration of rights of that state. . . . Massachusetts excludes from the application of the initiative all of the matters . . . [not] subject to the referendum; measures relating to the recall of judges or 'to the reversal of a judicial decision' [etc.]."—Illinois Legislative Reference Bureau, *Initiative, referendum and recall (Constitutional Convention Bulletin, no. 2, pp. 85, 91-92)*.—"Maryland [1915] and New Mexico [1911] have only the referendum for state-wide legislation. Of the . . . [twenty-two] states having the initiative and referendum [in 1920] five do not apply the initiative to constitutional amendments. [These five states are: South Dakota, Utah, Montana, Maine and Washington.]"—Illinois Legislative Reference Bureau, *Constitutional Convention Bulletin, no. 1, pp. 80-81*.

**In city government.** See COMMISSION GOVERNMENT IN AMERICAN CITIES: 1907.

**Other countries.**—While the most important development of the initiative and referendum has taken place in Switzerland and in the United States the movement has not been altogether absent from other countries. The question has come under consideration in France, Norway, Sweden and England. The initiative and referendum are employed in New Zealand, and the referendum has been a part of the constitution of the Australian Commonwealth since the formation of the union.—See also AUSTRALIA: 1915.

**INQUISITION**: 1203-1525.—**Definition**.—Relation to the age.—Origin of Holy Office.—St. Dominic and the Dominicans.—Episcopal inquisition.—Apostolical or papal inquisition.—Spanish inquisition and its terrible rule.—Estimate

of victims.—**Expulsion of Jews and Moors**.—"The most permanent defense of the Church against heresy was the establishment, under the headship of the Pope, of a system of courts designed to ferret out secret cases of unbelief and bring the offenders to punishment. These courts, which devoted their whole attention to the discovery and conviction of heretics, were called the Holy Inquisition. . . . The unfairness of the trials and the cruel treatment to which those suspected of heresy were subjected, through long imprisonment or torture,—inflicted with the hope of forcing them to confess their crime or to implicate others,—have rendered the name of the Inquisition infamous. Without by any means attempting to defend the methods employed, it may be remarked that the inquisitors were often earnest and upright men, and the methods of procedure of the Inquisition were not more cruel than those in the secular courts of the period. The assertion of the suspected person that he was not a heretic did not receive any attention, for it was assumed that he would naturally deny his guilt, as would any other criminal. A person's belief had, therefore, to be judged by outward acts. Consequently one might fall into the hands of the Inquisition by mere accidental conversation with a heretic, by some unintentional neglect to show due respect toward the Church rites, or by the malicious testimony of one's neighbors. This is really the most terrible aspect of the Inquisition and its procedure. If the suspected person confessed his guilt and abjured his heresy, he was forgiven and received back into the Church; but a penance of life imprisonment was imposed upon him as a fitting means of wiping away the unspeakable sin of which he had been guilty. If he persisted in his heresy, he was 'relaxed to the secular arm'; that is to say, the Church, whose law forbade it to shed blood, handed over the convicted person to the civil power, which burned him alive without further trial."—J. H. Breasted and J. H. Robinson, *Outlines of European history*, pt. I, pp. 483-484.—"In forming an estimate of the Inquisition, it is necessary to distinguish clearly between principles and historical facts on the one hand, and on the other those exaggerations or rhetorical descriptions which reveal bias and an obvious determination to injure Catholicism, rather than to encourage the spirit of tolerance and further its exercise. It is also essential to note that the Inquisition, in its establishment and procedure, pertained not to the spirit of belief, but to that of discipline. The dogmatic teaching of the Church is in no way affected by the question as to whether the Inquisition was justified in its scope, or wise in its methods, or extreme in its practice. . . . Heresy . . . was for society in those times what we call anarchy. Hence the severity with which heretics were treated by the secular power long before the Inquisition was established. As regards the character of these punishments, it should be considered that they were the natural expression not only of the legislative power, but also of the popular hatred for heresy in an age that dealt both vigorously and roughly with criminals of every type. . . . That such intolerance was not peculiar to Catholicism, but was the natural accompaniment of deep religious conviction in those, also, who abandoned the Church, is evident from the measures taken by some of the Reformers against those who differed from them in matters of belief."—J. Blötzer, *Inquisition* (*Catholic encyclopedia*, v. 8, p. 36).—"In the earlier ages of the Church, the definition of heresy had been committed to episcopal authority. But the cog-

nisance of heretics and the determination of their punishment remained in the hands of secular magistrates. At the end of the 12th century the wide diffusion of the Albigensian heterodoxy through Languedoc and Northern Italy alarmed the chiefs of Christendom, and furnished the Papacy with a good pretext for extending its prerogatives. Innocent III in 1203 empowered two French Cistercians, Pierre de Castelnau and Raoul, to preach against the heretics of Provence. [See also ALBIGENSES: 1209; 1210-1213; Results.] In the following year he ratified this commission by a Bull, which censured the negligence and coldness of the bishops, appointed the Abbot of Cîteaux Papal delegate in matters of heresy, and gave him authority to judge and punish misbelievers. This was the first germ of the Holy Office as a separate Tribunal. . . . Being a distinct encroachment of the Papacy upon the episcopal jurisdiction and prerogatives, the Inquisition met at first with some opposition from the bishops. The people for whose persecution it was designed, and at whose expense it carried on its work, broke into rebellion; the first years of its annals were rendered illustrious by the murder of one of its founders, Pierre de Castelnau. He was canonised, and became the first Saint of the Inquisition. . . . In spite of opposition, the Papal institution took root and flourished. Philip Augustus responded to the appeals of Innocent; and a crusade began against the Albigenses, in which Simon de Montfort won his sinister celebrity. During those bloody wars the Inquisition developed itself as a force of formidable expansive energy. Material assistance to the cause was rendered by a Spanish monk of the Augustine order, who settled in Provence on his way back from Rome in 1206. Domenigo de Guzman, known to universal history as S. Dominic, organised a new militia for the service of the orthodox Church between the years 1215 and 1219. His order, called the Order of the Preachers, was originally designed to repress heresy and confirm the faith by diffusing Catholic doctrine and maintaining the creed in its purity. It consisted of three sections: the Preaching Friars; nuns living in coventual retreat; and laymen, entitled the Third Order of Penitence or the Militia of Christ, who in after years were merged with the Congregation of S. Peter Martyr, and corresponded to the familiars of the Inquisition. Since the Dominicans were established in the heat and passion of a crusade against heresy, by a rigid Spaniard who employed his energies in persecuting misbelievers, they assumed at the outset a belligerent and inquisitorial attitude. Yet it is not strictly accurate to represent S. Dominic himself as the first Grand Inquisitor. The Papacy proceeded with caution in its design of forming a tribunal dependent on the Holy See and independent of the bishops. Papal Legates with plenipotentiary authority were sent to Languedoc, and decrees were issued against the heretics, in which the Inquisition was rather implied than directly named; nor can I find that S. Dominic, though he continued to be the soul of the new institution until his death, in 1221, obtained the title of Inquisitor. Notwithstanding this vagueness, the Holy Office may be said to have been founded by S. Dominic; and it soon became apparent that the order he had formed was destined to monopolise its functions. . . . This Apostolical Inquisition was at once introduced into Lombardy, Romagna and the Marches of Treviso. The extreme rigour of its proceedings, the extortions of monks, and the violent resistance offered by the communes, led to some relaxation of its original constitution. More authority had to be conceded to the bishops; and

the right of the Inquisitors to levy taxes on the people was modified. Yet it retained its true form of a Papal organ, superseding the episcopal prerogatives, and overriding the secular magistrates, who were bound to execute its biddings. As such it was admitted into Tuscany, and established in Aragon. Venice received it in 1289, with certain reservations that placed its proceedings under the control of Doge and Council. In Languedoc, the country of its birth, it remained rooted, at Toulouse and Carcassonne; but the Inquisition did not extend its authority over central and northern France. In Paris its functions were performed by the Sorbonne. Nor did it obtain a footing in England, although the statute 'De Haeretico Comburendo,' passed in 1401 at the instance of the higher clergy, sanctioned the principles on which it existed. . . . The revival of the Holy Office on a new and far more murderous basis, took place in 1484. We have seen that hitherto there had been two types of inquisition into heresy. The first, which remained in force up to the year 1203, may be called the episcopal. The second was the Apostolical or Dominican: it transferred this jurisdiction from the bishops to the Papacy, who employed the order of S. Dominic for the special service of the tribunal instituted by the Imperial Decrees of Frederick II. The third deserves no other name than Spanish, though, after it had taken shape in Spain, it was transferred to Portugal, applied in all the Spanish and Portuguese colonies, and communicated with some modifications to Italy and the Netherlands. Both the second and the third types of inquisition into heresy were Spanish inventions, patented by the Roman Pontiffs and monopolised by the Dominican order. But the third and final form of the Holy Office in Spain distinguished itself by emancipation from Papal and Royal control, and by a specific organisation which rendered it the most formidable of irresponsible engines in the annals of religious institutions. . . . Castile had hitherto been free from the pest. But the conditions of that kingdom offered a good occasion for its introduction. . . . During the Middle Ages the Jews of Castile acquired vast wealth and influence. Few families but felt the burden of their bonds and mortgages. Religious fanaticism, social jealousy, and pecuniary distress exasperated the Christian population; and as early as the year 1391, more than 5,000 Jews were massacred in one popular uprising. The Jews, in fear, adopted Christianity. It is said that in the 15th century the population counted some million of converts—called New Christians, or, in contempt, Marranos; a word which may probably be derived from the Hebrew Maranatha. These converted Jews, by their ability and wealth, crept into high offices of state, obtained titles of aristocracy, and founded noble houses. . . . It was a Sicilian Inquisitor, Philip Barberis, who suggested to Ferdinand the Catholic the advantage he might secure by extending the Holy Office to Castile. Ferdinand avowed his willingness; and Sixtus IV gave the project his approval in 1478. But it met with opposition from the gentler-natured Isabella. . . . Then Isabella yielded; and in 1481 the Holy Office was founded at Seville. It began its work by publishing a comprehensive edict against all New Christians suspected of Judaising, which offence was so constructed as to cover the most innocent observance of national customs. Resting from labour on Saturday; performing ablutions at stated times; refusing to eat pork or puddings made of blood; and abstaining from wine, sufficed to colour accusations of heresy. . . . Upon the publication of this edict, there was an exodus

of Jews by thousands into the fiefs of independent vassals of the crown—the Duke of Medina Sidonia, the Marquis of Cadiz, and the Count of Arcos. All emigrants were 'ipso facto' declared heretics by the Holy Office. During the first year after its foundation, Seville beheld 298 persons burned alive, and 79 condemned to perpetual imprisonment. A large square stage of stone, called the Quemadero, was erected for the execution of those multitudes who were destined to suffer death by hanging or by flame. In the same year, 2,000 were burned and 17,000 condemned to public penitence, while even a larger number were burned in effigy, in other parts of the kingdom. [See also Jews: Spain: 8th-15th centuries.] . . . In 1483 Thomas of Torquemada was nominated Inquisitor General for Castile and Aragon. Under his rule a Supreme Council was established, over which he presided for life. . . . In 1484 a General Council was held, and the constitution of the Inquisition was established by articles. . . . The two most formidable features of the Inquisition as thus constituted were the exclusion of the bishops from its tribunal and the secrecy of its procedure. . . . In the autumn of 1484 the Inquisition was introduced into Aragon; and Saragossa became its headquarters in that State. . . . The Spanish Inquisition was now firmly grounded. Directed by Torquemada, it began to encroach upon the crown, to insult the episcopacy, to defy the Papacy, to grind the Commons, and to outrage by its insolence the aristocracy. . . . The Holy Office grew every year in pride, pretensions and exactions. It arrogated to its tribunal crimes of usury, bigamy, blasphemous swearing, and unnatural vice, which appertained by right to the secular courts. It depopulated Spain by the extermination and banishment of at least three million industrious subjects during the first 130 years of its existence. . . . Torquemada was the genius of evil who created and presided over this foul instrument of human crime and folly. During his eighteen years of administration, reckoning from 1480 to 1498, he sacrificed, according to Llorente's calculation, above 114,000 victims, of whom 10,220 were burned alive, 6,860 burned in effigy, and 97,000 condemned to perpetual imprisonment or public penitence. He, too, it was who in 1492 compelled Ferdinand to drive the Jews from his dominions. . . . The edict of expulsion was issued on the last of March. Before the last of July all Jews were sentenced to depart, carrying no gold or silver with them. They disposed of their lands, houses, and goods for next to nothing, and went forth to die by thousands on the shores of Africa and Italy. . . . The exodus of the Jews was followed in 1502 by a similar exodus of Moors from Castile [see MOORS: 1492-1609], and in 1524 by an exodus of Mauresques from Aragon. To compute the loss of wealth and population inflicted upon Spain by these mad edicts would be impossible. . . . After Torquemada, Diego Deza reigned as second Inquisitor General from 1498 to 1507. In these years, according to the same calculation, 2,592 were burned alive, 896 burned in effigy, 34,052 condemned to prison or public penitence. Cardinal Ximenes de Cisneros followed between 1507 and 1517. The victims of this decade were 3,564 burned alive. . . . Adrian, Bishop of Tortosa, tutor to Charles V, and afterwards Pope, was Inquisitor General between 1516 and 1525. Castile, Aragon, and Catalonia, at this epoch, simultaneously demanded a reform of the Holy Office from their youthful sovereign. But Charles refused, and the tale of Adrian's administration was 1,620 burned alive, 560 burned in effigy, 21,845 condemned to prison or

public penitence. The total, during 43 years, between 1481 and 1525, amounted to 234,526, including all descriptions of condemned heretics. These figures are of necessity vague, for the Holy Office left but meagre records of its proceedings." —J. A. Symonds, *Renaissance in Italy: The Catholic reaction*, pt. 1, ch. 3. See also SPAIN: 1524-1526.

1487-1567.—Spread.—Holy office at Rome.—"The dread of the Spanish Inquisition was such that only in those dependencies early and completely subdued could it be introduced. Established in Sicily in 1487 its temporal jurisdiction was suspended during the years 1535-46, when it was revived by the fear of Protestantism. Even during its dark quarter, however, it was able to punish heretics. In an *auto* [see AUTO DA FÉ] celebrated at Palermo, of the twenty-two culprits three were Lutherans and nineteen Jews. The capitulation of Naples in 1503 expressly excluded the Spanish Inquisition, nor could it be established in Milan. The Portuguese Inquisition was set up in 1536. The New World was capable of offering less resistance. Nevertheless, for many years the inquisitorial powers were vested in the bishops sent over to Mexico and Peru, and when the Inquisition was established in both countries in 1570 it probably meant no increase of severity. The natives were exempt from its jurisdiction and it found little combustible material save in captured Protestant Europeans. A Fleming was burned at Lima in 1548, and at the first *auto* held at Mexico in 1574 thirty-six Lutherans were punished, all English captives, two by burning and the rest by scourging or the galleys. The same need of repelling Protestantism that had helped to give a new lease of life to the Spanish Inquisition, called into being her sister the Roman Inquisition. By the bull *Licet ab initio*, Paul IV reconstituted the Holy Office at Rome, directing and empowering it to smite all who persisted in condemned opinions lest others should be seduced by their example, not only in the papal states but in all the nations of Christendom. It was authorized to pronounce sentence on culprits and to invoke the aid of the secular arm to punish them with prison, confiscation of goods and death. Its authority was directed particularly against persons of high estate, even against heretical princes whose subjects were loosed from their obligation of obedience and whose neighbors were invited to take away their heritage. The procedure of the Holy Office at Rome was characterized by the Augustinian Cardinal Seripando as at first lenient, but later, he continues, 'when the superhuman rigor of Caraffa, one of the first Inquisitors General, held sway, the Inquisition acquired such a reputation that from no other judgment-seat on earth were more horrible and fearful sentences to be expected.' Besides the attention it paid to Protestants instituted very severe processes against Judaizing Christians and took cognizance also of seduction, of pimping, of sodomy, and of infringement of the ecclesiastical rules for fasting. The Roman Inquisition was introduced into Milan by Michael Ghislieri, afterwards pope, and flourished mightily under the protecting care of Borromeo, cardinal archbishop of the city. It was established by Charles V, notwithstanding opposition, in Naples. Venice also fought against its introduction but nevertheless finally permitted it. During the sixteenth century in that city there were no less than 803 processes for Lutheranism, 5 for Calvinism, 35 against Anabaptists, 43 for Judaism and 109 for sorcery. In countries outside of Italy the Roman Inquisition did not take root. Bishop Magrath endeavored in 1567 to give Ireland the benefit of the institution,

but naturally the English Government allowed no such thing."—P. Smith, *Age of the Reformation*, pp. 416-417.—See also ITALY: 1530-1600; JESUITS: 1573-1592; JEWS: 16th century.

INSTRUMENT OF GOVERNMENT.—A constitutional document, known as the Instrument of Government, was drawn up by Cromwell's leading supporters, and accepted by him December 16, 1653. See ENGLAND: 1653 (December).

The following is the text of the Instrument of Government:

THE government of the Commonwealth of England, Scotland, and Ireland, and the dominions thereunto belonging.

I. That the supreme legislative authority of the Commonwealth of England, Scotland, and Ireland,

and the dominions thereunto belonging, shall be and reside in one person, and the people assembled in Parliament; the style of which person shall be the Lord Protector of the Commonwealth of England, Scotland, and Ireland.

II. That the exercise of the chief magistracy and the administration of the government over the said countries and dominions, and the people thereof, shall be in the Lord Protector, assisted with a council, the number whereof shall not exceed twenty-one, nor be less than thirteen.

III. That all writs, processes, commissions, patents, grants, and other things, which now run in the name and style of the keepers of the liberty of England by authority of Parliament, shall run in the name and style of the Lord Protector, from whom, for the future, shall be derived all magistracy and honours in these three nations; and have the power of pardons (except in case of murders and treason) and benefit of all forfeitures for the public use; and shall govern the said countries and dominions in all things by the advice of the council, and according to these presents and the laws.

IV. That the Lord Protector, the Parliament sitting, shall dispose and order the militia and forces, both by sea and land, for the peace and good of the three nations, by consent of Parliament; and that the Lord Protector, with the advice and consent of the major part of the council, shall dispose and order the militia for the ends aforesaid in the intervals of Parliament.

V. That the Lord Protector, by the advice aforesaid, shall direct in all things concerning the keeping and holding of a good correspondency with foreign kings, princes, and states; and also, with the consent of the major part of the council, have the power of war and peace.

VI. That the laws shall not be altered, suspended, abrogated, or repealed, nor any new law made, nor any tax, charge, or imposition laid upon the people, but by common consent in Parliament, save only as is expressed in the thirtieth article.

VII. That there shall be a Parliament summoned to meet at Westminster upon the third day of September, 1654, and that successively a Parliament shall be summoned once in every third year, to be accounted from the dissolution of the present Parliament.

VIII. That neither the Parliament to be next summoned, nor any successive Parliaments, shall, during the time of five months, be accounted from the day of their first meeting, be adjourned, prorogued, or dissolved, without their own consent.

IX. That as well the next as all other successive Parliaments, shall be summoned and elected in manner hereafter expressed; that is to say, the persons to be chosen within England, Wales, the Isles of Jersey, Guernsey, and the town of Berwick-upon-Tweed, to sit and serve in Parliament, shall be, and not exceed, the number of four hundred. The persons to be chosen within Scotland, to sit and serve in Parliament, shall be, and not exceed, the number of thirty; and the persons to be chosen to sit in Parliament for Ireland shall be, and not exceed the number of thirty.

X. That the persons to be elected to sit in Parliament from time to time, for the several counties of England, Wales, the Isles of Jersey and Guernsey, and the town of Berwick-upon-Tweed, and all places within the same respectively, shall be according to the proportions and numbers hereafter expressed: that is to say, Bedfordshire, 5; Bedford Town, 1; Berkshire, 5; Abingdon, 1; Reading, 1; Buckinghamshire, 5; Buckingham Town, 1; Aylesbury, 1; Wycomb, 1; Cambridgeshire,

4; Cambridge Town, 1; Cambridge University, 1; Isle of Ely, 2; Cheshire, 4; Chester, 1; Cornwall, 8; Launceston, 1; Truro, 1; Penryn, 1; East Looe and West Looe, 1; Cumberland, 2; Carlisle, 1; Derbyshire, 4; Derby Town, 1; Devonshire, 11; Exeter, 2; Plymouth, 2; Clifton, Dartmouth, Hardness, 1; Totnes, 1; Barnstable, 1; Tiverton, 1; Honiton, 1; Dorsetshire, 6; Dorchester, 1; Weymouth and Melcomb-Regis, 1; Lyme-Regis, 1; Poole, 1; Durham, 2; City of Durham, 1; Essex, 13; Malden, 1; Colchester, 2; Gloucestershire, 5; Gloucester, 2; Tewkesbury, 1; Cirencester, 1; Herefordshire, 4; Hereford, 1; Leominster, 1; Hertfordshire, 5; St. Alban's, 1; Hertford, 1; Huntingdonshire, 3; Huntingdon, 1; Kent, 11; Canterbury, 2; Rochester, 1; Maidstone, 1; Dover, 1; Sandwich, 1; Queenborough, 1; Lancashire, 4; Preston, 1; Lancaster, 1; Liverpool, 1; Manchester, 1; Leicestershire, 4; Leicester, 2; Lincolnshire, 10; Lincoln, 2; Boston, 1; Grantham, 1; Stamford, 1; Great Grimsby, 1; Middlesex, 4; London, 6; Westminster, 2; Monmouthshire, 3; Norfolk, 10; Norwich, 2; Lynn-Regis, 2; Great Yarmouth, 2; Northamptonshire, 6; Peterborough, 1; Northampton, 1; Nottinghamshire, 4; Nottingham, 2; Northumberland, 3; Newcastle-upon-Tyne, 1; Berwick, 1; Oxfordshire, 5; Oxford City, 1; Oxford University, 1; Woodstock, 1; Rutlandshire, 2; Shropshire, 4; Shrewsbury, 2; Bridgnorth, 1; Ludlow, 1; Staffordshire, 3; Lichfield, 1; Stafford, 1; Newcastle-under-Lyne, 1; Somersetshire, 11; Bristol, 2; Taunton, 2; Bath, 1; Wells, 1; Bridgwater, 1; Southamptonshire, 8; Winchester, 1; Southampton, 1; Portsmouth, 1; Isle of Wight, 2; Andover, 1; Suffolk, 10; Ipswich, 2; Bury St. Edmunds, 2; Dunwich, 1; Sudbury, 1; Surrey, 6; Southwark, 2; Guildford, 1; Reigate, 1; Sussex, 9; Chichester, 1; Lewes, 1; East Grinstead, 1; Arundel, 1; Rye, 1; Westmoreland, 2; Warwickshire, 4; Coventry, 2; Warwick, 1; Wiltshire, 10; New Sarum, 2; Marlborough, 1; Devizes, 1; Worcestershire, 5; Worcester, 2. Yorkshire.—West Riding, 6; East Riding, 4; North Riding, 4; City of York, 2; Kingston-upon-Hull, 1; Beverley, 1; Scarborough, 1; Richmond, 1; Leeds, 1; Halifax, 1. WALES.—Anglesey, 2; Brecknockshire, 2; Cardiganshire, 2; Carmarthenshire, 2; Carnarvonshire, 2; Denbighshire, 2; Flintshire, 2; Glamorganshire, 2; Cardiff, 1; Merionethshire, 1; Montgomeryshire, 2; Pembrokehire, 2; Haverfordwest, 1; Radnorshire, 2. The distribution of the persons to be chosen for Scotland and Ireland, and the several counties, cities, and places therein, shall be according to such proportions and number as shall be agreed upon and declared by the Lord Protector and the major part of the council, before the sending forth writs of summons for the next Parliament.

XI. That the summons to Parliament shall be by writ under the Great Seal of England, directed to the sheriffs of the several and respective counties, with such alteration as may suit with the present government to be made by the Lord Protector and his council, which the Chancellor, Keeper, or Commissioners of the Great Seal shall seal, issue, and send abroad by warrant from the Lord Protector. If the Lord Protector shall not give warrant for issuing of writs of summons for the next Parliament, before the first of June, 1654, or for the Triennial Parliaments, before the first day of August in every third year, to be accounted as aforesaid; that then the Chancellor, Keeper, or Commissioners of the Great Seal for the time being, shall, without any warrant or direction, within seven days after the said first day of June, 1654, seal, issue, and send abroad writs of summons (changing therein what is to be changed as aforesaid)

said) to the several and respective sheriffs of England, Scotland, and Ireland, for summoning the Parliament to meet at Westminster, the third day of September next; and shall likewise, within seven days after the said first day of August, in every third year, to be accounted from the dissolution of the precedent Parliament, seal, issue, and send forth abroad several writs of summons (changing therein what is to be changed) as aforesaid, for summoning the Parliament to meet at Westminster the sixth of November in that third year. That the said several and respective sheriffs, shall, within ten days after the receipt of such writ as aforesaid, cause the same to be proclaimed and published in every market-town within his county upon the market-days thereof, between twelve and three of the clock; and shall then also publish and declare the certain day of the week and month, for choosing members to serve in Parliament for the body of the said county, according to the tenor of the said writ, which shall be upon Wednesday five weeks after the date of the writ; and shall likewise declare the place where the election shall be made: for which purpose he shall appoint the most convenient place for the whole county to meet in; and shall send precepts for elections to be made in all and every city, town, borough, or place within his county, where elections are to be made by virtue of these presents, to the Mayor, Sheriff, or other head officer of such city, town, borough, or place, within three days after the receipt of such writ and writs; which the said Mayors, Sheriffs, and officers respectively are to make publication of, and of the certain day for such elections to be made in the said city, town, or place aforesaid, and to cause elections to be made accordingly.

XII. That at the day and place of elections, the Sheriff of each county, and the said Mayors, Sheriffs, Bailiffs, and other head officers within their cities, towns, boroughs, and places respectively, shall take view of the said elections, and shall make return into the chancery within twenty days after the said elections, of the persons elected by the greater number of electors, under their hands and seals, between him on the one part, and the electors on the other part; wherein shall be contained, that the persons elected shall not have power to alter the government as it is hereby settled in one single person and a Parliament.

XIII. That the Sheriff, who shall wittingly and willingly make any false return, or neglect his duty, shall incur the penalty of 2,000 marks of lawful English money; the one moiety to the Lord Protector, and the other moiety to such person as will sue for the same.

XIV. That all and every person and persons, who have aided, advised, assisted, or abetted in any war against the Parliament, since the first day of January 1641 (unless they have been since in the service of the Parliament, and given signal testimony of their good affection thereunto) shall be disabled and incapable to be elected, or to give any vote in the election of any members to serve in the next Parliament, or in the three succeeding Triennial Parliaments.

XV. That all such, who have advised, assisted, or abetted the rebellion of Ireland, shall be disabled and incapable for ever to be elected, or give any vote in the election of any member to serve in Parliament; as also all such who do or shall profess the Roman Catholic religion.

XVI. That all votes and elections given or made contrary, or not according to these qualifications, shall be null and void; and if any person, who is hereby made incapable, shall give his vote for

election of members to serve in Parliament, such person shall lose and forfeit one full year's value of his real estate, and one full third part of his personal estate; one moiety thereof to the Lord Protector, and the other moiety to him or them who shall sue for the same.

XVII. That the persons who shall be elected to serve in Parliament, shall be such (and no other than such) as are persons of known integrity, fearing God, and of good conversation, and being of the age of twenty-one years.

XVIII. That all and every person and persons seised or possessed to his own use, of any estate, real or personal, to the value of £200, and not within the aforesaid exceptions, shall be capable to elect members to serve in Parliament for counties.

XIX. That the Chancellor, Keeper, or Commissioners of the Great Seal, shall be sworn before they enter into their offices, truly and faithfully to issue forth, and send abroad, writs of summons to Parliament, at the times and in the manner before expressed; and in case of neglect or failure to issue and send abroad writs accordingly, he or they shall for every such offence be guilty of high treason, and suffer the pains and penalties thereof.

XX. That in case writs be not issued out, as is before expressed, but that there be a neglect therein, fifteen days after the time wherein the same ought to be issued out by the Chancellor, Keeper, or Commissioners of the Great Seal; that then the Parliament shall, as often as such failure shall happen, assemble and be held at Westminster, in the usual place, at the times prefixed, in manner and by the means hereafter expressed; that is to say, that the sheriffs of the several and respective counties, sheriffdoms, cities, boroughs, and places aforesaid, within England, Wales, Scotland, and Ireland, the Chancellor, Masters, and Scholars of the Universities of Oxford and Cambridge, and the Mayor and Bailiffs of the borough of Berwick-upon-Tweed, and other places aforesaid respectively, shall at the several courts and places to be appointed as aforesaid, within thirty days after the said fifteen days, cause such members to be chosen for their said several and respective counties, sheriffdoms, universities, cities, boroughs, and places aforesaid, by such persons, and in such manner, as if several and respective writs of summons to Parliament under the Great Seal had issued and been awarded according to the tenor aforesaid: that if the sheriff, or other persons authorized, shall neglect his or their duty herein, that all and every such sheriff and person authorized as aforesaid, so neglecting his or their duty, shall, for every such offence, be guilty of high treason, and shall suffer the pains and penalties thereof.

XXI. That the clerk, called the clerk of the Commonwealth in Chancery for the time being, and all others, who shall afterwards execute that office, to whom the returns shall be made, shall for the next Parliament, and the two succeeding Triennial Parliaments, the next day after such return, certify the names of the several persons so returned, and of the places for which he and they were chosen respectively, unto the Council; who shall peruse the said returns, and examine whether the persons so elected and returned be such as is agreeable to the qualifications, and not disabled to be elected: and that every person and persons being so duly elected, and being approved of by the major part of the Council to be persons not disabled, but qualified as aforesaid, shall be esteemed a member of Parliament, and be admitted to sit in Parliament, and not otherwise.

XXII. That the persons so chosen and assembled in manner aforesaid, or any sixty of them, shall

be, and be deemed the Parliament of England, Scotland, and Ireland; and the supreme legislative power to be and reside in the Lord Protector and such Parliament, in manner herein expressed.

XXIII. That the Lord Protector, with the advice of the major part of the Council, shall at any other time than is before expressed, when the necessities of the State shall require it, summon Parliaments in manner before expressed, which shall not be adjourned, prorogued, or dissolved without their own consent, during the first three months of their sitting. And in case of future war with any foreign State, a Parliament shall be forthwith summoned for their advice concerning the same.

XXIV. That all Bills agreed unto by the Parliament, shall be presented to the Lord Protector for his consent; and in case he shall not give his consent thereto within twenty days after they shall be presented to him, or give satisfaction to the Parliament within the time limited, that then, upon declaration of the Parliament that the Lord Protector hath not consented nor given satisfaction, such Bills shall pass into and become laws, although he shall not give his consent thereunto; provided such Bills contain nothing in them contrary to the matters contained in these presents.

XXV. That [Henry Lawrence, esq.; Philip lord visc. Lisle; the majors general Lambert, Desborough, and Skippon; lieutenant general Fleetwood; the colonels Edw. Montagu, Philip Jones, and Wm. Sydenham; sir Gilbert Pickering, sir Ch. Wolseley, and sir Anth. Ashley Cooper, Barts., Francis Rouse, esq., Speaker of the late Convention, Walter Strickland, and Rd. Major, esqrs.]—or any seven of them, shall be a Council for the purposes expressed in this writing; and upon the death or other removal of any of them, the Parliament shall nominate six persons of ability, integrity, and fearing God, for every one that is dead or removed; out of which the major part of the Council shall elect two, and present them to the Lord Protector, of which he shall elect one; and in case the Parliament shall not nominate within twenty days after notice given unto them thereof, the major part of the Council shall nominate three as aforesaid to the Lord Protector, who out of them shall supply the vacancy; and until this choice be made, the remaining part of the Council shall execute as fully in all things, as if their number were full. And in case of corruption, or other miscarriage in any of the Council in their trust, the Parliament shall appoint seven of their number, and the Council six, who, together with the Lord Chancellor, Lord Keeper, or Commissioners of the Great Seal for the time being, shall have power to hear and determine such corruption and miscarriage, and to award and inflict punishment, as the nature of the offence shall deserve, which punishment shall not be pardoned or remitted by the Lord Protector; and, in the interval of Parliaments, the major part of the Council, with the consent of the Lord Protector, may, for corruption or other miscarriage as aforesaid, suspend any of their number from the exercise of their trust, if they shall find it just, until the matter shall be heard and examined as aforesaid.

XXVI. That the Lord Protector and the major part of the Council aforesaid may, at any time before the meeting of the next Parliament, add to the Council such persons as they shall think fit, provided the number of the Council be not made thereby to exceed twenty-one, and the quorum to be proportioned accordingly by the Lord Protector and the major part of the Council.

XXVII. That a constant yearly revenue shall be

raised, settled, and established for maintaining of 10,000 horse and dragoons, and 20,000 foot, in England, Scotland, and Ireland, for the defence and security thereof, and also for a convenient number of ships for guarding of the seas; besides £200,000 per annum for defraying the other necessary charges of administration of justice, and other expenses of the Government, which revenue shall be raised by the customs, and such other ways and means as shall be agreed upon by the Lord Protector and the Council, and shall not be taken away or diminished, nor the way agreed upon for raising the same altered, but by the consent of the Lord Protector and the Parliament.

XXVIII. That the said yearly revenue shall be paid into the public treasury, and shall be issued out for the uses aforesaid.

XXIX. That in case there shall not be cause hereafter to keep up so great a defence both at land or sea, but that there be an abatement made thereof, the money which will be saved thereby shall remain in bank for the public service, and not be employed to any other use but by consent of Parliament, or, in the intervals of Parliament, by the Lord Protector and major part of the Council.

XXX. That the raising of money for defraying the charge of the present extraordinary forces, both at sea and land, in respect of the present wars, shall be by consent of Parliament, and not otherwise: save only that the Lord Protector, with the consent of the major part of the Council, for preventing the disorders and dangers which might otherwise fall out both by sea and land, shall have power, until the meeting of the first Parliament, to raise money for the purposes aforesaid; and also to make laws and ordinances for the peace and welfare of these nations where it shall be necessary, which shall be binding and in force, until order shall be taken in Parliament concerning the same.

XXXI. That the lands, tenements, rents, royalties, jurisdictions and hereditaments which remain yet unsold or undisposed of, by Act or Ordinance of Parliament, belonging to the Commonwealth (except the forests and chases, and the honours and manors belonging to the same; the lands of the rebels in Ireland, lying in the four counties of Dublin, Cork, Kildare, and Carlow; the lands forfeited by the people of Scotland in the late wars, and also the lands of Papists and delinquents in England who have not yet compounded), shall be vested in the Lord Protector, to hold, to him and his successors, Lords Protectors of these nations, and shall not be alienated but by consent in Parliament. And all debts, fines, issues, amercements, penalties and profits, certain and casual, due to the Keepers of the liberties of England by authority of Parliament, shall be due to the Lord Protector, and be payable into his public receipt, and shall be recovered and prosecuted in his name.

XXXII. That the office of Lord Protector over these nations shall be elective and not hereditary; and upon the death of the Lord Protector, another fit person shall be forthwith elected to succeed him in the Government; which election shall be by the Council, who, immediately upon the death of the Lord Protector, shall assemble in the Chamber where they usually sit in Council; and, having given notice to all their members of the cause of their assembling, shall, being thirteen at least present, proceed to the election; and, before they depart the said Chamber, shall elect a fit person to succeed in the Government, and forthwith cause proclamation thereof to be made in all the three nations as shall be requisite; and the person that they, or the major part of them, shall elect as

aforesaid, shall be, and shall be taken to be, Lord Protector over these nations of England, Scotland and Ireland, and the dominions thereto belonging. Provided that none of the children of the late King, nor any of his line or family, be elected to be Lord Protector or other Chief Magistrate over these nations, or any the dominions thereto belonging. And until the aforesaid election be past, the Council shall take care of the Government, and administer in all things as fully as the Lord Protector, or the Lord Protector and Council are enabled to do.

XXXIII. That Oliver Cromwell, Captain-General of the forces of England, Scotland and Ireland, shall be, and is hereby declared to be, Lord Protector of the Commonwealth of England, Scotland and Ireland, and the dominions thereto belonging, for his life.

XXXIV. That the Chancellor, Keeper or Commissioners of the Great Seal, the Treasurer, Admiral, Chief Governors of Ireland and Scotland, and the Chief Justices of both the Benches, shall be chosen by the approbation of Parliament; and, in the intervals of Parliament, by the approbation of the major part of the Council, to be afterwards approved by the Parliament.

XXXV. That the Christian religion, as contained in the Scriptures, be held forth and recommended as the public profession of these nations; and that, as soon as may be, a provision, less subject to scruple and contention, and more certain than the present, be made for the encouragement and maintenance of able and painful teachers, for the instructing the people, and for discovery and confutation of error, hereby, and whatever is contrary to sound doctrine; and until such provision be made, the present maintenance shall not be taken away or impeached.

XXXVI. That to the public profession held forth none shall be compelled by penalties or otherwise; but that endeavours be used to win them by sound doctrine and the example of a good conversation.

XXXVII. That such as profess faith in God by Jesus Christ (though differing in judgment from the doctrine, worship or discipline publicly held forth) shall not be restrained from, but shall be protected in, the profession of the faith and exercise of their religion; so as they abuse not this liberty to the civil injury of others and to the actual disturbance of the public peace on their parts: provided this liberty be not extended to Popery or Prelacy, nor to such as, under the profession of Christ, hold forth and practice licentiousness.

XXXVIII. That all laws, statutes and ordinances, and clauses in any law, statute or ordinance to the contrary of the aforesaid liberty, shall be esteemed as null and void.

XXXIX. That the Acts and Ordinances of Parliament made for the sale or other disposition of the lands, rents and hereditaments of the late King, Queen, and Prince, of Archbishops and Bishops, &c., Deans and Chapters, the lands of delinquents and forest-lands, or any of them, or of any other lands, tenements, rents and hereditaments belonging to the Commonwealth, shall nowise be impeached or made invalid, but shall remain good and firm; and that the securities given by Act and Ordinance of Parliament for any sum or sums of money, by any of the said lands, the excise, or any other public revenue; and also the securities given by the public faith of the nation, and the engagement of the public faith for satisfaction of debts and damages, shall remain firm and good, and not be made void and invalid upon any pretence whatsoever.

XL. That the Articles given to or made with the enemy, and afterwards confirmed by Parliament, shall be performed and made good to the persons concerned therein; and that such appeals as were depending in the last Parliament for relief concerning bills of sale of delinquent's estates, may be heard and determined the next Parliament, anything in this writing or otherwise to the contrary notwithstanding.

XLI. That every successive Lord Protector over these nations shall take and subscribe a solemn oath, in the presence of the Council, and such others as they shall call to them, that he will seek the peace, quiet and welfare of these nations, cause law and justice to be equally administered; and that he will not violate or infringe the matters and things contained in this writing, and in all other things will, to his power and to the best of his understanding, govern these nations according to the laws, statutes and customs thereof.

XLII. That each person of the Council shall, before they enter upon their trust, take and subscribe an oath, that they will be true and faithful in their trust, according to the best of their knowledge; and that in the election of every successive Lord Protector they shall proceed therein impartially, and do nothing therein for any promise, fear, favour, or reward.

**INSURANCE: Marine insurance: Ancient.**—Development in Europe.—**Marine law.**—Lloyds and other companies.—“The practice of marine insurance may be regarded as the earliest form of indemnity, antedating other kinds of insurance by many hundred years. Even centuries before the introduction of marine underwriting as we know it to-day, the commercial nations of the ancient world secured the benefits of insurance through the so-called ‘loans on bottomry,’ e.g. loans made on the security of the ship and cargo at high rates of interest, and with the understanding that the principal with interest was to be repaid only in the event of the safe arrival of the vessel, and that the lender was to forfeit both principal and interest in case of loss. Instead, then, of paying a premium before starting the voyage, as is now the case, and receiving the indemnity after a loss is incurred the insured under the bottomry loan received the indemnity in advance, and only returned the same plus a premium after safe termination of the voyage. Such loans on bottomry, we are told, were especially sought after and entered into by members of the Roman nobility, who, too proud to interest themselves directly in commerce, and yet desirous of obtaining large interest returns, could here find a convenient method of investing their funds profitably, and at the same time avoid engaging personally in mercantile pursuits. That such loans were prevalent among the commercial peoples of early history is attested by the numerous references concerning such transactions which are found in the judicial and other literature of the Romans. In an edict of the Roman Emperor Justinian of A.D. 533, for example, the rate of premium on such loans was fixed at 12 per cent., implying at least that the practice must

have been very general at that time. Though indirect in form and partaking merely of the nature of quasi-insurance, this method of indemnifying loss by means of loans was nevertheless real insurance in its results. It should be borne in mind, however, that this method of indemnification is the only one approximating modern insurance of which antiquity furnishes us any clear and direct evidence. . . . Marine insurance as it exists to-day originated at a much later date than the loan on bottomry. Evidence seems to show that it had its start in Italy, especially among the Lombard merchants, at the close of the twelfth and the beginning of the thirteenth century. From thence it spread to Flanders, Portugal, and Spain during the fourteenth and fifteenth centuries, and was finally carried to England by the Lombards in the early part of the sixteenth century. As early as 1601 the British Parliament declared marine insurance to have existed from time immemorial. . . . Following its introduction in England, marine insurance spread to the various commercial centers of Europe [see **DANUBE: 17th-19th centuries**], its application becoming very general, if judged from the consideration given to the subject in the numerous commercial codes and ordinances of the fifteenth, sixteenth, and seventeenth centuries. Finally, there followed the epoch-making Ordinance de la Marine of 1681, which became the model for practically all the modern codes of commercial law on the continent, including the law of marine insurance. In England, on the contrary, the development of the law concerning sea insurance did not begin to assume such clear and definite form until almost the middle of the eighteenth century. [See also **ADMIRALTY LAW.**] It was then that Lord Mansfield, in his efforts to formulate the commercial law of England, began to draw his legal principles very largely from the commercial ordinances and codes of the continent with a view of applying them to English conditions. His decisions practically constitute the foundation of marine insurance law in England, and in turn have become the basis of American decisions. As supplementing this lengthy and continuous legal development, it is important to note that the Lloyd's policy prevailing in England to-day is very similar to the policy which was in use in the early part of the seventeenth century, and that many features of the English policy have in turn been incorporated in the policies used in America. In other words, we have in marine insurance several centuries of usage and judicial interpretation relating to the signification of a single document. Turning now to the financial development of the business as distinct from the legal, marine insurance has naturally reached its highest efficiency in the United Kingdom. Its history in that country, whose merchant marine for many decades comprised nearly half of the ocean-going tonnage of the world, has been rendered famous by the close identification of the business with the world renowned corporation of Lloyds. This gigantic institution had its origin in a mere seamen's coffee house, established by an Edward Lloyd near the middle of the seventeenth century. This enterprising and energetic man, besides making his coffee house a convenient place of meeting of merchants and seamen, also created an elaborate system of home and foreign correspondents to supply him with news from all the leading ports of the world concerning the movements and character of vessels for the information of his patrons. In fact, at first the underwriting of marine risks was a subordinate feature of his business. The systematic manner, however, in which maritime information

was collected and disseminated soon won for him a large following, and made his coffee house, among the many others existing in London, the principal meeting place for merchants and professional underwriters who, unhampered by any rules or regulations, assembled there and transacted a general marine business. Thus it came to pass that Lloyds soon outgrew its early usefulness, was transferred in 1692 from its original location in Tower Street to Lombard Street, and finally, in 1774, to the Royal Exchange of London, and there developed into the chief center of marine insurance in the United Kingdom, and, for that matter, in the world. From this account it is not to be inferred that marine insurance in the United Kingdom is confined to Lloyds or to British shipping. Prior to the beginning of the eighteenth century the business was, it is true, confined almost entirely to the plan of Lloyds, according to which individuals assumed risks upon the strength of their personal honesty and financial standing in the community. Indeed, it was the practice of various individuals subscribing their names to the insurance contract for a certain portion of the total risk that gave rise to the familiar term 'underwriter.' But gradually companies began to participate in the same business that Lloyds was pursuing. The movement seemed to gain strength rapidly, when, in 1720, the British government in return for a payment of £300,000 to the Exchequer limited the privilege of insuring marine risks to only two companies besides Lloyds, namely, the London Assurance Corporation and the Royal Exchange Assurance Corporation. Shortly after, however, this monopoly was removed and since then, especially during the nineteenth century, numerous corporations in London, Liverpool, and Glasgow with vast accumulated assets and far-reaching importance, have risen alongside the unique and unrivaled corporation of Lloyds, and, like that institution, have extended their influence to all corners of the earth. So effective, in fact, has the competition of the powerful insurance companies become that Lloyds, although yet the center of attraction in the marine business, has largely ceased to possess the dominating influence of former days. It is estimated that Great Britain to-day [written in 1905] transacts about six-eighths of the sea insurance of the world, a proportion so large that one can look for an explanation only to the preponderating importance of Great Britain as a shipping nation."—S. Huebner, *Development and present status of marine insurance in the United States* (*Annals of American Academy of Political and Social Science*, v. 26, pp. 423-426).—In 1921 the total amount of the premiums of forty companies in Great Britain according to the "Insurance Year Book" for 1922, amounted to £14,438,123.

**Marine insurance: Development in the United States.**—"A review of marine insurance in the United States shows that its development as well as its present status is radically different from that in England as just described. In the first place, the business has been conducted almost altogether by corporations, the Lloyds system of underwriting, though often tried, having never obtained a prominent foothold in this country. Secondly, while British companies have had a long and prosperous career, the companies of the United States, with few exceptions, have either failed or changed the character of their business. If we are justified in fixing definite limits, the development of the business in this country seems to divide itself into four main epochs, each with distinctive characteristics of its own. The dates of these periods may be roughly placed at 1793

as marking the end of the first period, 1793 to 1840 as indicating the limits of the second period, 1840 to 1860 the third, and 1860 to the present time the final period. During the first period, extending to the end of the eighteenth century, the only form of insurance upon goods or vessels of which we have definite knowledge was by personal underwriters. Resort was had at first to the private underwriters of Great Britain, frequent mention being found in early colonial correspondence concerning London indemnity for American shipping. Even as late as 1721 there was as yet no insurance office in Philadelphia, dependence being placed mostly upon foreign underwriters. In that year we find a Mr. John Copson advertising in the *American Weekly Mercury* of May 25, the opening by him of an office of public insurance on vessels, goods, and merchandise. . . . Four years later Mr. Francis Rawle, of Philadelphia, advised the establishment of a marine insurance office under colonial legislative sanction. . . . Following Mr. Copson's and Mr. Rawle's pioneer attempts to establish insurance offices, few efforts were made to follow in their footsteps. . . . In New York City it was not until 1759 that the first marine insurance office was opened, and not until 1778 that the New Insurance Office was established. The underwriting in all these cases continued to be by individuals or partnerships only, who generally represented wealthy citizens of the community. It was not until near the close of the eighteenth century that a number of citizens of Philadelphia succeeded in inducing the General Assembly of Pennsylvania to charter a marine insurance company, capitalized at \$600,000. . . . The Assembly, in the year 1704, chartered the Insurance Company of North America, the first stock company of its kind upon the continent whose name it bore. . . . In the very first year of active business the company refused to write for private offices, and 'realizing its strength, made public advertisement of their rules, and invited orders to be addressed directly to the company.' This important step toward the establishment of corporate underwriting with all its advantages was soon to serve as a model for similar undertakings in other parts of the country, and before another decade had passed the Insurance Company of North America was to have active associates in its own home as well as in New York, Boston, Baltimore, Charleston, and other places. In 1706 was established the Insurance Company of New York in New York City, followed by the Associated Underwriters of the same city in 1707, the United in 1797, Columbian in 1801, Washington Mutual in 1802, Marine in 1802, Commercial in 1804, Phoenix in 1807, Firemen's in 1810, Ocean in 1810, and others. In Philadelphia there followed the Insurance Company of the State of Pennsylvania in 1704, the Phoenix in 1803, the Philadelphia in 1804, Delaware in 1804, Marine in 1809, and the United States in 1810. Boston also came into the field at an early date, the Massachusetts Fire and Marine Company being organized in that city in 1705, and the Boston Marine in 1700; while among other early companies of importance may be mentioned the Charitable Marine Society of Baltimore, organized in 1706; the New Haven Insurance Company, of New Haven, in 1707; the Charleston Insurance Company, of Charleston, S. C., in 1797, and the Newburyport Marine, of Newburyport, Mass., in 1797. So rapid, in fact, was the movement of incorporating insurance companies that prior to 1800 thirty-two insurance companies had been established in this country, of which ten were doing a marine business. By 1811 there existed in Philadelphia

alone eleven companies, seven of which were marine companies and one a fire-marine company, while by 1825 there were twelve marine stock companies in New York, and at least a dozen in Boston. Prior to 1830 the history of these companies may be characterized as one of periodical prosperity and depression. . . . So great was the competition that at the close of 1825 the stock of only four of the twelve stock companies in New York was quoted at or above par. Beginning with 1828 marine insurance companies were also obliged to pay extraordinary losses occasioned by fraudulent wrecks on the Atlantic, Gulf, and West India coasts. Estimates place the losses incurred in this way at one-third of the total loss sustained by companies during the twenty years preceding 1840. It was not till 1844 that the companies of Philadelphia, for example, managed to organize a protective association through whose action these heavy losses by fraud could be averted. Beginning with the fifth decade, the business again showed signs of gradual revival, and the twenty years following 1840 may be justly characterized as the 'golden period' of American marine insurance. It was during these years that the American clipper ship received its highest development, and became probably the most efficient carrier in the world. . . . But this period of unparalleled growth proved to be but temporary, and was followed by an epoch, extending to the present [1905], as disastrous to the business as the preceding period had been beneficial. For many years marine insurance had kept in the forefront of our commercial life, and could indeed be ranked with fire insurance in importance. It began to show unmistakable signs of decay . . . when the American flag began to vanish from the sea. This decline has been continuous and unchecked. In fact, during the last thirty-five years marine insurance by native companies has had to struggle for its life."—*Ibid.*, pp. 432-435, 437-438.—According to the statistics in the "Insurance Year Book" for 1922, the total income of fire and marine insurance companies for the year ending December 31, 1921, was \$624,271,578 of 304 American stock companies, \$105,050,826 of 403 mutuals; and \$186,500,003 of 95 foreign stock companies. Separate statistics for marine and fire insurance are not available.

**Marine insurance: Provisions in Treaty of Versailles.** See VERSAILLES, TREATY OF: Part X: Section V: Annex II.

**Life insurance: Early forms.—Development from marine insurance.—Opposition.—Lack of scientific basis.—London Bills of Mortality.—Discovery and application of theory of probabilities.—First English companies based on scientific lines.—"Life insurance was an outgrowth of marine insurance, just as marine insurance was an outgrowth of commerce. . . . It was not an uncommon event in these earlier days, specially in the Mediterranean, for a ship to be captured by pirates and it was by no means uncommon for the captain of the ship, who was usually its part owner, to deposit a certain sum to be used in ransoming him in the event of his capture. The next development was to insure the captain's life for the duration of the voyage, which of course was term insurance."—W. A. Hutcheson, *Evolution of life insurance*, pp. 337, 339.—"The question as to whether or not life insurance was known to the ancients has received no small degree of attention on the part of several distinguished jurists and commercial historians, and there seem to be traces of something resembling insurance in the days of ancient Rome. The Roman Collegia, which were unions of a religious nature, had amongst their**

other features, provisions for burial of their members. . . . It would seem . . . that there is considerable analogy between these Roman Collegia and our present mutual life insurance companies: I cannot find, however, that they had either actuaries to guide them aright or agents to canvass for new members. In passing, it is of interest to state also that the legionaries of the Roman Army had provisions made for them, just as there were provisions made for our own soldiers and sailors under the Insurance Act of 1917; first, the Romans were given pensions on completion of a period of service; second, they were required to save by being compelled to deposit half of any sums given to them in certain events, e.g., the amounts distributed when they won a victory, and these sums were returned, without interest, on retirement, or were paid to their relatives on death, which provision seems somewhat akin to endowment insurance. . . . If we turn to England, before the Norman Conquest, we find similar organizations for bearing one another's burdens. Every freeman of 14 years whose rank and property did not afford an ostensible guarantee for his good conduct, was compelled after the reign of Athelstan (925-940 A.D.) to find a surety to keep the peace. Certain neighbors composed of ten families, which combination was called a 'Tithing,' bound themselves for one another either to produce any one of their number who offended against the law or to make pecuniary satisfaction for the offense. These Tithings raised a fund by mutual payments, and out of this fund 'pecuniary satisfaction' was paid. . . . After the Norman Conquest, the ancient 'Friendly Societies' were established in England. At their meetings, each member had to make some contribution to the common fund, and when any member got into trouble, or died, the common fund and each other member were called upon to help out. Later on, Guilds were established, some for the express promotion of religion, others for charity, and still others for trade. . . . They were originally charitable organizations to help their brother members in need. [See GUILDS.] At these Guild meetings, 'the sick man's box' and the 'dead man's box' were passed around, so that sickness insurance as well as life insurance of a primitive nature was in existence in these days. The payments to the Guilds were voluntary and the amounts received by the beneficiaries were uncertain. Later on, 'Tontine Funds' were formed; each member paid either a single or an annual contribution, and the income, or a certain proportion of the accumulated fund, was divided amongst the survivors at the end of each year; the whole fund went either to the last survivor, or to some definite number of last survivors, or to the survivors at the end of some definite period of years, according to the rules of each particular fund. In none of these cases was the law of averages, based on previous experience, made the basis of the payment to the fund or the benefit to members, and it is not to be wondered at when we consider that so many forces were working which threw out the law of averages, or which at any rate made it impossible to recognize that there was any such law. Take the various visitations of the plague. In 1686, Sir William Petty in an 'Essay concerning the Multiplication of Mankind' tells us that (a plague happeneth in London once in twenty years, or thereabouts,' and he added that such plagues 'do commonly kill one-fifth part of the inhabitants.' . . . In 1661 'another kind of insurance [was] made by other nations than France upon the life of men, in case of their decease upon their voyage, to pay certain sums to

their heirs or creditors.' This is term insurance and such insurance was the first kind of life insurance of which we have any record. It will be observed, however, that such term insurance was forbidden in France as against good morals and customs of the times. At a still earlier date life insurance was forbidden in the Netherlands. The 24th Article of the Amsterdam Ordinance of 1508 recites: 'We expressly prohibit insurance of the life of any person, and likewise wagers upon any voyage or frivolous purpose; and where they are made, we declare them void.' In 1681, the 10th Article of the great French Marine Ordinance of Louis XIV says, 'We forbid the making of any insurance on the life of men,' but the 11th Article of these Ordinances goes on to qualify 'his statement by saying that 'Nevertheless, those who shall redeem captives may have the price of the redemption assured upon the persons whom they withdraw from slavery, which the assurers are bound to pay, if the redeemed on his way back is retaken, killed, drowned, or if he perish by other means than natural death.' In 1783, life insurance was still regarded as obnoxious in France. Emerigon, in his work on insurance, states that 'At Naples, Florence, in England, and other places, assurances on the lives of men are allowed to be made; but this kind of assurances are not assurances properly so called, they are true wagers. These wagers, improperly called assurances, are prohibited in Holland and in several other countries. For a long time they have been prohibited in France and this prohibition has been renewed by the marine ordinance. Man is beyond price. The life of man is not an object of trade, and it is odious for his death to become matter for mercantile speculation. And, as observes Grivel, these kinds of wager are of sad augury, and may occasion crimes. Such assurances are therefore absolutely void. The premium stipulated is not even due.' The ban was lifted in 1788, the Revolution and the Napoleonic Wars intervened, and life insurance was not successfully introduced in France until 1810.

"In the seventeenth and eighteenth centuries, gaming was very prevalent all over Europe, and we must remember this fact in connection with these prohibitions on insurance. Gambling on the duration of human lives and other events became so popular in Britain that in 1774 'The Gambling Act' was passed by Parliament prohibiting insurance except when there was an insurable interest. The Preamble of this Act reads in part as follows: 'Whereas it hath been found by experience, that the making insurances on lives, or other events, wherein the assured shall have no interest, hath introduced a mischievous kind of gaming.' The Act then goes on to prohibit such insurances and ends up by providing 'always, that nothing herein contained shall extend . . . to insurances *bona fide* made by any person or persons, on ships, goods, or merchandises.' . . . This Act was passed in 1774 when insurance was in its infancy and before the formation of many insurance companies. When an *individual* or a group of individuals undertakes to act as insurer either of a single life or of a single event, it is in the nature of a wager unless he covers a sufficiently large number of lives, or events, to justify him in counting upon the operation of the law of averages. This insuring a sufficiently large number of lives is what a life insurance company does, and it is this, *inter alia*, that takes it out of the gambling class. As far as the insured is concerned, he must have some *bona fide* interest (independent of the policy) in the life insured, or the event, to take his policy out of the class of wagers. . . . It was not until 1706 that

the first life insurance company was formed. This company was the Amicable of London. It was founded on principles of mutual benevolence and not on scientific principles. It was what we might call a Mortuary Tontine Company. Each member paid 10 shillings entrance fee, a monthly premium of 10/- with an additional 1/- per quarter, making a total annual charge of £6.4/- irrespective of age, but only those between ages 12 and 45 were admitted, and the membership was at first limited to 2,000. The amount insured was indefinite. . . . It was not until 1807, or 45 years after the Old Equitable . . . had started business; that the Amicable commenced to write insurance on the ordinary plan, insuring definite amounts and charging premiums graduated according to age at issue. Until the Amicable started business in 1706, the small amount of life insurance issued had been underwritten by individuals or groups of individuals, and it had always been on the one-year term plan, *without right to renew*, but the Amicable's policy was renewable as the Society's full title—The Amicable Society for a *Perpetual Assurance Office*—indicates. The Amicable was amalgamated with the Norwich Union in 1866. In the year 1720, i.e., 14 years after the establishment of the Amicable in 1706, two stock companies were formed in London—the London Assurance and the Royal Exchange. These companies are still in active existence and celebrated their 200th anniversaries this year [1922]. The Royal Charters, granted them in 1720, authorized them to write marine insurance, and both companies were given additional charters in 1721 to write life and fire insurance. One difference between the Amicable and these other two companies was that the Amicable *did not* guarantee a definite sum at death, but simply a pro rata share of the definite amount set aside for payment of death claims each year, whereas the London Assurance and the Royal Exchange *guaranteed* a definite sum at death. . . . The time was not yet ripe [in 1721] . . . for life insurance based on scientific lines, because mortality tables, the foundation on which all life insurance is built, had not yet been compiled."—*Ibid.*, pp. 331-334, 342-345, 348.

The "London Bills of Mortality . . . were the precursors of our Mortality Tables. The 'Bills of Mortality' were published at irregular intervals in England at this time—in fact, they were so published for 300 years from 1538 to 1836—giving lists of the numbers of christenings (which were, of course, less than the number of births, for only those christened according to the rites of the Established Church were recorded) and also the numbers of burials, arranged in 1629 and later according to the causes of death. These Bills of Mortality seem to have had their origin in a Commission for a General Visitation of Religious Establishments granted by Henry VIII to Thomas Cromwell, Vicar General, in 1535, when he broke with the papal authorities and was declared 'Supreme Head of the Church.' In 1538 new Protestant Rules and Regulations for the Kingdom were issued, and amongst them was an injunction, made September, 1538, by Cromwell, to the effect that every 'Parson, Vicar or Curate' was to keep a true and faithful account of all 'weddings, christenings and funerals' in his particular parish, subject to a penalty of three shillings and four pence for every omission. The system of registration so inaugurated seems to have fallen into disuse during the reign of Queen Mary, in whose reign the Papal supremacy was re-established, but it was again put into force in 1558 on Elizabeth's accession to the throne. Until 1562, London seems

to have evaded these registration ordinances, but, in this year, the subject of mortality acquired a fearful interest in London by the visitation of the plague and registration seems to have been instituted then in London. . . . These Bills of Mortality were issued continuously from 1603 until 1836. They were no longer required thereafter, for in 1837 registration of births and deaths became compulsory in England. In 1728, for the first time, the numbers of deaths, occurring under two years of age, between 2 and 5, 5 and 10, and then in 10-year groups of ages, were stated in the Bills of Mortality, but without information as to the causes of death at the various ages. . . . For the next 100 years the ages were given and then in 1837 registration of births and deaths became compulsory in England. The records of the city of Breslau, in Silesia, however, gave the age at death and the sex, and in 1693 Dr. Edmund Halley (born October 29, 1656), the Astronomer Royal of England, and the discoverer of the Halley Comet, published a mortality table deduced from these Breslau death records and from the birth records there for the five years 1687 to 1691, inclusive. He arranged his life table in the form in which such tables are still used. . . . It was one thing, however, to keep birth and death records, but it was quite a different matter to make use of them. That required the development of the theory of probabilities. Fortunately, however, coincident with the collection of these statistics, a Frenchman—a profound and versatile thinker—Blaise Pascal (1623-1662) applied himself to the study of the problem of chances (or probabilities as we now generally call them) and he established the first principles of the doctrine of chances which was necessary in laying the foundation of the theory of vital statistics and its application to the calculation of life contingencies. . . . However, it was Johan de Witt, the illustrious Dutch Statesman and Mathematician, at that time Grand Pensionary of the United Provinces of the Netherlands, who first conceived the idea of applying the doctrine of probabilities to the valuation of human life. The Netherlands, at that time fighting with England and France, had for some time been raising money by the sale of life annuities based on 'nine years' purchase,' irrespective of the age of the annuitant, and these annuities were generally made to depend upon the lives of young nominees, so that De Witt's problem was to find the highest value of a life annuity, or the number of years' purchase which his Government could, with perfect safety, fix as a uniform selling price. In 1671, De Witt presented a report to the States-General, estimating the value of a life annuity at age 3 (assuming 4 per cent. interest) at 16 years' purchase. . . . As it was money, and not correct annuity rates, that the Government wanted, De Witt's treatise was suppressed until 180 years later, when, in 1851, Mr. Frederick Henriks, the famous British Actuary, recovered the Report and Calculations in the 'Resolutions of the States of Holland and West Friesland' for the year 1671. . . . The first use to which mortality tables were put was the calculation of the premiums for the purchase of annuities, and, in fact, the first life insurance company of which we have record was one started in London by the Mercers' Company in 1698 for the purpose of selling annuities for the widows of clergymen and others.

"Life insurance on scientific lines dates from the year 1762, for in that year the first company to write ordinary life policies and to charge premiums graded according to age at issue commenced business. This company, the Equitable Life Assur-

ance Society—the 'Old Equitable' of London—was the first *mutual* life insurance company. The promotion of the Equitable was commenced several years earlier, but its establishment was delayed for some time by the opposition of the three existing companies—the Amicable, the London Assurance and the Royal Exchange. The name 'Equitable' was given it because the premiums were to be proportionate to the chance of death at each age. In addition, it contemplated charging extra premiums for hazardous risks. From its earliest days it issued life as well as term policies, it allowed 30 days of grace for payment of premiums, and an additional three months for reinstatement on evidence of good health. No medical examination of applicants for insurance was required in these days, but the applicant had to appear before the Board of Directors and he had to undergo a cross-examination both as to his family history and personal condition of health. It also contemplated dividends to its members, so that it was really a 'mutual' company in the present sense of that word. Last, but not least, it provided for an actuary. . . . In 1815, The Scottish Widows Fund and Life Assurance Society, which is still the most representative British life company, commenced business on the mutual plan. It was originally intended to be a society for the issuance of life annuities. Its original prospectus issued in the year 1811 stated that it was a plan to establish a general fund for securing provision to widows, sisters, and other females. In 1812, the second prospectus, however, stated that it was a plan for establishing a general fund for securing provision to widows, sisters, etc., and for insuring capital sums on lives. The 'Scottish Widows' was avowedly framed on the lines of the Old Equitable. . . . Its original premiums were based on the net Northampton Table of Mortality and 4 per cent. interest, with a loading of 2½ per cent. They issued ordinary life, limited payment and single payment life as well as term policies from the start. These original premium rates held good until 1864 when new rates based on Joshua Milne's Carlisle Table of Mortality and 3 per cent. interest were put in force. They paid cash surrender values and made loans on policies from the beginning, even after payment of only one premium."—W. A. Hutcheson, *Evolution and life insurance*, pp. 334-335, 340-351, 350-360.—That the life insurance business in Great Britain has resumed a normal course of development since the World War is shown by the fact that the amount of new business in 1920 broke all previous records.

Life insurance: Development in the United States.—Stock and mutual companies.—Crisis.—Recovery.—"It was seven years after the first fire insurance company came into existence in America that the first life insurance company had its origin. In 1750 the Presbyterian synods of New York and Philadelphia procured a charter from the proprietary government of Pennsylvania for a corporation whose purposes were fully expressed in its title, 'A Corporation for the Relief of Poor and Distressed Presbyterian Ministers and of the Poor and Distressed Widows and Children of Presbyterian Ministers.' This institution, which has become a life insurance company, the oldest now existing, was a growth, not a creation of one year. A fund had previously existed in aid of the poorly supported clergy, and the ministers had

expressed a wish that, by some fund, like payment could be granted to their surviving wives and children. . . . Soon after [1800] . . . there began to be some active interest shown in life insurance covering the whole of life. Level premium life insurance had now been in operation in England for more than a generation. Some correspondence had taken place between people in the States and the English life insurance companies. Early in 1807 the Pelican Life Insurance Company of London established an office in Philadelphia. In various sections of the country the idea of insurance was penetrating from England. Already an association called the 'Pennsylvania Company for the Insurance on Lives' was projected, and while the project matured slowly, it was in readiness for formal organization late in 1809. The organization of this company marks the beginning of life insurance in the United States upon a business basis. This company was capitalized at \$500,000. The policy forms were copied from those in use in England and the rates charged were those charged by the London companies, raised in some localities to offset what was considered a heavier mortality rate. In 1818 the Massachusetts legislature chartered the Massachusetts Hospital Life Insurance Company. This was a stock company capitalized at \$500,000 and empowered to do a life insurance and trust business. . . . The company did very little life insurance business, and no other life insurance companies were organized in Massachusetts for twenty years. . . . The next company organized to do a life insurance business was the New York Life Insurance and Trust Company. Chartered in 1830, it issued during the first nine years of its existence nearly two thousand policies. It, too, was a stock company with a capital of a million dollars. Several characteristics are common to all three of these first corporations organized in America to furnish life insurance. All were stock companies with large capitalization; all were chartered to do two kinds of business, life insurance and trust business; all have given up the issue of life insurance policies and all survive as prominent trust and banking companies in the cities where they were first chartered. With the chartering of the New England Mutual Life Insurance Company by Massachusetts in 1835, and the Girard Life and Trust Company by Pennsylvania in the following year, a new era in life insurance history in the United States began. So far, outside of the half charitable plans for the Presbyterian and Episcopal corporations already noticed, all life insurance was being conducted on the stock plan. News of the great success of the Equitable of England began to be known in America. Even the stock companies were advertising this success as a means of inducing people to take out life insurance. . . . The Equitable was a mutual company, that is, a corporation without capital stock. Every policy-holder was a member and shared in the profits which were made. With the constant attention which was now being directed to the Equitable, it would have been strange if a company had not been organized in America on a similar plan. The New England Mutual Life Insurance Company of Boston was chartered by Massachusetts in 1835 to emulate the Equitable of London. But the Massachusetts legislature was afraid of a mutual company without capital, and so provided that the organizers of this company should furnish \$100,000 of guarantee capital which later was to be refunded. This made it difficult to complete the organization of the company, and it was not until 1843 that the company commenced to write insurance. In the meantime, it happened

that a stock company took the first real step towards the adoption of the mutual principle. The Girard Life and Trust Company of Philadelphia, organized in 1836, while holding to joint stock management, made provision whereby the profits of the business might be shared with the policy-holders. In 1844, in accordance with its promise, it declared its first dividend. The plan proved so popular and the Girard prospered so much that its competitor, the Pennsylvania Company, announced that thereafter all premiums for one or more years of insurance would entitle the policy-holder to a credit of one-half the profits. Once started, the mutual plan of life insurance spread rapidly. . . . In 1842 the Mutual Life of New York was organized. In 1843 the New England Mutual completed its organization. In 1845 the Mutual Benefit of New Jersey was chartered. In the same year the New York Life Insurance Company succeeded in fulfilling the requirements which the legislature had laid down as prerequisite for organization. With the formation of these companies begins the great development of life insurance in the United States, a development which has resulted in a larger per capita amount of insurance in force in the United States than is found in any other country in the world. Interesting it is to trace the spread of insurance at that time over the country. With the formation of more companies, competition for business began. The three early stock companies had been content with such business as had come unsolicited to the office. Under competitive conditions, the companies began to appoint men in different cities to solicit life insurance as a side issue to their other work. Ministers, teachers, and lawyers were appointed agents and given a small commission. With agents soliciting business, more people began to be interested in life insurance. As they became interested they wondered why a local company could not be organized. Thus it was that life insurance was spread over the country. Take, for instance, the manner in which life insurance started in Connecticut. The Mutual Benefit appointed an agent in Hartford in 1846. An active campaign for policy-holders was inaugurated. The idea of life insurance was so new that wide attention was given to it in a way little understood at present. Public meetings were held to discuss the question. All at once the novelty of life insurance became the talk of the town. The Mutual Benefit agent did a large business. The thought struck some Hartford business men that they could as well organize a home company. In February, 1846, the agent had been appointed for the Mutual Benefit; three months later the Connecticut legislature chartered the Connecticut Mutual Life Insurance Company. . . . So it was that with the novelty of the business, with a delusive way of declaring dividends, and with the adoption of the system of paying premiums with note, life insurance in the United States from 1850 to 1870 had a development unparalleled for its rapidity and extent. A change soon took place. The prosperity of the life insurance business had brought men to it who ought not to have been attracted. Even if the country as a whole had not soon suffered one of the most severe financial and industrial depressions it has ever experienced, there would probably have been trouble in the life insurance business. The growth in the number of companies had been too rapid. . . . In 1868, even while new companies were still being organized, three companies went into the hands of receivers, one insured in another company which subsequently failed, and one was closed at the suit of stockholders. In 1870 seven companies went out

of existence. In 1871 two went into the hands of receivers, and the disaster was but started. In 1872 thirteen companies failed, or reinsured in companies which failed. Thus before the financial depression which affected all lines of business had begun, thirty life insurance companies had been forced to discontinue. When the general hard times did set in, and failures in other lines of business became frequent, the rate of insurance failures was accelerated. In 1873 fourteen companies were closed up, in 1874 four, in 1875 nine, and in 1876 nine. Six companies went to the wall in 1877, making a total of seventy-one life insurance corporations which had been forced out of business in ten years. The weaker companies had been weeded out and failures became less frequent. Between 1878 and 1888 a few more companies failed, but mostly as a result of conditions arising in the previous decade. Along with the actual failures of many companies had come a decline in the business of all. There was nearly two billion dollars of insurance in force in 1870; by 1880 it had decreased to less than a billion and a half. . . . By 1880 began the revival in business. The companies which had survived had been subjected to a hard test. Gradually they recovered their ground as financial conditions improved and as memories of life insurance in the seventies became less vivid. No new companies were organized for twenty years, but from 1880 to 1905 the business done by the old companies increased apace. In 1885 the total insurance in force passed the two billion mark, five years later it had doubled, by 1900 nine billion dollars of insurance was in force, and by 1905 five million level premium life insurance policies were in force in the United States, insuring for a total amount of twelve billion dollars. . . . During the summer of 1905, starting with a personal quarrel for control of one of the largest companies, revelations were made of bad management which led New York and other states to make an investigation into the management of a number of companies. Exposures were made in some cases of betrayal of trust which shocked the public. These disclosures, coming at a time when the public mind was already inflamed by exposures made in other lines of business, resulted in a demand by the public that remedial legislation should be enacted, and during the following two winters, many legislatures busied themselves in revising the insurance laws. . . . From 1860 on, nowhere else in the world have so many laws, attempting to regulate the business to such a great extent, been enacted as in the United States. But what was attempted before 1905 has been surpassed by the laws placed upon the statute books since that year. Laws have been passed [written in 1909] regulating salaries, expenses, and premiums. Standard policies have been provided. The amount of insurance that could be written has been prescribed. Surplus is limited in amount. Methods of allotting dividends have been defined. Systems of control by the policy-holders have been enacted into law. More publicity is demanded."—F. C. Oviatt, *History of fire insurance in the United States* (Yale readings in insurance: Property insurance, pp. 77, 81-84, 88-90).—From a financial point of view life insurance has continued to hold the most important place in the insurance business. From 1909, when the total income of 189 companies was about \$750,000,000, it has grown to an income of approximately \$1,800,000,000, of 253 companies, in 1920, thus showing a growth of more than 100 per cent.

**Life insurance: Provisions in Versailles**

**Treaty.** See VERSAILLES, TREATY OF: Part X: Section V: ANNEX II.

**Fire insurance: Early forms.—Development in England and on the continent.**—"Fire insurance as now commonly practiced is usually considered to have begun after the great conflagration of London in 1666. . . . It is true that some forms of provisions for the aid of those suffering from loss by fire and other calamitous causes apparently existed in very remote times, as the following quotation will evidence: 'The earliest application of fire insurance known to us was in connection with communes of towns and districts. These communes flourished in Assyria and the East more than 2,500 years ago. Judges, priests and magistrates were appointed for each town and district with power to levy contributions from each member of the commune to provide a fund against sudden calamities such as drought and fire. If the judges were satisfied that the fire was accidental they empowered the magistrates to assess the members of the commune either in kind or in money, and in the event of any member being unable through poverty to meet his share of the contribution, the deficiency was made up from the common fund. These communes still exist [written in 1904] in a modified form in China.' As early as 1240 A.D. the laws of Count Thomas of Flanders provided that the members of a community as a whole should make good a loss which fire might cause to an individual unless the incendiary who caused the fire could be discovered, in which case the loss was to be made good from his property and he was to be banished. It will be noted that the plans outlined above contemplated an assessment by the state and that all property owners were protected. We may discover here, therefore, the beginning of state fire insurance, which . . . continues in Germany and elsewhere to this day on a large scale. Another method for protection and security against loss by fire, water, robbery or other calamities, arose during the Middle Ages in connection with the various Anglo-Saxon and German guilds, the members of which made regular contributions toward a common relief fund. In 1609 a plan was suggested by one of his subjects to Count Von Oldenberg, wherein it was proposed that he individually should consent to insure those of his subjects, who might so desire, against the loss of their houses by fire upon an annual payment to him of a fee or premium of one dollar for every one hundred dollars of valuation. This suggestion was declined by the Count, though not without some hesitation, and, though he suggested that such a plan might well be undertaken by a company of private individuals, no action on his suggestion seems to have been taken. This, so far as I have been able to discover, was the first suggestion ever made looking toward the formation of a company or association for fire insurance purposes only. In England various fire insurance schemes were proposed in 1635, 1638 and 1660, but for one reason or another—largely owing to the great Civil War—none of them was fully organized, and as late as 1667 there is evidence that fire insurance as we know it did not exist. In 1666 came the great fire of London, which burned for four days and nights and spread over 436 acres of territory. . . . Over 85 per cent. of the buildings in London were destroyed. . . . Immediately after the fire various plans for the protection of individuals against loss by fire began to be devised. In 1667 the first regular system for insuring buildings against fire began. In that year, one Nicholas Barbon opened an office where he individually proposed to insure houses and buildings. A few years

later, in 1680, after having had some success, he formed a partnership known as 'The Fire Office.' This company, for a given consideration, engaged to pay the assured the amount of indemnity declared in the policy, or contract, should his house or building be destroyed by fire, or to repair it should it be only 'damnified'—i.e., damaged. No liability, it will be noted, rested upon the assured beyond the payment of the premium. In 1681, a few years after this first company was established, an attempt was made by the City of London to establish an insurance account, or business, and funds and property were put aside and dedicated for that purpose. Houses were insured for any term up to one hundred years. But the enterprise did not prosper and was abandoned in 1683. Then followed, in the same year, what was called the 'Friendly Society.' This concern, which had an existence of nearly one hundred years, conducted its business upon an entirely different plan, as follows: First, the assured paid yearly a small sum, varying according as the building to be insured was brick or frame. This charge was to cover the expenses and, we may presume, the profits of those who operated the company. Second, the assured deposited with the company a sum equal to five annual payments as a guarantee that future payments and assessments would be met as required. This money could be appropriated by the company if the assured failed to keep up his payments. Third, the assured signed an agreement to contribute his share toward the payment of any and every loss which the company might sustain up to an amount not exceeding thirty shillings for every one hundred pounds of insurance carried by him. It will be seen that all losses were to be paid from the contribution of the assured, upon whom, also, rested all liability and for whom the operators of the company or the 'undertakers,' as they were termed, acted only as collectors and distributors. This was a form of mutual insurance, as it is now called; that is to say, insurance where the policy-holders are directly liable for one another's losses. This company was also fairly successful. Another purely mutual company was organized in 1696. . . . The company prospered and grew and is in existence today, . . . being the oldest insurance company in existence. . . . The original title of this company was 'Contributors for Insuring Houses, Chambers or Rooms from Loss by Fire by Amicable Contribution.' This was afterward changed to 'Amicable Contribution-ship,' and in 1776 the name of 'Hand in Hand'—taken from an emblem used by the company in marking and designating buildings which it insured—was adopted. The companies heretofore mentioned all confined their operations to buildings and mostly to dwellings only, but the need for insurance upon goods and stocks of merchandise was very great. About 1706, one Charles Povey opened an office for insuring such property in London. He was without backing or support of any kind and furnished merely his promise to pay in event of loss. This venture was apparently greeted with ridicule and the proposal to insure personal property seems to have been commonly considered impractical. Nevertheless Povey persisted and soon began another enterprise designed to insure personal property throughout Great Britain and Ireland, but finding his first venture unprofitable devised the scheme (which would seem to be quite in accord with some very modern methods of corporate finance) of organizing a third institution to take over the other two. This was accomplished. The new concern was at first called the 'London Insurers,' but almost immediately after its

formal inauguration in 1710 it adopted the name of the Sun Fire Office, and under this name began its successful career which still endures, making that office the oldest non-mutual company in existence as well as the first company which ever undertook the insurance of movables or personal property. It has continued to be a partnership, i.e., not a corporation, and is almost unique among insurance companies in that respect. The first contracts of the Sun provided for payment of losses out of a reserve to be made up of one-half the premiums paid, the liability of the company ceasing when that reserve should be exhausted. Later the company, doubtless under stress of competition, made its promise to pay absolute, and in 1726 a capital fund of 48,000 pounds was created as additional security for policy-holders. . . . Between 1710 and 1720 numerous insurance schemes were launched, modeled after one or the other of those described above. Some succeeded; more failed or were wound up. In 1720 the first chartered companies or corporations made their appearance. In that year two companies—the Royal Exchange Assurance Company and the London Assurance Corporation—were granted charters, first to do a marine insurance business, and in the following year to also transact fire and life insurance business. This date then, 1720, marks the advent of modern stock companies in fire insurance. . . . This may be said to bring the history of fire insurance in Great Britain down to modern times. During the last three-quarters of the eighteenth century fire insurance companies, both mutual and stock, but chiefly the latter, were organized in very considerable numbers and for the most part copied the methods, contracts and practices of the earlier companies. Many of these companies still survive, indeed, some of the largest English companies in existence date from that period. . . .

"In the various kingdoms and provinces which [formerly constituted] . . . the German Empire, . . . the various communal guilds had provided some crude form of insurance for their members, and in many places this function was transferred to the various municipalities as the guilds disappeared. One writer [J. S. Bloomington, "Fire Insurance"] describes this process as follows: 'As the absolute monarchical police-state constitutes the bridge between the middle ages and modern times, so too the transition from the mediæval guild plan of mutual help to the modern system was bridged by state insurance. The guilds of the middle ages lost their importance and private industry was not rapid enough to supply the void left by them, and so the state was forced to step into the breach.' Such public fire insurance outside of Germany is still [1904] to be found in German-Austria, Denmark, Switzerland, and Scandinavia. At a comparatively recent date about 40 per cent. of the outstanding insurance in Germany was carried by the institutions conducted by the government or by various municipalities. Throughout Germany and Switzerland to-day all buildings of ordinary occupancy are assured by the government as soon as built. Each owner is assessed pro rata, according to the appraised value of his own insured buildings, for the losses within the state. Money payments are not made by the state in event of loss, but the damage is repaired or the building replaced by the government. The necessity for insurance on other classes of property than buildings caused the formation of the first stock company in Germany in 1812, since which time many companies, both stock and mutual, have arisen, also various local associations similar to the old guilds and perhaps descendants from them. In

France, while various insurance companies were set on foot during the second and third quarters of the eighteenth century, all perished during the general financial collapse which accompanied the French Revolution. The first regular stock company organized thereafter seems to date from 1818. In other European countries fire insurance seems to have had even a later development—thus in Austria the first stock company was organized in 1822, and the first mutual company in 1825. In Russia the first company appeared in 1827. In all civilized countries there are now fire insurance companies.”—R. M. Bissell, *History of fire insurance in Europe (Yale readings in insurance: Property insurance, pp. 59-65, 67-69)*.—The rise in value during the period of the World War affected fire insurance in Great Britain to a large extent. However, the companies weathered the war conditions so well that they find themselves in a better position to-day than before the war.

**Fire insurance: Provisions in Versailles Treaty.** See VERSAILLES, TREATY OF: Part X: Section V: Annex II.

**Fire insurance: Development in the United States.—Westward spread.—Period of coöperations.**—“For a long period the insurance business of the colonies continued to be marine. . . . In 1762, at the London Coffee House, at the southwest corner of High and Front Streets, Philadelphia, John Kidd and William Bradford announced that they would underwrite risks in general, and before the close of the century a considerable number of such offices had been established. In Philadelphia the first steps toward the protection of property took the form of organizations for the extinguishment of fires and regulations concerning the nature and location of buildings. . . . In 1752 . . . the *Pennsylvania Gazette*, under date of February 18, contained an advertisement of proposed articles of insurance of houses from fire in or near the city. The plan had the approval of the lieutenant-governor of the province and of Benjamin Franklin, and on April 13th, directors were elected, and the Philadelphia Contributionship was thus formally organized, being the first fire insurance company to be organized in the United States. Its plans were an adaptation of those of the Hand-in-Hand of London; in fact, the company became quite generally known as the Hand-in-Hand, and its first house mark was four hands clasping wrists. . . . The directors of the Contributionship in 1781 decided that houses having trees planted before them should not be insured, because the trees made it difficult to fight fires. This policy created considerable friction and opposition, out of which grew, in 1784, the Mutual Assurance Company. . . . Both of these companies are still [1905] in existence and continue to transact business along the same general lines as at first, namely, what is known as perpetual insurance. This, in brief, is a deposit of a certain percentage of the face value of the policy which is paid once for all, the interest on it providing sufficient to provide for the losses sustained. In 1794 the Baltimore Equitable Society, operating upon the same general plan, was established. In December, 1792, the General Assembly of Pennsylvania was petitioned for permission to incorporate the Insurance Company of North America, and on April 14, 1794, the incorporation of the company was authorized, and almost immediately thereafter that of the Insurance Company of the State of Pennsylvania. Both of these companies were organized to transact marine insurance, but during the first year of the North America's existence, the directors concluded to add the business of fire insurance, and

the proposals for insurance were completed in the latter part of the year. . . . The earliest company in New York, of which we have any record, was the Knickerbocker Fire, organized April 3, 1787, under a deed of settlement. The original title, however, was that of the Mutual Insurance Company, the name Knickerbocker not being assumed until May 12, 1846. The company was by its charter permitted to transact fire, marine, and life insurance, and in less than a month the New York Insurance Company was organized with practically the same privileges. Three years later, March 21, 1801, the Columbian Insurance Company of New York was organized, and on April 4, 1806, followed the incorporation of the Eagle Fire with a capital stock of \$500,000, and now the oldest New York stock fire insurance company. Most of the companies in New York organized during the latter part of the eighteenth century, and the first forty years of the nineteenth century, were what are known as special charter companies and, following the development of the day, most of them were organized for the purpose of writing marine insurance. Another of the early New York companies which is still in business is the Albany Insurance Company, which was organized in March, 1811. The charters of most of the companies of this day were what are known as limited charters. . . . The oldest fire insurance company in Connecticut is the Mutual Assurance of the city of Norwich, which was organized in May, 1795, under a deed of settlement. The company has never attempted to do a large business, being largely a neighborhood affair. In 1810 the Hartford Fire was organized and is thus the oldest stock fire insurance company in the state. . . . In 1819 the Aetna was organized [at Hartford], with a capital of \$150,000 with the privilege of increasing it. The first policy of the Aetna was issued August 7, 1819, and about a month later the first reinsurance known in this country was entered into by the Aetna when it assumed all of the outstanding risks of the Middletown Fire. . . . Until the close of the [eighteenth] century there had been about ten mutual and four stock companies, organized in the country, while by 1820 this number had increased to seventeen stock companies in New York, six in Pennsylvania, two in Connecticut, and one each in Rhode Island, New Jersey, and Massachusetts. Of these, twelve are still [1905] doing business. . . . The great New York fire in 1835 swept out of existence most of the New York companies. This fire closes what may be termed the first period of American fire insurance, a period devoted almost wholly to pioneering. . . .

“Turning our attention to the second period we find new factors entering the business. The public demanded more certainty in the matter of the contracts and greater provision for the stability of the companies, so in 1837 the first step was made in the direction of reservation. The State of Massachusetts provided that companies should maintain a fund to insure their contracts being carried out, and this was the beginning of what is known as the unearned premium fund. . . . Another feature of the second period was the development of the mutual idea. The New York fire of 1835 destroyed a great majority of the New York companies. This created a feeling of distrust in the public mind, and the organization of mutual companies became the order of the day, and by 1853 sixty-two companies reported to the comptroller of New York, having an aggregate capital of over eleven million dollars. The mutual plan commended itself to the people of that day as correct theoretically and economical in opera-

tion. In practice, however, these companies proved unsatisfactory for the reasons that they were based upon incorrect principles and because of a lack of staying power. . . . The mutual companies had attempted to operate upon the same basis as the stock companies did. The mortality among the mutuals, however, was excessive. A general insurance law was enacted in 1849, and during the succeeding four years over fifty-four mutual companies were organized. By 1860, however, only seven of these survived, and Superintendent of Insurance, Barnes, of New York, estimated that the losses to the people through the failure of these forty-seven companies averaged at least \$50,000 per company. . . . The companies gradually recovered from the blow of the New York fire and in a few years additional companies had started so that the number of companies was in a measure commensurate with the growing business of the country. There were a large number in New York, Philadelphia, and Boston, and there were companies in other cities where there was enough local business to warrant. These companies served the business of the country well, as a whole, and only began to retire as the development of the country's business interests, consequent upon the development of the railway system and the telegraph, gave the company doing a general business a decided advantage over the one doing a local business. In this period also state supervision took a definite form in the shape of the establishment of departments by New York and Massachusetts and gradually by other states. Attempts were also made to devise a more nearly uniform fire insurance policy. . . . Ephraim Robins, a merchant of Cincinnati, saw a notice in a Hartford paper that the Protection had been formed [in 1825, from the Hartford Insurance Company]. Having lost most of his property in a cyclone, the importance of insurance was presented in a very forceful way to the mind of Mr. Robins. He came to Hartford, presented the claims of the West in such a way that the company authorized the establishment of a western department with Mr. Robins as general agent. This was in 1825, and the task of planting the agencies of the company in Ohio and other western states was immediately started. . . . Following the Protection, the Insurance Company of North America and the Aetna made the venture into the territory west of the Alleghanies, the former locating at Erie and the latter at Cincinnati. The failure of the Protection gave a great impetus to the development of the western department of the Aetna, as it was in the field and ready to make the most of the opportunity offered. . . . The Hartford began to send out numbered policies in 1864. . . .

"The third period of fire insurance development begins practically with the close of the Civil War. This may be termed the period of coöperations. Conditions were very unsatisfactory, rates were low, and prosperity for the companies was not very apparent. Hence, in 1866, the fire insurance companies of the country organized the National Board of Fire Underwriters, and for the next ten years it was the controlling factor in fire underwriting, and marks the most important change which had so far been brought about in the fire insurance business. Its purpose was to bring about a coöperation between the companies upon matters of common interest and to insure adequate rates and proper forms. At this time there were a very large number of local companies and quite a number of what are best classified as agency companies. . . . Belonging to this third period, but really beginning with the closing years of the sec-

ond period, was the opening of the Pacific coast to the business of fire insurance. The Phoenix, of Hartford, was the pioneer. The officers of the Phoenix visited the Pacific coast, looked over the ground and on May 1, 1862, established a Pacific coast department in charge of R. H. Magill. At this time, all the fire insurance business of the coast was written at San Francisco through correspondents. The company had a correspondent in a town, information concerning the risk and the amount desired was sent in, the policy issued and forwarded. This was rather cumbersome and slow, so in 1863 Mr. Magill began the establishment of local agencies in the towns of the coast. His success was so great that other companies were obliged to follow his example. The National Board of Fire Underwriters was just beginning to wrestle with some of its difficult problems when along came the Chicago fire [in 1871] and wiped out many of the insurance companies of the country. Many of the purely local companies were caught through the surplus lines they wrote or the reinsurances which they secured from the agency companies. The companies had only partially recovered when along came the Boston fire [in 1872] and completed the wrecking of a large number of the fire companies which had been struggling along in a crippled condition during the year intervening between the two fires. The National Board now promptly took hold of the situation, and rates were sharply advanced. State boards and local boards in smaller towns were organized and an elaborate system of control was worked out; in fact, in the long run, it was too elaborate. . . . [There was] a large influx of new companies as a result of the increased rates following the Boston and Chicago fires. In 1874 the companies doing business in New York were compelled to report their unearned premium liability, and to this period also belongs the adoption of the safety fund law in New York. The increase in the number of companies, and the profit which attended the business because of the increased rates, induced a period of demoralization which extended from 1874 to 1880, during which numerous irresponsible companies were formed. To make matters worse, the National Board, in April, 1877, stopped making rates and relegated this subject back to the local boards, with the result that the high rates could no longer be maintained. Every company was a law unto itself; there was no profit, and it was apparently a struggle for the survival of the fittest. The fire insurance business, however, had become so large that this demoralization could not be permitted to continue. Some method of coöperation had to be found, and this begins the last period of this study. . . . The rating by the National Board, through its state boards and local boards, had been so much of an improvement over the former conditions that things could not be permitted to go backward. Something new, however, had to be devised. In the eighties, the field man proved the way out. He had been doing his work quietly and unobtrusively; and the main difficulty had been lack of numbers and too large territory to oversee. The abdication by the National Board of its rate-making powers threw a large amount of additional work upon his shoulders. Accordingly, in 1872, the New York State Association of Supervising and Adjusting Agents was organized; in 1881, the Underwriters' Association of the Middle Department; in 1883, the Underwriters' Association of New York State and the New England Insurance Exchange; in 1882, the Illinois State Board of Fire Underwriters—all of which may be considered as pioneers in the attempts at coöpera-

tion. Into the hands of these associations the detailed work of rate-making was given. Upon them also fell the work of readjusting the local boards, so that the chain of cooperation might be complete. The local agents, then the special agent, and the problems which they could not individually adjust, were sent to the field men's organization and the residue of problems was sent up to the organizations of the companies. Two of these organizations were formed about this time, namely, the Western Union in 1879, and the Southeastern Tariff Association in 1882, while the Fire Underwriters of the Pacific had been in existence since 1870. The Western Union and the Eastern Union are now the managing underwriter's medium of cooperation in the territory east of the Rocky Mountains, while the Pacific coast is under another organization. An outgrowth of the National Board should be mentioned here, namely, the Fire Underwriters' Association of the Northwest. When the National Board gave up its rate-making function the Northwest Association became simply a social and educational association of the western field men, and has increased from year to year in power and influence, until it is the leading social and educational association of the field men in this country."—F. C. Oviatt, *Historical study of fire insurance in the United States (Annals of the American Academy of Political and Social Science, v. 26, pp. 336-338, 340-350, 352-354)*.—For 1921 statistics, see above: Marine insurance: Development in the United States.

**Industrial insurance: Distinction between ordinary and industrial life insurance.—Development in England and the United States.**—"The distinctions between ordinary and so-called industrial life insurance are these: 1. A higher assumed mortality for industrial insurance in view of a higher death-rate and a shorter probability of life among the industrial population. 2. A much smaller average amount of insurance, and for this reason a higher administrative cost, and 3. Finally, a weekly (instead of an annual or semi-annual) collection of premiums through personal visits by agents; and all these three factors go far to increase the cost of industrial insurance as compared with ordinary insurance. This can easily be shown by a comparison of rates. Nevertheless, the number of people insured under this system in the United States, in England, and in Germany is enormous."—I. M. Rubinow, *Social insurance, pp. 417-418*.—"Industrial insurance is so called because the system is primarily designed to meet the needs of wage-earners employed in manufacturing industries, and the weekly premium payments coincide with the weekly payment of wages and salaries. The premiums are from five cents to seventy cents a week. . . . Industrial insurance had its origin in England, and the evolution of the business can be traced backwards by an unbroken record through friendly societies and burial clubs to the trade and craft guilds of the fifteenth century. . . . The Prudential . . . realized the immense opportunity to extend the principles of life insurance to the broad field of workingmen's insurance in general. On the recommendation of the best available actuarial talent, required for the construction of tables and plans, and after purchasing the existing business of a few small companies, The Prudential, in 1854, commenced the business of industrial insurance. . . . During the fifty years which have passed since the introduction of industrial insurance the business has been extended to almost all civilized countries with more or less success, but the development has been the greatest in English-speaking countries, and

there are now more than forty millions of industrial policies in force in the world. Of this number over one-half are in force in the United Kingdom, about four millions in Germany, and not far from one-half a million in Australia."—J. F. Dryden, *Burial (or "industrial") insurance (Yale readings in insurance: Life insurance, pp. 384-386)*.—"In this country [the United States], though industrial insurance was first begun only about thirty-five years ago, its growth was phenomenal, so that by the end of 1911, there were nearly 25,000,000 policies in force. . . . It has been freely admitted for years that the problem which industrial insurance aims to solve, is not of 'life insurance' but of 'death insurance,' not the problem of relief for the survivors, but of a decent burial for the dead. If the purpose of social insurance be defined as 'improvement of the standard of living,' industrial insurance aims to improve the 'standard of dying' and of burial. . . . The total amount contributed by the insured in premiums is enormous. The bare statement that for thirty-six years \$1,893,000,000 was spent does not tell the full story. More significant is the fact that the annual amount has increased from less than \$2,000,000 in 1881 to \$183,000,000 in 1911, almost equaling at present the total cost of the German social insurance system. Thus, the American working class pays for funeral insurance as much as is contributed in Germany by all three parties concerned, the wage-workers, the employers, and the state, for (1) accident insurance, (2) sickness insurance, (3) funeral insurance, (4) maternity insurance, (5) invalidity insurance, and (6) old-age insurance combined."—I. M. Rubinow, *Social insurance, pp. 418-420*.—See also SOCIAL INSURANCE; BELGIUM: 1886-1909; Labor conditions; GERMANY: 1883-1900.

**Government insurance: In the United States and Great Britain during World War.—United States War Risk Insurance Act.**—"National government insurance of marine risks was very extensively adopted during the war and served to supplement the efforts of private companies to supply the large amount of insurance then demanded. In the United States this form of insurance was very helpful in meeting the emergency then existing but afterward was abandoned. It served the purpose of insuring American and Allied vessels and cargoes against the ordinary marine perils and against the war risk. Likewise the government maintained a fund for the self-insurance of its own vessels."—R. Riegel and H. J. Loman, *Insurance, principles and practices, p. 36*.—The British government provided for the granting of war insurance on shipping by the government up to 80 per cent of the values, following the recommendation of a committee presided over by Huth Jackson. The insurance was carried on through the mutual associations of shipowners, organizations called into existence by the conditions created by the World War. "When the United States became actively engaged in the World War in 1917, it was soon realized that some provision should be made for insuring the lives of soldiers and sailors. At the same time it was evident that the rates which old line companies would have to charge for so dangerous an occupation were prohibitively high. Congress therefore decided that the Government should bear the excess burden and on October 6, 1917, passed the War Risk Insurance Act which, in addition to providing for family allowances and allotments, and compensation for death or disability, granted benefits in the form of voluntary insurance. In order to administer the affairs of such an undertaking, a separate division was established in the Treasury

Department known as the Bureau of War Risk Insurance, which was placed under the supervision of a Director, subject to the general supervision of the Secretary of the Treasury. None but those actively engaged in the service of the Army or Navy was eligible to obtain this insurance, which was granted upon application to the Bureau and without medical examination within 120 days of entrance to the service (or before April 6th, 1917) and before discharge or resignation. The applications were handled through the Army and Navy Insurance and Allotment Officers designated in the Quartermaster and Paymaster Corps respectively. The type of insurance was a one-year renewable term policy of the increasing step-rate variety, convertible into a permanent form within five years after the signing of the proclamation of peace. The amount obtainable was a multiple of \$500 and not less than \$1,000 nor more than \$10,000, and the rates charged were the net rates of the American Experience Table on a 3½ per cent. basis, reduced to a monthly premium. The coverage was for death or total and permanent disability, and the proceeds in event of loss were payable at the rate of \$5.75 each month per \$1,000 of insurance in force. The total insurance written on this plan reached approximately 38 billions of dollars. The premiums collected during the war amounted to 300 millions, and the losses to over one billion, which means that the United States bears a loss of over 700 millions, payable from other revenue. In regard to the conversion privilege and in pursuance of Section 404 of the Act, regulations have been issued specifying the types of insurance into which the temporary or war insurance may be converted. Thus far, six kinds of permanent policies have been issued: 1. Ordinary-Life. 2. Twenty-payment Life. 3. Thirty-payment Life. 4. Twenty-year Endowment. 5. Thirty-year Endowment. 6. Endowment maturing at age 62. The rates on these are calculated on the same basis as the temporary insurance except that allowance is made for annual, semi-annual and quarterly premiums. In this connection it should be explained that under the original Act no provision was made for the separation of this converted insurance from the temporary, nor was any settlement made possible except by monthly installments. An amendment to the Act was passed December 24, 1919, and among other liberal provisions it provides for settlement by means of a lump sum or other optional methods; it extends the class of possible beneficiaries; and it authorizes a separate life insurance fund in the United States Treasury for the converted insurance."—R. Riegel and H. J. Loman, *Insurance, principles and practices*, pp. 36-38.—"The bureau . . . adjudicated, as of December 1, 1920, 437,588 claims for death and disability compensation. The last monthly payment for compensation being paid to disabled soldiers amounts to \$10,164,493.09 and the last monthly payment of the bureau to the dependents of deceased soldiers amounted to \$1,345,617.42. The total amount disbursed to December 1, 1920, by the bureau for compensation purposes amounting to \$163,979,175.25."—B. G. Cholmeley-Jones, *War risk insurance (Scientific Monthly, Mar., 1921, p. 233)*.

Early effects of World War on life, marine and fire insurance.—"The war has had very decided effects on the business of life insurance, and these effects may be discussed under the following heads: (a) The effect on the amount of insurance written. (b) The effect on the policy contract. (c) The effect on the finances of the companies. . . . The decrease in the amount of insur-

ance written since the beginning of the war is due primarily to two causes. In the first place, the cost of insurance was largely increased by the greatly enhanced hazard of war service by prospective applicants. . . . Some companies have refused to insure those entering the military and naval service, and practically all companies increased the premium charge to a marked amount, so that for many the cost of insurance practically became prohibitive. . . . The second cause of the decrease in insurance is found in the fact that many insurance officials and salesmen were withdrawn from their insurance activities to serve in the army, navy, or other branches of the state service. . . . [The total amount of business done by sixteen of the largest insurance companies in Great Britain in 1914 aggregated £73,428,100 as against £67,197,700 in 1915.] In Canada no marked decrease in insurance in force has shown up to the end of the year 1916. In Canada, as in England, special efforts were made in the early stages of the war to postpone the increase in the premium charge. . . . In Germany preceding the war the life insurance companies had enjoyed several years of great prosperity. . . . At the outbreak of the war, the amount of new business written annually amounted to over 1,300,000,000 marks, and the total amount of life insurance in force aggregated over 16,000,000,000 marks, with an annual premium income of about 700,000,000. The war has had a marked effect on the business. Agency and field forces of the companies have been destroyed or disorganized, because many have been called to war service. Economic depression has had its effect in decreasing the business. . . . In Russia the German insurance companies held the most important position in all fields of the business, not excluding the Russian companies. With the outbreak of the war, the business of insurance with enemy companies was restricted or wholly prohibited. This has resulted in an extension of the business of the domestic companies, although the disturbed conditions which have since prevailed in Russia have prevented the normal extension of life insurance. . . .

"The second effect of the war on life insurance to be discussed is the changes which have been necessitated in the policy contract. These modifications have pertained to the following subjects: First, the insertion of a military service clause and a modification of the disability clause to cover the contingency of disability, due to military service; second, certain increases in the premium charge and in the provisions with respect to the time of payment of the premium. . . . A report was submitted to the Association of Life Insurance Presidents, in which was recommended for adoption the following military or naval service clause: During the first ten years of this policy military or naval service in time of war is a risk not assumed by the company unless the insured shall give notice thereof to the company within thirty-one days after entering on such service, and pay such extra premiums as the company may fix therefor. In event of the insured entering upon such service and failing to give such notice, or failing to pay such extra premiums at the times and in the manner required, the liability of the company for death of the insured during such period of ten years, while engaged in or as a result of such service, shall be limited to the reserve at the time of death, less any indebtedness hereon to the company. This recommended clause, or a modification of it, has been adopted by a large number of life insurance companies in the United States. There is a considerable difference

in the amount of the extra premium which companies are charging for this extra military hazard. It will be observed that this clause applies only to those who, having as a civilian obtained a policy, later enter the military or naval service. It leaves the subject of insuring those who are already in such service to the discretion of the company. There is also a very great difference in the practice of life insurance companies in regard to the general treatment of war risks. . . . The practice of the British assurance companies before August, 1914, in respect to provisions of the policy in case of military or naval service was but little less liberal than that of American companies. . . . The life insurance companies in France had in general a war clause in their policies of insurance which provided that the policy was not forfeited in the event of military service, even though the extra premium required in the case of such service was not paid. If, however, the insured died within eight months of the cessation of hostilities, the insurance company would pay to the beneficiary only the reserve value on the policy. At the suggestion of the French Government, the insurance companies agreed to reduce the eight months limit to three months and also agreed to distribute among the insured any excess of the war premiums which had been collected to meet the additional mortality due to the war. . . . In Austria-Hungary, the practice of the life insurance companies in their treatment of war risks differed considerably. There was an inclination at first on the part of many companies to make a distinction between the Landwehr and the Landsturm. A number of the companies assumed the war risk for the full amount of the policy, without any extra premium up to a certain maximum amount of insurance, although there was a distinction sometimes made in this connection between the Landwehr and the Landsturm. The maximum amount of insurance for which the company agreed to be liable was in neither case in excess of \$6,000. The full risk was assumed in some companies by the payment of an extra premium. In the case of a number of companies, the full risk was assumed to one-half the face of the policy, which, of course, amounted to a reduction in the risk for the company, although not necessarily to a one-half reduction. Other companies refused to assume any part of the war risk without an extra premium, although they allowed in general the reserve value of the policy in case of death. . . .

"If . . . a summary of the more important effects of the war on the finances of life insurance companies is made, the following positive and negative influences are found to prevail: As positive or favorable influences: (a) The increase in premiums, received by those whose policy contained or had inserted in it a war clause. Whether this is ultimately, as contrasted with the immediate effects, a positive factor, will depend upon the actual mortality experience of war risks as compared to the expected. (b) The writing down of the security values which has been in progress in some companies and the resulting increase in interest return, as well as the possibility of a future increase in the actual value of these depreciated securities. (c) The investment of current surplus receipts in the higher interest-bearing securities which have been placed on the market since the outbreak of the war. As negative or unfavorable influences: (a) The decrease in the amount of new business written in most countries and hence the reduction in the premium receipt over that which could have been secured. (b) The increased mortality on risks both civilian and military with

or without the extra premium. (c) The increase in lapses and surrenders of policies. (d) The heavy depreciation in securities. (e) The subscription to government loans at a rate of interest below that which has been earned. (f) The increase in the taxation of life insurance. It will be observed that the above listing of effects seems to indicate a generally unfavorable effect of the war on the finances of life insurance. Such deduction seems to be clearly warranted from the evidence at hand. . . .

"It may . . . be stated by way of summarizing the effect of the war on marine insurance: first, that all the leading nations have found it necessary to grant, either directly or indirectly, aid in the insuring of war risks; second, this has not meant the absorption of the private companies, but on the contrary a co-operation with such companies, and in all probability a healthy competition which has had a marked effect in keeping down rates, and at all times stabilizing such rates; . . . third, the private insurance companies have in practically all the leading countries enjoyed a period of prosperity, and in many cases their financial returns have been in excess of that enjoyed in times of peace. . . .

"First, it is somewhat surprising that the fire insurance companies have been able to make so good a showing with respect to financial results. In a number of cases, the returns to shareholders since the war are in excess of those enjoyed in many years previous to the war. Warning, however, must again be given against making too sweeping deductions as to final results of the effect of the war on fire insurance. In many cases complete statistics are not available and in many cases causes which will produce negative results either have not had time to bring about these final effects, or have not yet begun to operate. Second, there has been a marked increase in the hazards or risks in fire insurance in practically all the leading nations. In some cases this has been counteracted by the increase in the rates. Owing to the high level of prices and the consequent increase in property values, the fire insurance companies have been able to increase their premium receipt without a proportional increase in the number of risks written. This has had a two-fold favorable result. In the first place, it has meant an increased premium receipt on the same volume of business without any marked increase in certain material expenses connected with writing the risk. In the second place, unless a marked increase in the losses occurred, this has meant a larger amount out of which to pay losses, or, in other words, a reduction in the real amount at risk by the insurance company. Third, there has been an increase in the amount of taxes which the companies have had to pay, as well as an increase in wages and prices for supplies. At the same time, there has been a depreciation in many of the investments held by fire insurance companies. All in all, it can scarcely be argued that the war has brought to the business of fire insurance, any more than to most businesses, conditions which are favorable. The war has introduced into the fire insurance business many disturbing factors, and it is in times of peace a business which has to contend with so many fluctuating conditions, that anything approaching scientific bases for determining prices or rates is extremely difficult to secure."—W. F. Gephart, *Effects of the war upon insurance, with special reference to the substitution of insurance for pensions*, pp. 49-53, 57, 64, 72, 78-80, 103-104, 206, 246.

**INTELLIGENTSIA.**—"Its ordinary translation, 'The Intellectuals,' would much better be rendered, 'The Civilized.' The Intelligentsia was, in fact, the *ensemble* of those persons from all the regular social classes who believed themselves 'enlightened' in contradistinction to 'those who do not know.' Their creed consisted of two articles: hatred of the ruling régime, and boundless faith in their ability to regenerate and 'civilize' their country. . . . The Intelligentsia were usually disciples of West European culture and believers in Western institutions. They were also opposed to the old bureaucratic centralization and 'Russification' of the empire's non-Russian peoples. Their ideal, however vague, was a parliamentary, federalized Russia, avoiding foreign adventures and with internal liberty for all."—T. L. Stoddard, *Present-day Europe, pp. 178-179.*—"Time and again Russian intellectuals attempted to organize and apply their ideas in practice. Their organizations, however, being largely influenced by foreign examples and being premature under social and political conditions that existed in Russia, were doomed to failure. Such was the revolt of December, 1825, when army-officers and other intellectuals at-

tempted to apply to Russia the ideas of the French revolution. Such was the enthusiastic movement of the Narodniki (Populists) in the 'seventies, when hundreds of highly cultivated, inspired young men and women attempted to apply Socialism to the Russian rural community. Such was the movement of the terrorists who succeeded in assassinating Tzar Alexander II on March 1, 1881, but soon succumbed to the superior force of the existing order."—M. J. Olgin, *Soul of the Russian revolution, pp. 45-46.*—"When the great Revolution broke out in the autumn of 1904 . . . the Intelligentsia were not very numerous, but their political importance in 1904 was out of all proportion to their numbers. It was they who had hitherto constituted the sole opposition party in Russia. It was their fighting wing, the Nihilists, which had waged truceless war against the bureaucracy in the darkest hours of absolutism. . . . But the Russian Revolution is the story of the Intelligentsia's lamentable failure. . . . The reason was that their program was a purely negative and destructive one. A mere *ensemble* of individuals from all classes, they possessed no settled, positive philosophy, and on their first attempts at constructive measures they fell apart like a rope of sand. Also, the old régime found a man—P. A. Stolypin—whose iron hand bent Russia once more to the yoke of established order and authority."—T. L. Stoddard, *Present-day Europe, pp. 178-179.*—See also **POLAND: 1905-1914.**—"The intellectuals had gained nothing through the revolution. Their political situation had become even worse than before. The administration suspected an enemy in every educated man, and the most hideous attacks of the Black Hundred were aimed at the intellectuals. The search for 'suspects,' the hunting for hidden destroyers, made the life of thousands of intellectuals a nightmare."—M. J. Olgin, *Soul of the Russian revolution, p. 363.*—"The intellectuals, disappointed in revolutionary ideas, turned partly to theosophy, partly to the pursuit of personal success, partly to dark and morbid moods. The revolution was beaten. The revolutionary organizations were destroyed. Over the débris of the great movements a shadow remained,—the Imperial Duma, a mere plaything in the hands of the administration. Legally a constitutional monarchy, Russia was in reality an autocratic state. Such was the situation from 1907 to 1917."—*Ibid., p. 187.*—"In Russia, both the inexorable policy of the party, unswervingly true to principle, and the attitude of the intellectuals themselves, threw back the workers upon their own resources; and this indubitably, accounts for the success of the [Bolshevist] Revolution. What, now, were the subsequent developments? The intellectuals . . . made haste to retrace their steps and proffer their services, which have been accepted. But their co-operation was far from being a cordial one, and covert opposition, or, at least, absolute deficiency of co-operation was a general phenomenon. . . . And yet the Soviet took a great deal of trouble to meet the wishes of intellectuals and engineers. Technical and intellectual work was highly appreciated, and this appreciation, which was also expressed in the shape of high salaries, was transferred to the representatives of capitalistic intellect. But these gentlemen did not feel at home under a workers' dictatorship. . . . The intellectuals, generally speaking, offered their services to the Soviet for material considerations only, and this, as a rule, without any enthusiasm."—S. J. Rutgers, *Intellectuals and the Russian revolution (Lenin, Bukharin, Rutgers, New policies of Soviet Russia, pp. 83-84, 89, 91).*

**INTEMPERANCE.** See **LIQUOR PROBLEM.**

**INTENDANTS:** In France, term used to designate an official invested with a commission by the king. The early intendants were called *intendant de justice* or *intendant de finance*. They were appointed to levy the *aides* or temporary subsidies. In the 16th century they formed the superior administration of the finances of the government. They went out of existence with the *ancien régime*. The *intendants des provinces* came into office during the latter part of the 16th century. They became the direct general representatives of the king.—See also COLONIZATION: French; ADMINISTRATIVE LAW: Administrative law in France.

In Spanish America, functionaries of Spanish Colonial government, who came into existence in 1786 at the reorganization of the local government. The viceroalties and captaincies-general were subdivided into intendancies, and the *subdelegados* of the intendants took the place of the *corregidores* and *alcaldes mayores*.—See also LATIN AMERICA: 1715-1810.

**INTERBOROUGH RAPID TRANSIT COMPANY.** See NEW YORK CITY: 1860-1920.

**INTERCHURCH WORLD MOVEMENT,** an organization aiming "to present a unified program of Christian service and to unite the Protestant churches of North America in the performance of their common task." The foundations for the Movement had been securely laid by coöperation in many lines of Christian work at home and abroad, especially by the Federal Council of the Churches of Christ in America. The proposal for a new movement came from the Foreign Mission Board of the Presbyterian Church in the United States [South] by summoning a conference of mission boards in New York, December 17, 1918, to consider the unification of their plans and efforts. At the same time a conference was being held at Atlantic City under the auspices of the Commission on Interchurch Federations of the Federal Council. . . . The two movements were combined and a plan of organization was formulated, which . . . [was] approved by over forty denominations and interdenominational boards and societies. . . . At first a coöperative movement of mission boards and societies, the Movement rapidly widened its scope to include such other forms of Christian work as . . . Christian education, ministerial relief and pensions, care of approved eleemosynary institutions and similar enterprises. The plans of the Movement [were] . . . based on a five year program and group themselves into three main lines of effort: 1. To undertake a survey of the world's needs from the standpoint of evangelical Christianity; 2. To bring the information secured in the survey to the attention of every person throughout the United States; 3. To discover and develop the resources of life, money and prayer required by the program suggested by the needs revealed in the world survey."—S. R. Warburton, ed., *Year Book of the Churches*, 1920, pp. 269-270.—"The organization committed itself to the following practical measures in the carrying out of the program adopted: Thirty evangelical denominations in the United States to coöperate in a united drive for funds from April 25 to May 5, 1920, these denominations, including a membership of almost 15,000,000 and representing sixty per cent of the Protestants in the United States; the total budget to be fixed at \$336,777,572 of which \$175,448,349 was to be paid in 1920, the remainder in periods of from two to five years, according to denominational policies; no item which had not found a place in some denominational budget to be in the general askings; the coöperating boards to receive all the money collected and to spend it according to de-

nominal plans."—L. L. Pierce, *Littleness of the world's biggest business* (*World Outlook*, Apr. 20, 1920).—The financial campaign was undertaken at the appointed time but proved unsuccessful, due "partly to the withdrawal of the Baptists and Presbyterians but mainly to the failure of the 'friendly citizens' to contribute \$40,000,000 for the Movement's expense fund. Of the total askings . . . only \$176,000,000 was subscribed, and the appeal to 'No Man's Land' for the expense account brought in less than three million dollars. However, something has been salvaged from the wreckage. . . . Encouragement is lent to the view that the Movement is not wholly 'a lost cause' from the fact that the General Committee decided on July 8 to continue the endeavor 'on a greatly modified basis.' At this meeting it was determined that 'the main purpose and objects for which the Interchurch World Movement was created should be conserved,' a budget not to exceed \$75,000 was agreed upon, and a committee of fifteen was appointed to confer with representatives of other interchurch bodies and recommend plans for the future."—*Why the interchurch movement failed* (*Literary Digest*, Aug. 7, 1920).—The affairs of the Movement were consequently closed up in 1921. The most outstanding and permanent contribution of its short career is generally agreed to be its publication in 1920 of a report on the steel strike of 1919. This report made an exhaustive analysis of the industrial conditions involved in the strike, especially of the twelve hour day.—See also PRESBYTERIAN CHURCHES: 1919-1920.

**INTERIOR, DEPARTMENT OF THE, United States.**—"Though familiar to public men since the foundation period of the Constitution, and advocated more or less forcibly by such characters as Madison, Monroe, John Quincy Adams, and Andrew Jackson, the idea of a Department of the Interior was newly conceived and clearly formulated by an experienced and public-spirited Secretary of the Treasury from Mississippi. For the plan of organization Robert J. Walker has never received from any historian the credit that is his just due. He voiced the need and launched the project more carefully than any statesman before him. [The large accession of territory resulting from the Mexican War and the consequent increase in the government's responsibility for internal affairs necessitated a department of the interior.] But it must not be overlooked that his plan was skilfully and ably supported in a doubting

Senate by two such leaders as Daniel Webster and Jefferson Davis. . . . The first Secretary of the Interior, Thomas Ewing, in his Report of December 3, 1849, wrote: "The department is named in the title "A Home Department"; but the body of the act provided that it shall be called the "Department of the Interior." . . . Secretary Alexander H. H. Stuart suggested, in his Report of December 2, 1850, that Congress remove the ambiguity. But nothing was done until the revision of the statutes in 1873, when the department was properly entitled."—H. B. Learned, *President's cabinet*, pp. 287, 289-290.

"The Secretary of the Interior is charged with the supervision of public business relating to patents for inventions [see STATE DEPARTMENT OF THE UNITED STATES: 1790-1900], pensions and bounty lands, the public lands and surveys, the Indians, education, the Geological Survey, the Reclamation Service, the Bureau of Mines, national parks, the Capitol Building and Grounds, distribution of appropriations for agricultural and mechanical colleges in the States and Territories and certain hospitals and eleemosynary institutions in the District of Columbia. By authority of the President the Secretary of the Interior has general supervision over the work of constructing the Government railroad in the Territory of Alaska. He also exercises certain other powers and duties in relation to the Territories of Alaska and Hawaii. He is authorized by Executive order of March 20, 1920, to adjust, liquidate, and pay claims against the United States Fuel Administration. . . . The Commission of Pensions supervises the examination and adjudication of all claims arising under the laws passed by Congress granting pensions on account of service in the Army or Navy rendered wholly prior to October 6, 1917; claims for reimbursement for the expenses of the last sickness and burial of deceased pensioners; claims for bounty-land warrants based upon military or naval service rendered prior to March 3, 1885, and claims for annuities, refunds, and allowances, arising under the act of May 22, 1920, providing for the retirement of employees in the classified civil service. . . . The Director of the Bureau of Mines is charged with the investigation of the methods of mining, especially in relation to the safety of miners and the appliances best adapted to prevent accidents, the possible improvement of conditions under which mining operations are carried on, the treatment of ores and other mineral substances, the use of explosives and electricity, the prevention of accidents, the prevention of waste, and the improvement of methods in the production of petroleum and natural gas, and other inquiries and technological investigations pertinent to such industries. He has charge of tests and analyses of coal, lignites, ores, and other mineral fuel substances belonging to or for the use of the United States; supervises the work of the mine inspector for Alaska; and administers the regulations governing the production of oil and gas from lands mined under Government lease. He also has charge of the Government fuel yards for the storage and distribution of fuel for the use of and delivery to all branches of the Federal service and the municipal government in the District of Columbia and such parts thereof as may be situated immediately without the District of Columbia. . . . The Director of the National Park Service is charged with the duty of administering the national parks, the national monuments under the jurisdiction of the Interior Department, and the Hot Springs Reservation in Arkansas, including the maintenance, improvement, and protection of parks, monuments, and reservation, and the control of the conces-

sioners operating utilities therein for the care of visitors. [See also CONSERVATION OF NATURAL RESOURCES: United States: 1911.] . . . The Alaskan Engineering Commission was created under the act of March 12, 1914, which empowered, authorized, and directed the President to locate, construct, operate, or lease a railroad, or railroads, to connect the interior of Alaska with one or more of the open navigable ports on the coast. Authority was also granted to purchase existing railroads, to construct, maintain, and operate telegraph and telephone lines, and to make reservations of public lands in Alaska necessary for the purposes of the railroad. For the execution of this work a commission of three engineers was appointed by the President to make the necessary surveys. They were directed to report to the Secretary of the Interior, under whom the President placed the general administration of the work. After the completion of the preliminary surveys, the President by Executive order selected the route for the railway from the coast to the interior. Construction of the railway was begun in 1915, under the general supervision of the Secretary of the Interior, and is now in progress. . . . The War Minerals Relief Commission assists the Secretary of the Interior in the readjustment of claims filed under the war minerals relief act for losses incurred in producing or preparing to produce manganese, chrome, pyrites, or tungsten during the war."—*Congressional Directory*, 66th Congress, 3rd Session, Jan., 1921, pp. 335-337.—"The Commissioner of Patents is charged with the administration of the patent laws and supervision of all matters relating to the granting of letters patents for inventions and designs and the registration of trade-marks. . . . The Director of the Geological Survey is charged under direction of the Secretary of the Interior with classification of the public lands and the examination of the geologic structure, mineral resources, and mineral products of the national domain. In conformity with this authorization, the Geological Survey has been engaged in making a geologic map of the United States, involving both topographic and geologic surveys, in collecting annually the statistics of mineral production, in conducting investigations relating to surface and underground waters, in testing mineral fuels and structural materials, and in investigating the causes of mine accidents. . . . The Commissioner of the General Land Office is charged with the survey, management, and disposition of the public lands, the adjudication of conflicting claims relating thereto, the granting of railroad and other rights of way, easements, the issuance of patents for lands, and with furnishing certified copies of land patents and of records, plats, and papers on file in his office. In national forests he executes all laws relating to surveying, prospecting, locating, appropriating, entering, reconveying, or patenting of public lands, and to the granting of rights of way amounting to easements. . . . The Bureau of Education collects statistics and general information showing the condition and progress of education, issues an annual report in two volumes, a bulletin in several numbers annually, and miscellaneous publications; has charge of the schools for the education of native children in Alaska; supervises the reindeer industry in Alaska, and administers the endowment fund for the support of colleges for the benefit of agriculture and mechanic arts. . . . With the exception of the schools for native children in Alaska, the Commissioner of Education has no jurisdiction over the schools in the Territories or outlying possessions. . . . The Reclamation Service, under the personal supervision and direction of the Secretary, is

charged with the survey, construction, and operation of the irrigation works in arid States, authorized by the act of June 17, 1902. . . . The Commissioner of Indian Affairs has charge of the Indian tribes of the United States, exclusive of Alaska. He looks after their lands, moneys, schools, and general welfare, and purchases the necessary supplies."—Department of the Interior, *General information*, pp. 2-4.

**INTERLOPERS**, term applied by the Dutch to English free merchants. See EAST INDIA COMPANY, BRITISH.

**INTERNATIONAL IMPROVEMENTS**, Question of. See U. S. A.: 1806-1812; 1816-1817.

**INTERNATIONAL**, or *Internationale*: Its forerunners.—"Efforts towards the international organisation of labour have proceeded chiefly from men who, banished from their own country by reactionary governments, have carried to other lands the seeds of new thought, and, meeting abroad those of like mind and like fate with themselves, have naturally planned the overthrow of their common oppressors. The origin of the famous International Association of Working Men was largely due to such a group of exiles. In 1836, a number of German exiles at Paris formed themselves into a secret society, under the name of the *League of the Just*, the principles of which were communistic. Being involved in a rising at Paris in 1839, they removed to London. Here they met with workmen belonging to the nations of Northern Europe, to which German is a common speech, and the League naturally began to assume an international character. This was not the only change which the League underwent. Its members began to understand that their real duty under the present circumstances was not conspiracy or the stirring up of revolutionary outbreaks, but propaganda. The basis of the League had been a sentimental communism, based on their motto that 'all men are brothers.' From Marx they learned that the emancipation of the proletariat must be guided by scientific insight into the conditions of its own existence and its own history; that their communism most indeed be a revolutionary one, but it must be a revolution in harmony with the inevitable tendencies of social evolution. The cardinal point in the theory worked out by Marx and now impressed upon the League, was the doctrine that the economic conditions control the entire social structure, therefore the main thing in a social revolution is a change in economic conditions. The group of exiles put themselves into communication with Marx, and a Congress was held in London in 1847, with the result that the association was reorganised under the name of the Communist League. . . . Marx and Engels were commissioned by the League to set forth its principles in a manifesto, which, as the manifesto of the communistic party, was published shortly before the Revolution of February 1848. [See COMMUNIST MANIFESTO.] . . . The old motto of the League, 'All men are brethren,' was replaced by the new battle-cry, 'Proletarians of all lands, unite,' which openly proclaimed the international character of the struggle. Seventeen years later this battle-cry resounded through the world as the watchword of the International Working Men's Association, and the militant proletariat of all lands has to-day written it on its banner."—T. Kirkup, *History of socialism*, pp. 171, 175.

1862-1872.—First International.—Origin and

career.—"Appropriately enough, the event which gave the first occasion for the founding of the International Association of Working Men was the International Exhibition of London in 1862."—*Ibid.*, p. 175.—"In 1862 certain manufacturers, such as M. Arlès-Dufour, and certain newspapers, such as 'Le Temps' and 'L'Opinion Nationale,' started the idea that it would be a good thing to send delegates from the French working men to the London Exhibition. 'The visit to their comrades in England,' said 'L'Opinion Nationale,' 'would establish mutual relations in every way advantageous. While they would be able to get an idea of the great artistic and industrial works at the Exhibition, they would at the same time feel more strongly the mutual interests which bind the working men of both countries together; the old leaven of international discord would settle down, and national jealousy would give place to a healthy fraternal emulation.' The whole programme of the International is summed up in these lines; but the manufacturers little foresaw the manner in which it was going to be carried out. Napoleon III appeared to be very favourable to the sending of the delegates to London. He allowed them to be chosen by universal suffrage among the members of the several trades, and, naturally, those who spoke the strongest on the rights of labour were chosen. By the Emperor's orders, their journey was facilitated in every way. At that time Napoleon still dreamed of relying, for the maintenance of his Empire on the working men and peasants, and of thus coping with the liberal middle classes. At London the English working men gave the most cordial welcome to 'their brothers of France.' On the 5th of August they organized a fête of 'international fraternization' at the Freemasons' Tavern. . . . They proposed to create committees of working men 'as a medium for the interchange of ideas on questions of international trade.' The conception of a universal association appears here in embryo. Two years afterwards it saw the light. On the 28th of September, 1864, a great meeting of working men of all nations was held at St. Martin's Hall, London, under the presidency of Professor Beesly. M. Tolain spoke in the name of France. Karl Marx was the real inspirer of the movement, though Mazzini's secretary, Major Wolff, assisted him—a fact which has given rise to the statement that Mazzini was the founder of the International. So far was this from being the case that he only joined it with distrust, and soon left it. The meeting appointed a provisional committee to draw up the statutes of the association, to be submitted to the Universal Congress, which was expected to meet at Brussels in the following year. In this committee England, France, Italy, Poland, Switzerland, and Germany were represented; and afterwards delegates from other countries were admitted. They were fifty in all. They adopted none of the ways of a secret society. On the contrary, it was by publicity that they hoped to carry on their propaganda. Their office was in London. . . . Mazzini, by his secretary, Wolff, proposed a highly centralized organization, which would entrust the entire management to the leaders. Marx took the other side. . . . Marx carried the day. Soon, in his turn, he too was to be opposed and turned off as too dictatorial. Mazzini and his followers seceded. . . . The progress of the new association was at first very slow." [The first congress was held at Geneva in September, 1866.] After its second congress, held at Lausanne, in 1867, it spread rapidly and acquired an influence which was especially alarming to the French government. [The third

congress was held at Brussels in 1868 and the fourth at Basel in 1869; on the latter occasion Bakunin and other anarchists joined the International and were soon active in opposing Marx. (See also ANARCHISM: 1861-1876.)] In 1870 the International was at the summit of its power. In 1872 its congress, at The Hague, was a battlefield of struggling factions and clashing ideas, and practically it perished in the conflict. "The causes of the rapid decline of the famous Association are easy to discover, and they are instructive. First of all, as the organizer of strikes, its principal and most practical end, it proved itself timid and impotent. The various bodies of working men were not slow to perceive this, and gave it up. Next, it had taken for motto, 'Emancipation of the workers by the workers themselves.' It was intended, then, to do without the bourgeois-radicals, 'the palaversers,' 'the adventurers,' who when the revolution was made, would step into power and leave the working men as they were before. The majority of the delegates were nevertheless bourgeois; but, in reality, the sentiment of revolt against the aristocratic direction of the more intelligent members always persisted, and it fastened principally on Karl Marx, the true founder of the International, and the only political brain that it contained. But to keep in existence a vast association embracing very numerous groups of different nationalities, and influenced sometimes by divergent currents of ideas, to make use of publicity as the sole means of propaganda, and yet to escape the repressive laws of different States, was evidently no easy task. How could it possibly have lasted after the only man capable of directing it had been ostracized? The cause of the failure was not accidental; it was part of the very essence of the attempt. The proletariat will not follow the middle-class radicals, because political liberties, republican institutions, and even universal suffrage, which the latter claim or are ready to decree, do not change the relations of capital and labour. On the other hand, the working man is evidently incapable of directing a revolutionary movement which is to solve the thousand difficulties created by any complete change in the economic order. . . . A further cause contributed to the rapid fall of the International, namely, personal jealousies."—É. de Laveleye, *Socialism of today*, ch. 9.

ALSO IN: J. Spargo, *Karl Marx, his life and works*.

1872-1886.—In America.—By the order of the congress of the International held at the Hague in 1872, the General Council of the association was transferred to New York. "Modern socialism had then undoubtedly begun to exist in America. The first proclamation of the council from their new headquarters was an appeal to workmen 'to emancipate labor and eradicate all international and national strife.' . . . The 'Exceptional Law' passed against socialists by the German Parliament in 1878 drove many socialists from Germany to this country, and these have strengthened the cause of American socialism through membership in trades-unions and in the Socialistic Labor Party. There have been several changes among the socialists in party organization and name since 1873, and national conventions or congresses have met from time to time. . . . The name Socialistic Labor Party was adopted in 1877 at the Newark Convention. In 1883 the split between the moderates and extremists had become definite, and the latter held their congress in Pittsburg, and the former in Baltimore. . . . The terrible affair of May 4, 1886, when the Chicago Internationalists endeavored to resist the police by the use of dynamite, terminated

all possibility of joint action—even if there could previously have been any remote hope of it; for that was denounced as criminal folly by the Socialistic Labor Party. . . . The Internationalists, at their congress in Pittsburg, adopted unanimously a manifesto or declaration of motives and principles, often called the Pittsburg Proclamation, in which they describe their ultimate goal in these words:—"What we would achieve is, therefore, plainly and simply,—First, Destruction of the existing class rule, by all means, i. e., by energetic, relentless, revolutionary, and international action. Second, Establishment of a free society based upon co-operative organization of production. Third, Free exchange of equivalent products by and between the productive organizations without commerce and profit-mongery. Fourth, Organization of education on a secular, scientific and equal basis for both sexes. Fifth, Equal rights for all without distinction to sex or race. Sixth, Regulation of all public affairs by free contracts between the autonomous (independent) communes and associations, resting on a federalistic basis."—R. T. Ely, *Labor movement in America*, ch. 8-9.

1889.—Second International.—Origin.—Anti-militarist policies.—"From the early seventies until 1889, the international movement among the workers was in abeyance. In the latter year the second International was born at Paris. Militarism was one of the most important subjects on the agenda at the opening congress. Demands were here made that standing armies be abolished, that international arbitration tribunals be formed, and that the people have a voice in the question of peace and war. These demands were reaffirmed at Brussels in 1891, at London in 1896, and at Paris in 1900. At the last named congress, Jean Jaurès declared that the organization of international peace and brotherhood was the most important question of the gathering. The policy toward militarism was again discussed, the congress declaring against all appropriations for army and navy."—H. W. Laidler, *Socialism in thought and action*, pp. 249-250.

1904.—Congress at Amsterdam.—"At the next gathering held at Amsterdam (1904) in the midst of the Russian-Japanese War, fraternal greetings were sent to the proletariat of both countries and the socialists and workers of all lands were called upon to oppose with all their might the continuance of war. The congress wildly applauded when delegates from Russia and Japan clasped hands and declared they had no animosity against each other."—*Ibid.*, p. 251.

1904-1921.—Movement to unite with Socialist party of France. See SOCIALISM: 1904-1921.

1907.—Congress at Stuttgart.—"The past achievements of the socialists in preventing wars, the cause of modern wars, and the general strike as a preventive of wars were discussed from many points of view at the famous Stuttgart Congress of 1907. . . . After discussing the causes of most modern wars, the congress finally passed a resolution in which it attributed war in general to competition for markets, militarism, national prejudices and the desire to weaken the growing power of the working class. . . . While the question of the causes of war gave rise to considerable controversy, the methods of preventing war from breaking out under the system of private ownership received the greatest amount of attention. The preventive most vigorously discussed by Jaurès, Bebel and others was the general strike. . . . In 1907, prior to the International gathering, a general strike resolution was adopted by the French socialist congress, favored by the moderates,

Jaurès and Vaillant, and opposed by Guesde. The resolution in substance was brought before the Stuttgart assembly. . . . The resolution finally adopted out of regard for the German's fear of the disrupting influence of the general strike plank made the use of the general strike a possible weapon against war, but not a required weapon."—*Ibid.*, pp. 251, 253-257.

1910.—Copenhagen Congress.—"The Copenhagen Congress also gave much attention to the question of militarism. It restated the causes of war as given at the Stuttgart Congress, though in a somewhat modified form, declaring that wars would cease completely only with the disappearance of the capitalist mode of production and that the working class bore the main burdens of war. It demanded again that socialist representatives refuse the means for armament and advocated disarmament, arbitration of international disputes, the abolition of secret diplomacy and a guaranty of all nations against military attack or suppression by force."—*Ibid.*, p. 257.

1912.—Special congress at Basel.—"A special congress was called at Basel, Switzerland, on November 24 and 25, 1912, to discuss the [Balkan] situation. This special congress—the last before the European war—reiterated the resolution passed at the Stuttgart and the Copenhagen Congresses in which the working classes were urged to use the means which seemed to them to be most efficacious to prevent war, and to assist in bringing the war, should it break out, to the most speedy conclusion, and declared that the Balkan outbreak, if allowed to spread, 'would become the most frightful danger to civilization and the workers.' It approved of the efforts of the socialists of the Balkans to establish a democratic federation of Balkan states; opposed national jingoism and inequality of opportunity among the Balkan peoples; urged the socialists of Austria-Hungary and environs 'to prevent any attack of the Austrian monarchy upon Serbia'; congratulated the Russian workers on their protest strikes and urged them to oppose all bellicose Czarist undertakings."—*Ibid.*, pp. 259-260.

1914.—Meeting of International Socialist Bureau at Brussels.—"With the majority vote [at the National Congress of French Socialists July 15-17, 1914] favoring the general strike [against war], Jaurès and the other leaders of the French socialists planned to attend the International Socialist Congress, scheduled for Vienna on August 23, 1914—fifty years after the birth of the first International. The discussion of war and the general strike promised to be memorable in the history of the movement. The congress, however, was not to be held. A few days after the French gathering adjourned, Austria issued its note against Serbia. The International Socialist Bureau hastily called a special conference of its members in *la Maison du peuple* in Brussels to discuss the means whereby the conflict might be averted. On the afternoon of July 29, the day after Austria declared war against Serbia, delegates from the more important countries of Europe hurried to Brussels. They decided to change the place of the International Congress from Vienna to Paris, to forward the date to August 9, and to make the subject of war the chief question on the agenda. The bureau urged 'the workers of all nations concerned not only to continue but even to strengthen their demonstrations against war in favor of peace and of a settlement of the Austro-Servian conflict by arbitration.' . . . That night the Belgian Labor Party held a great 'guerre à la guerre' (war against war) demonstration. . . . The meeting of Brussels, while the only genuinely international demonstration held

in the days of late July, was but one of hundreds held by the socialists of Europe during the week preceding the explosion."—*Ibid.*, pp. 267-269.

1915-1920.—Contribution to education of workers. See EDUCATION: Modern developments: 20th century: Workers' education: United States.

1918.—Spartacist manifesto. See SPARTACIST MANIFESTO.

1919 (February).—International Socialist conference at Berne.—"The first attempt to rehabilitate the International after the armistice was made in February, 1919, at the International Socialist Conference at Berne, Switzerland. Delegates were present at this conference which lasted from February 2 to 9, from Great Britain, France, Holland, Germany, Austria, and a score of other countries, purporting to represent some fifty millions of people. The Belgian socialists refused to meet the socialists of the Central Powers until the latter confessed their guilt. The American delegates failed to receive passports in time to make their appearance at the conference, which they later repudiated, while the Socialist Parties of Italy, Servia, Rumania, and Switzerland refused to lend the conference their support. The Communist Party—the Bolsheviks—of Russia, in stating their reasons for failure to attend, declared that in their opinion the most dangerous enemy of the world revolution was 'the yellow international,' and that the workers should carry on 'an implacable struggle against the pseudo-socialist traitors.' The majority of those present were veterans in the socialist cause, youth being conspicuous for its absence. The main topics on the agenda were: the responsibility for the war, the League of Nations, the territorial readjustment, the labor charter and the Russian situation."—H. W. Laidler, *Socialism in thought and action*, p. 290.

1919 (March).—Third or Communist International.—"Of a much more radical nature than the Berne Conference was the first gathering of the so-called third International—the first congress of International Communists—held in Moscow from March 2 to 6, 1919. The call was issued by representatives of socialist groups of the left wing in nine countries and countersigned by the Minister of Foreign Affairs of Russia. It specified numerous left wing organizations in Europe and America whom it deemed worthy to be called to the councils of the revolutionary International. Thirty-two delegates, with power to act, were present at the conference from parties or groups in Russia, Germany, Hungary, Norway, Sweden, Bulgaria, Rumania, Finland, Ukraine, Esthonia, Armenia, delegates from the labor unions of Germans in Russia, from the Balkan Union of 'Revolutionary Socialists,' and from the 'Union of Socialists of Eastern Countries.' Others were there with consultative powers from groups in Switzerland, Holland, France, Great Britain, Bohemia, Jugo-Slavia, Turkey, Turkestan, Persia, Corea, China and the United States. Of chief import was the manifesto written by Lenin, Trotsky, Zinoviev, Tchicherin and Fritz Platten, a Swiss Socialist, and issued by the conference."—*Ibid.*, p. 302.

1920.—Congress of Second International at Geneva.—The Congress of the Second International, which opened July 31, 1920, at Geneva "was attended by a score of different nationalities, officially represented by six times as many delegates, besides groups and sections present in a consultative capacity, or for information only. Certainly, in most countries, fractions or groups have broken away, but the delegates from Great Britain, Germany, Belgium, Sweden, Denmark, Holland and some other nations could report that either the

whole or the vast majority of the organized working class and socialist movements, aggregating a membership of something like twenty millions, maintained their affiliation. . . . Norway and Spain have definitely withdrawn, the latter apparently under a misunderstanding; whilst the majority in Italy are definitely for withdrawal. Austria, Hungary and Czecho-Slovakia were simply absent. The Congress, whilst not falling so far short in the number of nations represented, was numerically much smaller than the congresses, prior to the war, at Stuttgart, Copenhagen and Amsterdam, respectively. This falling off in numbers, (and indeed, the entire absence of Austria, Hungary, Czecho-Slovakia, Jugoslavia, and some others), is to be accounted for mainly by the financial exhaustion, and still more, by the financial dislocation of Europe. . . . The most marked feature of the Geneva Congress was the hearty cordiality of the delegates, one to another, the unbroken courtesy and kindly urbanity of all the proceedings, the obviously genuine 'international' good feeling. . . . The main achievement of the Congress—one of some political importance to Europe—was the complete reconciliation between the organized working class and socialist movements of the nations lately at war with each other. International unity was shattered when the war broke out, and deep feelings of indignation entertained, especially by Belgium and France, against the German Social Democratic party for its failure to break with the imperialist German government that was violating the independence of Belgium and committing such terrible misdeeds against civilians, have hitherto prevented any formal reconciliation. After six years the breach is now healed. The Belgian delegates, supported by the French, insisted on raising the question of whose was the 'war guilt'? The Congress, according to custom, referred it to a committee on which every nationality was strongly represented. In the committee a few dignified speeches were made; the German delegates made a manly confession of their failure, and expressed their sincere regret that they had been misled; and an affecting scene of reconciliation took place, in which the delegates embraced each other. The declaration was reported to the Congress, where it was received with heartfelt applause, the Belgian spokesman, with the concurrence of the French, and the support of every other nationality represented, promising that the past should be no more referred to, and expressing the unanimous determination of the European working class and socialist movements no longer to permit themselves to be divided in the pursuit of their common aims. This reunion of hearts will be of political importance on European politics. It greatly increases the difficulty that the statesmen will have in restarting the war, under any pretext. . . . The lengthy and declamatory resolutions voted by the Congress, as is usual at such gatherings, are of interest more as indications of the trend of socialist and trade union thought throughout Europe than for any executive force that they may claim. The Congress expressed itself wholeheartedly against war, and for the immediate economic reconstruction of the bankrupt countries of Europe. It called for active government intervention in controlling the import of foodstuffs and raw materials, in order that the ruined nations might not be deprived, merely as the result of the competition of richer nations, of their indispensable quota of the supplies available. The Congress was emphatic and impartial in its condemnation of imperialism, militarism, and the repression by force of subject races or minorities, striving to exert their rights to 'self-determination.' But perhaps more

important than all these was the attempt made by the Congress to define clearly its position in contrast with that of the Bolshevism of Soviet Russia, and to propound, without equivocation, what the socialism of the organized labor movement in Western, Northern and Central Europe really means and proposes, as distinguished from the declarations and achievements of Lenin. In the first place, the Geneva Congress declared emphatically, in a long and precisely formulated resolution, that it repudiated any 'dictatorship,' and all violence, and that it stood for complete democracy and the supremacy of the Parliamentary government, with universal suffrage in geographical constituencies. . . . The practical proposals of socialism for the administration of industries and services were formulated by the Congress in a long and detailed report on 'Socialization,' which emphasizes the inevitable gradualness of the process, one great industry or service being dealt with at a time according as each becomes ripe for nationalization or municipalization. . . . With regard to industrial administration, the Congress (a) sharply separates Parliamentary control from actual management; (b) entrusts the management of each nationalized industry to a tripartite national board, representing the mass of workers, the management and technicians, with the consumers and the community as a whole (the 'Plumb plan'); (c) suggests district councils and works committees (Mr. Justice Sankey's proposal for the British coal mines); and (d) a joint committee of the management and each separately organized vocation for collective bargaining (as is common in England today). . . . A third contrast with Lenin was presented in the specific revision of the definition of what was meant by the term Labor (arbeiterclass proletariat). By this classic terminology of European socialism, the Congress declared was meant, not only the manual working wage-earners, but also the intellectual workers of every kind, the independent handicraftsmen and peasants, and all those who personally cooperate in the production of utilities of any sort. The term Labor (arbeiterclass proletariat) is thus officially declared to exclude, among healthy adults, only those who idly 'live by owning.' The deliberate adoption, by the British Labor party a couple of years ago, of the phrase 'workers by hand or by brain' is thus internationally endorsed and extended to all countries. The British Labor party was, moreover, paid the compliment of being unanimously entrusted with the task of negotiating with the fractions and sections not represented at Geneva, in order to bring them once more to affiliation. Mr. Arthur Henderson was elected President; Mr. J. H. Thomas, treasurer, and Mr. J. Ramsay Macdonald, a member of the new international executive of nine members, which was directed to meet regularly in London, to which it is proposed and hoped to transfer (at least temporarily) the seat of the International Socialist Bureau and of the Secretariat (over which, for the moment, M. Camille Huysmans will continue to preside in Brussels). What Geneva has done, in short, is to declare emphatically against the acts and declarations of Lenin and Soviet Russia; to adopt, as the definition and practical program of its socialism, an essentially Anglo-Saxon and even Fabian expression; and, with German consent, to replace the typically 'continental' complexion of its theory and even its phraseology, by something much more in consonance with English experience." —S. Webb, *Socialist International* (*New Republic*, Sept. 22, 1920).

1920-1921.—Second congress of Third International at Moscow.—Effect of the “twenty-one points.”—Move to start a Fourth International.—In August, 1920, the Third, or Communist, International held its second congress at Moscow. A platform of twenty-one points was adopted for submission to the Socialist and Communist parties in the different countries for acceptance or rejection within four months. The rigid demands made by the twenty-one points on the various parties for sacrifice of their autonomy and for exact compliance with the revolutionary purpose of the central body operated in several countries to repel or divide the parties. The National Executive Committee of the American Socialist party declared its willingness to accept the Moscow program with reservations, but those reservations were not acceptable to the executive of the Third International. (See U. S. A.: 1920 [May-November].) In Great Britain, a Communist party was organized in August 1920, but was denied admission to the Third International. At the congress of the French Socialist party in Tours, the majority voted on December 29, 1920, for unconditional acceptance of the “twenty-one points.” On the following day the party was split into right and left wings. In Italy the split in the Socialist party occurred January 20, 1921, and the Italian Communist party was formed January 21. Germany has both a Communist and a Communist Labor party; the former is a member of the Third International and the latter has been recognized as a “sympathizing member.” Austria and Poland both have small Communist parties. A similar party has been organized in Belgium. In Scandinavia, the Moderate Swedish Socialists continue the adherence to the Second International; the National Committee of the Norwegian Socialist party voted to accept the twenty-one points, and the small left wing group of Danish Socialists in a convention in November 1920 also voted to accept the Moscow program. A Communist party has been organized in Australia, against the opposition of the Australian Labor party and Socialist Labor party. In South America, the Socialist party of Uruguay on September 22 and that of Chile on December 31 voted to join the Third International; the Socialist party of Argentina voted both against joining the Third International and in favor of seceding from the Second International, with the possibility of later joining the new international, the formation of which seemed likely, in Vienna. At Berne, Switzerland, a conference was held on December 5, 1920, attended by representatives or parties that had left the old Second International, but had not yet joined the Communist International. From this conference a manifesto was sent out urging all Socialist parties to withdraw from both the Second and the Third Internationals and to send delegates to a convention to be opened at Vienna on February 22, 1921, for the purpose of organizing a middle-of-the-road international. This proposed body was referred to elsewhere as the Fourth, and also as the Two-and-a-half International. The manifesto was signed by representatives of the German Independent Socialists, the French Socialist party, the Austrian Social Democracy, the British Independent Labor party, the Russian Mensheviks, the Swiss Socialists, the German Socialists of Czecho-Slovakia and the American Socialists.

1921.—Third congress of Third (Communist) International at Moscow.—“Disharmony among the Socialist and Communist forces of the world for an indefinite period was assured when the third congress of the Third (Communist) International, held in Moscow, from June 23 to July 12, 1921,

voted to stand by the famous Twenty-one Articles of Faith adopted by the second congress, held in the Russian capital a year ago. There was a four-day debate over the mooted points, and Nikolai Lenin, the Bolshevist Premier of Russia, was obliged to come to the aid of Leon Trotzky, G. Zinoviev and Karl Radek when they found themselves hard pressed by delegates supporting modification of the Communist program in the interest of international unity. . . . In addressing the Congress upon . . . [the] matter of concessions Lenin said Soviet Russia was using the breathing spell obtained by negotiations with foreign nations for the purpose of rebuilding her own industries, and that in the meantime the Communists must use this same breathing spell to prepare a revolution against all capitalistic countries. He added that he could not promise anybody any liberty or any democracy, because all the reactionaries were using those slogans. Lenin also declared war must be continued upon the Mensheviks and the Social Revolutionaries. . . . A resolution was passed approving his position. President Zinoviev's victory was made complete by being authorized by the Congress to inform the Italian Socialist Party that it could not be readmitted to the Third International until it expelled Signor Serrati and his comrades. The delegates of the Communist Labor Party of Germany heard their party condemned to unite at once with the regular United Communist Party of Germany and to drop its open warfare against all parliamentary activities. A program of world-wide propaganda, worked out by Karl Radek, was adopted by the Congress and made binding upon all affiliated parties, despite the objections of some delegates who, while agreeing with its general principles, thought these could not be applied to their own countries. Zinoviev was unanimously re-elected President of the Executive Committee.”—*New York Times Current History*, Sept., 1921, pp. 1026-1027.

1921-1922.—Effect of World War and Russian communists.—“The extent to which the radical labor forces of the world have been divided by the World War and by the agitation of the Russian Communists is shown by the fact that there are now three so-called international political labor organizations, viz., the Third International, the Second International (the remnant of the pre-war Socialist International) and the International Working Group of Socialist Parties (the so-called Two-and-a-half International organized in Vienna last February); there are two contending revolutionary trade union internationals, viz., the Moscow body, with possibly 10,000,000 adherents, and the International Federation of Trade Unions, with headquarters in Amsterdam and an affiliated membership of about 27,000,000; and there are two Young People's Internationals, viz., the Communist organization and the Young Workers' International, organized in Amsterdam last May [1920]. Then there are many powerful labor bodies—such as the American Federation of Labor—which are not affiliated with any of the international groups.”—*New York Times Current History*, Sept., 1921, p. 1027.

**INTERNATIONAL COMMERCIAL CONGRESS.**—An important step in promotion of the development of international commerce was taken at Philadelphia, in October, 1899, by the assembling of an International Commercial Congress, under the auspices of the Philadelphia-Commercial Museum and the Franklin Institute, with the cooperation, not only of the city and the state, but also of the Congress of the United States. Some forty governments, and a great number of chambers of commerce and other business organizations were represented, and much good was expected from the meeting. It adopted resolutions urging cooperative and assimilated action by all nations, in the registration of trade marks, in the preparation of trade statistics and agricultural reports, and in the establishing of the parcels post. It commended the Philadelphia Commercial Museum as an example to be imitated; urged the construction of an interoceanic canal, recommended free trade in artistic works, and pleaded for the pacific settlement of international disputes by arbitration. At the time of the session of the Congress, a National export exposition was being held at Philadelphia, under the same auspices, with great success.

**INTERNATIONAL JUSTICE, Permanent Court of (1922).**—According to Article 14 of the Covenant of the League of Nations, "The Council shall formulate and submit to the members of the League for adoption plans for the establishment of a Permanent Court of International Justice. The court shall be competent to hear and determine any dispute of an international character which the parties thereto submit to it. The court may also give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly." (See also **LEAGUE OF NATIONS: Achievements of the Council.**) The first session of the Assembly opened at Geneva on November 15, 1920, and on December 16 the protocol outlining the plan for the establishment of the court was signed. It was decided that the court was to consist of eleven judges "to be elected by the Assembly and the Council, and to be effective upon ratification by a majority of the member nations. . . . Thirty-six states made a futile effort to make its jurisdiction compulsory, but Great Britain, France, Italy and Japan would not yield, declaring that they would not engage themselves to submit all disputes to the court."—*Political Science Quarterly*, 1921, *Supplement*, p. 18.—See also **ARBITRATION, INTERNATIONAL: Modern:** 1919-1920.—"Every stable nation in the world, with the single exception of the United States, has ratified the protocol creating this court. That protocol is entirely aside from the Treaty of Versailles and the League of Nations Covenant, and the United States could ratify it without binding itself in any way to the treaty or the League. . . . At The Hague it is suggested that if the United States should ratify the court treaty with the reservation that this ratification is not to be effective until satisfactory provision is made for American participation in the election of judges, the way would be immediately opened for . . . [America's] entry into the court. America's reservation would be accepted by the nations and the proper action taken to allow the seating of her delegates when occasion arose. This arrangement can be made at any moment that the United States expresses a desire for it."—W. A. Du Puy, *New Hague court at work (New York Times Current History, Oct., 1922)*.—At the second plenary conference of the League of Nations held at Geneva from September 5 to October 5, 1921, the judges were elected from a list of over ninety nominees. "A preliminary session of the Court was held on January 30 [1922]; three days later Dr. Loder of Holland was elected President of the Court. The new tribunal was formally opened at The Hague on February 15, when it began to work out its rule of procedure."—*Political Science Quarterly*, 1922, *Supplement*, p. 21.—The eleven judges constituting the court were as follows: Dr.

Bernard C. J. Loder, Holland, president and chief justice; Viscount (Robert) Finlay, Great Britain; Prof. John Bassett Moore, United States; Prof. Charles A. Weiss, France; Prof. Dionisio Anzilotti, Italy; Dr. Yorosu Oda, Japan; Senator Rafael Altamira y Crevea, Spain; Prof. Max Huber, Switzerland; Senator Ruy Barbosa, Brazil; Prof. Antonio S. de Bustamante, Cuba; Judge Didrik G. G. Nyholm, Denmark. The deputy judges were: Judge Frederick W. N. Beichmann, Norway; Judge Wang Chung-Hai, China; Prof. Demetriu Negulesco, Rumania, and Judge Michael Yovanovitch, Jugoslavia. Two panels of expert assessors are attached to the court, whose duties consist in advising on technical points in connection with the Labor, Transit and Communications problems arising out of the various peace treaties, Versailles, St. Germain, Sèvres, Neuilly, etc. On these particular points, indeed, the court is the final authority in many cases, being invested with such powers by the treaties themselves: otherwise it has as yet no compulsory jurisdiction. On June 24, 1922, the court made public "a message from Charles E. Hughes, Secretary of State for the United States, dated March 31, which is the first American recognition of the Permanent Court. Mr. Hughes, replying to a communication from the Permanent Court, said:—"The State Department will be glad to receive any communication from the court, transmitted directly or through the American Legation at The Hague. Any letters which may be received will be forwarded to the appropriate executive authorities in the United States in order that they may be brought to the attention of the court for such action as it is possible to take with reference to them under the laws of this country."—*Christian Science Monitor*, June 24, 1922, p. 2.—"The first case [that came before the court, in 1922] was based upon a technical point in the interpretation of the Treaty of Versailles. Holland wanted to know if the International Labor Office, also a child of this treaty, had acted properly in seating the delegate of its workers at the International Labor Conference last year. There had been rival claimants to a seat, and controversy as to which had the proper credentials. The point was important, since this labor conference, which is held annually for the purpose of improving the conditions of the people who work, must be assured that its actions are just, else it might lose standing. The action which it had taken was sustained by the court. The second case heard by this court was upon a question raised by France and also had to do with the activities of the International Labor Office. That office had interpreted the word 'industry,' as used in the treaty, to include agriculture. The French Government maintained that it did not include agriculture and that the International Labor Office was 'incompetent' in matters of agriculture. The court again sustained the International Labor Office, thus further clarifying a situation that, but for it, must have remained obscure. The Permanent Court of International Justice is the Supreme Court in the world in actual operation. It places itself at the disposal of the nations of the world for the settlement of any dispute which cannot otherwise be reached, providing a judicial means for settling disputes that have hitherto been settled by war."—W. A. Du Puy, *New Hague court at work* (*New York Times Current History*, Oct. 1922).—The Court adjourned until June 15, 1923, unless an extraordinary session should be necessary before that date.

**INTERNATIONAL LANGUAGE:** Early history.—Unfitness of "dead" or "living" languages to serve as an international medium.—Classification of proposed "world" languages.—"The desire of a generally accepted means of international communication has been expressed with growing emphasis since it was first uttered in the early seventeenth century by the great Bohemian educator, Johann A. Komensky, better known as Comenius. At an even earlier date, the idea had been toyed with by Descartes; and Leibnitz attempted to lay down definite principles to govern the construction of an international language. Since the seventeenth century, more than 200 artificial languages have been invented, most of them during the nineteenth century. The use of Latin, Greek or Hebrew, each of which has its supporters, has made no headway, due to a realization of their relative inflexibility and lack of adaptation to modern conditions. English, French, German, Italian, Spanish and other living languages have been put forward on different grounds by natives of the respective countries where they are naturally spoken; but their utter lack of neutrality, their obvious fitness for the special function of expressing the historically developed psychological processes of the nations in which they have grown up in contrast with those of other peoples, and the dangerous dominance in world-affairs naturally accruing to the favored nation whose language should be chosen as the official international medium, have disqualified them, no less than their complexity of structure, irregularities of spelling, pronunciation, grammar and syntax, and their enormous use of local and national idioms, which hinder their complete mastery by others than natives. The only remaining possibility is the creation of a new language, scientifically constructed, phonetic and non-idiomatic, easily acquired and of neutral quality. . . . The earliest attempts were based upon the medieval idea that man might attain to a perfect knowledge of the universe. The whole sum of things might, it was thought, be brought by division and sub-division within an orderly scheme of classification. To any conceivable idea or thing capable of being represented by human speech might therefore be attached a corresponding word, like a label, on a perfectly regular and logical system. Words would thus be self-explanatory to any person who had grasped the system, and would serve as an index or key to the things they represented. Language thus became a branch of philosophy as the men of the time conceived it, or at all events a useful handmaid. Thus arose the idea of a 'philosophical language.' . . . Words, then, are reduced to mere formulæ; and grammar, inflections, etc., are similarly laid out on purely logical, systematic lines, without taking any account of existing languages and their structure. To languages of this type the historians of the universal language have given the name of a *priori* languages. Directly opposed to these is the other group of artificial languages, called a *posteriori*. These are wholly based on the principle of borrowing from existing language; their artificiality consists in choice of words and in regularization and in simplification of vocabulary and grammar. They avoid, as far as possible, any elements of arbitrary

invention, and confine themselves to adapting and making easier what usage has already sanctioned. Between the two types come the *mixed languages*, partaking of the nature of each."—W. J. Clark, *International language, past, present and future*, pp. 76-78.—Perhaps the best exposition of the idea was a work published in London in 1668 by John Wilkins, bishop of Chester, entitled, "An Essay towards a Real Character and a Philosophical Language." Already in 1661 George Dalgarno had published in London a treatise on the subject entitled "Ars signorum."

**Other proposed languages.**—In addition to Esperanto, 1887, which is the only international language that has met with favorable reception, the following artificial languages of recent years deserve to be noted: "Volapük" made its appearance about 1879; "Spelin," by G. Bauer, Agram, 1888; "Myrana," by J. Stempfi, Kempten, Germany, 1889; "Lingua International," or "Mondolingua," by J. Scott, Vienna, 1890; "Universala," by E. Heintzeler, Stuttgart, Germany, 1893; "Kosmos," by E. A. Lauda, Berlin, 1894; "Novilatin," by E. Beerman, Leipzig, 1895; "Bolak" or the "Blue Language" by Léon Bollack, 1896; "Idiom Neutral," devised by M. Rosenberger, former director of the Akademie, St. Petersburg, 1902, is said by some to be the simplest passively invented. In spite of the growth of Esperanto, differences of opinion have arisen with reference to some details in its structure; and various groups of its adherents have advocated certain changes. The most prominent of these systems of "revised" Esperanto is known as "Ido." Others are "Europal" and "Esperantida." An interesting recrudescence of the *a priori* language idea is the work of the Rev. E. P. Foster, of Marietta, Ohio. His language, known as "Ro," has undergone several transformations since the original proposal, but has hitherto failed to secure any considerable following.

**Natural development of some artificial languages.**—"Paradoxically speaking, there are several of these artificial languages in existence which have been naturally evolved. The *Lingua Franca* of the Levant and Hindustani are well-known instances. The former was the creature of commercial necessity operating in a veritable museum of races; the latter originated in the second half of the sixteenth century, when Akbar's court and camp were crowded with the representatives of scores of peoples and languages, the elements of an empire in the making. The Chinese of the Mandarins, which is used by the educated classes throughout a vast country of many dialects so diverse as to be almost distinct languages, is largely the creation of *literati*, and is characterized by a very high degree of artificiality. The smell of the student's lamp also hangs about literary Italian (consciously constructed by Dante and others on the basis of a virile and versatile dialect descended in the male line, so to speak, from the *Lingua Rustica*), and about the 'Ciceronian' English of the eighteenth century which was deliberately Latinized by Dr. Johnson and other 'poisonous scholars' of the Palladian Age. Every sport, again, has its little language, the product of the journalistic mind which calls a cat 'the popular domestic feline'; devastating examples are the *argot* of the old prize-ring and the jargon of the American base-ball reporter. Of composite languages Pidgin-English, Yiddish, and the Chinook jargon are curious instances. Pidgin-English, which consists of words from European languages (the majority are liquidated English) in a grammatical framework of Chinese construction, is used not only in China but also in all the great seaports where there is any

sort of a Chinese quarter. I have often heard it in London's dockland. Yiddish, an amalgam of Hebrew and German, with many words from other sources, is the nearest thing to Hindustani in the Western world; it has a literature of its own which is by no means contemptible. [See also PHONOLOGY: 2]. The Chinook jargon, by means of which the Indian 'nations' or tribes of the portion of North America once known as Rupert's Land (the name is still kept in an ecclesiastical title) communicate with one another and with traders, was largely the work of the Hudson's Bay Company's officers. It is based on a dialect spoken along the British Columbian rivers, and contains a considerable number of French words."—E. B. Osborn, *Universal languages (Nineteenth Century and After, Sept., 1913)*.

**Esperanto.**—Aims.—History of its creation.—Principles.—Periods of growth.—Literature.—Spread.—The failure of Volapük, due to its own serious defects and to dissensions among its supporters, in no way discouraged those who were seeking for a solution of the problem of an international language. "Doctor Ludovic Zamenhof, Doctor of Medicine [1859-1917], the inventor of Esperanto . . . was born . . . in Russia, where he spent his boyhood. The inhabitants of Bialystock [his native town] were of four different nationalities, Russians, Poles, Germans and Jews, each speaking different languages, and generally on bad terms with each other. The boy's impressionable nature caused him to reflect that this animosity was caused by divergence of language, and thus the first seeds of an international language were sown. Even at an early age Dr. Zamenhof came to the conclusion that an international language was possible only if it were neutral, belonging to no nationality in particular. . . . In his boyhood he learned French and German, and began to work out the idea of his new language; but when, in the fifth class of the gymnasium, he began to study English, the simplicity of its grammar was a revelation to him; and his own grammar soon melted down to a few pages without causing any loss to the language. But his giant vocabularies left him no peace of mind. . . . One day, when he was in the sixth or seventh class in the gymnasium, he, by chance, observed that the signs over shops had certain terminations, as we might notice in England, for instance, 'Surgery,' 'Bakery,' etc.; and it then struck him for the first time that these terminations had certain meanings, and that by using a number of suffixes, each always having the same meaning, he might make out of one word many others that need not be separately learnt. . . . He at once understood how important it was to make use of this power, which, in the natural languages, plays only a blind, irregular and incomplete rôle. So he began to compare words and to search out the constant and defined relationship between them. He cast out of his vocabularies a vast series of words, substituting for each huge mass a single suffix, which had always a certain fixed relationship to a root-word. . . . On leaving the university, Dr. Zamenhof commenced his medical practice, and began to consider the publication of his language. He prepared the manuscript of his first brochure, 'An International Language,' by Dr. Esperanto, Preface and Full Manual,' and sought out a publisher. For two years he sought in vain, the financial question meeting him at every turn; but at length, after strenuous efforts, he succeeded in publishing the brochure himself, in 1887. He had 'crossed the Rubicon,' and Esperanto was given to the world!"—G. Cox, *Preface to grammar of Esperanto*, pp. x-xii, xvi.—"The general prin-

ple upon which Dr. Zamenhof has worked is this: to eliminate all that is accidental in our national languages, and to keep what is common to all. In consequence, and strictly speaking, he invents nothing; he builds entirely with material that has been in existence for a long time. Here, then, is the way in which he proceeds regarding the various elements that are necessary to the formation of a language. The sounds . . . that are peculiar to one language are eliminated. The English *th* and *w* are not found in French or German, therefore they are dropped. On the other hand, the French *u*, the German *ü*, and the French nasals do not exist in English; they too are dropped. The Spanish *ñ* and *j*, and the German *ch*, have the same fate. Thus, only sounds which are found everywhere are kept, and no one will have any difficulty about pronunciation, no matter to what country he belongs. Spelling is of course phonetic: one and the same sound for one letter. There are no mute letters, as in French; neither are there double letters. . . . The accent is always on the penultimate syllable. Esperanto reminds one of Italian, when spoken, and has proved extremely melodious for singing. In the vocabulary, the principle of internationalism is applied . . . in a most ingenious fashion. Dr. Zamenhof proceeded thus: he compared the dictionaries of the different languages, and picked out first those words which are common to them all. He spelled them according to the phonetic system, dropped the special endings in each idiom, and adopted them as root-words in his proposed language. . . . Then he picked out those which appear in most languages, although not in all. . . . For the remaining words,—and there are comparatively few left,—which are never the same in the different languages, Dr. Zamenhof selected them in such a manner as to make the task of acquiring Esperanto equally difficult or equally easy for all concerned.”—A. Schinz, *Esperanto: the proposed universal language (Atlantic Monthly, Jan., 1906)*.—“The history of the Esperanto movement falls conveniently into four periods: we are [written in 1922] at the opening of the fifth. The first, from its inception to 1898, was one of obscure and slow progress. A devoted band of Slavs and Scandinavians kept the language alive, and supported a small magazine, *La Esperantisto*, published first at Nürnberg, then at Upsala under the new name *Lingvo Internacia*. Then, in 1898, the French took the lead, and the period of genuine expansion began. . . . The French Society for the propagation of Esperanto was founded in 1898; M. Gaston Moch gave a report on the International Language Question at the Eight Universal Peace Congress (1897); M. Ernest Naville read a paper in favour of Esperanto before the French Academy of Moral and Political Sciences (1890); the innumerable meetings and conventions held in Paris during the World’s Fair of 1900 gave a new impetus to international problems. The Delegation for the adoption of an International Language was first thought of in 1900, and actually organized in 1901. In the same year, General Sébert, of the French Academy of Sciences, brought the question before the newly created International Association of Academies. The richest and most active private organization in France, the Touring Club, with over 100,000 members, gave Esperanto its powerful support; and the old, conservative, semi-academic firm of Hachette became the chief publisher of the new literature. Thus, from 1898 to 1905, the progress of Esperanto was extremely rapid, and several hundred thousand copies of Chefch’s small Esperanto textbook were sold. The third period, from 1905 to 1914, was one of worldwide develop-

ment, characterized by the annual International Conventions—the embryonic Parliament of Esperantoland; by the growth of an important periodical press; and by the creation of new organs for the practical application of Esperanto to the needs of commerce, industry, science, and travel. The first of the International Conventions was held at Boulogne-sur-Mer, France, in August 1905; the second at Geneva in 1906; the third at Cambridge in 1907; the fourth at Dresden in 1908; the fifth at Barcelona in 1909—in spite of the revolutionary outbreak which had occurred in that city a few months before; the sixth at Washington, D.C., in 1910; the seventh at Antwerp in 1911; the eighth at Genoa in 1913. These conventions . . . lasted over a week, and attracted up to 1,800 delegates from all parts of the world. . . . The Great War forms . . . the fourth and darkest period of Esperanto history. International meetings were out of the question: the Eleventh Congress, held at San Francisco in 1915, at the time of the Panama-Pacific Exposition, was but a ghost of what such gatherings had been; no other, even on that limited scale, was possible until 1920. The number of Esperanto periodicals fell from over a hundred to less than thirty. Groups ceased to exist, or were reduced to a state of ‘suspended activity.’ . . . But the cataclysm is over. . . . Groups are reconstituted everywhere; magazines are published anew; according to Dr. Cottrell, ‘over seventy are again appearing and almost every week brings word of further resumption of publication or the starting of new ones.’ International conventions have been resumed: the twelfth took place at The Hague in 1920, the thirteenth at Prague in 1921.”—A. L. Guérard, *Short history of the international language movement*, pp. 116-117, 123-124.—“The oral use of the language is not, up to the present, the more important. Esperanto is still principally a written tongue. Of the magnitude of its literature, few outsiders form an adequate idea. Some people have a vague notion that there are only a few textbooks in existence, with perhaps half a dozen ‘faddy’ magazines. Now, in 1914 there were over a hundred Esperanto papers: some in Esperanto and a national language, devoted to propaganda in a particular country; others entirely in the universal tongue, and dealing with some special subject: *La Revuo* (literary), *Vocho de Kuracistoj* (medical), *Scienca Revuo*, *Internacia Socia Revuo*, *Dia Regno* (Christian Endeavour), *Espero Katolika*, etc. A large number of current periodicals used to print Esperanto articles, as the *North American Review* did for a while. The volumes of *La Revuo* alone—published in Paris by Hachette, with regular contributions from Dr. Zamenhof—contained a wealth of excellent literature, translated or original, in prose or in verse. . . . [The] *Outline of Esperanto Literature*, published by the Esperanto Association of North America, . . . contains several hundred titles. . . . Esperanto is no longer an end in itself—a fad or a game: it has already been used in non-Esperanto gatherings, either in connexion with natural languages, as in the Medical Congress of Buda-Pest in 1909, or exclusively, as in two Catholic conventions held in Paris in 1910 and at The Hague in 1911. It has been found useful for tourists, and as such endorsed by the French Touring Club and by Messrs. Thomas Cook. Descriptive pamphlets and catalogues are published in it. Firms like the Manufacture Française d’Armes et de Cycles, of St. Etienne, and the world-famous ‘Bon Marché’ corresponded in Esperanto. . . . The Universal Esperanto Association (Geneva, Switzerland) devotes itself exclusively to

this practical side: Esperanto is not its aim, but its instrument. This Society at the end of 1911 had 1,000 delegates and 766 "consuls," 158 information bureaux in 885 places and 47 countries; 7,804 individual members; 17 Esperantist Associations were affiliated with it, as well as 266 non-Esperantist societies, groups or firms of all kinds, including the Chamber of Commerce of Los Angeles.' The U.E.A. [Universal Esperanto Association] is the nucleus of the Esperanto 'super-nation,' scattered all over the globe, but one in interests and ideals, as it is one in speech."—*Ibid.*, pp. 119, 121-122.—Esperanto was endorsed and urged by Abdul Baha, the head of the Bahai religious movement, and by many international bodies, including the Red Cross and the International Order of Good Templars. At the first session of the Assembly of the League of Nations, held in Geneva, in December, 1920, a resolution recommending its teaching in the schools of the world preparatory to its adoption as the language of the League was favorably reported by the committee to which it had been referred; but its consideration was postponed by a small majority.

"The Paris Chamber of Commerce has taken the initiative in instituting Esperanto classes in all their commercial schools so that students can learn for commercial purposes an auxiliary international language. Before taking this step the chamber appointed a committee to inquire into the real usefulness of Esperanto, and among other tests they made was to translate a large number of business letters into Esperanto and then back into French. It was found that the sense of the letters was in no way lost. The committee recommended that Chambers of Commerce in other countries should be asked to institute similar classes in the language invented by Dr. Zamenhof, which they are convinced will enable international business to be carried on without error and with much greater dispatch and cheapness than when translators into half a dozen languages have to be employed. The ease with which Esperanto can be learned and its accuracy in translation were regarded as its two principal recommendations above other artificial languages. . . . Some of the texts submitted to the test were such that the slightest mistake would completely change the meaning, but Esperanto was found to meet all requirements. M. André Baudet, Chairman of the committee on whose recommendation it was decided to open the classes, describes Esperanto as rather an international code than as a language. 'It won't revolutionize the world,' he said, 'and there is no likelihood that it will take the place of any language, but, just like a telegraphic code or a system of stenography, it can be useful to every people and aid enormously in international business.'"—*New York Times*, Feb. 16, 1921.

**INTERNATIONAL LAW: Definition.**—"International Law consists in certain rules of conduct which modern civilized states regard as being binding on them in their relations with one another with a force comparable in nature and degree to that binding the conscientious person to obey the laws of his country, and which they also regard as being enforceable by appropriate means in case of infringement."—W. E. Hall, *Treatise on international law*, p. 1.

**Nature, sources, and sanction.**—Some writers, especially Austin and his followers, have defined law so narrowly that international law could not properly be included as such. But according to

the present trend of opinion (Maine, Hall, Nys, Westlake, Pollock, Taylor, Moore, Lawrence, Oppenheim, and others) customary law may have an existence previous to and apart from the recognition of it as law by the state, and international law may be equally truly law, even though not imposed or enforced by any external authority. "Regarding the law of nations, then, as a true customary law, though still imperfectly organized, we may say that it is ascertained and developed in three ways: by the authority of writers, by recognition and declaration in treaties and other diplomatic acts, and by the embodiment of general opinion in the usage of nations. . . . Official judicial and other learned persons who cannot conceive authority divested of official sanction have gravely pointed out that Grotius and his successors, not being legislators, could not make law. More than twenty years ago, Sir Henry Maine gave the right answer: 'What we have to notice,' he said, 'is that the founders of international law, though they did not create a sanction, created a law-abiding sentiment. They diffused among sovereigns, and the literate classes in communities, a strong repugnance to the neglect or breach of certain rules regulating the relations and actions of States. They did this not by threatening punishment, but by the alternative and older method, long known in Europe and Asia, of creating a strong approval of a certain body of rules.' . . . Another kind of evidence of the law of nations is afforded by treaties and similar instruments. These, however, must be used with caution. For it is obvious that the terms of an express convention between two or more Powers can of themselves have no binding force upon any other Power which is not a party to it. . . . It is otherwise . . . where an agreement or declaration is made not by two or three States as a matter of their own private business, but by a considerable proportion, in number and power, of civilized States at large, for the regulation of matters of general and permanent interest. Such acts are the outcome of congresses or conferences held for the purpose, and they are now commonly so framed as to admit of and invite the subsequent adhesion of States which may not have been parties in the first instance. Moreover it is certain that, when all or most of the Great Powers have deliberately agreed to any rule of general application, their agreement has very great weight, even among States whose consent has not been given. . . . The weight of actual usage, and the proof derived from it, remain the most important factors of all; for the final test of validity must in the case of international law, no less than in that of any other customary law, be found in general consent evidenced by conduct."—F. Pollock, *Modern law of nations and prevention of war* (*Cambridge modern history*, v. 12, pp. 711-715).—"From the time of Grotius downwards, all civilized states have recognized the validity of this body of law, and have enforced it in their courts exactly as if it had been enacted by their own supreme legislative bodies. A large part of the literature of the subject consists, indeed, of the judgment of great lawyers, like Lord Stowell in England, given in the course of the trial of cases wherein the provisions of this book-made law were accepted as decisive."—R. Muir, *Nationalism and internationalism*, pp. 147-148.—"Every satisfactory definition of law implies a sanction. Some penalty must be imposed upon a law-breaker, to be exacted, in the last resort, by external power. . . . But the power which stands ready to enforce

the law in every ordered state, and diverts many would-be offenders from their purpose, itself came into being by the will or consent of the dominant part of the community, and relies for its support on their continued consent. . . . A few months ago [1919] an impending national strike on the railways of Great Britain seemed to threaten, by its possible consequences, the whole system of law and government. But as soon as the blow fell, it was at once evident that the general body of the public were wholly opposed to constitutional changes brought about by pressure from any single section of the community, and from that moment the ultimate issue was certain. When, on the other hand, Germany and Austria challenged the public of Europe in 1914, the challenge was not at once accepted by every member of the family of nations, nor by so many of them as to make the task of the law-breaker hopeless from the outset. And so the issue was long in the balance, and the law of nations was suspended for a time. But though a comparison between these two cases shows that the sanction of the municipal law of England proved to be stronger than that of the public law between states, the difference between them was solely one of strength, and not at all a difference in kind. Both systems of law depend for their enforcement upon external power resting upon general consent; neither can ever be wholly exempt from the possibility of breakdown or overthrow."—R. F. Roxburgh, *Sanction of international law (American Journal of International Law, Jan., 1920)*.

Usages in the ancient world.—"Nearly all our knowledge of international law among ancient states is derived from their intercourse with the Jews, and with the Greeks and Romans, more especially with the latter. Most of the rules were founded on religion. Treaties were sanctioned with solemn oaths, the violation of which it was believed would be followed by the vengeance of the gods. War between nations of the same race and religion was declared with sacred rites and ceremonies, but when once begun it was waged with little rule or check. The heralds proclaimed its existence by devoting the enemy to the infernal gods. Ambassadors and heralds always had a sacred character. The division of the Greek world into a large number of independent communities favoured the existence of an Hellenic law of nations, presenting in many points—such as the recognition of common Hellenic customs, religious and political, and of the principle of a balance of power—a parallel to modern international law. They generally gave quarter, allowed the ransom of prisoners, respected trophies, and allowed truces for the burying of the dead; and they had a usage bearing a resemblance to the consular system of the present day. The *jus feciale* of the earlier Roman law regulating the formal intercourse between Rome and other nations, is indeed the germ of what might have been a system of pure international law, but the rise of the Roman Republic to the mastery of the world rendered a *jus inter gentes* unnecessary and impossible. The principles of natural justice to international relations, however imperfectly executed, and though never reduced to a system, were not unknown to the Romans. . . . But international law, as we understand the term at the present day, did not exist when Rome was mistress of the world. . . . There were some redeeming features, such, for example, as the allowing prisoners of war to purchase their freedom, and selling them only when unransomed and from this practice, in the course of time, grew up the more

humane custom of allowing the exchange of prisoners. Captives were not maltreated by the Romans as the Athenians were at Syracuse by Greek conquerors, with the exception of kings and generals, who were, at least in Cicero's day, butchered without mercy, after having been led in triumph through the city. Nor did the Romans entirely deprive the inhabitants of the conquered country of their lands; they allowed them to retain some small portion on the condition that they paid rent for the same as tenants (*coloni*)."—J. E. R. Stephens, *Rise and growth of international law (New Century Review, Feb., 1898)*.—See also ROME: Republic: B.C. 367; JUS GENTIUM.

Medieval usages.—"As the Roman Empire fell, the advancing tide of barbarian invasion swept away the bulwarks of civilization. Commerce disappeared; warfare was restrained by no rules; pirates swept the seas. And in the ninth century the terrible incursions of the Northmen began to add a fresh element of horror to the universal confusion. But a new and better order slowly evolved itself out of the chaos. The Christian Church softened the manners and mitigated the cruelty of the barbarian nations, as one by one they entered into her fold. The temporal power of the Holy Roman Empire and the spiritual authority of the Papacy worked together for a time in the cause of civilization. Feudalism became the great organizing principle in remodelling society. The study of Roman Law gave a magazine of new ideas and rules to statesmen and lawyers. . . . Viewed in connection with international relations, the most important part of the new organization of Europe was the universal supremacy claimed by the Roman Pontiff and the Emperor, the former in the spiritual, the latter in the temporal sphere. . . . It may, however, be advisable to point out here that both Pope and Emperor were rather judges and arbitrators than law-givers. They dealt with particular cases, not with general rules. There was no *corpus* of International Law till comparatively modern times. The nearest approach in the Middle Ages to any system of regulations that could be known beforehand by states was found in the various maritime codes."—T. J. Lawrence, *Principles of international law, pp. 35-36*.

Maritime codes.—"It is to mediæval commerce that we owe those collections of maritime law which have exercised such a great influence upon the subsequent development of this branch of international jurisprudence. By far the most important of these was the *Consolato del Mare*, a private collection of rules derived from maritime practice in the Mediterranean, which was published in Barcelona, Spain, in 1494. These rules showed a remarkable liberality toward friends or neutrals. They made ownership of the ship and goods the test of liability for forfeiture, and laid down the principle that a friend's goods found on board an enemy ship were to be restored to the owner on payment of the freight. . . . On the other hand, enemy goods found on a neutral vessel were subject to confiscation, although even in this case, the vessel, which might be compelled to carry the cargo to a place of safety, was restored to its owner. . . . Other important mediæval collections or codes of maritime law were: (1) The so-called *Amalfitan Tables*, which appear to date from the eleventh century. (2) The *Laws of Oleron* for Western Europe, which seem to have been completed in the latter part of the twelfth century. (3) The *Laws of Wisby*, dating from about 1288, for the Baltic

Nations. (4) *The Maritime Law of the Hanseatic League*, completed in 1614. (5) The so-called *Rhodian Sea-Law* of the Roman Empire and the Early Middle Ages, which, however, is generally regarded as apocryphal.—A. S. Hershey, *International relations during antiquity and the Middle Ages* (*American Journal of International Law*, Oct., 1911, p. 929).—See also ADMIRALTY LAW: 1798.

**Renaissance.—Innovations facilitating international relations.—Renewed interest in jurisprudence.—Effect of Reformation.**—The new custom of permanent embassies, during the fifteenth and sixteenth centuries, added greatly to the security and facility of international intercourse. Standing armies, and consequent uniform military discipline paved the way for more universal rules of warfare. New questions of maritime rights were brought up by the great discoveries and explorations, and consequent changes in commerce. A revived interest in classical law and jurisprudence inspired the treatises of Suarez, Ayala, and Gentilis, which opened a new field, that of international jurisprudence. "The Renaissance of science and art in the fifteenth century, together with the resurrection of the knowledge of antiquity, revived the philosophical and æsthetic ideals of Greek life and transferred them to modern life. Through their influence the spirit of the Christian religion took precedence of its letter. The conviction awoke everywhere that the principles of Christianity ought to unite the Christian world more than they had done hitherto, and that these principles ought to be observed in matters international as much as in matters national. The Reformation, on the other hand, made an end to the spiritual mastership of the Pope over the civilised world. Protestant States could not recognise the claim of the Pope to arbitrate as of right in their conflicts either between one another or between themselves and Catholic States."—L. Oppenheim, *International law*, v. 1, p. 57.

**Grotius and the early jurists.**—"The horrors of sixteenth and seventeenth century warfare, however, and the faithlessness and brutality which often marked the relations of states during those centuries, and especially during the hideous Thirty Years' War, awakened men to the need of having some clear and accepted exposition of the restrictions by which states should be bound in their mutual relations. Two or three partial attempts in this direction were made in the late sixteenth and early seventeenth centuries, but the work of the Dutch scholar and jurist Grotius *De Jure Belli et Pacis*, published in Paris in 1625 in the midst of the horrors of the Thirty Years' War, marked so immense an advance on anything that had been previously done, and attained so quickly an authoritative position, that it has been justly claimed that modern International Law sprang fully-developed from the brain of Grotius. He had a long succession of followers during the seventeenth and eighteenth centuries, and it is remarkable that all the most respected writers on this new subject came from those little states which were most conscious of the need for the protection of a system of international law; Puffendorf, Leibniz, and Wolff sprang from the little divided principalities of Germany; Bynkershoek, like Grotius, from Holland; Vattel (whose *Droit des Gens*, published in 1758, became the most generally popular exposition of the subject) from Switzerland."—R. Muir, *Nationalism and internationalism*, p. 146-147.—"The object of Grotius was to correct the false theories and pernicious maxims which then existed by shewing a community of senti-

ment among the wise and learned of all nations and ages in favour of the natural law of morality. He also endeavoured to shew that justice was of perpetual obligation and essential to the well-being of every society, and that the great commonwealth of nations stood in need of law, the observance of faith, and the practice of justice. His idea was to digest into one systematic code the principles of public right, and to supply authorities for almost every case in the conduct of nations; thus, he had the honour of reducing the law of nations to a system, and of producing a work which has been resorted to as the standard of authority in every succeeding age."—J. E. R. Stephens, *Rise and growth of international law* (*New Century Review*, Feb., 1898).—"The chief inspiration of Grotius himself was the *jus gentium* or *jus naturæ* [see *JUS GENTIUM*] which he borrowed directly from the Roman jurists. . . . This 'law of nations' which the Roman lawyers had worked out had been created in the first instance by the practical necessity of finding a common set of rules for the many different tribes whom Rome had conquered. But the idea had been enlarged by being merged with the philosophical idea of the Law of Nature, or body of fundamental moral conceptions which Nature was supposed to prescribe; the two really distinct ideas of the 'Law of Nations,' or greatest common measure of various tribal customs, and the 'Law of Nature,' or moral rule of the universe, were blended and confused, and in this form were handed down to the Middle Ages, which very readily accepted the conception. Obviously the Law of Nations as conceived by the Roman or mediæval jurist was something quite different from what we mean by International Law: it was a body of law that was obligatory upon all individuals, not a body of law regulating the relations of sovereign states with one another. But the universal acceptance of the binding character of this Law of Nations, and the suggestion of internationality conveyed by its name, made it easy for Grotius to apply it to the new purpose. . . . A second source of International Law was the body of customs which had grown up during centuries. Some of these were in part the product of the feudal age and the usages of chivalry, such as the rules regarding the treatment of heralds, ambassadors, and prisoners of war. Others had arisen from the needs of commerce. . . . These usages were capable of codification and unification. So far as concerned maritime law, this was done first by the Dutchman, Bynkershoek [in his treatise *De Dominio Maris* (1721)]. Lastly, the innumerable treaties between various states implied or embodied many principles which were capable of being expressed in a legal form, and this was done by the philosopher Leibniz in his *Codex juris gentium diplomaticus* (1693)."—R. Muir, *Nationalism and internationalism*, pp. 149-152.—Other notable jurists of the seventeenth and eighteenth centuries (with the date of publication of their more important works) are Zouch (1650); Puffendorf (1672, 1675); Wolff (1749, 1750); and G. F. von Martens (1785, 1788, 1791).

1648-1714.—Peace of Westphalia becomes basis of doctrine of territorial sovereignty.—Growth of law of nations.—Maritime law.—Progress in laws of land warfare.—"The Thirty Years' War was an epoch-making event in the history of international law. It was not merely a great struggle between Protestantism and Roman Catholicism, but from it emerged the principle of territorial independence as opposed to imperialism. The international system of the present day was definitely marked out and the characteristics of

the modern state defined."—E. M. Borchard, *Diplomatic protection of citizens abroad*, p. 7.—"The Grotian system depends upon a full and unqualified recognition of the doctrine of territorial sovereignty from which flow the corollaries that all states are formally equal, and that territory and jurisdiction are coextensive. Such was the basis of the settlement embodied in the Peace of Westphalia [see GERMANY: 1648: Peace of Westphalia], so far as the written treaty law was concerned, and upon that basis it has been claimed from that day to this that, before the law of nations, the legal rights of the greatest and smallest states are identical. But such rights and such equality have always been enjoyed *sub modo*,—that is, subject to the irresistible power vested by the conventional or higher law in a committee composed of the representatives of a few of the greater states acting in behalf of the whole."—H. Taylor, *Treatise on international public law*, p. 98.

"The intermediate period between the peace of Westphalia and that of Utrecht was filled with a series of wars, growing out of the ambitious projects of Louis XIV. . . . The history of this long series of wars, and of the negotiations by which they were occasionally suspended, is fruitful in examples of the progress which the law of nations continued to make, in spite of the practical violation of its precepts too often occurring in the intercourse of states. Cardinal Mazarin, looking only to political and commercial interests, did not hesitate to recognize the government of an usurper [Cromwell] who had shed the blood of his sovereign on the scaffold. He avowed the maxim that the relations of amity and commerce between states had no necessary connection between the form of their respective governments, and sought to maintain the good understanding between France and England by a religious execution of the subsisting treaties which had been made with the dethroned and banished house of Stuart. It was only when the revolution of 1688 placed at the head of the British government an active and able prince, who formed the continental alliance by which the ambitious designs of Louis XIV were baffled, that the latter monarch embraced the cause of the Stuarts; motives of political interest coinciding with the principle of legitimacy and the divine right of kings. During all this period, the influence of the writings of the publicists, including Grotius and his successors, was perceptibly felt in the councils and conduct of nations. The diplomacy of the seventeenth century was learned and laborious in the transaction of business. Its state papers are filled with appeals, not merely to reasons of policy, but to the principles of right, of justice, and equity; to the authority of the oracles of public law; to those general rules and principles by which the rights of the weak are protected against the invasions of superior force by the union of all who are interested in the common danger. . . . Among the principles constantly appealed to . . . was that of the right of intervention to prevent the undue aggrandizement of one European state affecting the general security and independence of nations by materially disturbing the equilibrium of their respective forces."—H. Wheaton, *History of the law of nations*, pp. 78-80.—Maritime law was the subject of many international agreements, as well as of disputes and disagreements. The theory of sea sovereignty was ultimately rejected; but laws of capture and search received more and more attention. The French Ordinance of 1681 and the Treaty of Utrecht are the most important public

documents on the matter. In connection with the growing conception of neutrality, Bynkershoek formulated (1702) the modern idea of territorial waters. But the greatest progress was made in the laws of land warfare. "This improvement may be most distinctly and visibly traced in the treatment of prisoners of war. . . . The exact time at which the practice of exchanging was substituted for that of ransoming is not easily ascertained. It appears from a proclamation of Charles I of England issued in 1628 that it had not then completely taken place. . . . In the year 1665 there is mention of a person coming to England, in a public capacity to negotiate an exchange of prisoners *flagrante bello* between that country and Holland. It appears to have been practiced between the French and Imperial armies in Italy during the war of the Spanish succession."—*Ibid.*, pp. 87, 162-163.

1713-1800.—Practice and theory.—"The most important events in the international relations of the eighteenth century were: the admission of Russia under Peter the Great to full membership in the circle of European states; the rise of Prussia under Frederick the Great as a first-rate Power; the declaration and achievement of American independence; and the outbreak of the French Revolution. The colonization of America by the leading nations of Europe, which was begun on a large and effective scale during the seventeenth and continued during the eighteenth century, gave rise to new questions to which the Roman law of *occupatio* and *alluvium* was applied. In Europe the main issues were dynastic, economic and territorial, and the principle of the balance of power based on an equilibrium of forces was repeatedly affirmed and violated. The diplomacy of this period was dominated by Machiavellian aims and methods. The end was the glory and aggrandizement of dynasties and states; and to attain these ends all means seemed good. Treaties were violated whenever the interests of the state (*raison d'Etat*) appeared to demand it, and wars were undertaken on the slightest pretexts. Frederick the Great suddenly invaded Silesia upon the death of Charles VI, in 1740, within a few years after having written his 'Anti-Machiavelli'; and of all the states which had guaranteed the pragmatic sanction of the Emperor, England alone (and she acted from motives of self-interest) kept faith with Austria upon the accession of Maria Theresa after the death of her father. But the greatest crime committed by the Machiavellian statesmen of the eighteenth century was the extinction of one of the most important members of the European family of nations—the three-fold division of Poland in 1772, 1793, and 1795."—A. S. Hershey, *History of international law since the Peace of Westphalia* (*American Journal of International Law*, Jan., 1912, pp. 40-41).—See also POLAND: 1763-1790; 1793-1796.—In sharp contrast to actual practice were the idealistic principles of the French theorists, later endorsed by the American and French revolutions. "The Abbe de Saint-Pierre had presented the world with his 'Project of Perpetual Peace' in 1713. Montesquieu taught that the law of nations is naturally based upon the principle that the various nations should do each other as much good as possible in times of peace; in war as little harm as possible, without injuring their true interests. Rousseau affirmed that war is not a relation between individuals but a relation between states. Mably, the author of an important work entitled *The Public Law of Europe Based on Treaties* (1748), advocated love for justice and humanity, respect for treaties, and the immunity

of private property in maritime warfare. The National Assembly of France solemnly declared on May 22, 1790, that 'the French Nation renounces wars of conquest and will never use force against the liberty of any people.' But on November 19, 1792, the National Convention, abandoning the early principles of the Revolution, issued its famous decree that France 'will grant fraternity and aid to all peoples who may wish to recover their liberty,'—a decree which was, however, abrogated on April 14, 1793, by one declaring in favor of non-intervention. The Jacobins incorporated the principle of non-intervention in their still-born constitution of 1793. On June 18, 1793, Abbe Gregoire presented a 'Project for a Declaration of the Law of Nations' in twenty-one articles, as a pendant to the 'Declaration of the Rights of Man' of 1789. It contained few principles which are unsound. Some of them form part and parcel of the fundamental rights of states; others belong to the international law of the future; only a few are impracticable. This project, which has been characterized as Utopian, was rejected by the convention; but it may nevertheless be regarded as expressing the altruistic and idealistic spirit of the French Revolution in its attitude toward foreign nations."—*Ibid.*, pp. 43-44.—Similar theories, combined with political motives, were the basis of the armed neutrality of 1780, in which Catherine of Russia "laid down as principles she intended to defend, the rules proposed by Denmark some months earlier; freedom for neutrals to trade with belligerents; free ships, free goods; contraband limited to munitions of war, exclusive of naval stores; a blockade not binding unless effectually maintained."—L. F. Brown, *Freedom of the seas*, pp. 95-96.

1792-1885.—French and English violations.—Protest of the United States.—Progress.—"During the period of the gigantic revolutionary and Napoleonic struggles (1792-1815), fundamental principles and customs of international law, more especially of maritime law, were set at naught by both France and England, and the rights of neutral commerce were violated in the most outrageous manner. Napoleon, through his Berlin and Milan decrees of 1806 and 1807, not only declared the whole British Isles to be in a state of blockade and interdicted all commerce and correspondence with them, but ordered that all vessels sailing to or from any port in the United Kingdom or its colonies should be confiscated. [See also BLOCKADE: Meaning.] The British Orders in Council declared all French ports, together with those of her allies, to be in a state of blockade, and ordered the confiscation of any neutral vessel carrying 'certificates of origin'—a device for distinguishing between British and neutral goods. These measures taken together threatened the destruction of all neutral commerce. These abuses called forth the protest and opposition of the United States, which had become the main champion of neutral rights and duties at the beginning of Washington's administration in 1793—a position which she has since, on the whole, maintained."—A. S. Hershey, *History of international law since the Peace of Westphalia* (*American Journal of International Law*, Jan., 1912, p. 45).—"The principles of international law (or as the diplomats still preferred to call it, the Law of Nations) were repeatedly endorsed in general terms by the statesmen of 1815, but they made no attempt to draw up 'a new code of the law of nations' such as Alexander I had suggested in 1804. They left it, what it had been since its first exposition by Grotius, a body of rules and usages generally

observed by the nations, and enforced by their courts, but nowhere quite authoritatively defined, and therefore open to dispute and to varying interpretations. They thus lost a great opportunity not only of placing the system on a sound basis, but of extending its scope. For there were many spheres in which international rules would have been advantageous, and might have been readily accepted in 1815, but which could only be dealt with by common agreement; such as the conditions under which a citizen of one state should be admitted to citizenship of another, the restrictions that ought to be imposed upon shipping for the safety of passengers and crew, or the rules for the extradition of criminals. Nevertheless, some additions were made in 1815 to the scope of international law. Thus there was an elaborate definition of the rights of navigation on rivers which pass through more than one country. More significant, there was a general declaration against the slave trade, first issued in 1815 on the proposal of Britain, and renewed in stronger terms at the Congress of Verona in 1822; and though these declarations did not amount to a formal prohibition, they were interpreted by the Conference of Berlin in 1885 as having made the slave-trade illegal 'in conformity with the principles of international law as recognised by the signatory powers.'"—R. Muir, *Nationalism and internationalism*, pp. 170-171.

1815-1914.—Great powers system.—The primacy of the great powers is the basis of the European concert. The Monroe Doctrine was originally conceived as a form of opposition to this theory, but has since lent itself to a similar idea of the position of the United States with regard to America. Japan, admitted to the circle of the great powers in 1899, has likewise formulated a theory of hegemony with regard to the Far East. These various doctrines, although endorsed by usage, have not received the universal assent which would make them a part of international law, and hold a rather anomalous position.—See also MONROE DOCTRINE.

1856-1909.—Rapid growth of international legislation.—Treatises and unofficial codifications.—"The half century beginning with the Declaration of Paris [see also PARIS, DECLARATION OF] in 1856 and ending with the London Conference in 1909 . . . has been a period of congresses and conferences, of international unions and associations with definite organs in the shape of commissions and bureaux which are rapidly developing a sort of international legislation and an international administrative law. Although the principle of nationality won its greatest triumphs during this period in the achievement of Italian and German unity (1859-70), it seems that the spirit of nationality is being modified or supplemented by that of internationalism, and that the older conceptions of sovereignty and independence are yielding to ideals of interdependence."—A. S. Hershey, *History of international law since the Peace of Westphalia* (*American Journal of International Law*, Jan., 1912, pp. 50-51).—"Before the end of the nineteenth century, general conventional agreements had been made and signed by a large number of states acting together upon such matters as an 'International Bureau of Weights and Measures' (Metric System), 1875; 'International Protection of Industrial Property,' 1883; 'Protection of Submarine Cables' (in time of peace), 1884; 'Exchange of Official Documents, Scientific and Literary Publications,' 1886; 'Repression of African Slave Trade,' 1890; 'Formation of an International Union for the Publication of Customs Tariff,'

1890; and 'Regulation of Importation of Spirituous Liquors into Certain Regions of Africa,' 1890. Such international agreements became a part of the written law of nations, but covered only a very small part of the entire field of international relations in peace and war."—G. G. Wilson, *Legislative aspects, in symposium on international law (American Philosophical Society, Proceedings, v. 55, p. 308)*.—See also COPYRIGHT: 1909-1021.—The more formal international legislation of the period deals largely with the rules of war and neutrality, and means of avoiding war; it comprises, in addition to the Declaration of St. Petersburg (1868) and the abortive discussions of the Brussels conference of 1874, five important acts: the Declaration of Paris; the Geneva conventions (q. v.); the Hague conventions of 1890 and of 1907 (q. v.); and the Declaration of London.

The official codes of 1856, 1864, 1890, 1907 and 1909 were the outgrowth of long agitation. As early as the end of the eighteenth century, Jeremy Bentham emphasized the need of authoritative knowledge of precisely what is the law between nations. It is to Bentham that we are indebted for the term "international law" which replaced the earlier "law of nations." His influence, especially great in England, France and Spanish America, inspired many other publicists. Yet it is to the government of the United States that the world is indebted for the first official codification of the laws of land warfare, in the "Instructions for the government of armies of the United States in the field" prepared by Dr. Francis Lieber, and issued in 1863. This served as a model for the Geneva convention, and also initiated a general policy of drawing up codes for both military and naval action, by all the more important European governments. Treatises on international law, and unofficial codifications, are now numerous. The more important writers, grouped according to nationality, are as follows: British: Phillimore, Travers Twiss, Hall, Maine, Lorimer, T. J. Lawrence, Walker, Westlake, Baty, Barclay, Cobbett, Higgins, Holland, Phillipson, Spaight. American: Kent, Wheaton, Woolsey, Halleck, Field, Pomeroy, Snow, Moore, Davis, Taylor, J. B. Scott, Hershey, Wilson. Swiss and German: Heffter, Bluntschli, Perels, Ullman, Oppenheim. French: Ortolan, Funck-Brentano et Sorel, Pradier-Fodéré, Bonfils, Despagnet, Merignhac. Italian: Fiore, Mancini. South American: Calvo. Belgian: Laurent, Nys. Russian: F. de Martens. Austrian: Lammasch, Neumann. Japanese: Ariga, Takahashi. With these should be included Sir William Scott, Lord Stowell, of England, and judges Marshall, Story and Gray, of the United States. The Institut de Droit International, founded at Ghent in 1873, has exerted considerable unofficial influence through its various resolutions and recommendations. A somewhat analogous place is occupied in America by the American Society of International Law.

1914-1919.—Violations during World War.—Treaty of Versailles.—It is impossible to determine exactly the present status of international law. In the World War violations were alleged on both sides, in connection with such matters as validity of treaties; treatment of prisoners, enemy aliens, and occupied territory; status and transfer of enemy merchantmen; use of gas and explosive bullets; submarine and aerial warfare; bombardment of monuments and unfortified towns; blockade and embargo; contraband; etc. This by no means implies that the law is non-existent. "Law does not cease to exist merely because it

is broken, or even because for a time it may be broken on a large scale; neither does the escape of some criminals abolish penal justice. . . . Concerning the law of nations, the wonder is not that it should be broken, but that, down to the present war it should have been fairly well observed by most nations and ostensibly respected by all, in spite of lacking any definite sanction."—F. Pollock, *Introduction to Wheaton's Elements of international law, pp. xl-xli*.—See also WORLD WAR: Miscellaneous auxiliary services: X. Alleged atrocities, etc.—"I do not hesitate to affirm that the violations of international law during the present conflict in Europe, fierce and wide extended as it is, have not exceeded, either in number or in importance, those that occurred during the wars growing out of the French Revolution and the succeeding Napoleonic Wars. In reality, many recent violations, which are commonly supposed to be new, have precise precedents, or analogies in what took place in the former titanic struggle, in which there were extensions of the contraband list and interferences with commerce under pretences of blockade, just as there have been during the present great struggle. These things are done, not because of any uncertainty as to the law, but because the parties to the war, being engaged in life and death contention by force, naturally think more of their own safety than of the interests of neutral nations. Nor is there in these things any reason for discouragement as to the future of international law. As the ordinary rules of intercourse have in all previous conflicts been more or less disregarded, according to the exigency or the intensity of pressure, so it has been found that when the incidents of the struggle came to be surveyed, there arose a general desire to extend the domain of law, to define its rules more clearly, and to take measures for their more effectual enforcement. This was what happened after the Thirty Years' War. The same thing occurred after the close of the wars growing out of the Spanish Succession. It happened again after the close of the Napoleonic Wars; and a similar phenomenon distinguished the ending of the Crimean War. . . . Judging, therefore, by the past, we are justified in looking forward to important developments in international law."—J. B. Moore, *Outline, in symposium on international law (American Philosophical Society, Proceedings, v. 55, pp. 294-295)*.—This prophecy, written during the progress of the war, has not yet been wholly fulfilled. The Treaty of Versailles does not attempt the urgently needed revision and clarification of international law. It does, however, set up in the league an international administration. And as precedents, its various provisions will doubtless affect the law profoundly, especially in the fundamental problem of the equality of nations, often referred to under the term "rights of small nations." "The primacy of the great Powers is sanctioned by more than a century of custom, which allows the affirmation not even of a legal equality. For although the acquiescence of the small nations in the decisions of the great Powers may have relieved the former of the necessity of admitting any invasion of the doctrine of equality, it is evident that the invasion took place none the less, inasmuch as their non-acquiescence would not have deterred the great Powers from carrying their decisions into effect. [The Treaty of Versailles perpetuates this system. Although equality is theoretically to be observed in legislation, the distinct preference shown to the five powers in the constitution of the judiciary] is

significant.] On the other hand, a new implication of the doctrine, one which has not yet received explicit definition, namely, that on highways or in zones, international or under international control, nations have equal rights of passage and trade, was recognized and sanctioned by so many provisions of the treaty that it must be regarded as firmly established. Finally, the only possible conclusion from the provisions of the treaty relating to the administration of international affairs is that they crystallize the primacy of five nations, the United States, Great Britain, France, Italy and Japan. . . . It is almost incredible that the crystallization of the inequality of nations in international administration should not result in the invasion by inequality of the status of nations in the formation and application of international law. Evidence is not lacking that the invasion has already begun."—S. W. Armstrong, *Doctrine of the equality of nations and the treaty of Versailles* (*American Journal of International Law*, Oct., 1920).

1920.—Recommendations of a committee of jurists.—A committee of jurists which met at the Hague in the summer of 1920 "unanimously recommended a series of conferences to be called 'Conferences for the Advancement of International Law,' to meet as successors to the first two Hague Conferences, [which met in 1899 and 1907] at stated times, to continue the work left unfinished, and the committee recommended further that the first of the series be held as soon as practicable for the purposes which they were bold enough to state as follows: 1. To restate the established rules of international law, especially, and in the first instance, in the fields affected by the events of the recent war. 2. To formulate and agree upon the amendments and additions, if any, to the rules of international law shown to be necessary or useful by the events of the war and the changes in the conditions of international life and intercourse which have followed the war. 3. To endeavor to reconcile divergent views and secure general agreement upon the rules which have been in dispute heretofore. 4. To consider the subjects not now adequately regulated by international law, but as to which the interests of international justice require that rules of law shall be declared and accepted."—J. B. Scott, *Development of modern diplomacy* (*History and nature of international relations*, E. A. Walsb, ed., pp. 121-122).

INTERNATIONAL LAW, American Institute of. See AMERICAN INSTITUTE OF INTERNATIONAL LAW.

INTERNATIONAL LAW, Private: Definition.—"Private international law is 'the jurisprudence arising from the conflict of the laws of different nations, in their actual application to modern commerce and intercourse.' In the validity, obligation, and dissolution of contracts, in the modifications and transfer of property, in successions by will or on intestacy, in questions of the capacity or status of persons, in delicts, and in many cases not easily classed, this conflict arises from the claim of a party to the benefit of some law other than that commonly administered by the Court in which he stands."—J. Westlake, *Collected papers*, p. 285.

Leading principles.—Of the main principles applied to the conflict of laws, the earliest to be derived were "the *Lex Situs* . . . and the *Lex Domicilii*, . . . [then] the *Lex Loci Contractus*, or the law of the place where the contract was made, which applied generally, to contracts; *Lex Loci Actus*, or law of the place where an act is done, which governed the validity of an act as regards its form, whence the principle *Locus Regit Actum*; and the *Lex Fori*, or law of the place where a dispute is being litigated, which governs matters of procedure. These principles have all been incorporated into English law, subject to various limitations and exceptions. The latest principle to be adopted is that of 'The Proper Law of The Contract,' which governs disputes as to the interpretation and obligation arising out of a contract. The term is used to indicate the law of parties meant to apply, which must be ascertained from a consideration of the contract itself. . . . In the most important Continental States nationality seems the determining factor. In France (Code Napoleon 1803, art. 3), Italy (Code 1865, art. 6), and Germany (Civil Code, 1900) their respective subjects are governed by their national law as regards status and capacity, and these nations similarly apply to foreigners the law of the party's nationality. Austria applies the law of nationality to its own subjects, but the law of domicile to aliens. English law generally applies the law of the party's domicile to such matters."—W. N. Hibbert, *International private law, introduction*, p. xxviii.

Conflict of laws in Rome and medieval Europe.—"When the Roman praetor under the republic judged between citizens of those states which it gradually absorbed, he aimed at extracting that supposed essence of all law in which their various codes agreed, and the result was a *jus gentium*, afterwards supposed to be identical with the *jus naturæ*. But when the conquest of Rome by the barbarians, and still more the mutual conquest of the barbarians by one another, had filled every country with a new diversity of laws, no second attempt of that kind was made. . . . The German disdained to be sued in the court of the vanquished race, and his own judges knew nothing of the texts to which the Roman plaintiff [see FETIALES] might have appealed. Thus within each of the new kingdoms there arose a system of personal laws, the mode of administering which, as well as their mutual claims, were necessarily regulated by the positive institutions of the victors. The general rule was, that the law of the defendant governed To the ancient idea of extracting a

residuum of agreement from conflicting laws, there had succeeded the idea of choosing one of them. Thus marriage was to be celebrated by the law of the husband; and so strictly was this rule adhered to, that wives who had been married by their law were dismissed at caprice, a practice to which, in the year 895, the council of Tribur could oppose none but religious sanctions. A thousand years before, the Roman praetor [see *ROME: Republic: B.C. 367*] would have separated the intention in which the laws agreed from the rites in which they differed, and would have held the marriage valid by the *jus gentium*. Nor could the principle be confined to the collision of laws within any one of the barbarian kingdoms. The German stranger who passed from one to another of them, if he did not belong to any of the races whose laws were recognised in his new abode, was aggregated to the victor people: theirs was the prior claim to what in German ideas was the benefit of the new partner. The Roman stranger brought his own law with him, for it existed everywhere; and his too was the common law of all those classes who, from the exercise of any trade or industry, were likely to have dealings creating the tie of legal obligation between subjects of different kingdoms. Thus, in the dismemberment of the Roman empire, the habit of appealing to some positive law in all possible private disputes descended unbroken from the days when the world obeyed but one master and knew but one jurisprudence."—J. Westlake, *Collected papers*, pp. 290-292.

14th century.—Bartolus' conception of international contracts and jurisprudence.—"There can be no doubt that the first trace of a distinct conception of the rules we now call Private International Law is to be found in the famous chapter of Bartolus, a great Italian civilian of the middle of the fourteenth century. . . . The first section distinguishes the formalities of a contract from its substantial effects, and places the former, as we do, under the law of the place where it is made. This is one of the great canons grounding all modern rules on the subject. The next section lays down another of our great canons—that the *lex fori* determines the course of procedure in every trial. Next, he treats of the rule of the *lex loci rei sitae*: then he treats of the law as to personal status, and therein of the general principle of domicile. Then comes the rule that in Private International Law, as distinguished from the Roman law, a testator may die partly testate, partly intestate. He then treats of laws extending personal capacity as having effect outside the territory, whilst those which limit personal capacity are confined to the territory where they are in force; next, the case whether the English rule of inheritance by primogeniture would be extended to real estate situate out of England. He next treats of the extra-territorial effect of penal statutes."—F. Harrison, *On jurisprudence and the conflict of laws*, pp. 108-109.

17th and 18th centuries.—Dutch and French jurists.—Late introduction into English law.—"The next great epoch was in Holland and Northern France in the seventeenth and eighteenth centuries. The Dutch civilians, who held fast, on the one hand, to the old theory that personal statutes everywhere followed the person whom they affected, on the other hand were confronted with the fact that Dutch independence required the most rigorous assertion of the principle that the Sovereign is supreme within his own territory, and also with the fact that they found themselves

surrounded with a mass of small communities having different local laws, and closely united in commercial intercourse. The Dutch jurists set themselves valiantly to adapt the problem of a supreme territorial law to the personal capacities and liabilities of a very migratory people. It was, in truth, a dilemma which far exceeded their utmost ingenuity. . . . The term in familiar use in modern law—conflict of law—seems to have been introduced (it certainly was popularized) by Huber, and dates from 1686. . . . The French . . . added nothing to the general principles of the science. It is needless to do more than note the works of D'Aguesseau, Bouhier, Froland, and Boullenois, all of whom flourished in the first half of the eighteenth century, the great pre-Revolution era in France."—*Ibid.*, pp. 114-116.—"So far as I know, there does not exist, in the whole range of the English law library, a single treatise, not an essay or a commentary, on this branch of law earlier than the nineteenth century. The Dutch civilians were scarcely known at all; the French were occasionally cited. Down to the middle of the eighteenth century in England I cannot find a single opinion or decision which seemed to show the consciousness on the part of English lawyers that there was any branch of law such as that we are now considering."—*Ibid.*, pp. 117-118.

19th century.—Development.—Problems in America.—"From the close of the eighteenth century, and in the early part of the nineteenth century, a series of new causes began to operate. The great school of philosophical jurists which culminated in Savigny transformed the field of jurisprudence. After the appearance of his *System of Modern Roman Law* the whole scheme of legal ideas received a new foundation. But before this, other causes had been at work. The new codes and system of law in Europe began to be compared with each other. New relations of intercourse between states were multiplied. And a far more fertile source of growth was at work. The States of America had each their own system of law, and they threw up a mass of problems, turning on the interchange of Municipal Law, precisely similar to those which the local law of the small communities of Holland and the provinces of old France had furnished to the Dutch and the French civilians of the seventeenth and eighteenth centuries. Each State in America had its law of marriage and divorce, its bankruptcy law, its system of land law and security law. Louisiana had the civil law of France for its common law, and the Code of Napoleon for the type of its code. The Northern States had the English common law and English decisions. Here was an unlimited source for problems in the Conflict of Laws. To solve these problems, the great American lawyers and judges were thrown back upon the old Dutch and French civilians. The American decisions and dicta of the civilians were all collected rather than arranged in the vast and trackless wilderness, that encyclopædia of learning, known to us as Story's *Conflict of Laws*. This famous work was first published in 1834. . . . and from the date of its appearance hardly a single case on this subject in America or in England, and perhaps few on the Continent, have ever been decided without some reference to this learned book. . . . But whilst the States of America had been furnishing to Story and his fellow-countrymen a vast assemblage of difficulties to solve in the Conflict of Municipal Laws, an analogous movement has been at work in England from the beginning of the nineteenth

century. . . . What was done by Story in America had been in some measure previously done for England by Lord Stowell. . . . The immense colonial empire which had been acquired or consolidated during the long wars at the close of the eighteenth and the opening of the nineteenth centuries, threw upon . . . [British] tribunals the ultimate decision of a vast body of cases arising under multifarious systems of law. English judges were called on to determine cases under French law, Dutch law, Danish law, Spanish law, and all kinds of modifications of the civil law, in accordance with local practice or special legislation. Along with these cases came those under the Indian law, partly Hindoo, partly Mahomedan, partly of British enactment. And cases under any of the local systems, or under any colonial code, were correlated with, or conflicted with, English law. . . . English tribunals, and especially the Privy Council, the ultimate tribunal of appeal for the whole colonial empire, . . . consequently had cast upon them a task such as perhaps never fell to the lot of any tribunal in ancient or modern times. It was nothing less than that of trying cases complicated by the rules of almost every system of law that obtains in any part of the habitable globe."—F. Harrison, *On jurisprudence and the conflict of laws*, pp. 118-122.

**INTERNATIONAL ORGANIZATION OF SCIENTIFIC RESEARCH.**—Two centuries ago the Royal Society of London [founded 1660] and the Paris Academy of Sciences [founded 1666] could easily embrace the whole range of science, and include in their membership essentially all

of the able investigators of England and France. The establishment of the Linnean Society in 1788 marked the beginning of a dispersive movement that has continued ever since. [But] the complete separation of investigators who might work in cooperation is certainly not desirable. The rise of astrophysics and physical chemistry is evidence enough of the advantage of bridging the gaps between diverging branches. . . . These principles have been applied in the United States by the formation [during the World War] of the National Research Council, a federation of research agencies, established under the Congressional charter of the National Academy of Sciences. The international scientific organizations that existed before the war were of several distinct types. Some devoted their efforts to the establishment of uniform standards of measure, others organized co-operative researches, while the majority held occasional congresses for the personal interchange of views. The International Association of Academies [founded ?] was without permanent headquarters or adequate funds, and was almost completely inactive between its triennial meetings. . . . The Royal Society [therefore] called an Inter-Allied Conference on International Scientific Organizations which opened in London on October 9, 1918. Belgium, Brazil, France, Great Britain, Italy, Japan, Serbia, and the United States were represented by delegates. The Conference decided to recommend the withdrawal from former international organizations and the formation of new ones, in which nations that had been neutral in the war would be invited to take part. It was recognized that some of the old associations would doubtless be recognized and continued. A second Inter-Allied Conference was held in Paris under the auspices of the Paris Academy of Sciences from November 26 to November 29, 1918. Delegates were present from the countries represented in London, and also from Poland, Portugal, and Rumania. The International Research Council [suggested at the previous conference by the American delegates] was provisionally constituted. [This] council and its associated bodies, the International Astronomical Union, the International Geodetic and Geophysical Union, and the International Union of Pure and Applied Chemistry, were formally inaugurated at the Palais des Académies, Brussels, at a meeting held July 18-28, 1919. The objects of the International Research Council, as defined at the Brussels meeting are: 1. To coordinate international activities in the various branches of science and its applications. 2. To encourage the formation of international associations or unions needed to advance science. 3. To guide international scientific activities in fields where no adequate organization exists. 4. To establish relations with the governments represented in the union for the purpose of interesting them in scientific projects. The General Assembly meets triennially at the permanent headquarters in Brussels. The United States is represented in the International Research Council by its National Research Council. The International Research Council provides the long desired means of coordinating the activities of international scientific bodies, which in the past have almost invariably worked independently. Similar confusion has prevailed in each of the participating countries, where no agency has existed to bring together men engaged in different classes of international research.—G. E. Hale, *International organization of scientific research* (*International Conciliation*, Sept., 1920, pp. 431-440).—See also INTERNATIONAL UNION OF ACADEMIES.

**INTERNATIONAL RELIEF.**—The term international relief has come to be associated almost entirely with relief work necessitated, directly or indirectly, by the World War. It might, however, be applied with equal exactness to all forms of charitable and philanthropic aid from foreign countries to any nation in distress. Thus there have been numerous instances of relief in time of famine, flood, earthquake, fire, and similar disasters. In the past the most frequent cases were of aid given by European nations and the United States to relieve distress caused by earthquakes, flood or famine. (See ITALY: 1908-1909; JAMAICA: 1907.) During and after the war, on the other hand, international relief was directed to the succour of the peoples of the war stricken countries, and it is this great work which is of the widest historical interest.

**Relief in Belgium and northern France.**—During the World War the people of Belgium and the invaded districts of northern France were reduced to great straits for food. A multitude of refugees fled to England, northern France and Holland where they were housed and cared for. But the bulk of the population was left behind without the means of obtaining adequate food, and many of them without the means of obtaining work. How to feed this multitude of helpless people was a problem which the American minister to Belgium undertook to solve. An American commission for relief in Belgium was organized under the directorship of Herbert Hoover, who in the face of manifold difficulties successfully carried out the great task laid upon him. Emile Commaerts made the statement that the need was so great "that the population would have been decimated by famine but for the help of the Commission for Relief in Belgium." "Mr. Hoover, in speaking [during World War] . . . of the work of the Commission, summed it all up under three heads. It had organized an almost perfect machine for securing justice and equality in the distribution of food, so that the poor had thereby been fed and kept up to the normal physical standard, enabling them to offer spiritual resistance to the invasion; it had provided a moral rallying-point to the communes; its delegates as eye-witnesses had acted as a constant restraint on Kreischefs and so prevented much brutality. Of the one hundred and fifty men who had thus far entered the Commission's service in Belgium, two were in asylums for the insane and thirty were suffering from nervous breakdowns."—B. Whitlock, *Belgium*, v. 2, pp. 233-234.—"Public appeals made in October, 1914, by Mr. Hoover, on behalf of the newly organized American Commission for Relief in Belgium, and by Minister Whitlock through the President, resulted in the swift organization of relief committees all over America. . . . At the same time Mr. Hoover begged the British Government for a subvention that would enable the Commission to begin work at once. . . . The sum of £100,000 [approximately \$500,000] was granted, and, with this actual money in hand . . . the Commission was able to begin making purchases and contracts on the large scale necessary to meet the Belgian cry."—V. Kellogg, *Fighting*

*starvation in Belgium*, pp. 95-96.—The annual report of the commission for 1916, stated: "The Commission for Relief in Belgium has its head office in London, with main branches in New York, Rotterdam and Brussels, and provincial or district offices in Antwerp, Liège, Namur, Ghent, Mons, Libremont, Hasselt, Charleville, Valenciennes, Longwy, St. Quentin and Vervins. All the functions of relief outside Belgium, including the purchase and transportation of foodstuffs and the mobilisation of charity, are carried out solely by this organisation. Through its Brussels branch the Commission maintains a separate organisation and direction in Belgium and Northern France, coördinating with the Comité National and the French district committees in the control of all relief distribution. . . . The Commission is of semi-diplomatic standing, . . . and is specially charged with responsibility as to the international guarantees under which it operates and the elaborate stipulations . . . providing that the foodstuffs shall remain in possession of the Commission until finally distributed to the consumers. . . . The 1914 crop and the pre-war stocks were not only to some extent destroyed and absorbed, through military operations, by the occupying army, but they could not, in the circumstances, be brought under control and properly conserved. Therefore, comparatively little wheat was left at the time relief began in November [1914]. . . . Negotiations were initiated in the month of June looking toward drastic control of the 1915 harvest of bread-stuffs. The total of such materials in the occupation zone . . . was placed under control of a Committee comprising American and Belgian nominees of the Commission for Relief and the Comité National, together with representatives of the German authorities. It was decided that an appropriate proportion of each peasant's production should be set aside for seed and food for his family through the year and left in his possession. . . . In the étape zone, however, the entire bread-stuff harvest was taken over by the [German] army, and an undertaking entered into with the Commission to supply the local committees with a ration. . . . The total overhead expense of the Commission was sixty-four one-hundredths of one per cent. the first year and forty-five one-hundredths of one per cent. the second year on the total value of supplies shipped to Belgium and Northern France, affording ample proof of the [volunteer nature of the services rendered]. . . . Most of the firms engaged in commercial operations on behalf of the Commission have either returned their fees or have made no charges. Inland purchases and conveyance from America, Canada and the Argentine have necessitated extensive rail transportation arrangements in which connection the Commission has enjoyed many generous concessions in rates and a large amount of entirely free transport, to say nothing of continuous and general favours in the way of extra facilities as to handling and delivery. The chartering and management of an entire fleet of vessels, together with agency control practically throughout the world, has been carried out for the Commission quite free of the usual charges by large transportation firms who offered these concessions in the cause of humanity. Banks generally have given their exchange services and have paid the full rate of interest on deposits; insurance has been facilitated by the British Government Insurance Commissioners; and the firms who fix the insurance have subscribed the equivalent of their fees. Harbour dues and port charges have been remitted at many points, and stevedoring

firms have made important concessions in rates. . . . In Holland exemption from harbour dues and telegraph tolls has been granted, and rail transport into Belgium provided free of charge. . . . The measure of the value of this volunteer service . . . is the low price at which foodstuffs have been delivered to the consumer in Belgium and the North of France. . . . To provide overseas transportation a frequent cargo-steamship service has been maintained between North America, the River Plate, India and United Kingdom with Rotterdam, all foodstuffs being shipped into that port for reshipment into Belgium and Northern France."—*Second Annual Report of Commission for Relief in Belgium, Nov. 1, 1914, to Oct. 31, 1916, pp. xxi-xxii, xxxii, xxxiii, xxxix, xl, xliii.*—In 1917 the organization had grown from small beginnings until it represented a volunteer service of fifty thousand persons, among whom were a very few partly paid experts. In February, 1917, H. C. Hoover said: "We buy our own material, we employ from fifty to seventy cargo ships at all times, and these ships fly the flag of The Commission for Relief in Belgium, and this is to-day the only flag at sea that is immune from attack or seizure. We employ hundreds of tugs and railway cars. We operate warehouses, mills, factories, and monthly distribute 220,000,000 lbs. of bread and 20,000,000 lbs. of bacon and lard, 5,000,000 tins of condensed milk, beans, corn, coffee, sugar, and thousands of tons of other commodities. Our dependants every month consume the wheat product of nearly 200,000 acres of American lands. . . . To assure the integrity of our organization we maintain bureaux of accounting, audit, statistics and inspection, covering the whole range from New York and Buenos Ayres to the last village in Northern France and Belgium. And our governmental relations involve . . . our own direct intervention with the governments on all sides and in broader issues the assistance of our own and the Spanish Ambassadors. . . . Of the \$250,000,000 spent in this work, approximately \$30,000,000 has come to our hand from the public benevolence of the world and less than \$0,000,000 of this sum has come from the American people. And, with the exception of one great gift of \$1,000,000 [from the Rockefeller Foundation], it has been the little rills of charity of the poor towards the poor. The great bulk of this expenditure has been furnished by the Allied Governments, and has been debited to the Belgian Government or to the Communes or Municipalities in Northern France which have received its benefits." After the United States entered the war the actual administration of relief was carried on by Dutch and Spanish staffs under H. C. Hoover, who continued to direct the work from outside Belgium. "Up to June 1, 1917, when the Government subsidies were provided for by loans from the United States Government, the Commission had had from the British Government, in round numbers, \$80,500,000, and from the French Government \$66,000,000, both these sums being in the form of loans to the Belgian Government, for relief work in Belgium. In addition, the Commission had had, from France, \$108,000,000 for relief expenditure in German-occupied Northern France. As charity from private sources, the Commission had had, up to the same date, . . . cash, food, and clothing to the amount of \$28,500,000, of which \$17,000,000 came from committees and persons in the British Empire, and \$11,500,000 from the United States. In addition the Commission had to its credit, on June 1, 1917, an additional \$5,000,000, temporarily accumulated in the course

of its commercial operations, which may be referred to as 'profit.' All this so-called 'profit' accumulation, however, is from time to time transferred to the Commission's strictly benevolent account. Altogether, therefore, the Commission had had available for its work, up to June 1st . . . [1918], \$297,000,000 in cash and goods. This takes into no account the large sums given within Belgium by cities, communes, and strictly Belgian organisations, sums whose total is not known to us but cannot fall short, up to date, of 500,000,000 francs [approximately \$100,000,000]. . . . The great sum received by private gifts from British sources has been chiefly raised by the admirably organised and energetically directed campaign of the British National Committee for Belgium Relief. . . . [About £800,000 was raised in the British Isles and used to supply ambulances for the Allies. The agricultural society also raised large sums for use in reconstructing devastated areas in France, and also in Serbia; but much of the work was lost when these areas were again overrun by the enemy. The British National Committee] has always worked in close co-operation with the Commission, but has managed its own affairs as to methods and details, turning over to the Commission, in London, the money, food, and clothing collected by it. The 'record' of all giving to Belgian relief is held by New Zealand, which from its population of 1,150,720 has sent to the National Committee \$2,655,758, or a *per-capita* average of \$2.29. Australia has given \$1.34 per capita, Canada 22 cents, the United Kingdom 9 cents, while the contribution of the United States averages slightly more than 10 cents."—V. Kellogg, *Fighting starvation in Belgium, pp. 96-98.*—"At one time in the fall of 1917 there were in progress in America fourteen national campaigns in the interest of raising money for war relief work in foreign lands and among our own troops for the year 1918. The funds sought in these various campaigns for purposes of war aggregated more than \$300,000,000. . . . [The] total funds raised for foreign relief in America up to 1918 amounted to more than \$20,000,000, and . . . supplies have been shipped valued at more than \$10,000,000, making a total of \$30,000,000!"—I. C. Clarke, *American women and the World War, p. 15.*—It is impossible to give anything like an adequate idea of the work done with these large sums and additional contributions made in other ways. Food was sent to Belgian prisoners in Germany; the American Ambulance Hospital in Paris was supported; the Civilian Committee of the American Fund began in 1917 to assist in the work of reconstruction; French children were cared for, some in homes, some "adopted" by individuals who undertook to send them a stated sum annually for a term of years; and hospitals were supplied.—See also BELGIUM: 1914-1918: National distress; WORLD WAR: Miscellaneous auxiliary services: IX. War relief.

Serbian relief: Scottish Women.—American, British and French funds.—"It was the good fortune of the Scottish Women to be able to give to the French four years of uninterrupted service in France, and over three years in Salonika. With the exception of the first four months, the Scottish Women worked for the Serbian nation during the whole war, through all their changing fortunes. With them they grappled with the dread typhus and overcame it; they accompanied them in the Great Retreat; they tended their wounded and prisoners in Krushevatz, and their refugees in Corsica; they followed them fighting through the Moglena Mountains; they strained to keep up

with their victorious armies over crest after crest, in the 'breathless rush' to Prilep, past Krushevatz and Kraguievatz, . . . and at the rear of their armies they entered Belgrade."—E. S. McLaren, *History of the Scottish women's hospitals, introduction*, pp. vii-viii.—The Serbian Agricultural Relief Committee of America, with the object of providing relief for the distressed peasant population of Serbia—the first organization for Serbian relief established in the United States—was founded in February 1915 under the auspices of the Serbian government. During the spring and early summer of 1915, seeds, plows, and other agricultural implements were shipped to Serbia, for use in reestablishing farms in the areas devastated during the Austrian invasion of 1914. When, however, the country was overrun by the Central Powers in the autumn of 1915, it became impossible to furnish further relief within the boundaries of Serbia. The word "agricultural" was dropped from the title of the committee and thereafter throughout the war its efforts were directed mainly to the relief of Serbian refugees, wounded and prisoners of war in Austrian territory. The work was carried on through English, French, and Swiss organizations, through whom money and supplies contributed in the United States were forwarded for distribution. The Serbian Relief Committee of America also had a large share in equipping and financing an Italian vessel which rendered vital service in rescuing Serbian refugees, after the great retreat to the Adriatic in 1915-1916, and transporting them from Albania to Italy. Early in 1919 the committee took up direct work in Serbia. The honorary secretary, with a unit of five, reached Belgrade in April, 1919, and in August a medical unit of twenty began operations in southern Serbia. The work expanded rapidly, and it was found necessary to appoint an overseas commissioner who took full direction of the work in Serbia in October, 1919. Changes in policy were made desirable by the altered conditions after the signing of the armistice, a general reorganization which was effected at the end of the year took effect on January 1, 1920, and the title of Serbian Child Welfare Association of America was adopted. At this time the overseas division was actively engaged in work in fifteen cities and towns and the association was supporting three trade schools, two orphanages, a vocational institute, a children's home placing bureau, seven health centers and dispensaries, three hospitals and a sanitarium beside engaging in other work. During the year 1920, the Association ministered to the sick and suffering, and fed, clothed and taught a total of one hundred thousand Serbians, the majority of whom were children who had passed through dispensaries, health centers and hospitals conducted by the association, or who had been visited by its physicians and nurses, or fed by its feeding stations. Through these institutions, preventoria, summer health camps and other agencies, some urgent need of an average of twelve thousand children a month was met. One of the most interesting and important departments of the work, and one which has had far-reaching results, was that of placing war orphans in subsidized families throughout Serbia, in accordance with the admirable plan put into operation by the Jugoslav government child welfare department. According to the official returns of 1920 there were still 50,000 of these homeless, orphaned children in Serbia proper to be provided for, while the government department had no funds available for the purpose. The association entered into full cooperation with

the government on October 1, 1920, and early in 1921 was placing the children in suitable homes at the rate of 1,000 a month. Before the association entered on this undertaking, a definite agreement was made between it and the government. Every child of school age had to have a satisfactory record of school attendance. The children were placed in selected communities, in groups of from 200 to 400, and wherever such a group was planted a health center was established. The municipality supplied the building, its furnishing, light, heat and water supply—also a Serbian staff of four. It was responsible for the upkeep of the building, and pledged itself to continue the work after the withdrawal of the Americans. The health center extended its care to all classes of children in the community, and established classes in practical home hygiene, the care of babies and children, and the training of nurses. The American association furnished, from its own trained staff, a doctor, dentist, dietitian, nurse, and assistant nurse, medical supplies, instruments, a definite sum of money to be used for definite purposes, and undertook the training of the Serbian staff. The beneficial effect, upon the country, of this program can hardly be estimated. From two to four hundred children were cared for in the families of each of a large number of carefully chosen communities, through the aid of a subsidy which required, and made possible, first, school attendance for the child; second, the establishment of a health center where every child was registered and his school attendance checked and through which, also, the subsidized homes were visited and material aid given wherever needed; the health of the children of the community was looked after by doctor, dentist and nurse, and classes were established in hygiene and nursing. The final responsibility for the administration and success of the program rested upon the people themselves, through local committees whose officers represented both the government and the leading civic organizations of the country. Such a program united the community life into a social whole. It was in effect, genuine community building; an organized effort to improve the health, child-care, education and well-being of each community.

The Serbian Relief Fund (British) was organized in September 1914 and immediately sent out three hospital units to Serbia. From November to January cases of typhus began to appear, and by the end of January the units were battling with all their might against the scourge. Then came the Austro-German invasion, and the Serbian defeat, which did not put an end to the activity of the Serbian Relief Fund. "On the contrary, it imposed fresh and ever increasing efforts on it. So long as the Serbian Army was able to defend its home territories, the task of the Serbian Relief Fund was to supplement its Medical Service. The converging invasion of the German, Austrian, and Bulgarian Armies introduced a new problem. Many thousands of refugees quitted their homes, and the task of succouring them fell to their Allies. . . . The stream of refugees flowed in two directions, the one to Salonica, the other to Scutari and the Adriatic. In spite of . . . difficulties the agents of the Fund were able to direct both streams with equal success, . . . to see the refugees comfortably settled under the care of the French Government in Corsica. The most difficult and adventurous task in the experience of the Fund fell to Messrs. Theodore Rigg and Robert R. Tatlock, two workers of the Friends' War Victims Relief Committee, who . . . spent

the months of December and January in Scutari and on the Adriatic coast. . . . The Serbian Government was in flight. . . . [Stores on torpedoed ships were lost, one large vessel laden with supplies was sent to the wrong port but they] managed to find food and organize relief for about ten thousand civilian refugees. . . . [The Serbians who arrived destitute of food and clothing and utterly weary, had in some way to be fed and sheltered. R. R. Tatlock in his journal said.] 'During this time sections of the Serbian Army had been moving off to Medua . . . and to Durazzo, and soon the refugees began to follow them. . . . [The Serbian minister of the interior promised] that all refugees at the coast should be fed with the army food. . . . [But at Medua everything was] in hopeless confusion. There were about 3,000 people lying on the rocks under the open sky, some having done so during six weeks. . . . There was plenty of excellent food on the shore, but several refugees were dying of hunger every day.' . . . Salonica was at once too overcrowded and too insecure to serve as a site for a settlement in which the refugees could be cared for until Serbia is restored, . . . and eventually the offer of the French Government to provide hospitality for all the refugees on its own soil was accepted. The majority were sent to Corsica, some to Algeria, and a few to places in the South of France. The Serbian Relief Fund would have been prepared to meet the full financial responsibility for the settlement in Corsica, but the generous offer of the French Government rendered this unnecessary, for it included not only lodging, but maintenance. . . . [To] the workers of the Relief Fund [however] . . . fell the medical care of the refugees and the responsibility of clothing them. . . . No time was lost in starting work to occupy the refugees. This was developed in such a way as to add to their efficiency, so that they would return to Serbia with some permanent gain from their exile. The French authorities sent the boys and students to Lycées, where they received the best education that France can provide."—G. Gordon-Smith, *Through the Serbian campaign*, pp. 293, 295, 296, 299, 300, 304-307.

**American Friends (Quakers).—British Friends.**—From the beginning of the World War until June, 1917, the American Friends cooperated with the English Friends in carrying on relief and reconstruction work in France. In June, 1917, upon the entrance of the United States into the war, the American Friends Service Committee, representing all the Friends (Quakers) in America was organized in Philadelphia. Over six hundred young men and women were sent to France to help build little portable houses for French refugees, raise rabbits, chickens and bees for distribution among the peasants, distribute clothing supplies, and operate hospitals for the civilian population. This work was closed early in 1920, except for the building and endowing of the Châlons maternity hospital at Châlons-sur-Marne, which will cost 1,250,000 francs and will provide for forty-six beds. This committee has worked jointly with the English Friends in all fields. Following the armistice the service committee sought means of bringing relief to the stricken people in Germany and Austria, and of healing the wounds of war. At first the work was confined to helping the German families whose husbands were still interned in England and the United States and in getting relief supplies to hospitals. In November, 1919, however, Herbert Hoover of the American Relief

Administration asked the committee to take charge of the child-feeding program for the whole of Germany. A careful survey was made and it was found that 75 per cent. of the children of Germany were undernourished and in need of outside help. Through the facilities afforded by the American Relief Administration food was shipped to Germany in January, 1920, and actual feeding operations began in February along the lines of the European Children's Fund operations in other countries. Feedings were carried on through school centers, and in June, 1920, as many as 732,000 children were fed daily. Simultaneously with the beginning of the work in Germany, the Friends began their work in Vienna for the relief of children under six years of age so as not to overlap the work of the European Relief Council which provided relief for all children between the ages of six and fourteen. As many as 32,000 children with about 4,000 nursing and expectant mothers were provided with extra food. Considerable contribution in food supplies were received from the American Red Cross for this work. In addition to the work of child feeding, distribution of clothing was made and general relief given to the middle classes and to students. In order not to pauperize the people a small charge was made for all supplies, except that contributed by the American Red Cross, and the money thus obtained was used to purchase more supplies. Considerably more than \$500,000 was spent in relief work in Austria prior to 1921. The group of Friends, who were designated to work in Serbia, arrived at Salonica, August 28, 1919. Their first work was to supervise the building of 100 houses by Bulgarian prisoners. Next they reestablished a government agricultural school at Leskovatz, put it in running order, and in 1920 turned it over to the Serbian authorities. They then went to Pec, in western Serbia, where they supervised the building of 153 houses for Montenegrin families, worked tractors and threshing machines, in order to help the Albanians and Serbians take care of their crops, and supervised dispensaries in the city of Pec and four nearby villages. In Poland the Friends engaged in anti-typhus and agricultural work, and endeavored to help the peasants to obtain farm equipment and farm stock. Much work was done in the care of the thousands of refugees who poured into Warsaw, and in helping the refugees with whom the Friends worked in the province of Samara and Siberia at the time of the Bolshevik drive. About \$200,000 had been expended in this work up to 1920. The work carried on in Russia during the war was continued after the armistice until February, 1919. Activities centered in the province of Samara, east European Russia, later in Omsk and Vladivostok, and by invitation of the soviet government permanent headquarters for relief work were established in Moscow.—See also below: Russian famine relief.

When work in the war stricken countries was begun in the autumn of 1914 British "Friends little imagined . . . that workers wearing the Quaker Star would find their way to France, Holland, Russia, Serbia, Poland, Corsica, and later to the Central Empires themselves. The first country claiming help [in October, 1914] was, naturally, devastated France. . . . The first task of the workers was to provide the most needful clothing and footwear, and to set to work on the construction of shelters in the destroyed villages, both in the Marne and the Meuse, [and the establishment of a hospital]. . . . It would be impossible to enumerate the villages and towns where relief and medical work was established. One of the principal centres was for a long time at Sermaize les

Bains . . . [where] a hospital was started, which became the centre of a very large medical and surgical work in the district. Later, when American Friends came on the field, a second hospital was opened. . . . In all the destroyed villages, the erection of temporary houses, or the repair of those which were still partly standing, formed a large part of the work of the Mission, and both at Dôle and Ornans in the Jura construction camps were established. . . . In many centres industries were started, to help the people to provide for themselves. . . . The Somme unit were installed in 1917, in desolate country . . . [where] it was necessary to haul everything from the outside world. . . . [Here agricultural workers were assisted to commence life anew.] The entry of American Friends into the work, both in France and in other fields, made it possible to extend very greatly, and the co-operation during the last two or three years . . . [was] a most happy piece of true international service. . . . Early in the autumn of 1914, work was started in *Holland*, among the Belgian refugees who had flocked across the frontier in thousands, and had been most generously received by the Dutch who provided them with shelter, food and clothing. . . . The enforced idleness of the refugees made it needful to start industries for the men, such as brush-making, and work rooms for the women and girls who soon became expert in rug-making and embroidery. . . . In 1915, in co-operation with the Serbian Relief Fund, work was started for *Serbian* refugees, first at Salonika, and later in Corsica, Corfu and Algiers, where work rooms were started both for women and men. . . . But among all the unhappy victims of these years of war perhaps none have suffered more than the peasants of *Russia*. . . . A pioneer party of four Friends left England in April, 1916, to investigate and report on the possibilities of giving help, . . . and the district of Buzuluk, an area as large as Belgium, was chosen as being a centre perhaps more destitute of help, and more crowded with refugees than any other. There was no doctor in the whole 700 square miles, though thickly peopled with 100,000 souls, of whom a quarter were refugees from the western frontier, 1400 miles away. . . . By the end of 1916, about thirty workers were scattered among various centres, and relief, medical and industrial work was in full swing. . . . Efforts were made during 1917-18 to combat the famine, consequent on a succession of bad harvests, and a special fund was raised in England for this purpose, chiefly for the purchase of seed-corn in Siberia and elsewhere. . . . In 1918, owing to the state of civil war in Russia, and the great unsettlement of the country, the Unit was obliged to withdraw, *via* Siberia, some to take up work among the refugees there, and others to return to England and America. . . . [Later the Relief Committee went to] *Poland*, in response to urgent appeals for help from various sources. By the autumn of 1919, a Unit of twenty-four workers was fighting typhus, starvation and lack of clothing."—E. F. Howard, *Friends' service in war-time* (pamphlet), pp. 18-26.

**Jewish relief.—Joint Distribution Committee.**—This committee consists of representatives of the American Jewish Relief Committee, the Central Committee for the Relief of Jews Suffering through the War, and the Peoples' Relief Committee. It was established November 27, 1914, after a conference between representatives of the American Jewish Relief Committee and the Central Relief Committee. The Peoples' Relief Committee was invited to send representatives to the Joint Distribution Committee on November 20, 1915. The

Joint Distribution Committee had a sub-committee of six members which received and digested all reports from belligerent countries and which upon the basis of such reports made recommendations or appropriations to the full committee. The delays in the receipt of reports from the different committees abroad and the fact that it was impossible from this end to decide as to the best methods to be employed for the relief of the appalling distress, led the Joint Distribution Committee to arrange to send a commission of its own representatives to investigate the situation on the spot and to establish permanent distribution agencies responsible directly to the Joint Distribution Committee. It exerted every effort to place the relief funds in the hands of a responsible committee in each country, which could, upon a judgment formed after a general survey of the situation as contained in each zone, apportion the money for the best interests, present and future, of the hundreds of thousands of people it was endeavoring to assist. In February, 1915, President Wilson was induced to issue a proclamation appointing a National Jewish Relief day, for which contributions were especially asked. Proclamation certificates of varying denominations were given in return for contributions and brought in \$67,000. The "Week of Mercy" secured more for the cause. For this the relatively small municipality of Sioux City, Iowa, alone gave \$8,000 and from Attleboro, Mass., where there are only thirty-five Jewish families, there came \$1,426. A statement by Herbert H. Lehman, the treasurer of the Joint Distribution Committee, issued in April, 1917, shows a total of more than \$8,200,000, collected by the three committees and distributed by the Joint Distribution Committee. Not a part of Europe or Palestine, where Jews suffered failed to receive assistance. Large sums went to Russia, Poland, Lithuania, Austria-Hungary, including Galicia, Palestine, Greece, Turkey, Syria, Egypt, Rumania, Serbia, Smyrna, Bulgaria, Tunis, Algiers, Morocco, Switzerland, and to Russian Jews in France and Turkish Jewish refugees in Spain. Help was extended to three continents and to fourteen distinct countries. Relief ships with food, medicines and supplies were sent abroad through coöperation with the state and navy departments of the United States, and with the consent of foreign governments, and arrangements were made for the bringing to America from the Far East of hundreds of refugees. Not even the supplying of matzoths for the feast of the Passover was overlooked. Special work was done by the Joint Distribution Committee in looking after the thousands of Jewish war refugees scattered throughout Europe. The committee hastened to order its workers to initiate relief activities at all the refugee centers and to coöperate at every point with the Hebrew Immigrant Aid Society, which had been working in the field of immigrant relief for many years. The committee established a special department for the care of Jewish war orphans, with headquarters in New York. This department supervised the work of caring for the Jewish war orphans in Europe and the East; it utilized the advice and services of experts in this field and worked in every possible way to provide shelter, care and homes for as many of the children as possible. The department operated under the direct supervision of the committee on war orphans of the Joint Distribution Committee. The plans for the care of Jewish war orphans were as follows: To survey the problem of Jewish orphan care in Europe, ascertaining the number of orphans in each country, the agencies active, available

workers, etc.; to secure data on budgets required for the work in the various fields and to develop uniform budgets for the entire work of orphans' care; to arrange for the registration in Europe of orphans having relatives in America or other countries and make arrangements for the reuniting of these children with their relatives wherever possible; to study the problem and possibilities of special care for pogrom orphans and arrange for their removal to other localities or their bringing to America; to arrange for a system of "orphan adoption" similar to the plan used in non-sectarian fields in Serbia, France, and Belgium, by which persons in America might pay a given amount for the support of a designated child in an institution or private family in Europe. The committee rebuilt many destroyed homes, provided for the permanent care of war and pogrom orphans, and supplied individuals and associations of artisans and traders with easy credit, tools, machinery and raw material. On all these activities the committee had expended, from the time of its organization until December 27, 1920, the magnificent sum of \$35,010,101.85, of which \$10,633,580.20 was disbursed in 1920.—See also below: European Relief Council; Russian famine relief; WORLD WAR; Miscellaneous auxiliary services: XI. War relief: f.

The work did not end with the immediate post war activities, but was carried on in eastern Europe and Palestine, more especially with the idea of assisting the recipients of aid to become self-supporting. "Reconstruction activities in the distribution of credit through locally organised credit institutions are now [1922] being carried on in Poland, Latvia, Lithuania, Esthonia, Rumania, Turkey, and Palestine. Credit activities are being instituted in Czechoslovakia and Hungary. A field party is at present on its way to Russia, and much work will be done there shortly. Approximately three million dollars have been appropriated for credit alone already, 361 approved loans for individual rehabilitation . . . [amounted to] 1,002,700 lei (in September the lei was approximately 150 to the dollar), and of the realty loans 5,313,100 lei, a total of 7,305,800 lei. Of the realty reconstruction loans 74 per cent were for terms of between 10 and 15 years, and 14 per cent between 5 and 10 years. The great majority (93 per cent) of the individual rehabilitation loans were for periods of over two years. More than half the borrowers were of the commercial class; 25 per cent were artisans. A similar table for Poland would show 186 co-operatives to which have already been transmitted for co-operative credit operations 117,600 dollars, and which have already disbursed as loans for individual rehabilitation Polish marks 760,545,867.50. . . . In Lithuania realty loans have been approved in fifty towns for a total of 34,835,000 marks. Actual construction has been started in 34 towns. On September 30 there were 364 houses under construction, . . . [to] provide accommodation for 1,888 individuals. More than one thousand houses are under construction in Bukovina. In Bessarabia, in Poland, in Latvia, in Czechoslovakia homes and stores are being constructed and repaired with loans made by the A.J.D.C. through locally organised co-operatives. Additional disbursements have been made for loans to co-operatives. In Lithuania, for example, 1,425,000 German marks have been lent to produce co-operatives, and 150,000 German marks to agricultural co-operatives. In Poland 43,000,000 Polish marks have been lent to 14 co-operatives, ten of which are consumers, three raw material, and one produce. In other countries similar loans have been made, and these, to-

gether with special loans to agriculturists, add a considerable sum to the budget of the Reconstruction Department. . . . The third important feature of the programme of the Reconstruction Department is trade education. Subventions are being granted to trade schools in Poland, Lithuania, Latvia, Hungary, and Rumania for the purchase of equipment destroyed during the war. . . . In addition to the re-equipment of trade schools which have suffered by reason of the war, the A.J.D.C. . . . adopted the policy of equipping and helping to maintain during the first few years of their existence new institutions for trade education. In East Slovakia and Sub-Carpathia, where the need for such new institutions has been made apparent, the A.J.D.C. is equipping and partially subventioning the support of teaching workshops and an agricultural school."—M. S. Viteles, *American aid to Jewish war sufferers* (*Manchester Guardian Commercial*, Nov. 16, 1922, pp. 630-631).—See also FOOD REGULATION: 1918-1921; WORLD WAR: Miscellaneous auxiliary services: IX. War relief.

**American Relief Administration.—European relief after the Armistice (1918-1922).**—"On the day after the signing of the Armistice, Mr. Hoover, then United States Food Administrator, was requested by President Wilson to proceed overseas to enter into arrangements with the Allied Governments for the immediate supply of food to the war-torn countries of Central and Eastern Europe. . . . After negotiations with the Allied Governments Mr. Hoover was appointed Director General of Allied Relief, acting under the Supreme Economic Council. . . . No evidence need be repeated showing why the people in a broad belt from the Baltic to the Adriatic and Black Seas needed food at the close of the most exhaustive war of civilisation, and no picture need be drawn of the even more complete catastrophe that would have followed had not help been forthcoming. . . . The principal task of the American Relief Administration, or the A.R.A. as it became known, was that of arranging the transportation and distribution of some 3,000,000 tons of foodstuffs from America, but to carry out efficiently these arrangements it was found necessary for the Director General of Relief to take over the temporary control of railroads in Central and Southern Europe; to establish or control some 10,000 miles of telegraph and telephone lines; to arrange barge shipments on the Danube, Elbe, and Vistula; to initiate exchange of food commodities between central and southern Continental States; to arrange the shipment of certain United States army stocks in France; to ship and distribute some 5,000 tons of American Red Cross clothing; to establish a temporary exchange system between America and Europe by which some \$7,000,000 were sent by Americans to relatives in devastated countries; to assist in the importation of raw materials to these countries; and in general to assist in the re-establishment of normal economic life. . . . The Allied and neutral countries thus supplied through the United States were Denmark, Holland, and Italy. The ex-enemy countries supplied were Germany, Austria, Bulgaria, and Turkey. The so-called liberated territories supplied were Finland, Esthonia, part of North-West Russia, Latvia, Lithuania, Poland, Belgium, Northern France, Czechoslovakia, Hungary, Rumania, Kingdom S.H.S. (Jugoslavia), part of South Russia, and Armenia. . . . The supplies delivered by the American and the Allied and neutral Governments, under the direction of Mr. Hoover, reached the . . . total of about 4,760,000 tons of foods, valued at over \$1,147,600,000.

Of these the value of supplies from America was about \$870,000,000, or nearly 77 per cent; those from the British Empire about \$120,000,000, or over 10 per cent; from France and Italy about 2 per cent each; about 4 per cent was financed jointly by the United Kingdom, United States, France, and Italy; and the remainder came from other countries. Of the deliveries from the United States approximately 20 per cent were sold for cash, 77 per cent on credit, and 2.2 per cent were given as charity. This latter item amounted to about \$10,300,000, including child feeding supplies from the United States Government as well as supplies furnished by charitable organisations. Of the deliveries from the British Empire administered by Sir William Goode about 65 per cent were sold for cash, 32 per cent on credit, and 3 per cent, or about \$3,498,000, given as charity, which, in view of the stringent food situation in the United Kingdom itself, represented a very substantial gift. In addition, it is roughly estimated that American charitable organisations, acting independently during this period, contributed relief to the value of some \$33,000,000. . . . The child relief started by the old A.R.A. was . . . carried on by the new private organisation. This work was projected for only one more year, and although improved conditions in certain parts made it possible to reduce the programme in 1920, the situation was then still bad in Central Europe generally. In short, the prolongation of the conditions caused by war disruption in Central Europe, unexpected by all to last as long as they did, made it seem essential to carry on these and other measures of relief through to the harvest of 1922, when it was found possible finally to withdraw. During this time mass child feeding was carried on under Mr. Hoover's direction in fourteen countries of Central and Southern Europe. These were Finland, Esthonia, part of North-West Russia, Latvia, Lithuania, Danzig Free City, Poland, Northern France, Czechoslovakia, Austria, Hungary, Rumania, Jugoslavia, and Armenia. The greatest number of children fed were in Poland, Austria, and Czechoslovakia. With each harvest year it was possible to further reduce the programme until, in the present year [1922], child feeding was being carried on only in Esthonia, Latvia, Poland, and Austria. . . . During the whole period about 8,000,000 different children in Central Europe have benefited from these relief importations, including 1,000,000 fed in Germany under the American Quakers, with whom the A.R.A. co-operated in furnishing and transporting supplies. The programme of distributing free cooked meals has included as many as 4,000,000 children at one time, to whom a total of over 1,500,000,000 meals have been given since the Armistice. Warm clothing valued at over \$8,000,000 was distributed to more than 2,000,000 children, who came to kitchens in the coldest weather most pitifully clad. One of the tests of the urgency of the need in the various countries was the willingness of the respective Governments and people to contribute materially to the relief of their own needy children. . . . Leading citizens gave their services to national, district, or local organisations which conducted the feeding, and over 100,000 men and women co-operated, most of whom were volunteer workers. . . . From the start it was the constant endeavour to organise this relief as a step in self-help. . . . With few exceptions this policy attained complete success. The total expenditures of the A.R.A. for child relief in Central Europe from American funds since the Armistice amounted to about \$47,000,000 (not including relief in Germany

under the Quakers), while the known values contributed to the same operation by Governments and citizens of the countries aided amounted to about \$28,000,000, or 60 per cent of the American donation. . . . The policy of organising local bodies composed of prominent citizens to carry out this relief work has yielded the hoped-for result of providing a foundation for the continuation of child-welfare measures by these countries themselves. Such organisations, founded and built up by the A.R.A., have been perpetuated as national welfare bodies in Poland, Czechoslovakia, Austria, Hungary, and Rumania, incorporated as semi-official agencies by legislation and provided with subsidies or assistance by the national and provincial Governments. . . . In Finland and in Jugoslavia this work was taken over by the respective Ministries of Health. In addition to child relief the A.R.A. purchased, shipped, and delivered to other foreign relief organisations supplies valued at \$4,462,000, for which these organisations paid. Relief was given to needy members of the educated or professional classes in Austria, Poland, Czechoslovakia, and Hungary from funds given by various American charitable organisations, most prominent among which was the American Commonwealth Fund with gifts amounting to nearly \$1,000,000. This relief was afforded through food packages given the most needy members and through university and other kitchens. Material for clothing was also distributed. . . . Meals were also furnished to 30,000 needy university students in seven countries from donations of \$370,000 and refugees and others were given food from special funds of \$452,000. There was also the food draft operation through which those in America and elsewhere were enabled to purchase drafts for standard parcels of food to be delivered to friends or relatives in Central European countries. Delivery points were set up in Germany, Austria, Poland, Czechoslovakia, and Hungary. The foods were shipped in bulk, made up into parcels at the local points, and delivered upon presentation of the drafts by their recipients. Food could thus be sent to a person in Vienna or Warsaw as quickly as the mails could carry a letter, with no damage or loss. 397,000 such food parcels were delivered, the value of which was about \$5,850,000."—S. Brooks, *American aid to Europe through Mr. Hoover* (*Manchester Guardian Commercial*, Nov. 16, 1922).

**European Relief Council.**—Organization for child relief in Europe.—Hoover campaign.—Eight great relief organizations, working among every race and creed, united under the name of the European Relief Council to coördinate child relief in Europe. In the winter of 1920-1921, the council sought to provide funds for 3,500,000 starving and diseased children in eastern and central Europe and to administer this relief economically, according to Herbert Hoover, who was chosen chairman. The coöperating agencies were the American Relief Administration, the American Red Cross, the American Friends Service Committees (Quakers), the Jewish Joint Distribution Committee, the Federal Council of the Churches of Christ in America, the Knights of Columbus (see KNIGHTS OF COLUMBUS: 1914-1918), the Young Men's Christian Association and the Young Women's Christian Association. Franklin K. Lane was chosen treasurer of the council and R. J. Cuddihy of the *Literary Digest*, director of publicity. The relief was divided into two parts: (1) that of providing food and clothing, and (2) that of providing medical supplies and giving medical and nursing aid. The work of providing food and

clothing was carried out by the American Relief Administration, the American Friends' Service Committee, and the Jewish Joint Distribution Committee. The child-feeding program was carried on in each district by local authorities under the supervision of American directors, and the medical and nursing work was operated through units composed of a doctor, several nurses and a social worker, the units using local personnel. Where possible all efforts were directed toward building up in the community, in collaboration with the public authorities and local organizations, permanent constructive measures for saving child life which remained effective when American agencies withdrew. Upwards of 150,000 women of the various races in Europe furnished this service necessary to care for the children of their own countries.—See also FOOD REGULATION: 1918-1921.

Near East Relief.—“Near East Relief, incorporated by act of Congress, approved August 6, 1919 [with national headquarters at New York and Washington], continued the work of the American Committee for Armenian and Syrian Relief (sometimes known as the American Committee for Relief in the Near East). This earlier Committee, the American Committee for Armenian and Syrian Relief, was organized in October, 1915, in response to an urgent cablegram from Hon. Henry Morgenthau, United States Ambassador in Constantinople. . . . This unincorporated association issued appeals to the American public and transmitted funds for relief purposes through . . . [the American ambassador] and other American representatives from October, 1915, to October 14, 1919. The first meeting of the Board of Trustees of Near East Relief was held October 14, 1919, at which time the organization was completed. . . . The relief work of Near East Relief on the foreign field has been administered by an overseas staff of 538 American men and women, organized under the direction of Col. William N. Haskell, U. S. A., Allied High Commissioner for Armenia, with headquarters at Tiflis; Col. J. P. Coombs, with headquarters at Constantinople, and Maj. James H. Nicol, with headquarters at Beirut, and American Consular agents in Persia and Bagdad. The immediate object of the Near East Relief has been physical relief, the distribution of food and clothing to save men, women and children from death through starvation and exposure. Coincident with the provision of food and clothing, it has been necessary to engage in related activities, directly due to the atrocities and other tragedies of the war in the Near East—such as the care of dependent children made orphans by massacres and deportations, homes for Christian girls enslaved in Moslem harems, hospitals and medicine for the thousands suffering from disease and malnutrition, and industrial workshops to aid a people normally industrious to become again self-supporting. All of these various forms of relief work have been carried on under a unified management.”—*Report to Congress by the Near East Relief, 1919, pp. 5-7.*—“When the relief work was undertaken, it at once became evident that a great number of children . . . must be cared for in institutions. . . . So far as funds have permitted, educational work has been carried on. The older children have been taught the various arts and crafts that will enable both boys and girls to become self-supporting. . . . Near East Relief in all its work aims at permanent results and to this end makes education for the orphans in its care one of its primary objects. As soon as the children are physically fit they are allotted to classes, the older ones alternating a half day in the school room with a half day of

industrial training. A director of education has been appointed to standardize the educational system, and to further the plan already under way to relate the course of study in the orphanages to that already established by government. Teaching is done in the native languages. . . . One feature of Near East Relief work that touches America closely is the reuniting of families and the transmitting of funds from friends and relatives of the distressed from the United States to the Near East. Constant advertisements for relatives in America are placed in our foreign press, and during [1920] \$100,000 per month has been transmitted through Near East Relief to relatives and friends, and such persons have been returned to the care of relatives. The card catalog of refugees with over 40,000 names is a register of human woe so pressing that it takes a stout heart to meet it.”—*Report of Armenian Committee, pp. 30-31, 35.*—The Commonwealth Fund was able in 1919 to contribute \$750,000 to the Near East Relief and to feeding Armenian children. In 1920 \$500,000 was used for food drafts to be distributed in Vienna, Warsaw, Budapest, and Prague, to women engaged in the arts and professions, including teachers, former army officers and officials of state, in a word, to the needy of a class which was ordinarily overlooked in the distribution of relief because of the difficulty of reaching them.

“Near East Relief . . . conducted activities during . . . 1921 in Constantinople and the adjoining territory in European Turkey, Thrace, Anatolia, Armenia, Cilicia, Kurdistan, Syria, Palestine, Mesopotamia, Persia and Trans-Caucasia (Russia) including Russian Armenia and Georgia. . . . While relief has been given on the basis of greatest need to all suffering and dependent people of the Near East, the greater part of the work has been among the Armenians, Greeks, Syrians and Assyrians. On account of political conditions and continued military operation, it is impossible to secure complete and accurate statistics for the entire near East Relief area as of any given date. . . . [but] the general fact is established that at least 1,000,000 people, chiefly Armenians and members of the exiled subject races, are living in the Near East today who would have perished had it not been for American relief. . . . The largest single unit of relief work done by the Near East Relief has been in the portion of Transcaucasia known as Russian Armenia. Probably one half of the people now living in this area owe their lives, more or less, directly to the work of the Near East Relief. The president and other officials of the Armenian Republic a year ago officially declared that America literally saved the country from starvation. Certainly not less than 500,000 people in this area at that time were dependent upon relief. Many thousands had died of starvation before relief reached them, the victims of starvation in a single city such as Alexandropol or Erivan averaging at certain seasons from 150 to 200 a day among refugees, exclusive of citizens who died in the shelter of their homes. . . . The largest continuing feature is in connection with the orphanages. As of December 31, 1921, Near East Relief is conducting 124 orphanages in which there are 64,107 children, wholly dependent upon the orphanages as their only home, and approximately 50,000 others, fed and dependent upon the orphanages for the necessities of life.”—*Report to Congress by the Near East Relief, Dec. 31, 1921.*—“By the end of 1922, Near East Relief had equipped and staffed five relief stations, forty-four hospitals, which treated monthly 148,728 clinic patients, and sixteen homes for women rescued from Moslem harems. The

association employed an American staff of about 300,—some of them volunteers—as organizers and administrators of the system designed to and actually giving employment to 100,000 native workers. Near East Relief shipped overseas in 1921, 13,408 tons of clothing, food, medical supplies and other commodities, valued at \$2,186,833; and up to November 30, 1922, shipped 25,322 tons, valued at \$4,251,074. The total value of Near East Relief's operations to date approximate \$73,000,000."—*New Far East, Feb.*, 1923.—In 1922, Australia organized the Armenian Relief Fund of Australia, which raised \$100,000 preliminary to taking over a group of orphanages. The commonwealth also sent four cargoes of flour to the starving people, with the assurance "that there would be one each month."

Russian famine relief.—"Just at the time when it was thought that the A.R.A. could withdraw from their work in Europe the world was startled by the news of the famine in Russia, and in response to an appeal from Mr. Maxim Gorki, Mr. Hoover replied on July 23 [1921] . . . expressing his willingness to extend the aid of the A.R.A. After full discussion between Mr. Walter Lyman Brown, Director for Europe of the A.R.A., and Mr. Maxim Litvinov, representing the Soviet Government, an agreement was signed at Riga on August 20 which provided that the A.R.A. were to give relief to famine sufferers to the limit of their resources, and that the Russian Government were to pay all overhead expenses of this work in Russia, including transportation and warehousing of all supplies, the expense of Russian personnel, and other expenses of internal distribution. Resources available at the start only permitted plans for the feeding of one million children. Other resources which later came to hand permitted the raising of this programme until one meal a day was being furnished to over 4,000,000 children and to 100,000 adults, refugees and in hospitals; a daily ration of one Russian pound of corn being given to over 6,000,000 adults in the famine region (bringing the total fed to over 10,000,000); medicines and medical supplies valued at \$7,600,000 to combat the spread of epidemics that followed in the wake of the famine were being distributed to hospitals in Russia; and 200,000 tons of seed grain had been distributed for sowing in the Volga valley. This work was made possible by the contribution of \$24,000,000 in cash and medical supplies by the United States Government, of \$3,600,000 worth of medical supplies by the American Red Cross, about \$4,000,000 by the American Joint Distribution Committee for Jewish War Sufferers, and of \$12,000,000 worth of seed grains purchased and transported by the A.R.A. against gold payment by the Soviet and Ukrainian Governments. By agreement this gold was guaranteed and attested to have been in the possession of the Russian Treasury since August, 1914. An individual food-package plan was also started. By September more than 700,000 of these parcels, valued at over \$7,000,000, had been purchased in Europe and America for delivery to individuals in Russia. These parcels are made up and delivered through nineteen delivery stations in the principal cities of Russia. Clothing remittances are also now [November, 1922] being sold. Besides this the A.R.A. has delivered in Russia to other foreign relief organisations supplies to the value of \$1,825,000, and has credits on its books for \$1,000,000 worth of supplies for the future operations of these organisations. American relief organisations other than those mentioned above affiliated with the A.R.A. in Russia are the Society of Friends,

Memnonite Relief, European Student Relief, Federated Churches of Christ, National Catholic Welfare Council, National Lutheran Council, Volga Relief Society, Young Men's Christian Association, and Young Women's Christian Association. Some of these organisations have contributed funds through the A.R.A., and others have, in addition to other activities, distributed foodstuffs to the value of over \$1,100,000, mentioned in the preceding paragraph."—S. Brooks, *American aid to Europe through Mr. Hoover* (*Manchester Guardian Commercial, Nov. 16, 1922, p. 628*).

ALSO IN: V. Kellogg, *American relief for starving Russia* (*New York Times Current History, Jan., 1922*).

"In response to a personal request from President Harding, Herbert Hoover, Secretary of Commerce, on Feb. 10 submitted to the President a special report on the status of the work for famine relief. This report read in part as follows: . . . 'The American Relief Administration was appointed by you to distribute the Congressional appropriation; also to distribute food, clothing and medical supplies from a number of other sources. The total resources of the organization since the beginning of its work in Russia, are in round numbers . . . \$52,809,700. [In December, 1921, the American government appropriated \$20,000 for Russian relief on condition that the Soviet government would expend \$10,000,000 for the purchase of food and seed supplies in the United States within 90 days. In January the relief administration was feeding 1,200,000 Russians.] The larger resources made available at the first of the year permitted a program of distribution to adults and the provision of seed. Under your direction a purchasing commission for the Congressional fund was established on Dec. 24, through whom all purchases are made from the lowest bidders. The first ship from this fund was dispatched on Jan. 1, and during that month twenty-four full American shiploads and several part cargoes were dispatched on all accounts. . . .

"In the early Fall, . . . arrangements were settled for co-ordination between the various American charities then interested in Russian relief, with a view to assuring the efficient handling and distribution of the supplies under American direction inside Russia. The growing intensity of the famine has enlisted the interest of additional organizations and stimulated the creation of many new committees throughout the United States of various religious and political faiths. . . . The Jewish Joint Distribution Committee [which had already contributed \$861,000] informs me it will make a further contribution. . . . The American Friends Service Committee (Quakers) and the Russian Famine Fund of New York, . . . distributes through its own American staff in Russia and co-ordinates its work with the Relief Administration. I am informed by the Friends that their resources total about \$1,000,000, of which \$265,000 is included above.

"The American Federated Russian Famine Relief Committee has apparently secured about \$350,000 in cash and some \$200,000 in kind. . . . The International Committee in Europe, under Dr. Nansen, . . . [administered] the British Save the Children Fund and other funds [which] provide about \$2,500,000; the Norwegian, Swedish, Italian and other European national funds. . . . also distribute through this agency. The French Government has voted \$550,000, and the totals available to Dr. Nansen's organization apparently amount to about \$4,000,000.'"—*New York Times Current History, Apr., 1922, pp. 147-149*.—At the

same time 17,000 children were being fed by the relief administration in Latvia.—“A meeting of the principal Directors of the Russian relief work was held in New York on July 30 [1922], Herbert Hoover presiding. It was decided to continue the work for several months, especially the medical aid which threatened the rest of the world with contagion. ‘Russia, from the world’s standpoint,’ said Mr. Hoover, ‘is a cesspool of contagious infection.’ An alarming spread of cholera and typhus in South Russia was reported on July 19. In Odessa 3,000 cases of cholera were developed in July. Mr. Rickard and Mr. Brown issued a statement which said in part: ‘The Russian people have been snatched from the brink of a catastrophe unequalled in the history of the world’s disasters. For the last sixty days no one has starved in Russia. Deaths from starvation, which six months ago threatened to extend into the millions, have been limited to a number which certainly will not exceed half a million. Today almost 10,000,000 destitute people subsist on American foodstuffs. Literally millions of people have been and will be inoculated against the five major diseases. Hundreds of thousands of food packages have been delivered to individuals under the food remittance plan. The intelligentsia of all categories have been fed. The Russian railroads have been prevailed upon to do infinitely more than was deemed possible in the transport of food supplies. Ports long closed to commerce have been reopened. . . . The famine is dead, and the Russian people live.’ . . . The famine situation, according to statements made by Colonel William N. Haskell, Acting Director of the American relief work in Russia, on his departure for America on July 11, was greatly relieved. Over 9,000,000 people were then receiving American food who would otherwise have died of starvation, a total five times as many as the American army in France was feeding at the close of the World War. The Relief Administration had distributed 120,000 tons of food for children, over 200,000 tons of food for adults, the whole seed grain appropriation, and \$7,000,000 worth of medical stores.”—*New York Times Current History*, Aug., 1922.—At the end of August, 1922, the director of the American Relief Administration announced that relief work would go on in the Ukraine and that the children would be fed in Southern Ukraine where the rains had come too late, and crops were very poor. The continuation of relief was made possible by an additional contribution of \$1,250,000 from the American Jewish Joint Distribution Committee. The director stated that at this time almost 2,000,000 were being fed by the Relief Administration. Medical relief would be continued and an effort made to improve sanitary conditions with the hope of staving off epidemics of contagious sickness.

**INTERNATIONAL UNION OF ACADEMIES**.—There were, during the World War, minor organizations in the allied nations in the fields of history, economics, and political science but nothing in any way comparable to the National Research Council (United States). With the assembling in Paris of the various peace delegations there were brought together large groups of scholars whose presence furnished the opportunity, as the creation in the preceding fall of the International Research Council (see INTERNATIONAL ORGANIZATION OF SCIENTIFIC RESEARCH) offered the inspiration, for the organization of an International Union devoted to the humanities. The initiative in this movement was taken by the French Academy of Inscriptions and Belles Lettres which in March, 1919, issued an invitation to the principal academies and learned societies of the allied countries to send representatives to a conference to be held in Paris during the month of May. The conference was attended by delegates from seven countries: France, Belgium, Italy, Rumania, Greece, Japan and the United States. It drew up a definite project for the establishment of an International Union of Academies, which was to be submitted to the learned societies of the allied and neutral countries. At the second conference, held on October 15-18, eleven countries were represented by delegates and three other countries had announced their intention of becoming members of the new Union. Thus the proposed organization had the support of fourteen countries, the seven mentioned above as being represented at the first conference and in addition to them, Great Britain, Denmark, the Netherlands, Norway, Spain, Russia, and Poland (Portugal and Serbia were added at the first meeting). The only refusal to join in the conference came from the Swedish Academy of Belles Lettres, History, and Archæology, which, however, announced its willingness to join the union “when it shall be possible to invite all countries to participate in it,” referring thus to the fact that, for the present, the central powers are not included. The first and principal task of the conference thus assembled was to perfect the plans drawn up at the first conference for creating an international scientific federation, corresponding in the domain of the humanities to the International Research Council in the domain of pure and applied science. This was accomplished by organizing a federation bearing the name Union Académique Internationale. The visible body of this federation is styled the Committee of the Union. The headquarters of the union, like those of the International Research Council, are established at Brussels. The first meeting of the union, after its final organization, was held in Brussels in May, 1920, when Professor Henri Pirenne, of the University of Ghent was elected president.—W. G. Leland, *International union of academies (International Conciliation*, Sept., 1920).

**INTERVENTION.**—"Intervention is the interference of a state or group of states in the affairs of another state, for the purpose of compelling it to do or refrain from doing certain acts. Its essential characteristic is force, either open or concealed. Simple mediation or even a formal protest, unless there is present the intention of enforcing the demand, does not constitute intervention. The relation of intervention to international law and even the rules governing the practice are still in an extremely unsettled state. Most writers content themselves with a discussion of the particular conditions under which intervention is or is not justifiable, and make no attempt to determine the place of intervention in a system of international law. Almost without exception they treat the subject in an 'a priori' manner. From the premises that nations are independent, politically equal and possessed of the same rights, they deduce what the doctrine of intervention must be and what the con-

ditions which justify its use. Whatever may be said in favor of this deductive method from the ethical standpoint, from the legal and historical point of view it must always remain unsatisfactory. It proceeds from ideals rather than from the facts of history; from the standpoint of what ought to be, rather than from that of what is. States to-day [1900] do not base their actions on innate ideas of justice, or upon precepts deduced from considerations of absolute rights antecedent to custom and law, but on rules which can be shown to have been followed by all or most of the states. . . . In regard to the various grounds that have served as a basis for intervention in the past it would appear that some have been entirely abandoned, while others are firmly established. Intervention to prevent hostile acts, when the danger is imminent, is established to-day both in doctrine and practice. A disturbance of the balance of the power in its modern form stands as the ground for the assertion of the higher European right. Revolution and the establishment of a new form of government have not been considered as acts calling for the exercise of intervention since the first half of the [nineteenth] century, and the principle seems so antagonistic to modern political thought that it may be said to be abrogated. Intervention on humanitarian grounds is recognized, though it appears that national self-interest has usually been too powerful to allow intervention for humanitarian reasons solely. The precedents show that the stronger motives based on political and economic interests are usually necessary to induce states to intervene. Indeed intervention under this head is always based on a number of different but closely allied grounds, and as such is considered legitimate. In regard to intervention based on treaty agreement the precedents do not speak with any degree of precision. . . . Treaties securing a claim to intervention often became anachronisms, while others are in their very nature antagonistic to the consensus of opinion and precedents, and are therefore illegal from the beginning. With these two exceptions the practice seems to recognize a violation of a compact between states as a legitimate ground for intervention. . . . Intervention is becoming more and more recognized as the legal means by which the society of nations enforces its rights. This is true whether it is carried out by several states or by an individual state, acting in accordance with precedent and the consensus of international public opinion, although the modern practice shows a strong tendency towards action in concert. Intervention, therefore, instead of being outside the pale of the law of nations and antagonistic to it, is an integral and essential part of it; an act of police for enforcing recognized rights, and the only means, apart from war for enforcing the rules of International Law."—W. E. Lingelbach, *Doctrine and practice of intervention in Europe*, pp. 1-2, 24-25, 31-32.—From the ethical standpoint, we have a different view of intervention of which with some inconsistencies the United States has been the chief exponent. "Among the rules of conduct prescribed for the United States by the statesmen who formulated its foreign policy, none was conceived to be more fundamental or more distinctly American than that which forbade intervention in the political affairs of other nations. The right of the government to intervene for the protection of its citizens in foreign lands and on the high seas never was doubted; nor was such action withheld in proper cases; . . . the statesmen of America, believing that they had a different mission to perform, planted themselves upon the principle of the equality of nations as expounded

by Grotius and other masters of international law. This principle was expressed with peculiar felicity and force by Vattel, who declared that nations inherited from nature 'the same obligations and rights,' that power or weakness could not in this respect produce any difference, and that a 'small republic' was 'no less a sovereign state than the most powerful kingdom.' The same thought was tersely phrased by Chief-Justice Marshall, in his celebrated affirmation: 'No principle is more universally acknowledged than the perfect equality of nations. Russia and Geneva have equal rights.'—J. B. Moore, *Principles of American diplomacy*, pp. 131-132.—'It is unfortunate that publicists have not laid down broadly and unanimously that no intervention is legal, except for the purpose of self-preservation, unless a breach of the law as between states has taken place, or unless the whole body of civilised states have concurred in authorising it. Interventions, whether armed or diplomatic, undertaken either for the reason or upon the pretexs of cruelty, or oppression, or the horrors of a civil war, or whatever the reason put forward, supported in reality by the justification which such facts offer to the popular mind, would have had to justify themselves when not authorised by the whole body of civilised states accustomed to act together for common purposes, as measures which, being confessedly illegal in themselves, could only be excused in rare and extreme cases in consideration of the unquestionably extraordinary character of the facts causing them, and of the evident purity of the motives and conduct of the intervening state.'—W. E. Hall, *International law*, p. 304.

'There are . . . cases where there is moral justification for intervention by one or more nations. These are cases of intervention upon the ground of humanity; they cannot be called legally right, but they may be morally justifiable and even commendable. [See BELGIUM: 1914; World War; Germany and Belgian neutrality.] They come under what 'Historicus' calls 'a high act of policy above and beyond the domain of law.' A case in point was the intervention of the great powers of Europe in regard to the persecution and murder of Christians in Asia Minor in 1860. Interventions in order to preserve the balance of power in Europe were until recent times considered admissible and at times just. It can no longer be considered as justifiable—and in Europe, at least, is not practised. . . . [In 1865 the United States] government informed the French Government [which had established Ferdinand of Austria as emperor of Mexico] that their treatment of Mexico was regarded as injurious and menacing to republican institutions, and an American army was massed on the Rio Grande under General Sheridan. As a result, Napoleon III withdrew his forces from Mexico and the empire of Maximilian came to an end. In 1898 the President of the United States . . . declared that the intervention of the United States in the affairs of Cuba, then in insurrection against Spain, would be justified on the grounds of humanity and of protection to . . . [the citizens and commerce of the United States] as well as removing a constant menace to . . . peace. As a result, action by Congress followed which brought on the war with Spain. In June, 1900, on account of the Boxer movement, unprecedented disturbances arose in China directed largely against all foreign life and property. . . . An international expedition which included an American detachment was formed and raised the siege of the legations and took possession of Peking after overcoming the

resistance of the Chinese troops, the imperial household having fled. [See also CHINA: 1900.] This joint intervention was explained by Secretary Hay as being necessary to open communication with Peking to rescue our officials and with the purpose of affording all possible protection everywhere in China to American life and property and to guard all legitimate American interests. In November, 1903, the United States intervened in Cuba, in accordance with our treaty rights and guarantees, on account of the disorders arising upon the island.'—C. H. Stockton, *Outlines of international law*, pp. 100, 101-102.—'The Republic of Geneva was connected by an ancient alliance with the Swiss Cantons of Berne and Zürich, in consequence of which they united with France, in 1738, in offering the joint mediation of the three Powers to the contending political parties by which the tranquillity of the republic was disturbed. The result of this mediation was the settlement of a constitution, which gave rise to new disputes in 1768; but they were again adjusted by the intervention of the mediating Powers. In 1782, the French Government once more united with these Cantons and the court of Sardinia in mediating between the aristocratic and democratic parties; but it appears to be very questionable how far these transactions, especially the last, can be reconciled with the respect due, on the strict principles of international law, to the just rights and independence of the smallest, not less than to those of the greatest States. The former constitution of the Swiss Confederation was also adjusted, in 1813, by the mediation of the great allied Powers. . . . In 1862, a proposition was made by France to England and Russia, that the three countries should offer their friendly mediation to the contending parties in the American Civil War. The moment was deemed inopportune by Russia, and England declined to accede to the proposal. 'According to the information we possess,' wrote Prince Gortchakow to M. D'Oubil, Russian chargé d'affaires in Paris, on the 27th October, 1862, 'we are led to believe that a combined movement of France, England, and Russia, however conciliatory it might be, and with whatsoever precautions it might be surrounded, if it came with an official and collective character, would have been declined had it been made.'—C. Phillipson, *Wheaton's elements of international law*, pp. 125, 126.—The British intervention in Egypt; the intervention by the United States, in 1806, in British-Venezuelan affairs, in order to uphold the Monroe Doctrine; the intervention by the A.B.C. countries, in 1916, in the Mexican embroglio; by the Allies in Greece, during the World War, are all important instances of the application of the principle.
