A FOREST SURVEY PROGRESS REPORT

J. W. Cruikshank, Regional Survey Director

U. S. DEPARTMENT OF AGRICULTURE, FOREST SERVICE

Appalachian Forest Experiment Station
I. T. Haig, Director
Asheville, N. C.

PREFACE

Through the McSweeney-McNary Act of 1928, Congress authorized the Secretary of Agriculture to conduct a comprehensive survey of the forest resources of the United States. The Forest Survey was organized by the Forest Service to carry out the provisions of the Act, and each of the 11 Regional Forest Experiment Stations is responsible for the work in its territory. In the Middle Atlantic States the Forest Survey is an activity of the Appalachian Forest Experiment Station, Asheville, North Carolina.

The work of the Survey is divided into five major phases:

1. Inventory. Determination of the extent, location, and condition of forest lands, and the quantity, species, and quality of timber on these lands.
2. Growth. Determination of the current rate of timber growth.
3. Drain. Determination of the amount of industrial and domestic wood used, and the total loss resulting from fire, insects, disease, suppression, and other causes.
4. Requirements. Determination of the current and probable future requirements for forest products by all classes of consumers.
5. Policies and plans. Analysis of the relation of these findings to one another and to other economic factors as a basis for public and private policies and plans of forest land use and management.

This progress report presents information on one part of the inventory phase of the Forest Survey, and deals specifically with the forest area and timber volume by county in the Carolinas and Virginia.

APPROXIMATE FOREST AREA AND TIMBER VOLUME BY COUNTY

IN THE

CAROLINAS AND VIRGINIA

This report, giving the approximate forest area and timber volume in each county of the Carolinas and Virginia, is based upon field surveys made as a part of the inventory phase of the Forest Survey at the Appalachian Forest Experiment Station. In the East the nation-wide Forest Survey did not plan to release information for areas smaller than survey units (four to ten million acres), but the demand for forest statistics by counties has shown a marked increase as planning for post-war development becomes more intense with the gradual approach of victory. To meet this demand the original Forest Survey statistics for survey units within states have been recomputed to provide estimates of forest area and timber volumes by counties, and are presented in this report as a series of three statistical tables for each state. The figures are as of the date of the original survey, and no attempt has been made to correct them for recent changes in forest area or annual timber growth and drain. In South Carolina the data are for 1936, in North Carolina for 1938, and in Virginia for 1940.

LIMITATIONS ON USE OF COUNTY DATA

The sampling procedure used on the inventory phase of the Forest Survey ($\frac{1}{4}$ -acre plots at 10-chain intervals on lines 10 miles apart) was designed to give reliable estimates of forest area and timber volumes for survey units totaling several million acres in size. This extensive sample does not provide an adequate basis for accurate determinations of forest area and volume for individual counties, as some values will be too high and others too low. Therefore, the data given in the following tables should not be considered correct for individual counties, although tests have shown that the forest area estimates are within 10 percent of areas planimetered from aerial photographs in a high proportion of the counties checked.

The intended use of these tables is to provide a flexible method of obtaining approximate forest acreages and timber volumes in areas that differ, in size and location, from the established Forest Survey units. Such areas might include the wood procurement territories of pulp companies, the zone of influence of towns and cities, the freight territory along railroads, and land tributary to proposed new forest industries. For reliable estimates the combined acreage of the counties in the selected area should be not less than two million acres.

EXPLANATION OF TABLES

Tables of Area

South Carolina: County areas are according to the Bureau of the Census, 1935. According to area revisions published by the Bureau of the Census in 1942 the State contains 19,580,160 acres, an increase of 63,360 above the 1935 acreage.

The area of the coastal islands of Beaufort County is included in table 1. These islands, which contain about 91,200 acres with 27,400 forested, were not included in previously published Forest Survey reports.

North Carolina: County areas are according to the Bureau of the Census, 1935. According to area revisions published by the Bureau of the Census in 1942 the State contains 31,450,800 acres, an increase of 257,200 above the 1935 acreage.

The public-reserved land listed is only the forested portion of the Great Smoky Mountains National Park.

Virginia: County areas are according to the Bureau of the Census, 1940.

The public-reserved land consists of national parks, state parks, national monuments, and similar public areas on which commercial timber cutting is prohibited.

All States: Noncommercial forest land lacks the qualities essential for the growth of merchantable saw timber or pulpwood.

Commercial forest land includes both private and public lands, excluding public-reserved lands.

Tables of Volume

All States: Board-foot volumes include the net volume of all merchantable softwoods and cypress 9.0 inches d.b.h. and larger, and all merchantable hardwoods 13.0 inches d.b.h. and larger.

Volumes in cords include the net volume in all sound trees 5.0 inches d.b.h. and larger, including the saw-timber volume shown in board feet.

Cypress is included with hardwoods.

Chestnut is not included with the volume estimates.

The volume per average acre is the average stand on the total acreage of commercial forest land in the county.
