LETTER OF TRANSMITTAL.

WAR DEPARTMENT, PORTO RICAN CENSUS,
Washington, November 7, 1900.

SIR: I have the honor to submit the following report of the census of Porto Rico:

The Executive order for taking the census was issued September 8, 1899 (Appendix I). An estimate of expenses was made on the basis of the probable population, and the execution of the field work by native Porto Ricans, on the lines followed in taking the census of Cuba, except that the supervisors were not brought to Washington.

Mr. Harrison Dingman, an experienced officer of the United States census, was selected as Assistant Director to superintend the field work, and left Washington with his office force September 30.

The division of the island into 917 enumeration districts and the appointment of the enumerators were finished November 6, and promptly on November 10 the enumeration was commenced. On December 20 it was completed, and on January 25, 1900, Mr. Dingman and party left Porto Rico for Washington, arriving January 30.

The field work was carried on under great difficulties, owing to the effects of the hurricane of August 8 and the prevalence of the rainy season, which made communication almost impossible in many parts of the rural districts. Nevertheless, the enumeration was rapidly and thoroughly done despite all obstacles, and Mr. Dingman, the supervisors, and their associates are to be congratulated on the thorough accomplishment of the work. The same precautions were observed as in Cuba in determining literacy in doubtful cases, the persons enumerated being requested to read and write. In the latter part of December and early in January, the Director of the Census made a visit of inspection to a majority of the departments. The Supervisors were found to be entirely qualified for their important duties and their offices in good running order. As many enumerators as possible were questioned concerning the schedules, and gave unmistakable evidence of their intelligence and their anxiety to perform their duties honestly (Appendix III). Sixty-two women were appointed enumerators, and thus, for the first time in Porto Rico, as in the census of Cuba, women were given public employment.

The tabulation was made by the Tabulating Machine Company under a contract executed Feb. 1, 1900 (Appendix V). Three census bulletins were issued, and in their preparation, as well as in the preparation of this report, I have had the valuable assistance of Mr. Henry Gannett, of the Geological Survey, and Mr. Walter F. Willcox, of the United States Census.

As several voluminous reports have been published recently on the economic and social conditions prevailing in Porto Rico, notably those of Gen. George W. Davis, Military Governor, and Hon. Henry K. Carroll, special commissioner for the United States to Porto Rico, and as other reports are in course of preparation, it has not been thought necessary to enter minutely into details concerning history, government, and education, all of which have been or soon will be elaborately presented.

As a subject of great interest the methods employed by the Porto Ricans in the cultivation of their principal staples—coffee, sugar, and tobacco—are given, together with such views of the island as will explain its varied and beautiful characteristics.

Very respectfully,

J. P. SANGER, *Ins. Genl.*,
Director Census of Porto Rico.

Hon. ELIHU ROOT,
Secretary of War, Washington, D. C.

CENSUS OF PORTO RICO.

GEOGRAPHY.

Porto Rico, the easternmost and smallest of the Greater Antilles, is within the Tropics, between latitudes $17^{\circ} 50'$ and $18^{\circ} 30'$ north, and longitudes $65^{\circ} 30'$ and $67^{\circ} 15'$ west. It lies east of Haiti, being separated from it by Mona Passage. It is in shape rudely rectangular, its longest axis lying east and west. Its length is a trifle over 100 miles and its breadth about 36 miles. Its area is approximately 3,600 square miles, three-fourths the size of Connecticut and about the size of the province of Matanzas, Cuba.

OROGRAPHY.

The structure of the island is simple. Passing across it from east to west, a little south of the middle of its breadth, is a broken, irregular range of hills or low mountains, which toward the eastern end trends northeastward, and terminates near the northeastern corner of the island, where it culminates in the peak of El Yunque, 3,609 feet in altitude. Elsewhere it ranges in altitude from 2,000 to 3,000 feet, with occasional summits slightly above 3,000 feet and gaps slightly below 2,000 feet. This range is known in different parts of the island by various names, Cordillera Central, Sierra de Cayey, and in the northeast Sierra de Luquilla. From its crest the land slopes northward and southward in broad undulations, deeply cut by streams, giving most of the interior of the island a steep, hilly surface, gradually becoming more nearly level until near the coast it spreads into broad, level *playas*. This range forms the water divide of the island, and from it streams flow northward and southward, those flowing north having much the longer courses and gentler slopes. None of these streams are navigable, excepting for a very few miles near their mouths, where they are in effect estuaries. The largest are the Rios Loiza, Bayamon, Morovis, Arecibo, and Blanco, all on the north of the dividing ridge. On the south the dividing ridge descends steeply, with short spurs and a narrow coastal plain. Here the streams are short, with very steep descents.

The coast is low and for the most part simple, with few good harbors, the best being that of San Juan, on the north coast. Ponce

and Guanica are the only harbors on the south coast into which vessels of ordinary draft can enter, but the island of Vieques has several commodious ports where the largest ships can ride at anchor. The coast of Porto Rico, unlike that of Cuba, is not bordered by fringing reefs or islets.

Means of internal transportation are scanty. There are altogether about 159 miles of railway in the island, but they are in disconnected pieces and closely parallel the coast, none extending into the interior. Of wagon roads there are all sorts. The Spanish Government has constructed about 285 miles of military road which is well built and kept in good repair. Of this sort is the road from San Juan to Ponce, with a branch from Cayey to Guayama. Most of the other roads of Porto Rico are almost impassable except for pack trains.

Porto Rico is divided into seven departments, which correspond with the provinces of Cuba, and into 69 municipal districts. These in turn are divided into *barrios*, or wards, the plan of subdivision for governmental purposes being thus quite similar to that of Cuba.

Besides the island of Porto Rico, the Government has jurisdiction over the islands of Vieques and Culebra, lying to the eastward, and Isla Mona to the west, in the Mona Passage, together with a few other islets in their neighborhood.

Most of the area of Porto Rico is held as farms, and a large portion, more than one-fifth, is under cultivation. The forested areas are small and are almost entirely confined to the higher parts of the mountains. The largest of these tracts is on El Yunque, in the Sierra Luquilla. Here are found small tracts of primeval forest, composed of large trees of a variety of species, several of which are of great value, such as Spanish cedar, ebony, and sandalwood, besides many others as yet unknown to American markets. Timber is, however, very scarce, and most of that used in building is imported.

CLIMATE.

Lying in the Tropics, the island is within the region of the southwest trades, which blow with great regularity. The annual temperature at San Juan, on the north coast, ranges in different years from 78° to 82° F. The mean monthly temperature ranges from 75° in January to 82° in August. The maximum temperature on record is 99°, and the minimum 57°, indicating a very slight range and a uniform climate. The only difference of temperature to be observed throughout the island is due to altitude, the highlands of the interior having a mean annual temperature as low as 72° F. Serious storms occur, and occasional earthquakes, but the latter are not violent, doing but little damage. The annual rainfall at San Juan averages 60 inches, about the same as at New Orleans, and nearly two-thirds of this falls in the summer and

EL YUNQUE, IN SIERRA LUQUILLO.

autumn. The annual relative humidity at the capital is very high, averaging not far from 80 per cent.

The annual rainfall increases eastward from San Juan, until near the northeast corner of the island it exceeds 100 inches. It increases also upon the highlands of the interior, reaching a maximum upon the dividing ridge of nearly 100 inches. The south slope of the island, on the other hand, is much drier, both rainfall and atmospheric moisture being less, so much so that in some regions irrigation is necessary for cultivation of crops.

MINERALS, FLORA AND FAUNA.

While many valuable minerals have been found in Porto Rico, and while good placers were long ago worked by Spaniards, no mining of any sort is at present carried on. Yet it is not at all improbable that a geological examination may develop valuable mineral resources not at present suspected.

Owing to the fact that Porto Rico has for centuries maintained a dense population almost entirely supported by agriculture, a large portion of its surface is under cultivation, and only a trifling proportion remains in its natural condition. Hence little of its vegetation is indigenous.

The native fauna of the island is, owing to the same cause, very limited. There are no large mammals except such as are domesticated. It is said that there are no noxious reptiles and few insect pests.

The fisheries on the coast and in the rivers are very valuable, the fish being abundant everywhere and of valuable species.

HISTORY.

The history of Porto Rico presents but few points of interest as compared with Cuba or the other colonies of Spain in this hemisphere.

The island was discovered by Columbus November 16, 1493, during his second voyage. He approached it from Santo Domingo and first sighted Cape Mala Pascua. From there he sailed along the south and east coast to Aguada, where he landed November 19. He took possession of the island in the name of the reigning sovereigns of Spain and named it San Juan Bautista, in honor of St. John the Baptist. Its Indian name was Borinquen. Columbus remained for several days and then returned to Santo Domingo. It does not appear that he ever visited the island again.

During the next fourteen years numerous trading vessels stopped at the island, usually for water, but it remained unexplored and uninhabited by white men until 1508, when Nicolas de Ovando, Governor of Santo Domingo, having learned that the mountains and streams abounded in gold, sent Juan Ponce de Leon to explore the island. He embarked with a small party of Spaniards and a few Indian guides

and landed near Aguadilla, the home of the principal cacique, Aqueybana, by whom he was kindly received and conducted to different parts of the island. In the course of the journey Ponce de Leon verified the reports of the Indians in regard to the presence of gold, and returned to Santo Domingo, leaving a few of his companions as guests of Aqueybana.

Ovando now determined to subjugate and colonize the island, and Ponce de Leon was selected to conduct the enterprise. Before organizing the expedition, however, Ponce de Leon resolved on another friendly visit for the purpose of a more thorough reconnoissance, and accordingly returned to Porto Rico. He found that his companions had been kindly treated and that the Indians were friendly, and believing he could get possession of the island peaceably he returned to Santo Domingo to solicit the appointment of Governor. He found, however, that during his absence Ovando had been superseded by Don Diego Columbus and that Cristoval de Sotomayor, a Spanish cavalier, had been appointed Governor of Porto Rico by the Crown. But Don Diego Columbus would not confirm his appointment or appoint Ponce de Leon, and sent Juan Ceron as Governor and Miguel Diaz as his second. Prompted by a love of adventure and the hope of bettering their fortunes Ponce de Leon and Sotomayor joined the expedition.

In the meantime Ovando returned to Spain, where he gave such a favorable account of the character and services of Juan Ponce de Leon in Porto Rico that the King appointed him Governor of the island and intimated plainly to Don Diego Columbus that he must not presume to displace him.

Ponce de Leon took charge in 1509, and founded the town of Caparra, about 3 miles inland from the bay of San Juan. It was afterwards named Puerto Rico and transferred to the present site of San Juan. Subsequently the island and the city exchanged names, although by what process does not appear. The site of Caparra, the first town founded, is now known as Pueblo Viejo.

Having fixed the seat of government at Caparra, Juan Ponce de Leon began the pacification and colonization of the island in the usual manner. A conspiracy among the native caciques, led by Aqueybana, the brother and successor of him who had first welcomed the Spaniards to the island, was exposed and suppressed, but not without desperate efforts on the part of the Spaniards, the death of Sotomayor, and the destruction of such Spanish settlements as then existed. It does not appear that the colonists had any serious trouble with the natives thereafter.

Lying between and practically controlling the Virgin and Mona passages from the Atlantic into the Caribbean Sea, Porto Rico occupies a strategic position of much importance, which, no doubt, was recognized at an early day. Certain it is that several attempts were made to

RUINS OF CHURCH AT PUEBLO VIEJO.

wrest the island from Spain. Thus, in 1597, Admiral George Clifford, Earl of Cumberland, blockaded and captured San Juan, and took possession of the island. But being forced by an epidemic of yellow fever to withdraw he destroyed the city, killed a number of its inhabitants, and carried off as trophies 72 pieces of artillery. Two years before, the English freebooter, Drake, had sacked and burned San Juan and destroyed all the vessels found in the harbor. These disasters led to the completion of the Morro of San Juan, commenced some time before, and an increase in the garrison of the island. In September, 1625, San Juan was attacked by a Dutch fleet of 17 vessels and a detachment of 2,500 men. They landed and besieged the city for 28 days, but were finally forced to withdraw with considerable loss. In 1626 the French attempted a landing, but were repulsed. Between this and 1797 several minor and unsuccessful attacks were made. In April of that year, a British squadron and a detachment of 6,500 soldiers, under Lord Ralph Abercrombie, attacked San Juan, but withdrew after an investment of two weeks. From this time to the date of the American occupation of the island (1898) Porto Rico was exempt from outside attack. On May 12 the American fleet, under Rear-Admiral W. T. Sampson, in search of the Spanish fleet under Admiral Cervera, bombarded the fortifications guarding the harbor of San Juan. After three hours firing the fleet withdrew, having ascertained in this way that the Spanish fleet was not there.

On July 21 Major-General N. A. Miles, with a force of United States troops, landed in the bay of Guanica without serious opposition, and, on the 27th, occupied Ponce, which was surrendered on demand. Organized in three columns, numbering about 12,000 men, the American forces pushed forward in the direction of Arecibo, Mayaguez, and Aibonito, meeting with slight resistance. At Aibonito, while about to attack that stronghold, word was received that the peace protocol had been signed, and hostilities were suspended.

Porto Rico has also been free from serious civil disturbances, although early in this century the native Porto Ricans manifested some signs of opposition to the insular authority, and a small republican faction proclaimed independence. But the prompt measures of Governor de la Torre, the presence of the troops, and the small area of the island prevented an outbreak. Some of the revolutionary leaders were executed. In 1868 there were manifestations in Ponce, Bayamon, and Arecibo, but, in consequence of the adoption of the Spanish liberal constitution of 1869, the island ceased to be a colony and was declared a province of Spain, although it had been nominally so since 1809.

Notwithstanding the generally peaceful condition of the island, its material progress was slow. During the sixteenth century but 3 settlements were made, to wit: San Juan, in 1521; San German, 1543, and

Aguada, 1590; in the seventeenth, but 3 more were added, viz: Arecibo and Coamo, 1616, and Ponce, 1620; in the eighteenth century 28, and in the nineteenth, 35. In fact, for many years after its colonization Porto Rico was simply a military station, and practically, although not so designated officially, a penal colony, to which civil, political, and military prisoners were sent from Spain and from her colonial possessions in America. The population increased slowly, so that by the middle of the seventeenth century it numbered but 880 souls. During the next hundred years it had increased to 44,883, and by 1812, to 183,014.

The system of taxes and duties applied to Porto Rico was very much the same as in Cuba and other Spanish possessions. Up to 1784 the public treasury was under the management of a treasurer and an accountant appointed by the Crown, who were responsible jointly with the Governor of the island for all revenues. In that year, by a royal decree of May 24, the intendancy of Porto Rico was established.¹

The principal insular sources of revenue at the end of the last century were export and import duties (*almojari-fazgo*); the tithes (*diezmos*); the *alcabala*, or tax on all sales of merchandise products, etc.; the tax on *aguardiente* and *aloja*, the latter a beverage of water, honey, and spices; the tax on stamped paper; on the introduction and branding of negroes; the *estanco*, a tax on the sale of negroes; the *medias annatas*, or tax on the salaries of certain civil and clerical officers; court fines, licenses, and the *manda pia forzosa*, a tax on mills. The salt works of Cabo Rojo, Guanica, and Coamo were also sources of revenue, and all unidentified property, such as cattle, etc., belonged to the King by authority of law. The export and import duties discriminated largely against all foreign merchandise. The tithes were established in 1501 by a bull of Pope Alexander VI and continued until abolished by royal decree in 1815. They were imposed again in 1830 and finally abolished in 1848. During this interim from 1815 to 1830 when the tithes were not collected and the tax on sales (*alcabala*) and existing restrictions on immigration were removed, a tax of 2½ per cent on the agricultural products of the island was substituted for the tithes. They were paid in kind from the crops after they had been gathered, and in 1789 amounted to 69,720 *pesos*, a third of which went to the support of the clergy.

But all these sources of revenue were insufficient to cover the expenditures, and but for the aid (*situados*) from the treasuries of Mexico and Guatemala, the condition of the Government would have been critical. From the year 1790 to 1809 the total amount received from *situados* was 4,409,991 *pesos*, which was applied chiefly to the defenses of the island and the maintenance of the garrisons. The need for this help was fully demonstrated when the payments ceased in 1809. The insular treasury being without sufficient reserve funds or other

¹ Señor Coll y Toste, Civil Secretary of Porto Rico..

AGUADILLA.

x Monument erected at this place to Columbus, where he first landed November 19, 1493.

resources, and the people very poor, a period of financial distress followed, and in 1812 the usual expedient of governments without sufficient gold or silver money was resorted to, the issue of paper money. But this depreciated so rapidly that a silver *peso* was soon worth 10 *pesos* in paper, so that in 1815 the retirement of the paper *peso* was ordered. About this time the island was greatly benefited by the revolutions in Santo Domingo and the Spanish-American colonies, from which many Spaniards emigrated to Porto Rico, bringing with them capital, industry, and a knowledge of the cultivation of sugar and coffee.

At the date of the American occupation the system of taxes, duties, etc., was practically the same as in Cuba; but, in strong contrast to the disposition made of the Cuban revenues, those of Porto Rico were expended in the island, and, with but few exceptions, no funds were sent to Spain except by way of loans to the Spanish Government. Again, the financial management was such that no insular debt existed, nor were the municipalities allowed to incur debts or to make loans except to meet their obligations to the insular treasury.¹

From 1850 to 1890 the revenues and expenditures, every tenth year, were as follows:

Year.	Revenues.	Expenditures.
1850	\$1,709,170.08	\$1,665,588.86
1860	2,316,095.92	2,684,746.44
1870-71	2,630,000.00	1,943,081.20
1880-81	3,786,650.00	3,615,063.22
1890-91	3,683,100.00	3,633,586.60

In the year 1897-98 the budget covered an estimated income of 5,157,200 *pesos*² and an expenditure aggregating 4,754,042.19 *pesos*. In the year 1898-99 the estimated income was 5,107,092.89 *pesos*, and the expenditures 4,781,920.20 *pesos*.

But, notwithstanding the favorable financial condition of the municipalities and the surplus in the insular treasury, property owners throughout the island were greatly embarrassed, as appears from the following statistics taken from the report of Brig. Gen. George W. Davis, Military Governor of Porto Rico, September 5, 1899. In 1897 the wealth of the island was estimated at \$150,000,000, the total declared value of the city and country property being \$28,867,928.79, while the mortgage indebtedness of the latter was \$18,610,086.17, or 64 per cent. Other indebtedness, General Davis reports, would no doubt raise this amount to \$50,000,000, or one-third of the total wealth of the island. The rate of interest charged on mortgages was, on a large part of the loans, from 1 to over 24 per cent per annum, while on \$6,000,000 the rate was not specified, but probably exceeded the above rate.

¹ The total municipal indebtedness of Porto Rico does not exceed \$1,000,000.

² The *peso* was worth 60 cents United States money.

The state of the laboring classes was usually that of extreme destitution, which, with the advent of the hurricane of Aug. 8, 1898, resulted in famine and distressing want, upward of 250,000 indigents being fed by the Government.

The present economic condition of Porto Rico has been so fully and intelligently presented by General Davis in his several reports published during the past year that no further comments on this subject are necessary.

Although the government for three hundred and fifty years was entirely in the hands of Spaniards to the exclusion of native Porto Ricans, and there was practically the same system of laws and taxation as in Cuba, and the same, or even greater, neglect of public education, yet the internal condition of the two islands differed widely, as a very brief examination will show. In Cuba great discontent was manifest among the natives, while in Porto Rico, except on one or two occasions, perfect tranquillity prevailed. This was probably due, in great measure, to the attitude of the mother country, which was more mild and conciliatory toward Porto Rico than toward Cuba, to the comparatively small expenditures in behalf of the insular government, the absence of an insular debt, and of periodical assessments in behalf of the Spanish treasury, and the greater prevalence of free labor as compared with the slave labor of Cuba.¹ Again, the character of Porto Rican emigration from Spain was quite different, being chiefly Catalans and Biscayans, from the Basque country, who went to remain, and who were devoted to the monarchy and the church, with a corresponding indifference toward liberal political principles, while Spanish emigrants to Cuba were largely Castilians, Andalusians, and Asturians, who had no intention of remaining in the island, and had, therefore, but little interest in its material progress and government. The latter statement, made in 1876 by the honorable Caleb Cushing, American minister to Spain, is largely borne out by the agricultural statistics of the censuses of Cuba and Porto Rico just completed. While in Cuba the proportion of farm owners to the whole number of farms is but 28 per cent, in Porto Rico it is 93 per cent. On the other hand, the proportion of the cultivated area owned by occupants is but 43.5 per cent in Cuba, while in Porto Rico it is 91 per cent. In other words, a large proportion of the cultivated area of Cuba is in the hands of comparatively few landlords, some of whom reside out of the island, while in Porto Rico large numbers of the rural population own their homes and are permanent residents.

Finally, the small size of Porto Rico and the presence of the Spanish garrisons and an organized militia were no doubt potent and peaceful

¹ According to the census of 1872, the proportion of slaves to the total population was 5.1 per cent, while in Cuba it was 27.8 per cent.

influences, and effectually suppressed any disposition on the part of the natives to rebel against the established authorities, if, in fact, such feelings prevailed. That some discontent existed among them in 1897-98, as the result either of their sympathy for the Cubans or of a desire for home rule, there is but little doubt. At all events, the troops of the American Army received from all classes of natives in all parts of the island occupied by them a spontaneous and enthusiastic welcome as deliverers and friends.

GOVERNMENT.

Porto Rico was founded and governed practically on the same plan as other Spanish colonial possessions, a full account of which will be found in the report of the census of Cuba just published.

For many years the island was of so little importance that its government was intrusted to officers of subordinate rank in the Spanish army; in fact, it was little more than a military post. (See Appendix V for list of Governors.)

With the increase in population and the development of its resources, the office of Governor came to be filled by a general officer with the title of Captain-General. As in Cuba, the Governor was supreme in military affairs, and practically so in civil affairs, being president of the royal audience, or supreme court, and of all other tribunals, although for the decision of legal questions he had a legal adviser appointed by the Crown, whose opinions he might or might not accept.

In 1825, in consequence of the revolutions in South America, the Captain-General was clothed with extraordinary powers, very much as in Cuba, but it is said they were never used to oppress the people. Until 1813 the intendancy (receipts and disbursements of the revenues) was vested in the Governor, but in that year it was placed under the control of an intendant appointed by the Crown. He was assisted by a secretary and a number of clerks, but could not order the disbursement of funds without the knowledge and consent of two chief officers appointed by the King, who had each a key to the treasury chest, and who could reject three times any order for the payment of money which they considered irregular or unjust. After that they were obliged to comply with the order, but could file a protest for their own protection. Of course this regulation, like all others, was for the ordinary transaction of business, the Captain-General having supreme control over the funds as well as over all parts of the machinery of government and its agents.

For the immediate supervision over police and municipal affairs there was the *cabildo*, consisting of two boards, each composed of two *alcaldes*, two *regidores*, and one *sindico*. Besides the *cabildo*, there were the ecclesiastical tribunal, the naval tribunal, and the *consulado*.

The first was composed of the bishop of San Juan and the treasurer of the church, and was for the management of all church affairs. Over this tribunal, as well as over the bishop and other prelates and the business relations and proceedings of the church, the Captain-General, as vice-patron, had supervision and control. He had authority to compel the observance of all church regulations or orders, to appoint all curates, and to suspend the bishop or any other prelate from office, reporting his action to Madrid.

The naval tribunal had supervision and control over everything connected with the navy, including the trial of offenses committed by persons in the navy. It was presided over by the naval commandant, assisted by a legal adviser. From the judgment of the naval tribunal appeal could be made to the Spanish admiral commanding in Cuba. While the administration of this tribunal was in a measure independent of the Captain-General, he was in supreme command of all the naval forces.

The *consulado* was a tribunal for the settlement of all mercantile disputes arising under the commercial and mercantile laws applicable to Porto Rico. - It consisted of a consul and two persons selected by the litigants or parties in interest. Before the tribunal the disputants appeared with their legal advisers. Cases were either arranged to the mutual satisfaction of the contestants or decided in favor of one or the other.

Other features of the insular government were a civil secretary, a bureau or board of public works, and a chief of staff for the administration of military affairs.

From this brief description it will be seen that the entire government of Porto Rico—executive, legislative, and judicial—was for many years vested in the Captain-General, and that such boards or tribunals as existed were merely for the transaction of routine business.

In short, up to 1870 Porto Rico was governed by the Captain-General as a Spanish colony under the laws of the Indies and such special decrees and orders as were proclaimed from time to time by the King.

By a law of August 28, of that year, Porto Rico was made a province of Spain and given a provincial deputation consisting of deputies elected by universal suffrage. At the same time the island was divided into the seven departments of Aguadilla, Arecibo, Bayamon, Guayama, Humacao, Mayaguez, and Ponce, having as capitals the cities of corresponding name. In 1874, through the fall of the Republican Government of Spain, the constitution of 1869 was suppressed, and, as a result, the provincial deputation was abolished, and Porto Rico returned to the government existing prior to the law of 1870. In February, 1877, the new Spanish constitution of 1876, together with the provincial and electoral laws of December, 1876, were extended to Porto Rico, and the provincial deputation was reestablished, the members of which were elected by all male residents 25 years of age

or more who had received a professional diploma, or paid taxes to the amount of 25 *pesos*.

In 1897 Porto Rico, in common with Cuba, was given an autonomous government. It was inaugurated February 11, 1898, and continued in operation until the time of American occupation, October 18, 1898.

The government consisted of a Governor-General and cabinet and a representative assembly of very limited legislative powers, elected by universal suffrage.

On October 18 Maj. Gen. John R. Brooke, United States Army, was appointed Military Governor of Porto Rico. On November 29 he abolished the provincial deputation and made other changes in the insular administration. He was followed by Maj. Gen. Guy V. Henry, United States Army, December 6, 1898, who, by executive order of February 6, 1899, dissolved the insular cabinet or council of secretaries, and constituted the departments of state, justice, finance, and interior, each presided over by a chief or minister, with a salary of \$6,000 per annum.

On May 9 General Henry was succeeded by Gen. George W. Davis as Military Governor. By executive orders of August 12 General Davis abolished the departments of state, treasury, and interior, and their respective chiefs or secretaries, and at the same time created a bureau of state and municipal affairs, a bureau of internal revenue, a bureau of agriculture, a bureau of education, a board of public works, a judicial board, a board of charities, a board of health, a board of prison control, a board of insular policy, and the office of civil secretary to the Military Governor. The last official received a salary of \$4,000, while the chiefs of the bureaus of state, internal revenue, and agriculture received a salary of \$2,000 per annum. Through these bureaus and boards General Davis administered the affairs of the island wisely, thoroughly, and economically.

On May 31, 1899, provision was made for issuing the writ of habeas corpus by any judge of instruction, and on June 27 trial by jury was authorized.

By the act of April 12, 1900, which took effect May 1, Congress made provision for a civil government to consist of a Governor and an executive council to be appointed by the President for four years, and a house of delegates of 35 members to be elected biennially by the qualified voters.

The executive council is composed of the insular cabinet and 5 other persons of good repute. The cabinet includes a secretary for civil affairs, an attorney-general, a treasurer, an auditor, a commissioner of the interior, and a commissioner of education, all appointed for the term of four years. The executive council and house of delegates comprise the legislative assembly of Porto Rico.

On May 1 this government was established by the inauguration of Governor Charles H. Allen, of Massachusetts, and is now in operation.

MUNICIPAL, DISTRICT, AND DEPARTMENTAL GOVERNMENT.

Municipal government existed in Porto Rico from the beginning of its history, and by the commencement of this century there were 28 municipalities. Owing to the political agitation resulting from the revolutions of the Spanish-American colonies all the municipalities except those of San Juan, Aguadilla, San German, Mayaguez, Ponce, Guayama, and Humacao were abolished in 1823, and seven military divisions or districts were established for civil and military purposes.

At the head of each of the seven geographical divisions of the island was an officer of the army as the representative of the Captain-General. He had his headquarters in the capital city and had limited civil jurisdiction. Similarly, all towns and villages of any importance had an *alcalde* or mayor, appointed by the Captain-General, who performed the duties of magistrate, and a committee of 12 property owners appointed by the Captain-General, who had charge of the public highways and the general affairs of the community. They met by order of the Captain-General, and at no other time, for the consideration of such matters as might be referred to them.

By a royal decree of December 13, 1872, the municipal laws of Spain were extended to Porto Rico, the number of municipal districts was largely increased, and the districts were changed to the seven departments now existing. The members of municipal councils were elected by all males 25 years of age paying 5 *pesos* in taxes, or holding a professional diploma.¹

By executive order of September 21, 1899, General Davis established the qualifications of an elector as follows:

He must be a bona fide male resident of the municipality, 21 years of age and a taxpayer of record, or able to read and write. He must also have resided in the island for two years next preceding the date of his registration, and for the last six months of said two years within the municipality where the election is held. Mayors, councilmen, municipal judges and their substitutes, and school trustees are elected annually.

THE JUDICIARY.

Prior to the year 1832 the laws and mode of procedure were the same as in Cuba and other Spanish colonies. The courts were limited, however, to the judges of first instance and the municipal judges. There were no *audiencias* in the island, as it was under the civil and criminal jurisdiction of the *audiencia* of Santo Domingo, which, in 1795, was removed to the province of Puerto Principe, Cuba. By a royal decree of June 19, 1831, a territorial *audiencia* was established in San Juan, Porto Rico, and appeals were then made direct to the supreme court of Madrid.

¹For a description of municipal government, see Report of the Census of Cuba, 1899.

At the date of American occupation each municipal district had a municipal judge, and there were twelve judicial districts each having a judge of first instance and instruction, with original jurisdiction in civil actions involving more than 200 *pesos*, as well as appellate jurisdiction over civil cases begun in the municipal courts. In criminal cases they prepared evidence and made recommendations to the *audiencias*.

There were three *audiencias*, one territorial of six judges, having its seat in San Juan, with both civil and criminal jurisdiction, and two criminal *audiencias* of three judges each, located at Ponce and Mayaguez, respectively. The judges were appointed by the Captain-General.

A full description of the judicial system of Spanish colonies will be found in the Report on the Census of Cuba, and it is not considered necessary to repeat it here. It does not appear that the administration of the system in Porto Rico was free from the intricacies, delays, and defects of the system in Cuba, or that the court officials were different in character. In criminal cases the prisoner was supposed to be guilty until his innocence was established, and the burden of proof was thrown on him.

Since the American occupation many salutary and important changes have been made in the Spanish system, as established in Porto Rico, including the discontinuance of the theory of the guilt of an accused person, *ex parte* investigations, and the *incomunicado*. For these, speedy and impartial trials, by jury, or otherwise, have been substituted, while the writ of *habeas corpus* protects those who may have been unjustly confined. In August, 1899, on the recommendation of the judicial board, Military Governor Davis reorganized the courts, reduced the number of judicial districts from 12 to 5, and gradually introduced many American rules of procedure, and the system observed generally in the courts of the United States.

As in Cuba, the jails and prisons were found filled with prisoners who had been in confinement for years either without trial or awaiting sentence, and their condition was one of great moral and physical degradation. This has all been corrected, and the penal institutions of Porto Rico will compare favorably in point of sanitation and good administration with such institutions in any other tropical country. Not until suitable buildings are erected can the discipline which prevails in the prisons and jails of a majority of the States of the Union, be maintained in Porto Rico. To this subject, however, the authorities are giving close attention.

ABORIGINES.

The Indian population of Porto Rico at the date of its colonization by Spain is said to have numbered between 100,000 and 600,000 souls. According to the historian, Fray Iñigo Abbad, who published an

account of the island in 1788, "it was as thickly populated as a beehive." It is not likely that a correct estimate of the population was made by Ponce de Leon or any of his companions, and, as in the case of Cuba, the number will doubtless remain a subject of conjecture.

Of the traits of the Indians of Porto Rico, Fray Iñigo remarks that they were copper colored, although sallow and of darker complexions, short in stature, well proportioned, with flat noses, wide nostrils, bad teeth, and narrow heads, flat in front and behind, "being pressed into this shape at the time of their birth." They had long, thick, black, coarse hair, and were weak and indolent, regarding with aversion all exertion which was not necessary to their amusement or involved in fishing, hunting, or in obtaining food from other sources. They were governed by caciques, or chiefs, whose rights descended to the eldest son or to the eldest son of a sister. In an interesting account of the aborigines compiled by F. Bedwell, British consul to Porto Rico in 1879, he remarks that "the orders of the caciques were announced as emanating from their tutelary god, *Cemi*, who was made to speak as desired by means of the *buhitis*, or medicine men, who were at the same time the priests. The *buhitis* hid themselves behind the statue of the *Cemi* and declared war or peace, arranged the seasons, granted sunshine and rain, or whatever was required, according to the will of the cacique who dictated, and when announcements or promises were not fulfilled, they declared that the *Cemi* had changed his mind for wise reasons of his own.

"The chiefdoms were divided into small provinces, which for the most part only comprised the inhabitants of a valley; but all were subject to the head cacique, who at the time of the conquest was Aquey-bana. He was actually governor in chief, the others being his lieutenants, who carried out his orders in their respective districts.

"Men and unmarried women wore no clothing, but painted their bodies abundantly and with much skill, drawing upon them many varieties of figures with the oils, gums, and resins which they extracted from trees and plants. In this uniform they presented themselves in their military expeditions, public balls, and other assemblies. This simple costume, which was acquired with little labor, and was varied according to individual taste, was not without its ornaments and trimmings, in respect of which opportunity was afforded for the display of skill and inventive powers, not only in the various figures and colors with which each one painted himself or herself, but also in the head dresses that were made with feathers of exquisite colors. They put small plates of gold on their cheeks, and hung shells, precious stones, and relics from their ears and noses, and an image of their god, *Cemi*, was never forgotten. The chief used as a distinctive emblem a large golden plate worn on the breast. Married women wore an apron which descended

to about half their leg; but no clothing was worn on the rest of the body. The wives of the caciques wore their aprons to their ankles, except at the national game of ball, when they also wore short ones.

“It is not known what formalities they used to celebrate marriages, but it appears that they took two, three, or more wives, according to their means of maintaining them, and that they abandoned some and took others at their caprice. The chiefs possessed a larger number of wives than their subjects, but one of them was generally preferred over all the others. They all lived together, it is said, without displaying jealousy or envy of the favored one. All, however, in effect, became slaves of their husbands; they dressed his hair each time he left his habitation, and they had, besides their domestic duties, charge of agricultural pursuits and worked in his fields. Those best loved were buried alive with their husbands on his decease, and if they did not voluntarily offer to accompany him to the other world, they were compelled to do so. Married men separated themselves from their wives for fifteen or twenty days before going to search for gold in the river, as they believed that otherwise their sight would not be good, and that they consequently would not be successful. They did not intermarry with relations of the first degree, from a belief that those guilty of incest died a bad death.

“Their habitations or huts were constructed upon pieces of timber or trunks of trees driven into the ground at short distances from each other, and they were either oval, round, or square, according to the disposition of the land. Upon these posts they formed the floor of cane or sticks, and the walls were likewise made of cane, bound together by filaments with the leaves and bark of the palm tree and meeting in the center like the poles of a tent. They usually had neither windows nor chimneys, and light was only admitted by a narrow doorway. But there were other huts stronger and of better proportions. From the ground to the floor, which was likewise formed on the trunks of trees driven into the earth, they left an uninclosed space which served as a *patio* or courtyard, and in the higher story they left air holes or windows, made of cane. The roof had a double fall and was covered with palm leaves.

“Fray Iñigo remarks that, when he wrote, the habitations in the interior of the island were of the same construction, with a slight difference that the floor was sometimes made of boards, but that the huts were built upon stakes driven into the ground.

“It is remarkable to notice how very little change has even yet taken place in this respect. I have seen hundreds of huts exactly similar to those described, even in the vicinity of towns of considerable importance. This idea of building upon poles driven into the ground is dictated by the requirements of the climate, which is everywhere exceedingly damp. The valleys and lowlands are often flooded

by the rains and the rising and overflowing of the rivers. The consequences of this are in some measure avoided by the houses being built upon posts at a certain elevation. The only wonder is that these frail constructions are not carried away by the gusts of wind. They are, however, carried away when their owners desire it, in a most easy manner. A pole to which wheels are attached is placed underneath the building, and it is thus wheeled off to the other side of the road, or the new site selected for it. This does not apply to the mere huts of the peasants, but to the more pretentious wooden houses, which are built in the suburbs of all the towns.

“The hammock and the calabash shell formed the principal articles of furniture and cooking utensils of the aborigines; they do so of the *Gibaros* or white country people of to-day.

“The Indians lighted their fires by means of three sticks, two of which were tied together at one end; they then placed the point of the third against the ends of the others, and beat them together between the palms of the hands, and thus ignited them with great facility.

“Their arms were a bow and arrow and the *macana*; a wooden weapon in the form of a scimitar, to which they also gave the shape of an ax, and armed with stone. They were very skillful in shooting the arrow, but they did not poison their arrows as the Carib Indians did. They had canoes for fishing in the rivers, and for their sea voyages some large enough to hold 40 or 50 men; but all were hewn out of the trunks of trees. Trees of such dimensions no longer exist in Puerto Rico—three centuries and a half of wood and charcoal fires have had a disastrous effect upon the island in this respect. In many parts all the larger trees have completely disappeared, and seasons of drought are naturally experienced in consequence; yet nowhere are more beautiful or useful kinds of wood to be found than in Puerto Rico.

“Fray Iñigo says that the occupations of the Indians were as few as their necessities. They passed their days in their hammocks or squatting upon their heels on the ground, and they only moved with pleasure to dance or to eat. Their agricultural pursuits were limited to the simple cultivation of maize, sweet potatoes, and plantains, and even this work was left to the women. Fishing and hunting were the pursuits in which the men were supposed to occupy themselves. They ate many grubs and insects, and not only shellfish, but even lizards and bats, says the author, were favourite dishes.

“Their religion consisted of the superstitious worship of the *Cemi*, whose image they carved and painted as their imagination dictated. They placed this image everywhere, and in their huts and habitations they set aside a dark corner to pray to it for help in their necessities. Outside the villages they had a temple where the image of the tutelary god was placed. Thither the caciques repaired with the *buhitis*, who

hid themselves, as previously described, behind the idol, and expressed by his mouth the will of the chief. In the religious ceremonies which they celebrated they took food to the *Cemi*, upon which the priests regaled themselves. They had a notion of two invisible beings—one, naturally benevolent, without prayer or supplication being necessary in order to obtain his favor—from the other they feared every misfortune, trouble, and calamity, and to him, offerings and prayer were necessary to mitigate his anger. They regarded him as the enemy of mankind, from whom all evils sprang. Their religious ceremonies consisted of various humiliations, the scattering of certain powders over the head of the idol, and other superstitious practices, which were inherited from generation to generation, and thus, too, were handed down their images.

“Images of the *Cemi* have been found from time to time, and in quite recent years, in various parts of the island. These idols, although varying in size and in the kind of stone of which they are made, generally display similar characteristics. I have also seen some made of baked clay, which are smaller than those carved in stone. The carving on the stone is indeed truly wonderful, when it is remembered that the use of iron was unknown to them.

“Don Jose Julian Acosta, of Puerto Rico, who has republished Fray Inigo’s work, with copious notes, describes several of these antiquities in his possession, and observes that they show that at the time of the conquest the aborigines of Borinquen were in the second period of the age of stone. He remarks that the resemblance among the images of the *Cemi* serves to prove the unity of their religious belief, while the existence of these symbols in various and distant places—now on the coast, now in the interior—show that the island was inhabited in all directions. Señor Acosta believes that the skeletons of the Indians yet exist in the grottos and caves which abound in the island, and which have not been explored.

“The Borinquens believed that the dead would rise in a land of supreme delights, where eternal spring would be enjoyed, where they would find beautiful forests filled with every kind of game and watered by rivers abounding with fish, and where they would all enjoy the blessings of life, accompanied by their wives and their relatives who had preceded them.

“When one of the chiefs or principal men fell sick, the priest-doctor, or *buhiti*, was called, who, after performing several superstitious ceremonies, purged himself, and observed the same diet as the sick man. If he did not strictly comply with this and other obligations, and the sick man died, the friends and relations sometimes put out the *buhiti*’s eyes, beat him, or inflicted other punishment upon him. When the Indians saw that the sick were near their death they suffocated them, even if they were chiefs. After death they opened

and dried the body by fire, and buried it in a large cave in which were interred also some live women, the arms of the deceased, and provisions for his journey to the other world. Sticks and branches of trees were then placed on the top and the whole was covered with earth, which was thus kept from the bodies of those interred.

“Every event which was attended by either joyful or melancholy circumstances was celebrated by the *areito* or dance, accompanied by music, singing, and intoxication. Fray Inigo says that the *areito* was not exactly an amusement; it was rather a serious and important occupation. If war was declared, the *areito* represented the sentiments which were to lead on to vengeance. If it were desired to mitigate the anger of the *Cemi*, to celebrate the birth of a son, to mourn the death of a cacique or friend, there were special dances according to circumstances and the feeling by which the actors were animated. If some one was sick, they danced in order that he might recover, and the *buhiti* danced for the patient if he could not himself support the fatigue of doing so.

“All the dances were in imitation of some event, and although the music which governed their movements was very simple, the dances were lively and full of animation. The war dance was the most expressive of all. Every action of a complete campaign was represented in it—the departure of the warriors, their entry into the enemy’s country, the precautions as to camping, ambuscades, surprises, the fury of the battle, the glory of the victory, the conveyance of the prisoners—all was set before the spectators with such ardor and enthusiasm that it appeared to be fighting in earnest. The actions, manner, and tone of voice of the performers were in keeping with each incident, and always in accord with the music and singing which accompanied the dances.

“The musical instruments were drums of various sizes, made out of the hollow trunks of trees, the *macara*, and the *guiro*, or *guicharo*, all made with the dried fruit of the calabash tree. These instruments may yet be said to be the national musical instruments of the island. Not only are they still used in the dances of the *Gibaros*, but the *guiro* or *guicharo* (the long calabash shell indented and played upon with a stick) is used in balls in society, as an accompaniment to the piano, and other modern instruments. It is even adopted by the Spanish military bands when they play the country dances. The songs of the Indians were serious and even historical, for in them were recounted the most important events of their life and their country; the genealogy of their chiefs, the dates of their death, their fortunes in war, and the victories they had acquired, good and bad seasons, etc.

“The *areito* was composed of a large number of persons; sometimes men only danced, on other occasions only women; at other times men and women together. They formed two rows hand in hand and were

TYPES OF PORTO RICANS.

led by a guide or master of the ceremony, who gave the time, and all followed, repeating the history which he sang. While some thus danced others gave drink to the dancers, who, Fray Iñigo says, did not stop until they fell intoxicated, when their places were filled by others. The *areito* was concluded by all becoming intoxicated, with a drink made by the women of fruit, maize, and other ingredients, and with the smoke of tobacco which they imbibed by their nostrils.

“Besides the *areito*, the Indians had a game of ball, for which they had places set apart in the vicinity of the villages. Both men and women engaged in this game likewise; but when not engaged in one of the occupations or amusements mentioned, the Indians passed their days smoking in their hammocks and were generally silent.

“In bartering they little regarded the value of the object or that given in exchange for one they fancied. They had neither money, weights, nor measures of any kind. The crime which the Indians invariably punished most severely was theft. He who took the property of another was impaled alive and thus left to die. It was regarded as a bad action to intercede for a thief, even if the mediator were his father or a near relative; thus the crime of theft was very rare among them.”

Having completed the subjugation of the Indians Juan Ponce de Leon proceeded to enslave them under the Spanish system of *repartimientos* and *encomiendas*,¹ as had already been done in Santo Domingo, Cuba, and other Spanish colonies. As the result of their battles with the Spaniards, of disease and emigration to other islands, of hard labor in the mines, and other unaccustomed drudgery, the native population rapidly disappeared, so that in 1543 it was reported to the King of Spain by the bishop of San Juan² that there were but 60 native Indians in the island. At this time there are few traces of them remaining, at least this census has not discovered any. Still, in such matters no census can vie with a trained observer, and therefore attention may be called to the following statements of Capt. W. S. Schuyler in a report of August 30, 1899: “While work was being done on the roads, I had occasion to watch crowds of 700 or 800 men gathered about the pay tables at Las Marias, La Vega, and Añasco. The frequency of the aboriginal type was very noticeable. While it is almost certain that there is to-day no single individual in Puerto Rico of pure aboriginal stock, it is equally sure that the type can be

¹ A *repartimento* was a grant of land, which carried with it the right to the labor of the Indians occupying it or living within a short distance of it, at first for cultivating the soil. This privilege was subsequently extended so that the Indians could be used in any kind of labor.

An *encomienda* was practically a grant of Indians, irrespective of the land. At first the grant expired with the grantee. It was subsequently extended through two or three lives, and in effect became perpetual. As a result the Indians were slaves.

²The first bishopric was established in 1512, and the Inquisition in 1513.

seen everywhere in the mountain settlements. At San German I noticed a woman whose color, hair, and features were true Indian as seen in the southwest of the United States." (Report of Gen. George W. Davis, 1899, p. 312, f.)

NEGROES.

It is probable that a small number of negro slaves accompanied the earliest Spanish expeditions from Santo Domingo to Porto Rico, as slaves had been introduced into that island several years before. In consequence of the rapid disappearance of the native Indian population, the introduction of negro slaves into Porto Rico on payment of a tax amounting to 2 ducats per head was authorized as early as 1513. From the history of the island by Fray Iñigo Abbad, it appears that through various imperial authorizations negro slaves were introduced into Porto Rico as follows:

1530.....	200	1550.....	250
1536.....	200	1551.....	150
1540.....	300	1553.....	400

Thus, from 1530 to 1553, about 1,500 negroes were legally imported. It is probable that a corresponding number were smuggled to avoid the per capita duty.

According to the same author, contracts for the importation of negro slaves continued throughout the seventeenth century, the privilege being held by the Genoese, Portuguese, and Dutch, sometimes Spaniards, and the French. Between the years of 1613 and 1621, during the government of Don Felipe de Beaumont y Navarra, 11 vessels laden with negroes entered Porto Rico. It is probable that during the seventeenth century other importations took place, legal and contraband, as, from a general study of Porto Rican history, it appears that during that century its black population increased greatly over the population at the end of the previous century.

A corresponding increase occurred during the eighteenth century, due to the commercial reforms which stimulated the progress of the island and gave an impetus to the slave trade.

In 1760 a contract was made with Miguel de Uriarte for the importation to several points of America—Porto Rico among others—of 15,000 negroes.

By a royal *cedula* o. October 31, 1765, the Company of Caracas was authorized to introduce 2,000 negroes into that province and into that of Maracaibo, which had lost many of the natives by smallpox. As these negroes were taken to Porto Rico under a foreign flag, and thence to Caracas under the Spanish, the company was prohibited from exporting merchandise in the foreign vessels bringing the negroes or from transacting any business which might injure or affect the

NATIVE NEGROES.

Company of Barcelona having a monopoly of the island's commerce, or which might affect the contract executed with Miguel de Uriarte and his partners relating to negroes to be brought to the island of Porto Rico.

By a royal *cedula* of November 8, 1765, extended to the islands of Cuba, Santo Domingo, Porto Rico, Marguerite, and Trinidad, the King ordered the abolition of the taxes and duties which were being paid in the said islands for the introduction of negro slaves, there being substituted therefor a moderate capitation tax, to be paid annually by persons engaged in the importation of slaves. This royal *cedula* contained other provisions which were beneficial to agriculture according to the economic ideas then prevalent.

The number of negro slaves in Porto Rico in 1765 and for a hundred years later was as follows:

1765.....	5,037	1827.....	31,874
1794.....	17,500	1830.....	34,240
1802.....	13,333	1834.....	41,818
1812.....	17,536	1846.....	51,216
1820.....	21,730	1860.....	41,738

From 1862 to 1872 the number of slaves was gradually reduced, as appears by the census of that year, which gives the total black population of the island as 257,709, of which 31,635 were slaves. From these statistics it will be observed that the number of slaves increased rapidly to 1845 and steadily declined from that date. The decline and disappearance of slavery were due to the treaties made by Spain with England, the laws and decrees promulgated by the Government, the growing sentiment against it in all civilized countries, especially in England and the United States, and the corresponding watchfulness of British and American cruisers in West Indian waters.

On the 22d of March, 1873, a law was passed by the Spanish revolutionary National Assembly abolishing slavery in Porto Rico forever, on condition that all freedmen should enter into contract for continued labor with their actual possessors, with other persons, or with the State, for a period of not less than three years. Three officials were appointed by the insular government to guard the interests of the slaves in all contracts. Articles 3, 4, 5, and 6 provided for the indemnification of the owners of slaves on the basis of such an appraisalment as might be determined by a board of officials and slave owners, for which the law made provision.

As in other Spanish possessions, the slaves of Porto Rico were humanely treated, as a rule, and granted many privileges not accorded to them by other governments. Among these was the privilege of purchasing their freedom, of which, as shown by statistics, many took advantage.

As in Cuba, the black population has always been of great conse-

quence to the agricultural interests of the island, more especially in the cultivation of the sugar cane. This fact largely affected the terms of the law of 1873, and caused the insertion of the clause requiring service under contracts. To have freed the slaves without this condition might, and probably would, have resulted disastrously to the slaves as well as to the planters and others dependent on them for labor.

CHINESE.

The number of Chinese is so inconsiderable that no special account of them is necessary. Their presence in the island is entirely voluntary.

SUMMARY OF PAST CENSUSES.

In connection with the work of the present census, a summary has been made of all the past censuses of Porto Rico, of which the official figures were obtainable. This summary thus includes the census of 1860, that of 1877, and that of 1887. The details for the Spanish census of 1897 are not available.

FORM OF POPULATION SCHEDULE.

If the population schedule adopted for the Porto Rican census be compared with the schedule of the Eleventh Census of the United States, it will be found that, while in general design they are the same, they differ in respect to the number of inquiries, and that the latter is the more comprehensive of the two. This is quite natural and results from the simple and homogeneous character of the population of Porto Rico, in which a less extensive investigation is necessary to determine the state of the population than in the United States. In Porto Rico the industries of the people are quite limited and a very large majority of the population is native.

The population schedule used in the present census, translated into English and reduced in size, is as follows:

¹8,143 absent residents are included.

NATIVE HUTS, CATANO

METHOD OF TABULATION.

It was decided that to save time, which was important, the tabulation should be done by machine, and not by the old hand-tally system.

As the electric tabulating machines, invented by Mr. Herman Hollerith, had been successfully used in tabulating the Eleventh Census of the United States, and were to be used again in the Twelfth, and as his system was known to be accurate and expeditious, it was adopted. Its operation is described by Mr. Hollerith as follows:

“The population of each enumeration district was first established by a so-called ‘rough count’; that is, the number of persons recorded on each schedule were counted by two clerks independent of each other, and where such counts disagreed, a third, or even a fourth, count was made to determine the correct population of each enumeration district.

“The detailed tables were then prepared by means of the electric tabulating system. For this purpose all the necessary data relating to each person were expressed by means of holes punched in certain places in a card by means of the key-board punch.

Pattern of the card.

1 2 3 4	X	X	1 2	B	V	0 1 2 3	S	Cu	Cn	It	Af

19 99

“If the record related to a white person, B, standing for *blanco* (white), was punched, while N was punched for a negro, or M for mixed, Ch for Chinese, etc. For males V was punched, and H for females. The age was recorded by punching 0 for less than 1 year, 1, 2, 3, or 4 for the respective years, 5 for the group 5-9, etc. Conjugal

NATIVE HUT.

condition was recorded in the next field or division of the card. Birth-place was recorded by punching in another division of the card PR for Porto Rico, Esp for Spain, It for Italy, OC for other countries, etc. Citizenship was similarly recorded. For each occupation two holes were punched, according to the number assigned to the given occupation in the corresponding classification of occupation, NG being punched for those without gainful occupation. Literacy, school attendance, education, and the sanitary condition of the dwellings, size of families, etc., were similarly recorded by punching in the respective divisions of the card.

“At the extreme left a space of four rows of 12 holes was used to record the department, municipality, and enumeration district to which the card related. The combination of holes would, of course, be the same for all the cards of a given district, and the holes were made not by the keyboard punch, but by the gang punch.

“In addition, each card was provided at the extreme right-hand edge with a double number, one number indicating the sheet of the particular enumeration district on which the record of the corresponding person could be found, and the other indicating the particular line on which the facts were reported to which the card related. By means of the gang-punched holes and these numbers any one of the million cards corresponding to the population of Porto Rico could be identified and the correctness of the punching verified.

“The punched cards were then passed through the electric tabulating machines. In this machine a series of electro-magnetically operated counters are arranged, according to the tables it is desired to compile, in electric connection with a circuit-closing device, the circuits through which are controlled by the holes in the punch-record card, which is placed on the bedplate of such circuit-closing device.

“The cards relating to a given enumeration district were fed one by one into the tabulating machine, which recorded the number of native white males, foreign white males, colored males, native white females, the number born in Porto Rico, in Spain, the number less than 5 years of age, 5 to 9 years of age, etc. The sum of the details of each group of facts should equal the total number of cards tabulated, and, of course, should equal the population of the enumeration district as established by the rough count, thus providing a third check on the accuracy of the count.

“At the same time that a card operates the counters it opens one compartment of the sorting box, into which it is placed when removed from the circuit-closing device. The object of such sorting is to arrange the cards to facilitate subsequent tabulation by means of which the more detailed tables are obtained.

“By thus tabulating first one group of data and then another with intermediate sorting or arranging of the cards the various tables were obtained.”

DISCUSSION OF POPULATION TABLES.

TOTAL POPULATION.

The population of Porto Rico, shown by the schedules of the recent census, taken as of November 10, 1899, was 953,243. This is a little more than two-thirds that of Cuba in 1899 and about the same as that of West Virginia in 1900. Previous censuses of the island in comparison with this show the following results:

Population at each census.

1765	44, 883	1846	447, 914
1775	70, 250	1860	583, 308
1800	155, 426	1877	731, 648
1815	220, 892	1887	798, 565
1832	330, 051	1899	953, 243

From the above figures the decennial rates of increase have been computed, with the following results:

Rate of increase per decade.

	Per cent.		Per cent.
1765-1775	57	1846-1860	21
1775-1800	37	1860-1877	14
1800-1815	26	1877-1887	9
1815-1832	27	1887-1899	16
1832-1846	24		

The above figures show a remarkably uniform gradation in the rate of increase from 56 per cent per decade between 1765 and 1775 down to 9 per cent between 1877 and 1887. The surprising rise between the last two censuses may be due to a more thorough enumeration in 1899 than ever before, although it must be said that if the lower rates of increase in earlier periods had been due to imperfect enumeration, it was scarcely to be expected that the series of rates of increase above given would have shown as smooth a curve.

The last rate of increase, that between 1887 and 1899, is much less than that of the United States between 1890 and 1900 (21 per cent), but agrees with that of the state of Arkansas for the same decade.

GROWTH OF THE TOTAL, THE WHITE AND THE COLORED POPULATION

HUNDREDS OF THOUSANDS

Before making a comparison for departments and municipal districts between the population in 1887 and that in 1899 five changes call for mention. Three of them are merely nominal. The San Juan department of 1887 appears in the present census as Bayamon, the Sabana del Palmar district of 1887 is now Comerio district, and the Hato Grande district of 1887 is now San Lorenzo. Two municipal districts no longer appear in any shape in the list, for Ceiba has been consolidated with Fajardo, and Luquillo has been divided between Rio Grande and Fajardo. As the last change affects the boundary between two departments, in preparing the table below the municipal district of Rio Grande has been included in the department of Humacao, in order to ensure that the comparison in every case is for identical areas.

Department.	Population.		Increase, 1887-1899.	
	1887.	1899.	Absolute.	Per cent.
Humacao (with Rio Grande)	93,214	100,866	7,652	8.2
Mayaguez.....	115,926	127,566	11,640	10.0
Guayama.....	96,991	111,986	14,995	15.5
Aguadilla.....	86,096	99,645	13,549	15.7
Bayamon (less Rio Grande)	122,862	147,681	24,819	20.2
Ponce.....	159,311	203,191	43,880	27.5
Arecibo.....	124,165	162,308	38,143	30.7
Porto Rico.....	798,565	953,243	154,678	19.4

The boundaries between these departments divide the island, by lines trending either north and south or east and west, into four regions, which may be called the eastern (department of Humacao), east central (departments of Bayamon and Guayama), west central (departments of Arecibo and Ponce), and western (departments of Aguadilla and Mayaguez). Each of these four divisions, except the first, is subdivided into a northern and a southern part.

An inspection of the preceding table, with these facts in mind, shows that the central departments, except Guayama, increased faster than any of the three at the east and west ends of the island; that of the three departments at the ends of the island those at the west grew faster than Humacao, and of the four central departments the two west central ones grew faster than either of the east central ones. Each department on the north coast also grew more rapidly than the department directly south of it, viz, Aguadilla faster than Mayaguez, Bayamon faster than Guayama, and Arecibo faster than Ponce. The three most populous departments are the ones in which the rate of increase was above the average for the whole island.

Among the 69 municipal districts into which these departments are subdivided 7 decreased in population between 1887 and 1899. As all of them lie on the coast, their situation suggests that the coast districts as a whole may have grown more slowly than the interior of the island. To test this hypothesis the population of the coast districts

and of the interior districts has been found separately for 1887 and 1899 with the following results:

Class of district.	Number.	Population in—		Increase.	
		1887.	1899.	Absolute.	Per cent.
Coast districts.....	40	487,704	573,484	85,780	17.6
Inland districts.....	29	310,861	379,759	68,898	22.2

From these figures it appears that the average increase of population in the interior has been more rapid than that on the coast. If the figures for the coast cities of San Juan, Ponce, and Mayaguez had been excluded the difference would have been more marked. The depressed condition of sugar-cane growing in the West Indies of recent years may have played an important part in producing this difference, for the growing of sugar cane is common in the coast plains of Porto Rico.

The area of Porto Rico, including the adjacent and dependent islands of Vieques, Culebra, Mona, and Muertos, has been measured in connection with this census and found to be 3,606 square miles. But owing to the imperfect surveys on which all maps of Porto Rico are based, there must be a considerable and indeterminate margin of possible error in any such measurement. The island is about three times the size of Long Island, which was in 1890 perhaps the largest insular division of the United States. It is also slightly greater than the eastern shore of Maryland (3,461 square miles).

The relative sizes of the larger West Indies are as follows: Cuba, the greatest, is about equal in area to all the rest combined. Haiti, the second, is about two-thirds the size of Cuba, while on the other hand it is seven times the size of Jamaica and eight times the size of Porto Rico. Porto Rico, again, is more than double the size of the fifth island, Trinidad, which is itself about three times the size of the sixth island, Guadeloupe.

The area, population, and density of population of the seven departments of Porto Rico are given below.

Department.	Area in square miles.	Population.	Persons to a square mile.
Guayama.....	561	111,986	200
Humacao.....	413	88,501	214
Ponce.....	822	203,191	247
Arecibo.....	621	162,308	261
Bayamon.....	542	160,046	295
Mayaguez.....	407	127,566	313
Aguadilla.....	240	99,645	415
Porto Rico.....	3,606	953,243	264

Porto Rico has 264 persons to a square mile. This density of population is about the same as in New Jersey, nearly twice that in Pennsyl-

vania, and thrice that in Illinois. It is more than seven times that of Cuba and nearly twice that of Habana province.

The table puts in a clear light the slight difference between the various departments. Aguadilla has hardly more than twice as many people to a square mile as Guayama. In Cuba, on the contrary, Habana province has over nineteen times as many people to a square mile as Puerto Principe. This remarkable evenness of settlement in Porto Rico extends to the 69 municipal districts, the density of which is shown on the map opposite this page. The least settled district has 58 persons to a square mile, or about the same number as Indiana. The densities of these districts range about 264, the density for the island, and depart from it by an average amount of 106 units, or 40 per cent of that number.

On comparing the preceding table with an earlier one showing the rate of increase in each province during the past twelve years, it will be seen that the two departments, the population of which has been increasing most rapidly, are two of the four in which the density of population is below the mean for the island. This suggests that the evenness of settlement now so conspicuous is not decreasing, but rather the reverse. The table shows also that each department along the northern coast is more thickly settled than is the department immediately south of it, viz, Bayamon than Guayama, Arecibo than Ponce, and Aguadilla than Mayaguez.

URBAN POPULATION.

[See Table IV.]

The people of Porto Rico are, in the main, a rural community. There are no large cities in the island, the largest two being San Juan, which, regarding the entire municipal district as a city, had a population of 32,048, and Ponce, which with its port constituted practically one city, with a population of 27,952. These are the only two cities exceeding 25,000 inhabitants. The next city in magnitude is Mayaguez, on the west coast, with a population of 15,187. The only other city exceeding 8,000 inhabitants is Arecibo, with a population of 8,008. The total urban population of the island contained in cities exceeding 8,000 inhabitants each was 83,195, or only 8.7 per cent of the population of the island. This is a much smaller proportion than in Cuba, where the corresponding figures are 32.3 per cent, or in the United States, where the corresponding proportion in 1890 was 29.2 per cent.

There were in Porto Rico 57 cities, each having a population of 1,000 or more. The total urban population of the island, under this definition, numbered 203,792, or 21.4 per cent of the total number of inhabitants of the island. Similar figures for Cuba show 47.1 per cent of the population of that island to be urban.

The number of urban inhabitants in each department of Porto Rico, with the proportion it bears to the total population of the department, is shown in the following table:

Department.	Total population.	Urban population (1,000+).	Percentage urban to total.
Aguadilla	99,645	15,518	15.6
Arecibo	162,308	21,166	13.0
Bayamon	160,046	46,728	29.2
Guayama	111,986	26,829	24.0
Humacao	88,501	18,219	20.6
Mayaguez	127,566	29,463	23.1
Ponce	203,191	45,869	22.6
Total	953,243	203,792	21.4

From the above it is seen that the smallest proportion of urban population was in the department of Arecibo, where it constituted 13 per cent of all the inhabitants. From this it ranged to 29.2 per cent in Bayamon department. The range in the proportion among the different departments was small compared with the corresponding range in Cuba.

CENTER OF POPULATION.

The center of population for Porto Rico has been computed for the inhabitants as distributed in 1899, and the center of area of the island has also been computed. The center of population is the center of gravity of the inhabitants of the country. If Porto Rico were a plane surface without weight and were loaded with its inhabitants distributed as they were in 1899, each inhabitant being supposed to have the same weight, the center of population would be the point about which all parts of the island would balance.

The center of area is similar if we substitute square miles or square yards for population. If the island be conceived as a plane surface of uniform thickness and density, the center of area would be the point about which all parts of it would balance.

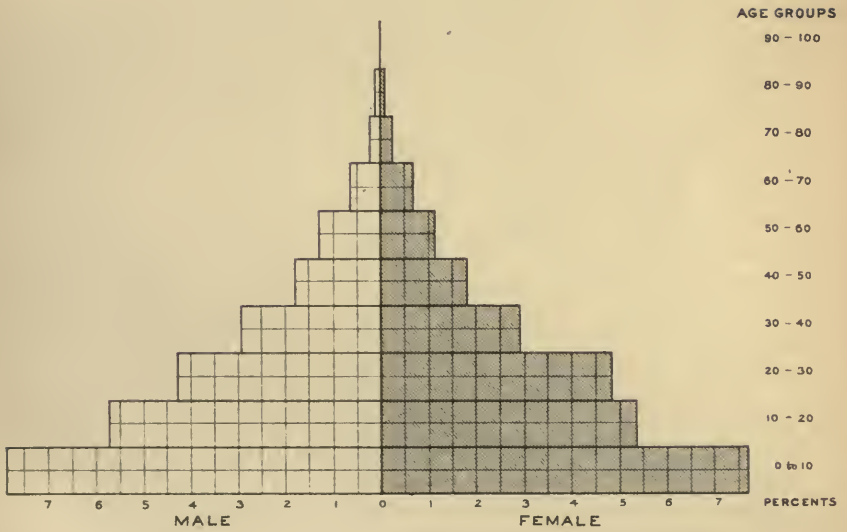

The method of computing the centers of population and of area has been described in the reports of the United States Census, and in the report upon the census of Cuba, so that it is unnecessary to repeat it in this connection.

The center of population of Porto Rico was situated at a point 6.6 miles west and 2.4 miles north of the little town of Barros. This point is near the southeastern corner of the municipal district of Ciales, in the department of Arecibo.

The center of area is situated 3 miles north and 2.1 miles west of the town of Barros, and is thus 0.6 mile north and 4.5 miles east of the center of population. It is situated in the southern part of the municipal district of Morovis, in the department of Arecibo. Owing to the inaccuracy of the maps of Porto Rico it is impracticable to express

PORTO RICO

SHOWING
POPULATION, BY AGE AND SEX

its location in terms of latitude and longitude. That the center of population is slightly south and between 4 and 5 miles west of the geographical center is evidence that the western half of the island is more thickly settled than the eastern and the southern half has slightly more residents than the northern.

SEX.

[See Tables V and VI.]

In a total population of 953,243 Porto Rico had 8,721 more females than males, an excess amounting to 0.9 per cent of the total population. In 1887 the excess of females in the *de jure* population was only 478, and in the *de facto* population the males were 523 in excess. In 1860 the males outnumbered the females by 9,653, or 1.7 per cent of the total population. It appears thus that the proportion of females is slowly increasing. An excess of that sex was found in six of the seven departments into which the island is divided. The following table gives the absolute excess of males or females in each department and the ratio which this excess bears to the total population of the department:

Department.	Absolute excess of—		Ratio of excess to total population.	
	Males.	Females.	Males.	Females.
Bayamon		3,588		2.2
Mayaguez		2,066		1.6
Guayama		1,554		1.4
Aguadilla		1,197		1.2
Humacao		533		0.6
Arecibo		506		0.3
Ponce	723		0.4	
Porto Rico		8,721		0.9

In no department did the excess of females equal the average excess of males in the island of Cuba (3.6 per cent) or the excess of females found in many other West India islands. As a marked inequality of the two sexes is usually a result and evidence of considerable migration into or away from the district under consideration, so an approximate equality in the numbers of the two sexes, both in the island as a whole and in its several departments, is probably connected with the slight amount of immigration, emigration, or migration within the island, and also with the small urban population, since an urban population usually contains a decided excess of females. The two departments in which the ratio of males was highest are also the two which are growing most rapidly. This may point to some immigration of males to Ponce and Arecibo from other parts of Porto Rico.

When the several municipal districts are examined with regard to the proportion of the two sexes, the three small outlying islands are found to have an excess of males, but among the sixty-eight districts

of Porto Rico proper it appears that the coast districts in rather more cases than the inland and upland districts have an excess of females, as seen by the following table:

Class of district.	Total number.	Number with excess of—	
		Males.	Females.
Coast districts	39	11	28
Inland districts	29	15	14
Island	68	26	42

Of the inland districts one-half and of the coast districts only about one-fourth, have an excess of males.

In the coast districts 48.5 per cent of the population are male, while in the inland districts 51 per cent are male. The three coast cities, San Juan, Ponce, and Mayaguez, collectively, contain 48.5 per cent of males, or the same as for the coast districts as a whole. The percentage of males, therefore, in the inland districts is perceptibly higher than along the coast.

AGE.

[See Tables VIII and IX.]

Probably the best single and simple expression for the age of a great number of people like the inhabitants of Porto Rico is what is called the median age; that is, the age such that half the members of the population group under consideration are younger and half are older. To compute it accurately, the census tables should present the ages by single years. That information being given, it is easy to ascertain within what single year of life the median age must lie. It is then assumed that within the year of age thus fixed the persons were evenly distributed; in other words, that there were as many persons living in the first tenth of the year as in each other tenth. In this way the median age of the population of the United States in 1890 has been fixed at 21.9 years. The present census of Porto Rico reports ages above 5 not by single years but by periods of years, usually five,¹ and, accordingly, to get the median age it has been necessary to distribute the population of Porto Rico for one age period to the single years. In so doing it has been assumed that the number of each year of age in that period bears the same proportion to the total in Porto Rico that it does in the United States. The median age in Porto Rico

¹The division of the group 15-19 at 17 enables one to know the population of school age, 5-17, and that of age to serve in the militia, 18-44. The division of the group 20-24 at 20 enables one to know the potential voters. The division of the group 0-4 into single years allows a study of the balance between birth rate and death rate during the early years, before it is seriously affected by migration.

as thus found is 18.1 years. That in Cuba is 20.7 years, and in the United States in 1890 it was 21.9 years. The people in Porto Rico, therefore, are more than 2 years younger than those in Cuba and nearly 4 years younger than those in the United States. While the median age in Porto Rico is much below that in Cuba or in the whole United States, it is higher than that in seven American states in 1890, including most of those with a large negro population. The median age of the several departments of Porto Rico is as follows:

Department.	Median age.
Guayama.....	17.3
Arecibo.....	17.6
Humacao.....	17.7
Aguadilla.....	17.9
Bayamon.....	18.2
Ponce.....	18.5
Mayaguez.....	19.1

The populations of the 7 provinces differ comparatively little in median age, the range between Guayama and Mayaguez being less than two years, while in Cuba the range between the 6 provinces is over five years, and in the United States the range between the 49 divisions for which the age constitution was reported in 1890 was no less than twelve years. This uniformity in age composition of the several departments of Porto Rico is another statistical witness to the similarity of economic and social conditions throughout the island.

In the preceding table one may notice, however, that the three departments of Bayamon, Ponce, and Mayaguez, containing the only cities of much size in Porto Rico, are the three in which the median age is greatest. It may be that these two facts are connected, that is, that the population of these cities has so high a median age as to raise that for the departments in which they lie. To test the fact the following table has been constructed, showing the median age for these three cities and that for the rest of the department containing the city. The former has been called the urban and the latter the rural population.

Department.	Median age of—		Difference.
	Urban population.	Rural population.	
Bayamon.....	22.3	16.7	5.6
Mayaguez.....	21.9	18.6	3.3
Ponce.....	22.2	17.7	4.5
Porto Rico.....	22.2	17.7	4.5

From the preceding table it appears that the median age of the rural population in Bayamon, Ponce, and Mayaguez averages below that for the entire island, but that the median age of the three large

cities, Mayaguez, Ponce, and San Juan, is from three to five years higher than that for the rural districts in the same department. Hence the hypothesis which the table was designed to test is established. The population of these three cities treated as a unit has a median age of 22.2, while the median age for the rest of Porto Rico is only 17.7 years. The average difference between city and country in Porto Rico is more than double that between the two most widely divergent departments.

The median age is a summary expression of the age constitution and gives only a preliminary idea of the facts. The analysis is carried a step farther by the following table, in which the three population groups are compared in more detail. The table states the proportion that the number of persons in each ten-year period from the beginning to the end of life made of the total population of all ages.

Age constitution of the population of Porto Rico, by ten-year periods, compared with that of Cuba and the United States.

Age period.	Per cent of total population in age period named.		
	Porto Rico.	Cuba.	United States (1890).
0-9.....	30.9	22.7	24.3
10-19.....	22.8	25.3	21.7
20-29.....	18.1	18.5	18.3
30-39.....	11.7	18.9	13.5
40-49.....	7.4	9.2	9.4
50-59.....	5.1	5.8	6.4
60-69.....	2.6	3.1	3.9
70-79.....	0.9	1.0	1.8
80-89.....	0.4	0.4	0.4
90-99.....	0.1	0.1
100+.....
Unknown.....	0.3
Total.....	100.0	100.0	100.0

This table shows that the proportion of children under ten in Porto Rico is notably higher than it is in Cuba or the United States. It is also much higher than in most countries of Europe, for the only European country with a higher proportion among the eighteen mentioned in an accessible summary of recent censuses¹ is Bulgaria, in which 31.5 per cent of the population was reported by the census of 1888 as under ten. There is no American state in which, by the census of 1890, the proportion of children under ten was as large as it is in Porto Rico. If the population of the United States be taken as the standard, the population of Porto Rico contains many more young children, a few more children in their teens, about the same proportion of persons in the twenties, but a noticeably smaller proportion of persons in each subsequent decennial period until the ages of eighty and over, when the proportions are apparently about the same as in the United States, or even greater. Of persons over sixty there are in Porto Rico only 40 in 1,000, while in the United States there are

¹ Allgemeines Statistisches Archiv III, 472 (1894).

62. If we assume that in both countries children under ten and aged persons over seventy are supported by persons between ten and seventy, then in Porto Rico there would be 47 such dependents, young or old, for every 100 persons between ten and seventy, while in the United States there would be only 36.

There are fewer elderly persons over sixty in Porto Rico than in the United States or Cuba, and all three have a lower proportion of aged persons than any of the eighteen countries of Europe. The small proportion in Porto Rico is due in part to the rapid growth of population, but also in large degree to the short average lifetime of the people, resulting from unsanitary conditions, ignorance regarding care for the health, and poverty, all of which are widely prevalent among certain classes.

The analysis may be carried one step farther by finding the proportion of the population belonging to each period of five years between birth and death. The results, in comparison with those for the United States and Cuba, and also with an artificial stationary population from which the errors due to misstatement of age or to uneven growth of population have been excluded, are contained in the following table:

Age constitution of the population of Porto Rico compared with that of Cuba and the United States, by five-year age periods.

Age period.	Porto Rico.	Cuba.	United States (1890).	Farr's English life table.
0-4	15.8	8.3	12.2	9.8
5-9	15.1	14.4	12.1	8.8
10-14	13.0	14.0	11.2	8.5
15-19	9.8	11.3	10.5	8.2
20-24	9.3	9.7	9.9	7.9
25-29	8.8	8.7	8.4	7.6
30-34	6.8	7.6	7.3	7.2
35-39	5.0	6.3	6.2	6.8
40-44	4.6	5.4	5.1	6.4
45-49	2.8	3.8	4.4	5.9
50-54	3.5	3.7	3.7	5.4
55-59	1.6	2.2	2.7	4.8
60-64	1.9	2.2	2.3	4.2
65-69	0.7	0.9	1.6	3.4
70-74	0.6	0.7	1.1	2.4
75-79	0.2	0.3	0.6	1.5
80-84	0.3	0.3	0.3	0.8
85-89	0.1	0.1	0.1	0.3
90-94	0.1	0.1	0.1
95-99
100+
Unknown.....	0.3
Total.....	100.0	100.0	100.0	100.0

The great number of young children previously noted is emphasized by the preceding table. In each of the first two age periods there are about 3 more children to 100 of the total population than there are in the United States; that is, in an average 100 Porto Ricans there are between 6 and 7 more children under 10 than there are in an average 100 Americans. Porto Rico has a larger proportion of children under 5 than any American state in 1890, and a larger proportion of children between 5 and 10 than any American state in 1890, except

South Carolina and Mississippi. This large proportion of young children witnesses clearly to a very high birth rate on the island, and therefore, as the population has not increased with very great rapidity and has not been much influenced by immigration or emigration, it testifies indirectly to a very high death rate.

An examination of the preceding table shows also that during adult life, and especially the later years, the proportions, and therefore the numbers, in Porto Rico belonging to the successive quinquennial groups vary irregularly. For example, the proportion of persons between 50 and 55 is much larger than the proportion of persons between 45 and 50. One would expect the number in each group through middle life to fall below that of the next younger group by a somewhat constant proportion. That it does not is perhaps sufficiently obvious from the table, but the fact is more distinctly brought out in the following derivative table:

Number and per cent by which the reported population at the age group named fell below the number in the preceding age group.

Age group.	Difference between group named and preceding quinquennial group.	Per cent that difference makes of total in preceding quinquennial group.
10-14	-19,193	13.3
15-19	-31,205	25.0
20-24	-4,673	5.0
25-29	-4,210	4.7
30-34	-19,948	23.6
35-39	-16,761	26.0
40-44	-3,310	6.9
45-49	-17,849	40.3
50-54	+6,474	24.5
55-59	-17,541	53.3
60-64	+3,056	19.9
65-69	-11,707	63.6
70-74	-433	6.4
75-79	-3,863	61.8
80-84	+276	11.5
85-89	-1,886	70.9
90-94	-105	13.5
95-99	-368	55.0

Such irregularity in the decrease with advancing years is counter to all the probabilities in the case. The most simple hypothesis that arises to explain it is errors in the reporting of ages. Where such errors occur they reveal themselves in the large number of persons whose age is reported as a multiple of 5 or especially of 10. Hence, as a result of this tendency, quinquennial groups containing a multiple of 10 are erroneously swollen and the intervening groups correspondingly diminished. An examination of the preceding table will show that this is true of the reported ages in Porto Rico. Farther evidence of the irregularity may be found in the following table. The number of persons in each quinquennial group has been compared with half the sum of the numbers in the groups immediately preceding and following. If the curve representing the population by age groups were a straight descending line (for a stationary population and through the

- FEMALE

years of adult life it closely approaches a straight line), the number thus found would in each case be 100 per cent. The departures from 100 per cent, therefore, in the following table measure approximately, and the departures from the figures in the first column measure more accurately, the irregularity and probable error in the reported ages in Porto Rico. Columns for the United States and Cuba are introduced for comparison.

Per cent that population in each quinquennial group makes of the arithmetical mean of population in the next younger and next older groups.

Age group.	English life table, No. 3.	Porto Rico.	Cuba.	United States (1890).
5-9	84.2	104.5	128.8	103.2
10-14	96.8	105.2	109.0	99.6
15-19	100.4	87.6	95.4	99.2
20-24	100.4	99.8	97.0	105.2
25-29	100.2	105.4	101.2	97.0
30-34	100.2	97.7	100.4	100.6
35-39	100.2	87.7	97.4	99.6
40-44	100.2	119.6	107.2	96.6
45-49	100.4	68.6	83.8	99.2
50-54	100.6	157.5	123.0	105.6
55-59	101.0	59.9	73.4	88.4
60-64	101.4	167.9	144.0	108.6
65-69	101.6	54.3	60.6	93.6
70-74	100.4	128.3	128.4	100.0
75-79	95.8	54.3	53.8	86.8
80-84	85.8	175.0	157.2	87.0
85-89	69.6	47.1	42.4	66.2
90-94	50.4	140.0	146.4	58.4

By disregarding the first two age groups and finding for each following group the differences between the figures in the first column and those in each other column, one obtains a measure of the real or alleged excess or deficiency of population in certain age periods.

Measure of excess (+) or deficiency (-) of population in age group named.

Age group.	Porto Rico.	Cuba.	United States (1890).
15-19	-12.8	- 5.0	- 1.2
20-24	- 0.6	- 3.4	+ 4.8
25-29	+ 5.2	+ 1.0	- 3.2
30-34	- 2.5	+ 0.2	+ 0.4
35-39	-12.5	- 2.8	- 0.6
40-44	+19.4	+ 7.0	- 3.6
45-49	-31.8	-16.6	- 1.2
50-54	+56.9	+22.4	+ 5.0
55-59	-41.1	-27.6	-12.6
60-64	+66.5	+42.6	+ 7.2
65-69	-47.3	-41.0	- 8.0
70-74	+37.9	+28.0	- 0.4
75-79	-41.5	-42.0	- 9.0
80-84	+89.2	+71.4	+ 1.2
85-89	-22.1	-27.2	- 3.4
90-94	+89.6	+96.0	+ 8.0

In all three countries the population in age groups including a multiple of 10 was usually in excess, and that in other age groups in deficiency. In Cuba the deviation from the standard after the age of 30 was greater and in most instances many times greater than in the United States, and in Porto Rico with few exceptions it was much greater than in Cuba. In the United States where ages are reported

This table throws some light upon the table already given (p. 47), showing median age by departments. For example, from the former table it appeared that the median age in Mayaguez was more than half a year higher than that of any other department. From the present table it appears that Mayaguez has a smaller proportion of children under 15, and a larger proportion of persons at each age period but one between 30 and 60, than any other department. The median age of the population is closely dependent upon the proportion of children under 15. This appears from the following table, in which the departments are arranged in the order of their median age, and the proportion of children under 15 to the total population is given:

Department.	Median age.	Proportion of population under 15 years.
Guayama	17.3	45.6
Arecibo	17.6	44.9
Humacao	17.7	44.9
Agua dilla	17.9	44.4
Bayamon	18.2	43.6
Ponce	18.5	43.2
Mayaguez.....	19.1	41.4

It will be seen that the departments with a low median age are uniformly those with a high proportion of children, while those with a high median age are those in which the proportion of children is smaller.

In the same way, the high median age of the urban population is due to the small proportion of children under 15 found in the cities of Porto Rico. Treating the population of these cities as a unit, it appears that the children under 15 therein constituted only 32 per cent of the total population of the cities, while in the rest of Porto Rico such children constituted 44.9 per cent, a difference between city and country of 12.9 per cent, or thrice that separating the two most diverse departments.

AGE AND SEX.

In Porto Rico the median age of the males is 17.5 years, while that of the females is 18.6 years; that is, the females were more than a year older than the males. In the United States in 1890 the males were four-fifths of a year older and in Cuba in 1899 more than eighteen months older than the females. Each sex in Porto Rico was much younger than the corresponding sex in Cuba or the United States.

The greater age of females is elucidated by the following table. It states the ratio between the total number of each sex in a given quinquennial age group and the total of that sex at all ages.

Age period.	Per cent of—		Excess of—	
	Males.	Females.	Males.	Females.
0-4.....	16.3	15.3	1.0
5-9.....	15.4	14.7	.7
10-14.....	13.8	12.3	1.5
15-19.....	9.1	10.5	1.4
20-24.....	8.8	9.79
25-29.....	8.4	9.39
30-34.....	6.6	6.93
35-39.....	5.1	4.9	.2
40-44.....	4.7	4.6	.1
45-49.....	2.9	2.7	.2
50-54.....	3.4	3.51
55-59.....	1.8	1.5	.3
60-64.....	1.8	2.13
65-69.....	0.8	0.6	.2
70-74.....	0.5	0.72
75-79.....	0.2	0.2
80-84.....	0.2	0.31
85-89.....	0.1	0.1
90-94.....	0.1	0.1
95-99.....
100+.....
Unknown.....
Total.....	100.0	100.0

From the preceding table it appears that in Porto Rico a much larger proportion of the males than of the females are under 15, but that this difference is almost entirely offset by the fact that among females a much greater proportion are between 15 and 30. The higher median age of females is thus due to the disproportionate number of males among children and apparently of females among young adults. After the age of 30 the proportion of the two sexes remains almost the same. It would appear from the table, however, that the proportion of males is greater in the age periods 55 to 59 and 65 to 69, while that of females is greater in the periods 50 to 54, 60 to 64, 70 to 74, and 80 to 84. This difference may plausibly be assigned to the greater inaccuracy with which the ages of Porto Rican women are returned. As already shown, a considerable number belonging outside the period including a multiple of ten have been returned as in these periods, and this tendency affecting women more powerfully than men has distorted in the table the real balance of the sexes during the higher age periods. To determine whether this hypothesis is correct the following table for the two sexes has been constructed in accordance with the method previously explained (p. 50, f.):

Per cent that population in each quinquennial period makes of the arithmetical mean of population in the next younger and next older period.

Age period.	Males.	Females.
25-29.....	108.1	112.3
30-34.....	98.4	96.8
35-39.....	90.6	84.7
40-44.....	117.6	121.7
45-49.....	70.2	66.7
50-54.....	148.3	167.5
55-59.....	67.4	52.8
60-64.....	143.1	195.0
65-69.....	63.5	46.5
70-74.....	114.8	163.0
75-79.....	62.9	46.7
80-84.....	135.8	198.4

Inspection of this table shows that, throughout, the females depart more widely than the males from the normal of 100 per cent, but that this difference between the two sexes, while constant, is comparatively slight up to the age of 50 years. Thereafter it is very striking.

Corroborative evidence may be found in examining which sex was more fond of reporting the age as exactly 20. In a stationary population about 20.3 per cent of all persons between 20 and 25 are actually 20, but in Porto Rico 32.3 per cent of the males and 34.8 per cent of the females 20-24 reported themselves as 20. This shows that women's tendency to answer in round numbers even at this early age is a little higher than men's.

One may safely conclude that erroneous statements of age, at least after middle life, are more common among Porto Rican women. Where errors of age occur during the later years, they are likely to exaggerate the real age. For example, in the United States in 1890, among every 100,000 colored, 128 claimed to be 90 years old or more, but among every 100,000 native whites of native parents, only 45 claimed to be 90 or more, yet the whites certainly live longer. As elderly Porto Rican women are more prone to report their ages in multiples of 10, so they are probably more prone to exaggerate their age, and part of the high proportion of women 70 years old or more may be thus explained. At the same time, as general experience testifies to a somewhat lower mortality of women in civilized countries, the greater proportion of women in the later ages may probably be accepted as correct, although the census figures exaggerate the difference.

RACE.

[See Tables V, VII, and IX.]

With reference to race, the population of Porto Rico is divided by the census into two main classes—those who are and those who are not pure whites, or Caucasians.

The number belonging to each of these two classes is as follows:

Race.	Number.	Per cent.
White	589,426	61.8
Colored	363,817	38.2
Total.....	953,243	100.0

The word "colored" in the preceding table includes a very few (75) Chinese and many persons of mixed white and negro blood, as well as the pure negroes. Somewhat more than three-fifths of the population of Porto Rico are pure white, and nearly two-fifths are partly or entirely negro. In the following table the proportions of white and colored in other West India Islands are given for comparison:

Country or state.	Date of census.	Per cent of—	
		White.	Colored.
Jamaica	1891	2.3	97.7
Leeward Islands	1891	4.0	96.0
St. Vincent ¹	1891	6.0	94.0
Turks and Caicos.....	1891	8.1	91.9
Barbados	1891	8.6	91.4
Bahamas ²	1881	25.3	74.7
Bermudas ¹	1897	38.4	61.6
Porto Rico.....	1899	61.8	38.2
Cuba	1899	66.9	33.1

¹ According to Statesman's Year-Book for 1899.

² Figures for race not given in census of 1891.

These are all the West India islands for which the facts regarding race were accessible. The table shows that the two islands of Cuba and Porto Rico are exceptional in having a majority of whites. In all others the colored are more numerous, and in all except the Bermudas and Bahamas, both of which lie north of the sugar-producing islands, they are at least ten times more numerous than the whites. The other West India islands have a far smaller proportion of whites than any American state, but there are several American states with a smaller proportion of whites in 1890 than Porto Rico had in 1899. They are as follows:

States with smaller proportion of whites than Porto Rico.	Per cent of whites in total population.
South Carolina	40.1
Mississippi	42.3
Louisiana	49.9
Georgia	53.3
Alabama	55.1
Florida.....	57.5
Virginia.....	61.6
Porto Rico.....	61.8

All the American coast states from Virginia to Louisiana, inclusive, except North Carolina, had a smaller proportion of whites than Porto Rico.

The best collection of information regarding the numerical relations of the races at earlier periods has been found in Delitsch's article on Porto Rico, and from that source, eked out wherever possible by official censuses, the following table has been prepared:

Date of return.	Total population.	White.	Colored.	Per cent of—	
				Whites.	Colored.
1802.....	163,192	78,281	84,911	48.0	52.0
1812.....	183,014	85,662	97,352	46.8	53.2
1820.....	230,622	102,432	128,190	44.4	55.6
1827.....	302,672	150,311	152,361	49.7	50.3
1830.....	323,838	162,311	161,527	50.1	49.9
1836.....	357,086	188,869	168,217	52.9	47.1
1860.....	583,308	300,406	282,775	51.5	48.5
1877.....	731,648	411,712	319,936	56.3	43.7
1887.....	798,565	474,933	323,632	59.5	40.5
1897.....	890,911	573,187	317,724	64.3	35.7
1899.....	953,243	589,426	363,817	61.8	38.2

¹Including 127 whose race was not stated.

The proportion of whites was lowest and of colored highest about 1820, when only four-ninths of the population was white. Since that time the proportion of whites has tended upward, although not with entire regularity. Probably in Porto Rico, as in Cuba and the United States, the accuracy of the enumeration has varied. When omissions occur, they are usually more numerous among the colored than among whites. The irregularities in the preceding series of percentages may flow, therefore, from the varying accuracy of the several censuses. Still the general trend of the figures probably reflects a real change in the population whereby the proportion of whites has risen in eighty years from four-ninths to three-fifths of the population.

But in considering the amount and presumably the influence of white blood in Porto Rico, attention should not be confined to the persons of pure white blood. Many of those ranked as colored have some degree of white blood in their veins. Perhaps the best statistical measure of this is the ratio that the persons of mixed blood bear to the total colored. By the last census five-sixths (83.6 per cent) of the total colored were returned as of mixed blood. Figures regarding race blending can never be obtained with close accuracy by a census, and the results of an effort in this direction are always to be received with reserve. Yet the broad results in this case are probably of some value and may fairly be set beside the results of similar inquiries in the other West India islands and in the United States, as is done in the following table:

Country.	Date of census.	Total colored.	Persons of mixed blood.	Per cent of mixed blood.
St. Vincent ¹	1891	31,559	554	1.8
United States.....	1890	7,633,360	1,132,060	14.8
Leeward Islands.....	1891	122,653	23,320	19.0
Jamaica.....	1891	621,176	121,955	19.6
Barbados.....	1891	166,693	43,976	26.4
Turks and Caicos.....	1891	4,397	1,399	31.1
Cuba.....	1899	520,400	270,805	52.0
Porto Rico.....	1899	363,817	304,352	83.6

¹Figures from Statesman's Year-Book, 1899.

In Porto Rico five-sixths of the colored appear or claim to have white blood also in their veins. In Cuba this is true of only half the colored population; in Jamaica, of one-fifth; in the United States, of one-seventh. This statistical evidence, reenforced as it is by the testimony of competent witnesses, probably warrants one in believing that persons of mixed blood are more numerous in Cuba and Porto Rico than in the other West Indies or in the United States, and more numerous in Porto Rico than in Cuba.

The following table gives the proportion of mixed to total colored for those censuses for which the facts are obtainable:

Date of return.	Total colored population.	Mulattoes.	Per cent mulattoes.
1802 ¹	71,578	55,164	77.1
1812 ¹	79,806	63,983	80.2
1820 ¹	106,460	86,269	81.0
1827 ¹	120,487	95,430	79.2
1830 ¹	127,287	100,430	78.9
1877.....	319,936	240,701	75.2
1887.....	323,632	246,647	76.2
1897.....	317,724	241,900	76.1
1899.....	363,817	304,352	83.6

¹ Figures from Flinter's State of Puerto Rico, p. 206. They apply only to the free colored, not to the slaves.

Throughout the century from three-fourths to five-sixths of the free colored in Porto Rico have had or claimed the blood of both races in their veins. Even if we assume that in 1802 all the 13,333 slaves in Porto Rico were of pure negro blood, still the mulattoes would have been two-thirds (65 per cent) of the total colored. The percentage column suggests that the proportion of mulattoes may have increased since 1877; but examination of the absolute figures shows an apparent increase in the two years 1897-1899 of 16,239 whites, and, with a smaller initial population, of 46,093 colored. The increase of colored was the balance of an increase of 62,452 mulattoes and a decrease of 16,509 negroes. That in two years whites should have increased 2.8 per cent and mulattoes 25.8 per cent, while negroes decreased 21.6 per cent, flies in the face of statistical probabilities. It is simpler and more likely to suppose that a certain number of colored persons who escaped enumeration in 1897 were enumerated in 1899 and that others who were enumerated as negroes in 1897 were returned in 1899 as mulattoes.¹ On the whole, therefore, no inference regarding the relative increase of mulattoes during the century can be drawn with confidence from the preceding table. Yet what indications it affords point to a secular change whereby the pure negro blood has lost ground before the mixed, as the two together have apparently lost ground before the whites.

In the following table the number and proportion of whites and of

¹ Compare p. 85, f.

colored in each department at the present census is stated. In order to call attention to the geographical distribution of the two races, the departments are arranged in the order of decreasing proportion of whites:

Department.	Absolute number of—		Percentages of—	
	White.	Colored.	White.	Colored.
Aguadilla	85,298	14,347	85.6	14.4
Arecibo	125,059	37,249	77.1	22.9
Mayaguez	82,044	45,522	64.3	35.7
Ponce	121,187	82,004	59.6	40.4
Guayama	56,805	55,181	50.7	49.3
Bayamon	78,228	81,818	48.9	51.1
Humacao	40,805	47,696	46.1	53.9
Total	589,426	363,817	61.8	38.2

To one who is familiar with the location of these departments, it is clear that the proportion of whites is greatest in the western departments and decreases toward the east. In Aguadilla the proportion of whites is about the same as in Kentucky, while at the eastern end of Porto Rico it is about the same as in Louisiana. In general the proportion of whites is greater also in the northern departments. As one passes from west to east or from north to south the proportion of colored increases.

If the 69 municipal districts be divided into two classes, the 40 which touch the seacoast and the 29 which do not, and the average proportion of whites in each class be computed, it appears that in the 29 interior districts the whites make up 66.3 per cent of the population; but in the 40 coast districts they are only 58.8 per cent. As the inland districts are usually the upland and cooler districts, it seems that the whites are somewhat more numerous relatively in the cooler parts of the island.

In San Juan the proportion of whites (47.6 per cent) is much larger than in the neighboring municipal districts of Rio Piedras (38.0 per cent), or Carolina (39.1 per cent), but a little less than in Bayamon (51.1 per cent). In the other two large cities, Mayaguez and Ponce, the proportion of whites in the city is noticeably less than in the remainder of the municipal district embracing the city.

City.	Per cent of whites.	
	In city.	In rest of district.
Mayaguez	59.8	68.2
Ponce	55.3	62.2

Apparently the colored are somewhat massed in the cities. The difference in this regard between the capital and the other two cities may be due to the large number of foreign-born whites in San Juan.¹

¹ 2,873 as compared with 754 in Mayaguez and 1,182 in Ponce. See p. 189.

RACE AND SEX.

The following table shows the proportions of the sexes in the two races and for the three classes of colored distinguished by the census:

Race.	Number.		Per cent.		Per cent in Cuba:	
	Males.	Females.	Males.	Females.	Males.	Females.
Whites	294,195	295,231	49.9	50.1	53.5	46.5
Colored	178,066	185,751	48.9	51.1	48.4	51.6
Negro	29,122	30,268	49.0	51.0	47.7	52.3
Mixed	148,878	155,474	48.9	51.1	46.3	53.7
Chinese	66	9	88.0	12.0	98.9	1.1
Total.....	472,261	480,982	49.5	50.5	51.8	48.2

There is a slight excess of females over males in Porto Rico, a numerical relation much the same as in several American states along the Atlantic seaboard—e. g., New Hampshire, Connecticut, New York, Maryland—but quite different from that in Cuba. This excess of females is most marked among the persons of mixed blood. The same is true in Cuba, but with both the negro and the mixed the sexes are much nearer to an equality in numbers in Porto Rico.

RACE AND AGE.

In analyzing the figures for age the term median age was explained and the method of computing it set forth (p. 46). This concept enables one to state summarily the difference in age between the two races as in the following table. For purposes of comparison the figures for Cuba and the United States are included.

Median age.

Race.	Porto Rico.	Cuba.	United States (1890).
White	18.3	20.5	22.4
Colored.....	17.8	21.6	18.3

The table shows that the extreme youth of the population of Porto Rico already mentioned (p. 47) is true of both races. The whites of Porto Rico are about two years younger than those in Cuba and four years younger than those in the United States. The colored in Porto Rico are but little younger than those in the United States, half a year, but nearly four years younger than those in Cuba, where, by a curious anomaly, the colored are older than the whites. Although this is not the place to dwell on the Cuban figures, it may be mentioned in passing that the aged Chinese and African immigrants in Cuba are the main if not the entire cause of the anomaly.

Where a race or social class maintains itself by excess of births over deaths, or natural increase rather than by immigration or transfer from other social classes, there a low median age is an indication of

low vitality and a short life. Where the population is growing with abnormal rapidity this inference may fail, but that explanation does not hold in Porto Rico.

In the following table the age composition of the two races is indicated for Porto Rico, Cuba, and the United States by five-year periods:

Per cent of total population of specified race in age period named.

Age period.	Porto Rico.		Cuba.		United States.	
	White.	Colored.	White.	Colored.	White.	Colored.
0-4	15.8	15.8	8.2	8.5	12.0	13.9
5-9	14.8	15.4	14.6	14.0	11.8	14.5
10-14	12.9	13.3	14.2	13.5	10.9	13.7
15-19	9.8	9.8	11.7	10.7	10.3	11.6
20-24	9.4	9.1	10.4	8.5	9.9	9.8
25-29	8.9	8.7	9.2	7.7	8.5	7.7
30-34	6.9	6.5	7.9	6.9	7.6	5.7
35-39	5.1	4.8	6.6	5.8	6.3	5.6
40-44	4.7	4.6	5.4	5.5	5.2	4.2
45-49	2.8	2.7	3.7	4.0	4.5	3.7
50-54	3.4	3.6	3.1	4.7	3.8	3.1
55-59	1.6	1.6	1.9	2.7	2.8	1.9
60-64	1.9	2.0	1.6	3.4	2.4	1.8
65-69	0.7	0.7	0.7	1.3	1.7	1.1
70-74	0.6	0.7	0.5	1.3	1.2	0.8
75-79	0.2	0.2	0.2	0.4	0.7	0.4
80-84	0.3	0.3	0.1	0.6	0.3	0.3
85-89	0.1	0.1	0.1	0.1	0.1
90-94	0.1	0.1	0.2	0.1
95-99	0.1
100+	0.1
Unknown
Total	100.0	100.0	100.0	100.0	100.0	100.0

From the preceding table it appears that below the age of 20 in Porto Rico the colored are more numerous, but from that age to 50 the whites, and in old age, apparently, again the colored. Conceive two groups, one of 10,000 whites, the other of 10,000 colored, and of age distribution the same as that of the average in Porto Rico for these two races. The negro group would have 108 more children under 15, and 17 more elderly persons over 50. The white group would have 125 more between 15 and 50, or in the productive years of life. If we assume that these answers are correct and that persons under 15 and over 65 are dependent for support upon persons between those years, then under present Porto Rican conditions 1,000 self-supporting whites, men and women, must maintain on the average 837 young and old of the same race, while 1,000 colored must maintain 874, or 37 more dependents, the difference being due almost entirely to the larger proportion of children among the colored.

The preceding table also shows by the concentration upon 50, 60, 70, 80, and 90 that the colored in their answers report their ages more often than the whites as multiples of ten, and therefore are more inaccurate in their statements of age. The greater proportion of colored above the age of 50, as shown in the tables, is probably an error. The colored men and women, being more inaccurate in their statements of

age, are more prone to exaggerate it when past middle life, and this tendency more than offsets the probably smaller proportion of colored in the later years.

NATIVITY.

[See Tables V, VII, X, and XI.]

The number of foreign born returned by the census is 13,872, or about 1.5 per cent of the total population. There are few regions in the Western Hemisphere in which the proportion of natives is so high and that of the foreign born so low. Even the southern portion of the United States as a whole had a greater proportion of foreign born, although eight of these states had a proportion slightly smaller than Porto Rico. In the other West Indies the proportion of foreign born ranged from 2 per cent in the Barbados to nearly 45 per cent in Trinidad, while in Cuba it was about seven times as great as in Porto Rico.

Of the total foreign born, 11,422 were white, constituting 1.9 per cent of all the whites, and 2,450 were colored, or 0.6 per cent of all the colored.

Of the total number of foreigners, 5,935, or 43 per cent, were found in the three cities of San Juan, Ponce, and Mayaguez, thus illustrating upon this island the general tendency of foreigners toward the cities.

Of the total foreign born, 7,690, or 55 per cent, decidedly more than one-half, were born in Spain. These were nearly all of the white race. The whole of Spanish America contributed 1,542, of which 1,194 came from the West India islands. The United States contributed 1,069. From Africa were reported 427, of which 258 were colored. This is probably the last remnant of the imported slaves. China was represented by but 68 persons.

MALES OF VOTING AGE.

[See Table XII.]

This table presents the potential voters of Porto Rico, classified by race, by country of birth, and by literacy, with a view of determining the effect upon them of making the ability to read and write a condition of the elective franchise.

The element of foreign birth in Porto Rico is trifling in number and proportion and is quite uniformly distributed. Among the males of voting age only 3.8 per cent were of alien birth, 2.8 per cent being Spanish.

The classification by birthplace and by citizenship shows that the two are practically identical. The people born in Spain or other countries and living on the island have, with few exceptions, retained their alien citizenship. On these accounts it is deemed unnecessary to pub-

lish the extended and complicated tables required to present citizenship as well as birthplace.

In the following tables the males over 21 are classified as white and colored, and the whites as born in Porto Rico, born in Spain, and born in other countries. Each of these groups is then classified under the following heads:

Can neither read nor write.

Can read but can not write.

Can read and write.

With superior education.

In the following discussion it is to be understood that illiterates are those who can neither read nor write, the remainder being regarded as literates.

The males of voting age in Porto Rico numbered 201,071. Classified by birthplace and race, they were as follows:

Race and birthplace.	Number.	Per cent.
Whites born in Porto Rico.....	120,295	59.8
Whites born in Spain.....	5,662	2.8
Whites born in other countries.....	2,104	1.1
Colored.....	73,010	36.3

Of the whites of Porto Rican birth 35,397 were literate, forming 29.4 per cent of all this class. Of the colored, 12,576 could read, or 17.2 per cent of all the colored. Under this educational qualification, therefore, the number of those entitled to vote in the island would be 47,973, or 25 per cent of the native males of voting age and 24 per cent of all males of voting age. Thus the suffrage would be restricted to about one-fourth of the males of voting age.

The effect of such a provision upon the people of the several departments is next to be considered. The following table shows the percentage of males over 21 years of age in each department, classified by birthplace and race:

Percentages of males 21 + by nativity and race.

Department.	White.			Colored.	Total native of both races.
	Native.	Spanish.	Other foreign.		
Aguadilla	84.5	2.0	0.5	13.0	97.5
Arecibo.....	74.2	2.6	0.4	22.8	97.0
Bayamon.....	44.2	5.6	2.1	48.1	92.3
Guayama.....	50.9	2.1	0.5	46.5	97.4
Humacao.....	45.5	1.5	0.7	52.3	97.8
Mayaguez.....	63.1	2.5	1.0	33.4	96.5
Ponce.....	57.4	2.3	1.5	38.8	96.2

The last column is formed by the addition of columns 1 and 4 on the assumption that all the colored are natives, an assumption which is very nearly correct.

It is seen that the whites of Porto Rican birth ranged from 44.2 per cent in Bayamon up to 84.5 in Aguadilla; that the persons of Spanish birth ranged from 1.5 per cent in Humacao up to 5.6 per cent in Bayamon, and that persons of other foreign birth ranged from 0.4 per cent in Arecibo up to 2.1 per cent in Bayamon. The high percentage of persons of Spanish and other foreign birth in this department is due to the fact, of course, that it contains the large and important commercial city of San Juan. The colored ranged from 13 per cent in Aguadilla up to 52.3 per cent in Humacao, the latter department having four times as many proportionally as the former. Including the colored, the proportion of males of voting age who were of native birth was smallest in Bayamon, where it was 92.3 per cent, and highest in Humacao, where it was 97.8 per cent. With the exception of Bayamon, no department contains more than 3.8 per cent of foreign born, Ponce containing this proportion, Mayaguez 3.5, while the other provinces contain less than 3 per cent each.

The following table shows in each department the number of native white and of colored literates, with the proportion which they bear to the total among males 21 years of age.

Number and proportion of literates.

Department.	Literate native whites.		Literate colored.		Literate foreign whites.	Per cent of literates to all males of voting age.
	Number.	Per cent.	Number.	Per cent.		
Aguadilla	3,684	21.0	539	20.1	443	23
Arecibo	5,648	22.4	979	12.6	816	22
Bayamon	5,205	35.5	3,303	20.7	2,394	33
Guayama	3,664	32.0	1,289	12.3	549	24
Humacao	2,487	30.0	1,240	12.9	365	22
Mayaguez	6,179	35.0	1,968	21.1	864	32
Ponce	8,530	33.4	3,258	18.9	1,533	30

We see that among the native whites the proportion of literates to all native white males of voting age ranged from 20.5 per cent in Aguadilla up to 35.5 per cent in Bayamon. Aguadilla and Arecibo seem to be together with a low percentage of literates, all the other departments containing 30 or more per cent in that class.

Among the colored the smallest percentage of literates was found in the department of Guayama, where it was 12.3 per cent; or, in other words, fewer than 1 in 8 could read. From this it ranged up to 21.1 per cent in Mayaguez, at the west end of the island. Here rather more than 1 in 5 were able to read.

The fifth column presents the number of literates among those born in Spain and other countries. These figures are given for the purpose of comparison with the literates of native birth, and show that the latter far outnumber them. Indeed, the only department in which the native literates were not many times as numerous as the foreign

born was Bayamon, and here the latter were outnumbered in the proportion of 3.5 to 1.

The last column gives the proportion which the number of actual voters will bear under a literacy qualification to the total number of native males over 21 years of age. This per cent ranges from 22 in Arecibo and Humacao up to 33 in Bayamon, which department, therefore, has the proud distinction of possessing the smallest proportion of illiterates among its native population.

In the cities of San Juan and Ponce is concentrated a considerable part of the foreign element of the island, and here, if anywhere, will the restriction of the suffrage to literates give the foreign born an advantage. It is well, therefore, to examine the conditions in these two cities. The following table shows in the cities of San Juan and Ponce the number of males 21 years of age and over who could read among the white natives of the island, the whites of Spanish birth, the whites born in other countries, and the colored.

Race and birthplace.	San Juan literates.	Ponce literates.
Native white.....	1,925	2,190
Spanish born.....	1,100	409
Born in other countries.....	592	268
Colored.....	1,822	1,265

It appears that in the city of San Juan the native whites and the colored each outnumbered the foreign element, while together they outnumbered them nearly 2.5 to 1. In Ponce this proportion was even greater, the native whites being more than three times and the colored twice as numerous as the foreign element.

CONJUGAL CONDITION.

[See Tables XIII-XVI.]

The census schedules classified the population as regards conjugal condition into three groups—single, married, and widowed. Since the Roman Catholic Church does not permit divorces, the class of divorced persons is not represented.

There is, however, another class represented in Porto Rico, as in Cuba, which consists of persons living together in the conjugal relation without religious or legal sanction. This class, which is large not only in these islands but in much of Spanish America, probably owes its existence to the fact that throughout these countries the only legal authority for sanctioning marriage is the Catholic Church, and the expense attendant upon the wedding ceremony has caused it to be waived in large numbers of cases. Such unions by mutual consent, while commonly regarded in the United States as binding, have not been so regarded in Porto Rico, Cuba, or other parts of Spanish America,

and the children resulting therefrom are regarded as illegitimate. An attempt has been made to distinguish and tabulate the members of such unions, and while the results are probably below the truth, they are believed to be valuable, at least as indicating the minimum number of this class.

The population of Porto Rico, as regards conjugal condition, was distributed as follows among these four classes, expressed in percentages of the total number of inhabitants of the island:

Single	69.7
Married	16.6
Living together by mutual consent	8.8
Widowed	4.9
	100.0

THE SINGLE.

Of the total population of Porto Rico nearly seven-tenths (69.7 per cent) were single. This proportion, which is exceedingly large, is comprised in great part of children. Excluding them from consideration and considering only that portion of the population which is 15 years of age and over, it is found that 45.9 per cent of what may be thus regarded as the adult population were single. Including those living together by mutual consent among the single, the percentage of single among those over 15 years of age was increased to 61.7 per cent. These proportions also are exceedingly large—much greater than in most countries of the earth. The corresponding proportion in the United States in 1890 was 36.9 per cent.

The following table gives the corresponding proportion in most of the leading countries of the earth:

Country.	Date of census.	Per cent of single to population 15+.	Country.	Date of census.	Per cent of single to population 15+.
Hungary ¹	1890	23.2	Chile	1885	45.3
Mexico	1895	34.9	<i>Porto Rico</i> ³	1899	45.9
France	1886	35.3	New Zealand	1891	46.4
Italy	1881	36.5	Costa Rica	1892	47.5
Denmark	1890	36.7	Argentina	1895	47.9
United States	1890	36.9	Queensland	1891	48.3
Germany	1890	38.3	Ireland	1891	50.8
England and Wales	1891	39.6	British Honduras	1891	51.4
Austria	1890	40.4	Cuba ²	1899	53.4
Sweden	1890	40.7	Leeward Islands	1891	57.7
Netherlands	1889	40.8	Barbados	1891	61.5
Switzerland	1888	42.8	<i>Porto Rico</i> ⁴	1899	61.7
Belgium	1890	43.9	Trinidad ⁵	1891	63.5
Turks Island	1891	43.9	Cuba ⁴	1899	66.6
Guatemala ²	1893	44.7	Martinique	1894	78.5
Scotland	1891	45.2			

¹ Population 16+ is the basis.

² Population 14+ is the basis.

³ Excluding persons living together by mutual consent.

⁴ Including persons living together by mutual consent.

⁵ Excluding the East Indians.

Throughout the following discussion the persons living in consensual unions, as well as the married and widowed, will be excluded from the

PORTO RICO

CONJUGAL CONDITION BY RACE, SEX AND AGE

single. Furthermore, the discussion will be confined, as regards nativity, to the native white and the colored elements, since the foreign whites form so small a proportion of the population as to be practically negligible.

The following table shows the proportion of single among the native white males and females and the colored males and females:

	Per cent.
Native whites.....	68.6
Male.....	71.5
Female.....	65.8
Colored.....	72.1
Male.....	73.6
Female.....	70.6

As is seen, the males were relatively in excess in both races, and among the whites to a great extent.

The following tables show the distribution of the single by age, sex, and race, expressed in percentages of the total number of persons in the several age groups:

Percentages of single.

Age group.	Native white.		Colored.	
	Male.	Female.	Male.	Female.
15-19.....	98.5	88.7	98.1	89.1
20-24.....	82.1	54.9	80.0	61.1
25-29.....	49.8	33.4	51.6	41.9
30-34.....	29.9	24.9	34.9	36.4
35-44.....	19.5	19.5	24.7	31.1
45-54.....	13.7	17.1	20.1	30.6
55-64.....	10.2	16.2	16.5	32.4
65+.....	8.6	16.0	19.1	36.2

At the same ages the proportion of single among the males was, in the earlier years, greater than among the females. This extended among the whites up to the age of 35, beyond which the proportion of single females became the greater. Among the colored it extended to the age of 30, beyond which the proportion among the females was greater.

Among the native whites, both males and females, the proportion of single diminished steadily through all ages, but among the colored it reached a minimum and then increased again. This minimum was reached among colored males at the age period of 55 to 64 years, and among females at the age period of 45 to 54 years. This phenomenon is doubtless due to the fact, as will appear hereafter, that consensual unions are much more common among the colored than among the whites, and that when such unions cease by the death of one or the other member the remaining member is placed among the single instead of being regarded as widowed.

The distribution of the single among the several departments of Porto Rico shows great uniformity, the proportion of the single to the total population ranging from 68.5 up to 71.5 per cent, the latter

proportion being found in the department of Bayamon, which includes the city of San Juan.

The following table shows the percentages in the several departments:

Percentage of single.

Aguadilla	68.5	Humacao	69.8
Arecibo	68.5	Mayaguez	68.4
Bayamon	71.5	Ponce	70.3
Guayama	69.9		

The fact that the department of Bayamon contained a larger proportion of single than any other of the seven departments indicates that the proportion of single was greater in urban than in rural districts. That this is true is shown by the fact that in the largest three cities of Porto Rico, taken collectively, the proportion of single was 71 per cent, while in the remainder of the island, which may be regarded as rural districts, the proportion was 69.6 per cent.

THE MARRIED.

In this discussion two groups of married persons will be considered: One, those legally married under the forms of the church; the other, the consensual unions already referred to. These will be discussed both together and separately.

The proportion which the legally married bore to the total population was 16.6 per cent, or about one-sixth. The proportion of the inhabitants who were associated in consensual unions was 8.8 per cent, or a little more than one-half of those legally married. Hence the proportion of those living together in the marriage relation was 25.4 per cent. This is a very small proportion, smaller than in any European country and much smaller than in the United States in 1890, where it was not less than 35.7 per cent.

The following table shows the proportion of those married and of those living together by mutual consent and their sum, in each of the seven departments of the island:

Department.	Married.	Living together by mutual consent.	Sum of two.
Aguadilla	20.8	5.4	26.2
Arecibo	19.1	7.3	26.4
Bayamon	15.2	8.8	24.0
Guayama	15.2	10.4	25.6
Humacao	13.5	12.3	25.8
Mayaguez	17.7	8.2	25.9
Ponce	15.2	9.9	25.1

Thus it appears that while there was considerable variation in the proportion of married in the several departments, ranging from 13.5 per cent in Humacao up to 20.8 in Aguadilla, these differences are very

nearly offset by corresponding differences in the proportion of those living together by mutual consent, which range from 5.4 in Aguadilla, where the proportion of married was greatest, up to 12.3 in Humacao, where the proportion of married was least, making the figures in the fourth column, which express the proportion of those living together under the legal sanction of marriage, together with those living together by mutual consent, very nearly the same in all the departments. Furthermore, it will be noted that those departments in which the proportion of all the married was the smallest, namely, Bayamon and Ponce, were those containing the only two large cities of the island, San Juan and Ponce. This difference between the urban and rural parts of the island is, furthermore, brought out in the statement that, while the proportion of married in the three cities of San Juan, Ponce, and Mayaguez, together, is 14.6, in the rest of the island, which may be regarded as a rural region, the corresponding proportion was 16.8, while the proportion of those living together by mutual consent was the same in both the cities and the rural districts.

Classified by race, it appears that the proportion of those legally married was greater, and of those living in consensual unions was less, among the whites than among the colored, while the proportion of the two classes together was somewhat larger among the whites than among the colored, as appears in the following table:

Race.	Married.	In consensual unions.	Total.
Native white.....	19.1	7.0	26.1
Colored.....	12.0	11.8	23.8

It appears, furthermore, from the above that the proportions of married and of those living together among the colored were very nearly equal.

Classifying the married and those living in consensual unions by sex, as well as by race, shows the following results, expressed in percentages of the total number of each class:

Race and Sex.	Married.	In consensual unions.	Both.
Native white:			
Male.....	18.6	7.1	25.7
Female.....	19.5	7.0	26.5
Colored:			
Male.....	12.4	11.8	24.2
Female.....	11.7	11.7	23.4

Thus it appears that the proportion of the married among the white females was somewhat larger than among the males, while those in consensual unions were about equal. Among the colored there was no decided difference in either class.

Classified by age, as well as race and sex, the following results appear:

Race, sex, and age.	Married.	In consensual unions.	Both.
Native white males:			
15 to 19 years	0.6	0.9	1.5
20 to 24 years	10.0	7.4	17.4
25 to 29 years	31.3	17.4	48.7
30 to 34 years	46.2	21.2	67.4
35 to 44 years	54.1	21.2	75.3
45 to 54 years	59.6	16.1	75.7
55 to 64 years	60.5	10.1	70.6
65+ years.....	54.4	6.0	60.4
Native white females:			
15 to 19 years	6.8	4.4	11.2
20 to 24 years	28.9	15.0	43.9
25 to 29 years	43.5	19.6	63.1
30 to 34 years	48.5	19.1	67.6
35 to 44 years	50.0	14.1	64.1
45 to 54 years	42.0	7.0	49.0
55 to 64 years	30.0	2.8	32.8
65+ years.....	17.1	1.1	18.2
Colored males:			
15 to 19 years	0.5	1.3	1.8
20 to 24 years	6.8	12.9	19.7
25 to 29 years	19.1	28.4	47.5
30 to 34 years	29.7	33.4	63.1
35 to 44 years	35.1	36.2	71.3
45 to 54 years	42.3	28.8	71.1
55 to 64 years	46.8	21.6	68.4
65+ years.....	42.5	14.6	57.1
Colored females:			
15 to 19 years	4.3	6.4	10.7
20 to 24 years	15.4	22.6	38.0
25 to 29 years	24.2	31.6	55.8
30 to 34 years	27.0	31.6	58.6
35 to 44 years	29.7	26.8	56.5
45 to 54 years	29.0	14.5	43.5
55 to 64 years	21.6	7.8	29.4
65+ years.....	12.4	2.8	15.2

Thus it appears that among the native white males the maximum proportion of married occurred in the age group between 55 and 64 years, where it reached three-fifths of the whole number, while among those living together by mutual consent the maximum occurred about the age of 35 years. Among the native white females the maximum proportion of married occurred between the ages of 35 and 44 years, where one-half of this class were married. The subsequent diminution in the proportion of this class is explained by the increase in the proportion of widowed, as will be shown later. The maximum proportion of those living together by mutual consent occurred between the ages of 35 and 44 years, where it reached one-fifth of the total number.

Among colored males the maximum proportion occurred, as among the white males, between the ages of 55 and 64, and the maximum among those living together by mutual consent between 35 and 44 years. Among the colored females the maximum among the married was found between 35 and 44 years, and of those living together by mutual consent at about the age of 30.

The map opposite this page shows the proportion which those in consensual unions bore to the married in various parts of Porto Rico. A study of it shows that the consensual unions were relatively most numerous in the eastern and southeastern parts of the island, especially on

the eastern half of the south coast. Of the total number of municipal districts in the island, 35 contained a larger proportion of consensual unions than the average of the island, and in 9 municipal districts consensual unions were more numerous than lawful marriages.

THE WIDOWED.

Of the inhabitants of Porto Rico, 4.9 per cent, or nearly one in twenty, were widowed. The proportion of widowed among native whites (5.3 per cent) was greater than the average of the island, and that of the colored (4.1 per cent) considerably less. This is due to the fact, as shown above, that consensual unions were more numerous relatively among the colored, and that upon the dissolution of such union by the death of one of the members the other became classed with single rather than with widowed.

The widowed native white males formed 2.8 per cent only of the population, and the widowed native white females not less than 7.7 per cent. The corresponding figures for the colored were, for males 4.1, and for females 6 per cent.

The following table shows the distribution of the widowed by race, sex, and age:

Age period.	Native white males.	Native white females.	Colored males.	Colored females.
15 to 19 years	0.1	0.1	0.2
20 to 24 years	0.4	1.1	0.2	0.9
25 to 29 years	1.5	3.5	0.9	2.3
30 to 34 years	2.7	7.5	1.9	5.0
35 to 44 years	5.2	16.4	4.0	12.4
45 to 54 years	10.6	33.9	8.8	25.9
55 to 64 years	19.2	51.0	15.1	38.1
65+ years.....	30.6	65.7	23.8	48.5

As will be seen, the proportion of widowed increased steadily with advancing age among all classes. It reached in the native white males 30.6 per cent at the oldest age, and among the colored males 23.8 per cent, while among females it reached 65.7 per cent among the native whites and 48.5 per cent among the colored. There was here, therefore, as elsewhere, a much larger proportion of widowed among females than among males. This excess is in part due to the fact that the death rate is greater as an average, among married couples, with men than with women, on account of the greater average age of the husband, and in part to the fact that more men remarry than women, and, to a considerable extent at least, select single women rather than widows.

EDUCATION.

As far as history throws any light on the subject, it would appear that prior to the year 1799 there were no schools in Porto Rico, outside of the cities of San Juan and San German, which had free schools for girls, where needlework and the catechism of the Catholic Church were

taught, a class in philosophy established by the Dominican monks, and a few private schools attended by the children of the wealthier citizens.

During the next forty years a number of private schools and a few colleges were opened, but it was not until 1845 that public primary schools were provided for. For a full account of education in Porto Rico the reader is referred to Senate Document 363, Fifty-sixth Congress, publishing the report of Gen. George W. Davis, Military Governor of the island.

The system was the same as that of Spain, which is fully described in the Report of the Census of Cuba.

On June 30, 1898, there were in existence in Porto Rico 380 public schools for boys, 148 for girls, 1 for adults, and 26 private schools, having an enrollment of 44,861 pupils. The total amount annually expended, including the subsidy granted by the insular government to private schools, was 309,810.75 *pesos*, or \$185,886.45.

At the end of the school year 1899 there were 525 public schools, having a total attendance of 21,873 pupils, at a cost of \$203,373. The number of children of school age at that time without school facilities was 268,630.

Gen. Guy V. Henry, U. S. A., who succeeded General Brooke as Military Governor, took an early interest in education, and on May 1 established a code of school laws which provided for school boards in all municipal districts in which schools were in operation and abolished many of the evils of the Spanish school system, as, for example, the payment of fees by parents who could afford it, and the teaching of religion and church doctrine. He established a teachers' manual and free text-books, graded the schools, and made provision for high schools, and the necessary professional schools.

Under Gen. George W. Davis these laws were carefully revised and modified by the introduction of many beneficial changes suggested by experience.

On August 12, 1899, General Davis substituted for the bureau of education an insular board of education having general charge of public instruction. The first public school building was erected under his supervision in 1899 in the city of San Juan. Others will doubtless follow as funds become available in the various municipalities.

As in Cuba, no subject is of greater importance to the inhabitants of these islands than the education of the children who will in time be called on to perform the duties and assume the full responsibilities of citizenship.

LITERACY.

[See Tables XVII and XIX.]

A census can take cognizance of the degree of education of a people only as it is indicated by certain simple tests, which refer usually to formal or book education, not because that is necessarily the most

PUBLIC SCHOOL IN ARECIBO.

important, but because it is the most easily tested. The tests used by the present census were attendance at school, ability to read, ability to write, and possession of higher education. It is obvious that attendance at school certifies nothing regarding a person's educational attainments, yet if the entire population is to be classed according to degree of education some assumption must be made regarding children attending school. It can not introduce serious error to give such children the benefit of the doubt and assume that all of them were able to read and write, but that all under 10 years of age and not attending school were not able to read. On these assumptions the population of Porto Rico may be classed as follows:

Persons in Porto Rico	Number.	Per cent of total.
With higher education	5,045	0.5
Able to read and write	143,472	15.0
Able to read	158,852	16.6
Population answering educational questions	951,836	100.0

In the preceding table the classes are not mutually exclusive, but each succeeding class includes all those in the preceding. From this table the following may be derived by taking the differences in the successive numbers of the preceding:

Persons in Porto Rico	Number.	Per cent.
With higher education	5,045	0.5
Able to write, but without higher education	138,427	14.5
Able to read, but unable to write	15,380	1.6
Unable to read	792,984	83.2
Not stated	1,407	0.2
Total	953,243	100.0

From this table it appears that the three classes of those able to read, but unable to write, those with higher education, and those not answering the educational questions, including together less than one-fortieth of the total population, were numerically insignificant. Attention, therefore, may be centered on the other two classes. The several departments of Porto Rico had the following numbers and proportions of persons able to read:

Department.	Popula- tion.	Able to read.	
		Number.	Per cent.
Aguadilla	99,645	12,277	12.3
Arecibo	162,308	20,030	12.3
Humacao	88,501	12,222	13.8
Guayama	111,986	16,730	14.9
Ponce	203,191	36,359	17.8
Bayamon	160,046	33,740	21.0
Mayaguez	127,566	27,494	21.5
Porto Rico	953,243	158,852	16.6

In the whole island about one person in six is able to read. The seven departments fall into two groups, four in which the percentage of persons able to read is below the average of the island, and three in which it is above. These three, it will be seen, are those which contain the three cities of Mayaguez, Ponce, and San Juan. It is likely, therefore, that ability to read is more prevalent among the inhabitants of these cities than in the rural districts. The following table presents the facts on this point:

City.	Popula- tion.	Able to read.	
		Number.	Per cent.
Mayaguez	15,187	7,826	51.5
Ponce	27,952	12,934	46.2
San Juan	32,048	16,618	51.8
Total cities	75,187	37,378	49.7
Rest of island	878,056	121,474	13.8

This table shows that in the three cities of Porto Rico about half the population are able to read, a proportion nearly four times that in the rest of the island. Accordingly it seems fairer to compare the three departments containing these cities with the other four only after the urban population has been excluded. This is done in the following table:

Department.	Rural popula- tion.	Able to read.	
		Number.	Per cent.
Bayamon	127,998	17,122	13.4
Mayaguez	112,379	19,663	17.5
Ponce	175,239	23,425	13.4

This table, supplementing that on page 73, shows that outside the large cities ability to read is much more general in the department of Mayaguez than in any other, and that next to this come the two departments at the eastern end of the island, Guayama and Humacao, while the two northwestern departments, Aguadilla and Arecibo, have the smallest proportion of persons able to read. This result is surprising in that it shows that the departments containing a very high proportion of colored (p. 59) have also a large proportion of literates, while the departments containing the largest proportion of whites are those in which illiteracy is most common. From an examination of the table showing by departments the proportion of population living in cities of 1,000 inhabitants and over (p. 44), it appears that those departments with the smallest population able to read are just the ones which have the smallest proportion of urban population, while Guayama has, after Bayamon, the highest proportion of urban population, and Humacao has a proportion decidedly higher than that for either Aguadilla or Arecibo. It seems probable, therefore, that the propor-

PUBLIC SCHOOL IN MANATTI.

tion of population residing in the smaller cities exercises more influence than the proportion of whites in determining the proportion of literates.

The following figures show the returns of literacy at the censuses of 1860 and 1887 as compared with the present:

Census.	Popula- tion.	Number able to read.	Per cent able to read.
1860.....	583,181	51,386	8.8
1887.....	806,708	111,380	13.8
1899.....	953,243	158,852	16.6

These figures show that the proportion of literates in the total population has increased from 8 to 16 per cent in forty years. Notwithstanding this slight increase, the proportion of illiterates in Porto Rico is higher than in any of the states of this Union or any of the other West Indian islands. Guatemala is the only country in the region for which statistics are obtainable, where the proportion of illiterates is higher than in Porto Rico.

SCHOOL ATTENDANCE.

[See Tables XVII and XX.]

The total number of persons attending school in Porto Rico during the year preceding November 10, 1899, was 26,212, or between 2 and 3 per cent of the total population. But in the discussion on age it was shown (p. 49) that the children in Porto Rico between 5 and 15 years old, and so at the age when school attendance is most common, were unusually numerous. Hence it is better to compare the children attending school with those of school age. From Table XX (p. 267) it appears that only 414 children under 5 or over 17 years of age attended school—that is, about 1.5 per cent of the entire number. The school age may therefore be assumed to be 5–17, and the slight proportion of persons over or under these limits neglected.

Number and per cent of children attending school.

Country.	Population 5-17.	Persons 5-17 attend- ing school.	
		Number.	Per cent.
Porto Rico.....	322,393	25,798	8.0

It has already been shown that the proportion of persons able to read, and probably also the proportion of children attending school, was much higher in the cities of Porto Rico than in the rural districts. In the following table the facts for the two cities included in Table XX are given.

Number and per cent of school children in cities.

City.	Population 5-17.	Persons 5-17 attend- ing school.	
		Number.	Per cent.
Ponce	7,904	1,877	23.7
San Juan	8,886	1,901	21.3
Total	16,790	3,778	22.5

On the average in the two cities less than one-fourth of the children 5 to 17 attended school during the year preceding the census. If the figures for these two cities be subtracted from all Porto Rico, the following results are reached:

Number and per cent of school children in rural districts.

Region.	Population 5-17.	Persons 5-17 attend- ing school.	
		Number.	Per cent.
Porto Rico outside two cities of 25,000.....	305,603	22,020	7.2

In the rural districts of Porto Rico less than one-fifteenth of the children between 5 and 17 years of age attended school during the year preceding the census, but in the large cities the proportion was a little more than three times as great.

In the following table the figures are given for the seven departments after the two large cities have been excluded:

Number and per cent of school children in rural districts, by departments.

Department.	Population 5-17.	Persons 5-17 attend- ing school.	
		Number.	Per cent.
Arecibo	56,388	3,313	5.8
Ponce	60,369	3,604	5.9
Aguadilla	33,766	2,096	6.2
Bayamon.....	44,817	3,150	7.0
Humacao.....	30,038	2,361	7.8
Guayama.....	38,537	3,228	8.3
Mayaguez.....	41,688	4,268	10.2
Porto Rico.....	305,603	22,020	7.2

The conspicuous position of Mayaguez agrees with the results of the analysis regarding ability to read (p. 74), but in the present table the position of this department is influenced by the inclusion of the city of Mayaguez. Here, too, one notices that the proportion of children attending school, like the proportion of literates, is lowest in the two northwesterly departments, where the proportion of whites is highest, while the two departments of Humacao and Guayama come next to Mayaguez in the proportion of children attending

PUBLIC SCHOOL IN MAYAGUEZ.

school, notwithstanding the fact that about half of their population is colored.

That there is a rough correlation between the rank of the departments in the order of school attendance and in the order of literacy, appears from the following lists:

Departments in the order of

Increasing literacy:

Arecibo.
Ponce.
Aguadilla.
Bayamon.
Humacao.
Guayama.
Mayaguez.

Increasing school attendance:

Aguadilla.
Arecibo.
Bayamon.
Ponce.
Humacao.
Guayama.
Mayaguez.

School attendants classified by sex.—The following table gives the facts for Porto Rico by sex:

Number and per cent of school children by sex.

Sex.	Population 5-17.	Persons 5-17 attend- ing school.	
		Number.	Per cent.
Male	162, 838	15, 273	9. 3
Female	159, 555	10, 525	6. 5
Total	322, 393	25, 798	8. 0

The proportion of males attending school is much higher than that of females, and so great a difference in this respect is unusual.

School attendants classified by age.—In the following table the proportion of school attendants in the several age classes is given:

Number and per cent of school children by age.

Age period.	Population.	School at- tendants.	Per cent attend- ing school.
0-4.....	150, 403	209	0. 1
5-9.....	143, 546	10, 254	7. 1
10-14.....	124, 353	14, 492	11. 6
15-17.....	54, 494	1, 052	1. 9
18+.....	480, 447	205
Total	953, 243	26, 212	2. 7

The one noticeable feature of the preceding table is the relatively small proportion of children between 5 and 10 years of age who were attending school, and the sharp maximum in the proportion for the age period 10-14. In Cuba the proportions of children of these two age periods attending school are more nearly alike.

School attendants classified by race.—The following table gives the facts regarding school attendance for Porto Rico, by race:

Number and per cent of school children, by race.

Race.	Population 5-17.	Persons 5-17 attend- ing school.	
		Number.	Per cent.
White	196,961	17,516	8.8
Colored	125,432	8,282	6.6
Total	322,393	25,798	8.0

The proportion of colored children attending school is slightly less than the proportion of white children, but the difference between the two races in this regard is comparatively slight.

In the following table the proportion of school attendants for each race is given by departments:

Department.	Per cent of school attendants among children 5 to 17 years old.	
	White.	Colored.
Aguadilla	6.0	7.2
Arecibo	6.1	5.1
Ponce	8.8	6.7
Humacao	10.3	5.7
Bayamon	11.1	7.7
Guayama	11.1	5.5
Mayaguez	11.9	7.3

The proportions of school attendants in the several departments do not vary for the two races in the same way. In Arecibo both races have few children in school and in Mayaguez both have many, but in Aguadilla, relatively to the other departments, there are few white and many colored school children, and in Guayama there are many white and few colored. Hence school attendance among the two races must be influenced by somewhat different conditions.

LITERACY AMONG PERSONS OVER TEN YEARS OF AGE.

[See Tables XVII and XVIII.]

It is hardly accurate to include infants with the illiterate, even though they can not read, for the word "illiterate" implies that the person has advanced at least out of infancy into childhood. Hence it is the usual practice for a census in gathering information on this topic to disregard all children under a specified age. This has not been done in the censuses of Spain or of the Spanish colonies, but in American census practice all children under ten are omitted from the illiteracy tables. Such a classification is made in the present census of Porto Rico, and will be regarded in the following discussion. For reasons already explained, only two classes will be considered—those who are

and those who are not able to read. The following table gives the facts for all Porto Rico:

Class.	Population 10+.	Per cent.
Able to read	149,796	22.7
Unable to read	509,498	77.3
Total	659,294	100.0

About one-fourth of the population of Porto Rico, excluding young children, were able to read, a proportion decidedly less than that in any American state.

The following table shows for the several departments the number and proportion of persons able to read. The departments are arranged in the order of increasing proportion of literates.

Department.	Total population 10+.	Persons able to read.	Per cent able to read.
Aguadilla	68,307	11,454	16.8
Arecibo	110,832	18,796	17.0
Humacao	60,539	11,574	19.1
Guayama	75,750	15,497	20.5
Ponce	141,901	34,390	24.2
Mayaguez	91,052	25,931	28.5
Bayamon	110,913	32,154	29.0
Porto Rico	659,294	149,796	22.7

Here, as in the previous discussion, it appears that the part of the island most imperfectly provided with school facilities, and offering the least evidence of even elementary educational attainments, is in the northwest—Aguadilla and Arecibo. The three departments having the highest proportion of persons able to read are the departments containing cities of some size.

The per cent of persons over 10 who were able to read has also been computed for each municipal district and will be found graphically represented on the map facing this page. While it is not worth while to present here the figures for each district, since they can readily be computed from the data in Table XVII, it may be of interest to present the ratios for a few districts having the largest and smallest proportions of literates. The first five and last five districts in this respect were as follows:

Municipal district.	Per cent of persons 10+ able to read.	Municipal district.	Per cent of persons 10+ able to read.
San Juan	63.7	Aguada	12.4
Mayaguez	41.6	Moca	12.2
<i>Mayaguez city</i>	61.3	Piedras	11.7
Ponce	38.3	Naranjito	11.3
<i>Ponce city</i>	55.5	Rincon	9.9
Vieques	30.8		
Guayama	29.8		

The preceding figures show clearly the degree to which the elements of education are confined to the cities of Porto Rico. Each of the three cities has a percentage of persons over 10 able to read, almost twice as high as the highest of the 66 municipal districts not containing a large city. As nearly 2,000 years ago the elements of Christianity spread first through the cities of the Roman Empire, while the inhabitants of the villages and rural districts clung to the earlier faith until the residents of the village (*pagus*) or of the country (*heath*) came to be identified as pagans and heathen with the believers in the religion that was passing away, so at the present time in Porto Rico and Cuba the elements of education seem to have spread mainly or exclusively in the cities, leaving the country folk to ignorance. This illiteracy presses upon both races alike, and so far as one can judge from the geographical position alone, it is not true in Porto Rico, as in the United States, that illiteracy is most prevalent where the colored race is in largest proportions. For the five municipal districts in Porto Rico given in the preceding list as having the smallest proportions of persons able to read have, respectively, beginning with Rincon, 14.1 per cent, 21.7 per cent, 62 per cent, 11.7 per cent, and 15.9 per cent of colored population, while the average for the whole island is 38.2 per cent.

If one examines the location on the map of Porto Rico of the municipal districts with largest and smallest proportion of persons able to read, one notices that the districts with the best educated population seem to lie along the coast, while the districts having the most illiterate population generally lie in the interior. In order to determine whether this is a general fact, the percentage of illiterates to the population over 10 has been computed for the 37 coast districts, the three containing large cities being excluded, and for the 29 inland districts. It appears that along the coast outside the large cities, 20.5 per cent of the population over 10 were able to read, while in the inland districts on the average only 17.3 per cent were able to read. But it has already been shown in the discussion of race (p. 59) that the percentage of colored in the coast districts is 7.5 per cent higher than in the interior districts, and from a subsequent paragraph (p. 82) it will appear that the percentage of illiteracy among colored in Porto Rico is much higher than among the whites. It is not improbable, therefore, that there is a greater difference between the whites of the interior districts and the whites along the coast, and between the colored of the interior districts and the colored along the coast, than the figures just stated would indicate. In other words, this may be an instance of two counteracting tendencies which nearly neutralize each other. The two races in Porto Rico, as in the United States, tend somewhat to separate along lines of altitude, thus making the whites more numerous in the interior. But the inland population apparently has less opportunity and perhaps less craving to acquire the elements of educa-

tion, while on the other hand the white race usually has a somewhat greater eagerness for this accomplishment than the colored.

In the following table the facts are given for Porto Rico by sex:

Class.	Population 10+.		Per cent.	
	Male.	Female.	Male.	Female.
Able to read.....	82,882	66,914	25.7	19.9
Unable to read.....	239,685	269,813	74.3	80.1
Total.....	322,567	336,727	100.0	100.0

The corresponding per cents of persons able to read in Cuba are: Males, 44.6; females, 41.7; and for the United States they are: Males, 87.6; females, 85.6; so that in all three countries, and indeed in most countries where the information is obtainable, ability to read is somewhat more general among men than among women.

In the following table the proportion of persons able to read in each age group is given for the total population:

Age period.	Per cent able to read.	Age period.	Per cent able to read.
10-14.....	20.6	45-54.....	19.2
15-19.....	25.2	55-64.....	17.8
20-24.....	27.1	65+.....	17.7
25-29.....	24.4		
30-34.....	23.2	Total.....	22.7
35-44.....	22.3		

Of the persons between 15 and 30 years of age about one-fourth were able to read, while persons in the earlier or later age periods less often possessed this ability. That the persons in the later age periods are most illiterate appears clearly from the table, and points to the conclusion, already shown by the illiteracy figures of earlier censuses, that the rising generation are enjoying better educational advantages than their parents.

In the following table the per cent of persons of each sex able to read is given for the successive age periods. To economize attention the numbers from which the ratios were computed have been omitted. They may be found on page 245, f.

Age period.	Per cent able to read.	
	Males.	Females.
10-14.....	21.8	19.3
15-19.....	25.9	24.7
20-24.....	31.2	23.4
25-29.....	29.2	20.1
30-34.....	27.6	19.0
35-44.....	26.6	17.8
45-54.....	22.8	15.7
55-64.....	20.6	15.0
65+.....	20.5	15.2
Total.....	25.7	19.8

From this table it is seen that at all age periods the ability to read is an attainment somewhat more common among men than among women, but that the difference between the two sexes is least during the early periods of life, between 10 and 20 years of age, and greatest during the years of middle life. Apparently, therefore, educational facilities are open to the two sexes more equally at the present time than a generation ago.

In the following table the number and per cent of males and females able to read are given for Porto Rico, with distinction of race:

Race and sex.	Total persons 10+.	Persons able to read.	Per cent able to read.
White males.....	202,351	62,335	30.8
White females.....	206,727	48,511	23.5
• Total white.....	409,078	110,846	27.1
Colored males.....	120,216	20,547	17.1
Colored females.....	130,000	18,408	14.2
Total colored.....	250,216	38,950	15.6

Of the whites over 10 years of age, more than one-fourth are able to read, while of the colored, not quite one-sixth have this attainment. One notices also that the difference between the two sexes is greater among the whites than among the colored. The proportion of white females able to read is about two-thirds greater than the proportion of colored females, but the proportion of white males able to read is four-fifths greater than the proportion of colored males.

In the following table the proportion of persons able to read at the successive age periods is given separately for native white, foreign born white, and colored:

Age period.	Per cent able to read.		
	Native white.	Foreign born white.	Colored.
10-14.....	23.3	87.2	15.9
15-19.....	28.3	93.4	18.9
20-24.....	29.7	92.4	20.3
25-29.....	26.5	91.6	17.5
30-34.....	25.2	91.2	15.6
35-44.....	24.7	87.9	13.5
45-54.....	22.2	83.3	9.8
55-64.....	21.1	79.2	8.3
65+.....	21.4	74.9	7.2
Total.....	25.4	87.5	15.6

The preceding table shows most conspicuously the very high degree of literacy among the few foreign born whites in Porto Rico. At the ages at which immigrants usually come to the island, over nine-tenths of the foreign born white are able to read, while among native whites

the proportion never rises to three-tenths. This high proportion of literacy among the foreign born no doubt contributes to the high degree of literacy in the cities in which these foreign born usually remain.

Another inference from this table is that the difference between white and colored, like the difference between male and female, is less in the rising generation than it was in the preceding. During the ages from 10 to 20, the per cent of literates among the native whites is only about one-half greater than it is among the colored, but in the latest age period the proportion of white literates is more than three times that of colored literates.

STATISTICS OF EDUCATIONAL INSTITUTIONS.

[See Tables XXI and XXII.]

In addition to the facts regarding education derived from the schedule for population and just explained, a special schedule for schools was furnished to the enumerators, of which the following is a translation:

Census of Porto Rico, taken under the direction of the United States, 1899.

SCHEDULE NO. 2.—SCHOOL STATISTICS.

Supervisor's district No. ———. District of enumeration No. ———.

Compiled by me on the ——— day of ———, 1899.

—————, *Enumerator.*

1. Name of the school.
2. Situation.
3. State whether the school is supported by public, private, or religious funds.
4. State whether pupils are day or boarding pupils.
5. Number of buildings composing the school; seating capacity.
6. Number of teachers: males; females.
7. Number of pupils in the school during the last school year:

Color or race.	Pay pupils.		Free pupils.	
	Males.	Females.	Males.	Females.
White
Negro
Mixed
Chinese.....

8. Number of working days in the last school year, from ———, 1898, to ———, 1899.

9. Average daily attendance of pupils during the last school year.

Tables XXI and XXII have been prepared from the facts reported on that schedule. From Table XXII it appears that 27,118 pupils were reported on the school schedule as attending school. From Table XX it appears that 26,212 children were reported as having attended school at some time during the twelve months preceding November 10, 1899; that is, the school children reported on the school schedule were 3 per

cent more numerous than those reported on the population schedule. In the following table the results are brought together by departments:

Department.	Children reported as attending school.		Excess (+) or deficiency (—) reported on school schedule.
	On population schedule.	On school schedule.	
Aguadilla	2, 109	2, 282	+173
Arecibo.....	3, 368	3, 795	+427
Bayamon.....	5, 207	5, 795	+588
Guayama.....	3, 250	3, 678	+428
Humacao.....	2, 403	2, 966	+563
Mayaguez.....	4, 304	3, 590	-714
Ponce.....	5, 571	5, 012	-559
Porto Rico.....	26, 212	27, 118	+906

In five departments more children were reported on the school schedule, and in two, more were reported on the population schedule. The general results from the two independent sources of information, however, are not very widely divergent and serve rather to corroborate than to impeach each other.

The number of school teachers reported on the school schedules was 623, while the total number of teachers reported on the population schedule (Table XXV) was 809. This suggests that there were either many teachers on the island who were not school teachers or many from whom no returns were obtained regarding their schools. The deficiency was almost entirely among male teachers, for the occupation returns show 246 female teachers, while the educational returns show 248 female teachers. On the other hand, the occupation tables show 563 male teachers, while the returns on the educational schedule show only 375 male school teachers.

Aside from the conclusions already drawn from the tables for education, school attendance, and literacy, the following inferences from Tables XXI and XXII seem warranted:

1. The reported seating capacity (29,164) was about 8 per cent greater than the entire number of pupils (27,118).

2. The average attendance was only about four-sevenths of the pupils enrolled.

3. Of the schools, about seven-eighths were public and one-eighth private or religious; a condition widely different from that in Cuba, where only about one-half were public.

4. In five departments the number of school buildings was equal to the reported number of schools; in the other two departments the school buildings slightly outnumbered the schools.

5. Of the school-teachers, about three-fifths were male and two-fifths female. In Cuba about two-fifths were male.

6. Of the pupils, about nine-tenths were free pupils and one-tenth pay pupils. In Cuba three-fourths were free pupils and one-fourth

pay pupils. But in Cuba, outside of Habana province, the proportions were more like those of Porto Rico.

7. The following table gives the proportions of each class of population reported as in school:

Class of population.	Total number.	Pupils entered.	Per cent of pupils to population.
White	589,426	17,874	3.0
Negro	59,390	2,427	4.0
Mulatto	304,352	6,717	2.2
Total	953,168	127,018	2.8

¹Seemingly 100 pupils in Guayama were not returned by race. Compare the figures for this department in Tables XXI and XXII.

It is surprising that the proportion of negroes in school should be higher than that of the whites. Some light may be thrown upon this fact by a study of the proportion in school of each race in the several departments. That analysis follows:

Department.	Per cent of race specified entered as pupils.		
	White.	Negro.	Mixed.
Aguadilla	2.1	5.7	2.2
Arecibo	2.4	3.2	1.6
Bayamon	4.1	4.3	2.7
Guayama	3.9	4.5	2.1
Humacao	4.1	4.0	2.3
Mayaguez	3.0	3.2	2.2
Ponce	2.7	3.5	1.9
Porto Rico.....	3.0	4.0	2.2

Here again it appears that in all but one of the seven departments the proportion of negroes attending school is greater than that of the whites, while the proportion of mixed is lowest of the three. These ratios are so contrary to the usual fact in such cases that one is compelled to cast about for an explanation. It is perhaps fair to assume that a certain number of school children have been reported on the school schedule by their teachers as negro, while the same children were reported on the population schedule by their parents as mixed. If so, the true number of negro school children would be exaggerated or the number of negroes in the total population understated.

In confirmation of this hypothesis the following evidence may be offered. By the present census there were 363,817 returned as colored, substantially all being negroes or mixed, the Chinese constituting less than 100 of the total. Of these colored only 59,390, or 16.3 per cent, were returned as negroes. Among the children attending school, as returned on the school schedule, there were 9,144 colored, and of these 2,427, or 26.5 per cent, were returned as negroes. There seems little reason to suppose that the proportion of negroes among colored school children is greater than the proportion of negroes among the colored

population of all ages. The presumption apparently would be in the opposite direction. Assuming, however, that the true proportion was the same, it would seem that while only one-sixth of the colored population were reported at their homes as negro, more than one-fourth of the colored children attending school were reported as negroes by the teachers giving information concerning them. This tends to discredit the testimony obtained by the census from the population of the country regarding the degree of intermixture between white and colored, and to strengthen the distrust of the figures for negro and mixed already aroused by the surprising change in the reported proportion of mixed between 1897 and 1899. (See p. 58.) Whether the line separating the white population from that of mixed blood has been drawn in the census with greater accuracy is open to question, but upon that no internal evidence has been found.

OCCUPATIONS.

[See Tables XXIII-XXX.]

The instructions issued in Spanish to Porto Rican enumerators with reference to filling this part of the schedule may be translated as follows:

This inquiry (column 11) applies to every person 10 years of age and over having a gainful occupation, and calls for the profession, trade, or branch of work upon which each person depends chiefly for support, or in which he is engaged ordinarily during the larger part of the time. In reporting occupations avoid general or indefinite terms which do not indicate the kind of work done. You need not give a person's occupation just as he expresses it. If he can not tell intelligibly what he is, find out what he does, and describe his occupation accordingly. For wives and daughters at home, engaged in the duties of the household only, write "at home" (*en casa*). For children not actually at work, write "at school" (*estudiante*) or "at home" (*en casa*), as the case may be. Spell out the name of the occupation and do not abbreviate in any case.¹

The number of Porto Ricans reported as having gainful occupations was 316,365, or 33.1 per cent of the total population. The figures for Porto Rico are compared with those for Cuba and the United States in the following table:

Country.	Date.	Total population.	In gainful occupations.	
			Number.	Per cent.
Porto Rico.....	1899	953,243	316,365	33.1
Cuba	1899	1,572,797	622,330	39.6
United States.....	1890	62,622,250	22,735,661	36.3

¹ It is desirable that some brief terms should be introduced to describe persons covered by the preceding instructions, and accurately but clumsily described as persons engaged in gainful occupations and persons not engaged in gainful occupations. In the following discussion the terms "breadwinners" or "persons at work" will sometimes be used for one class, and "dependents" for the other. Any term must be understood in accordance with these instructions rather than with its usual and popular meaning.

From these figures it appears that Porto Rico has only one-third of its population engaged in some gainful occupation, while in Cuba the proportion is about two-fifths, and in the United States about midway between the two. Some reasons for the difference will appear as the subject is probed farther.

The absolute and relative number of persons engaged in gainful occupations in the several departments is as follows:

Department.	Population.	In gainful occupations.	
		Number.	Per cent.
Arecibo.....	162,308	51,439	31.6
Guayama.....	111,986	36,154	32.2
Humacao.....	88,501	28,815	32.5
Aguadilla.....	99,645	32,644	32.7
Bayamon.....	160,046	52,822	33.0
Ponce.....	203,191	69,803	34.3
Mayaguez.....	127,566	44,688	35.0

Here, as elsewhere, one finds little difference between the departments of Porto Rico in comparison with that between the provinces of Cuba or the states of the American Union. The range in Porto Rico between the highest and the lowest divisions was 3.4 per cent, while for the provinces of Cuba it was 12.6, and for the states of the United States 25.4 per cent. There is no correlation traceable in the preceding table between the proportion of persons in gainful occupations and the proportion of urban population. Yet it is generally found that the relative number of breadwinners¹ is greater in cities than in the rural districts. To determine whether this general statistical fact holds for Porto Rico, the following table has been prepared for the three large cities and the remainder of the departments in which these cities lie:

Department.	Per cent of persons engaged in gainful occupations.	
	In principal city.	In rest of department.
Bayamon.....	43.7	30.3
Mayaguez.....	43.7	33.8
Ponce.....	46.2	32.4
Total.....	44.6	32.1

From the above it will be seen that in Mayaguez city the proportion of breadwinners is nearly three-tenths greater than in Mayaguez department outside the city, and that in Ponce and San Juan cities the proportion is over two-fifths greater than in the remainder of the departments in which they lie. The difference between city and country in Porto Rico as thus measured, is more than one-half greater

¹ See page 86, footnote.

than the average difference in the United States, and fully four times greater than the average difference in Cuba.

BREADWINNERS CLASSIFIED BY SEX.

The following table gives the absolute and relative number of males and of females reported as engaged in gainful occupations in Porto Rico. For comparative purposes the figures for Cuba and the United States have been included.

Country.	Males.			Females.		
	Total.	Breadwinners.		Total.	Breadwinners.	
		Number.	Per cent.		Number.	Per cent.
Porto Rico	472,261	268,664	56.9	480,982	47,701	9.9
Cuba	815,205	555,974	68.2	757,592	66,356	8.8
United States (1890).....	32,067,880	18,821,090	58.7	30,554,370	3,914,571	12.8

From this table it appears that the small proportion of breadwinners in Porto Rico, as compared with Cuba, holds only of the males, the proportion of females at work in Porto Rico being somewhat greater than in Cuba, although decidedly less than in the United States. The differences between the departments in the number of male breadwinners are slight, the range between Bayamon and Ponce, the departments with the lowest and highest proportions, respectively, being less than 3 per cent. Among females, the range between Arecibo, with the lowest proportion, and Mayaguez, with the highest, is nearly 5 per cent, a range somewhat greater than that obtaining with males. As the department with fewest males at work is not that with fewest females at work, and as the department with most males at work is not that with most females, it would seem that the conditions affecting breadwinning on the part of the two sexes are not identical. The three departments with a high ratio of female breadwinners are the three containing large cities. This suggests that breadwinning on the part of women may be more common in the cities. To test this, the percentage of breadwinners in the urban and rural population of these three departments is given with distinction of sex.

Per cent of breadwinners in urban and rural population, by sex.

Department.	Male.		Female.	
	In principal city.	In rest of department.	In principal city.	In rest of department.
Bayamon.....	65.8	53.1	24.1	8.1
Mayaguez.....	64.0	57.5	27.3	10.3
Ponce.....	65.4	57.4	29.0	6.8
Total.....	65.3	56.1	26.6	8.1

From this table it appears that while gainful occupations are more common with both sexes in the cities, yet the difference is far greater among females than among males. Female breadwinners in the cities

are over one-fourth, while in the rural districts the proportion is only one-third as high. The difference between city and country in the ratio of breadwinners to population is thus partly explained by the greater proportion of female breadwinners in the cities.

BREADWINNERS CLASSIFIED BY AGE.

In the discussion of age it was shown (p. 48) that the proportion of children under 10 in Porto Rico is larger than almost anywhere else in the civilized world. In the vast majority of cases, such children are dependent upon their elders for support. It is not quite accurate, therefore, to compare the number of persons engaged in gainful occupations, practically all of whom are over 10, with the total population, nearly a third of whom are under 10. A more specific comparison, that of breadwinners with the population over 10, is made below.

Country.	Persons 10 +.	Persons in gainful occupations.	
		Number.	Per cent.
Porto Rico.....	659,294	316,365	48.0
Cuba	1,215,810	622,330	51.2
United States (1890).....	47,413,559	22,735,661	47.9

When the children under 10 are excluded, the difference already noted (p. 86) between Porto Rico and the United States in the ratio of breadwinners disappears. But the difference between the two and Cuba still remains.

When similar percentages are computed for the seven departments, it appears that the lowest, Arecibo, differs from the highest, Ponce, by only 2.8 per cent, while, when the total population is included, the lowest differs from the highest by 3.4 per cent. This shows that the differences between the departments are partly, though not entirely, due to their differences in the proportion of young children. In the following table the number and per cent of persons in gainful occupations are given with details of age, and for comparison percentage columns for Cuba and the United States are introduced.

Persons in gainful occupations.

Age period.	Population.	Number in Porto Rico.	Per cent in—		
			Porto Rico.	Cuba.	United States.
0-9.....	293,949	1,670	0.5	0.6
10-14.....	124,353	27,939	22.4	24.6	8.6
15-19.....	98,148	45,990	49.3	48.8	42.9
20-24.....	88,475	48,195	54.4	56.2	61.4
25-29.....	84,265	45,008	53.4	57.7	} 59.1
30-34.....	64,317	35,593	55.3	59.3	
35-44.....	91,802	52,267	56.9	60.4	57.7
45-54.....	59,263	32,859	55.4	60.3	56.4
55-64.....	33,716	17,951	53.2	59.5	54.1
65+.....	19,950	8,893	44.5	52.0	41.6
Total.....	953,243	316,365	33.1	39.6	36.3

In Porto Rico over one-fifth of the children between 10 and 14 are reported as engaged in gainful occupations; between 15 and 19 nearly one-half are so reported; and from that age to that of 65, between five-tenths and six-tenths of the persons are reported as at work. During the later years of life, from 35 to 65, the proportion of persons at work in Porto Rico is lower than in either Cuba or the United States, but for persons over 65 the minimum is found in the United States. The high proportion of children in gainful occupations is closely connected not merely with the poverty of the masses in Porto Rico, but also with her backward industrial condition and the slight development of the school system, which has appeared from the illiteracy and education tables.

BREADWINNERS CLASSIFIED BY AGE AND SEX.

In the following table the number of breadwinners in Porto Rico of the specified sex and age is given, and the percentage that the breadwinners make of the total number of persons of a given age and sex is shown in parallel columns for Porto Rico, Cuba, and the United States. The figures for Porto Rico from which the percentages have been computed may be derived from those on page 306.

Number and per cent of persons, of sex and age specified, engaged in gainful occupations.

Age period.	Males in gainful occupations.				Females in gainful occupations.			
	Number in Porto Rico.	Per cent in—			Number in Porto Rico.	Per cent in—		
		Porto Rico.	Cuba.	United States (1890).		Porto Rico.	Cuba.	United States (1890).
0-9	900	0.6	0.9	770	0.5	0.2	
10-14	23,155	35.5	44.0	4,784	8.0	4.5	5.9	
15-19	37,453	87.2	91.6	8,537	17.0	10.3	27.4	
20-24	40,408	96.9	98.1	7,787	16.6	11.4	30.6	
25-29	38,497	97.5	98.5	6,511	14.5	12.0	17.3	
30-34	30,665	97.7	98.6	4,928	14.9	13.4		
35-44	45,228	97.4	98.3	7,089	15.5	14.6	13.2	
45-54	28,468	96.2	97.5	4,391	14.7	15.6	12.9	
55-64	15,857	94.6	96.2	2,094	12.3	15.8	12.0	
65+	8,033	86.6	90.2	860	8.0	13.3	8.3	
Total	268,664	56.8	68.2	58.7	47,701	9.9	8.8	12.8

If the percentages for the three countries in the above table be carefully compared, it will appear that, generally speaking, Porto Rico occupies an intermediate position between Cuba and the United States. Among the three countries Cuba has the largest and Porto Rico the smallest proportion of male breadwinners, while on the other hand the United States has the largest and Cuba the smallest proportion of female breadwinners. This is true, not only of the total population over 10, but of most of the separate age groups.

A noteworthy difference between both of the West India islands on the one hand and the United States on the other is the large proportion of male breadwinners between 10 and 15 years of age. The proportion of these in Porto Rico is more than three times, and in Cuba nearly four times, as great as the proportion in the United States.

Of male breadwinners between 15 and 19, the proportion in the two West India islands is greater than it is in the United States by one-half, but thereafter the proportions of male breadwinners in the three countries do not differ very widely. During the latest years of life, over 55, the proportion is lowest in the United States, undoubtedly owing to the considerable number of persons who have withdrawn from gainful occupations and are living on their own savings or on the surplus of other members of the household. Boys and old men are thus at work in Porto Rico to a greater degree than they are in the United States.

In the three columns for women another remarkable difference appears between the two West India islands and the United States. In the latter the proportion of female breadwinners rises rapidly in the years of early life to a maximum between 20 and 24 years of age, when three women out of ten are in gainful occupations. In this age period the proportion of female wage earners in the United States is almost double that at any age in Porto Rico or Cuba, but the proportion declines so rapidly that from the age of 35 it is at each period lower than in Cuba, and in each period but the last lower than in Porto Rico. Wage earning on the part of women in the United States thus seems to be in many cases only a preliminary to marriage and the duties of family life, while in Porto Rico and Cuba it would seem that female breadwinners more commonly work through the years of later life.

It has so often been found that the departments differ but slightly from each other in their census figures, that it is hardly worth while to push the analysis to that detail. The city and country districts, however, have been found in some cases to differ widely, and to determine whether a material difference exists in the present case the following table has been compiled, in which by "urban districts" are meant the two cities of more than 25,000 inhabitants—Ponce and San Juan, and by "rural districts" is meant the rest of the island. Reference to the extended tables will show that these are the only two cities which are separately reported.

Per cent of persons in urban and rural districts, of age and sex specified, who were engaged in gainful occupations.

Age period.	Per cent of breadwinners.					
	Total.		Male.		Female.	
	Urban.	Rural.	Urban.	Rural.	Urban.	Rural.
0-9.....	1.1	0.5	0.9	0.5	1.3	0.4
10-14.....	21.5	22.5	27.7	35.9	15.6	7.6
15-19.....	58.3	48.6	86.4	87.3	34.3	15.5
20-24.....	65.2	53.4	97.0	96.9	36.1	14.8
25-29.....	65.7	52.3	97.5	97.5	35.4	12.8
30-34.....	67.7	54.3	96.9	97.8	40.4	12.8
35-44.....	64.5	56.3	95.7	97.5	37.1	13.6
45-54.....	59.5	55.1	91.5	96.5	35.6	12.9
55-64.....	53.7	53.2	87.0	95.0	31.0	10.6
65+.....	35.5	45.1	73.2	87.2	17.9	7.2
Total.....	44.9	32.4	65.6	56.3	26.4	8.7

From the first two columns of the preceding table it appears that gainful occupations are less common in the rural than in the urban districts of Porto Rico at every age period except that from 10 to 14, and that of 65+. Child labor is apparently, and the labor of old people is certainly, more common in the country districts than it is in the larger cities. The greater proportion for the cities in the other age periods, and the larger proportion of children in the country, result in a ratio of breadwinners to total population in the urban districts much greater than in the country.

Passing to the two columns for males, one notices that gainful occupations for that sex are usually more common in the rural districts, the only important exception being the two age periods between 20 and 30, when the proportion of breadwinners in city and country is about the same. The minor difference in the proportion under 10 may be neglected. Many may be surprised that the proportion of males engaged in gainful occupations is greater in the country districts at almost every age period, and yet that for the total of all ages the proportion of males in gainful occupations in the cities is greater. At first one is at a loss to understand how an excess at each age period, or practically that, can sum to a deficiency in the total. The paradox is explained by noticing that the proportion of children in the urban districts is very much less than in the rural districts, and that, consequently, the proportion of total population eligible for gainful occupations is much greater. In the two cities under consideration only 20.9 per cent of the total population are under 10, while in the rest of the island no less than 31.4 per cent are under 10. If in each case the male children are subtracted from the total male population, one finds that, of the total males over 10 in cities, 84.1 per cent were breadwinners, but in the rural districts 83.2 per cent were breadwinners.

Lastly, if one compares the two columns giving the proportion of female breadwinners in city and country, it appears that at each age period the female breadwinners are somewhat more numerous in the urban than in the rural districts, the excess rising in the cities at the age period 30 to 34 to more than three times that in the country districts at the same age period. And, owing largely to the smaller proportion of children in the cities, as just mentioned, the female breadwinners of all ages in cities are relatively thrice as numerous as in the country.

BREADWINNERS CLASSIFIED BY RACE.

In the following table the absolute and relative number of persons engaged in gainful occupations is given with distinction of race:

Race.	Population.	Persons in gainful occupations.	
		Number.	Per cent.
White	589,426	189,762	32.1
Colored.....	363,817	126,603	34.8
Total	953,243	316,365	33.1

This shows that the proportion of breadwinners was somewhat higher among the colored than among the whites. In the following table the corresponding per cents for the United States (1890) and for Cuba are introduced:

Per cent of persons in gainful occupations.

Country.	White.	Colored.	Difference.
Porto Rico.....	32.1	34.8	2.7
Cuba.....	38.3	42.1	3.8
United States (1890).....	35.5	41.8	6.3

The difference between the two races appears in all three countries, but in Porto Rico it is only about three-fourths of the difference in Cuba, and less than half the difference in the United States. To elucidate these differences the classification by sex may be added to that by race.

BREADWINNERS CLASSIFIED BY RACE AND SEX.

The following table gives the absolute and relative numbers for Porto Rico:

Race and sex.	Population.	Persons in gainful occupations.	
		Number.	Per cent.
White males.....	294,195	167,662	57.0
Colored males.....	178,066	101,002	56.7
White females.....	295,231	22,100	7.4
Colored females.....	185,751	25,601	13.7
Total.....	953,243	316,365	33.1

The difference between white and colored among males is too small to be significant. The difference between the two races is due entirely to the fact that gainful occupations are followed by colored women to nearly twice the extent that they are by white women. To determine whether this is true also of other countries the percentage figures are given side by side in the following table:

Per cent of persons in gainful occupations.

Country.	Males.			Females.		
	White.	Colored.	Difference.	White.	Colored.	Difference.
Porto Rico.....	57.0	56.7	0.3	7.5	13.8	6.3
Cuba.....	68.4	67.6	0.8	3.6	18.2	14.6
United States.....	58.9	57.4	1.5	11.0	25.8	14.8

In all three countries the proportion of breadwinners among white males was slightly higher than the proportion among colored males; but in all three this difference is outweighed by the fact that colored women are at work more generally than white women. The difference between the women of the two races in this regard, however, is less

marked in Porto Rico than in either Cuba or the United States. For each race and sex, with a single exception, the proportion of breadwinners in Porto Rico is lower than in either of the other countries. White women are working in gainful occupations in Porto Rico to twice the extent they are in Cuba, although to an extent little more than half that prevailing in the United States.

BREADWINNERS CLASSIFIED AS NATIVE AND FOREIGN BORN.

This distinction is made in the occupation tables only for the whites. The colored foreign born, of whom there are 2,450 in Porto Rico, must be disregarded. The facts for the whites are given in the following table, by race and sex:

Nativity and sex.	Population.	Persons in gainful occupations.	
		Number.	Per cent.
Native white males	285,303	159,478	55.9
Foreign born white males.....	8,892	8,184	92.0
Native white females	292,706	21,862	7.4
Foreign born white females.....	2,525	238	9.4
Total	589,426	189,762	32.1

Hardly a moment's reflection is needed to detect the cause of the wide difference indicated in the preceding table between the native and the foreign born males and to reveal the insignificant character of such a table taken alone. The immigrant whites are mainly adults, and the large proportion of workers among them is not because they are of foreign birth, but is because they are adult. Hence, if there is any real difference between these two classes of whites, to discover it, groups of the same age must be compared. This is done in the following table:

Age period.	Males.			Females.		
	Native white.	Foreign white.	Colored.	Native white.	Foreign white.	Colored.
0-9	0.4	0.9	0.8	0.3	0.8	0.8
10-14	33.6	38.0	38.4	6.5	0.9	10.5
15-19	85.6	93.9	89.6	13.7	7.0	22.3
20-24	96.5	98.1	97.6	13.1	18.1	22.2
25-29	97.3	97.9	97.7	11.2	11.1	19.7
30-34	97.5	98.3	98.0	10.8	13.0	21.5
35-44	97.2	96.0	97.9	10.9	9.2	22.7
45-54	96.1	93.8	96.7	9.9	10.9	22.0
55-64	94.3	92.5	95.2	8.1	9.2	18.9
65+	86.9	76.8	87.3	5.5	4.7	12.0
Porto Rico	55.9	92.0	56.7	7.4	9.4	13.7

This table shows that among males child labor is more common among the colored than among the white, but that from the age of 15 to that of 35 the proportion of breadwinners among the foreign born white is greater than among either of the other two classes. For later ages, from 35 on, the proportion is greatest among the colored, while that among the foreign born white sinks to the lowest of the three.

This may be due to the better economic condition of the foreign born white, enabling them to retire at an earlier age, or it may be explained by considering that the foreign born white are not preeminently engaged in agriculture, and that the other forms of industry can not be carried on so effectively by persons of advanced years. Among the females one notices that from the beginning to the end of life, the proportion of wage earners among the colored is greater than in either of the other classes, and in the later age periods it is more than twice as great among the colored as among either of the other classes.

BREADWINNERS CLASSIFIED BY KIND OF OCCUPATION.

The occupations in which persons are engaged are grouped by the census into five main classes. Arranged in the order of their prevalence, the groups are:

1. Agriculture, fisheries, and mining.
2. Domestic and personal service.
3. Manufacturing and mechanical industries.
4. Trade and transportation.
5. Professional service.

The first class includes all persons engaged in the so-called extractive industries, or those concerned with getting the wealth out of the earth or water; the third class includes those who transform the raw material furnished by the extractive industries into new forms or combinations; the fourth class includes all engaged in giving place or time values to wealth by moving it from a place where it is less needed to a place where it is more needed, or by saving it from a time when it is less needed till a time when it is more needed, while the second and fifth classes include all whose contribution to society is in the form of personal service rather than of goods or of services upon goods. The line of division between these groups or classes is often obscure, and in many individual cases serious difficulties arise regarding the best group to which a person or an occupation should be assigned under the imperfect description found on the schedule.

The population of Porto Rico engaged in gainful occupations was divided among the five groups as shown in the following table, where similar proportions for Cuba and the United States are added.

Persons in gainful occupations.

Class of occupation.	Number in Porto Rico.	Per cent in—		
		Porto Rico.	Cuba.	United States (1890).
Agriculture, fisheries, and mining	198,761	62.8	48.1	39.7
Domestic and personal service.....	64,819	20.5	22.8	19.2
Manufacturing and mechanical industries.....	26,515	8.4	14.9	22.4
Trade and transportation.....	24,076	7.6	12.8	14.6
Professional service.....	2,194	0.7	1.4	4.1
Total.....	316,365	100.0	100.0	100.0

From this table it appears that the proportion of breadwinners engaged in agriculture in Cuba is nearly 10 per cent higher than in the United States, and in Porto Rico nearly 15 per cent higher than in Cuba. About five-eighths of the breadwinners in Porto Rico were reported as engaged in agriculture. The proportions engaged in personal and domestic service are not widely different in the three regions. The great number of Porto Ricans engaged in agriculture is counter-balanced mainly by relatively much smaller numbers engaged in manufacturing and mechanical pursuits, and also in trade and transportation. The number of persons engaged in professional service in Porto Rico is only one-half what it is in Cuba, as in Cuba it is only one-third what it is in the United States. In the following table the per cent of all breadwinners engaged in each class of occupation is shown by sex for the three countries:

Per cent of breadwinners in the five classes of gainful occupations.

Class of occupation.	Porto Rico.		Cuba.		United States.	
	Male.	Female.	Male.	Female.	Ma'e.	Female.
Agriculture, fisheries, and mining.....	73.3	3.9	52.6	10.3	44.3	17.4
Domestic and personal service.....	10.2	78.4	17.2	69.6	14.3	42.6
Manufacturing and mechanical pursuits.....	7.5	13.4	14.7	16.6	21.6	26.2
Trade and transportation.....	8.3	3.6	14.2	1.0	16.4	5.8
Professional service.....	0.7	0.7	1.3	2.5	3.4	8.0
Total.....	100.0	100.0	100.0	100.0	100.0	100.0

Nearly three-fourths of the male breadwinners in Porto Rico were engaged in agriculture, but not one twenty-fifth of the females. On the other hand, about one-tenth of the males and eight-tenths of the females were engaged in domestic and personal service. Thus these two classes taken together were apparently a complement of each other and included between them nearly five-sixths of all the breadwinners of each sex. As between trade and transportation on the one hand, and manufacturing and mechanical pursuits on the other, the males in Porto Rico were somewhat evenly divided, but of the females nearly four times as many were engaged in manufacturing as in trade and transportation. Comparing the three countries, one notices that the proportion of male breadwinners devoted to agriculture rises from about four-ninths in the United States to nearly three-fourths in Porto Rico, but the number of females devoted to agriculture varies inversely from a minimum of one twenty-fifth in Porto Rico to a maximum of one-sixth in the United States. The same is true for the persons of each sex devoted to professional service, and, with one slight exception, for all persons of each sex devoted to trade and transportation. The whole table points to an extremely simple and primitive organization of industry in Porto Rico, wherein manufacturing, trade, transportation, and professional occupations play a very small part. To illustrate this, one may compute from the preceding table the number of persons

among 100 breadwinners in each of the three countries who were engaged in other pursuits than agriculture, fisheries, and mining, or domestic or professional service. In Porto Rico about 17 in 100 breadwinners, in Cuba about 25 in 100, and in the United States (1890) about 40 in 100, were engaged in some form of manufacturing or mechanical pursuits, in trade or transportation, or in professional service.

BREADWINNERS CLASSIFIED BY SPECIFIED OCCUPATIONS.

Table XXV gives the specified occupations of the great majority of breadwinners in Porto Rico. A cursory examination shows that the single occupations are very imperfectly distinguished and that little can be derived from their inspection by one unfamiliar with local conditions. The following table shows the per cent of all breadwinners in each of a few leading occupations:

Specified occupation.	Per cent of all breadwinners so engaged.	Specified occupation.	Per cent of all breadwinners so engaged.
Laborers.....	68.2	Salesmen and saleswomen	1.5
Servants.....	8.2	Agents	1.3
Launders.....	5.4	Operatives in cigar factories	1.2
Merchants.....	2.8		
Dressmakers and seamstresses....	1.8	Total	92.0
Carpenters	1.6		

In these nine specified occupations are included over nine-tenths of the breadwinners of Porto Rico. Of all males in gainful occupations nearly four-fifths (78.8 per cent) are reported simply as laborers. The other leading occupations followed by men, arranged in order of prevalence, are merchants, servants, carpenters, salesmen, agents, operatives in cigar factories, bakers. The leading occupations entered by women in order of prevalence are servant, laundress, dressmaker and seamstress, laborer, merchant, hat and cap maker, teacher, planter, huckster and peddler.

SIZE OF FAMILIES.

[See Table XXXI.]

A family, in the ordinary or popular sense of the word, means a group of persons bound together by ties of kindred. Usually they live together, but this is not necessarily involved in the word, for a married son or daughter occupying a separate house is regarded as still a member of the family. On the other hand, not all persons who live with the family are deemed members, for servants, laborers, or boarders are excluded.

The census finds such a definition of the family inapplicable to its field of work. The test of kindred can not be applied by the enumerator. In many cases families of relatives are dispersed through the

community, returns about them come through different enumerators, and their names and the facts about them can not be assembled on the schedules or tabulated together. Accordingly in this field, as in several others, the census is forced to abandon the effort to bring together data that belong together, and to confine itself to the simpler and more practicable task of tabulating together data that are found by the enumerators conjoined. The census test of a family is not kinship by blood, but association in home life. Persons living in the same home are, for census purposes, members of the same family.

In census usage, therefore, the word "family" means the group of people, whether related by blood or not, who share a common dwelling and table. If one person sleeps and eats alone, he constitutes for census purposes a family. On the other hand, if a large group of people sleep and eat in a common dwelling, like a hotel or convent, they make up a single census family. Census families, therefore, may be divided into two classes—natural families, or families in the popular sense of that word, and "other families." Members of a natural family are bound together primarily by ties of kindred. Members of other families are bound together primarily by other motives, usually of an economic character. The latter may, perhaps, without great violence to the facts, be called economic families. These two classes of motives may and often do coexist, but the family should be classed with natural families or with economic families according to the class of motives which is primary. For example, a family having only one boarder should doubtless be grouped with natural families, but a family in which the boarders largely outnumber the blood relatives should be grouped with economic families.

The limits of size are much wider in the economic family than in the natural family. The economic family may consist of one person living alone, of two partners living together at their place of business, of three or more boarders living with a housekeeper, or of hundreds of guests, nuns, or prisoners living together in a hotel, convent, or prison. On the basis of number of members alone no sharp line can be drawn between natural families and economic families. Still, the only classification of census families presented in Table XXXI is that by size, and on this basis, therefore, an attempt may perhaps be ventured to divide census families into two classes, one of which should consist mainly of natural families and the other mainly of economic families.

As a natural family can not be composed of a single member, the lower limit of size for a natural family may be drawn with confidence between two members and one. The higher limit is more vague and uncertain. Yet it seems that if all families of more than ten persons are grouped as economic families, a large proportion, if not a majority, of the persons in them might be assumed to be living apart from their kindred—that is, as farm laborers in their employer's family, or as boarders, lodgers, or residents of hotels, schools, prisons, or other

institutions treated by the census as a family, but not so regarded in ordinary speech. On this basis, therefore, the families in Porto Rico may be divided into the following three groups:

1. Families of 1 member.
2. Families of 2 to 10 members.
3. Families of more than 10 members.

Of these groups, the second consists mainly of natural families, the first entirely and the third largely, if not mainly, of economic families.

FAMILIES OF ONE MEMBER.

This class in Porto Rico numbered 7,854, or 0.8 per cent of the population. In the United States and Cuba the corresponding per cents were 0.7 and 1.9, respectively. Families of one member, therefore, are slightly more common in Porto Rico than in the United States, but less than half as common as in Cuba.

In the following table the proportion of population living in families of a single member is given by departments:

Department.	Population.	Population in families of one member.	Percent.
Mayaguez	127,566	1,714	1.3
Bayamon	160,046	1,400	0.8
Humacao	88,501	771	0.8
Ponce	203,191	1,620	0.7
Guayama	111,986	857	0.7
Arecibo	162,308	960	0.5
Aguadilla	99,645	532	0.5
Total	953,243	7,854	0.8

The departments with the smallest proportion are the two in which the proportion of population living in cities is lowest (p. 44). It may be, therefore, that families of one member are more common in cities. To test this conjecture the following table has been constructed, showing the number of persons living in families of one member in the three large cities of Porto Rico and in the rest of the island, and the per cent these make of the total population of each district.

District.	Total population.	Population in families of one member.	Percent.
Three cities	75,187	1,496	1.9
Rest of Porto Rico.....	878,056	6,358	0.7

The table shows that the proportion of persons living alone in the three cities is nearly three times that of the proportion living alone in the rest of the island. A similar fact holds for Cuba, the explanation of which doubtless is that in the country a family must be, in a large measure, an economic unit and self-sustaining, while when people are living as close neighbors, such economic independence of the family is far less essential. When the figures for the several cities and depart-

ments are analyzed, it appears that in the city of Mayaguez living alone is much more common than in either of the other large cities, and that in the department outside of the city, it is much more common than in any of the other six departments, even if the cities be included with them.

FAMILIES OF ELEVEN OR MORE MEMBERS.

Such families in Porto Rico included 109,300 persons, or 11.4 per cent of the entire population—that is, more than fourteen times as many persons were living in these big families as were living alone. In this respect Porto Rico differs widely from the United States, where only 6.6 per cent of the population lived in families of 11 or more members, and from the South Central states of America, where race conditions and agriculture are somewhat like those of Porto Rico, but where the proportion of population in families of more than 10 members was the same as the average for the United States.

As hotels, boarding-houses, and institutions are more common in cities than in the country, it may be that these large census families, like the very small ones, are more common in the cities.

The following table tests the conjecture:

District.	Total population.	Population in families of 11+ members.	Per cent.
Three cities.....	75,187	11,061	14.7
Rest of Porto Rico.....	878,056	98,239	11.1

These very large families, therefore, were somewhat more common in the three cities of Porto Rico than they were in the rest of the island, a relation between city and country in which Porto Rico differs from Cuba, where large families are more common in the rural districts.

On examining the three cities separately it appears that the high proportion of large families does not hold of Mayaguez, but only of San Juan and Ponce. In Mayaguez the proportion of population living in these large families was slightly less than the average in rural districts.

The following table gives the same facts for the island by departments:

Department.	Total population.	Population in families of 11+ members each.	Per cent.
Aguadilla.....	99,645	11,242	11.2
Arecibo.....	162,308	18,703	11.5
Bayamon.....	160,046	22,294	13.9
Guayama.....	111,986	12,685	11.3
Humacao.....	88,501	9,473	10.7
Mayaguez.....	127,566	11,395	8.9
Ponce.....	203,191	23,508	11.5

SIZE OF FAMILIES

PER CENTS

FAMILIES OF FROM TWO TO TEN MEMBERS.

As Porto Rico has a much larger proportion of persons living in families of more than 10 members than the United States, and about the same proportion of persons living in families of 1 member, it clearly must have a smaller proportion of persons living in families of from 2 to 10 members, or what has been termed "natural" families. In Porto Rico about seven-eighths (87.7 per cent) of the inhabitants are living in families of between 2 and 10 members. In this respect Porto Rico holds an intermediate position between Cuba, where 85.2 per cent of the population were living in families of from 2 to 10 members, and the United States, where 92.6 per cent were so living. The proportion of population living in families of this size varies little from department to department, the proportions ranging from Bayamon, with 85.2 per cent of its population living in natural families, to Mayaguez, where 89.7 per cent were so living.

Families having from 2 to 10 members may conveniently be subdivided into three classes: Small families—those having 2, 3, or 4 members; families of medium size—those having 5, 6, or 7 members; and large families—those having 8, 9, or 10 members. The members of natural families, or families having between 2 and 10 members, in each department have been thus subdivided with results shown in the following table:

Department.	Absolute number of persons in families of—				Percentage of persons in families of 2 to 10 members living in—		
	2 to 10 members.	2 to 4 members, i. e., small families.	5 to 7 members, i. e., families of medium size.	8 to 10 members, i. e., large families.	Small families.	Families of medium size.	Large families.
Aguadilla.....	87,871	22,545	40,673	24,653	25.7	46.3	28.0
Arecibo.....	142,645	39,385	63,361	39,899	27.6	44.4	28.0
Bayamon.....	136,352	36,186	60,332	39,834	26.5	44.3	29.2
Guayama.....	98,444	27,488	44,455	26,501	27.9	45.2	26.9
Humacao.....	78,257	21,611	34,887	21,759	27.6	44.6	27.8
Mayaguez.....	114,457	37,310	50,569	26,578	32.6	44.2	23.2
Ponce.....	178,063	48,582	79,199	50,282	27.3	44.5	28.2
Porto Rico.....	836,089	233,107	373,476	229,506	27.9	44.7	27.4

Apparently the size of families among white and colored in Porto Rico was about the same. For in the preceding table the percentages for Humacao, where there were most colored, differed little from those for Aguadilla, where there were most whites.

Families of 2 to 4 members and families of 8 to 10 members each included about one-fourth of the total population living in families of from 2 to 10 members. Small families (2 to 4 members) were proportionately fewer than in Cuba, and large families (8 to 10 members) were more numerous. The families of medium size were also slightly more numerous than in Cuba. The departments differ but

little among themselves. The most conspicuous divergence from the average is in the department of Mayaguez, where families of from 2 to 4 members, like families of 1 member, are unusually numerous, and where large families (8 to 10 members) are correspondingly few.

The following table shows the proportion of the total population of Porto Rico living in families of specified size, and for purposes of comparison columns have been added giving the same ratios for Cuba and the United States:

Number of members of family.	Per cent of total population living in families of specified number of members.		
	Porto Rico.	Cuba.	United States (1890).
1.....	0.8	1.9	0.7
2.....	4.3	6.4	5.3
3.....	8.5	9.8	10.1
4.....	11.6	12.0	15.3
5.....	13.5	12.6	14.1
6.....	13.5	12.2	13.6
7.....	12.2	10.9	12.1
8.....	10.2	9.0	9.6
9.....	8.1	7.0	6.9
10.....	5.8	5.2	5.6
11+.....	11.5	13.0	6.7
Total.....	100.0	100.0	100.0
Average size of family.....	5.3	4.8	4.9

In comparing Porto Rico with Cuba and the United States it appears that the average size of family is somewhat greater than in either of the other countries. Families of less than 5 members included in Porto Rico 25.2 per cent of the population, while in Cuba they included 30.1 per cent, and in the United States 31.4 per cent. On the other hand, families of 7, 8, 9, or 10 members were more common in Porto Rico than in either of the other countries. The fewness of small families and the many large families doubtless account for the greater average size of families on this island.

SANITARY CONDITON OF HOUSES.

[See Tables XXXII-XXXIV.]

In the present census all buildings, whether occupied November 10, 1899, or not, were reported by the enumerators, and the facts regarding the provisions in them for supplying water and for disposing of garbage and excreta were ascertained. Before proceeding to a discussion of these topics a brief analysis of this return of buildings may be made.

The total number of buildings in Porto Rico, whether occupied or not, was 178,518, or 5.3 persons to a building. The average number of persons to a building, occupied or unoccupied, may be computed from those tables. The provinces range as follows:

Department.	Population.	Number of buildings.	Persons to a building.
Mayaguez	127,566	26,616	4.7
Aguadilla	99,645	19,842	5.0
Arecibo	162,308	30,751	5.2
Humacao	88,501	16,997	5.2
Guayama	111,986	20,648	5.4
Ponce	203,191	37,410	5.4
Bayamon	160,046	26,254	6.0
Porto Rico	953,243	178,518	5.3

In Bayamon there were 6 persons to a building, while in Mayaguez there were 4.7. In Cuba it was found that the proportion of persons to a building was greater in the cities than in the rural districts. To determine whether the same is true for Porto Rico, the following table has been constructed:

District.	Population.	Number of buildings.	Persons to a building.
Three cities	75,187	10,283	7.3
Rest of Porto Rico	878,056	168,235	5.2

This table shows that in the three cities of Porto Rico there were on an average rather more than 7 persons to a building, while in the rest of Porto Rico there were about 5. That the three cities differ widely among themselves in this regard is shown by the following table:

City.	Population.	Number of buildings.	Persons to a building.
San Juan	32,048	2,776	11.5
Mayaguez	15,187	2,522	6.0
Ponce	27,952	4,985	5.6
Total	75,187	10,283	7.3

From this it appears that there are about twice as many persons to a building in San Juan as in either of the other cities in the island, and more than twice the average number for the whole of Porto Rico. The number in San Juan is also decidedly greater than in Habana city, where there are 8.8 persons to a building. The reason for this crowded state of the population in San Juan is somewhat like that to which a similar condition is due in New York city, namely, location on an island of small area, with the resultant barriers to expansion of the population.

Of the 178,518 buildings, 20,213, or nearly one-ninth, were unoccupied, a proportion slightly less than that in Cuba. The ratio of unoc-

cupied buildings in the several departments varies, as is shown in the following table:

Department.	Total number of buildings.	Number of unoccupied buildings.	Per cent unoccupied.
Aguadilla	19,842	2,056	10.3
Arecibo.....	30,751	4,247	13.8
Bayamon.....	26,254	2,415	9.2
Guayama.....	20,648	1,720	8.3
Humacao.....	16,997	1,541	9.0
Mayaguez.....	26,616	4,445	16.7
Ponce.....	37,410	3,789	10.1
Porto Rico.....	178,518	20,213	11.3

The minimum proportion is found in Guayama, where one building in twelve is unoccupied. The following table shows the figures for the three cities and the rest of the island:

District.	Number of buildings.	Number of unoccupied buildings.	Per cent.
Three cities	10,283	1,028	9.9
Rest of Porto Rico.....	168,235	19,185	11.4

From this it appears that the proportion of unoccupied buildings in the three cities of Porto Rico is somewhat, though not much, less than the proportion in the rural districts. The three cities differ considerably among themselves in this regard, Mayaguez having a much higher proportion than the average in the rural districts, while the other two have a lower rate.

Passing to the occupied buildings or dwellings, one may examine the average number of persons to each. Here again only slight differences are found between the departments, Aguadilla having the lowest and Bayamon the highest proportion, as appears from the following table:

Department.	Population.	Number of dwellings.	Persons to a dwelling.
Aguadilla	99,645	17,786	5.6
Arecibo.....	162,308	26,504	6.1
Bayamon.....	160,046	23,829	6.7
Guayama.....	111,986	18,928	5.9
Humacao.....	88,501	15,456	5.7
Mayaguez.....	127,566	22,171	5.7
Ponce.....	203,191	33,621	6.0
Porto Rico.....	953,243	158,305	6.0

The following table shows the number of persons to a dwelling in the three cities and in the rest of Porto Rico:

District.	Population.	Number of dwellings.	Persons to a dwelling.
Three cities	75,187	9,255	8.1
Rest of Porto Rico.....	878,056	149,050	5.8

When the three cities are taken together, the persons to a building in them are more numerous than in the rest of the island, due largely to the influence of San Juan. To show that, the facts for the three cities are given separately in the following table:

City.	Population.	Number of dwellings.	Persons to a dwelling.
San Juan	32,048	2,519	12.7
Mayaguez	15,187	2,107	7.2
Ponce	27,952	4,629	6.0
Total	75,187	9,255	8.1

It appears that the number of persons to a dwelling in Mayaguez city is not much higher, and in Ponce city no higher, than it is in the remainder of the respective departments, or in the island taken as a whole, while in San Juan the proportion is more than double that for the rest of the department or for all Porto Rico.

DWELLINGS AND FAMILIES.

By comparing the number of dwellings in Table XXXII with the number of families in Table XXXI, one may ascertain the ratio between census families and dwellings. Every dwelling contains at least one family, for, as already explained, one person living alone is for census purposes a family, and an unoccupied place of habitation is not a dwelling. As certain dwellings contain two or more families, the number of census families must exceed the number of dwellings. The figures for Porto Rico, compared with those for Cuba and the United States, are given below:

Country.	Number of families.	Number of dwellings.	Families to 100 dwellings.
Porto Rico.....	181,594	158,305	114
Cuba	327,965	262,724	125
United States.....	12,690,152	11,483,318	111

From these figures it appears that there were more families to 100 dwellings in Porto Rico than in the United States, but less than in Cuba. Still, if the figures for Habana be excluded, the number of persons to 100 dwellings in Cuba outside of Habana is found to be almost the same as the average for Porto Rico.

In the following table the figures are given by departments:

Department.	Number of families.	Number of dwellings.	Families to 100 dwellings.
Aguadilla	18,309	17,786	102
Arecibo	30,501	26,504	115
Bayamon.....	29,544	23,839	123
Guayama.....	21,353	18,928	112
Humacao.....	16,965	15,456	109
Mayaguez	26,558	22,171	119
Ponce	38,364	33,621	114
Porto Rico.....	181,594	158,305	114

The high rate of Bayamon and the low rate of Aguadilla suggest that in the rural districts each family is more likely to have a dwelling to itself, while in the city we find frequently more than one family to a dwelling. In the following table, therefore, the figures for the three cities and the rest of Porto Rico are given separately:

District.	Number of families.	Number of dwellings.	Families to 100 dwellings.
Three cities	15,821	9,255	171
Rest of Porto Rico.....	165,773	149,050	111

It appears that the proportion of families to a dwelling in the three cities is much higher than it is in the rest of Porto Rico.

In the following table the facts are given for the three cities separately:

City.	Number of families.	Number of dwellings.	Families to 100 dwellings.
San Juan	6,281	2,519	249
Mayaguez.....	3,647	2,107	173
Ponce	5,893	4,629	127
Total	15,821	9,255	171

From these figures it appears that in Ponce there is comparatively little crowding of two or more families into a dwelling; that in Mayaguez there is more; but that in San Juan there are, on an average, about five families to every two dwellings, a proportion even higher than that in Habana city, and further indicative of the serious crowding of population in the capital of Porto Rico.

SOURCE OF WATER SUPPLY.

The original source of water supply in Porto Rico, as elsewhere, is rainfall. This rain may fall on a building and be guided into and stored in a cistern, or may fall on and percolate through the ground either under or upon the surface. Flowing water may be obtained for human use as it comes to the surface either in a natural spring or an artificial well; or it may be obtained as it flows over the surface either in a natural water course or in an artificial water course or aqueduct. Accordingly, the census recognizes four sources of water supply, as follows:

1. Cistern for rain water.
2. Spring or well for ground water.
3. Water from a natural stream.
4. Water from an artificial aqueduct.

In Porto Rico these four sources are drawn upon for a water supply in the following proportions:

Source of water supply.	Number of dwellings supplied from source named.	Per cent of total dwellings.
Stream.....	85,348	54
Cistern for rain water.....	55,993	35
Aqueduct.....	9,393	6
Spring or well.....	7,896	5
Not specified.....	575	0
Total.....	158,305	100

About one-third of the Porto Rican buildings are supplied with water from cisterns, and more than one-half from streams, or nearly nine-tenths from these two sources combined. About one-seventeenth of the dwellings are supplied from aqueducts and one-twentieth from wells.

In comparison with Cuba, the use of cisterns is much less common, while streams are relied upon by almost twice as many houses. The stream as a source of water, it will be noticed, requires less initial expenditure of labor than the cistern, well, or aqueduct. Aqueducts supply only about one-third the proportion of houses in Porto Rico that they do in Cuba.

Per cent of dwellings obtaining water from source named.

Department.	Stream.	Cistern.	Aqueduct.	Well.	Not specified.
Aguadilla.....	25	71	0	4	0
Arecibo.....	58	37	0	5	0
Bayamon.....	44	40	2	14	0
Guayama.....	69	25	5	1	0
Humacao.....	68	21	4	7	0
Mayaguez.....	40	44	11	4	1
Ponce.....	68	17	14	1	0
Total.....	54	35	6	5	0

The preceding table shows that the use of cisterns is most common in the north and west, and least common in the east and south, the proportion varying from one-sixth in Ponce to more than two-thirds in Aguadilla.

Reliance upon streams, on the other hand, is most common in the east and south, and least common in the north and west, the proportion varying from one-fourth in Aguadilla to two-thirds in Ponce, Humacao, and Guayama.

Aqueducts are a supply of little importance, except in Mayaguez and Ponce, where slightly more than one house in ten gets its water supply from this source.

Wells are also little used in most of the departments, but in Bayamon about one house in seven uses them.

Aqueducts are the principal source of water supply in the cities of Mayaguez and Ponce, but not apparently in San Juan, where the greater part of the population—nearly two-thirds—rely upon wells.

The following notes on the water supply of the three large Porto Rican cities have been gleaned from various sources:

SAN JUAN.

“The city is poorly supplied with water. There is a good spring on the island of Miraflores, but within the city there are only cisterns for rain water and a scanty source in the well of San Cristobal castle. There is another good well in the neighborhood of San Antonio bridge.” Delitsch, p. 1931a [1871].

“There is no running water in the town. The entire population depends upon rain water caught upon the flat roofs of the buildings and conducted to the cistern, which occupies the greater part of the inner courtyard, that is an essential part of Spanish houses the world over, but that here, on account of the crowded conditions, is very small. There is no sewerage except for surface water and sinks, while vaults are in every house and occupy whatever remaining space there may be in the *patios* not taken up by the cistern. The risk of contamination to the water is very great, and in dry seasons the supply is entirely exhausted.” R. T. Hill, *Cuba and Porto Rico*, p. 176 [1898.]

“In the few months of American occupancy water from the works in process of construction by the Spanish, for several years, has been brought into the city.” Carroll, *Report on Porto Rico*, p. 210.

“Nine miles from San Juan, by the military road, near the little town of Rio Piedras, there is a piece of engineering just approaching completion which is to result in furnishing the capital of Porto Rico with a much-needed water supply. * * *

“It is calculated that within four months San Juan will be able to dispense with the questionable supply of rain water in cisterns, to which may be attributed a portion of the sickness developed, which will be replaced by well filtered water drawn from an uncontaminated source far up in the mountain ravines.

“This has been practically accomplished by damming a mountain stream, at normal periods some thirty feet in width, by a substantial wall of masonry twenty feet high. American engineers would pronounce this portion of the work defective, in that along the low flood-plains to the left of the stream there are no extension retaining-walls, and hence all flood waters rush around the unprotected end of the dam. The monetary loss, when the spring waters cut a new stream-bed, as they will, over the alluvial plain, will be of small moment as compared to the distress which will be caused by the temporary cutting off of the water-supply from a city whose people have become educated to the use of water from faucets.

“Beyond this primary objection to the work as it stands, it may be said that the undertaking has been well and ably executed, under the direction of Spanish engineers, including, as it does, settling basins, sand filters, pumping basins, steam lifting pumps, primary receiving reservoirs, and secondary distributing reservoirs.

“It is estimated that this plant is capable of raising and distributing two million gallons of water in twelve hours, with one set of pumps in action.

“All the great basins have been built by throwing up a massive surrounding-wall of earth, and erecting against this a stone wall four feet in thickness, finished with a cement lining. The stone used in their construction is a fine-grained blue limestone brought from the mountains within a mile and a half of Rio Piedras. As a building-stone, it is said to be excellent. It is worked, however, with some difficulty. * * *

“The water comes from the dam through a twenty-four inch pipe to two settling basins, which are used alternately, and it is here held for twenty-four hours, until the major portion of the foreign matter has precipitated.

"Provision is made at the lower end of these basins to flow off the water into the stream. * * *

"From the settling basins, it is flowed into great duplicate filter basins, which have a bed covering of four feet of coarse sand; the water passes through these beds of sand into the final pumping basin.

"In the event of any trouble with the filter beds, it is possible to flow the water, by side trenches with cemented walls, around the filter basin, directly into the pumping pits. The pumps are direct-coupled, and the engines are of the condensing type, manufactured by a Glasgow firm.

"The primary reservoir is situated one hundred and sixty feet above the pumps, and is a work of beauty. The walls are of rough masonry, topped with a handsome stone fence. The center of this great basin, holding three million seven hundred thousand gallons, is divided by a median wall, and the valve-house is situated at one side of this division.

"A twenty-inch main pipe leads into the city. * * * The total cost of the completed plant with the water in the mains, it is said, will be somewhat over six hundred thousand *pesos*." Dinwiddie, *Porto Rico*, p. 185-187 [1899].

PONCE.

"Water for all purposes, including the fire department, is amply supplied by an aqueduct." Hill, p. 178.

"Ponce has the merit of an admirable water supply." Carroll, p. 210.

"There are waterworks supplying an abundance of good, potable water." Dinwiddie, p. 189.

MAYAGUEZ.

"The city has excellent waterworks." Hill, p. 179.

"The water for the city is brought from a mountain torrent two miles away in the foot-hills, and is good and abundant." Dinwiddie, p. 193.

"Its water supply is excellent, requiring only proper filtration to make it acceptable. * * * The city council has voted a considerable appropriation for the improvement of its waterworks, and a comprehensive system of sewerage is a probability of the near future." Carroll, p. 209.

DISPOSITION OF GARBAGE.

The enumerators were instructed to write in the column for answers to this question "Municipal" (municipal), "Particular" (private), or "Se quema" (by burning), according to the method of disposition used at the dwelling where the question was put. In addition to these three classes it was necessary to introduce a fourth for unspecified or insufficiently specified, but less than 1 per cent of the houses fell into this last class. The facts for Porto Rico as a whole are shown in the following table:

Method of disposing of garbage.	Number of dwellings so reporting.	Per cent of all dwellings.
Municipal	20,194	13
Burning	24,637	15
Private	112,347	71
Not specified.....	1,127	1
Total.....	158,305	100

Of the total dwellings in Porto Rico about one-eighth were provided with some municipal means of disposing of garbage, and the inhabitants of rather more than one-seventh used burning as a method of disposition. In substantially all the remainder—that is, in more than seven-tenths of the dwellings on the island—the inhabitants reported private means of disposition other than burning.

Among the departments, municipal disposition of garbage was most common in those at the eastern end of the island, Guayama and Humacao, and least common in those at the northwest, Aguadilla and Arecibo.

Burning was much more common in Ponce and Humacao than elsewhere, the other five departments all falling below the average for the island in this respect.

Per cent of urban dwellings using specified method of garbage disposal.

City.	Municipal.	Burning.	Private.	Not specified.
Mayaguez	65	5	29	1
Ponce	68	25	6	1
San Juan	58	23	19	0
Total	64	20	15	1

In the three cities, as shown above, between half and two-thirds of the dwellings were provided with some municipal disposition of garbage, and in Ponce and San Juan the residents of about one-fourth of the dwellings were reported as disposing of their garbage by burning.

DISPOSITION OF EXCRETA.

The entries which the enumerators were allowed to make in the column containing the answers to this question were “pozo,” “inodoro,” or “ninguna” (none). In addition to the three thus allowed, there will be found in the tables a fourth class of “not specified,” to cover cases where the question was not answered. The only recognized methods of disposal, therefore, were *pozo* and *inodoro*. As it is difficult to find any exact English equivalent for these words, they will be retained in the following discussion of the tables.¹ In Table XXXIV *pozo* has been translated as cesspool and *inodoro* as sewer, but these English words are not exact equivalents of the Spanish terms they render.

¹ The *inodoro* includes every receptacle for excreta in which an effort is made to destroy or decrease the foul odors arising therefrom, usually by the addition of such substances as lime, dry clay, or ashes. The *pozo* includes all other forms of closet. The modern form of closet flushed by water from a system of pipes, called *escusado ingles*, is very unusual in Porto Rico. Either the *inodoro* or the *pozo* is cleaned, when it is cleaned at all, by scavengers hired by the property owner.

The following table shows the frequency of these various modes of disposal:

Mode of disposing of excreta.	Number of dwellings using it in Porto Rico.	Per cent of total dwellings.
No form.....	120,924	76
Pozo.....	34,829	22
Inodoro.....	1,181	1
Not specified.....	1,371	1
Total.....	158,305	100

More than three-fourths of the dwellings in Porto Rico have no provision of any kind for this purpose. It is said that in rural Spain the inhabitants commonly have no closets or outhouses, but resort to the fields, and the same is apparently true of Porto Rico. Of the houses having conveniences of this sort, over nineteen-twentieths (96.7 per cent) reported a *pozo* and less than one-twentieth (3.3 per cent) an *inodoro*. In this respect the departments stand as follows:

Per cent of total dwellings supplied with specified mode of disposal of excreta.

Department.	Pozo.	Inodoro.	No form.	Not specified.
Aguadilla.....	17	0	83	0
Arecibo.....	17	0	83	0
Bayamon.....	28	1	69	2
Guayama.....	23	0	77	0
Humacao.....	17	0	81	2
Mayaguez.....	24	1	75	0
Ponce.....	25	2	72	1
Total.....	22	1	76	1

It is clear that except in the three departments containing large cities the *inodoro* is practically unknown. In the following table the facts are given for the three cities separately reported:

Per cent of urban dwellings using specified method of disposing of excreta.

City.	Pozo.	Inodoro.	No form.	Not specified.
Mayaguez.....	75	6	18	1
Ponce.....	79	4	16	1
San Juan.....	71	11	18	0
Total.....	76	6	17	1

This table shows that in San Juan an *inodoro* was found in a little more than one-tenth of the dwellings, but that in the other two cities it occurred in only about one dwelling in twenty. In the three cities one house in six, on an average, was without closet conveniences.

In the following table the facts are given for the rural districts of

the three departments containing these cities, i. e., for the three departments outside of these cities:

Per cent of rural dwellings using specified method of disposing of excreta.

Rural districts of—	Per cent.			
	<i>Pozo.</i>	<i>Inodoro.</i>	No form.	Not specified.
Bayamon.....	23	0	75	2
Mayaguez.....	18	1	81	0
Ponce.....	17	1	81	1
Total rural.....	19	1	79	1

In these rural districts there was a *pozo* in connection with less than one-fifth of the dwellings, while nearly four-fifths were without this or any other form of receiving excreta.

VITAL STATISTICS, 1888-1898, INCLUSIVE.

[See Tables XXXV-XXXVII.]

In connection with the present census a careful and accurate report was received at the office of the Director, giving the number of births, deaths, and marriages registered in each municipal district of Porto Rico for each calendar year from 1888 to 1898, inclusive, and, in the case of births and deaths, with distinction of sex. In the report the districts are arranged alphabetically, but for purposes of analysis they have been assembled by departments. In this form the figures are included in the present volume, and those for the several departments are here introduced from pages 345-351:

Deaths in Porto Rico, 1888-1898, by departments.

Department.	1888.	1889.	1890.	1891.	1892.	1893.	1894.	1895.	1896.	1897.	1898.	Total.

Porto Rico	3, 289	2, 401	4, 079	3, 894	3, 996	4, 297	3, 934	4, 265	3, 773	3, 729	2, 728	40, 885

The first question which arises regarding such tables as the preceding is, How accurate and complete are the figures? The table received by the Director of the Census was entirely free from arithmetical errors, and in the course of analysis only one slight defect—a transposition of two numbers—was detected. But this does not vouch for the completeness of the original records, of which this table is a summary. In default of opportunity to examine the law and administration of Porto Rico in such matters, one is compelled, in determining the probabilities of the case, to rely upon internal evidence. For this purpose one must compare the proportion between the recorded births and deaths and the population, and ascertain whether these proportions, the so-called death rates and birth rates, agree with the known probabilities under such conditions as prevail in Porto Rico. In order to estimate the population, it has been assumed that the inhabitants increased by an equal number each year between 1887 and 1899—an assumption sufficiently accurate for the purpose in hand.

DEATHS AND DEATH RATES.

The total population of Porto Rico for each year, and the deaths and death rates, or average number of persons dying to each thousand of the estimated population, were as given in the following table:

Death rates, 1888-1898.

Year.	Estimated population.	Deaths reported.	Death rates.
1888.	811, 454	25, 568	31. 5
1889.	824, 344	26, 255	31. 8
1890.	837, 234	26, 955	32. 1
1891.	850, 124	24, 089	28. 3
1892.	863, 014	24, 474	28. 3
1893.	875, 903	21, 616	24. 6
1894.	888, 793	24, 896	28. 0
1895.	901, 683	26, 284	29. 1
1896.	914, 573	25, 435	27. 8
1897.	927, 463	31, 980	34. 4
1898.	940, 353	33, 614	35. 7
Average for 11 years.	875, 903	26, 469	30. 2

If these figures may be trusted, it appears that about 3 per cent of the population of Porto Rico die each year. If the population of Porto Rico were what is known as stationary—that is, neither increasing nor decreasing year by year in total numbers, and experiencing no

loss or gain from emigration or immigration—and 3 per cent died each year, it is clear that a number equal to the total population of the island would have died at the end of thirty-three and one-third years. This does not imply that every person on the island would die on reaching that age, but does imply that the persons dying below the age of $33\frac{1}{3}$ years would be equal in number to those dying above that age, and, consequently, that a child born in Porto Rico would have an even chance of reaching $33\frac{1}{3}$ years before its death. This is what is sometimes called by statisticians the expectation of life. In such a stationary population, also, there would be as many persons below as above $33\frac{1}{3}$ years—that is, the median age of the population would be $33\frac{1}{3}$ years. Now, it has already appeared from the analysis of the age figures of Porto Rico (page 47) that the median age is not $33\frac{1}{3}$, but 18.1 years. A part of this difference is due to the fact that the population of Porto Rico is increasing rather than stationary. But this increase is far from sufficient to account for the difference between the observed median age of the population and the median age estimated on the assumption of a stationary population and a death rate of 30 per annum. The only obvious way of escaping the difficulty is to assume that the true death rate in Porto Rico must be somewhat higher than the death rate of 30 obtained from the analysis of the figures, and that many deaths have occurred on the island which have not been entered in the registers or reported to this office.

Another line of argument may be offered tending to the same result. Porto Rico has been gaining but little by immigration, and nearly all of its increase has been by excess of births over deaths. This increase, however, for the last few decades, has been but little more than 1.5 per cent per annum. If one can ascertain approximately the births in Porto Rico each year and their ratio to population, one may ascertain indirectly the probable number of deaths. Now, two censuses, those of 1860 and 1899, have reported the number of children under 1 year of age in Porto Rico. They are the survivors of the children born within the preceding twelve months. In the following table these two are compared with the total population reported by the census:

Per cent of population under 1 year of age.

Census.	Total population.	Population under 1 year of age.	Per cent.
1860.....	583,308	16,833	2.8
1899.....	953,243	26,309	2.7

These figures indicate a birth rate for Porto Rico of at least 27 per thousand population, but two considerations warrant the belief that the true birth rate must be much higher than this. In the first place, no account has been taken of the number of children who were born and

then died in Porto Rico in the year preceding the census day. From all that is known of the conditions on the island, one may assume that this proportion was very high. Where ignorance, poverty, and unsanitary conditions prevail, it is not at all uncommon for one-fourth of all the children born to die during their first year of life. If one assumes that this is true in Porto Rico, the true birth rate would be 35 or 36 instead of 30. That this is not an exaggerated estimate of the true birth rate is perhaps indicated by the fact that Spain, for the years 1865-1869, reported an average birthrate of 36.7, for the years 1878-1880 an average birth rate of 35.7, and for the years 1887-1888 an average rate of 36.3. All that one knows of Porto Rican conditions indicates that the birth rate on that island must be decidedly higher than it is in Spain.

A second cause for thinking the birth rate in Porto Rico to be much higher than 27 is found in the general tendency of parents, in reporting the ages of young children, to overstate them. For this reason the number of children under 1 becomes erroneously small by the transfer of many infants really belonging in that class into the class of children 1 or even 2 years old. From Table IX it will be noticed that the children in Porto Rico 2, 3, and 4 years old, November 10, 1899, were much more numerous than those under 1. Such a relation, if it existed, could be due only to an abnormally low birth rate for the preceding year or a very high infant mortality affecting mainly the children under 1. Neither of these assumptions seems so probable as that a considerable number of Porto Rican children belonging to the first year of life have been transferred, as often happens, to the later age periods. When one considers that Saxony, Russia in Europe, and Roumania have a birth rate of between 40 and 50 per annum, it seems probable that the true birth rate of Porto Rico must be as high as 40 per annum, and that the true death rate is nearer 40 than 30, while both birth rate and death rate may not improbably rise above 40. On the whole, therefore, it is not probable that the births and deaths recorded in the preceding tables included all or nearly all of those which occurred in Porto Rico. Still, inferences may perhaps be derived from the figures, notwithstanding the admission that they are imperfect and incomplete.

From the table showing deaths and death rates in Porto Rico year by year it appears that these have varied quite widely from a minimum rate of 24.6 to a maximum of 35.7. The rates at the beginning and end of the period of eleven years were much higher than for several years in the middle of the series. The variations, however, have not been sharp, being in nowise comparable with those shown in Cuba for the same period.

In the following table the death rates are given by departments for each year:

Death rates in Porto Rico, 1888-1898, by departments.

Year.	Aguadilla.	Arecibo.	Bayamon.	Guayama.	Humacao.	Mayaguez.	Ponce.
1888.....	31.3	31.6	23.3	26.9	29.4	39.3	36.1
1889.....	34.6	32.0	24.3	33.1	35.0	33.7	32.2
1890.....	28.6	38.1	26.4	33.7	33.0	40.6	32.2
1891.....	27.6	26.3	25.3	27.1	30.3	33.3	28.6
1892.....	26.9	29.6	25.1	23.1	31.9	33.2	28.1
1893.....	23.2	24.9	23.4	21.0	25.8	26.4	26.3
1894.....	27.7	27.7	25.3	27.0	27.3	31.0	29.1
1895.....	27.9	30.6	30.0	25.4	27.1	35.5	26.8
1896.....	28.0	30.0	24.3	27.0	30.9	31.7	24.7
1897.....	28.4	32.7	31.9	39.3	45.6	34.9	32.0
1898.....	36.3	38.9	26.2	39.2	35.7	42.2	33.7
Average.....	29.1	30.5	26.0	29.4	32.0	34.7	29.9

These departments do not vary widely from the average for the island, nor does it appear that any one or more of the departments suffered severely while the remainder were unaffected. In one case, in the year 1897, it would seem that the eastern end of the island, Humacao, Guayama, and Bayamon suffered and the death rate rose, while in the other four departments this did not occur. In 1893 nearly all the departments seem to have had a comparatively low death rate, while in 1890 the death rate in two of the western departments, Mayaguez and Arecibo, was unusually high. One is somewhat surprised to find the average rate for Mayaguez running higher than in the other departments, and the suspicion arises that this may be due to more accurate records rather than to a rate really above the average.

BIRTHS AND BIRTH RATES.

The following table gives the birth rates for Porto Rico as a whole, by single years:

Birth rates in Porto Rico, 1888-1898.

Year.	Population.	Births.	Birth rates.
1888.....	811,454	27,401	33.7
1889.....	824,344	25,113	30.4
1890.....	837,234	24,281	28.9
1891.....	850,124	23,496	27.6
1892.....	863,014	25,302	29.3
1893.....	875,903	25,457	29.0
1894.....	888,793	24,548	27.6
1895.....	901,683	25,090	27.8
1896.....	914,573	26,270	28.7
1897.....	927,463	25,827	27.8
1898.....	940,353	19,719	19.9
Average.....	875,903	24,768	28.2

One notices that, on the average, the registered number of births to a thousand persons is less than the registered number of deaths to a thousand persons. As Porto Rico has been gaining but little by immigration in recent years, this apparent inference from the tables must be rejected as incorrect and interpreted as evidence of omissions in the

birth records. In nearly all countries omissions of births occur much more frequently than omissions of deaths. The birth rate in Arecibo and Mayaguez is higher than elsewhere, a condition which leads one again to suspect that the figures for Mayaguez are probably more accurate and careful than those kept by the other departments. Much the lowest birth rate in the island is found in Bayamon.

It is probable that the proportion of children under 5 in 1899 to the total population would vary from department to department in rough agreement with the variations in true birth rate during the preceding years. That they do not thus vary is indicated by the following list:

Departments arranged in the order of

Increasing proportion of population, 0-4: Increasing birth rate, 1895-1898:

Mayaguez.	Bayamon.
Ponce.	Humacao.
Bayamon.	Guayama.
Arecibo.	Aguadilla.
Aguadilla.	Ponce.
Humacao.	Mayaguez.
Guayama.	Arecibo.

From these figures one's belief is strengthened that the differences in birth rate and death rate are due primarily to differences in the accuracy of registration rather than to differences of actual rate.

MARRIAGES AND MARRIAGE RATES.

The proportion of marriages to population in Porto Rico, is so low as to make the figures insignificant. One notices from the table (p. 113) that marriages were apparently much more numerous during the years from 1890 to 1895 than during the two years before or after that time. This may be an indication that the economic conditions on the island were somewhat worse during the earlier and the later parts of the eleven-year period than they were in the intervening time, but beyond this scarcely any inferences from the table seem warranted.

In the following table the departments are arranged in the order of the average marriage rate for the eleven years, and in the second column the proportion of white to the total population is stated:

Department.	Average marriage rate for 11 years.	Proportion of white to total population.
Humacao	2.5	46.1
Guayama	3.5	50.7
Bayamon	3.6	48.9
Ponce	3.8	59.6
Mayaguez	4.5	64.3
Arecibo	5.1	77.1
Aguadilla	6.0	85.6

It will be noticed that, with a slight exception in the case of Guayama, the two columns vary concomitantly. This confirms what was also shown by the figures for marital condition, that lawful marriage is much more common among the white population than among the colored.

AGRICULTURE.

While agriculture is now the principal source of wealth to Porto Rico, the early settlers were for many years engaged in cattle raising, and this is still an important industry, the rich and luxuriant pastures and many streams providing all that is necessary for this purpose. It may be said that all fruits and vegetables adapted to a tropical climate will yield abundantly in Porto Rico, and this is especially true of the coffee tree, the sugar cane, and the tobacco plant, the three staples of most importance in the order named, and grown widely over the island.

The following reports, prepared especially for the census by Señors M. Badrena, supervisor of the department of Mayaguez; Ricardo Hernandez, supervisor of the department of Bayamon, and M. Planella, of Cayey, give interesting facts concerning the history and cultivation of coffee, sugar, and tobacco. They are printed substantially as received.

COFFEE.

Report of Señor RICARDO HERNANDEZ.

“The coffee plant is a shrub 2 or 3 meters high with permanent leaves, a delicate, flexible trunk of some 6 centimeters in diameter, with opposite and alternate ramifications forming crosses. It generally bifurcates at the surface of the ground, giving the appearance of two or three plants being joined together. This is due to the fact that each grain of coffee gives origin to two plants. The system of cultivation has limited the development of the height to the point above indicated, but in Arabia and in some parts of America where the tree is allowed to grow freely, the coffee becomes a thick tree with sharp lanceolate erect leaves, dark green in color, permanent, thick, and smooth.

“The blossom of the coffee is white, fragrant, and resembles the jasmine blossom, with five stamens grouped together and implanted in the axila of the leaves; tubular corolla, small globulous calyx with five teeth.

“The fruit is oblong, fleshy, resembling the cherry, bright green in color, which on ripening turns to an intense red, and contains in the interior the seed composed of two coriaceous plano-convex discs, so firmly united at their plane surfaces that they sometimes break before separating.

“The coffee has a central or tap root which penetrates the ground about 80 centimeters, and also many secondary rootlets near the surface.”

COFFEE PLANTATION IN MAYAGUEZ.

SUITABLE CLIMATE.

“In Porto Rico the select and renowned coffee is produced between 200 and 800 meters above the sea level. At this elevation are found the towns of Yauco, Lares, Maricao, Utuado, Cayey, etc., which form the productive region of the renowned coffee of Porto Rico. This region, which includes something more than the southwest quadrant of the island, is characterized by a climate of perpetual spring. The constant breeze refreshes the atmosphere and the frequent rains equalize the seasons so that not even in times of drought does the vegetation suffer as occurs on the southern coast of the island, nor during the rainy season are the rains so heavy as on the north coast. Owing to these favorable climatic conditions and to the fact that the coffee groves are situated in valleys sheltered from the strong winds, and the soil, of which we will presently speak in detail, is due the enviable reputation of the coffee of the country.

“In the central range of Porto Rico is the Sierra Luquilla, which has an elevation of 1,500 meters above the level of the sea, and it is observed that above the middle height of this mountain coffee groves do not exist. Whether owing to the climate or to the soil, which may be unsuitable, where only grow some shrubs in thickets and some worthless herbs, it is true that after 800 meters have been passed the coffee is not seen, and all attempts to grow it at that altitude have been without results.

“Coffee growers modify the climate by employing shade, that is, they plant their coffee groves beneath the shade of a grove of thick trees, as, for example, the *hucares*, *guaba*, *jobo*, *guama*, *mango*, etc., and under the banana trees when the coffee groves are young.

SUITABLE SOIL.

“The coffee grows on hills of low elevation, associated with many other trees, which afford shade, modify the temperature, and protect the coffee from the hurricanes and torrential rains.

“The composition of these coffee soils is variable, but in all of them sand predominates and on the surface there is an abundant covering the product of the decayed vegetation of the forest.

“The land which produces the renowned coffee of Porto Rico, as to its physical appearance, seems to be a very fine clay, and when it rains becomes as slippery as soap, and transit at such times is dangerous. It has a red color when moist, and when squeezed through the fingers resembles in its color and smoothness the oxide of iron paint, but when dry it becomes very hard.

CULTIVATION OF COFFEE.

“The method employed in Porto Rico and other points for the growing and multiplication of coffee, by utilizing the plants which spring up from the seed which falls alone or is lost at gathering time, must be superseded by another method more certain, employing seed set apart for the purpose.

“In order to make seed beds, a place is selected with a slightly inclined surface, or at least one which will not become swampy or muddy and which has a good layer of vegetable soil, and it is worked or spaded until the same is well pulverized. It is cleared of all roots, stones, etc., and if the land be not sufficiently fertile it is enriched with common barnyard manure. After this has been done, in the month of February, the sowing takes place, for which purpose coffee grains in the berry or husk are selected which can be seen to have unusual size and weight, and which give signs of being perfectly formed, and they are planted at a depth of 3 centimeters. The grains are planted with the finger, or, as is more convenient, with a stick, and after being placed in the hole are covered with earth, which is pressed down with the hand. The planting should be in rows separated from each other a distance of about 15 centimeters, and the distance between each planted grain should be the same. In about twenty days the new coffee plants will commence to spring up, and they are allowed to remain for a year or a year and a half, when they will have acquired a height of about 80 centimeters or have three crosses, at which time they may be transplanted to the site determined upon for the coffee grove.

“The care of the seed beds during this time is limited to clearing it of weeds and taking measures to prevent the winds from injuring the tender plants, because if they are seen to turn black or take on a burnt color the center or stock of the little plant will cease to grow. They may be protected from the winds by making palisades or shelters of boards, palm leaves, cane, bamboo, etc.

“When the small plants have acquired the height indicated, the lower and middle branches are cut off, leaving only the cross branches in order that the trunk may grow straight and clean, and its top or branching commence at the height most convenient for the work of gathering the crop.

“Some days after this pruning the trees are taken up from the seed bed, using for this purpose a narrow spade, which is thrust into the earth near the foot of the tree to a depth equal to the length of the roots, and then by gently employing the necessary force, the tree is taken out with all its roots intact, and with a clod of earth which it is necessary to preserve, so that the roots may remain covered and insure a new rooting when transplanted.

COFFEE PLANTATION IN ADJUNTAS, SHOWING GLACIS FOR DRYING.

“When the trees taken up have very long tap roots, say of 20 centimeters, it is well to cut off the lower half with a pair of scissors.

PLANTING.

“The first necessary condition which land intended for a coffee grove must have is that it be protected from the full force of the constant and tempestuous winds; thus ravines, points protected by a mountain or masses of vegetation, those exposed to the south, etc., possess these conditions. The land must also be sloping or high, so that the rains shall never form pools or mud holes.

“The preparation of the land consists in the labors necessary to pulverize the ground, turn the earth over, thoroughly cleaning it of roots, stones, etc., and making the holes which are to receive the young plants.

“The planting or setting out of the plants is done in the following manner:

“On the land plowed and cleaned equidistant lines are marked out, $2\frac{1}{2}$ meters from each other, and along this line, at intervals of $2\frac{1}{2}$ meters, holes are dug 45 centimeters long, 45 centimeters wide, and 45 centimeters deep. The superficial earth is placed to the right of the hole, and the lower earth, or subsoil, to the left, the latter being thoroughly mixed with a kilogram of barnyard manure.

“Eight days after the holes have been dug the plant is set out, being brought from the seed bed in baskets, the roots wrapped in bark and banana leaves and covered with damp coffee sacking, and then the laborers proceed to set out the plants. One man takes the plant and places it in the hole, throwing in first the earth on the right-hand side of the hole—that is, that portion of earth taken from the surface, which, being richer, is best to place next to the roots—and then the hole is filled with the remaining fertilized earth, tramping it down in the hole in order to make it firm.

“Three or four months after the first planting it is necessary to replant—that is, to set out trees in those holes in which the first plantings did not live—taking care that the new trees have the same size as the others in order that the entire grove may develop and grow evenly.

WORKINGS.

“The coffee groves situated on level lands, or those but slightly inclined and in situations which permit the employment of oxen, ought to be worked with the plow, giving it two plowings a year, the first after the replanting and six months later the second, selecting such times for this operation as will find the soil fresh and moist.

“If, owing to the condition of the ground or on account of its inclination the plow can not be used, the coffee grove must be worked by

hand, and the hoe employed for this purpose should penetrate 30 centimeters into the ground; and as this work is expensive, it is done but once a year, in the month of December.

PRUNING.

“The coffee, like all trees intended to bear fruit, requires pruning. If the excessive, badly calculated pruning which has been practiced in Cuba has been prejudicial, the abandonment of these groves to spontaneous development, to which they have been left in Porto Rico and other points, has also worked injury. If we consider the tree as a machine destined to give fruit and produce forced profits, its growth must be regulated and its organs prepared.

“The coffee tree should be pruned from the time it is 3 years old, counting from the time when the first pruning gave shape to the tree. This operation consists in cutting away during the third year the first crosses above the roots in order to commence the formation of a clean, strong, straight trunk. The fourth year, the fourth and even the fifth cross is removed for the purpose of preparing the final and only cross of the tree, which is to serve for the woody branches and for the formation of the top. During the fifth year the center is cut in order to restrain the longitudinal growth of the tree, and leave the cross at the height of a meter and a half, which is most convenient afterwards when gathering the fruit. If the tree should be allowed to grow taller the gathering would be difficult, and if it should have a lesser height it would reduce the body of the tree and diminish the productive zone.

“In addition to the formative prunings which terminate during the fifth or sixth year an annual pruning is necessary, which is intended:

“First. To make the grove render the largest possible amount of fruit; and in order to secure this result it is necessary to cut off the old branches, or those which have exhausted their capacity to bear fruit, in order to give the tree the necessary light and ventilation.

“Second. To suppress the suckers which absorb the sap and give no fruit; to cut the sprouts from the foot of the tree and also from the trunk and those which grow among the branches in unsuitable places; to suppress crooked and badly placed branches, those that may have been broken by storms, in the gathering of the fruit, or those which may have been broken by the excessive weight of the fruit.

“The pruning is done after the harvest has been collected—that is, in the months of December and January—and a saw should be employed for the thick branches, and limbs over an inch and a half in thickness should scarcely ever be cut off. For the slender branches and sprouts, a sharp cutting *machete* should be used, always making clean cuts close to the limb, covering the wound with some sort of grafting wax.

COFFEE PLANTATION IN LARES.

HOEING.

“Hoeing is for the purpose of freeing the ground of pernicious vegetation. In Porto Rico, Cuba, and many other places this operation is usually performed by cutting away the growth with blows of the *machete*.

“The hoeing in the improved cultivation is not performed in this manner, because by the following month, in tropical regions, the pernicious vegetation has again grown up, owing to the climate, temperature, and humidity. The cleaning must be done with a hoe, digging well into the ground and causing the pernicious plants to dry up even to the roots. This is the way to destroy this vegetation in a few years and also benefit the coffee trees and enrich the ground.

“If in the month of January the hoeing or plowing was done, of which mention has already been made, it will not be necessary to weed the ground again until the month of April, when the coffee grove is in full bloom. This work of weeding, in addition to destroying the weeds which absorb the strength of the ground, also loosens the soil which aids the bloom and assists in the development of the fruit. Another weeding, although more superficial, should be given in August in order that the fruit may receive the benefits which the blossoms received as before mentioned, and so be nourished and acquire additional weight.

GATHERING.

“The coffee blooms in February and March and the fruit is gathered in October and November. It can be readily seen how long the tree is engaged in reproduction, and during this time is exposed to rains which soak the pollen of the blossoms and render them sterile, to the winds which shake the fruit, to the sun which dries it up, to the birds, insects, and accidents which destroy the product of the grove.

“The gathering may be performed in the following ways:

1. By hand, gathering the berries one by one, placing them in baskets, sacks, etc.
2. By shaking the tree, causing the ripe fruit to fall by a gentle motion, and then gathering the berries from the ground.
3. By spontaneous falling, waiting until they by natural processes fall to the ground.

“The first process is the one employed in Porto Rico, Cuba, and other places. It is the most reasonable, perfect, and proper, but it is necessary to have command of a sufficient working population, as it calls for numerous hands. Each person can or ought to gather a *fanega*¹ in a day.

¹A *fanega* is about 100 pounds.

COFFEE INDUSTRIES.

“The coffee from the time it is gathered until sent to market goes through eight delicate processes or operations, on which depends the commercial value of the grain.

“1. The most primitive method of hulling consists in putting the coffee into a wooden mortar and with a hard, heavy wooden pestle pound it long enough to loosen the hull of the coffee, green or dry, according to the plan adopted.

“2. The coffee, after being hulled green, remains covered with a mucilage that must be removed, for which purpose the grains are washed in ordinary water.

“3. After the coffee is washed it must be dried, and for this purpose it is spread out on the drier for the time necessary, so that the heat and air may thoroughly dry the grains.

“4. From the warehouses or granaries where the coffee has been hulled the drier or seasoner is taken, which is a large shallow box of wood on stringers placed on supports. These boxes are movable, so they may be run out into the sunshine or returned under roof at night or when it rains.

“5. When the coffee is dry it must be separated from the membranous endocarp or parchment which still covers and protects the grain, and this is so adherent that considerable force is necessary to separate it, and a good degree of skill in the work is needed in order to avoid breaking of the grain.

“6. As the above-described operation leaves the coffee mixed with the film with which it was covered, it is necessary to clean it, and owing to the lightness of the film compared to the grain, wind is used to make the separation, and it is therefore made to fall in a shower from a certain height in some place where there is a good current of air.

“7. Classification is the most tedious and delicate operation, and in Porto Rico is performed by women, who put the coffee out upon the ground or on a table and proceed to classify or select, forming the first class of the sound, large, entire, and clean grains. This is ‘select’ coffee. The second class, called *triache*, is composed of small, dark grains, having been too long in the dryer or taken from the tree before they were fully ripe. The third class is ‘broken’ coffee, which includes all grains that are torn and broken during the various cleaning operations.

“8. After the coffee is classified and selected it is packed in such a manner that it will be protected from exterior influences and causes that might damage or injure it. Wooden boxes, barrels, or sacks are used for this purpose, and are stored in the warehouses until the coffee is sold.

“There are small plantations where the cultivation is both intelligent and intense, which produce 30 quintals and more per *hectare*, but this is exceptional, for there are lands in the same region which scarcely produce one quintal. As an average crop, taken from the different classes of land, and taking into account also the variations that occur from year to year, a production of from 10 to 14 quintals per *hectare* may be counted on as the result of fairly intelligent cultivation.”

Report of Señor M. BADRENA.

HISTORY.

“It is unquestionable that the cultivation of coffee in the island of Porto Rico was started by emigrants from the island of Haiti, situated westerly of Porto Rico. The insurrection of the black element against the white decided most of the latter to quit the French side of that island and seek refuge in Porto Rico, not only on account of the fertility of the soil, but also because of the good nature of the natives. The many families of French descent which reside in the coffee districts confirm my opinion about this particular.

PROGRESS.

“Progress in cultivation was necessarily slow, as the plant requires ten years for full development, and markets were also to be found. Up to the year 1876, planters had no inducement to extend the cultivation; the prices left no margin of profit, and the augmentation in the crops came only from natural development and some work done indifferently. Coffee was then considered of little consequence in the future of Porto Rico. Up to that time our markets were limited to ports of the Mediterranean Sea, Italy ranging the first. Some was exported also to Germany and France; very little to other markets. All at once the United States of America opened their markets to free coffee, and a jump of from \$12 to \$19 soon occurred; then another jump and the price went up to \$29.30 per hundredweight, and I say dollars because at that time our exchange was below par. As mentioned before, this happened in the year 1876, and many were the cargoes that left our shores for the United States, sailing ships being the only vessels obtainable. Unfortunately, no attention was paid to the quality shipped, and as we can not compete with Brazilian coffee on account of its relative cheapness, the field in the United States remained for Brazil. Later the attention of many was called to coffee growing; there was a good margin in it then, and more care in the manipulation of the bean brought to us the highest prices and the best markets of Europe. Spain and Cuba consumed the poorest qualities.”

HARD TIMES.

“Not all of the planters prospered, however, during the long period of good prices. Excessive expenditures, unnecessary expansion in buying new lands, money borrowed at high interest, and other causes, principally the changing from the gold basis to silver, which apparently, but only apparently, favored their interests, resulted in bad times for the planters, who found themselves involved in debt.

“The war came; burning of plantations was of daily occurrence, the demand from Spain and Cuba was annulled, and the price was lower than could be remembered in a generation. Hopes, however, were bright for a good crop and good prices this year, but the hurricane of the 8th of August brought the final collapse. Much more can be said, but the above is sufficient in general terms to bring the attention of the Government to the present condition of the coffee interests.

CULTIVATION SEEDING.

“The old method was simple enough and consisted in breaking up soil and planting the berries after they were deprived of their soft cover or pulp. In this way a considerable quantity of small plants, as many as 15,000 to 16,000 per *cuerda*,¹ were obtained. When the plants were 3 years old they were removed or transplanted. Cost per *cuerda*, \$15, United States currency. According to the modern method, the soil is prepared as above. The sprouts which grow near and around the old trees are carefully gathered and transplanted in holes of about 10 to 12 centimeters, placed 1 square foot from each other. In this way from 5,000 to 6,000 plants are obtained in good condition every year from each *cuerda*, and the cost is \$16, United States currency. The young plants are invariably removed to places where the shade and consequent moisture of large trees favor their growth. It is a fact that without this sort of protection the shrubs will not thrive. Thus every care is taken in the selection of the best shade, as the prospect of the future coffee-bearing tree largely depends on that. The coffee tree is completely developed and producing after seven years if the conditions under which the growth has been perfected have been favorable. Otherwise it will need ten years, and the product will never compete with that of a good sound tree. The cost of one *cuerda* of good coffee up to the date of production will average \$180, United States currency.

PRODUCE.

“When the tree is four years old it will not produce sufficient to cover expenses, and if the soil is not of the best quality the conditions will be the same after five or six years. In such districts of this department (Mayaguez) as Las Marias and Maricoa, the produce of 1 *cuerda*

¹A *cuerda* is equal to 1.008 acres.

will range from 200 to 1,200 pounds. A fair average will give for every *cuerda* 400 pounds. The topographical conditions of the coffee-growing districts are such, and the hills so steep, that the only agricultural implement that can be used with effect is the common *machete*, or chopping knife. It is used both for cleaning the ground and for making the holes.

“During the months of March and April the trees are in full blossom. The flowering season covers two months; the flowers begin to show early in March, and in April the force of the florescence is complete. If March turns out to be a rainy month, most of the flowers are lost and the crop is a tardy one. If the rains in April are heavy and persistent, the chances are that the flowers will soon rot and fall to the ground and the crop be a poor one.

GATHERING.

“The gathering of the ripe berries is commenced late in July or early in August, and by the end of December all the crop is in. The beans are gathered one by one by hand, taking care to leave on the tree the green berries and to preserve the branches from injury. The result of a day’s gathering when delivered, is passed through a cylindrical tube wheel, which takes away the soft part of the berry, and when free of this, the berries are thrown in a water tank, built of solid brick, in which they are left from eight to twelve hours, until fermentation sets in and the viscosity around the shelly part of the bean is washed away. The process is helped by moving the mass two times with a rake, putting in fresh water, and then taking it out.

DRYING.

“The process of drying by the heat of the sun will take about six days. The chances are, however, that more days are necessary, as the gathering is effected during the rainy season. In some cases twenty days are required. The way that the drying is effected is by spreading the beans on a *glacis*, a large square place built of brick and the best cement, a few inches above the ground, and where the beans receive the direct rays of the sun. A new device is large boxes, a few inches deep, which slide in and out of small wooden receptacles.

“There is also a system of drying by steam. It consists of a revolving drum through which a column of hot air is forced by steam pressure, the drum containing a certain quantity of beans, and the operation is concluded in twenty-four hours. The cost of this apparatus prevents the use of it by the general planters. Its name is *secadora*. The result is advantageous, both as regards quality and cheapness, the cost for drying a hundredweight being only a fourth that of the common process.

“Once the bean is well dried it is taken to the *tahona*, or coffee mill,

which is made of very hard wood, in the shape of a double circle, within which one or two wheels run at high speed; the wheels are also constructed of the heaviest wood and generally covered with a sheet of white metal. The pressure of the wheel over the beans removes the shell. To every mill a coffee fan is attached, which blows off the dust as the stream of beans comes out of the mill. The produce is again placed in the mill for the last stage of the process, the polishing of the bean. This is obtained by friction of the beans against each other, and of all against the revolving wheel.

“When the coffee is intended for shipment to the Mediterranean ports, then some chemical is added which imparts to the bean a beautiful bluish tint. Common blueing is mostly used for the purpose.

SORTING.

“Then the produce is ready for the market if a general good quality is required, but in some plantations the process is not completed before the beans are passed through a mechanical device called *separadora*. It is a large wire cylinder through which the beans run full length, and naturally fall, according to size, into so many departments. To produce what is called in the market ‘picked plantation,’ the picking is done by hand by expert women, bean by bean. Two hundred pounds a day is the average work of an expert *trilladora*; 30 cents, Porto Rico, are paid for every 100 pounds.

COST AND SHIPMENT.

“The total cost of a hundredweight of coffee ready for market, including expenses for cultivation, is from \$10 to \$12 Porto Rican money, equal to \$6 to \$7.20 United States currency. The produce is shipped in bags, containing each from 85 to 100 kilograms.”

On June 8, 1768, the King issued a royal *cedula* giving to Porto Rico a project for the cultivation of coffee and relieving or exempting the growers from the payment of any taxes or charges for a period of five years. In 1770 the island produced 29,121 *arrobas*¹ of coffee, and, according to the report of Governor O'Reilly, in 1776 the production amounted to 45,049 *arrobas* of coffee. Since then the production, according to Señor Coll y Toste, civil secretary of Porto Rico, has been as follows, viz:

Year.	Pounds.	Value.
		<i>Pesos.</i>
1850	11, 783, 684	707, 021. 04
1860	15, 924, 524	955, 471. 44
1870	17, 416, 762	1, 045, 005. 70
1880	48, 032, 296	3, 077, 304. 00
1890	43, 822, 794	5, 577, 166. 56
1897	51, 710, 997	12, 222, 599. 48

¹ An *arroba* is 25 pounds English.

The crop of 1898, which promised to be very large, was practically destroyed by the hurricane of August 8.

The quality of the Porto Rican coffee is excellent, and the principal markets have been Cuba and Spain, but very little having been imported into the United States, where it is not well known. Under favorable conditions the coffee crop of Porto Rico is easily worth from \$6,000,000 to \$10,000,000.

SUGAR.

Report of Señor RICARDO HERNANDEZ.

“The sugar cane was introduced into the island of Cuba in 1548, and was sown on the banks of the Toa River, where a plantation was established with hydraulic apparatus. The sugar cane is a perennial plant, whose maturity is retarded in proportion to its approximation to the extreme limits of its geographic area; in the tropical region it may reach maturity in one year, but circumstances of an economic character in its cultivation generally retard it from 12 to 20 months; outside of the Tropics, where winter is felt, cane suspends its vegetation temporarily and takes two years or more to reach maturity.

“The root of the cane is fibrous, rough, crinated, and entwines the joint which contains the germinal point of the stem; the thickness is from 1 to 5 millimeters, and the length from 50 to 80 centimeters, the number of roots varying with the age of the plant and the character of the ground; they sink to a depth of from 20 to 50 centimeters.

“Every cane stalk with a germinal point which is planted produces first a shoot with the roots corresponding to the joint from which the sprouts spring; these sprouts produce afterwards others which throw out roots at their respective joints in such manner that the root of the cane becomes a stalk or bunch composed of the collection of threads attached to the canes which have grown.

“After the stalk has been dug up, and the canes have been separated with their respective roots, and planted separately, they grow and thrive in the same manner as if they had been joined to the mother bunch.

“Sugar cane has such a propensity for throwing out roots that it even issues them at the joints around which dry leaves are wrapped.

“The stalk is a solid cane containing a longitudinal vascular pith, or tissue, straight and smooth, the epidermis of which in some varieties is covered with a species of varnish or cereous matter called cerosin. The color varies from a yellowish white to a deep yellow, and from a wine red to violet, there being some varieties which are striped with violet and yellow.

“It reaches a height of 3 to 4 meters, and a diameter of 4 centimeters on an average, but there are some specimens of twice this thickness, and also one-half of the dimensions indicated, depending principally on the ground in which the plant thrives.

“The stalk is apparently divided by annular depressions, situated at a distance of 5 to 20 centimeters from each other according to the ground, which are called the joints, being formed by crossed ramifications of the vascular longitudinal pith which forms the interior matter of the stalk.

“Every joint is provided with a fertile bud which has such vitality that its contact with damp air is sufficient for it to sprout, and afterwards 10, 20 to 60, or more canes grow from this single bud constituting the stalk or bunch.”

SUITABLE CLIMATE.

“The geographical area of the sugar cane is bounded on the north by a line which, starting from the center of the state of Louisiana in the United States toward the thirty-fifth degree of latitude, continues along the coast of Andalusia, thence to the coast of Greece, crossing southern Asia and continuing as high as Pekin, being lost finally in the East; and is bounded on the south by the heights of Brazil, including all of Africa, and continuing to Oceanica, touching the north coast of Australia.

“In such a zone, which includes the most important islands of the planet, and the most varied climates, it may be understood that the sugar cane is obliged to suffer meteorological accidents and phenomena very distinct and varied. The most essential factor in the life of the cane is heat, and in proportion to the fall of the thermometer in the temperate zones the period of vegetation is lengthened, or, what is the same, maturity is retarded, it being possible to make the following scale:

“In countries the average temperature of which is 15 degrees centigrade in the sun, it takes the sugar cane twenty-four months to reach maturity; in countries where said temperature is 19 degrees in the sun, sixteen months; 23 degrees, fourteen months; 25 degrees, twelve months.

“When the average temperature is more than 25 degrees, as is the case in Porto Rico, then it is possible for the cane to reach maturity in from nine to ten months, provided there is sufficient humidity and it is planted in a fertile soil. In climates having a low temperature, where frosts occur, especially in the springtime, the production of cane is not very remunerative, as it generally freezes; such is the case in Spain when it is attempted to cultivate sugar cane beyond the zone which we indicated in mentioning its geographical area.

“At altitudes of more than 2,500 meters sugar cane is not produced well, the fall of temperature being fatal.”

SUITABLE SOIL.

“There are two circumstances which determine the value of lands for sugar cane: Their situation and their composition.

CLEARING A CANE FIELD.

“Rough lands, which are worked with difficulty and which are drained by evaporation and filtration with rapidity, are not good for this character of cultivation; and lands situated in ravines, without any drainage, which become flooded frequently, are also bad for cane.

“On the other hand, plain coast lands, cleared, which receive rains or irrigation and retain humidity some time without becoming swamped, are good for this plant; these lands not situated high above the level of the sea, near the coasts, which are flooded by large rivers in extraordinary freshets, but which on account of their natural location and great depth are quickly drained, receive the name of *tierras de vega*, and are those used for the cultivation of sugar cane everywhere. These lands in general are alluvial lands and are very rich in fertilizing elements.

“Far from the coasts, in the interior of many countries and at altitudes of 2,500 meters above the level of the sea, there are valleys, plains, and plateaus, which also have some merits for the cultivation of sugar cane, such as the *tierras de vega*, or meadow lands, which are considered the best, the reason being that the lands of the tables and valleys are formed by transportation and carriage.

“The physical composition of the cane lands is very variable; but in alluvial lands it is produced very well, because being relatively a surface plant it does not sink to a great depth, and therefore in other lands it would not secure sufficient space and material, which is only obtained in nutritious or very well cultivated lands.”

TIME OF SOWING.

“In the tropical zone, where the temperature is nearly constant during the entire year, the seeds and stalks of the plant may be placed in the earth at any season, with the assurance that in a few days they will sprout in order to fulfill the laws of their destiny in nature. They will mature and die, leaving at the foot numerous ratoons.

“This is the physiological life of the plants which is assisted by nature, giving them every year greater support for their existence, and thus we see the luxurious and exuberant vegetation of the plants which are left to themselves; but this spontaneous development of vegetation is modified by submitting it to rules somewhat fixed when cultivation is in question; when the plants are to fulfill economic functions, then their entire life is subjected to the satisfaction of our requirements; they are planted when it is convenient, and they are torn up when their fruit is in sufficient quantity and of the quality desired for the market.

“This is one of the reasons why it is not immaterial, in tropical vegetation, when the plantings are made; these being annual plants they must, like rice, pass through periods of heavy rains in the same way as tobacco has to have a dry season, and corn a happy medium, etc.

It is clear that in regions of an irregular climate, and among cultivators who do not observe these laws of the plants, the success of the crops is questionable.

“In so far as the planting of sugar cane is concerned, let us give it a full study, discussing the nature of the plant, the character of the climate, the practices observed in different countries, and the reciprocal relations between these elements, in order to deduce the laws which may serve as a guide to the farmers for the purpose of fixing the season for planting their cane.

“Being protected by the good climate, it appears that among the cultivators of sugar cane, in Porto Rico as in other countries, there is no fixed season for making the plantings, although in all parts there is a preferred period which practice has shown in each locality to be the best, submitting them thus by conviction to the law of relation between the character of the climate and the economic mission of the plant.

“We state below what seasons are observed for the plantings of sugar cane in Porto Rico:

“*Large cultivations.*—Second half of September, and all of October, November, and December; first half of January. It is cut down in from 14 to 18 months.

“*Smaller cultivations.*—Second half of January, all of February and March, first half of April, being cut down in from 12 to 14 months.

“*Spring.*—Second half of April, May, first half of June; 12 months.

“*Late spring.*—First half of June, and all of July and August, first half of September; from 12 to 20 months.

“In Porto Rico the general planting is that of large cultivation, but some farmers, either because they have hopes of the other plantings, because they have lands which are worked and irrigated, or because they have more than time and people enough, plant also the small cultivation and spring cultivation; on the other hand the late spring cultivation is hardly used by anyone.”

REPRODUCTION OF SUGAR CANE.

“The sugar cane is not reproduced by seeds. Its flowers are sterile, and whatever may be the cause, we know that all attempts made to secure the fecundity of the flowers have been in vain, and the experiments we have personally made for the same purpose have had the same negative results.

“There is no way of avoiding it. We are obliged to deprive ourselves of the advantages we would secure if fertile seeds could be obtained.

“Sugar cane not having a natural reproduction, artificial propagation must be used in its cultivation, by means of the germinating points located in every joint.

CLEARING A CANE FIELD WITH HARROW.

“The cane is cut into various stalks of 20 to 40 centimeters in length, having 1, 2, 3, or more germs. All the germs contained in the body of the cane may also be used for propagation, although in cultivation those situated at the base are thrown out. Near the joint of each one there grows a shoot, which is an exact reproduction or continuation of the mother plant. All the germs have a similar virtue and faculty and the same power to germinate. In the cane region the date of the opening of the germs varies; in fact, the entire body of the cane does not complete its development or reach its maturity at the same time in the same degree, and neither have all the germs been able to complete their development at the same time. Sugar cane, when it has reached maturity—that is, when it has arrived at the time for cutting—may be divided into two regions of different degrees of maturity and saccharine richness, the stem and the cane top, the latter being formed by the last three or four joints of the point of the same.”

PREPARATION OF THE GROUND.

“We will not speak of virgin lands which require clearing, nor of those which require drainage, or which have never been subjected to cultivation and require careful preparation for their cultivation, which special information is included in treatises on general agriculture.

“The preparation of the lands which interest us is that of the special lands for sugar cane, which takes place every time a planting is made or the cane field is renewed.

“As the lands devoted to sugar cane cultivation are generally plains, low and near the coast, etc., and are generally moist and frequently flooded by the freshets of rivers, or irrigated by the rains, without the waters having a natural and rapid outlet, they require special drainage work, which constitutes the technical part of the preparation of these lands.

“If the lands are high and sloping, their preparation is much simpler, as they do not require draining.

“No matter what may be the land to be prepared, if it has been abandoned for some time to spontaneous vegetation, the first work to be done is to cut down to the level of the ground with the *machete* all plants and weeds in the way of the plow. These plants, which are sometimes heavy and abundant in view of the exuberant vegetation of the country where sweet sugar cane grows, are gathered at several points on the ground, and when dry are burned, the ashes being scattered over the same.

“After the ground has been thus cleaned, it is divided by means of marks and pickets into square patches, which, when permitted by the topography and nature of the ground, must have an area of 100 square meters. These patches are separated from each other by means

of roads 4 meters wide, for the use of the wagons and other service of the plantation.

“After the patches have been marked off, the ground is plowed over, where this can be done, to a depth permitted by the character of the ground; sometimes in very deep and loose ground, such as good meadow lands, a board plow is used of a large size, drawn by three yoke of oxen, which plows to a depth of 60 centimeters; at other times the ground only allows the use of a small plow which penetrates to a depth of 20 centimeters; a hard subsoil renders the work more difficult.

“This first plowing is for the purpose of breaking the ground, and does not penetrate to a great depth, the hardness of the ground making it inadvisable.

“After fifteen or twenty days have passed, if the weather does not prevent it, the ground is plowed for the second time to the same or to a greater depth than the first, and crossing it at right angles; and after another similar period, a third plowing takes place, the furrows being in an oblique direction to the last two, in order that the plow shall not pass twice through the same furrow.

“After each plowing it is advisable to make use of an iron harrow.

“After the land has been cleaned, marked off, and plowed, the furrowing is begun, for which purpose, with a double plow and following the direction most convenient within the fields, furrows are made as deep as possible, parallel and at a distance of 3 meters from each other. If an ordinary plow is used, it will be necessary to go over the furrow twice in order that a pile of earth may be thrown to each side.

“The purpose of these furrows is to drain the plantation. Afterwards the laborers enter with rakes in order to prepare the banks, flattening out the ground taken from the furrows and even taking more from the same, thus placing the ground between the furrows higher and forming a bank on which planting is afterwards done in straight rows. The space between two lines of canes is called a street.

“After the furrows and banks have been made, ditches are dug for the drainage of the land; these are larger than the furrows, the waters of which they receive, and are cut following the slope of the land.

“In general, this is sufficient; but there are cases where it is advisable to make larger furrows, the final receivers of the water from the furrows, and from the ditches.

“It will be understood that after the land has been prepared, and in marking it off into lots, the direction of the furrows, ditches, etc., must be very carefully considered.

“On high land, hilly, sloping, dry land, and on land where excessive moisture is not to be had, the work is simplified, the preparation being reduced to the clearing and plowing necessary, which do not require

SUGAR PLANTATION IN ARECIBO.

the special and difficult work of drainage. When land subject to irrigation is in question, the preparation is the ordinary and current one for all kinds of plantations. The topography of the land will show the system to be adopted, and the canals and irrigating ditches which go around the high portions of the land, by means of locks or other means, give the water to the cane, the planting of which may take up different forms.

“Sometimes it becomes necessary to harmonize the drainage and irrigation of the plantation, which is very easily done by means of furrows, which conduct the water during the irrigation to the other furrows and ditches or banks.

“The vegetation of sweet cane is so exuberant that it is sufficient to throw upon the ground a stalk containing knots having sufficient eyes or buds, for it to grow and produce as good a cane as the richness of the ground will permit. It will be understood that there is an infinite variety of ways of planting the cane, from simply throwing it upon the ground or adopting the latest methods suggested by science.

“We show below the most ordinary and usual manner of planting the sugar cane in Porto Rico.

“*Spade planting.*—Is adopted when the land is hard to work, or when it is sandy or compact, or when the soil is very deep, and when replantings are made, and on dry, cleared land.

“*Holes or pits.*—On ground having a deep soil, no irrigation, where the planting is to last several years, and where there are sufficient laborers.

“*On banks.*—On land having a shallow soil, with much moisture, no drainage; on plantations on a small scale, and where a sufficient number of workmen can be procured.

“I will state here what each kind of planting of sugar cane consists of.

SPADE PLANTING.

“This planting requires a small removal of earth and consists in digging rectangular holes of more or less depth, according to the moisture and thickness of the vegetable coat.

“The holes are dug in straight lines and at equal distances from each other; in each hole two, three, or even four stalks are placed, which are laid at the bottom of the hole, or against one of the sides thereof, in an almost vertical position for the purpose of throwing off the humidity and for protection against the ravages of insects. The stalks are covered with a coat of earth of 1 inch thickness.”

PLANTING IN HOLES OR PITS.

“After the ground has been cleared and prepared with the furrows and ditches necessary, the places for the holes are indicated by means of pegs, and the laborers, with spades, each take one line, digging holes

which are generally square and of a depth varying between 15 and 30 centimeters, the greater depth being given to dry land or to land swept by winds. The workmen in digging the holes place the earth dug up at their feet near the edge of the hole, thus making small hills of from 35 to 40 centimeters in height. Sometimes this earth is thrown off to the right of the holes, making a continuous hill in the center of the street remaining between the holes. These hills receive the name of banks, which are very different, however, from those made between furrows and on which planting is done.

“In each hole between two and four cuttings are placed. The latter number in general is too high and is only used when, on account of the bad character of the cane which can be procured and the poverty of the ground, the ravages of insects are feared, or other causes which might destroy the shoots, by which the expense of replanting is avoided.

“The cane stalks placed in the holes may be placed in different positions; they may be laid down on the bottom or on the sides of the holes. In the first case they may be placed parallel to each other and at equal distances, or some parallel and others crossing the same, or leaning against the corners of the hole and allowing them to meet in the center of the bottom, or crossing the corners and leaving an open space in the bottom, etc. In the second case all the stalks are placed against the same side, or half on one side and half on the other, or, finally, one on each side.

“Before placing the stalks in the hole, it is customary to throw some loose earth at the bottom to serve as a bed. After the stalks have been placed in position, they are covered with earth, taken from the hills adjacent thereto, but not more than 1 inch in thickness.

“This is the general character of the planting done in Porto Rico, where the land is prepared in an excellent manner; but as it is never fertilized nor irrigated, the returns are very meager.”

PLANTING ON BANKS.

“This kind of planting is convenient or advisable in the cases we have mentioned in the classification above, and consists in laying off the ground and raising banks over the ordinary level of the ground, taking ground from the furrows which are to separate the same. The planting is made on these banks, according to the rules mentioned, in such manner that each bank does not contain more than two lines of canes.

“The manner of preparing the land is the same as we have mentioned in speaking of the preparation thereof, and is adopted in many plantations on a small scale, as when the cane is to be sold in towns for chewing or for the purpose of making beverages.

“Afterwards the cane requires the following care:

SUGAR MILL AND PLANTATION IN MANATI (INJENIO).

REPLANTING.

“Not all the stalks having germs which are placed in the ground give good results, sometimes on account of a mistake in the character of the planting adopted, or on account of the bad condition of the shoots, or of lack of humidity in the ground, which paralyzes the progress of the growth, or sometimes on account of an excessive degree of moisture which causes the roots to rot, and finally by reason of other accidents, such as the ravages of animals, insects, etc., to such an extent that there often remain in the plantation empty spaces without any cane whatsoever.

“Whatever be the number of stalks or shoots lost, replanting is necessary; to what extent may be seen after the planting begins to spring up.

“The stalks used in the replanting are to be of proper condition and have the germs perfectly developed, in order that they may soon germinate and reach the height of the preceding cane. Should there be a great difference between the development of one and the other, when the cutting period arrives, the cane will have a different state of maturity, reducing the degree of sugar.

“For replanting, the spade system is generally used. Sometimes, but not very often, new holes have to be dug and the disposition of the ground changed, which will give rise to new expenses.”

WEEDING.

“This operation consists in tearing out of the ground the weeds which grow in the plantation.

“In cane countries spontaneous vegetation is excessive to such an extent that it constitutes the principal enemy of all cultivation, and if it is not frequently and tenaciously combatted, no cultivation of any kind would be possible in these countries.

“Generally one month after the cane has sprung up the first weeding must be done, which is done with a hoe or spade, tearing up by the roots the weeds which exist between the lines or in the streets, and with the hands those growing between the cane. The first weeding is sometimes confined to this only, when there is not a sufficient personnel, or when other work is to be done on the plantation.

“The weeds torn up by their roots are gathered together, and after the earth has been shaken from them they are placed on the hills of earth for the purpose of rotting and fertilizing the ground, or to serve as a bed for the cane when it develops and falls.

“The weeding must be repeated at frequent intervals until the cane, when about five or six months old, has grown to a sufficient height to cross and for its foliage to cast a shadow on the ground, after which hardly any weeds grow and injure the cane.

“The number of weedings during this period must not be less than two or more than five, depending on the fecundity of the ground, the character of the climate, the previous condition of the land, the preparatory labors, and even the kind of fertilizer used.

“Thus the rules for weeding are reduced to the following:

“1. To extirpate the roots of weeds with a hoe or by hand, taking care not to injure the roots of the cane.

“2. To deposit the weeds uprooted on the edges, hills, or banks, where they are not in the way and where they can serve as a bed for the cane.

“3. To repeat the operation whenever there is an abundance of weeds covering the soil, or which injure the plantings.”

HILLING.

“This is the operation of covering the foot of the plants with earth.

“The sugar cane, the same as corn, tobacco, and many other plants of active vegetation, has the faculty of throwing out visible roots at the level of the ground. They appear to rise from the ground, and if they were not protected by cultivation their economical rendition would suffer to a high degree.

“According to the class and form of planting adopted, the hilling is done before or after the same. In plantings with buds in the air the hilling must be done within thirty days after the shoots have sprung up; in deeper plantings it is done at a later period.

“This operation is done from one to three times, according to circumstances, because if the lack of earth at the foot of the cane is great, an excess thereof is injurious. Its object is to give a greater basis to the plant from which to derive nutrition; it favors the development of the shoots and prepares the bunch for the subsequent crops.

“This explains the necessity of hilling, which should not be very great, as several coats of earth would prevent the germs of the shoots at a certain depth from germinating on account of a lack of air or of energy to surmount the obstacle, thus endangering the subsequent crops.

“Therefore a little hilling is necessary and sufficient; too much is expensive and injurious for the future life of the cane field.”

BREAKING OFF SUCKERS OR SHOOTS.

“Cane planted under normal conditions is all the time producing shoots, and if this were permitted it is understood that when the cutting period arrives there would be cane of all kinds in the plantation, some ripe and others half ripe, and it would require a considerable expense to separate it. If not separated they would go together to the mill, and while the ripe cane would give a sirup heavily charged with sugar, the green cane would give it charged with glucose, thus giving together a sirup having a reduced amount of sugar, requiring more combustion to secure evaporation, and rendering less sugar.

SUGAR MILL IN MANATI.

“Therefore, when the third or fourth weeding takes place, the shoots which have not reached the proper stage are torn out, especially those which it is known will not reach a mature state at the time for cutting, and which if left would deprive the principal plants of nutritious elements. This operation is done by hand, and a slight effort upward is sufficient to remove them.”

STRIPPING OFF LEAVES.

“As the sugar cane grows and approaches maturity, its internodes develop in proportion, reaching such a stage that they shed the protecting leaves that envelop them.

“The spontaneous shedding of leaves begins on the lowest internode, and continues ascending, in proportion as the plant reaches maturity, until the foliage is reduced to the cane top, which is also shed after blooming, when the plant dies, first in the economical order and then in the physiological.

“In stripping the leaves it may easily be ascertained when the operation is to take place. A leaf which is still green does not detach itself easily and must not be touched until it is dry.

“The first stripping takes place after four months, and from this time until the cutting the operation must be repeated two or three times.

“The stripping must not be made during very warm weather and intense sun, because it somewhat dries the tender portions of the plants.

“The stripping, besides avoiding the injuries which we have mentioned and increasing the degree of sweetness of the juice of the cane, has also the object of retarding the blooming.”

CUTTING THE CANE.

“The sugar cane has a critical moment of maturity which it is necessary to take advantage of for cutting. Maturity is reached when the cane blooms, or ceases to grow and develop. At this period the cane contains the largest amount possible of sugar.

“The cane, before reaching maturity, in its green condition, has not had time fully to elaborate its juices—that is to say, to transform the glucose into sucrose—and the cutting, therefore, at this stage would be disastrous, because as much sugar would be lost as there is glucose in the cane, and furthermore rendering the operation of elaborating much more difficult.

“On the other hand, if maturity is reached—a long period of time should be allowed to elapse—other evils would originate. Rains on ripe cane make it green again, as is the case with indigo and other industrial plants. The juice of the cane is reduced; the saccharine matter turns into glucose. In addition, the ripe cane has fulfilled its mission, and from this moment it begins to die. It leans over until it touches the ground, roots sprouting from the internodes which touch the

ground, and the respective germs develop shoots, all of them developing at the expense of the juice of the cane—that is, from the saccharine, which diminishes and becomes transformed into glucose until it is exhausted. On the other hand, old cane becomes hard, increasing the cost of the cutting and rendering the operation of grinding much more difficult. From all this it may be seen that green cane, as well as over-ripe cane, can not well be used for industrial purposes.

“The age of the cane and the condition of the weather determine the time for cutting; when these two factors do not concur with each other, the right moment has not arrived.

“Cane ready for cutting changes color and becomes lighter; the leaves, excepting those of the cane top, are dry, the stalk becomes brilliant or shiny. The characteristic signs of the cane ready for cutting when once seen can never be mistaken.

“I state below, according to the analysis made by M. Deitell at the agricultural station on Reunion Island, the composition of cane at the different stages of maturity:

Age of cane in months.	Per cent of crystallizable sugar.	Per cent of not crystallizable sugar.
10	11.21	3.01
13	12.44	2.55
15	15.15	1.05
16	16.85	0.36
17	20.65	0.23
22	21.03	0.07

The following statement of cost of planting and caring for 1 *cuerda* of sugar cane from date of planting to time of cutting was prepared by Señor Badrena, supervisor of the department of Mayaguez:

“When the soil is sandy and loose it will need—

Plowing three times, cost	\$7.50
Ditching	6.00
Holes for planting the shoots, 2,500 to every <i>cuerda</i>	5.00
Cost of shoots, 7,500 to every <i>cuerda</i>	9.37
Planting the same	3.12
Cleaning the ground from weeds four times during the growth	8.00
Clearing the plant from dry leaves	2.00

Total cost of 1 *cuerda*:

Porto Rican currency	\$40.99
United States currency	24.59

“When the soil is hard it will need—

Plowing four times, cost	\$12.00
Making the ditches	8.75
Making the holes	7.50
Planting the shoots	13.12

RUINS OF SUGAR MILL DESTROYED BY HURRICANE OF AUGUST 8, 1899. ANASCO.

“When the soil is hard it will need—

Cleaning the ground from weeds	\$10.00
Clearing the plant from dry leaves.....	2.00

Total cost of 1 *cuerda*:

Porto Rican currency.....	53.37
United States currency.....	31.02

Cutting 1 *cuerda* of cane costs \$4=\$2.40 United States currency.

Average cost of manufacturing 1 hogshead of sugar, 10 *pesos*; equal to \$6 United States currency.

Net weight of 1 hogshead of sugar in shipping condition is 1,200 pounds.

Tare that is usually deducted from gross weight of cask, 12 per cent.

Loss of weight during transportation to ports of the United States by steamships, 6 per cent; by sail, 10 to 12 per cent.

Cost of putting 1 hogshead on board ship, 25 cents, Porto Rico.

Bonofication, usually paid to planters for lighterage from the plantation to market, \$1, or \$0.60 United States currency, per cask.”

According to Fray Iñigo Abbad and Col. George D. Flinter, of the general staff of the Spanish army, and for many years a resident of Porto Rico, the production of sugar in 1775 was 273,750 pounds; in 1803, 176,344 pounds; in 1810, 2,544,923 pounds; in 1828, 12,251,662 pounds, and in 1830, 31,514,388 pounds. According to Señor Coll y Toste, the production for and since 1850 was as follows, viz:

Year.	Quantity.	Value.
	<i>Pounds.</i>	<i>Pesos.</i>
1850	112,129,432	3,910,167.38
1860	116,015,181	3,480,455.33
1870	191,649,670	5,749,492.10
1880	221,220,894	3,016,948.55
1890	123,021,904	3,782,465.50
1897	126,827,472	4,007,992.08
1899	¹ 132,000,000	

¹ Estimated.

As in Cuba, the tendency is toward large plantations, with central mills for grinding. Comparatively few of the sugar estates are provided with steam vacuum machinery for making sugar, and nearly one-half of the cane-grinding machines are worked by oxen. The hurricane of August 8, 1899, damaged the sugar mills considerably, and the financial straits of the planters have made it impossible to restore the plants. Larger plantations or *colonias*, improved methods of cultivation, and central mills with improved machinery will in time no doubt add enormously to the output of sugar.

TOBACCO.

Report by Señor PLANELLA.

“It may be said that the cultivation of tobacco prior to the year 1870 was limited in some parts of this island to small plantings for domestic consumption in cigarettes, cigars, and fine cut tobacco.

“In the year above mentioned exportation to Cuba commenced and tobacco growing received a great stimulus and development.

“The increase of tobacco factories, which demanded a constant supply of leaf tobacco, suitable for being worked into cigars, had a tendency to increase the cultivation in those localities which were adapted to produce the most select product for the manufacturer.

“The establishment of new factories has made the Porto Rican product known in the various markets of Europe and America. The demand and consumption stimulate the manufacturer to a regular production in those factories which employ the select stock raised in good localities.

“It must be confessed, however, that up to the present time the cultivation of tobacco has not kept pace with the demand of the manufacturer, who is obliged by the demands of his buyers to seek first-class stock which has the quality, flavor, style, and workmanship desired by the consumer. The cultivation of tobacco has responded to none of these demands, because the quality of the tobacco depends more on the land than the cultivation, which has not produced a marked improvement in the product.

“A careful selection of seed has not been made, and to this fact is due the varieties of tobacco cultivated. The grower has given his attention to the raising of plants that produce beautiful leaves that will look well in the market and that have good weight, the only qualities he looks for in order to obtain remuneration for his labor. At the present time, however, the manufacturer requires of the tobacco grower a product that will satisfy the demands of manufacture and also the demand for the product. This advancement in the industry calls for an advance in the cultivation which constitutes a specialty, and has produced among tobacco cultivators a real revolution, destroying known methods in order to establish others which will produce qualities called for both by taste and manufacturing. It is not sufficient any more that the tobacco should have a good flavor and burn well. It must also have a light, clear color, a fine aroma, be elastic both in the leaf and intercostal spaces, which must also present a large surface.

“The grower must have as a principal factor special land, rich in salts of potash, on which to grow the plant under the proper conditions, in order that the tobacco may acquire the aroma, a certain special flavor, richness of nicotine, which should not exceed 2 per cent, and good burning qualities; all these being essentials looked for by the manufacturer and demanded by the consumer. This is the reason why the regions recognized as producers of good tobacco are so appreciated. Cayey, for the quality of tobacco produced, is in Porto Rico, what *Vuelta Abajo* is in Cuba.

“Several varieties of the nicotian plant are cultivated in the country—that called *Guacharo*, which is believed to be a native of

COCOANUT FARM IN MAYAGUEZ.

Venezuela, the *Virginia blanca*, the *Corazon de Vaca*, the *Cubano*, and others. As yet the selection of the variety best suited for the purposes of the manufacturer has not been made. He prefers a leaf with color, elasticity, large intercostal spaces, and small ribs, which are the best for the manufacture of the different kinds of cigars which the consumer demands—essential qualities which oblige the maker to seek the locality productive of good tobacco, indeed the only selection that is now made.

“The cultivation of tobacco presents three principal phases: First, the seed; second, the general cultivation in all its details; third, the cutting and curing of the leaf.

“In order to obtain good seed, as a general rule forest land or that next to rivers is selected. When the land is properly prepared, the seed is irrigated from the 30th of August until the end of September, special attention being given to germination until the plant is sufficiently developed to be transplanted to the field where it is to be cultivated.

“Some months before the seed is sown the land is prepared, the plowing being done in the months of June and July. If the ground is full of weeds, they are turned under, so that as they decay they may serve as a fertilizer. In August the ground is plowed again, and as a final preparation it is harrowed so as to be kept loose. The months of October, November, December, and January are the months in which tobacco is sown, October being the month in which it is most likely to secure good results, because the plants grow during the season of light showers. The hard rains of April injure many leaves.

“Tobacco fields require careful cultivation and constant attention in order to overcome the many insects that attack the plant. The cultivator must persecute them morning, noon, and night.

“The tobacco grower, as the plant develops, separates the leaf from the plant, which should not be done until said plant is three months old. The leaves are cut off with the proper instrument in handfuls, which the laborer places on his arm, in order to deposit them with much care on wooden frames, and carries them to the curing house, where they are placed with the proper spaces between them.

“From 16,000 to 20,000 plants should be set out on each *cuerda* of land.

“The leaves are cured in houses covered in such a manner that the air does not penetrate, and never the rays of the sun nor the rains.

“When the leaf is cured it is taken from the curing house, and after cutting off a small piece of the stem attached it is put through the first ‘sweat,’ or, rather, a slight fermentation.

“When the tobacco is sorted the leaves are united in bunches of 15 or 20, tied together at the base, and this bunch is known as a *manilla*. These *manillas* are then arranged according to classes, forming large

piles, so that they undergo the second fermentation, which should be watched and brought to an end at the proper time. Finally the *manillas* are packed in *yaguas* (palm bark), being in this form ready to be stored in the warehouses.

“The tobacco leaves undergo three fermentations or sweatings in the months of April, June, and August.

“There is much tobacco which, after undergoing the three fermentations, loses its strength and becomes in this manner of poor quality for the manufacture of cigars. In Latin America this is called *tubano*.

“The manufacturer, jealous for the reputation of his factory, always keeps this fact in mind, and therefore it is necessary to have a good knowledge of the place of production and the importance which a good producing zone acquires.

“The tobacco produced on the coast, in forests, and other places, not suited to be made into cigars, is employed in the manufacture of fine cut chewing tobacco. This is prepared in the following manner: A given number of leaves are twisted together, and to this twist is added another equal to the former, and this process is continued until a cord or rope some 80 yards long is produced, which is then rolled like thread on a spool, forming a roll a yard in diameter, covered with banana leaves.

“In order to cut or thread the tobacco, it is moistened with salt water or an infusion of coffee, for the purpose of developing a sufficient quantity of nicotine and acquiring greater strength when it ferments. Many of these rolls are lost after the last sweat, which is in August, owing to the poor quality of the tobacco, which fact the merchant keeps in mind and buys with the proviso that he will pay 10 or more dollars a roll, if in August it should not spoil. After this date the roll is safe and the tobacco improves with age.

“In conclusion, this plant, which gives no element of life to the human organism, is one of those most desired by mankind, and develops an industrial-agricultural movement of such importance that it gives employment to thousands of persons, forming an industry which represents millions of dollars, in which skill and good taste unite in order that the cigar smoker may reduce their products to smoke and ashes, delighting his senses in a grateful and aromatic combustion.”

In remarking on the origin and production of tobacco in Porto Rico Señor Coll y Toste writes:

“Our tobacco is an indigenous plant. The Government originally was opposed to smoking, and there exist two Papal bulls excommunicating any one using it. There exists also a royal *cedula* of 1608, prohibiting the cultivation of tobacco in Porto Rico. In 1634 planting was resumed. According to statistics in 1770, the production of tobacco amounted to 83,651 *arrobas*, and, according to the report of Governor O'Reilly, in 1776 the production amounted only to 28,070

GATHERING COCOANUTS.

arrobas. The planting of tobacco, which began to receive an impetus to such an extent that in 1836 it was exported from the island, afterwards diminished so that importation in large amounts became necessary to meet the local demand."

Production.

Year.	Quantity.	Value.
	<i>Pounds.</i>	<i>Pesos.</i>
1850	2,973,308	118,932.32
1860	2,557,448	95,010.77
1870	5,950,322	238,012.88
1880	12,188,517	831,035.45
1890	3,977,987	589,465.37
1897	6,255,953	1,194,318.30

In this connection, Gen. G. W. Davis, Military Governor of Porto Rico, reports:

"The year 1897 is the last for which statistics have been published. It is noticed as relevant that the records show that the value has remained about the same—i. e., from 19 to 21 *centavos* per pound, since 1892.

"As respects the quality or grade of tobacco there are several kinds, as in many other countries. The cheapest is known locally as *baliche*, which is only marketed in Europe, and is worth from 4 to 4½ *centavos* per pound. The portion so graded is not more than one-fourth or one-third of the total crop. Of the remainder, about 1,000,000 pounds, more or less, is manufactured into cigars and cigarettes, and is consumed locally. The more valuable grades are known to the trade as 'filler and wrapper,' and the aggregate of this grade of a normal crop would reach quite 4,000,000 pounds. In 1897 all this grade of tobacco went to Cuba, and brought, on an average, from 15 to 20 *centavos* per pound. But the prohibitive duty of \$5 per pound on tobacco imported into that island has sealed the door to further business, and as there is no market for it in Europe, and taxes in the United States are all the way from 35 cents to \$1.85, it results that there is no foreign market at all for the better grades.

"When the Cuban tax went into effect last January the fact was at once known, and last spring not more than one-third of a normal crop was planted. Hence there is a comparatively small quantity now in store. This is the surplus of the last two crops, and may reach 1,500,000 pounds, but there are few buyers. Unless the United States or Cuban market is open to Porto Rico, this stock must remain stored until finally worked up here, and future planting must be diminished until supply and local demand adjust themselves. This means the cutting off of a source of revenue that has in the past brought to Porto Rico an annual income of from 500,000 to 1,250,000 *pesos*.

"Were the United States tax abated outright, the production would rapidly increase, and might in two or three years be expected to reach a total of \$5,000,000, for with improved methods of culture and preparation for market it will bring much better prices."

STOCK RAISING.

Classed with agricultural industries is stock raising, an important and remunerative industry. Horses, mules, donkeys, cattle, sheep, goats, and hogs are raised, the number in 1897 being shown in the following table, prepared in the office of the civil secretary, viz:

Cattle of all kinds.	Number of head.	Price per head.	Total price.
		<i>Pesos.</i>	<i>Pesos.</i>
Horses.....	67,751	30	2,032,530
Mules.....	4,467	30	134,010
Donkeys.....	717	30	21,510
Black cattle.....	308,612	20	6,072,240
Sheep.....	2,055	5	10,275
Goats.....	5,779	4	23,116
Swine.....	13,411	5	67,055
Total.....			8,360,736

The following, from the same source, gives the total number of farms, plantations, etc., together with their area, for the year 1897. The agricultural tables will show their present number and area when the census was taken:

Number of estates.....	60,953
Sugar cane.....	<i>cuerdas</i> 61,556
Coffee.....	do. 122,358
Tobacco.....	do. 4,227
Grain.....	do. 93,508
Other cultivation.....	do. 17,176
Pasture.....	do. 1,127,086
Woodland and swamps and barren.....	do. 664,270
Total.....	do. 2,090,181

ROADS, RAILROADS, AND AGRICULTURAL IMPLEMENTS.

Among the great drawbacks to agriculture are the lack of roads and railroads and the inferior agricultural implements in use. With the exception of the military road between San Juan and Ponce, a branch from Cayey to Guayama, the road from Aguadilla to San Sebastian and from the port of Ponce to Adjuntas, there is not a good road in the island.¹ Even those in the immediate vicinity of the cities are in poor condition, and during the rainy season all of them, with the exceptions noted, are almost impassable for vehicles. The total length of all railroads is about 159 miles, all tracks being narrow-gauge, and the rolling stock, roadbeds, etc., very inferior. Facing this page a photograph of a collection of the agricultural implements in ordinary use may be seen. They are of the most primitive kind, and will, no doubt, soon be replaced by something better.

Among other causes which have greatly retarded the agricultural

¹ General Davis is giving this subject special attention, and has expended upward of \$1,000,000 in the repair and construction of roads.

AGRICULTURAL IMPLEMENTS.

ORANGE GROVE IN MAYAGUEZ.

development of Porto Rico, the hurricane must be given a prominent, and, it is feared, a permanent place. Between 1515 and 1899, eighteen hurricanes, more or less disastrous in their effects, have swept over the island. Against this peril the planter, the farmer, the stock raiser, and the rural poor have no possible protection. The last one, which visited the island August 8, 1899, was especially disastrous, the estimated loss, present and prospective, to the coffee industry alone being 25,000,000 *pesos*. A large number of people lost their lives, and 250,000 were thrown on the charity of the Government. For an account of this hurricane and, in fact, of the condition of the island in general, the reader is referred to the voluminous report of General Davis, to which reference has already been made.

DISCUSSION OF THE AGRICULTURAL TABLES.

[See Tables XXXVIII-XLIII.]

The following is a translation of the schedule used by the enumerators in gathering the agricultural data:

SCHEDULE No. 3.—AGRICULTURAL STATISTICS.

Supervisor's district No. _____ District of enumeration No. _____
 Compiled by me on the _____ day of _____, 1899. _____, *Enumerator*.

1. Name of farmer or owner.
2. Residence.
3. Color or race.

NOTE.—State whether white, negro, mixed, Chinese.

4. Porto Rican or Spaniard.

NOTE.—State whether Porto Rican, Spaniard, or citizenship in suspense, according to whether he has taken the oath; if this question relates to a foreigner and is therefore superfluous, write foreigner.

5. Does the farm or plantation belong to the person named or is it leased?
6. Area of the farm or plantation in *caballerias* and *cordeles*.
 Area under cultivation at the present time.
 Area uncultivated at the present time.
7. Approximate area under cultivation prior to 1895.
8. Wooded area. Character of woods, high or low.
9. Distribution of area under cultivation, according to crops:

Crops.	Area in <i>cabal- lerias</i> .	Crops.	Area in <i>cabal- lerias</i> .
Tobacco.....	Cocoa.....
Sugar cane.....	Malangas.....
Rice.....	Oranges.....
Sweet potatoes.....	Corn.....
Potatoes.....	Honey.....
Yams.....	Wax.....
Bananas.....
Cocoanut trees.....
Coffee.....
Onions.....
Pineapples.....

NOTE.—Indicate on blank lines any other crops.

10. Number of cattle on the hoof on the day of enumeration:.

Kind.	Number.	Value, in pesos.	Kind.	Number.	Value, in pesos.
Horses	Bull calves
Mules	Bulls
Asses	Heifers
Swine	Steers
Goats	Cows
Sheep	Yearlings
Poultry
Oxen
Lambs

NOTE.—Indicate on blank lines any other cattle on the hoof.

11. Number of grinders and evaporators on the plantation on this day:

Mills, number. Output, in *arrobas*, of cane per day.

Evaporating apparatus, number. Production, in sacks, per day.

12. Number and capacity of the stills on the plantation:

Number. Capacity, in gallons, per day.

Agriculture is the principal—indeed, almost the sole—occupation of the people of Porto Rico. This fact, which is so plainly shown in the tables of occupations, is further emphasized by the small proportion of urban population. The industries of trade, transportation, and manufactures are of almost trifling importance. In the census no attempt was made to obtain statistics of other branches of industry than agriculture, and the inquiries concerning that industry were purposely made as simple as possible, in the belief that it was better worth while to obtain, in fairly complete form, a few leading facts than to attempt with a probability of failure an exhaustive inquiry into the details of this industry. The inquiries were limited to those relating to areas of farms; to cultivated land and woodland; to the tenure of farms, with the race of the occupant; to the area cultivated in certain leading crops; to a few details regarding the production of sugar and coffee, and to the number and character of live stock. The questions were identical with those asked in Cuba. The results of the inquiries were in most respects more satisfactory than in the larger island, owing to a variety of conditions. The island had been in a state of profound peace under settled conditions. Owing to its comparatively dense population, land values were higher, and, consequently, the limits and areas of farms were better known. For the same reason there was little or no uncertainty as to the character of the tenure. There were practically no squatters in Porto Rico.

Table XXXVIII presents for Porto Rico, for each of its seven departments and for each municipal district, the number of farms, the area included within them, the cultivated area, and the area covered with timber. Throughout this and subsequent tables, and in great part in this discussion, the measure of area which will be used is the Porto Rican *cuerda*, which may be accepted as the equivalent of an acre. Of the total area of Porto Rico—3,606 square miles—2,743 square miles were included within farms. This is 76 per cent, or more than three-

fourths of the area of the island. The area under cultivation was 747 square miles, or not less than 21 per cent of the entire area of the island. These figures are in strong contrast with those for Cuba, of which 29.9 per cent only were included within farms, and only 3 per cent of the area of the island was under cultivation. They approach more nearly the condition of things in the United States, where in 1890, 16 per cent was under cultivation. Yet, considering the density of the rural population, which is far beyond that of any part of the United States, the proportion of cultivated land is small. To illustrate this, consider the case of Illinois, in which the number of rural inhabitants to a square mile was in 1890 but 42, or less than one-fifth as great as in Porto Rico, while more than seven-tenths of its area was under cultivation.

The total number of farms in Porto Rico was 39,021; the total area was 1,757,774 *cuerdas*; the average farm had an area of but 45 *cuerdas*, or acres; the cultivated land comprised 477,987 *cuerdas*, an average to a farm of only 12 *cuerdas*. In the United States in 1890 the average farm contained 137 acres, of which 78 acres were improved. In Cuba the average farm had an area of 142 acres, of which, however, only about 13 acres were under cultivation.

The following table gives for each of the seven departments of the island the total area, the cultivated area, the proportion cultivated, the average size of the farm, and the average number of *cuerdas* under cultivation:

PORTO RICO.

Department.	Total area.	Cultivated area.	Proportion cultivated.	Average size of farm.	Average amount cultivated.
	<i>Sq. miles.</i>	<i>Sq. miles.</i>	<i>Per cent.</i>	<i>Cuerdas.</i>	<i>Cuerdas.</i>
Aguadilla	240	83	35	28	9
Arecibo	621	158	25	50	15
Bayamon	542	68	13	45	8
Guayama	561	78	14	57	13
Humacao	329	49	15	33	10
Mayaguez	395	123	31	36	13
Ponce	821	183	22	53	17
Total	3,606	747	21	45	12

From the above table it appears that there was considerable range among the different departments in the proportional area under cultivation, this being least in Bayamon and largest in Aguadilla, the western departments having the largest proportion of land under cultivation.

The average size of farms ranged from 28 *cuerdas* in Aguadilla to 57 in Guayama, the departments having the largest proportional area under cultivation having, as a rule, the smallest farms.

The distribution of cultivated land is shown upon the map opposite this page. The municipal district has been used as the unit of computation and coloring. The map shows that the western part of the

island was in a much higher state of cultivation than the eastern part, the largest proportion being found at the west end and in the interior of the western half, while the north and south coast strips were less highly cultivated.

FARM TENURE BY RACE.

Table XXXIX shows for Porto Rico and the several departments the number of farms, classified by the race of their occupants and the character of the holdings, whether owned or rented, while the fifth column comprises all classes of mixed occupancy. Each of the above groups is furthermore classified by the size of the cultivated areas of the farms.

Table XL gives the cultivated areas of farms, classified in a similar manner.

From the first of these tables, which classifies the number of farms by tenure and race, it appears that 71 per cent of all farms were owned by whites and 22 per cent were owned by colored, making a total of 93 per cent of the farms of Porto Rico owned by their occupants. Five per cent were rented by whites and 1 per cent by colored, the remainder being mixed tenure. This proportion of owned farms is unusually large. In the United States in 1890 only 72 per cent of the farms were owned, and in but few states was the proportion of owned farms as large as in Porto Rico. The proportion was not only large in the island as a whole, but also in every one of the departments. The following table shows the percentage of farms owned and rented by their occupants in the several departments:

Department.	Farms owned.	Farms rented.
	<i>Per cent.</i>	<i>Per cent.</i>
Aguadilla.....	92	8
Arecibo.....	97	3
Bayamon.....	89	11
Guayama.....	85	15
Humacao.....	70	30
Mayaguez.....	93	7
Ponce.....	96	4

As is seen, the lowest percentage of owned farms was in Humacao, where the proportion of colored was the greatest, but even here seven-tenths of the farms were owned by their occupants. The proportion ranged up from this to 97 per cent, or practically all the farms, in Arecibo, on the northern coast, while in Ponce, Mayaguez, and Aguadilla, also, more than nine-tenths of the farms were owned by their occupants. The proportion of ownership was least in the eastern part of the island and greatest in the western part.

From Table XL it appears that 82 per cent of the cultivated area of Porto Rico was owned by whites, and 7 per cent was rented by whites; 9 per cent was owned by colored, and 1 per cent rented by

colored; while the areas which could not be thrown into either of these classes comprised only 1 per cent. Hence, it appears that not less than 91 per cent of the cultivated area of the island was occupied by its owners, and only 8 per cent was rented. These proportions are in strong contrast with those of Cuba, where only 43.5 per cent were owned and 52.4 per cent rented. This general ownership of farms, however brought about, has unquestionably had a great influence in producing the contented condition of the people of this island as contrasted with the restlessness of the Cubans.

Classifying the occupancy by race, it is seen that 89 per cent of the cultivated area was occupied by whites and only 10 per cent by colored, showing that, as in Cuba, the whites occupied a much larger proportion of the cultivated land than would have been expected from their relative number. It follows from this that the average area of the cultivated farm occupied by whites was greater than that occupied by the colored. That this is true is seen from the following:

	Average area.
White owners.....	14
White renters.....	17
Colored owners.....	5
Colored renters.....	6
Others.....	17

The following table shows, by percentages, the proportional area in each class of farms:

Race and tenure.	0-4 <i>cuerdas.</i>	5-9 <i>cuerdas.</i>	10-19 <i>cuerdas.</i>	20-49 <i>cuerdas.</i>	50-99 <i>cuerdas.</i>	100 + <i>cuerdas.</i>	Total.
White owners.....	9	9	12	18	14	38	100
White renters.....	7	8	10	17	16	42	100
Colored owners.....	28	20	18	18	9	7	100
Colored renters.....	29	22	16	20	10	3	100
Others.....	8	8	7	16	10	51	100

It is seen that in the case of white occupants the areas increase with the size of farms, while with colored occupants the reverse is the case.

The following table shows, by percentages, the leading facts regarding the tenure of farms and the race of occupants for the different departments of the island:

Proportional areas under different kinds of tenure.

PORTO RICO.

Department.	White owners.	White renters.	Colored owners.	Colored renters.	Others.	Total.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	
Aguadilla.....	87	6	6	1	100
Arecibo.....	89	2	8	1	100
Bayamon.....	69	16	12	2	1	100
Guayama.....	65	16	14	2	3	100
Humacao.....	70	14	14	1	1	100
Mayaguez.....	86	4	8	2	100
Ponce.....	85	5	9	1	100
Total.....	82	7	9	1	1	100

It is seen that the areas owned by whites ranged from 65 per cent of all cultivated land in Guayama up to 89 per cent in Arecibo; that the largest holdings by the colored were in the eastern departments and the smallest holdings in the western; that the holdings of the whites ranged in the different departments from 81 to 93 per cent of all the cultivated area in the departments, while the holdings of the colored ranged from 7 up to 16 per cent.

FARM PRODUCTS.

The only measure of agricultural products which was obtained by the census consisted in the area cultivated in each crop. Measured in this way, the following table shows the relative importance of each such crop, expressed in percentages of the total area of cultivated land:

	Per cent.
Coffee	41
Sugar cane	15
Bananas	14
Sweet potatoes	8
Indian corn	4
Malangas	2
Rice	2
Cocoanuts	1
Tobacco	1

From the above it is seen that coffee is much the most important crop of the island; that sugar cane is of much less relative importance than in Cuba, and that tobacco, which is one of the leading crops of Cuba, is here of trifling importance.

To illustrate the tenure of land under different crops and the race of the occupant, the following table is presented, showing, for different tenures and races in percentages, the proportion which was planted in each of the different crops above enumerated:

Crop.	White owners.	White renters.	Colored owners.	Colored renters.	Others.
Tobacco	1	3	1	2	1
Sugar cane	14	47	2	10	31
Rice	2	2	3	3	1
Sweet potatoes	7	8	15	3	5
Malangas	2	2	5	4	1
Yams	-----	4	8	1	-----
Bananas	15	8	17	13	11
Cocoanuts	1	1	13	3	2
Coffee	47	18	31	22	34
Indian corn	4	4	5	5	2

It is seen from the above table that of the cultivated area owned by whites 47 per cent, or nearly one-half, was planted in coffee. Bananas occupied 15 per cent, and sugar cane 14 per cent. Of the area rented by whites, on the contrary, 47 per cent was planted in sugar cane and but 18 per cent in coffee. This distribution of crops among the areas owned by negroes was wider, coffee occupying nearly one-third of the

area, while sugar cane, the second most important crop in the island, occupied only 2 per cent. Among colored renters the areas were also widely scattered.

The following table shows the proportion of the cultivated land in each department which was planted with each of these crops, and thus shows the relative importance in the various departments of the several crops. In Mayaguez more than half and in Arecibo half the cultivated area was planted in coffee; in Aguadilla and Ponce 43 per cent, and in Guayama 38 per cent; sugar cane occupied more than one-half of the cultivated area of Humacao, and more than one-fourth that of Bayamon. In these two departments, and these only, sugar was of greater importance than coffee.

Crop.	Aguadilla.	Arecibo.	Bayamon.	Guayama.	Humacao.	Mayaguez.	Ponce.
Tobacco	1	1	-----	4	2	1	1
Sugar cane	6	5	27	16	53	12	15
Rice	1	1	4	3	2	2	2

COFFEE.

Of the total cultivated area of Porto Rico 41 per cent was planted in coffee, a statement which at once shows the importance of this crop to the island. Of the entire area planted not less than 91 per cent was occupied by whites and only 7 per cent by colored, the remaining 2 per cent being in unknown occupancy. Of the lands occupied by whites nearly all, or not less than 88 per cent of all the cultivated land, was owned by whites, and of that occupied by colored practically all was owned by colored. This high degree of ownership is doubtless due to the fact that lands cultivated in coffee must remain in one ownership for a long time.

The number of coffee plantations was 21,693, and the entire area planted 197,031 *cuerdas*, an average of only 9 *cuerdas* per plantation. The average size of the coffee plantation owned or occupied by the two races was as follows:

	<i>Cuerdas.</i>
White owners.....	10
White renters.....	7
Colored owners	3
Colored renters	3
Others.....	11

The average area of coffee plantations in the several departments of the island was as follows:

	<i>Cuerdas.</i>
Aguadilla.....	7
Arecibo.....	11
Bayamon.....	4
Guayama.....	7
Humacao.....	4
Mayaguez.....	11
Ponce.....	11

The distribution of coffee planting in the island is shown on the map opposite page 153. It is seen from this that coffee planting was most important in the western and in the interior parts of the island, mainly away from the coast, the hillsides of this region forming the most valuable coffee land.

SUGAR.

Sugar is, in Porto Rico, a crop of secondary importance. There were 2,336 plantations, comprising 73,132 *cuerdas*, or an average of 31 *cuerdas* to a plantation. The departments differed in importance in the production of sugar, as follows:

Department.	Number of plantations.	Area.	Area per plantation.
		<i>Cuerdas.</i>	<i>Cuerdas.</i>
Aguadilla.....	550	3,453	6
Arecibo.....	290	5,625	19
Bayamon.....	429	11,598	27
Guayama.....	149	8,310	56
Humacao.....	156	16,743	107
Mayaguez.....	611	9,138	15
Ponce.....	150	17,265	115

As is shown by the above table, and also by the accompanying map, opposite this page, the production of sugar was carried on mainly in the neighborhood of the coast, and particularly in the eastern and southeastern parts of the island, Ponce and Humacao being the departments of most importance in this regard.

The following table shows the distribution of sugar growing by race of the planter and by tenure of the plantation:

Race and tenure.	Number.	Area.	Average area.	Percentage of total area.
		<i>Cuerdas.</i>	<i>Cuerdas.</i>	
White owners.....	1,691	53,758	32	75
White renters.....	269	14,824	55	21
Colored owners.....	300	939	3	1
Colored renters.....	37	341	9	-----
Others.....	39	2,284	58	3

As is seen from the above table, sugar was produced almost entirely by whites, since 96 per cent of all the area was either owned or rented by them, and only 1 per cent by colored, and three-fourths of all the

area was owned by white planters. In the average area of the sugar plantations there were also striking differences. The largest plantations were those rented by whites, and the next largest were owned by whites, while those occupied by the colored were relatively very small.

Sugar mills and distilleries.—The cultivation of sugar cane and the production of sugar, molasses, and rum were, in Porto Rico, industries of far less relative importance than in Cuba. As has been shown, the area under cultivation in cane was much less. The number of mills and distilleries is given by departments in the following table, together with their average capacity, that of sugar mills in *arrobas* (25 pounds each) of cane per day, and that of stills in gallons of rum per day.

Sugar mills and distilleries.

Department.	Number of sugar mills.	Capacity in <i>arrobas</i> of cane.	Average capacity.	Number of stills.	Capacity in gallons.	Average capacity.
		<i>Per day.</i>	<i>Per day.</i>		<i>Per day.</i>	<i>Per day.</i>
Aguadilla.....	55	45,085	819	34	2,475	72
Arecibo.....	33	69,835	2,116	27	2,864	106
Bayamon.....	61	172,370	3,171	26	3,063	117
Guayama.....	32	134,766	4,211	22	2,987	135
Humacao.....	32	269,589	8,424	23	3,635	158
Mayaguez.....	100	161,255	1,612	42	3,236	77
Ponce.....	32	133,607	4,175	31	3,436	110
Total.....	345	986,507	2,858	205	21,696	106

Comparison of this table with the corresponding one for Cuba shows that the number of mills was greater in Porto Rico than in Cuba—345 to 207. Their collective capacity, however, was but little more than one-tenth as much, and their average capacity was little more than one-fifteenth that of the Cuban *centrals*. The crushing of cane and manufacture of sugar and molasses were carried on in Porto Rico in a retail way in small mills. Their product is commonly coarse brown sugar and molasses.

With distilleries the case is the same. The number was nearly two and one-half times as great as in Cuba, but their capacity was little more than one-eighth, and their average capacity per distillery only about one-twentieth.

APPENDICES.

APPENDIX I.

WAR DEPARTMENT ORDER ORGANIZING THE CENSUS.

WAR DEPARTMENT,
Washington, D. C., September 8, 1899.

I. By direction of the President, a census of the population, of the agricultural products, and of the educational conditions of Porto Rico shall be taken on the 10th day of November, and completed by or before the 20th day of December, 1899.

II. Lieut. Col. J. P. Sanger, Inspector-General, is appointed Director of the Census, with office in Washington. It is made his duty to superintend and direct the taking of the census, and to perform such other duties as may be required of him.

III. Mr. Harrison Dingman is appointed Assistant Director of the Census, with office in the city of San Juan, Porto Rico, and is charged, under the direction of the Director of the Census, with the collection of the information required by this order and such instructions as may be issued.

He will fill all vacancies which may occur among the supervisors of the census and will appoint all enumerators and such special agents as may be necessary, reporting his action to the Director of the Census.

IV. For the purpose of this census the island of Porto Rico is divided into seven census departments, and the following-named citizens of Porto Rico, nominated by the Military Governor, are hereby appointed supervisors of census:

1. Ricardo Hernandez, census department Bayamon.
2. Felix Seijo, census department Arecibo.
3. Luis A. Torregrosa, census department Aguadilla.
4. Manuel Badrena, census department Mayaguez.
5. Enrique Colom, census department Ponce.
6. Luis Muñoz Morales, census department Guayama.
7. Guillermo Riekohl, census department Humacao.

(The islands of Vieques and Culebra are a part of the census department of Humacao; the island of Mona, a part of the census department of Mayaguez.)

Each supervisor shall be duly commissioned by the Secretary of War, and shall be sworn to the faithful performance of duties by the Director or Assistant Director of the Census, or by any civil or military officer authorized to administer oaths in the form and manner prescribed by the Secretary of War.

V. Each supervisor of census shall be charged with the performance, within his department, of the following duties: To consult with the Assistant Director of the Census in regard to the division of his department into enumeration districts most convenient for the purpose of enumeration, which districts shall be declared and the boundaries thereof fixed by the Assistant Director of the Census; to nominate to him suitable persons as enumerators within his department, one for each enumeration district and resident therein; but in case it shall occur in any enumeration district that no person qualified to perform and willing to undertake the duties

of enumerator resides in that department, the supervisor may appoint any fit person to be the enumerator of that district; to communicate to enumerators the necessary instructions and directions relating to their duties, to examine and scrutinize the returns of the enumerators, and in event of discrepancies or deficiencies appearing in the returns for his department, to use all diligence in causing the same to be corrected and supplied; to forward to the Assistant Director of the Census the complete returns for his census department in such time and manner as shall be prescribed by said officer. He will also make up and forward to the disbursing officer of the army designated to make payments in his department, not later than the 25th of each month, the accounts required for ascertaining the amount of compensation due himself, each enumerator in his department, his clerk and messenger, his office rent, and current expenses, which accounts shall be duly certified as true and correct by the supervisor, and said accounts so certified shall be accepted by the disbursing officer so designated, and payment thereon shall be made by draft in favor of each person to whom payment is due. The accounts of enumerators will be sworn to by them and certified as true and correct by the supervisors. The duties imposed upon the supervisors by this order shall be performed, in any and all particulars, in accordance with the instructions and directions of the Secretary of War, and any supervisor who may abandon, neglect, or improperly perform the duties required of him by this order and the instructions he may receive, may be removed by the Assistant Director of the Census, who will report his action to the Director of the Census.

VI. Each enumerator shall be duly commissioned by the Secretary of War, and shall be sworn to the faithful performance of his duty by the supervisor of census, or by any civil or military officer authorized to administer oaths, and in the form and manner prescribed by the Secretary of War.

VII. Each enumerator shall be charged with the collection, in his district, of the facts and statistics required by the population schedule, and such other schedules as the Secretary of War may determine shall be used by him in connection with the census. It shall be the duty of each enumerator to visit personally each dwelling house in his district, and each family therein, and each individual living out of a family in any place of abode, and by inquiry made of the head of each family, or of the member thereof deemed most credible and worthy of trust, or of such individual living out of a family, to obtain each and every item of information and all the particulars required by the order prescribed as of the date November 10, 1899. And in case no person shall be found at the usual place of abode of such family, or individual living out of a family, competent to answer the inquiries made in compliance with the requirements of this order, then it shall be lawful for the enumerator to obtain the required information, as near as may be practicable, from the family or families, or person or persons, living nearest to such place of abode; and it shall be the duty of each enumerator to forward the original schedules, duly certified, to the supervisor of census of his census department as his returns under the provisions of this order, and in the event of discrepancies or deficiencies being discovered in his said returns he shall use all diligence in correcting or supplying the same. In case the district assigned any enumerator embraces all or any part of any incorporated township, village, town, or city, and also other territory not included within the limits of such incorporated township, village, town, or city, or either, it shall be the duty of the enumerator of such district to clearly and plainly distinguish and separate, upon the population schedules, the inhabitants of all or any part of such township, village, town, or city, as may be embraced in the district assigned to such enumerator, from the inhabitants of the territory not included therein. No enumerator shall be deemed qualified to enter upon his duties until he has received from the supervisor of census of the census department to which he belongs the commission authorizing him to perform the duties of enumerator.

VIII. The district assigned to any enumerator shall not exceed 1,500 inhabitants for urban and 1,000 inhabitants for suburban or rural districts, as near as may be, according to estimates based on the preceding census or other reliable information, and the boundaries of all enumeration districts shall be clearly described by civil divisions, rivers, roads, public surveys, or other easily distinguished lines: *Provided*, That enumerators may be assigned for the special enumeration of institutions, when desirable, without reference to the number of inmates.

IX. Any supervisor of the census may, with the approval of the Assistant Director of the Census, remove any enumerator in his department and fill the vacancy thus caused or otherwise occurring. Whenever it shall appear that any portion of the enumeration and census provided for in this order has been negligently or improperly taken, and is by reason thereof incomplete or erroneous, the Assistant Director of the Census may cause such incomplete and unsatisfactory enumeration and census to be amended or made anew under such methods as may in his discretion be practicable.

X. The Assistant Director of the Census may authorize and direct supervisors of the census to employ interpreters to assist the enumerators of their respective districts in the enumeration of persons not speaking the language of the country, the compensation of such interpreters not to exceed three dollars per day for each day actually and necessarily employed.

XI. No supervisor's clerk, interpreter, special agent, or other official shall enter upon his duties until he has taken and subscribed to the oath or affirmation prescribed by the Secretary of War; and no supervisor, supervisor's clerk, enumerator, or special agent shall be accompanied by or assisted in the performance of his duties by any person not duly appointed as an officer or employee of the Porto Rican census, and to whom an oath or affirmation has not been duly administered. All appointees and employees provided for in this order shall be appointed or employed solely with reference to their fitness to perform the duties of the position to which they may be appointed.

XII. The enumeration of the population required by this order shall commence on the 10th day of November, 1899, and be taken as of that date. And it shall be the duty of each enumerator to complete the enumeration of his district and to prepare the returns hereinbefore required to be made, and to forward the same to the supervisor of the census of his department on or before the 20th day of December, 1899.

XIII. If any person shall receive or secure to himself any fee, reward, or compensation as a consideration for the appointment or employment of any person as enumerator or clerk or other employee, or shall in any way receive or secure to himself any part of the compensation to be paid for the services of any enumerator or clerk or other employee, he shall be deemed guilty of a misdemeanor, and on conviction thereof shall be fined not more than \$1,000, or be imprisoned not more than one year, or both.

XIV. If any supervisor, supervisor's clerk, enumerator, interpreter, special agent, or other employee, who, having taken and subscribed the oath of office required by this order, shall, without justifiable cause, neglect or refuse to perform the duties enjoined on him by this order, or shall, without the authority of the Director of the Census, communicate to any person not authorized to receive the same any information gained by him in the performance of his duties, he shall be deemed guilty of a misdemeanor, and upon conviction shall be fined not exceeding \$500; or if he shall willfully and knowingly swear or affirm falsely, he shall be deemed guilty of perjury, and upon conviction thereof shall be imprisoned not exceeding two years, and shall be fined not exceeding \$500; or if he shall willfully and knowingly make a false certificate or a fictitious return, he shall be guilty of a misdemeanor, and upon conviction of either of the last-named offenses he shall be fined not exceeding \$2,000 and be imprisoned not exceeding two years.

XV. Each and every person more than 20 years of age belonging to any family residing in any enumeration district, and in case of the absence of the heads and other members of any such family, then any representative of such family, shall be, and each of them hereby is, required, if thereto requested by the Assistant Director, supervisor, or enumerator, to render a true account, to the best of his or her knowledge, of every person belonging to such family in the various particulars required, and whoever shall willfully fail or refuse to render such true account shall be guilty of a misdemeanor, and upon conviction thereof shall be fined in a sum not exceeding \$100. And every president, treasurer, secretary, director, agent, or other officer of every corporation, and every establishment of productive industry, whether conducted as a corporate body, limited liability company, or by private individuals, from which answers to any of the schedules, inquiries, or statistical interrogatories provided for by this order are herein required, who shall if thereto requested by the Assistant Director, supervisor, enumerator, or special agent, willfully neglect or refuse to give true and complete answers to any inquiries authorized by this order, or shall willfully give false information, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not exceeding \$3,000, to which may be added imprisonment for a period not exceeding one year.

XVI. All fines and penalties imposed in this order shall be enforced by due legal process in the supreme court, and the courts of the judicial districts of the island, according to the nature and degree of the offense, and they are hereby granted jurisdiction for this purpose.

XVII. The Director of the Census may authorize the expenditure of necessary sums for the traveling expenses of the officers and employees of the census and the incidental expenses essential to the carrying out of this order as herein provided for, and not otherwise, including the rental of offices for the Assistant Director and supervisors of the census, and the furnishing thereof.

XVIII. All mail matter of whatever class, relative to the Porto Rican census and addressed to the Director, Assistant Director, or any supervisor or enumerator of the census, and indorsed "Official Business, War Department, Porto Rican Census," shall be transported free of postage; and all telegrams relative to the Porto Rican census sent or received by the officials aforesaid, shall be free of charge; and if any person shall make use of the postal and telegraph franking privileges herein granted, to avoid the payment of postage or telegraph charges on a private message, letter, package, or other matter sent by mail or telegraph, the person so offending shall be guilty of a misdemeanor and subject to a fine of \$300.

XIX. The Director of the Census is hereby authorized to print and bind such blanks, circulars, envelopes, and other items as may be necessary, and to tabulate, print, publish, and distribute the results of this census.

XX. The expenses of taking the Porto Rican census, including the pay and allowance of civil officials and employees, shall be paid from the revenues of Porto Rico, and the Military Governor of Porto Rico will nominate one of the disbursing officers of the army in each census department to act as paymaster, who shall be provided with the necessary funds and who shall make disbursements in behalf of the Porto Rican census, according to such instructions and under such regulations as may be prescribed by the Secretary of War. The names, rank, and stations of the officers so nominated will be communicated to the Adjutant-General of the Army by the Military Governor of Porto Rico, and will be announced in War Department orders.

XXI. The Military Governor of Porto Rico, and all civil and military officers in the island, will render such assistance to the Director, Assistant Director, supervisors, and enumerators of the Porto Rican census, as may be necessary to enable them to carry into effect the provisions of this order.

ELIHU ROOT,
Secretary of War.

APPENDIX II.

WAR DEPARTMENT ORDER ORGANIZING THE CENSUS.

WAR DEPARTMENT,

Washington, September 22, 1899.

I. The following-named officers nominated by the Military Governor of Porto Rico are appointed disbursing officers of the Porto Rican census, and will be respected accordingly:

- Maj. Charles L. Davis, Eleventh Infantry, census department of Bayamon.
 Capt. A. C. Macomb, Fifth Cavalry, census department of Arecibo.
 Lieut. S. G. Chiles, Eleventh Infantry, census department of Aguadilla.
 Capt. P. M. Travis, Eleventh Infantry, census department of Mayaguez.
 Maj. F. W. Mansfield, Eleventh Infantry, census department of Ponce.
 Capt. F. W. Foster, Fifth Cavalry, census department of Guayama.
 Capt. Eben Swift, Fifth Cavalry, census department of Humacao.

II. Disbursing officers will pay the compensation of the Assistant Director, supervisors, enumerators, clerks, and other employees of the census, the rent of the offices of the Assistant Director and supervisors, the purchase or rental of office furniture, transportation and telegraph vouchers, the expenses of travel of officers and employees, as established by the Secretary of War, and such incidental expenses as may be authorized by the Director of the Census under paragraphs XVII and XIX of the order of the President for taking the census of Porto Rico.

III. In making expenditures and keeping their accounts, disbursing officers will be governed by the rules and instructions applicable to the revenues of Porto Rico established by the President: *Provided*, That the accounts of expenditures in behalf of the census of Porto Rico shall be kept separately from all other accounts and furnished in this form to the War Department.

IV. Disbursing officers will be stationed in the principal cities of their respective census departments and will communicate, without delay, with the supervisors of census, and will give them such information as to preparing their vouchers and keeping their accounts as may be necessary to the prompt settlement of all indebtedness.

ELIHU ROOT,
Secretary of War.

APPENDIX IV.

CONTRACT FOR TABULATING THE ENUMERATION OF POPULATION OF THE ISLANDS OF CUBA AND PORTO RICO.

Whereas the Tabulating Machine Company, through its general manager, Herman Hollerith, has submitted an offer to the Director of the Census of Cuba and Porto Rico to tabulate the enumeration of the population of the said islands, and said Director has concluded to accept said proposition,

It is hereby agreed by and between Colonel J. P. Sanger, Director of the Census of Cuba and Porto Rico, party of the first part, and the Tabulating Machine Company, a corporation of the State of New York, party of the second part, as follows:

The party of the second part, in consideration of the payments to be made to it as hereinafter provided, agrees to tabulate by the Hollerith tabulating system, and under the direction of its general manager, the enumeration of the population of the islands of Cuba and Porto Rico from the schedules to be delivered to it by the party of the first part according to the twenty-two (22) tables heretofore submitted.

The party of the first part hereby agrees to pay to the party of the second part for such tabulation the sum of three and one-half (3½) cents for each person, and one (1) cent for each building enumerated, as follows:

Eight-tenths (0.8) of one cent per person on completion of the tabulation of tables 1 and 2.

Three-tenths (0.3) of one cent per person on completion of the tabulation of tables 3 and 4.

Three-tenths (0.3) of one cent per person on completion of the tabulation of tables 5 and 7.

Forty-five hundredths (0.45) of one cent per person on completion of the tabulation of tables 8, 9, and 10.

Seventy-five hundredths (0.75) of one cent per person on completion of the tabulation of tables 11, 12, 13, 14, and 15.

Nine-tenths (0.9) of one cent per person on completion of the tabulation of tables 16, 17, 18, 19, 20, and 21.

The payments for tabulating tables 1 and 2, and for tabulating tables 3 and 4, are to be made on the completion of such tables for each province of Cuba and department of Porto Rico, and for the remaining tables 5 to 22 inclusive, on completion of such tables for each island.

The party of the second part agrees to commence such tabulation without delay upon receipt of the schedules from the party of the first part, and to proceed with and complete said tabulation with diligence and dispatch.

The party of the second part further agrees to tabulate the schedules relating to agriculture and schools for said islands according to such tables as may be required by the party of the first part, for which tabulations the party of the first part agrees to pay to the party of the second part, in addition to the payments above provided for, the actual cost of such tabulation (which shall include rent, clerk hire, material, and all other expenses) plus ten (10) per cent of such cost for the services of the party of the second part for superintending and directing the work.

The party of the first part may at any time discontinue the tabulation of the schedules relating to agriculture and schools by giving written notice to that effect to the party of the second part; and in such event all records and results are to be delivered to the party of the first part, and the party of the second part shall be paid for the cost of the work plus said ten (10) per cent for services, to the date of the receipt of such notice by the party of the second part.

In witness whereof the parties aforesaid have executed this agreement in quadruplicate, and have hereunto set their hands and affixed their seals this 1st day of February, A. D. 1900.

Signed by contracting parties and witnessed.

APPENDIX V.

GOVERNORS OF PORTO RICO.

1. Juan Ponce de Leon, appointed by their Majesties on March 2, 1510, captain of the island, and turned over the command by royal order in 1511 to

2. Juan Ceron and Miguel Diaz, appointed by Admiral Diego Columbus in the use of his rights, acknowledged by the Council of Indies. They governed until 1514, at which period the same admiral removed them and appointed

3. Commander Moscoso, whose administration was very brief, resigning the authority in the same year to

4. Cristobal de Mendoza, who led the expedition against the Indians of Vieques and left for Sevilla, being substituted in his turn by

5. Juan Ponce de Leon, appointed for the second time, on September 27, 1514, captain of the island, with civil and criminal jurisdiction on both land and sea. He governed seven years, and as he was preparing, in 1520, for his second expedition to Florida, he intrusted the command to

6. Antonio de la Gama, who, in September, 1519, had arrived at San Juan in the capacity of judge, and who married a daughter of Ponce de Leon. Gama retained the supreme authority until the beginning of 1521, in which year he transferred it, by order of the King, to Diego Columbus, who selected as his lieutenant

7. Pedro Moreno, the municipal mayor, who had been the solicitor of the city, and who retained the command until 1529, in which year

8. Antonio de la Gama, Ponce de Leon's son-in-law, was appointed in his place. His management could not have been very satisfactory, as he was removed in 1531, his successor being

9. Lucas Vazquez de Ayllon, a justice of the *audiencia* of Santo Domingo, in order that, assuming the general authority, he might supervise the actions of Moreno as

well as of Gama. The latter left for Venezuela, and after his task was ended Ayllon returned to the Española, in the same year, the command being transferred to

10. Francisco Manuel de Lando, the ordinary municipal mayor, appointed, as Moreno had been, the lieutenant of the admiral. Lando discharged his duties until 1537, in which year the Crown recovered the right to appoint the captains and justices of San Juan. This news was very gladly received in the island, but as seven years elapsed without the right being exercised, the ordinary mayors continued exercising the government, to the great dissatisfaction of the residents, who complained in 1541 that they had no head. Finally, in 1544, His Majesty appointed as captain

11. Geronimo Lebron, who arrived in Porto Rico in 1545, and died a natural death fifteen days after his taking possession of the office. He was substituted in the same year by

12. Licentiate Cervantes de Loaysa, a justice who resided in the Española, and who was appointed on the petition of the residents of San Juan. His strict rule brought about such dissatisfaction that in 1547 the municipality requested the monarch that he should not be allowed to govern in perpetuity, because it would mean the ruin of the island.

13. Luis de Vallejo governed from June, 1550, to April, 1554, being replaced by

14. Licentiate Caraza, appointed in 1555, and who governed until 1561. He was succeeded by

15. Antonio de la Llama Vallejo, who married Leonora Ponce, the daughter of the conqueror, and who governed to 1564. In this year the appointment of civil officials as governors of the island was discontinued and

16. Francisco Bahamonde Lugo, a cavalry captain in Flanders, was appointed. He was obliged in person to lead an expedition against the invasion of savages, receiving an arrow in a muscle which endangered his life. His government ended in 1569, and he left for Spain. At the beginning of 1570 he was succeeded by

17. Francisco de Solis, a native of Salamanca, appointed for four years at an annual salary of 775,000 *maravedis*. He was succeeded in 1575 by

18. Francisco de Obando, who continued in office until 1580, being followed by

19. Juan de Cespedes, who died the same year. The next governor arrived in the island in 1581.

20. Juan Melgarejo, a native of Sevilla, whose duty it was to prepare a geographic description of the country. He transferred the government in 1583 to

21. Diego Melendez, mentioned by Abbad, and who governed the island for eleven years, from 1583 to 1594.

22. Pedro Xarez, colonel, governed provisionally in 1593 and 1595.

23. Alonso Mercado, in 1599, captain.

24. Sancho Ochoa de Castro, in 1602.

25. Gabriel de Rojas, in 1603.

26. Felipe Beaumont y Navarra in 1614.

27. Juan de Vargas, in 1620.

28. Juan de Haro, in 1625.

29. Enrique Henriquez, in 1630.

30. Inigo de la Mota, 1635.

31. Agustin de Silva, in 1656.

32. Maestre de Campo Juan Perez de Guzman, in 1661.

33. Maestre de Campo Geronimo de Velasco, in 1664.

34. Maestre de Campo Gaspar de Arteaga, in 1670. Died on March 7, 1674.

35. Maj. Diego de Robladillo, in 1674, temporary.

36. Capt. Baltasar Figueroa, in 1674, temporary.
