THE  
STREET RAILWAY  
REVIEW

INDEX TO VOLUME VIII

1898

CHICAGO

WINDSOR & KENFIELD PUBLISHING COMPANY

MONON BUILDING

## PAGING BY MONTHS.

January	116 to 68
February	69 to 138
March	139 to 210
April	211 to 282
May	283 to 354
June	355 to 426
July	427 to 498
August	499 to 600
September	601 to 704
October	705 to 778
November	779 to 848
December	849 to 918

## EDITORIAL

Accidents, Fraudulent	559
Accidents, Some Street Railway	851

### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supply or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that supply. We make no charge for publishing such notices in our DAILY BULLETIN.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8, JANUARY 15, 1898. NO. 1

The City Council of Chicago, undertook to inaugurate a wholly unwarranted inspection of the private affairs of the street railway companies, which concerned none but the companies and their stockholders. The presidents, politely but firmly, declined to answer the questions propounded, and the august body and its officious committee are placed in a very ludicrous and ridiculous position in consequence.

Saginaw, Michigan, thought it did something clever when it secured an order directing the receiver of the road there to institute a low fare schedule. This was last August. The receiver finds it more than even an officer of the court can do to run a road on 3-cent fares, and the order will be rescinded. All the law and courts in the land cannot get something out of nothing, which is only another way of stating the problem that you can't give a 5-cent ride for a 3-cent fare and pay men and bills.

A professional witness has been brought to grief in Chicago. He offered his services to one of the street railway companies and was promptly reported to the court by whom he was remanded to jail until the case in question is settled. Then the court will make a case of him. It is earnestly to be hoped such an example will be made of the offender, as will teach those of his class that the manufacture of evidence is punishable as severely as another species of counterfeiting. It is the duty of every street railway to expose to the

fullest extent, and secure the heaviest punishment possible for, every such ease which is brought to them.

The city fathers in Cleveland in hunting for something with which to make trouble for the street railway lines thought they had struck a lead in the wires used by the roads for the sale of power, and ordered the roads to cut the same. This the companies declined to do, and the mayor directed the public works warden to do so. When that official investigated the matter he found the city was being supplied without cost with power for operating its swing bridges, and the wire-cutting scheme is not so popular around the city hall as it was at first.

In February, 1897, we published an account of a personal injury case against a New Jersey street railway, which was compromised by the injured party in violation of an agreement with his attorney. The attorney then sued his client for money advanced by him in the prosecution of the claim and was non-suited on the ground of the agreement being "barratrous, champertous, for maintenance, and against public policy." In this issue is an Illinois decision holding that any contract preventing a client from settling or discontinuing a suit is void because it would foster litigation. The old restrictions against barratry have been removed so that a contingent fee contract will be sustained in most states, but it is evident from these two cases that the courts do not look with favor upon the "accident attorneys" who hover in the wake of personal injuries to feed upon them. The rule in Illinois will probably prove very discouraging to this class.

On a western road the men employed largely belong to a union, and one of the agreements between the company and its men was, that where an employe was dissatisfied with the ruling of the office, the case should be appealed to a board of arbitration, one member of which was to be chosen by the company, one by the union, and a third by these two. At the time the agreement was made the company very reluctantly yielded, stating then, that it had no confidence in the decision of the board of arbitration being any more satisfactory than under the old system, where the manager was the judge. The men, however, knew if only they could have arbitration everything would be lovely. Recently a case came up for arbitration, which was so apparent it left nothing to arbitrate, but the board was appealed to, and upheld the decision of the manager in full. Now the union are highly displeased and say no justice can be had from arbitration. The outcome is quite what might have been expected, and shows the folly of any company delegating to outsiders those matters which its officers of all persons, are best qualified to pass upon.

On another page will be found a portion of the argument of Everett W. Burdett presented to the special committee on the "Relations of Street Railway and Municipal Corporations in Massachusetts" in behalf of the street railways of the state. We regret our inability to lay the whole of Mr. Burdett's speech before our readers at this time, for it is well worth the most careful consideration; but we must be content with submitting the arguments on but six of the 20 heads into which the discourse was divided. These deal with the growth of the street railways of Massachusetts in the last 30 years, and more particularly in the last decade:

with the history of the highways and the status of street railways therein; with the use of the highways as an alleged reason for subjecting the railways to special taxation; with the question of the alleged increase of the cost of maintenance of the streets because of their use by street railways; with the burdens imposed on the street railways, and with their inability to bear any additional burdens. The facts as to cost, mileage, traffic, operating expenses, profits, etc., are exhibited in a number of tables, and the climax is reached in the statement that: "The introduction of electric traction has not increased the net results of operation." In Table E it is shown that the dividends paid have varied but little since 1886, while as shown in Table F, the surplus has been cut down from 15.01 per cent to 1.66 per cent of the capital stock. It is of course true that the advancements and improvements in the operation of street railways in these 10 years have been almost infinite. The inevitable conclusion follows that it is the employes and the patrons who have benefitted thereby.

We note this month the street railway men of Illinois have followed the example of their brethren in New York, Ohio, Connecticut, Massachusetts, Pennsylvania, Michigan, Texas, Maine and California, and organized a state association. The plan for such an organization in Illinois has been broached before and the subject agitated more or less for the last 10 years. The excellent work of the National Association is ably seconded by that of the state organizations, which are thus enabled to take up matters of importance to the individual members, but which, naturally, could hardly be considered in the national meeting on account of being chiefly of local interest. These local interests, however, are often vitally important to the roads, and this is where the state organizations become necessary. In addition, there are many who cannot go so far away as the National meeting requires, but who all the more feel the need of acquaintance and conference with other managers. Not a manager but can spare the one day and short trip necessary to be present at a state meeting. While Illinois has been among the last to organize, we may expect the lost time will more than be balanced by the earnestness and enthusiasm displayed in the organization meeting.

On another page will be found a brief description of the system of discipline for trainmen adopted by the Metropolitan Elevated, of Chicago, and it is interesting to compare this system with that in use on the Canal & Claiborne road in New Orleans, discussed by Mr. Davis in his paper before the American Association at the Niagara Falls meeting.

On both, as on nearly all large roads, one of the preliminaries to securing employment is the passing of a physical examination; also the candidate gives a brief account of his previous history, as his experience with other employers, the length of time he was so employed, and the nature of the employment, all of which serves to advise the manager as to whether this particular applicant will make a good man for the company. On both roads the distinctive feature is competition, and promotions are made on the men's records. The competitive feature is introduced earlier in the man's career on the Canal & Claiborne, however, and the manner in which comparative standing of the men is reduced to the record is different.

The applicants for positions on the Canal & Claiborne are given a competitive civil service examination and only

the fittest chosen. These preliminaries being passed successfully the record is made by averaging daily reports as to each man's conduct, each petty officer, (foreman, starter, inspector, etc.) making reports to the office as to all the men with whom he comes in contact. In addition to this report of general conduct special acts are reported and are entered on the record according to a fixed scale, as merits or demerits. At the end of the month the record is balanced and if the sum total is below zero the employe is discharged. Promotion among a class of employes is made on the record alone, and motormen and conductors are also promoted to starters, inspectors and transfer agents on their records without examination, no attention being paid to the date at which a man entered the service. All vacancies in the service are filled from among the employes, if one with the requisite knowledge and ability can be found. For the higher positions competitive examinations are made the test.

In the system in use on the Metropolitan, of Chicago, seniority in point of time, as well as conduct, has weight in determining a man's position, and his chances of promotion. This appears in the following manner: If an employe is reported for violations of the rules his record suffers. If he is reported for a meritorious act his record gains. If his conduct has been according to the standard, that is, he has been caught doing neither good nor evil, his record is increased by 2 per cent, because the standard set by the rules is considered high enough to warrant this reward for a compliance with it. It thus appears other things being equal the senior employe has the advantage, which is as it should be, when "other things are equal." It may be said that this adding of 2 per cent is but another way of reaching the same result as is achieved by Mr. Davis, the value of a careful observation of the regulations being fixed and credited unless a violation be reported; the New Orleans method is to take the judgment of all the superiors as to the quality of the man's service, a method involving more labor. On the Metropolitan promotions from grade to grade in the train service are on the record alone as is the case in New Orleans.

It is a truism that for the greatest good to the company there must be good will and zeal on the part of the employes, and this state of affairs will naturally follow fair dealing and impartiality on the part of the company. Punishment there must be for violations of regulations and for carelessness, and it should be sure and swift; on the other hand nothing yields such good results as proper recognition of meritorious acts. Both of the schemes of discipline referred to have given excellent satisfaction on the roads where they are in use and deserve the careful study and consideration of managers.

In many of our cities the continued and wholly unwarranted and unjust attacks made by the local press upon the street railway interests have worked great damage to the city. Such papers seem to think they strike a popular chord when they abuse the management, the service and the property, when the chances are ten to one the road has done better under the conditions of earnings and expenses than any private business man would have thought he could do with decreased earnings and increased expenses.

Whatever improves the street railway helps the town; usually the money to do this has to come from the outside, and is just so much added investment from which the city

will receive taxes and the public increased facilities and accommodations. Whether these attacks are made ignorantly or knowingly, the result on the people in money centres, where the company is trying to place its securities, is the same. And the public will serve its own selfish interests if it would assert itself and compel the papers to deal fairly.

What would the public think if, when a new factory or industry which was to give added employment at good wages through the entire year was being promoted, the papers came out and stated the town had all the factories it needed; that the new work for unemployed men was an outrage, and that because the men who talked of investing their money lived in hopes of some return on their venture, that they were thieves and ought to be locked up? Yet this is precisely the tenor of some papers toward the street railway of their city under similar circumstances.

We have previously stated that the daily press of Chicago has worked untold injury to the city through its outrageous attitude toward the street railway interests. The latest instance is of a certain daily which makes out the Northwestern Elevated as one of the most irresponsible and unworthy ventures ever attempted here. The company has now retaliated and entered a damage suit in the sum of \$500,000 and retained the best legal talent in the city to push the case. The construction of the road means transportation facilities to many square miles of territory where the people have been at the mercy of the steam roads for the past 30 years; it means millions in the enhancement of small properties held by men whose homes are their all; the construction already erected is as good as any in the world and has already cost upwards of \$5,000,000. Now, when the management is closing arrangements for its completion and operation, this paper comes out with a statement which would make any but one thoroughly acquainted with the truth so afraid of it he would not want to pay 60 cents for a gold dollar.

We hope to see heavy damages awarded in the case, and such a lesson taught that others will be made to realize they cannot trifle with legitimate business interests for mere sport or blackmail.

The president of the road, D. H. Louderback, says: "So far as these roads are concerned we're going to stop this thing of newspaper libeling. We've no objections to the truth being printed about us, but they've got to stop lying about us. No enterprise that has ever been projected in Chicago has a better class of men behind it. The best men in Chicago have invested their money in it. It won't do to call them 'bandits' or 'fleecers' or 'thieves.' If these men want to stand it they can, but this corporation will not. We will stop it if there is law in Illinois to stop it. Many a business enterprise, and many a business man, has been ruined by Chicago newspapers. Millions of money have been driven away from this city by these newspapers, and every business man in this city will tell you so. So far as the corporations that I represent are concerned, we will not suffer it any longer. They can tell the truth. We do not fear that, but we are determined to put an end to reckless and malicious lying."

Dearborn, Mich., now claims to be a suburb of Detroit, the Detroit, Ypsilanti & Ann Arbor, the electric line now building, having been completed that far.

## UNDERGROUND CONDUIT ELECTRIC ROADS IN AMERICA.

None of the methods of electric traction have furnished a field with more attractions for the inventor than the underground conduit, and some hundreds of such systems, or, rather, portions of such systems, have been designed; many of these have been described in the periodicals of their respective times, a few have reached the dignity of a trial and subsequent abandonment, and fewer still have proved a practical success in operation.

The work now in progress on the lines of the Capital Traction Company, of Washington, makes this a fitting time to review the progress of electric conduit roads in this country.

Experiments have been made with both open and closed conduit systems, the latter known also as surface contact systems. Since less has been done with the closed conduits it is perhaps best to speak first of them. Abroad they have been several systems elaborated by Pollak, Lineff, Gordon and others; one of the most recent is that known as the Claret-Vuilleunier with seven miles of single track in operation in Paris; this last was described in the "Review" for July, 1897, and is notable as the only surface contact system described in the report of Birmingham Tramway Committee, which visited nearly all of the cities of Europe where electric traction is employed. In the United States the Wheless, the Van Depoele and the General Electric systems have attracted most attention.

Early in 1893 an experimental line on the Van Depoele system was laid at Coney Island by the American Engineering Company; two insulated cables were laid in a wooden conduit with contact boxes placed at intervals of 10 ft. along each, the two sets of boxes being staggered so that measured along the track the boxes were 5 ft. apart. Severe tests were made in order to show that the system would work successfully under all climatic conditions, and that it could not be short circuited by water.

The Wheless surface contact system was first applied to a section (about 3-4 mile long) of the Washington, Arlington & Falls Church Railway in Washington. It has also been in successful operation for several years at the works of the Westinghouse Electric & Manufacturing Company, which controls the system, at East Pittsburg, where the yard tracks are so equipped.

The General Electric Company within the last year perfected a surface contact system, and changed the tracks in the yards of the works at Schenectady from the overhead trolley for surface contact working. The Thomson-Houston Company is now engaged in laying this system over 3 miles of track at Monte Carlo.

The first electric system to operate in competition with horses was laid in Cleveland by Bentley & Knight, and the road, 2 miles long, was opened to the public in July, 1884. A slotted conduit made of wood was laid between the rails; this road was operated for about a year. In January, 1888, 1 mile of the Observation Hill Passenger Railway, in Allegheny City, was equipped with the Bentley-Knight conduit; about a year later 3 miles of conduit were laid in Boston on the West End road, and a portion of the North & East River Railroad in Fulton street, New York, was so equipped. The Bentley-Knight conduit in the later installations consisted of iron yokes supporting Z or Phoenix slot rails; to the yokes were bolted pieces of timber, to

which were attached bare conductors, one on each side of the conduit. All of these lines were abandoned after more or less lengthy trials, and some thought at the time that the last hope of being able to place bare wires in an open conduit had also disappeared.

Following these failures came the reports of the successful working, from a financial as well as from an electrical or a mechanical standpoint, of the now celebrated Budapest line installed by Siemens & Halske. This road is most interesting, because it is the "Modified Budapest" system that has been laid in this country. The conduit was of cement, oval in shape, 11 in. wide at the widest point and 13 in. deep. The two conductors were of angle irons supported on the sides of the conduit about 10 in. above the floor by insulators placed at short intervals. This road was first opened in January, 1889.

Among other conduit roads, most of them, only slight modifications of the Budapest, are two short lines in Brussels, one in Dresden about  $\frac{1}{2}$  mile in length, a line  $1\frac{3}{4}$  miles long in Berlin, and one comprising seven miles of single track laid in Madras, India, in 1895. In August, 1894, an air seal conduit (so-called because the conductors were hung under strips of inverted U section, so that in event of the conduit becoming flooded the water could not reach the conductors because of the air entrapped under the U-shaped guards) was laid near Berlin and reported to give satisfaction.

The conduit road at Blackpool, England, has but one conductor in the conduit, the rails being used for the return.

The two systems of open conduits that have been successfully operated in the United States are the Love and the General Electric. The Love Traction Company in 1892 by arrangement with the North Chicago Railroad laid a conduit  $1\frac{3}{4}$  miles long on the Fullerton avenue loop in Chicago which was operated intermittently from March 1, 1892, till the fall of 1894. This road was laid in mid-winter and in great haste, and a mistake was made in trying to economize in materials. Yokes were used which provided for a conduit 9x15 in.; bare No. 0000 copper wire was used. Difficulties in operation were experienced from two sources: There were four curves on the loop and the distance between the trolley wires and the yokes was but  $\frac{3}{4}$  in. on curves, so that the trolley wheel would come in contact with the yokes at these points. The trolley wires expanded in summer and caused trouble.

The next piece of conduit laid by the Love Company was on 12 miles of double track of the Rock Creek Railway in Washington. This was completed and in operation April 1, 1893. At the Street Railway Convention in that year M. D. Law, electrician of the Rock Creek Company, reported that the operation had been very satisfactory. During 1894 there were a number of interruptions, the greatest trouble being due to the expansion and contraction of the conductors, and that the insulation was not readily accessible.

In 1895 this company contracted to build for the Third Avenue Railroad Company, of New York, a section of underground conduit, nearly half a mile of double track, which was completed early in 1896.

The Metropolitan Railroad, of Washington, was forced by act of Congress in effect August 2, 1894, to change its lines to the underground conduit system, the time being limited to one year for the 9th street line and two years for

the F street line. The system adopted is that known as the "Modified Budapest", or the General Electric; the details were worked out by A. N. Connett, chief engineer of the Metropolitan Company. The two lines equipped aggregate 22 miles of single track. The conductors in this work differed from those used in the first conduit laid by the Metropolitan, New York, in being of T-section instead of channels.

In 1894 the Metropolitan Traction Company, New York, decided to equip its Lenox avenue line (8.62 miles measured as single track) for the underground conduit system, and the work was completed the following summer. The company did not have perfect confidence in the success of its experiment, and built the conduit as if it were to be used for a cable line, in order that a cable might be installed without loss of time if necessary. Two methods of supporting the conductors, which were of channel section, were used on different sections of the line, that of suspending them from insulators bolted to the slot rails, and that of setting them on soapstone pillars.

In the summer of 1897 the Metropolitan Company undertook to extend the system to nearly 60 miles (measured as single track) more of its lines. Work was commenced in August and at the present time is more than two-thirds finished. The operation of the Lenox avenue line having proved the electrical system to be satisfactory, the conduit was made smaller than in the former construction, the bottom of the interior being but 20 in. below the top of the rails. Rails of T-section were adopted and some minor changes made in the insulators and methods of supporting the conductors.

The Capital Traction Company, of Washington, after the destruction of its cable power house by fire on September 20, last, decided to adopt the conduit system, so that we may soon place the underground conduit mileage of the United States at more than 100 miles. This is a small amount in comparison with the total for street railways, but it demonstrates that the open conduit has won a place for itself as being preferable to the cable where the conditions would make a cable road a paying investment.

We do not look for the extension of the system outside of Washington and New York. In Washington the question of motive power was settled for the Metropolitan road by Congress. In New York the inability to secure frontage consents for the use of the trolley made it necessary, and the great traffic density made it possible, to lay either a cable or an electric conduit line; the superior advantages of electricity led to the adoption of the latter.

After the mechanical details of supporting the bare conductors properly had been worked out, the important problem was that of properly draining the conduit. The recent experience in Washington has been that while the flooding of the conduit does not shut down the line, when 150 ft. is flooded the power required to propel the cars is about doubled.

When J. B. Dyar obtained a franchise from the city of Port Huron, Mich., to build an electric railway he deposited a certified check for \$2,000 as a forfeit for not completing the road in the specified time. On account of financial difficulties the road could not be built, and Mr. Dyar asked for his check; the council at first refused, but later complied with his request.

## RELATIONS OF STREET RAILWAY AND MUNICIPAL CORPORATIONS.

History and Growth of Street Railways—Their Status in Public Highways—The Use of Highways by Them—The Question of Increased Cost of Maintenance of Roads—Ample Returns Made by Street Railways—They Can Carry No Greater Burdens.

BY EVERETT W. BURDETT.

As has been stated in these columns a special committee, consisting of Charles Francis Adams, William W. Crapo and Elihu B. Hayes, was appointed by the governor of Massachusetts under an act of the last legislature to investigate and report upon the relation of street railway and municipal corporations in Massachusetts, and has been hearing testimony and argument. On December 3, Everett W. Burdett, counsel for the Massachusetts Street Railway Association, closed the case for the street railways, in an able argument which, we regret to say, lack of space prevents us from giving in full. Below will be found that portion of Mr. Burdett's argument which deals with the topics of widest interest to street railway men outside of Massachusetts.

### I. History and Growth of Street Railways.

As a basis of our inquiries, it will be well to review briefly the history and present condition of the street railway industry itself.

Street railways are an American invention, and are said to have been first operated in the city of New York in 1825. The first car was run in Boston by the Cambridge Railroad Company in 1836, and in the fall of the same year the old Metropolitan Railroad began to run its cars between Roxbury and Boston. Both of these companies subsequently became parts of the existing West End system, and it is an interesting fact that both the Metropolitan and the West End roads have, successively, been the largest street railway corporations in the world. Today, I believe, the West End is exceeded in mileage and equipment by one road only—that in Philadelphia. But incidentally I may say that it appeared here the other day, as you will remember, that, whereas in Philadelphia the mileage exceeds that of the West End by about 33 per cent, its capital exceeds the capital of the West End by about 100 per cent.

The success of the street railway in New York, and of the Cambridge and the Metropolitan railways in Boston, was such as to lead to the application for many charters prior to the sixties. Some were operated and some were not. Difficulties were encountered, as, for example, in the case of the Cambridge Railroad, which found itself in the position of having its tracks torn up in the streets of Cambridge, and finally, when they came to equip the road, the original stockholders were unwilling to do it, and they had to organize another corporation and get fresh capital, which capital, as a matter of fact, furnished the cars which were first run from Cambridge into Boston. In this connection I may call your attention to a very interesting article, written by Prentiss Cummings, vice-president of the West End Company, entitled "The Street Railway System of Boston," published in the "Professional and Industrial History of Suffolk County," copies of which have been separately printed and can probably be obtained from Mr. Cummings.

The growth of this industry during three periods of 10 years each—that is, between 1866 and 1896 will be very strikingly shown by a table which I will now submit, from which the following facts, in brief, appear:

In 1866 the total mileage operated was 107; in 1896 it was 1,291. The car-miles run in 1866 were 4,952,248, and in 1896 they were 53,613,685. The capital stock and debt in 1866 were \$5,257,540, and in 1896 it was \$61,117,714. The gross receipts in 1866 were \$1,707,447, and in 1896 were \$14,900,941. From this it appears that 30 years ago the entire mileage of the street railways of Massachusetts was only about one-third of the present mileage of the West End system alone; that in 1876 that mileage had increased so that it represented about two-thirds of the present mileage of the West End system; that in 1886

TABLE A.

Growth of Industry in Last Thirty Years.

YEAR	Miles Operated.	Car Miles Run.	Capital Stock and Debt	Gross Receipts.
1866.....	107.82	4,952,248	\$5,257,540 00	\$1,707,447 35
1876.....	266.05	9,130,952	8,496,426 00	2,975,091 23
1886.....	407.64	19,661,675	14,590,374 00	5,878,583 05
1896.....	1,291.04	53,613,685	61,117,714 00	14,900,941 93

Capital stock of companies in Massachusetts Sept. 30, 1896, \$30,727,818  
 Net indebtedness (exclusive of capital stock) Sept. 30, 1896, 30,389,896

Total investment Sept. 30, 1896, \$61,117,714

that total mileage had grown so as to exceed the present mileage of the West End by about 25 per cent; while in 1896, the total mileage being about 1,300, the West End mileage constituted less than 25 per cent of the whole.

I have here another table, showing in detail the growth of this industry in the last 10 years. This table shows that the number of companies has increased in the last 10 years from 41 to 83; that the total investment has increased from about \$14,600,000 to over \$61,000,000; that the gross receipts have increased from less than \$6,000,000 to almost \$15,000,000; the car-miles run from less than 20,000,000 to nearly 54,000,000; the number of passengers carried from 112,000,000 to almost 300,000,000, the number of employes from 4,615 to 9,130, and the wages paid to employes from \$2,250,000 to an amount considerable in excess of \$4,000,000. This increase has been due principally to the introduction of electric traction.

Table B exhibits in detail the items of growth from 1886 to 1896, inclusive.

The first successful use of electricity in this Commonwealth was not, as has generally been supposed, by the West End Company, but by the Lynn & Boston Company. That company began to run cars by electricity in July, 1888; the West End, in February, 1889.

One of the curious facts connected with the sudden and wonderful development of electric traction in this Commonwealth is that in 1885, by chapter 337 of the Acts of that year, the Legislature, foreseeing the possible substitution of some motive power for horses, passed a law that companies might use cable as a motive power, but wholly ignored the possible use of electricity. In the West End Act of 1887 (chapter 413) that company was authorized to use cable and electric systems. The possibilities of electricity had at that time become sufficient to warrant the insertion of the word in the act; but the cable was really the motive power which the West End at that time intended and expected to use. In the early days of electric traction in this Commonwealth, the companies were generally incorporated by special acts, which gave them express authority to use electricity as a motive power. But, curiously enough, no general law has ever been passed authorizing the use of electricity as a motive power in place of any other. The companies depend today upon Public Statutes, chapter 113, section 39, which is to the effect that a street railway company "may use such power on its tracks" as the aldermen or selectmen may from time to time permit. Some doubt has been suggested as to whether this provision of law is broad enough to include the erection of poles and wires and the making of such surface and underground alterations as are necessary for the operation of the present modern electric railroad. But that question has

TABLE. B.  
Growth of Industry in Last Ten Years.

YEAR.	No. of Co's Organized.	No. of Co's Operating.	Construction and Equipment.	Total Investment.	Gross Receipts.	Miles Operated.	Car-Miles Run.	Passengers Carried.	No. of Em- ployees.	Wages Paid to Employees.
1886.....	41	40	\$10,577,627 60	\$14,590,374	\$5,878,583 05	407 64	19,661,675	112,087,384	4,615	\$2,257,584 71
1887.....	43	40	12,202,581 19	16,544,688	6,459,524 80	470.27	20,625,846	124,787,328	5,222	2,638,183 40
1888.....	44	38	12,933,255 08	18,464 101	6,860,504 32	533.59	23,244,767	134,478,319	5,531	2,688 730 85

1890.....	44	42	17,142,670 13	25,611,989	8,388,015 48	612.38	26,516,937	164,873,846	6,246	3,149,710 81
1891.....	54	51	19,859,405 16	31,210,768	8,901,123 36	672.45	27,670,166	176,090,189	6,449	3,254,477 94
1892.....	59	54	26,067,957 79	38,794,814	9,817,537 35	749 95	29,617,975	193,760,783	7,157	3,353,096 30
1893.....	60	54	33,681,321 89	49,589,688	10,894,704 11	874.14	34,507,282	213,552,009	8,070	3,285,926 00
1894.....	68	54	35,552,503 36	53,020,295	11,236,428 32	930.47	36,722,978	220,464,099	7,451	3,216,638 24
1895.....	75	58	37,151,041 24	55,357,081	13,246,371 98	1087.17	43,655,560	259,794,308	8,048	3,607,881 42
1896.....	83	77	42,389,132 47	61,117,714	14,900,941 93	1291.04	53,613,685	292,358,943	9,130	4,143,379 74

become so well settled now by usage that I suppose nobody would undertake to question the sufficiency of the general law for that purpose; at any rate we do not suggest any change in it.

## II. Status of Street Railways in Public Highways.

Having traced the history of the street railway, let me next refer to the history of roads themselves; because the history of roads and streets, the nature and theory of their uses, and the law which underlies those uses, constitute the secret of this whole question.

Highways of some kind or other are as old as civilization itself, but have been of very different kinds and qualities in different times and countries. The Romans built some of their wonderful roads in England, but these were allowed to fall into decay, and for centuries together such things as good roads were unknown in England. Macaulay, in his History of England, in commenting upon the wretched condition of roads in the time of Charles II., and upon the unsatisfactory social conditions for which that fact was chiefly responsible, deliberately expressed the opinion that inventions which abridge distance are more important to civilization than any others, the alphabet and the printing press alone excepted. In the times to which he refers a "coach and six" were not matters of luxury or extravagance, but were absolutely necessary, owing to the condition of the roads. When, only about 200 years ago, carriages were invented which were capable of making the journey from Oxford to London in one full day, instead of two, as had theretofore been required, they were such wonders that they were dubbed "flying coaches." A short time ago I saw an original copy of an old advertisement of a line of coaches which proposed to start in April, 1706, and make the journey from York to London; which advertisement stated that the coach "will perform the whole journey in four days (if God permits), and sets forth at 5 in the morning." These antiquated schedules were not owing to the fact that they did not have good horses in England at that time, or that the art of coach-making had not advanced so that they could make vehicles which would stand the journeys, but to the wretched condition of the roads; and I am surprised to find, upon investigation, that the art of road-building in England is hardly more than one century old. In this country it is familiar knowledge, that, prior to the invention of the present form of bicycle, really good roads were unknown outside of a few of the principal cities and their immediate suburbs.

The Indian's trail through the primeval forests was the forerunner of the highway in this country. That was followed by the path blazed by the pioneer, which was scarcely more dis-

tinct than the Indian's trail had been. The pioneer was followed by the settler, who made paths for driving cattle and for horseback travel. Finally the colonist constructed rude highways for the use of carts and, finally, for the use of carriages.

Up to this time the only use of highways, in fact or law, was the use for travel. Lord Mansfield said in his day that the only right the king himself had in the highways was a right of passage for himself and for his subjects (1 Burrows, 143); and such has been the law since the time of Edward IV., at least (16 Mass. 34). But gradually, from necessity, as civilization became more complex and the demands of the public became more numerous, the uses of the roads were multiplied. In the case of *Boston v. Richardson*, 13 Allen, 146 (1866), the Court said: "The right of the public in a highway, even when so ancient that its origin is unknown, is ordinarily limited to an easement for the purpose of travel." But they added: "Whenever land is taken for public use as a highway, and due compensation made, the public, or those corporations or officers who act as trustees or agents of the public, have a right to make any use of the land, directly or incidentally conducive to the enjoyment of the public easement, and which the necessity or convenience of the public may require."

"And such uses clearly include (besides the use for travel) the making of culverts, drains, and sewers under the highway for the cleansing of the streets and the accommodation of the inhabitants on either side."

In a more recent case, which I will refer to again presently, that of *Pierce v. Drew*, 136 Mass. 75 (1883), Judge Devens said: "It has never been doubted that, by authority of the Legislature, highways might be used for gas or waterpipes, intended for the convenience of the citizens, although the gas or water was conducted thereunder by companies formed for that purpose."

Certain other uses of the highway, besides those for travel, have been regarded in some jurisdictions as "in aid of the easement," as it has been put; as, for example, the location and maintenance of poles or posts for the support of public lights to light the highways. That use has been said to be in aid of the easement, because it is one of the methods of promoting the safety of public travel.

The question finally arose whether the presence of horse-railroad tracks in the streets was a new use, imposing a new servitude. That question was determined in the case of *Attorney General v. Metropolitan Railroad*, 125 Mass. 515 (1878).

Inasmuch as this is one of the vital points in our discussion, you will pardon me if I read a paragraph from that decision. The Court says: "The franchise granted to a street-railway corporation is not the grant of a right to appropriate without

compensation an additional easement in the soil of the street. Nor can such use of the street, under proper restriction, be considered as the imposition of an additional servitude upon the land of the owner. The peculiar privilege given is the right, not to acquire land, or an easement in land, but only the right, so long as permitted by certain municipal authorities, to lay tracks in streets already appropriated to the use of public travel for the purpose of facilitating such travel; to modify the public use, and change, to some extent, the law of the road. Such a privilege, however wide the street in which it is exercised, must always create some obstruction to other travel, and be to some extent exclusive; and this is true of all other kinds of public travel. The location of a highway creates a servitude which includes all forms of travel not prohibited by law, with the right in the Legislature to give to municipal or other corporations, or to private individuals, the power reasonably to modify the use of the same for travel, as public convenience and necessity, in the application of modern improvements, may from time to time require."

A more difficult question subsequently arose, as to whether the location and maintenance of telegraph poles (and the same question, of course, is applicable to telephone poles) was consistent with the original use of the highway, or was a new use and imposed a new servitude. In other jurisdictions—in New York and Minnesota, perhaps elsewhere—this has been held to be a new use of the public highways; but in one of the most thoroughly discussed cases in our reports the contrary view has been taken by the Supreme Court of Massachusetts. It was a case where the selectmen of a town were about to grant a right to a telegraph company to erect poles in the public streets, and certain abutting land-owners brought proceedings to restrain their action, on the ground that this was a new use of the highway, for which the Legislature had provided no new compensation.

This was the case of *Pierce v. Drew*, 136 Mass. 75 (1885). The majority of the Court in that case said: "When the land was taken for a highway that which was taken was not merely the privilege of traveling over it in the then known vehicles, or of using it in the then known methods for either the conveyance of property or transmission of intelligence. . . . The discovery of the telegraph developed a new and valuable mode of communicating intelligence. Its use is certainly similar to if not identical with that public use of transmitting information for which the highway was originally taken, even if the means adopted are quite different from the postboy or the mailcoach. It is a new discovered method of exercising the old public easement."

Two able judges, however, took the contrary view. They regarded the analogy from the street railway to the postboy and the mailcoach as "a somewhat remote analogy;" but they distinctly agreed with the doctrine of *Attorney-General v. Metropolitan Railroad*, to the effect that the establishment of a horse-railroad track in highways did not impose a new servitude upon them, and say that that decision is "founded on just principles."

On the other side of the line are steam railroads, whether on the surface or in the air. The leading case with respect to steam roads is that of *Williams v. New York Central Railroad*, 16 N. Y. 97.

There it was held that the dedication of a street in Syracuse to public travel did not include, in anticipation, the use of it for a steam-railroad track. Anybody who has ever had the experience, as I have, of attempting to sleep in a hotel located on that street will readily agree with the view which the Court took of its uses for railroad purposes.

It has also been held in the State of New York that an elevated railroad, which occupies practically the whole street and a portion of the sidewalks with its tracks, and runs cars 11 ft. high, at high rates of speed, by means of steam locomotives, emitting smoke and cinders and dust and gas, and creating a great deal of noise and disturbance, and undermining the peace and comfort of all the people along the road, constitutes a new use of and imposes a new servitude upon a public street. The correctness of that view is recognized in our state, because the reason why the Boston Elevated Railway must use the Subway is because it will thereby avoid payment of enormous

damages to property, which would arise if the road was erected in the streets in the business section of the city.

But some people thought that the previous decision might not include the electric street railway. And so a bill in equity was brought to restrain the building of the West End road in certain streets in Cambridge. It is the case of *Howe v. The West End Street Railway Company*, 167 Mass. 46 (1896).

Inasmuch as this involves one of the precise issues which we are discussing, you will pardon me if I read a few words from the language of Chief Justice Field:

"The electric railway of the defendant as now constructed and used is something intermediate between the street horse railway and the ordinary steam railroad."

"It is obvious that the use made of a public way in the operation of an electric railway is of the same general kind as that for which the way was originally laid out, viz., the transportation of persons and things from place to place along the way. It is equally obvious that the actual operation of the electric railway shown in the present cases does not exclude ordinary travel from the way; that there is no exclusive occupation by the railway of any part of the surface of the way, and that the overhead structure is incidental to the use of the surface way, and does not prevent the public from using the way in the ordinary manner. . . . The whole system of street railways is founded on the theory that the use of the ways by the railways must be consistent with the use of the ways by other travellers at the same time."

So it is settled in Massachusetts, finally and deliberately, that the electric street railway, as it exists today, in its most aggravated form, as it might be termed, does not constitute a new use of the public highway or impose a new servitude upon it, but is entirely consistent with and similar to that for which the highway was originally dedicated.

It is well enough to remember that even the driving of cattle through the streets is a use which has been held to be consistent with the ordinary use of the highways. Originally, our highways were nothing but cattle-paths; and the right to drive cattle through these paths having been acquired in ancient days, the right remains in the streets of modern cities. I suppose a drove of cattle might be today driven through Washington street, in Boston, with impunity, unless some police regulation of the city might thus be violated.

In very recent times a new use of the highways, in the ordinary sense of the term, has grown up and become very important, namely, the use by bicycles. I have no fault to find with the modern bicycle; I am somewhat of a devotee to it myself; and yet of all the nuisances that exist on earth I sometimes think that the bicycle is the chief. It is, at times, practically exclusive of other uses of the highway. Every one who wants to use the highway for any other purpose knows this to his sorrow. And yet nobody has suggested that the people who make this aggravating and sometimes almost exclusive use of our highways are subjecting them to a peculiar use for which they ought to pay something in the form of extra taxes.

In New York they now have motor cabs; in Newport, and perhaps other places, they have motor carriages; the fire-engine propelled by steam is already with us; and other new (in the sense of unusual) uses of the highways are likely to develop rapidly.

Nobody would suggest that these new-comers should pay for the use of streets in the form of extra taxes. And yet nobody knows how far these new uses may be multiplied and developed.

The following may therefore be named as existing uses of highways which are regarded as within the classes of uses for which highways in Massachusetts have been dedicated; namely, the uses made of them by pedestrians, equestrians, carriages—public and private—express wagons, drays and carts of all descriptions, for moving merchandise, coal, iron, lumber, granite, furniture, etc., cattle, bicycles and tricycles, motor carriages, omnibuses, and street railways.

All these involve more or less wear and obstruction of highways, and more or less curtailment of other uses. But all uses must reconcile themselves to each other, and any use is tolerated which is consistent with the original purpose of the highway, and will promote the convenience of the public.

In addition to the use for travel, the following other uses may be mentioned as having been held to be incidental to the original purposes of the highway, and not imposing a new servitude: Underground pipes for drains, sewers, gas, water, electricity, steam, etc., and overhead poles and wires for telegraph, telephone, light and power lines, signal apparatus and other purposes.

*But the highest of all uses is that for travel.* None of these uses are specially taxed and none ought to be.

### III. Use of Highways by Street Railways No Reason for Special Taxation.

#### 1. THE NATURE OF THE USE.

It has been aptly said in this hearing that the street railway car is "the people's omnibus," a mere improvement of the old omnibus or stage-coach, running for purposes of convenience and of economy, along two rails laid on the surface of the road. I think I can safely venture the statement that all other methods of public travel in public highways put together do not promote the original purpose of highways as much as does the use to which the street railway car subjects them. It is, therefore, a natural use, a legal use, and it has come to be the most popular and the most beneficial use to which the streets can possibly be put.

To tax these conveyances—these people's omnibuses, which are making the most popular, the most useful, the most comprehensive, the most convenient, the most economical use of public highways—involves as a necessary corollary the taxation of the omnibus, the cart, the dray, the heavy team, and whatever other mode of travel subjects the highways to use and the communities in which the highways are located to expense. When you get to that result you have re-adopted the idea of the old toll road, where every "chariot" (as it was called on an ancient signboard which I saw a short time ago), and every cart and every horse and every sheep had to pay its way over the public roads.

I notice a significant shake of the head on the part of one of the members of this Committee. If I have not made this matter plain by reference to the history of roads, and by citations of decisions of our courts, I am fortunate in being able at this point to call attention to an opinion (which, by the way, I had not read until after I had formulated my own) given by a body of men who are perhaps better qualified than any others in Massachusetts to express an intelligent opinion upon this subject. If you will refer to the Railroad Commissioners' report for 1896, you will find on page 110 some significant language upon this point, which I would not have read except for the incident to which I have just referred. I am a little afraid that it might not otherwise be read by the Committee, and I will therefore take time to read it.

The Chairman:—My only thought was that it seemed to me you might go still further in your argument in the same line, without danger.

Mr. Burdett:—I have gone far enough for my purpose, Mr. Chairman.

The Chairman:—I thought you might go still further, that was all, sir, with perfect safety.

Mr. Burdett:—You will pardon me for reading an extremely well put and succinct argument upon this subject from the Railroad Commissioners' report:

"The railway is not to be regarded as an intruder, having no legitimate place or right to be on the public street. It is nothing more nor less than an improved method of public highway travel. The use of the highway by one method of travel necessarily interferes to a greater or less extent with the convenience and safety of its use by other methods. There are well-known inconveniences and dangers to other travellers attending the use of the highway by travellers in street cars. It must be conceded, however, that there is no known method of conveyance by which such large numbers of persons can be transported through the streets with so much convenience, expedition, and safety to themselves and other travellers, with so little noise, confusion, and dirt, and with so little obstruction and wear and tear of the street, as by the electric railway."

Nobody has ever accused the Massachusetts Railroad Commission, as now constituted, of being unduly prejudiced in favor

of electric street railways, and the language just quoted is the language of a quasi-judicial body, knowing all the facts. They continue:

"There are carried on the railways whose lines center in Boston, an average of 425,292 persons daily—a number equal to nearly 86 per cent of the entire population of the city. The great majority are carried through the most crowded thoroughfares. If it were possible to transport the same number of persons by any other available method of public or private conveyance, the obstruction, annoyance, and danger would on the whole be much greater than they now are."

That is a fact which people forget. No other method can be suggested by which so many people could be put through the streets of Boston without confusion if not chaos. They further say:

"It has been more or less seriously proposed to make the ordinary use of the surface of the street for railway purposes a source of revenue or relief to the municipal treasury, either by sale of the railway location, or by an excise on cars, or a tax on earnings, or by requiring the railway company to pave or otherwise maintain the surface of the entire roadway."

They recognize in this opinion, that paying is a tax, and I shall have occasion to refer to that a little later on.

"There is no reason why the railway company should not pay a tax on its corporate franchise and property such as other similar corporations pay. It is also proper that it construct at its own cost the tramway specially adapted to its use, and keep the portions of the roadway adjacent thereto in safe condition for other travel, as is now required by statute. These charges are a part of the cost of transportation which the passenger must expect to pay. Beyond this, it is not easy to see why one who carries passengers for hire in a car should be subjected to a tax for the use of the street, any more than one who carries passengers for hire in an omnibus, or who carries merchandise for hire on a dray. The radical objection to the proposed impost is not, however, that it is a burden on the railway company, but that it is a tax on the traveller. A tax on the carrier is a tax on the passenger. Whatever fare the railway passenger might otherwise have to pay, he must pay in addition to that fare his proportion of the tax; and the possibility of the reduction of his fare is to that extent postponed. Nothing has hitherto been more free than the use of the highway, for all persons, and for all purposes of travel or transportation. There is no good reason why the person who travels in a street car should pay, directly or indirectly, for the privilege of travelling on the highway, any more than the person who travels in a public coach or in his private carriage."

#### 2. THE REASON OF THE USE.

Why do street railway companies use the public streets? Is it a matter of choice with them? Is it a matter of preference on their part? Not at all. The highways are used by street railways as a matter of necessity, to meet the public demand for that exact use of the highways; and it is largely from the fact that the steam railroad is located at a distance from the regular lines of travel, and, unlike the electric road, does not land its passengers at the doors of their offices and their houses, that this other use of the highway is required by the public. I am inclined to think, from such examination of the figures as I have been able to make, that if the street railways might be permitted outside of the large cities, where, of course, it would be impracticable to go upon private land and buy their way and own their road-bed, and exclude from that road-bed all other forms of travel, they would be financially better off than they are to-day. But the curious fact is, as I understand it, that under the present laws of Massachusetts, a street railway corporation goes outside of the terms of its corporate franchise when it buys a piece of land and constructs its road over it. I know of a case now where a railroad company is desirous of buying and using land along the side of the highway, but is unable to do so because the laws of Massachusetts are not sufficient for that purpose. What sense is there in talking about a special tax upon an industry which uses the highway in promotion of the principal uses of the highway, and uses it because the public demands that that particular use shall be made of it?

### 3. THE CHARACTER OF THE USE.

A single word as to the peculiar character of the use. That use is monopolistic, confessedly monopolistic; but it is necessarily monopolistic and preferably monopolistic. And no person with correct ideas upon these questions would for a moment suggest that it ought to be anything but monopolistic. The impracticability and inadvisability of the operation of two street railway lines through the same streets is too apparent for argument. Companies consolidated into large and important corporations, under the regulation, as they are, of State boards of the strictest control, operating in streets to the exclusion of other companies of the same kind in the same streets or in the same towns and cities, give the public better service and better satisfaction in every way than competing companies could do.

### IV. Do Street Railways Increase the Cost of Maintenance of Roads?

If I have succeeded at all to this point, I have demonstrated that neither in law nor logic is there reason for the suggestion that this particular class of corporations ought to be subjected to any peculiar excise for the use which it makes, in common with other users, of the public highways. But underlying the other argument—and this I believe to be the only premise which can be safely assumed by the other side—is the proposition that, admitting there is no just ground in law or logic for the special taxation of these corporations for their use of public ways, yet that they subject these ways to a peculiar and extraordinary expense, and ought to be required to pay something in the nature of reimbursement for that expense. I think I have not heard it put just that way, but that is the most favorable way of putting it for the other side. We have heard a great deal said about charging rentals for the use of the public highways, which is a ridiculous proposition, inasmuch as there is nothing to rent. There is no title in the street, as we shall presently see, in the municipalities which control them. We have heard a good deal said about taxes and excises, but not much about reimbursement, which, as I say, would be the strongest statement of the case.

Assuming the claim of extra expense to be true, that is no reason for the imposition of special taxes, because all forms of use of public highways for purposes of travel involve some expense to the municipalities in which the highways exist; and it is therefore only a question of degree whether this, that, or the other use subjects the town in which the highway is to more or less expense. As soon as you begin to impose taxation because the degree of use in one case is greater than in another, you lose sight of all general principles, and are adrift. So that, if you assume the fact to be that the use of highways by street cars subjects those highways to extra cost, that in itself constitutes no reason for special taxation of the company which operates the cars.

But what is the fact about it? Do or do not street railways subject highways to a use which involves additional expenses upon municipalities? I shall not discuss the evidence which has been put in upon that point. You have heard some evidence upon it,—good, bad, and indifferent,—some very loose statements, and some more accurate statements. The principal witnesses may be said to be the superintendents of streets of Brookline and Springfield, on the one side, and an ex-mayor of Springfield and an ex-superintendent of public works of New Bedford, on the other. The Brookline official did not undertake to give any figures, but simply gave his impressions from observation, that in macadamized roads the extra cost of maintenance is a good deal, according to the width of the road. The Springfield official published a paper (which I had reprinted for the information of those concerned), in which he undertook to give some statistics; but it turned out that in the entire list of streets which he named there are but two where there are any street railway tracks and those are practically continuous.

Mr. Drake, of New Bedford, after a very careful and exhaustive study of the well-kept books of the street department of that city, showed that that city, at any rate, has been subjected to a larger expense for streets that are not encumbered by tracks than for those that are. The explanation seems to be that, in some cases, ordinary travel avoids the streets where the tracks

are; but upon the whole, his evidence tended strongly to show that it is at least doubtful, all things considered and all places taken together, whether the presence of tracks in any but the narrowest roads really subjects the other portions of the road to such a great deal of additional wear as has been claimed. In the case of streets that are paved from curb to curb, I believe nobody pretends that there is any great difference in expense; nor do they pretend that there is any great difference of expense where the railways are laid along one side of the public road, as is usually the case in the rural sections of the State; but it is only where the tracks are put in the middle of a macadamized street, not sufficiently wide outside of the tracks themselves to accommodate the travel, that this extra expense is incurred to any great extent.

I think, Mr. Chairman, that an intimation dropped by you at the first hearing is one which may well be borne in mind in the discussion of this question. The intimation was, as I understood it, that the art of road-building in the United States, even in Massachusetts, has hardly begun to be developed. In comparison with the state of the art in Europe. While you found there street railway accommodations which cannot for a moment be compared with those in Massachusetts, you also found such roadways that the presence in them of the street railway tracks constituted, practically, no obstruction to other travel. Let our municipal road-builders give us better roads, as they ought to do and will do in time, and much of the complaint against the car tracks will disappear.

### V. If Street Railways Increase Cost of Road Maintenance They Make Ample Returns Therefor

But assuming, if you will, that, all things considered, these companies do subject the municipalities in which they operate to larger expenses for road maintenance than would otherwise be the case, and that that is a sufficient reason for subjecting them to extra taxation, I announce, without any hesitation, that the companies make ample and sufficient returns therefor.

#### I. DIRECT TAXATION.

In the first place, they make returns in the form of direct taxation. They pay local taxes upon all their real estate and machinery, and they pay to the Commonwealth a franchise tax upon the full value of their shares, after deducting the valuation of their machinery and real estate. (Public Statutes, ch. 13, § 39.) I have here a table showing the growth of taxes upon these companies for the last 10 years. The result of it is, that while the increase in the number of companies has been 100 per cent, the increase in the total taxes paid by them has been 298

**TABLE C.**  
**Taxes Paid, 1886-1896.**

YEAR.	Total Taxes.	Average per Co.	No. of Co's Paying Taxes.	Taxes per Passenger.	Taxes and Interest per Passenger.
1886 ....	\$131,356 15	\$4,529 52	29	\$0.00117	\$0.00212
1887 ....	196,311 66	5,948 83	33		
1888 ....	190,474 74	5,952 33	32		
1889 ....	227,123 24	7,326 55	31		
1890 ....	284,979 33	7,916 09	36		
1891 ....	324,106 79	7,537 36	43		
1892 ....	404,721 22	9,636 24	42		
1893 ....	455,339 94	10,841 42	42		
1894 ....	418,999 37	9,976 17	42		
1895 ....	488,138 01	9,571 33	51		
1896 ....	523,346 19	9,023 21	58	0.00179	0.00389

1886-1896: Increase in number of companies, 100 per cent.  
 Increase in total tax, 298 per cent.  
 Increase of taxes per passenger, 52½ per cent.  
 Increase of taxes and interest per passenger, 83½ per cent.

per cent. You may say that does not prove anything, inasmuch as the increase in the number of companies may not represent the actual increase in the investment. That is true, but the table contains other figures, which show that the companies pay, proportionately, in the form of taxes, much more than they did 10 years ago. The increase in taxes paid by the companies per passenger carried—which is a proper unit—was 52½ per cent in the last 10 years. When interest on funded and unfunded debt is taken into consideration, as well as taxes, the charge or expense per passenger carried has increased to the enormous extent of 83½ per cent in the last 10 years.

The gentleman who represented before this Committee the Citizens' Association of Boston, found fault, as he always does, with the fact, as he claims it to be, that a street railway pays no more taxes than a bank or a mill situated in the same town or city. In the first place, it ought not to pay any more; it ought to pay nothing but proportional taxes. In the second place, it does pay more if it has more to pay upon. Why? Because that which gives value to the franchise of a street railway company is the presence of its tracks in the public streets; and so far as tracks make the stock of the company valuable, so far that value enters into the franchise tax which is assessed by the Commonwealth upon the aggregate value of the property and franchise of the company. A bank has nothing in the public streets. A mill has nothing in them. But so far as the tracks of a street railway company constitute an element of value, just so far that element of value enters into the tax which the Commonwealth assesses. Therefore, the street railway company does pay more than the mill or the bank, which has nothing of the sort to pay upon.

## 2. INDIRECT TAXATION.

In the second place, these companies make a still larger contribution to the public in the form of what I call indirect taxation. The items of paving, both original and renewals, road widening and grading, bridge strengthening and building, removal of snow and ice, accommodation of public authorities in the construction, removal, and repair of pipes and sewers of all descriptions, constitute these taxes. From returns which I have recently received from some of the companies, I have taken the paving expenses of five companies at random, outside of Boston. These companies were organized at various times; some are old and some are comparatively new. But they have together invested the sum of \$1,120,722 in pavements alone. The items are: Round paving, \$224,575; block paving, \$890,745; other paving, \$5,402. Some of the figures are estimated and some are exact. If the Committee wishes, I will furnish it with all figures on this subject which I have succeeded in collecting. The assertion has been made in this State House more than once, and has not been contradicted, that the West End Street Railway Company has at least \$2,000,000 of its capital invested in pavements in the streets of Boston and the surrounding towns and cities. I give these items merely to show the enormous aggregate that that charge becomes in the course of years. They have been accumulating a good many years in some cases, so that the charge per annum might not be regarded as very large. I do not want to be understood as saying or admitting that the annual expense for paving in Massachusetts—taking all the companies together—is equivalent in amount to any of the new taxes which have been suggested. I only say that the aggregate investment in paving has become very large in the course of years.

I do not need to discuss the testimony which has been given here as to the amount of these indirect taxes in other forms; but I beg you to bear in mind what different gentlemen have said as to how they have been called upon to widen highways, without expense to the communities in which they are located; how they have re-graded highways in many cases; how they have made boulevards out of cart-paths; how they have strengthened and, in some cases, built bridges; and how they have in various other ways made substantial money payments to or for the benefit of the public, in consideration of the privileges which have been granted them. In some cases, for example, they have paid astonishingly large amounts, not counting inconvenience and loss of traffic, in accommodating themselves to public works, such as the laying, repairing, and moving of sewers and water-pipes and things of that description. If you think it material to

go into an investigation of this item, you will find that these companies return to the communities in this form very considerable amounts, for which they should be credited.

## 3. CONTRIBUTIONS TO THE PUBLIC.

But perhaps more important than anything that I have yet mentioned are the contributions which the companies make to the public in another form. Take the matter of the increase of valuations. I will not inflict upon you statistics on that point. They are difficult to gather, and must be taken with a grain of salt. There has of course been a natural growth of population and of valuation in Massachusetts; but the growth in valuation has undoubtedly been very much promoted and accentuated and accelerated by the opening of the lines of street railway companies. In the case of the same five companies to which I have before referred, the increase in valuations in the towns and cities where they operate, since the adoption of electricity, has been \$51,839,818, and the average yearly increase since the adoption of electricity has been \$10,793,243. And the testimony shows that very much of this is directly due to the introduction and development of electric traction.

Mr. Storey, a gentleman who unselfishly devotes a portion of his time and thought to the consideration of public questions, made the astonishing statement here, that, in his opinion, the town of Brookline is no better off than it was before the advent of the electric railway, because, as I understand him, the taxes are no less than they used to be. And yet I was interested to find that the municipal expenditures of Brookline in 1886 were \$303,863, and that those expenditures had increased in 1896 to the sum \$955,949—an increase of 58 per cent without the increase of a single foot of territory. Brookline, making this expenditure in 1896 as against the smaller one in 1886, without any increase of territory, seems to me to be much better off than it was before. There has been an increase in population in that time almost exactly proportionate to the increase in municipal expenditures; but that increase in population has been largely brought about by the introduction of the electric railroad. The people who have moved in have brought money with them, have

TABLE D.

*A.*—Railroad depot three-quarter mile from the populous part of the city. Street railway through main streets.

*B.*—Stage.

*C.*—With change of cars.

*D.*—Line not yet started.

The street railway companies furnishing these accommodations have paid dividends of from 4½ to 6 per cent.

bought property, have improved it, and thus have added to the municipal valuation. All things considered, that community of 16,000 people to-day enjoys much better accommodations and conveniences, and is far richer and better off, than the community of 10,000 people in 1886.

But I think I would be willing to place over and above all the things which I have mentioned the enormous contribution to the public which has been made by the companies in the form of increased facilities. You will remember particularly the testimony of W. B. Ferguson, who has probably had an experience as large as, if not larger than, that of anybody else in this State, in the exploitation and management of suburban or country roads. Some of the figures which he gave, off-hand, without a note, were most astonishing in their character. P. F. Sullivan, of Lowell, unquestionably the ablest statistician in this business, gave to you a statement of the facts with respect to Lowell and the towns and cities adjacent to that city. I have compiled a table from the stenographic report of the testimony of Mr. Ferguson and Mr. Sullivan, which is very interesting and instructing upon this point, and which I will now submit.

Take Lowell, for example. In old times the fare between Lowell and Tyngsboro, on the railroad or the stage-coach, I don't know which, was 17 cents, and there were 4 trips a day; today the people travel between the same places for 10 cents, and have 34 trips a day. In old times the fare from Lowell to North Chelmsford was 9 cents, with 6 trains a day; now it is 5 cents, with 53 trips a day. Take some of the other cases: The fare from Worcester to Leicester by stage, before the advent of the electric railway, was 25 cents, and the stage made 2 trips a day; people can now go for 10 cents 50 times a day between those places. Between Haverhill and Amesbury the old fare was 65 cents, with 4 trips and a change of cars; today the electric railroad takes the people between those points for 20 cents and gives them 40 trips a day.

One of the most marked cases which was testified to was that of the route between South Framingham and Milford or Hopdale. In old times—or, rather, in very recent times—one had to leave Boston not later than 5 o'clock to connect at South Framingham with a branch railroad, in order to get to Milford the same night, and at an expense of 27 cents for the transportation. Now one can leave Boston at any time prior to 9 o'clock, and on Saturdays 11 o'clock, in the evening, and can connect with the street railway at South Framingham, and get home the same night, for 15 cents.

Between Medway and Milford—and that was a case, I remember, where the testimony showed that the entire highway was rebuilt by the electric railroad—the old fare was 30 cents, with 4 trips a day and a change of cars; whereas now the fare is 10 cents, with 16 trips a day.

And the roads giving those facilities to the public have paid only small dividends to their stockholders, without accumulating surpluses or making proper charges for depreciation.

You will also recall the testimony of N. Sumner Myrick—a professional gentleman, connected with several roads in suburban or country districts. He told you how, in some cases, the district schools in the outlying portions of country towns had been discontinued and the children transported by the electric cars to the village schools and given the privileges of a better education; and how the farmers and the people who go to sewing circles and to prayer meetings, and to other social and religious gatherings, nowadays go by electricity, rather than behind the old nag or on foot as they used to do.

In short, these roomy, clean, safe, attractive, well-lighted, well-heated, easily propelled omnibuses are not only carrying our people from door to door, but from town to town; are not only promoting social intercourse and furnishing additional facilities for healthful and reasonable recreation, but are increasing the values of the property, and facilitating the transaction of the business of our people; are transporting them more comfortably, more quickly, more cheaply, and more satisfactorily than ever before; and in many other respects are adding daily and yearly to the convenience and happiness of our

## VI. The Companies Cannot Carry Greater Burdens.

But whatever may be the truth with respect to the issues which I have so far discussed, I maintain that the street railway companies of Massachusetts today cannot bear any heavier bur-

den than they now carry. Corporate bankruptcy, reduced wages, or diminished facilities are inevitable, if any great raid is to be made upon their finances in the shape of extra taxes. Right here lies a fundamental difficulty in the public mind. Owing to the enormous increase in mileage and in the number of passengers carried and in the amount of the gross receipts of these corporations, the public has jumped to the conclusion that the business of electric railroading is nothing short of a Klondike bonanza. But quite the contrary is the fact. I suppose the average man who pays his 5 cents in a railway car in Boston thinks that he is making the West End a present of a large amount of money; but, in fact, the labor alone employed on the West End road takes nearly one-half of the 5-cent fare, and when the other expenses are paid, the stockholder gets only about *three-fifths of one cent* as his share of that fare. The fact is: *The introduction of electric traction has not increased the net results of operation.*

In the last 10 years, during which these roads have grown up, while the number of companies and the mileage and the gross receipts have increased as I have already stated, and while the aggregate dividends have increased from less than half a million to almost two million dollars, the rate of dividend has hardly increased at all, and it remains today at the very low figure of 5.87 per cent of the total capital invested. The following table gives the figures for the last 10 years:

**TABLE E.**  
*Dividends, 1886-1896.*

Year.	No. of Co's. Operating.	No. of Co's. Paying Dividends.	No. of Co's. not Paying Dividends.	Total Dividend.	Highest Rate, Per cent.	Lowest Rate, Per cent.	Average Dividend Rate for All Co's., Per Cent.	Average Dividend Rate for Co's. Paying, Per Cent.
1886	40	22	21	\$494,070 00	12A	2	5.41	6.73
1887	40	25	19	530,920 00	13	2.5	5.26	6.29
1888	38	21	25	625,616 67	10	3	5.74	6.72
1889	39	21	25	838,649 00	10B	2	6.82	7.61
1890	42	25	23	965,154 00	10	1	6.47	7.15
1891	51	22	34	1,100,015 00	10	3	5.63	6.44
1892	54	21	39	1,582,696 50	10	3	6.72	7.81
1893	54	25	35	1,716,637 50	10	1.5	6.63	8.22
1894	54	30	38	1,610,886 00	10.5	1	5.97	7.00
1895	58	33	42	1,606,196 00	9	2	5.76	6.63
1896	77	43	40	1,802,847 00	10.5	1.25	5.87	6.82

A. — One company (Naumkeag), with capital of \$150,000, paid special dividend of 22 per cent. on \$70,000.

B. — One company (Merrimac Valley) paid 42½ per cent. on \$80,000.

The Railroad Commissioners' Report for 1897 shows that of the 77 active companies 34 paid no dividends and 43 paid dividends ranging from 1¼ to 10½ per cent.

The number of companies paying dividends within these limits is interesting and instructive in this connection. For the year ending September 30, 1896 (the date of the last returns), the companies paid dividends as follows:

34 companies paid dividends of.....	0	per cent.
1 company paid dividends of.....	1 25	"
1 company paid dividends of.....	2 5	"
1 company paid dividends of.....	2 15	"
2 companies paid dividends of.....	3	"
3 companies paid dividends of.....	4	"
2 companies paid dividends of.....	5	"
12 companies paid dividends of.....	6	"
1 company paid dividends of.....	6 5	"
2 companies paid dividends of.....	7	"
9 companies paid dividends of.....	8	"
1 company paid dividends of.....	9	"
1 company paid dividends of.....	9 5	"
1 company paid dividends of.....	10	"
1 company paid dividends of.....	10 5	"

In the above table the West End company is put down twice, as it paid 7 per cent on common stock and 8 per cent on preferred stock.

The company credited with paying the highest dividend, 10.5 per cent, in fact paid 8 per cent on \$100,000, and 2.5 per cent on \$300,000.

One company credited with paying 8 per cent paid 5 per cent on \$50,000, and 3 per cent on \$90,000.

One company credited with paying 6.5 per cent paid 3 per cent on \$125,000, and 3.5 per cent on \$187,500.

The following companies paid the dividends put down against them upon less than their full capital stock:

One company paid 8 per cent on \$250,000 only, out of \$400,000.

One company paid 7 per cent on \$300,000 only, out of \$400,400.

One company paid 6 per cent on \$600,000 only, out of \$800,000.

One company paid 6 per cent on \$400,000 only, out of \$600,000.

But when we come to examine the net earnings and the surplus accounts of these corporations, and try to find the surplus profits which they have accumulated over and above the payment of very moderate dividends, we have some surprising figures to deal with. In 1886 the net surplus was \$1,453,602; in 1896 that surplus had fallen, notwithstanding the enormous increase in business and capital, to \$510,609. The percentage of that surplus to the capital invested had fallen during that 10 years from 15.01 per cent to 1.66 per cent—almost the disappearing point. If you will consult the next table you will find that it has been since the introduction of electricity that these drops have become most positive and most startling.

**TABLE F.**  
**Net Earnings and Surplus.**

YEAR.	Net Earnings.	Surplus.	Per Cent. of Net Receipts to Gross Receipts.	Per Cent. of Surplus to Capital Stock.
1886.....	\$1,026,774 90	\$1,453,602 92	17.46	15.01
1887.....	919,160 73	1,402,900 83	14.22	13.89
1888.....	1,096,852 79	1,111,490 72	15.86	6.82
1889.....	1,372,690 42	723,764 92	18.10	5.91
1890.....	1,813,942 56	740,319 88	21.62	4.74
1891.....	1,778,830 01	607,983 68	19.98	2.90
1892.....	2,356,312 40	950,771 35	24.00	3.55
1893.....	1,993,399 62	673,526 47	18.29	2.09
1894.....	1,812,668 30	760,687 78	16.13	2.30
1895.....	2,257,355 40	681,048 58	17.04	3.06
1896.....	2,280,775 71	510,609 51	15.30	1.66

**TABLE G.**  
**Average Investment per Mile of Track.**

YEAR.	Amount.	YEAR.	Amount.
1886.....	\$32,660 61	1892.....	\$46,215 54
1887.....	32,670 22	1893.....	53,367 28
1888.....	32,303 80	1894.....	52,963 10
1889.....	33,887 73	1895.....	49,120 00
1890.....	38,279 58	1896.....	46,372 66
1891.....	40,917 56		

The difference between 1886 and 1887, as you will observe, was scarcely more than 1 per cent. But in 1890 it was only 4.74 per cent; 1895, 3.06 per cent, and now it is down to 1.66 per cent.

The percentage of net receipts to total income, which is another test of the solvency and success of corporations, has also fallen during this period, although in not so marked a degree as the surplus to which I have referred,

During this same period the average investment per mile of track has increased \$13,712.05, or 42 per cent.

Let us apply another test by the use of a table showing the density of traffic during the last 10 years. The average number of persons carried per mile of main track operated in 1886 was

**TABLE I.**  
**Net Earnings, 1886-1896.**

YEAR.	No. of Co's.	Average Net Earnings per Mile Operated.	Average Net Earnings per Car-Mile Run.
1886.....	29	\$2,350 57	.0522 cts.
1887.....	32	1,868 22	.0446
1888.....	26	1,990 69	.0472
1889.....	29	2,360 60	.0566
1890.....	31	2,911 62	.0684
1891.....	32	2,639 21	.0643
1892.....	33	3,112 70	.0796
1893.....	34	3,218 18	.0835
1894.....	42	3,644 16	.0923
1895.....	49	3,767 80	.0938
1896.....	66	3,315 85	.0799

274,961, and in 1896 it had fallen to 226,453, or, excluding the West End, it had fallen from 150,647 per mile of main track operated to 121,396. That is to say, although the number of passengers carried, taking the whole state into consideration, had increased 60 per cent during that 10 years, the density of traffic per mile of main track operated had decreased 17.64 per cent, or, leaving out the West End, the traffic had increased 384 per cent and the density of traffic had decreased 19.42 per cent.

During those 10 years, the average net earnings per mile operated had increased from \$2,350.57 to \$3,315.85, and the average net earnings per car-mile run, from .0522 cents to .0799 cents.

Referring back to Table B, we find that there has been an increase in total investment of 318 per cent, while from Table I we see that there has been an increase in net earnings per mile operated of only 41 per cent and an increase per car-mile run of only 53 per cent.

Here is a still more striking and discouraging table. Between 1886 and 1896, while the number of miles operated has increased

**TABLE J.**  
**Total and Average Gross Receipts.**

YEAR.	Miles Operated.	Gross Receipts.	Average Gross Receipts per Mile Operated.	Car-Miles Run.	Average Gross Receipts per Car-Mile Run.
1886.....	407 64	\$5,878,583 05	\$14,421 01	19,661,675	\$0 2948
1887.....	470.27	6,459,524 80	13,735 77	20,625,846	0.3131
1888.....	533.59	6,860,504 32	12,857 25	23,244,767	0.2822
1889.....	571.65	7,554,509 06	13,215 26	24,259,491	0.3114

## THE STANDARD SYSTEM OF ACCOUNTS.

216 per cent, and the gross receipts have increased 153 per cent, and the car-miles run have increased 172 per cent, the average gross receipts per mile operated, which is the proper unit, have decreased 20 per cent, and the average gross receipts per car-mile run have decreased 57 per cent.

Referring to the aggregate surplus shown by the returns of 1894-5, which was only \$234,304 for the entire street railways of Massachusetts, the Railroad Commissioners very aptly say that this is "close figuring," considering the amount of capital invested and business done. (R. R. Comms. Rep. 1896, p. 106.) And during all this time, while the surpluses of the companies have been diminishing, there have been practically no charges for depreciation.

I beg to call your particular attention in this connection to the Railroad Commissioners' Report of 1896, page 106. Discussing this question of whether or not the roads have increased in prosperity since the introduction of electricity, they say:

"The inference from the foregoing statement might naturally be, that the street railway companies are largely adding to their net revenues from year to year, and earning if not paying more liberal dividends, or piling up a more abundant surplus. A closer and more careful scrutiny into the results and present conditions of street railway service does not sustain this conclusion."

Then they go on to discuss all the elements, which I should like to read, if I did not think it was an imposition to do so, giving the comparative results of street railway operations between 1885 and 1895, and say:

"The truth appears to be that the electric railway is not on the whole earnings so large a net percentage on the capital invested, or paying so large a dividend to the stockholders, as did its predecessor, the horse railway; and this will be found to be as true with respect to the city as the country railways, taken as a class."

They then proceed to discuss the figures (pages 108 and 109), which will be found interesting and instructive, and conclude as follows (p. 110):

"It is not by any means intended to convey the impression that electric railway operation is, or is destined to be a financial failure. The idea that it is likely to prove a source of extraordinary or abnormal profit must, however, be abandoned. It is a close business, yielding with skillful and prudent management only a fair average return, quite within the limit allowed by statute and conservative opinion as adequate and proper for investments of this character."

The most important work undertaken by the Accountants' Association was standardization of street railway accounts. An excellent report was submitted at the October convention by the committee having the subject in hand, and afterwards that committee was made a permanent one, it being understood that one of its chief aims would be to secure the adoption of the system. The members of the committee believe that they personally should practice what they preach; Mr. Duffy, secretary of the National Railway Company's roads, St. Louis, and Mr. Calderwood, secretary and auditor of the Twin City Rapid Transit Company, Minneapolis and St. Paul, put the new standard system of accounts in operation on January 1, so that the system will receive a thorough, practical test, and a basis for the interchange of information and comparisons between at least two companies is afforded, if such be desired.

Mr. Duffy advises us as to the details of the change as follows:

"The 39 operating expense accounts, as recommended, I condense into 16 ledger accounts carried on the ledger, the number of ledger accounts I have always used, and 169 items are carried on a 'Distribution of Operating Expenses Book', for the purpose of showing full and complete detailed and statistical information, as has always been my practice. I have found it entirely practical and comparatively easy to adapt my system of accounts to conform with the system recommended by the Accountants' Association to the permanent committee. The system can be conformed to without disturbing any system now in use, without discarding the ruled account books, and without any expense further than the cost of the necessary printed instructions and a 'Distribution of Expenses Book'. It is not necessary to change the ledger accounts, thereby rendering a comparison of the operations of a road in 1898 valueless and impossible, as compared with 1897; at least,

WORK ON THE CAPITAL TRACTION,  
WASHINGTON.

I did not find it necessary. These would be the main reasons why objections would be raised to adopting and using any standard system recommended by the Association. Any additions or changes that may finally be made by the permanent committee, I can easily conform to by pursuing the same method as the one I have just made use of."

Since writing the foregoing we learn that Mr. Duffy has received letters from three of the St. Louis roads, which are as follows:

James Adkins, auditor of the Lindell Railway: "Beginning with January 1, 1898, I have started to keep my accounts in the manner and along the lines laid out by the Street Railway Accountants' Association, and desire to express my appreciation to you and your co-laborers for the amount and satisfactory work done in relation to these matters."

Frank R. Henry, secretary and treasurer of the Missouri Railroad: "In order to encourage the committee on standard classification of accounts and to help the good work along, it is a pleasure for me to say that on January 1 we rearranged our accounts, and had new statement blanks printed to conform to the report of the committee."

James H. Roach, secretary and treasurer of the Union Depot Railroad: "Please say to your associates of the committee, of which you are chairman, that our company will, after March 31, 1898, adopt the standard system of account, approved by the Accountants' Association at the convention held in Niagara Falls in October last."

PROPOSED ENGLISH ROADS.

Lighting, London, publishes a list of electric lighting and railway enterprises for which application for provisional orders or for private acts of Parliament will be made during 1898. The number of applications scheduled is far in excess of that for any recent year:

	Local Authorities.	Companies.	Total.
Electric Lighting Provisional Orders.....	62	28	90
Electric Lighting Bills.....	2	7	9
Tramway Provisional Orders.....	8	6	14
Tramway Bills.....	19	12	31
Railway (Electric) Bills.....	—	7	7
Light Railways (Electric) Provisional Orders..	—	16	16
Total.....	91	76	167

A few words of explanation regarding provisional orders may not be out of place. Under the Tramways Act of 1870 the Board of Trade upon the application of the local authorities, or upon the application of persons or companies who have already obtained the consent of the local authorities, after hearing protests, etc., may grant a provisional order authorizing the construction of a tramway. This order does not acquire final validity and force until confirmed by Parliament. Advertisement and notices must be given by promoters who contemplate asking for a provisional order in the months of October or November and December preceding.

The conditions imposed by the Tramways Act are very onerous, and on the passage of what is known as the Light Railways Act—which did not, however, define a "light railway"—many promoters of tramways endeavored to incorporate under the new law, which was much less exacting. It is stated that the Board of Trade at first approved of, or at least winked at, the practice, but now is inclined to define a light railway as a suburban or interurban line.

The Capital Traction Company was chartered September, 1895, being organized under an act of Congress, approved March 1, 1895, which authorized the Rock Creek Railway Company to contract with any intersecting line for its joint management, lease or purchase and joint operation, and to increase its capital stock by an amount not in excess of the actual cost involved in the consolidation, provided one fare only were charged by the new company. Under this act the Washington & Georgetown Railroad, whose charter did not permit it to purchase or lease other lines, was acquired by the Rock Creek Railway, and the two merged into the Capital Traction.

The Washington & Georgetown Railroad was organized in 1862, and was operated by horses until equipped for cable traction, the 7th street line about 1888 and the Pennsylvania avenue line in 1891; this road, with its 21.5 miles of track, constituted the cable mileage of the Capital Company. The Rock Creek Railway was organized in 1888, the motive power being electricity, and opened in 1892; the mileage comprises 6.25 miles of double track operated with the overhead trolley and 1.14 miles of double track with the Love conduit.

The road is an important one, the traffic being much heavier than might be expected in a city of only 300,000 inhabitants. The total mileage of the road is but 36 miles, and in 1896 the number of passengers carried was 22,700,000. For comparison the mileage and passengers carried in 1896 are given for the three important Chicago roads: Chicago City, 184 miles, 95,000,000 passengers; North Chicago Railroad, 100 miles, 56,500,000 passengers; West Chicago system, 250 miles, 79,500,000 passengers. This will serve to explain how the company could afford the cable construction.

As noted in the "Review" for November last, page 800, the Capital Traction is now engaged in equipping the cable conduit on the Pennsylvania avenue line with conductors for operation on the General Electric underground system. Through the courtesy of D. L. Carl, chief engineer and superintendent of the company, we have received the plans of the work.

The diagram showing the location of the underground feeder conduits will serve also to give a general idea of the location of the lines in the city. It will be remembered, of course, that Pennsylvania avenue does not meet 14th street at right angles, but at an angle of 60°. The ducts on Pennsylvania avenue and 14th street have practically been all laid, the total, counting each line as a single duct, is 382,074 ft., and includes more than will be used at present, provision being made for future extensions.

The standard feeder manhole is shown in plan and in section by Fig. 2, and the drawing is sufficiently clear to require no explanation. The manholes are placed between the tracks at intervals of 400 ft. The feeders are connected to the conductor bars at every alternate manhole.

Fig. 3 shows a section of the conduit and method of securing the conductor bars to the insulators and the method of bonding them at the joints. It will be seen that the insulator is that used on the newer work of the Metropolitan in New York. To protect the conductor bars, the old cable slot rails are provided with drip flanges by riveting

1 in. x 1 in. angles to them as shown. The provisions for draining the cable conduit were considered ample, and none additional were made.

Fig. 4 is a sketch showing the plow as it is carried on the hangers and in the conduit.

Along the straight track the traps which were already in place were spaced 31 ft. 6 in. apart between the slot and the outer rail on each track. These have been supplemented by three times as many smaller traps so that access may be had to each insulator; the insulators are spaced 15 ft. 9 in. apart and the traps are in pairs, one either side of the slot. On curves the original traps were 2 ft. 8 in. long and spaced 4 ft. 6 in. between centers; the insulators on the curves have

been spaced about 9 ft. apart, small traps being added where necessary, i. e., opposite every alternate large one.

The contract for the street work was let to E. Saxton, of Washington, who, as our readers probably remember, installed the conduit for the Metropolitan Company. On December 20, Mr. Saxton commenced the installation of the conductor bars, insulators, drip bars, etc., on the 14th street line, and the work will be pushed to completion as rapidly as possible.

FIG. 1.—DIAGRAM OF FEEDER DUCTS.

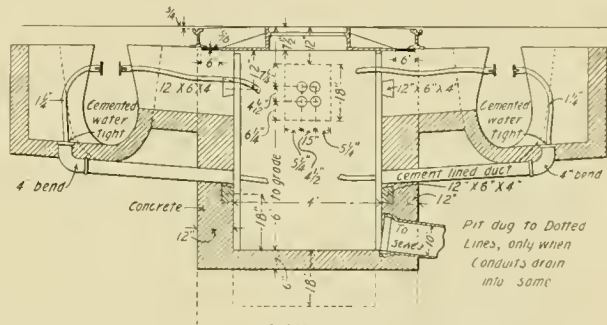

FIG. 2.—STANDARD FEEDER MANHOLE.

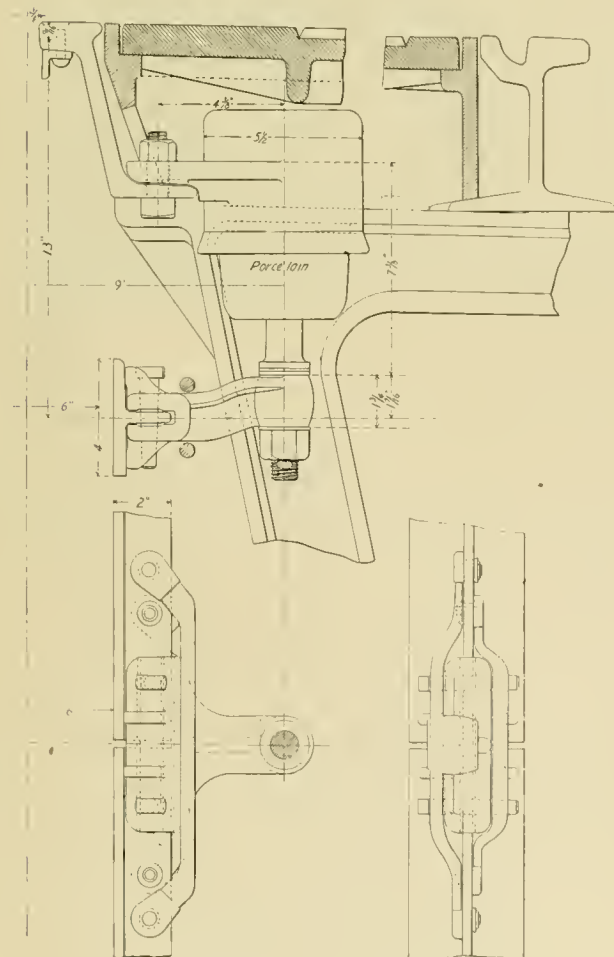

FIG. 3.—SECTION SHOWING INSULATOR.

FIG. 4.—PLOW AND HANGER.

The new power plant is located in Georgetown, where a building, formerly used for manufacturing purposes, has been secured. This building is 62x208 ft., with one long front on Grace street and the other along the canal. The canal will furnish a water supply, and the Potomac river will serve to transport coal. A number of changes in the floor levels, etc., are proposed. The boiler room is to be 160 ft. long and occupy one end of the building. The engine room is in the other end, the floor being about 8 ft. above the boiler room floor and 13 ft. above the basement.

The power house installation, at present contemplated, comprises three Cahall-Babcock & Wilcox water tube boilers of 600 h. p. each, carrying steam at 130 lbs., and three Allis tandem compound engines of 750 h. p. each, direct connected to General Electric multipolar railway generators. Boosters will also be used. The generators are of 525 k. w. capacity, with a voltage of 550 at no load and 600 at full load.

### ANNUAL MEETING OF NORTH AND WEST CHICAGO STREET RAILROADS.

The annual meeting of the North and West Chicago Street Railroads occurred in this city January 11; the Yerkes surface properties made an excellent showing. Eight months of '97 were poor business, while the last four months of the year were very good. The North Chicago Street Railroad earned 14.47 per cent on its capital stock—a trifle less than in '96. The gross earnings were \$2,911,552, and the operating expenses, \$1,319,926, which left a net of \$1,591,625. Out of this fixed and special charges (such as wiping out World's Fair stock) were taken, leaving for dividends \$955,162. After paying usual dividends, \$163,220 was carried to the income account. No noteworthy improvements in plant were installed during the year, and no radical changes are contemplated. The connection of the outside suburban lines as feeders has proved conclusively the importance of the arrangement. Following are some of the details of operation:

	1896.	1897.
Percentage operating expenses.....	49.32	46.83
Passengers carried.....	56,523,620	56,354,147
Miles run.....	10,590,936	11,641,210
Passengers per mile.....		5.3
Receipts per mile.....		2.75
RECEIPTS.		
	1896.	1897.
Cable lines.....	\$1,575,311.05	\$1,421,487.78
Electric lines.....	1,192,641.85	1,377,063.57
Horse lines.....	98,887.75	20,911.75
Total receipts.....	\$2,824,800.65	\$2,818,398.10
Percentage Operating Expenses		
	1896.	1897.
Cable.....	45.17	47.67
Electric.....	51.22	44.92

	1896.	1897.
Cable.....	13	13.4
Electric.....	12.5	11.4
Horse.....	22.1	20.6

Directors:— Charles T. Yerkes, W. F. Foubek, Benjamin B. Lamb, F. H. Winston and J. Charles Moore.

#### WEST CHICAGO STREET RAILROAD.

This road, which has two elevated systems electrically operated in competition with it, earned 6.32 per cent on its

capital stock, as against 6.52 per cent the previous year. Receipts fell off \$125,283, but operating expenses were reduced \$208,704. The receipts for 1897 were \$3,801,918; operating expenses, \$1,920,664, leaving a profit from operating of \$1,970,253. After paying fixed charges there is left for dividends, \$824,068. The opening of the Union Loop to the elevated roads was expected to seriously cripple the earnings of the surface lines, but on this point Mr. Yerkes says:—

"It was expected that the opening of the loop would have an effect upon the business of this company, but, strange to say, notwithstanding the fact that the loop commenced business the fore part of October, the increase in receipts for October over the same month last year was over \$22,000.

"There is no doubt in my mind that it does have some effect on our company, but the truth is that better facilities induce travel, and while it is possible that our increase since the loop commenced running would have been greater, yet it is certain that the opening of the loop has produced an increase in travel.

"As I said to you last year, the prospect for the future depended entirely on the general business of the country, which at that time did not look very bright, so that prospects for this year depend on the same cause; but the reverse this year is the case, because there never was a brighter outlook for the business interests of this country than at the present time."

The election of directors resulted as follows: Charles T. Yerkes, W. L. Elkins, P. A. B. Widener, Harvey T. Weeks, S. W. Rawson, F. H. Winston and J. M. Roach. The election was unanimous.

#### THE LAKE STREET ELEVATED

held its annual meeting the same day, and President Louderback reported that the road had seen its worst days, and from now on would be on the gain. The earnings for the year were \$579,960; the operating expenses \$329,124. The deficit for the year is \$72,842, but this includes the expense of raising the structure at Rockwell street, which cost some \$31,000, etc.

### AN ECHO OF THE CLEVELAND STRIKE.

During the street railway strike in Cleveland in 1892, the strikers were enjoined from interfering with the operations of the lines. Fourteen men derailed a car in violation of the order and were taken before the court on a charge of contempt, being fined in sums ranging from \$200 to \$500 each. Exceptions were taken to some of the rulings of the circuit court and the cases taken to the supreme court on appeal. On December 7 last the supreme court gave its decision, affirming the judgment of the circuit court.

### PREPARING FOR COMPETITION.

It is rumored on what appears to be good authority that the Detroit & Lima Northern Railroad will equip its Toledo-Detroit line with steam dummies in order that it may maintain a shorter headway and be in better shape to compete with the electric line which is contemplated between those cities. It is understood that the company is negotiating with the Schenectady Locomotive works for three combination locomotive trucks similar to the one furnished recently to the New England Railroad.

### A TYPICAL COUNTRY TROLLEY ROAD.

The introduction of the electric motor is doing a great work in bringing out-of-the-way districts into close communication with the great cities. The great trunk line steam roads connect sections and business centers and branch roads reach out to important cities and towns, but there are districts and villages of more or less importance in the commercial world, within 10 or 20 miles of trunk lines, that appear almost out of the world; simply because the trunk line cannot see its way to construct and equip a spur to their doors. Often there will be heavy grades, and again there may be so many cuts and fills required that it would cost more for the steam road than the returns would warrant. The steam road causes new cities and new centers to rise and flourish, while the small city or village that once

propelled by the very stream that furrows the neglected valley. The road and the power plant to run it can be owned by the community it reaches, making it master of its own toll gate.

There is perhaps no better illustration of taking advantage of conditions than the work done by the Shelburne Falls & Colrain Street Railway Company, at Shelburne Falls, Mass. Here is a typical country railway. The Fitchburg Railroad, in its course from Albany to Boston, failed to pass through Colrain City, leaving it several hours, by team, farther from Boston and New York than some of its more favored rivals. Colrain City is at the head of a beautiful valley that is rich in agriculture, also several factories of various kinds find motive power in the small river that drains it.

About a year ago a company was formed of factory own-

POWER HOUSE AND CAR BARN—SHELBURNE FALLS & COLRAIN STREET RAILWAY.

was the boasted pride of a section has been sapped of its wealth and power because the main line missed it by a few miles. This condition exists in so many localities in the eastern and middle states, that Goldsmith's "Deserted Village" becomes almost a reality to the traveler in these sections.

The time was when the wealth and power of our country was found principally in these smaller business centers, but the railroads have so changed the conditions that the smaller towns now are only agents for the great cities, and their success as agents depends upon their facilities for handling products that are shipped to and from the great centers of trade. The trolley road is destined in a measure to restore to many of these "side tracked" villages some of the advantages lost by being "out of line." The trolley car can climb steep grades, round short curves, and cross rivers on wagon bridges. It can carry freight, passengers and mail as readily as the trunk line, putting the population of an out-of-the-way valley into direct communication with the world at large. Last, but not least, the trolley car can be

ers and citizens generally, for the purpose of constructing an electric railway beginning at Colrain City, touching at Griswoldville and at Shattuckville, intersecting the Fitchburg road at Shelburne Falls. An unused water-power was secured near the center of the line, and on this site a power house and car barn were built. A second car barn was also built at Colrain City.

The power is supplied by a pair of 27-in. turbine water wheels working under 20-ft. head and furnished by the Holyoke Machine Company, Worcester, Mass. The speed of these wheels is regulated by a governor built by the Replogle Governor Works, Akron, Ohio. As it was necessary to carry the water from the dam to the wheels in a long iron feed-pipe it was also found necessary to make all the pulleys very heavy in order to counteract the bad effects of the long closed flume. In other words, care was taken to add ample balance-wheel effect, with the result that the plant is well governed for the work required of it. The power is transmitted by belt to two 75-k. w. multipolar generators built by the Westinghouse Electric & Manufactur-

ing Company, Pittsburg, Pa. The generators are driven from a line shaft that is provided with the necessary cut-out clutches. The line shaft can be separated from the water-wheels and the supplementary engine, or connected at will, by sleeve clutch pulleys. The engine reserve consists of one cross-compound Fitchburg engine 12 and 20x24 in. and a No. 16 Deane jet condenser, and is supplied from one horizontal tubular boiler 18 ft. x 6 ft.

The road comprises six and one-half miles of main line and about one-half mile of spurs. It follows the entire length of the principal street in Shelburne Falls, and when finished will meet the Fitchburg road on the south side of the river.

The motor equipment consists of six No. 12 Westinghouse motors on three Bemis trucks, two No. 38 Westinghouse motors on a double truck, and two No. 38 motors under a snow plow mounted on the wheel axles.

There are one combination car for passengers, express, baggage and United States mail, one 26-ft. closed car, one 28-ft. open car, one 34-ft. open car, and two trailers. There are also four box cars and four flat cars for freight traffic.

The freight traffic on this road has reached as high as 660 tons in one month, and consists of cotton, coal, manufac-

A VIEW ALONG THE LINE.

tured products, etc. The passenger service is well patronized, and consists of 14 trains daily from Colrain City to Shelburne Falls and return, also special trains when traffic demands them. The Sunday service consists of 10 trains each way. We do not have information concerning the average number of passengers carried daily, but on July 5 last the records show that 3,208 fares were collected.

The management is making preparations for a park at the Colrain City end of the line, and the indications are that the enterprise is a success from all points of view. The immediate operation of the road has been in the hands of L. N. Wheelock, electrician and superintendent. G. W. Smead is engineer and superintendent of power house.

While this road is a success, there were many difficulties to overcome. Part of the roadbed is immediately on the river bank, where a spouty and spongy surface had to be provided against. Other parts have steep grades and not a few curves. Also a few difficulties presented themselves in the construction of a power plant, but the fact that all these difficulties have been overcome proves conclusively that small manufacturing towns can bring themselves closer to

market by their own exertions, and in doing so can compete with the world in the products of their factories, with the advantage of the benefits to be derived from low taxes, cheap labor, and healthy homes.

#### FRANCHISE CASE IN CALIFORNIA.

Through the courtesy of E. I. Tolle, manager of the Santa Ana & Orange Motor Company, Santa Ana, Cal., we have received a copy of a decision by the Superior Court of Orange county, in which the grant of its franchise is sustained. The company had secured a franchise for operating a street railway with animal, electric, or steam power, and several suits were brought against the city to have the grant annulled, but the city was in each case successful.

The suit in which we have the opinion was by one Hill. The decision was adverse to the plaintiff on two grounds: 1. His interest as a citizen and taxpayer, not being different from that of any other citizen or taxpayer, gave him no standing in court. 2. The writ was to review judicial functions only, while the action of the Board of Trustees in granting the franchise was legislative only.

The dicta on other points raised are also interesting. It was contended the franchise had been changed after the bid of the purchaser had been accepted, by changing the gage of the proposed road and also by withdrawing the privilege of running trail cars. This was conceded by the court, but he added that no one but the company had any right to complain.

It was also contended that the franchise was not that of a street railway, but the court held that it was. The grant is "the right, privilege, franchise and permission granted, etc., for a term of 50 years to construct, operate and maintain a motor railroad with all necessary turn-outs and switches upon and along Main street in said city of Santa Ana, from Second street to the north boundary line of said city, upon and along the line now occupied by the track of the Santa Ana, Orange & Tustin Street Railway Company whereon passenger cars may be propelled by horses, mules, electric power or by steam motor cars, similar to the one now in use on said track."

This latter company sold part of its tracks to the Santa Ana & Orange Motor Company, and removed the others.

#### RAPID TRANSIT IN NEW YORK.

We again hear of an underground rapid transit line for New York which is to be built by a syndicate comprising the Astors, the Vanderbilts and J. Pierpont Morgan, the same syndicate that announces that it has secured an option on the New York & Brooklyn Railroad Company, which has the right to construct a tunnel under the East river from Broadway and Ann street to Fulton and Furman streets in Brooklyn. The proposition is to build a road to cost \$35,000,000 and at the end of 50 years turn it all over to the city for nothing; the city is to be at no expense whatever, merely "lending its credit," which we take to mean that the city is expected to guarantee the \$35,000,000 worth of bonds.

The brickmakers of Springwells, Mich., contemplate using the new electric road from Detroit to Ann Arbor for marketing their product, and save a 5-mile haul by team.

### BURNING LOCOMOTIVE "SPARKS."

In the paper read by Colonel Heft at the street railway convention was the statement: "I suppose we are producing power more cheaply than can be done in any power station in the country using coal as fuel, the reason being we are burning sparks." E. C. Boynton explains in the *American Engineer, Car Builder and Railroad Journal*, how these sparks are used as fuel in the power houses of the N. Y., N. H. & H. Railroad at Berlin, Nantasket and Stamford.

The sparks consist of fine particles of coal, half consumed, that are removed from the extension fronts of the locomotives. These are shipped direct to the stations and fed into the furnaces without the addition of coal or other fuels. Some difficulties were experienced at first in the firing as it requires about twice as great a quantity of sparks as it does of coal. The fire increases so rapidly in thickness that it must be cleaned at intervals of three to four hours. One furnace is cleaned at a time, but an even steam pressure is maintained through the process, as the fire is quickly brought up to the required temperature by the aid of a blower. The fireman has to be educated for this work, as it is radically different from coal firing.

Some alterations in the boiler settings were necessary; the boilers are the ordinary horizontal flue type, 72 in. in diameter and 19 ft. long. Extending across and resting on top of the brick settings, at right angles to the boilers, are two pairs of heavy channel irons. From these four iron rods extend down to the sides of each boiler, two on either side near the ends of the boiler. These rods hook into lugs riveted on the sides of the boiler, at the center line; the boilers are thus suspended from four points, and this provides for all movement due to expansion and contraction. A large combustion chamber is secured by setting the boiler so that the shell is 44 in. above the grate bars and the top of the bridge wall only 18 in. above them.

A forced draft comes from a steam blower which consists of a cast iron cylinder 9 in. in diameter and 24 in. long, bell mouthed at one end, and extending through the boiler front into the ash pit. The fine steam jet blowing into the ash pit draws a large quantity of air with it. When the steam pressure is reduced the efficiency of the blower decreases rapidly, and in firing this has to be guarded against. The normal steam pressure is 100 lbs., but for heavy loads 125 lbs. is carried. About 6 lbs. of sparks are consumed per horse-power-hour.

### CANON CITY & CRIPPLE CREEK ELECTRIC RAILWAY.

One of the most interesting roads in the process of construction is the one between Cañon City, Colo., and the famous mining camp of Cripple Creek. This road was built for the purpose of furnishing cheap transportation, so that low grade ores could be carried to the mills and worked with profit. The Florence & Cripple Creek Railway, a narrow gage steam road, has a monopoly of this traffic, and its rates have been so excessive as to invite competition. Passenger rates are uniformly 10 cents mile, and the freight rates even higher in proportion, so that coal, which is mined in abundance in Cañon City, costs \$8 a ton in Cripple Creek. This railroad is 43 miles long, with an average grade of 7 per cent, and but one-fourth of it is straight track. In an air-line distance between the two cities of 18 miles the difference in altitude is nearly 5,000 ft.

The Cañon City & Cripple Creek Construction Company has been more fortunate in the selection of its route, as the grades will be but 5 per cent and the length of track 35 miles. More than 11 miles of this roadbed are now ready for the ties and rails, and 600 workmen are making rapid progress with the rest of the work. Contracts for the electrical apparatus have not been let. The power station will be located in Cañon City, where there are fine deposits of coal, little inferior in quality to anthracite. Probably alternating currents will be used in transmitting the power to sub-stations along the line. The electric locomotives will be sufficiently powerful to draw 20 cars, each loaded with 33,000 lbs. of freight, up the steep grades. The road will be standard gage. Its estimated cost is \$800,000. The freight business will consist in hauling coal and merchandise from the railroad in Cañon City to Cripple Creek, and ore from the mining camps to the reduction works in Cañon City. The conditions seem to justify such a road. Cripple Creek and vicinity has a population of 50,000, and the value of the minerals mined during the past month is \$1,500,000. The Chicago office is in charge of Paul E. Hirsch, who is treasurer of the company.

### A BALLOON RAILWAY.

We take the following from the *Mechanical World*:

A mountain railway constructed on a novel plan is shortly to be opened on the Hochstauffen, near Bad Reichenhall, Bavaria. The chief feature of the new system is that the force of traction is directed vertically upwards, being derived from a balloon. The latter has a diameter of 66 ft., and a lifting power of 10,560 lbs. The balloon, car, net, ropes, etc., weigh 4,620 lbs., and an allowance of 3,300 lbs. is made for passengers and aeronauts, leaving a margin of 2,640 lbs. A single rail is used for the sole purpose of directing the course of the train and keeping the balloon with its load captive. To this end the rail is made T-shaped, and the car runs on it, gripping it from the sides and from below. The rail is anchored to the ground at distances of about 15 ft. In descending the mountain the propelling force is gravity, and the balloon acts as a check to prevent accelerated motion. A ballast of water, taken in at the top of the mountain, provides the additional downward force required. The difference in weight caused by passengers entering or leaving the car is regulated by the use of separate weights.

### JOINT USE OF TRACKS IN NEW YORK.

The opinion of the New York Court of Appeals in what is known as the "Kingston case" where one street railway sought to condemn a right of way over the tracks of another is given at length on another page. There has been some doubt as to whether this ruling would prevent the operation of the cars of one company over the tracks of another by mutual agreement, unless the consents of the abutting property owners were also obtained.

In an interview Justice Haight of the Court of Appeals states that the question of joint operation by mutual agreement of the two companies is yet an open one, the Kingston decision having to do only with the question of condemning a right of way.

It is probable that a case to determine this open question will be brought before the court.

## REPAIR SHOP OF THE CHICAGO CITY RAILWAY.

The question of repairs on a railway system, whether it be large or small, is an important one to the management. Many nice problems in economy present themselves; infrequent repairs, parts requiring special tools, castings of various kinds, armature windings, gears, etc., are in some cases cheaper to buy than to make, while other shops have the facilities to save manufacturers' profits. The general manager or master mechanic must decide these questions and only put such sums of money in tools and buildings as the savings justify. In some of the larger cities the shops of the railway companies are very extensive, and as much machinery and as many men are employed as in a large

a repair shop depends so much upon its management that it might be well to say a few words regarding its chief. C. E. Moore, master-mechanic of the Chicago City Railway since October, 1895, has been largely instrumental in making the repair shop what it is today. His mechanical training commenced by serving a seven-year apprenticeship in Cincinnati and in Evansville. He then became tool maker for the Vandalia Railroad, later for the Belt Railroad of Chicago, and afterwards for the Lake Shore & Michigan Southern. He has a practical and thorough knowledge of the minute details of machine and blacksmith shop practice. Many of the labor saving devices are of Mr. Moore's design.

From the office the visitor passes directly into the machine shop; partitioned off only by a railing is the power

FIG. 1.—CHICAGO CITY RAILWAY SHOP.  
FIG. 2.—POWER PLANT.

FIG. 3.—MACHINE SHOPS.  
FIG. 4.—WHEEL PRESS.

manufacturing establishment. Such an institution is the repair shop of the Chicago City Railway which has been built up under the supervision of M. K. Bowen, general manager.

The building, Fig. 1, is in the rear of the State street cable power house, facing on Dearborn street and occupying a block between 20th and 21st streets. Part of it is a relic of the horse car days, but the construction is substantial and serves the purpose as well as a more modern structure. For the most part the building is two stories in height, each having a floor space of 45,000 sq. ft., but the third is a monitor story built between the skylights and has an area of 20,000 sq. ft. All this makes available a floor space of nearly three acres. Besides this a basement, lighted by incandescent lamps, is used for storing rough iron and brass castings.

The office is in the front of the building midway in the block, and an entrance is assured by pulling a rope attached to a gong. The latch-string, as it were, is always hanging out, and one of the commendable features of the Chicago City Railway is soon in evidence, i. e., information of service to street railway men is freely given. The efficiency of

and electric light plant, Fig. 2. A 75-h. p. Wheelock-Corliss engine is supplied with steam from the boilers of the station across the alley. The cylinder dimensions are 18x46 in. and the speed is 60 r. p. m. This engine drives the shafting which extends into the machine shop, the wood room, and up to the second and third floors, belting being used throughout. The building is lighted by 88 arc and 350 incandescent lamps. The incandescent machine is belted to a jackshaft driven direct from the shop engine and can be started or stopped at any time by means of a tight and loose pulley. The two arc light dynamos, a Brush 50-lamp and an Excelsior 45-lamp are belted to an Ideal engine, 13x13 in., 275 r. p. m., and these are run during the mornings, dark days and for night work. Both arc and incandescent circuits are connected to the switchboard, the incandescent lamps being in four circuits. Two Weston ammeters are in the arc circuits and an ammeter and a voltmeter, made by the Standard Electric Company, are in the incandescent light circuit. The entire building is heated throughout by exhaust steam from the cable power station.

A compressed air system has been installed which facilitates some lines of work. The double air compressor, of

Pedric & Ayres make, has a capacity of 120 cu. ft. of air per minute and is belt driven. An attachment on this machine automatically shifts the belt when the pressure rises above 80 lbs. In the basement are two storage tanks made of old vertical boilers with tubes removed and with pipe connections. A 3-in. pipe extends to the third floor with a cross connection at each floor, and supply pipes run the entire length of the building with T connections at convenient intervals. The air is used for the hoists, for the lifting devices, for the wheel press, for sanding glass, for cleaning castings and motors, and blowing the shop whistle.

To the south of the power plant is the machine shop, Fig. 3, which has the following equipment of machines: 7 engine lathes, 1 turret lathe, 6 drill presses, 1 turret drill press, 1 planer, 1 shaper, 1 milling machine, 1 boring machine, 1 hydrostatic press, 1 car-wheel grinder, 1 large Q. & C. cold metal saw, 1 power hack-saw, 1 air compressor, 1 tool grinder and 4 air lifts.

The tool room is just to the rear of the office; in it every tool has a place and is labeled, being drawn out only on a check. Files, screws, rivets, tool steel, etc., are also kept here. The sharpening and grinding are all attended to by one man. Some of the machines have been inherited from horse car days, but they have been kept in good repair and others added as requirements demanded. From the Dearborn street entrance the cable grips in need of repairs are brought in on a supply car. By means of a telescope air hoist they are lifted and carried along the overhead track to the blocks where the necessary repairs are made. Along one side of the shop run the work benches built out 3 ft. from the wall so that the floors can be easily cleaned and a double crew of men can use each bench. Along the edges of the benches are steel strips set in the wood so that the upper surface is flush with the top. This construction insures a true and permanent edge.

Along the partition dividing the machine shop from the foundry is a row of ventilated closets for the workmen. These closets have sloping tops which prevent the accumulation of waste and old clothes. Hooks on the outside are for the accommodation of overalls and greasy garments, as the inside is kept neat and clean for street apparel.

The equipment of machines in the shop is very complete and designed to accommodate the heaviest work at any time. The turret lathe has provision for six tools, which are generally used for brass work. Brass hangers, pull-offs and other parts of overhead work can be bored, faced-off and threaded with one adjustment of the chuck. Inside and outside threads and all kinds of chucking and boring can be done on this machine. The six-headed turret drill press with 1 1/4-in. spindles is also a time saver, for with templates and jigs such pieces as controller segments with different sized holes at different angles may be drilled very quickly and with cheap labor. The No. 1 universal milling machine is valuable for heavy fast work. A trolley wheel can be milled in 4 minutes with a B. & S. relieved cutter. The power hack-saw does the work of one man and only requires the odd moments of a lathe hand, who adjusts the lengths of the pieces to be cut. It will saw bars up to 4x4 in. The saws, being held by constant tension, wear much longer than by hand use.

The wheel press, Fig. 4, has been rebuilt from an old-styled machine which was operated by hand; now the power is transmitted through bevel gears to the counter-shaft and a belt run to the press pulley. Two different

sized cylinders, side by side, both work at first to fill the press with water, then the small plunger is actuated alone to get high pressures. In a glass case above the machine is a working gage, also a test gage which is used at times to standardize the other; both register in tons. The most convenient arrangement is the latest addition, a lift

FIG. 5.

for raising the wheels into position. It was quite laborious to place the heavy wheels and axles in position in the press by hand. An air cylinder was placed on a stand under the floor with a horizontal beam resting on the piston rod. At the ends of the beam are vertical pieces under the two plates. In the bulb of the air valve a hole is drilled which permits the exhaust as soon as the valve is closed. The wheels are slipped on the axles and rolled on the two iron plates. The knob on the valve stem is then shoved down by the helper's foot and both plates with the wheels and axles are lifted up and the wheels roll into place in the press by gravity. If the wheels are for motor cars a pressure of 30 to 40 tons is exerted; if for trailer, 20 to 30 tons. At the end of the hydraulic cylinder there is a small brass one and its piston is connected to the ram. After a pair of wheels has been pressed on and the ram is to be returned to its former position a valve in the compressed

FIG. 6.

FIG. 6 A.

air pipes leading to the brass cylinder is opened and the air pressure does the work previously done by weights. The wheel grinder has two 18-in. emery wheels which rotate at 900 r. p. m.; the car wheels are revolved at 20 r. p. m. From 8 to 12 pairs of wheels are ground per day. On account of the very hard service the wheels do not have a long life.

Another handy air tool is the drill shown in Fig. 5. In repairing cars, holes have to be bored in the sills and other wood work with a brace and bit, which requires much time and labor. This device is designed to do such work quickly and easily. A bit is placed in the jaws and a flexible hose from the air pipe is connected to the end of the handle. Fig. 6 shows the cross section of the turbine, the revolving part being eccentric to the cylinder. The sliding bar with

springs on either side to prevent leakage of the air, presents a greater surface on one side than the other and is made to rotate. The speed of the turbine is 2,500 r. p. m., which is reduced to 1,000 r. p. m. by the gearing. Another turbine, designed by Frank Perry, foreman of the machine shop, has 10 chambers; this will give a corresponding decrease in speed and increase in power. Holes up to  $\frac{3}{4}$  in.

diameter may be bored. By attaching brushes to the jaws it can be used to clean the dirt from the trucks.

A heavy machine for a street railway shop is the combined shear and punch, made by Hilles & Jones, which will cut a bar 2x6 in. and punch a 2-in. hole through 2-in. metal. Its belt connection is such that it is quick acting, suitable for ordinary work. With a special die bolt holes are punched in the rails in making crossings. This effects a great saving in time over drilling the holes, and with the cold metal saw, crossings can now be made with much less time and labor.

Close by the shears are 10 reels of chains, from 3-16 to  $\frac{1}{2}$  in. in size, which are used for hanging scrapers for brake chains, etc. The reels occupy little space and are convenient to the shears.

All iron castings are purchased of the Wells-French Company, but a foundry has been equipped for brass work, the output last year being 574,000 lbs. As a rule three runs are made each day and nine furnaces are in blast all the time. The 18-in. cupola is utilized for making copper pigs from scrap wire, the insulation being first burnt off. One of the greatest improvements in the foundry is in making molds for trolley wheels by the "pan process". The follow board, with a half of the wheel pattern and a print just the size of the pan, is placed at the bottom of the drag and the sand rammed in. It is rolled over, the board removed and the iron pan dropped into the print left by the follow board. The other half of the pattern is put in place and the pan filled with sand. The cope is filled and removed. The upper half of the pattern is withdrawn, the pan lifted, the lower half of the pattern withdrawn, the center cores put in place and the mold put together for pouring. A section of the mold is shown in Fig. 6A. By this method 72 castings for wheels can be made in eight hours, whereas without the pan only 16 were made. These trolley wheels are milled as described in the "Review" for June last, and the average life is from 14 to 18 months. The mixture for these wheels is 40 lbs. of copper, 5 lbs. of tin,  $1\frac{1}{2}$  lbs. of lead and  $\frac{1}{2}$  lb. of zinc.

The babbiting furnace is simple and convenient, being made from a cannon stove with a sheet iron hood, and has a metal capacity of 300 lbs. Around the upper edge of the caldron is a ledge where the boxes are placed to bring them up to a high temperature before putting them in a two-part hinged mold ready for pouring. A patent "motor metal" has been found to give the best results. The foundry stock room, containing scrap copper wire, brass, antimony, tin, brass nigger heads, etc., is kept under lock and key. The materials are weighed out to the workmen and the stock is kept checked up. All the ashes from the brass foundry are washed and sifted. The bar iron is stored in between the foundry and blacksmith shop, all the different sizes being separated and set on end, in which position the pieces can be easily handled.

The blacksmith shop is especially well equipped with labor saving tools and appliances, there being one small Bradley hammer, one steam hammer, one belt driven drop hammer, three furnaces and eight forges. Whenever there are as many as 500 pieces of one kind to be made, the foreman, Fred Steen, designs a swedge or die for forging or shaping the piece with the drop hammers. For instance, with one of the swedges a front step hanger with brace can be made in 12 minutes with one heat, while only 10 could be made in a day on the anvil by a blacksmith and helper. As an example of the die work, Fig. 7 shows a kick spring for releasing the brakes and the die for making the same. A hole is punched in the piece of iron at the proper distance from the end, placed over the pin in the die and one drop of the hammer gives it the proper form. Fig. 8 represents a die for making a fender hanger with two bends formed by one blow. The lower part of the die for forming the two sizes of straight fender hangers is shown in Fig. 9. The hole is formed by forcing the metal to the edges, thus getting it where it will do the most good. The brake chain eye-bolt has caused much trouble by breaking

FIG. 11. BELT SANDING MACHINE.

off just under the head, until the design shown in Fig. 10 was adopted. The blanks are punched out of mild steel and 20 are drop-forged per hour. As may be seen, the horizontal stress is received by the metal in the head. The

bending tools are of much merit, such things as coupling links, S hooks, rings, etc., being bent either cold or with one heat. Patterns are made for the dies and kept, so that if one be broken another can be made in a short time.

The equipment of the wood room comprises 1 planer, 1 jointer, 2 molding stickers, 2 rip saws, 1 cross cut saw, 1 band saw, 1 scroll saw, 2 shapers, 2 mortising machines,

FIG. 12—CAR SHOP.

1 tenoning machine, 1 sandpapering machine, 1 turning lathe, 1 emery wheel.

The swing saw with a hinged bed is very effective in saving time, as bevel cuts can be made by setting a part of the carriage at the desired angle. This machine, as well as the belt sanding machine, Fig. 11, used for sandpapering dash-rails, hammer handles and other irregular shapes in wood, was made in the shop.

A "cyclone" has been built at the rear of the boiler room, the shavings and dust being collected from the planers, saws and cushion cleaner and fed into the boiler furnaces.

In the wood room is the large car elevator operated by a winding drum driven from the shafting. The tracks run direct from the street onto the elevator and the cars are raised to the second floor. They are run on the transfer table and placed on any of the 11 tracks shown in Fig. 12. The table is operated by an 8-h. p. General Electric motor, one man attending to the controller and the other to the rope connected to the double trolley. In this part of the shop 42 cars can be repaired at once; in the north part of the second floor there are six tracks with a capacity for 16 cars; on the third floor 17 cars can be accommodated, and on the first floor are five tracks for 12 cars, four pits and two extra ones for emergency work. The total capacity is 87 30-ft. cars. In the north end of the building only trail and grip cars are handled, because of the limited capacity of the car elevator. The hot water for washing the cars and trucks is taken from a tank into which the condensed steam from the heating system is drained.

Fig. 13 is a view in the paint stock room. Each kind of paint and oil is stored in certain labled cans. The paint is mixed in the cans shown in the cut, by compressed air. The color, oil, etc., are put in the tank in proper proportion, the air passes through the holes in the perforated pipes, and the mixture bubbles violently until it is thoroughly homogeneous. The barrels of oil, paint, etc., are emptied into the tanks by compressed air, four to five minutes only being re-

quired to syphon the contents of one barrel into the tank. All skins, the leavings in buckets of all kinds of paints are saved, ground in the paint mill and toned up a little for truck color. The paints for the car bodies are bought already ground, as it is more economical to do so. At one end of the building is a tank of paint and a drain leading to it. Here the cable-car gates are dipped in the paint and allowed to drain off. One man has charge of the glass department, where all kinds of glass for windows, signs, etc., are cut, fitted and stored.

On the second floor is kept a testing apparatus for gears and pinions. There are a pair of fixed and a pair of movable centers. Along the guides are marks for the proper position of the different sizes. When a lot of gears or pinions are received they are placed in the centers and turned to see that there is no backlash and that they operate smoothly. It is a cheap, easy and practically accurate method. This machine was made in the shop.

On the third floor at the south end are the pattern shop and storage racks, where are kept all patterns for iron and brass work, including molds for Falk joints which are being used in much of the new track construction. North of this is the tin department, where all the tin appliances used about the cars, stations and barns are made. Bent dashes are run through a set of rolls, and, in this way, all the kinks are removed. Copper, silver and nickel plating is also done, the current for the baths comes from a small low voltage dynamo driven from the shafting. There is a large vat of concentrated lye for cleaning the metal work before plating. The pieces are suspended in the bath for a length of time depending on the kind and thickness of the plating. If there is to be a brass oxidized finish the piece is dipped in a solution of chloride of iron, hydrochloric acid and arsenic; if for a copper finish, a solution of sulphuret of potassium is used, and the pieces are then polished in spots. A metal-lined tank of sawdust is heated by steam

FIG. 13—PAINT STOCK ROOM.

to dry and clean the work. The lacquering work is also done here, put in the oven, and subjected to a temperature of 200° F. for one hour. Once a year the bright work on the Columbia stoves is renickeled and lacquered, the stoves being replaced in the cars early in November.

All the harness, hand straps for cars, and other leather pieces are made on the third floor. The brooms for the sweepers are made from bundles of small cane wrapped in

bunches with linen thread and cemented with rosin and pine tar. The average life of a sweeper broom is about six weeks. The upholstering department is provided with three sewing machines, belt-driven, and other appliances for making curtains, cushions, etc.

The armature coils are all made in the shop, special forms being made to fit the different windings. For turning the commutators and for band winding a 24-in. lathe is used. The motor armatures are also tested when they are sent for repairs. As shown in Fig. 14, there are cases and fields for the General Electric 800, the Westinghouse No. 3 and 12 B, and the other motors which are in service. The switchboard is connected to the trolley circuit and has an ammeter and voltmeter. Each armature is run for 15 minutes at 50 per cent overload, the load being

once a year, and under this system there are cars that have been in service almost constantly for 24 years. From 19 to 20 cars are run into the shops for repair each day. At present there are 256 men at work in the shop, engaged as follows: 15 blacksmiths, 28 machinists, 7 molders, 10 tinners, 1 plumber, 45 painters, 102 carpenters, 5 pattern makers, 14 electricians, 14 truckmen, 3 wagonmakers, 1 harness maker, 2 watchmen, 7 store room men, 2 office men.

#### THE TRAMWAYS AT CORK.

The British Thomson-Houston Company is now constructing in the city of Cork, Ireland, 11 miles of track and will completely equip the system. The track is 3-ft. gage, and the rails weigh 83 lbs. to the yard. In the power sta-

FIG. 14—TESTING DEPARTMENT.

applied by a prony brake, and in that time any faults develop. By this method the number of failures when the armatures are sent to the barns has been reduced 50 per cent. The new drying room recently built is giving good satisfaction. It is a room 10 ft. high and 7x16 ft., brick lined, with corrugated iron roof and double iron doors, and was used for storing shavings before the cyclone was installed. The walls were lined with steam pipes 7 ft. up from the floor, and two ventilators extend from the roof to within a few inches of the floor to carry away the moisture-laden air at the bottom. Iron trestles hold the armatures. At a temperature of 200° F. it now requires 20 hours to dry an armature where formerly it took three to four days.

There are two busy seasons during the year, the first from January 1 to April 1, when the summer cars are overhauled, and from May 1 to August 1, when the winter cars receive attention. Each car is re-varnished and generally repaired

tion there will be three McIntosh & Seymour side-crank, tandem compound, condensing engines direct connected to 200-k. w. generators, and three boilers of American make. In connection with the station there is a storage battery consisting of 256 Tudor cells, capable of discharging 110 amperes for seven hours, with a booster for charging the same. The peculiarity of the station is that it will be used for lighting as well as tramway purposes, the same machines being interchangeable for either service. The cars are to be mounted on single Peckham trucks and will have double motor equipments with series-parallel control.

The bicycle railway at Mt. Holly, N. J., which was such a novelty and financial success a few years ago, is now losing money and will probably be sold under foreclosure proceedings.

## PRIZE EXAMINATION OF THE LINDELL MEN.

As noted in the "Review" for December last, George W. Baumhoff, general manager of the Lindell Railway, St. Louis, conceived the novel idea of calling in all his motormen and conductors and giving them an examination. Fifty questions regarding their duties were propounded, and the answers required without giving the men any opportunity to confer with one another. Prizes ranging from \$25 to \$10 were offered both sets of men for the first, second and third best papers. We give the lists below, which will at once be seen to include questions on all lines of conduct in which the men are desired to be informed, and the instructions regarding which are laid down in the rule book.

Such examinations not only serve to point out to each man any item regarding which he is uncertain, but tend to refresh his memory and impress upon it all the points brought out; and may suggest to even some of the oldest employes the importance of brushing up frequently on the rules. We presume that such employes as gave incorrect answers will be referred to the rule with which they were not familiar at the examination, and the result cannot fail to be an improvement in the service, and stimulate the men to a better knowledge and study of the company's instructions.

### CONDUCTORS.

1. What do you consider the four chief requirements of a conductor, in the order named?
2. What is your duty respecting the handling of the bell cord?
3. Who has charge of the car and to what extent?
4. In case of an accident, what is the conductor's duty?
5. What is the substance of the rule which the conductor is required to read frequently and to his motorman occasionally?
6. Under what circumstances are motormen permitted to pass persons waiting to board the car?
7. In case your car is a little behind time how would you make up the same?
8. What is your position on the car when not engaged in collecting fare?
9. What is your duty when ladies and children and infirm people board or leave the car?
10. During any difficulty or altercation with a passenger what should you strive to do?
11. To what extent are you permitted to use tobacco while on duty?
12. State the rule respecting passengers smoking on the car?
13. State substance of rule respecting expectorating in the car, or on the car floor?
14. What are the small windows on the roof of the car placed there for?
15. During cold weather when should the rear door be permitted to remain open?
16. During dusty weather what do you consider the best preventive from dust entering the car?
17. Would you expect to retain the good opinion of our patrons, and your employers, if you addressed the passengers in a rude or ungentlemanly manner?
- 17A. Have you ever been reported or reprimanded for ungentlemanly conduct?
18. What is the limit to number of passengers on platform when there are seats vacant inside?
19. Why should the passageway from car door to step be kept clear?
20. What is your duty before giving the signal to start?
21. Why should the trolley never be pulled down unless the motorman has shut off the current at the controlling switch?
22. Why should all collections be completed and fares registered before your car arrives at transfer station?
23. Name all bell signals?
24. Are you thoroughly versed in the use of the telephone?
25. How would you secure a connection with the telephone station required?
26. In case of a blockade along the line, whose duty is it to notify the office?
27. What is your duty when discharging passengers if you see them attempt to cross the street after leaving your car?
28. What is your duty respecting the examination of the car assigned to you, before leaving the car shed?
29. What is your duty respecting the examination of car before taking the same from relief conductor?
30. In what condition should the car be left before entering the car shed?
31. State regulation respecting the transportation of employees?

32. How much change should each conductor provide himself with?
33. Under what conditions are you permitted to eject a passenger from the car?
34. What is your duty when the trolley wire is down?
35. What is your duty in case of injury to person or persons?
36. If a bill of large denomination were tendered and you could not return proper change, what course would you pursue?
37. If a person whose statement you did not question should inform you that he or she had no money with which to pay fare, what course would you pursue?
38. Why are some of the poles along the line painted with a single white band?
39. Why are some of the poles along the line painted with a double white band?
40. Why should cars be evenly spaced after a blockade, and not started up together and run in bunches?
41. What is the advantage to the public in having cars operated according to schedule time and on spaces equally divided?
42. What are the rules of the company respecting the carrying of large packages, bicycles, glass and dogs?
43. What would you limit the size of a package permitted to be carried on a car?
44. Why are conductors prohibited from holding the bell cord while the car is at a standstill?
45. What would be your duty after signalling the motorman to stop and before reaching the crossing or stopping place, if a passenger should attempt to leave the car before the same has been brought to a stop?
46. In discharging and taking on passengers, how would you expedite the same—that is to say, where a number of passengers desiring to get off and others anxious to get on at the same time?
47. How should the time on the stand at each end of the road be occupied?
48. Should you car be derailed or from any cause blockade the crossing of a steam railroad, what would be your first duty?
49. Why should a sharp lookout for passengers be at all times maintained?
50. Over what division would you instruct passengers to reach the following points, and at what street would you direct them to get off?  
To a connection with the Midland Railway, etc. (Here follows list of various intersections.—Editor.)

### MOTORMEN.

1. Having been assigned a car by the foreman of your division, what should be your first duty before taking the same out of the shed?
2. Who is supposed to have charge of the car?
3. What are your duties as motorman from the time you take charge of the car until the time you turn the same in, or deliver the car to your relief man?
4. What are your duties with reference to running over railroad crossings, frogs and switches?
5. How would you cross a railroad crossing, cross-over, frogs and switches ("with the brake set or released")?
6. What are your duties with reference to handling your car down grade?
7. In running through water to what advantage should motors be operated?
8. What are your duties in case your car gets beyond your control in going down a grade?
9. In case your car wheels slip in making a grade, what method should you apply to obviate same?
10. What are your duties in case power is shut off respecting starting up?
11. Under what circumstances are you permitted to reverse your motors?
12. In case it becomes necessary to reverse the motors, what is your first duty?
13. In what manner would you replace a fuse?
14. In case a second fuse blows in succession, what is your duty?
15. If a commutator acts badly, or other electrical troubles present themselves and either motor becomes uncontrollable, what means would you take to ascertain or locate same?
16. What are your duties with respect to occupation of your time while the car is on the stand?
17. What would you do in case your controller becomes unmanageable with the current on and set, and not being able to turn cylinder in a backward or forward position?
18. Where are the contact switches located for the purpose of cutting out motors on various types of motors?
19. To what extent is the motorman responsible for the operation of the car?
20. Under what circumstances are you permitted to pass persons desiring to board your car?
21. In passing persons desiring to board your car, what is your duty?
22. When approaching a car on opposite track that has been brought to a stop, what is your duty?
23. Why should you reduce the speed of car on approaching a switch point?
24. Why should the car clear the cross street before bringing the same to a stop?
25. Should your car be derailed or from any cause blockade the crossing of a steam railroad, what would be your first duty?
26. Why should you ring the gong when a vehicle is ahead of your car and alongside of the track?
27. What do you consider the most economical method of operating the controller switch handle?
28. Explain the path of the current from the time of leaving the generator at the power house to its return thereto?

29. Why should the trolley never be pulled down whilst the current is applied?
30. Under what circumstances would you operate your car faster than time points named on time table?
31. In what condition must your car be left in the car shed?
32. What is your duty should you find the trolley wire down?
33. Do you consider it more important to get away as quickly as possible in the event of accidents in order to maintain your car on time, or to remain and render all assistance possible?
34. Before bringing the car to a stop on up grade with a slippery rail, when would you begin dropping sand?
35. Before making stop on slippery rail, how should sand be used to prevent flat wheels?
36. Should sand be used on a dry rail?
37. Should sand be used on a clean wet rail?
38. Can a car be brought to a stop in the same distance under all conditions of the rail?
- 38A. In what distance would you bring your car to a stop on a level, or slightly down grade, car being operated at rate of 10 miles per hour, condition of track dry, and clean rail?
39. What is your duty with respect to the rail ahead of your car?
40. In case a car does not start after stopping on a dirty rail, what means would you take in overcoming same?
41. In what position should your controller handle be with respect to the motors, running down grade?
42. If any electrical trouble presents itself with the motors and becomes uncontrollable from the controllers, what effort would you put forth in checking same?
43. In what manner should you handle your controller in building up the motors to full speed?
44. What are your duties with reference to brakes before bringing your car to a dead stop?
45. What is your duty to avoid further destruction when a ring of fire presents itself passing around a commutator?
46. Name the two chief requirements of motormen?
47. Why should a sharp lookout be at all times maintained on the rail when the car is in motion?
48. What tools and appliances are motormen to have on the car at all times?
49. What are the bell signals?
50. Why are motormen and conductors not allowed to enter a car in the car shed, other than the car assigned to them?

## TWO PENNSYLVANIA DECISIONS.

Two cases in which the Philadelphia & Bristol Railway Company, an electric road, was defendant, were decided by Judge Yerkes in the lower court of Bucks county, Pa., in November last, which will doubtless be of interest.

In one, the plaintiff was a property owner who had given notice, to the company, of his opposition to the road, and had received assurances from the company that it would not build upon his side of the highway. The track was, however, laid there and the company sought to prevent its removal on the ground that the plaintiff in the present suit had stood by and permitted the improvement. The court held that it was no want of diligence that the plaintiff had not taken steps to secure an injunction, because the assurance of the company that such a step would not be necessary had not been withdrawn. A perpetual injunction was granted and the tracks ordered removed.

In the second case the plaintiffs were the owner of the life estate in a piece of abutting property, and the trustee for the reversioners. It was claimed that as the deed of trust expressly prohibited the trustee from incumbering the fee, the consent to building the road was void. The court held that a passenger railway upon a public highway in the country over the land of another is an incumbrance on the fee, and that therefore the plaintiffs had no power to grant a license to build. But it was claimed in behalf of the company that the plaintiffs by their laches had surrendered to the defendant the right to maintain its railway. The company had intended building on the other side of the highway, but an injunction obtained by the Pennsylvania Railroad removed all probability of that, and before the restraining order was rescinded the company entered upon the plaintiff's land, but was unable to complete the road before being served with a writ.

It appears that the defendant, by reason of inability to pass over a portion of the intended route, will not be able to complete the line as located. The supreme court of Pennsylvania has held that when the lack of consent by a municipality or quasi municipal division prevents the building of a road as located, the company cannot lawfully build distinct roads. In a former case Judge Yerkes declined to take the position that the company could not build because it lacked the consent of a single landholder, but in this decision says that he has grave doubts as to the correctness of this.

But such a failure is a warrant for those who have consented to withdraw. In concluding the opinion says: "Conceding, then, that there was power to grant the license, the written consent having expired by its own limit and there being no evidence even on the part of the defense of a renewal in writing and for a consideration, in view of the refusal to renew, it is difficult to comprehend by what authority the defendant occupies the land of the plaintiffs, provided the latter complained with sufficient promptitude, which I think they did. For these several reasons the preliminary injunction will be continued and made perpetual, and the defendant will be commanded to remove the incumbrance from plaintiff's land."

## THE CHEAPENING OF STEEL.

The first steel rails made in the United States were of Bessemer steel and rolled in 1867; they sold for \$160 per ton. By 1871 the price had fallen to \$102 per ton, and by 1873 to \$90. The production of Bessemer steel in America was insignificant in amount in the early seventies, in 1876 the annual product had reached 500,000 tons and increased each year until 1879, when began a race with England on the output of Bessemer steel. The American output exceeded the English for the first time in 1884, and each year since then the lead has been increased until in 1895 the American output was three times the English. In the production of open-hearth steel England has heretofore been greatly in the lead of the United States, but for the last three years our output of open-hearth steel has been increasing at a more rapid rate, the indications being that we shall soon overtake and pass England in this product, also.

Up until 1887 the steel rails rolled in America absorbed more than two-thirds of all the steel manufactured; since then there has been a gradual decrease in the rail output, so that now it is about what it was 15 years ago, and is but one-quarter of the total steel produced.

The factors leading to the fall in the price of rails from \$90 in 1873, to less than \$30 (\$17 was the price reached for a short time in the spring of 1897), have been the substitution of machinery for hand labor, the reduction of freight rates, and the working of mines containing superior grades of ores. The one thing above others is said to be the use of the Lake Superior ores.

The Board of Aldermen of New York has been temporarily enjoined from granting a permanent franchise to the 42d Street, Manhattanville & St. Nicholas Avenue Railway Company, and restrained from passing an ordinance granting franchises for more than 25 years. The charter of Greater New York forbids any franchise for the use of the streets being given for more than 25 years.

THE SCOTTE ROAD MOTOR.

During the past few months there have been many references in our foreign exchanges to the competitive trial of heavy-weight vehicles driven by other than animal power which has been conducted under the auspices of the Automobile Club of France. It is thought that a power diligence line might be made to pay where a light railway line would fail, and the government also is interested from

SCOTTE OMNIBUS.

a military point of view; at the late competition was a committee appointed by the Minister of War with directions to report on the probable value of such vehicles for the transportation of supplies and troops, the removal of wounded, etc.

The competition was for vehicles designed especially for the transport of passengers and personal baggage (the minimum being fixed at 10 persons and 700 lbs. of baggage), those for freight only, and those for passengers and freight (the minimum weight of freight for this class being 2,200 lbs.). Three different routes were selected, which each competitor had to traverse in turn. The grades on some were severe, being as much as 14 per cent; one route was 25 miles long, of which 6.8 miles was over paved roads; a second of 28 miles had 3.5 miles paved; and a third 41 miles had 6.8 miles of paving. This class of road surfaced with the heavy rounded blocks, so common in the suburbs of Paris and other Continental towns, is very destructive to ordinary carriages, and should be peculiarly trying to self-propelled vehicles. As each of the competitors traversed all the routes twice, the total run was 190 miles.

Fig. 1 shows the Scotte motor car, one of the competing steam-driven vehicles which gave excellent results. The motor car had four places, and hauled a vehicle of 18 seats and a baggage car holding over a ton. The steam engine on the motor car was of 16 h. p.; the mean speeds attained on the three routes were 4.3 and 4.7, 5.6 and 6.1, and 4.3 and 5.0 miles per hour. For freight service there was a Scotte train consisting of a locomotive weighing 5,600 lbs. which drew a wagon weighing 20,000 lbs. loaded, and made a speed of from 3.2 to 3.7 miles per hour. The Scotte omnibus, holding 12 passengers with their baggage, a total of 9,000 lbs., and drawn by the 16-h. p. motor car made 9.3 miles on a level, and the average speeds over the three routes varied from 4.5 to 6.1 miles per hour.

The steam omnibus has developed into what may be considered a standard type. The line drawings for which we are indebted to Engineering, London, show the ar-

rangements. The motor car empty weighs 9,200 lbs. It is 17 ft. long and 5 ft. 11 in. wide. The coach body at the rear holds eight persons, and there is standing room on the platform for six more. In Fig. 3, A is the engine and B the boiler. The boiler is a vertical tubular one known as the Scotte, a variation of the old Field boiler, and carries steam at 170 lbs. per sq. in. The engine is vertical with two cylinders, each 4.52x4.72 in. The normal speed is 400 strokes per minute, which with the cut-off at three-quarters of the stroke gives 25 h. p.

The axles of the front wheels are mounted on vertical pins at the ends of a transverse bearer, attached to the main frame, and their movements about the pins are regulated by connecting rods so that both wheels take the same angle. The reversing wheel is shown at t. Motion is transmitted from the motor to the rear wheels through their axle E, by the toothed gearing of the speed-changing device; by the steel chain h driving the differential shaft D; and by the chains i, i. Water is carried in tanks, I, I, placed under the seats and floor of the cab, which holds about 150 gallons. Fuel is stored in the box, J, with a capacity of 14 cu. ft. The trailing car for passengers is 14 ft. 9 in. long, with a capacity for 24 persons—12 seats and 12 standing places.

There has been a regular service of Scotte trains for a year past between Courbevoie and Colombes, near Paris. Quite recently a Scotte train was placed in service between St. Germain-en-Laye and Ecqueville, a distance of 3.3

ELEVATION AND SECTIONAL PLAN.

miles. The running time was fixed at 95 minutes, including 16 stops, making the necessary speed about 9.3 miles per hour.

Various tests have been made with most satisfactory results. The car climbed a 6 per cent grade on a road newly laid with broken stone, and has mounted a 9 per cent. grade on a better road.

At 10 p. m. on December 26 a trolley car on the lines of the Schuylkill Valley Traction Company was held up by four highwaymen near Swedeland. The conductor was shot and killed on refusing to surrender his money; four women who were passengers were not molested.

### CONDUIT CONSTRUCTION IN BERLIN.

The electric line which is being constructed from Behrenstrasse, a city district to the south of the river Spree, and Treptow, a suburb, is partly of the conduit system. The total length of the single track is 11 miles and  $1\frac{1}{3}$  miles in the city of Berlin where the trolley is not permitted. The illustration from the Railway World, gives a good idea of the form and manner of construction of the conduit. The cast iron yokes are set 4 ft. apart under the inner rails. Boards are placed around the yokes and cement concrete rammed about them. This bed of concrete is carried 30 in.

CONDUIT CONSTRUCTION IN BERLIN.

below the rail level and the conduit itself is an oval 14 in. wide and 18 in. deep.

The rails are not used for a return as the positive and negative conductors are carried in the conduit. These consist of two inverted T-irons insulated and supported in the conduit to either side of the center so that they can be reached only by the contact shoe. The conductors are supported every 5 ft. from insulators fastened to cast iron extensions to the rail bases. The contact shoe or plough is the same type as that at Budapest and is so formed that when the trolley is used it is automatically drawn out of the conduit. The feeders are armoured cables laid underground. The current is supplied from one of the Berlin city lighting stations.

### COPPER FOR STREET RAILWAYS.

The copper lines which radiate from the street railway power station are analagous to the arteries passing from the heart to every extremity of the human body. Over these wires is transmitted the current which gives the power for every movement. Without copper the trolley system, and in fact all electrical industries would be impossible. It seems providential that within the last score of years since electricity has taken such a prominent part in industrial progress, great deposits of copper should have been discovered and worked, resulting in a great decrease in the price of the metal.

Copper is almost as widely distributed as iron and was probably the first metal known and used in primitive times. Its malleability, ductility and tenacity make it an easy metal

to work into any form or implement. If exposed to moisture a green carbonate will form on the surface but it is not affected in a dry atmosphere. It is a little heavier than iron, the relative weights being as 8.95 to 7.25 and its conductivity is six times that of iron. Copper unites with facility with almost all the other metals but the principal commercial alloys are brass, bronze, German silver and aluminum bronzes.

Copper occurs in the metallic state in nature as well as in combination with oxygen and sulphur. The first extensive deposits came from the Island of Cyprus, from which the present name is corrupted. Later Spain and Portugal produced the metal in large quantities, the Romans and Phoenicians worked the mines in early times, and they are still very rich. England, Germany, France, and Scandinavia possessed mines of considerable magnitude. In the new world the Chili mines were the first to be extensively operated and were for a time the chief source of supply, the production in 1876, being 52,308 tons but has since gradually declined. Vermont, Tennessee and several other states in the Appalachian range produced some copper early in the century. In 1763 Alexander Henry, an Englishman, discovered deposits of ore on the south shore of Lake Superior and commenced mining operations on a small scale, but he was unsuccessful. Not until 1844 were the rich ore beds in the northern peninsula of Michigan worked with profit. The copper here was found in its native state, which, with the exception of small quantities in Peru and Bolivia, is the only copper not derived from sulphuretted or oxidized ores. This copper supplies the grade of metal with the highest conductivity, owing to its natural purity. Silver and iron are the only foreign metals in the lake copper but they are in very small quantities. This ore is treated by the pyrometallurgical or dry method which consists of the ordinary smelting process.

Other kinds of ore are treated in the hydro-metallurgical or wet method and others by the electrolytic process. The electrolytic copper is not so pure as the lake copper as in spite of every precaution in refining there remain small quantities of bismuth, antimony, arsenic, tellurium and selenium. A small per cent of impurity is very detrimental to the conductivity of the metal. The great increase in the world's supply of copper is largely due to the enormous production of electrolytic copper in the United States. Previous to 1890 there was little of this work done in this country, the ores being shipped to Europe for refining. The bi-products of gold and silver made this work very profitable and now that foreign refiners have lost the American trade beyond hope of recovery they are looking to the recently discovered copper mines in New Zealand and Tasmania for a return of prosperity.

In Montana and Arizona the production has increased by leaps and bounds. The Anaconda mines in Montana yielded 132,364,198 lbs. of copper the company's last fiscal year. The total product of these mines has been 488,753 tons of copper besides 35,584,067 oz. of silver and 118,638 oz. of gold. The ores have 4.5 per cent of copper and 4 oz. of silver to the ton. The cost of placing the copper on the market is 9.75 cents per lb. but the by-products in gold and silver are so great that last year the profits were \$5,136,048.

The electrolytic refining plant of this company is very interesting and is the largest in the world. To supply current for the work one 400-h. p. compound engine, one 300 h. p. and

two triple expansion engines, of 900 h. p. each, drive seven Westinghouse generators with a total capacity of 1,780 k. w. In the refinery there are six systems of 200 cells each, and they have an ultimate capacity of 210 tons of electrolytic copper per 24 hours. The process consists in passing a current through a solution of copper sulphate, the crude copper being the anode of the cell and the refined copper being deposited on the cathode. The impurities of the raw copper collect as a precipitate in the bottom of the cell. This slime is carefully preserved as the valuable by-products are in it.

An overhead trolley to load and unload the copper is above the cells and beneath them is a 20-in. railway used to convey the slime to the silver mill. Railroad cars transport the copper to the refinery. The copper pigs are picked up by the cranes and set in the cells, and cathodes to correspond are put in place. The tanks are then filled with liquid and the current turned on. When the process is complete the cathodes and anodes are removed, the liquid drained off and the slime washed out. The cost is .31 cent per lb. of copper. This slime or "silver mud" is boiled in acid to remove the copper, arsenic and antimony, and is then washed and dried in pans. It is fed into a furnace and ingots of silver poured. In this way 350,000 oz. of silver and 1,500 oz. of gold are obtained per month. There are 120 men employed in the work and their wages average \$3.00 a day.

The Spanish mines have ore with about 3 per cent of copper and it costs 7.44 cents per lb. to place it on the market. Sulphur is the profitable by-product. The Arizona mines produce 60,000,000 lbs. of copper per year, gold and silver being the by-products.

The Michigan mines are the only ones not having any by-product, the copper being in its native state; it is freed from its impurities by smelting. In the Calumet and Hecla mines some of the veins are 13 to 14 ft. in thickness and have been followed for 5,000 ft. below the surface. The production is 4,000 tons of ore per day, and from this 92,475,595 lbs. of copper was reduced last year. With one exception this has been the most profitable mining property in the world, as \$50,850,000 have been paid in dividends.

From these three great mining districts in the United States has come the increase in the world's supply of copper. From the table below it will be seen that nearly 55 per cent of the copper is produced in the United States. The price of copper has gradually declined, the second table showing the average market quotations for the respective years.

Production in tons, 1896:	Price in cents per lb.:	
United States.....	203,893	1870—35
Spain and Portugal....	53,325	1880—20
Chili.....	23,500	1890—15.75
Japan.....	21,000	1891—12.63
Germany.....	20,065	1892—11.5
Mexico.....	11,150	1893—10.75
Australia.....	10,000	1894—9.5
South Africa.....	7,450	1895—10.75
All others.....	21,825	1896—10.87
Total.....	373,208	

For the past year or two the home consumption has somewhat decreased, but the foreign demand has augmented. This demand has been occasioned by the construction of street railways in Europe, and for war material. Copper is like gold and silver in one particular, that is, it is costly enough to save and for whatever purpose it is used it is

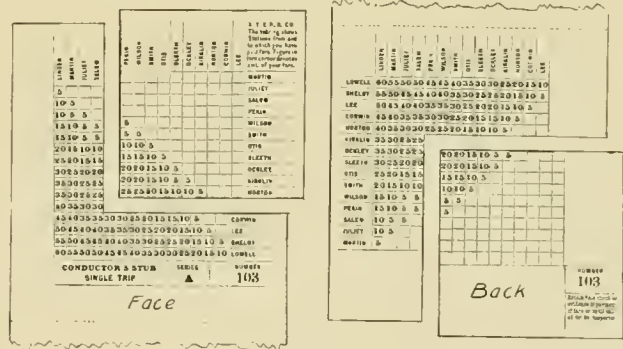

still available for a stock supply. It is not entirely worn out in any service, is not corroded, and is not thrown away. This fact was discovered when an effort was made in January, 1889, to corner the copper market. The price went up to 17¼ cents per lb. and great supplies began to accumulate from unknown sources. Especially from China and India quantities of old copper were drawn to the market by the rise in price.

For electrical purposes copper has stood alone. Silver has a slightly higher conductivity, but is too costly, and save in exceptional cases iron is too bulky for electric conductors. At present the only other metal which seems available is aluminum, which has about 60 per cent of the conductivity of copper. The increased production and the decline in the price of this metal may bring it into the field of competition. Although the supply of copper seems inexhaustible, yet it would be a great boon to electrical industry to have these two metals on the market as competitors.

## CASH FARE RECEIPT.

We illustrate herewith a simple and practical cash fare receipt for suburban and interurban roads. The face of the ticket shows in the lower left hand corner of the portion torn out, the portion given the passenger, the amount of the fare, and in the margins the stations between which he pays. On the back of the conductor's stub is shown the amount of the fare for the use of the auditor; this amount is at the bottom of the last torn column, however, and not in the corner.

The tickets are bound in books of any number desired. The book is held in the left hand, the binding edge at the

CASH FARE RECEIPT.

bottom and a small square of sheet metal slipped into the proper position; a quick jerk with the right hand detaches the passenger's portion of the ticket. When the ticket is properly torn the square is slipped behind the stub and serves as a book mark. At the end of the trip or run the stubs are detached along the perforated line and turned in with the cash received.

It is stated that three tickets of this type can be issued in the time required to punch and detach one ordinary duplex ticket.

The Santa Barbara Consolidated Electric Company made November 12 a benefit day for one of the conductors on the road who recently had the misfortune to lose his foot as the result of an injury received through his own carelessness. All the employes gave one days time and the company gave the gross receipts for the day.

### THE ELECTRIC PLANT AT BRIANCON, FRANCE.

Some years since the military authorities at Briançon, France, on the Italian frontier, sought to secure a supply of electricity for lighting and power purposes at the barracks and arsenals, and for the aerial cable service which is an important one at most of the mountain fortifications. The only difficulty was the expense of installation, which the department could not afford, and after asking for propositions from all who desired to bid, one by Guillon & Co. was accepted and the firm given a contract for nine years from August, 1893, by the minister of war. The income guaranteed by the military department was 15,600 fr. per

INTERIOR OF BRIANCON STATION.

annum. At about the same time the company secured a monopoly of the street lighting of the city of Briançon for 30 years, with the receipts from this source guaranteed at 4,000 fr. per annum for 10 years.

The power house is on a small stream, of which there are many in the district, and the equipment comprises two 150-h. p. Faesch & Piccard turbines and two alternators. The turbines are placed with the axles horizontal and are connected to the generators by elastic couplings. The speed is 500 r. p. m., the generators giving at this speed 100 amperes at 2,000 volts with a frequency of 50 per second. The illustration from *La Nature* shows the plant.

The financial results of the installation have been very satisfactory. The total cost was 200,000 fr.; in 1896 the receipts were 45,000 and the expenses 27,000 fr.

### FENDER STATISTICS.

The Consolidated Car Fender Company of Providence has recently issued a pamphlet of over 80 pages, descriptive of the Providence fender and the other safety devices manufactured by the company, and also giving the official statistics of all front end accidents of cars on the Consolidated, of Jersey City, and the Union Depot road, St. Louis, for two years.

As to the fender it is stated: "The Providence car fender, as now made, is the result of more than four years' study, a long series of experiments, and three years' practical use on electric cars. It embodies many ideas given us by practical railroad men, which in many cases was the result of their experimenting for months before adopting it, and placing it upon the cars of their respective roads. About 4,000 Providence fenders are in daily use in 55 cities and towns of the United States."

The accident records above mentioned are thus summarized: "The official accident records of the Consolidated Traction Company of New Jersey, and of the Union Depot Railroad Company of St. Louis, where cars are run very fast, show that 97 per cent of the persons who are struck are rescued by the Providence fender, and that 99 per cent of the rescued escape injury entirely, or receive insignificant scratches and bruises. Where both the front fender and the wheel guard have been used, no fatal accident has occurred."

### REORGANIZATION IN LINCOLN, NEB.

The Lincoln Street Railway Company, Lincoln, Neb., has been in the hands of a receiver since 1894. Since that time it has been necessary to abandon a number of lines and reduce the service on a number of others, in order for the receiver to make both ends meet. On December 17 the road was sold to Messrs. Scudder and Belcher, representing a reorganization committee chosen by the first and second mortgage bondholders. The purchase price was \$50,000; there were no other bidders.

The Lincoln Traction Company, which will now operate the road, was incorporated December 1, the capital stock being fixed at \$1,065,000. The outstanding obligations of the old company were: first mortgage bonds, \$300,000; second mortgage bonds, \$840,000; owing to the city for paving and taxes, something in excess of \$50,000.

### CHANGES IN SAN FRANCISCO.

E. P. Vining, general manager of the Market Street Railway Company, San Francisco, advises us that the company has under consideration changing the motive power on the Park & Ocean Railroad, four miles of double track, from steam to electricity, and equipping the 8th street horse line, one-half mile of double track, for electricity. It is also proposed to extend the salt water pipe line, used for condensing purposes, from the Bryant street power-house to the station at Market and Valencia streets; the distance is about one mile and the cost is estimated at \$40,000. Other changes may follow during 1898, but they are not under consideration at present.

### PROFESSIONAL WITNESS UNMASKED.

The trial of a personal injury case against the Chicago City Railway, in which the damages were laid at \$50,000, was the occasion of the exposure of Cleveland G. Arnold, one of the witnesses for the plaintiff, as a professional. On cross examination he admitted writing letters, which were offered in evidence, addressed to the Chicago City Company, in which he stated that he was the only witness to the accident, that his evidence was necessary to the plaintiff's case, and that he desired an interview as soon as possible, "as no doubt it will be to our mutual advantage."

In a second letter he offered his services for "a small consideration." He also stated that he was receiving \$2.50 per day from the People's Casualty Claim Adjusting Company, which was handling the case.

Arnold also confessed to having served a term of six months in the penitentiary for violations of the postal laws in connection with a matrimonial agency. In default of \$500 bail the witness went to jail and will answer to the charge of contempt after the conclusion of the case.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Condemnation Proceedings by one Street Railway Company  
Against Another.*

One street railroad company can not maintain condemnation proceedings against another to acquire the use of a portion of its road in the street until it has first obtained the consent of the property owners and local authorities to use the street.

Consent given by the local authorities and property owners to one company to operate its road in the street is not sufficient to authorize another company to come into the street, notwithstanding the new company is to use the same tracks and appliances as the old one in operating its cars.

Yann, J., in the opinion of the court says:

If the consent of the local authorities or of the abutting owners is required to enable the appellant to extend or operate its road through Broadway, under the circumstances, this proceeding can not be maintained until the requisite consent has been obtained. If it is required at all, it must be had before the proceeding is begun, for the statute in providing that the consent "shall have been first obtained" makes it a condition precedent. As said by this court, when construing a similar statute under somewhat similar circumstances: "Sufficient vitality and strength to go on with and construct a railroad do not exist \* \* \* until infused by the consents of the local authorities and property owners." (Matter of application of Rochester, etc., Railroad, 123 N. Y., 351, 358.) It is, however, insisted that the appellant does not seek to build a railroad through Broadway, but to acquire the right to use a road already built after consent had been duly obtained from all sources required.

It is true that the appellant does not intend to build a railroad through Broadway in the sense of laying a track there, but it does intend to "extend and operate" its railroad by so using the tracks of the respondent as to unite the two sections of its own road. Tracks alone do not constitute a railroad within the meaning of the statute which declares that a railroad shall not be "built, extended or operated" until certain preliminaries have been complied with. Cars and other appliances are required in order to make or operate a railroad. If the appellant shall finally succeed in acquiring the right to run its cars for a short distance on the respondent's tracks, it will still be operating its own railroad, not that of another company, over that part of its route as well as any other. It clearly would not be operating the respondent's railroad, but using a portion of the tracks of the respondent to operate its own railroad. Two different companies can not operate the same railroad at the same time, although both may use the same track in part to operate their respective roads.

When the statute provides that "any street surface railroad company may use the tracks of another street surface railroad company" upon certain conditions, permission "to use the tracks" implies use for the purpose of operating its cars thereon. Manifestly no other use is intended. A railroad is none the less in operation between two points, because it runs its cars for a part of the way over the tracks of another road. When a railroad corporation acquires the right to run its cars over a street, whether upon its own track or that of another, that right becomes a part of the railroad, and in exercising that right the corporation operates its own road. The operation of a railroad includes the running of cars; and when a company runs its own cars, receives its own passengers and collects its own fares over a continuous route of four miles, and all the trackage be-

longs to it except a connecting link of a few hundred feet in the middle, which it acquires the right to use through the power of eminent domain, we think it is to be regarded as operating its own railroad over the entire route, within the meaning of the Constitution and the statute. The prohibition is in the disjunctive, and is directed against operation the same as it is against construction.

It is further insisted that where one company has the consent of both local authorities and abutting owners to build and operate a railroad through a street, no further consent from either of those sources is necessary to enable a second company to use the tracks of the first, and hence that neither the Constitution nor the statute applies to the case in hand.

The consent required is not simply to the laying of the tracks, but also to the operation of the road. When the municipal authorities consented that the respondent might operate its road through Broadway, they did not consent that another company might operate a distinct and independent line through that street. The operation of one railroad might cause so slight an interference with the use of the street as not to seriously impair its usefulness, whereas, if two or more railroads were permitted to operate their lines through the street it might virtually destroy it for the ordinary purposes of a highway.

The danger of crossing at grade steam surface railroads, of which there are two running across the strip in question, would be greatly increased by the traffic of several street railroads, which shows the necessity of keeping the subject thoroughly under the control of the public authorities by conservative legislation and conservative construction of that legislation. So an abutting owner might be willing to permit one company to operate its line through the street in front of his property, which would involve the passage of but three or four cars an hour, but not be willing that several companies should have that privilege, which might involve the passage of a car every two minutes. It is not the laying of tracks but the running of cars that constitutes the chief burden both upon the street and the property of the abutting owners. Consent to the burden of one road should, in reason, be limited to that road with whatever increase of business it may have, but should not be extended to as many roads as can crowd their cars into operation upon the street. It would be an unreasonable construction to hold that this is what the public authorities or the private citizens intend when they consent to the building and operation of a street railroad.

Instead of an advantage to the public, or to those owning property on the street, which is the inducement to obtain consent, it might result in a heavy and unexpected burden upon both, without any power to prevent it, and yet with no intention to consent to it. It would be a perversion of the consent given by extending it far beyond the intention of the parties. The object of the statute is to protect the public against injury to the streets, without the consent of their representatives, and also to protect the property of the citizen against injury without his personal consent or the consent of a majority of the abutting owners, or where the refusal to consent is unreasonable, the order of the Appellate Division of the Supreme Court. The consent thus

required is of such importance as to be imbedded in the Constitution itself, not in the interest of railroad corporations, but of private and public rights.

The statute, however, goes a step farther than the Constitution, by providing, through Section 102 of the Railroad Law, additional protection to the public by prohibiting a second company from laying a track in a street already occupied by the track of another company, and thus incidentally protecting the latter from competition on the same street without compensation. Sections 91 and 102 relate to the same general subject, and should be construed together. The latter does not provide an alternative right, but is an additional requirement to regulate the construction and operation of street railroads so that the public interests may be promoted and private rights protected. (In re 34th St. R. R. Co., 102 N. Y., 343.) Construed as an alternate provision, it would be in violation of the Constitution, for it would authorize the operation, if not the construction, of a street railroad without the consents required by that instrument. Even if the old road should consent, under Section 102, the new road could neither extend nor operate without the consents required by Section 91.

We agree with the reasoning of the learned Appellate Division in this case, and should have adopted their opinion as our own had it not been silent upon the question as to the necessity of consent on the part of property owners. In order to avert further litigation in this as well as in other cases that may arise, we have deemed it our duty to express our views upon that subject also.

We think that when consent is given either in behalf of the public, or the abutting owners, to one company, it is for its own use and not for the use of an indefinite number of other companies, regardless of the interests of the city or of the owners of property on the street.

(New York Court of Appeals. The Colonial City Traction Co. vs. The Kingston City Railroad Co., 30 Chicago Legal News, 73.)

*Injury to Person alighting from Car—Duty of Railway Company—Attempting to Bribe Jurors.*

Appellee was injured while alighting from one of appellant's horse cars, and brought suit for damages against appellant, claiming that he was injured by the negligence of appellant's servants.

The appellant having stopped its car, the appellee was not thereafter bound to notify the appellant that he wished to get off and take his children off the car; but the appellant was bound to exercise the greatest care, to take notice of what the appellee was doing: Chicago W. D. Ry. Co. v. Mills, 105 Ill., 63, 68, 72.

When an ordinary steam railway train, moving and stopping for the reception and discharge of passengers only at regular stations, stops at a place not designated for the reception or discharge of passengers, it is perhaps not the duty of the carrier to keep watch of the movements of the passengers who may see fit to get off at such place; but in respect to street cars in a city, the rule, because of the practice of the people and the permission of the carriers, is different. The duty of a common carrier is that it should exercise the highest degree of care, skill and diligence for the safety of its passengers that it is practicable and consistent with the efficient use and operation of its cars: R. R. Co. v. Arnol, 144 Ill., 271, and cases cited; W. C. St. R. R. Co. v. Martin, 47 App., 615; N. C. St. R. R. Co. v. Wixam, 51 App., 312.

After the jury in the court below had rendered its verdict in this cause, the court publicly announced in the court room that two of the jurors had been corruptly approached and offered a bribe by some one, unknown, to bring in a verdict for the defendant, this being communicated to the court by said jurors while the trial was in progress. This public announcement after the verdict was the first knowledge of either parties or counsel in the case, of that fact. We think this was a mistaken course on the part of the trial judge. He, no doubt, was conscientious, believing it to be in the interest of justice to keep the attempted bribery secret, but we are clear this was error.

Counsel have given us no assistance on this question, by the citation of any authorities, and we have not felt it was necessary to support our views by extended reference to precedents, but are satisfied with the reason and correctness of the statement in 2 Thompson on Trials, 2560, to the effect that a corrupt attempt to influence the verdict of a jury by other means than evidence and argument in open court, on grounds of public policy, is always ground for a new trial, without reference to the merits of a case, and whether successful or not: Heffron v. Gallupre, 55 Me., 565; and Nesmith v. Clinton Fire Insurance Co., 8 Ab. Pr. Rep., 141.

The case at bar is a close one, both on the questions of care by the appellee and the negligence of appellant, and no one can say but the verdict was affected by the efforts to bribe the two jurors. The trial should certainly not have continued without a knowledge by the parties of the fact, and their consent. For errors noted the judgment will be reversed and the cause remanded.

(Appellate Court of Illinois, West Chicago Street Railway Co. v. Luka, 30 Chicago Legal News, 82.)

*Ordinance Requiring Fenders on Electric Cars—Validity of Ordinance.*

An ordinance requiring proper and suitable fenders on the front of electric cars to prevent accident, and making it unlawful to operate them in the streets without such fenders, is held to be a valid exercise of the power to regulate the use of the streets.

(Supreme Court of New Jersey, State ex rel. Cape May, etc., Ry. Co. v. Cape May, 36 Lawyer's Reports Annotated, 633.)

*Change from Horse Railway to Electric Railway—Not an Additional Servitude.*

The conversion of the existing single track horse car railway into a double electric railway under legislation and municipal authority is not an additional servitude on the street for which abutting owners are entitled to compensation.

(Supreme Court of Virginia, Reid v. Norfolk City Railway Co., 36 Lawyer's Reports Annotated, 274.)

*Exclusive Grant to Use of Streets for Street Railroad Purposes—In Excess of Powers of Municipal Corporation.*

The grant of an exclusive privilege or use of the streets for street railroad purposes is in excess of the powers of the municipal corporation under a statute providing that its consent must be obtained and that the railway shall be under such regulations and upon such terms and conditions as the municipality may prescribe.

(Supreme Court of Michigan, Detroit Citizens' Street Railway Company v. Detroit, 35 Lawyer's Reports Annotated, 859.)

**PRACTICAL OPERATION AND MAINTENANCE OF ELECTRICAL EQUIPMENT IN THE POWER HOUSE.**

BY J. D. DE GURCHY.

(Continued from December, 1897.)

In regard to sandpapering commutators; although some require it very seldom, others will not run well without being sandpapered once a month, and, where they are run with frequent or continued overloads, even oftener. I have one multipolar 500-k. w. dynamo under my care, which has run smoothly and absolutely without repair for 14 months, but several others of the same type require sandpapering once in five or six months, with occasionally some slight repairs to the insulation between the segments, or to the brushes. Thirty sheets of sandpaper, 10x12 in., say 25 sheets of No. 2 and five sheets of No. 0, with a pressure of about 5 lbs. to the sq. in., will clean, smooth and polish a 900-segment commutator 10 in. wide and 6 ft. in diameter, with a wear of but two lbs. of copper. One light cut with a turning tool will not true up the whole surface of a commutator so large; two will invariably be found necessary, and the loss in copper would be about 50 lbs., or about the loss that would occur in two years by giving the commutator 30 sheets of sandpaper once a month, provided it should be found to require it. If the machine is well designed, the brushes set in the proper positions in relation to the field-poles, the lead adjusted to the variations in load, and all other trouble, such as loose commutator bars or short circuits in segments, attended to in time to prevent abnormal cutting, the commutator ought to run at least six months without sandpapering; turning off is almost unnecessary.

When spacing brushes on large commutators, do not do it by measuring between each set or by counting segments, for where there are 10 brush-holders it is very easy to creep  $\frac{1}{4}$  in. in a circumference of 15 ft. or more. To set brushes

FIG. 3.—SANDPAPERING DEVICE.

in their proper positions, get the circumference of the commutator with a strip of stiff paper 1 in. wide; divide it into 10 equal parts, making each division with a thin, clear

line; then replace the paper strip and adjust the brushes to the divisions thus procured. If the brushes are properly adjusted, much unnecessary sparking and consequent wear will be obviated. Fig. 3 shows a very convenient block for use in sandpapering. Pressure can be applied by hand or by means of a pair of blocks and tackle and a lever about 5 ft. long, using the brush-holder yoke as a fulcrum about 1 ft. from the end of lever, bearing on the sandpaper block B. A strong pull upon the end of the lever will give sufficient pressure to the sandpaper bearing upon the commu-

FIG. 4.

tator. A little sperm oil applied to the sandpaper immediately before using will prevent the commutator from rolling sand off the paper, insure even cutting, and keep the copper dust from flying.

There are some panel switchboards with a perfect maze of unnecessary wires, binding posts, bus bars, etc.; with wires of the greatest difference of potential near together, and positives sometimes crossed with negatives. Study the switchboard, for there may be some better way of running wires, or it may be found possible to dispense with some. If the machine panel wiring appears crowded, study out a simpler and more direct way of meeting the requirements. There may be some complicated or faulty wiring which could be simplified before some accident occurs, which might lead to a short circuit that would disable one or more machine panels.

I recall an instance where the dynamos had been thrown on the bus bars with one voltmeter plug, which method was very uncertain, owing to the loss of time in changing the plug from one panel to the other, and the necessary waiting for the needle of the voltmeter to come to rest after the contact was made. To obviate the necessity of changing the plug, two were procured and so connected that the pressure readings were found by means of a two-way pivot switch. The method proved to be all right until one of the plugs was placed in the voltmeter contacts inverted, which caused a fuse in the voltmeter circuit to blow, and the fuse block being inadequate for the high e. m. f., an arc was formed across the terminals, and owing to the crowded condition of the wiring the machine panel was practically wrecked, the system being at a standstill for 30 minutes. It is needless to say that the panel has since been changed, and also all the other machine panels in that in-

stallation, and they are now using a Weston differential voltmeter.

Machine bus bars, no matter how large, should be well insulated; then, if trouble ever occurs, there will be no heavy arcing between them. Where station lights are supplied from the power switchboard it will be found very simple, safe and convenient to connect them as shown in Fig. 4. The only change in shutting down a dynamo is in transferring the negative connection from the dynamo to be shut down to the one to be left on the line. The only possible way to get into trouble would be to close the negative light circuit switch on an idle dynamo with the equalizer in, or to leave it in on a dynamo which has been disconnected from the line. Any such mistake, of course, would be gross carelessness and wholly unnecessary.

Circuit breakers should be given considerable care to insure perfect action. The slides and plug should be kept perfectly clean and smooth, and should be adjusted to maintain a closed circuit in the magnet coils until the main contact has opened at least  $\frac{1}{2}$  in. The interior of the fibre box enclosing the secondary contact should be kept free from carbonized substances thrown off and burned against the walls by the arc, and all the connections should be tight. The main terminals, especially on the machine breakers which are sometimes obliged to carry an overload, will get very hot if allowed to become loose. The jarring of the breaker is liable to loosen the screws in the connectors of the magnet coils, and if these get very loose it will so increase the resistance of the blow-out magnetic circuit coils that the short circuit is liable to assume gigantic proportions before being broken, and might possibly arc

FIG. 5.—SWITCHBOARD.

at the main contacts. An off-set screwdriver should be procured for tightening these, for an ordinary screwdriver is too long to be of any practical use where the circuit breakers are arranged on panels close together.

Circuit breakers should never be opened for repairs without first being open circuited, or some other path provided for the feeder supply. To take off the front blow-out magnet plate would break the magnetic field, and although the circuit breaker would open, the destructive

FIG. 6.—REAR OF SWITCHBOARD.

arcing would render the sliding connections and contact plug useless. If the short circuit were particularly heavy, it would open the machine circuit breakers, thereby cutting off the current supply from the lines, because the feeder circuit breaker, being without the magnetic blow-out, would continue to arc after it had opened mechanically. In the accompanying photograph, Fig. 5, will be seen an arrangement of connections and switches for cutting out any of the 16 circuit breakers for inspection or repairs, without interfering with the current supply of the feeders, and with the aid of but one spare circuit breaker. The front of each rear panel shows a circuit breaker and switch and two feeder ammeters. The panel directly in front holds a circuit breaker and switch only, the ammeter being left on the rear panel for convenience in arranging the switch contacts. The lower front panels were installed in order that a circuit breaker could be provided for each feeder without a great sacrifice of space.

Now, looking at the photograph of the rear of the feeder panels, Fig. 6, A is the main positive bus bar from which all the feeders are supplied, the connection H supplying the circuit breaker at the top of the main panel. D, D, D is an auxiliary bus bar and is connected to the main bus A by means of a spare circuit breaker. Now, with the switch E thrown to the left to connection B1, the feeder takes current from the main bus A at H through the circuit breaker to the switch jaw contact B1, which is behind but not connected to the bus D, down through the switch E to the ammeter between E and L, to the main feeder switch on the front of the panel, and out to the line. To cut out the circuit breaker connected at H the bus D is made alive by closing the spare circuit breaker. Now, the switch jaw contact B2 being connected to the auxiliary bus D and

being of the same potential as A, if the switch E is thrown to B2 the panel breaker H B1 is cut out and can be opened for repairs without opening the feeder circuit, because the switch E makes contact with the connection B2 before leaving B1. The circuit breaker on the front panel is supplied from J, the current going down to and beneath the platform to the circuit breaker and through the main feeder switch back to the jaw contact C1, through the switch F, to the lower ammeter and through the feeder M to the line. To cut out the circuit breaker on the front panel the switch F is thrown from the jaw contact C1 to contact C2, and, like the switch above, makes electrical contact with C before leaving C1. The jaw contact C1 is given rigidity by being clamped to the feeder bar L, but is not electrically connected, being well insulated with  $\frac{3}{4}$ -in. fibre.

## DISCIPLINE OF EMPLOYEES.

The Metropolitan West Side Elevated Railroad Company, of Chicago, has a system of discipline based on the percentage classification. W. E. Baker, superintendent, and A. S. Jones, superintendent of transportation, made a careful study of the subject before adopting the present system, April 1, 1895. The defects of any system of promoting men simply according to seniority of service, or of discharging them for all infractions of rules, were evident. A system was desired which would encourage the trainmen to not only do their duty, but to in every way conserve the company's interests, and one which would have an educating influence.

The following article was incorporated in the rule book:

"It is the desire of this company to impress upon the mind of each person accepting service in its employ that retention in service will be based upon good deportment and strict observance of all rules and regulations. It is the aim of this company to reward such good deportment and obedience to rules and regulations by promotion from time to time from one class to another when vacancies occur, this promotion to be governed by ability and a fair percentage basis, seniority only having the preference when other qualifications are equal. Upon entrance in each class by promotion or appointment each employe will be credited with a 100 per cent mark, and for each violation of rules, in addition to the punishment of suspension from duty that may be inflicted by the head of the department, a deduction of 5 or more per cent, according to judgment of the head of department, will be made from standard. When an employe in a class has fallen below the rate of 45 per cent he will be reduced in rank to next lower class, with a 100 per cent credit rating from said time of entrance. A credit of 2 per cent per month will be placed to each employe having for that time had no reports against him for dereliction of duty."

The punishment of suspension is no longer inflicted, as it was found to bear most heavily upon the family of the offender, and if the violation did not warrant dismissal the loss of percentage was sufficient punishment. Intoxication is the only transgression which is invariably followed by dismissal.

The figure indicates diagrammatically the classes into which the trainmen are divided and the process of promotion. The motormen, having the most responsible positions, are in Class 1 and receive the highest pay. Switch-

men and conductors are in Class 2, switchmen receiving higher wages, however, than the conductors. Class 3 comprises the couplers and the guards, the former receiving higher pay. In Class 4 are the extra couplers and extra guards; no other "extras" are employed, vacancies in any class being filled from the class below. Extra guards receive the wages of guards, and extra couplers the wages of couplers, for the time that they are on duty. An extra guard is promoted to a guard, an extra coupler to a coupler, a guard to a conductor, a coupler to either a conductor or a switchman, and conductors and switchmen to motormen. Each man starts into the next higher class with a percentage of 100.

When an application is made a blank is filled out giving the previous occupation, height, weight, etc., of the applicant, and filed at the office. When an extra guard or coupler is needed, the applicant is given a physical examination and his sight tested. If everything is satisfactory the man starts in with 100 per cent at the beginning of the month next succeeding his appointment. At the first of the next month 2 per cent is added for seniority allowance to his average if he has not violated any of the rules and regulations of the company. These records are kept in the main

office on cards, and for each employe there is a complete history of his services with the company. By this means the officials have accurate information concerning every employe, and can tell almost at a glance how faithful any one has been in the performance of duty.

Whenever there is a violation of any rule, or any man has been guilty of negligence or bad judgment, the superintendent at once consults his record. If the man's record is good and nothing serious has resulted, a bulletin is posted giving a warning or reprimand. If the action calls for severer punishment a certain per cent is deducted from the man's record, and a bulletin is posted in the four trainmen's rooms giving an account of the violation and whatever advice is necessary. These bulletins, which all the trainmen see, are a large factor in educating the men in the performance of their duties. Examples of the punishments are as follows: One guard was seen flirting with some girls and not attend-

ing to his duties; his percentage was reduced by 10. A motorman ran past a danger signal; he was fined 5 per cent. A train ran one car past the station and the conductor gave the signal to back up while the passengers were passing from the cars; he was fined 5 per cent for bad judgment.

If the employes are to be punished for mistakes it is proper to reward acts of extraordinary care and good judgment. One guard was given 5 per cent for rescuing a passenger who had fallen from the station platform. It was noticed that some of the motormen were taking extra precautions to keep their cabs clean and the apparatus polished. The cars were inspected and 2 per cent was added to the percentages of the deserving motormen. A number of the conductors and motormen were very careful in keeping their uniforms brushed, their linen clean, shoes polished and preserving a tidy appearance generally, and additions of 2 and 1 per cent were made on the records of such men. Bulletins commending the good conduct of the men are also posted, and this is a great encouragement for the best service. Each motorman, at the end of his run, makes a record in a book of the condition of his motor car, and mentions any defects or needed repairs. The night men take this book and examine and repair any noted defect.

If another man is needed in any of the three upper classes the employe who has the highest percentage in the class below is selected for promotion. For motormen the incentive to make a good grade lies in the choice of trips. A complete record of all the trips, the hours of service and the time allowance, is made out, and the motorman having the highest percentage is given his choice of trips, and so on down the line, according to each man's grade. There are 322 trainmen governed by this system. The clerical work involved is not excessive, as it is systematized and attended to monthly. The orders are written by the superintendent of transportation, and his private secretary keeps the records. The towermen, dispatchers and station sellers are also under this discipline. There has been a recent proof of the effectiveness of the plan. Complaints were made by the cashier and auditor that the ticket sellers were making too many mistakes in the money and the figures on the envelopes turned in, also too much bad and mutilated money was coming into the office. The superintendent of transportation posted bulletins notifying the ticket sellers that the next three mistakes would be followed by a warning bulletin, at the fourth mistake 2 per cent would be deducted from their percentages, at the fifth mistake 5 per cent would be deducted, and subsequent errors might be followed by dismissal. This practically put a stop to the carelessness.

This system is similar in many respects to that adopted on some railroads, yet in a number of essential features it is quite different. Publicity is given to all records, names being in all cases freely mentioned, and a punishment in loss in percentage is positive and permanent. A man can never regain his original position among those fellow employes whose service has been exempt from mistakes. The officials give their unqualified indorsement to the system, for no one can question its success. The discipline is second only to that of a military organization, and the employes have been trained and educated so that they are competent and reliable in their positions. Letters complimenting the company on the neatness, precision and efficiency of its employes are constantly received at the office from patrons of the road.

## SPARKING AT THE COMMUTATOR.

In a paper before the American Institute of Electrical Engineers, Thorburn Reid discussed the cause and effects of sparking on commutators. He spoke of the following as some of the various ways in which imperfect commutation may occur and the manner in which this imperfect commutation causes injury to the commutator:

First—Suppose that the current flowing across the contact surface of the receding segment does not decrease as rapidly as the contact surface of that segment decreases. The current density then increases and is a maximum at the last part of the segment that touches the brush. More energy is thus concentrated at that point than at any other, and owing to the fact that time is required to conduct that energy to other parts of the segment that part will be raised to the highest temperature. This temperature may be high enough to melt, or even volatilize the copper of the segment, therefore when the brush leaves the segment the current continues to flow through the film of melted copper, volatilizes it and draws an arc. This arc constitutes the injurious or "vicious" spark. The removal of the volatilized copper from the receding edge gradually wears that edge away. Reduction of the contact surface thus continually increases the current density, and the arc is formed at an earlier stage of the commutation when the current to be broken is greater, and thus the spark increases in viciousness until the commutator has to be turned down before the machine will run at all.

Again, the energy developed at the receding edge of the segment may not be sufficient to melt the copper. In this case the current to be broken when the segment leaves the brush will jump across from the brush to the segment. This spark has no deleterious effect, since most of its energy is developed in the space between the segment and the receding brush, instead of being concentrated at the edge of the receding segment. This spark is of the same bluish color as that of the Ruhmkorff coil, by which it may be distinguished from the injurious spark, which is yellow.

Second—Suppose that the current flowing across the contact area of the entering segment increases more rapidly than the contact surface increases. The current density in that part of the segment then increases and more energy is concentrated at this point than at other parts of the segment, and it will accordingly be raised to a higher temperature. If this temperature is not high enough to melt the copper, no harm results and there is no spark, since the contact is not broken at that point. If, however, the temperature produced is high enough to melt the copper, the melted copper may be carried along by the brush, and the entering edge of the segment is thus gradually eaten away. This will not show by any sparking immediately, but it will eventually cause a spark to appear in the following manner: The eating away of the entering edge of the segment gradually reduces the area of the entering segment and thus increases the resistance of that segment. This delays the decrease of current in the receding segment, and the current density in both segments increases until the temperature gets high enough to produce a spark, as described in the first case of imperfect commutation. Another incidental injury that may occur is the deposition of the melted copper at the back of the segment, thus raising the surface of the segment at that point, and this, together with

the depression of the surface at the front of the segment, would cause the brush to jump and chatter, which of itself would cause deleterious sparking.

This would explain the cases where a machine runs perfectly sparkless when first set up, but after a time commences to spark, the spark increasing in intensity and deleterious effect and disappearing when the commutator surface has been turned up, only to reappear after sufficient time has elapsed. The wearing away of the front edge of the segment is hardly likely to be noticed, since no injury would be looked for until the spark appeared, and then the cutting of the back edge would be much more prominent, because that, being produced by an arc, would have a roughened appearance, while the surface of the front edge would be left smooth, by the rubbing off of the melted copper.

Third—The reversal e. m. f. may be large enough not only to reverse the current in the coil under commutation, but even to increase it beyond the value of half the brush current. In this case the extra current would flow through both segment surfaces, but owing to the fact that this current would be increasing while the receding segment was reducing its contact area, that segment would get hottest, and as soon as it reached the melting point an arc would be drawn and destructive sparking would ensue.

Perfect commutation for any particular position of the brushes can only take place at one value of the load. At heavier loads than this critical one the current is not completely reversed before the segment leaves the brush, and at lighter loads it is more than reversed. This problem may be stated a little more precisely in the following manner:

Assume that the brushes are set as far back as is consistent with sparkless running at the maximum load at which the machine is required to run sparklessly. This means that the reversal e. m. f. is just equal to the coil impedance e. m. f. at that point. Now let the load be removed gradually. The impedance e. m. f. of the coil under commutation is reduced while the reversal e. m. f. remains practically constant. The tendency is therefore for the current to be more than reversed, and this tendency increases as the load is reduced, until finally, when the load has been removed entirely, there is no current to reverse, and the reversal e. m. f. simply tends to produce a current in the coil under commutation. The production of this current is now opposed by the inductance and resistance of the coil and by the resistance of the brush contact surfaces, the contact surfaces of the two segments being in series as regards this current. If the impedance of the coil is low as compared with this contact resistance, the reversal e. m. f. would be small compared with the current times resistance drop across the contact surfaces at full load current. Therefore, the current produced by the reversal e. m. f. would be small as compared with the full load current.

We may also note here that, whereas the variation of the contact resistances aids the reversal of the current, as soon as this current becomes greater than that which flows through the armature, the excess current must pass across the contact areas of both the segments under the brush. The resistances of these two surfaces are then placed in series as regards this current, and the lowest possible resistance that these could have would be reached when the brush covers an equal surface on each segment, making the contact resistance in the path of this current equal to twice the resistance of the contact surface of either segment at

that time. The resistance of this path then starts at infinity, decreases to this minimum and goes back to infinity again.

Now examine more closely the order of events in commutation at no load. The resistance of the coil circuit first starts at infinity and rapidly decreases, while the reversal e. m. f. starts at a minimum and more slowly increases. If there were no contact resistance, the current would reach its normal full load value at about the middle of the commutation period. This of course assumes that the reversal e. m. f. is of such a magnitude as to reverse the current at full load without the aid of the varying contact resistances. In fact, the reversal e. m. f. does a very small part of the reversing at full load when the inductance is small compared with the contact resistances. The current at the middle of the commutation period would therefore be much smaller than the normal full load current, even if there were no contact resistance to limit it. Now introducing this contact resistance, which starts at infinity and decreases to a minimum, which may be several times greater than the impedance of the coil, the current must be reduced at least in the proportion of the impedance to this minimum resistance. During the rest of that period the resistance is increasing till at the end it has reached infinity again. The current, already very small, is rapidly cut down till it is too small to produce a visible spark at the break, and the commutator has not been heated up enough at any point to produce arcing.

The same principles hold in the case of machines whose brushes must be shifted, the range of sparkless commutation only being less.

There have been some machines, however, which would not run sparklessly for any position of the brushes. This is readily explained on the hypothesis of too high an impedance, for in that case the variation of the current during commutation will be mainly governed by the impedance and reversal e. m. f., instead of by the variation of the contact resistances, so that even if complete reversal is exactly attained, the current density at other parts of the commutation period does not remain constant, with the result that the total energy of commutation is increased. A large part of this energy is concentrated at the beginning and end of the commutation period, thus producing heating at the edges of the segments with its corresponding melting of the copper and arcing.

These considerations indicate two ways by which sparkless commutation may be assured. First, by increasing the brush contact resistance; and, second, by decreasing the impedance of the coil under commutation.

The limitation of the second of these conditions is merely one of economical design, lowering of the inductance below a certain point increasing the cost of the machine.

The limitation of the first condition is that of rise of temperature of the commutator. It has been shown that for perfect commutation the current density is constant and uniform throughout the whole period of commutation. Its value is found by dividing the total brush current by the contact area of the segments under a brush. This varies inversely with the brush contact area, and the energy developed therefore varies in the same proportion. The amount of commutator metal to be heated, as well as the radiating surface, also varies inversely with the current density, so that the rise of temperature probably varies nearly as the square of the current density, provided the commutation be practically perfect.

The increasing use of the carbon brush in place of the copper brush is thus explained by the fact that the contact resistance of carbon on copper per square inch is much greater than that of copper on copper. Increased resistance is obtained with the carbon brush by reducing its contact area, but this also reduces the metal to be heated in the commutator, as well as its radiating surface, so that the same amount of commutating energy will result in a much greater rise of temperature.

By taking these facts into consideration, however, and properly proportioning the contact areas and inductance, commutating machines may be designed to run as cool with copper brushes as with carbon wherever this may be desirable.

The reasoning so far has been based on the assumption of but one coil being commutated at a time. This assumption will only be true when the brush thickness is equal to or less than the width of one segment, plus twice the thickness of the insulation between segments. In practice, brushes are often made to cover a segment and a half, sometimes two segments, or even more than this without deleterious sparking. This means that the current in two or more coils is being commutated at the same time.

At first sight this appears to be an advantage since it enables us to get the same current density with less length of commutator, but the time of commutation is increased, so that while the rate of development of energy is not changed, the total amount of energy developed will vary with the time of commutation, and in addition to this the amount of metal to be heated and the radiating surface are both decreased, so that in this respect the change is rather a disadvantage than an advantage. Another important advantage is gained, however, in that the increase in the length of the commutation period decreases the reactance of the coil by decreasing its frequency of commutation, so that the ratio of impedance to contact resistance is decreased, thus tending towards more perfect commutation. This advantage is again limited by the fact that the mutual inductance of two coils commutating at the same time increases the reaction of both.

To sum up, the deleterious effects of sparking are due to excessive local heating of the commutator contact surface, causing the copper to melt, and an arc to be drawn, the segments being thus disintegrated.

The causes of deleterious sparking are either too great a departure from perfect commutation or too high a current density.

Perfect commutation can only be practically secured by making the impedance of the coil negligible as compared with the contact resistance. A comparison of the sparking constants of a large number of machines was made before this theory of commutation was evolved.

It has been found to explain many cases of sparking which had before been unexplained.

It has been found difficult to determine definite safe working constants, on account of the small number of tests that have been made to determine accurately the inductance of the coil under commutation and the effect on each other of two or more coils commutating at the same time.

At the meeting of the New Jersey State Grange of the Patrons of Husbandry resolutions were adopted favoring the repeal of the state law which prohibits street railways from carrying freight.

## ILLINOIS STATE ASSOCIATION.

In response to the call issued by W. H. Patterson, president of the Bloomington City Railway, as published in the "Review" for December, representatives of the street railways of Illinois, met at the Great Northern Hotel on January 5 and organized the Illinois Street Railway Association.

Officers were elected as follows: President, W. H. Patterson, Bloomington; vice-president, D. B. Sherwood, of the Carpenterville, Elgin City & Aurora Railway; secretary and treasurer, C. K. Minary, general manager of the Springfield Consolidated Railway Company. Also an executive committee which comprises the officers of the association, and W. L. Ferguson, general manager of the City Electric Railway, Decatur; B. F. Harris, Jr., president of the Urbana & Champaign Electric Street Railway, Champaign; W. F. Brennan, superintendent of the Chicago General Railway, and Walter Barker,

W. H. PATTERSON.

president of the Central Railway Company, Peoria. The executive committee drafted a constitution and by-laws for the association and fixed the third Wednesday in May as the date for the first regular meeting which will be held at the Great Northern Hotel in Chicago.

Sixteen roads were represented at this preliminary meeting, while President Patterson had received replies from ten other companies stating that they were heartily in sympathy with the plan for a state association and regretting their inability to send representatives to participate in the organization. The success that has attended this attempt at forming an association for Illinois is highly gratifying to Mr. Patterson, who has had the preliminary work to look after, and the more so that the subject has been more or less agitated for the past 10 years.

## RECEIVER MAKES A GOOD REPORT FOR THE CALUMET.

The Calumet Electric Street Railway, of Chicago, has made a good record during the past year, according to the report of the receiver, John C. McKeon. The earnings for the last eight months have been \$144,995 and the operating expenses \$23,970 less. The summer traffic on this road is always very heavy, and last summer was good, although the weather was unfavorable for pleasure riding; July was the best month. Among other improvements during the past year have been the addition of three boilers, a large car barn and 10 motor equipments. The property is in good condition and the indications now are that in another year the road will earn the interest on its bonds.

A jury at Ann Arbor, Mich., awarded \$7,000 to John Shadford, who sued the street railway company for injuries sustained from falling while repairing a trolley wire. A former trial resulted in a verdict for \$4,500.

VESTIBULES IN OMAHA.

The legislature of Nebraska last winter passed a bill making it unlawful for any railway company to operate cars, propelled by steam, cable or electricity, between November

ished by a fine of \$100, and each day's operation is considered a separate offense. It is provided, however, that this act will not apply to trail cars.

The Omaha Street Railway Company had 90 motor cars which came under the provisions of this act, and it was necessary to design a neat vestibule of moderate cost. The three illustrations, furnished by D. H. Goodrich, secretary of the company, represent the standard form of vestibule adopted. The best materials were used throughout in the construction, and the cost, including all necessary changes in the car, was \$78 per vestibule. It will be noticed that only one end is protected. This is made possible by the fact that all the terminals of the lines are Y's; the equipping of the terminals not already provided with Y's involved an extra expense of \$5,000.

WHAT THEY DID ON CHRISTMAS.

The Columbus (O.) Street Railway provided Christmas dinners for its employes. The married men, 300 in number, were presented with turkeys, the weight being tempered to the size of the family; the unmarried men received \$1 each.

The Consolidated at Bay City, Mich., departed from its usual custom of giving turkeys to the employes on Christmas, and instead presented the wives of the men with books of complimentary tickets. Christmas was made a short day, the car service not commencing until 7 o'clock, and by a special order the men were allowed to smoke while on duty.

C. C. Howell, manager of the Knoxville Street Railway, took advantage of the season to promulgate a new rule to the effect that on the first of January and on the first of July of each year the company will present a suit of clothes to those motormen who have not cost the company more than \$5 because of accidents during the preceding six months. On Christmas eve the motormen who had not cost more than \$10 for accidents since Mr. Howell took charge, August, 1895, received their first suits. A similar recognition of good service on the part of the conductors is contemplated, but exactly what has not been decided.

FRONT VIEW.

1 and April 1, without the platforms being enclosed by a vestibule made of wood, iron and glass. The vestibule must be so constructed that it will not interfere with or obstruct the vision of the operator. Violations of this act are pun-

SHOWING VESTIBULE ADOPTED BY OMAHA STREET RAILWAY.

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

When the power house of the Capital Traction Company, of Washington, was destroyed by fire on the night of September 20, last, there was a large amount of coal, several hundred tons, on hand. At the end of three months the pile of coal was still slowly burning; no attempt was made to extinguish the fire as the cost of doing so would exceed the value of the coal that could be saved, and there was no danger to surrounding property in letting it burn. During the day the only indication of the fire is a slight smoke rising from the pile, but at night the flames from the burning hydrocarbons are visible. The Traction Company would gladly have given the coal to those desiring to take it away were it not for the fear that some one would be injured in working about the ruins, and sue the company for damages. Accordingly everything, save some tools and bar iron stored in the building, was sold to the contractor who is under agreement to have the site cleared by March 1. The stack will be left standing as it may be of value to the purchasers of the property, and in any event it will cost no more to remove it at a future date than at the present time.

\* \* \*

We desire to place on record the peculiar combination of circumstances leading to the partial disablement of the power station of the Metropolitan Elevated in Chicago a few weeks since. Ever since the Metropolitan trains were put in operation around the Union Loop the power station has been loaded nearly to the maximum, and a few days before the accident it was necessary to throw one engine out of service to replace a bolt under the main bearing, thus putting an overload on the three others. About midnight on Christmas a heavy load was thrown on the station which should have opened the circuit breakers; one of them did not act, however, and the increased load on the engine caused so much steam to be carried to the condenser that the pressure increased in the latter until the relief valve opened. Some of the water which escaped at the relief valve of the condenser fell on the belt driving the condenser pump and caused it to slip off; the load being thus suddenly relieved the small engine ran away, and the fly wheel burst. Until the condenser engine could be repaired the large unit was operated non-condensing. The total damage to the plant did not exceed \$300.

\* \* \*

Of all supply men, the man who has a saving device has probably the most tantalizing job, when it comes to selling. His fellow salesmen look at him with envy and say: "If I only had something that would save money instead of the supplies I now carry I'd call it a snap." But the salesman with the saving device quietly thinks to himself that the other fellow has much to learn about human nature if he has never tried selling something for saving money. One manager will say that if he bought all the saving appliances that were offered he would be running his plant for nothing. Another will be delighted with the idea, but the company treasury will be low. Another will, through ig-

norance, refuse to believe in the economy of an appliance, all experience and tests to the contrary notwithstanding. The path of the manufacturer is further not made easy by the fact that it is often difficult to make a correct estimate of the saving effected by any device because of the variable conditions under which tests must be made. This is well illustrated by the following tale of woe related by a manufacturer of condensers. He had installed a condenser on trial in a place where the water for condensing cost absolutely nothing. It did not even have to be raised to the level of the condenser, as it was used in a manufacturing process and was delivered to the condenser without any extra cost. The condenser was put in and gave a nearly perfect vacuum. Now any steam engineer worthy of the name would know that this would mean a saving of about 20 per cent if the conditions were the same before and after the condensers were installed, and that if no economy was shown something was wrong somewhere else around the plant. Nevertheless, after the condenser had been in a while the engineer sent word that he didn't want the condenser; it must be taken out. The maker expressed considerable surprise, since the vacuum was as good as could be expected with any condenser. The situation was fully but briefly explained by the engineer: "Oi knows nothin' av your vacuum, but me coal bill is the same as before." The condenser came out, and the maker has concluded that since he can't run the steam plants himself and since a saving at one place may be made up for by a leak at another when such an ignoramus is in charge, that he will hereafter guarantee nothing but the vacuum.

### A Three-Point Boiler Suspension.

At the December meeting of the American Society of Mechanical Engineers, George W. Bissel, of the Iowa Agricultural College, presented a description of a boiler setting designed by him some time since, by which a three-point support for the boiler is secured, thereby freeing it from all stresses due to the settling of the setting; also the boiler and setting are made independent, prolonging the life of the setting and making repairs easy.

The boiler to which the setting was first applied is of the horizontal return tubular type, 54 in. in diameter and 16 ft. long. Two pairs of lugs of special design are attached to the sides of the shell above the fire, at a distance, to centers, of 3 ft. 6 in. from the ends of the shell. These lugs rest on hangers of 1-in. round iron, which are carried by nuts on wrought iron saddles cut from 3x1-in. bar iron. The saddles are carried on I-beams. At the front of the boiler one 7-in. beam is used; at the back end the saddles are supported by an 8-in. equalizing I-beam 5 ft. long, which rests on a 1-in. roller, the roller bearing on the 9-in. I-beam. The I-beams at the front and back end are supported on columns, which are 6-in. channels. Suitable castings serve as caps for the columns and sole plates for the I-beams; the

foot plates for the columns are of cast iron 12x12x $\frac{1}{2}$  in. These foot plates are set perfectly level on piers of brickwork about 2 ft. square, built independently of the boiler setting proper.

Tie-rods of  $\frac{3}{4}$ -in. round iron hold the columns in place

BISSELL BOILER SETTING.

at the top, and longitudinal stability is given by setting the channels into the brickwork of the setting so that the flanges do not project but are flush with the wall.

### The Q & C Oiling System.

The idea of connecting all the oil cups of a plant with a central source of supply by means of piping is an old one, but in working it out it was found that the difficulty lay in getting the oil through the piping so as to feed the bearings regularly. Many plans have been tried, feeding by gravity and under steam pressure, water pressure, or ammonia pressure, and by means of a pump. Steam and ammonia were abandoned because of their injurious effect on the oil; water pressure because of its filling the piping and because of the difficulty of getting a uniform pressure. The gravity system was the only one of the old methods which was at all satisfactory in action and the application of it was limited to those cases in which there was ample room to place the tank above the machinery, while having the whole system exposed to the same temperature. The greatest objection to this plan is that any reduction of level of the oil in the tank reduces the pressure at the cups and varies the supply; also in the case of any stoppage of the pipes the gravity system offers no ready method of clearing them of obstructions, and when the oil reaches a certain low level the cups stop feeding though there is yet considerable oil in the piping.

The use of air under pressure for driving the oil through the piping has proved to be very successful as developed by the Q & C Company, and its system has been installed in a number of the largest street railway power houses in the country. The illustration gives a very good idea of the arrangement of pumps, tank, filters, etc. The tank shown, called the "fountainhead" or central point of distribution, is of from 40 to 80 gallons capacity, and is erected on two pipe standards 8 ft. above the engine room floor. The line of pipe to the left, containing a check valve at the top and a globe valve in the center, is the oil-supply line running from the main oil-receiving tank in the basement; the line of pipe to the right is the air-supply line running through a reducing valve to the main air receiver in the basement. Between each of these pipes and the adjoining pipe standard is erected an upright air compressor connected to the main air receiver. These compressors work independently of each other or together as may be desired. Just below the fountainhead and connected to it by the main oil-feed pipe are placed two pressure filters, which work independently of each other or together as may be desired. Back of the whole is placed a fountainhead board on which are located the necessary gages showing the pressure carried on the main air receiver, main engine oil receiver and main cylinder oil receiver. The fountainhead itself is equipped with its own pressure gage, gage glass, cocks, etc., besides having

THE FOUNTAINHEAD AND PUMPS.

a small independent line of pipe running to and over the large filter in the basement. In this pipe is placed a pop or relief valve, which works automatically to relieve the fountainhead when, in forcing oil into it from the main receiver, the pressure becomes greater than the maximum used for feeding purposes.

## Code for Boiler Tests.

At the December meeting of the American Society of Mechanical Engineers, Messrs. Emery, Porter, Barrus and Kent, as a sub-committee of the committee appointed in 1895 to revise the Society's Code for standard boiler tests, submitted a report in the form of a paper, "subject to revision." The report is quite voluminous and fills 52 pages of the Transactions, notwithstanding that the appendices of the 1885 Code, which it has been decided to retain, were omitted; these appendices will be given in full when the report is finally revised.

The Code, when completed, will prove very valuable, because, together with the appendices, it will give in a single paper the methods recommended by the eminent engineers constituting the committee for making boiler tests and also descriptions of the various pieces of accessory apparatus. In fact, some of the appendices rise to the dignity of treatises.

The standard of evaporation, one pound of water at 212° F. evaporated into steam at the same temperature, is retained. The unit of capacity is the Centennial standard with the wording slightly changed; its definition is as follows: "In all standard trials the commercial horse-power shall be taken as 34½ units of evaporation; that is, 34½ lbs. of water evaporated from a feed-water temperature of 212° F. into steam at the same temperature. This standard is equivalent to 33,317 B. T. U. per hour. It is also practically equivalent to an evaporation of 30 lbs. of water from a feed-water temperature of 100° F. into steam at 70 lbs. gage pressure."

The two methods of starting and stopping a test known in the 1885 Code as the "standard" and the "alternate" methods are retained, but a modification of the method of computing the rates of combustion and evaporation is to be made when the standard method is employed, so that there appears to be no good reason for retaining the "standard" method. The language of the Code is as follows: "When the 'standard method' of starting and stopping the test is used, the hourly rate of combustion and of evaporation and the horse-power may be computed from the records taken during the time when the fires are in active condition. This time is somewhat less than the actual time which elapses between the beginning and end of the run. This method of computation is necessary, owing to the loss of time due to kindling the fire at the beginning and burning it out at the end."

The Code recommends two methods of defining and calculating the efficiency of a boiler:

1. Efficiency of the boiler, equal to the ratio of the heat absorbed per lb. of combustible to the heating value of 1 lb. of combustible.
2. Efficiency of the boiler and furnace, equal to the ratio of the heat absorbed per lb. of coal to the heating value of 1 lb. of coal.

The first, sometimes called the efficiency based on combustible, is recommended as a standard of comparison for all tests and is to be understood as the one referred to when the word "efficiency" is used without qualification. The second, sometimes called the efficiency based on coal, however, is to be also included whenever the object of the test

is to determine the efficiency of the boiler and furnace together with the grate (or mechanical stoker), or to compare different furnaces, grates, fuels or methods of firing.

In calculating the efficiency where the coal contains an appreciable amount of surface moisture, allowance is to be made for the heat lost in evaporating this moisture by adding to the heat absorbed by the boiler the heat of evaporation thus lost.

It is apparent that in determining the efficiency of the boiler the "heat absorbed" may be ascertained much more readily than the "heating value." To get the latter recourse must be had to calorific tests or to analysis, or to both. This opens up the whole subject of coal calorimetry as a mere introduction to the subject of efficiency, and the former is one of the most mooted points connected with boiler testing. The Code says: "The rational method of determining the total heat of combustion is to burn a sample of coal in an atmosphere of oxygen gas. The chemical analysis of the coal should be made only by an expert chemist. The total heat of combustion computed from the results of the ultimate analysis should be obtained by Dulong's formula (with constants modified by recent determinations), viz.:  $14,600 C + 62,000 [H - (O \div 8)]$  in which C, H and O refer to the proportion of carbon, hydrogen and oxygen respectively, and determined by the ultimate analysis. It is recommended that the analysis and the heat test be made by two independent laboratories, and the mean of the two results, if there be any difference, be adopted as the correct figures."

Appendix XIV, by Mr. Kent, discusses comparative calorimetric tests of coals and gives the results obtained by different experimenters with different forms of calorimeters, and says in conclusion: "The conclusion to be drawn from the two series of tests tabulated above is that closely concordant results may be obtained from different calorimeters when properly handled by expert chemists, and that these results will agree with the results calculated from accurate analyses; but that occasionally very erroneous results may be obtained, and that a single calorimetric test unchecked by comparison with a test by another calorimeter is to be regarded with suspicion, especially when the test is made with a Thompson calorimeter, when the reported heating value per lb. of combustible is low compared with the results of other tests of coal from the same region, and when the boiler efficiency calculated from such calorimetric test is high."

The committee reports that it is expected that Prof. Thurston will submit an appendix on coal calorimetry.

The recommendations as to using coals regarded as commercial standards when making tests of efficiency or capacity are similar to those in the 1885 Code.

"For New England and that portion of the country east of the Allegheny mountains, good anthracite egg coal, containing not over 10 per cent of ash, and semi-bituminous Cumberland (Md.) and Pocahontas (Va.) coals are thus regarded. West of the Allegheny mountains, Pocahontas (Va.) and New River (W. Va.) semi-bituminous, and Younghiogheny or Pittsburg bituminous coals are recognized as standards. There is no special grade of coal mined in the western states which is widely recognized as of superior quality or considered as a standard coal for boiler testing.

\*Increase cost of fuel due to coal strike.

\*\*Miscellaneous expense .017 cent per k. w. h.

Big Muddy lump, an Illinois coal mined in Jackson county, Ill., is suggested as being of sufficiently high grade to answer the requirements in districts where it is more conveniently obtainable than the other coals mentioned above."

In a foot-note it is stated that these coals are selected because they are about the only coals which contain the essentials of excellence of quality, adaptability to various kinds of furnaces, grates, boilers and methods of firing, and wide distribution and general accessibility in the markets.

For the determination of the moisture in the steam the barrel calorimeter of the old Code is superseded by the throttling or the separating calorimeter, either kind being used. This is in accord with the practice of recent years.

In measuring the area of the heating surface it is directed that the outside diameter of the tubes be taken, whether fire tubes or water tubes, the change being made in an endeavor to make the practice in rating heating surface uniform.

As to smoke observations the Code says: "It is desirable to have a uniform system of determining and recording the quantity of smoke produced where bituminous coal is used. The system commonly employed is to express the degree of smokiness by means of percentages dependent upon the judgment of the observer. The committee does not place much value upon a percentage method, because it depends so largely upon the personal element, but if this method is used, it is desirable that, so far as possible, a definition be given in explicit terms as to the basis and method employed in arriving at the percentage."

The appendix (XXXVII) on this subject, written by Mr. Barrus, describes a novel method of obtaining a continuous smoke record and is as follows:

"In a series of competitive trials between two furnaces which the writer made in June, 1897, for the Detroit Water Works, a method of obtaining a continuous record of the quantity of smoke was introduced, which seems to him of great value in making specific what has heretofore been based upon the judgment of the person conducting the observations. The method referred to consisted simply in suspending, at a suitable point in the smoke passage between the boiler and the flue, a smooth, flat, brass plate, having its face at right angles to the direction of the current.

This plate served to collect a certain portion of the soot which was carried along by the waste gases, and indirectly furnished a means of sampling the gas in respect to its smokiness. The plate was 24 in. long and  $\frac{3}{8}$  in. wide, and it presented a surface amounting to 21 sq. in. Being inserted through a hole in the top of the flue, and suspended by a wire, the hole being covered, the plate could be readily withdrawn from its place whenever desired, and the collection of soot removed by the use of a stiff brush. This was done every two hours during the progress of the trial. The quantity of soot which collected on this plate varied according to the type of the furnace and the character of the fuel, as also according to the conditions of the firing and the working conditions of the boiler. The records of the smoke-measuring device, and those of the ocular observations of the chimney, were in accord with each other. The quantity of soot which was collected, reduced to the hourly rate, varied in these tests from 9 milligrams to 184 milligrams. The method has not as yet been tried in the case of a flue carrying very dense smoke."

### GAS ENGINE AT LANCASTER, O.

W. F. Kelly, general superintendent of the Columbus Street Railway, writes us concerning the 100-h. p. gas engine installed in the summer of 1896 in the street railway power house at Lancaster, O., as follows:

"Our total expense for repairs to engine, piping, cooling tank, and everything connected with it during the first 10 months of this year was \$49.33, or about 16 cents a day. As all repairs and adjustments must necessarily be made after shutting-down time, and men are paid extra for their labor at this hour, it will be readily seen that most of this expense has been for labor. I believe that but few, if any, steam plants, operating under the same conditions of service, could show an equally favorable record."

The gas used is natural gas, and the road is a small one which could not afford to maintain a steam plant.

John W. Borchinal, a director of the Moundsville, Benwood & Wheeling Electric Railway, has been active in making arrangements for building an electric line from Frostburg, Md., to Piedmont, W. Va., a distance of 18 miles.

## IMPROVED DEVICES AND METHODS FOR THE SAFE OPERATION OF CARS ON INTER-URBAN AND CITY LINES.

During the past three months several collision accidents, two attended with fatal results, have occurred on interurban roads. Two of the disasters were primarily due to heavy fog, which prevented the motormen from seeing the approaching car until the two were only a short distance apart; the others were caused by various reasons, such as meeting on curves where the track was laid in a cut, etc. It has seemed to us that the safe operation of interurban lines, most of which are of single track, is a subject deserving careful study, especially by such roads as thus far have not worked out as perfect a system as they would like.

While the experience of steam road operation has taught us that even the best system and the most expensive mechanical appliances are not infallible, and do sometimes fail in the most important moment; yet the art of moving frequent trains on a single track has been brought to that degree of certainty that head-on collisions so frequent 15 years ago are now a matter of unusual occurrence.

The electric roads do not need the telegraph, so essential to the steam lines, but the telephone has been adopted in some cases as an improved substitute, and mechanical devices have been perfected and are already installed, not only on interurban but at dangerous points in urban service, such as crossings and draw bridges.

We propose in this and succeeding articles to show what has already been adopted and put in operation throughout the country, and though the method selected by any one road may not be the best or as good for all the others, owing to the diversity of local conditions, we believe that the study of them all will suggest possible improvements to many. Where no other precaution than the time table is employed, except on lines operating only a very small number of cars, we would urge upon the manager the adoption of additional safeguards, even though it involve some expense at the start.

Road No. 1:—As our line is yet incomplete, we have not put in operation any blocking device, although we expect to do so as soon as the road is in full operation. At present we have but one turnout, and instructions are for a car to lie at that point for 10 minutes beyond the schedule or regular meeting time, then to proceed at half speed very cautiously; the car that is late or caused the delay also runs at half speed, and will know that the first car is entitled to the right of way. This plan is of course open to much objection, and will fail utterly if car men are given to taking chances.

I believe the best scheme is that of a private telephone line, with special instruments, such as are furnished now by a number of makers. Place a connection box on a pole at all turnouts, and between if desirable, and have each car carry the detachable combination ear and mouth piece; then in event of any delay or accident to a car occurring at any point on the line, the conductor will at once proceed to the nearest connection box, "plug in" his instrument, notify the office, and receive instructions. In the same way the other cars or crews ask for orders when the delay occurs at meeting points. Thus cars may be shifted when all are late and put upon schedule again. Of course no method is infallible, as reckless car men will often go contrary to or-

ders, but with careful, competent men, and means supplied by which they can quickly communicate with the office, I think the chances of accidents are remote.

Road No. 2:—On our single track road we use the ordinary block signals, although it has not prevented, on one occasion, an end-on collision, although that was due entirely to the negligence of the crews in not using the signals. The great trouble on this occasion, and I suppose it exists on all roads, was an exceptional motorman with a "large head" who thought he could "make it." I find the safest plan is to relieve such men from such positions as quickly as possible. We believe the block system is the most feasible plan to date, although they are useless in the hands of such men as above referred to.

Road No. 3:—Has 20 miles single track.—I am glad to see that you have taken hold of this matter, as I feel that it is one of utmost importance. There is no question but what it is a good field for inventors. In my estimation some sort of a signaling system, controlled from a central point by an operator, that will automatically indicate to the operator when cars pass given points, would be the most satisfactory arrangement for interurban lines. The one thing that is against such a system is the first cost.

On our road we use the telephone system, having a telephone at each side track; this works very well, but there is always the liability of a misunderstanding between the dispatcher and the party to whom the order is given. We have had this occur once or twice, even after taking the precaution to have all orders repeated when received.

At present I know of nothing used by interurban roads that is as satisfactory as the telephone, but still I feel that there is lots of room for improvement, even there.

Road No. 4:—30 miles.—At present we have no such system, only requiring by post signals that motormen run slowly at dangerous places. We, however, appreciate fully our need for a system, and have decided to install one before our heavy summer traffic opens. We have been investigating, and are undecided, between an electric block signal and a telephone dispatching system.

Road No. 5:—40 miles—city line: When the weather is foggy we try to use every precaution possible. All motormen are instructed, when leaving the station, to use extraordinary care in the running of their cars, so as to avoid collisions. This warning is given by foreman of the station from which they start. Then we have our superintendents and street assistants on the street at the time, and the cars are allowed to consume all the time necessary in making the trip, even if two hours are consumed, although the run ordinarily may not be more than 30 or 45 minutes. Safety, above all, is to be considered.

Road No. 6:—30 miles.—Has the following bulletin to its car crews:

When it is stormy or a fog prevails that is thick enough

to obscure the track so that you are unable to see at least 500 ft. ahead, you will not run your car at a greater rate of speed than 3 miles an hour, and in such cases you must sound your gong continually. You must never leave a siding until you are sure there are no cars coming from the opposite direction. You can ascertain this by listening, as the vibration of the trolley wire will cause a rumbling noise in a car that is at a standstill when the car in motion may be 500 or 600 ft. distant. Should your car become disabled or stalled by snow or any other cause, you must, if on single track, guard both ends of the same by going in either direction at least 300 ft. and warn all approaching cars or plows of your position. If on a double track, it will be necessary to guard the rear end only. If necessary to do this, the motorman must throw off the overhead switch on both ends of his car.

Road No. 7:—We are all double track except on two ends, one of these with only one car on at a time, and the

Road No. 9:—11 miles.—We do not allow our men to take any chances whatever, and deem it sufficient cause for discharge to jump a switch without orders from the superintendent. If, for any reason, a car is started from the house to take the place of a disabled car, it is either run double head with a regular, or, if running alone, the conductor is obliged to signal ahead on every corner and curve between switches. If a car is disabled, or has laid longer than the limited time on a switch, the trainmen telephone to the car house for orders. As stated above, we do not allow any chances to be taken.

In this connection a description of the

### Skeen Signal System

will be of interest. It has been worked out and already introduced on several roads, where it is working with great satisfaction, by the Skeen Electric Switch & Signal Com-

FIG. 1.

FIG. 3.

FIG. 2.

#### SKEEN BLOCK SIGNAL SYSTEM.

Fig. 1. A siding showing a signal at each switch—"All clear!"—Fig. 2. Car leaving siding, entering block. White signal acting as rear block, and showing that red signal has operated at the other end of the block, and is holding an approaching car as in Fig. 3.—Fig. 3. Red signal holding car till arrival of the car shown in Fig. 2.

other with two cars and one switch. We are running on the old system, but we should not wish to run a single track interurban without either a good block system or by use of telephone.

Road No. 8:—11 miles.—The nature of our interurban service is not exacting with respect to the points which you raise. On one line we have only one car operating on a regular schedule, and on the other line two cars. On the latter line we have a turnout about midway, which is an established meeting point under normal conditions. Our car barn is situated near this turnout, and should one car be detained at the terminus, by reason of trains being late, etc., the conductor notifies the foreman at the car barn, or the conductor of the other car, of the fact.

For interurban service requiring a considerable number of cars and high speed a double track is, of course, the best solution of the problem, when feasible; otherwise we should suggest frequent turnouts with established meeting points, together with a block system, and, as an additional precaution, telephonic dispatching at such times as the schedule became seriously interrupted or disturbed.

pany, of St. Louis. Many of our readers will recall the interesting exhibit made at the Niagara convention of the Skeen automatic signal. This signal is intended for use at the crossings of steam and street railways, approaches to draw bridges, tunnels and other danger points. Its work is entirely automatic, and the danger signal is locked until the car passes.

For interurban operation the two-way Skeen signal is especially adapted to single-track roads, the line being divided into blocks by the sidings.

The car is governed by the signals on the right of the track, whether going or coming, and always takes the turnout to the right. A car going into this siding (from the direction of the reader) is not governed by the signal on the left of track, but the motorman sees the signal on the right is at normal with its targets flat and lights out, and knows the block ahead is clear. As he pulls out toward the signal, his trolley throws a red danger signal at the farther end of the block he is entering, thus warning any car coming towards that end that this car is on this block. This danger signal is a red target and a red light, and both are thrown whether it be night or day.

Not only is the danger signal set ahead for the car coming, but the motorman knows before he leaves his siding that it has been set. The signal on the right is so wired to the signal ahead that a safety signal (a white target and a white light) is shown to the motorman at this end, and at the same instant he sets the danger signal at the farther end of the block. This "tell-tale" gives positive evidence that the danger signal has been set and locked, as this tell-tale at this end cannot operate, unless the danger signal ahead has been thrown and locked.

As the car enters the block both the motorman and conductor have assurance from the white tell-tale that the block ahead is clear and is being held for them alone. They can therefore go ahead with confidence and safety; the conductor rings "go ahead" as soon as he also sees the tell-tale. Thus both are held responsible.

The danger signal thus set ahead can only be unlocked and reset to normal by this car, on leaving the block at the other end, and passing the siding where the other car is being held by the danger signal.

The consumption of current is only one ampere and that only for the fraction of a second, while the trolley wheel is passing the contact above the trolley wire. The voltage may drop 250 volts without affecting the operation of the signal, which is adapted for working between 300 and 550 volts. For less than 300 volts a special wiring is provided.

The tell-tale also serves as a rear block to the car setting it, and would hold a second car which might be following too closely, until the first car had run out of the block and allowed the tell-tale to drop to normal position. In this way an absolute check is provided against more than one car entering a block, even though both are running in the same direction.

T. F. Sneed, general superintendent of the St. Louis & Suburban, which has used the Skeen system for 10 months past, states: "We also have on the St. Louis & Meramec River Railroad 4 miles of single track equipped with 14 Skeen signals; they also have given complete satisfaction. In fact, it would be impossible for us to operate this track without these signals, as we make about 250 trips per day on that section, it being a joint track.

"I have used all kinds of semaphore signals on steam roads, and can conscientiously say that yours is the best signal I have ever seen used. They have never been known to fail once, except when the voltage was so low that the cars could scarcely get over the road; that was not the fault of the signal, however. I consider your signals simply indispensable to anyone using a single track."

A four-way signal is also furnished for use at intersections, which dispenses with the flagmen placed at such points. This signal sets at a distance of 200 ft. or more, as desired, according to the grade, rate of speed at such points, etc.

(To be continued.)

In Indian Engineering an extract is given from the draft order providing for the use of the Calcutta tramways for scavenging and other municipal services. "The Municipal Council may during such hours, not exceeding 6 in the 24, as may be prescribed, use the tramways for moving night soil, ashes, refuse, coal, gas and water pipes, road material, etc., free of all tolls and charges. The motive power shall be selected and furnished by the tramway company."

## A TAPE WINDER.

A coil taping machine, which has proved a labor-saving device, has been patented by C. E. Moore, master mechanic of the Chicago City Railway. A large stock of armature coils is kept in stock at the repair shop, and girls are employed to tape the coils by hand. By the use of this small machine, between two and three times as much work can be accomplished. The tape is held in the spool shown in the upper part of the cut, and any desired tension put upon it by the thumb screw shown. The spool is fastened to a gear which rotates it. The hollow center in the gear is provided for the coil to be wound. To get the coil into the center a slot is cut out of the gear and the ring about which it revolves. The gear meshes with another one of the same size, which is on the driving spindle. The pulley shown in the elevation is driven by a round belt and drives the gear spindle through friction disks. The friction disk is worked by a lever one end of which is curved in two planes, as shown, so that when moved up it presses the belt pulley against the leather disk. There is a treadle attachment so

TAPE WINDER—CHICAGO CITY RAILWAY.

that the lever can be thrown on and off by the foot of the operator.

The coil is placed in the hollow center, the end of the tape is given a turn around the wires, and a pressure on the treadle starts the spool revolving, winding the tape around the wires of the coil. The operator simply moves the coil along fast enough to give it the proper covering of tape. Some special cotton tape will be provided as it is believed that cotton will prove just as durable and as good an insulator as linen. The cotton tape will not be treated with any insulating compound, and when wound will only have sticky substance at the end. Each spool will have just enough tape to cover one coil, several spools being provided for the machine.

The Nassau Electric Railroad Company recently performed a new class of service. A section of the new park at Dycker Meadows needed filling in, and some building property on 44th street between 5th and 6th avenues required excavating. The contractor put in a switch and transported the dirt over the tracks of the trolley road in ordinary dump cars, the motive power coming from some old summer cars. Much time and expense were saved thereby.

Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.

By a typographical error in our December issue the population served by the New Castle (Pa.) Traction Company was stated to be 12,000, instead of 32,000, which is the present estimate.

W. W. Annable, superintendent of the power station of the Consolidated Street Railway Company of Grand Rapids, Mich., will soon make a test of a chainless bicycle of his design.

The street railway companies of St. Louis will be presented with a numbered plate, 4x7 $\frac{3}{4}$  in., for each car license paid in 1898. The plates are to be fixed on the cars in conspicuous places.

Press reports state that on December 20 two pasteboard boxes came in contact with the steam pipes in a car on the 6th avenue elevated road, New York, and exploded, injuring two persons.

December 26 an electric car in Providence got beyond control of the motorman on Olney street hill, left the track and struck a frame building. Three of the twelve persons on board were slightly injured.

The Northwestern Elevated Railroad Company has sued the Chicago Daily News Company for libel, laying the damages at \$500,000, because of an editorial published by that newspaper on December 31, 1897.

An attempt, very nearly successful, to rob the safe in the general offices of the Duluth Street Railway Company was made recently. After drilling two holes in the safe the burglars were frightened away by the watchman.

An ordinance was passed in East Orange, N. J., imposing a fine of \$25 for every tree destroyed in stringing trolley wires. The Consolidated Traction Company appealed to the Supreme Court, but the ordinance was upheld.

In New York three men have been arrested charged with stealing rails from the Metropolitan Company. Rails to the value of \$1,200 have disappeared; \$600 worth were found in the junk shop of one of the men under arrest.

The franchise for the Milford & Dover (Del.) Electric Railway has been sold to New York capitalists. The proposed route is from Milford to Frederica, and thence to Magnolia, to Camden, to Dover, to Smyrna, to Woodland Beach.

One Louis Kerr has been arrested for stealing copper wire and bonds from the Louisville Railway Company, which in the last six months has suffered a loss of copper by theft of \$600 or more. The superintendent identifies the wire found on Kerr.

The Altoona & Logan Valley Electric Railway was sued by John Bement for \$5,000, damages being claimed because the conductor refused to accept a 10-cent "shinplaster" of 1862 in payment of the fare. The jury found for the company.

The gross earnings of the Brooklyn Rapid Transit Company's system for December were \$446,800, which is \$14,000 in excess of 1896 and \$40,000 in excess of 1895. For the half-year the gross earnings were \$2,805,000, an excess of \$68,000 over 1896 and \$216,000 over 1895.

The Central Railway & Electric Company of New Britain, Conn., has presented long service badges to the employes who have been in the service more than five years. There are six motormen and conductors who are entitled to wear the monogram on the lapel of their coats.

E. E. Downs, manager of the Citizens' Traction Company, Oshkosh, Wis., is receiving many commendations for the way work has been pushed on the extensions to the lines. A summer resort is under consideration by this road, but the plans have not as yet been decided upon.

The Brooklyn Elevated is experimenting with a device for placing the different stations on the line in connection with the office, so that the number of people passing the station turnstiles may be automatically recorded and indicated in the office. One station is at present so connected.

The street railway postal service has been extended in Chicago. The West Chicago Street Railroad Company receives \$1,830 more per year for transporting the mails to stations E and G. The North Chicago Company now carries mail to station B, and the Chicago City to station N.

The Southwest Electric Railway, Cartersville, Mo., has been sued for \$10,000 by a woman who was struck on the head by the brake handle while boarding one of the company's cars. There was a large crowd at the time and a mad scramble for places, during which the accident occurred.

A trolley parlor car, containing Mayor Wurster, ex-Congressman T. L. Johnson, President Johnson of the Nassau Electric Railroad Company, President Rossiter of the Brooklyn Heights Railway Company, and other prominent citizens, ran over the tracks of the Nassau electric railway and across the Brooklyn bridge to New York while the last moments of the old year were passing. Some alterations were necessary on the bridge, but these were soon completed, and now the trolley cars run from Park Row in New York city to Coney Island.

Trolley wire thieves are still troubling the street railway companies. At Milwaukee two discharged linemen of the railway company procured a horse and wagon and cut down 1,200 ft. of wire early in the morning when the current had been turned off the line. It happened that a test was being made and it was found that there was something radically wrong. The linemen arrived at the scene just as the robbers were driving away with their booty. The police were notified and the men arrested. The Lynn & Boston Rail-

road Company has suffered a similar loss. Nearly a mile of wire was taken from the line running in Revere. This part of the road is used only in the summer time, and both last winter and the year before the trolley wire has been cut down and carted away.

The Houston (Tex.) Electric Street Railway Company recently distributed \$500 among the motormen and conductors who had the best records. There were 40 men whose reports were free from complaint and these received \$10 each. About 20 others whose records were good received \$5 each.

The Atlanta Consolidated Street Railway Company has just completed two 42-ft. cars in its shops for service on the line to Decatur. The cars are complete in all their equipment, having air brakes, electric heaters and large motors. With these cars the schedule will be shortened from 45 minutes to 30 minutes.

D. H. Louderback, president of the Lake Street Elevated, is reported to have stated to Judge Grosscup of the federal court, before whom the foreclosure suit is pending, that there is a plan on foot to consolidate all the Chicago elevated roads. The chief obstacle is the foreclosure suit against the Lake Street.

The report for 1897 shows that the past year has been a very prosperous one for the Buffalo & Niagara Falls road, the gross earnings were \$69,663, an increase of \$15,136 over 1896; the operating expenses were \$23,382, an increase of \$10,344; the net income (after paying fixed charges) was \$31,940, an increase of \$9,328.

The Citizens' Street Railroad Company of Indianapolis has been sued for \$1,000 by William Poynter because he was refused a ride on a transfer. During the state fair a transfer was issued to him, but on account of the crowds he was unable to board a car. The next day he attempted to use the ticket, but was ejected.

The Philadelphia & Bristol Trolley Company has called upon the stage coach to assist in its competition with the Pennsylvania Railroad Company. Each hour a coach runs between Corydon and Bristol, carrying passengers for 5 cents and making the total fare to Philadelphia 18 cents, while the railroad charges are 57 cents.

A dense fog was the cause of two rear-end collisions on the Manhattan Elevated Railroad, one resulting in the injury of two passengers and the fireman. The locomotive and the rear coach were shattered. The trains were full of passengers, who were considerably shaken up. The other collision was not so severe and the trains were empty.

The Louisville Trust Company, which furnished the money to build an extension of eight miles to the Main Street Railway in Cincinnati, originally only three miles long, has won the suit brought against it by the trustee for the first mortgage bondholders. The latter claimed that their mortgage covered the extension as well as the original line.

The Board of Aldermen of Brooklyn passed an ordinance granting a perpetual franchise to Patrick H. Flynn for a right of way for the East River & Atlantic Ocean Railroad, which would be operated through 40 miles of streets. Mayor Wurster vetoed the resolution, as some of the streets had been newly paved at great expense, and the transportation facilities were not needed.

A passenger on a blockaded Broadway cable car walked several squares ahead of the blockade and caught a car on that line which was in operation. He was arrested for refusing to pay his fare, but was discharged in the police court. He brought suit against the street railway company for \$20,000, but after a short examination the judge ordered the jury to return a verdict for the defendant.

A large fire on Madison street near Dearborn, Chicago, blocked the North Chicago and the Madison street cable lines from the afternoon of December 23 until nearly noon the following day, because of the large number of hose lines carried across the tracks of the two cable loops. Much needless inconvenience was suffered by Christmas shoppers who were not aware that the North Chicago road was operating as usual north of the river.

The snow storm, which visited Pittsburg and Allegheny, blockaded nearly all the street railway lines in the two cities. The greatest difficulty was caused by the telegraph and telephone poles giving way under the heavy weight of ice and snow. The falling poles carried many trolley wires and feeders down with them. The officers and men of the street railway companies went to work and soon cleared the tracks from snow and replaced the wires.

C. L. Rossiter, president of the Brooklyn Rapid Transit Company, has sent a printed address to the employes of the company, complimenting them on the efficient service now rendered. He exhorts them to put forth every effort to avoid accidents, to keep the cars neat and clean and to be very attentive to the patrons of the road. He calls attention to the fact that over \$2,000,000 was paid in wages last year and that increased earnings mean a greater expenditure for wages.

The Union Traction Company, of Philadelphia, has issued an order restricting the use of the 8-cent exchange tickets. By the use of these tickets the purchaser was enabled for 8 cents to take a ride over two routes, involving a change of cars, but many patrons have abused the privilege by using them as round-trip tickets, making practically a 4-cent fare. Certain transfer points are printed on the tickets and their use is now restricted to these junctions.

The Worcester & Suburban Street Railway Company has heretofore provided its employes with pass books which entitled them to ride at any time. A large number were in use and to trace out these tickets required a considerable amount of time in the accounting department. An order was issued recalling all the books. The employes took exception to this and signed a petition to have the order revoked, but it will stand. As the employes can ride free at any time with their uniforms it works no great hardship upon them.

**A LARGE INDUCTION MOTOR.**

The illustration represents a 400-h. p. two phase, induction motor, built by the Westinghouse Electric & Manufacturing Company for the Buffalo & Niagara Falls Electric Light & Power Company. Two of these machines are in operation and one of the same type, but of 500 h. p. capacity, is now building, these being the largest motors of this kind

400-H. P. INDUCTION MOTOR.

ever constructed. The efficiency is equal to, if not greater than, the best motors of any type. This motor is remarkable in that it requires practically no attention, having no commutator or collector, no brushes, nor even any sliding contacts. The bearings are self-oiling, and from no load to full load the speed drops off very little. These motors drive alternators at a frequency of 60 cycles per second.

**TAX DECISION IN KENTUCKY.**

In the case of the city of Covington, Ky., against the South Covington & Cincinnati Street Railway Company to recover taxes for the years 1893 to 1895, inclusive, on the franchises of the company, the court has overruled the demurrer in behalf of the company. As there is no question that the taxes have not been paid, this virtually decides the cases now pending against the various corporations of Covington. The case will be appealed to the higher courts.

**CONDUCTIVITY OF CAST-WELDED RAIL JOINTS.**

We herewith publish the results of some tests of a cast-welded joint and a copper-bonded joint made by James R. Chapman, chief of the electrical department of the North Chicago Street Railroad. The illustration is a view of a section of the cast-welded joint tested, kindly lent us by Mr. Chapman.

With a view of determining the electrical value of a track return system when the rails are joined by what is known as the cast-welded process—as against the same rail with 6-hole fish plate joints and copper bonds—experiments were made December 17, 1897, at the California avenue power station of the Chicago Electric Transit Company.

Joints of each description were placed between the neg-

ative terminal of a generator and the bus bar. Simultaneous readings were then taken—at the 10-second intervals—showing the amount of current flowing through the rail, also the drop in potential along 5 ft. (lineal) of rail carrying the joint as compared with the drop due to an equal length of rail without joint.

CAST-WELDED RAIL.			
Test Number.	Average current flowing, amperes.	Drop in 5 ft. with joint, volts.	Drop in 5 ft. without joint, volts.
1.	792.5	.0583	....
2.	890	....	.0553
3.	860	....	.0526
4.	830	.0535	....
BONDED RAIL.			
5.	837	.1218	....
6.	837.2	....	.0585
7.	239.7	....	.0159
8.	328	.0476	....

The rail used was of 6-in., 72-lb., girder section; the cast joint was made on the street by the contractors at the same time that some track was being welded two weeks previously. No special care was taken in making this joint and no extra cleaning was done. Length of cast block 14 in., weight of metal 129 lbs.

The bonded joint, however, was made with great care.

SECTION OF CAST-WELDED JOINT.

Two No. 000 36-in. "Chicago" bonds with tinned 13-16-in. terminals were used; the holes in the rail were cleaned and tinned; the web of the rail around the hole was faced on both sides with a rose reamer 1½ in. in diameter. The bonds were then driven and expanded, all the joints being immediately flushed and wiped with solder. One and one half miles of double track recently bonded in this way cost \$1.50 per joint.

These tests indicate that the average cast-welded joint has about 97 per cent of the conductivity of the rail with a current flow of 115 to 120 amperes per sq. in. of rail section; while a bonded joint, with the flow of current reduced so as to be less than one ampere per circular mil of copper in the bonds, has only 46 per cent of the conductivity of the rail, the calculated loss in the bonds alone being 62 per cent of the total drop as measured.

Carrying this calculation a little further and it appears that to electrically connect two 72-lb. rails as perfectly as by an average cast-weld requires the use of upwards of six No. 000 36-in. bonds with soldered terminals as above described.

Jas. R. Chapman.

Chicago, Dec. 30th, 1897.

In this connection we might add that the work referred to, including the joint illustrated, was done by the American Improved Rail Joint Company, of Chicago, of which A. S. Littlefield is president.

### A FACE PROTECTOR IN MAINE.

The description and sketches of the motorman's protector herewith illustrated were sent us by F. B. Lee, superintendent of the Norway & Paris (Me.) Street Railway, who states that it admirably serves its intended purpose of protecting the motorman's face. It consists of a frame 20 in. high and 28 in. wide, with glass set in it, hung from front edge of the hood, as shown in the sketch. It is hung from pin-and-eye hinges and is prevented from swinging by a coil spring, which is a brush-holder spring; when not needed

MOTORMAN'S PROTECTOR IN MAINE.

the frame is swung up and lies on the roof, as shown by the dotted lines. The frame is removed by taking out the two cotter pins, and is easily transferred from one end of the car to the other.

The glass does not frost, and sleet can be easily brushed off, so that it offers no obstruction to the view of the motorman. If so simple a device is found to give satisfaction in Maine, where the winters are very severe, it would seem that it might be substituted for a vestibule in some other of the states; it certainly has none of the disadvantages which are strongly urged against the latter.

The superintendent of an eastern road in transmitting his subscription to the "Review" says: "I feel that I have received at least \$10 for \$1 from your paper the past year. No trade paper which comes to my desk equals it for practical assistance." And such as this makes the editorial heart glad.

### VESTIBULES IN DENVER.

The city of Denver has a vestibule ordinance which went into effect on November 12 and requires that vestibules be placed on cars from November to March, inclusive. No time was allowed for the roads to equip their cars, and feeling that this was unreasonable the street railway men have moved slowly in matter of complying with the ordinance. The several companies are experimenting with different types of vestibules and have not yet decided which is best suited to their needs. It is stated that in Denver there are but 40 days in the year when a vestibule is at all desirable, instead of the 151 provided by the ordinance.

### SIGNALS ON THE DETROIT & OAKLAND.

The Detroit & Oakland road, which it will be remembered experienced a collision in December, has adopted a signal system which is described as follows:

"Four locked boxes are placed at as many switches along the line. They contain wooden blocks numbered 1, 2, 3 and 4. The first car out takes block No. 1, and cannot pass the first switch on the return trip until it secures block No. 2 from the second car and gives up block No. 1. At the second switch block No. 3 is secured, and so on. The motorman is the custodian of the block, and he is not allowed to start his car until he has the new one in his possession."

### A BIG CAR BARN FOR THE CALUMET.

The Calumet Electric Street Railway Company, of Chicago, has been handicapped for some time by its limited storage capacity for cars. The summer trail cars had to be left out in the yards all winter with no protection from the elements. Within the past month a building of iron, stone and brick has been finished and shelters 110 summer cars. It is 125 ft. wide and 376 ft. 6 in. long with nine tracks laid its entire length. A space 35 ft. wide along the north side of the building, is reserved for offices and store rooms.

### MURRAY IRON WORKS ALL RIGHT.

The Murray Iron Works, Burlington, Iowa, had an unfortunate experience in being erroneously reported by one of the merchantile agencies, as having filed a deed of trust to protect preferred creditors. What the company did was to execute a trust deed to secure an issue of bonds the proceeds of which are being used in making needed additions to its plant made necessary by a rapidly increasing business. The company advises us it has no debts and therefore no creditors to prefer, and that it has brought suit against the agency for damages.

### A STREET CAR VICTORY.

The postmaster of Chicago applied to the department for leave for the carriers to discontinue the use of bicycles in making their rounds, on the ground that better time can be made by using the street cars, and the request has been granted. In the future the allowance of \$3 per month to each man will be invested in street car tickets instead of bicycles.

**WEST END CAR HOUSE BURNED.**

The Ferry street car house of the West End Street Railway, at Everett, Mass., was burned on the morning of December 23, the fire being discovered about 3 o'clock. The building was one and one-half stories in height, and the greater portion was of wood. The loss on the building is placed at \$30,000, the wood portion being entirely destroyed. There were about 90 cars in the house at the time, only five of which were saved; the cars burned were valued at from \$1,000 to \$1,500 each, making the loss a heavy one.

The illustrations are from photographs of the car house before and after the fire. We have seen no official statement as to the origin of the fire; it is said, however, to have been caused by the heating or crossing of electric wires at one end of the building.

"A few days ago, in my haste to see a patient, I boarded a mule car, and after traveling several blocks it left the track and climbed up on the pavement. The driver started back to town on foot. I said: 'Look here, ain't you going to try to put this car back on the track?' He said: 'No, I ain't; I'm not allowed to turn a wheel until the board of directors meets and passes resolutions as to whether they want it back or not. They don't allow me to assume any responsibility.' I threw two bricks at him and went back home. Gentlemen, the operation of the ——— mule car is one of the sights of this city."

**NEW FRANCHISE IN COUNCIL BLUFFS.**

A franchise, for a term of 50 years, has just been granted to the Omaha & Council Bluffs Railway & Bridge Company by the city council. It was thought best to give a long

CAR HOUSE BURNED AT EVERETT, MASS.

**THE DOCTOR DIAGNOSED THIS CASE.**

At a recent meeting of a medical association in Texas, the city physician, in the course of his address of welcome, found expression in the following, which has the true Texas flavor:

"Gentlemen: We have but little to brag about, and we hesitate to brag a little about what little we have to brag about, but we have in our city the only, as we believe, genuine all-American double-back-acting plug mule street car line on earth. You can observe the operation of the Air-Tight & Great Windy line here in front of the Oriental Hotel (a car passing every other day), listen to the voice of the Jehu, which will notify you to get on the grass until his Juggernaut passes by. From the way he curses you would suppose him to be a Presbyterian, but I understand that he has no church affiliations, simply a drift chip on the tide of time.

time franchise whereby the company could raise enough money to put it in such condition that it could afford modern service in every particular, instead of a short franchise with its accompanying difficulties. For this privilege the company agreed to issue 30-ride commutation tickets, good for 30 days, to be sold for \$1.50 and used between Omaha and Council Bluffs, but not good if used locally, the regular fare being 10 cents. This gives the laboring classes and regular passengers, who live in one city and work in the other, the benefit of a 5-cent fare, but for others the usual rate is maintained.

Preparation is being made for a large business during the Exposition. A 400-k. w. generator, direct connected to a Corliss engine, and 16 43-ft. cars will be added to the equipment. The beneficial effects of the Exposition are already felt in Omaha and Council Bluffs; work is progressing rapidly on the buildings and grounds, and everything promises to be in readiness at the opening, June 1.

### Arkansas.

LITTLE ROCK, ARK.—A franchise to build and operate an electric street railway in North Little Rock has been granted by the city council to M. Greenwood and D. L. Dyas of St. Louis and Maxwell Coffin of Little Rock. Cars must be running within six months.

### California.

SANTA ROSA, CAL.—By the recent purchase of the horses, cars and all other property of the McDonald Street Railway Company, the Union Street Railway Company acquires control and management of all the street railways of Santa Rosa.

### Chicago.

CHICAGO.—The Chicago Electric Traction Company has been incorporated to reorganize the Englewood & Chicago Electric Street Railway. The capital stock is \$2,000,000, and the incorporators are Charles R. Holden, 507 West Monroe street; Carl Meyer, 2009 Prairie avenue; William L. Tibbs, 6049 Ellis avenue; Thomas A. Moran, Jr., 4710 Vincennes avenue; Alfred S. Austrian, 3129 Michigan avenue, and E. R. Gilbert, all of Chicago; Samuel R. Shipley, Philadelphia; Isaac L. Rice, New York; Henry Levis, Philadelphia; Gustave J. Wetzlar and Julius S. Bache, New York.

### Colorado.

COLORADO, SPRINGS, COL.—Bids for track work and rolling stock for 2.5 miles of electric road in Colorado Springs are asked by C. M. Coleman.

PUEBLO, COLO.—The change of the Pueblo Street Railway from four power houses to one is expected to be completed in six months. All the engines and generators now in use at the central station will be discarded. During the next few months the overhead work will be overhauled, and 20,000 new ties laid. The number of passengers carried in October was 11,000 greater than in the October preceding.

### Connecticut.

SHELTON, CONN.—Judge Wheeler having granted the Shelton Street Railway Company permission to extend its line to connect with the Bridgeport Traction Company at Paradise Green. President Radel will push the work with a view to its completion by April 1.

### District of Columbia.

WASHINGTON, D. C.—A bill has been introduced to incorporate the Washington & Annapolis Railroad Company. The incorporators are: Edgar L. Marston, H. C. Knox, Elisha K. Camp, John J. Knox, O. C. Brothers, Jr., Alfred S. Miller, J. Harry James, William G. Morgan, Joseph Bowes, C. H. Syme, W. L. Bryant, and George G. Hazleton.

### Florida.

CLEARWATER, FLA.—H. B. Plant of 12 West 23d street, New York, has received a franchise to build an electric railway in Clearwater.

KEY WEST, FLA.—Materials for the extension and electrical equipment of the street railway will be purchased by Charles Sperry, superintendent, 12 West 31st street, New York, N. Y.

### Illinois.

ROCKFORD, ILL.—The Ogle county commissioners have granted a franchise to the Rock River Electric Railway Company.

ELMHURST, ILL.—The DuPage Interurban Electric Railway Company, which has been talked of for some time, is trying to get a franchise from the village of Elmhurst.

EAST ST. LOUIS, ILL.—The Belleville & St. Louis Electric Railroad Company, of which John A. Day is president, has received a franchise from the village of Winstanley.

ROCKFORD, ILL.—The explosion of a gasoline stove in the south barn of the Rockford City Railway, December 28, started a fire which destroyed the building and several cars. Loss, \$12,000; fully insured.

PEORIA, ILL.—The Peoria & Pekin Traction Company has paid \$5,000 for a site on which to erect a union depot in Pekin. The Pekin council now looks with more favor on the application for a franchise.

QUINCY, ILL.—J. C. Hubinger is said to be interested in a scheme to construct an electric road 146 miles in length, extending from Quincy to St. Louis, Mo. The cost is estimated at \$12,000 to \$15,000 per mile.

BELLEVILLE, ILL.—The Belleville & East St. Louis Electric Railway Company, of which John A. Day is president, will petition for a franchise to lay track the full length of West Main street. A large construction force is at work.

PEORIA, ILL.—The Peoria & Prospect Heights Railway Company has been incorporated to build and operate a street railway in Peoria, Tazewell and Woodford counties. Capital stock, \$100,000; incorporators, Walter Barker, president of the Central Railway, John L. Flinn and I. C. Pinkney.

### Indiana.

ANDERSON, IND.—Noah Clodfelter petitions for a franchise to build an electric railway from Summitville to Alexander and Elwood.

FORT WAYNE, IND.—Receiver M. S. Robison asks the court for a discharge, having presented a report. He asks \$20,000 compensation.

HUNTINGTON, IND.—A franchise for the use of Etna avenue has been granted to the Huntington Street Railway & Power Company.

GOSHEN, IND.—The recently incorporated Elkhart, Goshen & Southern Railroad Company has received a franchise from the county commissioners. The road is to be built within a year.

CONNERSVILLE, IND.—The Connersville Street Railroad Company has been incorporated. Capital stock, \$25,000; directors, Charles Mount, Thomas Downs, E. M. Ansted, Daniel Roots and G. C. Florea.

SOUTH BEND, IND.—The attempt to have the charter of the South Bend & Mishawaka Street Railway Company annulled has failed, Judge Hubbard holding that the property is in better condition than when acquired by the company.

GOSHEN, IND.—The Elkhart, Goshen & Southern Railway Company has been incorporated to build an electric road connecting the cities of Elkhart and Goshen and Lake Wawasee. Capital stock, \$250,000; directors, William H. Holcomb of Chicago, H. D. Judson and N. J. Aldrich of Aurora, Ill.

ANDERSON, IND.—George F. McCulloch, secretary and treasurer of the Citizens' Street Railway, Muncie, it is said, has joined C. L. Henry, of Anderson, and Philip Matter, of Marion, in a plan to build a road connecting Muncie with Anderson and passing through Chesterfield, Daleville, Yorktown, West Muncie, and the Spiritualists' camp grounds, with a branch at Linwood extending to Florida Station. The Gas Belt Electric Railway, built by Henry and Matter, is about ready for operation.

## Iowa.

CEDAR FALLS, IA.—The Patton motor has been given a test on the new street railway.

DES MOINES, IA.—The Des Moines City Railway Company contemplates a change in routes that will necessitate the laying of a mile of new track.

COUNCIL BLUFFS, IA.—Superintendent W. S. Dimmock of the Omaha & Council Bluffs Railway & Bridge Company will within the next 90 days buy a 325 or 400-k. w. direct connected generator and a corliss engine to correspond. Mr. Dimmock also expects to purchase 16 equipments of large motors for the interurban traffic between Omaha and Council Bluffs, to be placed under 43-ft. car bodies.

## Louisiana.

LAKE CHARLES, LA.—Adolph Meyer, president of the Lake Charles Street Railway Company, says his company will equip with some electric system, starting with ten cars.

## Maine.

BANGOR, ME.—The erection of a new power house is contemplated for the Bangor, Orono & Oldtown Railway and the Penobscot Central Railway.

SACO, ME.—Surveys have been completed for the Saco River Electric Railway. Contracts for construction will be let by Francis A. Hobart, 4½ Beacon street, Boston, Mass.

BRUNSWICK, ME.—The Lewiston, Brunswick & Bath Electric Railroad Company has been formed at Brunswick to build a road the coming spring. A. M. Shaw, Bath, president; A. F. Gerald, Fairfield, vice-president and general manager; Elias Milliken, Augusta, treasurer.

## Maryland.

ELKTON, MD.—Stockholders of the projected Cherry Hill, Elkton & Chesapeake City Electric Railroad have re-elected Dr. Frank H. Mackey president, and Charles H. Smith secretary and treasurer. A bill will be presented to the legislature asking that the \$58,000 credited to the Elkton & Southern Railroad be transferred to the Cherry Hill Company. The right of way will be obtained early in 1898.

## Massachusetts.

WORCESTER, MASS.—The Worcester & Clinton Street Railway Company will let contracts for 12 miles of road. A. S. Paton of Leominster is president.

RIDGE HILL, MASS.—The Hanover Street Railway Company has decided to postpone the extension of its lines from Assinippi to Norwell Centre to next spring.

LOWELL, MASS.—Negotiations are pending for the purchase of the Newburyport, Amesbury & Plum Island Electric Railway by the Lowell, Lawrence & Haverhill Company.

SPRINGFIELD, MASS.—Wilson C. Reynolds, who has furnished ties valued at \$4,182, asks the appointment of a receiver for the Springfield & Southwestern Electric Railway, now under construction. J. W. Starr, the general contractor, says there will be no difficulty about the payment of any debts.

TAUNTON, MASS.—James F. Shaw, H. Fisher Eldredge, P. W. Sprague and W. Sumner Minds are interested in a project to build an electric railway from Taunton to Rhode Island by way of Dighton, Rehoboth and Seekonk. The Bristol County court is asked to grant authority to construct the line.

FALL RIVER, MASS.—The Tiverton council has granted a franchise to the Fall River & Stone Bridge Railroad Company to build an electric railway, being a section of the road by which Tucker, Anthony & Co., of Boston, expect to connect Fall River and Newport, R. I. December 14 the town of Portsmouth granted a franchise to the same parties. The opposition of wealthy summer residents at the seaside town, headed by Cornelius Vanderbilt and A. C. Taylor of New York, was unavailing.

MARLBORO, MASS.—Tucker, Anthony & Co., of Boston, are financing the Framingham, Southboro & Marlboro Street Railway Company. This 10.5 miles of road will be a connecting link between Boston and Worcester.

BOSTON, MASS.—The Ferry street car house of the West End Street Railway at Everett was burned December 24, together with 87 cars. The cause is unknown, except that it was not electrical. Loss, \$200,000, fully covered by blanket policy.

## Michigan.

PONTIAC, MICH.—The Oakland Electric Railway has been placed in operation.

OWOSSO, MICH.—The Owosso & Corunna Traction Company has been ordered to repair its track within 30 days under penalty of forfeiting its franchise.

MENOMINEE, MICH.—A. A. Carpenter has sold the greater part of his street railway stock to A. Spies, G. A. Blesch, J. Henes, S. M. Stephenson and E. Daniell.

DETROIT, MICH.—J. E. Tucker, of Mt. Clemens, receiver of the Detroit & St. Clair River Railway, has been authorized to issue \$60,000 of certificates for construction.

BAY CITY, MICH.—The Bay Tuscola & Huron Railway Company has been incorporated to build an electric road from Bay City to Sebawaing. Capital stock, \$100,000.

DETROIT, MICH.—J. R. Trufant and stockholders of the Rapid Railway are talking of an electric road five miles long, to run from the Clinton River bridge to Huron Pointe.

ADRIAN, MICH.—A. P. Southworth, a former motorman, has bid in the Adrian Street Railway at receiver's sale for \$1,200. It is said the Page Wire Fence Company is interested.

BENTON HARBOR, MICH.—The Benton Harbor & Eastman Springs Railway has been placed in operation, in connection with St. Joseph & Benton Harbor Electric Railway.

DETROIT, MICH.—Hoyt Post, of Wilkinson & Post, attorneys, says that the electric railway in which he, Seymour Brownell and other capitalists are interested, will not be built unless farmers owning land along the right of way give a bonus of \$10,000.

MT. CLEMENS, MICH.—The suit brought by the Mt. Clemens & Lakeside Traction Company against the Detroit, Lakeshore & Mt. Clemens Railway Company is only to clear title, the latter company, which never owned the property, having given a mortgage.

HOLLAND, MICH.—Residents of Holland have received \$7,000 in payment of their claims from J. E. Cochran, Jr., of Chester, Pa., the capitalist who took up the violated contract of Foster & Louis, of Chicago, and saved the franchise granted the Holland & Lake Michigan Electric Railway Company from being revoked.

LANSING, MICH.—The Lansing, Dexter & Ann Arbor Electric Railway Company has been organized to build an interurban line. Capital stock, \$250,000; directors: President, C. A. Mapes, Lansing; vice-president, R. J. Shanks, Lansing; secretary, Charles W. Taylor, Lansing; treasurer, Thomas Berkett, Dexter; Morris Topping, of Plainfield; L. C. Chase, of Danville, and C. P. Black, of Lansing.

LANSING, MICH.—The Lansing, St. Johns & St. Louis Railway Company, organized for the purpose of building an electric railroad from Lansing to St. Louis, a distance of about 50 miles, has elected the following officers: President, M. V. Montgomery, Lansing; vice-president, A. P. Darragh, St. Louis; secretary, Frank L. Dodge, Lansing; directors, Jacob Stahl, M. V. Montgomery, Lansing; A. B. Darragh, Stiles Kennedy, St. Louis; Isaac Hewitt, Maple Rapids; George D. Stone, Ithaca.

DETROIT, MICH.—Alexander E. Riopelle, C. W. O'Brien and Julius Freud of Detroit promise to have the Detroit & Toledo Electric Railway in operation by July 1. The last of the right of way has been

obtained. The line will pass through Ecorse, Trenton, Gibraltar, North Rockwood, South Rockwood, Berlin, Brest, Monroe, Lasalle, State Line, Manchester, West Toledo and Toledo. Steel bridges will be built across the River Rouge, the Huron and Raisin rivers, and at Swan Creek, Lasalle and Erie. The power house will be located at Newport. Passenger cars will be run every hour and an entrance to Detroit will probably be made over the tracks of the Fort street road. The rate of fare has been fixed at one-half of that charged by the steam roads.

### Minnesota.

ALBERT LEA, MINN.—George L. Carrington and other local capitalists will ask a franchise to build an interurban electric railway from Albert Lea to Geneva, passing through Bancroft and Clark's Grove. Passengers, freight and mails will be carried.

### Mississippi.

VICKSBURG, MISS.—Two propositions for street railroad franchises have been made to the city council by rival promoters, Percival Steele and J. P. Tracy. The Hon. Patrick Henry is interested.

JACKSON, MISS.—The organization of the company which is to build the electric railway has been completed and construction will be pushed. Mayor R. E. McKisson of Cleveland, O., has been elected president, H. C. Ellison, vice-president, and Samuel G. McLure, secretary and treasurer.

### Missouri.

ST. LOUIS, MO.—The council has killed the Cabanne Place Railway bill.

ST. LOUIS, MO.—It is said the Baden Electric Railway will be extended to the Chain of Rocks.

ST. JOSEPH, MO.—Vestibules are rapidly being placed on all the cars in compliance with the city ordinance.

ST. LOUIS, MO.—Rumors are afloat anent a consolidation of the Lindell and the Missouri Railroad systems.

ST. LOUIS, MO.—L. M. Rumsey petitions the court to remove Charles Green as the receiver of the People's Railway Company.

KANSAS CITY, MO.—The Metropolitan Street Railway Company has applied to the county court for right of way for the electric road from Washington park to Fairmont park.

KANSAS CITY, MO.—The Kansas City, Lawrence & Topeka Electric Railway & Power Company has been incorporated with \$3,000,000 capital stock, to build an electric freight and passenger line.

HANNIBAL, MO.—The Hannibal Street Railway Company has taken hold of the project to build an extension to Palmyra. The city lines will also be rebuilt and a steam heating system installed.

ST. LOUIS, MO.—The Midland Railway Company, which is controlled by the Lindell Railway Company, has agreed with the Overland Real Estate Company to extend its lines from Creve Coeur Lake to the limits of St. Louis, in consideration of \$10,000 in cash, 100 shares of its stock, a 50-ft. right of way and five acres of land.

HANNIBAL, MO.—The Hannibal Street Railway and all property pertaining thereto was sold December 14 under foreclosure of mortgage to Colonel John H. Garth, president of the Farmers and Merchants Bank. The price paid was \$13,500. The road is said to have been losing money ever since the old management disposed of it over a year ago.

KANSAS CITY, MO.—The incorporators of the Kansas City, Lawrence & Topeka Electric Railway Company are E. B. Purcell, of Manhattan; John G. Johns, of Houston, Texas; Henry McGrew and W. L. Wood, of Kansas City, and Edward E. Holmes, James Haggard and A. N. Gossett, of Kansas City, Mo. E. B. Purcell is at the head of the concern, representing a syndicate of eastern capitalists.

KANSAS CITY, MO.—The Kansas City, Forest Lake & Bonner Springs Railway Company has been incorporated to build a double

track electric road 20 miles in length, from Kansas City to Bonner Springs, a summer resort. Capital stock, \$250,000; directors, John W. McDaniel of Bonner Springs, Rudolph Markgrof and W. S. Campbell of Kansas City, Mo., and Charles A. Ebert and C. F. Hutchings of Kansas City, Kan. The Northeast Electric Railway Company is arranging to invade the territory of the Metropolitan Street Railway. Superintendent Weaver says that three routes are being considered and that within 120 days the company will be landing passengers at the corner of 11th and Main streets.

### Nebraska.

LINCOLN, NEB.—The Lincoln Traction Company has been incorporated to operate the reorganized Lincoln Street Railway. Capital stock, \$1,065,000; incorporators, M. L. Scudder of New York, William Belcher of New London, Conn., and J. H. Ames, D. D. Muir and E. F. Pettis of Lincoln.

LINCOLN, NEB.—The property and franchises of the Lincoln Street Railway were sold December 17, by a master in chancery to representatives of the first and second mortgage bondholders for \$60,500, subject to paying taxes of more than \$40,000. The holders of the \$300,000 of first and \$840,000 of second mortgage bonds are M. L. Scudder of New York, Judge William Belcher of New London, Conn., and other Eastern capitalists. The road, consisting of 55 miles of track, during the past three years has been operated by a receiver, Brad D. Slaughter, who has devoted the small surplus earnings to paying off back taxes and other pressing liabilities.

### New Jersey.

MONMOUTH, N. J.—Those interested in the recently incorporated Monmouth Traction Company are Edward Morrell of Philadelphia, H. V. Massey and Mitchell B. Perkins of Beverly, Pa., and A. B. Stoney of Keyport. The Company has purchased and will equip electrically the horse car line between Keyport and Matawan.

PERTH AMBOY, N. J.—The Perth Amboy & Sewaren Electric Street Railway Company has been incorporated to build a road. Capital stock, \$25,000; incorporators, Cassimer W. Boynton, Woodbridge, N. J.; Henry Maurer and Robert W. de Forest, New York, N. Y.; Garret Brodhead, Patrick Convery, C. Whitman Boynton, Jr., and John Pfeiffer, Jr., Perth Amboy.

JERSEY CITY, N. J.—John L. Heins, president, has been appointed receiver of the New Jersey Electric Railway, known as the "White Line," on application of the Mercantile Trust Company of New York. The company was established in 1894, with a capital of \$10,000,000, to consolidate several roads and has a line in Passaic City and another running from Hoboken to Secaucus and besides controls leases of the Jersey City, Hoboken & Rutherford Railway and the Paterson, Passaic & Rutherford Railway and Idlewild Park. The immediate cause of the receivership was a default in the interest on \$3,500,000 of the first mortgage bonds.

### New York.

NYACK, N. Y.—The Nyack Traction Company, A. B. Wilgus, promoter, has been granted a franchise by the trustees of South Nyack.

NEW YORK, N. Y.—The park commissioners have resolved that the charter of the Union Railroad Company be annulled and its tracks torn up.

GREENBUSH, N. Y.—J. M. Sullivan & Co., who have the contract to construct the Greenbush & Nassau Electric Railway, it is said, will soon resume work.

STATEN ISLAND, N. Y.—The Staten Island Midland Railroad Company has received a franchise for the Tottenville branch and the loop line through Pleasant Plains.

ONEONTA, N. Y.—The contract for constructing the car house and power plant of the Oneonta & Otego Valley Railroad, has been awarded to Andrew Douglass of Binghamton.

BUFFALO, N. Y.—Plans for new lines have been filed with the board of public works by the Buffalo Traction Company. Work is to begin as soon as weather will permit in the spring.

NEW YORK, N. Y.—Mayor Strong has vetoed the Pelham Park Railway Company's franchise, and the aldermen have been permanently enjoined from passing it over the mayor's veto.

BROOKLYN, N. Y.—The property of the Brooklyn Cable Company was sold under foreclosure, December 23, to John C. Breckenridge, chief engineer of the Brooklyn Rapid Transit Company.

NYACK, N. Y.—Frank Demarest has obtained a franchise for the company which will build an electric railway from Rockland Lake through West Nyack and South Nyack to the Bergen county line at Tappan, paralleling the Northern Railroad of New Jersey.

NEW YORK, N. Y.—The Metropolitan Street Railway Company and the Third Avenue Railroad Company have settled all their differences, it is said, thus enabling the latter to immediately install the conduit system on 42d street, the Boulevard and the entire Dry Dock system.

MT. VERNON, N. Y.—The Union Electric Railway Company will extend its Fifth avenue line from Mount Vernon to Bartow and City Island; the company has also under consideration the construction of a trolley road over the abandoned route of the North Mount Vernon Horse Railroad Company, through Chester Hill to the county seat at White Plains.

WATERTOWN, N. Y.—The Black River Traction Company has been formed to reorganize the Watertown & Brownsville Street Railway, recently sold under foreclosure. Capital stock, \$65,000; directors, Julius A. Leucher, George Krentz and Chandler W. Riker of Newark, N. J.; B. Van Wagenen of South Orange, N. J.; Hiram F. Inglehart, Byron B. Taggart and George H. Walker of Watertown.

SYRACUSE, N. Y.—The Onondaga Lake Railroad Company is the second to make application for right of way for an electric line through Baldwinsville. The directors are the following influential business men of Syracuse: Wing R. Smith, Edward Joy, James M. Belden, P. R. Quinlan, E. A. Powell, John S. Kaufmann, H. N. Babcock, W. Judson Smith, A. R. Peck, Herman Bartels, Charles M. Warner and Louis House.

SOUTHFIELD, N. Y.—The New York Beach Railroad Company has been incorporated to build five miles of electric street railway in the town of Southfield, Richmond county. Capital stock, \$50,000; directors, Albert Reynand, of New Dorp. S. I.; Ernest G. Wightman, of Stapleton, S. I.; Charles N. Harris of No. 35 Nassau street; William B. Welde, William D. Stratton, Robert Emmet, H. T. Ferris. A. S. Drake and James P. Egan of New York City.

YONKERS, N. Y.—The Hudson River & Long Island Sound Railway Company has been incorporated to build 10 miles of electric road from Yonkers to Pelham Manor. Capital stock, \$100,000; incorporators, Henry C. Bassett, Washington; Henry A. Welch, Detroit; James F. Secor, Jr., Pelham Manor; D. B. Halsted, Paul Gorham, and John H. Seed, Brooklyn; Seward Baker and Walter R. Quick, New York, and William L. Stout, Elizabeth, N. J.

DELHI, N. Y.—A scheme is on foot with good backing to build 15 miles of electric road between Delhi, Bovina Centre and Andes. A company, to be known as the Delaware Valley Railroad Company, is now being formed by James F. Scott and William C. Oliver of Andes; Thomas E. Hastings and Alexander Hilson of Bovina Centre; Hon. A. H. Sewell and H. S. Sewell of Walton; Hon. Henry Davie, Charles E. Hitt and Samuel P. Wilber of Delhi.

BROOKLYN, N. Y.—The United Railroad Company has been incorporated as a reorganization of the Brooklyn Cable Company, whose property was recently sold to John C. Breckenridge. The capital stock is \$300,000. The directors are: Henry C. Barrow, John M. Ward, Robert B. Smith, Henry Wyse and Walter F. Downs of Brooklyn, and Henry C. Evans, J. Clarence Farvey, Charles M. Bates and Frederick W. Bruckel of New York. Under the charter of the original company the new corporation is authorized to construct and operate a railroad in Brooklyn, between Fulton Ferry and the Cemetery of the Evergreens, on Front street, Fulton, Water, Washington, Concord and Navy streets, Park avenue, Broadway, Locust Park and Beaver street, Bushwick avenue, Jefferson street and Central avenue.

## Ohio.

ELMORE, O.—Dr. Teetzell, of Genoa, has applied to the council of Elmore for a franchise for an electric railway.

DEFIANCE, O.—On January 3, W. R. Faben, receiver, was ordered by the court to advertise the sale of the street railway property of the Defiance Light & Railway Company.

MASSILLON, O.—S. W. Goudy reports good progress on the electric railway scheme. It is soon to be incorporated as the Massillon, Dalton & Wooster Street Railway Company.

ZANESVILLE, O.—William Christy has been appointed receiver of the Zanesville Street Railway and the Zanesville Electric & Railway Company, on petition of the International Trust Company, which is foreclosing a mortgage of \$175,000.

ZANESVILLE, O.—Creditors and stockholders of the Zanesville Street Railway have decided to terminate the brief receivership, on a showing made by Receiver William Christy that the road is earning sufficient to meet all obligations.

DAYTON, O.—The county commissioners have extended the time for the completion of the Dayton & Western Traction Company's line from January 1 to February 1, 1898, on the allegation by the company that it was unable to procure ties.

CLEVELAND, O.—The Cleveland, Berea & Elyria Railway Company has been consolidated with the Elyria & Oberlin Electric Railway Company as the Cleveland, Berea, Elyria & Oberlin Railway Company. Capital stock, \$1,000,000; principal office, Berea.

NORWALK, O.—W. W. Graham, of Norwalk, and Clark Rude, of Sandusky, who hold a franchise to construct an electric railway from Norwalk to Sandusky, via Monroeville, have been granted an extension of time by the commissioners of Hume and Erie counties.

DAYTON, O.—The county commissioners have granted the petition of the Dayton, Springfield & Urbana Electric Railway Company for a renewal and extension of the franchise until October next. Some changes were made relative to cost of construction and maintenance of bridges.

YOUNGSTOWN, O.—The Mahoning Valley & Southeastern Railway Company has been organized to build the electric road as reported in the DAILY BULLETIN. John E. McVey, president; L. W. King, vice-president; C. Y. McVey, secretary, and A. A. Anderson, treasurer and general manager.

CINCINNATI, O.—The Cincinnati & Hamilton Electric Street Railway Company will build its line over the Hamilton turnpike during the coming summer. A franchise has been granted by the corporation of Mt. Healthy. Among those interested are: O. V. Parrish, J. C. Hooven and other citizens of Hamilton; C. T. McCrea, of College Hill, and ex-Mayor Caldwell, of Cincinnati. The Cincinnati & Miami Valley Traction Company is behind the enterprise and will ultimately control the entire route. Peter Schwab, brewer, of Hamilton, is one of the promoters.

## Pennsylvania.

SCRANTON, PA.—A car barn will be erected by the Scranton Traction Company, adjoining the power house.

KITTANNING, PA.—The Kittanning & Ford City Traction Company will be incorporated by James A. Gault, J. F. Hellman and others, to build a line between Rosston and Nealeton.

PITTSBURG, PA.—The Greensburg & Mt. Pleasant Street Railway Company has given a mortgage for \$200,000 to the Union Trust Company of Philadelphia. The road is to be built at once.

SOUTH BETHLEHEM, PA.—The South Bethlehem & Hellertown Electric Railway is to be extended with a branch line to Freemansburg. President Hugh Crilly also states that a car barn is to be erected.

WAYNESBORO, PA.—The Blue Ridge Electric Street Railway Company has been incorporated to build the 3.5 miles of road as reported in the DAILY BULLETIN of October 29. The capital stock is \$50,000, with \$5,000 paid in.

SHARON, PA.—A high speed engine and generator will be installed in the power house of the Valley Street Railway Company. Other improvements will be made. The company increased wages 12 per cent on December 15.

ELLWOOD CITY, PA.—The Park Gate & Ellwood City Street Railway Company has been incorporated to build three miles of electric road from Park Gate, Beaver county, to Ellwood City, Lawrence county. Capital stock, \$25,000; president, Thomas Dugan of Ellwood City.

ALLENTOWN, PA.—The Allentown & Emaus Street Railway Company has been incorporated to build an electric road from Allentown to Bethlehem, Mountainville and Emaus, with a branch line to Allentown. T. J. Crilly of Allentown is one of those interested; capital stock, \$50,000.

SHAMOKIN, PA.—Gibson & Rhinefelter of Philadelphia have purchased the franchises of the North Susquehanna Transit Company for an electric railway from Shamokin through Paxinos, Elysburg and Big Roaring Creek to Danville, Bloomsburg and Espy. Surveyors are in the field and construction is to begin in March. Orders for rails, it is said, will be placed with the North Branch Steel Works of Danville. The route will traverse one of the most picturesque regions of Pennsylvania.

LYKENS, PA.—The Lykens & Williams Valley Street Railway Company has been incorporated to build the electric road which has been promoted for several years. From Lykens to Johnstown, a distance of ten miles, the road takes in Wiconisco, Williamstown, Tower City, Reiner City and Bearmont. John B. Styles, Martinsburg, is president; C. C. Cocklin and W. E. Fletcher, Harrisburg; B. W. Brown, Derry Station, and W. E. Stewart, Indiana, directors. Dr. S. R. Ickes, of Harrisburg, is the largest stockholder.

### South Carolina.

CHARLESTON, S. C.—It is said that an electric road will be built by the Charleston & Seashore Railroad Company, just organized.

### Tennessee.

CHATTANOOGA, TENN.—Congress has referred to the committee on military affairs the bill granting S. W. Divine's Chattanooga Rapid Transit Company right of way through the Chattanooga National Military Park.

### Texas.

LAREDO, TEX.—An extension of 1.5 miles will be made by the Laredo Electric & Railway Company.

CORPUS CHRISTI, TEX.—The Council has granted the Corpus Christi Street Railway Company permission to tear up its tracks.

DALLAS, TEX.—At foreclosure sale the Dallas City Street Railway was bought in December 7, for \$267,000, by C. H. Alexander of Dallas and associates. The road, comprising 14 miles of horse and 10 miles of electric line, is to be largely improved.

### Vermont.

BARRE, VT.—The Barre & Montpelier Traction & Power Company has given a mortgage to the American Loan & Trust Company of Boston to secure \$100,000 of bonds.

BRATTLEBORO, VT.—E. C. Crosby of Brattleboro is one of syndicate which offers to build an electric railway 13 miles in length between Brattleboro and Northfield, Mass., via Hinsdale, N. H., provided the towns of Brattleboro and Hinsdale will construct two bridges across the Connecticut river.

BURLINGTON, VT.—J. S. Pierson, F. C. Kennedy and J. J. Flynn, all of Burlington, are interested in a project to build an electric railway connecting Fair Haven, Castleton, Hamden, Hydeville, Lake Bomoseen, Poultney, East Poultney and Middletown Springs.

### Virginia.

NORFOLK, VA.—The Norfolk Street Railway Company has been reorganized with Lancaster Williams of Richmond as president.

PORTSMOUTH, VA.—Right of way has been obtained for the River Front Railway, which will extend from Columbia Park to Gilmerton, and connect with the Portsmouth Street Railway.

LYNCHBURG, VA.—By a decree of the United States court the Lynchburg Electric Company is given until January 15 to pay its entire indebtedness; failing to do so, all its franchises and street railway property are to be sold to the highest bidder 30 days thereafter.

NORFOLK, VA.—Permission to build an electric railroad is asked by the Norfolk, Willoughby Spit & Old Point Railroad Company. H. L. Page and J. E. Cole, representing the company, says it contemplates purchasing the Ocean View road when it is put up for sale or building a power house and new road connecting the two ends of its property.

### Wisconsin.

RACINE, WIS.—The Belle City Street Railway has given a mortgage for \$250,000 to the Illinois Trust & Savings Bank, of Chicago.

JANESVILLE, WIS.—President Blabon offers to run the cars all winter, if local stockholders will pay their proportion of the expense.

OSHKOSH, WIS.—James K. Tillotson has practically completed arrangements to build an electric line to connect Oshkosh with Neenah, independently of the Fox River Valley Electric Railway.

WAUPACA, WIS.—Attorney Paul Sanborn, of Waukegan, Ill., is interested in the project to build an electric road. The city has granted a franchise, and right of way through Farmington is expected. One of the promoters is Robert D. Wynn.

MILWAUKEE, WIS.—All the property and franchises of the Milwaukee & Wauwatosa Motor Railway Company, the North Greenfield & Wauwatosa Electric Railway Company, the Waukesha Electric Railway Company and the Waukesha Beach Electric Railway Company, were, December 10, conveyed to the Milwaukee Light, Heat & Traction Company, which is the successor to the Pabst Power & Light Company, and is owned by the Milwaukee Electric Railway & Light Company, although a separate organization. The Traction Company now owns and controls both lines from the city to Wauwatosa, as well as the motor line to North Greenfield, the prospective electric line to Waukesha from North Greenfield, and the Beach line. This property will be operated for the Traction Company by the Milwaukee Electric Railway and Light Company.

### West Virginia.

WHEELING, W. VA.—B. W. Peterson and W. E. Stone, directors of the Wheeling Street Railway Company, are negotiating with the council of Martin's Ferry, O., for the privilege of extending their road.

WHEELING, W. VA.—A franchise has been granted by the county commissioners to the Wheeling & Elm Grove Railway Company for an electric street railway. Ordinary T rails are to be laid. Construction of the road will begin probably in the spring.

SISTERSVILLE, W. VA.—The Sistersville & Salem Railroad Company has been incorporated to build an electric line from Sistersville, on the Ohio River, to Salem, by way of Middlebourne, through the richest part of the oil fields. Both passengers and freight will be carried. Capital stock, \$500,000.

### Canada

NAPIERVILLE, QUE.—Napierville and the parish of St. Cyprian have voted a bonus of \$10,000 to the Southern Counties Electric Railway Company.

ST. THOMAS, ONT.—Ratepayers have voted in favor of the law to guarantee \$50,000 of the bonds of the street railway, which promises to build 6.5 miles of track.

## ELECTRICITY ON THE HOBOKEN SHORE ROAD.

The use of electricity for switching purposes on the steam railroad, in place of the noisy drill steam engine, takes another step forward. This time on the Hoboken Shore Road, Hoboken, N. J. The full name of this road is the Hoboken Railroad, Warehouse & Steamship Connecting Company. It runs from 17th street, Weehawken, to 4th street, Hoboken, along the water front, or from the Erie tracks at Weehawken to the docks of the North German Lloyd Steamship Company, Hoboken, a distance of about two miles.

This road was opened for traffic on September 20, 1897. It was constructed to provide connecting facilities between the tracks of the railroad companies entering Hoboken and the numerous warehouses and docks which line the west

bar pull is 10,000 lbs. The locomotive is driven through a single reduction gear of very low ratio. The speed is correspondingly low, and is rated at 8 miles an hour when hauling a heavy load.

The overhead wire is No. 00 suspended from wires strung between octagonal cedar poles, except at two or three points, where bracket construction is used. Where the locomotive turns in from Hudson avenue to the River Walk, a peculiar condition has caused a special method of bracket construction. It was necessary for the overhead line to be so set as not to infringe upon the limit of the next property. Thus at this point the overhead line is suspended from two bracket arms, one 6 ft. and the other 18 ft. long.

The current for the road is taken from the station of the Hudson Electric Light Company.

The Hudson Shore Road is one of the sub-companies of the Hudson Land & Improvement Company, organized

ELECTRIC LOCOMOTIVE FOR HOBOKEN SHORE ROAD.

side of North river from Hoboken to Weehawken. It is double track over a private right of way from 17th to 14th streets, single track down Hudson street to 11th street, and double track along the river walk to 4th street, Hoboken.

The switching of the cars for the past three months has been effected by a repair car of the Hudson County Electric Railroad Company. The new locomotive was put into regular service on January 4, 1898, hauling trains of loaded and empty freight cars between the docks and the Erie track.

The locomotive was constructed in the shops of the General Electric Company, at Schenectady, N. Y., and somewhat resembles in appearance the electric locomotive in use on the Manufacturers' Railroad, which connects with the N. Y., N. H. & H. R. R. tracks at New Haven, Conn., and those of the Baltimore & Ohio Railroad, at Baltimore. It is mounted on two four-wheel trucks, each axle carrying a G. E. 2,000 motor, giving the locomotive a total of 540 rated h. p. The weight on the drivers is 57,200 lbs.; the draw

52 years ago, under a special charter, by the Stevens family, to consolidate their interests in their several Hoboken properties. The present head of the Stevens family, Col. Stevens, is president, and Robert L. and Richard Stevens are respectively first and second vice-presidents; the general manager and treasurer is Palmer Campbell, and the secretary W. A. Macey.

The trial trip of this locomotive was witnessed by representatives of all the railroads having offices or termini in New York and New Jersey. The locomotive was coupled to eight loaded freight cars with an aggregate dead weight of 205.6 tons. It handled this train with ease. It was then coupled to a number of passenger coaches, and the party made the journey over the line from Hoboken to Weehawken and back.

At the luncheon which followed, two interesting speeches were made. F. Le Bau, general freight agent of the West Shore Railroad, pointed out emphatically the usefulness of such a road as the Hoboken Shore Road in facilitating the

transport of merchandise directly from the steamships to any part of the country, and of the rapid switching electric locomotive, by means of which the freight cars could be handled more easily and more expeditiously than with the ordinary steam drill engine. W. J. Clark, general manager of the railway department of the General Electric Company, in an interesting talk full of reminiscences of the early days of the street railway struggle, said:

"Ten years ago, the development of three things made electric street railways practicable and profitable. These were the under-running trolley, the carbon brush and the modern method of motor suspension. The development of three other things now renders the general application of electricity to standard railroads both possible and probable. These are the safe breaking of heavy currents, high voltage for their transmission and methods for their application to almost any load on any portion of a line. Other features are being developed that will seriously affect the result; not the least is the Sprague system of multiple and unit control, increasing the flexibility of the already most elastic of all transportation agents, and while the economy

extended system of suburban and interurban electric roads in densely populated districts also feeding the main lines.

"The electrical engineer has much to learn from the steam railroad man, and must constantly rely upon him for suggestions as to the best methods of making practical applications of electricity. The American transportation man and the American electrical engineer should go on hand in hand, continuing to lead the world, as they now do, in all transportation problems. The American engineer has won conquests abroad as well as at home; not the least is the solution of the problem of electrical equipment for the Central London Underground Railway, the most important of this character that has yet been accomplished. The American engineering plans were selected on account of their merit in the face of the severest competition from every European electrical manufacturing company, and no greater tribute can be paid to American engineering methods than to state that 80 per cent of all the railway apparatus used in Europe is designed in America, so that the American engineer stands today head and shoulders above those of any other country. With the encouragement of the co-

MAP OF HOBOKEN, N. J. HORE ROAD.

of electricity has already been thoroughly demonstrated in performing the same service as by steam or animal traction, so far as passenger service at least is concerned, something beyond the mere question of economy has now to be considered, to wit: accomplishment by electrical methods of what would be entirely impossible with steam. The first steam railway man within my range of acquaintance to fully grasp this idea is John Lundie, consulting engineer of the Illinois Central Railroad, who has set a pace on acceleration that would not have been dreamed of two years ago, and the schedule which he has mapped out for the contemplated electrical equipment of the suburban lines of his company involves speeds up to 40 miles per hour in 20 seconds. That this is practical has already been demonstrated.

"In another direction even greater changes may be prophesied which will come from the adoption of electricity in standard railroading, viz.: the lengthening of freight trains and the consequent reduction in that most important feature of operating expense, transportation wages. The advantages of electricity will have so thoroughly demonstrated themselves in the directions suggested that instead of main steam lines with electric feeders, in 10 years it will be a question of electrically operated main lines with steam feeders through the sparsely settled districts, and a more

operation of American railroad men, he is bound to revolutionize the entire method of transportation within a comparatively short space of time, so that American railroad methods will then, as now, be in advance or those existing anywhere else on the face of the earth."

#### IN THE HANDS OF RECEIVERS.

According to a compilation made by the United States Investor there are 64 street railways yet in the hands of receivers, as the result of the financial depression during the last three years. These 64 roads have an aggregate bonded and floating debt of \$40,608,826, own 958.3 miles of track and 1,910 cars. It thus appears that the insolvent companies own a trifle more than 6 per cent of the total track mileage of the country, less than 4 per cent of the cars, and that the debt is about 6 per cent of the total of street railway bonds outstanding.

The will of David W. Dickson, late president of the Philadelphia Traction Company, has been probated. The estate is estimated at \$200,000 and upwards. The final disposition of the greater part of the property is to the Old Man's Home, and, failing that, to the Episcopal Hospital of Philadelphia.

## PERSONAL.

W. T. Van Dorn is east on a business trip and will be gone for a month or more.

A burglar robbed the residence of J. R. Wooden, president of the People's Street Railway, Centerville, Ia., on the evening of December 23.

President A. Radel, of the Bridgeport Traction Company, is the proud father of twins, a boy and a girl, who came as a New Year's greeting.

At the annual meeting of the New Orleans Traction Company, Limited, held January 3, C. D. Wyman was re-elected general manager for another year.

F. B. Ward, of Kansas City, Mo., has accepted the position of shop foreman for the electrical and mechanical equipment on the Lake Street Elevated Railroad, of Chicago.

Clark Rude, receiver of the Sandusky (O.) Street Railway Company, and Andrew Thompson, superintendent, were on Christmas presented with handsome office chairs by the employes.

James Todd, president of the Sterling Varnish Company, was married to Miss Mary Louise Slagle, daughter of Judge Slagle. The best wishes for a long and prosperous married life are offered to the happy couple.

P. V. Burington, secretary and auditor of the Columbus (O.) Street Railway, recently lectured to the class in transportation at the Ohio State University on the subject of "The Financial Management of Street Railways."

S. Roy Wright, on December 31, resigned his position as general manager of the West End Street Railway, Denver, and is now installed as secretary of the Board of Education, School District No. 1, of Colorado, with headquarters in Denver. While out of the street railway business, Mr. Wright still considers himself one of the fraternity.

The employes of the Bristol (Conn.) & Plainville Tramway Company gave a smoker in honor of C. D. Shepard, who has accepted the position of general manager of the Palmer & Monson Tramway Company. Mr. Shepard received a present of a gold watch and seal charm from the officers and employes.

W. S. Freeman, while a motor inspector for the Milwaukee Electric Railway & Light Company, became involved in trouble and was imprisoned. Lately he forged his brother's name and has been sentenced to a term in the penitentiary. He endeavored to commit suicide while leaving the court room in Chicago.

On January 1, F. W. Fratt assumed his duties as engineer and superintendent of the Galveston (Tex.) City Railroad. Mr. Fratt has been engaged in steam railroad work ever since leaving college in 1881. At one time he was chief engineer of the Wisconsin Central lines; his last position was superintendent of the Texas Midland.

DeWitt Dilworth, who a short time since resigned his position as secretary of the New Castle (Pa.) Traction Company and the allied companies, was on the occasion of his leaving presented with a handsome gold watch by the employes.

Russel B. Harrison, president of the Terre Haute street railway, was a "Review" caller. He is making a splendid record in the face of the most aggravating difficulties, and has the hearty support of the public, his men, and in fact everybody but an obstreperous old mayor, who has done the city more harm in two years than he can possibly do good in twenty.

David W. Dickson, president of the Philadelphia Traction Company, died suddenly of a complication of heart troubles, December 13. Mr. Dickson was born in Philadelphia 63 years ago and has been identified with street railway interests since 1878. He was first treasurer of the West Philadelphia Passenger Railway Company, and later when P. A. B. Widener retired from the presidency of the Philadelphia Traction Company, Mr. Dickson succeeded him.

## NEW PUBLICATIONS.

With the first issue of the year the Electrical Review has taken a new form and size, presenting a handsome appearance. The page has been reduced to more convenient dimensions and the typographical work much improved.

We have just received the verbatim report of the sixth annual meeting of the Pennsylvania Street Railway Association, which was held at Allentown, Pa., on September 1 and 2. In addition to the papers presented, which were published in the "Review" for September, the report of the committee on legislation and the subsequent discussion will be found very interesting. Secretary Light is to be congratulated on the handsome appearance of the report.

"Street Railways of Greater New York," is a pamphlet of 72 pages prepared by Redmond, Kerr & Co., bankers, of New York and Philadelphia, which will prove valuable for reference. It gives a description of the surface street and elevated railways of Greater New York with particular reference to the securities, etc., of the several companies, the facts and figures being taken from official sources wherever possible. A comparative statement of the business and earnings of each company for the last two years is given.

The B. F. Sturtevant Company, of Boston, has just issued an octavo volume of nearly 400 pages entitled "Mechanical Draft," a practical treatise on that subject, representing the accumulated experience of the Sturtevant Company; also Walter B. Snow has devoted nearly two years to a special investigation of the subject. The objects are thus stated in the preface: First, to instruct by a lucid discussion of the entire subject, with such supplementary information as may be necessary to show the superiority of mechanical draft. Second, to show the special adaptability of the Sturtevant fans for this purpose, and to indicate to some degree the extent to which they have already been applied. The work brings the subject down to date in all the fields of engineering and is well worth a careful perusal.

The R. D. Nuttall Company, Allegheny, remembered its friends and customers with a neat calendar.

The Bradford Belting Company, Cincinnati, sent to its friends and customers a handsome wall calendar.

The Central Electric Company, of Chicago, has established an office in New York with Ira Abbott in charge.

Alfred F. Moore, manufacturer of insulated electric wire and cables, is distributing a very handsome calendar to the trade.

The Cleveland Leader is authority for the statement that the Walker Company contemplates the removal of its plant to New York.

The Western Electric Company is manufacturing a non-sparking brush, made of a composition of high and low resistance metals.

Harold P. Brown has received an order for 10,000 plastic bonds from the Dublin United Tramways Company, this being the third order.

Henry L. Shippy, of John A. Roebling's Sons Company, has sent a gold plated pocket cork screw to his many friends with New Year's greeting.

The Western Electric Company is placing on the market an ornamental enclosed arc lamp similar to the standard enclosed lamp but finished in polished brass.

One of the first of the 1898 calendars to arrive was that from the Dorner & Dutton Company, Cleveland, manufacturer of gears, pinions, wheels, axles, trucks, etc.

The Swarts Metal & Refining Company, of Chicago, has received a large order from Japan for brass ingots, which is the first contract of that kind in the foreign market.

John T. McRoy, Chicago, of conduit fame, remembered his customers, on New Years, with a fine fountain pen of excellent quality—a most acceptable souvenir to anyone.

The Jackson & Sharp Company in the latter part of December shipped to the Syracuse & Suburban Railroad, Syracuse, N. Y., seven of the cars ordered by that road.

B. F. Sweeten & Son, of Camden, N. J., are building the trolley line between Quakertown and Hellertown, Pa. The road is 14 miles long and the contract price is \$127,000.

J. A. Fay & Co., of Cincinnati, have been awarded the contract for furnishing the wood-working machinery for the new shops of the Cincinnati, Hamilton & Dayton Railroad Company at Lima, O.

J. H. Leonard & Co., of Pittsburg, Pa., eastern agents of the Swarts Metal & Refining Company, have again renewed their contract to look after the latter's interests.

The Sterling Supply & Manufacturing Company, of New York, reports that its business is in first class shape, large orders having been received lately from both old and new customers.

The Leschen-Macomber-Whyte Company, Chicago, maker of bare and insulated wires, and flattened strand wire rope, issued a pretty calendar with handsome photo-gravure fishing scene.

McGill & Pomeroy, Chicago, general western sales agents for a large line of railway specialties, are mailing customers and friends an unusually attractive calendar with steel plate figure engraved thereon.

The calendar which the W. H. Sills Company of Chicago, dealer in mica, sent to its friends bears a very handsome reproduction of the American flag in red, white, blue and gold which is a fine piece of work.

The Barney & Smith Car Company, Dayton, O., is doing a good business, and such a large number of orders has been received recently that it was necessary to increase the working force to 1,000 men.

The J. G. Brill Company recently shipped a number of closed vestibuled cars to the Woronoco Street Railway Company, Westfield, Mass., which will be put in service as soon as the motors and controllers are in place.

F. C. Randall, representing the Christensen Engineering Company, in the east, came on to attend the meeting for the organization of the Illinois Street Railway Association. He received a warm welcome from his many friends.

We have received the advance sheets of a most artistically designed catalog soon to be issued by the Sargent Company, Chicago. It is on the subject of brake shoes and includes the tests recently made of the "Diamond S" shoe.

The Metropolitan Street Railway Company, of Kansas City, tried the Pintsch system on its Westport line and the test was so satisfactory that the cars on the Holmes and 15th street lines will now be lighted in the same manner.

Elmer P. Morris, of 15 Cortlandt street, New York, is the manufacturer's agent for street railway materials of every description. His catalog No. 5 is a book of 136 pages, fully illustrated and containing a complete price list.

Gill & Co., of Philadelphia, have received the contract for the overhead work on the Red and White lines of the City Passenger Railway, Baltimore, Md. With this change the last of the cable roads of Baltimore will be superseded by electricity.

The Standard Paint Company states that its orders are increasing from all parts of the country. The company is now paying especial attention to the P. & B. tape and rubberoid motor cloth, and makes the offer to send to any street

railway company a motor curtain free of charge for trial. The "universal" coating is a preservative paint which is without an equal for conduit and general iron work.

The General Electric Company has published from its own press a general catalog on incandescence lamps which is not only a valuable treatise on the subject and full of information, but its typography and illustrations make it a model in this kind of work.

The DeWitt "common sense" sand box, made by E. F. DeWitt & Co., Lansingburg, N. Y., has been received with great favor by a large number of street railway companies. From the new and duplicate orders a large business is anticipated for the coming year.

The West End Street Railway Company, of Boston, has received five Taunton snow plows, through the agency of Wendell & McDuffie, of New York. This duplicate order makes a total of 13 plows received this year, and is a strong testimonial of their efficiency.

The Joseph Dixon Crucible Company presented its editorial friends with a most acceptable Christmas gift, a box of pencils, crayons and erasers. The utility of the remembrance will keep the generosity of the company constantly before those who were so fortunate as to be favored.

The Washburn & Moen Manufacturing Company, of Worcester, Mass., Waukegan, Ill., and San Francisco, Cal., has recently mailed from the Houston, Tex., office, which is in charge of George A. Cragin, a leather coin bag so that all its friends may be prepared for the prosperous year that is coming.

The firm of Herrick & Burke was dissolved on January 1, the partnership agreement expiring by limitation. Albert B. Herrick and James Burke, who constituted the firm, will continue to devote themselves to the practice of electrical engineering and their address will remain 150 Nassau street, New York.

The offices of the Standard Air Brake Company have been moved from 100 to 168 Broadway, New York. Joseph R. Elliott will succeed Mr. Wessels as managing director. The company is in a very prosperous condition, having in hand many orders from foreign countries as well as from all parts of the United States.

The Union Equipment Company has been incorporated at Trenton, N. J., to manufacture electric appliances and equip railways. The capital stock is \$1,500,000; and the incorporators are Frederick Hitchcock, Glenn R. Gardner and Francis J. Boyer, of New York; F. W. Hunter, Cranford, N. J.; Frank G. Gourley, Stamford, Conn.

The Chase Construction Company, Majestic building, Detroit, Mich., is about to begin work on 30 miles of electric road between Indianapolis and Greenwood, Ind., under a contract amounting to \$160,000. The company has the overhead construction of the Dayton & Western Traction Company well under way. An order for 360,000 lbs. of copper wire was recently placed by the Chase Company with the Western Electric Company, of Chicago.

The advance sheets of the United States consular reports which are issued daily, except Sundays and legal holidays, by the Bureau of Foreign Commerce of the Department of State cannot fail to prove of great value to American jobbers doing a foreign business, as accurate information as to matters of trade is thus early placed at their disposal.

A firm which has a strictly first class article in which quality is always maintained, and is content to sell it at a fair price, has all the monopoly it desires without resort to trusts and combines. Such a one is "Smith of New York," whose business the past year in all kinds of headlights and car lamps shows a big gain over the previous 12 months.

The Westinghouse Electric & Manufacturing Company has received the contract to supply engines, dynamos and cars for the new municipal lines of Glasgow, Scotland. Another foreign order recently awarded the Westinghouse Company is for engines and dynamos for street lighting in Malaga, Spain, a city which, hitherto, has used English machinery.

The Ohio Brass Company states that the volume of business done in 1897 exceeded that of any previous year, and that the shipments for the latter part were twice as great as for the corresponding period the year before. Arrangements have been made for handling a larger business during this coming year than for any other year in the history of the company.

The American Electrical Works, Providence, R. I., which during the year ingeniously keep before the trade the merits of their bare and insulated electric wire, make it a point to send their friends each Christmas, something novel. This year it was a Christmas tree laden with presents, all properly labeled, which did not fail to entertain and no doubt in many instances furnished ideas for what to get.

The Williams & Moore Manufacturing Company, of Chicago, which recently made an assignment, has sold all its interests to the Q & C Company, of Chicago. The two specialties of this company, the Williams & Moore railway jack, which is well known to the trade, and the Williams track drill, more recently brought out, will hereafter be manufactured and sold by the Q & C Company.

The Western Electric Company is the agent for an automatic time switch, recently perfected, for turning on and off electric lights. It is a double pole switch arranged in combination with a clock, the clock being set as an alarm clock would be, for turning on or off the lights. If a contract calls for lights to be turned off at a certain time the switch may be enclosed in a locked box and set each day by an inspector of the company.

A. O. Schoonmaker, 158 Williams street, New York, has lately received a number of letters from street railways highly recommending his solid sheet mica segments. The Atlanta Consolidated Street Railway Company writes: "In regard to your mica, we can say that we have been using this mica for five or six years and have no complaint whatever to make. It gives us satisfaction wherever used. Our orders have always been taken care of and filled promptly and correctly."

The Pennsylvania Car Wheel Company has been organized recently and will soon erect a plant in Pittsburg for manufacturing high grade car wheels. The company has a capital stock of \$100,000, and it has the backing of men experienced in the business. It is believed that Pittsburg is a favorable situation for producing the best grade of wheels at least cost, and will be a good distributing point. C. V. Slocum, formerly of the New York Car Wheel Works, will be the superintendent.

J. M. Denniston has resigned his position with the St. Louis Car Company to accept a much better one with the E. T. Burrowes Company, of Portland, Me. Mr. Denniston becomes general sales agent for the United States, and will for the present make his office headquarters at 1116 Chamber of Commerce building, Chicago. His 12 years' experience and his very wide acquaintance among and universal popularity with street railway men, render his new connection one in which his many friends will feel congratulations are equally due to Mr. Denniston and the company he is to represent after January 1.

The Siberian Railway of Russia and clear down to the Valadastock, Siberia, is being equipped with shops for repairing cars. The outfits of machinery for these shops were bought from the Egan Company of Cincinnati, Ohio, U. S. A. The plants are not large, but there are many of them, and any one of them, in a limited way, builds cars complete as well as repairs them. Prince Hillkoff, on his recent trip around the world, stopped off at Cincinnati, especially to visit the plants of the Egan Company, and he was much impressed with his inspection of this great wood working industry, and found it more complete and better fitted up to turn out machinery than any he had found in America or elsewhere.

While the large station units now installed are direct connected, there remain hundreds of the smaller roads which will continue for a long time to be belt driven, and these in the aggregate represent probably several times the power of the large stations. Though less is said and heard about belts, than formerly, the question of belting is an important one. The Shultz Belting Company, St. Louis, which has built up what is undoubtedly the largest business in street railway belts of any concern in the country, has done so on the high quality of its product, which when once used becomes standard. The Shultz home trade shows a large increase, as does also its foreign shipments, which have been exceptionally large during the past year. It has agencies in all parts of the world.

It is predicted that the Falk Manufacturing Company will make more cast-welded rail joints this year than have been made altogether previously, and this only from the present indications of business. About 2,000 of the 8,000 joints, for the Capital Traction Company, of Washington, D. C., are finished and work is progressing rapidly. Several thousand joints will be made for the 3rd avenue line, Brooklyn, as soon as the weather permits, as will also the finishing of the work on the Union Depot line, at St. Louis, where about 2,000 joints have been made and about 6,000 more are being welded. This winter has been a trying one for rail joints, owing to the great variations in temperature, but the reports, so far, of the Falk cast-welded joint, show

less breakage even than formerly, so there can be no excuse of "waiting to see," hereafter, as the Falk cast-welded joint has been demonstrated to be a practical joint to withstand the summer's heat and the winter's cold.

We received a neat and artistic booklet entitled "Sense and Nonsense in Street Car Heating," from which we quote:

"When the sportive icy Manitoba blizzard,  
Comes a snowin' and a blowin' down the street,  
Rolling shivers through your marrow and your gizzard,  
Nipping ears and nose, your fingers and your feet,  
Your instinctive thoughts revert in short-hand meter  
To the trolley car approaching up the street,  
For you know beside the New Columbia Heater,  
You will find there's warmth and comfort on the seat."

There is perhaps more sense than nonsense in the booklet, but they fit well and read well together. It is nicely illustrated and is well worth reading and will be sent on application by the McGuire Manufacturing Company, of Chicago.

The McGuire Manufacturing Company reports a most satisfactory condition of trade at the close of the year. It has practically completed delivery of the Alley "L" trucks and commenced work on heavy orders from the Consolidated Traction Company, of Pittsburgh. It also has large contracts on hand which will require several months to fill. Trade on the "New Columbia" heaters has been most satisfactory for the year, and the sale of the "Combined Snow Plow and Sweeper" has been surprisingly large with orders yet to fill and still coming. This sweeper is pronounced indispensable by many well regulated street railways. The company expects that the coming year will be the most extensive and prosperous in its history. To meet the prospective demand, it contemplates the erection of additional buildings and the installation of a large amount of machinery.

#### THE STOW FLEXIBLE SHAFT.

The latest catalog of the Stow Manufacturing Company of Binghamton, N. Y., describes and illustrates the adaptability of flexible shafts to many operations where it is desirable to take the tool to the work instead of the work to the tool. A drilling plant for work on street railway tracks has been very successful. It consists of a 500-volt, 1-h. p. motor, flexible shaft, universal joint, track drill press, track old man and an attachment for making electrical connections with the trolley circuit. The whole apparatus is simple and compact and weighs but 20 lbs. It is a great time saver on any work involving drilling holes in the rails outside the repair shop. The Stow apparatus and tools have given unqualified satisfaction, and when once used by a road become one of the indispensable fixtures.

That a hatpin is a very dangerous and effective weapon was demonstrated by a Chicago miss who rendered valiant service to a cable car conductor in fighting two highwaymen. The conductor was receiving a fare from the young lady when his arms were pinned to his side by one robber and the other began to rifle his pockets. The conductor struggled bravely but was being overcome when the young lady pulled a long and pointed pin from her hat and began to prod the legs of the robbers. This proved more than they could stand and they took to flight. Woman like, the girl fainted when the danger was past.

## THE NEW ENGLAND "COMPOSITE" CAR.

In a paper before the New England Railroad Club, C. Peter Clark, general manager of the New England Railroad, discussed what he calls the "composite" car and its field. The "composite" is a combined passenger car and locomotive, which was placed in service on one of the branch lines of the company last summer.

The reason for the experiment with this type of car is that an investigation of the density of the passenger traffic showed 325,000 train-miles per annum, where the number of passengers carried was less than 25; on some lines the average was as low as six. For the sake of economy it was necessary to reduce the cost of the service and yet not affect the frequency of the trains. Recourse was had to the dummy car, and after consultation with Mr. Clark, the Schenectady Locomotive Works designed the "composite."

The car is one formerly used as a dining car, is 64 ft. long and has a seating capacity for 60 passengers. One end of the car is carried on a six-wheel passenger truck and the

MOTOR TRUCK OF COMPOSITE CAR.

other on the motor truck shown. For this illustration we are indebted to the Railway Age.

The locomotive has cylinders 12 in. in diameter and 16 in. stroke, drivers 42 in. in diameter, and the boiler carries a working steam pressure of 200 lbs. per sq. in. The Reagan water grate is used and gives satisfaction. There being no room for eccentrics between the wheels, the Walchaert valve motion is employed. The car is equipped with Westinghouse air-brakes.

Probably the most interesting and ingenious feature is the arrangement for carrying the car body upon the power truck. Around the base of the boiler box is fastened a circular casting of iron. In this casting is a groove in which are 125  $1\frac{1}{2}$ -in. steel balls. A similar casting, with the groove upon the lower side, is built into the floor of the car, the intermediate sills of which are of necessity removed in the space needed for the boiler, with the casting upon the car floor resting upon the balls. In this way a circle of ball bearings is formed which enables the power truck to curve freely without appreciable friction, even with the considerable weight of the car body and contents. If there is any

swinging motion to the power truck, a simple roll of the balls relieves the car from all sympathetic motion, there being no suggestion of reciprocating motion communicated to the car body.

The fuel is either coke or anthracite coal. Water is carried in two tanks, 24 in. in diameter and 30 ft. long, carried under the car. They have a capacity of 1,500 gallons. As this water is wholly or partially used during a journey it follows that the springs carrying the car must be comfortable for the passengers, whether the car body weighs 12,000 lbs. more or less. This has been secured by putting helical springs between the tank hangers and the car sills.

The water carried will last for 50 miles on fairly level track, and the coke bin carries fuel for 100 miles. The best speed record so far attained is a mile in 61 seconds.

A New York sensational paper indulges itself in a full page on the fears that electrolysis will wreck the Brooklyn bridge.

The Rogers law, which was passed by the legislature of Ohio two years ago, authorizes the extension of street railway franchises for a period of 50 years beyond the termination of the existing franchises. A bill, repealing this law, has passed the House.

A new schedule was put in operation on the lines of the Scullin system in St. Louis on New Year's day. This will shorten the working days of the motormen and conductors from 12 to 9 hours per day, and will give a 2-minute service during the busy portion of the day.

While a Clark street cable car was passing through the La Salle street tunnel under the Chicago river, Conductor J. Burke fell from his car and was fatally injured. He was changing the gate on the middle trailer, lost his balance and was crushed by the wheels of the following car.

The Manufacturers' Railway Company, of Fair Haven, Conn. which has been operating an electric locomotive for switching purposes, has had a satisfactory business the past year. On an average 400 loaded cars are handled each month, and this was increased to 550 in November.

About 6 a. m. on December 26 a car on the Roxborough, Chestnut Hill & Norristown (Pa.) Railway got beyond control on a long grade, the rails being wet and slippery from mist and hail, and jumped the track. The motorman, the conductor and one passenger sustained painful injuries.

Special cars, to be built after the plans furnished by the postal department, will be put in service on the street railway lines in Detroit, which have contracts with the government to carry mail. The mail cars will have a daily mileage of 290, and about \$10,000 will be paid for this service this coming year.

Street railways in Arkansas are exempt from the railroad lien law. In the suit of the Little Rock Traction & Electric Company against R. C. Butler, et al., the act of 1887 making claims for supplies liens upon railroad property was cited. Chancellor T. B. Martin has just handed down a decision holding that the act does not apply to street railways.

## RECENT IMPROVEMENTS AT MEMPHIS.

We are advised by the general manager, F. G. Jones, that during the last year the Memphis Street Railway has done considerable work in the way of increasing and bettering its equipment. Fifteen miles of track have been rebuilt, the light rails being replaced with 80-lb. girders or 75-lb. T's. Sixteen new motor cars and equipments have been added. The power house equipment has been increased by an Allis cross-compound condensing engine direct connected to an 850-k. w. generator. Artesian wells were dug, and the necessary apparatus installed to make the plant a condensing one.

## GERMAN ELECTRIC LOCOMOTIVE.

The Allgemeine Elektrizitaets-Gesellsch..ft. of Berlin, has designed an electric locomotive suited to the conditions of service on the Prussian state railroads. The locomotive weighs 20 tons and has a capacity of drawing a train weighing 120 tons at the rate of 31 miles per hour. It is standard gage, 4 ft. 8½ in., and the wheel base is 8 ft. 2½ in. The wheels are 3 ft. 3½ in. in diameter. Provision has been made for using air brakes if desired. There are two series-wound

GERMAN ELECTRIC LOCOMOTIVE.

motors, each with a maximum capacity of 150 h. p. The gears are single reduction with a ratio of 1 to 3. As may be seen in the cut two bronze rollers are used in place of trolley wheels to permit continual reversal in the direction of motion. Two wires are strung in parallel about 6 in. apart. It is intended to have the rails bonded for a return circuit. Ballast boxes are provided for sand or iron to give additional weight to the locomotive. It would be of interest to compare the details of this locomotive with those of American manufacture which have preceded it.

## WHARTON & CO., CARNEGIE AGENTS.

William Wharton, Jr. & Co., engineers, founders and railroad contractors, Philadelphia, announce to the trade that the Carnegie Steel Company, Limited, has appointed them its general agents for the sale of girder and other special rails for street railways. The Carnegie Company is now preparing rolls for a line of up-to-date sections (including guard rails) 9-in., 7-in. and 6-in. in height, with wide base flanges. These rails will be made of the high carbon, low phosphorus steel now demanded by street railways. Wharton & Co. have increased their facilities, and are prepared to furnish all special work promptly. The Carnegie rails will be used and as the guard sections will exactly

splice with the straight track rails, street railways can secure a complete track (including special work) without a compromise joint in it.

## THE BRILL "PERFECT" TRUCK.

"The Record of the Perfect Truck" is the title of a pamphlet just published by the J. G. Brill Company; it is a brief resumé of the conditions of interurban and suburban service, the advantages of the "perfect" or No. 27 truck for such service, and what the roads using these trucks have to say of them. The truck has already been described in the "Review" and our readers are familiar with it. It will be noted that the letters from the users of the "perfect" truck are so strong that the manufacturer need not go beyond them for the most glowing description. They are as follows:

A. B. Greenburg, president of the Atlantic Highlands, Red Bank & Long Branch Electric Railway: "Knowing that you will be interested in the performance of your No. 27 trucks, furnished with the large cars which we purchased from you several months ago—considering the unusually severe conditions under which they are operated on our Belford division, we are pleased to inform you that they have given perfect satisfaction. On account of the bad condition of the track on this division, we found it practicable to operate only eight-wheeled cars, having your No. 27 trucks. The riding qualities of the trucks are such that between Red Bank and Belford the speed is frequently at the rate of 28 miles per hour, and occasionally a speed of 30 miles per hour is attained."

Herbert A. Clarke, general manager of the Long Island Electric Railway Company: "I have for the past couple of months been connected with the Long Island Electric Railway Company, where there are 10 double truck cars mounted on your No. 27 pivotal trucks. I am pleased to say that in my opinion the riding qualities of the No. 27 trucks are unequalled in any other pattern of truck."

Will Christy, general manager of the Akron, Bedford & Cleveland: "We think it has many points of advantage. The braking apparatus is especially good; it rides easily, and with our speed does not leave the track, although the treads of our wheels have to be narrow, owing to high pavements in the cities."

Charles W. Wason, president of the Cleveland, Painesville & Eastern: "Regarding your No. 27 truck, which you have named 'the perfect passenger truck,' I desire to say that we were quite a while deciding as to which would be the best suited to the requirements of our road. After having investigated most all of the different patterns of pivotal trucks, we went to Buffalo and took a ride on a car equipped with your 'perfect passenger trucks.' The difference in riding qualities was so marked that we decided then to adopt yours as a standard. I am pleased to say that our experience has proved our judgment to be correct, as the No. 27 truck is the easiest riding truck that we have ever had experience with."

B. Mahler, president of the Lorain & Cleveland: "I am pleased to say that on many of the roads in which I am interested we have tried not only your truck, but the trucks of other makers, and have settled upon your No. 27 as our standard. All of the cars of the Lorain & Cleveland Rail-

way Company are equipped with your No. 27 truck, and I am free to say that their operation, thus far, has been very satisfactory."

Burt Van Horn, general manager of the Buffalo & Niagara Falls road: "We are pleased to say that it was on our road that the first test was made of the No. 27 trucks under one of our cars. The difference in the riding qualities was marvelous, and it is not an exaggeration when we say that the people along the line of the road actually waited for the one car mounted on No. 27 trucks. The result was so satisfactory to us that since that time we have changed our entire equipment and are operating only your No. 27 trucks. They have given us the best of service and are the easiest riding trucks that we know of."

Lewis S. Wright, general manager of the Schuylkill Electric Railway Company: "Regarding your No. 27 trucks it gives the writer pleasure to advise you that during the short time we have had these trucks we find that they come fully up to your recommendations. In purchasing these it was with some little hesitance in the face of the fact that we had in service other trucks giving fairly good satisfaction, and which cost less money. However, it is now showing clearly that we have made no mistake, as they ride much more smoothly and quietly than the other trucks."

F. G. Jones, vice-president and general manager of the Citizens' Railway Company, Memphis: "We have had several in operation for nearly a year now, and up to the present time they have given the very best satisfaction and service, and from present indications we can see no reason

why they will not always continue to do so. They are exceedingly easy riding, and hold the rails with wonderful tenacity. On some of our divisions they are operated at a speed of 30 miles an hour, and we have never had one derailed under any conditions."

E. S. Breed, general manager of the Central Railway & Electric Company, New Britain, Conn.: "The No. 27 trucks, which we have in operation, are giving the very best of satisfaction. They run easy and ride smoothly; in fact, more so than any other pivotal truck that I have yet seen on any electric road. They possess advantages in construction, having a wider spring base than any other pivotal truck, and, in addition, have the spring swinging links, which keep the bolsters from coming in contact with the wheel piece when striking a curve at a high speed."

**TOO LOW A FARE IN BROOKLYN.**

It may be remembered that in January, 1897, the Brooklyn Elevated Railroad Company sued the Nassau Electric Railroad Company and the Brooklyn, Bath & West End Railroad Company to prevent the carrying of passengers to Coney Island for a 5-cent fare over the tracks of the two latter roads. The plaintiff secured a judgment for \$15,903.20, which, on appeal, was modified and reduced to \$10,653.20. The case has been carried to the Court of Appeals, the defendant companies agreeing to pay damages at the rate of \$10,000 per year up to the date of the final decision, if that shall be against them.

## BELT DRIVEN GENERATOR FOR STREET RAILWAYS.

Although the direct connected generator has been so universally adopted there is still a field for the belt driven dynamo in street railway power stations where small units only are required. The General Electric Company has recently introduced a line of these machines ranging from 110 to 500 k. w capacity in five sizes, the illustration represents the smallest machine. Already 55 of these generators, aggregating over 10,000 k. w. have been sold.

There are six magnet poles, and the frame is of cast steel heavily ribbed, making it light and compact. Its magnetic efficiency is very high. The steel poles and pole pieces are cast in one piece and so bolted to the frame that they may

taken from the coil to the segment directly beneath it. The ventilation of the commutator is effected by air being drawn through the body and discharged through air ducts in the core. The rotary motion of the armature creates a strong draft through the winding and the air ducts provided between the laminae of the core. The small difference of potential between the commutator segments secures permanent insulation and freedom from sparking.

## CHRISTMAS ON THE CAR.

An illustration of the great truth that people are good-natured at Christmas time was observed on an electric car the other day, says the Washington Times

The car was crowded with passengers who had evidently

GENERAL ELECTRIC 110-K. W. BELT DRIVEN RAILWAY GENERATOR.

easily be removed without disturbing either the armature or the frame. The bearings are built on the ball and socket principle, being self-aligning and self-oiling.

The shunt and series windings are placed side by side, instead of one on top of the other, and are entirely independent; either may be removed without disturbing the other. The strength of the magnetic field is so proportioned to the armature reaction that a constant brush lead and neutral point are assured even with heavy overloads.

The armature is of the barrel wound type, this method giving the smallest number of joints, and facilitating repairs, as few coils need to be removed to reach any particular one incapacitated for service. The cast iron flange, bolted to the armature spider at each end of the core, forms a support as well as a cylindrical receptacle for the projecting ends of the coils, and protects the windings from any oil that may be thrown from the bearings. The projecting ends of the coils in the flange are thoroughly insulated, and are held in place by steel bands. The commutator leads are each

been shopping for Christmas. Among them was a poorly but neatly dressed woman, who carried a basket, in which was a hen, the hen being tied by the legs. The car whizzed rapidly up the street; the hen, apparently quiescent, was reflecting on the joys of Christmas from a gallinaceous point of view, and presently worked her feet free of the fastenings, rose out of the basket and flew down the street. The owner of the hen, in great agitation, implored the conductor to stop the car, and as he good-naturedly did so, in the middle of the block, she descended, leaving her basket, her umbrella and her purse in the seat, and started on a lively chase after the hen, with odds on the hen. The conductor did not know what to do. He did not want to go on, taking the poor woman's property away from her, nor did he want to keep two crowded cars full of people waiting while that hen pursued the way to freedom. He compromised by getting off the car and joining in the chase. Four other men followed his example. The rest of the passengers poked their heads out and watched the hunt with interest. The hen was

finally, by the united efforts of six people, caught and firmly held, and the owner returned to the car with her guard of honor, her triumph, and her hen. Then the conductor breathed a sigh of relief, rang the bell, and the car went on. And nobody swore.

**SERVICE STRIPES AT CINCINNATI.**

The Cincinnati Street Railway Company has adopted service stripes for its employes, the resolution of the board of directors authorizing them being passed at the meeting held December 21. The resolution in full is as follows:

Resolved, That each employe of the Cincinnati Street Railway Company is hereby authorized, commencing January 1, 1898, to wear upon the left arm of his uniform coat, a stripe indicating the number of years of service with the company, in the following manner:

For two years of continuous service, a light blue stripe, 1/2 in. wide, pointing up and around the sleeve, the lower end starting at the cuff

For four years of continuous service, a light blue stripe, 1/2 in. wide, with a narrow scarlet strip on each edge, pointing up and around the sleeve, the lower end starting at the cuff seam.

For five years of continuous service, a gold stripe, 3/8 in. wide, laid on a light blue stripe, 1/2 in. wide.

For 10 years of continuous service, a gold stripe laid on a scarlet stripe.

For 15 years of continuous service, a gold stripe laid on an orange stripe.

Resolved, That the Cincinnati Street Railway Company will, at its own expense, furnish each employe entitled thereto, with one of the above decorations for each period of service named in the foregoing resolution.

Resolved, That the term of service shall begin with the date of employment by any of the following named companies, the Cincinnati Street Railway Company being the successor thereof: Cincinnati Street Railroad Company; Passenger Railroad Company; City Passenger Railroad Company; East & West End Street Railroad Company; Route Nine Street Railway Company; Cincinnati Consolidated Street Railroad Company; Storrs & Sedamsville Street Railroad Company; Cincinnati & Clifton Inclined Plane Railroad Company; Cincinnati & Spring Grove Avenue Street Railway Company; Walnut Hills & Cincinnati Street Passenger Railway Company; Mt. Adams & Eden Park Inclined Plane Railway Company; Mt. Auburn Cable Railway Company."

Immediately after this action the division foremen of the road were directed to take a census of the employes, and the latter were given orders for the work of affixing stripes to uniform coats.

**CONTINGENT FEES IN ILLINOIS.**

In 1896 it was decided in the supreme court of Illinois that it was legal for an attorney to undertake the recovery of damages for clients on a commission basis, providing the client advanced the costs. A decision rendered in December, 1897, holds that while such a contract is not champetrous it is void because against public policy; this leaves the attorney at the mercy of his client who may settle and circumvent the collection of the attorney's fees.

The facts were these: A Mrs. Butler sued the North Chicago Street Railroad for \$50,000 and assigned to her attorney, L. M. Ackley, one-half the right of action as his fee, she to advance money for court costs and actual expenses, however. Afterwards, she settled with the company for \$3750, without the knowledge of her attorney; the company having notice of the contract paid her in full. Ackley then sued the company for his fee, one-half the amount. The decision on the point involved is as follows: "The law does not discourage settlement in cases for personal injuries. Whether a cause of action exists, its nature and amount are always involved in uncertainty, and a defendant has the right to buy his peace. The plaintiff has a right to compromise and avoid the anxiety resulting from a cause pending to which he is a party. Any contract whereby a client is prevented from settling or discontinuing his suit is void, as such agreement would foster and encourage litigation."

### EFFECT OF THE UNION LOOP ON TRAFFIC.

It was confidently predicted that the completion of the Union Loop would have the effect of greatly increasing the traffic on the elevated roads in Chicago, but the results exceed the most sanguine expectations.

The Metropolitan began operations over the loop on October 11. The data as to the number of passengers carried daily since that time are not at hand, but an accurate estimate can be made. During the month of October the total number carried, as shown by the receiver's report, was 1,533,571. During September the total was 1,144,120, or 38,137 per day. Deducting 10 times this for the traffic during the first 10 days of October when the trains did not use the loop, leaves for the remaining 21 days a total of 1,152,798, or 54,866 per day. This is an increase of nearly 44 per cent. For the month of November the total number of passengers was 1,923,684, or 64,103 per day. This is an increase of 68.1 per cent over the September and 16.8 per cent over October traffic. The report giving the traffic for December has not as yet been filed. The equipment of the company has been severely taxed to take care of the business, and the receiver has obtained permission from the court to buy the needed rolling stock. Orders have been placed for 56 motor trucks and 26 cars, both being of the same type as now in use. At the present writing the particular type of motor to be used has not been definitely decided upon.

The South Side Elevated started around the loop just one week later, October 18. The average number of passengers daily from October 1 to 17, inclusive, was 32,327, and for the other 14 days 47,946, an increase of 48.3 per cent. The heaviest increase is during the shopping hours; for the different times of the day the figures are as follows: Midnight to 5 a. m., 30 per cent; 5 to 9 a. m., 46 per cent; 9 a. m. to 3 p. m., 53 per cent; 3 p. m. to 7 p. m., 49 per cent; 7 p. m. to midnight, 41 per cent. During November the daily average was 54,295, which is an increase of 66.7 per cent over that for the first part of October, and 13.2 per cent for the latter part of October. During December the daily average was 56,774, an increase of 4.6 per cent over November.

The Lake Street road has enjoyed the advantages of part of the Loop since October, 1896, when its trains began running down Wabash avenue to Adams street. The completion of the Loop has increased the traffic on this road, but official figures are not at hand.

### THE BOSTON LEASE.

Immediately after the rejection of the first lease negotiated between the West End Street Railway and the Boston Elevated Railway Companies a second proposition was formulated and at once ratified by the stockholders of the two companies. This was approved by the Railroad Commissioners in a special report issued December 15, in which they say:

"The lease now proposed contains important changes in several particulars to which attention was called in the special report on the first petition:

"1. The stipulated dividend rental on the West End common stock is reduced from 8 to 7 per cent per annum.

"2. The term of the lease is shortened from 99 years, to 24 years, 8 months and 9 days, from October 1, 1897, so that the lease shall expire at the same time with the special immunities which are granted to the Boston Elevated Railway Company by statute.

"3. There is inserted in the amended lease a covenant that the lessee 'shall not diminish the facilities for travel upon the lessor's railway, except so far as substantially equal facilities may be furnished in substitution therefor, either by the lessee's elevated railway or otherwise.'

"4. The mandatory provision in the former lease, that 'the lessor shall make and execute such other leases or operating contracts with other street railway companies as the lessee may request,' is stricken out."

The new lease provides that the West End transfers all its property to the Elevated, the latter to pay all operating expenses, repairs, taxes, fixed charges and damage claims, to assume all the contract obligations (except \$10,945,000 of bonds), and to pay the legal expenses and cost of maintaining the organization of the West End, and provide offices, etc., for the transaction of its business. Dividends of 8 per cent on the preferred and 7 per cent on the common stock are guaranteed to the West End stockholders.

The West End road is required to pay for certain improvements to the property, as follows: 1. Abolition of grade crossings. 2. Additional rolling stock and equipment. 3. Additional track mileage and equipment. 4. Additional real estate. 5. Additional stations, power houses, car barns, etc., and equipment. 6. Additional bridges, buildings, etc. 7. In renewals the excess of the cost of the renewal over the cost of the thing renewed.

A board of arbitration is provided to pass upon disputes arising between the parties.

### CHANGING INSULATORS ON A TEN-THOUSAND-VOLT CIRCUIT.

It has been a dangerous operation to replace a bad insulator on a high voltage transmission line without shutting off

the current. Wm. B. Jackson, of Detroit, describes in a letter to J. G. White & Co., his method of solving this problem. As shown in the figure a 30-ft. ladder, adjustable in length, is placed on an insulated platform, 30 in. square. At the upper end is a cross board having a hole in it to fit on the end of the cross bar. The lineman then screws on the cross arm a small hand vise which is of iron with a piece of copper wire soldered to it. This wire is touched to the line wire,

upon which the broken insulator is located, with a 3-ft. stick which has been boiled in paraffine. If everything is all right the wire is wrapped around the line wire. When the grounding wire is on, the lineman changes the insulator with bare hands, and then the grounding wire is disconnected and the clamp removed. It is stated that when the apparatus is dry this operation is quite safe.

### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supply or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that supply. We make no charge for publishing such notices in our DAILY BULLETIN.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8. FEBRUARY 15, 1898. NO. 2

A pessimistic writer in one of our English exchanges, commenting on fenders as used in this country on trolley cars, indulges in the belief "that the fender takes very much after its prototype the cow-catcher, which preserves the train from injury, but not the cow."

On another page is an account of a professional contortionist who sought to eke out his earnings by falling on railroad platforms and dislocating his hip, collecting substantial damages therefor. Being able to do this without serious pain or inconvenience to himself, the scheme offered many advantages. The ingenuity of these people who believe that the world owes them a living, and who generally try to collect it from transportation companies, is astonishing.

President Ripley of the Atchison, Topcka & Santa Fe Railroad has recently written two open letters in reply to attacks made upon railroads in general, and upon his road and his management of it in particular, by John Davis, who formerly represented a Kansas district in Congress. A brief abstract of the reasons why Mr. Ripley does not agree with Mr. Davis as to the desirability of the government ownership and operation of railroads appears on another page and will be found quite interesting. While similar legal questions might arise were a municipality to attempt to acquire the street railways within its borders, and questions of juris-

diction with regard to the operation of suburban and inter-urban lines, the political control of a business that requires the best of management, and the fact that former experiments show that the public is not a successful competitor with private companies in enterprises of this nature, are the points deserving consideration.

Furious storms of snow and sleet driven by high winds visited the central states on January 22 and 23 and again a week later, and the Atlantic coast states on January 31. The snow was damp and was packed by the force of the winds, rendering it in many cities impossible to remove with plows and sweepers. Notwithstanding the magnitude of the difficulties, the promptness with which the roads in all parts of the country opened their lines and resumed service was highly creditable to managers and employes.

And now the motorwoman. For years the street cars in many of the South American cities have had none but young women for conductors, and the plan has given satisfaction to the company and the public. It has remained to a New York state road to graduate the first full-fledged and duly credentialed motorwoman. From all accounts there seems no question but that the candidate for the head end of the car in this case has demonstrated her ability, both physically and mentally, to perform the duties of that position with safety and satisfaction.

The New York dailies, which have repeatedly had the underground road, known as the "Rapid Transit," all built on paper, now come out with the announcement that the scheme is dead. It is hard to understand how it can be so dead when it was never much alive, although the "Review" has held several post-mortems on the corpse during the past few years. In our opinion the solution of the problem will be the rebuilding of the present elevated roads to a double-decked structure, with two express tracks, and all four operated electrically.

When private corporations combine or consolidate their interests and operations, they uniformly decrease the expenses of operation. When cities consolidate, the reverse is the result. In the expense budget of Greater New York, which is found to be 25 million dollars in excess of the expenses of the individual municipalities prior to consolidation, we have a convincing proof, although none is needed, of the fact that cities cannot do business as economically as private corporations. When our great cities have demonstrated their ability to properly conduct the various business operations they already have in hand, it will be ample time to consider the increase of their powers by further municipal ownership and operation, and not until then.

"No seat, no fare," is a text upon which has been hung a great deal of abuse of street railway companies. The experience of all roads is that it is impossible to furnish seats to all who wish to ride at certain hours of the day, for the reason that the passengers insist upon taking the first car in or on which they can possibly find places, and will not wait for one that offers more room. Many of the personal injury claims arise because of over-crowding on the part of the passengers in spite of all that the company's employes can

do to prevent it, and in the past year we have published accounts of several such. Were the American public endowed with the patience of some other peoples the difficulty might very easily be arranged.

And now Mr. Pingree, of potato fame, has launched out in a tirade against street railway mail service, and emphasizes his ignorance of the progress of the age by claiming a carrier on foot makes quicker time; says none but the companies want it or can see any good in it. What Pingree says is usually undeserving of notice. The Postmaster-General has highly endorsed the service; so have the postmasters in the cities where it is in operation; so have the business men and citizens. Since the street car postal service has been introduced in Chicago it is possible, and a daily occurrence, to send a letter from one part of the city to another and get an answer the same day, which before was never accomplished in less than 36 hours, without the use of a special delivery stamp.

As a matter of fact, all but Pingree, and some of the companies which are hauling the postal cars at a loss, recognize in it one of the greatest of recent improvements in the urban postal system.

A western road some time ago secured an extension of its franchise for 50 years. The grant was secured in a perfectly open and above-board manner, and it was understood the extension made possible the floating of a large block of bonds, the proceeds of which were to be used in improving and extending the city lines—something the public heartily approved of. The president took his bonds and crossed the water to deliver them to purchasers who had agreed to take them only on the basis of a 50-year franchise, as the city is yet a comparatively small one, and it could not be expected the new investment would yield much return for the first few years. Before he could reach his destination some narrow-minded, short-sighted "reformers" entered suit to annul the extension of the franchise, the news of which traveling on the wires preceded the official to his destination. The result was a failure to deliver the securities, and he returned empty-handed. The people in that town are likely to be somewhat older and, it is hoped, wiser, by the time they get the much-needed improvements.

At the present time the most important problem confronting the owners and managers of interurban roads is that of insuring safety in operation. The number of collisions on such roads has increased with alarming rapidity, and during the past year some of the accidents have resulted in the loss of life. The correspondence which we have had with the managers of a number of these lines, portions of which are to be found in our issue of last month and in the present one, show that all have given the matter their earnest attention. There is agreement as to the best method of insuring safety, that is, to double-track the road throughout; but only in very exceptional instances is the traffic of sufficient magnitude to justify the expense. The double track being an impossibility for most of the roads, they have adopted signal systems whereby the line is divided into blocks, or else attempt to insure that only one car shall be on any section of the line by running according to a carefully prepared time table, with strong rules against leaving meeting points ahead of time or before the location of the car which it is

expected to pass is known. In the majority of cases a telephone dispatching system is found desirable, if not absolutely necessary, in order that cars may communicate with each other and with the office in event of delays. Some companies, while appreciating the advantages of proper signals, are deterred from installing them because the utmost economy is necessary to keep the road going at all; we think it safe to say that in all instances saving on safety appliances is false economy, for a single accident with its attendant damage suits will, as a rule, cost the road more than a good signal system.

The overhead trolley has been accepted in Great Britain; the fact is evidenced by the table of the electric tramways of the United Kingdom published in another column. Save where special conditions permit the third rail, all the electric roads in operation use the overhead trolley, except one storage battery road and one conduit road, which latter is even now being changed to an overhead trolley line. Further, all the roads now under construction will use the overhead wires. We have heard the opinion advanced by those familiar with the conditions abroad, that the application of electricity to street railway operation in Great Britain would be very slow because of the deep-seated objections to the overhead wires in the streets, although it was acknowledged that the overhead system offered the greatest advantages. The amount of the work under construction, over twice the mileage that is in operation, shows how rapid an increase may be confidently expected, now that the prejudice against the system has begun to disappear.

The long and bitter struggle in England between the employers and the Amalgamated Society of Engineers, as the organization of machinists is called, which began on July 12, 1897, is now at an end, and apparently the victory of the employers is complete. The dispute nominally had its origin in a demand by the men for a 48-hour week, which was promptly followed by posting lock-out notices by the employers, who thus met the threatened strikes more than half way. In fact, it was a fight for freedom from unwarranted interference with the management of their business by the trades unions, which by the "one man to one machine" rule, by restricting the output of the men, and thus establishing the principle of "a minimum of work for a maximum of pay," had brought the manufactures of Great Britain to a deplorable condition.

On January 21 the beginning of the end came in the shape of a notice that the demand for a 48-hour week was withdrawn. Thus the employers have won the nominal issue, and, since the strikers yielded only because they could fight no longer, the victors are in a position to win on the real issues as well. It is to be hoped that the employers will remember the dire results which in the past have followed concessions to the tyranny of trades unionism and will not permit sympathy for a fallen foe to lead to similar concessions now, which can only result in a renewal of the fight at some future time.

It is estimated that the strike, which has affected directly or indirectly over 200,000 persons, has caused a loss to the nation of \$75,000,000, as estimated by the English Labor Department. Of this, \$15,000,000 is represented by direct loss in wages and in money paid out by trades unions in supporting the strike.

## THE GOVERNMENT GOES INTO THE ADVERTISING BUSINESS

The industrial press of the country is with one voice protesting against the placing of advertisements in the public documents issued by the Department of State for the Bureau of American Republics. This monthly bulletin, issued in the joint industrial interests of this country and the South American republics, is in itself a praiseworthy enterprise, and undoubtedly capable of much good. When the annual appropriation of \$36,000 fell short of the bureau expenses, then it was the late J. P. Smith came to the bureau with a scheme to pull it out of the hole, and incidentally to pay himself the \$6,000 a year salary. His proposition was a comparatively easy one to work, for he proceeded to open an office in New York, from which vantage ground he solicited advertising from possible exporters of all kinds of merchandise, the said advertising to be inserted in the official publication of the Department. We do not deny that the medium may not be a desirable and valuable one to advertisers—so would an advertisement on all other of the Government documents be good advertising; but we do most emphatically protest against the injustice to every publisher in the land, of printing this monthly paper free on the Governmental presses, transmitting free in the domestic and foreign mails, and using the Government frank under which to send circulars and correspondence both ways, in soliciting these advertisements.

Is it any wonder that with the hundreds of tons of seeds, public documents, furniture, and now this advertising medium, with which the postal service is burdened, that there should be a big deficit annually?

It is a well known question of ethics among publishers, that high class publications absolutely refuse to accept and print certain advertisements. Such advertisers would be only too glad to avail themselves of the endorsement which the printing of their announcement in such papers would give. Hence an advertisement in a public document, bearing the imprint of the Government printing office, must inevitably carry with it a certain stamp of approval of the Government. What publisher in what land can hope to compete with the endorsement of his Government?

Why not carry the argument out to its ultimate possibilities? Fill the Congressional Record with announcements of pills, plasters and face powders (we cannot deny it would sometimes be an improvement on the matter generally appearing there), cover our postoffices, custom houses and mints with big many-colored signs proclaiming the merits of various cure-alls; put a border on the silver certificates in which the holder may learn where to get false teeth for three dollars a set, and testimonials of delighted sufferers from corns. Let our brass cannon carry a banner, "I was polished with Pasolio," and so on to the weary end. There is probably as much money spent in advertising each year as it ought to cost to run the Government in times of peace; why not let the country pay its expenses in this way and do away with taxes altogether?

We do maintain it is contrary to the spirit of our free institutions for United States Government to use its various departments, maintained at the general expense, to enter into competition with the investment of private capital in kindred enterprises. Were this an insufficient argument, we consider it beneath the dignity of the Government to go

into the publication business, charging for its publications and advertisements therein.

It opens the door to the admission of very grave evils.

## PRESIDENT HIGGINS ON THE STREET RAILWAY INDUSTRY.

At the sixth annual convention of the Northwestern Electrical Association, President H. C. Higgins, who is president and general manager of the Marinette (Wis.) Gas, Electric Light & Street Railway Company, in his opening address spoke of street railways as follows:

The street railway business has, I think, suffered more within the past two years than any other legitimate business. Not only has the hard times worked against them, but the bicycles have taken a large percentage of their business. It is gratifying, however, to street car men to know that the expenses of operating as well as those of original purchase have been very much reduced. The reduced receipts have had much to do with the reduction in operating expenses, so that perhaps after all the reduced receipts have been a blessing in disguise, although the reduced receipts have not been the whole cause of our reducing expenses, for when we first went into the electric street railway business it was all an experiment from start to finish. Everything was new to everybody, and we who have had the putting of these appliances into actual operation and have had to furnish the capital to test and bring to successful operation the different electric street railway appliances which are now running so successfully, have, I think, had as hard a task on our hands as the gifted geniuses who invented and put together the many appliances which were sold to us as the best in the market, and sold to us, as you know, at enormous prices, and even at these prices we found them defective in many ways, and we had to improve them as best we could and do the best we could with them.

We all went into the electric street railway business with the greatest hopes of financial success. It was a very attractive business. The man who was running a horse car or a mule car line would go to a town where they were running the new electric street railway; he would see the beautiful cars, with every seat occupied by a passenger, gliding over the track without any apparent effort and at a more rapid rate than he had ever hoped to accomplish on his line, a uniformed conductor on one end, a uniformed motor-man on the other, with everything bright and shiny—a beautiful sight to him—and frequently he did not go home until he first visited the office of John I. Beggs or B. E. Sunny, whose bright, smiling countenance was only a continuation of the bright things he had seen in the electrical equipment at the last town at which he had visited, and got prices from each of these gentlemen for electrically equipping his road at once. He went home, consulted his board of directors the first day, explained what he had seen and some of the things he had felt, and that night sent a night message accepting the proposition of one of the two contestants before mentioned. We all thought in those days that about all that was necessary was to secure a favorable franchise and the electrical companies would do the rest, but I know of no writing that so fittingly applies to the case as a verse in one of Moore's poems, which reads:

I saw from the beach where the morning was shining

A bark o'er the waters ride gracefully on;

And I saw from that beach when the eve was declining,

The bark was still there but the waters were gone.

The nickels which we had expected to have supported our enterprise had, like the waters, gone and left our bark, the street railway, stranded.

It is not to be wondered at that after these five or six years of experiments in the business, and with approved appliances, more efficient help, etc., we can reduce the operating expenses. Every appliance in the business has been an improvement on the first, and we have all contributed something towards this result, until the business has now become one of comparative pleasure to that which it was in its early history when we were trying to operate an electric road on a horse car track with inexperienced help, who, notwithstanding their incompetency, were high-priced and indifferent, for if they were not retained by you they were pretty sure of a job at the next town having a similar business. Our rail bonds were continually breaking, our track continually spreading and letting our cars drop to the ground, and no matter how well it was cared for the track was a constant annoyance. Our commuters were niggling and our motors short-circuiting, and on our very busy day these things seemed to combine to do their worst, or rather their best, to make us miserable. Our days were restless and our nights sleepless, but by patience and persistence we have become masters of the situation, and I think if the writer was alive to-day who wrote the sentence, "He who makes two blades of grass grow where but one grew before is a benefactor," he would add, and he who carries two passengers where but one was carried before is also a benefactor.

As I have been through the poor track and poor car business, and as one of the pioneers in the street railroad park business, I feel that it is not egotism to say that I am competent to give some advice to my fellow sufferers in that line. Do not use less than a 60-lb. steel T-rail; use good sound ties not less than 6 in. wide, lay them 2 ft. centers, and still closer is better; bond with not less than No. 0 bonds; use nothing less than No. 0 trolley wire; buy nothing larger than 16 to 20-ft. cars for general use, and you cannot make much of a mistake by buying the latest type of generators and car equipments from any of the leading companies making and selling such appliances. Do not, however, lay any extra line in order to establish a park, unless you can establish it on the edge of a body of water and have a town of not less than 30,000 people to draw from. Do not lay out much money on animals for your park. Do not run vaudeville or other shows unless you are so situated that their transportation will cost you but little. I believe that street railway parks should be well enclosed and no one admitted unless he pays car fare each way, no matter whether he comes by carriage or bicycle. I do not believe that any town of less than 25,000 people will support an electric street railway and give a decent return to its investors; although two towns aggregating a little less than that population and being some distance apart might be good paying properties, yet local conditions would have very much to do with this. I have known of towns of this size and seemingly about the proper distance apart, and without a cent of interest to pay and light taxes, almost no insurance and lying in the heart of a good coal district

where they got their coal for almost the hauling, and although the road appeared to be well managed still it went into the hands of the receiver for sheer lack of patronage and is still in his hands, and the Lord only knows when it will get out of his hands.

And now in my closing remarks in relation to electric street railroading, while congratulating ourselves upon the pleasant side of the business, I would ask how long the restless brain or the genius of the nineteenth century, or even the twentieth century, coming and already on our threshold, will let us alone. How long will it be before they will have something better to offer us for transporting passengers than an electric street railway? We are already threatened with the airship and the horseless carriage. What will be accomplished in this line is mere guesswork. Let us hope, however, that at least we who are in the business today will get a much needed rest from any further experiments.

---

#### EXECUTIVE COMMITTEE MEETING OF ILLINOIS ASSOCIATION.

---

The executive committee of the Illinois Street Railway Association met at the Leland Hotel, Springfield, on January 25, 1898; President Patterson was in the chair and all the members except Mr. Barker, of Peoria, were present. The meeting was called to consider a communication from Charles L. Bonney, vice-president and counsel of the Chicago General Railway, concerning the legal relations of street railways to municipalities in Illinois, and the draft of a bill to be submitted at the next meeting of the legislature whereby the contracts between the companies and the cities will be made to conform to the contracts already existing between the companies and the state, that is, of 99 years duration.

The secretary was instructed to notify all members that the matter would be discussed at the annual meeting of the Association on May 18, and Mr. Bonney was requested to prepare a paper to be read at that time. Mr. Bonney was appointed attorney for the Association until the next meeting. It was decided to have papers on the following subjects: "The Operation of Street Railways in Small Cities"; "The System of Collecting Fares and Checking Employes"; "The Relations of Street Railways and Municipal Corporations."

President Patterson, W. F. Brennan, of Chicago, and C. K. Minary, of Springfield, were appointed a committee on arrangements for the May meeting.

---

The Metropolitan, New York, is defending a suit against it brought by Inez Carusi, in which the damages are laid at \$75,000. Miss Carusi was a harp-player, whose thumb and index finger were so injured in a street car accident as to prevent her following her profession.

---

A collision occurred on the Milwaukee, Racine & Kenosha Electric Railway between a special car carrying the directors of the company, who were inspecting the road, and one of the regular cars. The ends of the cars were wrecked and one of the motormen had both legs broken. The heavy fog prevailing at the time is given as the cause of the accident.

## TEST OF THE CHICAGO STORAGE BATTERY ROAD.

The carefully conducted test of the plant of the Chicago Electric Traction Company furnishes the most valuable data at present obtainable regarding the application of the storage battery to street railway service. The vital question of the cost of battery maintenance is still an open one, yet the batteries tested have shown a better record than any of their predecessors. The results of the tests make a good average showing, just about what might be expected from a trolley road operating under the same conditions.

It may be well to preface the test with a sketch of the history of the company and a description of the equipment. The conception of the road was for the purpose of booming real estate in the southwestern portion of the city. The company was chartered early in 1894 with a capital stock of \$2,500,000, and almost from the beginning it has labored under financial difficulties. In 1895 a majority of the bonds were placed with parties interested in the manufacture of storage batteries with the understanding that battery cars should be run. The company owned six franchises covering 36 miles of streets, but nearly all the tributary territory is very sparsely settled. In a short time the company became insolvent, and in January, 1896, G. Herbert Condict was appointed receiver. Under foreclosure proceedings the road was sold at public auction October 12, 1897, to J. S. Bache for \$260,000. E. R. Gilbert was appointed general manager of the company. Some idea of the traffic of the road is given by a statement of the receipts and expenditures in the receiver's report:

	Passengers and Miscellaneous.	Operating Expenses.
January to June.....	\$4,972	\$9,188
June .....	2,482	3,224
July .....	6,045	4,609
August .....	7,045	6,048
September .....	6,347	6,584
October 1 to 12.....	2,254	2,880

The main line extends from the northern terminus at South Park avenue and 63rd street, the intersection with the Alley L, south to Englewood, Washington Heights and Blue Island, and a branch runs from Morgan avenue west through Morgan Park. The line passes several summer resorts and three cemeteries; a large summer traffic results from the former, and for the latter a car, specially designed for funerals, is in operation. On the Morgan Park line a grade of 9.3 per cent is encountered for a distance of 371 ft. on Prospect avenue. This gradient was insurmountable for a car equipped with one 50-h. p. motor geared to one axle only. A counter weight system was installed which is almost a duplicate of the one in Providence, R. I., designed by M. H. Bronsdon and J. P. F. Kuhlman, and described in the "Review," April, 1896. There are 23 miles of track now laid, of which 19 miles are double.

After the decision to use storage batteries was reached B. J. Arnold and J. H. Vail were employed as engineers to plan the entire system. All the designs follow the most approved lines of engineering practice, and no pains were spared to make it a model of its kind. From the boilers to the batteries everything was designed with a view to economy and convenience. Perhaps this is the first time that the storage battery has been given an honest and prolonged trial in this country, and if it is capable of successful operation in street railway service it should be demonstrated in this system.

The track, which was constructed by C. E. Loss & Co.,

is the very best, for this was essential to long life for the battery plates. Johnson 7-in. girder rails, weighing 80 lbs. and resting on tie plates, are joined by 6-bolt fish plates with tie rods at every joint. Oak ties, 8 ft. long, are spaced 2 ft. between centers and rest on 6 in. of gravel ballast. The construction, with the absence of trolley wires and rail bonds, appears as though it were intended for steam traffic.

The power station is worthy of note, for it is certainly different in many respects from any other railway station. It is not necessary to locate the power house at the "center of gravity" of the system to get the most economical current distribution, so a site was selected at 88th street and Vincennes avenue, convenient to the Rock Island railroad, and where land is cheap and transportation for fuel good. A view of the building is shown in Fig. 1. Car tracks run through the loggia, and above this are the offices, locker room, shower baths, toilet rooms and waiting rooms for the employes.

Fig. 2 is from a photograph of one of the engines direct connected to two of the generators, with the switchboard in

FIG. 1.—CAR BARN AND STATION.

the background. Unlike street railway stations in general, the dynamos are not all of the same voltage, for it is necessary to have three circuits of different potential to charge the batteries properly. Four 6-pole, 190-k. w., shunt wound Walker generators, with a variable voltage between 160 and 190, were installed. This is the ultimate dynamo capacity of the station, the fourth machine being held in reserve. The dynamos are direct connected to two 250-h. p. Willans engines, the kind so generally used in the electric power stations of Great Britain. These two engines are at either end of the room, and a third one, of 500-h. p., will be put in the center. To give the most flexible arrangement the Arnold system of power station construction was adopted. A solid shaft with couplings extends from one engine to the other. The armatures of the generators are fixed to quills which are free to rotate about the solid shaft. This makes a very complete and compact engine-generator installation, a 1,000-h. p. plant occupying a floor space only 12 ft. x 56 ft. Each engine has two sets of cylinders, the cranks being opposite to one another. The steam, enter-

ing the high pressure cylinder, from the steam chest, expands through the hollow piston rod into the receiver space below, ready to act on the following piston. An air cushion takes up the momentum of the moving parts and permits a speed of 380 r. p. m. without excessive noise or vibration. The speed is regulated by a throttle valve in the steam pipe controlled by a centrifugal shaft governor.

Just to the rear of the power units is the white marble switchboard, consisting of five panels, one for each generator and the fifth for the motor switches. There are four bus bars, the three lower ones being for the high, medium and low voltages and the top one the common negative bar.

FIG. 2.—ENGINE-GENERATOR UNIT.

Each panel has two switches, one for the negative lead of the generator after it has passed through a recording ammeter and circuit breaker, and the other switch can be turned through a semi-circle making connection with any of the three positive bus bars. Weston illuminated dial ammeter and voltmeter and a resistance box for controlling the voltage are attached to each generator panel. From the motor panel the circuits are controlled which run to the two battery transfer cars, the car transfer tables in the basement, to the cooling tower motor and the other motors in the building. By means of the circular switch in the center of the motor panel the motor bus bars can be connected to any of the three positive bus bars, or the motors can be operated from the car batteries when the generators are not running. The engine room presents a very attractive appearance, being finished with white marble floors and wainscoting, and visitors' gallery.

The passageway to the boiler room is behind the engines and by the condensers in the basement. There are three 200-h. p. Heine water tube boilers, with room for three more. Coal is delivered on a side track back of the boiler room, where it is intended to have the fuel transferred direct from the cars to the iron platform in front of the boilers about 7 ft. above the floor. From here it is shoveled into the hoppers of the Roney stokers.

The smoke stack, which is located about 30 ft. outside the building, is constructed of steel, is self supporting, 7 ft. in diameter and 150 ft. high. It rests on a brick foundation raising it 22 ft. above the ground. Connection to the

boilers is made through an iron flue back and above them and through a brick flue entering the brick base of the stack. A Green fuel economizer, having 192 tubes, is in the brick flue; a by-pass is also provided for service when the economizer is not in use. Adjoining the stack is a Worthington cooling tower, 12 ft. in diameter and 30 ft. high, Fig. 3. The condenser pump delivers the condensed steam and heated injection water to the top of the tower, and here, by means of revolving pipes turned by the pressure of the escaping water, it is sent in sprays over the tops of sewer tile set on end in tiers. During warm weather a large fan, driven by a Siemens-Halske motor, cools the water by evaporation, so that when it collects in the condenser well its temperature is about 80° F. The feed-water pipe taps into the condenser discharge before the pipe reaches the tower.

The supply of feed-water comes from an artesian well and from the city mains, but by the arrangement of the jet condensers and the cooling tower the amount taken is only sufficient to make up for the waste due to evaporation. The water can be taken through a heater which receives the exhaust from the auxiliary pumps and through the economizer into the boiler, or either of the heaters can be cut out if necessary. The economizer not only heats up the water to the boiling point, but also acts as a reservoir with a supply of hot water which increases the duty of the boilers. The steam is supplied to each engine through a 6-in. pipe having a copper expansion bend, and the engine exhaust is conducted to jet condensers.

The most unique and interesting features of the plant are to be found in the battery room, which is in the basement under the car barn. The car battery consists of 72 cells arranged in 12 rows of six each. These cells each have nine plates 7 3/4 in. wide and 14 3/8 in. long, five of which

FIG. 3.—COOLING TOWER AND ECONOMIZER.

are negative of the "Chloride" type and four positive of the "Tudor" or "Manchester" type. The positive plates are 5-16 in. and the negative 1-4 in. thick. Each cell, including plates, electrolyte and hard rubber jar, weighs 100 lbs., making the total weight for a tray 7,800 lbs. The plates are connected by electrically welded lead strips in four groups of 18 cells, each group being joined by flexible

cables to two large brass plates on the sides of the trays. A loose fitting rubber crate over the top of the batteries prevents the electrolyte from splashing out of the jars.

By means of the three separate generator circuits the batteries can be charged at three different potentials as the counter electromotive force in the battery rises. The discharged battery is first connected to the 160-volt main with a current of 150 amperes flowing. The current decreases as the counter electromotive force increases, and when the current diminishes to 30 amperes the battery is switched into the 172-volt circuit. The current jumps to 150 amperes and diminishes again, and then the terminals are transferred

tomary time is a little over a minute. The carriage with battery is shown in Fig. 5. The carriage then carries the discharged battery to an empty charging table, where it is rolled from the elevator and makes electrical connection with the charging circuit. The battery room, although well ventilated, is filled with the fumes of sulphuric acid. This disagreeable condition could probably be obviated by having hoods over the charging batteries and the fumes conveyed to the stack.

The general arrangement and dimensions of the car barn may be seen from Fig. 6. There is provision at present for 28 cars, but it will be extended eventually to accommodate

FIG. 4.—BATTERIES ON CHARGING TABLES.

FIG. 5.—CARRIAGE WITH BATTERY.

to the 176-volt circuit. This operation can be accomplished in about 40 minutes, although a slightly better battery efficiency is shown when the time is longer. The battery charging tables are shown in Fig. 4.

After the batteries are charged the next important step is to get them in the cars expeditiously, and this is accomplished by a traveling carriage which runs along the track in the alley alongside the battery tables. On either end of the carriage is an elevator with rolls on top which are operated by bevel gears. Similar rolls are on the charging tables, which can be coupled to the elevator rolls and the trays automatically shifted. In the middle of the carriage is the operator's platform, with a controller for each of the motors, two of which are for the rolls, one for each elevator and one to run the carriage along the track.

When a discharged battery on a car is to be replaced a charged one is rolled upon one of the elevators and the carriage is run to a position where the vacant elevator is directly beneath the track in the loggia. The car, at the end of each round trip, runs into the correct position, which is determined by the vertical position of a lever the conductor lifts so that the front bumper of the car just touches it. The vacant elevator of the carriage is raised and the discharged battery released from the car by pulling a lever. When it is lowered the carriage is advanced so that the charged battery is beneath the car truck. The battery is elevated, the hooks automatically engaging the cross bars and the brass plates on the sides of the trays making a sliding electrical connection with the spring clips on the car trucks which are the terminals of the controller cables. The entire operation can be performed in 50 seconds, although the cus-

50 cars. The transfer table, operated by an electric motor, runs on a track down the center of the barn. No special tools or preparations have been made for repairs. Besides the regular equipment of cars a 3,500-gal. sprinkler is provided for summer and a snow plow for winter.

The motor cars are mounted on Dupont trucks, made by the Johnson Company. Each truck has two bars running across the frame and engaging hooks formed by bending over four 5-in. channel irons, which pass under the tray. A 50-h. p. Walker motor is suspended on the outside of the car axle. The controllers, made by the Walker Company,

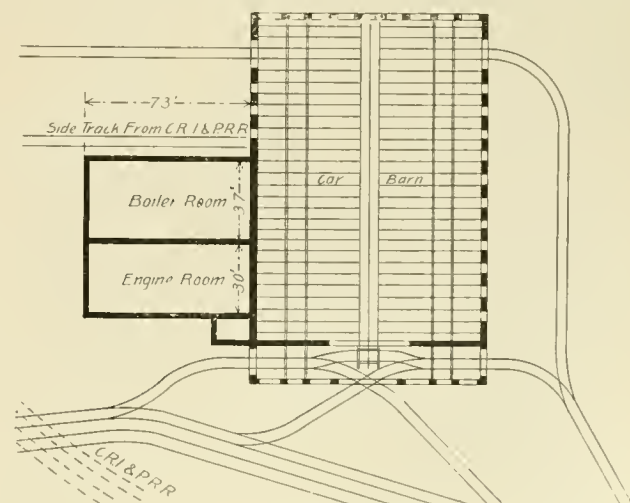

FIG. 6.—PLAN OF BUILDING.

had to be of special design for the service, as the low voltage necessitated large currents. There are five points: the first combines four sets of batteries in parallel, giving 36 volts; the second gives 72 volts with the cells in series-parallel; the third puts the batteries in series with resistance; the fourth cuts out the resistance but leaves the batteries in series, and the fifth shunts the motor field with the batteries in series.

During the summer of 1897 over 20 motor cars were operated, often with trailers, and when the winter schedule of nine cars was instituted Mr. Condict, then general manager of the road, decided to make a complete test of the road and power house to determine the most economical methods of operation. Under the direction of George A. Damon, who was assisted by Professor Gaylord and a corps of students from the Armour Institute, three complete tests were conducted under actual operating conditions. The following is an abstract of the report of the tests for which we are under obligations to Mr. Condict. We are also indebted to Mr. Damon for courtesies extended.

### TEST OF POWER PLANT.

The equipment of the power house has already been described. In preparing for the tests all proper precautions were taken to secure accurate data. The apparatus used was carefully calibrated. The water was measured by means of three tanks just before it entered the feed pumps. The steam used by the stoker engine, by the economizer engine, by the calorimeters, by the feed pump and by the air pump was condensed and carefully measured. The blow-off from the boilers and other unused piping was opened up to guard against the water escaping through unknown leaks. All water not accounted for by the auxiliaries was charged against the engines, with the exception of a liberal allowance for leakage in the live-steam line.

The first test was with the plant running with two boilers, two engines and three generators. The second test was with practically the same load carried by one boiler, one engine and two generators, while the last test was made under practically the same conditions as the second test, with the exception that the three-voltage method of charging the batteries was abandoned. In this test but one generator was used and the batteries were charged in successive sets, all at a common potential, the voltage being raised as the batteries became charged in such a way that the load upon the generator was kept nearly constant.

The coal used was from Fairmount, W. Va., and cost, delivered at the power house, \$1.90 per ton. An average of five determinations of its calorific value by the Berthier method gave 10,145 British thermal units per pound. The average of six analyses gives the following result:

Moisture . . . . .	6.326 per cent.
Volatiles and combustibles . . . . .	32.903 "
Fixed carbon . . . . .	48.126 "
Sulphur . . . . .	2.700 "
Ash . . . . .	10.030 "

*Card No. 7—Taken 3:15 p. m. on November 26, 1897.*

11:45	22	237.88	190.3	80.
Average indicated horse power, 217.				
Average electrical horse power, 172.				
Average all-day efficiency, 79.3 per cent.				

A typical graphical log of the boiler tests is shown by Fig. 7, which gives a comprehensive record of the data obtained on the last test made November 26, 1897, while the data obtained on the engines and generator during the same time are plotted in Fig. 8. These logs, taken in connection with the table of results, give a complete record of the power-house performance on that day.

The coal had a theoretical evaporative power of 10.5 lbs. of water from and at 212° F., and actually evaporated 6.6 lbs., giving for the efficiency of the furnace and boiler 62.86 per cent. This low efficiency is to be expected because of the boiler being 26 per cent underloaded. The equivalent evaporation per lb. of combustible was 8.22, so that the efficiency of the boiler alone is 78.3 per cent. The boiler then loses by radiation, convection, and through escaping gases 21.7 per cent of the original heat units, while the furnace is to be charged with 15.44 per cent of the lost heat, and 62.86 per cent appears in the steam.

The economizer did not give satisfactory results on the test shown. This is not the fault of the economizer, however, but is due rather to the unfavorable conditions under which it was installed and is operated. Several large cracks in the brickwork flue leading from the uptakes of the boilers to the economizer on the outside of the power house allow air to infiltrate to such an extent that the flue gases are cooled fully 100° before reaching the economizer. In spite of this fact, however, the economizer upon some of the other tests effected an economy of 7 per cent, as figured from the gain in temperature of the feed-water. A graphical log of the boiler test made November 5 is shown in Fig. 9, which indicates a rise of 75.7° F. in the feed-water due to the action of the economizer. This log also shows the amount of coal required for banking the fires over night. Upon this test, however, a larger amount of coal was burned in the boilers, and thus a greater amount of flue gases passed about the economizer pipes. During the latter part of the test on November 26, the economizer was cut out of service.

The pumps used 14.36 per cent of the water evaporated by the boilers. The feed-water, however, was heated by the pump exhaust from a temperature of 97.4° F. to a temperature of 202° F., resulting in a gain of 9.25 per cent. The fuel, then, to be charged against the pumps is only 14.36 per cent, less 9.25 per cent, or 5.11 per cent of the total fuel burned.

The test shows that the engines used 18 lbs. of steam per indicated horse-power. The conditions of the test were not favorable to either an accurate engine test or to the most economical operation of the engines. The steam pressure was lower than it should have been, while the vacuum was but 24.25 in. The engines were also overloaded during the entire run, and were operated at 363 instead of 380 r. p. m. The difference in the power developed by the two lines of cylinders is due to an improper adjustment of the cut-off on the north line. With a few changes there is no doubt but that a material improvement can be made in the duty of the engines.

The indicator cards taken with one engine operating one generator, running on open circuit, show a friction load of 32.26 i. h. p. This is but 14.86 per cent of the average, and is a very satisfactory figure.

The average efficiency between the horse power developed in the cylinders and the electrical power delivered on the switchboard is shown to be 79.27 per cent, which is also satisfactory.

The commercial efficiency of the generator (including the leads to the switchboard) at this load is 79.27÷85.14, or 93.1 per cent, which is all that can be expected of a generator running 32 per cent below its rated capacity.

The total station efficiency from coal pile to switchboard is 5.58 per cent. It may be of interest to compare this result with some other modern station. The Chicago Edison Company in its Harrison street station, produces electrical energy for .3 of a cent per kilowatt-hour burning coal containing 13,000 British thermal units per pound, and costing delivered \$1.05 per ton. The efficiency of that

station, therefore, is  $(1.05 \times 1,000 \times 3.43 \times 100) \div (.003 \times 2,000 \times 13,000)$ , or 4.61 per cent. This indicates that the net efficiency of the plant tested is 20 per cent better than that of the Edison station. The Edison station has an output of over 3,000 h. p., while the Englewood station has a maximum capacity of 500 h. p., which makes the comparison more striking.

The cost of fuel for a net kilowatt-hour on the switchboard is shown to be .611 cent. This high price is to be explained, then, not by the inefficiency of the station, but by the fact that a high price is paid for a poor coal. With a more advantageous arrangement in the purchase of coal there is no reason why this station should not develop a kilowatt-hour for less than .3 cent.

### DATA ON BATTERIES OBTAINED AT TIME OF POWER-HOUSE TESTS.

Two complete power-house tests made on November 5 and November 26, 1897, showed the amount of coal required to deliver a kilowatt-hour upon the switchboard. At the same time a complete log of the operation of the battery-charging pit was kept, which shows the history of each battery for the entire time of the test. In the test made November 5 the batteries were charged by the "three-voltage" method, but on November 26 the station was operated with one generator, and but one voltage was used to charge the batteries. During the latter part of this test the tracks became covered with ice, due to a sleet-storm, and it became necessary to change the batteries every half trip, which will account for the shorter time of charging indicated upon the latter part of the power-station log of the test, and also the smaller average number of miles per trip shown November 26. The data obtained at the charging tables were checked up with the conductors' reports. These reports show the number of the car, the time occupied by each trip, the length of the run, and the number of the battery used. The following table shows a summary of this information for the two days. This table shows the bat-

tery mileage for each day from the time of starting the road in the morning until the last trip at night.

TABLE OF BATTERY MILEAGE

No. of Battery.	November 5th.		November 26th.	
	No. of Trips.	Miles Run.	No. of Trips.	Miles Run.
1	2	33.0	...	...

44	4	80.2	3	34.2
Average miles each trip....		1,821.8	123	1,668.4
		16.56		13.56

This table shows the actual number of miles which the batteries ran the cars on the two days. In addition to this, batteries were used to operate the auxiliary motors of the plant. These motors are upon the transfer carriage used to handle the batteries in the charging pits and upon the transfer carriage used to move the cars in the car barns. No record was obtained of the power used by these motors. A recording wattmeter was secured to place in these auxiliary circuits, but unfortunately it was injured in transportation and could not be used. An effort was made to obtain an average value of the power used for each operation, by means of readings made at intervals of two seconds upon standard volt and ampere meters, but owing to the sudden fluctuations the data obtained were unsatisfactory. However, as the power used in the operation of handling the batteries in the pits and the cars in the barns may properly be charged to the operation of the cars, the total amount of energy delivered to the charging tables divided by the actual car mileage will give the total power required per car-mile. With the data at hand, however, this entire energy cannot be exactly divided into the amount used in the barns and the amount used on the road. The former amount will be a very small proportion of the latter, but this proportion will increase as the average length of battery trips decreases.

The power delivered to the switchboard and the amount of coal required upon November 5 is shown in the records of the test made that day. The power delivered upon November 26 was obtained for nine hours from the records of the test made from 3 p. m. to 12 m., and for the remainder of the day from the charts of the recording ammeter. The readings of this ammeter were

carefully compared with the readings upon a standard ammeter, and found to be correct. These ampere readings were multiplied by the value of the average voltage found upon the test made that day, and the resulting watts added to those obtained during the test.

The following table shows a summary of the results of the two day's run:

Date of test.....	Nov. 5th	Nov. 26th
State of weather .....	Rainy	Rainy and cold
Kilowatt hours delivered to switchboard .....	2,638.	2,895.
Kilowatt-hours used by cooling tower motor .....	151.	174.
Net kilowatt-hours delivered to charging bus-bars .....	2,487	2,721
Total number of car-miles .....	1,821.8	1,668.4
Kilowatt-hours on switchboard per car-mile.....	1.37	1.63
Pounds of coal per net kilowatt-hour.....	6.9	6.44
Pounds coal per car-mile.....	9.45	10.50
Cost of coal per ton .....	\$1.90	\$1.90
Cost coal per net kilowatt-hour.....	.00655	.00611
Cost coal per car-mile.....	.00597	.00996

It will be noticed that although the cost of a kilowatt-hour upon the switchboard was less in the second test, the cost of fuel per car-mile the same day was something more than in the test November 5. This result is due to the fact that the kilowatt-hours required per car-mile were greater in the second case. The difference in the amount of energy required per car-mile is to be explained by the presence of a coating of ice upon the rails during the latter part of the day (November 26). It is unfortunate that a freezing sleet-storm should have occurred at this time, though the results of the test indicate to a certain extent the amount of power required to operate the road under adverse conditions. Owing to the storm, the results of the two tests do not furnish a fair basis for a comparison of economy of the two different methods of charging the batteries.

#### EFFICIENCY TEST OF BATTERY ON CAR.

This test was made November 8, 1897, and was made to determine the efficiency of a battery under actual operating conditions. The battery was charged in the regular way by means of the three-voltage method. It was then discharged while making a round trip, and was then placed upon the charging table and again charged, thus giving two charges and one discharge to determine the efficiency. The battery used was one which had operated at that time over 8,000 miles, and was taken for the purpose of this test immediately after it had made a trip similar to the one upon which it was tested.

The current and voltage upon the two charges were obtained by means of standard instruments, and readings were taken every five minutes. The data are shown plotted graphically in Figs. 10 and 11, in which the abscissæ represent time in minutes.

The observations made upon the car while the battery was discharging consisted in taking voltage and ampere readings every five seconds, while the car was in motion, the time between stops and the length and location of each stop, and a continuous record of the speed.

The voltmeter was a standard Weston instrument and was connected across diagonal corners of the battery tray.

The voltmeter was so connected that it gave the voltage at the battery terminals for each combination. The car tested was 20 ft. long in the body, 30 ft. long over the platforms, and had a seating capacity of 28 passengers. The car weighed 13½ tons with the batteries, the batteries and trays adding about 4 tons to the usual weight of a car of that size.

The motor upon the car was a 50-h. p. Walker four-pole series motor. The entire current used at any one time passed through the armature, so that the ammeter was inserted in the positive brush leads. The ammeter used was of the round-pattern Weston type, and had been found to be correct by comparison with a standard. Five observers were used to obtain the ammeter and voltmeter readings; one called the time every five seconds, two read the instruments, and the other two kept the records. At time of starting the instruments were read oftener than at five-second intervals. A trial trip was made with another battery to get the observers acquainted with their positions, and as the

fluctuations in the current were not violent nor many, it is believed that the results represent very nearly the actual facts.

The duration of the stops and the time the car was in motion between stops was obtained by means of a stop watch.

The record of speed was obtained by means of a Boyer speed recorder belted, by means of a flexible belt, to the car axle. By means of pressing lightly upon the recording pencil a dot was made in the speed curve every five seconds.

The record of the speed recorder has been transferred to a larger scale and is shown in Fig. 12. The same diagram has been used to show the kilowatt-hour and elapsed-time curves. No attempt was made to indicate upon this diagram the ampere or voltmeter readings, as this information is given upon a larger scale in the acceleration tests.

The test may be divided in four parts, as follows:

	Distance.	Time.	No. of stops.	Average speed miles per hour.
1. Power house to Blue Island . . . . .	5.9	28:20	12	12.5
2. Blue Island to power house . . . . .	5.9	29:55	19	11.8
3. Power house to Sixty-third St. . . . .	5.3	27:40	13	11.5
4. Sixty-third St. to power house . . . . .	5.3	27:50	13	11.5
<hr/>				
Total number of stops . . . . .			57	
Total time from start, not including stops . . . . .				113:45
Total distance . . . . .	24.40			miles
Length of one back-up stop, 18 . . . . .				.04 "
Total distance traveled . . . . .	22.44			"
Average speed . . . . .				11.84 miles per hour

In making the stops an effort was made to approximate actual service and in every way reproduce the conditions of an actual trip. No regular passengers were carried, however, the load consisting of nine observers, the motorman and conductor. The motorman was instructed to follow his usual custom of coasting, where possible. The track was dry for the first two parts of the test, but during the last two parts it was raining and the tracks were wet. The energy taken from the battery was as follows:

	Distance. Miles.	Watt-hours	K. W. hours per car-mile.
1. Power house to Blue island . . . . .	5.9	5,533.1	.920
2. Blue Island to power house . . . . .	5.94	5,098	.868
3. Power house to Sixty-third street . . . . .	5.3	4,394.6	.820
4. Sixty-third street to power house . . . . .	5.3	4,689.6	.885
<hr/>			
Total . . . . .	22.44	19,715.3	.878

It is to be regretted that a profile of the road cannot accompany this report. The road, however, is practically level. The results of the last table would seem to indicate that in general the grade rose from the power house toward the two terminals.

The efficiency of the battery is shown as follows:

Kilowatt-hours, first charge . . . . .	36.757
Kilowatt-hours, discharge . . . . .	19.715
Kilowatt-hours, second charge . . . . .	31.631
Efficiency (discharge ÷ first charge) . . . . .	53.6 per cent
Efficiency (discharge ÷ second charge) . . . . .	62.32 per cent

The graphical log of the two charges is shown in Figs. 10 and 11, and it will be seen that they differ considerably. This is due to the fact that the charging of the battery was left to the regular operators of the plant, who used their judgment both as to the voltage and as to the time the battery should charge at each voltage. They also determined when the battery was fully charged. In the first charge there is no doubt but that the final voltage was too high, and in the second charge it would seem that the battery was charged too long, both of which conditions reduced the efficiency obtained. The result, however, shows the efficiency in actual service, but does not represent the possibilities of the battery.

The amount of the first charge was, of course, influenced by the immediate previous history of the battery, and for this reason the efficiency obtained by using the second charge as a basis is the more reliable. This test showed that the car used 1.41 kilowatt-hours per car-mile, as measured at the charging table, and .87 kilowatt-hour per car-mile was delivered from the batteries to the motor on the car.

### ACCELERATION TESTS.

In the tests made upon a car in actual service no opportunity was afforded for accurate acceleration tests. These were made November 13, 1897, upon a straight stretch of track along Vincennes road, extending south from the power house. In these tests the same instruments and observers as on the other car test were used, and readings were taken in much the same way, with the exception that in this test the observations were made at the time of passing from one point to another of the controller. After the fifth point was reached the readings were taken at five-second intervals. The time between points was obtained by means of a stop watch, and no effort was made to change the motorman's method of procedure in bringing the car up to speed. The average results of five trials are shown graphically in the curve, Fig. 13, which shows clearly the power delivered by the batteries at the different points of the controller and the energy required to accelerate the car.

The current curve shows a maximum of 320 amperes. It will be noticed, however, that at this time all four sets of batteries are in parallel, so that this total of 320 amperes indicates a total discharge rate of each cell of but 80 amperes. The dotted curve below the current curve indicates the actual discharge rate of the individual cells. At the fourth notch it coincides with the total current curve, and at this point indicates the highest discharge rate, which is seen to be 220 amperes, and this rapidly decreases until it reaches 100 amperes, which may be taken as a fair value of the current with the car in full motion. It is to be understood, of course, that the practice of coasting, in which the current is shut off, makes it impossible to obtain the power required per mile from this curve.

In conclusion it may be said that the foregoing tests do not demonstrate the best results that may be expected of accumulator traction, and were not made for that purpose. No excuse is to be offered for the fact that the road was not operating under ideal conditions while being tested, as the primary object of the test was to determine where improvement could be made. If this is kept in mind when comparing the results with those obtained upon the trolley systems of about the same size, it will be seen that the cost of fuel for accumulator traction, of something less than 1 cent per car-mile, is very favorable to storage-battery traction. The improvements suggested by the test are now being made. The overhauling of the engines, the repair of the economizer flue and the securing of a better coal than was used on the test, at a cheaper price, should bring the fuel cost per car-mile well within .5 cent. Figures upon the labor and maintenance factors in the cost per car-mile would be of interest in this connection, but are not covered by the figures of the test. The labor account will no doubt be as small as that of any nine-car road, while figures upon maintenance would be premature at this time. The batteries have operated from 8,000 to 14,000 miles and are standing the service remarkably well, so that the maintenance account, up to the present, has been comparatively small.

### PROSPERITY IN SPRINGFIELD, O.

The annual report of S. L. Nelson, general manager of the Springfield (O.) Street Railway Company, shows that there were collected 835,300 cash fares, 857,912 tickets and 352,331 transfers, making a total of 2,045,543. The car mileage was 870,016, a daily average of 126 miles for each car. The average passenger fare was 4.52 cents. For January, 1898, 37,836 more passengers were carried than in the same month of last year. The remarkable showing was in the number of accidents, only two persons being injured and these but slightly.

### THE WRIGHT WAVE MOTOR.

For some years experiments have been carried on in California to determine the merits of various wave motors. The motor herewith illustrated is the invention of Parvin Wright, who, after some preliminary experiments in January, 1897, organized the Wright Wave Motor Company. In June, 1897, the Los Angeles Ocean Power Company was organized to build a plant on the coast and transmit power to Los Angeles. Such installation was made at a point on the ocean beach three miles north of Redondo and about 18 miles from Los Angeles, to which has been given the name Potencia. A wharf 26 ft. wide was built out to a distance

WRIGHT WAVE MOTOR AT POTENCIA.

of 350 ft., at which point the swells usually begin to break, and three motor floats placed at the outer end.

The energy of the waves is utilized by means of floats which operate vertical hydraulic compressors, or pump cylinders, which are in turn connected with a large storage pressure tank of heavy steel. The movement of the waves raises and lowers these floats, and in doing so, pumps fresh water from a small reservoir into the pump cylinders and forces it into the storage pressure tank, where by compressing the air contained in the tank the water becomes subjected to a very heavy pressure. It flows out of the tank through a nozzle and impinges upon the buckets of a Pelton water wheel, by which is driven the dynamo or other machine to be operated. From the water wheel the water flows back to the reservoir from which it was originally

THE WRIGHT WAVE MOTOR.

taken, as is shown in the line drawing of the apparatus.

The accumulated pressure in the pressure tank exerts itself upon the pump pistons, so as to offset the weight of

the floats tending to draw such pistons down; the result is, that during storm periods, the floats ride upon the crest of the waves and are not permitted to drop into the trough of the sea. Mr. Wright is the first inventor to overcome this difficulty, which has heretofore been considered insurmountable.

The wharf at Potencia is a substantial structure with the three floats placed side by side in a line at right angles to its length. When the plant is enlarged the plan is to place the floats in three or more rows, as is indicated in the line drawing.

The half-tone engraving is from a photograph of the Potencia wharf and motors; when this was taken two only of the three floats were in operation.

By reports of tests made on 16 consecutive days in December last, during which the condition of the sea and weather varied from calm to stormy, and the number of waves per minute from 3 to 8, the power developed varied from 2.3 to 3.5 h. p. per float; this is the power developed at the water wheel. It is stated that the variations in the power developed were due to varying conditions under which the motor was tried. Engineers who have examined the plant report that 100 properly constructed floats might be relied upon to develop 5 h. p. each.

The cost of a plant, together with an electrical transmission line, to deliver 1,000 h. p. at Los Angeles, is placed at \$174 per horse-power.

### THE FARE IS TOO LOW.

At a recent session, the Massachusetts Railroad Commissioners were called upon to consider a petition from the Braintree & Weymouth Street Railway Company, which wishes to abolish free transfers on its line because the business on the South Weymouth branch does not pay the running expenses. The petition is an unusual one, and the matter has been taken under advisement by the board. The road is unfortunate in having commenced by issuing free transfers when the business did not justify it, and will no doubt find it a very difficult matter to increase the rate.

### MAIL CONTRACTS IN THE WEST.

The Post Office Department has awarded the contracts for carrying the mail from Seattle, Wash., to the suburban towns, to the local electric lines. The Seattle Traction Company will make one round trip per day between the city and Green Lake for \$100 per annum. The Grant Street Railway Company receives \$200 per annum for the service between South Park and Seattle, making two trips on week days and one on Sundays. The Third Street & Suburban Railway Company has the contract for a daily service to Latona, for \$50. From Seattle to Renton the contract has been awarded to the Seattle & Rainier Beach Railway Company; the service to Columbia City, which is between the two places, will be twice a day, and to Renton once a day.

The Commissioners of the District of Columbia have granted the petition of the Capital Traction Company and issued an order amending the police regulations of the city so that the use of salt on the street railway tracks is forbidden.

## OPERATING EXPENSES OF CONNECTICUT RAILWAYS.

The annual report, for the fiscal year ending September 30, 1897, by the Connecticut Railroad Commissioners, indicates that the street railways of that state are in anything but a prosperous condition. The report includes statements from 29 street railways, two more than last year. During the year 33.8 miles of new track were laid. The gross earnings for the year were \$2,626,227, a slight increase, but the average earnings per car-mile were but 19.60 cents, a decrease over the preceding year. The average dividends dropped from 3.7 to 2.8 per cent. The traffic on the majority of the railways decreased, but the operating expenses were also diminished by close management. The tables give the itemized operating expense account in dollars per car-mile. The figures for the miles of track are for the number of miles of single track, including sidings.

### BRIDGEPORT RAILWAY COMPANY.

Length of railway, measured as single track is 48.6 miles with 1.2 miles of sidings and switches. The company owns 53 closed, 51 open cars, 7 snow plows, 2 sweepers and 1 sprinkler; employs 200 men and carried 5,922,033 passengers with a car mileage of 1,805,412. The operating expenses were 54.4 per cent of the gross earnings, and 3.28 passengers were carried per car-mile.

## OHIO STREET RAILWAY ASSOCIATION.

The state association of the street railway men of Ohio has recently been reorganized and put upon a firmer basis; the name has been changed from the Ohio Tramway Association to the Ohio Street Railway Association, and the officers propose to exert every effort to make it the best and most progressive of the state associations. Ohio has over 1,200 miles of street railways and the exchange of experimental, statistical and scientific knowledge among the members cannot fail to be of benefit to the companies and to the public which they serve.

The membership fee has been fixed at \$10 for each company and the annual dues at 25 cents for each regular car operated; but the dues shall in no case exceed \$15 per year.

We have received from the secretary a copy of the Constitution and By-laws of the Association; the book is of a size convenient for the vest pocket and is bound in leather. The present officers of the association are: President, A. A. Anderson, Youngstown; vice-president, T. R. Catlin, Canton; secretary and treasurer, Frank J. J. Sloat, Akron; the officers together with H. P. Bradford, Cincinnati; F. L. Nelson, Springfield, and W. F. Kelly, Columbus, constitute the executive committee.

NORTHWESTERN ELECTRICAL  
ASSOCIATION.

The Northwestern Electrical Association held its annual meeting in Milwaukee, where some valuable papers were read, among them being "Long Distance Transmission" by Axel Ekstrom, "Present Efficiency of Incandescent Lamps" by J. E. Randall, "Electricity in Municipal Engineering" by Prof. R. B. Owens, and others. The session was concluded by a banquet attended by a number of distinguished guests, including Governor Scofield.

## ELECTRICAL INSPECTION AND TESTING OF CAR EQUIPMENTS.

### THE HERRICK SYSTEM.

The mechanical wear and tear of a car equipment is evident on inspection, and renewals and repairs can be intelligently made in order to maintain the equipment mechanically, but the electrical troubles are not generally visible until the defect has developed into a fault and the equipment is crippled. The commercial effect of adopting electrical inspection methods immediately results in a large saving in the cost of electrical maintenance, and the character of the work changes from that of repairs to that of maintenance.

The apparatus and methods for electrical inspection and

FIG. 1.—PORTABLE TESTING SET.

testing were developed from the necessity of reducing the cost of electrical maintenance, which costs aggregate in all the street railroads in the United States over 18 million dollars per annum.

There are very few faults that lie dormant in an equipment and develop under extra straining, loading, or weather conditions, that cannot be detected and remedied before they develop into a fault, the repair of which will cost many times that of preventive measures.

A number of methods of measuring and testing have been selected for the different tests which are applied to an equipment, each having its own particular advantages for the tests for which it is best adapted. These different methods have all been connected up on a switchboard so that the

interpolating of the apparatus on the plug board, by means of flexible leads, will make the proper connections for that test.

Commercial measuring instruments are used for the different tests, and are so calibrated that they give very reliable results. The methods of applying these tests to an equipment are so arranged that the equipment can be thoroughly tested and every defect located, without disconnecting or disassembling any part of the equipment except the ground connections. Every class of equipment has been standardized, and every point of the controller should give specific readings on the measuring apparatus; if these indications deviate from the standard by a certain amount, the cause can be immediately located. By the use of this method the relative efficiency of the motormen can be determined, if a regular inspection system is maintained, by means of the increase in temperature of the equipments which they bring in. By keeping records of motormen and temperatures, the poor motormen can be readily detected, as motormen running over the same schedule and route, with practically the same traffic, may make a difference of 40° Centigrade in the motors, due only to the improper handling of the controller, which means a waste of energy and depreciation of the equipment. Another large cause of depreciation is the lack of equalization between two or more motors operating under the same car body. This lack of equalization can be readily detected by the practical determinations of the relative temperatures of the several motors, and these can be equalized so as to be maintained at the uniform temperatures, which means working at the best possible advantage. The temperature measurements are not made by a thermometer, but by means of a calibrated rheostat on the testing switchboard, which is calibrated so that the temperature can be read directly on the rheostat when the indicating instrument reads at zero.

The system comprehends the following determinations. All measurements except those marked (\*) can be made without making any disconnection or disassembling of the equipments:

#### WIRING.

1. In new equipments, whether the car is correctly wired.
2. Poor connections in car wiring, and where.
3. Open circuit, and where.
4. Ground on wiring system, and where.

#### CONTROLLERS.

5. Improper connection of controller, and where.
6. Poor contact, and on which point.
7. Short circuit, and between which two contacts.
- \* 8. Poor connections to leads.
9. Where the buttons make contacts at correct points on controller face.
- \*10. Ground in controller, and where.

#### RHEOSTATS.

11. Are they properly connected in.
12. Are they standard resistance on each step.
13. Are they grounded, and on which step.
14. Temperature of the rheostat.
15. Open circuit, and where.
16. Whether the proper rheostat is used for the equipment.

#### MOTOR FIELD.

17. Whether the fields are properly connected.
18. Whether the field has broken down.
19. Whether the insulation is poor between the field and the ground, and which field.
20. Whether they are the proper field coils for the equipment.
21. What is their temperature.

- \*22. Whether they have the proper number of turns.
- 23. Whether they have the proper resistance.
- 24. Whether the connectors are making good connections between field terminals.

## SHUNT FIELDS.

- 25. Whether this is connected around the fields.
- 26. Its resistance.
- 27. Whether the two shunts are carrying equal loads or equally shunting both motors.

## ARMATURES.

- 28. Insulation to ground.
- 29. Brushes making contact with commutators.
- 30. Whether armature strikes pole pieces.
- \*31. Whether there are leaks or crosses between armature coils.
- \*32. Whether there are poorly insulated or short circuited armature coils, and which.
- \*33. Whether the armature is properly connected.
- \*34. Whether the coils are properly soldered to commutator.

## COMPLETE MOTOR TEST.

- 35. What is the temperature of the motor.
- 36. Whether two motors are equalized.
- 37. Whether the motor has been properly handled by the motormen.

The testing system is so arranged that any of the foregoing faults can be detected when the inspector makes three inspection tests. The first is made when the controller is on the first point. The second, when the controller is on the series step on the series-parallel controller, or on the

FIG. 2.

parallel step where the rheostat is used. For the third test the ground connection is then removed and the insulation of the equipment is taken. These three measurements, if they are standard, prove the equipment to be in good electrical condition, and if there is any tendency to a break-down, one of the above tests will show that there is trouble. A detailed test, occupying not more than five minutes, will then have to be made in order to locate the point or points where the trouble exists.

For these tests neither a bridge nor the drop method, as usually applied, were found to be sufficiently reliable or expeditious for practical work. The lower e. m. f., under which a bridge is used, may make a carbon brush contact or a bad controller point appear as an open circuit, whereas if higher potentials are used, this will break down to a metallic circuit. The drop method requires that both the voltmeter and ammeter be read, and it also requires the use of mathematics to figure the resistance; as the current value changes at every step of the controller it makes this method too tedious to be applied even for the three inspectors' tests, and as the drop test is usually applied, the contact resistance is also measured, and this seriously interferes with the accurate measurement of low resistances.

In order to readily apply the tests to the car equipments with the portable testing set shown in Fig. 1, the trolley is pulled down and the current is carried first from the trolley wire through the testing set back to the trolley wheel. There is a bank used in series with this circuit in order to regulate the current flow. A ground plate is inserted between the brake shoe and the car wheel, and the brake is brought up tight. These are the only two connections to be made for the tests. In the tests with the stationary switchboard, a trolley wire is run through the car house parallel with the present trolley wire, about 6 in. from it.

In order to test a car it is only necessary to transfer the trolley wheel to the test trolley wire, and the measurements can be made in the inspectors' office. The connections are so made that the resistances external to the car equipment are equalized, regardless of the position of the car.

The tests are made on the car by the movement of the controller handle to the different points. If the equipment is up to standard the balance indicator will stand at zero, when the pointer on a sliding scale is brought to a position on the scale corresponding to the point of the controller under measurement. On account of various combinations made by the controller of the motors, a fault in either or both can be expeditiously located.

The practical application of these tests brings out clearly the following points:

1. That the lack of equalization between the motors is largely accountable for the condition of one motor continually breaking down.
2. That more armatures are burnt out in weak fields than by the poor insulation of the armature.
3. That flashing of the brushes burns out more armatures than poor insulation between coils.
4. That armatures can be repaired which are often burnt out beyond repair by the motormen in cutting out the motor as soon as it bucks.
5. That the normal life of the motor is reduced 40 per cent by the improper use of the controller.

M. R. McAdoo, general manager of the Paterson Railway Company, who has been using this system, says in regard to it: "This system has proved so simple and direct in its operation that it immediately effected a large saving in our electrical repairs, and we have been able to maintain our equipments electrically by preventive measures, and have reduced electrical break-downs to a minimum. In fact, we have been able to get a much longer life out of our equipments and greatly decrease the expense under which we are operating."

Fig. 2 shows the different auxiliary appliances used by the inspectors in order to obtain the tests required.

# CROSSINGS OF STEAM RAILROADS AND STREET RAILWAYS.

## PART III.

### NEW JERSEY.

The law governing crossings in New Jersey is one approved March 22, 1895, which is as follows:

Be it enacted by the Senate and General Assembly of the State of New Jersey, That whenever the route of any steam or electric railroad hereafter to be constructed shall cross at points outside of the limits of cities the line of any steam railroad in this state, such crossing shall be made in such a way as will inflict the least injury upon the rights of the company owning or operating the railroad intended to be crossed and as will afford proper protection to the public; and no company shall hereafter construct any steam or electric railroad across the line of any steam railroad except within the limits of a city until it shall have first made application to the chancellor of this state to define the mode in which such crossing shall be made, and it shall thereupon be the duty of the chancellor, after causing reasonable notice of such application to be given to the municipal authorities, and also to the corporation owning or operating the railroad intended to be crossed, to define by his decree the mode in which such crossing shall be made and if, in his judgment, it is reasonably practicable and public safety so requires to avoid a grade crossing, he may in his discretion by his decree define and regulate the mode and manner of such crossing, and thereupon such crossings shall be made in the mode defined by such decree, and in no other way.

And be it enacted, That crossings of steam railroads by steam or electric railroads within the limits of cities shall be made subject to the present existing laws in regard to the same.

Under this act the apportionment of cost is made by the court. Usually the viaducts are for the use of the street railway only. When necessary to maintain flagmen at important crossings it is usually done by the street railway. One of the longest viaducts in the state is that built by the Consolidated Traction Company, of Jersey City, over the Delaware, Lackawanna & Western tracks; it is about 1,000 ft. in length and cost \$30,000.

Two very important decisions in regard to grade crossings have been rendered recently by the supreme court of New Jersey. The first was in the case of the Erie Railroad against the city of Newark, for the expense incurred in planking the crossing made necessary by the opening of a new street across its tracks and for the cost of erecting and maintaining gates. The company was allowed for the planking but not for the gates by the lower court; this decision was reversed, the supreme court holding that the taking of a railway's property for street purposes is an action entitling the road to damages, and compensation must include all moneys which the act causes the company to pay out, and the erection and maintenance of gates is an added expense for which the company is entitled to ask compensation. This would appear to be so sweeping that every municipality desiring to open new streets across railway lines will not only have to pay for the right of way, but will be compelled to maintain gates and gatemen there in perpetuity. The effect will probably be to bring about the abolition of grade crossings, since it will be cheaper in the end to cross over or under the railway line than to maintain gates and gatemen.

The second decision relates to flagmen or gates. The Philadelphia & Reading Railroad was convicted of maintaining a nuisance in having neither gates nor flagmen at a certain crossing. The supreme court holds that a railway company is not obliged to take any greater precaution for

the protection of crossings than is exacted by the statutes, the only exception being where a company has created a danger by its own act. The statute enacted in 1852 requiring the railroad in most instances only to ring a bell or blow a whistle when approaching a crossing was amended in 1895 to the extent that the governing bodies of all municipalities in first-class counties are given the power to compel the protection of crossings.

### NEW YORK.

For some years the state of New York has endeavored to reduce the number of railroad grade crossings, including those of highways and streets as well as street railways and other steam roads. In 1893 the law here quoted was enacted, giving to the courts the power to appoint commissioners to decide upon crossings when the two companies interested fail to agree.

Sec. 1. Whenever the railroad or route of any street surface railroad corporation shall intersect and cross, or shall cross the tracks and roadbed of any railroad, operated by locomotive, steam or other power, which are laid in, across or upon the surface of any street, avenue, road or highway in any city, town or village of the state, having less than 500,000 inhabitants, and such street surface railroad corporation having been unable to agree with the corporation owning the tracks and roadbed so intersected or to be intersected and crossed, as to the line or lines, grade or grades, points or manner of such intersection and crossing, or upon the compensation to be made therefor, shall have applied to the court by petition to appoint commissioners to determine the same, the court shall upon application made by such street surface railroad corporation, at, or after, the time of the appointment of such commissioners, or if an answer to the petition of such street surface railroad corporation has been interposed, at any time thereafter, direct that such street surface railroad corporation, be permitted to lay its tracks across and to intersect, upon the surface of the street, avenue, road or highway, the tracks and roadbed of such railroad operated by locomotive, steam, or other power, provided, such street surface railroad corporation shall at the time of obtaining such order make and file with the clerk of said court, its bond or undertaking in writing, in an amount and with surety or sureties to be approved by the court, conditioned for the full and faithful performance by such street surface railroad corporation of any and all conditions and requirements which may be imposed by said commissioners and be affirmed by the court, in determining the line or lines, grade or grades, points or manner of such intersection and crossing and as to the amount of compensation to be paid therefor, and also conditioned to conform such crossing and intersection made by virtue of such order of the court to the requirements made by said commissioners as affirmed by the court.

Sec. 2. No street surface railroad shall be allowed to lay its tracks at grade across the tracks or roadbed of any railroad operated by locomotive steam power at any point where there are three or more tracks of the steam road proposed to be crossed, which tracks have been constructed and in operation at least two years, unless the written consent of the state railroad commissioners be first obtained for such crossing at grade. But this section shall not affect the operation of section one of this act in any suit or proceeding now pending, nor any renewals of said pending suit or proceeding brought for any cause.

In 1897 the railroad law was amended and several provisions as to crossings made, all looking to the abolishment of grade crossings, the act applying to steam roads crossing other roads as well as street railways.

The several portions of this act with a direct bearing on the subject are as follows:

Sec. 60. All steam surface railroads, hereafter built, except additional switches and sidings, must be so constructed as to avoid all public crossings at grade, whenever practicable so to do. Whenever application is made to the board of railroad commissioners, under Sec. 59 of the railroad law, there shall be filed with said board a map showing the streets, avenues and highways proposed to be crossed by the new construction, and the said board shall determine whether such crossings shall be under

or over the proposed railroad, except where said board shall determine such method of crossing to be impracticable. \* \* \* (Provisions as to notice, etc.)

Sec. 61. When a new street, avenue or highway, or new portion of a street, avenue or highway shall hereafter be constructed across a steam surface railroad, such street, avenue or highway, or portion of such street, avenue or highway, shall pass over or under such railroad or at grade as the board of railroad commissioners shall direct. Notice, etc. \* \* \*

Sec. 62. The mayor and common council of any city, the president and trustees of any village, the town board of any town within which a street, avenue or highway crosses or is crossed by a steam surface railroad at grade, or any steam surface railroad company, whose road crosses or is crossed by a street, avenue or highway at grade, may bring their petition, in writing, to the board of railroad commissioners, therein alleging that public safety requires an alteration in the manner of such crossing, its approaches, the method of crossing, the location of the highway or crossing, the closing and discontinuance of a highway crossing and the diversion of the travel thereon to another not at grade, and praying that the same may be ordered; whereupon the said board of railroad commissioners shall appoint a time and place for hearing the petition, and shall give such personal notice thereof as they shall judge reasonable, of not less than 10 days, however, to said petitioner, the railroad company, the municipality in which such crossing is situated, and to the owners of the lands adjoining such crossing and adjoining that part of the highway to be changed in grade or location, and shall cause notice of said hearing to be advertised in at least two newspapers published in the locality affected by the application; and after such notice of hearing the said board of railroad commissioners shall determine what alterations or changes, if any, shall be made. The decision of said board of railroad commissioners rendered in any proceeding under this section, shall be communicated within 20 days after final hearing to all parties to whom notice of the hearing in said proceeding was given, or who appeared at said hearing by counsel or in person. Any person aggrieved by such decision, or by a decision made pursuant to Secs. 60 and 61 hereof, and who was a party to said proceeding, may appeal therefrom to the appellate division of the supreme court in the department in which such grade crossing is situated and to the court of appeals, in the same manner and with like effect as is provided in the case of appeals from an order of the supreme court.

Sec. 63. Whenever, under the provisions of Sec. 60 of this act, new railroads are constructed across existing highways, the expense of crossing above or below the grade of the highway shall be paid entirely by the railroad corporations. Whenever under the provisions of Sec. 61 of this act a new street, avenue or highway is constructed across an existing railroad, the railroad corporation shall pay one-half and the municipal corporation wherein such street, avenue or highway is located, shall pay the remaining one-half of the expense of making such crossing above or below grade; and whenever a change is made in an existing crossing in accordance with the provisions of Sec. 62 of this act, 50 per cent of the expense thereof shall be borne by the railroad corporation, 25 per cent by the municipal corporation, and 25 per cent by the state. Whenever, in carrying out the provisions of Secs. 61 and 62 of this act, two or more lines of steam surface railroad, owned and operated by different corporations, cross a highway at a point where a change in grade is made, each corporation shall pay such proportion of 50 per cent of the expense thereof as shall be determined by the board of railroad commissioners. \* \* \*

\* The legislature shall annually appropriate out of any moneys not otherwise appropriated, the sum of \$100,000 for the purpose of paying the state's proportion of the expense of a change in an existing grade crossing. \* \* \*

Sec. 66. The railroad commissioners may, in the absence of any application therefor, when, in their opinion, public safety requires an alteration in an existing grade crossing, institute proceedings on their own motion for an alteration in such grade crossing, upon such notice as they shall deem reasonable, of not less than 10 days, however, to the railroad company, the municipal corporation and the person or persons interested, and proceedings shall be conducted as provided in Sec. 62 of this act. \* \*

Sec. 68. All street surface railroads hereafter constructed across a steam railroad shall be above, below or at grade of such steam railroad as the board of railroad commissioners shall determine, and such board shall in such determination fix the proportion of expense of such crossing to be paid by the street surface railroad.

Sec. 69. The provisions of this act shall also apply to all existing or future steam surface railroads, on which, after the passage of this act, electricity or some other agency than steam shall be substituted as a motive power.

Buffalo and certain crossings in Rochester are exempted from these provisions.

The regulations of municipalities for the protection of the public at grade crossings by the employment of flagmen and otherwise vary, as also does the practice of apportioning the wages of such watchmen.

#### OHIO.

The law in Ohio prior to 1896 was that the maintenance of crossings should be borne equally by the two roads crossing. The law passed, and approved April 27, 1896, provides for the interlocking of grade crossings and places the subject under the control of the commissioner of railroads. Secs. 1, 2 and 3 of this act are identical with sec-

tions 2, 3 and 4 of the act passed by the Indiana legislature on the same subject in 1897, except that in Indiana the duties of railroad commissioner are given to the auditor of state; the portions regarding the repeal of speed regulations at protected crossings and the penalties for violation are also of the same tenor.

Prior to this act the rulings of the Ohio courts have been that the street railway was not a burden additional to the public easement, and consequently the rule as to crossings was that laid down in the Indiana decision, quoted in the "Review" for October, page 683.

In 1894 the power to condemn property was conferred upon street railways.

City ordinances as to flagmen vary. In some cases the flagman is hired jointly by the two companies, but in most instances by the steam road solely.

The statute for the prevention of accidents (1891) at crossings is as follows:

Sec. 1. Be it enacted by the General Assembly of the State of Ohio. That where the tracks of two street railroads cross each other or in any way connect at a common grade, when one or both such street railroads use other than horse power for propelling their street cars, the crossings shall be made and kept in repair at the joint expense of the companies owning the tracks, and all such cars used on said street railroads shall come to a full stop, not nearer than 10 feet nor farther than 50 feet from the crossing, and shall not cross until the way is clear; and when two or more cars approach the crossing at the same time the car or cars on the road first built shall have precedence.

Sec. 2. That whenever the tracks of any street railroads in this state cross the tracks of any steam railway at grade, the street railway company operating said line of cars shall cause their street-cars to come to a full stop not nearer than 10 feet nor farther than 50 feet from the crossing, and before proceeding to cross said steam railway tracks, shall cause some person in their employ to go ahead of said car or cars and ascertain if the way is clear and free from danger for the passage of said street-cars, and said street railroad cars shall not proceed to cross until signaled so to do by such person so employed as aforesaid, or said way is clear for their passage over said tracks.

Sec. 3. Every person in charge of any street-car or cars who wilfully fails to comply with the provisions of this act, and fails to bring said car or cars which he has in charge to a full stop, or causes the same before the way is clear, or signaled so to do to cross said steam railroad tracks, shall be personally liable to any person injured by reason of such failure as aforesaid, to a penalty of \$100, to be recovered by civil action at the suit of the state of Ohio, in the court of common pleas of any county wherein such crossing or connection is, and the company in whose employ such person having charge of said car or cars is, as well as the person himself, shall be liable in damages to any person or persons injured in person or property (having charge of such car or cars) as aforesaid.

The attorney-general of Ohio, on December 1, rendered an opinion at the request of one of the railroad commissioners, in which he held that the "interlocking" statute of 1896 applies only to interurban street railways and not to city street railways. Also, that under an act of 1891 the railroad commissioners may regulate the overhead work at city crossings independent of any interlocking device connected therewith.

#### INDIANA.

While the law in Indiana prior to 1897 was as stated in the opinion of the supreme court, of which an abstract was given in the "Review" for October, 1897, in that year the legislature passed a law for the protection of grade crossings. The essential parts of this law are as follows:

Sec. 1. Be it enacted by the General Assembly of the State of Indiana, that where it becomes necessary for the track of one railroad company to cross the track of another railroad company, unless the matter of making such crossings shall be agreed to between such companies, it shall be the duty of the circuit court of the county wherein such crossing is located, or the judge thereof in vacation, to ascertain and define by its decree the mode of such crossing which will inflict the least practicable injury upon the rights of the company owning the road which is intended to be crossed; and if, in the judgment of such court, it is reasonable and practicable to avoid a grade crossing, it shall, by its process, prevent a crossing at grade.

Sec. 2. That when in case two or more railroads, or a railroad and an electric road crossing each other at a common grade, or any railroad crossing a stream by any swing or draw-bridge, shall, by a system of interlocking, or by other works or fixtures to be erected by them, or

either of them, render it safe for engines or trains to pass over such crossing or bridge without stopping, and such system of interlocking works or fixtures shall first be approved by the Auditor of State, and the plan of such interlocking works or fixtures for such crossing or bridge designating the place of crossing shall have been filed with said Auditor then and in that case it is hereby made lawful for the engines and trains of such railroad or railroads to pass over such crossing or bridge without stopping, any law or the provisions of any law now in force to the contrary notwithstanding, provided, that the said Auditor shall have and is hereby given power in case such interlocking system or other fixtures shall in his judgment prove to be unsafe or impracticable, to order the same discontinued, opportunity first being given to the person or company operating the same to be heard before said Auditor as to the propriety of such order. In case such order is made and enforced, the existing statutes relative to stopping at crossings shall apply until such time as a device approved by said Auditor is substituted.

Sec. 3. That in case where the tracks of two or more railroads, or the tracks of a railroad and an electric railroad cross each other at a common grade in this state, any company owning any one of such tracks, whose managers may desire to unite with others in protecting such crossing with interlocking or other safety devices, and shall be unable to agree with such others on the matter, may file with the said Auditor a petition stating the facts of the situation, and asking said Auditor to order such crossing to be protected by interlocking or other safety devices; said petition shall be accompanied by a plan showing the location of all tracks and switches, and upon the filing thereof, notice shall be given to each company or persons owning or operating any track involved in such crossing, and the said Auditor shall thereupon view the site of such crossing, and shall, as soon as practicable, appoint a time and place for the hearing of such petition. At the time and place named for hearing, unless the hearing is for good cause continued, said Auditor shall proceed to try the question of whether or not the crossing shall be protected by interlocking or other safety devices, and shall give all companies and parties interested an opportunity to be fully heard; and after such hearing said Auditor shall enter an order upon a record book or docket, to be kept for that purpose, granting or denying such petition; and in case the same is granted, such order shall prescribe the interlocking or other safety devices for such crossing and all other matters which may be deemed proper to the efficient protection of such crossing, and in such order the Auditor shall designate the proportion of the cost of construction of such plant, and the expense of maintaining and operating the same, which each of the companies or persons concerned shall pay, and shall also fix the time within which such appliance shall be put in, such time, however, not to exceed ninety days from the making of such order.

Sec. 4. In case, however, one railroad company or an electric railroad company, shall hereafter cross at grade with its track or tracks, the track or tracks of another railroad, the railroad company or the electric railroad company seeking to cross at grade shall be compelled to interlock such crossings to the satisfaction of the said Auditor, and to pay all costs of such appliances, together with the expense of putting them in and the future maintenance and operation thereof; provided, this act shall not apply to crossings of side tracks only.

The remaining six provisions of the act require: (1) That the provisions of Secs. 2 and 3 being complied with trains shall not be required to stop at any protected grade crossing; (2) refusal or neglect to comply with the law shall be punished by a fine of \$500 per week for each week of such refusal or neglect; (3) the Auditor may, if he deems it advisable, employ a civil engineer to examine and report upon plans for interlocking, and the engineer "shall be allowed such reasonable sum as the Auditor may award;" (4) all laws inconsistent with this act are repealed and this act shall take effect immediately after its passage.

#### CANADA AND MEXICO.

In reply to an inquiry addressed to a railway company in Canada the following was received: "The law is supposed to be the law of common sense administered by the railway committee, and regulations vary according to seniority of franchise, changes of grades, circumstances, etc." This is an admirable statement of what a good law should be. The railway committee of the privy council of Canada is the one referred to, and this body decides on each individual case, the municipal councils having no authority in the premises; after argument by the parties interested the decision of the committee is final.

In Vancouver the crossings were made in virtue of private agreements between the street railway and the Canadian Pacific.

In Mexico City the construction and operating of railroads, street railways included, are only governed by the regulations issued by the Secretary of Communications and Public Works, and the city council has only to attend and supervise what relates to the location of the tracks in the streets, maintenance of pavements, etc. The regulations from the Secretary of Communications provide that all crossings of other railways' tracks shall be constructed and

maintained in perfect order at the expense of the company crossing the established track, but under this condition all railways are bound to allow their tracks to be crossed by other lines, the establishment of which have been duly authorized.

In reference to crossing tracks of steam roads, such crossings, outside the city, have to be established over or under the existing track, always submitting to the approval of the Secretary of Communications the project of all of the works connected with the crossing. Only on account of special local circumstances or in very exceptional cases, the appreciation of which corresponds to the Secretary of Communications, grade crossings may be permitted, and these also shall be constructed entirely in conformity with the projects approved by the Secretary of Communications. The company which crosses other tracks has to maintain, at its own expense, a flagman at each crossing, both day and night. The pay of these men is 88 cents per day. This refers only to crossing of steam roads, or of steam and mule tracks. When both are mule tracks no flagmen are required.

Where grade crossings with steam roads are prohibited the entire expense for viaducts or tunnels falls upon the street railway which crosses the established track. Such viaducts or tunnels are for the exclusive use of the railway which constructs them, and only by express consent of the company can they be opened to the general public.

#### WICK FEED OIL CUP.

An oil cup for motors which was adopted by the Metropolitan West Side Elevated Railroad of this city soon after it commenced operation, and which has since been adopted by the Lake Street Elevated also, is shown in principle in the accompanying sketch. The cups on the motor were originally designed for grease and the present cup was designed to enable oil to be used. It is simply a tin cup made

WICK FEED OIL CUP.

to fit in the grease cup and having an opening or tube up through the center. For feeding the oil a wick is put in the cup and one end of it allowed to hang over into the inner tube so that it touches the shaft. The lip or edge of the inner tube where the wick goes over must be made rounding; if it is left sharp it will stop the feeding of the oil through the wick.

The Atlanta Consolidated Street Railway has equipped some 30 of its cars with fenders.

AN ELECTRIC BRAKE FOR STREET CARS.

Electro-magnetic brakes of many different designs have been tried on street cars, but few have stood the test of actual service. The cars of the Ogden City Street Railway Company have been equipped for three years with the Skinner-Dorland electric brake, herewith illustrated.

The brake magnet proper is of the coil and plunger type, with a clutch to hold the brakes set after they have been ap-

plied through a variable resistance and draws the plunger into it with a pull according to the current passing through the coil, setting the brakes at any desired tension. The coils J are then cut out, which allows the spring R to press down the lever J, and clamps the shoe S against the plunger B. The coil C is cut out of the circuit and the brakes remain set until the coils J are again energized.

Several claims characteristic to this brake are made. It is simple in construction, not liable to get out of order, and easily repaired. It does not entirely depend on the current from the line to stop the car, for by moving the switch lever to the emergency stop the car motors are connected as generators. It can be attached to any style of car and connected to the ordinary brakes in use, and works in conjunction with hand brakes without interfering with them. The brake is very quick in action. Very little current is required and that only for a moment, when the brake is being set, then the current can be turned off and the brake will remain set.

FIG. 4.—SKINNER-DORLAND BRAKE.

plied. Fig. 1 is an end view and Fig. 2 a longitudinal section. In Fig. 2, C represents the coil of wire which when energized draws the plunger B, setting the brake. The clutch is composed of the shoe S, the lever L, and the spring R. The small coils J, and the plungers P, attached to the lever, are designed to operate the clutch by clamping the shoe against the plunger B. The chain at the outer end of the large plunger is connected directly to the brake levers.

Fig. 3 shows the controller switch with the case removed, and its appearance on the car may be noted in Fig. 4. When the switch is turned to the first point the coils J become a part of the circuit and they draw the lever L to the position shown by the dotted lines, which will allow the shoe S to drop away from the plunger, leaving it free to move. At the next turn of the switch the coil C is thrown into the cir-

PORTER ON SEATS.

Robert P. Porter, in his Topics of the Present Time, writes in the New York Herald a few lines on the seat question, a problem which has always caused the newspapers more real suffering than the people who do the standing. He says:

I note the following headlines in a telegram from Albany: "No Seat; No Passengers."

The article briefly states that an endeavor will be made to pass an amendment to the railroad law limiting the number of passengers that may be carried on the cars of the street surface railroads. If this law was passed, in my opinion it would lead to something akin to an insurrection, not only in New York City, but in every city of the state. The trouble in New York City is not the lack of cars during the busy time in the evening, for they are kept running at a few seconds' headway and just far enough apart so that they will not smash into one another. To enforce a law of this sort the street cars would have to do exactly what they do in Paris, which would be an interesting proceeding, especially on bitterly cold nights, or when it is raining and hundreds

FIG. 1.—FIG. 2.—SKINNER-DORLAND ELECTRIC BRAKE.

FIG. 3.

of people are anxious to get home. The car stops at a corner and the conductor then hands out to each one of the crowd clamoring for admission a large pasteboard ticket with a number on it. When the passengers have alighted, the conductor calls out a number, much as the head barber in some barber shops where the number system prevails, and one by one the persons owning the lucky number push their way through the crowd and get into the car. Then when all seats are filled, the car moves on, leaving the growling, howling mob at the corner. Last summer when in Paris I watched the process carefully, at one time standing on the street corner for nearly three-quarters of an hour. I discovered that it was not unusual for passengers to wait 20 and 25 minutes before they could secure a seat by this system. The American passenger is simply not built that way. He will not wait, because he wants to get home. If passengers were willing to wait on the average this length of time there would be little or no crowding in any of our cities. Saturday, in coming from Philadelphia, I was waiting to take the new electric Madison avenue car. One came up crowded with people hanging on the platform. I decided to wait one car. The next car contained about 15 people. At 42nd street the car with plenty of vacant seats caught up with the car overflowing with people, and we continued about 20 seconds behind that car until I reached home, less than a quarter of a minute later than those who preferred to hang on to the straps of the crowded car. When you can change the characteristics of a people so that they think nothing of waiting 15 or 20 minutes, or even half an hour, such legislation as here suggested will be practical, but not before.

## DOWN-TOWN TERMINAL IN DENVER.

The Denver Consolidated Tramway Company in October last completed its new down-town "turn around," which is undoubtedly one of the most complete street railway terminals in the west. It comprises two loops, connected to each other, providing for the convenient transfer of cars from one loop to the other. Two sidings are provided, one for disabled cars and one for extra cars and line car, etc. These loops are located in the business center of the city, in the block bounded by Arapahoe, Lawrence, 14th and 15th streets. The Post Office, City Hall, Chamber of Commerce, and Mining Exchange are all within one block.

The alley was widened into a 66-ft. street (designated "Tramway Place"), through which the cars on both loops enter from 15th street. Here transfer to and from all the company's lines is made under cover. The upper or Arapahoe street loop is used to turn the cars on the southern and eastern divisions, comprising the following lines: Twenty-second avenue, Stout street, Riverside Cemetery and Stock Yards, 19th and 25th avenue, Colfax avenue, 11th avenue, Broadway and South Broadway, South Tremont street, University Park, Pearl street, Harman and Arlington Park.

The lower or Lawrence street loop is used by the following lines: Lawrence street, east and west divisions, Agate avenue, Ashland avenue, Elitch Gardens and Berkeley, Rocky Mountain Lake, Union Depot.

There is 1,580 ft. of curved track in the two loops and their connections. All the curves have spiral approaches. The construction is of the very best character, girder T-rails weighing 72 lbs. per yd. being used exclusively. The ties, placed 24 in., center to center, are tamarack, creosoted

with 10 lbs. of oil to the cu. ft. by the Michigan Pipe Company of Bay City, Mich. Tie bars are placed at intervals of 6 ft. Brown-Edison plastic bands are used throughout. The

TERMINAL LOOPS, DENVER.

pavement is basalt (granite) blocks and asphalt. All of the curves, switches, frogs and special work, which is of a most substantial character, were built by the company in its own shops.

The detail plans and general construction were superintended by the company's constructing engineer, John A. Beeler, to whom we are indebted for the accompanying plan of the loop.

## MCLEAN RETURNS TO THE UNITED STATES.

Thomas H. McLean, who for the past two years has been president and general manager of the lines in the City of Mexico, has accepted the offer of the Toledo Traction Company, and will return to the United States about the first of April to become general manager of that road. Mr. McLean is recognized as one of the brightest and most successful managers in the fraternity, and has made a record at Mexico which is at once highly creditable to himself and satisfactory to his road. He has introduced American methods, reduced expenses, increased dividends, and his Mexican friends and company part with him with much regret. One of the reasons which has decided him to give up his office there is that owing to the altitude, Mrs. McLean was unable to remain there, although the attempt was made five times.

T. H. MCLEAN.

His many friends will be pleased to welcome his return, and both he, and President Lang of the Toledo Traction Company, are to be congratulated.

At the trial of a personal injury case in Brooklyn the plaintiff was stripped and examined in the court room.

## IMPROVED DEVICES AND METHODS FOR THE SAFE OPERATION OF CARS ON INTERURBAN AND CITY LINES.

(Continued from January.)

Road No. 10: This road operates an interurban line a trifle over nine miles long, all of it being single track, and at both termini uses tracks jointly with local companies; at one terminus the length of track so used by two companies is  $2\frac{3}{4}$  miles, and at the other,  $\frac{1}{2}$  mile. Traffic over the road is regulated by a time table and code of rules, the telephone being used for special orders in cases of delay. The half-mile section mentioned is operated as a block and traffic controlled by a block signal.

The rules governing the joint use of the longer section ( $2\frac{3}{4}$  miles) by interurban and local trains are in substance as follows: Interurban trains must not arrive at or leave any points designated in the time table ahead of time. In general the rights of local trains are superior to those of the interurban trains, except that the few interurban trains between midnight and 6:30 a. m. have absolute rights to the track; two whose leaving time is about 7 a. m., have equal rights; and on a specified section the interurban trains assume the rights of local trains, the latter following as second sections of the interurbans. When running on the time of a local train, the conductor of the interurban must notify all trains met or passed, in writing, giving the number of the motor car which is following him as a second section. Also, the motorman of an extra train must notify, in writing, the motorman of every train met or passed that his is an "extra."

On the half-mile section operated as a block the signal device consists of an electric bell with crank attachment, and an electric indicator at each end of the block. The bell is connected with and controls the electric indicator at the opposite end of the block section. The indicator displays on its face either the word "Block" or the word "Clear." If when a train arrives at the block the indicator displays the word "Block" it means that the block is occupied by an approaching train and the first cannot proceed until the latter has arrived and the conductor set the indicator at "Clear." When the indicator is at the "Clear" position, the conductor gives five complete turns to the crank, which rings his bell, then he gives five turns more, and if the bell does not again ring it indicates that the indicator at the opposite end is set at "Block," and the car being thus protected may proceed. If the bell does not ring at the end of the first five turns of the crank, or if it does ring at the end of the second five turns, or if the indicator falls to "Block" while the conductor is using the crank, it indicates trouble, and a flagman with the proper signals is sent at least five minutes in advance of the train.

This signal does not protect the rear end of the train, and each train must protect its own rear end when it stops or for any cause is moving at a slower speed than is customary.

In case a car becomes dead while crossing a steam railway's tracks the rule is as follows: "You will immediately notify all passengers to leave the car and proceed to a safe distance from the track of the steam railway. You must then proceed in both directions on the track of the steam railway (the motorman one way and the conductor the other), to a distance of at least  $\frac{1}{4}$  mile, or 10 telegraph poles, and place one torpedo on top of the rail on the engineer's

side. The conductor will then go to some telephone or in some other manner at once notify some authorized agent of the steam railway of the obstruction, and the motorman will return to his car. After the conductor has notified the steam railway, he will notify the proper officer of the company. A supply of torpedoes must always be carried in the motorman's tool box. After the car has been moved from the crossing of the steam road, and the track of the latter is clear, you should remove the torpedoes from the rails of the steam road if they have not been exploded by approaching trains."

The manager of this road writes us that while this system has worked satisfactorily, he has been considering installing a block signal for added security.

Road No. 11: This is an interurban line 23 miles long; it is single track with several sidings and turn-outs. The cars are operated on an hourly schedule, from 12 to 17 round trips being made per day, though as high as 80 have been made in one day. The cars are run by a time table, the meeting points being so arranged that the cars pass at two points on the even hour, and at one point on the half hour. There is a train dispatcher with telephone connections at each meeting point, and when a car gets behind time orders are given by telephone, the car out of schedule reporting at each telephone to the dispatcher who gives the order; this order the conductor enters in a book, which he carries for the purpose, and then repeats back to the dispatcher as a check. At meeting points, when delays occur, the car having the right of track is first located and ordered to pass the car which is out of time at some other point, and then the order is given to the late car.

The code of rules is complete and has been found well adapted to the service, so that a heavy traffic can be handled with safety. The dispatcher gives his orders through the agents at the regular stations or by having the conductors call him up at points where there are telephones but no agents at the regular stations or by having the conductors ber of cars, they are run in sections.

During the three years that the line has been in operation, the system has been found to work satisfactorily and the two or three slight accidents which have occurred have been caused by the employes over-running or forgetting their orders.

Road No. 12: This road operates 13 miles of single track in a district where very thick fogs are of frequent occurrence, and makes use of the telephone to protect the cars against accident. The instructions to motormen are to lie at every turnout until the car to be passed at that point has arrived, or until orders have been received by telephone to proceed. By this means the central office is kept advised as to the location of the cars.

Road No. 13: The superintendent of a western line writes regarding the system in use on his road as follows:

The company operates a line of single track about 8 miles

in length. Suitable turn-outs are provided which enable cars to be operated at 15, 20 and 30 minutes, as required, and which are closed when not in use for points of meeting. These turn-outs are known by numbers, as 2, 5, 8, etc. The track is laid on grades of from 1 to 10 per cent and has many curves. As a rule there is much foggy weather on this division, particularly during the summer months. Double truck vestibule cars are used on this line and are equipped with two powerful lever brakes and double headlights for night service.

No extraordinary precautions are employed to avoid head end collisions by the use of block signals or other automatic device.

The oldest and most experienced men in the company's service are employed on this division. The motormen have unbroken records of from three to six years' service and are regarded as expert men in every sense of the word, both in knowledge of their equipment and skillful handling of their cars. In the writer's judgment this is the first requisite in the operation of single track road.

Complicated rules or directions for running are not necessary or desirable, and therefore but one general rule is made which in effect is as follows:

If for any reason a car is detained and unable to make its appointed turn-out within five minutes of schedule time, it loses all rights on the main line and must give way to all cars going in the opposite direction.

Trailers are not used, owing to heavy grades, but on busy days two, and sometimes three, cars are run in one section. These cars are not permitted to run in closer proximity than 300 ft. All cars followed by another within that distance carry a green flag or light displayed on the corner of the forward vestibule. Cars on turn-outs are not permitted to take the main line when passed by a car carrying colors.

Aside from these precautions no other general rules govern the operation of the road. Therefore the conclusions arrived at in the operation of a single track road of 8 to 10 miles in length are as follows:

1. Good men to operate the cars.
2. A carefully prepared time card.
3. Well located turn-outs for the service required.
4. A general rule regarding the rights of way when detentions occur.

With these principles carefully observed a collision of any kind has never occurred on this division, and while Fate may not always remain equally kind to us, I regard this branch the safest part of the entire system.

---

Road No. 14: On our single track the precaution against head collisions is that the cars are scheduled to reach a certain point at a specified time. If one car is off time more than five minutes it must wait at the switch for the other car. For instance one car, north bound would reach a given switch on its scheduled time, there it would wait five minutes for the south-bound car scheduled to be at the switch at the same time as the first arrived, then it would leave. In the meantime the south-bound car being five minutes behind time would wait at the other switch until the arrival of the car which was on time. This is the best arrangement that we have been able to determine upon and would greatly appreciate anything which would tend to decrease the danger of collisions, either front or rear end.

Road No. 15: The superintendent of this road, which operates more than 40 miles of suburban lines, all single track, says: My rules are that all cars shall wait on turn-outs a stated time for cars due from the opposite direction, and all cars that cannot reach turn-outs within the same specified time must wait on the preceding turn-out. In case of cars being off time, as an extra precaution, we oblige all conductors to go ahead of their cars on curves where they cannot see for 500 ft. ahead, and in the evening all conductors carry red lanterns with them on the cars, and these are used in case of the failure of the power, or in running ahead on curves, as a danger signal. The speed on our lines is from 12 to 14 miles per hour.

---

Road No. 16: Two single track interurban lines, one 12 miles and one 6 miles long, are operated by means of the telephone. The general orders are that no car is to leave a meeting point until the other has arrived, unless specially ordered to do so. There are telephones at all the turn-outs and also at intermediate points, so that an accident is at once known at the office, and the movements of the cars can be regulated by telephone.

---

Road No. 17: In regard to rear end collisions during the daytime on account of fog, I have to say that the only remedy I know of is careful attention and good judgment on the part of motormen, and a slower speed than usual during the foggy period. In addition a tail light with a red lens, attached to the outside rear end of each car, is the best mechanical device I know of to prevent rear end collisions. These tail lamps can be obtained of "Smith of New York." One lamp with two bracket sockets is all that is needed to equip a car, and the cost per car is about \$3. In case the power is off and the car is left in darkness these lamps (with one red and one white lens) are always reliable. We think this is a good way to avoid accidents of this sort, and have equipped our road with the rear signal light.

---

Road No. 18: We use on our line—nine miles of single track with turn-outs—the block system. A small wire connects lamps placed at each turn-out and when a car enters a block the fact is made known at the next turn-out, by the lamp there being thrown in circuit. By this means a collision is made impossible unless the operators are seeking one. We consider the system a great success.

---

Road No. 19: We operate a single track line 15 miles long, on which we give a 30 minute service, by the telephone. We have telephones at each terminus, at each switch, at the power house, at railroad crossings, etc., so that while the road is thus divided into blocks the cars are handled almost entirely by telephone orders. The system is—in my judgment—comparatively safe.

---

Road No. 20: With a view to preventing head collisions we have equipped our road with a private telephone line. The instruments are located at the ends of the lines and at all sidings. They are placed in galvanized iron boxes such as are used in some cities for police telephone. These boxes are locked. Each motorman and conductor has his key.

The conductor on a car arriving at a terminal behind time is required to telephone to the dispatcher his time of arrival. The conductor on any car leaving the terminal behind time

is required to telephone to the office his time of leaving. The conductor on a car arriving at a siding ahead of time, or arriving at a siding on time and not finding the car there which he should meet, is required to telephone the facts to the office and take orders. We have one junction point where the cars pass going in opposite directions at such times that they do not actually meet or see each other; at this point there is a sheet placed in the telephone booth on which the east-bound conductors are required to register their initials and time of passing the junction. West-bound conductors are required to enter this booth and ascertain if the car has passed. If so they punch opposite the signature which the conductor has just made. If the west-bound conductor should arrive at the junction and not find the signature and leaving time of the east-bound conductor, he is required to telephone to the office and take orders.

We have found this method very reliable and are well satisfied with it. Will say that of course the conductors are required to follow instructions with regard to telephoning implicitly. Any neglect to do so of course receives prompt

plow. The length is 16 ft., the width 6 ft., and the stationary shear rises to the level of the window sill nearly 6 ft. from the track. This unusual size and weight was designed to meet the excessive snow fall of the east, and the whole plow was built strong enough to withstand the heaviest usage in deep, hard drifts, the shear being carried in very strong guides. The lower edge of the blade is rounded in such a way as to make the plow hug the track. An extra shear of  $\frac{1}{2}$ -in. plate is put upon the forward edge of the plow at the point so as to widen the portion of the track cleaned, and heavy wings and scrapers of unusual length are provided so as to throw light snow far enough away to prevent it from falling on the rails.

The motive power consists of two G. E. 1,000 motors. There are two sand boxes and the usual conveniences within the house. The shears are raised and lowered by means of a hand wheel operating a worm gear. The diggers and scrapers are raised and lowered with a lever. The plow is mounted on 33-in. wheels. The bay window ends have stationary sash except in the centre section where the sash

BRILL SNOW PLOW FOR THE PORTLAND RAILROAD

attention at the office. In the event of the telephone line being out of order, which very rarely happens, our men are instructed to run with the utmost care and to look out for cars everywhere, not to leave sidings ahead of time, and in short to use every possible precaution to avoid accident.

(To be continued.)

### HEAVY SNOW PLOW FOR MAINE.

An interesting form of nose plow built for the Portland (Me.) Railroad, by the J. G. Brill Company, of Philadelphia, is shown in the accompanying illustration. It is of the largest and heaviest type made for a street railway. The box or car is entirely enclosed and is mounted on a very heavy floor frame, to which jaws are bolted for carrying the boxes. The side sills and end timbers are 4x12 in. A double set of end timbers were used in this plow in addition to heavy diagonals. The side sills are continuous from the point of the

drops. The side door slides. Taken all together this is one of the heaviest shear plows that has been built for a street railroad.

### RAILWAY PROGRESS IN GERMANY.

The trolley car is being received with greater favor in German cities as each year goes by and the past one has been a record breaker in the introduction of electric traction. In 1891 but three cities had electric cars, two more were added the following year; in 1893 there were 11; in 1894, 20; in 1895, 32; in 1896, 44, and at the close of 1897 no less than 64 cities enjoyed the blessings of the trolley car. The length of track increased from 533 to 842 miles of single track, and the motor cars from 1,571 to 2,255. The trailers number 1,601. The total capacity of the power stations is 24,920 k. w. New systems are now building in 26 cities, and extensions in 30 others.

**GOVERNMENT OWNERSHIP AND OPERATION OF RAILROADS.**

E. P. Ripley, president of the Santa Fé Railway, has recently written two open letters in reply to attacks made by one of the uneasy advocates of the government ownership and operation of railroads, Mr. Davis of Kansas. The second letter of Mr. Ripley takes up the charge that the railroads are operated with a reckless disregard for human life (this was urged as a reason for government ownership), and after disposing of that the writer gives his reasons for opposing government ownership. The whole of the letter is very interesting, and some portions particularly so to street railway men, because the arguments are sound and their application not confined to the steam railroad field. They apply to the municipal ownership and operation of street railways. Mr. Ripley says:

"In approaching the subject of government ownership, let me say at first, that to me, as a railway officer, and to all railway officers, as such, the matter is one of indifference. If the government owned the railways it would need men to operate them, and I should be entirely willing to take my chances of holding my present—or some other equally good—position. As a railway officer I have no prejudices on the subject.

"Nor, on the other hand, are railway owners—the holders of stocks and bonds—opposed to it. The strongest plea that has been made in behalf of government ownership was made by T. B. Blackstone, president of the Chicago & Alton, and the ground on which he urged it was, justice to the railway investor. There is no holder of railway securities who does not believe that those securities would be advanced in value if there was any prospect of the government buying them, because they are at present below their intrinsic value. So, when any man argues in favor of government ownership, let him not suppose that he is arguing against the interests of existing companies or against the interests of railway stockholders and bondholders. If I am opposed to government ownership of the railways, it is not as a railway man, but on quite other grounds, as a citizen; and I will endeavor briefly to state those grounds, though the question is a large one."

Mr. Ripley's reasons for opposing government ownership are discussed under four heads: 1. There is a grave doubt as to the legal right of the federal government to acquire and operate railroads.

2. The cost of so doing would be enormous and there would be the interest charges to meet. On this point we quote a few words as to what may be expected in the conduct of the business: "It is easy to talk of the government giving better service, employing more men, lowering rates and still making money. As a matter of fact government operation or management of anything never was, will be or can be, as economical as private management; and to earn that interest the government would have to do one of three things: (a) increase the rates—very probably to the level of the rates on the government-owned lines of Australia—which would not be pleasant for the people; (b) cheapen the service, employ fewer men and let things generally get into disrepair, which is what was done on the government-owned lines of Italy, and would be still more unpleasant for the people, or (c) face an annual deficit and rely on taxation to make up the deficit—as has been done on the govern-

ment-owned lines in India—which would be most unpleasant of all."

3. The political considerations are cited as the most serious ones, and they would be of the same serious character were the municipalities to operate street railways. These considerations are thus stated: "There are about 850,000 railway employes in the United States. Under government ownership each of these would be a political appointee. It is certain that the application of politics to the railway service would lower the character of the service, but still more appalling is the tremendous political supremacy which those 850,000 offices would give to the party in power. In Kansas there would be about 26,000 officeholders more than there are now to support the administration.

"Worse still would be the political results of the contracts for construction of new lines, etc. The scandals and the jobbery of the river and harbor appropriations or of the tariff bill would be nothing compared to the field which would be opened to the spoilsmen by the railways. If two towns in Kansas wanted a new railway built, their getting it would depend entirely on the political 'pull' of their representatives at Washington. Districts or states of a political complexion opposed to that of the party in power would have to wait till the crack of doom for any new lines; and in districts where the friends of the administration came from there would be lines as thick as stripes on a cat's back. If there were nothing else to be said against government ownership, the political argument alone would be enough to condemn it forever—or at least until our politics and government were run on entirely different principles from what they are now or until the American people was converted into a race of angels, but there is much more to be said, as we shall see."

4. In conclusion quotations are made from various authorities showing that the government operation of railroads has been, where tried, more extravagant and less efficient than the operation by private companies.

**WORKMAN'S PASS.**

The accompanying illustration shows the form of workman's pass used on the Calumet Electric Street Railway, Chicago. In speaking of the ticket, General Manager Sloan

The Calumet Electric Street Railway COMPANY. <b>WORKMAN'S PASS.</b> No. 87419 GOOD ON ANY LINE FOR THE DATE PUNCHED.																July.	Jan.

states that it is a great relief from the annoyance of furnishing temporary workmen with transportation, and that it reduces very much the chances of misuse of such transportation offered by ordinary methods.

# THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

The Journal of Electricity for December describes a home-made oil filtering plant provided by G. J. Johnson, engineer of the Electric Improvement Company, San Jose, Cal. The plant, 1,000 h. p., used 8 gals. of lubricating oil per day before the filters were put in; afterwards  $7\frac{1}{2}$  gals. per month were sufficient. The oil is collected in drip pans and, together with what can be wrung from used waste by passing it through an ordinary clothes-wringer, is run into a receiver consisting of an oil barrel with a gage glass in the side. This serves as a settling tank, and the oil is led from the upper part of it to what is called the "filter," and then to the "refiner." The filter is a tank provided with a series of strainers of varying degrees of fineness, and the refiner differs only in having strainers of finer mesh, such as flannel or other woolen fabrics. In both of the filters the oil is washed by passing it through water. The cost of the outfit did not exceed \$25, and has effected a saving of nearly \$50 per month since its installation.

\* \* \*

The pond and troughs, for cooling condensing water from the power station of the Calumet Electric Railway, of Chicago, were described in the "Review," September, 1896, and other references have been made to them in these columns. The water supply for this self-cooling condenser has heretofore come from the city mains, and the water bill frequently amounted to \$100 per month. By a new system of drainage this charge will be entirely eliminated during the fall, winter and spring months. All the water from the roofs of the extensive car barns and other buildings about the plant is drained into the pond. At the northwest corner of the plant the electric cars pass into a subway which runs under the Illinois Central tracks. As the contiguous territory was all formerly a morass, a great quantity of water accumulates in the subway. This is collected in a dry-well and lifted to the surface by a centrifugal pump, driven by an old Ray motor. On an average 15,000 gals. of water was pumped out of this well a day into the sewer, but now this is directed into the cooling pond. The pond is provided with an overflow into the sewer. By the new arrangement, recently completed by General Manager Sloan, all the water needed for the boilers and condensers comes from the drainage.

\* \* \*

#### The Heat-Unit Basis.

Regarding the rating of electric power plants on the heat-unit basis, that is, expressing the performance of the station in the kilowatt-hours per 1,000,000 B. T. U. supplied to steam used in the complete plant, proposed by W. S. Aldrich in a paper before the American Society of Mechanical Engineers in June last, the author presents an abstract of the discussion of that paper in a second one before the Society in December. The points brought out in that discussion and in conferences with engineers since the meeting are thus stated:

"That the heat-unit as a basis for such ratings is both rational and scientific. It is, however, not in consequence the most satisfactory standard for use of builders, contractors and practical engineers dealing with this class of motive-power machinery; namely, steam engines and dynamos.

"That great differences of opinion exist as to the proper definition of the heat-unit required for such a standard. There are at least four different heat-units commonly employed.

"That the present extensive and satisfactory use of the heat-unit for steam-pumping installations is as it should be and is all right in that place; but this is no argument for its introduction and use in a similar manner in the rating of steam electric plants.

"That the present way of stating the performance of electric power plants, however unsatisfactory, is easily understood by all parties interested. Chief of these, of course, is the capitalist; he can readily comprehend rating based on the coal bill.

"That the load factor, after all, has not so much to do with the fuel economy of the plant, as such, however much the varying loads may individually affect any of the units of the installation, such as the steam-engine. Therefore, in the large city and suburban steam-power and electric plants now being installed, there is not the necessity for such strict adherence to economic load factors as in the case of plants with smaller units.

"That the watt expresses the activity or rate of the electrical output, in joules per second. In this respect it is analogous to the horse-power rating of mechanical output. Hence, the standard rating should be in kilowatt-hours per 1,000,000 B. T. U. supplied to the steam used in the whole plant.

"That if the heat-unit basis is considered as the proper standard for the steam electric plant, the whole heat supplied to the plant should be as carefully determined, and in the same manner, as now in vogue for similar standard ratings and contract trials for steam-pumping plants.

"That the boiler should be in evidence in all cases in which plant performance is mentioned. In the electric plant it is economy of installation that is desired quite as much as in the case of pumping plants. Why should the boiler performance be urged into consideration in the former case and not in the latter? If it is a good thing to introduce it in either case it would seem proper to do so in both cases.

"That the common rating of performance of pumping plants in foot-pounds per 1,000 lbs. steam would be amply sufficient for all purposes of rating electric plants for which the heat-unit basis is advocated. This seems particularly plausible on account of the small variation in the total heat of one pound of steam for quite a wide range of pressures now used in modern electric plants. Taking the standard temperature of feed water at  $212^{\circ}$  F., exactly 1,000 B.T.U. are required to raise the temperature and evaporate one pound of feed water into steam at 77.3 lbs. per gage (92 lbs.

abs.) Taking this as suitable for a simple non-condensing engine, we may compare it with that of 150.3 lbs. gage (165 lbs. abs.), in which 1,013.5 B.T.U. are required to raise the temperature from feed water (212° F.) and evaporate it into steam at the given pressure. In this case, therefore, if we adopt 1,000 lbs. steam instead of the 1,000,000 B.T.U., we make an error of only 1.3 per cent. It is claimed that this is within the usual allowable errors of observation and measurements in power-plant tests, and that there is not enough difference to warrant the trouble required to obtain the performance reduced to a B.T.U. standard."

In a table are given the results of four years' progress in the economic performance of steam-power electric plants, as gathered from reports of the Committee on Data of the National Electric Light Association. The watt-hours per lb. of coal are given in the table as follows:

Year.	No. of Stations.	Max.	Min.	Av.
1894.....	65	208	25	91.7
1895.....	24	262	36	128
1896.....	81	237	33	108
1897.....	14	269.5	98.7	156

These are all electric lighting stations; the descriptions of the plants having the maximum records and the minimum records are tabulated in a second table, in which are also given the daily output and the kind of fuel. The daily outputs of the stations having the maximum ratings were from 3,270 to 22,967 kilowatt-hours per day; those for the minimum records from 80 to 2,790 kilowatt-hours.

For the purpose of showing how the street railway plants, reports of the performance of which we have been publishing in the "Review" for some months, compare with the electric light plants given above, the daily output and the watt-hours per lb. of coal have been tabulated for the six stations regarding which the data are sufficiently complete. The outputs and the watt-hours are averages for six months except in case of No. 10, where they are for five months:

Station.	Daily Output k. w. h.	Watt-Hours pr. Lb. Coal.
1.....	35,203	338.8
2.....	4,728	236.3
3.....	5,695	193.2
4.....	8,294	246.6
5.....	54,849	281.0
10.....	10,232	212.2

Being railway stations and running a greater number of hours per day (roughly, at least three times as many hours

at good load) than the lighting stations, it appears that the six plants tabulated should be directly comparable so far as daily output is concerned with the "maximum" plants in the first table. The comparison shows that these six plants are well up as regards the watt-hours per lb. of coal. The Committee on Data in two of its reports cited the performance of the engine at the Chelsea Jute Mills, Brooklyn, showing a coal consumption of 1.482 lbs. per i. h. p. per hour with a load varying from 495 to 765 h. p.; and the performance of the Chestnut Hill (Boston) pumping plant, of an effective pump horse-power on 1.34 lbs. of coal. Were these to be equaled in electric stations the results would be 400 and 557 kilowatt-hours per lb. of coal, respectively.

It is admitted that the tabulations here given do not give all the information that could be desired, but they were made for the purpose of showing how the street railway plants compare with the lighting stations on the same basis as used for the latter in the paper quoted.

### A Continuous Recording Indicator.

In the operation of street railway power stations there is no difficulty in ascertaining the load upon the electrical machinery at any instant or in securing a record of the total output; this is merely a matter of reading the instruments. But when it is desired to determine the losses between the steam cylinders and the generators, it is necessary to provide a constant load for a considerable time or to attempt to take all the necessary observations at the same instant. The difficulty of providing a constant load in a street railway station is readily appreciated, and second method, that of taking simultaneously indicator diagrams and the instrument readings, is open to the objection that the results will always depend on whether the load at the instant is increasing or decreasing, that is, whether the flywheel is storing up or giving out energy.

A continuous recording steam engine indicator offers just what is desired, a means of recording all the work done in the steam cylinders, as the wattmeter gives the total output of the generators. It is, of course, not meant that there is the same need for an indicator as for a wattmeter in the ordinary operation of the station, but only for the purpose of tests under actual running conditions.

The obstacles to be overcome in the successful design of such an indicator can readily be appreciated, and few of them have proved of any practical value. We reproduce from Engineering, London, the accompanying illustration

and description of an instrument designed by W. G. and C. W. G. Little, of Bexley, Kent, which is simple in principle and construction and, as numerous tests have shown, accurate in its working.

The details of the instrument are as follows: A is the cylinder of the indicator containing the piston and spring, which are of the usual standard type. B is a carriage, sliding on to the upper part of the cylinder, and securely held in position upon the bracket of the instrument by the conical screw G which, on being screwed home, brings the axis of the shaft C into a position to cut the axis of the drum O at right angles. C is a shaft provided with a rigid arm P carrying the counter F and one pivot of the axis of the wheel E, the other end of which is pivoted on the shaft itself. The wheel is dished to allow of the forward bearing H being brought close up to the contact slide L of the drum O, and in line with the shaft C. The counter F consists of two toothed wheels, one of 100 teeth and the other of 99 teeth, both engaging with a worm on the axis of the plani-

LITTLE CONTINUOUS RECORDING INDICATOR.

meter wheel, the upper one being graduated in 100 divisions, a simple and well-known device for recording a large number of revolutions. D is a crank carrying a pin I working in the slot of the crosshead R, which pin is kept in contact with the lower surface of the slot by means of the small spring S. The spring I bears upon the pointed end of the shaft, keeping the wheel in contact with the drum at a fixed pressure. M is a rocker enabling the wheel to be placed in contact with the drum, or not, at will. K is a frame carrying the bearings of the drum O, the latter being provided with a hollow spindle which can be filled with oil for the lubrication of the upper and lower bearings, which are conical centres. The lower part of the frame is split, and fitting accurately over the spring box on the bracket, can be tightened up in any desired position by means of a single screw. The milled head T is a removable stop to the drum O. M is a device for accurately measuring the stroke of the drum while in motion, and which, by means of a vernier, can be read to .005 in. This device consists of

three parts, a center piece attached to the frame, and two rings fitting around it, each being provided with a tooth on the lower side, one ring being graduated, the other carrying a vernier. As the upper edge of the drum is provided with a similar tooth at the same distance from the centre, its contact with those on the rings causes them to set themselves apart by an amount equal to the stroke of the drum and thus to record accurately the amount of its rotation. L is a hard brass sleeve which can be slid up or down, allowing a change of the contact surface if necessary; but as the pressure of the wheel upon the slide is very slight, a great number of revolutions can be made upon one place before the line of contact can be detected even by the finger nail, and the instrument will continue to record accurately for an indefinite length of time.

This instrument is an integrating device, and its theory may be thus explained. The work done in the cylinder in any short interval of time is the product of the total mean pressure on the piston during that time multiplied by the distance the piston moves during the same interval, and is positive or negative according to the direction of the motion of the piston. The drum O being connected to the crosshead by a reducing motion, its motion is the same in direction and proportional in amount to the distance traveled by the piston. The drum O and the wheel E being in contact, it is evident that the rotation of E will depend on angle which its plane makes with the axis of the drum O; the distance traveled by a point on E is the distance traveled by a point on O multiplied by the sine of the angle of inclination of the plane of E to the axis of O. But because of the slotted crosshead R and crank D the sine of this angle of inclination is proportional to the steam pressure in the cylinder, provided the angle equals  $\theta$  when the pressure equals  $\theta$ . The result, therefore, is that the wheel E by its rotation during the forward stroke registers on the counter the work done, and during the exhaust stroke rotates backward an amount proportional to the negative work done by the piston. And the reading of the counter at any time, multiplied by a constant depending on the dimensions of the instrument and of the engine, gives the work done up to that time.

It can also be shown that it is not necessary that the angle of inclination between E and the axis of O be equal to  $\theta$  when the steam pressure is  $\theta$ ; that is, the wheel may be set at any initial angle. In practice this initial angle is made about  $35^\circ$ , which gives sufficient torque on the spindle of the wheel at all working angles, and any slip during the forward stroke is compensated for by the slip during the return stroke.

Tests have shown the instrument to be reliable up to speeds of 450 r. p. m.

#### The Q & C-Scott Boiler Feeder.

As we have frequently called attention in these columns to the wastefulness of steam pumps for feeding boilers, it is with satisfaction that we place before our readers the description of the Q & C-Scott boiler feeder, which supplies the boiler with water at a lower cost than can be done by the ordinary steam pump, and automatically maintains a constant water level. The economy of the apparatus over a pump is due to two things: 1. It is necessary with it to do absolutely less work to accomplish the same result, that is,

feed the boiler. This is true because the water is introduced into the boiler from the main receiver by gravity, and it is only necessary to lift it to a height slightly above the boiler, instead of pumping into the boiler against boiler pressure.

2. In the vessel in which the steam works when lifting the water all the ordinary losses except radiation, that is, the heat that would be lost because of leaky pistons, clearance, cylinder condensation, etc., is all returned to the feed water. Also, the items of pump repairs, packing and oil are eliminated.

The illustration shows the arrangement of the apparatus when the water is taken from an open heater; it is also arranged for use with a closed heater. The operation is as follows: Water from the heater enters and fills the primary receiver by gravitation, and is then driven to the main receiver by steam pressure admitted to the primary receiver through the differential and pass valves. When the main receiver is in this manner filled, the steam valve at the top rises and admits steam to the surface of the water. The pressure above the water balances the pressure from the boiler upon the check valve in the feed pipe, and the height of the column of water causes it to fall by gravity, discharging into the boiler.

During the time when the main receiver is discharging into the boiler, the primary receiver is refilling, the steam to force the water from this primary receiver being alternately admitted or cut off by the action of the differential valve.

The motions of this valve are governed by variations of the pressure in the main receiver, communicated by the equalizer pipe, in such a way that while the main receiver contains full boiler pressure, the valve is closed, but when pressure in the main receiver is reduced by a few pounds, the valve is opened. When the primary receiver has refilled, it awaits the reduction of pressure in the main receiver, which is needed to open the differential valve.

Assuming the primary receiver to be filled with water and the main receiver to be discharging, the latter will contain full boiler pressure and the differential valve will be closed. The main receiver will continue to discharge until the water recedes to such a level as to allow the float of the relief valve device to fall. This closes the steam valve above and confines a volume of steam equal to the capacity of the receiver above the water level. Natural radiation with its consequent condensation, almost instantly causes a slight reduction of pressure in this receiver below the pressure in the boiler, and this small reduction permits water to be driven back to the main receiver through the spray pipe, which is connected to the boiler feed pipe.

The spray which this returning water forms by impact against a deflecting plate, falls through the steam and causes a much greater reduction of pressure, amounting generally to 30 or 40 lbs. This fall of pressure opens the differential valve and admits live steam to the surface of the water in the primary receiver, and drives the water to the main receiver. As the main receiver fills, its pressure rapidly recovers until it equals that of the boiler. The differential valve then closes, thus allowing the steam in the primary receiver to exhaust and enabling the receiver to refill with water, which condenses whatever steam remains, thereby absorbing all the thermal units therein contained. A repetition of these actions makes the operation of the device continuous. The rapidity of the operation, however, varies with the boiler requirements without attention from anyone. Though usually arranged to make two or three discharges per

minute, a sudden call upon the boilers will cause the appliance to accelerate its speed of action, while a lesser requirement will correspondingly retard it.

It is evident that the only steam exhausted is that used

THE Q & C—SCOTT BOILER FEEDER.

in the primary receiver for lifting the water to the main receiver, and the volume of this steam, at boiler pressure, is equivalent to the volume of water transferred to the main receiver. Comparative tests have been made showing the steam required for this feeder system to be less than 12 per cent of that used by a duplex pump of the size usually provided for boilers of the size tested.

On January 23 the boiler room of the Salem power house of the Lynn & Boston Railroad Company was flooded by the concurrence of an unusually high tide and a heavy downfall of rain. The dynamos were stopped and cars stalled on the local division.

On January 28 a fire in the building adjoining the power house of the West Chicago Street Railroad threatened the former building. A large quantity of oil, which is used for fuel, was stored in the basement, which was flooded as a precaution. The offices of the company are in the building, and the danger appeared so imminent that the books and papers were removed to a place of greater safety. The hose lines carried across the track compelled the abandonment of the down-town loop for several hours during the evening.

### OFFICERS OF THE BOSTON ELEVATED.

At the meeting of the stockholders of the Boston Elevated Railway Company, held on January 3, the following directors were elected for the ensuing year: Frederick Ayer, William A. Bancroft, Samuel Carr, F. Jefferson Coolidge, William Endicott, Jr., William A. Gaston, Charles J. Paine, F. H. Peabody, Robert Winsor, James M. Prendergast and Jacob C. Rogers. A few days later officers were elected as follows: William A. Gaston, president; William A. Bancroft, vice-president; William Hooper, treasurer; John T. Burnett, secretary and clerk of the corporation. C. S. Sergeant, formerly general manager of the West End Company, was elected second vice-president of the Elevated Railway Company, with enhanced duties and emoluments. Prentiss Cummings, formerly vice-president of the West End, is advisory counsel, and J. H. Goodspeed, treasurer of the old company, is comptroller.

It is expected that the company will move its offices from the somewhat cramped and narrow rooms in which a portion of the business of the West End Company has been carried on for over 10 years, to the Converse building, now in process of erection at the corner of Pearl and Milk streets. The company will occupy eight or more stories in the new building and have ample room to provide for all of its office force, which is now scattered through five buildings in various parts of the city.

### STREET RAILWAYS IN PENNSYLVANIA IN 1897.

From the annual report of Major I. B. Brown, superintendent of the Bureau of Railways of Pennsylvania, we take the following data as to the street railways of Pennsylvania for the year ending June 30, 1897:

The capital stock outstanding at that date was \$143,489,309; the funded debt, \$42,812,430, and the current liabilities, \$34,266,976, making the total capitalization \$220,568,715. Of this amount of capital stock and funded indebtedness the street railway corporations themselves own \$52,314,349. It is stated that comparisons between this statement and those of former years are difficult to make and would probably be inaccurate because of the remarkable rapidity with which changes are made in the management, leasing or control of street railways as the result of recent legislation and the introduction of electricity as a motive power. There have been but few consolidations or mergers in law, yet there are a large number of cases where a traction company, as authorized by law, has leased the lines of other companies upon a nominal rental, and the stock of the leased companies, or a large portion of it, has been assigned to the new one, the stockholders taking the stock of the latter company in payment. This is practically a consolidation or merger, and it is said in the report that it would be well for all concerned if the laws were so amended as to permit such consolidation in law as in fact.

The total cost of road is reported at \$100,416,717, and the cost of equipment at \$17,833,297, making the total for road and equipment \$118,250,014. The total mileage is given as 1,551.97. Per mile the cost of road and equipment are, respectively, \$64,703 and \$11,491, a total of \$76,194.

The gross earnings from operations were \$18,879,649; income from other sources, \$8,516,840, or a total income of

\$27,396,489. The receipts have fallen off in a measurable degree from those of the previous year. Major Brown says:

"In all probability the use of the bicycle by business people and pleasure-seekers is the prolific source of the reduction in the receipts of many street railway companies. In cities where favorable conditions do not exist for the use of the bicycle, where the hills are steep and not easy of ascent or descent, the railway companies probably have not been affected by the use of the wheel to so great an extent, but in cities like Harrisburg and many others it cannot be gainsaid that the bicycle has become a most serious competitor of the railway.

"To reinforce this view of the case an observation was made on Third street, Harrisburg, during the month of October, 1897. The observation covered two days from 7 in the morning to 6 in the evening. During that time 6,078 persons passed a given point, 1,962 in the cars and 4,116 on bicycles; 67.7 per cent on bicycles and 32.3 per cent on the cars, or more than two to one in favor of the wheel. To what extent this large number of bicycle riders affected the receipts of the traction company can only be conjectured."

The total of operating expenses is given at \$10,075,644; taxes, \$1,567,335; interest on funded debt, \$1,919,084; rentals, \$7,736,525; other expenses, \$942,481; dividends, \$5,214,874; a total of \$27,455,943.

Reduced to per mile of track the figures for receipts and disbursements are, cents omitted, as follows:

Gross earnings, operations.....	\$12,165
Income, other sources.....	5,488
Total income .....	\$17,653
Operating expenses .....	\$ 6,492
Taxes .....	1,010
Interest on funded debt.....	1,237
Rentals .....	4,985
Other expenses .....	607
Dividends .....	3,360
Total expenditures .....	\$17,691

The report shows that there are in the service of the street railways of Pennsylvania 4,914 motor cars and 499 other cars, or a total of 5,413, and that the number of employes is 12,079, to whom was paid during the year \$6,920,692. The number of passengers carried is shown to be 409,723,418.

During the year there were 18 passengers killed and 510 injured; there were 4 employes killed and 71 injured; of other persons there were 71 killed and 364 injured; total, 93 killed and 954 injured. The statement is made that the hazard to passengers is greater on street railways than on steam railroads, as there were but 36 passengers killed and 782 injured on over 22,000 miles of steam railroads operated within the state. This is correct as to the hazard when the basis chosen for comparison is the number of miles of track operated. Based on the number of passengers carried, the figures are quite different, being as follows: Passengers killed: Street railways, 1 in 22,762,412; steam roads, 1 in 4,281,226. Passengers injured: Street railways, 1 in 789,448; steam roads, 1 in 107,086.

An extra car has been found necessary to accommodate the early morning traffic on the Wilmington (Del.) & New Castle Electric Railway.

## STREET RAILWAY ACCOUNTANTS' ASSOCIATION.

The increase in the membership of the Street Railway Accountants' Association, which was organized less than one year ago, is very gratifying. In March, 1897, the association organized with 25 companies as members; 12 others joined in the interval between that meeting and the Niagara Falls meeting in October, and at the convention 16 more companies were added to the membership. Since then the Brockton Street Railway Company, Brockton, Mass.; the Capital Traction Company, Washington, D. C.; the Detroit Citizens' Railway Company, Detroit, Mich.; the Atlanta Railway Company, Atlanta, Ga.; the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.; the United Traction Company, Pittsburg, Pa., the Salt Lake City Railroad Company, Salt Lake City; the New Orleans & Carrollton Railroad Company, New Orleans, and the Hartford Street Railway Company, Hartford, Conn., have also joined. One company, the Cincinnati Street Railway Company, has withdrawn from membership.

The 60 American and Canadian companies which are members of the association operate 3,721 miles of track and 17,414 cars. The total street railway mileage of the United States and Canada in 1897 is given as 16,228 miles, and the total number of cars operated as 52,779. Therefore, the members of the Accountants' Association represent 22.9 per cent of the street railway mileage and 33.0 per cent of the cars of the United States and Canada. No better evidence could be brought to show that the interest in the work of the association is genuine and that its career is certain to be a prosperous one.

The companies which have, so far as we are advised, adopted the standard system of accounting reported by the committee of the association are as follows: Cass Avenue & Fair Grounds Railway Company, St. Louis; Citizens' Railway Company, St. Louis; St. Louis Railroad Company; Lindell Railway Company, St. Louis; Missouri Railroad Company, St. Louis; Union Depot Railroad Company, St. Louis; Twin City Rapid Transit Company, Minneapolis-St. Paul; Cleveland Electric Railway Company, Cleveland; Toledo, Bowling Green & Fremont Railway Company, Toledo; Hamilton Street Railway Company, Hamilton, Ont.; Richmond Traction Company, Richmond, Va.; Akron, Bedford & Cleveland Railroad, Cleveland; Columbia Railway Company, Washington, D. C.; Tonawanda Railroad Company, Tonawanda, N. Y.; Augusta Railway & Electric Company, Augusta, Ga.; Montreal Street Railway Company, Montreal, Can.; Boston Elevated Railway Company, Montreal, Can.; Boston Elevated Railway Company, Boston; Capital Traction Company, Washington, D. C.; Lehigh Traction Company, Hazelton, Pa.

In January, Secretary Brockway addressed inquiries to the members of the association as to the action which they had taken in regard to standard system of accounts. The information which may be elicited will be awaited with great interest by all who wish to see the accounts of street railways placed on a basis that will admit of comparisons of value.

The scene of the hold-up has again shifted; this time it is in Omaha. Two men entered a car on the 13th street line and secured \$25 of the conductor and motorman.

## HIGH WATER AT NIAGARA.

The great storm which swept over the central states on January 21 and 22, doing a great deal of damage in wrecking pole lines by an overload of sleet and snow, made itself felt at the foot of Lake Erie in a terrific gale of wind. The storm blew at a rate of 50 miles an hour steadily out of the west for 48 hours, with a result that mountains of water were forced to the foot of the lake and rose at the docks in Buffalo to the highest point in many years. This volume of

WASHOUTS ON GORGE ROAD.

water naturally caused a rise in the Niagara river, where the water came to a point making it too dangerous to use the foot bridges to the islands, while the Sister islands were partly submerged. The water in the Gorge in places rose 30 ft. above normal and the Maid of the Mist landing and shelter at the foot of the incline were swept away. Serious injury was caused in places to the roadbed of the Gorge road, which, pending repairs, forced the cars to use the incline at the Battery. Our illustration shows one of the washouts in the track, the location of which will be readily recognized by all who were at the Niagara convention.

## WE ALL HAVE OUR TROUBLES.

"A Reader" hands us the following, which indicates some people are not afraid to ask for what they want, whether they deserve to get it or not:

"We have met the champion kicker; he kicked because the conductor asked him for his fare, when he only wanted to go to two blocks, and, the manager being on the car, he thought the conductor should have been instructed to carry him. He got off, but demanded an explanation from the manager when he met him a few days later."

# BOOSTERS FOR STREET RAILWAYS

The adaptation of the booster for street railway service has been of recent origin, and more consideration has been given to the subject this last year than at any previous time. Theoretically the booster is only a subterfuge, for the energy generated is not intended for useful work; the increase in voltage is only to compensate for the drop in the lines. The conditions which call for the booster, have been developed within the past year or two. Many companies have built lines out to pleasure resorts some miles from the city and the center of distribution. Only for a few months in the year is it necessary to make provision for power on such a line. At certain times the traffic will be so heavy as to tax the capacity of the conductor circuit to its utmost limit.

FIG. 1.—CONNECTIONS FOR BOOSTER OR GENERATOR.

The result is a very large drop in voltage, inefficient operation of motors, a slow speed of cars, and an enormous loss of current. The traffic is profitable, but on account of its being intermittent it will not justify large feeders and heavy line construction.

There are other cases where a separate system, with its own power plant, has been absorbed by a large company. The energy output of the small plant is very expensive as compared with that of the central station of the system, but the lines may be so long as to prohibit an economical distribution at 500 volts.

Perhaps the most frequent occasion for a booster installation comes from extensions to existing long lines, such as described by Charles Hewitt in his paper before the last meeting of the A. S. R. A. A line, having heavy traffic, terminated 7.3 miles from the power station. It became necessary to extend the line 3.9 miles farther, and the problem then presented was an economic choice between a sufficient increase in feeder capacity, an auxiliary station, storage bat-

teries and a booster. The estimated cost of the installation was \$52,000 in favor of the booster and battery. An old 300-k. w. dynamo was easily altered to serve for boosting. The generator circuit passed through the booster and the initial potential was raised 150 volts, more or less according to the current demand. By this means compensation was made for the drop in the feeders and the pressure at the battery house, which was located at the end of the line, remained nearly constant.

There is hardly a doubt but that there are many feeder lines which for economic transmission require a voltage above 500. In some cases the voltage at the generator has been raised to 600, but this can not be recommended. The raised voltage should only be where required, that is, on long feeder lines where the drop will reduce it to about the same potential as on the rest of the system. If careful tests were made it would be found that the installation of a booster in many central stations would be economical wherever feeders extend farther than 5 or 7 miles from the generators. In systems, like those in Chicago and Boston, where there is an enormous demand for current, the building of large sub-stations near the centers of distribution is unquestionably the best policy, but these conditions exist only in the largest cities.

One of the first railways to adopt the booster was the Chester Traction Company. In June, 1894, one 100-k. w. and one 150-k. w. Short railway generators were connected up as boosters. The connections, made by J. L. Woodbridge, are such that the machines can be used either as boosters or generators. Fig. 1 shows a diagram of connections for such alteration. A double-throw switch, having seven blades, four for the shunt field circuit, connects the dynamo as a booster when thrown up. However, the feeder switch is open, and the shunt fields are in parallel with each other and the feeder as shown. The machine can be used as a generator again by reversing the switch. The system has been in service ever since its installation on occasions of heavy loads, during Saturdays, Sundays, holidays and the summer months. The boosters, of course, are engine driven and are connected to two lines 7 and 9 miles long, upon which the potential is raised to 900 volts. This plan saved an investment of \$15,000 in copper, and the cost of operation is only a small fraction of the interest on that sum. The boosters have given satisfaction and have proved to be a good investment.

In July, 1895, a booster was started in the power house of the City & Suburban Railway Company, now a part of the Baltimore Consolidated Railway Company. Several of the lines extended 5 to 7 miles out from the station and terminated at summer resorts. On Sundays and warm nights during the four summer months as many as 20 cars are required on each division to handle the traffic, while for ordinary travel two or three are sufficient. Feeder lines were strung sufficient for six or seven cars and the booster was to care for the rest of the load. For this purpose a General Electric 125-volt six-pole lighting generator was installed. The field coils were rewound for series con-

nection and the machine belted to a small engine. The machine is connected up at the switchboard through a panel with an ammeter, voltmeter and circuit breaker on it. On the long distant feeder panels there is an auxiliary bus bar through which any of the feeders can be connected by a double-throw switch to the booster circuit.

The Toledo & Maumee Valley Traction Company and the Toledo, Bowling Green & Fremont Railway Company, two companies under the same management, each has a booster connected to its feeder lines. C. A. Denman, general manager of the two companies, gives the following description: "The Toledo, Bowling Green & Fremont line extends from Bowling Green to Perrysburg, a distance of 13 miles. From Perrysburg the cars run over the line of

FIG. 2.—FEEDER CONNECTIONS.

the Toledo & Maumee Valley Railway into Toledo. The Toledo & Maumee Valley Railway has a belt line of 23 miles in length, or around, extending up the west side of the river to Maumee, thence across the river to Perrysburg, returning on the east side by way of East Toledo. The Bowling Green road is fed from the Bowling Green power station at the extreme end of the line, and the Toledo & Maumee Valley is fed from the power house of the Toledo Traction Company in Toledo, a distance of 11½ miles from Toledo to Perrysburg.

"Owing to the length and variable travel on these lines, the ordinary method of distribution would not be applicable as the expense for copper would be prohibitive. The booster system is in use on both of these roads. The booster has been in service on the Bowling Green line since the road was built, which is about a year and a half. The Toledo & Maumee Valley Railway has been in operation about three and one-half years, the booster being used here for two and one-half years. Before it was installed it was

FIG. 3.—BOOSTER CHARACTERISTIC.

impossible to run on a fast schedule on account of the low voltage, but no trouble has been experienced since, however heavy the load. The first four miles of each road is fed direct from the generators and the rest from the booster. A diagram of the feeders is given in Fig. 2. The booster is a series wound machine with its negative brush connected to the positive bus bar, and the positive brush to the feeder; the voltage is thus raised automatically as the load increases, to compensate for the drop in the line. Theoretically, the rise in the voltage ought to be equal to the drop in the line, but such close regulation is not necessary in railroad work. The characteristic of the booster at Bowling Green taken in actual service is given in Fig. 3. It is seen that the voltage rises a little faster than theoretically required for loads under 100 amperes, and a little slower for loads above this, due to the fields approaching saturation. The booster, used at Bowling Green, Fig. 4, is one made by the General Electric Company, and is a 45-k. w. multipolar machine.

FIG. 4.—BOOSTER AT BOWLING GREEN.

FIG. 5.—TOLEDO & MAUMEE VALLEY BOOSTER.

"The one used at Toledo on the Toledo & Maumee Valley Railway is a 200-k. w. Edison bi-pole railway generator, Fig. 5, rewound for use as a booster. A double-pole, double-throw switch is used in order that the booster may be cut out, and this line fed direct from the generators and still have the current pass through the wattmeter. A diagram of connections is given in Fig. 6. Both machines are engine driven. On several occasions, due to accidents at

FIG. 6.—SWITCHBOARD CONNECTIONS.

the Bowling Green power house, power has been supplied from Toledo, a distance of 26 miles, and the cars operated, the voltage at Bowling Green being 400 volts with two cars on the line, each loaded with 40 passengers, and a speed of 24 miles an hour has been attained under these conditions. These were double truck cars, 36 ft. over all, equipped with two G. E. 800 motors each. If the question of running cars 26 miles away from the power station at a speed of 24 miles an hour were submitted to most electrical engineers they would say it would be impossible, but before trying the scheme I was confident that I could run cars that distance from the power house for the reason that I have frequently tested the voltage 11½ miles from the power house, and found that I had from 575 to 625 volts, but I was very much surprised to find on looking at the instrument, that I had 400 volts at Bowling Green with power cut in.

"From the Toledo power house we have a 350,000-c. m. cable running 4¾ miles from the power house and tapping into two No. 00 trolley wires running 4½ miles and one No. 00 trolley running 2¼ miles. This is the extreme end

FIG. 7.—T.-H. DYNAMOS USED AS BOOSTERS.

of the Valley circuit wire; it is then attached to the Bowling Green line with a fibre circuit breaker on the Bowling Green line. There are two No. 000 figure 8 trolley wires running the entire distance of the line, 13 miles. Then we have two No. 0000 feed wires, one running 7 miles from the power house, and the other 9 miles. The 7-mile feed wire is tapped into the two trolley wires running to the circuit

FIG. 8.—SWITCHBOARD, CALUMET ELECTRIC RAILWAY.

breaker which divides the current from the generator feed and the booster feed. When there are any break-downs at the Bowling Green power house, and it is necessary to run the Valley current through to Bowling Green, use is made of what are called jumpers from the two circuit breakers which divide the current from the Toledo & Maumee Valley and the Bowling Green lines."

The Scranton (Pa.) Traction Company has had in service for over a year a General Electric four-pole, 100-k. w. booster running at 750 r. p. m. The booster is engine driven and regulates the voltage from 550 to 750 according to the current demand. The line is 14 miles long and at the far end from the station there is a 10 per cent grade. The machine is connected in series with the switchboard bus bar and the feeder of the line on which it is used, with switches controlling a shunt so the booster may be cut out when desired. The booster is operated at all times when

FIG. 8A.—SWITCHBOARD CONNECTIONS.

cars are running on this line. The small engine, which drives the booster, was one already in the station and which during the night is used for other purposes.

The Nassau Electric Railway Company, of Brooklyn, installed about 18 months ago a General Electric eight-pole, 200-k. w. booster for regulating the voltage on a line 9.14 miles long. The booster is engine driven and raises the voltage to 700. During the winter season the booster is in service from 6 a. m. to 9 a. m. and from 3 p. m. to 7 p. m., and during the summer from 1 p. m. to midnight. The installation gives satisfaction and is believed to be economical. A contract has been signed with the Westinghouse Electric & Manufacturing Company for two additional boosters with a total output of 3,750 amperes at 200 volts.

Some four months ago the Detroit Citizens Street Railway Company put in its station a 55-k. w. booster set to raise the voltage to 625 on a line 7.5 miles long. It was considered cheaper to drive the booster with a motor than an engine. The booster is in service from 7 a. m. to 8 p. m. every day and no trouble has been experienced.

In the power station of the Realty Syndicate Railways, of Oakland, Cal., a 30-k. w. booster has been operating over a year and a half. It is connected to a line running 7.84 miles from the plant and keeps the initial voltage at from 525 to 690. On one of the large engines there was an extra fly-wheel to which the booster was belted. The installation is considered economical as the ratio of the average load to the maximum is very low. On this line there is a 5.5 per cent grade and another 4.5 per cent grade seven miles from the station, over which an electric locomotive, equipped with four G. E. 1,200 motors, pulls trains weighing 38 tons. The booster is run 21 hours a day and no trouble has yet been experienced.

The Calumet Electric Street Railway Company, of Chicago, has a unique booster installation which is home-

made. The lines of this company pass through comparatively thinly settled districts and some of them are long and have few cars. As a consequence the feeders are not large and the loss of potential is very great whenever there is extra traffic. During the summer, when pleasure riding is in vogue, the facilities of the whole system are taxed to

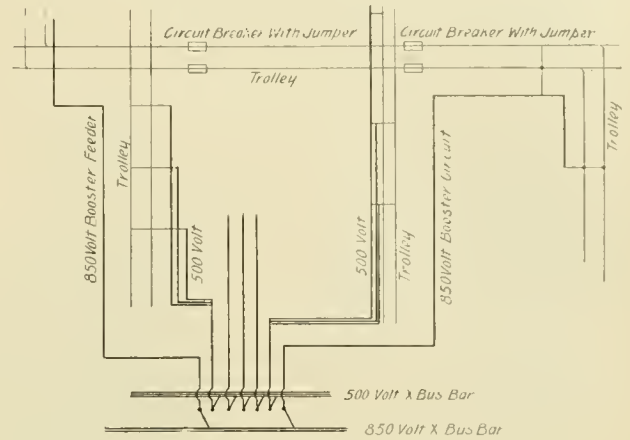

FIG. 8B.—FEEDER CONNECTIONS.

the utmost. Especially is this true of the trolley lines and feeders, for in some cases there is a drop of nearly 40 per cent in the voltage. The current was supplied from eleven 100-k. w. dynamos belted to high speed compound engines. A direct connected unit was installed, consisting of a cross-compound engine and a 550-volt, 500-k. w. General Electric generator, and this now carries the load of the station, the small dynamos being held in reserve. It was decided to use three of the small dynamos to boost the voltage on some of the long lines. Three 100-k. w. T.-H. dynamos, shown in Fig. 7, all belted to one engine, were selected for the service. The armature circuits were con-

FIG. 9.—BOOSTERS, SOUTH CHICAGO CITY RAILWAY.

nected in parallel and the three in series with the main bus bar. The switchboard has two positive bus bars, one of which is at the station potential, 550 volts, and the other at the potential at the boosters. As may be seen in Fig. 8, each generator and feeder panel, on the switchboard, has a two-way switch which can be thrown on either bus bar. An equalizing circuit connects the three series field windings but does not extend to the switchboard.

With the shunt windings cut out of circuit the voltage

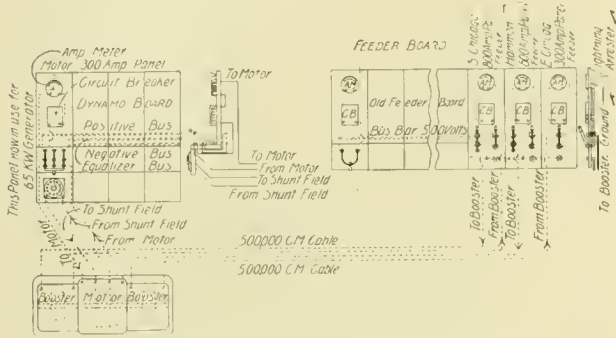

FIG. 10.—SWITCHBOARD CONNECTIONS FOR BOOSTER.

was boosted 150 volts but this was not sufficient. The shunt field was cut in and rheostats used to regulate the excitation. By this arrangement the potential was boosted 300 volts. At first there was some difficulty with this high voltage on some of the feeders as the current returned to the generator, but this was remedied by proper regulation. When it is necessary to run the boosters, the engine is started, the booster circuit connected to the high potential bus bar, the feeder circuit breaker is opened, the two-way switch thrown on the high potential bus bar and the feeder switch closed. The switchboard connections are shown in Fig. 8A, and a diagram of the feeder lines in Fig. 8B.

The boosters installed by the South Chicago City Railway Company at its central power house were for the purpose of generating all the current for all the lines at one station. Previous to this a small plant had been maintained to operate the Hammond branch at an expense of \$6,000 to \$7,000 per year. A 500-k. w., 550-volt direct connected Westinghouse generator was put in operation last year and furnished more power than necessary for all lines. With the feeders then strung there would be a loss of 300 volts on

a 150-h. p. 550-volt multipolar shunt-wound motor. The boosters are each capable of delivering 400 amperes at 125 volts and the voltage ranges downward with the current. A 25 per cent overload can be maintained for an hour. An automatic cut-out is provided for each booster when the circuit to the motor is broken so as to prevent the boosters running as series motors. Fig. 9 is from a photograph in the station showing the boosters. Either one or both of

FIG. 12.—SWITCHBOARD, SOUTH CHICAGO CITY RAILWAY.

these boosters can be operated at the same time, the circuits to the one not in operation being broken and the armature revolves in a demagnetized field. The booster connections to the switchboard are shown in Fig. 10, and the trolley line and feeders to which one booster is connected are indicated in Fig. 11. Fig 12 is from a photograph of the feeder switchboard, with the booster board to the right. The apparatus is the product of the General Electric Company.

Besides the installations described there are several others in the country, including a four-pole 75-k. w. machine for the Lewiston & Youngstown Frontier Railway, two D-62 machines belonging to the Worcester Construction Company, a four-pole, 30-k. w. G. E. booster in the station of the Canandigua (N. Y.) Electric Light & Power Company and two Westinghouse outfits in the station of the Baltimore & Northern Electric Railway Company. One is a four-pole 50-k. w. 225 volt booster connected to a motor by flexible shafting. The generator is series wound and gives an electromotive force nearly proportional to the current at full load, after which the voltage rises very slowly, thus avoiding an excessive load on the motor which is shunt wound. The 125-k. w. outfit consists of two engine type fields on a common bed plate having two armatures on one shaft with two bearings.

## ICE CAUSES DELAY AT GRAND RAPIDS.

The Consolidated Street Railway Company, of Grand Rapids, Mich., was obliged to stop running cars for two hours, from 7 to 9 a. m., on February 2, on all except one of its lines. The power house is on the Grand river from which the water for the condensers and boilers is drawn. During the night the screens protecting the outer end of the intake pipe became broken and the pipe became clogged with ice. Though the trouble had been discovered during the night, and the engineer and his assistants spent the early morning hours in the river fighting the ice, a two hours' delay occurred before the pipe could be cleared and the screens repaired.

FIG. 11.—BOOSTER FEEDER LINES.

the Hammond line which extends 9½ miles from the station.

The engineering advice of Sargent & Lundy was sought and it was decided that the best economy would result from using boosters, motor driven at the central station, with the necessary feeders, and shutting down the small station. Two 50-k. w. multipolar, series boosters are direct connected to

**ANNUAL MEETING OF THE CHICAGO CITY RAILWAY.**

At the annual meeting of the Chicago City Railway on January 15, President Wheeler tendered his resignation, and three of the directors, D. K. Pearsons, E. M. Phelps and James C. King, retired from the board. The new board consists of Samuel W. Allerton, M. K. Bowen, D. G. Hamilton, Joseph Leiter, George T. Smith, William B. Walker and George H. Wheeler. The new officers are: M. K. Bowen, president; William B. Walker, first vice-president, and Joseph Leiter, second vice-president.

The reports of the president and secretary summarize the operations of the road as follows: The road earned from passengers \$4,781,055, and from other sources \$35,461, a total of \$4,816,518. The operating expenses for all systems were \$2,908,982, or 60.8 per cent of the passenger earnings. The revenue car-miles aggregated 24,378,000, a net decrease of 174,000 miles, divided as follows: Cable, 12,562,610 (decrease, 1,345,580); electric, 11,616,530 (increase, 1,598,510); horse, 198,860 (decrease, 427,830). On all lines, 95,621,112 revenue passengers were carried; 41,444,636 on cable lines (43.34 per cent); 53,485,425 on electric lines (55.94 per cent); and 691,051 on horse lines (.72 per cent). These figures do not include rides on transfers. Compared with the report for 1896 it is found that the increase in the car-miles run and passengers carried on the electric lines is greater than for the previous year. The daily receipts were \$13,099, an increase of \$88 over 1896; operating expenses were \$7,970 per day, a decrease of \$165. The horse lines showed a net loss of \$13,366, a decreased loss, however, over 1896 of \$5,144.

The operating expenses per car-mile, in cents, were:

	1896	1897
Cable lines . . . . .	10.540	10.706
Horse lines . . . . .	25.889	24.096
Electric lines . . . . .	13.467	13.051
All lines . . . . .	12.126	11.932

There have been 5.50 miles of new track built during the year, and 2.35 miles changed from horse to electric. The total mileage is now: Cable, 34.75 miles; electric, 149.74; horse, 5.23.

Dividends of 12 per cent were paid on \$12,000,000 of capital stock and 4½ per cent interest on \$4,619,500 of bonds, which left a surplus of \$209,656. This is an increase in the surplus over 1896 of \$57,231.

**THROUGH TRANSIT IN NEW YORK.**

On the morning of January 21, four trolley cars made the circuit of the Brooklyn bridge and inaugurated the through transit project which will do so much to increase the capacity of the bridge and save time for passengers. The cars left the City Hall square at 10:30 and the round trip was made in 12 minutes, 10 seconds. The cars were loaded with men prominent in politics and in the street railway world, all of the electric and elevated companies being represented by their highest officers. The street railways have made application for permission to operate a limited number of cars before the work of widening the bridge roadways is completed, since it was found at the trial trip that there is sufficient room.

**WILLIAM A. BANCROFT.**

William Amos Bancroft, vice-president of the Boston Elevated Railway Company, was born in Groton, Mass., April 26, 1855, and is descended from old colonial stock—his ancestors having landed in Massachusetts about 1640. His early life was spent on the farm and in the public schools and the Lawrence Academy in his native town. After attending Phillips Exeter he matriculated at Harvard College and was graduated from the Law School; he was admitted to the Suffolk bar in 1881. When in college Mr. Bancroft went in for athletics and was captain and stroke of three victorious crews, and later was, for five years, the "coach" of

WILLIAM A. BANCROFT.

others. When a freshman he enlisted as a private in the 5th regiment of the state militia; he has continued in the service and in July last was made brigadier general.

Thirteen years ago, January, 1885, Mr. Bancroft began his street railway career as general superintendent of the Cambridge Railroad; 15 months later this road was consolidated with the competing line, the Charles River Railway, and Mr. Bancroft became superin-

tendent of the two companies. His success in this position and especially his energy, firmness, tact and executive ability at the time of the strike in 1887 brought him into prominent notice, and when the West End Company absorbed the other roads of Boston, Mr. Bancroft was made general roadmaster of the system. In 1890 he left the street railway business and returned to the practice of law.

He has been prominent in politics, serving as common councilman, alderman, three terms in the legislature, and four years as mayor of Cambridge. While mayor he was made an overseer of Harvard College. For four years he has been president of the New England alumni of Phillips Exeter Academy; he is president of the Mayors' Club of Massachusetts and the First Volunteers Citizens' Association of Cambridge.

In March, 1896, he became one of the counsel of the Boston Elevated Railway Company, and in January, 1897, was elected vice-president and managing director, a position which will give full scope to his abilities, as he will now direct the management of the company. Nearly all the officials, subordinates and clerks of the new company were with the West End when Mr. Bancroft was roadmaster, so that he is no stranger to his working force.

When the American Association holds its coming meeting in Boston no one will be found who will extend a warmer welcome to the street railway fraternity than General Bancroft.

The bursting of a copper steam pipe in the boiler room of the Badger Illuminating plant of the Milwaukee Electric Railway & Lighting Company resulted in the death of the fireman, William Howse, and the injury of a laborer; these two chanced to be the only persons about the plant at the time.

### NEW PRESIDENT FOR ATLANTA CONSOLIDATED.

Ernest Woodruff, who has since 1893 been connected with the Atlanta (Ga.) Consolidated Street Railway Company, first as vice-president and later as vice-president and general manager, was, on January 19, elected president of the company.

ERNEST WOODRUFF.

Mr. Woodruff is only 34 years old, but has had a long business experience. He was born at Columbus, Ga., and after graduating from the public schools he went into business with his father, and was for some years actively connected with the Empire flouring mills of Columbus. Since his connection with the Atlanta Consolidated Street Railway he has distinguished himself in his work, and his election to the presidency of the company is a fit recognition of his ability. The company operates 70 miles of track and has one of the finest street railway systems in the south.

Mr. Woodruff is a man of family and prominent in society. He has an elegant home at Inman park.

### "DUBLEOOK" BICYCLE HANGER.

In the last few years nearly all the street railways in the country have suffered greatly in their summer traffic from the great and growing use of the bicycle, and managers have been carefully considering how they can furnish transportation facilities for the accommodation of cyclists who may be caught in a storm or have their wheels disabled by accidents, and thus secure a portion of the business that has been lost. If the road is located in a city where there are steep hills, the opportunity for revenue from carrying wheels is greatly increased. During the last year in particular many roads have provided hangers on their cars with gratifying results in all cases.

The hanger which we illustrate is called the "Dubleook" or standard bicycle hanger and is manufactured by the Graham-Woodward Equipment Company, 26 Cortlandt

FOR DASH RAILS, VESTIBULES AND BAGGAGE CARS.

street, New York. It is made of the best steel and consists of hooks encased in rubber, and designed to be fastened to the front or rear dashboards of street cars or to the interior sides of baggage cars. The hangers for the interior are set in slots so that they may be easily removed as shown in the illustration. When suspended from these hooks by the handle bar, the bicycle rides perfectly rigid. When hung from the dash board the bicycle does not interfere with the movement of the brake handle, nor does it mar the car in any way.

The Market Street Railway Company, of San Francisco, states the two lines on which these hangers are used carry on an average of 1,800 bicycles a month, returning a revenue of \$180, that is 5 cents for the wheel and 5 cents for its owner. This gain in earnings is made without a corresponding increase in operating expenses, and as the wheels are carried at the owner's risk only (the trainmen do not han-

THREE BICYCLES AT EACH END—BROOKLYN.

dle the wheels at all), there is no liability for their damage incurred.

Several large roads have adopted these hangers and recently the New York Central Railroad adopted them for carrying wheels in its baggage cars.

### SORROWS OF STEAM ROADS.

President Clark, of the New York, New Haven & Hartford road, at the recent meeting of the New England Railroad Club, among other things, said:

"It has been decided by the railroad commissioners that an old law of this commonwealth, providing that after the lease of one railroad by another the accommodation shall not be diminished must be complied with, and standard roads are called upon to run trains which do not pay one-quarter of the cost of running them, because the construction of parallel electric railways has taken away most of their traffic. Some relief to your owners and to mine should be found, if possible, by which interests may be protected.

"Now, electricity, which is ordinarily steam power developed and conducted and made use of at various points away from the engine itself, affords a remedy for this in certain cases and in certain conditions. There is no longer question about that. The experiment of the New Haven road by the use of the third rail, which is only a trolley on the ground, shows us that with an adequate volume of business we may keep the requisite number of trains and afford the train service required without serious results. But on some light and side lines, to keep a locomotive, with its engineer and its fireman, with a baggage-master in the baggage car, and a

conductor to conduct his train, and a rear brakeman to look after accidents in the rear, is a burden which is entirely incommensurate with the revenue received. There is one electric railroad in this commonwealth which has taken from the New Haven Railroad in Massachusetts more than 90 per cent of its revenues, and we are obliged to pull a train backward and forward, with five men doing nothing, earning nothing, at a loss; to whom? To the people that employ them, the people that employ me."

**CONSOLIDATION AT KNOXVILLE.**

As a result of the negotiations, which have been in progress for some months, the three street railway companies and the two lighting companies of Knoxville, Tenn., have been consolidated. The railway interests comprise the Knoxville Street Railway Company, the Fountain Head Railroad Company and the West End Street Railroad Company. This combination of companies will make a very strong organization and with the outside capital, which comes in, all the lines will be put in first-class condition.

**CAR COUNTER FOR BROOKLYN BRIDGE.**

When the agreement was made between the trustees of Brooklyn bridge and the street railway companies to operate trolley cars over the bridge, it was stipulated that there should be a toll of 5 cents for every trolley car that makes a round trip and 12 cents for every elevated car. As soon as the regular schedule is in operation the trolley cars will make from 3,000 to 5,000 trips per day and on the elevated about 2,000 car-trips per day. A record must be kept of each trip and C. B. Martin, who is at the head of the electrical department of the bridge, has devised an automatic electric counter which seems well suited for the work.

It is intended to put a short insulated section in the trol-

COUNTER FOR BROOKLYN BRIDGE LINES.

ley wire in front of the collector's box on the bridge. The section is connected to the feeder through a solenoid, and the plunger of the solenoid is attached to the lever of an ordinary engine revolution counter. When the trolley wheel comes in contact with the insulated section a circuit is formed between the feeder and the rail which causes the plunger to move, working the counter. A duplicate counter will be placed in the collector's box as a check on the other, and this one is connected up through a solenoid and battery as shown in the diagram. The position of the apparatus will be on a straight piece of track up grade, which will prevent coasting and slipping the trolley wheel off the wire. A three months' trial will be given before the adoption of this device.

**THE FIRST MOTORWOMAN.**

While society ladies have occasionally, for charity, conducted and operated the front platform, we believe the first woman to claim the distinction of making a thorough business of handling the controller and brake is Mrs. Mabell A. Brierly, of Matamoras, Pa.

In reply to our inquiry as to why she had pioneered in a field hitherto unoccupied by women, and how she liked the work, Mrs. Brierly replies:

"Yes, I have been at work on the Middletown-Goshen Traction Company, of Middletown, N. Y., for the purpose of becoming an experienced motorwoman that I might obtain a position as such to earn a living for myself and two children. I was treated kindly by the men on the road, and with all due respect. My instructor was especially kind, taking all possible pains to teach me how to handle the controller and brake, which I can now do very nicely. I have

MRS. MABELL BRIERLY.

received a good many letters similar to the one you have written, but this is the first I have answered."

Mrs. Brierly had no intention of applying for a position on the Middletown line, having been promised a position on another road if she would first become proficient in the work. Owing to the notoriety given the matter by the New York papers the case was a cause of no little annoyance to the officials, at the same time Superintendent Urban says she handled her car with ease and care, and managed the brake and controller very well.

Judging from all reports we should say in this particular case there seems to be no doubt that Mrs. Brierly is physically and mentally competent to take charge of the head end of a car; and as women are naturally more careful than men, it is fair to presume they would be less likely to take chances. As a rule, however, we should expect women to be less reliable in emergencies than are men, although Mrs. Brierly has turned out to be a first-class motorwoman.

Mrs. Brierly has no desire to seek notoriety, and has repeatedly declined requests for her picture. She has kindly, though reluctantly, given her consent to its publication here as a matter of history.

### M. K. BOWEN ELECTED PRESIDENT CHICAGO CITY RAILWAY.

At its annual meeting, January 15, Menard K. Bowen was elected president of the Chicago City Railway. The honor was one earned and deserved and is a fitting recognition of the six years of service, during which he rose from the position of assistant superintendent to the highest office in one of the largest and best known corporations in the country.

Mr. Bowen is a very young man in years to carry the responsibilities of so large an enterprise, but his friends have no fears for his success and properly regard the honor all the more pronounced on that account.

Mr. Bowen was born at Jefferson Barracks, a few miles below St. Louis, in 1858; his father was General John S.

M. K. BOWEN.

Bowen, and much of the military bearing and quick decision of the soldier is reflected in the son. He was educated at the St. Louis University and the Washington University of that city, and at the age of 19 entered the government service in the engineering department. In this work he was engaged in river surveys and, later, jetty construction on the lower Mississippi. In 1880 he took charge of the topographical survey from Fort Smith, Ark., through to California. It was as chief engineer and superintendent of construction of the Kansas City Railway, when that road installed the cable system, that Mr. Bowen entered the street railway field.

In 1892 he was made assistant superintendent of the Chicago City Railway, rising steadily through the positions of superintendent, general manager and vice-president until he became its chief executive officer.

Mr. Bowen is a man of remarkable keenness and capacity for work, which he turns off with great rapidity. He is progressive; a firm disciplinarian who, when threatened with a strike unless the union was recognized, promptly discharged the leaders and quickly put an end to the controversy. His paper at the St. Louis convention gave evidence of his ability as an originator, thinker and writer and was widely copied across the water.

All the conversion of horse to electric lines—some 150 miles—has been done under his supervision, and the new problems which already confront his company will doubtless be worked out as speedily and successfully. He is a man of unusual executive ability, easy to approach and pleasant, with a bearing dignified and gentlemanly.

When Mr. Bowen was elected general manager of the company in January, 1897, some changes were necessarily made in the scheme of organization which obtained before that time, as it did not provide for such an officer, his duties devolving upon the president. The new scheme was described in the "Review" for March, 1897, page 180. With Mr. Bowen's election to the presidency the office of general manager was abolished and the requisite changes made in the organization. The treasurer, the secretary, the purchasing agent, the auditor, the general counsel, the chief of construction, the chief draftsman and the superintendent report direct to the president. The superintendent receives direct the reports of the interior departments, and through the assistant superintendent the reports of the track and line departments, barn foremen, etc.

The new superintendent, George O. Nagle, was born in Milton, Pa., December 31, 1868. In 1874 his family moved to Belle Plaine, Ia., where his father died one year later; the family then removed to Lima, O., where Mr. Nagle received his education in the public schools. Coming to Chicago with his mother and sisters in 1886, he attended the Chicago Atheneum for a short time, and the following year began work in the office of the Cragin Manufacturing Company. Shortly afterwards he left to go with the Chicago, Burlington & Quincy Railroad; he continued with this road, first in the ticket auditor's office and later in the general auditor's office, until February, 1891, when he entered the employ of the Chicago City Railway Company as junior in the claim department. Six months later he was promoted to the position of private secretary to the superintendent, which he held until appointed superintendent on January 18, 1898. He is a young man of much promise, and with the increased opportunities may confidently be expected to make an enviable record.

GEORGE O. NAGLE.

August C. Heidelberg, who for three years has been trackmaster of the road, has been appointed assistant superintendent and will have charge of the outside work of the superintendent's office; that is, the track and line departments, with supervision of barn foremen, supervisors, etc.

G. W. Knox has been appointed to the position of electrical engineer and engineer of construction, and C. J. Reilly is superintendent of motive power in charge of both the cable and electric power stations.

## TRAMWAYS IN THE UNITED KINGDOM.

The accompanying table is abstracted from one published in the Railway World for January and gives the location, operating company, manager, length, method of operation, and number of cars, for the electric tramways of the United Kingdom, including those under construction. The 20 lines in operation have an aggregate length of 82.06 miles, with 123.15 miles of track. The 19 lines under construction aggregate 162.50 miles with 261.16 mile of track; this does not include the Blackburn line, for which data are not given.

In addition to the tramways there are five electric railways, so called. Two of these—the Central London, with

6.5 miles of double track, and the Waterloo & City Railway, with 1.5 miles of double track—are under construction, these and the City & South London Railway, which has had three miles of double track in operation since December, 1890, are underground roads in London, using the third rail. These are all of standard gage—4 ft. 8½ in. The City & South London operates 16 motor and 36 trail cars.

The other electric railways are the Liverpool Overhead with 6.5 miles of double track, standard gage, and 44 motor and seven trail cars; and the Brighton & Rottingdean Seashore Railway, which was illustrated in the "Review," December, 1896.

The most striking feature of the table is that notwith-

standing the objections urged against the overhead trolley in Europe, of which we have heard so much, the overhead trolley has a clear field on all new surface lines, and of the 20 roads in operation five are using the third rail, one using accumulators, and 13 using the overhead trolley, while the only underground conduit line in England is changing to the overhead system.

**INTERNATIONAL RAILWAY MEETING.**

Arrangements have been made for an international meeting of the street railway, gas, and electric light and power men of the United States and Mexico in March next. A special meeting of the executive committees of the Texas Street Railway Association and of the Texas Gas & Electric Light Association was held at Austin on January 16. At this meeting it was decided that the two associations hold a joint meeting at Laredo, Tex., on March 9 to 12, inclusive. Letters were read from L. J. Christen, mayor of Laredo, promising that he and the citizens would do everything possible for the entertainment of the members and visitors of the association, and C. F. Yeager, superintendent of the Laredo Electric & Railway Company, stated that every preparation for the comfort of delegates and visitors would be made, that ample hotel accommodations

Committees on arrangements, transportation, etc., were appointed, and they have been very active in planning a successful convention, in which the social features will not be overlooked.

According to the program, which covers every minute of the time from the morning of Wednesday, March 9, until the following Monday, with meetings or entertainments, about one-half the sessions will be separate, and the others joint meetings of the two associations. At the separate meetings are to be presented those subjects which are of peculiar interest to the members of one association only, and at the joint meetings the subjects of more general interest. A number of the Mexican delegates will read papers, and as the Texas association is noted for its good work, much will be expected on this occasion.

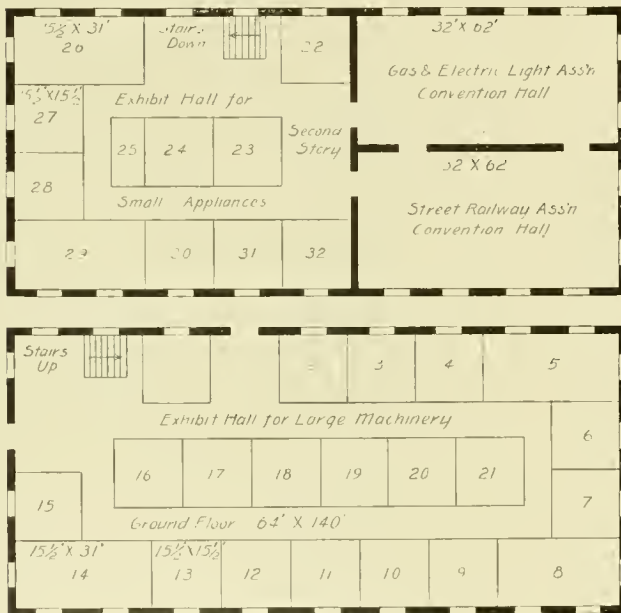

The papers before the Street Railway Association and before the joint meetings are as follows:

- "A Chapter on Accidents," by George B. Hendricks, Fort Worth.
- "Use and Abuse of Electrical Machinery, Apparatus and Appliances," by Harry L. Monroe, Dallas.
- "Car Bodies; Their Maintenance and Repair," by Frank E. Scovill, Austin.
- "Trucks and Their Maintenance," by George D. Hartson, Dallas.
- "Railbonding as a Power Saver," by H. C. Chase, Houston.
- "An Electric Furnace; Calcium Carbide, Acetylene Gas and Other Forms of Gas," by J. D. Cox, Galveston.
- "Ties; Their Life and Preservation," by D. D. Willis, San Antonio.

A number of other papers will be presented, on subjects to be chosen by the authors.

The most pleasing feature of the convention as planned is that it will bring into closer relations with us those of our Mexican neighbors who are interested in the same work. There has been marked progress on the street railway lines of Mexico in the last few years, and we can look forward to a rapid improvement in the near future. For this reason the facilities afforded for exhibiting apparatus will without doubt be gladly availed of by our manufacturers, and the exhibits prove to be extensive and interesting, as is the hope of those in charge to make them.

The joint executive committee having the international meeting in charge comprises Carl F. Drake, president of the Texas Street Railway Association; L. T. Fuller, president of the Texas Gas & Electric Light Association; W. E. Holmes, R. S. Wakefield, Thomas D. Miller, Frank E. Scovill, C. L. Wakefield, Geo. H. Cushman and J. H. Fitzgerald.

PLAN OF EXHIBIT HALL, LAREDO, TEX.

were assured, and that a large and convenient hall for the meetings and exhibits would be provided.

Mr. Yeager further stated that the Mexicans who are connected with the lighting, street railway and power interests of Mexico had shown great interest in the proposed meeting, and that the Mexican Government, through its Department of Foreign Affairs and through Senor Ornelas, Mexican consul at San Antonio, had expressed interest in the meeting and tendered offers of assistance, and that a large attendance might be expected from Mexico. It was then unanimously decided to make the meeting an international one, and the two associations extended invitations to the gas, electric, street railway and power men of Mexico to be present and read papers at the meeting.

**NEW SERVICE FOR STREET RAILWAY MOTORS.**

An electric hoist and cable way has been installed at the lime quarry of the S. E. & H. L. Shepherd Company, Rockport, Me., and the hoist is equipped with two G. E. 1,200, 500-volt railway motors, with K-11 controllers. The apparatus is built for lifting a load of 10 tons, and is capable of hoisting 2,000 casks of lime rock in a day. The current is furnished from the railway circuit of the Knox Gas & Electric Company at the rate of 4 cents per h. p.-hour. The cable way is 700 ft. long, suspended from two towers, one 55 ft. high, and the other, the main hoisting tower, is 65 ft. high. This is the third plant in the county to adopt electricity, and all of them are using the General Electric railway motors with series-parallel controllers.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Assignment of Claims for Personal Injuries.*

The sale or assignment of an action for injuries to the person is against public policy and void.

A contract whereby a client is prevented from settling or discontinuing his suit is void.

In the opinion of the Court, Phillips, Chief Justice, says:

On grounds of public policy the sale or assignment of actions for injuries to the person are void. The law will not consider the injuries of a citizen whereby he is injured in his person to be, as a cause of action, a commodity of sale. On other grounds assignability is not legal.

In this discussion of the question of assignability of causes of action for torts, courts have usually based the decision on the theory that where no cause of action survived it was assignable. Is that the sole test?

Bingham's Principles of Eq., pp. 218, 219, states:

"So, too, equity will not recognize assignments of certain species of property, which would be against the policy of the law to allow the owners to part with. These are pensions given as rewards for extraordinary services, pay or half pay in the army, the salaries of judges, and other revenues and emoluments of a kindred character, which reasons of state require should remain always for the benefit of the person to whom they were originally given. \* \* \* Yet in all these cases any balance unpaid at the time of death would survive to the present representative, but the right of assignment is precluded on principles of public policy."

Pomeroy, in his work on Eq. Jurisprudence, says:

"Sec. 1,275. It becomes important, then, in fixing the scope of the equity jurisdiction, to determine what things in action may thus be legally assigned. The following criterion is universally adopted. All things in action which survive and pass to the personal representative of a decedent creditor as assets or continue as liabilities against the representatives of a decedent debtor, are, in general, thus assignable; all which do not thus survive, but which die with the person of the creditor or of the debtor, are not assignable. The first of these classes, according to the doctrine prevailing throughout the United States, includes all claims arising from contract, express or implied, with certain well defined exceptions; and those arising from torts to real or personal property, and from frauds, deceits and other wrongs, whereby an estate, real or personal, is injured, diminished or damaged. The second class embraces all torts to the person or character where the injury and damage are confined to the body and the feelings; and also those contracts, often implied, the breach of which produces only direct injury and damage, bodily or mental, to the person, such as promises to marry, injuries done by the want of skill of a medical practitioner, contrary to his implied undertaking, and the like; and also those contracts, so long as they are executory, which stipulate solely for the special personal services, skill or knowledge of a contracting party."

Here is a distinction clearly drawn between injuries to property and injuries to the person. This distinction rests on a sound principle. If a person receives injuries to his

person through negligence of another they are, by our statute, Sec. 123 of Ch. 3, made to survive. By Ch. 70, where death results from such injuries caused by such negligence of another the action shall survive, but is brought for the exclusive benefit of the widow and next of kin. The administrator can not recover damages for the estate and at the same time recover for the exclusive benefit of the widow. Statutes like Ch. 70 are in force in most of the states. May a person injured assign the cause of action immediately after his injury, and then in case of his death from that injury legally make that assignment bar a recovery by the administrator for the exclusive benefit of the widow and next of kin? The purpose of Ch. 70 was not for the benefit of a deceased person, but for that of the widow and next of kin.

If an assignment on the basis of the survivor of the action was the sole test, then in the case mentioned the assignment would be valid. But the very purpose of the survivor as created by the statute is for the benefit of the widow and next of kin, which the law would not permit to be defeated. Whether the action be for assault and battery or injuries caused by the negligence of another, still the same rule attains and is included by the term, actions for injuries to the person, and as a possible result of such an assignment the purpose of the law might be defeated. Courts have without any exception steadily held that an action for injuries to the body was not assignable.

These actions did not survive at common law, and statutes providing for such survival have had their birth since the passage of Lord Campbell's act in 1852, which by Ch. 70 of our Revised Statutes is substantially adopted.

If such actions are held assignable on the sole ground of survivor, those or assignees in bankruptcy, or under the benefit of creditors, would take the cause of action.

This principle that actions for personal injuries are not assignable is well sustained by authority in *Rice v. Stone*, 1 Allen, 568; it was held that an assignment of a claim for personal injuries is void, although made after verdict but before judgment in an action to recover damages for such injury.

The court says: Such claims were not assignable at common law. On the contrary, a possibility, right of entry, thing of action, cause of suit or title for condition broken, could not be granted or assigned over at common law. But this ancient doctrine has been greatly relaxed. Commercial paper was first made assignable to meet the necessities of commerce and trade. Courts of equity also interfered to protect assignments of various choses in action, and after a while courts of law recognized the validity of such assignments, and protected them by allowing the assignee to use the name of the assignor for enforcing the claim assigned. And at the present day claims for property and for torts done to property are generally to be regarded as assignable, especially in bankruptcy and insolvency. There may be exceptions to this doctrine, but they need not be discussed here. But in respect to all claims for personal injuries, the questions put by Lord Abinger, in *Howard v. Crowther*, 8 M. & W., 603, are applicable: Has it ever been contended

that the assignees of a bankrupt can recover for his wife's adultery or for an assault? How can they represent his aggravated feelings? And we may add the broader inquiry—has any court of law or equity ever sanctioned a claim by an assignee to compensation for wounded feelings, injured reputation or bodily pain suffered by an assignor? There were two principal reasons assigned why the assignments above mentioned were held to be invalid at common law. One was to avoid maintenance. In early times maintenance was regarded as an evil, principally because it would enable the rich and powerful to oppress the poor. This reason has in modern times lost much but not the whole of its force. It would still be in the power of litigious persons, whether rich or poor, to harass and annoy others if they were allowed to purchase claims for pain and sufferings and prosecute them in courts as assignees. And as there are no counterbalancing reasons in favor of such purchases, growing out of the convenience of business, there is no good ground for a change of the law in respect to such claims.

The other reason is a principle of law applicable to all assignments, that they are void unless the assignor has either actually or potentially the thing which he attempts to assign. A man can not grant or charge that which he has not.

\* \* \* \* \*

The second proposition to be determined is, is a contract by which the person in whose name the action is brought and to whom it belongs restricted from compromising or settling such claim because of a contract to that effect? In other words, is such a contract valid and binding? The law does not discourage settlements in cases for personal injuries. Whether a cause of action exists, its nature and amount are always involved in uncertainty, and a defendant has a right to buy his peace. The plaintiff has a right to compromise and avoid this anxiety resulting from a cause pending to which he is a party. Any contract whereby a client is prevented from settling or discontinuing his suit is void, as such agreement would foster and encourage litigation: *Lewis v. Lewis*, 15 Ohio, 715; *Elwood v. Wilson*, 21 Ia., 523; *Foster v. Jacks*, 4 Wall., 334; *Boardman v. Thompson*, 25 Ia., 487; *Greenhood on Public Policy*, 474; *Kriber v. Johnson*, Miss. 70 N. W. R., 305.

(Supreme Court of Illinois, *North Chicago Street Railway Co. v. Ackley*, 30 Chicago Legal News, 156.)

*Running Electric Cars at Rapid Rate over Much-Frequented Crossing—Proof of Want of Contributory Negligence by Person Injured.*

Running an electric car at an unusually rapid rate over a much-frequented crossing, when the usual rate was from 12 to 14 miles per hour, was such negligence as constitutes little less than wanton and reckless negligence of human life, but it is held that some slight proof at least of a want of contributory negligence was required in case of a man killed by the car and found about 45 ft. from the crossing at which he had stepped from another car.

(Supreme Court of Indiana, *Evansville Street Railway v. Gentry*, 37 Lawyers' Reports Annotated, 378.)

*License Tax for Revenue Purposes—Exemption of Street Railway.*

The exemption of a street railway from a license tax is not granted by a mere grant of the privilege of operating the road for a term of years, if the license tax is imposed

under statutory authority, although for revenue purposes and not simply for police regulation.

(Supreme Court of Missouri, *Springfield v. Smith*, 37 Lawyers' Reports Annotated, 446.)

*Collision of Fire Truck with Street Car—Negligence of Driver of Truck.*

Driving a fire truck to a fire so rapidly that on approaching an electric street car track it is impossible to stop in time to avoid a probable collision, constitutes negligence on the part of the driver, although by the city ordinances he had the right of way.

(Supreme Court of Michigan, *Garrity v. Detroit Citizens Street Railway Co.*, 37 Lawyers' Reports Annotated, 529.)

## SANDUSKY, NORWALK & TOLEDO.

The above title is the name of a company which has already entered on its construction work, and will eventually build some 40 miles. The operation has been taken up by a syndicate of Philadelphia gentlemen, and A. E. Tennis, Harrison building, Philadelphia, is in charge of the financing and contracting. The engineers are Fowler & Loomis, 436 Walnut street, Philadelphia.

The company have already secured the Sandusky road of

10 miles and will build from that point to Norwalk, passing through Bloomingville, where the power house will be erected, North Monroeville and Monroeville, a distance of 18 miles. At North Monroeville a branch will extend 22 miles, connecting up Bellevue and Clyde with power house at Clyde. The extension on to Toledo will be taken up in the near future. Already three 325-k. w. generators and 1,000 h. p. of engines and boilers have been purchased. There are yet to purchase 12 passenger cars, 1 combination and 1 construction car.

The accompanying map gives an excellent idea of the territory traversed, which will be recognized as densely populated, and opening a desirable field.

For some years it has been the custom of Superintendent T. M. Jenkins, of the Cincinnati, Newport & Covington Street Railway Company, to offer cash prizes to employes for carefulness, tidiness and good demeanor. This year two motormen were each rewarded with \$25 in gold for not having an accident for 12 months, and seven others received \$10 each for having avoided all but very minor mishaps. One conductor was rewarded \$25 for keeping the cleanest car during the year, four others were given \$10 and four more \$5 each.

**SNOW PLOW AND SALT CAR, LEXINGTON, KY.**

Through the courtesy of R. T. Gunn, superintendent and electrician of the Passenger & Belt Railway Company, Lexington, Ky., we have received the photograph from which the accompanying engraving is reproduced. This car was built, not so much for a snow plow, as to furnish a car for effectively salting the track when the rails are covered with sleet; sleet is the cause of much more serious trouble for the street railways in Kentucky than is snow. While it has

SNOW PLOW AND SALT CAR.

not as yet been found necessary to use the large plow, the smaller plows or rail cleaners have been called into requisition a number of times during the present season.

The entire plow is bolted to the car in such a way that it may be quickly removed and the car used for construction purposes. The car is mounted on a Bemis No. 6 truck equipped with two 50-h. p. waterproof motors. The car was designed and built under the supervision of Superintendent Gunn and E. A. Longmire, foreman of the company's shop.

**COLORADO RAILWAY NEWS.**

(By Our Own Correspondent.)

The Boulder & Denver Railway Company has been incorporated to build an electric line 30 miles in length between the two cities. It is for the cheap transportation of ore and freight, as well as passenger traffic. It is intended to have an hourly schedule, the trains consisting of one combination baggage and passenger car and two coaches.

Numerous improvements are contemplated by the Durango Railway & Realty Company. Already the line has

been extended to the mineral springs, where there is a pleasure resort. In the spring a new power station will be built and some open cars purchased for the summer traffic.

About one-third of the Denver, Lakewood & Golden Railroad is operated by electricity, the power being furnished by the Denver Consolidated Tramway Company. It is expected that the remainder of the line will be equipped for electric traction in the near future.

The Gold Hill Tunnel & Railway Company has been organized by the H. J. Mayham Investment Company for the purpose of absorbing the Denver & Westminster Railway Company and to construct an electric line to Westminster University and to Gold Hill.

The Colfax Electric Railway Company has been operating its cars at a loss for the past seven months, and with the exception of two cars a day to hold the franchise, has ceased running cars.

The Colorado Springs & Cripple Creek Traction Company is extending branches to its line to the different mines and ore-houses in the Cripple Creek district. About 100 ore and freight cars are in service besides three trail cars and six motor cars, four of which are of the combination baggage and passenger type. This same company controls two others which contemplate building lines from Colorado Springs to Pueblo and from Denver to Colorado Springs.

The Colorado Springs Rapid Transit Company has received four open cars of the 10-bench type built by the Wells & French Company and mounted on McGuire trucks. During this coming season the company expects to extend some of its lines and rebuild some of the old track.

The Pueblo Street Railway Company has built five combination cars, 30 ft. long and with a seating capacity for 42. The cars are open at either end, with a closed apartment in the middle. They are equipped with G. E. 800 motors; two cars are mounted on Peckham trucks and three on Bemis trucks.

The Denver Consolidated Tramway Company is rebuilding a large number of cable cars for trailers on the electric lines, and the repair shops are busy fitting the cars with vestibules. The center pole construction has been replaced by poles at the sides of the streets. There are rumors that negotiations are in progress to consolidate this company with the other four large ones in the city.

**LOOK OUT FOR THE HIP-JOINT MAN.**

It is stated that the claim agents and attorneys of one of the railroads entering Indianapolis are searching for a professional contortionist who has chosen for an avocation the dislocating of his hip joint when the circumstances are favorable to securing a verdict for damages against a railroad company. Some months ago a man fell on the platform of a passenger station near Indianapolis, having caught his heel in a crack, and the result was a dislocated hip. The company settled for \$2,200 and attorney's fees, and extended courtesies in the way of furnishing transportation for the man and his nurse, etc. Quite recently a similar accident occurred in Virginia, and a claim for damages presented. The man had been seen the day before hunting about the platform for a hole in which to catch his heel, and a traveling man who was present recognized him as the victim of the "accident" in Indiana. The Virginia road did not settle.

## ROUND-CORNER SEAT-END PANELS.

The open cars for street railways have become a necessity for summer traffic, but everyone who has ridden on one in wet or stormy weather, or stood upon the running board when the seats were full, appreciates that there are some disadvantages in the usual construction. A recent improvement in a detail introduced by the J. G. Brill Company affords the means of overcoming some of the inconveniences to passengers and reducing the cost of maintenance to the road. This consists in making the seat-end panels with round instead of square corners. The illustration shows a view of a car with panels of this style.

The end of the seat is so rounded that the inside end of the curve is directly above the outside edge of the sill, and the iron panel is so formed at the top as to fit the seat. As the seat end has the same curve as the seat back arm, the

## REPORT OF THE NATIONAL, ST. LOUIS.

The annual meeting of the National Railway Company, which controls the Cass Avenue & Fair Grounds, the Citizens' and the St. Louis roads of St. Louis, was held at Chicago on January 25. The report of President D. G. Hamilton shows the gross receipts for the year ending December 31, 1897, to be \$1,467,976; the current operating expenses, \$879,940, which is 59.9 per cent of the receipts; the fixed charges, \$366,746; and the surplus gains, \$221,290. The proportion of the surplus gains which is applicable to the stock controlled by the National Railway Company is \$189,930, a decrease from 1896 of \$19,163, but an increase over 1895 of \$10,788. The total earnings of the National Railway were 8.45 per cent on its outstanding stock, as against 9.22 in 1896, 8.05 in 1895, 8.85 in 1894, and 9.08 in 1893. During the year \$20,625 was expended for betterments.

SECTION OF CAR FITTED WITH ROUND-CORNER SEAT-END PANELS.

capacity of the car is not decreased. At the same time there are no square corners to catch clothing and bundles on entering or leaving the car, making entrance and egress easier and saving time. Also, the round corners do not form such convenient foot-rests for passengers with muddy boots, neither do they catch and tear the curtains. And the man standing on the running board does not have to bend his body, and can stand erect without holding on. Iron panels have proved to be stronger for wear and in resisting accidents than wood panels, and the rounded form of panel has in addition the advantage that it tends to deflect anything striking it, and at the same time is less liable to catch passing vehicles. It will be noticed in the illustration that the curtain grooves are carried down to the floor, and the curtains can thus be lowered far enough to afford real protection.

This panel has been adopted by the Metropolitan Street Railway Company, of New York, which is a sufficient evidence of their value.

The total number of car-miles run on the company's lines was 12,010,683, and the passengers carried 29,359,515. The passengers carried per car-mile were 1.98 on the cable and 2.77 on the electric lines; the total cost of operating, including interest, was 6.52 cents per car-mile by cable and 8.76 cents by electricity; the total cost to carry each passenger was 4.22 cents by cable and 4.27 cents by electricity.

During the first eight months of the year there was a shrinkage in receipts, but the last four months showed an increase, which still continues. The decrease in the receipts for the year was \$54,298, and the decrease in total expense, \$24,246.

In view of the local conditions existing in '97, the results are very creditable to General Manager McCulloch.

The Cleveland & Chagrin Falls Electric Railroad and the Cleveland, Canton & Southern Railroad are reported as having a lively rate war. The steam road says that it is not to be driven out of business.

## THE REPORT ON THE RELATIONS OF STREET RAILWAYS AND MUNICIPAL CORPORATIONS IN MASSACHUSETTS.

Below will be found the text of the report of the Special Committee on the Relations of Street Railways and Municipal Corporations in Massachusetts. The Committee collected a great deal of valuable data on the street railways in America and abroad which will be added as an appendix as soon as the matter can be properly arranged.

The inquiry the Committee was directed to make proved, when fairly entered upon, far more comprehensive and laborious than was at first anticipated. A vast amount of experience of a most varied character, bearing on what may be termed the street railway problem in its different phases, has, during the last twenty-five years, been accumulated in nearly all portions of the civilized world; but no comprehensive study and comparison of results has been made, nor is there any publication or document, official or otherwise, containing a sufficient body of reliable data. On the general subject there is, it is true, much to be found scattered about in various official reports and investigations, as well as in almost innumerable short treatises, pamphlets and magazine articles; but these, in the comparatively rare instances where a degree of reliance can be placed upon them, have as a rule either been written for a specific purpose and in advocacy of some special theory, or they are of merely local interest. There exists, also, a vast and varied amount of popular misinformation as to results alleged to have been reached elsewhere, more especially in certain European cities. As regards these, indeed, statements are made of a character so wholly misleading that the Committee finally reached the conclusion that it was safe to accept nothing unless verified by examination on the spot; for, even where the facts are in the main as alleged, varying conditions made the conclusions naturally to be inferred from those facts usually deceptive, and almost invariably in greater or less degree inapplicable here.

While, therefore, two members of the Committee devoted themselves to investigations in this country and in Canada, one member went to Europe, there to make such inquiries as might, under the circumstances, be practicable. As respects information, the foreign conditions proved similar to those at home, though, if possible, even more pronounced; at a sufficient cost in time, patience and money, a vast amount of interesting and instructive experience was attainable; but the statistics are even less perfect than in America, and no comprehensive report or official publication exists.

The Committee has no disposition to appear to exaggerate the importance of street railway developments, and the interest felt in them; but as the investigation proceeded it became apparent that not only was the whole civilized world at work on improved municipal transportation, but every considerable town in both hemispheres is acquiring experience of more or less general value in regard to it, while at the same time seeking to learn the results of experience elsewhere. This is more obviously true of material and scientific appliances—cars, motors, inductors and track laying; but in its other and more abstruse aspects the problem is of the utmost hygienic and governmental importance. As a public agency the electric street railway is now fast revolutionizing the character of urban life, spreading it over a wider area and subjecting it to new influences; while entailing, in such items as paving, sewerage and police, a vastly increased municipal expense. Under these circumstances, while there is a widespread call for a comprehensive report on street railways, its preparation implies a very considerable command both of time and money, as well as of governmental machinery. To make such a report of general value, it would, in the judgment of the Committee, be necessary that the person preparing it should be not only in official communication with the whole consular department of the government, but he would himself have to give from a year to eighteen months of time to local examinations, and the comparative verification of the statements which reached him. It is needless to say that neither the time nor the means at the disposal of the Committee sufficed for work of this description. On the other hand, it is distinctly work which might most properly as well as advantageously be made a feature in the next national census, and the Committee proposes at the proper time to call to it the attention of those in charge of that work.

Under the terms of the act ordering the inquiry, it was confined to certain phases of the problem. Limited specifically to what may be termed the franchise relations of street railways and to questions of taxation, it was not to include the mechanical or scientific apparatus in use, the facilities afforded, or, except incidentally, financial and economical results. The present report will, therefore, be devoted to a brief discussion of principles, and a concise presentation of conclusions reached.

Though the street railway is in legislation as well as in the popular mind usually associated with the steam railroad, the two are, in law as well as in mechanics, quite distinct. Both are comparatively recent outgrowths of the tramway, which first came into use in the English mineral regions more than two centuries ago; but, while the railroad was a use of steam power in a new direction, and a pure consequence of the discovery of that power, the street railway was merely an obvious development of the old tram applied to the omnibus route. In its case the process of evolution was, therefore, in the earlier stages quite simple. As the modern municipalities expanded, the demand for better facilities of urban, or, as it would be termed in Europe, intramural, transportation, made itself increasingly felt. Naturally the street car and the tramway at length suggested themselves as convenient agencies—the street car being nothing more nor less than an improved omnibus, and the tramway a special feature in the pavement of the public way; a feature adapted, it is true, to the car's special use, but not necessarily excluding from general use the portion of the street in which it is laid. This is all the street railway was fifty years ago, when first laid; it is all it is now—an improved line of omnibuses, running over a special pavement. If this fact be firmly grasped and borne constantly in mind, the discussion, and the principles underlying it, are greatly simplified. The analogy throughout is with the omnibus line, and not with the railroad train; with the public thoroughfare, and not with the private right of way. Upon this distinction, indeed, all the questions now to be discussed, whether of taxation or of franchise privilege and obligation, will be found to turn.

The economic idea of regulation by means of competition through private ownership was long at the basis of street railway, as of railroad, legislation. Having a strong hold on the public mind, this theory, in the one case as in the other, had, slowly and wastefully, to be outgrown. The motive power in use with the street railway for very many years also underwent no practical change. Steam engines of various descriptions were tried, and, indeed, may still be seen in use in some European cities—notably in Birmingham, England, and Florence, Italy—but their use proved unsatisfactory; while the cable system, though still well adapted to certain conditions of topography and street movement, was too elaborate and costly for general adoption. It was not, therefore, until 1888, or practically within the last ten years, that the development of electricity as a motor introduced a new feature into street railway mechanism, and gave to the system an increased impetus, the far-reaching influences of which have as yet but in part made themselves felt.

The rapid development and increasing importance of the street railway as a public-service agency have meanwhile brought a new class of questions to the front—a class of questions already considered in connection with the supply of water and of gas, but which must now assume a somewhat different aspect. The idea of regulating street railways through competition of lines in private ownership, often for considerable distances of necessity using the same tracks, has by degrees been abandoned. The modern practice, as well as theory, is the consolidation of lines in a given municipality under one ownership, that ownership to be held to strict accountability as a recognized public agency. Through such a system it is believed the most economical results, public as well as private, can be attained—a much longer carriage for the same fare on the one side, and the avoidance of duplicate machinery and organization on the other. Single ownership of some sort, public or private, may therefore be accepted as a condition of the problem. Competition is eliminated from it.

The service to be rendered, and the agency through which it is rendered, involve, however, in this case a peculiar and to a

degree exclusive use of municipal thoroughfares. Not only has a special feature in the pavement to be provided and kept in repair, but the movement of vehicles on that special pavement is such as often to necessitate, through street widening and otherwise, provision of space; for, as the street car cannot turn out of the way of other vehicles, other vehicles must have room provided in which to turn out of the way of the street car. Under existing conditions also the street car is kept in motion by an apparatus of cables or wires—underground or overhead—established for its sole and separate use, and which can neither be duplicated nor used in common by others. When it is added that provision in all these respects has to be made on the surface of the most frequented thoroughfares and principal business streets, the importance and difficulty of the questions sure to arise at once suggest themselves.

The varied experience of the last forty years has already developed, or is now developing, three distinct lines of treatment of the relations between the street railway and the municipality. The first is the natural outcome of the original idea of private ownership of both track and vehicle; the improved omnibus, in other words, runs over a special pavement, laid down by the omnibus company in the public way for its exclusive use. The company owning and operating the line is organized under a State charter, but holds its location in the streets under a municipal permit, usually granted for a fixed term of years, but in Massachusetts perpetual in theory, though in point of fact revocable at any time. This is complete private ownership, and it exists not only in America, but is almost equally well known and recognized in Europe. The second line of development is a recurrence to the original principles of ownership; the street and its pavements belong to the public, the vehicles that run upon the pavements to private parties, whether individuals or corporations. No distinction of ownership or control is under this system recognized between pavements, whether of wood, stone, concrete or iron, or a combination of two of those materials or of all; in any and every case the pavement is laid down and cared for by the municipality, which thus in no way surrenders or compromises its control of its own streets. Having laid, and owning, the pavement, it does, however, concede to a company, on such terms as may have been agreed upon, the exclusive right to run vehicles for a greater or less period of time on a specially prepared part of the pavement. In this case the vehicles and motive power only belong to the private company. The third line of development is in the direction of full public ownership—what is known as municipalization. The analogy of the public water and public gas service is here followed, and both private ownership and private management cease, the municipality running the omnibus as well as controlling the street and owning the pavement. In the course of its investigations the Committee has enjoyed opportunities of studying each system in actual operation, and has heard the merits of each explained by managers and advocates.

In a general way, and subject to limitation and exceptions, it may furthermore be said that, while the first, or private, ownership system is that most commonly in use in America, in Germany the development is in the direction of the second, or mixed, system, and in Great Britain there is a strong and growing tendency towards a thorough trial of the last system, known as municipalization. But whether, in the process of development, the tendency is towards the adoption of one or of another of these three systems, it seems to be recognized everywhere as a fundamental principle that the application of the system is of distinctly municipal or local concernment, the community as a whole having only a broad interest in the principles involved. In other words, in Europe, as in America, the use made of streets and thoroughfares, as well as their care, is essentially a municipal matter. The town or city, whether technically owning the public ways or not, is responsible for them, and, under certain broad general regulations, is free to control and regulate them in such way as it sees fit. The use of the highway for street railway purposes, in Europe, as in Massachusetts, was at first an innovation, and, as such, legal provision had to be made for it; but when that provision was made, either by general law or special enactment, it became largely an extension of municipal, and not of state, functions and control. The officers of the municipality were authorized to permit the occupation of streets for tram or railway purposes under provisions of law; but the control of the municipality over them was subjected to the least possible inter-

ference from without. In passing upon every question which may arise this principle of municipal street control also should be clearly kept in mind. That the street railway, like the thoroughfare it partially occupies, has in many instances outgrown municipal limits, and so become an instrument of interurban travel and communication, is apparent, and this fact also has to be recognized as introducing new elements into the problem; but the fundamental principle of local control is thereby no more destroyed in the case of the railway than in the case of the street itself.

Starting, then, from this basis, the present elaborate street railway system has by degrees been evolved. The whole development has taken place within the last half-century, and vastly the greater portion of it within the last ten years; it has, moreover, been essentially American. That the system now in use, whether in Massachusetts or elsewhere, is in all respects perfect, no one, of course, would maintain; that it is rapidly developing in answer to a public demand is apparent.

So far, however, as Massachusetts is concerned, it may not be out of place here to say that a comparison of systems does not tend to show, either as to practical workings or results accomplished, any grounds for serious criticism. As a working machinery for the daily accommodation of vast numbers of persons, the street railway companies of the Commonwealth fulfill their function quite as well, with as little friction and at as reasonable a cost as any other similar machinery elsewhere which the Committee has had an opportunity to study. On this head, as already intimated, it is not safe to accept loose assertions, no matter how positively made or frequently reiterated, as evidence of what really exists. In every community, persons claiming to speak as authorities are apt to be in evidence declaring that somewhere else, in this case in Baltimore perhaps, or in Toronto, in Glasgow or Birmingham, or in Berlin, an ideal condition of affairs has been reached, in which perfect street railway accommodations, low fares, rapid transit, and contented officials and employes are working in harmony with a thoroughly well-satisfied municipal government, to the expenses of which the railway company contributes a liberal share, while at the same time paying reasonable dividends to its stockholders. The members of the Committee have only to say that, if such a street railway Utopia anywhere exists, they have in the course of their investigations failed to find it. That the street railways of Massachusetts have, as a whole, cost much more than they could now be replaced for, is as indisputable as it has been unavoidable; that in some cases they have been over-capitalized, through questionable processes of financiering, is more than probable; but these, after all, are to a greater or less extent incidents inseparable from an unusually rapid development along new lines and in untried fields.

And this statement at once suggests a consideration of importance, a consideration, in fact, going to the very root of the matter the Committee was appointed to investigate. It is not merely a question of greater or less expenditure, but, if the account is to be correctly balanced, what has been gained through that expenditure, or would have been lost had the expenditure not been incurred, must also be considered. To institute a comparison, for instance, between the street railway transportation of Boston as at present developed and that of Birmingham, of Glasgow or of Berlin, is so absurd as to suggest ignorance. The appliances in use in the European cities named may, and probably do, answer the demands there made upon them; but they pertain to conditions of urban life and of urban movement wholly different from those which now prevail in Massachusetts. A single illustration will suffice. Glasgow has a population of some 800,000, served by 73 miles of tramway, measured as single track; Leeds has some 400,000, served by 27 miles; Boston has nearly 500,000, served by 220 miles. In the neighborhood of 400,000 passengers are each day carried on the Boston street railways, while the combined railways of Glasgow and Leeds, serving a population more than twice as large, carry but 300,000. In other words, with more than five times the population to each mile of street railway track, the number of passengers daily carried in the two cities of Great Britain is only three-fourths of those carried in Boston.

While the Committee was conducting its investigation in Great Britain a sanitary congress, at which some 800 delegates were present, was held in Leeds, one of the cities above referred to.

The eminent medical authority who presided over the sessions of this congress referred in his opening address to the distribution of urban population over a wider area as one of the most crying needs of the day. In regard to it he used the following language: "What is urgently needed in Great Britain today is, firstly, drastic and radical legislation, by which local bodies may be able to acquire land compulsorily, on paying full compensation, for building workmen's houses, and then quick and cheap early travelling, rendering it possible for city workmen to live in the surrounding country."

So far as the work here referred to is concerned, that of distributing urban population over a wider area, with all the results, direct and indirect, therein implied, a most superficial examination will suffice to show that Massachusetts is far in advance of any portion of Europe. This has, too, in large degree been brought about in an extraordinarily short time, not by "drastic, radical legislation," such as that contemplated in Great Britain, but through the rapid and energetic expansion of the street railway system, seen in the comparative statistics just given. That in effecting this expansion much costly experimenting, not always successful, has been paid for, is undeniable; but it remains to be proved that the work, though done through private corporations, either cost them, or through them cost the community, more than from a public point of view it was worth, or a portion even of what it would cost if done in the way suggested at the Leeds Sanitary Congress. This is the other side of the account; and that the work in Massachusetts represented by the items which appear on this side was done in response to a public demand, at once outspoken and urgent, is matter of common knowledge.

One feature in the franchise granted to the Massachusetts companies immediately attracts notice; from the beginning they were, and still almost invariably are, in terms perpetual, while in reality legally revocable at the discretion of local boards. In this respect they are peculiar, almost anomalous; for, as a rule, both in this country and in Europe, concessions have been granted private companies for fixed periods of time only, during which the franchise, or concession, is in the nature of a binding contract. These contracts, especially in European cities, are almost infinite in their variety. They run from periods of fourteen to a hundred years, and, like leases between private parties, are framed so as to provide in advance for every contingency likely to arise. In Massachusetts, on the other hand, the grants of location have, as a rule, been of the simplest possible character, drawn in the most general terms, and with a noticeable absence of technicalities, reservations and safeguards against contingencies; and yet, while by these locations the local boards apparently granted the corporations rights in perpetuity in the public ways, the law, at the same time, reserved to the boards the power to revoke those rights at discretion.

In theory, such a franchise is to the last degree illogical. It can be compared only to a lease, terminable at will by the lessor, and without provision for the compensation of the lessee. Such a system, if suggested, would naturally be pronounced impracticable, if not absurd, and it would be assumed that private capital would never embark in ventures so lacking in the element of permanence and security. Yet in Massachusetts this has not proved to be the case; nor can it be said that the system has, for the half-century it has been in use, worked otherwise than on the whole satisfactorily.

A more fixed tenure of franchises is, however, by the terms of the act creating the Committee, one of the two points it is especially instructed to consider. The substitution for the present indefinite concessions of a specific and binding contract, covering a fixed term of years, setting forth the rights and obligations of the parties thereto and containing a rule of compensation for the purchase of the property in case of failure to renew, at once suggests itself as a measure of reform; and yet, in the course of the protracted hearings before the Committee, it was very noticeable that no such change was advocated by the representatives of the municipalities or of the companies, nor, apparently, did the suggestion of such a change commend itself to either. Some amendments in detail of the existing law, and partial measures of protection against possible orders of sudden, ill-considered or aggressive revocation were suggested; but it was evident that, while the municipalities wanted to retain as a weapon—a sort of

discussion bludgeon—the right of revocation at will, the companies preferred, on the whole, a franchise practically permanent, though never absolutely certain, to a fixed contract tenure for a shorter term, subject to the danger of alteration at every periodic renewal.

It is a generally conceded principle, that in dealing with matters of public policy it is not wise to disturb existing methods, no matter how logical or inconsistent with theory they seem, provided they work reasonably well in practice. The community is accustomed to certain ways of doing business and reaching results; and if the results, looked at as a whole and through a sufficient period of time, are satisfactory, it is questionable wisdom to scrutinize too closely either the logic or the symmetry of the ways in which those results are reached.

The term-franchise, or concession for a fixed contract period, is, moreover, open to serious objections. As the members of the Committee found wherever they studied it in operation, in this country or in Europe, it is apt to operate practically as a check on enterprise, and a bar in the way of any development involving the investment of fresh capital or of earnings which might be divided. The inducement is strong to get the largest profit possible out of the time conceded, without increasing the value of a system a renewed lease of which will at some specified time be under negotiation. This has been markedly the case in Great Britain. The term-franchise has there been universal since 1870, and the rights of the municipalities are so very carefully protected that their best interests have been systematically sacrificed. The municipalities have, in fact, been so afraid they would in some way be out-bargained that they have as a rule rarely overreached themselves; and now, after the lapse of twenty years, they are naturally served by undeveloped lines, with antiquated appliances, simply because they made it the distinct interest of the companies operating those lines to provide nothing better. The Massachusetts franchise, with its terminable-perpetuity feature, may be illogical—it seems, in fact, a contradiction in terms—but it recognizes an ownership under limitations, and the holder of the franchise works with the incentive of gain. It is the familiar case of the free-holder as compared with the leaseholder; and human ingenuity does not seem as yet to have devised any tenure under which men, much less corporations, will develop a business with the same degree of enterprise when they are working for the ultimate advantage of others as when they are working for themselves. Indeed, there is no feature connected with the street railway development of Europe, and especially of Great Britain, as compared with that of America, which is so noticeable as this. The companies are there all in the nature of tenants, or lease-holders, trying to get everything they can out of their concessions during the term for which they hold them. They care nothing for developments of which they are not likely to enjoy the results. In the end, therefore, the community suffers; and it is this sense of loss, and consequent discontent with the situation, which is the chief inducement held out for the experiment of municipalization; although, on the other hand, it is recognized that municipalization may involve an attempt at development on political rather than on business principles. The same thing was noticeable in the American cities visited by the Committee. The term-franchise here, too, has been productive of dissension, poor service, scandals and unhealthy political action. There is probably no possible system productive of only good results and in no respect open to criticism; but, in fairness, the Committee found itself forced to conclude that the Massachusetts franchise, which might perhaps not improperly be termed a tenure during good behavior, would in its practical results compare favorably with any. Certainly those results are as immeasurably as they are undeniably better than the results as yet produced in Great Britain.

While, therefore, the tenure by which the Massachusetts street railways now hold their locations is calculated to excite uneasiness in the minds of security holders, yet that uneasiness is, so far as the public is concerned, not without its compensating advantages in management. Questions involving hardship and litigation may at any time present themselves, and this possibility, there can be no doubt, does stand in the way of the sale of street railway company securities at a price they would otherwise command. The investigations of the Committee have not, however, led its members to believe that the public would derive benefit

from the substitution of any form of term-franchise now in use in place of the prescriptive Massachusetts tenure. But, even if such a substitution were on the whole deemed desirable, it would be intile to propose so radical a change, for existing companies at least, if, while no serious public detriment can be alleged, neither companies nor municipalities appear in advocacy of it. As was apparent at the hearings before the Committee, what the companies desire is a tenure as nearly as possible in perpetuity, with a restricted power of revocation only in the hands of the municipalities; what the municipalities desire is to retain, as a weapon convenient to have at hand, the legal power of revocation at will.

In the course of the hearings before the Committee, attention was called to certain features in the existing law, which, it was urged, might be changed to advantage. On behalf of the general public, it was asserted that, heretofore, concessions of great value had been much too freely granted by those temporarily in charge of the affairs of municipalities; that insufficient franchise obligations had been imposed on the companies; that no provision had been made in the franchises to compel companies to bear their reasonable share of expensive improvements rendered necessary by locations freely given them; that practically no limits had been set to profits, or provision made in case of excessive profits for a division of the same, or a reduction of fares; and, finally, that locations had been, and now occasionally were, made in streets and thoroughfares without any, or without sufficient, regard to the wishes and feelings of residents and property holders thereon.

On the part of the corporations it was alleged that the existing system was defective mainly through the insufficient protection afforded against the arbitrary revocation of locations, and the constant imposition of new and unjustifiable burdens through the threat of such revocation. They claimed, and submitted evidence to show, that the profits of the system were not unduly large, and that the constant changes necessitated by the advance of scientific apparatus, and the demand of the public for new appliances, the best accommodations and the most effective service, were such as to tax to the utmost the resources of the companies, while preventing any accumulation of profits beyond what was necessary for purposes of renewal—if, indeed, proper provision for renewal could now be made.

So far as the greater part of these grounds of complaint is concerned, whether advanced on behalf of the public or by the corporations, and however well founded they may be, they do not, in the judgment of the Committee, call for any considerable changes in the law as it now exists.

The Committee is aware that different views exist on the meaning of the present law. By some it is held that the "restrictions" of street railway locations in the several statutes relating thereto are limited, and that any additional terms exacted or conceded are, in legal phraseology, *ultra vires*, and cannot be enforced in law. This, however, is not the view usually taken, and, confessedly, the practice has been and now is widely at variance with it.\* Such a literal construction of the statute, if sound in law, would result in a noticeable breach in that principle of local self-government which is the basis of the Massachusetts polity. It would, indeed, carry the principle of centralized State control in this matter far beyond the point even, to which it is carried in the countries of continental Europe.

In the view of the Committee, however, the present Massachusetts system, while somewhat undefined and even contradictory in character—as is not infrequently the case with a system built up by degrees as the work of a succession of legislative bodies—tends to treat this whole matter of street railways as one of local

concernment. It is regarded as simply a question of the use which a given municipality sees fit to make of its thoroughfares. The municipalities are held to be the best, and, indeed, within broad limits, the only, judges of that use; just as the railway corporations are the best, and again the only, judges as to the degree of protection afforded by the grants they accept. If municipalities or corporations choose, from over-eagerness or for other reasons, to enter into ill-advised or improvident agreements, which they afterwards repent, that is their affair; and the officials entering into such agreements are responsible to their constituencies, whether the body of citizens or the holders of the company's stock. It certainly is not the part of the Commonwealth either to prescribe the terms of grants, or, after they are made, to examine those terms with a view to seeing that they contain nothing of which the parties to them may thereafter repent. In this view of the matter, it would seem, on the one hand, that improvident concessions of an apparently perpetual character may have been, perhaps were, made by the agents of the municipalities, and valuable privileges were conferred, not complied with corresponding obligations. On the other hand, in their eagerness to secure these valuable concessions and privileges, the corporations may have seen fit to regard the reservation which accompanied them as a mere matter of form. Under the system in use in Massachusetts, it was, as it now is, in the power, as it was and it the duty, of those representing both municipalities and companies to insist on more specific and better-considered grants, covering, if thought best, a given term of years, and binding in law during that term.

Taking this view of the principles of polity and the public and corporate interests involved, the Committee recommends certain changes in the present law, intended to make that law conform more closely to established practice and existing conditions. On the one hand, it would grant the local authorities explicit power hereafter to impose such terms and conditions as they deem the public interests demand, on original grants and locations in the localities over which they have jurisdiction; while, on the other hand, it would protect companies whose tracks have been already located from new and perhaps unreasonable conditions sought to be imposed in grants of alterations and extensions, which may be called for not less for public convenience than by corporate interests. These suggestions are incorporated in the draft of the act herewith submitted.

With the above exceptions, the Committee has seen nothing which would lead it to suppose that any detriment, so far as the public is concerned, has been or is likely to be sustained under the present system, except in one possible contingency. The representatives of the corporations asked that, throughout the Commonwealth, appeal should be allowed from municipal authorities ordering the revocation of a street railway location to the Board of Railroad Commissioners, as is already the rule within the territory served by the West End Street Railway system. (Acts 1887, chapter 413, section 8.) While it is true the revocation of a location may be arbitrarily ordered, not only at a possible serious loss to a railway company, but at no inconsiderable inconvenience to a local public, the local public can generally be trusted in such cases to make its influence felt on its representatives for its own protection. So far as the corporation is concerned, the concessions made to it are general, valuable and unlimited. The corporation might perfectly well have declined to accept the concessions coupled with the power of revocation, and refused to lay its tracks. With a full knowledge of what it was doing, it accepted the location, coupled with the right of revocation; and it is not easy to see on what ground, still holding the location, it can now ask to have the counterbalancing burden of revocation limited, as being liable to abuse, but without being able to instance numerous cases of such abuse, or, indeed, to show that the relations between the municipalities and the street railway companies had, on the whole, or indeed in any respect, been less friendly or productive of fewer good results in Massachusetts than elsewhere.

Cases may, however, at any time arise in which a dispute between a municipality and a corporation, and consequent revocation of the location of the latter, might occasion serious public inconvenience outside of the locality in which the difficulty occurred. It has already been pointed out that street railways are now largely agencies of interurban communication, or travel be-

\*"The law is very simple upon this point. It says that locations may be granted with such restrictions as in the judgment of the selectmen or the aldermen the public interests may require. But these local officials have in practice enlarged the word 'restrictions' so that it is made to include 'terms and conditions' also. To all practical intents and purposes the law might just as well read that locations shall be granted upon such 'terms, conditions, provisions and agreements' as the selectmen may in any case decide." (Argument of E. W. Burdett, counsel for the Massachusetts Street Railway Association, before the Committee, page 103.)

tween towns. The same company not infrequently operates roads in several connecting municipalities. Under these circumstances, it would seem but a fair degree of protection that no outside community should find itself suddenly deprived of its accustomed railway facilities by the removal of rails and wires as the result of a complication in some neighboring town.

An examination of the street railway map of the Commonwealth discloses the fact that such a provision of law would, though nominally limited in its operation, be practically general. All the considerable street railway companies operate routes in two or more cities or towns; and it would be a simple matter for the few smaller companies which now would not come under the protection of such a law to extend their lines so as to bring themselves within it. Such being the case, it has seemed to the Committee better, under the existing condition of street railway development, to establish one general rule for all. A provision to this effect, authorizing the Board of Railroad Commissioners to revise the findings of the local boards, has accordingly been included in the draft of an act herewith submitted.

The allegation that local authorities are in the habit of granting locations in streets against the wishes, or without due regard to the wishes, of residents in such streets, will next be considered. The Committee is not disposed lightly to recommend exceptions to the principle of local self-government. In the great majority of cases the municipal authorities are unquestionably better judges than an outside tribunal of both the wishes and the requirements of those dwelling in a given locality. Nevertheless, cases have arisen, and may again arise, where thoroughfares laid out with great care, and developed at large expense by those dwelling upon them, have been needlessly selected, against the remonstrance of residents, for railway location, when other routes, to the use of which no objection would be made, were almost equally available. Provision to meet such cases seems not to be unreasonable. The Committee, therefore, proposes, and herewith submits in the accompanying draft of an act, a provision that, where a majority in value, or a certain minority in numbers, of those owning real estate immediately abutting on any public thoroughfare protest in writing against the grant of a location for a street railway in such thoroughfare, the location shall be valid only after a hearing before the Board of Railroad Commissioners, and on the approval of that Board.

The extensive and costly street improvements often necessitated by the operation of street cars in the narrow streets of New England towns is a question which was often reverted to in the hearings before the Committee. In order to grant a location in it, a street not infrequently needs first to be widened; for other purposes it is sufficiently wide already. In this case it does not seem reasonable to impose the whole cost of the widening on the municipality. It is true that voluntary contributions have been made by street railway companies for such purposes, but the question may be raised that such contributions are *ultra vires*. Moreover, in cases of original location the proportion of cost which should be borne by the railway company should be clearly within the power of the municipality to determine. If the street railway corporation does not care to accept its location if burdened with such cost, it may refuse it.

A somewhat different situation, though of the same general character, arises when the growth of a community brings about an over-crowded condition of streets. The over-crowding is clearly in part caused by the necessities of the street car service. The widening of such streets is also a distinct benefit to the railway companies. In such cases, also, contributions to cost have heretofore not infrequently been made by railway companies, without any question being raised or intervention of the courts invoked. The technical legality of such transactions is, however, open to question; and it is but natural the companies should, when they can, seek to avail themselves of this point as an excuse for not contributing to a public improvement which they see must be made, but of which they prefer to secure the benefit without helping to bear its cost. Under the construction put upon the existing law, also, contributions by the companies for this purpose cannot be represented by additional issues of capital stock. If made, they must be provided for out of the company's net earnings, and, presumably, at a sacrifice of dividends. While, therefore, it is on the one side not unreasonable to give to the municipalities the right to

assess upon street railway companies, as upon other beneficiaries, a certain proportion of the cost of such improvements, on the other side, the money so expended should be looked upon as part of the cost of construction, and provision made to capitalize it on that basis. The Committee recommends legislation to cure this defect; and has accordingly incorporated in the draft of the act herewith submitted certain provisions from the laws relating to the assessment of betterments.

Reference has been made to the three lines of ultimate development into which the relations of street railway interests and municipalities seem now in this and other countries to be naturally working; that of (1) regulated private ownership; that of (2) the municipal ownership of a permanent way, to be operated by a private company as lessee; and (3) municipalization. The first of these lines of development is that through which the street railway interests of the Commonwealth have grown up, and its advantages and defects are well understood. The chief objection to it is obvious,—it necessarily involves a divided control of streets, resulting in continual jealousies, misapprehensions and disputes. While, because of its apparent simplicity, as well as from the analogy of the steam railroad, it naturally suggested itself in the early and experimental stages of street railway development, it certainly does not now commend itself as a permanent or scientific arrangement. Even should it be continued indefinitely, the Committee is clearly of opinion that it would be conducive to a better state of affairs were the municipalities to assume full control of the streets, meeting all charges for paving, for street cleaning, etc., and receiving therefor from the companies a net annual money payment in lieu of work in kind. This would be in the nature of a commutation,—a pavement and cleaning tax to be paid by the company in consideration of the special provision made in streets for its exclusive use. While clear as to the expediency of this readjustment of burdens, the Committee has had great difficulty in devising a satisfactory basis on which to recommend it. The cost of paving, etc., is included in the accounts of the street railway companies under the general head of "(35) Repair of Roadbed and Track," and the items for paving are not separated from others. On many country roads, also, the obligation to pave is nominal; in city thoroughfares it is heavy; while in other cases the amount of work to be done and expense incurred depend on the terms of particular locations. Again, the cost of removing ice and snow is another obligation which pertains distinctly to the care of streets. The tracks of the street railways are in the nature of sidewalks and footpaths. In winter the public convenience demands that they should be immediately broken out, and kept constantly clear. In the case of the track, as in that of the sidewalk, the snow and ice, when removed, are necessarily thrown, temporarily at least, upon the travelled way. If they cause an obstruction, it is obviously the duty of whoever is legally responsible for the condition of the traveled way to remove them; and for that condition the municipality is, of course, responsible. This has proved a fruitful source of misunderstanding between the companies and the town and city governments ever since the street railway system originated; and the singular spectacle has not infrequently been witnessed of one gang of men, in private employ, shovelling snow from a track, while another gang of men, in public employ, shovelled it immediately back. In this case two propositions seem to the Committee equally clear; first, that it is the business of the city or town to keep its streets properly clear of obstructions, and, secondly, that, under the circumstances, the street railway companies should, in this specific instance, compensate them for so doing. Yet, in the matter of removing ice and snow it is, under the New England climatic conditions, difficult to reach any rule of compensation, the expense actually incurred year by year varies so greatly. In certain years it is nominal, in others it is extremely heavy. Nevertheless, in the opinion of the Committee, some rule should be established.

After a careful study of such data and statistics as could be found bearing on this subject, the Committee has formulated certain provisions in the draft of a proposed act herewith submitted. They establish the legal obligations of the parties, restoring to the municipalities, in so far as may be, the full control of their public ways, and making them solely responsible for the condition of those ways, both as respects pavement and

freedom from obstruction; and, on the other hand, so far as the street railway companies are concerned, the present obligations for labor or pavement work are committed into fixed money payments, in the nature of a tax. While the fairness of this commutation as respects amount, etc., cannot be demonstrated mathematically, it has been reached after careful study of the reports, and is believed to represent approximately existing conditions reduced to an intelligible basis. But, whether it does so, or in some respects fails quite so to do, in its working the benefits will greatly outweigh any possible shortcomings, if it removes from the relations between municipalities and the street railway companies a fruitful cause for ill-feeling, recrimination and arbitrary dealing.

The system of private ownership of street railways, in the shape and to the extent now in use in Massachusetts, is not, however, that which most commends itself, in theory at least, to the judgment of the Committee. A better and more logical system would seem to be that already described, not unknown in Great Britain and elsewhere, but to which the experience of Germany is more especially tending,—a system under which the municipality both owns and controls the whole surface of its streets, whether paved with other material or with iron, and leases to a private company the right to run vehicles over prescribed routes on tracks therein specially provided.

The process through which this result has been, or is now being, brought about in foreign countries is simple and well worth the careful consideration of American municipalities. It is as follows: In the first place, European street railway franchises, or concessions, are never perpetual. They are always granted for a fixed term of years, this term being sometimes established by general law, and sometimes by special governmental authority. The average term is perhaps in the vicinity of twenty years; and the details of the individual concessions made under the general authority are then, as matters of local concernment, worked out in an almost infinite variety of forms,—the result of protracted negotiations between the officials of each municipality and the representatives of a company, or the concessionaires, as they are termed. When this agreement is thus completed, executed and approved by the proper ministerial authority, it constitutes a binding contract, enforceable on both sides during its continuance, and subject to change, termination or extension only by mutual consent, and in the way in it provided.

It is not necessary now to discuss the practical working of this system. It varies greatly under different conditions, depending largely on the traditions, character, political methods and business capacity of communities, but with a continual tendency towards some approved standard. For example, the municipal contracts recently entered into by Berlin and Frankfort, and that are now under consideration in Hamburg, are in Germany regarded as models, and consequently are in the main adopted in other German municipalities.

In the judgment of the Committee, they merit and will repay careful examination, being in curious contrast to the similar contracts entered into in America. As a rule, these foreign concessions are framed with special provision for the ultimate ownership by the municipality of whatever is a part of the streets. In some contracts it is provided that, at the expiration of the term, everything of this sort shall become the property of the municipality, at once and without any payment being made for it, the company during the term of the contract securing itself against loss through a system of amortization; in other cases a measure of compensation is provided, the municipality agreeing to take and pay for the property, in case of inability to agree on a renewal of the concession. In any event, the settled policy is to have everything pertaining to the street and pavement pass into the ownership of the municipality at some not remote future time, leaving the municipality free then to enter into contracts for the operation of the tracks, or to make such other arrangements as it sees fit. But the essential point to which the Committee desires to call attention is the distinction here drawn between the ownership of the pavement, and consequent full control of the street, and the running of the vehicle. The ultimate full control of the street, and exclusive ownership of whatever may be part of its surface, by the municipality, is, it may be said, now accepted in European countries as a fundamental principle of polity.

In the judgment of the Committee, this principle is correct, and could be advantageously incorporated into Massachusetts practice as applying to all street railway companies hereafter organized and locations granted. Even if the concessions in future are not made for a specific term of years, during which they shall be binding contracts to be changed only by mutual consent,—a change the Committee does not advise,—the general law should at least be so modified as to secure in every location hereafter granted a clear, well-considered rule of procedure and compensation, under which the municipalities may, at any time they desire so to do, assume, readily and at an understood and reasonable cost, the ownership of everything appurtenant to their streets.

But it will probably be said that this applies only to franchises hereafter granted,—that Massachusetts is now already well provided with street railways, and that some provision should be made to cover the system already existing. The Committee has given careful consideration to this phase of the problem. Should the question arise on any large scale,—should any particular municipality, for reasons good and sufficient to itself, desire to resume complete control of its streets and pavements, or of any part of them,—the case would, probably, be dealt with individually. The course of procedure would be simple. The municipality would ask of the Legislature a special act, probably framed on the precedents which already exist for the public taking of the property of water or gas light companies, and proceed in the way therein prescribed.

Meanwhile, cases may at times arise in which local communities, in the care of their public ways, might desire to take over certain tracks in particular streets without necessarily taking over all connecting tracks in other streets, or portions even of the same street. The Committee has framed, and herewith submits, a form of act intended to meet such cases. This act, drawn up on principles already laid down, explains itself. It in no wise disturbs, much less provides for the revocation of, any franchise or location of a street railway company. The franchise is treated as a license to run cars over certain routes in cities or towns, for the public convenience. In the case of a street railway such a franchise no more necessarily involves the ownership of tracks than the licenses to run a line of omnibuses involves the ownership of the pavement. If, then, under the proposed act, a municipality takes over the tracks in a certain street or streets, by so doing it in no degree impairs either the right or the duty of any railway corporation holding a franchise to run cars, whether through that street or elsewhere. The tracks specified merely pass into the ownership and care of the municipality, the corporation is compensated for them, and thereafter the cars are run over them, the corporation paying trackage to the municipality. The distinction is the familiar one between the omnibus line run by a private company, and the stone or iron pavement owned by a city or town; except that in this case the company, running its vehicles in exactly the same way as before, pays the city or town for the use of a particular species of pavement laid down for its special and exclusive convenience, instead of itself laying down and owning that pavement. In other words, the essence of the franchise, or location, is the right to run vehicles to carry passengers on certain routes, and the laying and ownership of the tracks is a mere incident, and not an essential incident, thereto. The act proposed deals only with the incident; it in no way affects the essence of the franchise. Under its terms, it will hereafter be in the power of any municipality to retain in its own hands full possession and control of those of its streets in which no street railway location has yet been granted, and then gradually, as occasion offers, to extend that possession and control over other streets in which locations have been granted, until the street railway corporation would by degrees be reduced to its original functions,—those of a private company licensed to run public vehicles over specified routes under fixed regulations, and in consideration of certain rentals and other money payments. It would become, in short, an improved omnibus line, run on scientific principles and adapted to modern conditions.

The third line of development remains to be considered,—that known as municipalization. This has been much discussed of late, and in the hearings before the Committee was advocated by some as the best practical solution of the problem; but even its warmest exponents admit that, as respects street railways,

municipalization is a most important and far-reaching proposition, yet in the experimental stage. The tendency towards it in Great Britain is pronounced, and, as a system in practical operation, it can now be studied in its tentative stage in Glasgow, in Leeds, and in numerous other places. In thus studying it, however, one thought immediately suggests itself to an American. So far as development, activity, and material and scientific appliances and equipment are concerned, apart from permanent way and track surface, the American street railway service is so far in advance of any to be found in Great Britain as not to admit of a comparison. Without exaggeration, it may be said that, while the street surfacing, and merging of track with pavement, are there far in advance of what we ordinarily find in America, all the other appliances and accommodations are either antiquated and positively bad, or recently taken from this side of the Atlantic and installed by American companies. In other words, in the field of scientific apparatus and mechanical development, America has experimented at immense cost, as our street railway capitalization shows, while Europe has patiently waited, and is to-day rapidly and quietly appropriating the results for which we have paid. As respects municipalization, the conditions are likely to be reversed. Foreign countries, and more especially Great Britain, seem disposed to experiment, and experiment on a very considerable scale; and perhaps it would be wise for America to allow these countries in this matter to bear the cost of so doing, sure of our ability at any time to appropriate all the useful results of foreign experience.

As yet no attempt at the municipalization of street railways has been made in any country on a sufficiently large scale and for a long enough time to be of real significance. Glasgow and Leeds, for instance, are the two European instances more frequently referred to. From the statements often met with in the press, and the assertions heard in discussion, it might well be assumed that the experiments made in these cities amounted to an indisputable and established success; whereas, in point of fact, such is in no degree the case\*. So far from being a demonstrated success, it may, on the contrary, be confidently asserted that nowhere, as yet, has the experiment of municipalization of street railways been worked out to any logical and ultimate results whatever, nor can it be so worked out for at least a score of years to come. Even then, political habits, social traditions, and material and economical conditions vary so greatly, and enter to so large an extent into the problem, that it will not be safe to infer that what may have proved safe and practicable in one community is either practicable or safe in another. At the present time, the municipalization of the street railways is not accepted as by any means indisputably desirable in Great Britain, while in Germany it is regarded unfavorably. This last fact is the more noteworthy, as Germany has been the field in which State ownership and management of steam railroads has been developed to the fullest extent, and with results pronounced to be unquestionable, as well as most satisfactory. The grounds for this apparently illogical action and contradictory policy were, during the last summer, briefly set forth to a member of the Committee by the highest German authority. They were purely practical. The State official referred to simply said that Germany had carried officialism as far as, in his judgment, it was prudent to go. The government employes tended always to increase; and there, as here, it was found that employment by the government signified much which did not at once appear. The line had to be drawn somewhere; and it was not considered expedient to add to the number already existing the numerous officials and employes of all the street railway systems in the Empire.

So far as Massachusetts is concerned, the Committee apprehends that grave difficulties of a practical as well as theoretical character would present themselves, should a serious attempt be made at the complete municipalization of street railways. The public ownership of tracks in the streets, like the control of the streets, is a simple matter. Each municipality might own

those in its own streets, or in a portion of its own streets, and a private company could run vehicles over the tracks, whether belonging to itself or to the public, in one or several cities and towns. It would be merely a matter of arrangement and contract. Not so municipal operation. It is necessary again, in this connection, to observe that the larger individual street railway systems are in Massachusetts rarely, if indeed ever, confined to one city or town; the largest of these systems—the West End—holds franchises from and locations in no less than eleven different towns and cities, and the Lynn & Boston in nineteen. Under these circumstances, complete municipalization obviously becomes a difficult problem. It is not supposable that one town or city could own, as well as operate, not only tracks but the buildings and appliances involved in the operation of tracks, in a number of adjacent cities and towns. For instance, complications could hardly fail to arise were the city of Somerville to decide to municipalize its street railways, and operate them as distinct in every respect from the system which served all the adjacent cities and towns; while, on the other hand, it is scarcely probable that Somerville would care to own lines of its own in all those cities and towns, or, if she did, that those cities and towns would regard the scheme with complacency. A community of action through some common organization would, therefore, have first to be devised. Though obviously a necessary preliminary, this, in itself, is an intricate problem, to the solution of which the Committee has not felt called upon to address itself. Should it arise, it will have to be dealt with under conditions not now apparent, and by the Legislature itself. The existing law does not provide for it; nor, in the light of the investigations it has made, is the Committee prepared to suggest any alterations of the law in this respect.

One subject, specially referred to in the act creating the Committee, remains for consideration. The Committee was directed to consider and report whether any uniform system of taxation should be adopted as applying to the street railway companies. This does not specifically raise the question of the disposition to be made of the taxes, already under the existing law collected from the street railway companies in common with all other corporations. That subject has, however, heretofore been considered, and notably by the Boston Rapid Transit Commission of 1891, and the Joint Special Tax Committee of 1892. Both of these bodies, for reasons stated in their reports, recommended an exception to the general rule in the case of street railways, and the payment of the corporation tax levied upon them to the towns in which the companies operated lines, instead of to the towns in which the holders of the stock resided. A bill to this effect was introduced in the Legislature of 1893, passing the House of Representatives by a large majority, but failing in the Senate by a single vote. The considerations in favor of such a disposition of this tax advanced in the two reports referred to commend themselves to the judgment of the Committee, and the change has been incorporated in the form of act herewith submitted.

So far, however, as a further special street railway franchise tax is concerned, grave popular misapprehension seems to exist as to the burdens in the way of taxation to which street railway companies are already subject,—a misapprehension due in no inconsiderable degree to the indirect and anomalous character of those burdens. It seems to be generally assumed that the street railway companies received, and are now receiving, public franchises of unusual value, for which they pay no money consideration and render very inadequate public service; that their profits consequently are inordinately large is also assumed, and that those profits are in some way concealed through a system of vicious financiering and deceptive bookkeeping.

The facts, however, do not seem to be as assumed in this presentation of the case. A more careful investigation fails to disclose those Massachusetts franchises of great value given away without consideration, or unduly large profits on the part of the companies as a whole, or more than exceptional cases of vicious financiering, or a deceptive general system of bookkeeping. There are in all 77 street railway companies in operation in the Commonwealth. Of these, one, the Boston Elevated, or West End, Street Railway, may be left out of consideration, its case being exceptional to such a degree as to make it necessary to put it in a separate class, as has in fact been done through

\*Those seeking further information on this subject are referred to a very interesting, as well as instructive, paper submitted to the committee by Robert P. Porter, superintendent of the United States Census of 1880, printed in the Appendix to this report.

recent legislation (Acts 1897, chapter 500.) Of the 76 remaining active companies, 34 paid no dividends in 1897, while 42 paid dividends of from 1.25 to 10.5 per cent, averaging 4.29 per cent, — a return certainly not excessive. Upon this point the inquiries of the Committee tend to confirm the conclusions of the Board of Railroad Commissioners in their report for 1896 (page 110). While in the business of operating street railways, as in every other business, there are—as, within reasonable limits, there should be—exceptional cases of large profit offsetting cases of failure to earn reasonable profits, yet the idea sometimes entertained that the electric railway is likely to prove a source of extraordinary or abnormal profit must apparently be abandoned. "It is a close business, yielding with skillful and prudent management only a fair average return, quite within the limit allowed by statute and conservative opinion as adequate and proper for investments of this character."

But it is often alleged that the capitalization of the companies is excessive and fictitious, and that, if measured by actual cost, the percentage paid in dividends is deceptive. This is a difficult question to decide; but the laws of Massachusetts as to capitalization have been strictly drawn and rigidly administered, nor has any evidence been adduced showing that they have been peculiarly ineffective. On the contrary, using round numbers only, the capitalization per mile in stock and bonds (\$46,600), is less in Massachusetts than the average (\$49,500) in the New England States, not a third of what it is in New York (\$177,800), or half what it is in Pennsylvania (\$128,200), less than half what it is (\$94,100) in the United States as a whole; and it is less than that in Great Britain (\$47,000), where both construction and appliances are far less costly and elaborate, and over-capitalization has been guarded against with the utmost care. The truth of this allegation in the case of the Massachusetts street railway companies remains, therefore, to be demonstrated, the weight of attainable evidence being distinctly the other way.

The Committee has already discussed what may be termed the special contributions made by the street railway companies to the cost of paving and the removal of snow and ice, and also to their participation in the cost of certain street widenings; and schemes of law are herewith submitted, looking to the better regulation of these matters. The changes therein recommended by the Committee are in main part commutations of burdens already imposed from payment by work to payment in money; the present proposition is of a different nature. It looks to the imposition on street railway companies, of a special franchise tax. The idea of such a tax is not new. The draft of a proposed act providing for one was specially referred for consideration to the large and exceptionally able Rapid Transit Commission of 1892, already referred to.

The Committee concurs in the general conclusions on this subject reached by the Rapid Transit Commission. The system of taxation of corporate franchises in use in Massachusetts is well defined, and, in general, works satisfactorily. All corporations, including street railway corporations, pay to the State their proportionate share of the general taxes according to the market value of their capital stock, which is perhaps the best index of their ability to contribute. The distribution of this tax is a distinct question, and, so far as the street railways are concerned, has already been discussed. Aside from the matter of distribution, there seems to the Committee no sufficient reason to suggest any additional taxation of street railways except in the following particular. It is a well-recognized principle in the treatment of street railway and other public service corporations in Europe, as well as elsewhere, to provide that, after the owners and organizers have received a reasonable return upon their enterprise and investment, any excess of profits over and above a fixed amount should in part be paid to the government in the nature of a franchise tax. This principle commends itself to the Committee. It is not subject to the criticism, which appears to be sound, that a limitation of dividends hampers enterprise and improvement. Where a corporation is not limited in the amount of dividend it may earn, but is simply required to pay over a sum equal to the excess of dividends actually paid over a fixed and reasonable percentage on its capital stock, it will be constantly spurred to render such service that its profits will increase. Being a public service corporation, owned and operated for private profit, it seems just and in accordance with sound

principles that, when the private ownership has received a reasonable return upon its investment, the public should share, through a form of special taxation, in the increment of profit, provided it can do so without the danger of offering an inducement to those in control of the property to stint or conceal their profits. A provision to this effect is incorporated in the draft of the act herewith submitted, similar in its general character to that recommended by the Rapid Transit Commission of 1892. (Report, pages, 119, 124, 281.)

Respectfully submitted,

Charles Francis Adams,  
Wm. W. Crapo,  
Elihu B. Hayes.

## ENGLISH FROGS FOR TROLLEY WIRES.

We find in one of our foreign exchanges descriptions of the frogs for overhead trolley construction which have been designed by W. Wood, chief engineer of the electrical department of the Bristol Tramways Company. It is stated that these frogs and crossings have been adopted on the

"WOOD" OVERHEAD SWITCHES.

electric lines of this company, the ones formerly in use, of American manufacture, being taken down. Fig. 1 is a frog adapted to two lines running into one, Fig. 2 a switch frog with movable tongue, and Fig. 3 the crossing.

## COUNTERFEIT NICKELS.

A considerable number of counterfeit 5-cent pieces have been turned in at the offices of the Ohio street railway companies. They bear the date of 1892, and are so well executed that only a close examination of the reverse side will enable one to distinguish them from the genuine.

## THE INDIANAPOLIS FIGHT.

The latest report as to the progress of the contest between the city of Indianapolis and the Citizens' Street Railroad Company is that the city has won a point. In 1894 a suit was begun to oust the company, on the ground that the charter had expired and the seven years' extension which had been granted was invalid. This complaint was amended a few months since, making the suit one to oust the company in 1901. The railway demurred on the ground that its right in the streets is perpetual. The contention of the city has been sustained in this suit in the circuit court. The case will be carried to the supreme court.

### THE LARGEST RAILWAY GENERATOR.

The 1,600-k. w. generators in the Intramural power house at the World's Fair were considered wonders and almost too big for practical service. Their utility was there demonstrated and later by like installations in the railway power stations in Chicago, Philadelphia, Boston and Brooklyn. But now the Louisville Street Railway Company is to have the giant of them all. This generator, which is to be the largest ever built for traction work, is now under construction at the works of the General Electric Company at Schenectady, and will be installed in the Logan street station in Louisville, Ky.

The capacity of the machine will be 2,400 k. w. or 3,000

### PREPARATIONS FOR THE CONVENTION IN BOSTON.

The executive committee of the American Street Railway Association met in Boston on January 26, to arrange for the annual convention. The members present were President Lang, Secretary Penington, Robert McCulloch, St. Louis; J. A. Riggs, Reading; R. S. Goff, Fall River; H. C. Moore, Trenton. Messrs. Roach, Wyman, Ely and Connetc were unable to attend. The officers and the executive committee have set about the preliminary work with great vigor and will spare no pains to make the coming convention a success in every way.

The convention will be held September 6 to 9, inclusive:

"MECHANICS' BUILDING," BOSTON.

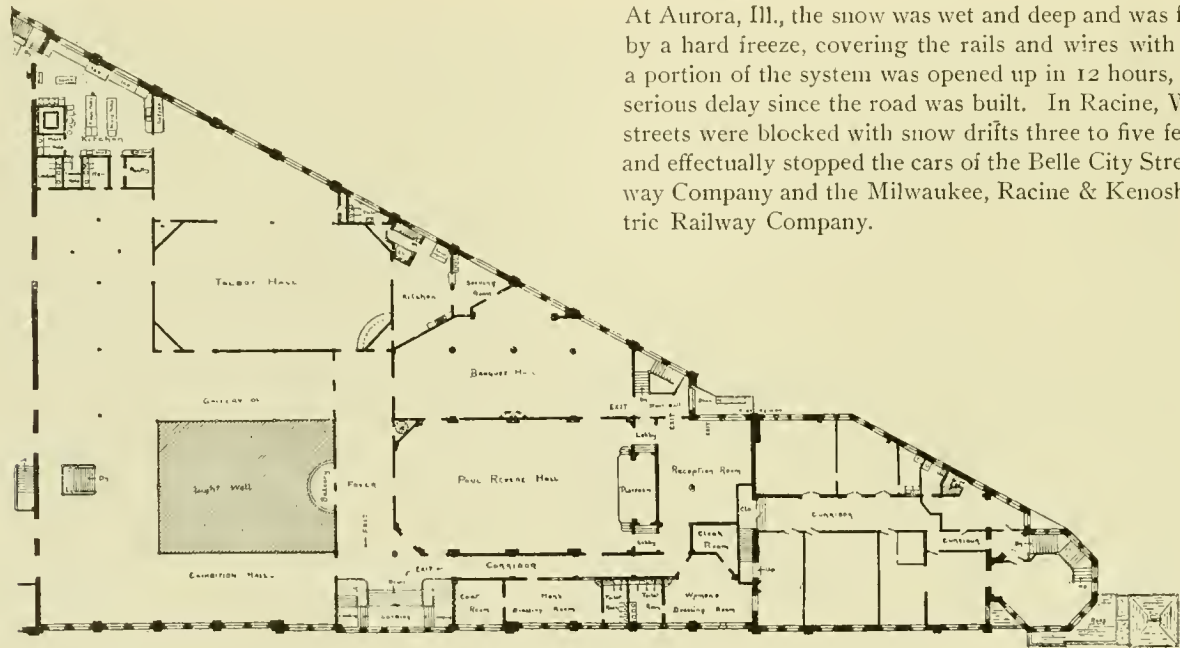

h. p. and will stand an overload of 33 per cent, so that the capacity in cases of emergency may be 3,200 k. w. or 4,000 h. p. The generator will be driven at a speed of 75 r. p. m. by a 4,000-h. p. cross compound engine, to be furnished by the E. P. Allis Company of Milwaukee. The principal dimensions are as follows: diameter of field frame, 19 ft.; width of field frame, 4 ft. 1 in.; 22 poles; diameter of armature, 12 ft. 9 in.; diameter of commutator, 9 ft. 8 in.; diameter of shaft, 27 in.; width of armature, 5 ft.; width of commutator, 21 in.; weight of armature and commutator, 83,000 lbs.; total width of generator, 77 in.; total weight of generator complete, 174,000 lbs. On account of the large diameter the armature can not be transported over the railroads in its completed state, either erect or on its side, and will have to be assembled in Louisville.

this early date was chosen largely because a suitable hall could not be had during October. Accommodations have been secured in the Massachusetts Charitable Mechanics' Association Building, generally known as "Mechanics' Building," located at Huntington avenue and West street, and which is used entirely for exposition and entertainment purposes. The exhibits will be located in two halls, one in the basement, for heavy machinery, cars, trucks, etc., and one on the first floor, for smaller and lighter appliances. The building is adjacent to the freight yards of the Boston & Albany Railroad, and also close to the tracks of the New York, New Haven & Hartford, so that the transportation of the heavy exhibits will be quite easy.

The plan of the second floor, which is here given, shows the location of the meeting rooms of the two associations; the American Association will meet in the "Paul Revere

Hall," and the Accountants' Association in the "Banquet Hall" adjacent to it. That portion of the building shown (the scale is approximately 64 ft. to 1 in.) is, in the first and basement floors, nearly all available for the exhibits; the floor space in the basement exhibit hall is in excess of 25,000 sq. ft., and that on the first floor considerably greater, so that the aggregate is over 60,000 sq. ft. Thus exhibitors will not be so cramped for room as has been the case in the past. The charge for space will be 10 cents per sq. ft.

On one side of the building, towards the railroad, the entrance is at the level of the basement, and on the other the entrance is practically at the level of the first floor; thus there is but one flight of stairs to reach the meeting rooms. The building has its own steam and electric plants, for heating and lighting.

PLAN OF SECOND FLOOR.

The subjects of the papers have been announced for the American Association, but the assignments have not all been made. The subjects are as follows:

"Maintenance and Equipment of Electric Cars."

"To What Extent Should Street Railway Companies Engage in the Amusement Business."

"Underground Electric Roads—Their Construction and Management."

"Carrying of United States Mail on Street Railways."

"Comparative Earnings and Economy of Operation Between Single and Double Truck Cars for City Use."

"How to Care for the Return Current."

"Inspection and Testing of Motors and Car Equipment by Railway Companies."

The entertainment of the Association will be in charge of the Massachusetts Street Railway Association. The plans of the State Association have not been completed, the first meeting having been held the second week in February, but it is understood that a number of entertainments of a kind to be found only in New England will be provided.

After drilling to the depth of 1,200 ft. the Omaha Street Railway Company abandoned the attempt to secure its water supply from artesian wells.

## THE BIG SNOW STORM.

The snow storm which passed over the northern central states the last week in January, was exceptionally trying to the street railway companies, and occasioned large expense and serious delays to traffic. It is estimated that it cost the street railway companies of Chicago \$75,000 to handle the snow. Work was in progress night and day to keep the tracks clear and haul the snow out of the streets. One company alone employed 1,000 men and kept from 100 to 500 teams going constantly until the streets were cleared.

The Milwaukee Electric Railway & Light Company had four plows and seven sweepers and a large force of men working and kept its tracks clean with great difficulty. Some of the railways in the smaller cities were not so successful. At Aurora, Ill., the snow was wet and deep and was followed by a hard freeze, covering the rails and wires with ice, but a portion of the system was opened up in 12 hours, the first serious delay since the road was built. In Racine, Wis., the streets were blocked with snow drifts three to five feet deep, and effectually stopped the cars of the Belle City Street Railway Company and the Milwaukee, Racine & Kenosha Electric Railway Company.

The snow storm in New England and the Atlantic states was no less severe and the railways, especially in the smaller cities, were blockaded with ice and snow. The Consolidated Street Railway Company of Worcester, Mass., had all its snow plows, sweepers and 500 extra men at work clearing its tracks. At first all the lines were blocked, but most of them were opened up on the day following the storm. No trolley lines were reported down. None of the suburban lines about the city were operated and several days elapsed before connections were made with Spencer, Marlboro, and other surrounding towns.

In New York City the conduit lines were delayed but not blocked at any time, and no trouble was experienced with snow and ice in the conduit. The first severe winter test was given to the third rail system of the New York, New Haven & Hartford Railroad. Although the steam trains were delayed for three or four hours, yet the electric trains were operated constantly with only a few seconds delay in the schedule. The snow completely covered the tracks and the third rails, but there was no perceptible leakage. This was considered a severe and successful test of the system.

In Boston, the storm, which was a genuine old-time "nor'easter," was the most severe in years. Snow fell to a depth of 20 in., and snow and sleet and wind combined to

wreck many pole lines. The trolley lines resumed operation earlier than the steam roads, some of which did not get their suburban service going for 48 hours. At one time the Boston Street Railway Company (West End road) had as many as 7,500 men at work. As high as 40 cents an hour was paid owing to the enormous amount of immediate work required. The storm cost the surface lines in the city \$250,000, besides loss of traffic.

While the writer was in the office of a western street railway manager, a few days after the storm a committee of property owners called to demand the removal of all the snow which had been piled in high banks on each side of the street. They were highly indignant and not as polite in their demands as the occasion warranted. The manager listened patiently until each had had his say, and finally, when there came a lull in the storm, greatly surprised his auditors by agreeing fully with them that the company ought to haul away the snow. The only point in question, he declared, was the amount of the company's share. Then he produced a diagram of the street and showed that allowing for the space from tracks to curb, what had been shovelled from sidewalks and thrown down from roofs, that the road had actually contributed just one-fifth to the snow banks. Then he closed the interview with a promise to remove his portion—one block for each four blocks they removed, and a request to advise him when they started in, and his teams would be ordered out at once. They departed in silence and as we go to press had not yet tackled their four-fifths of the proposition.

### PEDESTRIANS MUST TAKE CARE.

The supreme court of Iowa has recently rendered a decision affirming the old rule that pedestrians must "look and listen" before crossing railway tracks. The case was an action at law brought by Beem, administrator, against the Tama & Toledo Electric Railway & Light Company, to recover for the death of his intestate. The decedent was 71 years old and quite deaf, who walked upon the railway track and was struck by a freight car pushed by a motor car. Had he looked he could have seen the approaching train for a distance of 550 feet. After the evidence was in the lower court directed the jury to bring in a verdict for the company. The plaintiff appealed. In affirming the judgment below the court said in part:

"The grade of the railway descended from the crest of a ridge and although the evidence as to the speed of the train is not satisfactory, it may be conceded that the jury would have been justified in finding that it was greater than the ordinance permitted and that accident was due in part to negligence on the part of the defendant. It remains to be determined whether the jury would have been authorized to find that the decedent was free from negligence which contributed to the accident.

"It is true, as contended by the appellant, that it is the duty of persons in charge of a street car to be watchful and diligent to avoid doing injury to others, but persons who cross street railway tracks also have duties to perform. They cannot assume that without care on their part they will be seen and protected from harm and the car stopped if necessary to avoid a collision. They are not as a rule required to use the same degree of care as would be required if they were about to cross an ordinary commercial railway track. But street cars are operated according to established time schedules and their efficiency and value to the public demands that they be so operated. To require whenever a person approaches the track that they be stopped or their speed be slackened until it is evident that the

person will not be endangered by the running of the cars, would be to impose a serious and in many cases an intolerable burden upon the railway corporation and to subject its patrons to annoying and injurious delays without any substantial reason for so doing or benefit of importance to any one. Ordinarily a pedestrian who approaches a street railway track may and does without appreciable effort or loss of time ascertain if a car be near and it is his duty to do so.

"The only conclusion which can be reasonably drawn from the evidence in this case is that the decedent did not take any precaution to avoid the accident. Although he was unable to hear readily and therefore should have been more diligent to discover the approach of the train by the sense of sight, he could not have looked in the direction of the car when about to cross the track. There is no room for the presumption which arises in some cases that the natural instincts of the decedent led him to use reasonable care to avoid the accident. The evidence clearly shows that he could not have done so without avoiding it. It may be, although it is not shown, that the employe in charge of the train saw the deceased while he was walking near the track, but if so the employe had no reason to suppose that the decedent would turn towards and attempt to cross the track without looking for and avoiding the train. Until there was reasonable ground for concluding that he might do so the employe had the right to rely upon the presumption that he would exercise the caution which a person of ordinary prudence would have exercised. It is not shown that when the decedent turned toward the railway track to cross it that the car could have been stopped to avoid the collision. On the contrary, it is clear that the car could not then have been stopped before it occurred. We conclude that the evidence could not have authorized a recovery by the plaintiff, and this verdict was therefore properly directed for the defendant."

### W. R. GARTON.

W. R. Garton, who has been so long and favorably known in the street railway business, has established an office at 414 Ashland Block, Chicago, and will devote his attentions to consulting engineer's work. Mr. Garton's experience in

W. R. GARTON.

the street railway line has been a diversified one; starting 12 years ago as a conductor, he has been successively motorman, inspector, electrician, superintendent and general manager. During the past three and one-half years his time has been taken up with the commercial phase of the business. He was recently elected general manager of the Garton-Daniels Electric Company, and is a director and consulting engineer of the Raster Carbon Rheostat Company. Besides representing these firms Mr. Garton will be the western agent of several large eastern manufacturing companies, particularly those in the street railway field, but also some of those handling other leading industrial products. Mr. Garton's well known ability and energy guarantee success in his new undertaking.

The City & Suburban Railway Company, Portland, Ore., has leased the 2nd street line and is engaged in reducing the gage from standard to 3 ft. 6 in., which is the ordinary gage for street railways in Portland.

DEATH OF JOHN S. PUGH.

Few of the many salesmen in the street railway field had so large an acquaintance, or numbered so many of those acquaintances as friends, as John S. Pugh; and it was with a feeling of sorrow and surprise that the news of his sudden death was received.

JOHN S. PUGH.

He was born in New York City, November 7, 1858, and in 1872 entered the service of the John Stephenson Company, with which his father, D. W. Pugh, has been connected for so many years. In 1885 he became a member of the firm of Pugh & Russell, in the manufacture and sale of street railway supplies, and which later be-

came the selling agents for the John Stephenson Company. The firm was dissolved in 1889 and Mr. Pugh became associated with the Baltimore Car Wheel Company; leaving this concern in 1894 to become the general sales agent of Dorner & Dutton, of Cleveland. A year later he again represented the John Stephenson Company.

He was taken ill while on the road, and returned to his home in New Rochelle, N. Y., where he died suddenly of hemorrhage of the brain. He was a grandson of the late John Stephenson, and leaves a wife and three little daughters.

Mr. Pugh was a man who readily made friends, was successful and conscientious in his work, and a man of large heart and generous impulses.

TROLLEY COMPETITION IN MASSACHUSETTS.

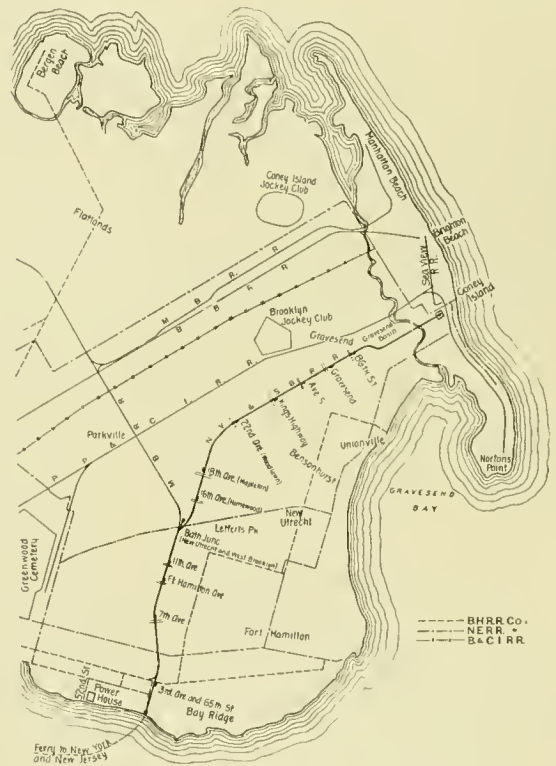

The decrease in the number of passengers carried by the steam roads in Massachusetts, and especially on those roads which run into Boston, has been very marked since 1893. For the 10 years up to and including 1893 there was an average increase in the steam road passengers of nearly 5,825,000 per year. In the four years since then there has been an average decrease of over 4,766,000 passengers a year; the total number carried in 1893 was 121,807,945, and in 1897, 102,743,890. In the same period the number of passengers carried on the West End Street Railway has increased at the rate of 9,672,700 per year, an increase of 29 per cent for the four years. The total for this and the four other roads running into or in Boston has increased at the rate of 12,208,000 per year, which is 31.1 per cent for the four years.

WHEELS WILL RIDE IN BROOKLYN.

The Brooklyn City & Newtown Street Railway Company has equipped two of its cars with hangers for carrying bicycles on the front and rear dashboards, with the view of determining whether the facilities thus afforded will be taken advantage of by cyclists. If experience shows that the convenience is sufficiently appreciated all the cars of the company will be provided with the hangers when the season is farther advanced.

NEW ELECTRIC LINE TO CONEY ISLAND.

The New York & Sea Beach Railroad, as announced in our December issue, has passed under the control of the Brooklyn Rapid Transit Company, which purchased a majority of the stock and bonds. The Sea Beach road extends from the foot of 65th street (Bay Ridge), Brooklyn, to Coney Island, a distance of six miles, and the object of the Rapid Transit Company in securing the line was to give a frequent and high-speed service to Coney Island from all

MAP OF LINES TO CONEY ISLAND.

parts of Brooklyn for a 5-cent fare. The only changes necessary were to put up overhead wires and bond the rails. Horseshoe bonds were used for this purpose. Motive power will be obtained from the South Brooklyn plant of the Brooklyn Heights road.

The accompanying map from the Railroad Gazette shows the several lines running to Coney Island; the three electric lines are those of the Brooklyn Heights Railroad, the Nassau Electric Railroad and the Coney Island & Brooklyn Railroad.

For through service from Fulton Ferry, Hamilton Ferry, South Ferry and the Bridge, connections have been made with the Brooklyn Heights road at 65th street and 3rd avenue; from other lines transfers are made at this point.

PROPOSED ELEVATED FOR CHICAGO.

The Chicago City Railway Transit Company was incorporated February 9, by parties connected with the Chicago City Railway. It is stated that the new company proposes to build an elevated road extending north from 30th street, in Dearborn street and Plymouth Place, with a down-town loop, for the better accommodation of the far southern and southwestern traffic of the Chicago City Railway.

38-FT. CAR—ATLANTA RAILWAY COMPANY.

### NOVEL TRUCKS AT ATLANTA.

We illustrate herewith a car, and its truck and motor equipment, built at the shops of the Atlanta Railway Company, Atlanta, Ga., after the designs of Frank M. Zimmerman, superintendent of the company. Though these are the first trucks that have been built the idea is not new with Mr. Zimmerman, he having had it in mind for some years past.

The car is 38 ft. long, 11 ft. 6 in. high and 7 ft. wide, and has a seating capacity for 60 people. The total weight is about 9 tons. The floor is 33 in. above the rail. From center to center the two trucks are 22 ft. 6 in. apart.

The construction of the truck is well shown in the illustrations. The wheels are 30 in. in diameter and the wheel base is only 32 in. The motor case which constitutes the truck frame is of cast iron. The motors, one on each truck, have four poles and are rated at 35 h. p. each. The motor is geared to both axles, the gear ratio being  $3\frac{1}{4}$  to 1. The weight of each truck is 7,500 lbs. The short wheel base enables the truck to turn between the sills, and both axles being driven all the weight of the car is available for traction.

This car has been in service for six months and has given the best of satisfaction.

Mr. Zimmerman's experience began with the old Sprague

Company, later he went with the Westinghouse Company and was with that company when it first entered the street railway field. He afterwards entered the employ of the Detroit Electrical Works, having charge of the equipment of the Detroit Citizens' Street Railway Company's lines. After the completion of some of the lines he accepted the position of superintendent of motive power, and remained in that capacity, doing all the electrical engineering, until August, 1895, when he resigned and went south to take the position he now holds with the Atlanta Railway Company.

### NO CONDUCTORS IN WINONA.

The street railway business in Winona, Minn., has not been on a paying basis, and the railway company was confronted with the alternative of shutting up shop or reducing expenses by discharging the conductors. It has decided to try the latter plan and fare boxes have been placed in the cars. The motorman alone is in charge of the car.

The Beaver Valley Traction Company, Beaver Falls, Pa., has leased a tract of 60 acres at the northern terminus of its line and will convert it into a handsome park and picnic grounds at a cost of about \$15,000.

SIDE AND END VIEWS OF TRUCK.

## PERSONAL.

A. F. Schoch has resigned as director and treasurer of the Ottawa (Canada) Electric Railway Company.

Robert Gillman, of Kansas City, has been elected a member of the Institution of Civil Engineers of Great Britain.

Alfred Wallace has resigned his position as superintendent of the Columbia (S. C.) Electric Street Railway, Light & Power Company.

F. S. Given has assumed the management of the Pennsylvania Traction Company which operates the street railways of Lancaster, Pa.

Edward Berry Kittle of the Sprague Electric Company, New York, was a "Review" caller while in Chicago on a few days' business trip.

I. W. Miller, superintendent of the Wilmington (Del.) & New Castle Electric Railway, has resigned to accept a similar position with the new road at Olean, N. Y.

F. S. Pearson, chief engineer of the Metropolitan Traction Company, of New York, has resigned because of ill health and will go to the south of France for a long rest.

Herman W. Falk, president of the Falk Manufacturing Company, has taken his family for an extended European trip on which he will combine business with pleasure.

H. T. Walter has declined a re-election as secretary of the Chester (Pa.) Traction Company, and accepted a position with the Staten Island Midland Railroad Company.

F. H. Fowler, of Springfield, Mass., late of the Bemis Car Box Company, has been appointed superintendent of the Washington & Great Falls Electric Railway Company.

Robert H. Dick has been appointed superintendent of the Wyandotte & Detroit River Railway to succeed John Busby who was recently made superintendent of the Detroit & Pontiac.

A. B. Skelding, general manager of the Wilmington (N. C.) Street Railway Company was recently married to Miss Clara Dorothy Ames, daughter of Rev. John G. Ames, of Washington, D. C.

G. Howard Duvall, who was for some time with the Baltimore, Middle River & Sparrow's Point Railroad, as secretary and treasurer, is now with the Chloride of Silver Dry Cell Battery Company, of Baltimore.

Henry Holgate has resigned the management of the Montreal Park & Island Railway, having accepted the position of general manager of the West India Electric Railway Company which is now building a line at Kingston, Jamaica.

W. E. Baker, superintendent of the Metropolitan West Side Elevated, of Chicago, responded to the toast "Intramural Transportation in Relation to Real Estate Values" at the 15th annual banquet of the Chicago real estate board.

F. S. Terry has accepted a position with the Western Electrical Instrument Company and has removed to Newark, N. J., to assume his new duties. Mr. Terry's abilities in the electrical industries of Chicago have long been known. His connection with the Electrical Supply Company, the Ansonia Electrical Company and with the Sunbeam Lamp Company have given him a wide experience in that line. We feel assured that success will attend him in his new field of work.

O. L. Stanton, who has been superintendent of the Ft. Wayne (Ind.) Street Railway Company since the spring of 1896, has severed his connection with the company. Mr. Stanton was successful in his management and deservedly popular with the employes under him.

Lemuel J. Coburn, recently connected with the supply house of Smith & Wallace, Boston, has resigned to give his entire attention to the New Orange Industrial Association, of New Orange, N. J. Mr. Coburn will make headquarters at 50 Market street, Poughkeepsie, N. Y.

Gus. Suckow, general manager of the Vose Car Spring Company, has returned from an extended trip and advises that business is excellent. Mr. Suckow has been with the Vose Company for 21 years, during which time he has become an authority on the manufacture of springs.

J. W. McFarland, formerly of Savannah, Ga., has been appointed superintendent of the Chattanooga Electric Railway Company. Mr. McFarland has been connected with electric railways since 1888, and with electric lighting plants since 1880, and the company is to be congratulated on having secured his services.

George Albert Cragin was married to Miss Minnie Cornwell Wilson on Thursday, January 20, at St. Louis. Mr. Cragin is the general representative of the Washburn & Moen Manufacturing Company in the south with headquarters at Houston, Tex., and was formerly in charge of the San Francisco office. During his business career, which has been a very successful one, he has made a host of friends in the street railway fraternity who will join us in wishing a bright future for him and his bride.

Augustine W. Wright, one of the best known and most successful street railway engineers in the country, has accepted the presidency of the American Railway Construction Company, of this city, and will give it his personal attention. Mr. Wright has had 30 years' experience in engineering work in horse, cable and electric railway construction, and during that time has put in 5,000,000 cu. ft. of concrete work, of which his company will make a specialty. With Mr. Wright are associated E. F. Cary, as vice-president, and Chester D. Wright as secretary. The high standing and ability of this company to carry out contracts of the largest character, is well known; at the same time less important undertakings will receive the same careful attention and be executed with the same fidelity. The office of the company is at 1203 Monadnock block, Chicago.

## OBITUARY.

Burr K. Field, vice-president of the Berlin Iron Bridge Company, died suddenly after a brief illness. He was born in May, 1856, and was graduated in 1877 from Yale University, where he had pursued the course in civil engineering. He was first connected with the Northern Pacific Railroad and in 1883 accepted a position with the Berlin Bridge Company. His services were valuable to this company and his promotion was rapid.

## FLOOD IN SOUTH BUFFALO.

During January there were heavy rains in the east which broke up the ice in rivers and creeks and resulted in disastrous floods in many places. South Buffalo in particular was a heavy sufferer, the Buffalo river and Cazenovia creek overflowing and submerging a large district in the vicinity of Cazenovia Park. Many of the street railway tracks were flooded and the regular cars were replaced by the company's snow plows which hauled open cars as trailers. In several places the water would come above the floors of the open cars.

## AN ELECTRIC FREIGHT LINE IN SWITZERLAND.

An electric railway, extending from Chavornay  $2\frac{1}{2}$  miles to Orbe in the canton of Vaud, was opened for freight and passenger service in the autumn of 1894. It was built to give railway facilities to Orbe, a town of 1,884 inhabitants, and make connection with the Jura-Simplon Railroad at Chavornay, a village of 800 population. The track was made standard gage so that the cars can be switched direct from the steam road to the electric line. The freight traffic consists chiefly in carrying provisions, coal, building material and agricultural produce. The map, Fig. 1., shows

FIG. 1.—CHAVORNAY-ORBE LINE.

the route of the railway which for  $1\frac{3}{4}$  miles follows the public road.

The current is supplied from a water power station situated a half mile west of the town on the river Orbe. There is an average fall of 33 ft. which furnishes 260 h. p. There are two 80-h. p. turbines belt connected to two 6-pole, 45-k. w., 600-volt generators. In the day time the surplus power from these machines is used to drive small motors in the town and for lighting purposes at night.

The trolley line is a  $\frac{1}{4}$ -in. steel wire but this is supplemented by a copper feed wire of the same diameter. The trolley wire is suspended from iron brackets on wooden poles which are spaced 100 ft. apart. The track is laid with

FIG. 2.

40-lb. rails with steel ties spaced 3 ft. Instead of a trolley wheel a sliding contact shoe is employed. These shoes wear very rapidly and have to be renewed every few weeks. There

are two passenger motor cars, one trailer and one motor car for freight service. The cars are each 20 ft. in length, 7 ft. 2 in. in width with a wheel base 7 ft. 6 in. One of the passenger motor cars, Fig. 2, has a compartment for mail and small parcels. It will seat 20 passengers and carry three tons of parcels. The other cars have a capacity for 45 passengers, and the remaining motor car, Fig. 3, can carry five tons of freight. The cars are heated by coal in the winter time. Each car with load weighs 15 tons. There are two 6-pole 30-h. p. motors under each car and these give a speed of nine miles an hour.

The daily schedule conforms with the arrival of trains on the railway at Chavornay which necessitates 11 round

FIG. 3.—MOTOR CAR.

trips daily. In Engineering, London, C. S. Du Riche Preller gives an account of the traffic and receipts. The first year after its opening the road carried 53,128 passengers, 106 tons of parcels, 2,488 tons of freight which, with the mail service, afforded a revenue of \$5,390. There were 21,600 train-miles run. The expense was divided as follows: Administration, .6 cent; maintenance, 1.2 cents; traffic, 5.8 cents; wages, 7.6 cents, and general charges, 2.2 cents, making a total of 17.4 cents per train-mile. There was a profit in the operation of \$1,475, which was a return of 2 per cent on the money invested.

## ABOUT TOWER WAGONS.

A most important part of the equipment of any road is the tower wagon. The time lost with makeshifts, to say nothing of the annoyance, inconvenience and danger, would in a few months pay for a first-class wagon. The Trenton trolley wagon has been adopted by the leading roads of this and foreign countries as the standard. Four years of hard usage have proved it to be a most convenient, reliable and thoroughly practical wagon, and it receives the highest praise from all who are using it. McCardell, West & Co., of Trenton, N. J., are the patentees and sole manufacturers.

The Toledo, Monroe & Monroe Beach line is being handled by Holt, Schober & Co., Hale building, Toledo. The line touches several popular beach resorts on the lake from which boats run to Put in Bay, Kelly Island, etc., and is one of the links in the road between Toledo and Detroit.

## FOREIGN FACTS.

A tramway is to be built at Lous le Saunier, France.

The electric railway at Elbeuf, France, is fast approaching completion.

Power to operate the street railway is sought of Parliament by the corporation of Newcastle, Eng.

Fred. Spencer, of Walsall, Eng., has been appointed general manager of the Halifax Corporation Tramways.

Edinburgh has concluded negotiations for the purchase of the Portobello section of the street railway for £40,000.

Dumdee, Scotland, is promoting a bill for the municipal ownership of the street railways and their equipment with electricity.

Electrical equipment will be placed on three miles of double and single line at Newport, Eng., at an estimated cost of £30,000.

La Société des Tramway Electriques de Gand has been formed in Ghent, Belgium, to acquire the horse lines and equip with electricity.

Siemens Bros. & Co. have received a contract to build eight 60-passenger cars for the corporation of Blackburn, Eng. The price is £5,444.

Although the scheme was vetoed, the London United Tramways Company has not given up its plan to construct electric lines in the Ealing District.

The New Zealand Light & Traction Company has been formed at London to acquire concessions in New Zealand. Registered by Paine's & Co., 14 St. Helens Place, London, E. C.

Proposals will be received until March 15 by the Stadtische Verkehrsdeputation, Rathaus III, Berlin, Germany, for the construction of several electric railways in that city.

Having completed the purchase of the street car lines, the council of Nottingham, Eng., is considering which form of mechanical traction to adopt, with a leaning toward electricity.

Bids are invited by the Corporation of St. Helens, Eng., for the supply of engines, generators, battery, trolley wire, poles and other street railway material. Tenders should reach W. J. Jeeves, Clerk, Town Hall, St. Helens, by February 21.

The new electric railway at Alexandria, Egypt, is of standard gage, with Broca rails weighing 88.5 lbs. per yard. No trailers are used, there being ten motor cars for the 7.5 miles of road, each equipped with two 25-h. p. motors. The cars are of the convertible type and are divided into first, second and ladies' class.

The New Cross & Waterloo Railway Company has been formed at London to build an underground electric road from a point in Old Kent Road to a point under Waterloo Road near the crossing of the South Eastern Railway. Capital stock, £975,000; directors, James Heath, M. P.; Robert Arthur Read, and Thomas S. Soden.

The Japan Weekly Mail reports that the Tokyo Street Railway will assume a definite form after Mr. Nomura, expert of the Bureau, returns from his inspection tour through Europe and America. The promoters of the Ina Electric Railway met some time ago in Hamacho, Nihonbashi-ku, to hear the report of an expert, Dengoro Ushioda, on their plans.

The Great Northern & City Railway Company has a bill in Parliament applying for power to extend its line and purchase land for a generating station. The Metropolitan Railway Company of London asks Parliament to grant power to equip all its lines with electricity and to acquire lands on which to erect a generating station.

Brown, Boveri & Co. are about to equip the standard gage railway between Burgdorf and Thun, Canton Bern, Switzerland, with their three-phase transmission, so successful at Lugano. The same firm has completed the entire electrical equipment of the railway up the Gorner Grat, near Zermatt, also employing three-phase transmission.

The Electric Street Car Manufacturing Syndicate has been registered at London with power to acquire certain patents of Thomas H. and Thomas Parker and the London Electric Omnibus Company. The capital stock is £25,000; and the directors are S. Craddock, Thomas Parker, Edward Lisle, Major Flood-Page and T. H. Parker.

The Hastings, Bexhill & District Light Railways Company, the Bournemouth, Poole & District Light Railways Company, and the Finchley District Electric Traction Company have been registered to build, equip and operate light electric railways in Sussex, Hants and Middlesex, respectively. In each case the capital stock is £10,000, and the registrar J. B. Glenn, 7 Poultry, London, E. C.

Buenos Ayres, South America, and the port of La Plata are to be connected by an electric railway, W. R. Cassels and John MacGee having applied to the government for a franchise. Mr. Cassels also asks a concession for an elevated electric railway from Plaza Colon to Casa Amarilla, thence to Calle Caseros and the Southern Railway station. The electrical energy would be supplied by the River Plate Electric Light & Traction Company. A. Pareus & Co. propose to construct and operate a system of electrical railways in the city.

The British Thomson-Houston Company states that several other tramway lines in England are inclined to follow the example of the Dover Corporation Tramways by adopting wattmeters for their cars. These meters are of the Thomson-Houston make and have a capacity of 25 amperes, guaranteed to register correctly 50 per cent overload for short periods. The armature and clockwork of the meter are placed on sensitive springs to take the vibrations of the car, and so far the meters have worked satisfactorily. The cost is about \$50 per meter.

## A NEW SITE WANTED.

The Jewett Car & Planing Mill Company, of Jewett, O., purchased its present plant about five months ago for manufacturing street cars of all kinds. A. H. Sisson, W. H. Lorentz and C. E. Krebs, three young business men of Wheeling, are back of the company, and it is due to their efforts that the firm has been so prosperous. Within two weeks of the date of purchase an order was secured and the orders now in hand will keep the plant running for some time. Owing to the limited capacity the traveling men have been temporarily recalled. The buildings are inadequate for the needs, and the company is seeking a new site, correspondence being carried on with several towns with this end in view. An order for cars has just been completed for the Charlestown Traction Company, and work is progressing on a large one for the St. Louis, Belleville & Suburban Railway Company. Recently the services of Niel Paulson, who has a wide acquaintance among street railway men, have been secured, and he will be superintendent of the car department.

## ECHOES FROM THE TRADE

The J. G. Brill Company reports sales of 500 of its double trucks from January 1, 1898, to January 20.

The Q. & C. Company has just issued a handsome catalog of its car door equipment and general railway specialties; it is called "Catalog C and D."

The J. G. Brill Company has just issued a pamphlet describing the new round-corner seat-end panel, which the company is putting on its latest open cars.

We have received from the Peckham Truck Company a large wall calendar for 1898, which shows the different types of Peckham trucks for single and double truck cars, snow plows, etc.

George F. Card, of the Card Electric Company, succeeds F. A. Rogers as general manager. The company has lately been receiving some very encouraging orders with good prospects for the year's business.

Frederick K. Stearns, Edwin J. Booth and David Meginnity, of Detroit, have organized the Michigan Contracting Company, Limited, and will engage in construction and equipping of steam and electric railways.

The Taunton Locomotive Manufacturing Company has received an unusually large number of orders for snow plows. It has already sold 49 plows this year which surpasses the number sold during any previous season.

The Egan Company, of Cincinnati, has just shipped 12 car loads of woodworking machinery for the Russian government. This is one of the largest of such exports ever made and speaks well for the enterprise of the concern.

William S. Turner, consulting and constructing mechanical and electrical engineer, has removed from No. 1 Nassau street to 120 Liberty street, New York, and will carry on as heretofore his engineering and constructing business.

Hirsch Bros. & Co., Chicago, advise us that contractors Orman & Croak, of Pueblo, started on the work of construction of the Canon City & Cripple Creek Electric Railway, with an increased force which now aggregates 1,000 men.

Alonzo G. Collins, 608 Pabst building, Milwaukee, is laying out a steam plant for one of the large manufacturing concerns in Wisconsin, which will include compound condensing engines, mechanical draft and other features conducive to economical operation.

The Central Electric Company is carrying complete stocks of "Insulac" and "Armamac" for the insulation of generators, motors and all kinds of high potential work. These two compounds are fast establishing a reputation for permanency and absolute reliability.

The Sterling Supply & Manufacturing Company, 145 East 25th street, New York, reports that the month of January was the busiest of any month since the company has been in business; it has been obliged to hire a great many new men and work the full capacity of the shop.

The partnership lately existing between John C. Dolph and Franz E. Triacca under the firm name of J. C. Dolph & Co., doing business in the city of New York, was dissolved by mutual consent on January 24. By consent, Mr. Triacca has been authorized to liquidate the business.

"The Pierrot calendar," which has been sent to its friends by the Vose Spring Company is one of the most tasteful calendars that we have ever seen. It is in the form of a crescent, upon which are attractive figures of children, the monthly calendars being on stars surrounding the crescent.

On January 26 the Jackson & Sharp Company shipped five sleeping cars and 27 electric cars which complete the large contract which the company had recently received from Buenos Ayres, Argentina. During the past year the foreign trade of this company, and especially in South America, has been very gratifying.

The R. D. Nuttall Company reports a very gratifying increase in business during the month of January, with prospects for a large trade. There is a very considerable increase in the demand for standard trolleys, many roads taking advantage of the liberal trade offers to dispose of old types and equip with the latest designs.

The illustrated catalog of the Skeen Electric Switch & Signal Company, St. Louis, is a pamphlet describing the automatic block signals for street railways, and includes a copy of the standard rules that govern the operation of single track roads when so equipped. The catalog will be sent to all who desire it, on application.

The General Equipment Company, 1011 Chestnut street, Philadelphia, which represents, in Pennsylvania, New Jersey, Maryland and Delaware, the Keystone electrical instruments, Dornier & Dutton gears, and other lines of street railway supplies, has recently sent to each of the managers in its territory a neat file case for price lists and circulars.

Westinghouse, Church, Kerr & Co. have removed the auditing department from New York to the Pittsburg office. This change made it necessary for W. L. Murray, the auditor, and his associate, G. W. Kimball, to make their homes permanently in Pittsburg, and a farewell dinner was given by the employees of the company in their honor.

J. A. Fay & Co., Cincinnati, received orders for 26 of the 30 machines, contracts for which were recently awarded by the John Stephenson Company for the equipment of the new car shops of the latter company at Elizabeth, N. J. Other recent orders were for the woodworking machinery for the car shops at Sormova, Siberia, and Psever, Russia.

"The Baragwanath Condenser" is the title of an illustrated pamphlet recently issued by Wm. Baragwanath & Son, 48-52 West Division street, Chicago. This condenser is of the inspirator jet type and was illustrated in the "Review" for December, in connection with the description of a 1,000-h. p. cooling tower. It is of course applicable to any purpose for which a vacuum is required.

The Electric Railway Equipment Company, Cincinnati, the operation of whose works it was feared might have to shut down temporarily on account of the unusually high water in the Ohio river, is glad to report that the danger has passed and there will be no delay in filling the large number of orders which have been pouring in during the past few months. At present there is greater likelihood of being flooded with business than with water.

The Garton-Daniels Electric Company, Keokuk, Ia., reports the best kind of business, and although this is the season of the year when it does not look for large orders, as much work is now going through the factory as in the busy summer months.

of 1895 and 1896. The demand from foreign countries has been, and continues, especially good, and everything points to a very extensive demand for the Garton arresters during the coming summer and spring.

Bibber, White & Co., 49 Federal street, Boston, have established a railway department under the management of Herbert W. Smith, formerly of the firm of Smith & Wentworth, dealers in street railway supplies in Boston. Mr. Smith, from his former extensive experience, is well qualified to take up the duties of his new position. A complete line of street railway supplies will be handled by this department, and the company is now manufacturing several new designs of hangers and other line material.

In a recent issue of American Trade, the organ of the National Association of Manufacturers of the United States, we note a request that the members and all other manufacturers interested in the South American markets, send catalogs, circulars and price lists of their goods to the sample warehouse of the Association at Caracas, Venezuela. We have previously mentioned this sample warehouse at Caracas, which affords an opportunity to exhibit samples of American goods at the minimum of expense to the exhibitor.

C. E. Barrett, who was formerly with the Missouri Car & Foundry Company, and who has had charge of the car-seat business of Hale & Kilburn, Philadelphia, for the last four years, has been appointed contracting agent of the Barney & Smith Car Company, of Dayton, O., and in this connection will push the sale of the Wheeler car seat manufactured by this company. This seat is already considered standard on many prominent railroads. Mr. Barrett is well and favorably known to the trade and we predict success for him.

On January 18, A. S. Littlefield announced that he had severed his connection with the American Railway Construction Company of which, ever since its organization, he has had the full direction, and had organized the North-American Railway Construction Company. Mr. Littlefield is president of the new company and Emmet M. Fry is general superintendent. The company will make a specialty of building electric railways and do a general contracting business, and has secured a crops of competent assistants with that end in view.

We have received from the Cambria Iron Company, Philadelphia, a copy of the new book of rail sections, which the company has just issued. It is entitled "Cambria Steel Rails. Vol. II, Girder Rails, etc., for Street and Electric Use." It comprises full size sections of the rails rolled especially for street and electric roads, sections of splice bars, an illustrated catalog of the Cambria tie plates, and a table of useful information relating to track material. The company will be very glad to send a copy to parties in the street railway business who desire to have it.

The New York & Staten Island Electric Company, in February, 1897, contracted for the installation of about 1,200 h. p. of the Cahall-Babcock & Wilcox type of boilers in its power station, which then contained some boilers made by the Babcock & Wilcox Company of New York. The company shortly doubled this order and now (just about a year later) has given the Cahall people not only a third order but also a contract to dismantle the boilers in the power station made by the Babcock & Wilcox Company, and rebuild them into the Cahall-Babcock & Wilcox type.

The Swarts Metal Refining Co., Chicago, requests us to make the following announcement: "Will you kindly mention in the next issue of your paper that we are not in any way connected with the Swarts Iron & Metal Company, which recently sold out its business? We are entirely on different lines, and have at no time had any connection with that company. The name being somewhat similar to ours, caused some confusion amongst the trade. We take this means of notifying the trade that we are still doing business at the old stand and are ready to fill any orders that may be entrusted to us."

The number of arc lamps, manufactured and shipped from the factories of the General Electric Company within the past fiscal year, has exceeded 24,000. There are thousands of the enclosed arc type now in service, and the introduction of the alternating enclosed lamp has still further increased the sales. There is also a constantly increasing demand for incandescent lamps. This is due in part to the waning popularity of the Welsbach burner, for the expense involved in renewing shattered mantles has proven excessive. These are rapidly being replaced by incandescent lights, and in stores, hotels and halls, where the Welsbach burner secured a temporary success, enclosed arc lamps are now in use.

We have received a catalog of high pressure air and hydraulic fittings and flanges prepared for the Tight Joint Company, by John Platt, of Thorpe, Platt & Co., engineers and agents, 97 Cedar street, New York. The book contains a description of the special fittings and gives tables showing the size of flanges for 750 and 1,500 lbs. pressure per sq. in. Part II. contains information for use in designing hydraulic plants, and includes matter that is of considerable value to those who have to design and use hydraulic machines. The information on rivetting, forging and flanging is worked up from experiments made in the shops. The formula for flanging dies, by T. R. Browne, will be found of value to all manufacturers using flanging presses.

South Canal street, Chicago, boasts of some of the finest machinery stores in the world. Railroad tracks running directly in the rear of the buildings make it a particularly favorable location, on account of being able to receive goods directly from the cars to the stores.

Probably the largest of these stores is that of J. A. Fay & Egan Co., located at numbers 22, 24 and 26, they being there for the convenience of customers located in northern Illinois, Wisconsin, Minnesota, Colorado, Iowa and Nevada. A full line of both J. A. Fay & Co., and Egan Company machinery is carried there, so that parties residing in this territory should, to save time, write direct to Chicago, the store there being an integral part of J. A. Fay & Egan Co. of Cincinnati.

Maurice Coster, the successful manager of the Chicago office of the Westinghouse Electric & Manufacturing Company, has a large territory at his command and is most vigorously looking after the interests of his company. His territory includes Michigan and Indiana to the Ohio river on the east, and a belt stretching west to the Rocky Mountain states. The increasing business of his office has necessitated recent additions to his staff, the latest of whom is Walter H. Whiteside, recently with the Gates Iron Works, of this city, where he was in charge of the high speed engine department. Mr. Whiteside has a large acquaintance and a wide experience, and in natural ability and previous business connections is especially fitted for the duties of his new connection, in which, with his friends, the "Review" wishes him deserved success.

The Hoppes Manufacturing Company, of Springfield, O., manufacturer of the live steam feed-water purifiers and exhaust steam feed-water heaters, reports large orders recently received through the Philadelphia office, as follows: The New York Sugar Refining Company, Long Island City, three special live steam purifiers aggregating 3,750 h. p., and three exhaust heaters of 4,500 h. p. capacity; the Union Traction Company, Philadelphia, 3,000 h. p. of special live steam purifiers for high pressure. The Springfield office reports sales as follows: Deering Harvester Company, Chicago, 2,500 h. p. of live steam purifiers; repeat order from the Proctor & Gamble Company, Ivorydale, O., 1,000-h. p. purifier; Louis Sands, Manistee, Mich., 1,000-h. p. purifier; Thomas & Smith for the Chicago Public Library, four special live steam purifiers of 300 h. p. each.

E. F. de Witt & Co. report that the demand for their "common sense" sand box has been good all through the hard times and the prospect for a brisk business for 1898 is very promising. A large order has lately been received from Europe through their foreign agents, the Peckham Motor Truck & Wheel

**MAYER & ENGLUND,****10 SOUTH TENTH ST. PHILADELPHIA, PA.****Electric Railway Material and Supplies

Company. Many fine testimonials have been received, among them one from the Chicago General Railway Company says: "That the 'common sense' sand box has been in operation on our cars for the past four years, and is giving better service than any sand box I know of." The Utica (N. Y.) Belt Line Railroad Company writes: "We are pleased to be able to state that we have experimented at different times with several different sand boxes for motor cars, and have concluded that the de Witt 'common sense' sand box for every day practical use is the best sand box we have ever had an opportunity to use."

In an editorial on the progress of tramways in Great Britain, the London "Electrician" has this to say about cast welded rails: "Nevertheless, electric traction construction shows no sign of crystallisation, for newer methods and improved details of plant are continually being introduced. Perhaps the most interesting illustration of this is the decision of the New General Traction Company to depart from the custom hitherto universal in this country of mechanically jointing and bonding tramway rails, and to adopt, in the new lines about to be equipped at Coventry and at Norwich, the Falk system of cast-welding rail-joints, which has proved so successful at Chicago and in other parts of the United States. British tramway engineers, whether directly interested in electric traction or only indirectly, will watch closely the process of acclimatisation of cast-welding in this country. Probably, on the whole, our fickle climate will prove less trying to the cast-welded joint than the great extremes of temperature it has had to withstand in the climate of some parts of America."

A. W. Atterbury, secretary of the Detroit Steel & Spring Company, in a recent conversation, said to our representative:

"I am always interested in reading your 'Echoes from the Trade,' as they are indications of the general condition of business throughout the different sections of the country. As you know, we are not only large producers of all kinds of engine and car springs, but have extensive rolling mills and a fair sized plant for the manufacture of steel castings. While our trade is

large among the steam railroads and street railways, we have a large trade among the agricultural implement makers, carriage and wagon makers, engine builders, dredge builders and various manufacturers who use bar steel and steel castings. In all of our departments since September, we have been running day and night and orders are booked ahead for several months to come. From the fact that we supply a number of different lines of manufacture, and in each line trade has been unusually large, we feel that our increased trade shows conclusively the general improvement and prosperity of the country. While the volume of business has been extensive, prices have not advanced materially. Collections have been excellent. We believe that 1898 will prove to be a satisfactory year to all manufacturers."

The Sargent Company, of Chicago, reports a very large business in railway supplies during the past few weeks, and advises us that orders for the new "Diamond S" shoe are coming in rapidly. This shoe, it will be remembered, was fully described in our columns in a recent issue. It is manufactured of cast iron with an insert of expanded steel, giving great friction and long life to the shoe, without injury to the tire. Tests have been made on a large number of railroads with uniform satisfaction, the result of which is shown by the large number of orders received. W. D. Sargent, the vice-president and general manager of the Sargent Company, has just returned from England and the Continent, where he has been engaged in introducing the "Diamond S" brake shoe. Notwithstanding the proverbial conservatism of foreign railway managers for American inventions, the merits of the shoe are so clear, that several of the railroads in England are already using them, and the prospect for a large extension of this business is most flattering. The Sargent Company has recently published the second volume in the series on the "Diamond S" brake shoe, giving the results of the tests of this shoe, which were conducted on the brake shoe testing machine at the shops of the Westinghouse Air Brake Company, at Wilmersburg, Pa. The company will be pleased to furnish copies of these pamphlets together with results of service tests to all railroad men, upon request.

**Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.**

Slippery rails caused a collision between a cable train and an electric car on the West Side lines, Chicago, February 1, which resulted in slight injuries to two persons.

A dead infant was found in a bundle left in one of the cars on the elevated road in Kansas City; later it was claimed by a physician, who gave a satisfactory account of it.

The directors of the Chattanooga Electric Railway Company were re-elected at the annual meeting of the stockholders. The board re-elected J. H. Warner president and E. D. Lilly secretary.

The Metropolitan Street Railway Company, of Kansas City, Mo., will install in its Riverview power station a new 2,000-h. p. unit, the machinery being an exact duplicate of that already in place.

The assessment made by the city of Elizabeth, N. J., against the Consolidated Traction Company has been reduced nearly 25 per cent by the state board of taxation in order to allow for the depreciation.

One of the linemen of the Augusta (Ga.) Railway & Electric Company cut some of the guy wires while at the top of a 30-ft. pole. The pole fell to the ground, crushing the man beneath it, but his injuries did not prove fatal.

The changing of the line of the Metropolitan Street Railway Company, New York, to the conduit system is proceeding rapidly. It is expected that within seven months only some of the minor cross town lines will be operated by horses.

The rumor is again afloat that the Chicago, Milwaukee & St. Paul road will soon ask the city council for permission to substitute trolley for steam on its suburban line, Chicago to Evanston, a distance of 12 miles. Officials decline to discuss the matter.

At the petition of one of the stockholders of the Delaware (O.) Electric Street Railway Company the court removed J. D. Van Deman, who had been appointed receiver, and named John A. Cone in his place. The objection urged against Mr. Van Deman was that he was a stockholder.

Notwithstanding that the company has done all in its power to comply with the vestibule law in the limited time allowed, the prosecuting attorney has commenced proceedings against General Manager W. T. Van Brunt of the St. Joseph (Mo.) Street Railway Company, and the case will be heard at the next term of the Criminal Court.

J. A. McElroy, of New York city, is now on his way to Glasgow to supervise the construction of some of the street

railway work in progress in that city. Mr. McElroy is also interested in a third rail system which he expects to introduce in England.

A bill has been introduced in the New York Assembly which provides that the elevated railroads shall not use any portion of their property for the purpose of advertising the business of any other corporation or person, nor for the sale of any goods except newspapers and periodicals.

During January, 1898, the gross earnings of the system of the Brooklyn Rapid Transit Company were \$414,809, an increase of \$22,524 over the corresponding month last year. For the seven months ending January 31, 1898, the earnings amounted to \$3,220,150, as compared with \$3,129,563 for the same time last year.

The Ottawa (Ill.) Street Railway Company was on January 20 placed in the hands of a receiver, as money to pay for the improvements made during the last summer was not forthcoming, and it was desired to place the road under the protection of the court. Local papers say that the citizens of the town do not support the road by their patronage, as they should.

The controlling interest of the Forest Park Highlands Amusement Company is held by G. W. Baumhoff, L. A. Thompson and other street railway men in St. Louis. Connections are made to the park from seven lines, the new ones being the Olive street, Leclde and Market street lines. An electric fountain and other attractions will be ready for this coming summer.

At a meeting of the stockholders, bondholders and receivers of the Fox River Electric Railway Company, Green Bay, Wis., which was placed in the hands of receivers a few weeks since, a plan of reorganization was adopted. C. L. Goodrich, of Toledo, was chosen superintendent, and C. H. Holmes, the former president, will have charge of the clerical and office force.

That portion of the line of the Union Traction Company, the Anderson-Marion (Ind.) road, which is already in operation, that is, the nine miles between Anderson and Alexandria, has proved to be a paying one, and has greatly cut down the passenger receipts on the Big Four Railroad between those points. In the spring a truck car for the accommodation of farmers will be put in service.

The stockholders of the Wissahickon (Pa.) Electric Railway at the annual meeting voted to accept the proposition to lease the line to the Roxborough, Chestnut Hill & Norristown Traction Company for a term of 999 years with compensation as follows: Two per cent on \$150,000 each year for two years; 3 per cent for the next six years; 4 per cent for the next seven, and 5 per cent thereafter.

The majority of the stock of the Newport (R. I.) Street Railway Company has passed into the hands of the Newport Illuminating Company, which is controlled by the Vanderbilts and other wealthy men having summer residences in the city. At one time they were opposed to the building of the line, but it will now be operated as hereto-

fore, but no extensions will be made into the fashionable portions of the city.

While a heavily loaded motor car and trailer were ascending a steep hill near the Capitol building in Denver one of the motor bearings became overheated and set fire to the oil and waste. The flames soon fired the car floor and caused a prompt exit of the passengers. The whole interior burst into flames and the fire department was summoned. The trailer was uncoupled and run out of danger, but the motor car was badly damaged.

The report of the South Side Elevated, Chicago, for the 11 months of 1897 after the reorganization shows the surplus from the operation to be \$121,943; after deducting interest for six months at 4 1-2 per cent on bonds outstanding and at present charged to the construction account, the net income is \$105,068, or about 1 per cent on the stock. Until the opening of the Union Loop the traffic by months was from 1 to 27 per cent less than for the corresponding month in 1896.

The Union Traction Company, Philadelphia, recently secured an injunction against a firm of machinery dealers and the teamster who had the hauling contract, restraining them from moving a large iron tank through the city over a route which was occupied in part by the line of the street railway. It would have required five hours to transport the tank, and during that time traffic on the railway would have been blocked; there was also danger of pulling down the overhead work.

The annual report of the Columbus (O.) Street Railway Company, of which W. F. Kelly is general manager, shows that the property has been well managed during the past year. There were carried 13,284,530 passengers and 3,514,545 car-miles run. The total receipts were \$605,921 and the operating expenses 47.3 per cent of this, divided as follows: Maintenance of way, .6 cent per car-mile; maintenance of equipment, .7 cent; conducting transportation, 4.6 cents; power, .7 cent; general expenses, 1.3 cents, making a total of 7.9 cents.

In the case of the People's Railway Company against the Grand Avenue Railway Company, of St. Louis, regarding the joint use of tracks, a decision has been handed down ordering the Grand Avenue Company to pay the People's Company an annual rental of \$2,284, 75 per cent of the cost of repairing the tracks, costs in appealing the suit, and furnish a bond of \$10,000 as a guarantee. The People's Company is required to repair all switches and connections, keep watchmen at necessary points and pay costs of the special commissionership proceedings.

The operation of the Tuscarawas Electric Railway between Canal Dover and Uhrichsville, O., has greatly diminished the traffic on the Cleveland, Lorain & Wheeling Railroad. To meet this competition the railroad has reduced the rates and put in service four additional fast trains each way daily. It is expected that the trolley line will make reductions to hold its patronage. The question is a rather trying one just now, as C. E. Mitchener, vice-president and superintendent, is in the far west and his daughter is attending to his duties as superintendent.

### FIRE IN MAINE.

On January 16 the Casino at Willard Beach, South Portland, which was the property of the Portland & Cape Elizabeth Railway Company, was destroyed by fire. A pavilion and restaurant were also burned. The Casino was built in the spring of 1896 at a cost of \$31,000 and contained an orchestration valued at \$3,500; the insurance amounted to \$27,000. The other losses amounted to \$4,000, partly insured. The origin of the fire is unknown.

### THE Q & C BUY THE STANWOOD STEP.

The Q & C Company, manufacturers of railway specialties, portable rail saws, track jacks, rail drills for both street and steam railways, have purchased the entire stock of the Stanwood Manufacturing Company and will continue the manufacture of the popular steel car step which is now in use on about 200 street railways, as well as on government vessels, etc. All inquiries or orders for these goods should be addressed to this company. These goods will hereafter be known as the Q & C Stanwood Car Step, and they will be made at the large and commodious factory of the Q & C Company, located 27 miles from Chicago on the C. & E. I. Railway, at Chicago Heights, Ill.; the general offices of this company being at 700-709 Western Union building, Chicago.

The Stanwood step, which is self cleaning, has been very popular with all managers who have used it, being light and very strong and extremely durable.

Press dispatches state that Tom L. Johnson has sold his stock, some 6,000 shares, in the Cleveland Electric Railway Company.

A. Groetzing & Son, Allegheny, Pa., state that the trade in "Dermaglutine" pinions continues very active. The general line of goods has been giving universal satisfaction.

W. H. Wilkinson has resigned his position as general manager of the Diamond Truck Company, and returned to the Peckham Motor Truck & Wheel Company, with which he was formerly connected. Mr. Wilkinson will have the position of assistant superintendent to Mr. Uebelacker. The increased business of the Peckham Company has necessitated additional force, and as Mr. Wilkinson was for several years connected with the concern as superintendent, his experience and ability render him a valuable addition. The company is unusually busy for this season. Among the large orders now being filled are 100 maximum traction trucks for Middleboro, England; 150 standard trucks for Dublin, and 60 extra long for Omaha.

### NEW PUBLICATIONS.

Lippincott's for February maintains the well known high standard of that popular publication. The leading story is by Captain Charles King, U. S. A., whose writings always find a responsive chord in the hearts of thousands. The other articles and stories are on timely topics, by competent and entertaining writers.

Munn & Co., New York, have just issued their new reference catalog of the Scientific American Supplement, which gives an elaborate index of over 10,000 important articles which have appeared in that periodical. The present edition is of a more convenient size than former ones. The catalog will be furnished free on application.

The Walker Company, of Cleveland, O., has recently published two instructive circulars, one being a paper by Prof. S. H. Short on "Electricity as a Motive Power on Elevated Railways," fully illustrated and accompanied by curves and tables, and the other is a short dissertation on "Mica Insulation," with three illustrations.

"The Motor Engineer's and Electrical Workers' Handbook," is a pocket manual for motor engineers and street railway men, compiled by William Lintern, of West Park, O., with the view of furnishing a book of reference in a simple and convenient form. It includes diagrams of machine and controller connections and the methods of testing for faults. Morocco, \$1; cloth, 50 cents.

The New York Switch & Crossing Company, Hoboken, N. J., has just issued a new catalog of "Railway Supplies," a handsome book of 40 pages illustrating the rail sections, fish plates, etc., which are now considered standard in street railway work, the special work for frogs, crossings and switches manufactured by the company, and the automatic electric switch known as the "Dividend Saver."

"Introductory Course in Mechanical Drawing," is the title of a book of 120 pages just issued from the press of Harper & Brothers. The author is J. C. Tracy, C. E., instructor in the Sheffield Scientific School of Yale University; E. H. Lockwood, M. E., of the same School has written the chapter on perspective. The plan of the work comprises two distinct but parallel courses of graded exercises, for either of which 90 or 100 hours is required. Following the statement of the problems are eight chapters treating of the principles involved in the different methods of projection used in mechanical drawing, and of the instruments and the methods of using them. The chapter on perspective in particular will be found very useful to draftsmen who wish to get in a concise form the rules and principles of the subject. The book is illustrated with 163 figures and 8 plates.

### NEWS NOTES.

ATCHISON, KAN.—The Atchison Railway, Light & Power Company, which recently took possession of all the property of the Atchison Gas, Electric Light & Power Company, is making arrangements to consolidate the power plants. A new car house 40x130 ft. will be built. This house will contain a machine shop.

BALTIMORE, MD.—Permission to lay tracks on the Fishhawk road has been granted to the Consolidated Railway.

BALTIMORE, MD.—Franchises for additional lines have been granted to the Consolidated Railway Company. Right to lay tracks on Caton avenue has been granted to the Baltimore, Halethorpe & St. Denis Railway Company.

BINGHAMTON, N. Y.—The Binghamton Railroad Company will add a new dynamo and necessary appliances, also a 250-h. p. McIntosh & Seymour engine. The company has secured the necessary franchises and right of way for a 6-mile interurban extension, but it is very doubtful if construction be attempted the coming season.

BIRMINGHAM, ALA.—J. B. McClary, general manager of the Birmingham Railway & Electric Company, is in the market for the following station equipment: One 750-h. p. horizontal, simple corliss engine, 90 r. p. m., to be direct connected to a 500-k. w. generator; two 500-h. p. simple corliss engines, 80 r. p. m., to be belted to two 300-k. w. generators; one 500-k. w., 500-volt, direct connected generator, capable of delivering an overload of 40 per cent and to overcompound 10 per cent at full load; fourteen return tubular boilers, 72 in. x 16 ft., each containing 91 4-in. tubes, for 120 lbs. pressure; and two pumps of 10,000 gals. per hour capacity. The Birmingham Railway & Electric Company will build two miles of sidings on suburban lines, using 40-lb. T rail.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

**DOES THE MANAGER WANT ANYTHING?**

If you contemplate the purchase of any supply or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that supply. We make no charge for publishing such notices in our DAILY BULLETIN.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8. MARCH 15, 1898. NO. 3

The Chicago Electrical Association is to be congratulated upon the step it has taken in adopting a standard system of conventional diagrams of electrical apparatus which is designed to secure uniformity in electrical engineering and patent drawings. The adoption of the diagrams chosen by its committee after the most careful consideration of those in use, by a recognized body places a standard of uniformity before the general public, and will have, it is hoped, the final result of making such diagrams clear and uniform and save much trouble and time in seeking printed explanations of drawings.

In an open letter to the public during a discussion of the relation of speed to public safety, General Manager Vining, of the Market Street road, San Francisco, said:

"The ground upon which a reduction of speed is requested is that of safety; yet I see no reason to believe that any speed can ever be adopted which will make it safe for parents to permit little children to play alone in the crowded streets; or for people, who from disease, infirmity or intoxication are unable to take proper care of themselves, to step suddenly in front of either a locomotive or an electric car in motion. As a matter of fact a number of the most serious accidents have been occasioned by children and others running suddenly in front of a car that was moving at a speed of not more than three or four miles per hour."

The preliminary list of manufacturers who have engaged space at the Electrical and Kindred Industries Exhibition to be held in New York in May, shows the interest which it has aroused among the electrical and allied trades, and is indicative of a fine display. The first exposition, held in 1896, will be remembered as a very successful one, yet at the corresponding time before the opening not one-fifth as many manufacturers had signified their intentions of making exhibits as have now secured space. The management is soon to announce the plans of the auxiliary and educational committee, whose work will be a particularly attractive feature.

An interesting feature in this issue is the report of the speed test on an interurban road, in which a speed of 55.5 miles per hour was made for a distance of one mile and a third; and an average of 45 miles per hour for a stretch of 17 miles. It points conclusively to the steady improvement in the possibilities of electric traction, and already compares very favorably with the ability of steam locomotives. It must be remembered these motors were not built for excessive speeds, but for the regular every day service. With the extension and increase of interurban roads we shall certainly witness a uniformly higher speed, and where such roads have their own right of way which can be inclosed, there is no reason why we shall not soon strike a pace and maintain it, too, which will be an additional source of grief to our steam road brothers.

All kinds of curious and unusual things occur in the operation of street railways, but Ottawa, Ill., comes to the front with the most remarkable exhibition of them all. The days of the street railway in that borough have not been so very few, but they have been very full of grief, and grief of all kinds, at that. The latest difficulty proved to be the universal desire on the part of the citizens to have the road again in operation, so that passengers on the steam cars passing through town might see the trolley, and realize the greatness of Ottawa—the only real difficulty being the belief that somebody else should do the riding and pay the fares. Recently the cash box of the company became so lean and ill favored that the wolf had entered and desperate measures had to be resorted to. As usual, in extreme emergencies, the women came to the rescue, and with nothing less than a volunteer concert for the benefit of the road. They sold tickets, hired a hall, took turns with vocal and instrumental numbers, and proudly rounded up \$300 clean profits. Now the manager has figured out that with about two such concerts a week, throughout the year, a Fourth of July dance and a turkey shoot at Thanksgiving, he could manage to keep the two car service in operation.

The salt question, which most street railway men thought had been permanently buried nearly 14 years ago, has risen from the grave and again stalks abroad. It is the alleged injury suffered by horses from contact with the brine that makes the ghost uneasy. This is particularly absurd, when it is remembered that some street railway men, who understood their business sufficiently well to make the road successful, in the old days kept their horses standing in brine for from three to six hours at a time, for medicinal purposes. It is odd also that the present fight against salt

should be in New York, when in 1885 the penal code of the state was amended so as to permit street railways to salt their tracks; this was brought about largely because of the facts developed by a discussion of the subject at the convention of the American Association in 1884.

As an introductory to an editorial which recently appeared, the "London Electrician" said: "There is a splendid field for British-made electric traction plant in America, as every electrical manufacturer in this country well knows; but the field nearer home, consisting in our own tramways, is by no means insignificant, and many of these sorely need electrical equipment in order to turn them into satisfactory paying concerns." No one can deny that there is a good American market for street railway apparatus, but it is hardly for the wares of British factories. It would be as inconsistent as carrying coals to New Castle. With a large per cent of the contracts for electric railways in the British Isles coming to America it requires considerable hardihood for a well informed technical paper to make the foregoing statement.

There is a disposition on the part of some British engineers and technical writers to decry any particular practice built on American experience. Credit for pioneer work is given grudgingly, and the sentiment prevails that the British engineers and manufacturing companies should be able to design and construct apparatus excelling that of American make without experience and experiments. Happily these sentiments are confirmed to those engineers who have stayed closely at home. All who have visited America have recognized the vast experience and development of electric traction in this country and are willing to learn and take advantage of the excellence of American equipments.

The statement is often made that the conditions are altogether different in England and America, but this hardly bears analysis as far as the apparatus is concerned. Certainly the engines and generators, designed to carry the heavy, fluctuating loads of electric railway lines, are suited for either country. In track and line construction it is improbable that the English engineers can improve upon American methods. The latter have been accused of being of shoddy construction, which in some cases is true, but hundreds of examples of the most substantial that need be designed can be found here. If the British are willing to pay for it the American factories can give them as good and enduring apparatus and equipment as they will likely evolve at home. The cars and car equipment can be designed for high or slow speed, light or heavy loads, level roadbed or steep grades, as the occasion may require, for there is hardly a condition likely to arise in England that has not been met with in America.

If the Englishmen could inspect the great factories which are now building street railway apparatus, with their special labor saving machines, their facilities for experimentation, and having the services of men familiar with every detail of railway work since its inception, they would understand why the best, cheapest and most efficient electric railway apparatus in the world is of American origin. As long as England could make the best boilers, engines, machines and manufactured products, they were purchased here; now let them follow a logical example and buy American street railway apparatus until the English factories can make something equally good and cheap.

## REPORT OF THE MASSACHUSETTS COMMITTEE.

The report of the special committee, consisting of Charles Francis Adams, William W. Crapo and Elihu B. Hayes, on the "Relations of Street Railways and Municipal Corporations in Massachusetts," of which the full text was published in the REVIEW for February, is a particularly able document, and the publication of the "Appendix" containing the data collected by the committee will be awaited with impatience.

There are a number of statements as to the "state of the art" at home and abroad, and as to the current beliefs regarding the same which can not be too often repeated, the hope being that they may be read and digested by the misinformed public which is now clamoring for the imposition of additional burdens on street railways, on the ground that the profits of the business are exorbitant; that the service rendered is more costly to the public; that there is not sufficient compensation for franchises and privileges; that there is fraudulent book-keeping to hide profits and avoid taxes; and in general, that things are much better managed where municipal ownership is in vogue. Some of these extracts from the report are here quoted:

"There exists, also, a vast and varied amount of popular misinformation as to results alleged to have been reached elsewhere, more especially in certain European cities. As regards these, indeed, statements are made of a character so wholly misleading that the committee finally reached the conclusion that it was safe to accept nothing unless verified by examination on the spot; for, even where the facts are in the main as alleged, varying conditions made the conclusions naturally to be inferred from those facts usually deceptive, and almost invariably in greater or less degree inapplicable here."

"As a working machinery for the daily accommodation of vast numbers of persons, the street railway companies of the Commonwealth fulfill their function quite as well, with as little friction and at as reasonable a cost as any other similar machinery elsewhere which the committee has had an opportunity to study. On this head, as already intimated, it is not safe to accept loose assertions, no matter how positively made or frequently reiterated, as evidence of what really exists. In every community, persons claiming to speak as authorities are apt to be in evidence declaring that somewhere else, in this case in Baltimore perhaps, or in Toronto, in Glasgow or Birmingham, or in Berlin, an ideal condition of affairs has been reached, in which perfect street railway accommodations, low fares, rapid transit, and contented officials and employes are working in harmony with a thoroughly well-satisfied municipal government, to the expenses of which the railway company contributes a liberal share, while at the same time paying reasonable dividends to its stockholders. The members of the committee have only to say that, if such a street railway Utopia anywhere exists, they have in the course of their investigations failed to find it."

"To institute a comparison, for instance, between the street railway transportation of Boston as at present developed and that of Birmingham, of Glasgow or of Berlin, is

so absurd as to suggest ignorance. The appliances in use in the European cities named may, and probably do, answer the demands there made upon them; but they pertain to conditions of urban life and of urban movement wholly different from those which now prevail in Massachusetts."

"The municipalities (in England) have, in fact, been so afraid they would in some way be out-bargained that they have as a rule fairly over-reached themselves; and now, after a lapse of twenty years, they are naturally served by undeveloped lines, with antiquated appliances, simply because they made it the distinct interest of the companies operating those lines to provide nothing better. \* \* \* \* Human ingenuity does not seem as yet to have devised any tenure under which men, much less corporations, will develop a business with the same degree of enterprise when they are working for the ultimate advantage of others as when they are working for themselves."

"As yet no attempt at the municipalization of street railways has been made in any country on a sufficiently large scale and for a long enough time to be of real significance. Glasgow and Leeds, for instance, are the two European instances more frequently referred to. From the statements often met with in the press, and the assertions heard in discussion, it might well be assumed that the experiments made in these cities amounted to an indisputable and established success; whereas, in point of fact, such is in no degree the case. So far from being a demonstrated success, it may, on the contrary, be confidently asserted that nowhere, as yet, has the experiment of municipalization of street railways been worked out to any logical and ultimate results whatever, nor can it be so worked out for at least a score of years to come."

"So far, however, as a further special street railway franchise tax is concerned, grave popular misapprehension seems to exist as to the burdens in the way of taxation to which street railway companies are already subject,—a misapprehension due in no inconsiderable degree to the indirect and anomalous character of those burdens. It seems to be generally assumed that the street railway companies received, and are now receiving, public franchises of unusual value, for which they pay no money consideration and render very inadequate public service; that their profits consequently are inordinately large is also assumed, and that those profits are in some way concealed through a system of vicious financiering and deceptive bookkeeping. The facts, however, do not seem to be as assumed in this presentation of the case."

"At the present time, the municipalization of the street railways is not accepted as by any means indisputably desirable in Great Britain, while in Germany it is regarded unfavorably."

The committee finds three lines of ultimate development into which the relations of street railway interests and municipalities seem in this and other countries to be working; these are that of (1) regulated private ownership; that of (2) the municipal ownership of a permanent way, to be operated by a private company as lessee; and (3) municipalization.

The chief objection to the first of these is stated to be that it necessarily involves a divided control of streets, resulting

in continual jealousies, misapprehensions and disputes. With the object of obviating this source of dispute the committee framed a bill under which the various obligations for paving, street cleaning, etc., would be commuted into a fixed money payment in the nature of a tax.

The committee is inclined, "in theory at least," to favor the second line of development, the third line, municipalization, being characterized as an experiment which will require a score of years to bring to logical and ultimate results. The public ownership and care of tracks and their private operation are urged as being in nowise different from the case of an omnibus line owned by a private company and the pavement owned by the city, except that the street car company would pay the city trackage for the use of a specially prepared way.

A bill has been drawn providing for the building or purchasing of tracks and overhead lines by the municipalities and their lease to the companies upon the payment of agreed rentals for the use and maintenance of the tracks. In case the two parties fail to agree the rental is to be fixed by referees appointed by the supreme court, the award to be based on the payment of interest on the actual cost of the tracks, together with a reasonable allowance for repair and renewal.

It appears to us that in recommending, even "in theory," the public ownership of street railway tracks sufficient weight has not been given to the fact that such an arrangement would take out of the control of the company the construction and supervision of a portion of its plant, the good condition of which is just as essential to the economical operation of the road as is an efficient and well-managed power plant, or repair shop, or efficient and careful employes.

As to how important a good condition of track is we may cite President Bowen, of the Chicago City Railway, in his paper before the American Association at St. Louis in 1896. By rebuilding the State street cable line (14 miles measured as single track) a saving in the cost of power for haulage of \$33,108 per year was effected; that is a saving of \$2,365 per mile per year.

For the estimated life of the new track the saving was sufficient to pay the principal and interest on nearly five times the cost of the improvement. And this did not take into consideration the decreased repairs of rolling stock and the increased comfort of passengers.

When the line is an electric one, in addition to the mechanical condition of the track, the efficiency of the rails as electrical conductors is equally important. And the overhead construction is another factor.

We consider that there would be two very serious difficulties to be met in any such system of independent ownership and operation; first, that of convincing the municipal authorities of the necessity of making proper repairs and improvements; second, that of getting the work honestly done when once undertaken. The care of the streets in all our cities is not such as to inspire confidence in the success of the municipality in caring for car tracks when the principal financial sufferer from neglect would be the operating company. And as for the manner in which the track building would be done, we might ponder upon the scandals and "jobs" which have in the past accompanied every governmental or municipal undertaking of magnitude.

## STORY OF THE GREAT STORM.

**Heaviest Snow in Many Years--Reports from All Parts of the Country--Record of the Splendid Work in Opening the Lines--Work of the Rotaries--Operation Resumed with Unprecedented Promptness--Six Days Fight at Quebec With Wind at 65 Miles an Hour and 12 Feet of Snow in the Streets--Valuable Experiences for Future Conflicts.**

The recent storms have in many quarters been the most severe in years, and the managers of street railways have found it necessary to exert every effort to get their lines opened up promptly when the worst was over. That these efforts were generally successful is a cause of pride. In some cities, as Boston, there were many telephone and other wires down across the street railway tracks which made it harder yet when the snow itself was a source of sufficient trouble. The city authorities some times added to the manager's troubles by insisting that he ought to clean off the street crossings, and failed to realize that he was doing all he could and that clean crossings were scarcely so important to the public as clean tracks.

Below will be found a few notes showing what street railways had to contend with and the means and methods used to keep the line clear.

The month of February proved a very costly one for the street railways of New England, but the greatest trouble was caused by the storms occurring during the first week of the month. Throughout that section of the country the reports tell of snow plows stalled and service suspended for periods of nearly a week on some of the smaller roads, notwithstanding the efforts made by the managers to keep the lines open. Ice on the rails and on the trolley wires were among the difficulties to be met in many places which were harder to overcome than the heavy fall of snow.

In the cities the greatest trouble was on account of fallen wires, not the trolley wires but telephone and telegraph wires which fell across the former, and until they were cleared away the railways could not turn the current on their lines for fear of injuring persons who might come in contact with the telephone wires. The delay thus caused placed the street railways at a great disadvantage. The Boston Elevated Railway Company suffered greatly for this reason. The cost of the storm to this company from loss of fares, repairs to wires, and for removal of the snow is estimated at \$200,000.

A few companies found their work of clearing the snow away hampered by the local authorities. The press reports contained the following account of the troubles of the Pawtucket Street Railway Company, of Providence, R. I.:

"The residents of Valley Falls and Lonsdale new village are for the present without trolley car service. There was a disagreement between the officials of the Pawtucket Street Railway Company and the town, as a result of which the railroad people abandoned the work of breaking out the track. Wednesday and Thursday the railroad company attempted to break out the tracks, but on Thursday afternoon Highway Commissioner Connolly put his men to work, who shovelled and scraped the snow into the tracks as fast as the railroad men shovelled it out. Then the Town Council, which was in session, called in Highway Commissioner Connolly and Superintendent Luther of the railroad. The question of whom was to remove the snow was discussed. The town officials held to the opinion that the railroad should remove it all at its own expense. Superintendent

Luther held that the town should bear half of the expense at least. No agreement could be arrived at and the railroad men withdrew, leaving the people to walk if they had rather do that than ride. The public opinion seems to be growing that the town should have borne the expense of cleaning up the street with the railroad company, as is done in Pawtucket and Central Falls. The people desire the conveniences of the cars, and are inclined to find fault now with the town authorities because they do not have the car service."

At Norwich, Conn., the worst trouble was in narrow streets where there was not room for the snow plows to throw the snow off the track without covering up the sidewalks.

The storms were severe in Vermont, from 12 to 20 in. of snow falling. E. C. Crosby, general manager of the Springfield Electric Railway Company, writes that he kept his 7½-mile electric freight line open by using his snow plow with the freight locomotive coupled behind it to help push. The plow is a Smith & Wallace nose plow equipped with two Westinghouse 50-h. p. motors. Only slight delays have been experienced because of snow.

One of our illustrations shows a view on the line of the Fitchburg (Mass.) & Leominster Street Railway Company after the track was cleared. The superintendent, W. W. Sargent, writes that he experienced the usual difficulties and that no apparatus with which he is familiar could have effectively cleared the tracks during the height of the storm. By putting shovelers at work at the worst places and running all the plows and sweepers, the road was kept in such condition that cars were operating over two-thirds of it when the storm ceased and by noon of the following day cars were on schedule time everywhere.

---

**Bangor, Me.**

---

W. H. Snow, superintendent of the Bangor (Me.) Street Railway, writes as follows: "The street railways of Maine have had their share of snow this winter, and although the weather has been warm for the past few days, the snow of course settling a great deal, it still averages, March 2, 20 in. in depth. The first storms of the season were of a character easy to be handled, from 3 in. to 9 in. of light snow falling at different times.

"These storms were taken care of entirely by two home made plows, each equipped with two G. E. 800 motors.

"The wings of the plows hang from the trucks, and are in two pieces with a joint in the middle so that the outside wing can be lifted without moving the whole wing; they are guided by chains running to the front of the plow, and are easily adjusted. When the wings are out as straight as is at all practicable a space 24 ft. in width is cleared and, as the quantity of snow increases, the wings are narrowed up little by little. In light storms the plows are used single, in heavy storms two cars are usually coupled on behind each plow. When storms clear off in the day time as soon as the streets are passable for teams we withdraw the plows

until night and then run them out and push back all loose snow; the wings take up so much of the street that we can operate with much more ease and safety when they are free from teams. Where the streets are wide six-horse road machines are used to scrape the snow from where the plow wings leave it to the side of the street. On narrow streets we cart off all the snow left by plow wings.

"We have had little or no trouble with sleet on the trolley

to February 24 at 11:30 p. m., that being the longest stretch of the winter.

"During storms we plan to keep our conductors and motormen well fed, never intending to let them go over six hours without eating. No matter how tired and sleepy a man may be, take him in and fill him with hot coffee and hearty food, and you have a new man. We have found that it is cheaper in the end to stop operations for 15 or 20 minutes in a storm and freshen up the men with food than to try to push on with a lot of cold and hungry workers. We make up the loss a dozen times over we think by so doing. Of course if the rail were covered with slush and about to freeze up that would be another thing, but in nine out of ten storms the few minutes can be taken, and to a good advantage to both men and company."

### Rochester, N. Y.

At Rochester, N. Y., the storms of January 31 and February 16, were the cause of extraordinary trouble to the street railway company. In the first of these there was a fall of from 8 to 10 in. of dry snow, and a heavy wind which drifted the snow until in many places it was 6 to 7 ft. deep. The second storm was wet snow and it also was badly drifted and very difficult to handle. In each of these storms the superintendent, J. W. Hicks, began working the company's plows when the snow commenced falling, and continued until the storm was entirely abated. The cars were kept running on as nearly as possible schedule time, and thanks to the untiring energy of Mr. Hicks in keeping his plows at work there was scarcely a moment's delay on any of the 22

AT FITCHBURG, MASS.

wire, although the rails have iced badly three or four times; in one storm in particular the ice was so hard that

TRACK AND SNOW PLOW AT WORK, ROCHESTER, N. Y.

the plow diggers would not break it—the plow would simply run up on to it and ground. We coupled five cars together, the forward car using no power—simply being pushed by the other four—its weight crushed the ice enough to allow the scrapers of the other cars to clear the rail. By the time the third, fourth and fifth car got along the rail was in pretty good shape. The hardest storm of the winter was the last one—that of February 23, 3 in. of light snow and 6 in. of hail on top of it falling in 10 hours. We used plows, cars, six-horse road machines and a great many teams and men, and managed to hold about one-half regular schedule time. It was necessary for us to run either plows or cars continuously from February 22 at 5:30 a. m.

lines of the Rochester Railway Company. The first of these storms was the one which caused so much trouble in the eastern cities and T. J. Nicholl, general manager of the company, feels very well satisfied with the record made on his road.

This company has eight electric plows, two Ruggles electric rotary plows and one Ruggles track cleaner, manufactured by the Peckham Truck Company, one electric sweeper and plow combined, and six horse plows and levelers. All of these were in use during the heavy storm. On the suburban and outside lines, where the drifts were worse than in the city, it was necessary to use the Ruggles rotary plow, and speaking of this Mr. Nicholl says that he believes it to

be the best track cleaner in the market. On the city lines the sweeper and plow does the best work, as it leaves the rails perfectly clean, and throws the snow far enough back from the rails. Track scrapers are used on all cars and are found very efficient. With an icy rail the horse plows are much better than the electric plows.

The illustrations show a view on one of the lines after the tracks were cleared and also the snow plows in action.

#### Bay City, Mich.

The storm of February 19-21 was very severe in Wisconsin and Michigan. At Bay City the Consolidated was compelled to abandon nearly all its lines on the night of the 20th. It put its men at work clearing the tracks at 4 o'clock the following morning, but they were obliged to desist after a short time, because the work proved to be perfectly useless, the gale driving the snow back into drifts again. They commenced again at 9 o'clock and opened up the city line. In the afternoon the track was opened to South Bay City, by first running two snow plows each drawn by four horses, and following it by four cars with track scrapers. On the Essexville line the same tactics were pursued, a large force of men with shovels to remove deep drifts also being used.

#### Milwaukee, Wis.

At Milwaukee the company made heroic efforts to keep its lines open, but was compelled to abandon many of them. The plows were put at work the morning of the 19th and kept running until the lines were cleared, although it was found impossible to keep them all passable for cars. On the South Milwaukee line traffic was suspended from Saturday until 11 o'clock Tuesday, and some of the other suburban lines were in the same shape.

ON THE MILWAUKEE, RACINE & KENOSHA.

This was the first winter in the operation of the Milwaukee, Racine & Kenosha line, and it came in for its full share of grief. The storm was particularly severe in the district covered by its lines, and yet the road was opened and travel resumed with a promptness which reflects credit on the management. The line is 30 miles in length, almost en-

tirely out in the country where the storm had full sweep, and about 25 miles of the line had drifts ranging from 18 in. to over 6 ft. in depth, and packed so hard and firm that in many places it had to be broken with picks and taken out in blocks with a shovel. Such spots, however, were the exception, and the work of the plow was very effective and highly satisfactory. An eye witness relates frequent runs of 300 to 500 ft. through snow 2 ft. to 3 ft. deep. The cars worked finely. One run into a frozen bank was made with sufficient force to break the cast iron nose of the plow weighing 1,250 lbs.

Our illustrations tell the story of the conflict most graphically, showing the various stages of before and after "bucking." In one view it will be noticed the snow was thrown nearly to the trolley wire; in another the compactness is seen in the huge blocks thrown out; in another the clean track when the plow had conquered.

The plow which is shown in action in the illustrations is the standard nose plow made by the Taunton Locomotive Manufacturing Company, and is much smaller and lighter than the heavy plows which are recommended for such service. The superintendent of the road, J. R. Nelson, speaks very highly of the apparatus and the builders are quite proud of its performance.

#### Grand Rapids, Mich.

G. S. Johnson, president and general manager of the Consolidated Street Railway Company, Grand Rapids, Mich., writes us regarding snow, and the means of overcoming it, as follows:

"During the past winter we have had extraordinary snow storms and unusual difficulty in keeping our tracks open. A good many storms have prevailed, but the one which visited us on February 19, and continued for three or four days, was, by far, the worst in the experience of this company, and taxed our resources to the utmost. The fall of snow was probably 2½ ft. on the level and, in many places, the accumulation caused by drifts, was over 5 ft. deep. In spite of the tremendous task which presented itself, we were determined that our lines should not be blockaded and that our service should not be stopped. To accomplish this every device in our possession and all the forces at our disposal were kept busy night and day. Our sweepers and snow plows left their shelters early in the evening and did not return to them for two nights and a day. When relieved, they were as much exhausted as the men.

"We had two very large snow sweepers, a large switching motor and several horse snow plows in operation and probably a hundred men (extras) during this period. With this help and the determination to keep our lines open, we succeeded in preventing the interruption of traffic, while in a good many cities travel was entirely abandoned.

"Our usual method of procedure was to start out our snow plow, or switching motor, equipped with wings; follow this up with a sweeper, after which would come the salt cars; and, often, to widen the path and keep the snow from falling back on to the track, the old horse snow plows, which had not been in use since the horse cars were placed on the retired list eight or nine years ago. All these were followed up by men with shovels, whose duty it was to throw the snow out of the way where it was too deep for horses to travel through. The result was that the tracks were left and kept in a tolerably free condition, but the

streets, on the sides of the tracks, were bad, so that it was almost impossible to traverse them with sleighs or any other vehicle. But our people were so glad for the service that little complaint was made of this condition of affairs. I am sorry no photographs were taken of the snow heaps before and after we had completed our work on them. It would be difficult to believe, after remembrance has past, that the streets in any city were piled so full of snow as some of ours were during this last storm.

"As I have said, we have two sweepers, a switching motor, used for switching purposes but convertible into a

many places, because we have no lines which are not badly cut up with grades, some being even as steep as 10 per cent."

Several managers have written us describing their methods and apparatus in detail. On one road with 20 miles of track there are no plows or sweepers, but the cars are equipped with track cleaners which it is stated readily keep the rail free from snow. In case the snow gets too deep between the rails, an A-shaped drag made of 2 in. x 12 in. x 10-ft. oak planks is fastened to the rear draw head. If a real blizzard comes and there are bad drifts which the scrapers and drag can not clear out, the cars are run into the barn

TAUNTON SNOW PLOW ON THE MILWAUKEE, RACINE & KENOSHA.

snow plow, and eight or ten horse snow plows. All of these were built in our own shops.

"The switching motor is a 60-h. p. apparatus, and the motors are two Rae, or Detroit, motors of 30 h. p. each. The motors which operate the sweeper are two Edison No. 12, which are 25 h. p. each. The sweepers are similar to those built elsewhere; the brushes being composed of rattan, placed in rollers and cut about 33 in. long. The brushes are so arranged at an angle with the track as to take the snow from the center of the way and throw it outside, clear from the rails. They are very effective.

"We use a good deal of salt to keep our rails in suitable condition. Salt is a most disagreeable adjunct and leaves the streets in very bad condition, but it is an aid to electric railway operation which cannot be supplemented or duplicated. We regret its use, but have been unable to find a substitute. We would have great difficulty, at times, to operate without a liberal use of it.

"No doubt the conditions are worse here than in a good

until the storm is over. Then the track is cleared by a road scraper drawn by horses.

The manager of a 40-mile road writes: "We have six snow plows equipped with independent motors of their own, that are used in heavy snows. For light snows the scrapers that are attached to each car answer the purpose and keep the track clean. When the snow becomes deep the heavy plows are put out, and they not only clean the snow from the track but have an arm reaching out to widen the roadway so that we can keep the rails in proper condition. We do not use sweepers of any kind. In exceedingly heavy snows we find it necessary at times to use the 'walkaway' horse plow outside of our rails to level the snow in the gutters. We have certain conductors and motormen that are familiar with all our lines, and men that have been with us for a number of years, who operate the plows. Each winter these men are assigned to certain plows and are notified by the superintendent or foreman when it is necessary for them to report for duty, so that if it is necessary to put the

LORAIN &amp; CLEVELAND SNOW PLOW.

plows out we have the men on hand to run them. We have a sweeper in addition to our plows, but we have never had any success in using a sweeper to fight snow with in this section of the country. We are a firm believer in plows for keeping our tracks open."

Another manager writes: "We have about 20 miles of track. We have two electric sweepers and two plows (one two-horse and one four-horse.) The plows are not used excepting in heavy storms, as the electric sweepers successfully handle any snow not over 6 in. deep; if the snow is light and dry the sweepers will take care of it up to 12 in. deep. It is a real pleasure to fight snow with the large

BRILL SHEAR PLOW.

sweeper (which was built in our own shop); it has the comfort of electric heaters and the convenience of electric brakes, and all levers are worked from a sitting position. When run the plows are operated by the trackmen, who are employed with the understanding that they will do extra work in snow storms. The train dispatcher gives special attention to the service during storms, and a point is made of getting to work at the commencement of the storm, so that it will not get the best of us."

Among the illustrations are three snow plows built by

NOSE PLOW.

the Brill Company. That built for the Meriden Electric Railroad is a shear board, and that for the Rutland Street Railway a nose plow. In both of these the length over the end sills is 16 ft., and the width over the side sills 6 ft. The cabs are sheathed up on the sides and entirely around the ends. They are provided with sand boxes. On both of these plows the height of the shear board is 36 in. The third one is a construction car built for the Lorain & Cleveland Railway Company, and fitted with a removable snow plow attachment. This car is 24 ft. long and 6 ft. 1 in. wide; the sills are 3 $\frac{3}{4}$  in. x 7 in., and the floor of 1 $\frac{3}{4}$ -in. stuff. The front end is vestibuled, and has a door on one side with a drop sash on the other. The roof is a plain arch with a trolley board at the rear end. The open part of the plow has drop sides 24-in. high with strap hinges the full width; sides are in three sections and the end in one; the sides are fitted with curtains all around. There are two large boxes on each side for sand or salt arranged to deliver between the trucks; the valves are enclosed in water tight boxes. The nose plow is in two parts and is fitted up with the usual hand wheels for raising and lowering the movable part; at the sides there are long shears to level off snow thrown aside by the plow. The car is mounted on two No. 27 trucks, the standard of the railway. There are four G. E. 57 motors. The wheels are 33 in. in diameter with 2 $\frac{1}{2}$ -in. treads. By removing the plow and wings the car is capable of being used for all sorts of construction purposes. It is fitted with extra heavy springs so as to be able to carry loads of rails when necessary. The framing is made heavy enough to enable it to do the most severe work in heavy snow.

#### Muskegon, Mich.

Fred. W. Thompson, superintendent of the Muskegon (Mich.) Street Railway Company, had to engage in a long drawn out combat with snow and describes his experience as follows:

"The performance was almost continuous from January 22 to February 5, and from February 19 to 24. We have a sweeper, a walkaway plow and a salt car, and all these were used pretty much all the time; in addition we put on a large force of men with snow shovels. Our track is 12 miles in length, including branches. The sweeper has one 15-h. p. motor for each broom and is pushed by one or two motor cars (as may be necessary), each having two 20-h. p. motors. My plan is to start out either on foot or with a team, when the storm begins and find where the heavy drifts are and send men to such points, so that the sweeper may not be stopped when it reaches there, but there were so many big drifts this winter that the sweeper would catch up occasionally, then all hands would turn in and shovel. From 8 p. m. January 22 to 8 a. m. February 5, the sweeper was on the road 160 hours, and as we can sweep the road in 2 $\frac{1}{2}$  to 3 hours ordinarily, it will be readily seen that there was 'heaps of trouble on the old man's mind'—in fact we had to work night and day during this two weeks. In 25 years' experience on steam and electric roads, I have never known anything like the continuity of blizzards that we have just experienced. The snow on our lines was from 2 ft. to 12 ft. deep. I understand that the government reports say that our district was the center of the heaviest snow that fell during this period. We certainly handled more snow than ever before. A large item of expense here was, owing to the

SCENES IN MUSKEGON, MICH.

enormous quantity of snow, which when swept and thrown out left a deep and narrow trench, to be quickly drifted full by the next storm, and which had to be constantly widened, so the sweeper would have room to throw. All our regular men were on call at all hours, and worked like horses, and our road gave very good service throughout.

"Tell me ye winged winds,  
That round my pathway roar,  
Do ye not know some spot  
Where blizards howl no more,  
Where snow falls not in solid chunks,  
From north, south, east and west,  
And where the weary manager  
Can snatch a little rest.  
The loud wind dwindled to a whisper low  
To gain more strength and answered—"No."

The illustrations reproduced from photograph kindly sent us by Mr. Thompson show three views on the line on January 25. No. 1 shows the plow in a 12-ft. drift; there were several long drifts from 4 ft. to 10 ft. deep; No. 2 was taken at the point where the depth of snow was least, on the top of the bluff. No. 3 is a view of the sweeper on its way home.

**London, Ont.**

The London (Canada) Street Railway Company on February 20 and 21 had to deal with the most severe storm in its experience, and for the first time in the three years of electrical operation the car service was tied up because of a

storm. The general manager, C. E. A. Carr, writing of this storm says: "It started with rain and sleet which froze upon the rails and wires and as we do not operate cars on Sunday, the groove in the girder rail completely filled with ice. The temperature gradually lowered and the rain turned to snow and fell so thick and fast that it was almost impossible to see across the street. This made a mixture of slush too heavy for the sweeper to clear. We suffered more from ice in the groove than from any other cause, as cars would leave the track every few yards and our service was demoralized for the greater part of Monday.

"Our appliances for fighting snow storms consist of heavy rattan sweepers of 100-h. p. capacity, with scraper cars and plows, which follow along behind the sweeper leveling the snow back from the track allowance. In addition to these we have a 'Monarch' snow scraper attached to a couple of cars on each route, which keeps the snow back from the track until the sweeper gets around again. With this equipment we have no trouble, and had it not been for the fact that the storm struck us on Sunday, when we do not run cars and our plant is shut down, we would have kept ahead of the storm, but before we could get steam up, the grooves were filled with ice and it was impossible to make much headway. This is one of the drawbacks of not operating cars on Sunday.

"The question of bucking snow is one which every railway manager in Canada must understand, and from early December until sometimes late in April our storm gangs are

STREET SCENES AT LONDON, ONT.

at work, occasionally night and day continuously. For this purpose we have a separate organization, which consists of a snow foreman whose duty it is to keep posted on the probabilities and watch carefully the condition of the tracks, and he is held responsible if he allows a storm to get the better of him. There is very little excuse for a Canadian road being tied up with an ordinary snow storm or blizzard and the storm gang should always hold itself in readiness to get out at a moment's notice. With the proper equipment, if taken in time, an ordinary storm should not interfere to any extent with the schedule time of the cars."

The illustrations show street scenes in London and serve to give an idea of what Canadian roads have to do in the way of fighting the storm king.

At Hamilton, Ont., also there was a great deal of trouble. The trolley wires were covered with sleet and the rails with frozen slush, making it difficult to operate the snow plows. By working Sunday night the city lines were opened for traffic and the car made the runs to the early morning trains on Monday. The Hamilton, Grimsby & Beamsville road was not opened for traffic until Monday afternoon; this line carries a great deal of milk to Hamilton and the blockade was hard on milk users. The Hamilton & Dundas line was blocked only a short time. The Hamilton Radial Electric Railway Company experienced difficulty with the frozen slush on the city end of its line; the road outside the city was easily cleared by means of a rotary plow and during Monday forenoon cars ran only to the city limits.

#### Chicago.

The Chicago Electric Traction Company, better known as the storage battery road, in the snow fighting it has had to do employed a plow and a sweeper. The plow was made by the J. G. Brill Company. The dimensions are: length

STORAGE BATTERY ROAD, JANUARY 25.

of body, 20 ft.; length from point to point of plows, 31 ft.; height, 12 ft. The weight including batteries is 22 tons. The motor equipment consists of two 50-h. p. Walker motors, one to each axle. There are two sets of batteries, which work in parallel; the batteries are 400 ampere-hour cells. The greatest distance which has been made with this machine without changing batteries is 24 miles. When the snow does not exceed a depth of 2 ft. the plow handles it

M'GUIRE SWEEPER ON THE STORAGE BATTERY ROAD.

easily without stopping and when bucking drifts it has been able to run a distance of several hundred feet through snow 5 ft. or 6 ft. deep. The general manager of the road, E. R. Gilbert, writes us that this plow is a "little wonder" and that he has never seen a trolley plow which would do the work of this one.

The sweeper is 35 ft. long outside and is the largest one ever built by the McGuire Manufacturing Company. The weight with batteries is 28 tons. There are three 50-h. p. motors, one to each axle and one to operate the brooms. There are three batteries, one for the broom motor and two working in parallel for the traction motors. The longest distance made without changing batteries is 18 miles. Regarding the sweeper Mr. Gilbert says that he is just as proud of the work it has done as is the McGuire Company.

The method of using these machines depends upon the quantity and quality of the snow. When the snow is dry, the plow is first sent over the line and followed by the sweeper. If there is a heavy damp snow they are used independently, being sent in opposite directions, and one does the work as well as the other. With these two machines Mr. Gilbert has kept his 26 miles of track open, except for four or five hours during the heaviest storm, and he states that in all the cases of which he has knowledge this line was open sooner than trolley roads operating under similarly exposed conditions.

H. M. Sloan, general manager of the Calumet Electric Railway Company, last year designed a 29-ft., 200-h. p. snow plow in which were embodied some ideas of his own as to how the shear should be arranged to give the best results. This plow was illustrated in the REVIEW for March, 1897. There are nose plows at each end and a spring supported shear under the middle of the body between the two trucks. During the recent storms it was demonstrated that this plow was fully capable of handling the heaviest drifts, and quickly cleared the road.

#### Sheboygan, Wis.

At Sheboygan, Wis., the snow was light and dry, but there was a heavy fall, estimated at 2 ft.; it was badly drifted, in many places to a depth of 6 ft., and some of it was well mixed with sand. Edwin L. DeBell, secretary of the Sheboygan Light, Power & Railway Company, sends us the following description of the apparatus and methods used in fighting snow.

"Our principal and most effective weapon is a home made snow plow, designed and constructed by J. M. Saemann, vice-president of the company. We used the trucks of an

old sprinkler car, and put a V shaped plow on each end. The plows are made of 3x12-in. white oak, faced with  $\frac{1}{4}$ -in. boiler iron. The side arms are made of 3x8-in. maple, faced with old tram rail. Heavy clamps are fastened to both sides of the car frame, to hold up the side arms of the plows, and are made so as to permit the raising and lowering of the plows at will. The plows have adjustable top pieces, made of  $\frac{1}{4}$ -in. steel, to increase their height when bucking deep snow. For double track work we have an adjustable wing, 7 ft. long, 2 $\frac{1}{2}$  in. thick and 14 in. high, faced with  $\frac{1}{4}$ -in. iron, which can be readily hinged to the nose of the plow. The front end of the wing is held in place by an iron bar running back and fastened to the plow proper. The wing is raised and lowered by means of a chain, running from its front end into car.

"Back of the plows are track scrapers, working directly on the rails. They are hinged to the plows, but work independently and leave a clean track for the motor car pushing the plow. One man operates the device, raising and lowering the plows with a hand lever, and the scrapers with a foot lever. For single track we use wings 2 $\frac{1}{2}$  ft. long, attached to the rear ends of the plow shears, to throw snow away from rails. In center of the car is a 500-lb. salt tank, with spouts directly over the rails, which requires a man to operate it.

"We have cleaned 2 $\frac{1}{2}$  ft. of snow from our tracks with this device in a very satisfactory manner, so that cars could follow the plow at once. This plow was made largely of old materials on hand, and it has proved an inexpensive and efficient one.

"For leveling the snow at the sides of the tracks we use two-wheeled graders.

"We find from experience the cheapest way to handle

snow is to start the plow as soon as it begins snowing, and keep it going until the fall has ceased and the tracks are entirely cleared."

It is not everywhere that the manager has had to stay up nights and direct the snow brigade. At Butte, Montana, there has been less than a foot of snow during the winter and never more than 2 in. on the ground at one time. The manager of the Consolidated road states that he has only sympathy for his brethren in the God-forsaken storm and blizzard-swept east, who are out bucking snow while he enjoys the health-giving and spice-laden breezes and delightful "Chinooks" from the Japan current. For the last 60 days the temperature at Butte has averaged but little below the freezing point, and bicycles are much more in demand than snow plows.

At Omaha, while there has been considerable snow, General Manager Smith, of the Omaha Street Railway Company, reports that it was only necessary to run all night on two occasions; one night the electric sweeper was kept at work, and once it was necessary to use sleet cutting trolley wheels and keep cars out all night. The trains were running on time in the morning and practically no delays experienced.

A manager who has had a great deal of experience in fighting snow has written us expressing the opinion that there is room for improvement in snow plows and suggests the following points: More powerful motors, smaller wheels, and the abandonment of sprockets and chains for connecting the motors to the axles, the idea being to secure greater power, strength and simplicity, and consequently a more reliable machine. The most important thing is to have motors of sufficient power, so that the plow can be forced through. Another manager has recently had built

SCENES AT LOCKPORT, N. Y.

in his company's shops a double track plow with 30-in. wheels and motors carried on the axles.

The Sandusky, Milan & Norwalk Electric Railway reports considerable trouble with snow, but less difficulty in keeping its track clean than city lines would have because it is laid along the side of the road and is not traveled by teams. The freight car owned by the company is equipped with track scrapers which will clear away 6 or 8 in. snow, and is used instead a regular plow. Where the snow is deeper it is necessary to clear it away by hand.

On February 15 street car patrons in Cleveland had a very disagreeable experience, there being a blockade on the street car lines and a blizzard. About 5 p. m. a large generator in the power house of the Cleveland Electric Railway Company was burned out, the snow storm throwing an overload on the plant. The Cleveland City Railway Company operates the down-town lines jointly with the Cleveland Electric, and could have cared for those lines without difficulty had it not been for the fact the lines are so connected that to feed one meant to feed all. The result was a blockade for about an hour and a quarter.

The Pennsylvania roads have in general experienced but little trouble with snow this season. S. S. Crane, superintendent of the Altoona & Logan Valley Electric Railway Company, reports that their snow equipment comprises one sweeper and one plow. The plow is a home-made one, weighing about 5½ tons, and has been found heavy enough to cope with all drifts that have been encountered. The cars on both roads of this company have made schedule time each day this winter, and there was but one delay last winter, when the cars lost 52 minutes while the sweeper was disabled.

#### The Storm at Providence, R. I.

BY J. H. DE GURCHY.

On Monday and Tuesday, January 31 and February 1, we experienced in New England, what was, almost everywhere, one of the most severe and destructive snow and sleet storms in the history of the street railway, telephone, telegraph and fire alarm systems. It snowed steadily Monday, but the snow being light and dry, caused no great inconvenience until 11 p. m., when it turned to sleet, and the temperature having risen to 32° F. produced ideal conditions for loading tons of ice upon all exposed wires and cables.

Notwithstanding the fact that many telephone and telegraph wires succumbed to the combined strain of ice and wind, the wires of the traction system remained intact without an exception, although hundreds of wires and many poles of the telephone system were broken, falling into the streets, grounding trolley wires, and sawing into many of the high tension wires of the electric lighting company.

The Narragansett Electric Lighting Company humanely shut down the high pressure service, but owing to the splendid line construction, and exceptionally good system of strong and well placed poles, they were not so severely inconvenienced as might be expected in consequence of such a severe battle of the elements. This company is to be especially commended for its great concern for public safety, and for the remarkably short time in which it cleared the wires and resumed the service, both municipal and private. The only fatalities reported were those of two horses, one of which could have been prevented if the spec-

tators had used a little common sense. The animal was slowly electrocuted, showing that the pressure must have been very low. Unfortunately the majority of a street crowd look upon an electric wire as something necessarily fatal to all who approach. This is due to the prevailing ignorance of the conditions necessary to shock. In this case a fence rail could have been used to lift a telephone wire off of the animal's body, which would undoubtedly have saved him. The depth of snow between the horse and rails must have greatly reduced the possible pressure which the animal would have received had he been in actual contact with the rails.

During the height of the storm, our system was in good working order, the cars and plows all running on storm time.

Now why could we not run our cars through 17 in. of snow? We have previously run through more snow which fell in a much shorter space of time. It was because the telephone and telegraph systems of wire and pole construction, were not equal to the enormous stress of ice combined with the high wind pressure. Consequently, the street railway system was handicapped at a critical time by falling wires, which grounding the trolley wires made it impossible to run either cars or plows. The short circuits produced on most of the sections were so heavy as to prohibit the resetting of the circuit breakers. The accompanying photograph shows what was the rule rather than the exception. The combined leakage load was of such proportions as to be sufficient to operate at least 250 cars. The snow and rain continued to fall, freezing into a solid mass, which after a few hours of trampling down by wheeled vehicles, horses, sleighs and pedestrians would have successfully resisted a steam locomotive.

It was necessary in order to open the lines to put large numbers of men at work loosening and casting away the beaten path of snow, before the plow could be forced through with the aid of one and sometimes two trolley cars. The loss to the road was two or three days' receipts, and the cost of employing a thousand men and the necessary horses, carts, etc. Between \$30,000 and \$35,000 was lost, and the only benefit two or three days' work for a few hundred otherwise idle men.

I have given the load curves for the six days commencing with Monday, January 31, which will show the actual load for the week, from 7 a. m. to 7 p. m., Monday being the heaviest, Tuesday the lightest, and gradually returning to normal conditions, which are reached the latter part of the week.

Now the remedy is to put the low pressure wires underground, at any rate within the city limits. The disadvantages of carrying such wires on poles have been frequently demonstrated in this city. The advantages of placing underground the multitude of wires now carried on poles in nearly all large cities are, with good conduits and cables, the following:

1. Almost absolute protection from the elements.
2. Freedom from damaged or burned out telephones, due either to crossed wires or inductional discharges of lightning.
3. A general reduction in the cost of repair and maintenance. The first cost of conduits for low pressure service is not prohibitive.

Placing high pressure arc or incandescent lighting wires,

with an e. m. f. of from 2,000 to 6,000 volts, or even electric traction wires of from 500 to 800 volts, would be inadvisable in many instances, from a physical as well as a financial standpoint.

A conduit could not be procured at a reasonable cost to successfully withstand the stress of such pressures, in heat or cold, snow or rain; except in most level, high and well drained areas, free from the effects of exceptionally high tides. Even then there is the ever present danger from the

There is no certainty that the present system of electric traction will be the one of a few years hence, and when any street railway company has put forth its best efforts, without sparing expense, to give the municipality a first class and sightly overhead equipment, it would seem unfair to compel it to assume the burden of the enormous expense of changing the whole line equipment under unfavorable conditions, and with no assurance that it would not be obliged to discard that in turn, at some future day, for the possible benefits of improved alternating systems, or of traction units self-contained.

Although the indications of current progress do not especially point to such a sudden and complete change from present methods, still there is the possibility. It would appear that if the electric motor is to supersede the steam locomotive, it must be as independent in respect to distances, and just as self contained. The greater the necessity the greater the incentive; and the greater the incentive the more certain the results.

### The Quebec District Railway and the Snow Storm.

BY EDWARD A. EVANS, MANAGER AND CHIEF ENGINEER.

A glance at a map will show that Quebec is situated on the River St. Lawrence in latitude 46° 48' and because of its situation is terribly exposed to the full sweep of the easterly gales so frequent in this part of the country; it will also be observed, that it is about on the same parallel as Bismarck in North Dakota; it has a population of about 77,000, and with its narrow streets, and old-fashioned houses, is particularly susceptible to snow blockades, the roofs of the houses, one would think, having been purposely constructed with the object of assisting to blockade the streets, by dumping all the snow they receive into, or near the centre of the roads.

SCENE IN PROVIDENCE.

explosion of gases which are bound to collect in enclosed spaces underground, and which are a menace of no mean proportion in themselves.

In the case of the overhead wires of traction companies there is another reason why they should not be changed.

LOAD LINES FROM 7 AM TO 7 P.M.

UNION RAILROAD, PROVIDENCE, R. I., JANUARY 31-FEBRUARY 5.

The Quebec District Railway operate at present 13.37 miles of track, and covers 10 miles of streets, and may be said to be divided into sections as follows: In the Lower Town, between the Champlain Market, steamboat landings and railway stations, to the western boundary of the city at St. Sauveur. In the Upper Town; between the General Post Office, Chateau Frontenac, and other principal hotels, via St. John street to Maple avenue, just outside the western limits of the city, and near the celebrated Plains of Abraham (where Wolfe fought his great and final battle) and returning via Grande Allee to the General Post Office. The Crown Street line, running across the city and connecting the Upper and Lower Towns at about midway of their length. The Palais Hill line, running across the city and connecting the Upper and Lower Towns at a point to intercept the railway and steamboat travel, and to connect the same with the principal hotels, more especially the Chateau Frontenac.

Of these routes the Lower Town may be said to be level; the Upper Town has a mean grade of about 3 per cent, with a maximum of 8.5 per cent; the Crown Street a mean grade of about 6 per cent with a maximum of 14.5 per cent; and the Palais Hill a mean of about 8 per cent, with a maximum

QUEBEC ICE CUTTER.

of 11 per cent; the curvature for the most part is sharp, the curves ranging from 200 ft. to 35 ft. radius; which latter are rather numerous, owing to the narrow streets and the difficulty in rounding corners.

The equipment consists of thirty 18-ft. vestibuled cars, each with two 12A Westinghouse motors, etc., three trailers (old horse cars supplied with new trucks), five sweepers, each equipped with three 12A Westinghouse motors (two for operating the car and one for the brushes), nine "Walk-away" plows made by the Fleming Manufacturing Company, Fort Wayne, Ind., and two ice cutters; all cars are mounted on Taylor trucks, having a 7-ft. wheel base.

Before proceeding to a description of the snow storm of February 20-26, it would be well to give the City By-Laws with reference to the removal of snow, etc., from the streets.

Previous to the construction of the electric railway the City By-Laws compelled every owner of property, or the tenant, to clear the snow from his frontage to the centre of the street, at his own cost; and that in no case was he allowed to leave more than 12 in. of snow upon the roadway, or more than 6 in. upon the sidewalk; this winter the by-law was changed, compelling the proprietors or tenants to remove the snow within 24 hours after the storm had ceased, and not to leave more than 4 in. either upon the street or the sidewalk; the electric railway, by its franchise, is compelled to remove the snow from the tracks and for the distance of 2 ft. outside the same, and the company, seeing the impossibility of doing this without throwing its snow to the side of the track, and mixing it up with that of the tenant, immediately made a personal canvas and interviewed every

proprietor or tenant, and agreed with them to receive and cart away the snow so thrown, paying the proprietor or tenant a certain price per lineal foot of his frontage for so doing; this arrangement only applies to that side of the street to which the company throws its snow. The arrangement was accepted by the great majority of the residents, and as the clause in the railway company's franchise does not relieve the tenant from clearing the snow to the centre of the street, those declining to accept (less than one hundred) were allowed to take their own chances, and arrange for themselves with the city police for not carrying out the by-law. It will be seen then, that by an amicable arrangement, which appears to have given satisfaction to all concerned, the electric railway had only to get the snow off its tracks, and having done so, the proprietors or tenants took it upon themselves to remove the same; and without exception they have diligently done so, so that within 24 hours of every storm the streets from house to house were leveled, and all snow except 4 in. removed.

The photographs from which the engravings were made, except where otherwise mentioned, were taken on Saturday, February 26, and fairly represent the condition of the city streets after the storm. It must be remembered that all the streets prior to the storm were level and clear of snow, as required by the city by-laws.

No. 10. A street at right angles to the track on Ann street, in Upper Town with a roadway cut through for vehicles; the railway track is immediately in front of the horse's head.

No. 3. Place d'Armes not far from where No. 10 was taken.

No. 2. D'Auteuil street taken on Friday, February 25.

No. 4. D'Auteuil street taken Thursday, February 24.

No. 1. Fabrique street at end of St. John street, February 25.

No. 9. Artillery street, a street parallel to St. John street, but having no tracks thereon; this gives a general idea of the condition of the streets.

No. 8. Grande Allee opposite Parliament buildings.

Nos. 11 and 12. Maple avenue, this street for a distance of nearly 2,000 ft. was completely blocked from side to side to the height shown. Notice the top of lamp post just observable in the snow immediately to the right of sweeper in No. 11 and to the right of the car in No. 12.

No. 7. Dalhousie street in Lower Town.

No. 5. D'Auteuil street with sweeper passing through, taken Friday, February 25.

No. 6. Grande Allee, with sweeper at work (an instantaneous photo): snowing hard at the time; taken Tuesday, February 22.

The storm of February 20-26 commenced at 3 a. m. with a northeasterly gale, having a velocity of 48 miles an hour, and immediately four sweepers and six plows were run out; at the usual hour the regular service of cars was put out, but at 3 p. m., seeing that there was every indication of the storm continuing, one-half of the regular service was gradually withdrawn, and at midnight, the usual time for running in the cars, the balance were brought in, together with the sweepers, the last sweeper being brought in at 1 a. m., the 21st. The plows were, however, kept out all night to throw the snow further back from the tracks and thus give the sweepers a better chance. On Monday, the 21st, the storm had turned into a regular hurricane, the wind blowing 66

miles an hour, and the snow falling heavily and drifting badly; four sweepers were run out at 3:50 a. m., and men placed to shovel the snow further back on all cross streets, the cross streets being more subject to drifts; nine Walk-away plows were put into service and, notwithstanding the hurricane, at the usual hour the full service of cars was put into operation. At about 8 p. m. the plows had to be withdrawn, it being impossible for them any longer to move the snow farther back from the tracks. At this time the streets, especially the more narrow ones, were completely filled with snow, the tracks alone being clear, with perpendicular walls of snow ranging from 4 ft. to 6 ft. high on either side. At 9 p. m. it was found that men could not possibly stand out in the storm, and the cross street known as Maple avenue, at the western end of the Upper Town route, had to be

abandoned; at 9:30 p. m. Ann and D'Auteuil streets, at the eastern end of the same route, were abandoned; at the same time the Palais Hill route, and finally, at 10 p. m., all cars, sweepers and men were withdrawn, and it was with the greatest difficulty the cars and sweepers were brought into the shed. On Tuesday, the 22d, the storm still continued unabated, and the tracks being completely snowed under, it was decided not to attempt to run cars, but as far as possible to open up the tracks; consequently four sweepers were run out at 6:30 a. m., but after two hours' work, in which St. John street for a distance of about one mile, was successfully opened, it was decided to discontinue the attempt, it being found that the track, and in some places the whole street, was buried in snow from 6 ft. to 12 ft. deep. At noon, however, it was seen that to wait for the storm to

SCENES IN QUEBEC.

abate was useless, and another attempt was made, a force of 175 shovelers being employed to loosen and open up the tracks ahead of the sweepers. This time St. John street, St. Louis street and Grande Allee in the Upper Town, the Crown Street line, and the lower town lines were successfully opened by 1 a. m., the 23d, and operations were continued all night. On Wednesday, the 23d, the storm still continuing, with the wind blowing 51 miles an hour, it was decided (although a good portion of the road had been opened) that it would not be advisable to run cars; in fact it would have been barely possible for passengers either to alight or enter the cars, leaving out of consideration the fact that the streets were deserted and all business practically suspended; it was, however, decided to continue the opening up of the system, and five sweepers were brought into requisition, four to keep the lines open, and one to open up with the shoveling gang; in addition to this the nine plows were again brought into requisition to throw the snow further back and clear the streets for vehicles. Operations were continued all night, and on Thursday, the 24th, at the usual hour, cars were put into operation on that portion of the lines opened, and at 10:40 p. m. the whole of the lines were opened. On Friday, although the wind had abated, the snow continued to fall; the regular service was put into operation, but it was found necessary to keep the five sweepers continually running together with the plows until 10 p. m., when much to the relief of all hands, the storm had practically subsided, although snow continued to fall lightly until 4 a. m. on Saturday, the 26th.

The method adopted of handling the snow where it was too heavy and deep for the sweepers was to run the ice cutter, a machine peculiar to this city, consisting of a pair of shafts fastened on to a bar of steel, as per sketch, over the packed snow, thus loosening it (about 12 in. deep at a time) for the men to shovel, and for the plows to move farther back; the process was repeated until the sweeper was enabled to handle it.

The following table gives the snow fall and duration and velocity of the wind during the months of November, December, January and February last, from which it will be seen that in November snow fell to the extent of 12.7 in. on 12 different days; in December, to the extent of 12.2 in. on 21 days; in January to the extent of 31.5 in. on 22 days; and in February, to the extent of 43.2 in. on 19 days; this table is prepared from statistics kindly supplied by the Meteorological department from the observatory at Quebec, and it is generally conceded that the storm of February 20-26 was the heaviest on record during the past 40 years.

WINTER 1897-98—SNOW AND VELOCITY OF THE WIND.

The mileage made by sweepers is as follows:

November	227.47 miles.
December	981.46 miles.
January	1,806.93 miles.
February*	2,307.29 miles.

5,323.15 Total mileage.

\*909.43 miles were made during the storm Feb. 20-26.

The rivalry between the steam and electric roads around Cleveland is becoming most bitter, which will likely result in further cutting of rates. It is stated that there have been several conferences of steam road officials, and it was decided that the Cleveland, Canton & Southern Railroad should make a rate of 15 cents per round trip between Cleveland and Bedford. It is probable that the steam roads will have to equip for electric traction as steam is too expensive to compete with the trolley.

## NEW MOTOR CAR FOR C. H. &amp; D.

In January, 1897, the Cincinnati, Hamilton & Dayton Traction Company was incorporated by several officers of the Cincinnati, Hamilton & Dayton Railroad, to operate rapid transit lines in connection with the latter company. There is an excellent suburban service on this railroad, and it was desired to further improve the service by increasing the number of trains during those hours of the day when the traffic is light, provided it could be done without too great an increase in the expense. It was desired to have a car with its own power plant, and the management had under consideration all the motors which have been urged as suitable for such service, finally deciding that a steam motor car would best fulfill the conditions. Accordingly a contract was entered into with the Baldwin Locomotive Works, which agreed to furnish a motor car suitable for the service. The final tests of this motor were made on the C. H. & D. tracks on February 22, and shortly afterward it was put into regular service. The photographs and description of the car were kindly furnished us by D. G. Edwards, president of the Traction Company.

The car body is 32 ft. 9 in. long over all, with a clearstory, and is divided into three compartments for passengers, baggage and the engineer. The passenger compartment is finished in quartered oak, and is provided with transverse seats

C. H. &amp; D. MOTOR CAR.

with an aisle in the center. There is seating capacity for 24 persons. This compartment is heated by steam and well lighted. The windows are provided with sash and spring rollers. All trimmings are of bronze metal. A toilet room

is located at one end of the compartment. Safety gates are provided at the sides of the back platform.

The baggage compartment is about 6 ft. long and located between the engineer's room and passenger compartment, with both of which it communicates.

C. H. &amp; D. MOTOR CAR.

The boiler is 48 in. in diameter, of the centrally fired, self-feeding type, and is supplied with fuel (either anthracite coal or coke) from the top of the car roof around the stack through a 10-in. pipe in the center of the boiler. The shell is of steel  $\frac{1}{2}$ -in. thick; there are 304 iron tubes  $1\frac{1}{4}$  in. in diameter and 5 ft. long. The working pressure is 180 lbs. per sq. in. The fire box is  $42\frac{5}{8}$  in. in diameter, and 22 in. deep. In the lower tube sheet are 12 circulating tubes, 2 in. in diameter and 8 in. long, which guide the fuel to the center of the fire box and also provide extra heating surface.

The frames supporting the cylinders and driving mechanism are embodied in a swivelling truck which forms a support for the forward end of the car. The steam pipe connecting the steam chest with the boiler is provided with flexible metallic joints to allow for the lateral motion of the cylinders caused by the swivelling motion of the truck.

Feed water is supplied by two injectors.

A four-wheeled swivelling truck acting simply as a carrier is placed under the rear end of the car and is provided with 30-in. wheels and axle journals  $3\frac{1}{2} \times 7$  in.

The steam cylinders are of the Vaucrain compound type,  $5\frac{1}{2}$  in. and 9 in. by 12 in. stroke. The driving wheels are 30 in. outside diameter. The driving wheel base is 5 ft. The driving axles are of steel with journal  $5 \times 6$  in. The driving boxes are of brass. The total wheel base of the car is 16 ft. 8 in.

A condenser is attached to the roof of the car into which all the steam from the cylinders may be exhausted. Two tanks, each with a capacity of 150 gallons, are placed under the car body, from one of which the feed water is taken, whilst the other, being connected with the condenser, receives the water formed by the condensing steam; but both these tanks are connected and supply the feed water to the boiler.

The car is provided with American vacuum brake equipment on both driving and truck wheels with upright ejector. Also, there is a pilot at the front end, one 10-in. round case headlight, signal bells, and one 14-in. gong.

The weight in working order, not including passengers, is about 48,000 lbs., of which about 32,000 lbs. are on the drivers.

The car was tested on the tracks of the Philadelphia & Reading road, and in addition to its own weight, pulled a

loaded box car. It ran a distance of 38 miles at speed varying between 30 and 40 miles an hour. The fire required no attention and received none during the entire run of 38 miles. The operation of the car was more free from noise than the ordinary trolley at that speed; rode as smoothly as a sleeping car, and the examining engineers made a very flattering report of its capacity in every way.

### VESTIBULE AT ST. JOSEPH, MO.

By the courtesy of W. T. Van Brunt, general manager of the St. Joseph (Mo.) Railway, Light, Heat & Power Company, we have received a photograph showing the vestibule which has been adopted by that company. As will be seen in the illustration, there are three sections; all filled with double strength glass, and the middle one may be pushed to one side when so desired. This sash is moved by pulling

VESTIBULE AT ST. JOSEPH, MO.

one edge in as shown in the cut, and then sliding it toward that side. This vestibule is quickly put in place or removed from the car, and does not in any way disfigure it. The only change in the car made necessary by using this vestibule was to set the brake staff back farther from the rail. The vestibules were built by a local concern and the total cost of equipping a car, including changing the brake staff, is \$28.

### A PLEA FOR GOOD VISION.

Editor Street Railway Review:

Acting upon your suggestion, I take pleasure in writing you concerning the necessity for good vision, color-sense and hearing on the part of those actively engaged in the operation of all kinds of street cars. My position as oculist to the Twin City Rapid Transit Company, of Minneapolis and St. Paul, has for many years, I think, given me exceptional opportunities for intelligent reflection upon the subject.

While the examination of locomotive engineers, firemen and others engaged in the active operation of railroad trains, for vision, hearing and color-sense, has attracted considerable attention in the world, but little, if any, notice has been taken of these matters in street railway circles. And yet if

any one *should* be in full possession of his senses it would seem to be a man who manipulates quick transit through the crowded thoroughfares of large cities. The writer is personally familiar with several distressing and expensive accidents occurring through the imperfect vision of motormen. The public has surely a right to demand that street cars should be operated with as little risk as possible to the millions of passengers carried annually. It is not desirable to injudiciously inflict hardships upon corporations, that are often already overburdened with expense and trouble, but if they voluntarily assume to operate crowded cars and trains through streets, on elevated tracks, and over railroad crossings, certain elementary requirements should rest upon them as city, state or United States obligations.

In other words, corporations should be required to have the eyes and ears of their motormen and conductors examined by a competent eye and ear surgeon. In the railroad world such examinations are required in two or three states. I think in Alabama, Massachusetts and Connecticut, and the system has stood the test of time and is commended by all parties concerned, including the employes themselves, whose lives are usually the first to be endangered in case of accident.

Many railroad systems are doing this work voluntarily, and I have recently made such examinations on the "Soo" Line with marked benefit. Many railroads make an effort in this direction by requiring examinations at the hands of division superintendents, or general surgeons; while others totally ignore their obligations in this respect. It is hoped that street railway systems will take up the work, and in order to accomplish the best results the best methods should be used. The first essential is, I believe, the retention of an experienced eye and ear surgeon, to make the tests, for while many of the cases will be of a simple nature, others will require much skill and experience to properly interpret and manage. Such matured judgment is only possessed by one whose time is entirely consumed in the care of eye and ear diseases.

The general surgeon pays but little attention to such matters, and a mere unprofessional employe of a corporation is certainly entirely incompetent. Some companies allow surgeons employed by a brotherhood or beneficiary association to make physical examinations of applicants for work. I regard this as an exceedingly questionable proceeding; for, while many surgeons are doubtless honest and conscientious, it is doubtful how far these qualities would extend when the retention of a lucrative position is involved, which might become exceedingly precarious if members of the brotherhood or association were frequently declared physically incompetent. Such examinations should be kept independently in the hands of the corporations themselves, with full ability to employ or reject those applying for positions of responsibility and trust.

I repeat, then, that eye and ear examinations should be conducted by eye and ear surgeons, and by them alone; but to render this possible, certain concessions as to detail, and pecuniary consideration, must be made by such surgeons. The details of examination for eye and ear disabilities can be made with sufficient accuracy, and a proper certificate issued, within (on an average) five minutes. Some cases will take much more time. I have in a few instances consumed hours, and several consultations, to satisfy myself as to the existence of color-blindness; but such instances are rare.

Certain simple rules should be observed in the examination of new applicants.

1. He should possess perfect eyes.
2. He should be able to easily hear ordinary conversation with each ear at a distance of 20 ft.
3. He should not be color-blind.

It is easy to find perfect men from the great horde of those seeking employment, therefore the standard should be high.

It is well to make concessions to old and trusted employes; therefore, while the rule for color-blindness and hearing should remain the same, some elasticity may be allowed in the matter of vision. The applicant should possess at least two-thirds vision in one eye and three-fourths in the other, and have no serious progressive ocular disease.

If the applicant falls below such visual standard, but can obtain it by means of properly adjusted glasses, he may be allowed to retain his position, provided he wears his glasses when on duty. The expense of an ocular examination and glasses should be met by the applicant himself, and should involve an extra fee upon the part of the oculist, although the applicant must be made to understand that he may select any oculist he chooses to perform this personal service, bearing in mind the fact that these glasses and their results must be inspected by the company oculist, in order that he may pass upon their usefulness.

I submit the little card, shorn of all bewildering technicalities, which I have been using in the Twin City examinations:

No. ....

Minneapolis, Minn. .... 189. ....

I have this day examined.....

with the following result:

Vision.....

Color Sense .....

Hearing .....

I would recommend his employment as.....

Remarks: .....

Frank Allport, M. D.

The eye and ear surgeon must also make such concessions as to price as to render his services attractive to street car corporations.

When work is in this way done upon a large scale, involving considerable money, and sure pay, the surgeon can afford to examine men at the rate of one dollar each, and I would suggest this as a proper and equitable fee. Under these circumstances the amount involved would be so small for a single company as to afford but a little excuse for not having it done. I would suggest that new applicants pay the fee themselves. I believe that such examinations will in the end prove actually economical to corporations. It is often necessary to spend money in order to save it, and this is the case in the issue at present involved. Without a doubt every corporation has in its employ a large percentage of men with defective eyes or ears; they are, therefore, fostering in their employ an enormous element, capable of leading them into much trouble, litigation and expense, to say nothing of remorse over lives lost from the employment of such defectives.

The consequence of one accident might easily much more than pay for the examination of every employe in a particular system. I am myself cognizant of a certain notable case, where an accident caused by a near-sighted motorman cost a company many thousand dollars.

Besides this it is hardly necessary to remind street railway officials that in case of accidents, involving litigation, where questions of eyesight, hearing, or color-sense are in issue; a certificate from a reputable eye and ear surgeon will possess more weight with a judge and jury than no certificate at all, or one from a division superintendent, or even a general surgeon. It will impress the court favorably to know that a street car company has been sufficiently observant of the welfare of the public to compel such examinations, and a company may often be placed in a position, after it gets into trouble, where it would be glad to pay a large sum if it only had had the precaution to have on file certificates of eye and ear health. But then it will be too late. It is like insurance; it must be taken out before fire or death.

Companies will spend fortunes to guard against trouble, and for litigation, but will neglect to surely ascertain if the man who drives a car, loaded with human freight, can see properly, hear properly, and distinguish signals properly, which could be done at very small expense.

Some ultra-practical men say that defects of the eye and ear become quickly self-apparent, and that employes thus defective will be dropped by the company or voluntarily resign through a personal sense of inability to properly perform their duties. The great army of defectives in railroad service detected under proper examinations by eye and ear surgeons, who have previously passed examinations by superintendents and even general surgeons, is an answer to this supposition. The mere fact that defective men have been able by tact and ingenuity to progress to high positions of trust is no argument against the necessity of high grade eyes and ears in such employes. The optimistic supposition that men will themselves resign, through self-consciousness of defects, while beautiful to contemplate, is found absolutely untenable in practice. I have examined many hundred railroad men. I have never found a man willing to admit a defect, or, after such a defect has been unmistakably demonstrated, willing to give up his job, even though he must see that he retains it at great risk to himself, his company and the lives and property of the public.

Improperly conducted eye and ear examinations are not only worthless, but injurious, because they engender a sense of unjustifiable security, as while many defects may and doubtless are developed under even a poor system, they cannot be depended upon for accuracy.

In the examinations made last year of the employes of the Twin City Rapid Transit Company, I found many men who from various ocular defects were absolutely unfit to have the care of cars, who were subsequently given other employment without engendering any hard feeling.

I therefore wish to emphasize what I have previously said, that companies operating surface and elevated street cars should have the eyes and ears of those employes actively engaged in operating such cars properly examined by eye and ear surgeons, as they are best able to perform such services. Such examinations will undoubtedly be of great benefit to the men themselves, the companies and the public. Respectfully yours,

Frank Allport, M. D.

---

John Kean has offered to pay \$100,000 to Union county, N. J., for a franchise to build and operate a trolley line on Westfield avenue, from Elizabeth to Plainfield, a distance of 12 miles. A 20-minute schedule is proposed and the line will be divided into three sections each with a 5-cent fare.

## GLASGOW DISTRICT SUBWAY.

Glasgow is a city widely noted as being the most progressive in Great Britain. One of its great problems has been to devise a suitable traction system leading into the congested centers of business. The streets are so crowded that the speed of trolley cars would necessarily be very slow, and in many places the streets are too narrow to permit the construction of an elevated road. Hence it was thought that only an underground line would be adequate for the conditions. A company was formed in 1887 and a bill introduced in Parliament; this was defeated because of objections to driving tunnels under the Clyde. Subsequently permits were granted to construct tunnels for pedestrians and vehicles, and, a precedent having been formed, the Subway Company was successful in 1889 with its petition to Parliament.

The line is tunneled throughout its length of  $6\frac{1}{2}$  miles and is roughly oval in shape. For the most part the tunnels are under the streets, as elsewhere a private right of way had to be purchased. The average depth to the top of the

FIG. 1.—EXAMPLE OF IRON TUNNELING.

tunnels is 29 ft., the greatest depth being 115 ft. and the least 7 ft. The tunnels are practically two endless cylindrical tubes, 11 ft. in diameter, being from 2 ft. 6 in. to 6 ft. apart and connected at intervals of 75 ft. by manholes, and at the stations the tunnels are merged into one arch of 28 ft. span. The grades are not excessive, none being over 5.5 per cent, and no curves have a radius of less than 600 ft. Many difficulties were met with in the tunneling, as it was necessary to pass through shale, sandstone, coal, clay, sand and mud. One portion of the tunnels passed under important buildings and railway shops, and to avoid all risk of a collapse the construction shown in Fig. 1 was adopted. Tunneling shields were used on this section. Each ring of the iron tube is 12 ft. in diameter and 18 in. in length. In passing under the river the air pressure in the tunnel blew up the bottom of the river no less than 10 times, but the work was completed after several months by carefully regulating the pressure in the tunnel to conform with the depth of water in the river. The tunnels are thoroughly drained by brick conduits underneath, and these are emptied by means of motor-pumps.

The act of Parliament permitted the adoption of any system other than steam, and David Home Morton visited

the principal street railways in England and America in search of suggestions for the best plans to operate the subway. The decision lay between the cable and electric traction. It was thought that electric motors would require heavier cars with a corresponding increase in the weight of the track. The numerous grades gave the cable system a great advantage, as the cars going down-hill assisted in pulling the cars on up-grades at different points on the line. The cars do not depend on adhesion for tractive power and were consequently made as light as was practical. It was unnecessary to have a conduit for the cable, and this made its installation comparatively cheap. The method of carrying the cable is shown in Fig. 1, it being about 2 in. above the top of the rails. The cable is  $1\frac{1}{2}$  in. in diameter and consists of six strands of 13 to 16 wires per strand, laid on a hemp core. Each cable is 36,300 ft. long, has 600 miles of steel wire in it and weighs 64 tons. About 1,700 track sheaves are used to carry each cable and are of three types. The vertical sheaves, for straight track, are spaced 30 ft. apart; the inclined sheaves, as in Fig. 1, are for curves of large radius, and the horizontal sheaves, for sharp curves and lateral pressure only, are used in connection with the inclined ones and spaced 8 ft. 9 in. apart. The sheaves are very substantially made, as they must revolve at high speed, the cable running 15 miles per hour. The tread is 16 in. in diameter; the spindles are driven tightly into place with the ends running on magnolia metal half-bearings, the upper half being in oil boxes which are carried on a cradle, fixed to a cast iron ballast box. The inclined sheaves are adjustable to any angle from  $30^\circ$  to  $60^\circ$ . At the stations where noise is objectionable, the sheaves are so constructed that the cable runs on leather or other non-metallic packing, but as a rule they are made of the best quality of cast steel.

The stations, 15 in number, are each situated at the summit of a slight elevation, the grade on either side being  $2\frac{1}{2}$  per cent. By this arrangement the stations are brought a little nearer the surface, the up-grade assists in stopping and the down-grade in accelerating the cars. Fig. 2 represents the interior of one of the stations; the arch is 28 ft. span and 150 ft. long and about 15 ft. above the level of the rails. The arrangement of the platform and the entrance is clearly shown. The street entrances to the stations are, as a rule, through buildings erected previous to the opening of the subway. The St. Enoch station, shown in Fig. 3, is a handsome structure situated in the center of the city near Buchanan street, the most fashionable thoroughfare in Glasgow. It is of the later German Renaissance type of architecture and is built of redstone.

The power station is a building of large proportions, the engine room occupying a space 138 ft. long and 100 ft. wide, and the boiler room being 132 ft. long and 88 ft. wide. The chimney is 180 ft. high and has an internal diameter of 8 ft. The weight of the stack is 1,244 tons. At the head there are 16 air ports so formed that the wind striking the chimney is diverted upwards, improving the draft. Over the coal storage room is erected a cast iron water tank, 73 ft. long, 34 ft. 8 in. high and 8 ft. 9 in. deep, capable of holding 125,000 gals. of water. This storage is to provide for any temporary stopping of the city water works and holds enough water for two or three days. There are two 1,500-h. p. engines of the horizontal single-cylinder, non-condensing type, with Corliss valves. One of these engines is illustrated in Fig. 4. The cylinders, which are

steam jacketed, are 42x72 in. and the speed is 55 r. p. m. To provide against racing two governors are in use, the larger acting on the valve-gear and the other on a throttle valve just above the main steam inlet valve. A vertical double-cylinder engine, 14x18 in., is between the two large engines to assist in starting them and also in running the cable backwards or forwards in case of repairs.

In the boiler room there are eight Lancashire boilers each 8 ft. in diameter and 30 ft. long, working under a pressure of 100 lbs. Mechanical stokers feed the coal from hoppers, into which it is distributed by means of an ele-

two lamps in front of red bull's eyes which are the tail-lights to the train. To distribute the current two conductor rails, of light T-section and bonded at the joints, are placed 6 in. apart on the inner side of the inner tunnel and on the outer side of the outer tunnel. Trolley wheels are attached to the sides of the cars and run horizontally on these conductors. Each car is fitted with these trolley wheels and when two or more cars are in a train they are coupled electrically. The track forms the third conductor in the circuit.

The passenger cars are especially designed for this line and have many unique features. The purpose was to get

2. IN COPLAND ROAD STATION.

3. ST. ENOCH STATION.

4. IN THE POWER STATION.

5. INTERIOR OF PASSENGER CAR.

vator and screw conveyors. Two large exhaust steam feed-water heaters deliver the water to the boilers at a temperature of 200° F. All the piping is in duplicate.

The car shed is a building 220 ft. long and 115 ft. wide and is built above the tunnels. The cars are run into the "car pit", an opening under the shed 28x55 ft., and are lifted a distance of 20 ft. by means of a 12-ton travelling crane. The car is then carried by the crane to any of the six lines of track for storage or repairs.

The subway, stations and buildings are all lighted by electricity. Four compound vertical engines of 129 h. p. each is direct connected to the dynamos. Two dynamos run at 540 volts and the other two at 270 volts. The current is distributed by the three-wire system and the circuit in the subway is tapped into by feeders at four different points. The interior of each car is illuminated by four incandescent lamps, the front vestibule by one 16-c. p. which also acts as a headlight, and the rear vestibule has

a car light, strong and with the greatest head-room and width inside. Fig. 2 and Fig. 5 show the proportions of the cars inside and out. The cars are double vestibuled and mounted on two trucks. The length over all is 40 ft. 9 in. and the greatest width 7 ft. 8 in. The head-room in the center of the car is 6 ft. 6 in. and the floor is 26 in. above the rails; the wheels, being 27 in. in diameter, extend slightly above the floor. There is seating capacity in each car for 48 persons.

The grip is secured to the front truck under the leading axle, and as it is desirable, on account of the small clearances of the track, that there should be no vertical movement, no springs are interposed between the truck and axle boxes. Smooth running is obtained by placing four sets of Timmis' patent steel springs between the truck and the car body. The jaws of the grip are fitted with renewable dies of rolled steel and are 2 ft. 4 in. and 2 ft. 9 in. respectively for the top and bottom jaws. Each car is

now fitted with a grip, but ultimately it is intended to have one trailer to each grip car.

Both hand and power brakes are used on the cars, the former being operated by a hand wheel in the front vestibule. The Westinghouse air-brake system is provided for emergencies with the engineer's valve in the front vestibule. The compressors are in the power station and store the air in a large reservoir at 100 lbs. pressure. Each car has small storage tanks under the seats with a capacity sufficient to make 40 stops. The whole line is operated on the absolute block system, being semi-automatic and quite simple. All the stations are connected with each other and with the power house by electric bells and telephone.

The subway was opened December 14, 1896, but the traffic proved too great for the accommodations and it was closed until January 21, 1897, when there were better facilities for handling large numbers of passengers. The regular fare is 4 cents, with special tickets at 2 cents for passage to the fourth station from the starting point.

The whole project is unique, and it is the only underground passenger cable railway in the world. And. Home Morton has written a history and description of the undertaking and published it in pamphlet form, from which we have taken the data and illustrations here given.

### THE ELECTRIC LINE IN DUBLIN.

The Dublin United Tramways Company has recently equipped its Clontarf line, three miles in length, for electric traction. The track extends from the city limits, along the sea coast of Dublin Bay, to Dollymount, a fashionable resident suburb. The track has been relaid with 7-in. girder rails, the gage being 5 ft. 3 in. Span wire construction is used throughout, supported by iron poles spaced 120 ft. apart. The poles are 29 ft. 6 in. long, built up of 5, 6 and 7-in. steel tubes. The trolley wire is No. 0, B. & S., and divided in half-mile sections. The track is bonded with No. 0000, 30-in. Chicago bonds and cross bonded at short inter-

STATION AND CAR HOUSES.

vals. There are two feeders, and at each connection with the six sections there is a magnetic blowout lightning arrester.

The power station is located at the Dollymount end of the line, with the repair shops and the car barns. These build-

ings, which were formerly used for stables and barns for the horse cars, are 140x166 ft., shown in Fig. 1. Fig. 2 represents a view in the engine and dynamo room, showing three units, consisting of McIntosh & Seymour, tandem compound engines directly coupled to Thomson-Houston six-pole, 150-k. w., 500-volt generators. The engine cylinders are 11½ and 23x17 in., and the speed is 200 r. p. m. The generators are the regular General Electric type, capable of carrying a temporary overload of 50 per cent.

The switchboard, also shown in the illustration, has a panel for each generator with the usual equipment of circuit breakers, quick-break switches, etc. A Thomson wattmeter

INTERIOR OF POWER HOUSE.

records the total output of the station. The current for both the arc and incandescent lamps about the building is supplied from a four-pole, 10-k. w. Thomson-Houston generator, direct connected to a vertical high-speed engine.

Steam is furnished from three water tubular boilers of American make. A Green economiser, consisting of 160 tubes, has been installed, and the main flue from the boilers is branched so that the gases either pass through the economiser or can be turned directly into the chimney. The stack is of brick, with an internal diameter of 7 ft. and a height of 112 ft. The water supply comes through two direct acting horizontal steam pumps with a capacity of 22,000 gals. per hour. A cast iron water tank, holding 10,000 gals., and a storage tank of 38,000 gals. capacity outside the station, provide a reserve water supply during any accident to the water mains of the township. All the steam and feed-water piping is in duplicate.

At present there are in service 15 motor cars, each being double-decked and capable of carrying 54 passengers. The bodies are mounted on Peckham cantilever trucks with 33-in. wheels. The trucks are fitted with wheel guards and adjustable fenders. The controllers are the Thomson-Houston K2 series-parallel type. The motors are the G. E. 800, two to each car.

The whole installation has been designed with the view of extensions and new electric lines. It is the intention in the near future to build a line to Howth, a sea-side resort six miles from Dollymount. From the boilers to the motors, the equipment and installation has closely followed American practice, and it can be predicted with certainty that the system will be successful in operation and be a model for future electric railways in Ireland.

## PRESIDENT POLK ON PUBLIC UTILITIES.

Jefferson S. Polk, president of the Des Moines (Ia.) City Railway, recently addressed the Des Moines Union Municipal League on the question of "Municipal Ownership." In the introduction Mr. Polk said:

"It gave me much pleasure some weeks ago to note the organization of this club for the non-partisan discussion of economic questions, among which is that of municipal ownership. You have been favored with several arguments in its favor by distinguished fellow townsmen, members of the three learned professions—the law, the clergy and the college professor.

"I am here this afternoon at your invitation, for which I thank you, to present as best I may the other side.

"Before entering into this discussion, permit me to say I am not here in the interest of local politics or of either of the candidates for the mayoralty, as on the question of municipal ownership I am opposed to both; nor am I here in the interest of the street railway company, in which I am personally interested, because I feel that municipal ownership would be a godsend to the stockholders, who have as yet received not one cent of dividend or one cent of profit therefrom. I am here, however, in the interest of good government and of a people overburdened with taxes and special assessments. What I shall say will be a plea of a citizen in behalf of a city we all love, whose progress has been checked and its every interest blighted by bad politics and by unjust and ruinous taxation."

The subject was discussed at length and we have space for only a brief abstract. It was pointed out that to acquire what are called the "public utilities," a city must either purchase existing plants or build new ones, in either case, only by incurring a vast debt, to be met by taxation. And while the burden of taxation is upon all having property, the advantages claimed in the way of reduced prices (which, in the light of experience in similar ventures, are thought to be mythical) can be at the service of only those who can afford the luxuries, and these constitute a limited portion of even property holders. The benefits from municipal ownership can accrue to but two classes, the office-holder and the rich.

All "public utilities" require skilled management. It is no disparagement to our city officers to say that they are not now and never will be competent for the successful management of these utilities, and disaster and ruin will follow, not from dishonesty, but from ignorance. Men are clothed with municipal office who have no knowledge or training for the duties they are expected to perform. As evidence of the deplorable condition of city governments quotations were made from speeches at recent conventions of good government clubs. Since the past has demonstrated that we cannot have civil service regulations that are effective, the only remedy left for the people from the crying abuses and wrongs in the administration of a municipality, is to strip the municipality of all powers and functions not strictly governmental, and prevent it from entering the domain of private business and speculation.

Municipalities have not found the operation of "public utilities" profitable. The recent action of Philadelphia in leasing the gas works to a private company and the history of numerous municipal electric light plants were cited in support of the proposition.

In conclusion the results of the municipalization of street

railways in Europe were considered and the difference in conditions here and abroad noted, and the effect on the distribution of population of the development of the street railways along American lines pointed out.

## PHYSICAL AND CHEMICAL PROPERTIES OF VOLATILE OILS IN BOILERS.

An address before the Northwestern Electrical Association by W. H. Edgar.

It is my purpose to speak on the subject of the use of volatile oils, hydrocarbons, kerosene, and oils of that nature, in the steam boiler. I do not believe there are any cases in this country where we get petroleum or other oils in our feed-water supply, but the general laws of nature are such that our waters are heavily impregnated with lime and magnesia, which are the main ingredients, the scale-forming salts, which form an incrustation in the steam boiler, which incrustation is a poor conductor of heat as compared with iron, so that we are forced to look around for something to counteract the evil effects of this incrustation and to get rid of it if possible. This has led us to put most everything into our steam boilers, and among the different reagents employed have been volatile oils. I know that they have pumped turpentine and resinous oils into boilers up in the lumber districts; because they found in districts where they were sawing hemlock and oak that the sap and washings from them have apparently kept the boilers clean; so they thought that if they put a little of the product they were working on into their boilers it would have the same effect, it all being vegetable. These volatile oils, including turpentine and oils of that nature, are all hydrocarbons, and when they have been put into steam boilers have caused a corrosion or general eating and deleterious effects upon the boilers from their use. In the oil fields, years ago, they put in what they called an oil brick, made from petroleum, and that was not successful; in the last few years they have been in the habit of pumping into the steam boilers kerosene, etc. I know of one man in Chicago who is at the head of some six or eight large plants belonging to one of the largest corporations we have in the city of Chicago, who put naphtha or gasoline into his boilers for years, and would persist in saying that it did the work to perfection; but he had to stop using it, due to the leaks, etc.

There are two ways of looking at this subject of incrustation and its proper antidotal reagents. A boiler is very much like the human system. We are liable to injure it, and we are liable to put something into it where the after effects are worse than the disease; so we must take up both sides of the question. Now, I want to bring out a few points about volatile oils and kerosene. Kerosene is a light distillate hydrocarbon, and has been used very extensively throughout the country, or tried here and there, and dropped for one or another reason; and I will offer these suggestions and take up these points without any personal motive whatever, for I have none; but I will just simply take up the evil effects of kerosene and petroleum and their different distillates.

Kerosene pumped into the steam boiler with the object of converting the incrustation into such form that we can readily wash it out, or prevent its formation, I shall consider in the first place. Kerosene is a hydrocarbon. If we had a carbohydrate, an animal oil, we would get an

oleate radical and could possibly get the oleate of lime or oleate of magnesia, which, however, would not help us out; but we could get a chemical reaction from carbohydrate, having a combining acid radical there; but in the hydrocarbons we have no possible acid radical; we have not the base; we have not the combination that will take the place of either base or an acid radical, and we get no chemical reaction whatever, and the action of the kerosene is purely mechanical, following the laws of capillary attraction. If I dip a blotter into water, the water will run up the side and penetrate the blotter; if the blotter is set over a tumbler of water the water will penetrate through the substance of the blotter; and if you play a hose on a brick wall the moisture will penetrate to the other side. Now, kerosene, being a light volatile oil, will penetrate everything of a porous nature, such as lime, magnesia, etc., and will penetrate to a greater extent and more rapidly than water. The scale incrustation in the boiler will be softened, will be penetrated by this kerosene, due to the laws of capillary attraction; the scale being porous, the kerosene will work through to the iron, and when it comes in contact with hot metal the oil will run back of the sheet of the scale, between the scale incrustation and the iron, and when you shut your boilers, draw your fires and let out your water, your boiler contracts, the iron contracting and expanding with the application of the heat. Now, you have put a substance of different physical properties, of a different nature, between your lime and magnesia incrustation and your iron sheet or plate. The lime and magnesia, little particles of them, will attach themselves to the sheet, due to the general affinity that they have for hot metal; they cling very tenaciously to the iron, and when this substance comes in between, you have lessened that adhesive property, and the incrustation is not adhering as tenaciously, and, consequently, being a non-conductor and not expanding and contracting uniformly with the iron, it is more readily scaled off, and you get a great quantity of this broken scale from the continued use of a volatile oil such as kerosene. The kerosene does not change the chemical composition of the scale; its action is purely mechanical.

There are other points to be considered. Kerosene volatilizes in the steam boiler; you get probably a third over with your steam; it passes off immediately and begins to come over from about 150 degrees to 300 degrees Fahrenheit. The kerosene that passes over constitutes hydrocarbon distillate, and your steam is hydrogen and oxygen, and you know the evil effects from condensation in a steam plant; you know that every year you have in your heating system to put in a few more nipples or an elbow here and there. When you put in a light volatile oil of a hydrocarbon nature, you intensify that action, you get a series of oxidizing hydrocarbon reagents that will intensify that general pitting and grooving 100 per cent; that is, you will get the general eating through of the joints and connections probably twice as quick as you would otherwise. Besides that, the kerosene carries over into your cylinders. It is a part of the cylinder oil in the first place; the cylinder oils all come from petroleum, except the animal oils. The kerosene is a solvent for them. It dilutes your cylinder oil; it has a tendency to change its lubricating properties just that much, and with the hydrogen and oxygen of the water and the compound formed in the distillate you will get blackening of your piston rods and deleterious general oxidizing

effect on your rings, and if you have a metallic packing you will have hard work keeping your packing in your engine. From these same distillates, these same products formed in your distillation, you will have the pitting and the general eating through of all the threads of your joints and connections through your entire steam system. Not only that, but the part that is left in the steam boiler and the part that goes through your scale and reaches the iron cannot stand that high heat. It is carbonized; it is all decomposed, and in the carbonizing of the hydrocarbon oil in the presence of iron or against the iron sheet, you are going to carbonize your iron, and you will have there a blistered-appearing spot where the iron has been carbonized; it will be of a blackish, blistered appearance, and you will get that action all through the water-submerged part of your boiler. You will never get all your scale out with kerosene; you will never get more than a third, and those who are using kerosene and claim that it is working well simply look at the scale that they take out and do not look in the boiler to see what is left. In my travels I have had some of my best friends tell me that they have used kerosene and their boilers are clean, their system is in good shape; and I have gone down to their plants, and looked around, and in the steam system, from the boilers to the engine, I have seen the little leaks; and when this leakage does start in and a flange gives out and you have to put a new one in, in taking that apart you jar the whole system and bring to sight more leaks where your piping is half-eaten through and almost ready to leak. Of course an old plant will show up leaks in a few months or a year, but a brand-new plant will disclose leaks in time, if you continually use kerosene.

Now, why do people want to use kerosene? It is generally the man up at the office end of the institution that clings to the practice; it is generally the superintendent or the manager that advocates kerosene, because, he thinks, it costs nothing; he is getting something for nothing. That is where so many men have made a mistake, even in the running of large enterprises and large businesses. One of the greatest dangers is to look for something for nothing. You cannot get something for nothing and you cannot get any man to run his business without profit. This is true of boiler compounds. In the use of them the modern steam-plant owner is far behind all other branches of science. If you will, in using kerosene or using any volatile oil of that nature whatever, take the subject up and look into it for yourselves, you will find that the deleterious effects, the general carbonizing and pitting, the general eating away of that thin, natural skin of the iron (the finish, as it comes from the boilermaker) is a dangerous thing. It takes several years to scale a boiler to start with, on a fairly good water, but if it is scaled once it will scale again in three months, because the skin of the iron is gone. When the skin of the iron is once gone the scaling ingredients readily attach themselves to the rougher iron; while in the new boiler they cannot adhere as rapidly as they can in the boiler where the skin is gone.

In the course of the discussion of the subject which ensued Mr. Edgar explained the action of pure water on the boiler and the effect of vegetable compounds in preventing scale.

The corrosive action of pure water on iron is purely an oxidation with the aid of hydrogen. There is a pitting and

grooving of the iron, and many of these pits have a scab or the appearance of a scab. If you tap that off you will find underneath a little raw sore, you might say, a hole eating through the skin of the iron, a pit hole, and in that hole you will find a red powder, which is the ferric hydrate. By boiling this it is converted into the oxides, finally going into black magnetic oxide of iron, and is found in the bottom of the boiler. Water is the greatest solvent known to chemistry. We have no artificial liquid or anything produced by nature that is as great a solvent; it must take up something to keep it satisfied.

We often pump water into a heater and get pitting in the heater and not in the boiler, which is due to lack of circulation, and the freeing of the air and oxygen held in the water, and it is almost a direct oxidation in that case; but we get a more rapid oxidation in the presence of pure water. It is in an unsatisfied condition, and the iron is taken up as a hydrate, and from that to an oxide. When the water of condensation is used again, if something could be introduced into the condensing system where the condensation begins to take place to satisfy it, the corrosive action might be stopped, but there is no way known of doing this.

Of vegetable compounds we use sugars and tannins only, and in this way: We find that we can take care of the carbonates of lime and magnesia with tannin extracts, and do not want the extracted tannic acid. The object is to convert the carbonates of lime and magnesia into tannates, and pure tannic acid is too stable in itself to be readily converted into tannates. We cannot work on gypsum, the sulphate of lime, with tannin. Gypsum is one of the four insoluble sulphates, and is so stable in itself that it is not even soluble in its own acid.

Sugar introduced into the steam boiler with the water will convert the sulphates into saccharates. The saccharates break up into oxalates, tartarates and carbonates; and in the presence of tannin extracts part of that goes into tannate of lime; so that we need but a small proportion of sugar present in the general mixture to handle a water containing both the sulphates and the carbonates. The proportions of the sulphates and carbonates in the water are to be determined by analysis.

The boiler compound should be introduced into the system as early as possible. The tannins in the extracted form and blended with the sugar give no tannic acid reaction, and no action on the metals. Using a vegetable mixture of this kind will keep the gaskets pliable. It is always well to mix a little slippery elm and pokeroor or powdered willow hardwood pulp, so as to get a little soluble wood starch and keep the sugars from being too stable and the tannins likewise, and thus get readily convertible tannates and saccharates.

A surface blow-off contrivance is very good, but the trouble with such things is that they are expected to do all the work, and sufficient interest and care is not usually taken in their application by the engineer. The boiler is too often neglected, and it cannot get up and speak its little piece like the engine, when anything is wrong.

Do not forget to treat the boiler regularly. Put in whatever you use regularly. Have the water analyzed, and go to the wholesale druggist and he can mix up the tannins and sugars in proper proportions; but do not use any soda. Some sulphate waters require considerable starch, slippery elm, etc.; they sometimes use 5 or 6 per cent of carbonate of soda, boiling it; that goes to kill the gelatine properties, and

then when you introduce your tannin extract the soda produces tannates of soda, 5 per cent tannate of soda, 20 per cent of sugar and 50 per cent of tannins. The steam users in the country should look into this thing and should study their boilers.

The greatest point in regard to compounds is the care given to the boiler.

### THE DOUGLAS FENDER.

We have received from General Manager Vining the accompanying drawings of the fender with which the cars of the Market Street Railway Company, of San Francisco, are now being equipped, and which is one of three approved by the Board of Supervisors. The fender was designed by G. W. Douglas, foreman of the company's car repair shop, who has applied for patents on it.

The fender is carried in front of the truck and the basket or scoop consists of curved steel rods 5-16 in. in diameter,

THE DOUGLAS FENDER.

It is ordinarily carried so that the front edge is a few inches above the level of the rail and is dropped either by the motorman pressing the foot-trip or by the front guard striking the object to be picked up. The front edge of the scoop is provided with rubber ferrules.

The borough council of Shamokin, Pa., has made some exacting demands on the street railway company regarding the paving of streets and the board of directors of the company decided to abandon the road rather than comply with the demand.

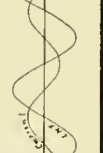

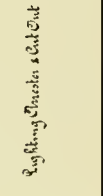

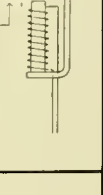

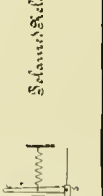

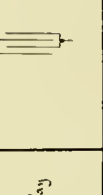

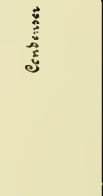

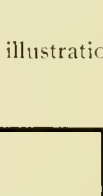

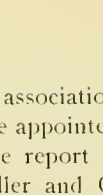

The stock of the Westport (Conn.) & Saugatuck Street Railway Company is being purchased at the rate of \$10 per share by New York capitalists, who, when the road is under their control, will make some important improvements and extend the line to Norwalk and Danbury.

## STANDARD CONVENTIONAL ELECTRICAL DIAGRAMS.

In January, 1897, D. W. C. Tanner read a paper before the Chicago Electrical Association on the subject of "Conventional Diagrams of Electrical Apparatus," and forcibly

presented the need for a standard system. The association took the matter up and the report of a committee appointed at that time has recently been published. The report is signed by Thomas G. Grier, Kemster B. Miller and C. Wiler.

The committee believes that the diagrammatic illustration

<p>NOTE: UNDER EACH OF THESE DIAGRAMS INSERT THE LETTER Q IN THE CIRCULAR SYMBOL, THE LETTER M IN THE RECTANGULAR SYMBOL &amp; THE LETTER W IN THE LETTER W</p>	<p>Dynamo or Motor</p> 	<p>Alternator Generator or Motor</p> 	<p>Series Wound Dynamo or Motor</p> 	<p>Shunt Wound Dynamo or Motor</p> 	<p>Compound Wound Dynamo or Motor</p> 	<p>Six Phase Dynamo or Motor (Star Connection)</p> 	<p>Six Phase Dynamo or Motor (Triangle Connection)</p> 	<p>Diodes Generator</p> 	<p>Battery</p> 	<p>Storage Cell</p> 	<p>Magneto Generator</p> 	<p>Compound Dynamo Magneto</p> 	<p>Shunt Electric Generator</p> 	<p>Current and Self-Excited (Alternating)</p> 	<p>Resistor</p> 	<p>Variable Resistance</p> 	<p>Single Pole Circuit Breaker</p> 	<p>Double Pole Circuit Breaker</p> 	<p>Lighting Circuit and Cut Out</p> 	<p>Relay</p> 	<p>Differential Relay</p> 	<p>Solenoid Relay</p> 	<p>Resistor</p>

of electrical apparatus should be reduced to an art, and points out that there should be a uniform system or code in which each piece of apparatus should have its own diagram, clear and simple and at the same time suggestive of the thing it represents. The improvement made in recent years in this line is largely due to the efforts of the electrical divisions of the Patent Office and to a number of patent attorneys. No attempt at originality was made in selecting the diagrams recommended, the aim being to adopt the best, whether in common use or not. In commenting on the diagrams, the committee says in part:

The representation of a dynamo or motor by a circle with two tangent lines showing the commutator and two brushes has long been in common use. This form of diagram may be used for any direct current machine in drawings where the form of the winding of the machine is either well understood or is not essential in the system to be represented. Similarly, the figure below it may be considered the generic alternator. Where it is necessary to show particularly the kind of a machine, the field coils may be added, as shown in the next three figures, which are so simple that they can not be misunderstood by one accustomed to read electrical diagrams. The diagram of the tri-phase dynamos or motors are shown by the characteristic windings of their armatures only. Where there is room for a doubt as to whether one of these diagrams represents a motor or a dynamo a letter M or G, as the case may be, will clearly distinguish them.

The diagram representing the motor-generator will, perhaps, be subject to adverse criticism. In its adoption, good perspective is undoubtedly sacrificed for ease in drawing, but who can say that the diagram is not suggestive of what it is intended to represent?

The differentiation of the diagrams for the primary battery and for the storage battery from each other and from the ordinary diagram for a condenser, has been the subject of a good deal of thought. The primary battery diagram is the one in ordinary use. The storage battery diagram differs from it by having the plates connected in multiple, as in practice, and by the drawing of a square around it. This diagram will hardly be taken as representing a condenser, for the reason that the lines representing the plates of the battery are made thicker than those connecting the plates to the battery terminals.

The reason for not representing the ordinary hand magneto-generator and the constantly driven generator by the same diagram, is that a need actually exists for a distinction between them. This is especially so in diagrams of telephone exchange systems where it is often difficult to distinguish between the hand generators at the subscribers' stations and the power generators at the central office.

In the matter of single and double-circuit breakers, many forms of diagrams were considered, each of which would probably have their advantages in certain places. This brings out well the fact that these diagrams must be taken merely as a guide, and not as a rigid code which must be absolutely followed. For instance, if it were essential that the circuit breaker should have an operating coil in each of the line wires, then it must be left to the designer or illustrator to make his own diagram for illustrating the particular case in hand.

On the simple telephone diagrams, but little comment is needed. It would be well if all would adopt the form of transmitter shown, from the fact that its construction is so extremely simple.

The listening and ringing key for telephone switchboards is a simple representation of one of these pieces of apparatus in common use. The remarks made concerning the cut-outs will apply with equal force to these.

Two diagrams for polarized bells have been shown. The one on the right hand side is preferable where its meaning can not be mistaken. The almost universal adoption of this form of diagram has led this committee to show it here, although unless one is familiar with polarized bells in telephone work it must be said that it is not at all suggestive. In cases where it is thought best to be extremely explicit, or where the immediate context of the diagram does not suggest the use of a polarized bell, the diagram on the left is to be preferred.

The diagram for a polarized relay is, it is believed, given here for the first time. By changing the plus and minus signs from one side of the armature to the other, it may be indicated that the relay will close on a minus current and open on a plus current, or vice versa. This is a feature which will be found at times very convenient.

The distinction between the ordinary resistance and inductive resistance is both simple and suggestive, the presence of the core inside of the coil conveying to the mind the presence of a certain amount of self induction.

The use of two parallel zigzag lines for induction coils or transformers, lends itself readily to the distinction between the primary and secondary, between the step up and step down transformers, and, moreover, its construction is of such a simple nature, that it was chosen without hesitation by this committee from among dozens of other good diagrams for representing the same apparatus.

In the telegraph sounder the magnet coil has been represented in outline. In this connection it may be said that where it is not essential to know the nature of the winding or the direction of the convolutions, this same form of magnet might be adopted in any of the relays or annunciators used elsewhere in these diagrams.

The difficulty in selecting a symbol for "a ground which might be universally accepted" is apparent. This custom of some artists of placing palm trees and grass, or the drawing of miniature landscapes surrounding their ground wire may add somewhat to the artistic effect, but certainly nothing to the clearness or merit of their work.

In conclusion it may be said that it is believed that where any particular piece of apparatus is to be presented for which no specific diagram is here found, it will be an easy matter for the person desiring such diagram to make it from the elements here shown.

---

### IMPROVEMENTS IN MEADVILLE, PA.

---

The new power station for the Meadville Traction Company is near completion, and the electrical machinery is being installed. Work will soon begin on the Edinboro line and at the Ponce de Leon Springs Park. It is the intention of the company to make this a very attractive summer resort. The buildings will include a dancing pavilion, a dining-room, passenger station, band stand and numerous rustic structures.

---

The British Columbia Electric Railway Company for the period from April 15 to September 30, 1897, reports a surplus of receipts over working and office expenses of \$11,500.

### SUNDAY CARS IN NOVA SCOTIA.

In December, 1897, an attempt was made to prevent the Halifax Electric Tramway Company, Halifax, Nova Scotia, from running cars on Sunday. A citizen filed a complaint before a magistrate alleging that the Tramway Company, by directing one of its motormen to operate a car on Sunday was "guilty of performing servile labor on Sunday," which had been made an offense by the provincial legislature. The company appealed to the supreme court of the province for an order prohibiting the local magistrate from proceeding to adjudicate upon the complaint.

The supreme court decided in favor of the company on technical grounds. The amendment making a person or corporation guilty of "performing servile labor on Sunday," when he or it caused or directed any of his or its servants or employes so to do, was held to be an amendment of the criminal laws. By the British North America act the criminal law of Canada was placed within the exclusive legislative authority of the Dominion parliament, and hence the attempted amendment by the Nova Scotia legislature was held invalid, and the prohibitive order was granted.

In the opinion of the court it was pointed out that the province might perhaps secure the same end by proper legislation under the head of "property and civil rights," but that in this case it had attempted to do so under the head of "crimes," and was therefore without authority.

### FUNERAL CAR FOR THE STORAGE BATTERY ROAD.

The Chicago Electric Traction Company has received a handsome special car which will be used chiefly for funerals, but its design and decorations are such as to make it adaptable for any purpose where a special car is desired. It is finished in solid mahogany, with handsome carpet and draperies, the latter being so arranged that the car may be divided into compartments if so desired. The seats are fine

FUNERAL CAR IN CHICAGO.

antique copper wire chairs with polished mahogany bottoms and can be arranged for any occasion as they are not fastened to the floor. The vestibules are built with a large door directly in front of the car door, so that when used for funerals the casket can be readily taken in and withdrawn. As may be noted from the illustration showing the interior it has the appearance of an elegant parlor car. An effort has been made to prevent its having a particularly funeral-like aspect. The car is known as the "Virginia," and is of

attractive external design. The car is equipped with two 50-h. p. Walker motors, and will run, with one charging of its batteries, a distance of 25 miles.

There are four cemeteries along the lines of the company,

VIEW OF INTERIOR.

three of them, Mt. Greenwood, Mt. Olivet and Mt. Hope, being on the Morgan Park branch. Arrangements have been made with the managers of the various railways connecting with the Chicago Electric Traction Company to permit this car to run over their lines, which gives a direct route to the cemeteries from any point in the southern part of the city. As the car is operated from its own batteries it is immaterial whether the route be over the trolley or cable tracks.

### PROPOSED ELECTRIC LINES IN CANADA.

A. J. Corriveau, well known to the street railway world, and especially to those who attended the convention at Montreal in 1895, by reason of his connection with the Montreal Park & Island Railway Company, recently made an important speech at a banquet of the Canadian press, in which he foreshadowed the early construction of a network of electric lines between Montreal, St. John's and the Townships, and stated that a number of the lines would be commenced the coming season.

Mr. Corriveau is also interested in a project to build a 14-ft. canal, connecting the St. Lawrence river and Lake Champlain; application has been made to the Dominion parliament for an act incorporating the Montreal & Lake Champlain Canal Company.

In spite of the bad weather, the running of Brooklyn Rapid Transit cars over the Brooklyn bridge has resulted in an increase in gross earnings of about \$1,400 daily.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Forfeiture of Franchise for Failure to Operate Street Railway.*

Entire failure to operate a street railway for three years when the ordinance under which the franchise was exercised required cars to run sixteen hours every day in the year constitutes a non-user which forfeits the franchise.

A contract that non-user of street railway tracks for any specified time shall not operate as a forfeiture of the franchise cannot be made by a city, either by ordinance or otherwise, since this would involve an authority to grant the right of the use of streets for private purposes.

The opinion of the Court is in part as follows:

The question then arises, was the non-user of the franchises by defendant company under the circumstances disclosed by the record sufficient to justify the court in declaring their forfeiture? In considering this question it may be said that the insolvency of the corporation is of no importance except in so far as it may have a bearing upon the question of abandonment of its franchises by defendant, for, if defendant continued to discharge its duties to the public, it makes no difference whether it was solvent or not. Were it otherwise, very many corporations might be ousted of their franchises at any time to the great detriment of the members thereof, as well also as the general public for whose benefit public corporations and franchises are presumed to be granted. The sale, however, by the defendant company of all its rolling stock, and its failure to operate its road for a long time, and then not in accordance with the terms of the ordinance, tended very strongly to show an abandonment by defendant of its franchises. But whether there was an abandonment by defendant of its franchises or not, the evidence clearly shows that the ordinances granting the railroad company the franchises were never complied with. Electric cars were run for about three months, and then steam cars, which it had no right to run, except upon the eastern extension of the road. It ran steam cars for about eighteen months, and for three years next preceding the trial it did not operate its road at all, while under the ordinances, its cars were to be regularly run not less than sixteen hours per day during every day in the year. In the case of *Roanoke Investment Co. v. Kansas City & S. E. R. Co.*, 108 Mo., 50, it is said: "But while it is true that mere non-user will not amount to an abandonment, it is well settled that an easement acquired by grant, or its equivalent, may be lost by abandonment. To constitute an abandonment of an easement acquired by grant, acts must be shown of such an unequivocal nature as to indicate a clear intention to abandon. *Curran v. Louisville*, 83 Ky., 628; *Dyer v. Sanford*, 9 Met., 395, 43 Am. Dec., 399; *Hayford v. Spokesfield*, 100 Mass., 491. It is said, however, that abandonment will be more readily inferred when the easement was granted for public purposes than when it was created for private use." In *1 Beach on Private Corporations* (Sec. 45), it is said: "It is conceded that a corporation may forfeit its charter or franchises for willful mis-user or non-user thereof. For it is a tacit condition annexed to the creation of every corporation, that it shall be subject to dissolution by forfeiture of its franchise for willful mis-user or non-user in regard to matters which go to the essence

of the contract between it and the state." On the same subject *Morawetz on Private Corporations* says (Sec. 1018): "It has accordingly been held in various cases, that, if a corporation has assumed the performance of duties for the benefit of the public generally, it cannot neglect the performance of these duties without incurring a forfeiture of its franchises. Thus it is the duty of a corporation chartered to build a turnpike road to maintain its road in repair as a thoroughfare for the public use. . . . The same rule undoubtedly applies to other corporations of a similar character, such as ferry and bridge companies, canal companies, gas companies, etc." The generally accepted doctrine is that the omission of an express duty imposed by the charter of a corporation is cause for its forfeiture, and in such circumstances the sovereign who granted the charter may insist on resuming the grant for breach of the duty imposed. *Com. v. Commercial Bank*, 29 Pa., 389; *Atty. Gen. v. Petersburg & R. R. Co.*, 6 Ired. L., 456; *Erie & N. E. R. Co. v. Casey*, 26 Pa., 287. And where there has been a willful mis-user or non-user by a corporation, it is subject to dissolution by forfeiture of its franchises. *Mumma v. Potomac Co.*, 33 U. S., 8 Pet., 281, 8 L. ed., 945; *Terrett v. Taylor*, 13 U. S., 9 Cranch, 51, 3 L. ed., 653; 38 L. R. A. *Chicago L. Ins. Co. v. Needles*, 113 U. S., 574, 28 L. ed., 1084; *People v. Broadway R. Co.*, 126 N. Y., 29. "The rule in regard to acts of mis-user and non-user is that they must relate to matters of the essence of the contract between the sovereign and the corporations, and we see no reason why that rule should not be applied in the present case. Where duties are imposed upon a corporation from motives of public policy, a total neglect of the duty justifies a judgment of forfeiture." *State Atty. Gen. v. Wood*, 13 Mo. App., 139; *Harris v. Mississippi Valley & S. I. R. Co.*, 51 Miss., 602. One of the duties imposed upon defendant by ordinance, which it accepted, and in which the public had an interest, was to run its cars sixteen hours every day in the year, with which there was no compliance on its part, but a total neglect of its duty; hence non-user. It was held in *State, Whitecotton v. Hannibal & R. C. Gravel Road Co.*, 37 Mo. App., 496, that quo warranto would lie where a corporation is charged with mis-user or non-user of its franchises.

But it is insisted by defendant that relator is estopped to maintain this action upon the grounds: First, that by its military force it prevented the company, and still prevents it, from completing its contract, and entering on the enjoyment of its grant; second, that the city, by its common council, passed an ordinance repealing, or attempting so to do, the grant made to defendant; third, that relator compelled the defendant to tear up its turntable, and by reason thereof necessitated and required the defendant to change its equipment, and to dispose of the equipment purchased by it, and then in use; fourth, that relator, by litigation instituted before defendant ceased to operate the road, rendered impossible the operation of the road on the part of defendant, and is, by reason thereof, estopped from taking advantage of its own wrong. With respect to the first proposition, *W. J. Smith*, president of defendant company, testified, that,

even if the city had allowed the company to lay a track from Main to Walnut streets, it would not have done the company any good until it got some right of way from the Metropolitan from Walnut to Grand avenue, which it never succeeded in doing. It seems that Fifth street between Walnut and Grand avenue, upon which there were at the time two parallel tracks owned by the Metropolitan Street Railway Company, is only 30 ft. between the curbs, and that there was no room for another track; hence, unless the defendant company could in some way have acquired the right to use the Metropolitan tracks, that part of the route from Main to Walnut, even had it been constructed, would have availed nothing; therefore no justification or excuse for not operating the road. Nor do we see how the fact that the city may have passed an ordinance repealing, or attempting to so do, the grant made to defendant could have afforded it any excuse for non-compliance with the ordinances. It is well settled that estoppel in pais must be pleaded, and, as the answer contains no allegation to the effect that the city compelled defendant to tear up its turntable, that question cannot be considered by this court. The records of the suits mentioned in the fourth proposition are not copied into the bill of exceptions, so that it is impossible to tell anything about the issues involved in them, or what possible effect they may have had upon defendant's failure to operate the road. The only litigation mentioned in the answer seems to have been by the city, and the evidence shows that it resulted in favor of defendant. But even the record in this suit is not in the bill of exceptions.

A further contention is that the record shows that the relator waived all the causes of forfeiture complained of. This contention is based upon Sec. 17 of the ordinance supra, which in case of forfeiture by defendant of its franchises for failure to comply with the provisions of said section, provides that such forfeiture may be had by proceedings instituted by said city in its own name in a court of record in Jackson county, Missouri, and that if any proceedings be not commenced within six months after such forfeiture has accrued, the city shall be deemed to waive the effect of such forfeiture. The streets of Kansas City are for the use of the general public, and its officers had no right to contract with defendant by ordinance or otherwise that non-user of its tracks by the corporation for the period of six months, or any other length of time, should not operate as a forfeiture of its franchises. To do so would be to recognize the authority of the city to grant the right of the use of its streets for private purposes, which it clearly has no right to do. To lay railroad tracks in the streets of the city, and then not use them, would not be a public use; and it is only in that sense that a city has a right to grant the use of its streets to any person or corporation for the purpose of operating cars thereon. To grant the use of its streets for a private use would be a misappropriation of the streets, and without authority on the part of the city. If the city had a right to provide by ordinance against the forfeiture of the franchises of defendant on account of the non-user of its tracks for a period of six months, it had the same right to provide against its forfeiture for an indefinite period, and thereby convert the use which was and could only be public to a private use. *State, St. Louis Underground Service Co. v. Murphy*, 134 Mo., 548, 34 L. R. A., 360. In the case of *Washington & R. Turnp. Road v. State*, 19 Md., 239, it was

said: "The consequences of the argument that an inability to keep the road in good order, owing to want of means, relieves the company from the duties imposed upon it by its charter, would be that the state would be obliged to permit the existence of roads impassible, and even dangerous. Such, it may safely be asserted, is without support from authority. In fact, the conclusion would seem to be inevitable, that is (as is conceded) the state can authorize the construction of a railroad anywhere within her jurisdiction, such authority is absolute, and can impose upon her no restriction, no loss of any other of her sovereign rights and powers, and cannot operate to close the doors of her own courts against her, when she wishes to inquire into the delinquencies of a corporation created by her, and responsible to her.

(Supreme Court of Missouri, *State of Mo. vs. East Fifth Street Railroad Company*, 38 Lawyers' Reports Annoted, 218.)

*Crossing of Trolley and Steam Railway Tracks—Injury by Trolley Wire to Person on Freight Train.*

The court concludes its opinion as follows:

There must be a duty by defendant in error to deceased before it can be said it was negligent in stringing its wire as it did. *Elliott v. Railroads*, Secs. 466, 472, and 1251; *Cooley on Torts*, 659-60. The latter author says: "The first requisite in establishing negligence, is to show the existence of a duty which it is supposed has not been performed."

The wire in question was strung rightfully, as it must be presumed in the absence of proof to the contrary, at the place of the accident. It was at a sufficient height to permit ordinary freight cars to pass under it with the brakeman standing on them, and so as to leave a space of four feet or more between it and the top of a barrel car. Deceased was five feet nine or ten inches in height, and the wire struck him on the breast. Defendant in error provided a safe passage for the barrel car with two men sitting upon it. That is all it should have done. The law does not require that it should anticipate every possible circumstance, or state of facts liable to occur, which would make it dangerous to string its wire at the height it did, only that it should be so placed that it was reasonably safe for the passage of persons who had the right to pass under it, not for persons who, for their own convenience or pleasure saw fit to pass under it by other than the usual and ordinary methods of travel or business. There were forty-nine other cars in the particular train on which deceased might safely have stood and passed the wire, or sitting on the barrel car he could safely have passed it.

In *Ry. Co. v. Walter*, 147 Ill., 64, in regard to the brakeman sitting on a high car of a train which passed under a bridge, causing his death while in the discharge of his duty, the Supreme Court approved an instruction to the effect that the law did not require the railroad company to build its bridges of such height that its brakemen can stand on the cars and pass under them in safety, and said that the only question was whether the bridge was of sufficient height that brakemen could discharge their duties with reasonable safety.

Certainly it is plain this wire was high enough to allow deceased to pass safely under it had he been sitting. This

was all the duty it could be said defendant in error owed to the deceased, if, in fact, it owed him any duty at all. He stood upon the barrel car for his convenience or pleasure—not because of the call of duty, or in the exercise of his right to be there, and no obligation rested on defendant in error to protect him from injury on the high car.

(Appellate Court of Illinois, *Gross v. South Chicago Railway Co.*, 30 Chicago Legal News, 186.)

*Responsibility of Master for Act of Servant Contrary to Orders—Horse Frightened by Street Sprinkler Operated by Electricity—Duty of Those in Charge of Cars.*

If a servant is acting in the execution of the orders of his master, and by his negligence causes injury to a third party, the master will be responsible, although the act of the servant was not necessary for the proper performance of his duty to his master, or was even contrary to the orders of his master.

Anyone who undertakes to propel a street railway car in a condition in which a reasonably prudent man would apprehend that it would frighten horses is bound to employ reasonable means to prevent injury to persons riding or driving along the street.

Where black coats were hanging on a projection at the side of a street water sprinkler operated by electricity, by, along, and on the tracks of an electric street railway, and the coats, by waving to and fro in the wind, or by operation of the car sprinkler along the tracks, frightened a well-broken horse of gentle disposition, and caused injury to the plaintiff, who was thrown from his carriage, the question whether the employes of the defendant, the street railway company, were in the exercise of reasonable care to prevent injury in operating such street car sprinkler, and the consequent liability of the company for the injuries to the plaintiff, is a question which the trial court must submit to the jury for their determination, even though it be that the coats belonged to such employes, and were by them hung upon the projection of the car, the car being in such a condition as to cause fright to the horse, and consequent injury to the plaintiff became a question for the jury to determine whether the defendant company was negligent in the performance of its duty to exercise reasonable care, by its servants, in the use of the public street, by operating the car while in this condition.

Quaere: Can the operation of a street railway car, painted a conspicuously bright and attractive color, along a public street, causing fright to a horse, with injury resulting therefrom, constitute negligence on the part of the street railway company, and render it answerable for injuries resulting from such cause?

(New Jersey Court of Errors and Appeals, *McCam v. Consolidated Traction Co.*, 38 Lawyers' Reports Annotated, 236.)

For more than a year there has been a bitter fight between the New York & Philadelphia Traction Company and the Brunswick Traction Company over franchises and rights of way in Bound Brook and other New Jersey towns. After a conference between the officials of the roads it was decided to withdraw their suits from the courts and make an amicable settlement. It was further agreed that the companies may each use the other's lines, and that the next extension will be from Bound Brook to Dumellen.

CLEVELAND, MEDINA & SOUTHERN.

The Cleveland, Medina & Southern Electric Railway Company, which was incorporated in October, 1897, to build an interurban line from Cleveland to Cincinnati, has already done considerable work and expects soon to let contracts for the power house equipment, and the rolling stock, and also for more grading and line work. Contracts for the grading and overhead work as far as Wooster, 52 miles, have been let, the ties purchased, and the company advises us that it expects to have this road as far as Chippewa Lake, 32 miles, in operation by June 15. When this is completed the construction on the section from Wooster to Columbus, via Mt. Vernon, will be commenced.

Cleveland is already the center from which five electric interurbans radiate, and the one under construction makes the sixth. This last road does not, like some of the other electric lines, parallel any railroads, the projected route as far as Columbus being at all points from 2½ to 15 miles from either steam or electric roads.

Between Cleveland and Wooster the road passes through the towns of Linndale, Albion, Strongsville, Brunswick, Me-

dina, Chippewa Lake, Leroy, Creston and Madisonburg. As seen from the map the road will be a much shorter route to Cleveland from these towns than any now available. Thus from Creston it will be 42 miles, while the western business of the Erie Railroad in order to reach Cleveland must be carried as far east as Leavittsburg, making a haul of 112 miles. The Pittsburg, Ft. Wayne & Chicago Railroad, which touches this line at Wooster, now transfers its through cars for Cleveland to the Cleveland & Pittsburg at Alliance, O., making the distance, 97 miles, as against 52. Similarly the Baltimore & Ohio reaches Wooster and runs north to Lodi, thence east to Akron, where a transfer is made, making 96 miles to Cleveland.

Chippewa Lake is one of the most popular points for pleasure excursions in northern Ohio, and the company intends to provide every facility for handling the excursion traffic.

The rails to be used weigh 65 lbs. and are laid on oak ties spaced 2 ft. between centers. In the line work 30-ft. cedar poles with 7-in. tops are used.

The company is capitalized for \$750,000, and the officers are: President, F. C. Goodman; vice-president, F. C. McMillan; secretary, A. R. Gibson; treasurer, J. W. Roof.

### A HOT TIME ON THE WIRES.

The illustration, which we reproduce from the Journal of Electricity, shows the remains of the two gray eagles that last fall caused a short interruption in the service of the 10,000-volt transmission line of the San Joaquin Electric Company, of Fresno, Cal. The two eagles evidently alighted on different legs of the three phase circuit, and coming in contact, formed a short circuit which not only incinerated the

WHAT THE LINEMEN FOUND,

eagles, but also burned off the wires. Where the broken wire touched the ground the soil, which is granitic sand, was fused into glass, and in one place a piece of quartz was found fused and run in with the glass. This piece is shown in the illustration.

### A FEW LESSONS FROM STEAM ROADS.

Street railways are daily finding it to their advantage to copy many of the systematic methods in use on steam roads. In view of the consideration that is now being given by many managers to the matter of keeping a continuous record of the power consumption of each motorman for the purpose of stopping waste of power, it will not be out of place to investigate the methods used on steam roads for carrying out the corresponding idea of keeping a record of the coal consumption of each engineer.

When coal records were first proposed there was naturally some fear among steam road men lest the clerical labor required would counterbalance any saving that might be made. There were also those who maintained that even if such coal records were kept, the various engineers would be indifferent to their individual records and no benefit would result. The fallacy of all these objections is best shown by the fact that today practically every steam railroad of any size has adopted the plan of keeping comparative coal records for each engine crew, which fact makes it unnecessary to add that the scheme is a money saver. Experience proves that the engineers will strive for a good record and that a great waste has been stopped by the keeping of such records.

It will not be necessary to go into the details of how the coal records are kept, as street railway managers will be interested simply in methods of instruction and discipline in use.

On the Chicago Great Western Railway, which has a very complete system, the engineers are compared on the basis of coal per ton-mile. Engineers that are in the same class of service on the same division only, are compared. It is determined by careful trials what is the lowest coal consumption per ton-mile that can be expected under favorable conditions. At the end of each month records are posted for each class of engineers showing how each one's performance compares with the standard figure. If any man's record is better than standard it is considered a high distinction, and the men take great interest in the records. On another large road an average has been established for each month of the year with which the engineers' records are compared. Usually each engineer receives a letter every month. If his record is good he is commended for it. If poor his attention is called to the fact and he is asked if he cannot improve it. If his record continues very bad an instructor makes a few runs with him to try and suggest how he can improve his methods. After some time it is found that all the different men's records are very close together. If a man complains that his low record is the fault of his engine, he is the next month given an engine run by a man making a good record. It has been found that even the most economical men improve very much, while in the case of those making the poorest records at first the improvement is enormous. Occasionally an engineer is found who has such deep-rooted wasteful habits that he is dismissed. On some roads a man's standing and promotion depend largely on his coal consumption record, taken together with his other qualifications. In view of the facts demonstrated by experience it is idle to maintain that properly kept comparative records have no effect on the behavior of the majority of men. That there are a few indifferent is to be expected, but they are not the kind that a railroad wishes to keep.

Fair comparisons of performance and credit for good work are the surest means to success in handling railway employes and insuring economy in all departments.

### A LIABILITY COMPANY SUED.

An interesting suit has been commenced by the City Electric Railway Company, of Port Huron, Mich., against the Guarantors' Liability Indemnity Company. A passenger was injured in the collision of an electric car with a locomotive and a judgment of \$1,000 was rendered. The railway company, which had paid an annual premium of \$1,500, sent in a bill to the indemnity company but payment was refused. As a consequence a suit in the circuit court was commenced.

It is reported that the Brooklyn Rapid Transit Company contemplates building a subway under Park Row, Center street and City Hall Park, from the Brooklyn bridge to Broadway and Warren street. The construction presents no engineering difficulties, and would greatly facilitate the handling of the bridge traffic.

Since commencing the work of changing its cable lines for underground electric working, the Capital Traction Company, of Washington, D. C., has decided to change the 7th street line also, which includes about three miles of double track.

### ELECTRIC CARS FOR HAULING ORE.

Shortly after the opening of the freight line of the Butte (Mont.) Consolidated Railway Company, in the fall of 1896, we illustrated the motor cars, of which there were two in operation at that time, employed in hauling ore from the mine to the smelter, a distance of three miles. Since then the operation of the ore road has been continued with constant additions to the equipment, as the service was found efficient and economical. Our illustration, for which we are indebted to the general manager of the company, J. R. Wharton, shows a train of eight of these on Montana street in Butte. The train is at the bottom of an 11 per cent grade, the front cars being on the commencement of a 9 per cent grade. Each car is loaded with 11 tons of ore. On February 1 these cars hauled 164,484 tons of ore.

The bodies of these cars were built by the Ramapo Iron Company and the trucks by the Peckham Truck Company.

The names of the exhibitors assure the success of the undertaking. It appears from them that there will be a good demonstration of electric power uses. Gas and oil engines as prime movers will compete with the steam engine for the smaller installations.

In electric railway work, some most interesting exhibits will be displayed, including several ingenious methods of perfecting the underground trolley and third rail system. There will be an operative exhibit consisting of a section of the under-running electric road with yokes, tracks, etc., blocked up above the floor of the Exhibition Hall, showing the method of picking up the current in this system. This will be a complete reproduction of a section of the system as in use on Madison avenue, New York, with one of the new cars in actual operation, and will be shown in addition to their general display by the John Stephenson Company, Peckham Motor Truck & Wheel Company, Walker Company, Gold Car Heating Company, Sterling Supply & Man-

TRAIN OF ORE CARS, MONTANA STREET, BUTTE.

### THE ELECTRICAL EXHIBITION.

In previous issues we have noted the plans of the Electrical Exhibition Company, which is conducting the "Second Electrical and Kindred Industries Exhibition," which will be held at Madison Square Garden, New York, next May. Those having the matter in hand have displayed great energy and the result of their efforts is to be seen in the wide-spread interest taken in the exhibit by manufacturers in the electrical and kindred fields. The management has published the preliminary list of exhibitors, which includes over 100 of the leading firms and companies in these lines, with allotments of space aggregating nearly 30,000 sq. ft. This is particularly gratifying since at the corresponding period before the first exhibit, in 1896, less than one-fifth as many exhibitors had signified their intention of taking space. It certainly behooves those others who desire to secure any of the space which yet remains to make their applications at an early date.

ufacturing Company, Providence Fender Company, and other companies who furnish supplies and material in connection with this class of work.

To convince export merchants of their opportunities in the electrical line, will be one of the benefits of this exhibition, and not its smallest. The markets north and south of this country are not yet as fully ours as they should be by any means; and while we are selling such apparatus in such large quantities to England, France and Germany, those countries are still getting orders that should be ours, all the way from Florida to Patagonia, to say nothing of the far east. Consumers visiting this country to give contracts for apparatus dislike greatly having to travel long distances to see some of it, and at this show they will find in profusion the objects they seek and want to buy.

The educational features of the exhibition were placed in charge of an auxiliary committee consisting of able men. Its plans are being carefully developed with a view to informing and interesting the public; the announcements of this committee are expected at an early date.

### T. J. NICHOLL'S WORK AT ROCHESTER.

The annual report of the Rochester Railway Company shows a remarkable improvement in the condition of the road as compared with previous years, especially in view of the adverse conditions which have been encountered, and the improvements which have been made in the system.

The result of the year's labor shows a surplus of \$5,623, against a deficit of \$43,652 in 1896, and this with a decrease of \$56,258 in the receipts, caused by unusual weather conditions, the great number of bicycles, and on account of many of the main thoroughfares having been torn up for repairs. The operating expenses for the year were \$491,420, against \$591,650 in 1896, a saving of \$100,230, or over 17 per cent. The percentage of receipts required for operation was reduced from 69.82 to 62.11 per cent, notwithstanding the large decrease in receipts. Had the earnings of the road been as good as in the previous year, there would have been a surplus of \$61,881, or an improvement of \$105,534.

The above economies have not been effected to the detriment of any branch of the system; on the contrary there

T. J. NICHOLL.

have been more necessary improvements made than ever before, more miles of streets have been paved or repaved, and more track relaid. The equipment has been put in better condition, the power house has also been greatly improved, and the service in general is much better than at any previous time.

The above remarkable showing has been effected through the ability and untiring energy of the present vice-president and general manager, T. J. Nicholl, who took charge of the company's affairs about a year ago. Since that time its stock has more than doubled in value, and its steadily advancing as the improvements become more apparent each month. The outlook for the present year is very encouraging, for while expenses are being maintained at the same or

a lower figure than last year, the receipts are greater than for the corresponding period.

Mr. Nicholl was born in England, but came to America when quite young. He commenced his railroad career with the engineering department of several western railroads, and afterwards successively became chief engineer of the Gilman, Clinton & Springfield Railway (now the Springfield Division of the Illinois Central); superintendent of the Dakota Central Division of the Chicago & Northwestern Railway, operating 600 miles of road, which was built under his supervision; vice-president and general manager of East & West Railway of Alabama; president and general manager of the Natchez, Jackson & Columbus Railway; general superintendent of the Louisville, New Orleans & Texas Railway; general manager of the Chattanooga Company Limited, and president of the Chattanooga Terminal Railway Company; and at the last convention of the New York State Street Railway Association, Mr. Nicholl was elected vice-president.

### THE CARE OF BOILERS.

A recent number of "Engineering," London, contains a leader on the care of steam boilers, in which attention is drawn to the fact that too often the men in charge of a steam plant, either through ignorance or a belief that boilers are unworthy their consideration, pay no attention to the boilers. Two instances are cited from reports of the Board of Trade inquiries into boiler explosions in the following language: "The delightful simplicity of the engine tender who, in a certain Yorkshire town, advised his master on no account to have his boiler insured, because every time the insurance company inspected it they would be sure to want some alterations made, and who recommended in place of periodical inspection by a qualified man, that the boiler should be charged from time to time with pigeon-dung to prevent corrosion, is only surpassed by the culpability of a certain owner who worked a boiler for over 20 years without ever having it examined by a competent person. These are only two cases taken at random out of a host of others which all point to a lamentable lack of ordinary common sense with regard to the management of boilers."

The writer discusses the great enemies of steam boilers, corrosion and incrustation, and a few of their causes; among these are oil and grease in the boilers, electrolysis, the solvent action of pure water, the presence of oxygen and carbonic acid gas in the water. In connection with incrustation the "boiler compound man" and his remedies as well as others are thus mentioned:

"Some are good, some useless, some actually harmful, and nearly all expensive out of all proportion to the good they do. Many of these nostrums are indeed traps for the unwary and lucrative sources of income to those who sell them. The best remedies for corrosion are generally the simplest and least expensive; but after all there can be no hard-and-fast rule laid down as to what should and what should not be used, as so much depends on the water, the kind of boiler, the conditions of work, and many other things. Perhaps two of the simplest remedies ever used as a safeguard against incrustation are petroleum and common soda; but even these must be used with care, and in the proper proportions, else the evils that they cure may be less than those they bring about, and it all comes back to what we said before, that steam users should have some competent man to

advise them, be he the engineer to a boiler inspection company or any one else capable of giving sound advice on the subject."

This statement regarding the use of petroleum and soda made editorially by "Engineering" is in direct conflict with the recommendations of W.H. Edgar in his discussion of the effect of introducing volatile oils in boilers which will be found on another page. Mr. Edgar maintains, and gives excellent reasons for his position, that kerosene only injures the plant; his advice as to soda is, "but do not use any soda."

### ALUMINUM CONDUCTORS.

In a paper, by A. E. Hunt, president of the Pittsburg Reduction Works, on "Aluminum as a Rival of Copper and Brass for Electrical Conductors," some interesting figures and comparisons are given. It is evidently the intention of the manufacturers of the metal that it shall become a rival of copper, for a special rate of 29 cents per lb. has been made for aluminum in wire, rods, bars and plates to be used for electric conductors. Furthermore experiments are now being made to determine just what alloy will furnish the maximum tensile strength, together with the greatest electrical conductivity. From results obtained it may be predicted that an alloy of aluminum can be made with a tensile strength of 165,000 lbs. per sq. in., with an electric conductivity of more than 50 per cent of pure copper.

Copper is 3,332 times heavier than aluminum, and has a tensile strength of from 16,000 lbs. per sq. in. for pure soft annealed copper to 65,000 lbs. when in hard drawn bars compared with 26,000 lbs. for pure aluminum drawn into soft wire or 40,000 lbs. in hard drawn wire. The substitution of an aluminum for a copper conductor means an increase in the cross section of 60 per cent, but a decrease in weight to 48 per cent. This increase in size will entail an extra expense for insulation of about one-third, but this remains to be accurately determined from some installations to be made later.

For aerial lines it has been determined that the snow and ice load is practically as heavy on lengths of small wire as upon large sections, so that no objection can be urged on this score to the use of the larger sections of aluminum wire. On account of having only 48 per cent of the weight and 60 per cent more strength the aluminum conductors could be used in longer spans between supports, reducing the number of poles and insulators. Properly drawn aluminum wire is as tough and will stand as severe bending without breaking as soft copper wire. The toughness of aluminum wire is, however, greatly modified by the care and skill in manufacture.

The power of withstanding corrosion is greatly in favor of aluminum. Copper does not change in dry air, but in the presence of moisture it becomes covered with a layer of basic carbonate of copper which has a corroding action, and does not coat and protect the underlying copper. Ammonia in contact with copper absorbs oxygen and the copper dissolves in consequence of the formation of a soluble cupric oxide. Aluminum is not acted upon in dry air, and in moist air an oxide of aluminum is formed, which prevents corrosion beneath the surface. Ammonia solutions act upon aluminum only upon the surface, leaving a brown coating containing silicon which resists corrosion from dilute mineral and organic acids.

The difficulty of soldering or brazing aluminum is the

chief drawback to its use as an electrical conductor. It can be soldered but it is a more difficult and slower operation than with copper and the joints deteriorate more rapidly, due to the galvanic action between the aluminum and the metals of the solder. Several forms of metallic joints have been successfully used to avoid the necessity of soldering.

The Journal of the Association of Engineering Societies for January contains "Some Notes on Aluminum," a paper read before the Detroit Engineering Society by Jesse M. Smith. In discussing this paper H. G. Field made the following remarks:

"I have just returned from a meeting of the American Street Railway Association at Niagara Falls. While there, I learned from Mr. Candee, one of the leading manufacturers of insulated wires, that he has under advisement at the present time the possible use of aluminum to replace copper as an electrical conductor.

"There are numerous objections to be overcome, both as to structural considerations and as to the cost of insulating and handling. The electrical conductivity of aluminum, in equal lengths and the same weights, is approximately twice that of copper; but, for the same cross-section, the specific resistance of aluminum is nearly double that of copper. The additional diameter of aluminum over that of copper for the same conductivity, will increase the cost of insulation for the same conductivity. The larger diameter also means more surface for the leakage of current, and the insulation resistance will be less, unless the thickness of the insulation is increased. An increased thickness of insulation means increased electrostatic capacity as well as greater cost. Moreover, it is found that if aluminum wires, of ordinary size, such as are used for electrical conductors, are bent once through an angle of 90° and back, they will break, whereas ordinary commercial copper conductors will stand from 15 to 20 of these same bendings before breaking.

"These are all objectionable features, and it would therefore seem doubtful whether aluminum conductors will prove merchantable. If such conductors are to be made commercially valuable it seems that the method of protection must necessarily be reduced to that of a mechanical covering, such as a braid or a series of braids treated with a bituminous composition to make it weatherproof, and also to assist in mechanical strength. This, however, will limit the use of aluminum for electrical conductors to special applications and prevent it from coming into general competition with copper.

"As particularly applicable to aluminum in the conduction of electrical currents I observed, at the Niagara Falls Power Company's work, 500 conductors about 000 B. & S. gage, used for carrying the current from the bus bars in the dynamo room up through the penstock shaft into the factory above, a distance of something over 200 feet. These conductors were not insulated, except by a coating of paint over each one. Each set, of 250 each, is run in a separate wooden trough up through this shaft. This is the only insulation provided. These conductors are riveted to copper bus bars at the terminals. The dynamos connected to these bus bars have a normal capacity of 4,000 to 6,000 h. p.

"I would state also that the Westinghouse Electric & Manufacturing Company is now using fuses of aluminum for switchboard work. These fuses are long and made of thin metal with reduced sections at the center. These are found to be accurate in rating, mechanically serviceable, and in many respects superior to the common soft metal fuses."

## THE USE OF SALT.

The question of whether street railways shall be permitted to use salt is again before us. The Binghamton (N. Y.) Railroad Company has for some years made use of salt to remove snow and ice and without opposition, until this winter when a number of horse owners became impressed with the idea that the salt was injurious to the horses' hoofs, and insisted upon the chief of police enforcing an old and almost forgotten ordinance against the use of salt. The management of the company realized that the question would no doubt be raised elsewhere and decided to test the validity of the ordinance, so that other roads in the state might have the benefit when confronted with the problem of keeping their lines open without salt.

J. P. E. Clark, the general manager, waited upon the chief of police, and stated that he had no desire to embarrass him in the discharge of his duty, but that the company regarded the use of salt as necessary to the operation of its road. The police were notified when the track was to be salted and were on hand to interfere. The company was fined \$100 before the city recorder, and appealed the case to the county courts where the validity of the ordinance will be contested on the ground that the council has no power to pass an ordinance imposing a fine for performing a necessary duty, that is, that the ordinance is in conflict with the rights conferred by the franchise of the company. Since the state law prohibiting street railways from salting their tracks was repealed in 1885 this contention appears to be correct.

Bills have been introduced in both houses of the legislature expressly authorizing the street railway companies to use salt, and the matter may be thus settled without waiting for the interpretation of the law as it is.

In an open letter to a local paper Mr. Clark says in part:

From the standpoint of practical operation, I state unreservedly that in case of snow storm either slight or severe, without the right to use salt upon curves, switches or cross-overs, it would be, in the first instance, very difficult and, in the second instance, entirely impracticable to operate electric cars without causing a tie-up of the system more or less general, thereby inconveniencing the public, especially the working people who are dependent upon the street cars for reaching their respective labors. We are handling at the present time a daily average of 10,000 persons, who would be affected by such delay or tie-up, and who, I believe, are entitled to consideration in determining the question.

For instance, we are transporting every morning between the hours of six and seven nearly 400 employes of the Lestershire Manufacturing Company, who reside in Binghamton. It goes without saying that they expect regular service (which we endeavor to afford them) regardless of the weather, and if regular service is not forthcoming they would have to make other arrangements. I consider the accommodation of the public the paramount question, although the financial loss of thousands of dollars in a particularly trying season of the year is a matter of considerable moment to ourselves at least. We consider ourselves an important local business and wage paying institution and believe we are entitled to some consideration in the matter.

The introduction of electrical traction and its rapid development of the past few years, has found municipalities, and even the state, unprepared with laws and ordinances necessary to regulate the every day operation, therefore, emergencies as they arise have to be met with good judgment until laws can be modified or new laws enacted whereby successful electric street railway operation can be carried on. In the days of horse cars in this city, with only one division to operate, it made no material difference whether or not there was an inch or two of snow and ice on the rail; but with the operation of electric cars the surface of the rail must be exposed before proper traction

and a complete circuit can be effected and the numerous switches and curves with their spring appliances, necessary to properly radiate the respective divisions of the system, must be kept entirely free from snow and ice and the only means whereby this can be accomplished is by the use of salt thereon. Therefore I consider the use of salt for the removal of snow and ice a very important question, confronting both municipalities and street railroads throughout the state where local ordinances do not exist granting the necessary right to use same in reasonable quantities.

Court street, the principal business thoroughfare of the city, seems to be the local bone of contention. The curves, intersections and cross-overs are numerous between Exchange and Oak streets and the salt is distributed thereon and the snow gathered up by the street department from the cross walks and thrown into the street is carried by the various vehicles between the points mentioned above, thereby injuring the sleighing and depriving this business thoroughfare to a certain extent of its utility as a boulevard. However, it seems to me as a citizen, irrespective of my business relations, that a rapid developing city the size of Binghamton, can well afford to give up a small portion of its principal business streets to business pursuits and confine the pleasure riding to the miles of thoroughfare where street railroad tracks and other evils (some of which, however, are quite necessary to the development of a city) do not exist.

It seems to be resolving itself into a question of whether adequate street railroad service shall be provided the thousands solely dependent thereon, or whether the principal business streets shall be preserved for the benefit of the horsemen. However, we do not wish to appear arbitrary or oppose existing laws and think this a question which with mature consideration and deliberation will right itself. In the meantime we shall strive to do the very best we can under the existing circumstances and afford the public as little inconvenience and delay as possible.

The reasons that have been urged why the use of salt should not be permitted are that it causes deterioration of the pavement, that it induces a lower temperature and injuriously affects the public health, that it injures the hoofs of horses and that the salt water is thrown on carriages and other vehicles and is more or less destructive to the varnish. In Washington, also, the Metropolitan Railroad has made complaint that the salt water has caused great damage by getting into the underground conduit and destroying the insulation, 54 cars having been disabled in three days from this cause during the winter of 1896-7. This objection is of course confined to Washington and New York city.

Of the other objections mentioned only the first has the merit of novelty. In the winter of 1894-5 a controversy over the use of salt arose between the street railway company and the city authorities of Newport, Ky., the latter claiming that the salt injured the brick paving. The injurious effect is, of course, not due to the salt itself but to hydrochloric acid which may be liberated by the reactions between the salt in solution and the various substances with which it may come in contact in the street. The extent to which such reactions take place must in general be rather limited. The authorities on brick agree in saying that while hydrochloric acid may cause rapid disintegration of soft brick it can have no effect on hard-burned or vitrified brick, such as are used for paving.

In Washington, where there is a great deal of asphalt paving, the use of salt has been prohibited for years past; it was always applied to the tracks when necessary, however, and the objection, so far as we know, was never made that there was serious injury to the pavement. In any event it would appear that since in the majority of cases the railway company has to keep the portion of the street occupied by it in repair, the company alone has ground to complain that the salt injures the paving.

The subject of the effect of salt on the public health and on horses' hoofs and on carriages was the subject of a report by a committee of the American Association in 1884. A great many medical opinions were taken and all agreed that the use of salt could have none but a beneficial effect on the public health. The discussion brought out the fact that on one of the largest street railways in the country, the horses were frequently kept with their feet in a bath of salt water for from three to six hours per day, the object being to remove soreness and cause the hoofs to grow. The beneficial results to be obtained from such treatment were corroborated by others who took part in the discussion.

The only valid objection which remained was the effect of brine on coach varnish. This is certainly not a serious one, for the carriages that would be injured are under no necessity of following the car tracks, where, only, the salt water is to be found.

The conclusions reached by this committee were that the use of salt was an imperative necessity in winter, and that any objections to it could easily be obviated. The evidence collected by the committee was published in a special report issued December, 1884, and was of great value to street railway companies in securing the repeal of obnoxious local legislation on the salt question. In New York the Penal Code, which made the use of salt by street railway companies a misdemeanor, was amended for the purpose of permitting its use.

At the present time it is more important that the rails be kept clean than it was in the days, nearly 15 years ago, when the use of salt was discussed by the American Association. It is necessary that the wheels of the car make contact with the rails for electric traction, and on curves and at special work where the resistance to traction is increased this is particularly important.

At the Montreal convention of the American Association a committee consisting of D. G. Hamilton, president, and Robert McCulloch, general manager, of the National Railway Company, St. Louis, presented a report upon the necessity of using salt and sand on street railway tracks, and regarding salt the report said: "The use of salt on the rails at certain times and during certain conditions of weather is absolutely necessary in order to clear the rails of a film of ice that will otherwise form on them. Without the use of salt it would be very unsafe to operate cars on a hilly system during winter and the committee is of the opinion that no road can afford to dispense with its use. Salt has been used on street railways throughout the United States constantly while horse cars were in vogue, and now more than ever before is its use imperative in the operation of electric cars."

**INJUNCTION AGAINST CHICAGO CITY DISSOLVED.**

Last summer the General Electric Railway Company secured an injunction to prevent the Chicago City Railway Company from interfering with the former company in completing its road, and from prosecuting any suit against it. The appellate court has just reversed the lower court; the opinion in part says: "The bill fails to allege any facts from which it can be told how any of the alleged acts or doings of the defendant or its agents and attorneys have injured, embarrassed, or delayed the complainant in the con-

struction of its lines of railway, nor in what way they have depreciated, or, to use the language of the bill, 'greatly tended to depreciate the value of the rights, privileges, and advantages secured to complainant,' nor in what manner complainant's credit has been or will be injured by any of said alleged acts or doings of the defendant."

**A PROSPEROUS RELIEF ASSOCIATION.**

The annual report of the Third Avenue Railroad Employes' Relief Association, of New York, was made February 25. The following officers were unanimously re-elected: President, John H. Robertson; vice-president, Isaac Hough; treasurer, John Beaver; secretary, Chas. C. Swertfager, and sergeant-at-arms, Sammel A. Jessup.

The treasurer's report for the fiscal year ending February 25 was as follows:

RECEIPTS.	
Cash on hand March 1, 1897.....	\$4,587.17
Dues, 65th street division.....	2,869.00
Dues, Harlem Division .....	2,704.00
Dues, 125th street & 10th avenue division... ..	1,379.00
Membership fees .....	583.00
	7,535.00
Assessments, 65th street division.....	38.50
Assessments, Harlem division.....	82.25
Assessments, 125th street division.....	20.00
	140.75
Received from two entertainments.....	2,091.75
Received from picnic.....	1,621.50
	3,713.25
Total .....	\$15,976.17
DISBURSEMENTS.	
Sick benefits .....	\$3,767.00
Death benefits .....	2,450.00
Talent, music, decorating hall, badges, printing, etc., for picnic, etc., entertainments .. ..	475.69
Dr. W. E. Woodend, salary as doctor.....	900.00
C. C. Swertfager, salary as secretary.....	461.00
General expenses .. ..	453.81
Stationery, printing, etc.....	115.25
Prizes for picnic.....	85.35
Rent of hall.....	50.00
	8,758.10
Cash on hand March 1, 1898.....	\$ 7,218.07

**CAR LINES CAN NOT BE BLOCKED IN ST. LOUIS.**

A sewer was laid out in St. Louis across one of the lines of the Union Depot Railroad Company. One night recently, after an owl car had passed, the contractor moved his excavating machine directly across the line blocking both tracks. Harry Scullin, general manager of the company, notified the street department of the city, which resulted in the contractor and several of his men being arrested. The machine was moved into a vacant lot and a temporary injunction was obtained restraining the contractor from interfering with the operation of the street cars. He was also cited to show why he should at any time block the car lines. When the right of the street railway company had been upheld an agreement was made with the contractor allowing him eight days to do the work, the passengers being transferred across the break. In this way the differences ended amicably.

## FREIGHT AND PASSENGER RATES ON INTERURBAN LINES.

In the development of the street railway business, as in nearly every other industry, certain principles become well defined by experience, but these are subject to change with new conditions. The street railway is an institution essentially for transporting passengers short distances, but of late years a new function has been added to it. After electricity placed the cities in close communion with the outlying districts and even contiguous towns, some far-sighted street railway managers saw a new and fruitful source of income in the carrying of packages, parcels and light freight on the cars. With frequent trips, cheap operation and low rates it seemed that a good business could be secured in competition with steam lines. Even in the cities the substitution of the electric car for the noisy drays and wagons might be effected with advantage to everyone. An inducement was offered by the Government for them to diverge from a strictly passenger service and carry the mail.

These possibilities were enlarged upon to such an extent that some interurban lines were planned with the freight and parcel business considered a large factor. The failure of the outcome of these hopes brought some of the interurbans into the hands of receivers and disappointment to many others. In the cities any concessions, for facilities in shipping or handling cars carrying freight, were vigorously opposed. In competition with steam lines, many difficulties were encountered. Connections with the steam roads were hard to make for competing lines were usually parts of, or feeders to large systems. In the cities it was found that the parcel service did not pay for the trouble and could not successfully compete with the more convenient wagon delivery at the door. Almost the same might be said of package and light freight between neighboring towns where the express companies were in the position to serve their patrons in a more convenient manner. Even the mail service fell below expectations and proved a loss in nearly all cases where separate cars were provided.

Through these ventures experience was gained and the freight service remained only under the fittest conditions. That first period of disappointment is past, although some of the effects still remain. Street railway managers can now base their calculations upon some data. This they are doing and instead of receding they are taking up the work in a judicious manner with prospects of success. The interurbans are stretching out and every town and city tapped increases many fold the possibilities of a successful freight business. In many places the express companies now recognize the advantage of the trolley car over the wagon and steam baggage car, and have made contracts with the railway companies. The Government is more liberal in its appropriations for the mail service and here the receipts are nearly all profit when the mail is in pouches carried in the vestibule of the car. Most of the franchises now sought contain some freight clause. In the near future it seems that as one town is joined with another by interurbans there will be a consolidation of interests and systems of considerable magnitude will be formed.

As a rule the people and public officials begin to recognize the value of the trolley freight service. In New Jersey such traffic is forbidden by law; in California the courts have laid arduous restrictions upon it, and in Massachusetts and some other states a special legislative act is necessary for trans-

porting freight. The opposition emanates generally from the railroads for under some conditions they fear freight rates will be lowered as have the passenger rates, always to the advantage of the electric lines. Many inquiries have reached us of late regarding rates and particularly in reference to the freight business. Although the REVIEW has investigated this subject before, progress has been so rapid it was thought well worth the while to get the expression of the latest views from street railway managers, and the following is the result:

The Los Angeles & Pasadena Electric Railway Company owns 44 miles of track between the two cities. Packages and freight are carried, there being one express car exclusively devoted to such service. The company furnishes the car and crew, but the business is controlled by the Pasadena Electric Express & Storage Company. For small packages 10 cents is the charge for each and the express and freight are handled in any quantities for 6 cents per 100 lbs. The passenger rates are as follows: 15 cents for a single trip; 25 cents round trip; 10 rides for \$1; 60-ride commutation book, good until used, \$6; same good for one month, \$5; 40-ride school ticket in Pasadena, \$3; same from Pasadena to Los Angeles, \$3.

The Elgin City, Carpentersville & Aurora Railway connects these three Illinois cities. The only freight business conducted is that of hauling freight cars from the Coleman station of the Illinois Central Railroad to the Illinois Southern Hospital for Insane, with switch tracks in Elgin and South Elgin. This work is done by an electric locomotive. There are four stations between Elgin and Geneva and two between Elgin and Carpentersville and the rates are 10 cents to Carpentersville and 25 cents to Geneva one way.

The Waterloo (Ia.) & Cedar Falls Rapid Transit Company has over nine miles of track with five stations. The regular passenger fare is 15 cents with commutation rate of 120 5-cent fares for \$5. The express charges are 20 cents for packages up to 100 lbs. and 6 cents for each 100 lbs. excess. The Milwaukee, Racine & Kenosha Electric Railway Company has 35 miles of track with 14 stations. The fare for the entire trip is 60 cents or \$1 for a round trip. The commutation tickets are sold for 20 per cent off regular rate. On the combination cars packages are carried for 10 to 25 cents with a weight limit of 200 lbs. The Manistee (Mich.), Filer City & East Lake Railway Company carries packages on its passenger cars; for an ordinary package, 5 cents; a trunk, 25 cents; beer keg, 10 cents, and other packages up to 100 lbs. are rated according to the size. In Brooklyn the National Express Company has an arrangement with the Brooklyn Heights Railroad Company whereby it runs its cars over the lines controlled by the railway company. The Nassau Electric Railroad Company, through the Brooklyn Heights, also grants to the express company the privilege of operating cars over certain of its lines, the compensation being on a mileage basis.

The Hamilton, Grimsby & Beamsville Electric Railway Company, with headquarters in Hamilton, Ont., owns over 23 miles of track and does a large freight business. The local freight and parcel express rates are based upon the mileage classified as the Canadian classification, the tariff being for six classes only. Class 1 includes tea; class 2, popcorn; class 3, canned goods; class 4, sugar in barrels; class 5, sugar in car loads, and all other goods are classed lower. The rates are given in cents per 100 lbs., being about 25 per cent lower than on the steam roads:

A. J. NELLES,  
Manager

Hamilton, April 1st, 1897

Distance.	Class						Small
	1	2	3	4	5	6	
10 miles and under	10	8	6	5	5	5	25 cents.
15 miles and under	12	10	8	6	5	5	25 cents.
20 miles and under	14	12	10	8	6	5	25 cents.
25 miles and under	16	14	12	10	8	6	35 cents.

The charges for through freight are arranged on a percentage division with the steam railroads and the steamboat company. The through express business is handled by the Dominion Express Company which pays the railway company so much per 100 lbs. carried. Milk is transported in cans and charged for according to the distance. Mail is also carried by contract with the government. Over 171,000 packages of fruit were shipped last year, the railroad freight and express cars being run over the lines and loaded at the orchards and vineyards. The fruit is shipped to the market without any further handling.

For local single fares none exceed 2 cents per mile and for return fares the rates have been arranged so as to require little change. The company sells three mileage books: 1,000 miles for \$10, and a 400-mile book for \$5, these two books being good for any member of a family living in one house, and a 500-mile book for \$5, good only for one person. The line is marked off in miles and one coupon is taken for every mile and fraction of a mile traveled, but at least five coupons are taken for each ride. There are also commutation tickets for school children, workingmen, berry pickers in season, etc.

The monthly school tickets are good for 44 rides with the following rates:

Under 5 miles	\$1.25 per month.
Under 8 miles	\$1.50 per month.
Under 10 miles	\$1.75 per month.
Under 15 miles	\$2.00 per month.
Under 20 miles	\$2.50 per month.
Under 25 miles	\$2.75 per month.

The workingmen's monthly tickets are good for 52 rides and are sold as follows:

Under 3 miles	3 cents per trip.
Under 5 miles	4 cents per trip.
Under 7 miles	5 cents per trip.
Under 8 miles	6 cents per trip.
Under 9 miles	7 cents per trip.
Under 11 miles	8 cents per trip.
Under 14 miles	9 cents per trip.
Under 15 miles	10 cents per trip.

The Twin City Construction Company leases and operates 6¼ miles of track of the Winston-Salem Railway & Electric Company. Commutation tickets are sold 6 for 25 cents in strips and 24 for a \$1.00 in books. For the freight service there are one motor and three trail cars. The rates depend on the length of the haul, weight and nature of the material, the average price for coal being 50 cents per ton to termini, cotton 20 cents per 1,000 lbs. One freight load constitutes 12,000 lbs. The form of report for freight hauling is as follows:

The Cleveland, Berea, Elyria & Oberlin Railway Company has a contract with the American Express Company and the only parcel or freight business is through that agency. There are 16 stations on the line which is 37 miles long. The rates are: Cleveland to Berea, 25 cents, round trip, 45 cents; Cleveland to Elyria, 45 cents, round trip, 85 cents; Cleveland to Oberlin, 60 cents, round trip, \$1.10. Commutation tickets are sold for individuals at a rate of 3 cents a station of 2½ miles, family tickets, 4 cents a station, and school tickets at half rate.

The Washington, Alexandria & Mt. Vernon Railway Company has one combination and three freight cars. Parcels are carried for 5 cents when weighing less than 10 lbs. 10 cents when less than 25 lbs., and 15 cents for 50 lbs. which is the limit. There are 30 stopping places on the route which is sixteen miles long. The passenger fares are from 5 to 35 cents one way and lower rates are given in the 25-trip commutation tickets for individuals, family and school children.

The Olean (N. Y.) Street Railway Company has recently posted this notice in reference to carrying packages on its cars:

"Articles when in charge of a passenger, who must pay regular fare for himself, will be charged for as follows: Bicycles 10 cents, trunks 25 cents, barrels under 100 lbs. 10 cents, barrels from 100 to 200 lbs. 20 cents, small kegs of beer 10 cents, large kegs of beer 15 cents, peddlers' packs 10 cents, wash baskets 5 cents. Articles not above enumerated, from 20 to 25 lbs. 10 cents, from 50 to 100 lbs. 15 cents. Articles occupying unusual space will be charged double rates."

The Akron & Cuyahoga Falls Rapid Transit Company has 23 miles of track with four stations with fares of 5, 10, 15 and 20 cents, no reduction being made for round trip

and no commutation tickets. Express packages are carried from Akron to Barberton and Cuyahoga Falls for 10 cents and to Kent for 20 cents. The route of the Kingston (Ont.), Portsmouth & Catawqui Electric Railway Company is 8 miles long. The regular fare is 5 cents but books of 100 tickets are sold for \$3.00. One freight car is provided and its use is charged for at so much per load. The Pittsburg (Kan.), Frontenac & Suburban Electric Railway Company operates 15½ miles of track and has three passenger stations. The fare is 5 cents between each station and 50-ride commutation tickets are sold for \$2.50 with privilege of transfer on city lines. Express packages are charged at the rate of 5 cents per 10 lbs. with a limit of 100 lbs.

Fig. 1 shows a shipping notice of the Mahoning Valley Railway Company which connects Youngstown, Girard and Niles, O. When the line was first opened the freight and package business was accommodated on the platforms of the passenger cars but this interfered with the passenger traffic. A contract was made in the early part of last summer with the American Express Company. Arrangements were further made with the Trumbull Electric Railroad Company to operate the freight and package car between Niles and Warren. Sliding doors were placed in the sides of an old 16-ft. box car and this was used for several months for carrying packages, freight and express matter. The business increased to such an extent that it was found necessary to have a larger car built adapted to the work. Fig. 2 is from a photograph of the new car. Three trips are made each way per day and the amount of traffic is deemed satisfactory by the company.

FIG. 2.—FREIGHT AND EXPRESS CAR.

The Akron, Bedford & Cleveland Railroad Company has a contract with the American Express Company and provides five combination cars for the traffic. The road is 26 miles in length and the fare varies from 5 to 60 cents, the latter being the charge for a ride from Akron to Cleveland.

The Toledo (O.) & Maumee Valley Railway, 22 miles in length, and the Toledo, Bowling Green & Fremont Railway, 13 miles long, are under the same management. The companies have four combination cars but can not do a freight or express business on account of the contract with the city company although a good business could be secured if arrangements could be made. Fig. 3 represents a ticket of the Toledo & Maumee Valley Railway Company with stations and rates of fare given, and Fig. 4 shows the

FIG. 1.

auditor's half of a corresponding ticket for the Toledo, Bowling Green & Fremont Railway Company.

The Cleveland, Painesville & Eastern Railroad Company now operates 19 miles of track and 19 additional miles will be opened in the spring. A combination car makes two round trips a day and the traffic is handled entirely by the United States Express Company. The passenger fares vary from 5 to 45 cents, the latter being the fare from Cleveland to Painesville. Books of 10 round trip tickets are sold for 10 per cent off the regular round trip fare.

Some of the interurbans have no provisions for carrying freight and transport passengers exclusively. The Greenfield (Mass.) & Turner's Falls Street Railway Company charges 20 cents for a ride of 13 miles with no reductions. The Allentown (Pa.) & Lehigh Valley Traction Company operates 20 miles of track and has a uniform fare of 15 cents. The San Jose & Santa Clara Railroad Company charges 10 cents for a 6-mile ride and a commutation ticket of 30 rides for \$2.00. The San Francisco & San Mateo Electric Railway Company is not permitted to engage in any other than regular passenger traffic. It has 23 miles of track and a 10-cent fare. In Massachusetts it requires a special act of the legislature in order to carry freight on an electric line. The Fitchburg & Leominster Street Railway Company has 18½ miles of track. Within the two cities the fare is 5 cents, 10 cents from end to end of the lines, 11 miles, and 25 cents for a circuit ride of 20 miles with stop-over privileges. Commutation tickets are sold 10 for 75 cents, workmen's tickets 12 for 75 cents, good from 5:30 to 7:30 a. m. and from 5 to 6:30 p. m. School children ride at half fare. The Lowell, Lawrence & Haverhill Street Railway Company has 57½ miles of track and charges 5, 10, 15, 20 and 25 cent fares.

The Aurora (Ill.) & Geneva Railway Company is not per-

## DOUBLE TRUCK CARS FOR THE METROPOLITAN STREET RAILWAY COMPANY.

The Metropolitan Street Railway, of New York city, is having a considerable number of new cars built for its electric service by the J. G. Brill Company, of Philadelphia. These cars are particularly interesting, because they are departures in many respects from ordinary construction. They are also worthy of attention as they are intended to meet the heaviest possible surface traffic and are to be operated under the shortest practicable headway. They are very handsome in appearance and will prove a credit to the road and to the builder.

Externally the features first striking the eye are the great length, which is 28 ft. over the end panels and 36 ft. over the dashers, and the "eureka" maximum traction trucks. The colors are as usual the standard of the road, cream for the concave and orange for the body panel. The dasher is cream color with the iron work black. There are ten windows upon a side fitted with French 26-oz. glass, 28x30 in.

The cars are 36 ft. long over the dashers or 38 ft. over all.

BRILL CAR FOR NEW YORK.

The width of body at the sill is 6 ft. 6 in., and the width at the belt rail 7 ft. 6 in.; the sills are  $6\frac{3}{4} \times 4\frac{3}{4}$  in. The corner posts are 6 in. thick, the window posts  $1\frac{7}{8}$  in. There are five iron carlines in each car. Behind the seat back there is an iron belt on each side going through the car. Under this belt there is a high heavy truss rod; it comes nearly up to the level of the windows rail. At the corner posts long angle irons secure the plates and take a long bearing on them. On the outside of the cars a wide and deep corner plate of pressed steel covers the joints between the letter board, corner post and the head pieces. These corner pieces not only impart great strength to that part of a car corner which is usually weak, but they add greatly to the durability by protecting the joints from the entrance of water. At the panels and belt rail there are other plates completely defending all the joints. The straps on the belt rails and other straps as far as possible are made continuous.

The inside framing is of the usual street car type except that beneath the seats a new feature has been introduced from the steam car practice. This is a truss plank extending the whole length of the car. It is 12 in. wide by  $1\frac{1}{2}$  in. thick, and is gained on to each post  $\frac{1}{4}$  in. It is cambered  $\frac{3}{4}$  in. at each end and bolted down to the sill at short intervals. This practically gives a sill  $18\frac{3}{4}$  in. deep. This adds very greatly to the stiffness of the car and enables the full benefit to be obtained from the use of the inside truss rod. Under the sill a separate truss rod is used which has a single strut in the center. The platforms are 4 ft. from end panel to dasher and are fitted with folding gates which when

turned back, are entirely out of the way. Each dasher has an electric headlight; Sterling brakes are used. These brakes, which are very powerful, are the invention of Thomas Millen, the master mechanic of the road. The inside finish is of second growth white ash. The lumber used was particularly fine in grain and white in color, making a fine effect when finished. The transoms are filled with white chipped glass. There are four four-sided signs on each car. These are operated by hand wheels from the inside of the car or from beneath the hood.

The trucks, as we have said, are of the maximum traction pattern. The large wheels are 33 in. in diameter, and the small ones 20 in. The truck is of the company's standard type and is designed to give a very large adhesion while employing but one motor per truck and in this case the motors are G. E. 1,000, one mounted on each of the trucks. The axles are of cold rolled steel.

## PROPOSED STREET RAILWAY LAW IN OHIO.

A radical street railway bill has been introduced into the Ohio legislature. The bill first provides that no ordinance or resolution to establish or define a street railway route shall be passed, and no action inviting proposals to construct and operate such road shall be taken, and no renewal or extension of a grant shall be made by the council of any city or village having a board of public works, board of improvements or board of control, except upon the recommendation of such boards. No ordinance shall be passed until public notice of the application has been printed. And no grant shall be made except to the corporation that will agree to carry passengers upon such proposed railroad at the lowest rates of fare. No grant for the construction or operation of any street railway shall be valid for a greater period than 25 years, and no renewal shall be valid for more than 15 years; nor shall any renewal of the grant be made until within one year next preceding the expiration of the grant; and during the term of the grant the municipal corporation cannot release the company from any obligation or liability imposed by the original terms of the franchise. An important feature of the bill relates to the extension of tracks. It provides that a company may extend its tracks and make connections with other roads by consolidation, but that the rate of fare shall not be increased either by reason of the extension or the consolidation. Where a road is built between towns the bill gives the right to the company to use the lines of any company which may operate roads in the towns between which the interurban road operates, but it requires the interurban road to obtain from the municipality an additional grant and that the amount of fare charged shall not be in excess of that charged by the local road. A new feature is provided in regard to local roads and the bill gives the right to one company to use and operate its cars upon the tracks of any other company, not to exceed one-third of its length. This is to be done by the approval of the council and the board of public works, board of improvements, or board of control in cities having such an institution. Where the directors of the two companies cannot agree, then the council may step in and fix the terms and conditions by which the cars of one line shall be run over the tracks of another.

## MOTOR TESTING AND INSPECTION.

BY J. R. CRAVATH.

It is now about two and a half years since the scientific testing of electric railway motors began to be used in everyday repair shop work on a large scale, though this practice was by no means entirely new then. The methods have been improved from time to time and the Herrick switch-board system described in the February REVIEW may be regarded as the most complete plan yet offered. There seems to be considerable difference of opinion among railway electricians as to the importance or necessity for testing motor equipments for electrical faults. I have even heard it maintained that an electrical test of a motor equipment was misleading and really told nothing of importance that a competent inspector would not find out by sight and touch. This is putting it rather strong to say the least, but it is well to look matters squarely in the face and find out just what is the proper field for testing and what for inspection. The fact that a marked saving in repairs has been made in every case where systematic testing for electrical faults has been inaugurated shows that under the existing conditions of practice such tests tell more than the sight and touch of an inspector, whatever may be the theory as to what an inspector ought to be able to do.

It is not entirely true that electrical defects are hidden and cannot be discovered by inspection, nor is it true that electrical troubles are all likely to be discovered in the ordinary run of inspection.

The mechanical points of a motor that need watching are principally:

1. Wear of bearings.
2. Lubrication of bearings and gears.
3. Loose bolts.

The electrical troubles most likely to occur are much more numerous, but the principal ones are:

1. Bad brushes and commutators leading up to armature trouble.
2. Oil, grease, dirt and carbon dust in the motor weakening the insulation.
3. Short circuited field coils causing armature burn outs.
4. Armature coils burned out or open circuited.
5. Wires to motor broken or grounded.
6. Motors not equalizing.

It is evident that many of these troubles can be discovered by inspection as well as by testing and the only question is as to which requires the least work and is the most likely to be correct. I think when the matter is fully considered we will see that the testing if not carried out to an extent where \$10 is spent in testing to save \$5 in repairs will show something quicker and easier than any other way.

In looking over the list of likely electrical troubles we see that the first one, that of bad brush and commutator contact, or bad commutator is one that can be easily looked after during mechanical inspection. If the cause of flashing at the brushes happens to be a broken or short circuited armature coil it will sometimes take testing to determine it unless the motor is torn apart, though it is usually the case such coils make themselves known by burning certain bars on the commutator. In either case, whether the burning be due to a defective bar or defective coil, the only relief is by the removal of the armature for repairs so that testing in this particular would be of practical use mainly in the repair shop.

The second point mentioned, that of dirt or oil of any kind endangering the insulation, is one that can usually best be taken care of by an actual overhauling and wiping of the motor. It may be a good plan, however, to make a test as a check on the thoroughness of the cleaning. If the motor is dirty it may show a low insulation resistance in a test and if cleaned it will test up all right. On the other hand it may be so dirty that if left much longer in that state it will break down and at the same time show a test within the limits adopted. There is no way to discriminate in a test between poor insulation due to dirt and poor insulation due to carbonized coils. Dirt may be on the motor, but lacking simply the oil or moisture necessary to destroy good insulation. Considering all these things it seems best not to depend too much either on the insulation resistance test or inspection alone. The wiper may not have done his duty, and if he does not, no one is the wiser until the motor breaks down. If the insulation resistance test shows low it is proof positive that there is something wrong, even though it may be nothing but dirt, and the man making the test can not put it down as right without deliberate dishonesty, which is improbable. If the motor is cleaned before the test is made and poor insulation is shown it locates the trouble either as caused by some dirt or oil that has not been cleaned away or faulty coils, probably the latter.

Under the third head, short circuited field coils, a trouble is mentioned which was at one time and probably is still the cause of numerous mysterious armature burn outs. When a field coil is short circuited on its inner layers it is not always easy to find. It is sometimes possible to discover the defective field coil when a motor is opened up and inspected immediately after a run by feeling the temperature of the different coils with the hand, but very often it is not practicable to make such an inspection and on a large road the car may not be looked at for several hours after it is turned in. Furthermore even if the "feeling" of the different coils is done at once after a run it is the case with hundreds of motors making fast schedule in large cities that all the coils get too hot to hold the hand on long enough to find their comparative temperature. It may be claimed that if the motormen did their duty in reporting peculiar actions of a motor that short circuited field coils would be at once found, but that is too uncertain a thing to depend upon. The most successful system is usually the one that will work fairly well in spite of neglect. Tests will reveal short circuited field coils before they do much damage by burning out armatures and this is probably the most important preventive work the testing outfit can perform.

Armature coils burned out or open circuited generally show themselves at the commutator.

Wires to motor grounded or broken need no testing outfit to discover them.

Whether the motors are equalizing or not can be told roughly from the relative temperatures to the hand of the motors soon after a run, but of course a test would give this more exactly.

The primary object of all testing and inspection of motors is to discover troubles before they become serious, on the "stitch in time saves nine" principle. The main thing to determine is how long the motors will run ordinarily before they are liable to need that stitch in time. Grease cups and commutators need attention every night. Modern motors are so constructed that it is impossible to tell what is going on inside the case unless they are opened. This should be done as often as experience shows that dirt and

grease will accumulate in the case in the service in question, or if the streets are clean and the motor bearings designed thin it may be necessary to open up the motors more often as the bearings require watching and attention. One thing is certain it does not pay to hire men to open up motors oftener than they are likely to need attention. It is a waste of money and muscle. Much depends on the care or carelessness of the men who look at the motors each day. If the daily inspection is not done right no amount of monthly or weekly overhauling will compensate for it, but if it is properly done the length of time between overhauls should be limited only by the life of the bearings and the dirt that will accumulate.

### A PHENOMENAL ADJUSTMENT.

A remarkable instance of accident adjustment has come to our notice, showing what intelligence and energy can accomplish, and forcibly illustrating the value of quick action. We have frequently noted in our columns cases throughout the country, wherein marked ability has been

S. H. BENNETT.

J. H. MULLIN.

shown in this, one of the most important and trying branches of street railway management; but the case before us is so phenomenal that we cannot refrain from commenting at length upon it.

On October 30, 1897, the Atlanta Railway Company, of Atlanta, Ga., was unfortunate enough to experience a horrible head-end collision. An open motor car, drawing a trailer, the two containing about 100 passengers, returning to the city from an inter-collegiate foot ball game, crashed into a closed car, which was also well filled, bound in the opposite direction. The collision occurred at a street crossing, at the base of two hills, just after twilight had given place to darkness, and in an instant the cars were utterly demolished. To render the situation more appalling the electric light at the point of collision, which up to that time had burned brightly, without apparent cause suddenly went out, leaving the wreck in total darkness.

A hurried telephone message from the scene of the wreck advised S. H. Bennett, secretary and treasurer of the railway company, and he at once notified J. H. Mullin, general adjuster for the Southern Department of the Guarantors Liability-Indemnity Company of Philadelphia, with whom the railway company was insured.

These gentlemen hurried to the wreck, and on reaching there a terrifying scene was exposed to view, by the faint

glimmer of the few torches which had been hastily improvised. A morbid crowd, which had been drawn to the scene, interfered with the proper care of the wounded. Many of these had been hastily removed by the army of cabs returning to the city from the foot ball game. In addition to this, many others of the injured found refuge in houses near by. As may be supposed, the omnipresent newspaper reporter was much in evidence, insisting upon being given a list of the injured, and refusing to believe that such request was unreasonable; but worse than the newspaper man was the horde of legal vultures which, as usual, flocked to the scene, intent upon plying their nefarious trade. Under these adverse circumstances it was only possible to secure the most meagre list, which, however, by working all Saturday night was augmented to a total of 35. The next day being Sunday, no legal settlements could be made, but these officials prudently called upon all whose names they had secured and assured them of the company's honorable intentions towards an amicable adjustment. This mode of procedure was of two-fold benefit, in that it produced good feeling towards the company, and enabled these officials to procure the names of many other persons who were aboard the cars at the time of the collision. Before the day was ended their list had been increased to fully 60 names, all of whom were visited without delay.

The wisdom of this course is apparent when it is stated that only four suits were entered against the company, and these by persons whom it was physically impossible to see that day, and before they could be interviewed, their claims had been placed in the hands of lawyers. On Monday, the day following, these two gentlemen began the actual work of settlement, and in the incredibly short time of two weeks, settled with the majority of the injured parties, and so kept in touch with those more seriously injured that the settlement of their cases was also practically attained.

Within a month and a half from the date of this casualty, only four unsettled cases remained, and these, as above stated, were in the hands of lawyers, who resisted reasonable settlement.

By an expenditure of but \$5,000 settlements were made with 55 persons, many of whom had been seriously injured.

It is safe to say that if the adjustment of this matter had not been so skillfully and expeditiously handled, the railway company would undoubtedly have been involved in endless litigation, and eventually have been forced to pay out many times the amount of money actually disbursed, and it has cause to congratulate itself on the results of the good work done by Messrs. Mullin and Bennett.

### TO OUR FOREIGN SUBSCRIBERS.

In remitting for subscription our readers abroad will greatly favor us if they will remit in American paper money where obtainable; draft on Chicago or New York; or if more convenient postal money order in which event it must be drawn on Chicago. We are in receipt almost daily of money orders from across the water, but which are domestic orders and can be cashed only in the country in which they are issued. Where none of the above desired methods are convenient, we will accept postage stamps of small denominations of any country, as we can make use of them; but the domestic money orders which have to be cashed where issued are practically worthless to us.

**BOSTON CONVENTION ANNOUNCEMENTS.**

Secretary Penington of the American Street Railway Association has issued the official circular concerning the Boston Convention. In addition to the date and place of meeting as published in our last issue, announcements are made as follows:

Every applicant is assured that he will get all the space desired, as our resources in this direction are unlimited.

The convention will be held on the second floor of the Exhibit Hall, all stairways leading up from the inside, thus insuring the attention of all delegates and visitors to the exhibits.

The income from sale of space will go to the American Street Railway Association. The executive committee of the Association has fixed the price at 10 cents per sq. ft., and ruled that no space less than 100 square feet will be assigned, but applicants may have as many multiples of this quantity as they may wish, all in one body. Payment for space should be made to T. C. Penington, secretary and treasurer of the American Street Railway Association, 2020 State street, Chicago. Application for space should be made to Charles S. Clark, 8 Oliver street, Boston, chairman committee on exhibits. We hope to have you with us with an extensive display.

The Mechanic Association will not allow any nails or screws to be driven in any floor, woodwork or plaster in the building, so those exhibitors who desire to erect booths must govern themselves accordingly.

All articles intended for exhibition shall be delivered at the building by the agent or owner, and at his expense, but the local committee has made arrangements with Robert S. Brine & Co. to haul and deliver all shipments to the building, if directed in their care.

All electrical connections for power and extra lights must be made at the expense of the exhibitor, and no connection will be permitted except by approved workmen and with the consent of the superintendent of exhibits.

We expect a large exhibit and perhaps it would be in the interest of the exhibitors to make arrangements to have the building open in the evening, as it is well lighted and the electrical companies expect to make a large display.

Space must be applied for by August 1. Assignments will be made as promptly as possible after that date, and exhibitors notified of their location. Exhibits of like character will be grouped together and space will be assigned in the order of application.

It is earnestly requested that all exhibits shall be in place and all work finished by Monday evening, September 5, which is the evening prior to the opening of the convention. Watchmen will be in charge of the premises, so that exhibits will be safe.

All goods should be marked to yourselves, "Mechanics' Building, care R. S. Brine & Co., 33 1/2 India street, Boston," sending them bill of lading or advice that you have shipped goods in their care, giving particulars in regard to shipment, and, if charges are prepaid, they will be delivered to your space in the Exhibition Hall. Ship all goods early to ensure delivery in time.

The headquarters of the association will be at the Hotel Brunswick. The Hotel Vendome is managed by the same parties, and will be used in connection with the Brunswick.

**HOTELS AND RATES.**

Brunswick, American plan.....	\$4.00	per day and up.
Vendome, American plan.....	4.00	" "
Copley Square, European plan.....	2.00	" "
Nottingham, European plan.....	2.00	" "
Victoria, European plan.....	2.00	" "
Turaine, European plan.....	2.00	" "
Parker, European plan.....	2.00	" "
Young's, European plan.....	2.00	" "
Thorndyke, European plan.....	2.00	" "

The annual dinner will be held at the Hotel Brunswick, Thursday, September 8, at 8 p. m. Tickets will be sold at the actual cost to the Association.

The executive committee advises all who desire rooms to apply at once, as the rooms at the Brunswick and Vendome are limited but no rooms will be assigned until March 15, and will be assigned in the order in which applications are received.

Of the hotels mentioned the first five are within five minutes' walk of the Mechanics Building; the others are down town with street cars to the door of the Hall. The usual arrangements have been made with the railroads, tickets being sold on the certificate plan.

The chairman of the committee on exhibits, C. S. Clark, advises us that very probably a track will be arranged so that cars and other bulky exhibits can be run into the exhibit hall on their own trucks.

The Massachusetts Charitable Mechanic Association will hold its 20th triennial exhibition from October 10 to December 3, 1898, and through the secretary of the executive committee having charge of this exhibition, solicits correspondence with parties who will exhibit at the American Street Railway Convention, in regard to exhibiting at the later one also. This committee states it will so far as possible arrange to allow the street railway exhibits to remain in place, if they are desirable, but that early applications will be necessary to secure this privilege. Communications on this subject should be addressed to Henry D. Dupee, secretary, Mechanics' Building, Huntington avenue, Boston.

**THE USE OF STREETS.**

Charles L. Bonney, vice-president of the Chicago General Railway, recently addressed a letter to the street railway companies of Illinois of which the following is an extract:

"I desire to direct your attention to the telegraphic report published in this morning's papers of the decision of the United States court of appeals in the case of the City of Richmond versus the Bell Telephone Company. The case involves the act of Congress of 1886 declaring that the streets of a city are post roads of the United States. The Bell Telephone Company's charter having expired, the city exercised its stipulated right to revoke it, but was enjoined from interfering with the company's poles and wires. The effect of the decision is to modify the injunction so as to prevent the city from driving the company from its streets, but the city is to retain its police power over the same.

"This decision of the federal courts is in harmony with the suggestions of the undersigned sent to you with the 99-year extension bill, proposed for the next legislature, and makes the distinction between the physical property of the company in the street and the police regulations of the use of the property. This decision will be found very useful in educating the public to the law as it is, and it should be carefully considered by all street railway companies in Illinois before the meeting of the state association in Chicago in May."

**A MOTOR OPERATING IN COURTROOM.**

The General Electric Company brought suit against E. G. Bernard & Co., of Troy, N. Y., for using a motor with a winding which infringes on one of its patents. The Western Electric Company, of Chicago, is behind the defendant. Many drawings were exhibited in the court room and a motor was set up and put in operation to demonstrate its principle.

The program of papers before the Western Society of Engineers for the first half of 1898 has been issued and announces 16 papers on technical subjects and two illustrated lectures.

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

The capacity of the new power house of the Capital Traction Company, Washington, D. C., will be considerably greater than it was at first contemplated. There will be five horizontal tandem compound Allis Corliss engines, 20 and 40x42 ins., running condensing and direct connected to 550-k. w. General Electric generators, giving 600 volts at 100 r. p. m. For the long feeders there will be three 100-k. w. General Electric boosters. There will be four batteries of Cahall-Babcock & Wilcox boilers.

\* \* \*

Although the original design of the power station for the Chicago elevated loop contemplated the burning of coal and the equipment included mechanical stokers and ash-handling apparatus as noted in the REVIEW for January, 1897, the fuel used will be oil. Storage tanks and pumps have been installed and the oil piping system, which is in duplicate, is practically completed. One of the 2,000-h. p. units is in place and has been in operation for six hours per day, from 6 a. m. to 9 a. m. and from 4:30 p. m. to 7:30 p. m., during the past few weeks. One of the generators, which were built by the Siemens-Halske Company, was illustrated last December.

\* \* \*

The data of the tests made on the power plant of the Chicago Electric Traction Company, published in the February REVIEW, serve to forcibly point out that the proportion of steam generated which is used in the auxiliary station apparatus is very large, and consequently there is a correspondingly large saving to be made by substituting electric motors for steam cylinders for driving the auxiliaries. The dry steam used per hour by the large engines in this test was 3,903 lbs. and the indicated horse-power 217, making the water rate 18 lbs. per i. h. p. per hour. The auxiliaries used steam (corrected for moisture in the steam) as follows:

Economizer engine . . . . .	38.4 lbs. per hour.
Stoker engine . . . . .	36.4 lbs. per hour.
Air and feed pumps . . . . .	685.0 lbs. per hour.

Total . . . . .	759.8 lbs. per hour.
-----------------	----------------------

This is 19.4 per cent of the steam used by the engines; this figure does not require extended comment.

It is true that in this case the exhaust from the pumps was used to heat the feed water and thereby the fuel charge against the pumps was reduced from 14.3 per cent (the proportion of the total water evaporated used by the pumps) to 5.1 per cent. However, since there is an economizer provided, the function of which is to heat the feed water, the gain from this source should have been made in the economizer, and the fact that the pumps used more than one-sixth as much steam as the engines driving the dynamos remains the significant feature.

One of the essentials in making an engine test is to have an accurate reducing gear for transmitting motion from the crosshead to the indicator drum, and all who have had to prepare for a test appreciate the annoyance caused and time lost by the necessity of attaching, and perhaps repairing, the temporary rig found in the majority of power stations, which between times is stored away somewhere to gather dust and get lost or broken. There would be economy and increased accuracy in having a well designed reducing motion permanently attached to the engine, and such are to be found in a few plants. This is the case in the power house of the Chicago Union Loop, each engine being equipped with a permanent rig. The description of the device, which gives a theoretically perfect motion, is as follows:

A shaft parallel to the piston rod is supported in bearings bolted to the under side of the upper guide, and so located that the shaft is sufficiently to one side to clear the crosshead and close to the guide frame so as not to prevent free access to the crosshead, stuffing box, etc. To the shaft is fixed a brass strip so curved as to form a portion of a helix or thread of very steep pitch. A fork provided with rollers is bolted to the crosshead and engages the helical strip. The proportions are such that the movement of the crosshead throughout the stroke of 60 in., the fork being in contact with the helix, rotates the shaft through an angle of something less than 60°. On brackets fastened to the side of the cylinder is a second shaft parallel to the other one with light wheels mounted on it about which the indicator cords are wound. Motion is transmitted from the first shaft to the second by means of two cranks and a connecting rod, the cranks being of equal length and parallel.

\* \* \*

Some months ago two Parsons steam turbines, direct connected to generators, were installed at the Blackpool (Eng.) Corporation electrical plant for furnishing power to the street railway. The transformation of this road from conduit to overhead trolley, now in progress, was contemplated at the time and one change provided for was the raising of the voltage from 250 to 500 volts. This was accomplished by making the new units each consist of a multiple expansion "parallel flow" Parsons turbine of 100-k. w. capacity, and two 50-k. w. dynamos, each giving 200 amperes at 250 volts. For the low voltage working the dynamos are connected in parallel and for the working of the overhead line they will be connected in series. The turbine and the dynamos are mounted on a bedplate of the twin girder type, and the dynamos are arranged to slide in the direction of the shaft so that the armature of the one adjacent to the turbine may be withdrawn by sliding the other dynamo along the bedplate which may be readily done. The coupling of the turbine and generators is by means of square sliding sleeves fitting loosely over the squared ends of the shafts.

In appearance the turbo-generator is very like that illustrated in the REVIEW, July, 1897, a second dynamo being added. The turbine takes steam at 120 lbs. absolute and expands it to  $1\frac{1}{2}$  lbs. The governor is an electric one in which the solenoid is connected to the first dynamo only. The floor space occupied by each 100-k.w. unit is  $42\frac{1}{2}$  sq. ft.; the weight is about 13,500 lbs.

Tests at the maker's works placed the steam consumption at 26.8 lbs. of steam per k. w. h. at full load and 29.9 lbs. at half-load, a rise of 11.5 per cent. The operation of these machines is reported to be satisfactory.

\* \* \*

In England there are a number of towns which conduct their own electric lighting plants, and which have refused to grant locations to tramway companies unless the latter agree to purchase their power from the towns; there are also cases of tramway companies which find it advisable to buy rather than generate their power. The result is that the question, What is a fair price for tramway power? is a burning one at the present time. From the point of view of the lighting plant, with power to sell, it is urged that the load factor of tramway plants is much less than in lighting plants, and the fluctuations more violent, so that because of a larger investment for machinery and heavier charges for repairs, current for tramways should sell for more than does current lighting. The tramway company argues that the time element is the most important one, and that the tramway plant would be running at a good load fully three or four times as many hours in the 24 as would the lighting plant, and therefore, current for this purpose could be sold cheaper. In this it is assumed that the cost of producing the current at the switchboard is considered and the charges on the lighting company for installing and maintaining its mains are not included.

No doubt the better load factor and the steadier load claimed for the lighting service are compensated for by the longer time during which the tramways would be operating, but it would seem that the fact which should determine the comparative price of the tramway power is whether the periods of heavy load in the two kinds of service come at the same or at different times. If they are at different times, so that to a considerable extent the same machinery may be used in each, a substantial reduction in the cost might be made, but if they occur at the same time so that the capacity of the station must be correspondingly increased no cheaper power can be reasonably expected.

The prices obtained for electrical power by the English stations seem very high when compared with American costs. It is estimated that "in the Midlands, with coal at the door, a million units (k. w. h.) per annum for traction purposes might be sold for 3 cents per unit, but in other parts of the country it could not be done for less than 4 cents."

\* \* \*

#### Reserve Machinery and Fuel and Water for Emergencies.

In a power station there must always be machinery in working order, and to speak figuratively, food and drink for it, that is, fuel and water. Accidents will always happen, sooner or later, and the fundamental rule not to trust a road to a single piece of apparatus is well understood and followed, and it is rare indeed that a road is completely disabled by reason of accidents to the machinery. Scarcely

anything, aside from a failure of all the machinery, will tie up a plant more quickly than a failure in the feed water supply. A coal shortage can be seen beforehand and a supply of fuel of some sort or other secured, but a water famine results from the unforeseen and the unexpected. A fuel famine is most seriously felt because it increases the cost of operation, while a failure in the water supply shuts down the road; such a stoppage often gives it a bad name and may injure it very seriously.

The mining and railroad strikes which occur at more or less frequent intervals, lead companies, particularly the large ones, to protect themselves by inserting the proper clauses in their contracts for fuel so as to get the same rate independent of the market price. Storage place is provided and at the first signs of trouble the contractor is called on to furnish coal enough to form a safe reserve.

When it is at all feasible to locate the power station close to running water it is done and then as a rule the feed is drawn from this source. In the great majority of cases connections to the city water mains are relied upon for emergencies. Where this latter is the source of regular supply, and sometimes when it is not, artesian wells are dug at the station, and in some instances storage tanks are built.

We give here some of the replies received to inquiries regarding the machinery reserve and coal and water supplies for emergencies. The roads have from 20 to 180 cars; nearly all of them have but one power station. The history of the road, whether it has had a rapid growth in the way of extensions after the first installation, and the date of the building of the station, no doubt have much to do with the number of units in reserve.

1. This is a 14-mile road with 20 motor cars. The power station equipment comprises three engines driving two 80-k. w. and one 200-k. w. generators. Either the two small units or the one large unit will care for the ordinary output, and usually the two small ones are in reserve. There are three return tubular boilers, one being always in reserve. Jet condensers are used and the water supply drawn from the river. In case of failure to supply the condensers, water for the boilers may be pumped from the river or drawn from the city mains. Coal is delivered as used, two car loads per week, and storage space is provided for nine car loads, which is sufficient for a month.

2. This is a 20-mile road operating 20 motor cars. In the station are three 150-h. p. engines and three 100-k. w. generators, of which one unit is in reserve. There are four water tube boilers, one in reserve. Coal is purchased as needed but the fire room is large enough to store 600 tons when it is desired to carry a stock. The feed water is ordinarily drawn from the city mains, but there is an artesian well for emergencies.

3. This is a 31-mile road with 76 motor cars. In the station are three water tube boilers rated at 400 h. p. each, and three engine-generator units rated at 400 h. p. each. Two units are sufficient for the average output. There is storage capacity, under a shed, for 700 tons of coal and a stock sufficient for two or three months is always kept on hand. The ordinary source of water supply for the boilers is a pond near the station, but in emergencies water may be pumped from the river or taken from the city mains.

4. This road has 60 miles of track and 115 motor cars. The total capacity of the station is 3,250 h. p., there being five 500-h. p. units and one 750-h. p. unit. The average

output it 2,000 electrical horse-power and the maximum 2,800, so that there are always one or two units in reserve. The boilers are in four batteries of 500 rated h. p. each, and three batteries are ordinarily fired. A six months' supply of coal is carried on hand. The water supply is ordinarily taken from the river but the city water is available for emergencies.

5. This road has 61 miles of track and 158 cars. The total rated capacity of the engines is 2,275 h. p.; there are two engines direct connected to 500-k. w. generators and three 150-k. w. belted units, all of which are in use during the periods of very heavy traffic, but usually about two-fifths of the station capacity is in reserve. There are 10 water tube boilers of which from two to four are in reserve. Coal is usually delivered on the power station track in daily lots, but there is ample room in the yard for storing 2,000 tons in case it is desired to lay in a supply. Feed water is drawn from the river ordinarily; for emergencies there are connections to the city mains.

6. This is an interurban road 27 miles long with 21 motor cars which are all double truck cars. There are two power stations each equipped with two 250-k. w. generators driven by Allis simple engines. Ordinarily one unit in each station furnishes sufficient power. In one station are three 250-h. p. Stirling boilers and four in the other; two boilers in each station are fired. There is storage room at the two stations for 20 car loads of coal. Water is drawn from the river which is the sole source of supply; the pumps and piping are in duplicate.

7. This road has 26 miles of track and 30 motor cars. There are two compound condensing engines rated at 300 h. p. each and three generators aggregating 520 electrical horse-power; of these one engine and one generator are in reserve. The boiler equipment is small, there being but two horizontal return tubular boilers. The heaviest traffic on this road is in the spring and summer when it is necessary to use both boilers; during the fall and winter only one is used. Coal is brought direct from the mines and shipped as used, two cars per week in summer and six per month in winter. The side track to the station is on a trestle, and the space underneath has been converted into a coal bin with capacity for 360 tons; this much is kept on hand when there is reason to anticipate any difficulty in securing a regular supply. Water for the condensers is drawn from the river, the feed being taken from the condenser hot

well; there are also connections to the city mains and a separate pump for drawing water from the river.

8. This road has 16½ miles of track and 53 motor cars. In the station are two 300-k. w. direct connected units, one being in reserve. There are two 300-h. p. boilers. The boiler room is large enough for storing 200 tons of coal. The feed water supply is ordinarily drawn from the city mains. For emergencies there is a tank holding 25,000 gals., and also a pipe laid to a neighboring creek.

9. This road has 50 miles of track and 104 motor cars. In the station are two 350-k. w. and one 200-k. w. generators each driven by its own engine; one unit is in reserve. There are eight horizontal tubular boilers rated at 125 h. p. each; these are run four at a time for 30 days and then cleaned. Coal is received in lots of from 600 to 700 tons, and stored in the yard, which has a capacity for 2,000 tons. Feed water is taken from the city mains; there are two tanks, each holding 2,000 gals. which in emergency would supply the station for a short time, until repairs could be made.

10. The engine room equipment of this station comprises two engines, one of 350 h. p. and one of 500 h. p., and five 80-k. w. generators. There are three Heine boilers rated at 250 h. p. each. One engine, one generator and one boiler are in reserve. The coal storage capacity is about 700 tons. Water is taken from the river ordinarily, with connections to the city mains also.

11. This road has 80 miles of track and 180 motor cars. In the power station are nine engines and 15 dynamos. Three of these are tandem compounds, each driving two dynamos; three are cross compounds, each driving two dynamos; three are simple engines, each driving one dynamo. Thirteen of the generators are of the same size, 100 k. w., and two are of 150 k. w. capacity. There are seven boilers of from 200 to 400 h. p. (rated) capacity, the total being 1,975 h. p. The rated capacity of the electrical machinery is 1,600 k. w. but it is frequently necessary to work it at 50 per cent overload. The average load on the station is heavy enough to require all of the engines except one of the smallest, so that there is practically no reserve. Similarly the boilers are all operated continuously except such as are being cleaned or repaired. Neither is there any storage capacity provided for coal, it being delivered daily. Water is drawn from the river through a race, with connection to city mains for use when the race is too low or too muddy to use.

12. In this plant there are four engines and seven generators. The engines comprise one of 1,000 h. p., two of 1,200 h. p., and one of 1,500 h. p.; the generators, one of 800 k. w., four of 500 k. w., and two of 200 k. w. To care for the average output a capacity of 2,300 k. w. is needed so there is 900 k. w. in reserve. Two engines are in reserve. In the boiler room are 18 boilers 17 ft. by 72 in., of which 14 are ordinarily fired. Coal is delivered to the station as needed; when it is desired to keep a stock on hand it is stored in an open lot, there being room for about 1,000 tons. Water is drawn from the river or from artesian wells; there is a 20,000-gal. tank for emergency use.

13. This road has 67 miles and 100 motor cars. The total rated capacity of the station is 2,500 h. p.; one unit of 900, one of 800, and two of 400 h. p. The ordinary output is from 900 to 1,300 k. w., leaving two units in reserve. There are six boilers, three rated at 150 and three at 250 h. p.; five of these are ordinarily in use. Bins holding 1,000 tons of coal are provided under the railroad switch for storage purposes. Feed water is taken from a creek; for emergencies there is a tank with a capacity of 150,000 gals.

\* \* \*

**The Peck & Patterson Furnace for Coal Dust.**

The accompanying illustrations show the coal dust furnace patented by Peck & Patterson, 308 Second avenue, Pittsburg, as applied to return tubular boilers. To burn coal dust successfully the combustion chamber must be separated from the boiler so that the cool surface of the latter will not prevent the complete combustion of the gases in

FIG. 1.

contact with it. In this furnace the boiler is encased throughout the entire length with a covering of fire clay or other suitable material. This casing extends about three-fifths of the distance around the boiler, or to the water line, and is placed about two inches from the boiler. The entire furnace is lined with fire-brick. The casing, consisting of single fire-clay rings, and joined together hermetically, is

made to conform to the circle of the boiler, each end of the rings being provided with a flange which rests in the side wall, and is supported by arches as shown in Fig. 1.

The center of the furnace, or bridge wall, is one-third the length of the boiler, and is divided into four spaces, or throats. The expansion chamber is fitted with a deflecting plate at the end of the boiler. It will be seen that the furnace consists of three compartments, viz.: the combustion chamber, throats or bridge, and expansion chamber.

This furnace is devised for the use of powdered coal which is pulverized and fed into the furnace as required. The feed can be adjusted by suitable valves in the pulverizing ap-

FIG. 2.

paratus, at will of the operator or fireman. This coal enters at the front of the furnace, or combustion chamber, through a specially devised spreader, together with the air required for combustion. Upon entering the furnace, the coal dust ignites at once and complete combustion rapidly ensues.

The gases enter the expansion chamber at the rear of the setting and thence are carried through the tubes to the stack. The ash resulting from the burning of the dust strikes a deflecting plate in the expansion chamber and is thrown into the lower part of the chamber where it remains until removed.

Fig. 2 shows a battery of boilers equipped with the Peck & Patterson apparatus. There is an air main carried over the front ends, with pipes to each furnace; a blower furnishes air under sufficient pressure to carry the coal dust into the furnace. The coal crusher is located convenient to the supply and the powdered coal is carried along an open trough in front of the boilers by a screw conveyor. The supply to each furnace is regulated by a valve in the branch pipe.

The advantages claimed for this furnace are: the combustion is more perfect, giving a substantial saving in fuel; the cheapest grades of coal may be used; a more uniform distribution of heat, the heat reaching the boiler shell only by radiation from the fire-proof casing; it is smokeless.

The furnaces are provided with grates of the ordinary type for use in emergencies. The furnace can be adapted to water tube boilers, in which case the combustion chamber is separate and located in front of the ordinary setting.

One of these furnaces has been in experimental operation for over three months in a Pittsburg plant, and has given very satisfactory results.

The Consolidated Traction Company, of Jersey City, has issued an order that newsboys will not be allowed to board the cars in the future.

### THE THIRD RAIL SITUATION.

The "Daily Herald" of New Britain, Conn., reports the president of the Boston & Maine Railroad on the subject of the third rail as follows:

President Tuttle, of the Boston & Maine, has been talking interestingly with the Boston representative of the Springfield Republican, on the future of the third rail electric system. He did not regard the third rail system as beyond an experimental stage in any part of the country. The Nantasket railroad, operated by the Consolidated, is to be regarded as still an experiment, and so is the third rail line from Hartford to New Britain. These seem to operate successfully, as far as they go, but they do not meet the problems of the main lines of railroad where there is a large amount of local and express passenger travel and of freight transportation. Thus far the third rail has operated light

Tuttle, of the Boston & Maine road, is not so enthusiastic about the third rail as some of the Connecticut railroad men. He can see very easily how single and detached cars can be propelled by the new power, but he cannot see how it can be used to furnish passenger or freight trains with force sufficient to move them. This is the problem at present, and it is bothering more people than President Tuttle. So far the only practical result of the third rail experiment is to furnish a method of competition with the trolley. And the most peculiar feature of the situation is that the railroads would never have dreamed of furnishing the facilities offered by the third rail as long as they had a monopoly of the travel. When the trolley began to do business, the steam railroads began to think of the needs of the dear public."

To us it appears that the problem of working powerful electric locomotives is not so serious as is indicated in the

VESTIBULE ON LINDELL RAILWAY, ST. LOUIS.

trains running for comparatively short distances. If the solution of the problem could be reached by breaking up the present local passenger trains into single car service, with such motor power as is now available, it could be solved easily. But to do it, under the present system of operating railroads, would require the construction of a new track for that particular business. As it is now, a local passenger train may be followed in a short time by an express as soon as the passenger is out of the way. After the express may come a long freight train. Both the express and the freight require far more power than can be given by any motors now in use. Electric transportation requires the breaking up of local trains into such small parts as will interfere with the freight and express passenger. The problem is not only the division of the power now used for local passenger trains into sufficiently small portions for the frequent running of single cars, but there must be secured, also, if the same tracks are to be used, sufficient power for the large trains. This step has not been taken yet, and hence, in a broad way, it is perfectly true that the system of electric transportation, as applied to the steam roads, is yet in an experimental stage.

The "Herald" then comments editorially: "President

foregoing extracts. The Baltimore & Ohio Railroad has demonstrated that the most powerful freight locomotives can be successfully operated on the overhead trolley system, and the third rail presents less difficulties than does the overhead wire.

### A ST. LOUIS VESTIBULE.

The illustration is from two photographs showing views of a car recently fitted with vestibules in the repair shops of the Lindell Railway Company, of St. Louis. Vestibules have been placed on this car for an experiment, and if they are favorably considered other cars will likely be equipped. The vestibules are similar on each end, and necessitated some slight alterations to the dash and roof of the car as may be seen in the cut. The approximate cost per car is \$100. We are indebted to the general superintendent, G. W. Baumhoff, for the photographs.

Two cars of the Wheeling (W. Va.) Railway Company had a head-end collision in a dense fog. Four of the employes on the cars were painfully injured by flying glass and splinters.

## WOMEN AS STREET RAILWAY SUPERINTENDENTS.

By Anna E. Mitchener, Superintendent of the Tuscarawas Railroad Company.

Basing my views on a brief but quite successful experience I would say that street railroading is a useful and fascinating work, one wherein a woman may use originality and tact at all times. The street railroad is first and foremost a public servant, and in that capacity one must study the public with which one has to deal. For all publics are not alike, and as far as the particular style of public to which one caters is pleased, just so far will one meet with success. A street car line must have the good opinion of the people or it will be an absolute failure, and to gain that good opinion it must have a steady, reliable car service and, above all, trustworthy motormen and conductors. As a matter of course, to have good car service means to have as good cars as one can get, and thoroughly capable men in the power house, but it is of the latter condition, motormen and conductors, that I want to speak now. These men should be selected with the greatest care, for—especially on an interurban line—a great deal depends on them. The motormen should be the kind of men that make good soldiers—with a quick eye, a steady nerve, a strict attention to duty, and should know well how to obey without questioning. Conductors must be equally able to deal with a disorderly crowd or to assist the aged and helpless, thus combining two great powers, strength and tenderness. Of course, only temperate and honest men should be employed in any way by a street car company.

Believing, as I do, that so much depends upon the men, it is necessary, after making a careful selection, to employ the best methods of inducing them to do their best. And I have found a mutual respect a great incentive in that line. To be met on an equal footing, to be made to feel that one gets credit for honest effort, and to know that mistakes, when they are really accidental, will be treated kindly and quietly by the employer, does much toward awakening the better qualities in a man, and that being done, the rest follows, naturally. It has been my constant endeavor to make our employes feel that what benefits the road benefits them, and thus they put forth their best efforts. Above all else they must understand that any work wherein a number of men are employed, must have a head, and that it is their duty to obey that head implicitly. Men are prone to think that a woman knows nothing about law and order, and obey her simply because she is a woman, but perseverance will gradually win a way into their confidence, and when that is gained the greatest difficulty has been overcome. With a large force of men ready to obey, on the instant, any orders that may be given them, there is a feeling of safety in the face of the gravest danger.

Any woman may take up railroading and make a success of it; for I believe that it is a position for which women are well fitted. A quick brain, dependence upon one's own judgment, and a strict observance of the rules of law and order will, with some knowledge of business principles, be found the chief requirements. Constant contact with humanity will broaden one's views, and the ever varying phases of railroad business will brighten one's intellect to such an extent that such a position affords a wide field for doing good—that one thing, above all others, that women wish to

do. And I hope soon to see the day when women will understand the benefits of and take their place in positions that offer such benefits both to themselves and to humanity.

Miss Anna E. Mitchener, who has for the last six months occupied the position of superintendent of the Tuscarawas Railroad Company, was born in Indiana in 1877, but removed with her family to Salt Lake City when two years old, and her childhood was spent on the shores of that inland sea. In 1891 her family removed to New Philadelphia, Ohio, where Miss Mitchener attended the High School and was graduated in 1894. The follow-

MISS ANNA E. MITCHENER.

ing fall she entered the Moravian Seminary at Bethlehem, Pa., expecting to pursue a classical course, but was obliged to withdraw after six weeks of study because of the failure of her eyes.

In June, 1896, her father, C. E. Mitchener, completed arrangements for the construction of an electric railway connecting New Philadelphia and the "twin cities" of Uhrichsville and Deunison. Miss Mitchener assisted her father in his correspondence and clerical work, and in this way became acquainted with the road in its infancy and gained in knowledge of the railway business as it grew to completion. From the date of its opening, September, 1896, she has been in the office and when her father was called away on an extended trip in November last he decided to leave the work in her hands. Since then she has filled the office of superintendent and has met with marked success in every way.

### NEW MISSOURI INTERURBAN.

The Hannibal, Palmyra & Suburban Electric Railway has been organized with a capital stock of \$275,000 to purchase the present street railway in Hannibal, Mo., and build extensions. These will be to South Hannibal, the Cemeteries and Hannibal Cave, about 2½ miles; to Oakwood, about 1½ miles, and to Palmyra, about 10 miles.

D. Thomson, of Hannibal, also advises us that the company will build a steam heating plant to supply the business section of the city with heat from the exhaust of the power station. Street railway, power and heating franchises for 33 years have been secured. A bond issue of \$200,000 has been authorized and will soon be placed on the market.

The safe in the office of the Buffalo & Williamsville Electric Railway Company was blown to pieces and the office destroyed. As there was no money in the safe the mission of the robbers was in vain.

**STRIKE AT SEATTLE.**

The conductors and gripmen of the Front Street Cable Railway Company, Seattle, Wash., struck for an increase of wages to 22½ cents per hour. There are 22 men running six trains on the line which is a particularly hilly and circuitous one. Three years ago when the patronage was poor on account of the hard times the uniform scale of wages was reduced from 22½ cents to 20 cents per hour to those who had been in the company's employ for more than a year, 19 cents for those between six and 12 months, and 18 cents for those under six months. The men thought the increased patronage justified a return to the old rate, but Receiver Colvin did not look at it that way and employed new men to run the cars. On account of private business affairs W. M. Caldwell, the superintendent, has severed his connection with the company.

**HIGH SPEED ON THE LORAIN & CLEVELAND.**

The Lorain & Cleveland Railway has made some remarkable records for high speeds. This line is 26½ miles long running from Lorain to the Public Square in Cleveland; from Lorain to Rocky River, about 18 miles, the company owns the fee of the right of way. This portion of the line is single track with turn-outs, and is practically devoid of curves and grades; it is laid with 70-lb. rails. From Rocky River to the Cleveland terminus, cars are operated over city tracks.

The regular schedule time for the whole distance is 90 minutes, but the necessity of conforming to the city headway from Rock River to the Square makes the schedule speed on the single track line about 30 miles per hour, including all stops. The following is a copy of the record of speed tests recently made.

Going West.	Time.	Distance.	Minutes.	Miles per Hr.
Lv. Rocky River double track	12:10½	3.56	5½	39
Ar. Dover Switch	12:16			
Lv. Dover Switch	12:17	4.52	6	45.1
Ar. Mitchell Switch	12:23			
Lv. Mitchell Switch	12:24	2.44	3	48.8
Ar. Avon Beach Park	12:27			
Lv. Avon Beach Park	12:28½	1.39	1½	55.5
Ar. Sheffield Switch	12:30			
Lv. Sheffield Switch	12:31	4.91	7	42.2
Ar. Reverse Curve	12:38			
		16.82	23	43.8
Going East.				
Lv. Reverse Curve	1:48	4.91	6	49.2
Ar. Sheffield	1:54			
Ar. Avon Beach Park	1:56	1.64	2	49.2
Lv. Avon Beach Park	1:59	2.44	3	49
Ar. Mitchell	2:02			
Lv. Mitchell	2:15	4.52	6	45.1
Ar. Dover	2:21			
Ar. Double Track	2:27	3.84	6	38.5
		17.35	23	45.5

It will be remarked that the time going east was the same

as the time going west, but that the distance is .53 mile greater going east. General Manager F. W. Coen says, in explanation of this, that all the switches are on the north side of the track and are taken going west, while going east the entire distance is straight track. The highest speed for any distance was 55.5 miles per hour; this was made on straight and level track between switches. This speed and the speed of 45.5 miles per hour for over 17 miles are believed to be the highest as yet attained on electric street railways.

**PAN-AMERICAN EXPOSITION POSTPONED.**

Buffaloians have abandoned the idea of holding a Pan-American Exposition near that city in 1899, owing to the lack of financial support of the scheme. It will be remembered that Capt. John M. Brinker, president of the Niagara Falls & Lewiston Railway Company, is president of the Pan-American Exposition Company, and that W. Caryl Ely, president of the Buffalo & Niagara Falls Electric Railway, was selected as director general of the project. The status of the scheme is recited in the following official statement:

"While the progress made in the financial arrangements for the Pan-American Exposition has been of a very satisfactory character, and the interest manifested by the citizens of the various communities on the Niagara frontier has been most encouraging, the immediate development of the project has been arrested by the unsettled condition of the public mind because of the Spanish-Cuban complications and the consequent apprehension of war. On account of this condition of public affairs it is believed by those best able to judge that at the present time it would be practically impossible to secure from Congress that recognition for the exposition which is considered eminently desirable to insure its success. It is not improbable, however, that the condition of material affairs may before long assume a more pacific phase. If this proves to be the case, the question then confronted will be 'Will there be sufficient time left in which to carry out the exposition in a comprehensive and effective manner upon the lines hitherto contemplated?' Possibly the answer may be in the negative, but even then it by no means follows that the project will have lost its vitality. A postponement of the time of holding the exposition for a year or even until 1901, may be found expedient. Those originally interested in the enterprise will not definitely abandon it until every means of carrying it to a successful issue have been abandoned."

**MIDDLETOWN-GOSHEN TRACTION COMPANY.**

The Middletown-Goshen Traction Company of Middletown, N. Y., has defaulted in the interest due January 1, on the first mortgage bonds, and a foreclosure is imminent. To save the expense of such a proceeding the company and the bondholders have agreed to pay creditors 25 per cent of their claims in full settlement before May 1, 1898. Nearly all of the creditors have accepted these terms. The unsecured liabilities amount to \$32,000. Those desiring to join in this arrangement should notify Wm. B. & H. B. Royce, 75 North street, Middletown. The bondholders' committee consists of Robert Wetherill, David A. Hunter and William S. Grant, Provident building, Philadelphia.

## NOISELESS ROLLING STOCK.

The REVIEW has called attention to the desirability of noiseless rolling stock for electric railways, and now the Chicago City Railway Company has built a car with that conception embodied in every element of design. C. E. Moore, master mechanic, worked out the details of the car, and President Bowen was so well pleased with the idea that he decided to have the car built and give it a thorough trial.

In the general dimensions of the body the car is the same as the standard closed car of the company, with the addition of the vestibules at the ends. The exterior is painted in the different shades of green, but in other respects it resembles the standard car, as may be seen in Fig. 1. Fig. 2 shows the interior of the car, which is very attractive. The car steps are covered with rubber matting and the floor with coca mats so arranged that the doors to the motors can be easily opened. Beneath the mats and extending up under the seats is a covering of "linoleum," which is extensively

facturing Company. The curtains are of special make of tapestry with Forsyth fixtures.

In each window casing is a push-button, to be used by the passengers to notify the conductor to stop the car. The buttons are connected to four dry cells under the seats to two bells, one in each vestibule. The motorman is instructed to pay no attention to any such signal, as the usual gong is provided for signals to start and stop the car.

The Carter momentum brake is used on this car. The brake staff is connected to a short horizontal shaft and bevel gears, as may be seen in the illustration. This alteration was made so that the brake staff could be placed close to the dash and not obstruct the passageway.

The most striking peculiarity of the car is the decoration, especially in the interior. No natural woods show in any part, every bit of wood work being painted in some harmonious shade of green. The decorative figures are all made with stencils, and the effect is very pleasing. By this system of painting, cheaper grades of lumber, and lumber that is

FIG. 2.—NOISELESS CAR, CHICAGO CITY RAILWAY.—FIG. 1.

used on hotel or corridor floors to deaden sound. Here it prevents the transmission of the noise of the wheels and motors into the interior of the car. The panels beneath the windows and in the roof of the monitor are stuffed with mineral wool. The mineral wool is placed in paper sacks cut to fit the hollow panels and pushed into place, and this effectually prevents any drum-like vibration.

The windows are all fixed, which in some cases might be an objection, but as it is only desirable to have windows open for a few days in the spring and fall, open cars are put in service as soon as the weather will permit, it was thought that the freedom from rattling and the greater warmth would more than compensate for the fixed windows. The small windows in the monitor provide for ventilation. The glass is set in rubber in the sash, and the sash is lined on the outer edges with strips of rubber  $\frac{3}{8}$  in. square. The doors are hung on rollers at the top instead of rolling on a track at the bottom. The track is off-set at either end so that when the door is fully opened or closed it is let down on a flange at the bottom and rests on a rubber strip. The arrangement of the doors and windows makes the car unusually free from vibration and warm in winter. The heat is supplied by a Columbia stove, made by the McGuire Manu-

off-color can be used. While the first cost of painting is a little greater, it is believed that the test will demonstrate that the maintenance charges will be less.

The motors are the standard Westinghouse 12 A, 30 h. p., and the controllers are the General Electric K2.

---

**VAN DORN'S LATEST.**

W. T. Van Dorn, of the W. T. Van Dorn Company, Chicago, whose couplers are standard on so many roads, has just brought out a new invention which has received the strongest endorsement from every steam and street railway man to whom it has been shown. It is a spring housing for draft rigging for steam and electric roads. He has combined in two parts four-fold spring resistance, each way, and this can be increased to an indefinite extent without an increase in the number of parts except the springs. The principle is equally well adapted to car trucks for electric railways or steam roads. The M. C. B. coupler requires 59 conditions to apply, while the Van Dorn has only 10 conditions, and gives unlimited spring resistance in addition. Every claim set forth in the patent was fully allowed.

## OWNERS OF STREET RAILWAY STOCKS.

The stock in the three large street railways in this city is held, not by a few millionaires as many suppose, but is divided among nearly 3,000 stockholders, of whom a very considerable number are widows and wards. A recent resume of the stock records of the companies resulted in the tabulation of the following figures:

### West Chicago Street Railroad:

Owners of 1 share.....	103
Owners of 2 to 5 shares.....	532
Owners of 6 to 10 shares.....	245
Owners of 10 to 50 shares.....	435
Owners of 50 to 100 shares.....	234
Owners of 101 to 1,000 shares.....	177
Owners of more than 1,000 shares.....	18

Total stockholders.....1,744

### Chicago City Railway:

Owners of one share.....	22
Owners of two to five shares.....	82
Owners of five to ten shares.....	62
Owners of 10 to 50 shares.....	222
Owners of 50 to 100 shares.....	65
Owners of 100 to 500 shares.....	140
Owners of 500 to 1,000 shares.....	31
Owners of 1,000 shares and over.....	24

Total shareholders.....648  
Number of women stockholders.....245

### North Chicago Street Railroad:

Owners of 1 share.....	18
Owners of 2 to 5 shares.....	88
Owners of 6 to 10 shares.....	60
Owners of 10 to 50 shares.....	195
Owners of 50 to 100 shares.....	68
Owners of 100 to 1,000 shares.....	106
Owners of more than 1,000 shares.....	7

Total stockholders.....542

## THE LONDON UNDERGROUND STEAM ROADS.

For nearly 30 years the steam locomotives have been used to operate the cars on two underground railways of London. These tunnels have been poorly ventilated, which has been a source of trouble for many years. The traffic has constantly increased, and last year 136,680,884 passengers were carried. Very large sums of money have been spent in the construction and equipment of these roads. The Metropolitan Railway is  $69\frac{1}{4}$  miles and the Metropolitan District Railway is  $14\frac{1}{4}$  miles long, the cost of the two aggregating \$100,000,000. Last year Parliament appointed a committee to investigate the question of a suitable traction system. The first conclusion of the committee was that electric traction should be adopted. It seems rather singular that the management should state that: "The moment we can get a reliable firm or combination to undertake the working by electricity we shall accept it," and "The question to be solved was having a sufficient reserve of energy in the event of two, three, four or more trains wanting to start at the same time for them to do so. That was a problem exciting the minds of electricians." Perhaps these are questions taxing the capacities of the companies and electricians of England, but they simply provoke a smile with designers

and manufacturers of American apparatus. Yet there is objection to employing American engineers to make the much-needed alteration with American apparatus.

## CAR BARN DESTROYED BY FIRE.

During the blizzard of February 20 the car barn of the Menominee (Mich.) Electric Light, Railway & Power Company caught fire and was entirely destroyed. There were eight motor cars, five trailers and repair wagons in the barn at the time; of these only three cars in a badly damaged condition were rescued. The fire was attributed to a live wire in the barn. The loss is estimated at \$30,000, with insurance of \$1,500 on the building and \$19,000 on the cars. Superintendent Daniel telegraphed orders for new cars to be delivered April 1, and asked for spare cars from the railway companies of Marinette, Janesville and Escanaba.

## SCORES THE VESTIBULE.

The Salem (Mass.) "Observer" says: A terrible accident occurred on the New People's Line of electric cars at West Newbury on Monday, during the storm, which demonstrated most terribly the danger which street car people have urged against the vestibuled car, the liability of collision. It was by far the worst electric car accident in the history of Essex county and it is a source of satisfaction, that there were only a few people in each of the colliding cars for had they been heavily laden the loss of life must have been terrible. As it was one of the motormen had his leg cut off and the conductor was thrown down and his leg broken. The accident occurred at the foot of the famous Pikestave hill. The cars were off the regular time and the motormen did not discover each other's cars, until they were so close together that their momentum could not be arrested.

## EXHIBITS AT ILLINOIS STATE MEETING.

On the invitation of the members of the executive committee of the Illinois Street Railway Association, a meeting was held in the Tremont house on February 19 to discuss the question of an exhibit at the coming state association convention. A committee of supply men was appointed with W. J. Cooke chairman, to canvass the matter. This committee did so and met at the office of the Wells-French Car Company on February 24, where it was found nearly all the proposed exhibitors had already promised other exhibits at the same date as the Illinois meeting and therefore it became impossible to make a display at the state meeting. It was unanimously voted to recommend to the executive committee the change of a few days in the date, so as to bring that convention to the date set for the convention of the National Electric Light Association, which convenes in this city on June 7, 8 and 9, in which event the supply men could make a joint railway and lighting display. Inasmuch as the two meetings are only a few days apart and many delegates will want to attend both, it would seem altogether the wiser plan to change the Illinois date to conform to that of the Electric Light Association, each association meeting separately but with the exhibits all being under one roof.

President Patterson is strongly in favor of the plan and as soon as he can get a meeting of his committee, it is expected the proposed scheme will be adopted.

Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.

The street railways of Chicago have applied to the city council for franchises on some 12 miles of streets.

During the winter time the Twin City Rapid Transit Company of St. Paul runs a sand car over its lines each night and sands the rails, an extra supply being given to the track at grades.

A head-end collision between trolley cars of the Lowell & Suburban Street Railway Company occurred in North Chelmsford, Mass., in which several persons were severely injured and the cars badly damaged.

A motor car of the Evansville (Ind.) Street Railway Company was struck by a passenger engine of the Eastern Illinois Railroad, the conductor being killed and the motorman and one passenger seriously injured.

The Plainfield (N. J.) Street Railway Company has put in a new equipment of motors one on each truck and these have given good satisfaction. Not one burn-out has resulted from the snow and water since the new motors were put on the cars.

An open switch at 31st street and Center avenue, Chicago, which the motorman failed to notice in time to stop, permitted a trolley car to leave the track and take a run over the pavement. A pedestrian standing near the track, waiting for the car to pass, was run over and badly injured.

An attempt was made to hold up a car of the St. Joseph Railway, Light, Heat & Power Company but the prompt action of the conductor put the highwayman to rout. The conductor drew his revolver when threatened and the robber took refuge behind a trolley pole until the car was out of range.

The statement of the Metropolitan Street Railway, New York, for the last quarter of 1897, shows an increase in the number of passengers carried of 2,214,000; in two years the increase has been 10,906,740. The earnings on the stock for the quarter were 1.785 per cent as against 1.36 per cent in 1896, and 1.19 per cent in 1895.

The report of the Toronto Railway Company gives the net profits for 1897 as \$332,022; of this dividends of 3½ per cent on the capital stock took \$210,000, and paving charges \$60,000. During the year 10 closed and 20 open motor cars were built in the company's shops, and 31 metal trucks and 50 motor equipments were added.

The board of directors of the Worcester (Mass.) & Suburban Railway Company decided to issue no more pass-books as they have been a constant source of trouble. No one will be entitled to ride free on the cars except employes in uniform. Even the officers and directors will be compelled to pay the full fare on the cars.

An ordinance has been introduced in the Oakland (Cal.) city council providing that each street car in the city shall have a crew of two men, each of whom shall not be less than 21 years of age. Some of the conductors employed by the street railway companies are mere boys and this ordinance is designed to put a stop to this custom.

The breaking of an intermediate gear in the cable plant of the Ninth street line, Kansas City, on February 21, tied up that line for 23 hours. A similar accident also occurred a week later in the plant at St. Paul. This accident was caused by a loose nut falling into the mesh, breaking out the teeth in blocks of five. Such accidents are quite rare.

Some miscreant piled stones on the track of Hagerstown (Md.) Railway Company, evidently for the purpose of wrecking the car. The motorman discovered the stones in time and removed them. Later in the evening the conductor was struck in the face by a stone. This was likely done by a passenger who was ejected by the conductor a short time before.

A verdict of \$10.10 was given to G. W. Carr against the Toledo Traction Company because he was compelled to pay an extra fare for an improperly punched transfer and a transfer was refused him on another line for the reason that he had not asked for it at the time he paid his fare. The case was immediately appealed and will be sharply contested by the company.

The Macon (Ga.) Consolidated Street Railroad Company has made a change in the length of the working days of its conductors and motormen. Formerly their services have been required from 12 to 18 hours a day, but now nine hours is a day's work with a maximum of 12 hours. By this change a large number of extra men have been given permanent employment.

During the rush hours in the morning and evening the trolley service on Brooklyn bridge has been found inadequate. A 15-second, and in some cases a 12-second, schedule is maintained but so great are the crowds, especially in the evenings, that it is like a Fourth of July jam at a pleasure resort. The cars from the seven lines now using the bridge number 2,050 per day but later on the cars from 15 lines will run over the bridge.

A bill has been introduced in the New York assembly compelling the street railway companies of New York city to provide two conductors to each car between the hours of 6 and 9 a. m., noon and 2 p. m., and between 4 and 8 p. m. Another bill provides that all the cars in the city, running less than the entire length of the line, shall have a sign showing their final destination.

The village board of Oak Park, a suburb of Chicago, insists upon the observance of an old ordinance which provides that the Chicago, Harlem & Batavia Railway shall furnish gates or flagmen at all street crossings in the village. This line is operated by the Suburban Railroad Company, and to comply with the law each car stops on the near side of every cross street, while the conductor walks leisurely ahead with a red flag.

Sir Frederick Bramwell is quoted as saying: "Another reason why electric traction has not made more headway in this country (England) as compared with America, is that in the United States they have not, as we have, legislation which checked private industry and would compel the proprietors to sell their property after a certain number of years at the price of old iron."

The Barney & Smith Car Company, of Dayton, O., has commenced a suit for \$19,000 against the Syracuse Rapid Transit Company for cars built by the former company. W. W. Hazzard purchased the cars and gave securities for \$19,000. The car company claims that the railway company is liable, Mr. Hazzard acting as its agent, but this is denied and payment refused by the transit company.

The statement of the earnings of the Brooklyn Rapid Transit Company indicates a decided improvement in traffic over the last two years. For the month of February the earnings were \$385,967, which is more than \$25,000 above the incomes of either 1896 or 1897 for the corresponding month. For the eight months preceding March 1 the earnings were \$3,607,823, a large increase over preceding years.

There is a city ordinance in Indianapolis that all street cars shall be heated when the temperature is less than 20° above zero. A passenger noticed that there was no heat turned on one morning when the temperature stood at 19° above and complained to the police court. J. M. Elliot, superintendent of the Citizens' Street Railway Company, was fined \$5 for the violation, but an appeal to the circuit court was taken.

Messrs. Bundy & Thompson, formerly room clerks at the Hotel Hollenden, Cleveland, have entered the field on their own account, and are now the proprietors of the "Stillman," which is centrally located on the famous Euclid avenue, and is absolutely fire proof. They are very popular young men with a wide acquaintance among the street railway men, who will find the Stillman a good place to make headquarters when visiting in Cleveland.

A peddler, while driving along the track of the Consolidated Street Railway Company, of Grand Rapids, Mich., fell asleep on his seat, it being late at night. There soon followed a head-end collision with a trolley car, which could not be stopped in time. The force of the blow threw the man through the front window into the vestibule of the car with hardly a scratch. The only unfortunate result of the accident was that the horse was killed.

A motor car of the Chicago City Railway Company was struck by four wild freight cars loaded with stock while crossing the Grand Trunk Railroad. The car was thrown violently on its side, killing the motorman and rendering unconscious two of the passengers. The grade crossing was guarded by gates and a flagman, and the conductor preceded the car but they failed to notice the detached freight cars which were coming swiftly and silently to the crossing.

The Capital Traction Company, of Washington, has started its cars on the electric conduit system which has

just been finished along the 14th street line, which are now running as far as the Treasury building. The current is supplied from the power station of the Potomac Electric Company and the whole system is working with perfect satisfaction. The cars will not be put in operation on the Pennsylvania avenue line before the power station of the traction company is completed.

The Boston Elevated Railway Company has invited competitive designs for a standard passenger station and a prize of \$1,000 is to be given for the successful plan. The intention is to get a structure which combines strength and security with architectural beauty. W. E. Baker, general manager of the Metropolitan West Side Elevated Railway Company, of Chicago, and W. T. Groundie, of the Kings County Elevated Railroad, has been called in for consultation. All plans will be submitted for the approval of Mayor Quincy.

The Michigan Manufacturing Company, Ypsilanti, Mich., is meeting with much success with the Sweet rail drill, manufactured by it. This drill, which was illustrated in the REVIEW, July, 1897, can be adjusted to or removed from the work in three seconds; it is simple in construction and can be operated by the cheapest labor. The drills are made for either T or girder rails, and there are special designs for structural work. The weight is about 150 lbs., and when it is desired to move it, it is turned upside down, and the balance wheels serve as a truck.

Arrangements have been completed between the Cleveland, Painesville & Eastern Railroad Company and the postal authorities to operate a mail car over the lines of the company. A new car will be built at once according to the specifications of the post office department. The car will leave Painesville going west daily at 6:30 a. m. and 2:30 p. m., and will leave Cleveland at 8:30 a. m. and 1:30 p. m. A mail clerk will be in charge of the car and distributions will be made along the route which will be a great boon to the residents of the suburban towns.

The motormen on some of the Brooklyn trolley lines took a unique method of protecting their faces from the wind and snow during the recent blizzard. One man, whose face had been blistered by the driving snow and the cold bought a false face at a toy shop and tucked it in between his fur cap and collar. The efficacy of this idea was recognized by his fellow employes, who were likewise exposed, and they adopted the same plan for protection. To those who were on the streets at the time of the storm it was a fantastic sight to see the grotesque faces peering out from the front platforms of the cars.

By a strange irony of fate the claim agent of one of the roads in Kansas City was badly injured by one of his own company's cars. At last accounts he was spending the forenoon in presenting the merits of his case to himself and trying to work on his own sympathies for a liberal allowance for these well nigh mortal injuries; and the afternoon in the endeavor to make himself believe he was out of town at the time the trouble occurred; meanwhile, being his own attorney, he has to lie awake nights for fear he will settle with the company on the quiet, and lose his fees for having handled the case and secured the settlement.

The International convention of the gas, electric light and street railway men, comprising the Texas Street Railway Association, the Texas Gas & Electric Light Association, and delegates from Mexico, was held in Laredo, Texas, March 9-11, inclusive. There were a number of causes which combined to make it impossible for many of the street railways of the state to be represented, and the plan, originally outlined, of having separate meetings of the two associations was abandoned, and the papers by street railway men were read before the joint sessions.

The convention was called to order at 9 a. m., Wednesday, March 9, and L. J. Christen, mayor of Laredo, delivered the address of welcome, as follows:

---

**Address of Welcome.**

---

The city of Laredo bids me greet the stranger within our gate, not as a foreigner, but as a guest and friend, for whom nothing that we have is too good; and never was a behest more gratefully obeyed. When I say "welcome," I would wish you to understand it in that generous hospitality that it bears in our own south-land. We shall endeavor to bear substantial testimony to the fact that we are not unmindful of the compliment and honor bestowed upon us in the selection of our city for your convention. These words, my friends, are not addressed to you as lip tricks, and in no spirit of time-serving or apology.

The marvels of your electric currents outrival all the magic of necromancer and alchemist. You are compelling nature to reveal the secrets which she has so artfully concealed. Your science is the magnet of our times. It woos the thinker and the worker alike; it opens careers and pays rewards of dazzling brilliancy. Ever since Edison has made our life almost automatic and your science so alluring, devotees have been flocking to it by the thousands.

The marvelous triumphs of electricity have been as beneficent as they are great. You have in myriads of ways ministered to our comfort. You are the benefactors of our race and the civilized world is gazing with amazement upon the wonders of your inventions.

My friends, I shall not trespass further upon your attention. You have heard that Mr. Lincoln, when called upon by

a body of clergymen to suggest certain measures during the war, said to them that "most words he listened to in life generally reminded him of something, but what they had said did not remind him of anything." But the scientific men that I see before me today remind me of something, indeed; and I had begun the preparation of an elaborate address to tell you of the great things of which you reminded me, but the atmosphere became so suddenly charged with electricity by your arrival that Mr. Yeager's wires became crossed and we were enveloped in utter darkness; and as I am constitutionally opposed to working by lamp-light, I resolved to cut my speech short and to confine myself to wishing you, one and all, a most hearty welcome.

President Drake, of the Texas Street Railway Association, responded in a happy speech thanking the mayor and the citizens of Laredo, and concluded by introducing Antonio de la Fuente, one of the delegates from Mexico, who addressed the convention. The following is a translation of his remarks:

Ladies and Gentlemen: The bonds that bring all countries into nearer and more friendly relations are those of fraternity. The light that shines the brightest over the path of progress is that of intelligence, and the shorest road to prosperity is that of honest labor. Today, one of the cities of our sister republic opens with creditable pomp the doors of one of its temples built to honor the fruits of labor and intelligence, to receive us as brothers and make us participate in the admiration of the latest achievements of science.

It affords me a real pleasure to comply with the honorable commission vested in me by the Mexican delegates, to express our sincere appreciation of the words of kindness we received in reaching the land of the immortal Washington from the distinguished mayor of this city. At the same time I receive no less satisfaction in expressing that we feel grateful to the initiators of this valuable meeting of intelligence, to which meeting the Mexican delegates attend possessed of the deepest feelings of admiration, respect and friendship; I say admiration because such is due to all which is wonderful; respect, for such is the tribute we owe to the conquests of knowledge, and friendship, because the bonds of fraternity which unite our countries are daily growing stronger. It is this principle of union that we must guard, and every citizen of the two great republics must concur in the task of

preserving it, with as much fidelity as we preserve the memory of our great ancestors.

L. T. Fuller, president of the Texas Gas & Electric Light Association, responded to the address of Senor Fuente, as follows:

It is with pleasure we greet you at this, the fourth annual meeting of our association, and we assure you we feel highly honored by your presence among us, and hope that your visit will be a pleasure to you and that you may profit by this meeting and find something that may be useful to you. We must, nevertheless, remind you that ours is a young association, but our members you will find are among the principal gas and electric light plants of our state, and some among us represent the great industries of the United States, you will also find that a great many of our principal manufacturing industries are represented in the display and exhibit

### Associate Work.

BY CARL F. DRAKE, AUSTIN.

The Good Book teaches us that God created man after His own image. If He had also given us those other attributes that go to make up a perfect creature, we should have but little reason to discuss the question of associate work, or to consider the evils as well as the benefits that arise from a concert of action amongst those whose interests harmonize.

Associate work is as old as history—yes, even older than written history; and so far as modern times are concerned, when the first bright rays of civilization cast their glinting beams on the dark ages of barbarism; when the semi-barbarous tribes of Europe began to feel the warmth of the new and better life, associate work was found necessary. First the traders and the crude artisans joined together for mutual protection as against the neighboring tribes; then the masses organized to protect themselves against the more powerful owners of the land; then certain classes of mechanics and artisans associated themselves together

MAYOR CHRISTEN.

PRESIDENT DRAKE.

PRESIDENT FULLER.

which you will be shown; the papers that will be read in your hearing we hope may be of interest to you, and that it will be a pleasure to have you enter into the discussion of them; and we desire to have the pleasure of numbering you among our membership at this the beginning of our first international association meeting and hope it will redound to our mutual interest, and that you will lend your aid and kindly preferred endeavors in building up an association that we may all feel proud of in the future.

At the first inception of this international meeting it was unanimously agreed by our executive committees to invite you, and again I assure you, we feel by your presence that we have been honored, and we thank your consul, Senor Ornelas, at San Antonio, and the minister of foreign affairs of the Republic of Mexico, for the kindness shown and interest taken in aiding us in bringing about this meeting, and we also have to thank the seniors in the several states that have so courteously aided us, and have to regret that the time was so short that some of them could not accept the invitation and be present with us.

Now, gentlemen, as the mayor of the city has so kindly tendered to you and us the hospitalities of the city of Laredo, we now turn you over to the members and our ladies and the several committees, and hope you will feel at home among us.

to protect some trade secret or particular style of workmanship. These latter organizations—guilds as they were called—soon spread over Europe and, particularly in the northern countries, became important factors of government. And so on down—the laboring classes, the commercial elements, and the very government itself has found the corner stone on which to erect the structure of success in associate work. And so long as organized labor has been confined to the honorable upbuilding of trade, commerce or good government, so long has associate work been most valuable; and if it had been confined to these channels there would have been but little use for us to discuss the advantages and benefits to be derived from associate work. But, unfortunately, like many other of the choicest gifts to man, the power that comes from a concert of action has so often been abused that even the most innocent organization, formed as ours is, not for gain or to foster the interests of any man or class of men, but rather as an educational institute, is looked upon with suspicion, and its actions closely watched by every shyster politician who hopes by this means to further some personal interest, even at the cost of the betterment of our people. This, my friends, is not confined to our own country, but wherever the touch of liberty has opened the gates to discussion.

Now, for a moment let us consider the reasons why we must defend as well as advocate associate work. As far back as the ninth century we find associate work in the feudal system, which is the foundation of our present form of government. Associate work was necessary for protection and development, but as the lord grew strong and waxed rich from the labors of his vassals, the old Adam developed and caused him to take advantage of his stronger organization to overthrow his neighbor, and thus the

story of evil results from the purest and best inceptions. And from that day the same unfortunate principles, or, rather, the lack of principles, have caused man to pervert those good things for pernicious and unlawful purposes. Such is the history of man's ambition, and often of his downfall.

Early in the sixties trades unions sprang up in England, fostered and encouraged by the government, and were doubtless of much benefit to the laboring classes, but, unfortunately, as they grew stronger there was but a repetition of history. Their power became such an important factor in the commerce that it was found necessary for the government to appoint a commission to examine into the modus operandi of the trades unions. This resulted in the enactment of laws in '69, '71 and '75, defining their rights and prescribing the limits to which they might combine, and how far their acts were lawful. Germany, France and Italy have also found it necessary to deal with these questions with more or less severe measures.

Of the darker side of associate work in our own country, about the first combination that proved a menace to society and threatened our commercial interests was that horrible organization formed amongst the coal miners of Pennsylvania, known as the "Molly McGuires". Horrible in its inception, dangerous from its birth, it took most severe measures to suppress it; and did more harm to labor and kindred peaceful organizations than can be eradicated by a thousand useful deeds. Perhaps the next most dangerous was that created by one Debs, who boasted but a year or two ago that at his word a million men would lay down their tools, and so hamper the wheels of commerce that the world of business must accede to his most outrageous demands; and while scarcely 5,000 answered his call, yet a trail of blood was left behind, and many widows and helpless children even today cry aloud against a crime perpetrated under the name of peaceful organization. But enough of this; we have endeavored to illustrate the evils that may arise from the vicious use of a most worthy method, where the greed for power or the hope of gain may cause trouble and disaster when placed in the hands of the avaricious or the ignorant.

Now let us look at the other side of associate work, and the advantages that may be derived from a proper use of its powers. The very foundation and corner stone of every Christian and civilized government is based upon organized efforts, and no nation exists to-day that cannot trace its origin and progress to associate work, and if we but had the time to compare the growth of the recognized nations of the world we would find that the ratio of united action measures the amount of development attained. The two grandest examples of the present age, the United States and her sister Republic of Mexico, are lessons of associate work that will live so long as history shall live. Divided as we are into municipalities and states, for the better management of local affairs, we are each a grand association for the purpose of better government, furnishing a larger field for development and better protection of our citizens. In our own country, the Brotherhood of Locomotive Engineers and the Knights of Labor, as operated under the guiding hand of Mr. Powderly, together with the hundreds of commercial clubs and kindred organizations, all bear witness to the wisdom of and the benefits to be derived from associate work. Associate work has, by its fostering care, given to us the greatest gems of art; by its support and encouragement developed for our use the best thoughts of man. It has builded well of church and school; it has been the best friend of the scientist; it has brought together the greatest minds of the world; and by an interchange of experience and the introduction of new thoughts has given to us the wonderful development and advancement of the nineteenth century. Individual minds must, of a necessity, if much work is accomplished, work in a single channel; and the collection of these ideas by association is what gives the world the best and greatest results. They formulate and prepare; then, by the aid of associated capital, theories become facts. What individual would have linked the Atlantic to the Pacific with an iron bond that makes orient and the occident almost one? What single person had the power to wrest from savage hands the broad plains of our beloved nation and offer them up to the sturdy frontiersman? Who, without associate work, could have turned these wild lands to the richest gardens, with a wealth of products that feed and clothe the world? Who would have dared to link all nations together with a wire, each moment pulsating with the news from all the world? And

so on we might at length illustrate the advantage of working together. Yes, my friends, we live in an age when man must realize that he is but an atom in the march of progress; we must realize that no matter how stalwart we may be we cannot combat with the wave of associate work.

We meet here to-day as the representatives of two organizations, whose members have taken up for their life work the study of that wonderful power, the effects of which we know so much, but of its origin and the limitation of its power so little—a power that we have chained by but a slender thread. We know that it is all powerful, but from whence it comes or what its limits are, we know not; we still grope in the darkness of theory, with but a limited application. These gentlemen who have made particular branches of the work their study, come to tell you of the knowledge that they have gained, to interchange their varied experiences, realizing that by association each may help the other to a better understanding, so that we may all be more useful and successful workers. Who can for a moment question great benefits of a concert of action? Who can say in honesty that the benefits do not far exceed the evils that arise from men forming themselves into organized bodies? Why, the very organizations such as we represent are necessary to hold in check and to overcome

JARVIS PLAZA.

the evil effects of man's greed. Civilization, church, state, science, the arts—all demand the best efforts of man, and man singly cannot combat with the demands of the progressive age in which we live; therefore, the peculiar necessity for combined effort. So let us active workers upon whose shoulders rests the responsibility of writing the last pages in the great book of the nineteenth century so unite our efforts that our children and our children's children, when our life's work is over and they are called to add their chapter to the history of the new century, may look back upon us and our work with pride and satisfaction that can only come from gleanings the best thoughts, separating the chaff from the wheat, and in the great mill of associate work bringing forth the richest proceeds garnered from the experiences of a century that will then be dead.

The meeting then adjourned till 2 p. m., when the officers and committees made their reports, and the convention proceeded with papers. The papers read by the delegates from the street railways will be found at the conclusion of the report of the convention. The papers read by the gas and electric light men included:

"Meter vs. Flat Rates," by J. R. Cullinane, Denison.

"Uniform Voltage and Continuous Service," by George R. Cushman, San Antonio.

"Street Mains and Services," by J. H. Fitzgerald, Houston.

"The Ups and Downs of the Manager," by J. D. Olinger, Cleburne.

"Instantaneous Water Heaters," by Thomas D. Miller, Dallas.

"Experiments in Efficiencies," by E. E. Gibbon, Corpus Christi.

"An Electric Furnace," by J. D. Cox, Galveston.

"Rates for Electric Lighting," by E. L. Wells, Jr., Marshall.

"Miscellaneous Matters," by W. L. Hall, Mexico.

On Friday morning it was decided to consolidate the two associations, and the new one will be known as the Southwestern Light and Street Railway Association. Officers of the new association were elected as follows: President, Carl F. Drake, Austin; secretary, E. L. Wells, Marshall; treasurer, Fred Frier, San Antonio.

The delegates were handsomely entertained by the local committees, and the citizens of Laredo during the intervals

CONVENTION HALL.

between the meetings of the conventions. Among the excursions was one to coal mining regions, 28 miles from Laredo.

After the adjournment on Friday evening the delegates left on a special train over the Mexican National Railroad for Monterey, Mexico, where they spent Sunday. The gold and silver mines and "El Toro" were the attractions at Monterey.

Among the exhibitors were the Waco Electrical Supply & Plumbing Company, Waco, Tex.; the Electric Appliance Company, Chicago; the Western Electrical Supply Company, St. Louis; the General Electric Company, Dallas, Tex.; the Central Electric Company, Chicago.

### Trucks and Their Maintenance.

BY GEORGE D. HARTSON, DALLAS.

The truck bears about the same relation to the equipment of a car as the management does to the road; it receives the blows, shocks and strains from the hard conditions in which it may be placed and delivers them softened and equalized to the traveling public in the form of comfort and pleasure. It is the court where justice is turned to mercy.

The first or incipient attempts at trucks were simply pedestal boxes fastened to the car body to furnish bearings for the axles, but now they are built to support and strengthen the car sills and protect the car and its load from the blows, jars and strains of severe service. Much work and cost of maintenance can be saved by a careful selection when getting equipment.

The first quality to look for is strength—ability of the parts to hold up and last. They should be braced so strong that they will stay in line and hold the wheels in line both on straight track and in going around curves. It is almost certain that sharp flanges and double treads are caused by the trucks allowing the wheels to get out of line.

The second is simplicity. A solid side bar is better than one built up of pieces bolted or riveted together, for it is almost needless to remind you that every bolt, nut, rivet or joint calls for inspection and attention, or it will be only a matter of time when they will work loose and repairs, if not worse, will be necessary. The fewer pieces, the less attention will be required.

The third point is convenience. Some trucks seem designed so that you can only get at the renewable parts in your mind and hardly with tools. To bang a motor, it is necessary to take off the car body, and to replace a pair of worn-out wheels will take all hands half a day, and to renew a brake shoe the car has to go over the pit. Motors must be inspected and overhauled, wheels will wear out and must be changed, and brake shoes must be renewed; and speaking of brake shoes—when will the truck maker win the lasting gratitude of the motorman and shopman by arranging an adjustable brake spring to let out as the shoe wears thin? Many a broken brake spring and many a cracked rib have been the results of the usual "once for all" spring in common use. The spring should have an adjustment of at least  $1\frac{1}{2}$  in. to allow for wear of the brake shoe and wheel.

The fourth quality, and an important one, is its riding quality. Some trucks ride easily at no load or light load, and others ride easily only when the car is loaded. A happy combination is one not too stiff when light and not "hard down" when loaded. The springs of a truck should have a short memory, a pitch hole in the track should not be repeated over and over again by the springs after the rough place has been passed. From common practice it appears necessary to have both coil and leaf springs.

The area of brake shoe surface should be sufficient to stop the car, but not enough to cause the wheel to slide. Many patterns of shoes could be shortened with safety in running and longer life to the car wheel.

The lubrication of the axle is better accomplished by oil and wick feed than by heavy grease. Who has tried roller bearings and gained experience from their use?

In closing, I will suggest a question: Why can there not be a standard axle—standard in length, at least, if it is impossible to be standard in diameter?

### Car Bodies; Their Maintenance and Repair.

BY FRANK E. SCOVILL, AUSTIN.

The maintenance and repair of car bodies being an important item of expense in the operation of a street railway system, the executive committee selected it as one of the subjects to be discussed at this meeting, and having assigned it to me I shall endeavor to present it in as brief a manner as possible.

The cost of maintenance and repairs of car bodies is on the same basis as that of any other part of the equipment, a great deal depending on the original purchaser and the honesty of the builder.

To maintain car bodies properly every system should have at least one extra body to every five cars in service in order to be able to spare one or more at any time for repairs. They should be frequently examined and great care should be taken to prevent the bodies getting loose in the joints or otherwise seriously injured before having proper attention, as in that case the expense of repairs will be much greater and the life of the car be very much reduced.

Car bodies that are used in this climate must of necessity have more attention and greater care than those used in most other parts of the country, owing to the long and continued hot seasons. The hot sun of this climate is exceedingly hard on wood work and paints. Continued drought, often lasting five or six months at a time, causes joints to open and paint to crack and peel, and in many sections of our state the alkali or lime dust is very destructive to the interior finish of the car, and experience has taught us that plush or cloth cushions are in all cases to be avoided.

FRANK E. SCOVILL.

It is our belief that the only way that car bodies can be prop-

Frank E. Scovill was born in the Town of Canaan, Litchfield county, Conn., June 14, 1862. At the age of 15 he entered the employ of the Western Union Telegraph Company as a messenger. In 1880 he became connected with the telephone business, first with the Thomson-Houston Electric Company at New Britain, and later with the same company at Lynn. In 1888 Mr. Scovill's health failed and he was advised to go west; he went to St. Paul, Minn., and became manager of one of the Erie Telephone & Telegraph Company's exchanges. Shortly afterwards he went with a lighting company and remained in the northwest with the Western Electric Company and the General Electric Company until 1894, when he was offered a position with the city of Austin, Tex., to supervise the construction of its plant. This contract for electrical construction and machinery amounted to over \$164,000, and Mr. Scovill saw that this was completed without any "extras" whatsoever. After this work was completed he remained as electrical engineer for the city until March, 1896, when he resigned to become secretary and superintendent of the Austin Rapid Transit Company.

erly and economically maintained is to put them first in as good and strong condition as it is possible to do, using only the very best grades of materials, including paints and varnishes, and to employ for this work only thoroughly competent workmen. Cheap labor is always dear at any price. To paint a car properly is an art in itself, and requires judgment and experience. A few cents added to the cost of material or to a day's labor may give the car an extra year of service.

All car bodies should go into the shop once each month and have the bolts and screws tightened up, and at least twice each year all marred and grazed spots should be touched up with paint and the body be given two coats of good varnish. This will preserve the paint, and the car will look nearly as well as when it first came from the repair shop. In this way car bodies can be kept in good condition for four or five years even in a climate like this. Owing to the small rail, low joints, bad track and generally faulty construction, which is the rule rather than the exception in the cities in this state, it is especially necessary that extraordinary care and diligence should be used in the repair and maintenance of our bodies.

When first appointed superintendent of the Austin Rapid Transit Railway I found the cars in a very dilapidated condition. Five of them were closed, and the others were open cars rebuilt and partially closed. We have rebuilt the closed cars after a style peculiarly our own, and which we find excellently adapted to the conditions that surround the operation of our property, but which might not be as satisfactory for others whose necessities are not identical with ours. We at Austin are fortunate in having streets that are wide enough to accommodate the travel of a much larger city, and the few extra inches taken up by the steps of this style of car are not noticed more than with open cars. The balance of the old cars were turned into animal cages at the park and sleeping rooms for our men.

When our road was rebuilt for electric service pine ties and light rails were used and after five years' service you all know the result, the car bodies telling the tale. The consequence was that at that time the whole system was like the wonderful "one-horse shay," going to pieces all at once. Our people were made to realize the necessity of doing something, so we began, a little at a time, and now we are in a fair way to have a good roadbed and to be able to keep up our rolling stock at much less expense than before, we having used over 18,000 cedar ties in the past two years.

You will notice in the illustration of one of the cars rebuilt, that we run a new sill under the entire length of the car, platforms and all. This had to be done on the first three in order to hold them together, and this sill has an iron plate 5-8 by 3-1/2 in. bolted on the outside of the entire length of the sill, thus making a strong support for the lookout platforms. The first ones of this style have been in service for over a year and a half, averaging 140 miles per day over the poorest piece of our track. To operate these cars we use a single G. E. 800 motor equipment, and the cars today show no signs of breaking away at any point. We purchased several light closed second hand bodies late in 1896. We ran them through the winter, then decided to rebuild them after the manner of others that were giving such excellent satisfaction, and today our closed bodies, excepting two purchased in December last, are after this style. The cost of this work, including material labor and supplies, besides adding many improvements, was a trifle over \$200 per car, and the first cost of these bodies to us delivered in Austin was not that much. We

consider that we have a good and reasonably cheap lot of car bodies.

You will notice that our steps are the same as the running board on open cars. This will accommodate about as many passengers to and from our parks and in crowds as an open motor would, and remembering that we take power on a meter basis we do not care to haul trailers more than is absolutely necessary to accommodate the travel. Some of you will ask are you not more liable to accidents by this manner of handling passengers? We answer no, as the facilities for hanging on are just the same as on open cars, and for over two years our claims for damages have been less than \$1,000 and over one-half of this amount was due to a lady falling out of an open car, and the balance was principally for broken vehicles, etc. We operate all closed motors with fare boxes now, and use trailers with conductors when necessary.

It is my belief that by the time our cars now in use are worn out there will be great improvements in the construction of bodies. I believe that steel I-beam construction will be almost exclusively used, reducing the dead weight and adding much strength to the bodies at possibly a smaller first cost and at a greatly reduced maintenance expense.

There has been a disposition in the past on the part of our legislature to somewhat hamper the operation of street railways, and

REBUILT CAR, AUSTIN.

some three or four years ago there was introduced in the legislature of this state a bill to force all systems to operate either open or closed cars during certain months of the year, thus necessitating a double equipment, something no line can afford, and had this measure become a law it would have forced us to materially contract our service, much to the inconvenience of our patrons and at a material loss to ourselves, and we hope that every representative of a street car line in Texas will make it his business to become acquainted with the member of the legislature from his district and so educate him as to our needs and to the great number of evils that now surround us and hamper our growth and development that he will see the necessity of assisting us rather than to add further loads to our already overburdened shoulders. Municipal governments also seem disposed in some cases to adopt a similar course, and we believe as much to the detriment of the people as to themselves.

In conclusion I will state that it was against my wishes to attempt to handle this subject, but I did so at the request of some of the committee who were aware that we had rebuilt our entire equipment. What has been said, is, however, the result of experience and is not theoretical.

The success attained in rebuilding and general overhauling the cars and system is in a great measure due to the encouragement

and ready assistance of our receiver whose business policy is, "Adopt a high standard and keep to it," a method so rarely pursued by the managers of street railway lines in the south. It seems to be the idea, with few exceptions, of the heads of most of our southern roads to operate their property with the least possible expense, regardless of the detriment to the machinery and equipment upon which of necessity is based the value of any street railway, and upon which depends so largely the earning capacity and the dividend paying ability of any system.

### Rail Bonding as a Power Saver.

BY H. C. CHASE, HOUSTON.

Rail bonding is a very important part of a properly constructed street railway using an overhead trolley wire for a conductor of current applied from some source containing electrical power and depending upon the rails upon which the cars are run to complete the circuit. It is generally known that rails connected by ordinary fish-plates furnish a very poor conductor for the electrical current, as the rail joints are generally rusty, both expand and contract, invariably work loose and they are not looked after until a bad joint is reported.

I think no well-informed street railway man will contradict me when I assert that the return current on probably a majority of the roads in this country is not as good as it should be, and that an appreciable loss in energy, therefore loss in dollars and cents, results. It is also probably true that a liberal return on the money required to thoroughly re-bond the rail would be realized. In many cases rails which are sufficient in conductivity to carry all the current required by the cars with a very small percentage of loss are imperfectly joined together at the ends electrically, so that a loss as high as 50 to 60 per cent results solely from imperfect or inadequate bonds. Probably there is not a road in this state operating so many cars that its rails are not ample to carry all the return current required with a loss of less than 10 per cent, and if the rails should be properly bonded to obtain such a result a good return on the investment would be insured. Many roads go on erecting heavy copper to carry the out-going or positive current, overlooking the fact that as good or better path is required for the return current. They depend on the ground, water and gas pipes in the vicinity to help out a poorly bonded track. These are very poor and uncertain factors at best, and very poor results are obtained wherever they are depended upon, always entailing losses not only to the street railway company, but also to the owners of the pipes by electrolysis. I believe there are few managers of street railways who realize what their loss on this account amounts to annually, and that many would be surprised if they could have the actual figures placed before them. The losses appear in various ways, principally, of course, in the direct loss due to energy required to overcome the resistance in the track. On many roads with a station voltage of 550 the average over the whole line is not over 400, or a direct loss of 27.8 per cent, while at distant points it may be as low as 350 or 300 volts, a direct loss of 36.3 and 45.4 per cent, respectively. Let us consider what a loss of 15 per cent on the track means to the railway company in dollars and cents. Take a road operating 25 cars daily, and assuming that fuel costs \$1.25 per car per day, or \$31.25 as total cost per day, which will give us \$11,426.05 annually. Now, 15 per cent saved on this amount equals \$1,710.92 annually, or 5 per cent on an investment of \$34,218.75. In addition to the direct loss above referred to in fuel, there are losses due to burning out of the electrical equipment, an item hard to estimate, but it is safe to say that 75 per cent of the burn-outs of armatures and fields on electric cars are due to the insulation on wires becoming overheated and therefore are weakened by being subjected to a current for which they were never intended. A motor wound for 500 volts to develop 26 h. p. requires 37.3 amperes. It will carry that amount of current without injurious effect, but to do the same work with only 300 volts requires 62 amperes, a current for which the motor and fields were never intended, and which they can not stand for any length of time without danger of the resistance becoming injured through excessive heating.

The Houston Electric Street Railway Company is using No. 0 tinned copper wire with 19-32-in. channel pins. Nearly two years

H. C. CHASE.

ago we placed some bare copper and tinned copper No. 0 bonds in our track as an experiment. Before finishing this paper I took pains to look at them. The bare copper wire was nearly eaten through by corrosion. The tinned copper wire was as bright and perfect as the day it was placed in the track. We are using the bonds both alongside and underneath the fish-plates. We find that if special care is taken in drilling the rails inserting wire and channel pins, driving flush to web of rail, there is little chance for moisture to enter. During the month of January we had two or three blocks of double track removed and replaced with 60-lb. steel, operating cars on both sides of reconstruction work. Before the completion of track and bonding our ampere meter indicated 500. After completion of track and thoroughly bonding the same our meter showed an average of 450, reduction of 50 amperes, and a saving of 10 per cent, lessening the load on the generator, consequently reducing the fuel expense. This proved to us what we could do on one line by thoroughly bonding the track.

We have double bonded the track entering both ends of the car shed, also all lines in close proximity to the power station. In addition we run an overhead No. 0000 ground feeder tapping the different lines at equal points and the belt lines on all sides, and we find our fuel bill has been reduced 30 per cent, and the load easy to carry and comparatively free from violent fluctuations. Our Franklin street line runs close to the power house and several lines are connected with it. We double bonded each joint on this line. When we reached San Jacinto street, three blocks from the power house, the ends of the rails commenced to arc, and it is with great difficulty our men could drill the rails and insert the bonds. After the remaining three blocks had been thoroughly bonded the drop in the load at the power station was perceptible at once, showing conclusively the necessity of good ground return. We have had some trouble in keeping our overhead ground feeders connected with the rail. They have been burned off several times at the rail connection. We find the trouble was caused by using too small a contact, and accordingly we increased the contact circuit by attaching the ground feeders to both rails and bond wires, and have had no trouble since this was done.

Rail bonding as a power saver depends upon the following three points which I have endeavored to cover:

First, bonds to be of ample capacity; second, perfect connections; third, large contacts.

## Ties; Their Life and Preservation.

BY D. D. WILLIS, SAN ANTONIO.

The ties used by the street railways of our state are, for the most part, pine, though some few roads have in the past few years tried other woods. When the San Antonio street railway was first built in 1877 a part of the track was put down on sawed cedar ties, 6 in. x 4 in. x 6 ft. When the road was equipped for electric traction in 1890, all pine ties, 7 in. x 6 in. x 6 ft. were put down. In 1897, when a system of sewers was being constructed in our city, some of the old cedar ties of mule car days were dug up, and found to be in a perfect state of preservation, after having been in the ground 20 years. In some of these ties the old spikes were still firmly fastened, and the ties showed the saw marks as plainly as on the day they came from the mill.

In low, moist climates, cypress ties last fully as well as cedar, but in a dry climate they are no better than sap pine. Good, heart pine ties last from five to eight years, while pine ties of young trees, even with some heart, last no better than those of old trees of all sap.

In 1894 our company purchased quite a lot of cypress ties, and put part of them in use without treating; the others were treated with C. A. wood preserver. In 1897 we took out some of both; those that were not treated were in a fair state; some could be put back, and some could not; those that were treated were as good as when first put down.

One reason the life of a tie is longer on a steam than a street railway is that only the centers are surfaced; where a tie is covered with earth in its entirety, it will decay much more rapidly than where only partially covered. There appears to be a great deal of rotten lime in our soil that causes our pine ties to decay very rapidly. In most climates a well seasoned, white oak tie will last well, but here they are very little, if any, better than a sap pine. Bois D'arc and mesquite wood are both said to make fine ties, though I cannot speak, from experience, of either. But the best tie for Texas street railways is the red mountain cedar. I know there are some objections urged against them by some street railway managers, but we have given them

D. D. WILLIS.

a fair trial, and I know they are good. Some say they will split when spiked; this is true to some extent, though the percentage of ties that will split in spiking is very small indeed. Others say they will not hold the spikes after being down a short while, and will permit the rails to spread. This has not been our experience; we have found in the last three years that they hold well, even on sharp curves where the strain is great. The supply is almost unlimited in this state, and the price not much in excess of treated pine, or other ties, and when one considers the cost of labor in renewals, say every six years, the cost of the cedar tie is in the end much cheaper, as I am satisfied that a sound cedar tie, 8 in. x 10 in. x 7 ft. will last from 25 to 30 years.

Our company treated some all heart pine ties with C. A. wood preserver in 1895, put on at 200° F., and I very recently took up some and found them perfect. I am lead to believe from this, that good heart pine may last well if properly treated, though I cannot, from experience, say how long, as I can with cedar, for I have talked with several old residents of our city, who tell me that they know, personally, of cedar posts that have been set 25 years and are still perfect, and while this is not personal experience, still I am satisfied it is true.

To all who are able to obtain them, I would say: buy a good heart, red mountain cedar tie, 8 in. x 10 in. x 7 ft.; use Goldie spikes, and a good roadbed of about 10 in. of gravel, and your track repairs will be light during the years to come.

To those not able to obtain cedar: buy a good, heart, long leaf pine tie, 7 in. x 8 in. x 8 ft.; treat it well with C. A. wood pre-

D. D. Willis was born in Claiborne county, Miss., in 1866; he attended school at Chalmers and Hunt Academy of Port Gibson until he was 18 years of age, and then started to work in the freight offices of the L., N. O. & T. Ry. at Port Gibson, and continued in the transportation service of the road until 1892. In March, 1893, Mr. Willis went to San Antonio to take a position with the San Antonio Street Railway Company; in the following June he was appointed assistant superintendent. In August, 1894, he was made superintendent, and in September was elected secretary, which position he has since held.

server, and with a good roadbed, I am sure you will obtain good results.

There is no economy in putting down cheap ties. The cost of labor alone in renewals will, in 10 years, be more than double the cost of good cedar or treated pine ties. A good roadbed is one of the essential parts of any railway, be it steam or electric, and without good ties, this cannot be obtained.

There are in use quite a number of wood preservers; of their merits I cannot speak, except as to one, and that is the C. A. wood preserver, or carbolinium. This I know to be good. We think so well of it that we use it on all bridge and culvert timber and on all of our poles, or rather those parts of our poles that go into the ground. The only objection we have to it is its cost. There is nothing of which I know that will better preserve ties.

## Crank in the Business.

BY C. L. WAKEFIELD, DALLAS.

Crank in the street railway business, are of two kinds, the positive and negative. I shall not deal with them, however, as to this classification, but simply try to call your attention to the few that I think of that are a curse to our business.

When the Creator stored our fuel products, aeons of years before our time, or before the possibility of our need had arisen, He gave the gas producing matter such nice balancing that the combinations it admits of are as numerous as the sands of the sea; and these combinations offer a stimulus to the desire of discovery implanted in every human mind that has worked great wonders, especially in the last few years.

One of the most poorly paid and least appreciated men in our business is the fireman; and because of this, and of the undesirability of the job, we find firemen independent and cranky; ignorant, as a rule, and unwilling to accept the experience and the result of the deep thought of scientific men who have, for many years, since the discovery of the use of steam, been bending their energies towards the accomplishment of the highest heat result out of a given fuel product. Most firemen have accidental ideas, suggested by the different phases of the moon, or some other abstract and totally illogical authority, for putting coal on a fire, and the general management of the boiler plant. I think that a distinct, determined, combined and unremitting effort should be made towards the bettering of the condition of the fireman, educating him, paying him more wages, surrounding him with what comforts can be given under the circumstances, and getting him interested in the theory, and able to carry out the practice, of the work upon scientific lines.

We next come to the engineer. There are engineers and engineers. We have those who have a certain kind of oil and a certain kind of waste that is the only oil and the only waste they can work with. We have engineers who have made up their minds that certain people who naturally come under their authority are the only people who can do the work; frequently they are relatives and social friends. A great many of our engineers are totally unwilling to try anything new; on the other hand, we have them just as bad in the other direction, in that they are always trying something new, and spending their time, which is the company's money, in experimentation upon paths never heretofore tried.

The dynamo tender: Dynamo tenders as a rule are fairly progressive; their form of crankiness being that they are always patching and never willing to get new parts, or that they always want new parts and are never willing to make use of the old in new shapes and new combinations.

Of the superintendents, I must say that where cranks exist in this business, in my opinion, they are generally those who are forever trying something new; that means, before you get

through with it, an almost entire change in your plant and lines, which latter probability they fail to foresee.

Then I come to the linemen. Linemen frequently get an idea that they own the earth and the heavens above, particularly the latter, and that they have a perfect right to drop wire, insulators, monkey wrenches, and other tools that have a considerable attraction towards the earth, upon the heads of innocent passersby, thus bringing on damage suits that, by our laws, are not only possible of heavy results against the corporation, but are actually stimulative to that end.

Of all the men in the street railway service the ones who probably have the most right to be cranky are the motormen and conductors; and yet I have found these men, as a rule, the most polite and the most careful and attentive to duty, of anyone in the whole service; and this is because more attention is paid to them than to almost any other employe; more arrangements are made for their comfort, and they are advanced wherever advancement is earned and possible under the circumstances. Crankiness in motormen takes the form of disregard of orders and instructions, in starting and stopping the car, in signalling for clearing of track, and in forgetting the time table. In conductors crankiness is found in the way they receive a fare, in their failure to let people off at the right street, and in their personal appearance and the appearance of their cars. It is said that some of them fail occasionally to turn in all the money they collect; but, if so, there is so much method in this madness that it could hardly be called crankiness.

We now come to the secretary or auditor, whose crankiness, if developed, is along the line generally of spending \$10 to save 1 cent.

Finally, next in importance to the fireman, we have the general manager-president, the executive head of the concern, who, too often, has no knowledge, either theoretical or practical, of the business in which he is engaged; and, in a few cases, has not discovered this fact. It is lamentable where only the first condition exists, but where the first and second conditions are found in combination, it leaves the company "poor indeed."

The manager is generally the purchasing agent in small stations, and, too often, does not provide his employes or himself with the means and instruments for properly testing supplies; nor does he arrange for a record of the life and conduct of machines or instruments used on the system.

In conclusion, I beg to apologize for this hastily written article, and congratulate you upon the fact that I have gone out of the street railway business, and it will therefore have one crank less.

### DISTANCE RUN IN QUICK STOP TESTS.

During the trial of a damage case recently in Brooklyn, considerable interest was occasioned by the statements of one of the experts who was called by the plaintiff to testify as to the distance in which a car could be stopped when running at various rates of speed. The expert (?), Stephen C. Crane, testified that in Akron, Ohio, on a road he was connected with there, he had a number of times stopped cars going 10 to 12 miles an hour in from 15 to 18 ft., and going 6 to 8 miles an hour in 10 to 12 ft.; this test being made by reversing the car. Upon the attorney for the defense asking if he was willing to make the test again, and on replying that he was, arrangements were made for it the following morning.

He examined the motor and controllers thoroughly, and said that everything was satisfactory: the car being a 10-bench open car. The spot of ground measured was 200 ft. in length and was practically level, and the time taken over this measured distance was to figure the speed of the car.

The first test that he made he was going between 9 and 10 miles, and when he was about to get to the finish line he reversed the motors. All witnesses on the stand with the exception of himself agreed that he was 30 ft. from the line when he reversed the car, and all agreed that the car went

15 ft. from the finish line. The best stop that he made going over 8 miles an hour was 36 ft. He made one stop in 23 ft. 6 in., when he was going 5 to 6 miles, having the controller on two points only.

### MICHIGAN INTERURBANS.

The board of directors of the Mt. Clemens & Lakeside Traction Company was reorganized at the annual meeting. The new board consists of C. H. Lawrence, Alex. Jacobi, E. G. Stevenson, and J. G. Tucker. F. Rouff, president of the company, sold out his interest and resigned, Mathew Slush being advanced from vice-president to the presidency. G. A. Skinner was elected secretary and treasurer. Several of the directors are also interested in the Detroit & Lake St. Clair Railroad, and the Detroit, Lake Shore & Mt. Clemens Railroad, and it is understood that the three roads will be combined. Surveys are in progress for building a line from Mt. Clemens to the head of Lake St. Clair. By April service is promised from Detroit to Marine City.

### THE JOYSE-CRIDLAND JACK.

The Joyse-Cridland Company, Dayton, Ohio, reports a good business for the past year, and all indications point to

a steady continuance and increase. They have recently brought out a jack which will specially interest street railway managers, especially at a time when many are contemplating the annual change of trucks from winter to summer bodies. Its jack No. 220, illustrated herewith, is designed for this special purpose, and where used will not only save enough in time to pay for itself, but will be found a great convenience. Used in pairs, first at one end of a car and then at the other, a car can be raised, without difficulty, clear of its trucks, without blocking, within a space of 10 minutes. The company manufactures a full line of jacks for all railway purposes, and if any of unusual or special design is desired, would be glad to assist managers with any information on the subject which may be wanted

One of the boilers in the Canal street power station, in Allegheny, Pa., gave out and tied up the cars on the Millvale, Etna and Sharpsburg lines, from 7 to 10 a. m., on March 4.

The Pearson Jack Company last November removed the home office from No. 156 Fifth avenue, New York, to No. 64 Federal street, Boston, and since that time it has increased its business remarkably. Its car replacing jack has been favorably received at home and abroad. Chas. G. Eckstein & Co. are the agents in Germany, and Laing, Wharton & Down represent the company in London. Both these firms have placed large orders in their territory, and the future outlook in this direction is very flattering. This company has lately issued a list of recommendations from a number of electric roads in this country, which shows conclusively, that the Pearson car replacing jack has come to stay. If you have not tried these jacks, the company is willing to send you a pair subject to your approval. If you have not seen their list of testimonials, write for a copy to the home office, No. 64 Federal street, Boston.

### COMBINATION OF OHIO ROADS.

At the annual meeting of the directors of the Cincinnati & Miami Valley Traction Company it was decided to lease the property of the Dayton Traction Company for a period of 999 years. The lines of the Dayton Traction Company extend from Dayton, O., to Miamisburg, and the Miami Valley Traction lines run south from Miamisburg to Hamilton. The terms of the lease proposed dividends to the Dayton Traction Company of 2½ per cent for 1898; 3 per cent for 1899; 3½ per cent for 1900 and a like increase until 6 per cent was reached. However a number of the minority stockholders of the Dayton Traction Company brought suit to cancel this contract and have a receiver appointed to operate the road. The directors of the Cincinnati & Miami Valley Traction elected the following officers: President, Judge D. J. Dwyer; secretary, W. P. Schwab, and treasurer, Isaac Silverman.

### NEW NAME FOR A DETROIT COMPANY.

The Fort Wayne & Belle Isle Railway Company was purchased by Tom L. Johnson, R. T. Wilson, Albert Pack and H. A. Everett for \$700,000, at the rate of \$175 per share. The name of the new company will be the Detroit, Fort Wayne & Belle Isle Railway Company, and its capital stock has been increased to \$1,200,000. The new officers are: J. C. Hutchins, president and treasurer, and A. E. Peters, secretary. Officers were chosen for the old organization which will be maintained for the purpose of paying off the bonded debt and closing up its affairs. A. B. du Pont, general manager of the Detroit Citizens' Street Railway Company, will occupy a similar position with the new company. N. W. Goodwin, who has been secretary of the Fort Wayne company for 23 years, has retired from the management and from active business as well.

### A LIVE ROAD.

Although not the largest road in the country the Atlanta Railway is certainly one of the most enterprising and up-to-date of roads.

Foreseeing the almost universal desire for a war with Spain and alert to the opportunity for benefiting his road, the manager of this company, by the judicious use of a number of lurid banners has succeeded in keeping his cars bound to Fort McPherson at all times well filled. Day after day the army post is thronged with excited visitors and the most ordinary drill is construed to be a rapid preparation for war.

It is the ever alert manager who fills his company's coffers and makes himself invaluable.

### ELECTRIC 'BUSES IN LONDON.

According to the following in the "London Electrician," electrical 'buses are not making much headway as transportation lines: "Electricity as a motive power for the 'buses owned by the London General Omnibus Company had very few friends at the meeting of shareholders yesterday, and the chairman, while admitting that the directorate are watching very closely the development of motor vehicles, held out no promise of an early introduction of mechanical power as a means of propelling the omnibuses which now

so nearly fill the London thoroughfares. One shareholder expressed his conviction that the day was very far off when 'buses would be propelled electrically, and to make matters worse, expressed himself as personally very glad this was likely to be the case."

### NEW ILLINOIS INTERURBAN.

Subscription books have been opened for the stock of the LaSalle County Railway Company which proposes to build electric lines in LaSalle, Grundy, Kendall, Will, Cook and Lee counties, Illinois. One of the lines projected is from Streator to Ottawa, 18 miles. The capital stock is \$500,000; the commissioners to receive subscriptions are W. H. Holcomb, of Chicago, and Charles H. Rathbun and W. H. Boys, of Streator.

### MUTILATED BILLS NOT LEGAL TENDER.

A suit was brought against the North Hudson County Railway Company by Clarence Anderson for being ejected from a car after refusing to give the conductor other money than a mutilated bill for his fare. He won the damage suit but the company appealed. Justice Van Syckel, in the Court of Errors and Appeals, filed an opinion in which he holds that a dollar bill from the upper left hand corner of which a piece one inch and a half by one and a quarter had been torn is not a legal tender for car fare.

The opinion says that a conductor is not bound to accept a bill substantially mutilated, and that if any part of the bill is absent which might aid in determining whether it is genuine he is under no duty to receive it. The rules of the treasury department, Justice Van Syckel says, in regard to the redemption of mutilated notes relate simply to redemption and do not affect the question of legal tender.

### CINCINNATI STREET RAILWAY'S NEW WORK.

The Cincinnati Street Railway has already laid out considerable work for this spring, and will shortly commence relaying 25 miles of track with 6 and 8-in. girder rails, contracts for which have already been made with the Johnson Company. Three miles will be laid with T-rail. The Falk Company will pour 7,000 cast-welded joints on the relaid track. Delivery will also begin in a few days of the 100 9-bench open cars which are building at the shops of the Laclede Car Company, St. Louis. These will all be mounted on Peckham trucks of the type known as the "Cincinnati Standard" and which will make a total of 375 of these trucks in use on this road. The motors will be C. E. 58.

### ELECTRICITY ON THE C. M. & ST. P.

The Chicago, Milwaukee & St. Paul Railroad has applied to the city council for an ordinance authorizing it to change its motive power on the Evanston division from steam to electricity. There are various rumors as to what will be done in the future with this line. One plan that has been discussed is to take the C., M. & St. P. electric trains over the Northwestern Elevated from Wilson avenue to the city. Another rumor is that the road will form a portion of an interurban between Chicago and Milwaukee. This division has never been a paying one and the change in motive power is made in an endeavor to reduce expenses.

## FOREIGN FACTS.

At Canterbury, Eng., it is planned to construct an electric railway to Herne Bay.

Work is soon to begin on an electric railway to connect Glauhan, Meerane and Crimmitschau, Germany.

Fourteen motor cars are running on the new line at Liegnitz, Germany, constructed by Felix Singer & Co.

A concession for an additional line in Alexandria, Egypt, has been granted to the Compagnie des Tramways d'Alexandrie.

The promoters of the underground electric railway at Brighton, Eng., are S. H. Doubleday, C. F. Webber and J. W. Kersley.

The adoption of electrical traction throughout the city is recommended by the tramways committee of the Liverpool council.

The street railway at Frankfort-on-the-Oder, built by the Allgemeine Elektrizitäts Gesellschaft, has been placed in operation.

The Swansea (Wales) Tramway Company has negotiated the sale of the undertaking to the British Electric Traction Company.

Municipal ownership and electrical equipment of the street railway will be considered by the district council of Wallasey, Eng.

A committee of the Waterford, Ireland, council has recommended the grant of an electric railway concession to Mr. Palmer, the promoter.

Leuz & Co., of Stettin, Germany, propose to build an electric railway from Frankfort through Hamburg and Dornholzhausen to Saalburg.

The Norwich (Eng.) Electric Tramways Company held a meeting in London to consider a bill to authorize the construction of additional lines.

Electric traction is being considered by the council of Aberdeen, Scotland, with a view to its application on the street car lines which are soon to come under municipal ownership.

A light electric railway between Bridlington and Flamborough, Eng., is being considered by the board of trade. The engineers are W. Myers Beswick and Bernard Drake.

When the stock of the new Oldham, Ashton & Hyde Electric Tramway at Oldham, Eng., was offered to the public by the promoters, the capital was subscribed for several times over.

The corporation of Hull, Eng., seeks power to borrow £270,000 on account of the street railway. A contract for the equipment of an electric line has been placed conditionally with Siemens Bros. & Co.

The Salford (Eng.) council committee recommends that when the lease of the Manchester Carriage & Tramways Company expires in 1901 the lines be relaid, extended to 32 miles and equipped with electricity.

The Yarmouth & Gorleston Tramway Company is negotiating the purchase of the Yarmouth (Eng.) Bus Company's entire plant with a view to constructing an electric railway between Yarmouth and Gorleston.

A proposal to construct an electric railway from Ingleton, Yorkshire, to the summit of Ingleborough is being received with favor. Plans and estimates of four miles of road have been prepared by J. Hewitson.

A strong recommendation to adopt the overhead trolley system has been reported by the special committee of the Salford, Eng.,

council, appointed to visit six of the principal cities using this system. The local lines are to be taken over by the municipality. A conference has been had with the authorities of Manchester, with a view to installing similar apparatus in both cities.

The Perth Tramways Company has been formed to build lines in Perth, West Australia, to be operated by electric or other power. Capital, £125,000; registered by Williams & Neville, Winchester House, London, E. C.

At St. John's, Newfoundland, an electric railway costing \$140,000 is to be constructed by a local contractor, Mr. Reid; with whom the government has made an agreement to take over the entire steam railway system of the colony.

The corporation of Bradford, Eng., has awarded the contract to equip nine miles of street railway for electric traction to the Westinghouse Electric Company, at £14,664. Alderman Cowgill stated that the tender of the Westinghouse Company was the lowest; but the most important consideration with the committee had been the wide experience and high reputation of the company.

The Manaus Railway Company has been incorporated under the laws of New York to construct and operate 20 miles of steam or electric railroad in the city of Manaus and elsewhere in the state of Amazonas, Brazil. Capital stock, \$500,000; directors, A. J. Moxham, of Lorain, O.; A. N. Brady, of Albany, N. Y.; E. C. Moxham, C. R. Flint and E. C. Converse, of New York; J. W. Scott, of Orange, N. J.; F. W. Stewart, of Brooklyn, and F. H. Hebelthwalte, of Manaus, Brazil.

American supplies are being almost exclusively used in the equipment of the "La Capital" electrical railway of Buenos Ayres, So. America. The rails are 9-in. 90-lb. grooved girder, made by the Johnson Company; the bonds, Edison-Brown plastic and Syracuse soldered; the entire rolling stock was built by the J. G. Brill Company, is mounted on Brill trucks and equipped with General Electric motors. The iron poles were furnished by Morris, Tasker & Co., and the overhead material by the H. W. Johns Company. In the power house three vertical Ball & Wood engines are coupled direct to Walker generators of 300 k. w. each. Steam is supplied at 140 lbs. pressure, by four Stirling boilers of 250 h. p. each. The plant includes Green's fuel economizer, Conover's condenser, and two Worthington pumps. A portion of the system is already in operation, with 41 cars.

## A RECORD FROM SERIES-PARALLEL CONTROLLERS.

Previous to April, 1897, the San Antonio (Texas) Street Railway Company used rheostatic controllers, but at this time substituted the K2 series-parallel controllers made by the General Electric Company. Practically no other changes were made in the apparatus or equipment. T-H. F 30 and Edison No. 6 double reduction motors were on the cars. The power-house equipment consists of four 125-h. p. high speed engines driving two 100-k. w. Edison bipolar and two T-H. multipolar 80 railway generators. With 25 cars in operation the load varied from 450 to 650 amperes and required all the units. After the change of controllers with 26 cars the load varies from 270 to 400, an average of 350 amperes, which was easily carried by three units. This saving, President W. H. Weiss thinks, is entirely due to the new controllers.

The Consolidated Street Railway Company, of Grand Rapids, has decided to distribute prizes once every two months to the conductors and motormen for efficient work and courteous treatment of patrons. The cash prizes are \$10, \$8 and \$6, and at the last distribution 11 employes were deemed worthy of such recognition.

## PERSONAL.

The engagement of Charles E. Yerkes, only son of Charles T. Yerkes, to Miss Garron, of Morristown, N. J., has been announced.

C. H. Lawrence has been appointed manager of the Mt. Clemens (Mich.) & Lakeside Traction Company.

W. S. Dimmock, general manager of the Council Bluffs & Omaha road, was a Chicago visitor in February.

Dr. Charles H. Holmes has resigned the presidency of the Fox River Electric Railway Company, of Green Bay, Wis.

Palmer Warden, chief engineer of the power station of the Union Traction Company, Saginaw, Mich., has resigned to seek gold in the Klondike.

Frank J. J. Sloat has resigned his position as superintendent of the Akron, Bedford & Cleveland, and will be engaged in the construction of a new road.

Charles H. Kirkland, for some time past connected with his brother, H. B. Kirkland, has gone with sales department of the C & C Company, New York.

Max Osterberg, of New York, has been appointed constructing engineer for the electrical exhibition which is to be held next May in Madison Square Garden.

On February 22, Dominick Schroeckenstein, chief engineer at the power station of the Calumet Electric Railway, was married to Miss Emma Grenewald, of Minneapolis.

W. A. Kahn, of the E. P. Allis Company, has sailed for Buenos Ayres to superintend the construction on a street railway for which his company furnished the machinery.

M. J. Griffith, formerly with the Schuylkill Electric Railway at Pottsville, Pa., has resigned to accept a position with the new street railway at Buenos Ayres, South America.

C. C. Lazarus, superintendent of the East Omaha Street Railway Company, recently met with a painful accident, being caught between cars and having his collar bone broken.

C. K. Durbin, general superintendent of the Denver Consolidated, and A. L. Lawton, general manager of the Colorado Springs Rapid Transit Company, spent several days in Chicago during the month.

Thomas Fricker has retired from the office of general manager of the Ashtabula (O.) Rapid Transit Company, but will retain his position as secretary. E. R. McDowell, of Pittsburg, has been appointed manager.

E. D. DuBois, who has been superintendent of the Muncie Street Railway Company for the past two years, resigned his position February 15. B. Frazier, formerly assistant superintendent, is temporarily in charge.

The friends of Joel Hurt, of Atlanta, insist upon his being a candidate for mayor at the coming spring election. Mr. Hurt would make as good a mayor as he did street railway president, and we hope he will accept the nomination and be elected by a big majority.

G. F. Magner has been elected general manager, and A. E. Burlaud superintendent, of the Newport (R. I.) Street Railway Company. Both of these gentlemen hold similar positions with the Newport Illuminating Company, which has become a first class property through their good management.

Electrician Cooke, of the Toledo Traction Company, spent several days in Chicago, this month, visiting relatives and friends.

W. A. Harding, master mechanic of the Calumet Street Railway, Chicago, was on February 16 married to Miss Phillippie H. B. D. Marsh, of South Chicago. Mr. and Mrs. Harding visited New Orleans on their wedding trip.

H. R. McLeod, general manager of the Portland & Cape Elizabeth electric railway, Portland, Me., spent a week in Chicago this month visiting relatives. He reports considerable activity in Maine in the direction of extensions and new interurbans planned for immediate construction.

Robert H. Lerch, of Easton, Pa., has been appointed general manager of the Freeport (Ill.) General Electric Company in place of J. T. Schlacks who has resigned. This is Mr. Lerch's first experience in the street railway business but he has been engaged for a number of years in managing electric lighting plants.

W. H. Patterson, president of the Illinois Street Railway Association, was a Review caller a few days ago, and reports the prospects most encouraging for a big attendance upon the first annual meeting in June. New members are coming in nicely and our state association promises to be one of strongest of the several similar organizations.

Dr. Louis Duncan has been appointed the electrical engineer of the Third Avenue Railway Company, of New York, and will have charge of all the electrical work during the installation of the conduit system. Dr. Duncan will retain his position at Johns Hopkins University and entrust the personal supervision of the work to S. H. Brown, his assistant.

J. T. Schlacks, who has been manager of the Freeport General Electric Company, Freeport, Ill., for the past three years, has resigned to go to Mexico to superintend the construction of an electric railway on the west coast for J. C. Sibley, president, and Charles Miller, treasurer, of the Freeport Company. Mr. Schlacks will make his headquarters at Topla, Durango.

C. Densmore Wyman, whose management of the New Orleans Traction Company has been attended with such marked success, delighted his old friends in Chicago by a few days' visit here on business last week. He reports the Mardi Gras as unusually well patronized this year, and business, both general and from a street railway standpoint, excellent. His West End line, which will be remembered as having operated with steam dummies for years, is being changed to electric, and his plans for entertainments at the lake comprise an even more pretentious undertaking than last year—which was one of the most extensive and successful in the country.

## OBITUARY.

James H. Rhotehamel, president of the Columbia Incandescent Lamp Company, of St. Louis, died on February 17, after a brief illness. Mr. Rhotehamel was 42 years of age, and has been prominent in the incandescent lamp industry for the past 10 years, his company having built up a large business.

William J. Ashmead, a representative of the Ajax Metal Company, of Philadelphia, died on February 26. Mr. Ashmead had been in the employ of the company for many years and had a very extensive acquaintance among the electric railway men of the country who learn of his death with regret.

H. W. Johns, president of the H. W. Johns Company, died at his home at Park Hill, Yonkers, N. Y., on February 8, after an illness of several months. Mr. Johns was 50 years of age. For the last 30 years he has been engaged in the development of the commercial uses of asbestos, and other insulating materials. Mr. Johns was also president of the Johns-Pratt Company, of Hartford.

Denis Doren, general superintendent of construction for the Western Union Telegraph Company, died suddenly at Norwalk, Ohio, at the age of 68. Since 1850, Mr. Doren has been engaged in telegraph construction work; during the rebellion he was superintendent of the telegraph construction corps of the Department of the Potomac.

Frederick Krutz, formerly president of the New Orleans Street Railroad Company, died at the advanced age of 80 years. He was a native of Alsace and on coming to New Orleans organized the first street railway in that city. He was president and superintendent of the city railways until 1892 when he retired on account of his old age.

On February 28 occurred the death of James A. Stratton, secretary and treasurer of the Birmingham Railway & Electric Company, after an illness of six weeks from typhoid fever. Mr. Stratton was a native of Indiana and 43 years of age; he went to Birmingham 14 years ago and has been secretary of the railway company since its organization.

---

### NEW PUBLICATIONS.

Steel gears and pinions form the subject of a small pamphlet, well illustrated and printed, issued from the press of the General Electric Company, under the title "A Modern Gear Plant." It contains a description of the extensive plant which that company has established at the River Works at Lynn, for the exclusive manufacture of steel gears and pinions, equipping it throughout with the most modern machinery. This pamphlet will be sent on application to any of the company's sales offices, one of which is found in every large city in the United States.

"A Pocket Dictionary of Electrical Words, Terms and Phrases," being the supplemental matter to, or an epitome of, the fourth edition of a Dictionary of Electrical Words, Terms and Phrases, by Edwin J. Houston, Ph. D. American Technical Book Company, New York, 1898. Price, leather, \$3.00; cloth, \$2.50. The last edition of Professor Houston's "Dictionary," published in 1894, contained some 5,000 words; when he came to prepare the fourth edition he found that the new words, terms and phrases which have gained currency since 1894 were in excess of those in the original dictionary with its appendix. As a result it was necessary to collate the old matter with the new in order to avoid having the second appendix larger than the dictionary. This pocket edition comprises the supplemental matter with the terms arranged alphabetically, and cross references and encyclopedic matter of the larger work omitted so that it is in convenient form for those seeking short definitions. There are over 11,000 words and about 15,000 definitions given, making it the most complete electrical dictionary ever published.

"Algebra Made Easy," by Edwin J. Houston, Ph. D., and Arthur E. Kennelly, Sc. D. American Technical Book Company, 45 Vesey street, New York. In the literature of every branch of science there is usually to be found one, or at most a very few, works which completely cover the field, and are ideal reference books. It is usually the case with books of this comprehensive character which deal with technical subjects, that because of the mathematical language necessarily employed they are not easily and understandingly read by those without mathematical training; to place the subject before this class of readers there are a host of books which have for their ostensible object the simplification of some valuable treatise so that he who runs may read; too many of them achieve but a doubtful success. The authors of "Algebra Made Easy" have attacked the problem of bringing the non-mathematical reader and the mathematical book together in a different manner, and by their little book seek to lift the reader up and not to drag the book down. It comprises a clear explanation of the mathematical formulæ in Professor Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents. The object is to explain the meaning and use of the symbols used in algebra, trigonometry and calculus, so that one may understand the meaning of the formulæ in the books mentioned even though unable to manipulate them.

### REPORT OF THE CINCINNATI, NEWPORT & COVINGTON.

The annual report of the Cincinnati, Newport & Covington Railway Company was compiled by President J. C. Ernst and published in a booklet. The financial statement shows a gratifying improvement over last year. The gross earnings for 1897 were \$638,477; the net earnings \$211,197, a gain of \$31,152. The ratio of operating expenses to gross earnings were 47.8 per cent. The income per car per day was \$28.86, and the gross earnings per car-mile, 21.3 cents. The operating expenses per car-mile were as follows: General expenses, 2.36 cents; maintenance of equipment, 1.58 cents; conducting transportation, 4.86; maintenance of way, 1 cent; motive power, 1.56; lighting, 1, and tolls, 2.8 cents, making a total of 14.26 cents. On account of the efficiency of the employes there have been very few accidents, only two resulting fatally in the past year and in neither of these cases was the company to blame. An accident fund has been started to which \$1,000 is contributed each month and this was found sufficient to pay all claims and have a balance of \$3,865 at the end of the year.

---

### CHANGES AT CHESTER AND WILMINGTON.

The Chester (Pa.) Traction Company and the Wilmington (Del.) City Railway Company are now controlled by Clark & Co., of Philadelphia, consequently several changes were made at the annual meetings. The new board of directors of the Wilmington City Railway Company consists of E. J. Moore, C. F. Stephens, I. C. Barr, Preston Lea, E. W. Clark and W. W. Pusey. C. M. Clark was elected president; E. J. Moore, vice-president, and T. H. Bellah, secretary. The Chester Traction Company has been reorganized and the directors are: C. F. Stevens, G. B. Lindsey, J. E. Moore, H. C. Howard and C. M. Clark. Mr. Clark was chosen president and C. F. Stevens secretary and treasurer. R. F. Fox, formerly superintendent of the Scranton Railway Company, is the new general manager of the two companies.

---

### NEW BUFFALO INTERURBAN.

The Buffalo, Hamburg & Aurora Electric Railroad is about to erect a brick power house and barn after plans made by R. B. Goodman, the chief engineer of the road. Mr. Goodman was formerly connected with the Lewiston & Youngstown road. The location of the power house is to be at the intersection of the Buffalo, Rochester & Pittsburg Railway, near Orchard Park, where the company has bought two acres of ground on the Mile Strip road. The capacity of the power house will be 1,400 h. p., with water tube boilers and compound condensing engines. Four 250-k. w. generators will be direct connected to the engines. The dimensions of the boiler room will be 48x60 ft., the engine room 48x72 ft., and the car barn 45x144 ft. When the road is first operated 12 cars will be put on the line, all of the latest improved model. In shape they will be like steam cars, having truss rods, straight sides, ventilated roof and vestibules. Each car will be equipped with four 35-h. p. motors, and will have seating room for 44 persons. The company has already let contracts for \$38,000 worth of ties, poles and heavy timber.

## CONSOLIDATED CAR-HEATING COMPANY.

In 1895 the American Electrical Heating Corporation contracted to equip 700 cars on the West End Street Railway, of Boston, with electric heaters and supplied exact copies of Consolidated Car-Heating Company's heater. Since that time the former company has similarly equipped 500 more cars and extensively advertised the fact. An infringement suit was decided in the U. S. Circuit Court in August, 1897, the court holding one claim of the McElroy patent valid and the other void on the ground of the identity of the two. Both sides appealed and a decision has just been rendered by the U. S. Circuit Court of Appeals sustaining all the contentions of the Consolidated Car-Heating Company. The two claims of the McElroy patent are held not to be identical; the first is for a general method and the second for a more particular method of constructing the heater.

## WHEELER REFLECTORS.

The Wheeler Reflector Company, 18-24 Washington street, Boston, manufactures reflectors for all classes of service and its success in the business is based upon the general principle of special shapes for special uses; among the recent catalogs of the company is a special one illustrating reflectors for street railways. Reflectors for the car hood are made of true parabolic form, 11 in. in diameter and with an outer shell or case to protect the reflector from injury; these are furnished with either Thomson-Houston, Edison or Westinghouse receptacle. The illustration shows a 10½-in. parabolic reflector as applied to the dash; the case is of malleable iron and projects but 4½ in., so that the buffer fully protects it. There are no holes made in the dash; this reflector is ventilated and is dust proof. For the interior of street cars the company manufactures several styles of silver-plated mirror reflectors which are widely used. Other styles of headlights are detachable, both for electric and oil lights.

with either Thomson-Houston, Edison or Westinghouse receptacle. The illustration shows a 10½-in. parabolic reflector as applied to the dash; the case is of malleable iron and projects but 4½ in., so that the buffer fully protects it. There are no holes made in the dash; this reflector is ventilated and is dust proof. For the interior of street cars the company manufactures several styles of silver-plated mirror reflectors which are widely used. Other styles of headlights are detachable, both for electric and oil lights.

## RAILWAY FUNERALS IN CONNECTICUT.

The lines of the Hartford, Manchester & Rockville Tramway Company connect with the Hartford Street Railway, and the Central Railway. There are three cemeteries on the lines of the first company and nine along the routes of the latter companies. Although the Tramway Company has no special car for the purpose it has carried several funeral parties in its standard enclosed cars, which are 28 ft. long, with vestibules, and 7 ft. 8 in. wide. The windows and doors at the ends of one of these cars are too narrow to admit the coffin and it has to be taken in at a side window, which is 34 in. wide and 28 in. high. The services have usually been rendered to persons from New Britain, Farmington or Hartford who were to be buried in one of the other towns through which the lines run. In some cases the cars did not make direct connection with the cemetery and in such events a hearse and carriages met the car at the

nearest point and transferred the body from the car to the place of burial. Where the parties were carried from 20 to 27 miles without change of cars it was found very much more convenient and comfortable in the winter than other means. Secretary J. W. Haynes says that without a special car the service is a makeshift, yet it seems to be appreciated by the people.

## PROJECTED NEW YORK LEGISLATION.

A bill has been introduced in the New York state legislature by Senator Seibert, authorizing the enlargement of the international bridge across the Niagara river at Buffalo, so that it may be made a double-deck structure, with room on the upper deck for trolley cars. This bridge is now used by the trains of the Michigan Central and Grand Trunk roads. It stretches across the single channel of the river above Grand Island, and has a draw span 160 ft. long. Its height above the water is about 20 ft. If the enlargement is allowed it is stated room will be provided for carriages and pedestrians. Should a trolley line be built across the bridge it is also contemplated to run the road down to the Falls along the river, there to connect with the cars and tracks of the Niagara Falls Park & River road to Queenston. By crossing to the New York side and using the tracks of the Gorge road and the Ely line on return to Buffalo a very fine belt line service could be established.

Assemblyman Bondy of Syracuse has introduced a bill which appears to have a connection with Senator Seibert's as it provides: "Whenever the terminus of any public viaduct, bridge or bridges, or public viaduct connected with any bridge or bridges heretofore or hereafter constructed in any city of the first class, or town adjoining the same, is or shall be located at or adjacent to or within one-half mile of the route of any existing street surface railroad, the corporation owning and operating such railroad may, irrespective of any provisions otherwise applicable thereto contained in any general or local act, upon obtaining the consent of the local authorities and property owners as above provided and upon complying with the provisions of the railroad law applicable thereto, extend its road or route and construct and operate its road to, upon and across such viaduct, bridge or bridges, and the approaches thereto, subject to the provisions of the railroad law; provided, however, that this paragraph shall not apply to any bridge over the Hudson or the East river."

## CONSOLIDATION AT BROOKLYN.

The Coney Island & Brooklyn Railroad Company has leased the Brooklyn City & Newton Railroad for some time but the terms of the lease have not been satisfactory and arrangements are now made for the consolidation of the two companies. The stock of the Coney Island company has been increased from \$1,000,000 to \$2,000,000 and in part exchanged for the stock of the Brooklyn City. Another reason for the increase of capital stock is that it will permit the issue of more bonds to raise money for needed extensions to the present system. A number of large handsome cars have been ordered and will be delivered in time for the summer traffic. The management anticipates a large business on the lines leading to the sea shore during the warm season.

## ECHOES FROM THE TRADE

The Boston Elevated Railway Company has placed an order for 50 open cars with the Laconia Car Company, the delivery to be May 1.

L. G. Hallock & Co., of Wheeling, were awarded the contract, February 22, to build the new electric street railway at Parkersburg, W. Va.

As fast as the underground lines of the Metropolitan Traction Company, of New York, are completed the cars will be equipped with Providence fenders.

W. H. Hooper has been appointed general agent in Chicago for the Safety Car Heating & Lighting Company of New York, George N. Terry having resigned.

C. R. Waterhouse of New Haven, has been awarded the contract to build all bridges and trestles for the Woodmont extension of the Milford (Conn.) Street Railway.

J. M. Atkinson & Co., of Chicago, have published an attractive illustrated leaflet, showing their flexible horse-shoe rail bonds and the method of connecting them to the rails.

The Brownell Car Company, of St. Louis, is busy filling orders from Baltimore, Kansas City and St. Louis, aggregating 100 cars. A good demand for cars is coming in from all sections.

The New England Electric Railroad Construction Company has been incorporated at Worcester, Mass., with \$25,000 capital stock. E. E. Carpenter is president and H. F. Leland, treasurer.

C. J. Harrington, formerly with the General Electric and lately with the Union Traction Company, of Philadelphia, has accepted a position as traveling representative for Elmer P. Morris.

Since the first of last September the works of the Ball Engine Company, Erie, Pa., have been in operation night and day to keep even with the orders for engines for electric light and power purposes.

The board of public works of Holyoke, Mass., contemplates the adoption of electric car sprinklers and is negotiating with the American Car Sprinkler Company, of Worcester, for the equipment.

Walter Phelps of Buffalo, N. Y., has taken the contract to supply poles and ties for the Buffalo, Hamburg & East Aurora Electric Railway. It is said the construction will be let to Cragg & Tench of Buffalo.

Frank E. Colbert, formerly with the Terre Haute Car & Manufacturing Company and later with Mayer & England, has taken charge of the Chicago office of the Miller-Knoblock Company, of South Bend, Ind.

John P. McIntyre & Co., of McKeesport, Pa., have received a contract to construct five miles of electric road between Boston and Buena Vista, being practically an extension of the Versailles Traction Company of McKeesport.

The Central Electric Company, of Chicago, is prepared to furnish from stock India or Amber mica, cut or uncut, in rings, washers, or any other standard form, a specialty being made of standard shapes for commutators.

The Metropolitan Street Railway Company, of Kansas City, Mo., has purchased 10 cars from the Brownell Car Company, of St. Louis. Five of them are the combination type, 45 ft. long and capable of seating 52 passengers.

The Forest City Electric Company, of Cleveland, O., has recently issued an illustrated catalog describing the different sizes and forms of its roll drop and drop forged commutator bars, also its protected rail bond and method of fastening bond to rail.

The St. Thomas Street Railway Company, of St. Thomas, Ont., has let a contract for electrical equipment to the Canadian Electric Company, and for eight cars to the Ottawa Car Company. Bids are invited for wiring and special work to the amount of \$12,000.

In the issue of March 5 the "Electrical World" celebrated its twenty-fifth anniversary and the number was of special size and merit. In the supplement were shown some interesting reproductions of 150,000-volt discharges and the subject was treated in a very scientific manner in the editorial columns.

G. H. Klumph, formerly with the Variety Iron Works, Cleveland, is now the western manager of the Fuel Economizer Company, of Matteawan, N. Y. A good business is being done by the western agency, several large plants being installed and the prospects for future orders are bright.

The Jackson & Sharp Company, Wilmington, Del., recently shipped eight cars to the Pensacola (Fla.) Electric & Terminal Railway Company. Four of them were 30 feet open and the remainder closed cars, 18 ft. 6 in. long. They were all handsomely finished and mounted on Peckham trucks.

The Sargent Company, of Chicago, appreciates the value of making its literature attractive in form as well as instructive, and its pamphlet on the "Diamond S Brake Shoe" is as handsome a trade publication as we have ever seen. It comprises the results of the laboratory and road tests of this brake shoe.

The General Electric Company has received an order from the Consolidated Traction Company, of Jersey City, for double 57 motor equipment for 40 cars. The Omaha & Council Bluffs Railway & Bridge Company has just ordered one 325-k. w. direct connected generator and 17 G. E. 57 double motor equipments.

The Chicago General Railway Company has let contracts for duplicating the unit it now has in its power station. A 500-h. p. Corliss engine is now being built by the Bates Machine Company, of Joliet, Ill., and the 300-k. w. generator is ready for shipment at the works of the General Electric Company. Additional feed wires will be strung in the spring.

The Garton-Daniels Electric Company, of Keokuk, Ia., has received a letter from the Atlanta Consolidated Street Railway Company testifying to the efficiency of the Garton lightning arrester. They have been in service for four years and have proven more satisfactory than any other, and have effectually protected the apparatus from damage.

E. W. Sherman, railway representative of the Beckwith-Chandler Company, New York, well-known manufacturers of railway varnishes, will hereafter devote his entire time to the western business with headquarters in Chicago. Mr. Sherman knows from experience just the special needs of street railway managers, in the varnish line, as he was formerly superintendent

of the North Chicago Street Railroad, and has made a careful study of the subject. His western friends will be pleased to learn of his return to Chicago, and wish him success.

Engene Munsell & Co., of New York and Chicago, importers and dealers in "Amber" mica, report a very gratifying demand for all their insulating specialties. The India mica is being used very largely by electrical manufacturers and street railway companies, both in this country and in Europe, on account of its being free from iron as well as because of its high insulating qualities.

The Consolidated Car Fender Company, Providence, R. I., which manufactures the "Providence" fender for street cars, is finding its business better than ever before and is running its two factories at their fullest capacity, and is still unable to supply fenders as fast as they are ordered. Among the roads ordering fenders is the Metropolitan, of New York, which is equipping 350 cars.

J. A. Fay & Co., Cincinnati, O., who manufacture what is probably the most extensive line of high grade wood-working machinery in the world, have just issued what may be termed an illustrated wall catalog of some of their principal machines, which will prove most valuable and convenient for reference. It illustrates and briefly describes nearly 100 machines for mills, factories, car shops, etc.

D. L. Bates & Bro., of Dayton, O., are prepared to supply the trade with all kinds of desk and ceiling electric fans. The various kinds of fans made by this company are described in a neat little pamphlet. Fans are kept in stock for running on circuits from 110 to 500 volts; the latter can be connected to a railway feeder. Small rheostats may be attached to the fan circuits regulating the speed.

The Brownell Car Company, St. Louis, reports that its orders for the first week in February exceeded by three times the entire business for 1897, and that there are yet other orders in sight. Among the large orders received may be mentioned those for the Baltimore Consolidated Railway Company, the Metropolitan Street Railway Company, Kansas City, Mo., and the Union Depot Railroad Company, St. Louis.

A very handsomely illustrated catalogue on decorative and candelabra lamps has been printed and circulated by the General Electric Company. It represents all the styles of series and multiple candelabra lamps, multiple sign lamps, series decorative lamps, and lamps for special uses, as bicycle, telephone, dental and surgical lamps made by the Edison decorative and miniature lamp department at Harrison, N. Y.

W. R. Garton, 414 Ashland block, Chicago, has been appointed western representative of the Keystone Electrical Instrument Company, of Philadelphia. This is another move that the company has made to secure increased sales in this district. Since the first of the year the works have been in operation day and night to fill the orders received and preparations are now being made to enlarge the manufacturing facilities.

A large water power station at Dolgeville, N. Y., was recently opened with considerable ceremony. The present installation consists of three 350-k. w., alternating current generators direct connected to the water turbines, but the ultimate capacity of the station is to be 3,000-h. p. The electrical apparatus was furnished by the Westinghouse Electric & Manufacturing Company. The current is used for lighting purposes and for operating several factories.

The Duff Manufacturing Company, Allegheny, Pa., advises us that their business in Barrett compound lever jacks is very good and that the outlook for the year is very bright. The export trade is increasing, and during the past few months it has ship-

ped large orders of different sized Barrett jacks to Hayti, Costa Rica, Mexico, Argentine Republic, Australia, Sweden, Russia, England and South Africa, and is at present negotiating sales for other countries.

Stanley Green, western manager of the Fuel Economizer Company for the past five years, and S. S. Howell, who has also been connected with the same office, have formed an agency with headquarters at 902 Fisher building, Chicago. They are the western agents for the American fuel economizers made by Broomell, Schmidt & Co., the Chicago agents for the Case Refrigerating Company and several other companies making steel stacks, coal and ash handling machinery, etc.

Norman & Evans, of Lockport, N. Y., are introducing a steam switch-back merry-go-round which should prove a great attraction and money maker at a summer resort or street railway park. The machine has an undulatory rotary motion, operating eight cars, designed to represent Venetian gondolas. The motion combines the sensation of the switch-back railway with that of the merry-go-round. A military band organ is attached and plays continuously, whether the machine is in motion or not.

The Stever Rail Joint Company, of Canton, O., advises us as follows: We have been extremely busy getting out some large orders for the Stever rail joint for spring delivery, and the joints everywhere are giving the best of results. All we ask is a trial order, and after that the business comes without further solicitation. We have made several improvements in manufacturing the Stever rail joint which go to make it the strongest and most perfect one on the market.

The Dorner Truck & Manufacturing Company, Cleveland, will engage in the manufacture of trucks, E. C. Dormer, formerly of the Dorner & Dutton Company, being secretary of the new company. Mr. Dutton has been in the foundry business since 1880. The works have been established in the building formerly occupied by the Brush Electric Works at the corner of Mason and Belden streets, with track facilities in the yard. New machinery, power cranes for loading, etc., have been installed, and the principal business will be the manufacture of street railway trucks, in which Mr. Dormer has had a long experience.

The Partridge Carbon Company, of Sandusky, O., is introducing a new generator brush of much merit. It is made of plumbago and other ingredients that give it a high conductivity and low resistance. There is no perceptible wear on the commutator and no sparking, which recommends it for machines carrying heavy loads. Large orders are being received for the "self-lubricating carbon brush" from all parts of this country and abroad. The company has just issued a new catalog which will be furnished on application.

The Pennsylvania Car Wheel Company, of Pittsburg, was incorporated January 14 and has already built a steel foundry building with an up-to-date equipment. It is the intention to make high-grade wheels of guaranteed durability and strength, the capacity being 225 wheels per day, but this can readily be doubled. The works are located on the lines of the Pennsylvania Railroad Company and a branch of the Baltimore & Ohio. The officers of the company are: J. W. Rhodes, president; W. L. Elkins, vice-president; C. V. Slocum, secretary and treasurer, and A. W. Slocum, superintendent.

Since issuing its last regular price list the Keystone Electrical Instrument Company, 9th street and Montgomery avenue, Philadelphia, has so extended and improved its line of instruments, among others having added a complete line of portable instruments, that it was considered desirable to bring all the separate lists and announcements together under one cover, and this has been done in its catalog, No. X. The Keystone instruments are well known, and are pleasing in appearance, sensitive, accurate, constant and durable.

The Boston Electric Light Company will consolidate all its small stations into one mammoth generating plant to be erected in South Boston. There will be four three-phase alternating current generators of 1,500-k. w. each with a reserve capacity of 50 per cent, making a total capacity of 12,000 h. p. They will be of the revolving field type, permitting a voltage of 2,200. These large generators, together with two small exciters, 18 synchronous motors, two rotary converters and other electrical apparatus, will be furnished by the General Electric Company.

The Q & C is now manufacturing the self-feeding rail drill patented by M. M. Moore and described and illustrated in the REVIEW of December, 1897. Some minor improvements have been made, and overhanging fastenings have been substituted for the under clamping device to the rail. The Q & C Company reports a number of good orders for the Q & C-Stanwood steel car steps, one of them being for the United States cruiser Atlanta. The new supplementary catalog illustrates the different styles of steps made, together with information regarding the rail drill.

Among the noticeable improvements in street railway rolling stock, made desirable by the development of the business, is the abandonment of the wooden shutter blinds in closed cars, and the substitution for them of Pantasote curtains which have long been recognized in steam service as handsome, durable and in every way desirable. Among the latest of the numerous street railways using them is the Metropolitan, of New York, which has adopted Pantasote for all its cars; also the Brooklyn Heights and the Long Island roads. The number of electric and steam cars so furnished is estimated at 1,000.

The South Side Elevated Railroad Company, of Chicago, gave the privilege to five of the leading car heating companies to equip one car each with electric heaters. These cars have been in operation on one of the other elevated roads and the heaters have been thoroughly tested. As a result of this a contract for the other cars has been given to the Gold Car Heating Company, of Chicago and New York, for 3,000 electric heaters, one of the largest contracts of this kind ever placed. Each car is supplied with 24 "Gold Standard" heaters so wired as to permit of six graduations, controlled by the regulating switch.

By recent action of the board of directors of the Dornier & Dutton Company, of Cleveland, the name has been changed to the Van Dorn & Dutton Company. The officers now are: President, J. H. Van Dorn, who is also president of the Van Dorn Iron Works Company; vice-president, E. I. Leighton, president and general manager of the Cleveland Punch & Shear Works; secretary and treasurer, W. A. Dutton, who is well known to the trade as the general sales agent of the Dornier & Dutton Company, and who will have full charge of the sales department of the new company. H. H. Hodell and T. B. Van Dorn, engineer of the Van Dorn Iron Works Company, are directors. Frank Schneider, formerly with the Brush Electric Company, and recently superintendent of the Sperry Engineering Company, has been appointed superintendent of the truck and gear department.

A man is known by his hat and boots; therefore the cap is one of the most important parts of a uniform. F. H. Newcomb, of 11 Washington Place, New York, who is known as the largest manufacturer in the world of uniform caps only, has recently sent to the trade a small booklet illustrating a few of the styles of uniform caps worn and giving an idea of the class of work done by him. Those who attended the Niagara Falls convention could not have failed to remark the large and handsome exhibit of uniform caps made by Mr. Newcomb. A few of the references given for New York and Brooklyn are: Metropolitan Street Railway, Postal Telegraph Cable Company, Adams Express Company, Eastern Steamship Company, Atlantic Avenue Railroad, Kings County Elevated Railroad, Brooklyn Heights Railroad, Brooklyn Post Office, Brooklyn Fire and Police Departments.

The Mica Insulator Company, of 218 Water street, New York, 117-119 Lake street, Chicago, and 12 Camomile street, London, reports a heavy increase in the volume of business. Many of the large manufacturers are using its "Micanite" segments exclusively in the construction of their generators and motors. The company has made many valuable improvements in the well known insulation, "Micanite," and is turning out a very fine commutator segment. It would be pleased to send a set of segments for any of the smaller machines, as sample, to electrical manufacturers or repair concerns who may make application. The M-I-C friction tape and "Empire" cloth are meeting with a large sale. They are used for the winding of fields and armature coils, and make the highest possible grade of insulation.

A. N. Loper, who has been prominently identified for the past five years with the New Haven Register Company, has resigned to accept an offer from the Sterling Supply & Manufacturing Company, of New York. Mr. Loper has been the general traveling salesman of the New Haven Company, and during his connection with that concern has covered the country thoroughly, having at one time or another canvassed everything east of the Rocky Mountains. He has made a very large acquaintance, and a correspondingly large number of friends, all of whom will wish him great success in his new alliance. He will make Chicago his headquarters and devote a large share of his time to the western and southern territory.

A. N. LOPER.

The Wabash Railroad Company has completed all arrangements for the operation of its own freight trains as well as its own passenger trains to and from Buffalo. Leases of the Grand Trunk and Erie tracks have been ratified and the Wabash thus practically extends its system eastward to Buffalo and gets the use of terminal facilities there. The line to be used will be from Detroit to Glenoe, thence, via the Southern line, through St. Thomas, Tilsburg, Sincoc and Welland to Buffalo, via the International bridge at Fort Erie, and from Welland via Allenburg Junction to Suspension Bridge. From Suspension Bridge the Erie line will be used into Buffalo. The Wabash will also have the right to use the Erie Belt line from the International bridge at Fort Erie around the city to the local freight houses, yards and tracks of the Wabash in Buffalo. From Chicago this is a shorter line than either the Michigan Central or the Lake Shore.

The McGuire Manufacturing Company has just completed delivery of the electric trucks for the South Side Elevated. The old trail trucks have been taken from under the coaches and the new McGuire electric truck substituted without interrupting the traffic of the road. This was accomplished by putting in the shops five cars at a time, which were completely fitted electrically, and then put back into service as trailers, so that as soon as the current is turned on every car in the system can be operated independently. This is the important feature of the Sprague system. Each coach is carried on one motor and one trail truck. The fact that the motor end of the car rides easier than the trailer end is a compliment to the builders of the motor trucks, which are ponderously heavy things for their size, weighing, with the motor, about 14,000 lbs., while the wheel base of the truck is only 5 ft. 6 in. The Brooklyn Elevated Railway has begun a similar change from steam to electricity, and the McGuire Company has the order for trucks; the Walker Company, of Cleveland, will furnish the motors, and the Sprague controller system will be used. The McGuire Manufacturing Company is also busy on truck orders for the Toledo Traction Company; the Consolidated Traction Company, of Pittsburg; the Steubenville

### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged to any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supply or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that supply. We make no charge for publishing such notices in our DAILY BULLETIN.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8. APRIL 15, 1898. NO. 4

The question of whether the Toronto Street Railway must pay taxes on its poles and rails is not yet finally settled, though it has been pending in the courts for three years. The decision of the supreme court, noted in this issue, is adverse to the company.

Many roads in southern Indiana and Ohio have been seriously inconvenienced by floods which occurred the latter part of March. Fortunately no extreme damage was occasioned to power plants, the chief losses being from shut-downs and on country lines some track washouts.

Indications point to an early season for putting the open cars in service and the opening of pleasure resorts. Reports from resort roads show the very general intention to enlarge the number of features of past years, and that this department of created travel is being better appreciated and understood each year.

No clearer demonstration of the folly of Detroit, which built a great system of street railways paralleling existing lines in order to experiment with 3-cent fares, can be furnished than in the fact that since the consolidation of the two companies the number of employes has been reduced 30 per cent. It was the public who paid for the now useless men.

It is announced that on May 1, Chicago is to have motor cars, and join the ranks of London and New York. For some months a few delivery wagons, for which storage batteries furnished the motive power, have been in use, and here and there one meets with an enthusiast who has his own motor-driven pleasure vehicle. The success of the new enterprise will be watched with interest.

Perhaps the busy manager who daily receives requests to give some new device a trial on his road thinks that the field of street railway operation is already well covered. There is, however, a demand for a good track brake for use on long and heavy grades, and the demand is each year becoming greater because of the increasing number of interurbans. The opportunity awaits the inventor with the "right thing."

The road which has been most seriously affected by the bicycle, so far as we know, is that at Woonsocket, R. I. Most roads have lost money, and that is no laughing matter, but only in this instance has the running time been interfered with. This latter trouble is of course not a direct result, but followed because the company decided that there would be no more cyclists injured by its cars if caution on its part could prevent, and cars now "stop when within 100 ft. of a moving bicycle approaching the car."

In the District Court at Duluth, the street railway company has won its case against the county, which since 1896 has collected a tax on the company's franchise. The court rules the franchise tax was not properly assessed and orders the amount so collected to be repaid. The county auditor states that if the assessment as made was irregular, it cannot be made at all. While the suit was brought by the street railway, it affects all other corporations in that city working under municipal grants.

And now Baltimore, St. Louis and Chicago are considering the conversion of part of their cable lines to trolley. The mileage of cable track is decreasing each year, and what at one time gave promise of becoming the universally adopted system of mechanical power is gradually growing less and less. The great advantage of using but one system of motive power on all the lines of a company, and the interchangeability of car service on trolley lines, with ease of getting around blockaded sections in case of fires and similar emergencies, is felt by every manager operating cable lines. While the cable is good, the trolley is for most places much better.

When the Post Office Department recently established an office in a new suburb in Pennsylvania, it christened the place "Trolley." Now the inhabitants thereof, who would not have had any town but for the trolley, are petitioning the department to change the name and bashfully suggest "Loveland" is a great deal better. We must admit that Loveland does have a mild, patriotic and affectionate sound, though it is a question whether it would be any more attractive to young people than Trolley. For the sparking proclivities of the trolley are well known, and have helped out many an ambitious but poor young man who could not afford the time-honored "rig." Moreover, Trolley is indicative of the greatest advance of the century, is strictly up to

date, has all kinds of go to it, and never fails to find room for one more. All these are attributes of which any budding town might be proud. As the trolley has come to stay we hope the P. M. G. will allow the name to remain over this new stamp dispensary.

The Supreme Court of Massachusetts has somewhat altered the old Biblical rule regarding lost eyes, and entered up damages against a street railway in the amount of \$5,045 for the loss of an optic by a patron of its pleasure resort. It seems among the attractions was a freak without hands, who posed as a crack marksman, working a gun with his elbows and toes; and missing the target he shot out an eye for the plaintiff who had been brought there in defendant's car. The decision opens up a new avenue of damage suits, and the ruling closes with the following opinion: "It cannot be held that the plaintiff assumed the risk. He might well rely on those who provided the exhibition or invited him to attend, to take due care to make it safe from such an injury as he received."

Prior to the passage of the Allen law in Illinois, which even now it is sought to make the issue of the next campaign in this state, we were treated to numerous dissertations on the advantages of home rule for cities, particularly in the matter of street railway franchises. In Missouri the larger cities are organized under constitutional provisions and therefore it might be thought that they would be secure in their rights to grant franchises on such terms as they might see fit; the state, however, is seeking to exterminate certain street railway corporations because the city granting the franchises did not exact at least 2 per cent of the gross receipts as compensation, in accordance with the Julian law passed in 1895. The question appears to be, how can the street railway best be milked?—in Illinois it is by the city; in Missouri by the state.

A Maryland reformer is making the attempt to do away with crowded cars by fixing the rate at 3 cents for standing room. Whether the bill now pending in the legislature will finally pass and the experiment made cannot now be stated, but it might not be such a bad thing to make a trial on some road. And if the trial is to be one worthy of the name it should be undertaken on the plan of a western manager, who, when he was confronted with the same problem a few years ago, announced his approval and determination to remove the seats from most of his cars, and hang out the sign, "Standing room only." It really would be amusing to see how many people of the class who at stated intervals introduce such impractical measures, would avail themselves of the 3-cent standing ride. We thoroughly believe that every company should spare no effort to supply seats for as many of its patrons as possible; but under the existing conditions in American cities it is a physical impossibility to take care of the deluge during certain rush hours with a seat for every passenger. To have two classes of fares, however, in the same car, is something the public does not want and companies could not carry out.

A practical demonstration of the working of the low fares of which so much has been printed and talked by people who were better posted on other subjects, is found in the recent

strike on the city lines at Saginaw, Mich. Under an order of court, the receivers of the road were compelled to sell regular tickets seven for a quarter, and workmen's and school tickets nine for a quarter. It was these same low rate tickets which brought the road into the receiver's hands, at which time an ineffectual effort was made to raise the rate. With limited earnings the service could only be maintained by increasing the hours of labor, and in their appeal to the public the striking employes set forth they are compelled to work 12 to 14 hours each day for a "day's pay," which was recently raised from \$1.34 to \$1.55. The trouble was settled after a few days by a reduction in the hours, the pay being unchanged; and an order by the court allowing the receivers to raise the rate of fare.

The incident should impress the general public with the fact that the low rates it often demands are only possible at the expense of the rights of others, and we do not believe the American people, when they understand the real facts in the case, will want to save the small fraction under a 5-cent fare when it has to be done at the expense of the welfare and rights of the street railway employes.

We have been much interested in a study of the report of nearly fifty roads, including each section of the country, and about evenly divided between large and small companies,—as to the comparative earnings for the first quarter of '98. As a rule, and with scarcely an exception north of the Ohio river, the earnings of the last quarter of the year are always much better than those of the succeeding three months, or first quarter. This is easily explained by the good weather which usually prevails until Christmas and the holiday riding of two to four weeks.

In the reports we have collected it has been gratifying to note that the decrease in earnings for January, February and March, as against October, November and December, is very much less than the decrease of one year ago; while a comparison of the first quarter of '98 with the same period twelve months ago shows a gain which is as surprising as it is satisfactory. Only one road reports a percentage of decrease, while the others range all the way from 3 per cent for the poorest gain to 25 per cent for the best. The majority report 6 and 7 per cent gains in revenue, and nearly all predict the prospect for the summer business as "good."

The explanation, as every manager knows from experience, lies chiefly in the resumption of industrial operations, which call out an army of workers for their ride twice each day; and the riding done by their families when the wage earner is employed.

One manager in a manufacturing town in Ohio, whose road has been going through deep waters for two years past, and which now shows an average gain of 24.90 per cent in earnings for the first quarter of '98, states: "Our industries are all in operation and with orders on hand to keep them going for several months. Practically all our idle labor has been employed; there is no skilled labor unemployed; empty houses are filling up, and the general outlook has not been so good since 1892."

It is devoutly to be hoped nothing will occur to turn back the improved conditions or to prevent their working out into that full measure of prosperity which means as much to the laborer striving to clear off the mortgage on his little home, as to the capitalist endeavoring to bring his securities up to par again.

## HOW WOULD WAR AFFECT STREET RAILWAYS?

**A Question Which is Confronting Every Manager in the Land—Expressions from a Large Number of Leading Presidents and Operators—Opinions Divided—Some Look for Increase in Their Earnings—Others Would Suffer.**

As we go to press the eventual outcome of our national difficulties with Spain is still an unsettled question, and, without entering into any discussion of the matter in dispute, it is proper to consider what the effect is likely to be upon street railway interests, in event of war.

As a well-known manager states in the opinions quoted below, that effect is largely a problematical one; and it is further probable that, as usual with street railways, the local conditions will largely govern. At the same time war could not but have many results which would be generally common to all.

It must be admitted at the outset that new projects, which are dependent on the placing of any considerable amount of securities would, temporarily at least, suffer. With a fluctuating money market, and that uncertainty which always prevails during hostilities, capital certainly will be wary of investment in operations which are not directly to be benefitted by government orders. On the other hand, it is pointed out that, while war is destructive and a great and extravagant consumer, vast sums of money are rapidly put in circulation. This money of necessity must be spent within our own borders, and all those industries which are operated to furnish war supplies will furnish work for thousands of men day and night, and the demand for raw materials and labor will be very great. These workers would be patrons of our transportation lines, and the money so earned will increase the ability of their families to ride.

A gentleman connected with the Japanese government said recently to the writer that the result of the war with China had been, during and especially since the conflict, to stimulate business and industries of all kinds to a degree never known before in Japan. It would be humiliating to think that a great nation of 70 millions people, with all the resources and boasted abilities which this country possesses, could suffer to any alarming degree in a conflict with a bankrupt power of only 17 millions, three-fourths of whom can neither read nor write. A visitor to this office who has traveled about the world extensively, with unusual opportunities to observe, and who has witnessed Spanish military evolutions in the past, expressed himself as confident that "the Yankees could go out to sea on logs and clean out the Spanish." While it does not behoove us to boast, it does not seem that there is good cause for that degree of apprehension which exists in the minds of some. We have weathered a long and terrible financial crisis, and the commercial interests of the country have had ample time to prepare for war conditions, and have done so.

Those street railway enterprises which were still unfinished up to the middle of March have been as completely tied up as if war had actually been declared; and this inability to proceed seems likely to continue as long as matters are unsettled. Indeed, some feel that actual hostilities could not work a greater hardship, and that, even with war, a fair prospect of its early termination would enable them to discount the result and float their bonds. We know of a large number of such tied-up enterprises, and unless relief is found soon in some definitely settled policy, some of them

are likely to go over to another year, as interurbans particularly are anxious to take advantage of as much of the summer riding as possible, and avoid starting out with the smaller business and increased expenses incident to operation during winter months.

We feel sure our readers will gladly avail themselves of the opportunity to learn how the situation and probabilities incident to a possible war period are viewed by the operators in the country, and we publish here the opinions of some of the best-known managers. In some cases these opinions could only be secured through a promise not to reveal the source of information, and we therefore must respect such requests.

Capt. Robert McCulloch, who knows the smell of powder from four years service on the field, finds it very difficult to predict results, and says :

You desire an answer to the question, "What will be the effect of war upon street railway business."

I don't think it possible to answer the question without coupling with it conditions that might exist.

The effect would be widely different in New York and St. Louis; the former city might be so filled with soldiers and visitors that a large addition to the present equipment would be necessary to accommodate the traffic, whilst in St. Louis the reverse might be the situation.

But to answer the question intelligently we must know, or at least suppose we know:

Will it be a naval war, and confined entirely to the high seas?

Will Cuba be the battle-ground?

Will Spain be the battle-ground?

Will the United States be the battle-ground?

What will be the duration of the war?

Will 50,000 soldiers be sufficient, or must our army number five millions?

Will other nations be drawn into the contest?

As I am unable to answer any of these questions, I have no starting point for my argument, so I don't think my opinion will give you any enlightenment.

A western manager; city of 100,000: With reference to what effect we think war will have on the street railway business, I would say that in the western states and in an agricultural country, where we are, we think that in case of war business will improve. It will certainly make prices of all grains higher, and also farm products, meat, etc., and the people will have more money and will feel more like spending it. We think it will not only improve street railway business, but steam railroad and all general business.

Another manager, inland city, operating 1,000 cars: In our opinion the business of street railways will be improved should war be declared against Spain. Our theory for this is that war will instigate an immense expenditure of money through furnishing troops with provisions, transportation and clothing, and factories of all kinds manufacturing goods which the government may use, will be run to their fullest capacity. This will improve conditions for the laboring class by the employment of a greater number, and the plac-

213  
 - W T  
 B B  
 - FUND.

ing in the hands of laboring classes additional money, will enable them to expend more for transportation and the necessaries of life. The greater the prosperity of the laboring classes, the greater the street railway travel.

W. F. Kelly, general manager Columbus (O.) Street Railway: I have not given the matter serious consideration, because, first, I do not anticipate there will be a war. Should war occur, however, I believe the results to street railway interests, so far as their earnings are concerned, will be beneficial rather than otherwise. Such an event would stimulate manufacturing and commercial industries, and would awaken great activity among all classes, which would result in an increased travel on street railway lines. This view, of course, supposes that no very large percentage of our population would actually be engaged in war service; that the result would not be so disastrous as to paralyze our commercial interests. A declaration of war would doubtless at first affect stock values, but even this, I believe, would be only a temporary depression.

From a manager in the Southwest: I do not care to be quoted on the question you propound, but do not think that a foreign war will have any disastrous effect on street railways in this territory.

The president of a 300-car road in the Central States says: The effect of war upon street railway business at present would, in my judgment, largely check improvements and extensions, but if it were not too prolonged would temporarily stimulate travel. In other words, capital will be timid in every way, which will doubtless throw many men out of employment, who will congregate in the cities and enjoy themselves so long as they have money to do so. Of course if many men should be called into service on land, the effect would be different; still, I think it would be very largely a naval battle and not require many men to carry it on.

The president of a Southern city road: Having had little faith in war being declared, I have not considered what effect it would have on the business of the street railway companies throughout the United States. Without having given the matter mature consideration, I would not like to express an opinion for publication. I might state, however, that in the event war is declared, I believe that, owing to the probable mobilization of troops in and around this city, this company's business would show an increase of 25 to 30 per cent.

The feelings of a manager in an important Southern seaboard city is voiced in the following: I am certain that the immediate effect of a rupture between our country and Spain would be one of injury to street railway business, in common with most all other business enterprises throughout the country, especially in seaboard cities.

The cessation of commercial carrying on the ocean would necessarily affect the number of men employed on the docks and wharves, and would further diminish receipts of the street railway companies in cities where laboring men of that class constitute a part of the street car patronage. Some of this loss would perhaps be made up in cities where, by reason of the massing of troops there, some riding from them would be obtained.

As an actual fact, even now in our city along our wharves the number of ships being loaded has been greatly reduced by reason, as I understand it, of the refusal on the part of the underwriters to insure cargoes at usual rates, and our receipts from longshoremen and others upon the docks show a corresponding reduction.

Further, in a general way, war means timidity on the part of capitalists in promoting new enterprises or to continue improvements, and this means in many cities a reduction in the number of men employed in such enterprises or improvements, and consequently a lessening of riders upon the street cars. War also means higher prices for material, and the result of this will be reflected in greater expenses in the operation of our cars and in our repair and maintenance account.

I can but feel that war will be a most deplorable thing in every way, as regards business enterprises in our country, with perhaps the exception of such factories as will be employed in the furnishing of munitions and material for the government.

As a lover of my country and its honor, however, I am, in common with all the dwellers in this fair land, jealous of our national reputation, and if peace cannot be honorably maintained, will be glad to see recourse had to arms; but it is my hope that every effort will be made that can be, consistent with justice and honor, to avoid a conflict, which I think can only be regarded as likely to result disastrously for the time being, at least, to our business interests.

The manager of a well-known company in New England reflects conditions there in these words: That, undoubtedly, if war were to be declared between the United States and Spain, it would have a very depressing effect upon the general business interests of this country. As a matter of fact, the uncertainty existing has already caused the monetary interests to act very cautiously and conservatively, as all banking interests are compelled, for their own protection, to withhold making loans, etc., excepting when the security is unquestionable and the rate very remunerative.

Even under these conditions they prefer not to make loans, but to await developments.

The second effect, to my mind, would be an inflation of values of all commodities in this country, to what extent it would depend very largely upon how long the conflict was continued, and after the ceasing of hostilities and peace is declared, then comes the reaction, and we are left in no better, if as good, condition than we are at the commencement of the hostilities.

I suppose out of the 70-odd million people in this country 10 million will have to bear the great burden of carrying on war, while 60 million are urging immediate action, regardless of the consequences.

To our mind, great credit is due to the conservatism of the President. With us, in this section, he is highly praised by the thinking people.

I have briefly expressed my opinion, of which I shall expect you to withhold the name of the author.

Israel A. Kelsey, general manager, West Haven, Conn.: I do not believe that in case of war between this country and Spain that it would affect the business of this line to any extent, unless there should be an attack on coast cities.

M. R. McAdoo, manager Paterson (N. J.) Railway Company: I have never seen the effect of a war upon any business, and therefore do not feel that I am competent to give an opinion on the subject. I understand from some of the men in our city that during the war of 1861-65, that Paterson was very busy, on account of the fact that all of its locomotive works were building locomotives for the government and employing for this work a great body of men, who were paid excellent wages. Using this as a basis for forming an opinion, I should say that in any city largely engaged in the manufacture of goods which would be used by the government in prosecution of a war, that the street railway interests would be benefitted. But otherwise, as I stated above, I have had no experience to guide me in forming an opinion.

John I. Beggs, general manager, Milwaukee Electric Railway & Light Company: In my opinion, in the unfortunate event of war with Spain, street railway business would not be perceptibly affected, so far as pertains to volume of business or cost of operation. There might be greater difficulty in obtaining capital to make extensions or build newly projected lines.

John B. Parsons, vice-president and general manager, Union Traction Company, Philadelphia: I see no reason why there should be any material effect for the time being upon street railway business. In the event of war I certainly do not think their business would be decreased any.

E. G. Connette, general manager, Nashville Street Railway: I do not believe that the prospective war with Spain will affect our business to any extent. Our city is so inland and our business and manufacturing interests of such a nature that I do not apprehend a depressing effect. I do hope, however, that there is to be no war with Spain and matters will be satisfactorily settled before hostilities occur.

W. W. Magoon, secretary of the Consolidated Light & Railway Company, of Huntington, W. Va., speaks of the resources of his state: We have your esteemed inquiry, and must admit our inability to reply very intelligently. We do not consider war a very healthful thing at any time, and it is very deplorable that such difficulties cannot be amicably and honorably settled in this enlightened age so near the close of the 19th century. Locally we do not feel that war with Spain or with any other country would materially affect our street railway interests, only so much as it affects business generally. While it would not affect the price of our stock in trade, it would undoubtedly advance prices of material we have to buy, more particularly coal, which is a large item of our current expenses. I think it is the general belief of our people that war would benefit our individual state of West Virginia, as we are great coal and timber producers, and it would create a large demand for these products, and our credit is largely based on our vast amount of undeveloped timber and mineral lands, which would offer good, safe investments for capital that is now invested in stocks and bonds which would be more or less jeopardized by the opening of hostilities.

George E. Maltby, superintendent of the Jamestown (N. Y.) Street Railway Company, says: We are inclined to believe that, should war be declared, the effect would be to force those who are now along the coast into the interior

for safety. This, of course, would necessarily increase the business of all street railways, and especially those which are fortunate enough to have summer resorts in connection with them, and as far as our company is concerned, we would be very willing indeed to make a great effort to take care of all who might deem it advisable to locate in or near Chautauqua, Jamestown or Celoron.

H. F. McGregor, manager of the Houston (Tex.) Electric Street Railway, writes: I generally have pronounced opinions on all questions, but have been unable to form any on the effect which war would have on street railway business. I have a vague idea that in some localities that furnish war supplies business will be stimulated and the street railways benefitted; in others business will be depressed and street railways will be affected thereby. I do not expect any beneficial effects in this city from war.

T. J. Nicholl, general manager of the Rochester (N. Y.) Railway Company, writes: In my opinion, so far as this city is concerned, a war with Spain would have very little effect upon our street railway business. I presume that in communities where large amounts of war supplies would be produced the effect would be to stimulate business somewhat, and hence improve street railway business.

George D. Munsing, general manager of the two street railway companies at Tampa, Fla., says: Owing to conditions and location of our company, we would be considerably benefitted in case of war, as Tampa, undoubtedly, would be headquarters for supplies and many troops of soldiers. I do not see how war would affect the street railway business of the United States unless there should be a demand for employes, which I hardly think there would be.

From a Chicago man: As to the effect of war upon street railway business, my opinions are simply guesses—nothing more nor less. I guess that the street railway business of Chicago would not suffer in event of war, unless Chicago were invaded and carried by the enemy, which, in my opinion, is a very remote contingency.

The president of a well known Southern road says: A short conflict say of three or four months will not be felt by the street railways of any part of the country. But a war of longer duration will affect the earnings of the street railways of the north and east by reason of the closing of factories of all kinds, thereby throwing out of employment thousands of people who ride each day. We of the south will not feel a war unless it is of longer duration than I think this will be. War may effect to a slight extent stocks and bonds of street railways even if it is of very short duration, though I very much doubt it.

Here is one from a manager who says in his case war already exists: The Lord only knows what the effect of war would be on street railway interests. Whatever I might say would be only a guess, and I should dislike to find myself on the wrong side. I leave today for —, where there is war in the legislative halls on our interests which we know would be fatal to us. We feel we are too far inland to be hurt directly by a foreign war. It is the home wars that affect us.

Russel B. Harrison, president of the Terre Haute Electric Railway Company, writes: "I do not think war will have any injurious effect upon the street railway business of the country, certainly not in the interior. It might in certain localities, as some sea coast city might be bombarded by a Spanish man of war. But this is not at all probable, as the Spaniards will be kept too busy protecting their own coast and Cuba to annoy our country very much. In case of bombardment the interference would be quick as the motormen and conductors would immediately desire a little recreation in the country if shells were dropping in the city. Being so far from the sea shore, war would have no effect upon our road except to cause the president of the road, who is a member of Governor Mount's staff, to don his fighting clothes and give his services to the defence of the flag and the country's honor. While war is undesirable, and in details very horrible, I consider it worth all it will cost in money and lives, in maintaining the honor of our flag and the dignity of this great country. It would prevent other fighting ships from being blown up and our brave seamen murdered. From the humanitarian side it will be worth all it cost in stopping Spanish cruelty as now practiced in Cuba, and would permit thousands of men, women and children to once more earn a living as God intended. Policemen in cities prevent outrages of the strong upon the weak and exert their power to preserve good order among all classes. This nation has a similar duty to perform in stopping the outrages by a cruel and decaying nation of the Old World upon the population of the Island of Cuba, an island that should and must be free."

The manager of an extensive system in the west: "Should we have war, in my judgment it will greatly embarrass the extension of lines and all new work, as there is a very strong probability of money rates being advanced, and of course this will have the effect of making it hard to sell bonds or raise money for new things. If the war, however, is of short duration it ought not to affect our regular business. We notice in the west already that there is considerable fear of the probable result, but, in my judgment, our line of business would not be near so much affected as others."

#### TROLLEY CARS ON BROOKLYN BRIDGE.

Since the trolley cars began crossing the Brooklyn bridge there has been a noticeable falling off of bridge receipts. This has amounted to about \$1,000 a day, which will leave a considerable deficit to be paid by taxation. Last year the bridge earned \$1,235,000, which was \$200,000 more than its expenses. The patronage given the trolley cars causes a large reduction in the receipts from the regular cable cars. Both the Brooklyn elevated roads and the ferries have suffered from the popularity of the trolley cars. On account of the diminished bridge receipts, it has been decided to decrease expenses by dismissing 50 trainmen.

A bill has been introduced into the New York Assembly instructing the Board of Railroad Commissioners to investigate and approve of some effective guards, fenders or sweeps for electric and cable cars. Street railway companies in all cities in the state over 60,000 shall provide the cars with such approved safety devices by January, 1899.

#### E. H. HARRISON.

E. H. Harrison, commander of the Naval Militia of Illinois, is well known to all the supply men of Chicago and a large number of street railway men in the West. In '93 Mr. Harrison was a member of the firm of Harrison & Cary, handling street railway supplies. When the firm was dissolved he went to Peoria as manager of the Spirits Company there, which position he now holds. He is a graduate of Annapolis, cruised in the Pensacola during the Chilean troubles, and can be depended on to command the Naval Militia with credit to himself and the state of Illinois. He

E. H. HARRISON.

is a brother of Hugh Harrison, of the J. G. White Company, New York.

#### MEETING OF THE ACCOUNTANTS' ASSOCIATION.

President Wilson and Secretary Brockway of the Street Railway Accountants' Association of America, have issued a circular of announcement to the membership giving the details of the convention in September so far as they have been arranged. The meetings will be held in the Banquet Hall of the Massachusetts Charitable Mechanics' Association Building, September 6, 7, 8 and 9.

Three of the papers to be presented have been decided upon; these are:

"Statistics—Their Use and Abuse."

"Car Mileage—How Arrived at and Its Use."

The report of the permanent committee on Standard Systems of Street Railway Accounting.

It is intended to make the exhibition of blanks and forms a feature of the meeting and it is earnestly urged that each member of the association be represented in this, in order that the exhibit may be complete, and as useful as possible.

The rapidly increasing scope and influence of the association is indicated by the application and admission to membership of the Honolulu Street Railway.

By direction of the management the motormen and conductors of the Metropolitan Street Railway, of New York, assumed their summer caps and suits on Easter.

M. T. Moloney, ex-attorney-general of Illinois, on March 30 purchased, for the amount of taxes due, the rolling stock of the street railway at Ottawa, Ill., which had been attached for unpaid personal property tax. Mr. Moloney sought to buy the road but could not make terms. He has leased the cars to the receiver of the road.

## THE GREAT FLOOD OF 1898.

Many Cities and Their Street Railways Inundated—Power Houses and Car Barns Do Not Escape—Fires Extinguished and Traffic Suspended—In Some Places Tracks Washed Away—Principal Losses, However, Are in Revenue.

Many towns and cities in Ohio and southern Illinois were inundated during the high water March 23 to April 4. The greatest catastrophe was at Shawneetown, Ill., on the Ohio river, where 30 persons lost their lives and the larger part of the town destroyed. The 25-ft. levee gave way so suddenly that little or no warning of danger was given to the inhabitants. No similar loss of life was recorded elsewhere, but the other damage was very great.

At Columbus, O., the levee guarding the west side broke and the city experienced the worst flood in its history. The accompanying illustrations convey a good idea of how the Scioto river ran riot over a portion of the city. The street

The bridges throughout the Licking valley were washed away and cut off all means of transportation around Newark, O. The power station of the Newark & Granville Electric Street Railway Company was under water and operation had to be suspended. The Tuscarawas river was higher than it has been in 50 years and much damage was done around New Philadelphia. The interurban line between Uhrichsville and New Philadelphia sustained damages to its roadbed to the extent of \$2,000 or more.

Miss Anna Mitchener, superintendent of the Tuscarawas electric line, distinguished herself during the flood. The electric line was badly crippled, more than two miles of the

THE FLOOD AT ZANESVILLE, O.

railway service was interrupted on some lines where the water was so deep as to flood the motors. On High street a lake formed 200 yds. wide which the cars could not cross and it was necessary to transfer passengers in busses. The water flowed into the wheel pits of the power station on West Spring street but pumps were put to work and the water kept pumped out until the river had fallen below the danger line. The two dynamo rooms of the Columbus Electric Light & Power Company were flooded and the engines and dynamos were covered by the water. A thorough overhauling and cleaning of the machinery is necessary and will entail a large expense.

The Ohio river was out of its banks and considerable damage was done around Cincinnati, Newport and Covington. The conditions were substantially the same as last year, a description and illustrations of the flooded districts being given in the REVIEW at that time. The patrons of the cars in Dayton and Bellevue, Ky., had to transfer from the cars into flat boats, draw themselves across the ponds by a cable and again take the cars for Cincinnati.

13 being under water. While the flood was at its height, Miss Mitchener hired a livery horse, donned a waterproof habit and went without an escort to the scene of the wash-out, where she personally directed the work of the employes of the line in guarding the railway property against damage. She then pushed through water half way up on the horse's side, rode to Uhrichsville, and, without dismounting, returned over the route the same day, making a total of 26 miles.

The road ran its cars through to Uhrichsville after several day's delay and the speedy resumption is due to the pluck and good management of the fair superintendent. Her father, Major E. C. Mitchener, wired his congratulations.

At Wheeling, W. Va., the water covered the floors of the power station and car barn. The cars were removed to a part of the city where there was no danger from the flood. It also became necessary to shut down the station and lift the generators off the foundations and support them on ties 6 ft. above the floor. By this course no damage to the ma-

Y BRIDGE AT ZANESVILLE, O.

chines was sustained. The lines of the Moundville, Benwood & Wheeling Railway Company were submerged and the cars operated on portions only of the route for a few days.

At Evansville, Ind., the river rose to 44.8 ft. and threatened the station of the street railroad company. The Miami Valley Traction Company, of Hamilton, O., suffered severe loss, its roadbed was swept away in numerous places and the damage cannot be repaired for some time. The flooded condition of the streets in Marion, O., caused a delay on some of the lines of the Marion Street Railway Company. The pits in the car barn were also flooded.

In reference to the flood General Manager Nelson, of the Springfield (O.) Railway Company, says:

"We suffered considerable loss and damage from the recent high water. The levee along Buck creek, above our power house, gave way and caused our premises to overflow. In fact there was about 2 ft. of water in our car barn and repair shop, and about 6 in. over the power house floor. This break occurred after shutting down time at night, and as we were expecting it, our belts were removed and machinery generally put above any height the water might possibly attain. We were, however, unable to start our machinery until 11 a. m., on March 23, and therefore suffered practically the loss of one-half day's business. It was impossible to get to or from our power house from about 2 a. m. until noon. We had a number of poles carried away and some track washed out, also two large oil storage tanks."

Zanesville, O., suffered much damage from the high water and the following account is from General Manager Westcott, of the Zanesville Railway & Electric Company:

"After a rain of four days, the Muskingum and Licking rivers, which join at the Y bridge, were so high they commenced overflowing their banks on Wednesday, March 23, in the morning, and by 11 a. m. had covered our Gant Park line to the depth of 2 ft., submerging about 200 acres of the 7th ward and driving 500 families from their homes. By 2 p. m. the water had risen, covering our Brighton line to a depth of 3 ft. in places, giving us some two miles of track which was out of use, all other portions of the line being in working condition, clear of high water. During the evening, the water got up to the power house, and began running into the cellar, but we finished the day without any interruption at the power plant. At 5 a. m. Thursday, March 24, the water had risen so high in the power house that it could not be operated, and no power was generated until Sunday morning, March 26.

"No damage was done to power house or tracks but the steam railroads were not so fortunate, as all roads entering the city were tied up for several days, with washouts, and bridges gone. The Baltimore & Ohio Railroad, Cleveland, Canton & Southern Railroad, the Zanesville & Ohio River Railroad, and the Cleveland, Akron & Columbus Railroad suffered the greatest damage, and were several days without trains; the Cincinnati & Muskingum Valley Railroad, the Columbus, Sandusky & Hocking Railroad and the Bellaire,

SCENES NEAR HARTFORD AND BROAD STREETS, COLUMBUS.

Zanesville & Cincinnati Railroad all suffered great damage from the water in this city.

"Practically the whole of the 8th ward, as shown beyond the 'Y' bridge in the picture, was under from 6 ft. to 10 ft. of water, also about half the 7th ward. Part of the 2nd ward and part of the 9th ward were under from 3 ft. to 8 ft. of

COLUMBUS ELECTRIC LIGHT PLANT.

water, in all about 2,000 houses were practically half under water. Great suffering was caused, and two lives lost. The Citizens' Committee raised a good quantity of money to aid sufferers, who were attended to promptly. The police force, assisted by a company of state troops from Battery C stationed here, did police duty, and there was no excitement or disturbance."

## A CHAPTER OF CASUALTIES.

On March 9 there was a collision on the Atlantic Highlands, Red Bank & Long Branch Electric Railway, between a construction car and one of the regular cars which resulted fatally to the motorman of the latter. The accident occurred on a piece of single track nearly opposite the old Monmouth Park gates. The construction car had been at the nearest turnout and the motorman thought he could reach the next one before the regular car was due and was running at high speed. The regular car was a trifle ahead of time and the two met head on; a heavy fog prevented the motormen seeing the approaching cars until it was too late to stop. No passengers were injured.

March 11 a passenger train on the Jersey Central struck a car of the Lansford & Tamaqua Street Railway at the Broad street crossing in Tamaqua, Pa. The front of the car was demolished, but no one injured except the motorman, who sustained severe cuts about the head. It is stated that the motorman was unable to stop his car on approaching the crossing and finding the safety gates closed because of the failure of the brakes to work properly.

On the same day a serious drawbridge accident was narrowly averted at New Brunswick, N. J. A car on the Brunswick Traction Company's track approached the bridge spanning the Delaware & Raritan Canal and because of the fog he failed to see that the draw was open until quite close.

When close enough to see the danger the brakes were applied, but the car coasted over the wet rails and was only prevented from plunging into the water by the guard chain stretched across the track.

March 13 there was a rear end collision between two trolley cars of the Consolidated Traction Company in Newark, N. J., in which several persons were injured, two quite seriously. The same evening a drawbridge across the Passaic river on the line between Newark and Harrison was opened as an electric car was running onto it and the passengers had a narrow escape; in this case the car had been signalled to come ahead by the gate tender.

A very unfortunate accident occurred at Racine, Wis., on March 31. The Milwaukee, Racine & Kenosha here uses the tracks of the Belle City Street Railway, which at one point cross a bridge over the Root river, which bridge is continued at one end as a viaduct over railroad tracks. Shortly after noon some boys were playing about the viaduct when a locomotive passed underneath; the smoke and steam rising through the cracks in the flooring concealed an approaching interurban car from the boys, and also hid them from the motorman. One of the boys, being on the car track, was struck and killed, the wheels passing over his body longitudinally.

## THE WAGE QUESTION IN GALVESTON, TEX.

The Galveston (Tex.) City Railroad Company is in the hands of a receiver appointed by the United States Circuit Court. Recently the employes petitioned the court to order an increase in the wages of the trainmen, and claimed that the surplus accumulated by the receiver since his appointment fully justified such an increase. The answer of the receiver showed that after deducting the interest on the first mortgage bonds and the floating indebtedness, there would remain, from the operation of the road for 12 months, a profit of but \$10,574; and that the extraordinary expenses, for material only, needed to improve the property amounted to \$46,000, which is greatly in excess of the surplus on hand and the profits to be expected from operation. He further said that the wages paid the company's employes were, with but one exception, as high or higher than the wages paid employes for similar work in any part of that section of the country. The rates are 14 cents per hour for the first year and 15 cents thereafter; an increase of 2 cents was asked.

The court denied the petition because of the condition of the property.

## RIGHTS IN THE HIGHWAY.

In a case now pending in the Pennsylvania courts between the Pennsylvania Canal Company and the Lewisburg, Milton & Watsonstown Street Railway Company the Canal Company sought to enjoin the street railway from crossing the canal on an overhead bridge near Watsonstown. In the lower court it was held that as the public road crosses on the bridge, the street railway also had a right to its use. An appeal has been taken to the supreme court.

The Northampton (Mass.) Street Railway Company has closed a contract with the postal authorities to carry the mail between Center and Bay State three times a day.

## PROSPERITY AMONG THE STREET RAILWAYS.

Reports From 30 Representative Roads Reflect Improved Conditions in all Sections of the Country—Highly Gratifying Increase in Earnings for First Quarter of '98—Industrial Activity Reflected in These Figures and the Outlook Is Universally "Good."

The REVIEW was not one of those who on the morning of November 4, 1896, went out upon the house tops to see the sun of prosperity rise and in a single day dispel the mists which had obscured the business horizon for over three years; many of those who did go out remained and their over-taxed eyes could not recognize the steady but gradual improvement in conditions which the last year has brought about—things appeared distorted and they earned the name of "calamity howlers." We believed that any lasting improvement in business must be of gradual growth—the result of united effort which would be made when the silver bogie was muzzled—and awaited the future with confidence. During 1897 the volume of trade in general was large, any dissatisfaction which was felt being due to the fact that the prices prevailing were low. It would be difficult indeed to find a series of predictions for the future more sanguine in tone than those of our advertisers which were published in "Echoes from the Trade" in our issue of December last; and they were justified by the statement of the year's business.

Looking, as we did, for the better times in 1898, it is with great satisfaction that we are enabled to give below the reports from a number of street railways which are so much better than expected as to be surprising. In all the northern states the street railways find that the last quarter of the year is very much better than the first quarter; this is because in our climate the bad weather of the year is for the most part crowded into the months of January, February and March, and the effect of what little of winter comes in December is more than counterbalanced by the holiday traffic during that month. The manager of a street railway, therefore, when looking over the statement for the first quarter of the year is usually much gratified if the decrease as compared with the previous quarter is not a great one. An absolute increase in the receipts of the first quarter over the last is not to be thought of, except in one's dreams, as a general thing.

The street railways are good barometers to indicate the state of the business atmosphere, and this is especially true of manufacturing centers. If a man is out of employment he has no use for a street car, and his family can not afford to ride. There is also a large class of people who, when driven to economize, find that street car fare costs more than shoe leather, and walk where in better times they would ride. The statements given below are indicative therefore of prosperity for us all.

The receipts of the Cleveland, Painesville & Eastern Railroad for January and February, 1898, were 20 per cent greater than for the same months in 1897. This company has built 14 miles of track in the last six months which is not yet in operation. The outlook is reported as good.

The Nassau Electric Railroad, of Brooklyn, which is an interurban as well as a city line, reports that the receipts for the first quarter of this year were 25.25 per cent above the same months in 1897, and that they were 10.71 per cent in excess of the last quarter of 1897. In anticipation of the

summer traffic the company has secured 120 new cars and increased the capacity of its power plant by 2,500 h. p.

The Springfield Railway Company, of Springfield, O., a city line, reports an increase in receipts for the quarter just closed of 24.90 per cent over the first quarter, and 5.75 per cent over the last quarter of 1897. Compared with the corresponding months of 1897 the increase was: January, 28 per cent; February, 22.5 per cent; March, 24.25 per cent. The prospects are good. The general manager, Samuel L. Nelson, writes: "Our industries are all in operation and with orders on hand sufficient to keep them going for several months. Practically all our idle labor has been employed, there being no skilled labor whatever unemployed. Empty houses are filling up and the general outlook has not been so good since 1892."

The Market Street Railway Company, of San Francisco, earned nearly 7 per cent more during the first quarter of 1898 than during the first quarter of 1897. General Manager Vining states that while the prospects for the summer are good there is a danger of a dry season in California which would have an unfavorable effect on all lines of business.

The receipts of the Toledo Traction Company from its street railway for the months of January and February were 12 per cent in excess of those for the corresponding months of 1897 and the prospect is reported as good for the summer.

The Schnylkill Valley Traction Company, which operates both city and interurban lines, reports an increase for the quarter of 12.5 per cent over the first and .5 per cent over the last quarter of 1897.

J. P. E. Clark, general manager of the Binghamton (N. Y.) Railroad Company, writes: "I am pleased to state that the passenger receipts for the months of January, February and March have shown an increase of about 16 per cent over the corresponding months of the year previous; and in fact the last three months of 1897 show about the same ratio of gain over the corresponding months of 1896. I think the outlook for a large increased traffic the coming summer is most favorable, and in accordance therewith we are arranging our plans for the transportation of the expected increased number of passengers, and with that end in view, we are adding a 250-h. p. engine and a new dynamo to our present station equipment. We shall also add to our rolling stock, and shall place our entire equipment in a first-class condition."

The Third Avenue Railroad Company, of New York, reports an increase of 3 per cent for the quarter just closed over the first quarter of 1897.

The Chattanooga (Tenn.) Electric Railway Company, operating both city and interurban lines, reports the increase in receipts for the first quarter of 1898 as 7.5 per cent over those for the same months last year. The prospect for the summer is good.

The Fort Worth (Tex.) Street Railway makes a most gratifying showing; the increase in receipts for the first

quarter of this year is 25 per cent over the first and 15 per cent over the last quarter of 1897; the prospect for the summer is reported as very good.

At Toronto, Canada, the same prosperous condition obtains. The earnings of the Toronto Railway Company from January 1 to March 23, were 16.5 per cent greater than for the same period in 1897, and the decrease when compared with the last three months of last year, which were exceptionally good, was only 6 per cent. The prospect for summer business is good.

The Columbus (O.) Street Railway Company reports that its receipts for the quarter just past are 11.5 per cent in excess of those for the same months of 1897 and are practically the same as the last quarter of 1897, the difference being too slight to mention. The outlook is good.

Miller Elliott, superintendent of the Citizens' Street Railway Company, of Indianapolis, is quoted as follows: "I believe there is an apparent improvement in general business circles. Traffic is quite heavy now, in fact, our 6 o'clock passengers demand more cars. I think the wage-earner is realizing more income now for the reason that he, as well as the employer, believes that there is a more prosperous season upon us and if we can all work in harmony I am sure there will be little cause for any complaint, as far as hard times are concerned."

The gross earnings of the United Traction Company, Reading, Pa., which operates 48 miles of road, for February were \$11,307, a gain of \$729 over the same weeks of last year.

The report of the Brooklyn Rapid Transit Company's system for March, 1898, shows passenger earnings of \$449,938, an increase of 15.2 per cent over March, 1897, and of 21 per cent over March, 1896.

The Charleston (S. C.) City Railway Company, which operates city lines only, reports receipts as follows: Increase over 1897: January, 34 per cent; February, 10.2 per cent; March, 32 per cent. Increase over 1896: October, 30 per cent; November, 29.4 per cent; December, 40 per cent. The gross receipts for the first quarter of 1898 were \$36,880, and for the last quarter of 1897, \$40,435. The prospect for the summer is stated to be good, if we do not have war. This system was operated by horses until July 1, 1897.

The following is a statement of the daily increase of each of the St. Louis roads for the last quarter of 1897 as compared with the last quarter of 1896. The same increase continued in January; if the gain is maintained throughout the year the increase for the St. Louis lines will be \$239,000 during 1898.

Cass Avenue & Fair Grounds Railroad.....	\$ 14.74
Citizens' Railway Company .....	34.92
Lindell Railway Company .....	155.78
People's Railroad Company .....	2.55
Missouri Railroad Company (Olive street).....	80.09
St. Louis Railroad Company (Broadway Cable).....	48.30
St. Louis & Suburban Railway Company.....	119.40
Southern Electric Railroad Company.....	24.38
Union Depot Railroad Company.....	179.06
<hr/>	
Total daily increase, all lines.....	\$663.95

Speaking of the increase in receipts shown by this table, C. H. Spencer, president of the Southern Electric Railway Company, said: "The January earnings of every road in town showed an increase over the corresponding month of last year, and if I am correctly informed, it breaks all rec-

ords. This is not a mere spurt on the part of one road for a single month, or of all the roads for a month; it has been the same for four months. October, November and December, as well as January, all show handsome increases, so that it cannot be credited to any unusual conditions of weather or anything of that sort. It shows that the people have found employment, that there is money in circulation, that the crops of the country have brought good returns to the farmers and that country merchants are getting their money for their goods and are paying the wholesalers in the cities for what they bought from them. The wholesalers in turn are paying the manufacturers, and every branch of trade is flourishing. It is not a local condition, but seems to be general throughout the country."

Reports have been received from several companies which for various reasons do not care to be quoted, but with a single exception they are of the same tenor, showing increased receipts and stating the outlook to be good. These reports in detail are:

1. This is the exception. It is an 8-mile city road which has but recently emerged from the purifying hands of a receiver. The receipts for the first quarter of this year were \$474.46 less than for the same period of last year.

2. A city and interurban road with 25 miles of track. The increase in receipts over the corresponding month of 1897 were: January, 26 per cent; February, 18 per cent; March, 16 per cent. Prospect very encouraging.

3. A city and interurban line with 35 miles of track. Receipts for first quarter of 1898 17.7 per cent in excess of the first quarter of 1897. The general manager writes that the company is building a few miles of new track and states that if the war scare subsides there will be a very much better business than last year.

4. City line, 160 miles. Increase of receipts for first quarter of 1898 over first quarter of 1897, 10 per cent; decrease as compared with preceding quarter, 6.3 per cent.

5. City road, 42 miles of track. Increase of receipts for first quarter of this year over first quarter of 1897, about 10 per cent; over last quarter of 1897, about 15 per cent.

6. A city and interurban line. Increase of receipts for first quarter of 1898 as compared with first quarter of 1897, is between 8 and 9 per cent.

7. A city road with 50 miles of track. Increase for the quarter, compared with first quarter of 1897, is 6 per cent.

## A HARD FOUGHT CASE.

For the fourth time a new trial has been granted in the case of Mrs. Macy Beaupre vs. the Citizens Street Railroad Company, of Indianapolis. The plaintiff claimed to have been very seriously injured in January, 1896, when attempting to alight from one of the defendant's cars; she alleged that she was dragged for 150 ft. The testimony in the case was very conflicting, and it is claimed that many of the plaintiff's witnesses perjured themselves. The four trials resulted as follows: First, disagreement; second, \$3,500 for plaintiff; third, \$15,000; fourth, \$2,500.

An eastern paper tells of a banker who at the request of a client investigated a Kansas street railway to discover why the dividends were not up to the standard, and received this reply: "The free and unlimited coinage of bicycles has taken all the profit out of our business."

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

Experiments made by Prof. W. L. Hooper, of Tufts College, to determine the temperature of four General Electric wattmeters show that for each degree, Centigrade rise of temperature the constant of the instrument decreases about one-twentieth of 1 per cent.

\* \* \*

In the Journal of the Franklin Institute for March is the report of a committee which tested the Arndt "econometer" for continuously indicating the percentage of carbonic acid gas present in the furnace gases, and thus giving a check on the manner of firing the boilers. This instrument was illustrated in the REVIEW, June, 1897, page 390. The test was conducted at the Baldwin Locomotive Works, the instrument readings being compared with the results of analyses of the gases made by Prof. Harry F. Keller. The report says: "These comparative tests satisfied the investigating committee as to the substantial accuracy of this instrument. The recorded variations given in the annexed tables show discrepancies so trifling that, if the econometer were used in the management of steam-boiler furnace fires, no considerable loss would occur by reason of the difference between the econometer reading and the chemical analysis. A saving in fuel would result because of a better and more intelligent management of fire and damper, allowing less surplus air to pass through the furnace than would ordinarily be the case."

The per cent of C O<sub>2</sub> by analysis, and by the econometer during the time the sample gas for analysis was being drawn out are as follows:

Analysis . . . . .	4.02	4.84	4.12	9.06	10.53	6.57	4.38
Econometer . . . . .	3.80	4.70	3.93	8.57	10.40	6.90	4.40

\* \* \*

C. C. Brown in "Municipal Engineering," March, 1898, in answer to a correspondent gives some data as to the cost of operating pumping stations in four cities; it is stated that the data are "from a table in preparation." The costs were given per 1,000,000 gallons pumped 100 ft. high.

City.	Capacity, Gals. per Day.	Cost per 1,000,000 Gals 100 Ft. High, Dollars.				
		Fuel.	Labor.	Oil, etc.	Repairs	Total.
1. Chicago.....	99,000,000	3.61	1.97	.12	.12	5.82
2. Milwaukee.....	35,000,000	1.00	1.44	.12	.08	2.64
3. Newark, N. J.....	26,000,000	1.86	1.72	.35	.27	4.20
4. Milwaukee.....	9,000,000	2.53	5.39	1.05	.47	9.24
5. Mankato, Minn.....	3,100,000	3.37	2.48	.16	.60	6.61

For the purpose of comparison with the power house costs published in the REVIEW, these pumping plant figures have been reduced to per kilowatt-hour at the switchboard. The kilowatt-hour is equal to 2,654,432 ft.-lbs.; the pumping

unit, 1,000,000 gal. 100 ft. high is equal to 833,900,000 ft.-lbs.; the pumping unit is therefore equal to 314.15 k. w. h.

City.	Capacity, Gals. per Day.	Cost per 2,654,432 Ft.-Lbs. (k. w. h.) Cents.				
		Fuel.	Labor.	Oil, etc.	Repairs	Total.
1. Chicago.....	99,000,000	1.149	.627	.058	.038	18.52
2. Milwaukee.....	35,000,000	.318	.458	.038	.025	.840
3. Newark, N. J.....	26,000,000	.592	.548	.111	.086	1.337
4. Milwaukee.....	9,000,000	.805	1.716	.334	.150	3.005
5. Mankato, Minn.....	3,100,000	1.673	.789	.051	.191	2.104

We have always been told that the steam plants of maximum economy were pumping plants because the load is constant, and the reduction of costs to the k. w. h. basis was made in order to see how far below the pumping plants the street railway plants would fall as regards economy of operation. The results were a genuine surprise to the writer as they will no doubt be to the most of our readers. By reference to the table, "Cost of Power for Electric Railways," on another page, it will be seen that the only pumping station showing a cost anywhere near as low as these street railway stations is the 35,000,000-gallon plant at Milwaukee. The engines in this station are the ones tested by Prof. R. C. Carpenter in March, 1893, when the water rate of 11.68 lbs. per i. h. p. per hour was obtained. The cost of operation of this station is above that of five of the street railway stations given, and not very much below three of the others.

There may be factors to be considered in connection with the pumping station data which we have overlooked, because not given in Mr. Brown's table, that would explain these high costs, and if so we should be very glad to have them brought to our notice.

\* \* \*

According to an account published by the inventor of the system, the best way to secure an efficient combustion under steam boilers is to close the openings ordinarily provided for the supply of air and draw the air down the chimney. As we understand it a comparatively short section of pipe of a diameter somewhat smaller than the stack is placed at the top, and projects a short distance above the stack; the hot gases find a way out through the interior of this pipe and cold air enters the annular space between the pipe and stack. The cold air flows down close to the walls of the chimney while the hot gases flow up in the center; on reaching the boiler the air flows through lower fire tubes to the rear end, and back underneath to the furnace; the gases resulting from combustion pass through the upper tubes.

The results of tests of this system are quoted which show gains of from 4.5 to 31 per cent over furnaces of the ordinary design.

The advantages claimed for the system are:

1. A saving is made by heating the air by contact with products of combustion after they have passed the sphere of useful work, instead of heating the air at the expense of the fuel.
2. A saving is made by feeding air heated by the products of combustion on top of the fire in automatically regulated quantities.
3. A saving is made by excluding the large amount of surplus air fed through the grate bars in ordinary practice.
4. Hydro-carbons and other combustible gases, which frequently escape before they are consumed for lack of oxygen, are wholly consumed in the combustion chamber.

It is probable also that by taking the air (which to flow down the chimney in the path marked out for it must be somewhat cooler than the waste gases) through the lower tubes, this portion of the boiler will be prevented from becoming overheated, though this is not claimed by the inventor.

\* \* \*

Last month we called attention to the steam consumption of the auxiliary apparatus in the power station of the Chicago storage battery road, which showed over 19 per cent of the total steam generated was used for that purpose. Such a figure is by no means unusual in the operation of other power plants using steam driven auxiliaries and the paper by Past Assistant Engineer W. W. White, read before the American Society of Naval Engineers, shows that the same conditions obtain on shipboard. Whether it would be practicable and safe to substitute electric motors for the steam pumps and blowers, and concentrate the electric plant is a question. But the presentation of such data as Mr. White gives in his paper will serve to call more attention to the subject, which is of particular importance on board naval vessels where any apparatus that wastes coal detracts appreciably from the power of the ship. The following is an abstract of the paper in question:

**Steam Consumption of the Auxiliary Apparatus of the U. S. S. "Minneapolis."**

The apparatus for testing the auxiliaries was primarily arranged to find the steam consumption of the dynamo engines. From an inspection of the cylinders it was known that these engines used an abnormally large amount of steam, due to leakage past the pistons which were grooved for water packing, and were without packing rings. New pistons with snap rings were designed and fitted in the cylinders of one of the three dynamo engines, and tests were made to ascertain whether the saving was sufficient to warrant the change in the remaining two. The method adopted in all experiments was to measure volumetrically the condensed exhaust steam in barrels provided for that purpose, the temperature being observed and the weight of the water derived from these observations and sample weighings. No attempt was made to specially prepare any auxiliary for testing. All were periodically examined and repaired, as found necessary, and thus kept in good condition. The tests were made as opportunity offered and with the auxiliary doing the service work required aboard ship. Indicator cards were taken during the different tests.

The electric lighting plant consists of three 24-k. w. generating sets constructed by the General Electric Company, Schenectady, N. Y. Each dynamo, which is compound

wound of the multipolar type, is driven by a two-cylinder, simple vertical inverted engine, the crank shaft being coupled direct to the armature shaft, and the bed plate common to both engine and dynamo. The designed speed of each engine is 400 revolutions with 80 lbs. steam pressure, the maximum output being 300 amperes at 80 volts. There is, however, considerable reserve allowed for in the design, and the engines are capable of a much higher power than that necessary to produce the output mentioned.

The engine cranks are set at an angle of 180°, and one eccentric, working through a rock shaft, furnishes motion to drive both valves, one for each cylinder. These valves are of the piston type without packing rings, one supplying steam at its ends, and the other in the middle. An automatic shaft governor regulates the angular advance of the eccentric, and tends to keep the speed constant with a variable load.

The valves are placed on the fronts of the cylinders, and the valve chests and cylinders are in one casting. The pistons, which are intended to be a neat fit to the cylinders, have three circumferential grooves for water packing. An examination of the cylinders, pistons and valves, preliminary to testing, showed the following results:

No. 1 Dynamo.—Both cylinders considerably eroded near middle of stroke, for about one-half the circumference, due to constant blowing of steam past the pistons; pistons a bad fit to cylinder bores. Forward valve a loose fit, after one fairly tight.

No. 2 Dynamo.—Cylinders slightly pitted and rusty, except about one-third of the circumference; pistons a closer fit than No. 1, but steam evidently blows past both pistons. Forward valves a fair fit, after loose and leaks.

No. 3 Dynamo.—Cylinders in fair condition and pistons a good working fit. Forward valve loose and top bridge piece between ports rusty from leakage of steam; after valve a fairly good fit.

As before mentioned, one new set of pistons with spring rings was cast, and these substituted at different times for the water-packed pistons in all three dynamo engines. To determine what saving resulted, a test was made of each engine before and after the change.

All tests were made with the dynamos doing the ordinary lighting of the ship. Usually one dynamo was sufficient for this, and in the absence of any special reason it was the rule to change from one to another in regular order every twelve hours.

A reducing valve and a separator are located in the dynamo room; the piping is so arranged that steam, before its admission to the cylinders of any of the engines in use, passes through both.

Tests made on No. 1 engine with and without new pistons and spring packing rings showed an average steam consumption per indicated h. p. hour with water-packed pistons of 123 lbs. and with pistons fitted with spring rings of 60 lbs., the load varying from one-half to full load and averaging about two-thirds load in each case. This great difference in the steam consumption would amount in a 24-hour run at this load to over 16,000 lbs. of steam, or, assuming a boiler efficiency of 1 lb. of coal per 7.75 lbs. of water, the difference in coal consumption would be over 2,000 pounds. Tests on one of the other dynamo engines fitted with pistons grooved for water packing showed an average steam consumption per i. h. p. per hour of 109 lbs., with the dynamo

loaded to about half its rated load, and 84 lbs. per i. h. p. hour with the dynamo loaded to about 15 per cent overload. The same engine fitted with new pistons with spring rings showed steam consumptions of 65 lbs. per i. h. p. per hour, on tests made at slightly over half load. The saving on the third engine was also considerable, although not as great as on the other two. Unfortunately, the steam consumption per electrical horse-power output was not derived, as the instruments for measuring the output were not sufficiently accurate.

While these steam consumptions seem to be considerably greater than they should be, the steam consumption of some of the other auxiliaries was still more serious.

The following table shows the indicated horse-power and steam per indicated horse-power of some of these auxiliaries:

Name of Auxiliary.	I. H. P.	Steam per I. H. P. H. Lbs.
Pump of starboard condenser.....	1.23	266
Circulating pump engine (fly wheel).....	.19	55
Starboard air pump.....	6.5	183
Center air pump.....	.25	78
Vertical duplex fire pump.....	1.	205
Horizontal duplex fire pump.....	0.8	319
Same pump.....	6.4	156
Vertical duplex bilge pump.....	2.5	171
Fire room feed pump (vertical duplex).....	8.8	91
Same pump.....	1.6	243
Forced draft blower engine (fly wheel).....	.16	77
Single cylinder horizontal flushing pump.....	1.4	194
Air ice machine.....	6.	70

Tests made of the relative amounts of steam consumed by the main and all the auxiliary engines on a run made between Gibraltar and League Island, Pa., showed that the main engines used about 33,600 pounds of steam per hour and all the auxiliaries about 10,000 pounds per hour. In other words, over 23 per cent of the steam generated was required by the auxiliary engines.

Some additional equipment has been placed in the repair shop of the Metropolitan West Side Elevated Railroad Company, of Chicago. A 16-in. table saw has been put in and a 48-in. boring machine. In the new equipments of motors and trucks the axles have been increased from 4¾ in. to 5¼ in. and the hubs of some of the wheels had to be bored out.

## THE ELECTRIC RAILWAY.

(Abstract of a Paper Read before the Chicago Electrical Association by W. R. Garton.)

The electric railway is today one of the greatest moral and financial powers; from its infancy it moved the public, and it still continues to do so, and to no small degree either, for it is fast superseding every other method of transportation. As a moral power and influence its effect is wonderful. It has raised the mule and horse car drivers to motormen, who in most instances must know something more than to handle a whip and a brake handle. It elevates its patrons by giving them opportunities of rapid transit at low rates, enabling them to live at a distance, own their own homes, thus encouraging thrift and industry. It also has the effect of inspiring to higher and better positions, from the very fact that the man who has been enabled to begin payment on a home naturally wants better wages. It has placed thousands of men, who prior to its advent were ordinary, thoughtless, careless groomers or foremen of horse barns, etc., in positions of honor and responsibility, and it has developed in those men the once dormant talents, thus causing them to respect their positions, their superiors and themselves. What greater influence for the betterment and elevation of mankind could we ask for?

As a ruling influence in the financial world—is it not true that wherever it goes it enhances the value of property? Does it not raise the price of real estate, and is it not known to every one that many a dwarfed community, suburb town or village has by its influence sprung into prominence as a manufacturing center, or as a much desired living place for the city business man? Has it not in just this way materially changed the value of the once valueless property, now a handsome and much esteemed home?

The electric railway, like all other great movements, must fight its battles, but very often its most bitter opponents come to be its strongest advocates. At first the electric railway was very skeptically looked upon from the very fact that it was a new thing, the practicability of which had to be proven, other electrical apparatus at that time being quite a novelty to the general public. It is well remembered the excitement and curiosity occasioned by the first car on our early systems but, as usual, the novelty soon wore away, and the electric railway was soon a commonplace thing.

The electrical man, however, has not from that time until now been content to look upon it as other than a great field for improvement and investigation.

Van Depoele is looked upon as the man who incorporated the necessary principals to make it lasting, practical and commercial. Benson Bidwell, now of this city, however, claims to be the father of the electric railway, having operated a car on the lake front in 1887, also having had in operation an electrically heated, lighted and propelled car at the exposition at Philadelphia in 1884. It was not until after the absorption of the Van Depoele patents, etc., by the Thomson-Houston Company that it assumed any considerable prominence.

About this time many other railway systems came into prominence, such as the Spragne, Short, etc. Aside from these three, there were many others, one that became quite popular was the Rae. All of these motors were electrically very efficient, but were mechanically inferior and expensive to maintain. It would, however, be grossly wrong if we did not give them much credit.

The T. H. and Sprague motors, while in some respects being constructed upon the same general principles, were essentially and radically different in others, as, for instance, in the manner of control. The T. H. motors were controlled by means of an external resistance, aside from a small portion of the field spool being so arranged as to be cut out on the last point.

This portion of the field was termed the loop, the direction was controlled by means of a three-point switch, known as the reverse switch, both the rheostat and reverse switch were manipulated by means of flexible cables, sprocket wheels and chains, the two controllers working in unison upon the same cables.

The Sprague system of control was that of the series-parallel, although not as we know it today. Each motor was provided with six field spools, each like set being constantly in series, that is, upper and lower spools were always in series with each other, and in so far as connections were concerned formed one field, two leads or terminals were run from each set of spools to a terminal box on the motor. The two motors always remained in multiple with each other, as was the case with the T. H., the change from series to series-parallel and finally to parallel taking place in the different field spools of both motors in unison. These changes were effected by means of cylinder controllers commutated in the same manner as those of today. This controller cylinder was divided into two parts, one for the forward motion, the other for the reverse. This was, of course, a very economical method of control, but it had its drawbacks. The Sprague or Edison No. 6 was a very powerful motor, but it was woefully deficient mechanically. The Rae system, while designed upon the same general principles, electrically, is in its general construction and arrangement very different. The principles laid down by Mr. Rae, I believe, are ideal had the mechanical difficulties been overcome. Mr. Rae's idea was to provide a powerful and an efficient motor equipment of few parts involving all the necessary principles and overcoming the defects in other systems. To do this, in the first place he provided one large motor of double the capacity of one T. H. or Edison motor, or equal to a complete double equipment of T. H. or Edison motors. The result from an electrical standpoint is at once obvious, he gained the combined strength of the two motors in one, which was always in harmony with itself and working uniformly on each axle. With a double motor equipment it is impossible to always have both motors doing equal duty, thus a dropping off in the efficiency of the equipment.

The tendency has been to reduce mechanical imperfections and to improve upon the electrical construction. Not only is this true of the motor, but also of the controller, as well as the method of control. The early motors were all double reduction, noisy and unprotected, the gears and bearings were open to dust, rain and mud, an accumulation of which shortened their life. These motors were bi-polar, the armatures were high speed and consequently gave maximum wear of the parts.

The first move to depart from the high speed motor was made in 1892. As I remember the first single reduction motor, the S. R. G. was first shown or introduced to the railway fraternity by the General Electric Company in October of that year. The S. R. G. was a modification of the F. 40 and looked much like it, with the exception of the absence of the intermediate gearing. From this on improvements came in rapid succession. The S. R. G. filled the requirements of a slow speed armature, consequently less gearing, less noise, less repairs, but still it lacked the armor to protect it from the weather and the accumulation of dust and dirt. To fill these requirements the W. P. was put upon the market, but it, like its predecessor, came but to be replaced by another, the G. E. 800.

Of course, there are many other motors upon the market equally as good as these mentioned, but, as they have all emanated from practically the same source, it is much easier to use them to illustrate the advance. This brings us up to the present with our highest development of electric railway equipment. We are to-

day not only in possession of high speed, high grade equipments, but also powerful motors for suburban and elevated service.

The electric locomotive is replacing the steam for heavy duty. Such as, for instance, the New York, New Haven & Hartford Railroad which is the longest section of any railroad in the world, hitherto exclusively operated by steam locomotives, to be equipped for electric traction. This system employs the third rail, the motor equipment consists of two G. E. 2,000 motors and style L controllers.

The Hoboken Shore road and the B. & O. tunnel road employ electric locomotives; they are mounted on two four-wheeled trucks, each axle carrying a G. E. 2,000 motor giving the locomotive a total of 540 rated h. p. the weight on the drives being 75,200 lbs. The draw bar pull is 10,000 lbs. Therefore, when we look back a few years and compare the 15 or even the 30-h. p. equipments which were then our best, with these monsters, does it not show marked progress?

Not only has the car equipment received so much careful consideration and been brought to so high a degree of perfection, but the entire system from the line to the power station shows the hand of the watchful and scrutinizing engineer. Consistent with the improvements in the propelling portion of the system, attention to the line and roadbed must needs have received equal consideration, otherwise the improvement in equipment and service would be entirely out of harmony.

In 1889 we used wood and canvass bell hangers supported by screw eyes, in 1892 the mica bell, then the well known cap and cone and at present the standard West End hanger; this last hanger incorporates all of the necessary and approved principles and qualifications. Mr. Henry, of Denver, suggests a cheap form of overhead construction by placing poles alternately on opposite sides of the street and running the span wires at an angle, thus decreasing the number of poles by one-half.

When the electric railway was first introduced, those introducing and installing it knew precious little more about it from a practical standpoint than the public. Quality of insulation, carrying capacity of conductors and the absolute necessity of a perfect and continuous metallic circuit had received practically no attention. The current was turned loose and allowed to wander back to the station as best it might.

A complete and well defined feeder system was not thought of, which is proved by the remark which a certain railway manager made in speaking of the successful operation of certain railway devices in connection with his system. He said, "What would you do when you reached the end of our line where I can lay the trolley wire upon the rail without throwing the circuit breaker at the station?" From this it will readily be seen that there was some considerable drop between the station and the terminus. Such things are to be found today only where communication with the outside world has been discontinued.

Our feeder systems are now as carefully calculated and laid out as the generator in the station or the motor under the car, but the perfection of the feeder system was not all that was necessary, the return or rail portion of the circuit is of as much import as any other part of the railway. It is remarkable to know how long it has taken the average railway man to fully recognize this important fact, and less than three years ago the electrician of a very large system remarked in the course of conversation, "I can't imagine why it is that I have such an enormous drop on my line." It was pointed out to him that he had some 18 or 20 feeders to carry the current out and was depending upon one No. 0 rail bond to bring it back. "Yes, but can't it come back on the gas and water mains?" The reply was, "Yes, it can." It did and the result you know, and to his sorrow he found out.

The T. H. Company began by using No. 0 copper rail bonds, while the Sprague or Edison and others used galvanized iron bonds, No. 6 being standard. Many roads were bonded with iron or copper, as the case might be, regardless of the size or duty of the system, but this bond question has been completely revolutionized, and the engineer is now as critical on this point as is possible. He not only wants to know the capacity of the bonds, the nature and method of its contact, but as well its construction and durability. He also wants to know with what success it has met in battling with Father Time, expansion and contraction, motion of joints, etc.

To show how well versed early railway engineers were, the following may serve. One of a number installing a certain system took his helper and a magneto and went out to test over some of the bonded joints, and to his satisfaction he found no drop. To-day such tests are made by means of very delicate and low reading instruments. By reference to a paper read before it is a solicitation by G. W. Know, electrical engineer of the Chicago City Railway last year, or to the articles in the STREET RAILWAY REVIEW of last year by Harold P. Brown, the high standard of rail bonding of to-day, is very apparent.

To keep pace with this wonderful improvement in the motor equipment and exterior portion of the system, it was, of course, necessary that the heart of the system should continually grow and develop with equal rapidity. No comparison is more striking than to visit a power station of the early '90's and then to inspect one of modern equipment. Our early stations were equipped with small high speed belt driven bi-polar units, while our most modern plants are provided with large direct connected slow speed multipolar machines, thus affording better regulation, high economy in operation, the absence of transmission losses, consequently a most economical basis of operation.

Although the standard of apparatus has steadily advanced, the remaining portion of the power house equipment has been kept on an equal footing, viz., the switchboard and accessories. There were not only in the old type of apparatus difficulties encountered in the maintenance and operation, but the operators of this age have with their improved power house and its complement of efficient boilers, engines and dynamos, found that without the installation of two very important features the pulse of the great system was caused to fluctuate wildly.

These two comparatively small members of the system are the automatic circuit breaker and the lightning arrester. In this particular the time element has certainly shown results. Formerly a short circuit or an excessive overload with the slow and exceedingly good natured fuse as a means of protection was the cause of many a gray hair and countless sleepless nights. The approach of a thunder storm thrilled the helpless superintendent or manager with a dread of his life, and not until the appearance of the promised sign, the rainbow, did he draw a natural, full, long breath, and feel that he was once more permitted to consider himself fortunate.

The switchboard which formerly was wood has given place to marble or marbled slate. We used to determine our voltage by means of a degree meter, but now we have magnificent direct reading illuminated dial instruments which are constructed on two well established lines; the first that of the permanent magnetic field with a spring set, the other with an electro-magnetic field and a gravity set. Our instruments today are certainly very superior and satisfactory.

We have almost exclusively confined our time and attention to the consideration of the trolley system. We are, however, compelled to consider the very promising storage battery railway. I will not in this paper undertake to go into a detailed comparison of the storage battery and trolley systems, but to those interested I would refer to the very interesting, complete and certainly gratifying and promising report of the test which will be found in the February number of the STREET RAILWAY REVIEW.

The success of the Chicago road has been so encouraging that one of the old horse car lines of New York is now operating several similar cars with a view to using the storage battery in preference to the underground trolley. Time is required to prove the true worth of the storage battery to the electric railway as an independent means of supply, the extremely heavy duty and trials of transportation are not at all favorable to the battery, though I would not predict any thing contrary to the success of this system.

To avoid the use of overhead conductors, especially in our large cities, has been not only the aim of the faithful city fathers, but as well that of many of our most prominent engineers. Time and again has it been all but an accomplished fact in the form of the underground trolley, but alas at the critical moment it was found wanting. The great difficulty has been to maintain the necessary insulation. To do this underground where subject to moisture due to atmospheric changes, without the aid of the wind or sun to say nothing of consequent dripping and drainage from the surface of the street, is certainly a task.

The General Electric Company has installed a system of this character in New York which has been in operation for about a year with some degree of success, but it is very doubtful if any system will ever become a competitor for the overhead trolley. Many different methods have been experimented with, such as compressed air, gas, and a combination of steam, gas or gasoline with a generator and motor all on the same truck.

Two of these locomotives which have gained considerable prominence are the Patton and the Hielmann. \* \* \* From the above it is plain that, although we consider our apparatus almost a work of art from a standpoint of attainment, the future has in store for us just as great possibilities as has been afforded in the past. Perfection is yet a great way off, therefore, let no one say there are not the opportunities there used to be. The Sprague multiple-unit railway system is most certainly a conspicuous milestone in the pathway of progress.

We have gone over the electric railway field almost from its inception to the present, and have briefly touched upon some points but have not been able to consider the comparative difference in the cost of operation and the methods employed in educating the men entrusted with the handling of the apparatus.

---

## NEW FENDER ORDINANCE FOR CHICAGO.

September 27, 1897, the Chicago city council passed an ordinance providing that all street cars should be equipped with fenders of a form to be approved by the mayor and the commissioner of public works. This ordinance was signed by the mayor on October 2, 1897, and was to take effect 60 days later. March 28, 1898, the city's legal adviser rendered an opinion holding the ordinance to be invalid, because not sufficiently definite.

A new ordinance has been prepared and introduced in the council in which it has been attempted to remedy this defect, the ordinance reading: "Every person or corporation controlling, operating or owning any street railroad in the city of Chicago be and hereby is required to equip and provide each and every car used on such street railroad with fenders of steel and of the basket kind, which shall be substantially attached to the front end thereof so as to guard passengers and pedestrians from being injured or thrown under the wheels in case of collision or other accident."

In succeeding sections it is made unlawful to use or operate any cars not so equipped, the penalties for violation ranging from \$25 to \$100. June 1, 1898, is the time fixed for this ordinance to take effect.

---

## WEATHER FORECASTS ON CARS.

At the suggestion of one of the observers of the local weather bureau at Rochester, N. Y., arrangements were made with chief of the bureau at Washington for a large supply of the weather cards and they are to be displayed in the street cars of the Rochester Railway Company. T. J. Nicholl, general manager of the company, was consulted and was heartily in favor of trying the experiment. On March 31 it was begun, the forecasts being displayed in 105 cars. The cards are placed at the right of the door, over the end window.

---

The Metropolitan Street Railway Company, of Kansas City, Mo., gets its transfers in large numbers. Recently a consignment of 10,000,000 was received from a Philadelphia printing firm.

**SOME EXPEDIENTS IN POWER STATION PRACTICE.**

BY J. H. DE GRUCHY.

In power station practice it is expedient, to get the greatest efficiency, to run the generating units at as nearly full load as possible. With the machine fuses of sufficient carrying capacity to take care of temporary overloads, one must necessarily depend for protection upon the feeder circuit-breaker on the line upon which the trouble occurs. But if, as sometimes happens, short-circuits occur on two or more feeders at one time, the machine circuit-breakers are liable to be opened by the excessive overload put upon them.

Short-circuits are caused by broken trolley or feed wires, by trouble in the car equipments, and by foreign wires

DEVICE FOR ADJUSTING THE LEAD.

crossing the trolley wires and rails. These are the causes of short-circuits, which generally come singly.

Short-circuits produced by lightning, either from direct discharges or those dissipated over a larger area and generally due to induction, are liable to occur on two or more feeders at one time. Sometimes they are accompanied by a discharge through the machine lightning arresters.

Such occurrences sometimes happen during severe thunder storms. If the machine circuit-breakers are in proper working condition they will open the main circuit. Now suppose we have four dynamos running with a capacity of 4,000 amperes at 560 volts pressure. With the feeder circuit-breaker adjusted to open at 1,000 amperes, short-circuits on two of them, together with a flow of current to the ground through one of the machine lightning arresters, would undoubtedly open the machine circuit-breakers. With a heavy short-circuit, the current flowing during a rupture, before the circuit-breaker is fully opened, is often

considerably in excess of the amount called for by the adjustment.

Generator.	Current Amperes.	Circuit Breaker.	Adjusted to Open.
1 . . . . .	900	1	1,400
2 . . . . .	900	2	1,400
3 . . . . .	900	3	1,400
4 . . . . .	1,300	4	1,800
	4,000		6,000
			4,000
			2,000

With a margin of safety of 2,000 amperes and an overload of 2,500 the result is obvious.

With dynamos running at full load the brushes will be set forward at a non-sparking position. When the machine breakers open, the load is suddenly thrown off and the brushes will spark excessively, burning the commutator and destroying the straight, even edges of the brushes. Some types of dynamos spark more than others, and it is sometimes possible to avoid extremely bad arcing by running the machine with as short a lead as is consistent with good running during a lightning storm. No doubt a great many stations are afflicted with some dynamos of the older type which, although good running machines otherwise, will spark excessively, regardless of precautions, when the load is thrown off with a forward lead of brushes.

I have stated in the following table the common causes of short-circuits on the feeders, and how they are indicated at the switchboard.

SHORT-CIRCUITS ON FEEDERS.

CAUSE.	INDICATION BY AM-METER	INDICATION BY CIR-CUIT BREAKER.
1. Trolley wire down near station.	Needle thrown over against the stop	Circuit breakers open as soon as switch is closed.
2. Trolley wire down at a great distance from station.	Dead load—may be from 700 to 1,000 amperes.	Remain closed
3. Bad car.	Needle moves unsteadily in a normal swings.	Opens, and after being closed does not again open till motorman starts car and reaches the notches on which trouble occurs
4. Foreign wire across trolley wire and rails.	Needle thrown over against the stop.	Opens as soon as switch is closed.
5. Swinging wire.	Needle thrown over against stop intermittently.	Opens whenever wire swings against trolley wire.
6. Lightning discharge, grounding trolley wire through car.	Needle thrown over against the stop.	Opens violently but can be immediately closed without further trouble.

When the machine circuit-breakers are opened the first duty of the operator is to set back the brushes of the dynamo from the forward or full load point to the neutral or non-sparking position. This is comparatively slow work with the hand wheel and screw, or other more complicated devices which are sent out with the generators by the builders. The device shown in the accompanying illustration is very quick, simple and easy to operate, being merely a new application of the eccentric. It is a great minute saver in just such an emergency as I have stated. I have seen the brushes of five dynamos reset to the non-sparking

It is the relation between the resistances of the series and shunt circuits that regulates the lamp.

If the rod should hang up, or the lamp were permitted to burn until all of the available carbon were consumed and the arc broken, the increased magnetizing effect of the abnormal current flowing in the inner or shunt winding of the cut-out magnet would raise the armature H on the end of which is placed a silver contact I, that when raised against F provides a path for the current, thereby prevent-

FIG. 3.

ing the shunt cut-out and shunt regulating coils from burning out, which they would surely do if a contact were not made between F and I, the current then going from the positive binding post A, through the outside coil of the cut-out magnet, through the resistance coils to the negative binding post C. The current flowing through the heavy winding of the cut-out magnet then keeps the contacts F and I together.

In operation this lamp should be given 9 amperes. The feed rod must be cleaned frequently with powdered pumice stone and naphtha, which, when applied with a cloth, quickly removes all dirt and tarnish and leaves the rod smooth without producing any perceptible wear on the teeth, which should afterward be cleaned out. If the lamps are carefully inspected, cleaned and oiled every two or three months, as the conditions may require, and the current kept at 9 amperes, no trouble will be experienced with burned out coils.

There is one thing to which I would like to call attention that I omitted in my article on commutators in the January REVIEW.

When turning off commutators, be sure to leave a wide wearing edge on the outer edge of the segments. In Fig. 3, at A is seen a solid wearing surface of copper and mica, which can be kept coated with a good insulating compound, thus preventing the accumulation of dirt near the binding. At B is shown the segments turned to a thin peak, which cannot be well protected. The mica is liable to crumble away; dust and dirt will get in and burn off the binding twine, which holds the strips of mica insulation in place; and if an arc should form and ground in the iron frame, it might be necessary to renew some of the commutator bars and insulation.

## CARRYING PARCELS IN MASSACHUSETTS.

There is now a petition before the legislature in Massachusetts which prays that trolley lines may be granted the privilege of carrying parcels. The railways presented the petition at the request of patrons of the electric lines and disclaim any interest in the matter other than a wish to serve the public in it; the arguments before the committee have been made by parties not connected with the railways.

## THE JULIAN LAW IN KANSAS CITY.

In 1895 the legislature of Missouri passed a law (the Julian law) providing that whenever the consent of public authorities of cities or counties was necessary for the construction, maintenance, etc., of an electric plant, gas plant, street railway, telephone or telegraph plant, that the right should not be granted until advertised for sale at public auction and should then be granted to the responsible bidder who would pay the largest percentage of the gross receipts to the city or county, and by the law 2 per cent was fixed as the minimum amount which must be paid for the first five years, and it was provided that thereafter for each period of five years such percentage should be increased to correspond with the increase in the value of the land occupied and used.

The East Side Electric Railway Company procured a franchise from the city council without observing any of the provisions of this law. Previous to this another street railway franchise had been granted in the same manner and the road has been built and is now in operation. It has been held by the city counselor of the city that the law does not apply to Kansas City, which is organized under a constitutional provision, Secs. 16 and 17, Art. 9, of the constitution, which provides that the people of the city may make their own charter and that it can be amended by a vote of the people and not otherwise. The present city charter was adopted in 1889, and Art. 12 of the charter makes special provision with reference to the granting of franchises, especially with regard to street railways. After franchise was granted to the company, suit was brought by a tax payer enjoining it from proceeding to build the road. The case has been argued and is now held under advisement by the court.

The charter provisions of Kansas City are in some respects inconsistent with the provisions of the legislative act and under the doctrine laid down in *Kansas City ex rel. vs. Scarritt*, 127 Mo., 642, it is contended that the legislative act has no operation within the city. The city counselor of St. Louis has held that the law does not apply to that city. Since the argument of this case in the circuit court the Attorney General of the State has brought quo warranto proceedings in the supreme court against the West Side Street Railway Company, whose franchise was procured in the same manner as that of the East Side Company. The second case will probably be argued in a few weeks, and it is hoped that some time during the spring the final decision of the supreme court of the state with reference to the validity of the law will be handed down.

The decision will no doubt turn upon the application of the Julian law to cities organized under provisions of the constitution providing for local self government to the greatest possible extent and the question of public policy have no effect in controlling the decision.

The theory on which such legislation as the Julian law is based is that the street railway uses the street and makes money out of its business, and should, therefore, pay the city for the use of the streets. And it might be added the city, being thought unable or unwilling to properly protect its interests, the state steps in to make the exaction of such compensation compulsory. This theory is open to severe criticism and reference may be had to the argument of Mr.

Burdett before the Massachusetts committee, which was published in part in the REVIEW for January, for an exposition of the status of street railways in public highways. The highways are for the use of the public and street railways are for the purpose of facilitating the greatest use to which the streets are put, that of travel.

The use of the streets for travel is promoted to a greater extent by the street railway than by any other agency, and to tax conveyances because of that use logically involves the taxation of all the other conveyances using the streets. Whatever sum is collected of the street railway, be it a tax, so-called; or a license fee collected under the police power or an express statute; or a bonus exacted for the franchise, that sum goes to increase the cost to the passenger.

It is thus put by the Massachusetts Railroad Commissioner: "These charges are a part of the cost of transportation which the passenger must expect to pay. Beyond this, it is not easy to see why one who carries passengers for hire in a car should be subjected to a tax for the use of the street, any more than one who carries passengers for hire in an omnibus, or who carries merchandise for hire on a dray. The radical objection to the proposed impost is not, however, that it is a burden on the railway company, but that it is a tax on the traveller. A tax on the carrier is a tax on the passenger. Whatever fare the railway passenger might otherwise have to pay, he must pay in addition to that fare his proportion of the tax; and the possibility of the reduction of his fare is to that extent postponed. Nothing has hitherto been more free than the use of the highway, for all persons, and for all purposes of travel or transportation. There is no good reason why the person who travels in a street car should pay, directly or indirectly, for the privilege of travelling on the highway, any more than the person who travels in a public coach or in his private carriage."

Were a city to erect a toll gate at each street corner and take tribute of those who used the streets, everyone would appreciate the situation quite readily, and perhaps look with less favor on the proposition to derive revenue from the use of the streets.

It might be suggested, too, that since in Missouri the fee of the streets is in the abutting owner, he and not the city should have the tax, if one is to be levied on the use of the street.

### THE TROLLEY WORKS IN THE CAUSE OF TEMPERANCE.

All who have witnessed the growth of street railways in large cities have remarked the effect of a trolley line in improving the moral tone of the street in which it is operated. There are several notable instances of this influence in Chicago, though it may be said that the purifying work is not fully completed.

The New York "Evening Sun" speaks thus of the Brooklyn Bridge line:

"The trolley's contributions toward the material progress of society are obvious, even historical, but that it numbers itself among the ethical forces working for the social welfare was left for demonstration till the Brooklyn trolleys ran over the Bridge. Since the travel on them has become large and continuous, certain facts have come to light which show that the trolley has other effects than the mere

check on population. Sociology will have to consider hereafter its influence in the direction of promoting temperance. The trolley is indubitably to be classed with the agencies for furthering sobriety, lending, as it does, its little mite to discourage the practices of tipping and treating, and bringing home the wandering boy and the cherished parent, duly mindful of the clock which in the steeple strikes one or other odd hours.

"In a word, through transit from the outer edges of Brooklyn to the confines of this city, or from New York to Brooklyn, has hit the proprietors of the gilded liquor saloons bordering on the Bridge Plaza very hard. It involves the cost of a glass of beer to interrupt a ride, to say nothing of the price of the drink for which the ride is interrupted. So many of those patrons of the trolley who were patrons of the saloons forego old habit, go thirsty or slake their thirst in this city or further up in Brooklyn.

"The connections which had to be made in former days gave a convenient opportunity to start the day right by resting meditatively against a polished brass rail and looking thoughtfully in a long mirror, and by the same process it was possible to give a finishing touch to the day's activities. The trolley has changed all that, by taking advantage of a reasonable human disinclination to pay two fares when one will do, and of the law of inertia in accordance with which a man prefers sitting to standing, and once seated will not move from his seat until he has to. All this is very good for the morals of the man, but how about the saloon keeper?"

### A LAUNDRY IN A REPAIR SHOP.

In the summer time the Chicago City Railway Company has over 800 open cars in service and on each car there were 14 storm curtains. The task of cleaning these curtains was very laborious and tedious, each one being spread out separately on a bench and scrubbed with brush and soap. This work required four hands during all the winter, and even

FIG. 1.—WASHING MACHINE.

with all this labor the result was not satisfactory. C. E. Moore, master mechanic, decided to test a washing machine for this work, and as he could find nothing suitable on the market, decided to build one. A machine was designed and

made in the repair shop and set up on the second floor, and in it are some features which are worthy of special mention. The driving mechanism may be seen in the foreground of Fig. 1. The three pulleys, the middle one being attached to the shaft fastened to the barrel, are connected by two belts to a jack shaft. By means of a cam the direction of rotation is automatically reversed, an equal number of rotations being given in each direction so that the curtains will not be rolled into a wad.

The time required for cleaning the curtains has been ascertained and is made uniform by the electric time signaling device. It consists of a clock with a metallic rim around its face having twelve holes in it; four dry cells are connected to the clock hands and the metallic rim. When the machine

FIG. 2.—MANGLE.

is started a plug is inserted in the proper hole and when the contact on the minute hand touches the plug the electric bell rings and warns the operator. About 40 curtains are washed at a time, about 30 minutes being required for the cleansing and 10 minutes for the rinsing.

A belt-driven wringer is placed near the washing machine and the water is drained off through a pipe from the zinc floor. All the apparatus was constructed in the shop at little expense and effects a great saving besides doing the work more satisfactorily.

The machine is also used for washing the towels which are used in the offices and barns. After the towels are passed through the wringer and hung up for a short time they are run through a mangle, shown in Fig. 2. Inside the polished metal cylinder is a gas burner for heating the cylinder to the proper temperature. The roll beneath the metal cylinder is covered with cloth and is adjustable, being regulated by the foot treadle shown. The work is done rapidly by one woman and reduces the laundry bills by half.

## A RECORD IN ACCIDENT ADJUSTMENT.

The claim department has two duties to fulfill: to fight frauds and to settle the claims for which the company is properly liable. A law suit is usually expensive, and while it may be cheaper to compromise any one fraudulent claim than to fight it, every company owes it to itself and to the other companies in the same business to follow the latter course; that is one of the necessary evils. It is in the second class of cases, where there are valid claims, that an adjustor by prompt, just and courteous action, will save his company money. It is quite true that the increasing number of vultures which disgrace the legal profession makes the compromise of claims more difficult, and therefore when the energy and ability of the claim agent enables him to do so he deserves the greater credit. The case at Atlanta, Ga., noted in our last issue, is a brilliant example of what may be done, and the following letter which fixes the "record," so far as we know, explains itself:

EDITOR STREET RAILWAY REVIEW:

In your March issue, under the caption of "A Phenomenal Adjustment," you refer to an accident occurring October 30, 1897, on the Atlanta (Ga.) Railway, and the remarkably quick settlement made for the injuries received therefrom.

On August 16, 1896, a rear end collision occurred between two open cars of the Baltimore City Passenger Railway Company at 12:40 a. m. The cars were returning from a trolley party, and each contained about 100 passengers, and, like the Atlanta accident, the collision occurred at the foot of a steep grade, in a very dark spot. The company's physician was telephoned for, and there being no cars running to the scene of the accident (which was about five miles from the city on a suburban branch), he went out on a special car, and upon his arrival found the injured lying around in all directions—one with a broken arm, another with a broken leg, and numerous contused limbs, cuts, etc.—in all, 23 injured. After giving them the necessary attention, he had them sent home in the police ambulances.

The next morning he started out to adjust the claims of those injured, and, though he either met or heard of several lawyers having already been after the cases, within 48 hours every claim had been settled, and for a total sum of less than \$700, and the company escaped without a single law suit.

NORMAN F. HILL, M. D.

Physician to, and Chargé Claims Department of Baltimore City Passenger Railway.

## LIVERPOOL OVERHEAD RAILWAY.

The report of the elevated railway in Liverpool makes a good financial showing for the past year. There were 735,172 train-miles run and 8,736,750 passengers carried. The average revenue per passenger was 4.045 cents and the expenditures were a little more than 60 per cent of the receipts. The expense in cents per train-mile was as follows: Maintenance of way, 1.174; repairs of structure and stations, 3.140; coal, 1.228; wages at power station, 3.84; oil and supplies, .662; repairs at station, 1.686; traffic expenses, including salaries and wages, 10.24; repairs of cars, .758; general charges, 4.18; miscellaneous, 2.694, making a total of 29.602 cents per train-mile.

etc.," is amplified by distinguishing between "shop" and "not shop" tools. Items 11, 14 and 15 are divided to show the distribution of wages, oil and supplies, and miscellaneous costs between the cable, electric and water power houses. Item 12 is divided to show the fuel cost for electric and cable plants. In the car service accounts, "fuel for cars" is separated from other "car and motor supplies" in Item 22, and "fuel for stations" from "miscellaneous transportation expense" in Item 23.

The gross earnings from operation, the income from other sources, the deductions from gross income, and the deductions from net income follow the form recommended by the committee, with the items not needed by the Twin City Company suppressed.

After the statement of receipts are blanks for the mileage made, passengers carried, etc., which facilitate the reduction of expenses and receipts to a per car-mile run or per passenger carried basis as may be desired.

Form 447, as printed measures 18 in. x 23 in., and is shown here reduced. The arrangement of columns for total amounts, amounts per mile, comparisons with the previous year, and the distribution between the different divisions of the road will be seen on inspection of the diagram.

Form 488 is 18 in. by 20½ in. and is for a comparative statement of the pay roll for the half-month. The officers and employes are classified according to their occupations so that the charge for wages in each department is shown here and the several totals can be drawn off in order to properly apportion the pay roll among the different items shown in Form 447. The object of the vertical columns is apparent on inspection.

On Form 449, printed on a blank 6¼ in. x 10¾ in., is shown a condensed statement for the month drawn from Form 447 and also a condensed comparative statement, with earnings, expenses, and surplus, reduced to the car-mile unit.

The two forms which we have designated, Forms A and B, are printed on opposite sides of a sheet 7 in. x 16 in., Form A occupying one-half of one side and Form B the whole of one side. Form A is a comparative statement of earnings and expenses (both fixed and operating), and Form B the general balance sheet.

---

### STREET RAILWAY TAXATION IN TORONTO.

---

In 1895 the city of Toronto assessed the rails, poles and wires of the Toronto Street Railway Company for taxation at \$6,500 per mile of single track. The company appealed to the Court of Revision, where Judges McGibbon and Dartnell held, Judge McDougall dissenting, that the assessment should be struck out. In 1897 the city again assessed the company's property in wards 1 and 2; the Court of Revision, on appeal by the company, again struck out the assessment, Judge McDougall dissenting as before. Then, as the company says, the Court of Revision and the city officials apparently entered into an arrangement to defeat the judgment—the Court of Revision striking out the assessment in the other wards. The city then having the right to appeal, appealed to one judge—Judge McDougall—who decided that the rails and poles and wires were liable for assessment, and declined, the company says, to state

a case for the Court of Appeal. Then the company was in the position of being liable for assessment in four wards, and not liable for assessment on like property in two wards, without the right of appeal from the decision of Judge McDougall, while the city had the right of appeal, under the statute, from the decision of three judges. A desire for a uniformity of decision led to the submission of the question to the Court of Appeal, by Order-in-Council.

The Court of Appeals on March 15 decided the question in favor of the city, the majority holding that the court was bound to follow the decision of the Supreme Court in the case of the Consumers' Gas Company, which decision made the gas mains assessable property, and in which decision it was pointed out that there is no difference between gas mains and street rails.

Chief Justice Burton, however, took a different view. The learned chief justice held that the Supreme Court had not, in that case, overruled the case of Fleming against the Toronto Street Railway Company, decided 23 years ago, and that that case, which decided that the rails, poles and wires were not assessable, was still good law. There had not been, the chief justice held, any change in the law relating to assessments since 1869.

The company will no doubt appeal to the Privy Council.

---

### BUILDING CARS FOR EXPORT.

---

Street railway managers abroad generally express a desire for American cars, but some appear to think that purchases here are out of the question because of the freight charges. To ship a finished car complete would be a very expensive affair and hence the "knock down" cars. The term "knock down" as applied to cars means that the car, after being erected, is taken apart, compactly boxed, and shipped in this condition. The ordinary knock down car has some grave disadvantages which will be mentioned in connection with an improved system of car construction by which not only may the former difficulties be avoided but many valuable features also obtained at the same time.

Some years ago the J. G. Brill Company, of Philadelphia, began the development of a system of car construction by which after erection they could be taken apart and snugly packed for shipment. Many difficulties were encountered, and many modifications of the methods of construction were necessary together with the introduction of a host of new ideas into the shops before the desired result was attained. This plan of packing is called "in the white." By this system the car is completed and the wood and iron work properly primed; the glass, however, is not put in nor is the upholstery furnished. The inside wood work is then treated with a coat of shellac or oil, as may be preferred, and when this stage has been reached and the car entirely finished, with the exceptions mentioned, it is taken apart. The sections, like so many cards, are closely packed in heavy iron bound and reinforced boxes.

This packing, while it calls for great skill and experience, is done with comparative ease. The parts of the car can be forced into actual contact, as there is no danger of injuring the paint, varnish, glass or upholstery. One of the great difficulties of packing cars in the old knock-down fashion arose from the fact that the varnish and often highly decorated panels had to be kept from chafing and protected

from even a touch of any other part. Glass was easily broken, while iron work was prone to come in contact with the linings, etc. There was of course great expense in doing this kind of packing and the boxes were of necessity bulky.

By the new system there is little to be injured; plain surfaces of wood covered with a primer are not easily damaged, and the packing can be made very close and at the same time secure. A car shipped in the white occupies at least 70 per cent less space than it would when shipped whole, and there is a gain of certainly 15 per cent in space alone over the older method. There is also a great reduction in the dangers during transit.

The cars built upon this system have a great advantage in point of durability over ordinary knock-down cars. The latter have their sections sawn apart, and there are many members which are doubled in thickness for this purpose. The double posts, etc., are bulky and awkward and when

to superintend the work. The cost of finishing is also reduced by the fact that the painting, varnishing, upholstering, etc., may be done by local labor.

The illustration shows the method of numbering and lettering used by the Brill Company. The cars in this order were for a South American line situated in the mountain districts, and so far away from tide water and so difficult of access that it was desirable to have the total weight of each package kept down to 160 lbs., a convenient weight where shipments have to be made, as in this case, on the backs of pack animals.

One of the cars was put up in the style shown and the accuracy of the mill work all tested. Numbers were then established for each part according to the system shown, parts coming together taking the same letter and number. The work having been tested by the construction and marking of a single car, all similar parts were marked in the same way and the pieces made up in bundles of the re-

BRILL CAR FOR SHIPPING "IN THE WHITE."

quired weight. The sills, plates and some other important numbers were shipped entire in spite of the excess of weight. Special means were adopted in transportation to meet these weights.

united in the finished car by small bolts, as is the practice, are very weak. Cutting of the sills also reduces the strength of the car body at points where the timbers cannot be effectively reinforced, and in fact the whole construction is a makeshift. The old style knock-down car cannot be said to be durable. By the adoption of new methods of construction, and designing the posts with special reference to taking down for shipment, it has been found possible to make the finished work a unit. The sawing apart is no longer necessary and the car becomes as strong after it is erected as it was at first. In service these cars stand as well and last as long as cars built in the ordinary way and put in service without being taken apart, in this respect showing themselves greatly superior to the old knock-down cars. This is a result which might have been expected, since there are no members severed after construction and the strength of the car is not made to depend on bolts and nuts. The appearance of the car is in no way changed and even an expert would be unable to tell, by the external appearance alone, one of these from an ordinary car.

Besides the saving in freight there is frequently a saving in customs dues by shipping an unfinished instead of a finished car. The system of marking the parts is so complete that it is unnecessary to send men to erect the cars or even

quired weight. The sills, plates and some other important numbers were shipped entire in spite of the excess of weight. Special means were adopted in transportation to meet these weights.

The erection was so simplified by care in designing and in the preparation of the parts that the cars were put together without difficulty by ordinary carpenters. The cars, when finished, seat 62 passengers and have one saloon. Except in the method of construction they are of the ordinary steam road type. The posts, however, are rather smaller than usual, and the absence of panels from between the windows and the narrowness of the letter board make the upper part of the side very light. This is a very necessary and highly valued feature in all warm climates.

#### COPPER OUTPUT.

Recent advices state that there is every indication that the output of the copper mines of Houghton county, Mich., for 1898 will be in excess of 150,000,000 lbs. All producing mines in the district are reported able to make a profit on 10-cent copper, without reducing wages. There are at the present time but eight mines in the county actively producing copper and these employ about 9,000 men.

# CHARGES FOR RENTED POWER

Within a few months we have received several requests for information as to the charges for street railway power when rented or purchased from other companies, and in order to secure the latest data on the subject we have addressed inquiries to those roads which we knew to be renting power. The answers received will be found given below.

It will be remarked that the basis for computing the price paid is not the same on all roads, and the prices cannot be reduced to a uniform basis because of the lack of exact data as to the number of miles made by each car per day, and the kilowatt-hours per car-mile. The grades, speed, weight of car, etc., will have much to do with determining whether a given rate per car-day is reasonable.

A few general statements may be made, however, and may prove of assistance in comparing the rates given. On city lines the mileage made per car per day will be from 100 to 150 miles; on suburban and interurban lines from 200 to 250 miles. The city cars (7 tons) will take about 1 k. w. h. per car-mile on level track; this figure may be increased because of snow or dirt on the rails. Interurban cars of the same size will take .75 k. w. h. per car-mile.

1. The road has 49 miles of track, very little of which is level, and operates 50 to 55 single truck cars in summer and 47 to 50 in winter. Power is taken from a power and lighting company and paid for at the rate of 1.1 cents per kilowatt-hour; formerly the price was 2.6 cents per car-mile. The power plant is a steam one and pays \$1.55 per ton for coal.

2. The road has 5.71 miles of track, on which are two 5 per cent grades each 150 ft. long; the rest of the track is practically level. Five single truck cars are operated regularly and extras when the service demands. The rental is \$10 per day, no charge being made for extra cars. The cars average 127 miles per day, which makes the rate 1.58 cents per car-mile. The power plant is a steam one and pays \$1.05 per short ton for coal.

3. This road is an interurban 9 miles long, in a thickly settled country, and operates 4 single truck cars regularly, with extras morning and evening. The price for power is \$5 per car-day of 18½ hours, the total running time of all cars being divided by 18.5 to give the car-days. The power station is a steam plant, paying about \$3.75 for coal.

4. This is a city line with 15 miles of track with numerous grades, operating from 10 to 21 single truck cars in summer and about 10 in winter. The charge for power is \$1.90 per car per day. The power station is a steam plant using coal costing \$1.75 per ton.

5. This is a city line 10.5 miles long; the line is fairly free from grades, the heaviest being one of 3 per cent

for 500 ft. In summer 10 single truck cars are run and in winter 8. The charge for power is \$2 per car-day of 18 hours for motor cars and \$1 for trailers. Power is furnished by a lighting company which pays \$1.25 for coal.

6. This is a city line with 42 miles of track with few grades; from 30 to 40 single truck cars are operated. Power is purchased from a water power company at the rate of 1 cent per k. w. h., which is quite low.

7. This is a 7-mile road with some heavy grades; from 3 to 5 cars are operated; the cars are of the double and the single truck types. Power is purchased from a lighting company at \$3 per day of 16 hours for 30-h. p. cars, or \$4.33 per day for 50-h. p. cars. The power station is a steam plant.

8. This is a line 2¼ miles long operating 4 cars—single truck—summer and winter. There are several grades on the line. Power is purchased from a lighting company for the lump sum of \$2,800 per year. The coal burned by the lighting company is run of mine, costing \$1 per ton.

9. This is a 9-mile road, owning 9 motor and 3 trail cars. Power is rented from a company which transmits a 10,000-volt current 15 miles and furnishes a 300-h. p. motor to the street railway. The latter pays for current by meter at .6 cent per k. w. h., and guarantees a minimum consumption of 650,000 k. w. h. per year.

10. This is a 7-mile road with long and steep grades. In winter 4 single truck cars are operated and in summer 5 regularly and up to 10 on special days. Power is rented from a lighting company which has both steam and water plants. The price paid is \$13.50 per day for 4 cars and \$1 per day for each additional car. In one year this rate made the cost of power 2.42 cents per car-mile.

11. This is a 4½-mile road with a few grades; 4 single truck cars are operated in winter and 5 or 6 in summer. Power is purchased from a lighting company which pays about \$4 per ton for coal. The street railway pays 3.5 cents per k. w. h. by meter, with a minimum rate of \$3 per car per day. This rate is considered too high.

12. This is a 7½-mile road reasonably free from grades; on an average 5 single truck cars are operated per day throughout the year. Power is taken from a lighting company which has to pay from \$3.25 to \$3.75 for coal. The railway pays \$4.50 per day and in addition 2.5 cents per k. w. h. used as shown by a meter.

13. This is a 7-mile interurban road with some very heavy grades; 4 single truck cars are run in winter and 8 in summer. Power is taken from a lighting company which

pays \$2.35 per ton for coal. The railway pays \$2.75 per car per day, and pro rata for fractions of a car-day.

14. This is a 36-mile city road with quite a few grades; from 35 to 50 double truck cars are operated. Power is taken from a lighting company, which pays \$2.90 per ton for pea coal. The railway pays for power on a car-mile basis, the rates being 2 and 2.5 cents per car-mile.

15. This is a 6-mile interurban with no grades greater than 2 per cent. From 4 to 6 single truck motor cars are operated. Power is taken from a lighting company which pays 50 cents per ton for coal. The rates paid by the railway are \$2 per day per car for 4 cars; \$1.50 per day per car for each additional car, and 50 cents for each trail car for each day in excess of 12 days per month.

16. This is a 35-mile road, with many grades of from 4 to 11 per cent; from 25 to 30 motor cars and from 6 to 10 trailers are operated; there are both single and double truck cars. Power is taken from a lighting company which pays 90 cents per short ton for coal. The rate is 1.6 cents per car-mile for 16-ft. motor cars, half-price for trailers and a higher rate for larger motor cars.

17. This road is near a large water power plant and pays \$25 per horse-power per year.

18. This is a city road with 18 miles of track; from 10 to 13 single truck cars are operated. Power is taken from a lighting company which pays \$4.85 per ton for coal. The charge is 2.25 cents per k. w. h. by meter.

19. This is a 15-mile road; there is one 5 per cent grade 1,000 ft. long on the line, and two of 2 per cent, 600 ft. and 800 ft. long. In winter 12 single truck cars are run; in summer 5 double truck and from 9 to 11 single truck cars. Power is taken from a lighting company which pays about \$1.90 for coal. The charge to the street railway is 1.25 cents per k. w. h. by meter.

20. This road, which has but few grades, had occasion to rent power during the time its own plant was building, and paid \$4 per car per day for the first 5 cars and \$3.50 per day for additional cars. This price included the heating and lighting.

21. This is an 8-mile road fairly free from grades; 10 single truck cars are operated. The company operates its own power station, burning natural gas, and the cost is about \$1.50 per car per day. For a period of 18 months power was rented at the rate of \$3 per car per day and 25 cents for each extra trip.

To summarize: Of the 21 roads replying to the questions, 1 pays a lump sum of \$700 per car per year; 1 pays \$25 per horse-power-year; 2 pay on a car-mile basis; 7 pay on a kilowatt-hour basis, and 10 pay on a car-day basis. The rates per k. w. h. vary from .6 cent to 3.5 cents. The car-day rates vary from \$1.90 to \$4; in most cases there are two rates, one for the first few cars, and a lower one for additional cars. As a rule, a trailer is counted as equal to one-half of a motor car.

## E. H. KEATING.

When Mr. Wanklyn was called to manage the Montreal Street Railway Company the Toronto Railway Company secured E. H. Keating, who was then city engineer, to fill the vacancy. It was his first venture in street railway affairs, but his long experience as engineer for various cities

E. H. KEATING.

qualified him for his new duties. The subject of this sketch was born in Halifax, N. S., August 7, 1844, and after attending at Dalhousie College of that city, took up the study of architecture. At the age of 20 an appointment to the engineering staff of Nova Scotia was accepted and his railroad experience commenced. He was successively connected with the Pictou Railroad, the Windsor & Annapolis Railroad, the Intercolonial Railroad

and the Canadian Pacific Railroad until 1873. For 18 years he was the city engineer of his native town and then accepted a similar position at Duluth, Minn. In 1892, Mr. Keating became the city engineer of Toronto and performed the duties of that office with entire satisfaction until called to manage the Toronto railway on the first of February last. Mr. Keating is a member of the Institute of Civil Engineers of Great Britain, and a member of the American and Canadian Societies of Civil Engineers, and also a Fellow of the Imperial Institute of London. The REVIEW anticipates a successful career for Mr. Keating in the street railway field.

## MR. CICOTT'S EXTENDED TRAVELS.

Frank X. Cicott, who already has a very large acquaintance among street railway men, and who has for the past year been representing a number of well-known American manufacturers in London, sailed on March 24 for a trip around the world. He expects to travel via Gibraltar, Malta, Naples, Port Said, Suez Canal, Egypt, Ceylon, India, Australia, Tasmania, New Zealand, Sandwich Islands, returning to London by way of San Francisco, Chicago and New York, and will cover over 30,000 miles.

Mr. Cicott is making this tour of the world for the purpose of investigating the prospects of electric traction in each of the countries named, and also the possibility of adapting electricity to the many light railways now operating by steam. He will certainly gather a vast amount of highly valuable information, and his friends wish him a successful and pleasant trip.

Another trolley car robbery in Chicago was frustrated but nearly terminated fatally. Three armed men attacked a conductor and motorman of the West Chicago Street Railroad Company while the car was at the terminus of the line. The robbers met with a determined resistance, and after receiving several thumps with the controller handle they retreated. One of them turned and fired a shot, striking Conductor Guyer and seriously wounding him. He is one of the old and trusted employes of the company.

## ROUTED THE SPARROWS.

The rapidly increasing number of English sparrows in all parts of the country has proved a nuisance of no small dimensions to many managers. By some intuition the sparrow seems to look upon the inviting roof and cross beams of a car house as his special property and makes himself at home, together with a large delegation of sparrow relations, running up into the hundreds.

Among those who were put to some means to effectively stop the trouble was H. R. MacLeod, general manager of the Portland & Cape Elizabeth Railway, Portland, Me. His car house and power plant were infested with hundreds of sparrows, and all the usual schemes of poison did not seem to make the slightest impression. After exhausting all the plans suggested, he bought a shot gun and a box of cartridges filled with fine bird shot. One of the men was detailed as executioner, and blazed away for a couple of

## THE CENTRAL LONDON RAILWAY.

A brief description with a map of the Central London Railway appeared in the REVIEW, July, 1897, when the contracts were let, but some developments in designing the apparatus are worthy of special attention. The most noteworthy is the system of distribution and feeding the current to the line. Although the line is but  $6\frac{1}{2}$  miles in length it was determined that an alternating system of distribution at 5,000 volts was more economical than a three wire direct current system at 600 volts.

The power station is located at one extremity of the line. There are to be 16 water tube boilers of American make to supply steam at 150 lbs. pressure. Vicar mechanical stokers will be used; a 1,500-ton coal storage bin is to be at the top of the boiler room; the coal handling machinery will be supplied by the C. W. Hunt Company. There will be six condensing cross compound 1,300-h. p. Reynolds-Cor-

FIG. 1.—850-K.W. ALTERNATOR.

hours, killing a large number. The shot was too small to do any damage to the roof, but got in its work on the birds; and since then, 18 months ago, not a sparrow has been seen in either place, while other neighboring buildings have them in plenty. Mr. MacLeod offers the suggestion as a cure, which is sure and cheap.

## THE NAVY STIMULATES TRAFFIC.

We noted last month that the Atlanta Railway Company had by the judicious use of "yellow" banners managed to keep its cars running to Fort McPherson crowded with people. The Union Traction Company, of Philadelphia, has recently completed an extension to League Island, and the cars are crowded with visitors to the navy yard there. Thousands evince a desire to see anything that savors of war.

liss engines, made by the E. P. Allis Company, direct connected to General Electric 850-k. w. three-phase generators. The exhaust steam will pass into four Barnard cooling towers. Green economizers will be installed. All the steam pipe bends and valves come from the Crane Company, Chicago.

Fig. 1 shows an outline of the generator, which is of the revolving field type, the magnets being mounted direct upon the engine shaft. There are 32 poles attached to the spider, which is built up of laminations insulated from one another. The output of the machine is 170 amperes at 5,000 volts with a frequency of 25 cycles per second. The weight of each generator will be 80,000 lbs., and the efficiency will be 95 per cent. Six of these machines will be installed and space is provided for two more.

From the switchboard, which is designed for high potential alternating currents, will extend two feeder lines to three sub-stations, the cables being carried on brackets fastened

FIG. 2.—900-K.W. ROTARY CONVERTOR.

to the sides of the tunnels. At each sub-station, located at the bottom of elevator shafts, will be static transformers receiving the alternating current at 5,000 volts and reducing it to 330 volts. The alternating current then passes to the rotary converters and is converted to a direct current of 500 volts. The total losses of all kinds in the circuit are estimated to be less than 5 per cent.

Fig. 2 is from an outline drawing of the rotary converter, which has a capacity of 900 k. w. The alternating current will be received by the collector rings shown on the left hand side of the figure and will operate the machine as a motor. From the same windings the current will be rectified by the commutator on the right of the section, and delivered to the third rail. The convertor will have 12 poles,

The Edison-Brown plastic bond will be used on the track rails. Wires will be connected to the lines and rails in such a manner that voltage readings can be taken at any time.

The electric locomotives will be entirely of American construction, resembling somewhat the Baltimore & Ohio type, although of much smaller capacity. Fig. 5 shows the general arrangement of the parts. On each axle of the two trucks there will be a motor having a capacity of not less than 65 h. p., the four motors giving a maximum draw-bar pull at starting of 14,000 lbs. Current is taken from the third rail by two contact shoes and passes through a circuit breaker and ammeter in the cab to the controller. Fig. 6 shows a cross section of the tunnel and locomotive. It indicates that it is necessary to make all the parts very compact to fit in such a confining space. The locomotive is fitted with Westinghouse air brakes. A series-parallel controller, with magnetic blow-out, places the motors four in

FIG. 3.

will run at 250 r. p. m. and have an efficiency of 95 per cent at full load.

The third rail weighs 80 lbs. to the yard and is rolled to channel section and supported on creosoted wood insulators in the center of the track, Fig. 3. Each joint will be bonded with No. 0006 flexible crown Chicago bonds. The track rails are of bridge section, Fig. 4, weighing 100 lbs. to the yard, and are laid on longitudinal wooden sleepers.

FIG. 4.

series, two in series-parallel and four in parallel, and with the resistances gives 22 combinations.

The motors are gearless, being placed directly on the axles and with no springs between the axles and the trucks. There will be 32 of these locomotives, each capable of hauling seven coaches having a seating capacity of 48 passengers each. Including the locomotive, the train weight will be 150 tons, and an average speed of 14 miles an hour will be maintained with stops of 20 seconds at each of the 13 stations.

A very important factor in maintaining a fast schedule is the alignment of the tunnels, a grade of 3 per cent being on either side of each station. This arrangement at the stations greatly increases the accelerating power and saves braking effort. One who is familiar with the current de-

FIG. 5.—LOCOMOTIVE FOR CENTRAL LONDON RAILWAY.

mand of the motors in accelerating the trains on the elevated roads will appreciate that more than a third of the total energy can be saved by the assistance of gravity.

The progress of the work is very satisfactory; the foundations of the power house are laid; of the 22,800 yds. of tunneling only a mile yet remains to be driven, and the

FIG. 6.—CROSS SECTION OF TUNNEL.

American factories are preparing to fill their orders promptly at the time set in the contracts. It is expected that the railway will be opened for traffic within 12 months.

**WANTS A SAFETY BRAKE FOR LONG GRADES.**

The manager of a western road with a very long 6 per cent grade desires suggestions as to the best track brake to use in addition to his wheel brakes. He has already had two or three runaways, fortunately without any serious results, and as the line leads from a pleasure resort from which heavy loads travel all summer he desires to take every possible precaution against accident. His present system of wheel brakes he considers first class, so far as it goes, but is anxious to supplement it with some form of track brake. We shall be pleased to publish any suggestions our readers may be good enough to send us.

**RATES OF FARES IN OLEAN, N. Y.**

The Olean Street Railway Company has recently issued a book of rules governing its employes and giving the rates of fare for passengers and such packages as may be carried on the cars. Each person over 5 years of age, 5 cents. Children under 5 years of age, when accompanied by parents or guardians, and not occupying seats required by passengers who are standing, will be carried free. If over 5 years of age, fares must be collected. Children whose fares have not been paid are not allowed to occupy seats when same are required by paying passengers.

Articles will be carried as follows, when in charge of a passenger, who must pay regular fare for himself:

Bicycles . . . . .	two fares
Trunks . . . . .	five fares
Barrels under 100 lbs. . . . .	two fares
Barrels from 100 to 200 lbs. . . . .	four fares
Small kegs of beer . . . . .	two fares
Large kegs of beer . . . . .	three fares
Peddler's pack . . . . .	two fares
Tin peddler's packs . . . . .	two fares
Wash baskets . . . . .	one fare

All other articles not enumerated will be charged as follows: Twenty to 50 lbs., two fares; 50 to 100 lbs., three fares. Articles occupying unusual space will be charged double rates. Conductors are required to collect above fares for parcels, etc. (excepting small articles, packages or parcels, traveling bags carried in the hands or about the person of passengers), and ring in the same on their registers.

No dogs (excepting small lap dogs) will be allowed inside the car, and they must be kept on the laps of the parties having them. Large dogs must be put on the front platform at owner's risk, and one fare charged for each dog. Under no circumstances will a dog be allowed on the seat of a car.

A rather peculiar incident happened on the tracks of the Broadway cable line in St. Louis. As a rule dogs in the city are very watchful and are seldom caught by the street cars, but in this case a dog laid down on the track and remained until struck by the car, although the gripman and passengers tried to frighten it away. It appeared to be a tramp dog and was tired of the wicked life in a great city.

## POLES.

There are not many electric lines which have been in operation long enough to test the life and comparative merit of poles of different kinds and settings. A sound pole, with ordinary precautions taken for preservation, should last from eight to ten years, but this life may be greatly lengthened or shortened according to the various circumstances. In choosing the kind of poles, some consideration must be given to their mechanical strength, for frequently the poles are subjected to unusual stresses. Last winter, on one of the Chicago lines, a guy rod broke and more than a score of poles snapped off like pipe stems, tearing the lines down and seriously impeding traffic on the street railway and on the railroad, which it crossed at that point. This accident was probably due to the low temperature and to the fact that no provision had been made for any one pole bearing more than its share of the stresses. To avoid a similar occurrence, iron poles were substituted for the poles that broke.

The cost of iron poles is prohibitive except in the larger cities, and the kind of wood to be selected depends on the locality. White northern cedar, northern pine and chestnut are extensively used in the north, and redwood in the west. Cypress, tamarack and red fir are also suitable. Pine is one of the most perfect and symmetrical of all timbers and has a good tensile strength. After seasoning, to impregnate the poles with a good creosote lengthens the life, and is believed to increase the strength. There are numerous preparations for this purpose, some composed chiefly of wood creosote which may be applied with a brush and readily enters the pores of the wood. Frenoline is a composition of 50 per cent wood creosote, 10 per cent pine tar, and 40 per cent oil of tar and has been used by some street railways. Whenever such special preparations are not used the life of the pole will be lengthened by the application of a heavy coat of tar or pitch on the butt end and for some distance above the ground level, also the cornice at the top of the pole should be treated in like manner.

In setting the poles the method and expense depends somewhat on the nature of the soil. In solid soils the hole should only be large enough to get the pole in easily, and the earth and stones should be heavily tamped around it. In sandy or soft ground it is advisable to fill around the pole with concrete, consisting of one part of Portland cement to two or three parts of sand and gravel.

In some cities wooden poles are not permitted, especially in the down-town districts, and many street railways use iron poles in such localities, whether required to do so or not, on account of their superior strength, longer life and more pleasing appearance. Some experiments have been carried on to show that gas pipe poles set in concrete without a protective coating will be dangerously corroded at 10 in. below the surface in three years, but this has not been the case in practice. It has been found that wrought iron yields to the corrosive action of water, with acids which come from the street surface, much more readily than cast iron. The North and West Chicago Street Railroads have a cast-iron sleeve about 2 in. thick, which is slipped over the pole and extends some distance above and beneath the surface of the street. This has proved very effective in preventing the poles from rusting at this point.

It seems to be the rule to neglect keeping the iron poles properly painted, but this is very objectionable as the cor-

rosion sets in and the poles present an unsightly appearance. One difficulty has been in the selection of the right kind of paint. As a result of a series of tests, Max Toltz gave to the Civil Engineering Society of St. Paul, a report of the best paints and the methods of use on iron work.

The paints examined were classified as follows: True asphaltic varnish paints; so-called asphaltic varnishes and paints, of inferior qualities; black carbon paints, in which the vehicle is practically a varnish; iron oxide paints, consisting of more or less iron oxide with siliceous matter and compounds of lime and magnesia; graphite paints, and silica graphite paints. After giving all a trial the best policy was decided to be: 1. At the mills the iron should be cleaned from all loose scales and given a coat of refined linseed oil. 2. When in place the iron should receive one coat of asphaltic varnish paint, made from the best grade of asphalt, linseed oil and gum; or a coat of a paint made of carbon black and boiled varnish. This coat should be carefully applied after the metal has been thoroughly cleaned. Air bubbles should be avoided, and this priming should form a continuous coating, fairly thick. The coat will be dry in about 10 days. 3. As a second coat, a graphite paint is applied as thickly as possible. Care must be taken to select a paint that is at least one-third of pure graphite, the rest of the pigment being natural rock, ground very fine in pure linseed oil. The graphite paint should be bought in paste form, well ground, and contain not less than 70 per cent of pigment and 30 per cent, by weight, of boiled linseed oil; the paste should be mixed with linseed oil at the place where it is applied. This will give a protective coating which will last for many years. The red lead and iron oxide paints have been largely used but are inferior to the graphite paints.

With the different street railways there is a variety of practice, generally differing with conditions. The Manchester (N. H.) Street Railway Company has been using the trolley but two years and this is not long enough to test the durability of either the iron or wooden poles. The standard size for the iron poles is 30 ft. length and 6 in. top. The wooden poles are of Georgia pine and chestnut and the experience so far has been very much in favor of the latter. The chestnut poles have given very little trouble but the pine poles, even at this time are giving out near the surface of the ground. The poles are set from 100 to 125 ft. apart and a rake of 10 in. is given, but at the corners this is somewhat increased. Each iron pole is set in concrete. The pole butts are not treated and the cement is relied upon to prevent corrosion. An emerald green paint is applied with a brush, and two coats have been found sufficient until the present time. A chestnut pole at least 10 in. at the butt, or an iron pole, is considered preferable to any other. The span wires are fastened to the poles by means of eye-bolts, and the feeders are carried on double petticoat insulators attached to spruce brackets with iron braces to the poles.

The Detroit Citizens' Street Railway Company uses white cedar poles, 8 in. at the top, 14 in. at the butt, and 26 to 28 ft. in length, and wrought iron poles, built up of 5, 6 and 7-in. tubes and weighing 600 lbs. The poles are spaced from 100 to 125 ft. apart and have a rake of 6 to 24 in., depending on the width of the street. At the corners 1,300-lb. iron poles are provided. The poles are set in concrete and planted to a depth of 5 to 7 ft., the average life of the wooden pole is between seven and eight years. The span wires are fastened to the wooden poles by a ratchet fastener, and to

the iron poles with cleats and insulators. The feeders are carried on the same poles, with cast iron cross arms and special insulators. Asphaltum is used in painting and requires attention once in three years. Iron poles are preferred, being more economical and having a better appearance in the streets.

The Gloucester, Essex & Beverly Street Railway Company uses only hard pine and chestnut poles with tops from 5½ to 7 in., butts 10 to 15 in., and in lengths of 28 to 35 ft. The poles are planted 4½ to 6 ft. deep, spaced 130 ft. apart, and with a rake of 12 in. The span wire is fastened to the poles by eye-bolts and the feeders are carried on the same poles. Once every two years a coat of paint is applied. Chestnut poles are favored.

On the Springfield (Mass.) Street Railway structural iron and round chestnut poles are the standards. The poles are set 6 ft. into the ground, spaced 100 ft. apart, and a rake of 10 in. is given. The iron poles are made up of 4, 5 and 6-in. pipe; the wooden poles are 7 in. at the top, and both are 30 ft. long. The average life of the chestnut poles is six years, while some of the iron poles which were set in 1891 are still as good as new. Concrete is employed only in quicksand and with corner poles. The feeders are carried on one, two and three-pin brackets and cross arms on the span wire poles. Asphaltum is applied to the iron poles and two coats are given once every three years. The iron poles are considered cheaper than the wooden ones.

The poles in service on the Citizens' Street Railway of Indianapolis are of white cedar, 7 in. top and 30 ft. long, and wrought iron, made of 5, 4 and 3-in., 6, 5 and 4-in., and 7, 6, and 5-in. pipe. The poles are planted in the ground 6 ft. 2 in., spaced 125 ft. apart and with a rake of 22 in. At the corners the heaviest iron poles are in use and are set 7 ft. deep in concrete. The span wires are strung from reels bolted through the poles. Green mineral paint is used and one coat lasts two years. The life of the wooden poles is between nine and ten years; some of the iron poles are six years old, with no signs of deterioration. For heavy traffic lines iron poles are preferable, but on other lines wooden poles give less trouble and lessen the cost of construction.

The Atlanta Railway Company has only red cedar poles

poles. The tops and the butts of the poles are treated with creosote and coal tar, and the poles are painted whenever necessary with creosote and oil paint. Wooden poles are preferred as they last for 10 years, are cheaper, and less insulation is needed.

The Belt Electric Line Company of Lexington, Ky., finds chestnut and red cedar poles, 7 in. at the top and 30 to

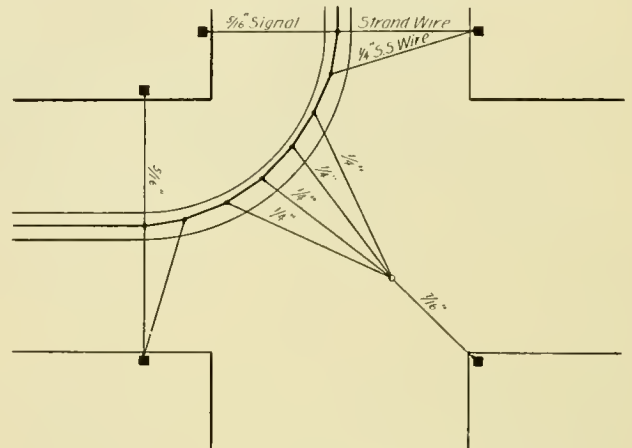

FIG. 2.—SPAN WIRE CONNECTIONS FOR SINGLE TRACK.

45 ft. long, preferable. The butts are treated with tar and last at least eight years. The poles are planted 6 ft. deep; concrete is used in soft earths, but none is needed in clay.

The Anderson (Ind.) Electric Street Railway Company uses only cedar poles with 7-in. tops and in 30-ft. lengths. These are planted 6 ft. deep, 100 ft. apart and with a rake of 24 in. The feeders are carried on four-pin cross arms, oak pins and pine cross arms, on the line poles. Wood's pole ratchet is used for the span wire. The corner poles are guyed to stubs. The poles are painted with white lead and raw oil once in five years. The poles show no signs of decay in five years and are preferable to iron, as they are cheaper, enable repairs to be made on the lines easier, and give better insulation.

The Hagerstown (Md.) Railway Company uses chestnut poles with 7-in. tops and 10-in. butts, 30 to 35 ft. long. These are planted 6 ft. deep, 100 ft. apart, and with a rake of 18 in. The span wires are fastened to insulated eye-bolts, and the feeders are carried on "jumbo" insulators on the same poles. One coat of metallic paint is given each year to the poles, and the poles last about seven years. Wooden poles are preferred, as there is less danger from grounded circuits.

The Ft. Wayne (Ind.) Consolidated Railway Company has both iron and wooden poles in service, the life of the latter being seven years and of the former unknown, for those which have been in service five years are as good as new. The poles are set 125 ft. apart, from 4 ft. to 6 ft. in the ground and with a rake of 6 in. Heavy poles are used at corners and in some cases these are set in concrete. The poles are painted from a ladder once in five years, with an "iron clad" paint. The iron poles are considered better, for they do not break, do not pull in at the top, and thus lower the trolley wires; also, with wooden poles the span wires rust where they pass through the poles.

The Chester (Pa.) Traction Company has yellow and white pine and chestnut poles with 7-in. tops and 9-in. butts. These are planted 6 ft. deep on tangents, and 7 ft. on

FIG. 1.—SPAN WIRE CONNECTIONS FOR TWO TRACKS.

with 7-in. tops and 30 ft. long. These are set 6 ft. deep, spaced 125 ft., with a rake of 12 in. The span wires are fastened by eye-bolts, and the feeders are carried on top groove glass insulators on cross arms fastened to the same

curves, are spaced 100 to 120 ft. apart, and have a rake of 12 in. The white pine poles last about four and one-half years.

At Birmingham, Ala., cedar poles with 8-in. tops and 12-in. butts and 28 to 35 ft. long are used. They are planted 5 to 7 ft. deep, spaced 120 ft. apart and have no rake. At the corners they are guyed to stubs. Fig. 1 represents the standard span wire connections at a corner.

The Atlantic Coast Electric Railroad Company of Asbury Park, N. J., employs Georgia pine and cedar poles; tops, 7 to 8 in.; butts, 10 to 12 in.; length, 30 ft. A rake of 30 in. is given and the poles are spaced 80 to 120 ft. apart. Concrete is used only at the corner poles. Two coats of paint are given every three years. Plenty of lead is the only requirement in the paint.

It is the policy of the Twin City Rapid Transit Company, of Minneapolis and St. Paul, to use as few wooden poles as possible. The iron poles are in three sizes; center poles, 6 in. in diameter, 25½ ft. long; side poles, 7 in. in diameter, 28 ft. long; for curves, 8 in. in diameter, 28 ft. long. None of the iron poles have had to be replaced, and the estimated life is 20 years; the life of the pine poles averages five years and of the cedar, 10 years. The poles are spaced 120 ft. apart; the center poles are planted 5 ft. deep, and those at the side a foot deeper. A rake of 18 in. is given to the side poles. At the curves concrete is filled in around the butt, but at other places rocks are rammed about the base. At the surface of the ground hot pitch is poured around the pole as a protection against corrosion. The span wires are fastened through an eye-bolt to an insulated cap. The feeders are not, as a rule, carried on the same poles. Paint composed of graphite and linseed oil is used, one coat being applied about every four years. Iron poles are preferred, as they give a more solid construction and are necessary

POLES IN BERLIN.

with No. 6 trolley wire. The heavier construction decreases trouble and repairs.

A year ago when the Portland (Me.) Railroad Company was rebuilding the Deering line, which was constructed in 1891, some of the poles were found badly rotted, but the majority would have lasted five years longer. These poles were of southern pine, with 9x9-in. butts, and were replaced

by poles with 12-in. butts and 8-in. tops and 30 ft. in length. On the Westbrook line about 25 poles were found rotted. From the surface of the ground down about a foot the tim-

POLES IN DOVER.

ber was rotted a third through, but the ends were perfectly sound. Fernoline is a preparation used in treating the poles. In the later construction the pole holes are dug 4 ft. long and 2 ft. wide. A railroad tie is split in two, and one-half placed in the bottom and the other at the top of the hole. This prevents the poles being pulled over towards the trolley line. At the curves a rake of 26 in. is given and 22 in. elsewhere. The span wires are fastened to ¾-in. eye-bolts through a fiber bushing. Fig. 2 represents the standard span wire connection. The feeders are carried on the same poles by spruce cross arms with 1¼-in. locust pins under the insulators. Every two years the poles are painted, but this is more for the sake of appearance, as the paint would last four or five years. The body of the paint used is white lead mixed with linseed oil and colored to a light green for the tops and a dark green for the lower parts of the poles. Wooden poles are preferred, as they are cheaper, safer for insulation, less leakage on the line, and not so apt to break in cold weather, although it must be said that iron poles look better in the city.

The Albany Railway uses cast and structural iron poles in the city, and wooden poles on the suburban lines. The iron poles are 5 and 6 in. by 27 ft., and those of cast iron are built up of 6, 5 and 4-in. pipe. These poles have been in service for nine years and there have been no renewals. The wooden poles are of Georgia pine, 10 in. at the top, 12 in. at the butt, and 30, 35 and 40 ft. in length. The poles are set 6 ft. deep, and 125 ft. apart, with a rake of 8 in. The span wires are fastened to the poles by insulated eye-bolts, and the feeders are carried on cross arms on the same poles. At the corners heavier poles are used, set deeper in the ground, with additional rake, and guyed where possible. With the wooden poles the tops are tapered, and the butts creosoted. Two coats of graphite paint are applied at first and one added every three years. Iron poles are preferable in the

city, on account of the size and appearance, but wooden poles are recommended on the suburban lines on account of their cost, and by using taller poles the feeders are raised out of the way of low trees and other wires.

The standard poles of the Toledo Traction Company are of iron pipe, built up in three sizes, 6, 5 and 4-in., 7, 6 and 5-in., and 8, 7 and 6-in., and cedar poles with 6-in. tops, 12-in. butts, and 30 ft. long. The poles are set 6 to 7 ft. in the ground and 120 ft. apart. The rake given the iron poles set in cement along paved streets is about 5 in., other places from 5 to 12 in., according to conditions, and the wooden poles are set with from 8 to 18 in. rake. Cement concrete is used for iron poles and with all wooden poles where the stress is enough to warrant it. The iron poles are not protected at the surface of the ground to prevent corrosion. The span wires are fastened to the iron poles by eye-bolts

POLES IN LEEDS.

through insulated tops, and by two turns around the wooden poles. The iron poles are painted with two coats of asphaltum, and the wooden poles are covered with a heavy coat of pitch at the surface of the ground before they are set.

From the foregoing it is noticeable that iron poles are often recommended in the city for their appearance. This question has not received the attention in the United States that it has abroad. Decorative poles are required by the municipalities when granting franchises, and in many cases provision is made for electric or gas lamps on the same poles. The accompanying illustrations represent the types of ornamental poles common in English and continental cities.

## PLANS OF THIRD AVENUE, NEW YORK.

The results of the operation of the underground electric lines in New York and its own experiments with the conduit system on Amsterdam avenue have decided the Third Avenue Railroad Company to change the motive power on its cable and other down town lines.

The change will be started on the 125th street and 10th avenue line, and work will be begun as soon as the weather becomes more settled. The company, after beginning the work, will lose no time and will make every effort to complete the change on all its roads as quickly as possible. The lines to be equipped with the underground trolley system include, besides the one mentioned, the Drydock and East Broadway line, the Grand street line, the 42nd street and St. Nicholas avenue line, and the Union road in the annexed district.

The company is about to build one of the largest and most complete power houses in the country on the Harlem river at Kingsbridge. It is to be an L with a frontage of 100 ft. on 216th street, 450 ft. on 9th avenue and 500 ft. on 218th street. It is to be built of brick and stone, three stories in height. The company has decided to build two power houses for the operation of its various lines. The other one is to be located down town and is to generate the power for the 3rd avenue, the Drydock and the southern division of the 42nd street, St. Nicholas avenue and Manhattanville lines. Plans for this building have not been prepared, nor has its site been selected.

The Kingsbridge power house is to supply the proposed extension in the Kingsbridge Road, the Fort Lee, the Amsterdam avenue and the upper division of the 42nd street line.

The company has just completed a smaller power house at Kingsbridge, which has cost some \$200,000, but this building is to be torn down at once to make room for the new building, which is to have a chimney 350 ft. in height. The present structure was built to furnish power for the extension which the company proposed to build in the Kingsbridge Road from 166th street north; it is two stories high and 115x125 ft. in size. When the company decided to change the motive power of all its lines from horse and cable to electricity it was found that the power house was far too small to meet requirements, and it was determined to remove it and build a larger one.

The company has built a three-story building on the opposite side of 9th avenue, 200x500 ft. in size, in which to store cars. It has room for 500 cars and is equipped with elevators for raising or lowering them from one story to another, as well as complete paint and repair shops.

In a suit brought against the Second Avenue Railroad Company, of New York, a verdict for \$10,000 damages was obtained in the supreme court in favor of an eight-year-old girl who was injured by a horse car last October.

No serious accident has occurred on the Union Loop in Chicago, although the trains often run with a few seconds headway. Recently the locomotive of a South Side train ran into the rear of a Metropolitan train, shaking up the passengers but doing little damage. A mistake in the signals was the probable cause of the accident.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Enjoining the Location of a Street Railway on a Public Street.*

Where the plaintiffs, as abutting proprietors and owners of the fee in a public way sought to enjoin the location of a street railway within the limits of a public way, *held* that the railway is allowed to share with the public, its right of transit over the same and its location does not create any additional servitude.

It matters not what may be the motive power used for surface transit nor whether the transit be the carriage of passengers, of freight, or the transmission of intelligence by telegraph or telephone or of water, gas or sewerage. All these are public uses that the public may permit regardless of the individual, so long as they do not infringe the statute which provides what the public use may be.

The opinion of the court in part is as follows:

The bill also seeks an injunction because the plaintiffs are not only abutters, but owners, of the fee of the way subjected to the servitude incident to public ways, and that the defendant's use is an additional servitude, for which they are entitled to compensation, that must first be paid before the servitude may be enjoyed; and this is the main controversy in the cause, for, if the defendant's use of the way be no additional servitude, then the plaintiffs' right in the way and its use are merged with those of the public, and the public alone, by its laws, must define, control and regulate such use.

What servitude, then, does the public acquire by the taking of land for a public way? It is the right of transit for travelers, on foot and in vehicles of all descriptions. It is the right of transmitting intelligence by letter, message or other contrivance suited for communication, as by telegraph or telephone. It is the right to transmit water, gas and sewerage for the use of the public. It is a public use for the convenience of the public, to be molded and applied as public necessity or convenience may demand, and as the methods of life and communication may from time to time require. Society changes, and new conditions attach themselves. The change evolves new ways of doing things, new methods of communication, new inventions for travel. When the way is constructed, the land owner has his compensation, not only for the land taken, but for the damages sustained, although usually benefits are conferred rather than injury inflicted. These damages are assessed as compensation for a surrender of his land to the public use for travel and transit, not only by the methods then applied, and for the volume then existing, but for all time and for such future use as the exigencies of the time may develop.

When the way has been created, the public controls its use, and regulates its repair by laws that the legislature shall enact. Under these laws, the use must be governed, for the people have a right to say what use will best subserve their interests. They have now said that ways shall be maintained "so as to be safe and convenient for travelers with horses, teams and carriages." That is now the criterion, and a use that infringes upon the rule becomes an unlawful use, and may be prohibited by public prosecution. That rule may be changed, for the public, by law, may regulate the use of its public ways in such manner as the legislature may think will best serve the public interest.

This doctrine allows the public to control the use of

public ways for travel and communication, as it may be pleased, from time to time, to do. The kind of use that may be permitted is of no consequence to the abutter. He must take his chances with the rest of the community in which he lives. Some cases may seem to work hardship, but it is better so than to embarrass the convenience of the people, and cripple and annoy enterprises which the present and future may recognize as necessary for the good and happiness of society.

No matter whether the way be used by the lone traveler on foot or on his wheel, by the two-horse chaise or four-wheeled carriage, by the dray, cart or coach, or by cars that may be permitted to run in the street, whether propelled by beast, steam, electricity, or any other agency that may be discovered suitable for the purpose. No matter whether the vehicle carries passengers or freight, or passes intelligence along its contrivance. All these are public uses, and, so long as they do not infringe the laws that regulate the use of highways, they cannot be prohibited either by the individual or public prosecutor. Ways must be "safe and convenient." When they are not, by reason of any incumbrance or permitted use, then ample remedy may be had by public action, and such incumbrance or use may be removed or prohibited.

The servitude complained of in this cause, therefore, is a public servitude, and lawful, so long as it does not infringe the laws of the state regulating the use of ways. It gains no hold upon the soil itself, but is allowed a share of the public use. Should that use be extinguished, its rights would be extinguished also. It must exist or fall with the servitude of the public; otherwise, the doctrines of this opinion would be illogical. If it gained any vested right in the soil that the public could not extinguish, then, manifestly, it has created an additional servitude, and taken land without compensation to the owner.

These doctrines have been discussed in the numerous courts of this country with varied results. It will not be profitable to review them, for we think best to declare a doctrine best suited to the convenience of our people, and most consonant with the laws under which we live. We have persistently maintained the right of "free fishing and fowling," free and unobstructed navigation of our rivers, the free taking of ice upon them, the right of eminent domain over and in the waters of great ponds; and we now assert the right of the people to control the use of their public ways as shall best meet their necessities, without vexation from the land owner, whenever growth and discovery show the convenience of applying new methods for public transit. Let a public way once constructed be free for the public use and control as it may choose. Let it be free as the ocean is free, as our rivers are free, and as our great ponds and lakes are free, for the use of all the people.

If the reverse of this doctrine be held, the numerous street railways now operating in our state would be crippled, if not destroyed. If every abutter could enjoin their operation unless his damages were paid, there would be no end of litigation and confusion. Moreover, it is now too late to invoke such doctrine. We have already decided that a

MANUFACTURE OF BRONZE CAR ARTICLES.

The use of bronze in connection with street railway car fittings has become quite extensive in recent years, and a short account of the process of manufacture may prove of interest. The copper is melted in a crucible set in a furnace especially designed for the work, and shown in cross section in Fig. 1; it is unnecessary to give the dimensions of the

FIG. 1.

furnace, since the latter is in each case proportioned to suit the capacity of the crucible to be used. The arrangement of the cover A, and the stack outlets C, C, is seen in Fig. 1

The piece of apparatus next in importance is that for drying the phosphorus, which is shown in Fig. 2. Usually the phosphorus is dried in an open pan on a wire netting, and if the phosphorus ignites the pan is closed. The arrangement I employ may not be an improvement over the usual way, but it serves me very well. A stone jar of about four gallons capacity is fixed on the top of a sheet iron box; the box is 20 in. high, 12 in. deep and 4 ft. long. Inside is a shelf of sheet iron with numerous 1-in. holes drilled through it and covered with a sheet of asbestos. A water pipe leads into the bottom portion of the box and water is

FIG. 2.

FIG. 3.

street railway propelled by electricity creates no additional servitude. *Briggs v. Railroad Co.*, 79 Me., 363; 10 Atl., 47. Relying upon that doctrine, electricity has become the principal motor for all our street railroads; and it would be unjust to now overturn it, if we were inclined so to do. On the contrary, we deem it best, and most consistent with our laws and polity, to affirm it, and, further, that neither motor nor kind of traffic to be engaged in makes any difference, so long as the use does not violate the requirements of the statute, concerning which we are not called upon to decide at the instance of an individual.

(Supreme Court of Maine, *Taylor v. Portsmouth, Kittery & York Street Railway*, 39 Atlantic Rep., 560.)

*Stopping Street Car at Dangerous Place—Implied Invitation.*

A motorman in charge of an electric street car on a dark night ran his car past a point at which the cars regularly stopped and did not go back to take up plaintiff, who desired to board the car, but stopped the car and held it at a point 14 or 15 ft. farther on where it was dangerous for any one to go to the car, of which the motorman was aware, and the plaintiff was injured in attempting to board the car. Held, that there was an implied invitation to the plaintiff to board the car at that point when it was stopped and held there, and that the motorman was negligent in so doing, and that the plaintiff's contributory negligence was a question for the jury.

(*Vasele v. Grant Street Electric Railway Co.*, 9 American & English Railroad Cases, N. S. 75.)

*Power of Municipality to Require Conductors on Cars—Reservation of Right to Regulate Operation of Road.*

A state statute conferred upon the mayor and aldermen of a city power to make all such ordinances, rules and regulations relative to the streets as they should see proper and necessary, and to establish such by-laws not inconsistent with the laws of the land as might tend to preserve the quiet, peace, safety and good order of the inhabitants. A street railway company was incorporated under an act of the legislature, by which act it acquired the rights and franchises of two companies who had preceded it, subject to the duties and liabilities of such companies, the charters of which provided that the city council should have the power to regulate the running of the cars. Such succeeding company, subsequently desiring to operate its cars by electricity, presented a petition to that effect accompanied by a draft of ordinance granting the desired leave, which contained a provision reserving to the city council the right of regulating by ordinance the manner of operating the railway, and of altering and amending the ordinances relating thereto by such enactments as, in their judgment, the public welfare might demand. Held, that the city council had power to pass an ordinance that no street car should be run unless in charge of a conductor.

(*State ex rel. Columbia Electric Street Railway, Light & Power Co. v. Sloan, Mayor et al.*, 9 American & English Railroad Cases, N. S., 44.)

There is some legal difficulty between J. J. Shipherd, president of the Ft. Wayne Consolidated Electric Railway Company, and Frank Robinson over \$150,000 worth of stocks and bonds of the company. Nine indictments have been secured in Cleveland against Mr. Shipherd.

always kept there. For 75 lbs. of copper I use about 3 lbs. of phosphorus; I first put the phosphorus in a solution of vitriol in the stone jar, leaving the sticks for about 40 minutes; they are then placed upon the asbestos covered shelf and soon dry, the coating they have received in the solution protecting them from the air, obviating all danger of ignition and fitting them to go into the crucible of melted copper.

At first I experienced a great deal of difficulty in introducing the phosphorus into the molten copper, but finally suc-

ceeded by using a dip pipe, as shown in Fig. 3. This pipe is of cast iron, 3 in. in diameter inside with a funnel-shaped top. This pipe is held in place with the end below the surface of the metal by two workmen, while a third drops in the phosphorus, which quickly melts and mixes with the metal.

For casting the arrangement shown in Fig. 4 was adopted after some experimenting. The flask, pouring gates, etc., do

FIG. 4.

not differ from those commonly used and require no description, except to say that fine sand is preferable and that plumbago makes a good facing for the molds. The main gate B, however, should be provided with some means for heating the metal in it; some castings may be made without this apparently extra work of heating, but unless all the conditions are nearly perfect the metal will not flow as freely as it should and defective castings will result. The main gate is provided at the bottom with a stopper for closing the outlet into the mold. The heater A is a chamber of sheet iron with openings into which the main gate is set. The metal is poured into the main gate at the top and a coke fire in the heater keeps it hot.

The finishing of phosphor bronze castings is very similar to the finishing of nickel-plated castings, and it is only necessary to mention the novelties in the apparatus used.

FIG. 5.

One of these is a mechanical scratcher built on the principle of the ordinary foundry tumbler, but covered on the interior with leather set with No. 30 steel wires; the falling of the castings on these flexible steel points for an hour or so gives the surface an odd and attractive appearance. Another arrangement for giving unique effects is the emery blast shown in Fig. 5. The casting is supported in a clamp at the end of a spring bracket set on a pivot so that the workmen bring any portion of the work in front of the blast. About No. 70 emery is used. F.

## AN OLD ADVERTISER'S ADVICE.

In New York a few days ago, says the "Globe Democrat," the resident partner in that city of the Wanamaker firm delivered an address before the Merchants' Association on "Advertising as a Business Force." The speaker based his remarks on a long experience in extensive and successful newspaper advertising. He began by saying that a retail business may be divided into three parts: the goods to be sold, the persons employed to sell them and the advertising. While the three were considered of equal importance the advertising was called "the dynamic power of the business," setting it in motion and increasing its volume. One point brought out is that the relative importance of advertising is not taken seriously enough, that is, not regarded as one of the essentials. The speaker would no more think of running a business without advertising than of owning machinery without a motive power. He prefers newspaper advertising because other kinds are resisted by the public, that passing through the mails often going direct into the waste basket.

Money, it was admitted, can be wasted in advertising. The advertiser may underrate its value and, indeed, give but slight study to its principles, and be soon discouraged. "The most successful advertising I have ever known," said this expert, "is that which has been exploited on a very large scale. The man who has had the courage to advertise to a certain extent and spend \$20,000, should have had the courage to spend another \$5,000 and vitalize all the rest." In these cases there is a lack of the needful faith and persistence. Advertising was presented as a necessity of the retail business, its pulse, movement and circulation. The newspaper column is the merchants' rostrum. In using it to address the public his statements must be veritable. Advertisements must be well expressed, and the illustrations of a good grade. It has been the Wanamaker policy to advertise in a terse, direct style, though freely as to space, and to use a typography which newspaper readers soon recognize as distinctive.

An anecdote was related of Gladstone, which the speaker could vouch for as true. The English statesman was asked why he bought the American edition of a certain American magazine instead of its English reprint. Mr. Gladstone replied that the American advertising interested him, and was to his mind a means of gauging the material prosperity of the country. Mr. Wanamaker's representative concluded his address by asserting that sound theories of advertising, founded on reason and common sense, are as certain to produce good results as are the forces of nature to bring forth a harvest. The growth of business is due to its controlling influences, among which advertising vitalizes the others. It is well known that newspaper advertising has been the corner-stone of the immense Wanamaker retail trade in Philadelphia and New York, and this address embodies experience rather than theorizing.

The Kingston (Jamaica) Street Railway Company has contracted with the Montreal Street Railway Company for 20 electric cars.

Owing to a strike of about 20 building laborers the work on the power station of the South Side Rapid Transit Company, of Chicago, was recently delayed for a short time.

## THE TROLLEY.

A portion of the story of the underrunning trolley is thus told in the April number of Cassier's Magazine: The now familiar trolley wheel and its pole in electric railway practice were not always held at their high value of today. William J. Clark, the head of the railway department of the General Electric Company, of New York, in speaking recently, in a reminiscent mood, told of his struggles about 10 years ago to sell the patent covering the devices in question. Mr. Clark was then acting as agent for Mr. Van Depoele, the inventor of the underrunning trolley, as it is called. He offered it to one group of American capitalists

## LOS ANGELES &amp; PASADENA INTERURBAN.

Pasadena is the largest and most beautiful suburb of Los Angeles, the metropolis of Southern California. These two cities are about 12 miles apart and are connected by the lines of the Pasadena & Los Angeles Electric Railway Company which are in all 44 miles long. The scenery along these lines is very beautiful as may be seen from the group of pictures in Fig. 1. The one in the upper left hand corner is from a picture taken at the Altadena terminus of the road and is the point at which connection is made with the celebrated Mt. Lowe railway. In the upper right hand corner is shown a view on the line running to the suburb of Altadena. The

FIG. 1.—SCENES ON THE PASADENA & LOS ANGELES ELECTRIC RAILWAY.

after another, at an upset price of \$100,000, without the slightest success, though he was prepared to dispose outright of the patent for that sum. Finally an offer of \$5 for each car fitted with the underrunning trolley was made to him and accepted. Mr. Clark continued that he was happy to say that from this contract he has since paid over to the Van Depoele heirs the sum of \$200,000. In his opinion, the three inventions which had brought about the immense development of electric urban and interurban railways were the Sprague patent for motor suspension, the Van Depoele underrunning trolley, and the substitution of carbon for copper brushes on the commutator. Mr. Sprague, who installed the first practical trolley line at Richmond, Va., where some grades were as steep as 8 per cent, found that with 30 cars in service it cost \$9 for a day to replace the copper brushes which had vanished into sparks.

picture in the center was taken at the corner of the two principal streets in Pasadena, the offices of the railway company being in one of these buildings. The lower left hand view is on the Altadena division with the Hotel La Pintesca in the background. The scene in the other corner is on the main line passing through the charming valley of the Arroyo Seco, and in it is a car crossing the viaduct which is 45 ft. high and 900 ft. long, between Garavanza and Lincoln Park.

In Fig. 2 is a front view of the car house and repair shop taken from Fair Oaks avenue on which the main line of cars run. Combination open and closed cars, a type in general favor in California, are here used. The pleasant temperature throughout the year makes it possible to use such cars with comfort at all times. The cars are finely upholstered and finished in mahogany with plate glass windows. The cars

FIG. 2.—CAR HOUSE.

FIG. 3.—INTERIOR OF SHOPS.

are 35 ft. over all and were built by the American Car Company and the J. G. Brill Company. Fig. 3 shows the interior of the car and paint shop.

The express car, with the superintendent's office and trainmen's room in the background, is portrayed in Fig. 4. Although the car has been running but three months it is now on a paying basis. The Electric Express & Storage Company has charge of this business, with offices and warehouses in Pasadena and Los Angeles. The express car makes four round trips between Los Angeles and Pasadena each day and not only are the charges very reasonable but from 12 to 24 hours are saved in the shipment of goods by this route.

The rates are as follows: Packages from 1 to 25 lbs. delivered from office to mile limit, 10 cents; charge of 5 cents for every additional half-mile. Packages from 25 to 75 lbs. delivered from office to mile limit 15 cents; charge of 10 cents for every additional half-mile. Packages from 75 to 100 lbs. delivered from office to mile limit, 20 cents; charge of 15 cents for every additional half-mile. Trunks delivered from express office to any part of city inside of one mile limit, 25 cents; delivered within 1½ mile limit, 35 cents; same charges will apply on calling for trunks. Trunks transported and deliv-

ered between Los Angeles and Pasadena within ordinary distances for 50 cents each, and at small additional charge for longer distances; several trunks at reduced rates.

Hand packages .....	10 cents.
Barrel flour, apples, etc. (under 200 lbs.) .....	15 "
Baby cab .....	15 "
Sewing machine, sofa or table .....	15 "
Syrup, oily tar, etc., per bbl. ....	25 "
Bicycles, used—uncrated .....	10 "
Bicycles—crated—each .....	15 "
Cases of boots or shoes .....	15 "
Easy chair .....	15 "
Dining chairs, per half dozen .....	25 "
Mattress or bed spring .....	15 "
Oil stoves .....	10 "
Stoves and small ranges .....	35 "
Mirrors, 40 inch .....	25 "
Bureaus .....	25 "
Refrigerators, set up .....	25 to 50 "
Sacks of potatoes, heavy goods, etc. (in lots of over 1,000 lbs.), per 100 lbs. ....	10 "

Orders may be telephoned between the two cities. Special rates are given to merchants who have considerable traffic business and discount books, containing 50 to 200 ten-cent stamps for payments of express charges, are sold.

FIG. 4.—EXPRESS CAR.

FIG. 5.—FUNERAL CAR.

FIG. 6.—FUNERAL CAR.

Figs 5 and 6 show two views of the funeral car now in service and which has met with much favor. It is one of the main line cars which has been suitably arranged and draped. The rates charged are about one-third of the cost of a hearse and carriages. When the business increases sufficiently it is the intention of the company to construct a car especially for this purpose.

The cost of coal in California is very high for it either has to be brought over the mountains or shipped from some foreign port. Fortunately oil fields of considerable magnitude have been developed in Southern California, particularly in Los Angeles, and furnish the best and cheapest fuel obtainable. Fig. 7 is from a photograph of a motor car attached to a tank car used in hauling fuel oil from Los Angeles to Pasadena. The car is standing alongside the power station and has just finished unloading 1,644 gals. of crude oil into an underground tank from which it is fed to the boilers. On an average of 1,800 gals. are used per day, the price varying from 60 cents to \$1.00 per bbl. of 42 gals. The interior of the boiler room, the fronts of the Stirling boilers and the oil feed pipes are shown in Fig. 8.

It has become necessary to add to the equipment in the power station to maintain a better schedule. A 15-minute service between Los Angeles and Pasadena in the winter

FIG. 7.—OIL TANK.

time during the tourist season does not accommodate the travel but the limited capacity of the power station prohibits a shorter headway. The present equipment consists of two Ball & Wood engines, one 450-h. p. and one 250-h. p., connected to two 200-k. w. Edison and one 112-k. w. Westinghouse generators. This will be greatly increased by the addition of a 650-h. p. Ball & Wood engine, two 250-h. p. Westinghouse generators, and two 40-k. w. boosters. Between the two cities a storage battery plant will be installed and will be complete for next winter's traffic. This will enable the company to give a 5-minute service during the busy hours in the morning and evening.

The officers of the company are C. W. Smith, president and general manager; W. H. Smith, assistant general manager and general passenger agent; H. I. Chatfield, auditor;

FIG. 8.—BOILER ROOM.

F. H. Jones, superintendent of transportation, and G. J. Kurtz, chief engineer. We are indebted to the kindness of W. H. Smith for the photographs here reproduced.

### EXTENSION OF THE WASHINGTON & GREAT FALLS.

F. H. Fowler, superintendent of the Washington & Great Falls Electric Railway, advises us that the company has commenced work on the building of two miles of double track, extending the line from Cabin John Bridge to Great Falls. The line now extends from West Washington to Cabin John Bridge and is along the banks of the beautiful Potomac for the entire distance; there are many curves and cuts and the route is a very picturesque one. The passenger traffic is large because of the football and bicycle grounds and the Chautauqua assembly grounds located on the line.

Heretofore the cars have been run at intervals of 15 minutes, being spaced by telephone, but the Skeen automatic block signal system is being installed, and this will enable the headway to be reduced to 2½ minutes with perfect safety. The Skeen Electric Switch & Signal Company, of St. Louis, is under contract to have its system in place by April 15, as the road has arranged to carry the visitors to the mothers' convention to be held at the Chautauqua grounds and commencing April 20.

**WOMEN MAY SMOKE.**

If our memory does not play us false, we have read accounts of women being ejected from street cars because they persisted in smoking. Such acts can not fail to be condemned as unwarranted interferences with the unalienable rights of liberty and the pursuit of happiness, in defence of which our forefathers fought and bled and died, and it is therefore with great satisfaction that we learn of the action taken by the Metropolitan Street Railway Company, of New York. The following letter was in answer to a request that separate smoking cars for women be put in service.

"Dear Madam: I have your esteemed favor, requesting that when the summer arrangements are made the Metropolitan Street Railway Company provide separate open smoking cars for ladies. I notice what you say about the great antiquity of smoking as a source of feminine consolation, and am interested in your statement that it is growing in popularity.

"As you speak with the assurance of perfect knowledge, and as I am lamentably ignorant of female habits, it is with hesitancy I suggest that I cannot believe the necessity is pressing enough to justify compliance with your request. Keen as is the general rivalry, the smoking habit is not, I think, quite so general with women as with men, and yet heretofore the Metropolitan Street Railway Company has never furnished separate cars for its smoking male patrons. Three seats in each open car, have, up to this time, sufficed to accommodate this class and gender of its patrons.

"May I suggest—since at the moment there seems to be no justification for separate women's smoking cars—that the gallantry of the gentlemen for whose exclusive use three back seats are reserved, can always be relied upon to provide a place, and even a light, for any woman who wishes to smoke?

"Yours sincerely,

"H. H. Vreeland."

**CONSOLIDATION IN NEW JERSEY.**

The annual meeting of the Consolidated Traction Company, of Jersey City, N. J., was held on March 28, and by a unanimous vote it was decided to lease its property to the North Jersey Street Railway Company, of Newark. The lease provides that the North Jersey Company will assume the obligations of the Consolidated and guarantee dividends on the \$15,000,000 of stock of the latter; nothing is to be paid on this stock the first year, 2 per cent the second, after that the rate is to be slightly increased each year until it reaches 4 per cent at the end of eight years.

The Consolidated Traction Company comprises the following companies: The Jersey City & Bergen Railroad Company, the Jersey City, Harrison & Kearney Railroad Company, the Newark Passenger Railway Company, the New Jersey Traction Company, the Passaic & Newark Electric Railway Company, the Passaic & Newark Electric Traction Company, the Newark Plank Road Company, the Port Richmond & Bergen Point Ferry Company and the Bergen Point & Staten Island Ferry Company.

The North Jersey Street Railway Company already controlled the South Orange, Montclair, Glen Ridge and Caldwell lines.

The Consolidated Traction Company re-elected its old officers: E. F. C. Young, president; E. B. Gaddis, David Young, vice-presidents; E. N. Hill, treasurer; Thomas J. George, secretary. The present officers of the North Jersey Company are: J. K. Cobiere, of Caldwell, president; Henry M. Doremus, of Newark, vice-president, and Wilbur Johnson, Orange, secretary and treasurer. It is stated, how-

ever, that upon the completion of the arrangements for consolidation the officers of the Consolidated will become those of the North Jersey.

An amicable agreement has been reached between the Brunswick and the New York & Philadelphia Traction Companies, which have for some time past been engaged in a fight for franchises in Middlesex and Union counties. Notwithstanding the agreement it is stated that a line along the Raritan river, paralleling the Brunswick line from New Brunswick to Bound Brook, will be built on the south side of the river. The New York & Philadelphia Company will build to within a few miles of New Brunswick and be met by an extension of the Brunswick Traction Company.

**DEATH OF COLONEL DYER.**

Lt.-Col. H. C. S. Dyer, president of the Colorado Springs & Cripple Creek Electric Short Line Railway Company, died very suddenly in London. Colonel Dyer was born in the year 1834. At the age of 18 he entered the Royal Artillery, and during his army career he saw a good deal of active service. He served in the Crimea, had his horse killed under him, and not only took part in the siege but was present at the fall of Sevastopol. During the Indian Mutiny he took part in many important engagements. He

was engaged in the relief of Lucknow and the battle of Cawnpore, in which he again had his horse killed under him. He took part in several other engagements, and retired from the Army with a high reputation as a soldier. He was on several occasions mentioned in official dispatches, and he held a medal with two clasps. He was also a Knight Commander of the Orders of the Crown of Italy, of Charles VII. of Spain, and of the

LT.-COL. DYER.

Rose of Brazil, while he also held the military order of merit of Spain. Colonel Dyer was at the head of the Federation of Northeast Coast Employers when the "engineers' strike" commenced last year and at once threw himself into the conflict, joining with employers of the Clyde, and the London Association and forcing a general battle in place of the piecemeal attacks contemplated by the strikers. He recognized the true issue and its importance, and to his energy the satisfactory outcome of the struggle is largely due, though the mental and physical strain proved too great a tax on his strength.

The Interurban Railway Company, of Saginaw, Mich., is strengthening its roadbed across the prairie land by filling in 500 car loads of gravel.

Although the transfer privileges of the Hamilton syndicate of railways in St. Louis are very liberal, General Manager McCulloch is considering the advisability of extending the use of the transfer between the Cass avenue, Northern Central, Union and Franklin avenue divisions and the Southwestern line.

OF INTEREST ABROAD.

In the "Review" for May, 1897, page 310, was a list of the questions proposed for discussion at the Tenth General Assembly of the Permanent International Tramway Union of Europe, to be held in Geneva in August next. We have lately received from M. Nonnenberg, the secretary of the Association, the replies which have been received, and abstracts of a few of them may prove of interest to American railway men and manufacturers.

All the companies making replies recognize that hand brakes are suitable for light cars and low speeds only, and that mechanical traction demands a power brake, and both electric and air brakes are highly recommended—the Sperry electric and the Standard air brakes are mentioned as giving

BRAKE FOR HEAVY GRADES.

most satisfactory service. The illustration shows a brake designed for use on steep grades which has been adopted at Lausanne and at Havre. The shoes or grips engage pieces of timber laid along the inner side of the rails, and are brought into contact by a worm and gear operated by a brake handle of the ordinary type. The shoes are  $4\frac{1}{4} \times 6\frac{1}{2}$  in. and the faces consist of pyramidal teeth about  $\frac{3}{4}$  in. square at the base and  $\frac{1}{2}$  in. high.

Regarding the electrical connection of rails, the Compagnie Générale Française de Tramways, Paris, says: "The welding of the rails by the Falk process, appears to give very good results at Lyons."

The Munich Street Railway answers the questions propounded in a manner short, sharp and decisive and says: "The best system of electric connection between the rails is the 'Chicago railbond' for rails buried in the ground."

Regarding accumulators, the Dresden Street Railway writes that it uses a mixed system, trolley and storage battery, having commenced the operation of the line in April, 1896. The belief is expressed that the weight of the batteries may be reduced by the more careful designing of the various parts, but any reduction in the size of the plate, made with a view to reduce the weight, decreases at the same time the capacity and the life of the battery. The life of the battery is estimated at from two to three years, according to the usage it receives. Exact determinations as to cost have not yet been made, but it is estimated at 1.2 cents per car-mile. As to the practical and economical value of storage batteries for tramway traction, the opinion is expressed that the overhead trolley is, and probably always will be, the most economical, but that the mixed system is of great value where the trolley cannot be used throughout.

To the question asking for the advantages and disadvantages of the different systems of electric traction, but three companies made reply; two use the overhead system and pronounce it satisfactory, but are unable to make com-

parisons; the third company comments on aesthetic objections to the overhead wires in the streets, but says that the other systems cost more to install and (especially with accumulators) the cost of operation is greater.

In response to the inquiry as to new developments in motors for mechanical traction, M. Lachmann, of Hamburg, presented an illustrated description of polyphase systems for railways as follows:

In the underground conduit, which is of the air-chamber type, the contact wires are in lengths of 3 meters (about 10 ft.) with longitudinal intervals of 300 mm. (1 ft.) between them. Each of these contact wires is connected to the third

FIG. 1.

one from it by a cable passing outside of the air chamber, so that there are a succession of groups of sections; in each of the three conductor wires constituting a section is one of the three currents. The arrangement is made clear by an inspection of Fig. 1, which shows the system diagrammatically; the full line and the two dotted lines indicate the three currents.

It is of course necessary, as shown in the sketch of the car, Fig. 1, to have three pairs of contact shoes on the car so arranged that only one set will at any time come in the intervals of 1 ft. between two conduit conductor sections. The arrangement of contact shoes is such that the magnetic field of the motor may have six poles. When the car advances the magnetic field advances by intervals of 1-6 of a revolution in the direction of rotation, and consequently the movement of the car causes the current to produce a rotating field.

The question has been raised as to whether serious difficulties would not arise because of sparking at the contact shoes, but the trials show that such is not the case. It is

FIG. 2.

possible by this arrangement of conductors to employ polyphase currents in underground conduits without increasing the dimensions of the conduit or using the rails to carry currents. The trials have also demonstrated that a polyphase

current of 1,000 volts is the equivalent, in point of view of electrolytic action, of a continuous current of 250 volts, so that a polyphase current of 2,000 volts might be used without increasing the present danger from electrolysis.

In Fig. 2 is shown the arrangement for a double track line when the conductors are placed between the two tracks. The three wires are placed one above the other, and arranged so that each one in turn is at the top for a distance of 19.5 m. (64 ft.), and the different sections so formed are separated by a distance of .5 m. This section length of 20 m. requires that the train be 40 m. long. Current is taken from the top wire only by means of six contact carriages spaced at proper distances along the train. A single line suffices for the two tracks, since the trolley shoes are designed to permit two of them to pass on the same line as shown in the lower part of Fig. 2. The height of the top wire above the surface of the ground is 1 m.

This plan admits of furnishing each car in the train with its own motor. In this case each car might, if necessary, operate alone, it being understood that two conductors of the current would suffice and that the rails could be used for a return. For switching, etc., in the stations it is necessary in any event to use a special locomotive, either steam or storage battery, to avoid complications at the switches.

Figs. 3 and 4 show the arrangement for an overhead trolley line; Fig. 3 gives the general scheme for a double track line, in which the poles are spaced 40 m. (131 ft.) apart, making the length of the conductor sections also 40 m.; Fig. 4 shows the motor connection when all six shoes are taking

FIG. 3.

current and when three of them are for the instant dead in passing the section insulators. In the several illustrations the three kinds of lines are used to denote the three currents.

The train length necessary with the installation in Fig. 3 is 85 m.

By this arrangement of the different currents one behind the others, it is impossible to produce a short circuit by the trolley leaving the wire, while an accident of this sort could very easily occur with parallel conductors, particularly at switches and crossings. The installations of the conduit at switches and crossings are very simple and the initial cost of the whole conduit, because of the economy in the use of copper, is only about one-third the cost of a continuous current installation. Also because of the saving in metal, the cost of the central station for generating a polyphase cur-

FIG. 4.

rent at 2,000 volts will be one-third less than the cost of a station to generate continuous currents at 500 volts.

The operation of trunk lines of railways by this system at a potential of 2,000 volts is possible at the present time.

#### A 3-CENT RATE IN MARYLAND.

A bill has been introduced in the Maryland legislature which provides for 3-cent fares for those passengers on street railways who are obliged to stand by reason of the seats being all occupied. Such legislation is prompted by the belief that street railway companies keep the supply of cars below the demand through a parsimonious policy; while the fact is, people ride in a crowded car because they refuse to spend any time in waiting for one that offers more room. Unless the profits of street railways are greater in Maryland than in other parts of the country the only effect of such legislation would be to reduce receipts, resulting in a further reduction in the number of cars because of poverty, and also cause friction between the fare collector and the public.

#### CONSOLIDATION IN OAKLAND, CAL.

The Oakland Consolidated Street Railway Company, the Central Avenue Railway Company and the Alameda, Oakland & Piedmont Electric Railroad Company, all under the control of the Realty Syndicate, have been consolidated. The articles of incorporation place the capital stock at \$5,000,000 and made F. M. Smith, E. A. Heron, F. C. Havens, W. H. Martin, D. D. Harris, J. C. Winans and C. R. Bishop directors for the ensuing year. The Piedmont and 8th street lines will soon be merged into the same company. The change will bring about a number of important improvements. Repairs are being made to the track, roadbed and rolling stock, and plans are now under consideration for generating the current at one power station and distributing it economically.

The Portsmouth (N. H.), Kittery & York Electric Railway Company has put a mail and express car in service on its line.

dition of service. From time to time the bulletins are posted on the boards at the five depots directing the men in reference to their conduct and duties. When an employe performs his regular duties or any special act worthy of commendation a record is made in the same manner as in an offense.

The rules governing the employes go into minute detail and are sufficiently clear for anyone to understand. When taking the car from the barn it is the duty of the motorman to carefully inspect the brakes and electrical equipment. Each motorman must provide himself with a monkey wrench, a pair of pliers, screw driver, oil can, 5 ft. of insulated wire, two extra lamps and fuses. This equipment is necessary for such slight repairs to the electrical equipment the motorman will have to make. In handling the controller specific instructions are given. Of the 10 notches the first four and the last three are the only running points and at least 10 seconds must elapse in passing to the last notch.

Caution is given against starting the cars when ladies' dresses are not entirely free from the car; no car should be run past a school house faster than four miles an hour; the car must not be run in the wrong direction until the conductor has gone far enough ahead to warn any approaching car; the motor car should not be nearer a car or vehicle ahead than a safe stopping distance. In case of accident the car is stopped at once and the name and residence of the injured party ascertained. Necessary assistance is rendered, and, if the case is serious, the conductor telephones at once to the superintendent's office. Witness cards are kept by every conductor and the name and address of witnesses must be obtained in their own hand writing. At the end of the day the following form is filled out, and with the witness cards attached is sent to the superintendent:

An accident occurred this day in connection with my car, the circumstances of which are as follows:

.....Depot. Date.....189... Time.....M.  
 No. of Car..... No. of Motor Car.....  
 Nos. of all other Cars in train.....Line.....  
 Direction Train was going.....  
 Place of Accident.....  
 Speed of Train.....On what Notch.....  
 How long had you been running on that Notch?.....  
 Was Motor in good condition?.....  
 Type of Motor.....  
 Was Brake in good order?.....  
 Condition of Track, slippery or not?.....  
 If Collision, give direction and rate of speed other Car or Vehicle was moving.....  
 If Collision, did you reverse?.....If so, how many Notches?.....  
 If not, why not?.....  
 Any other Train concerned in accident?.....Whose?.....  
 Were one or both Motormen ringing the gong?.....  
 Damage to Car.....No. of Car Damaged.....  
 Damage to Vehicle.....  
 Owner of Vehicle.....  
 Injury to Person.....  
 Name of Person.....  
 Residence.....  
 Position of Motorman and Conductor just before time of accident.....  
 Name and residence of witnesses on car.....  
 Name and residence of witnesses on the sidewalk, or elsewhere.....  
 Remarks:—State fully every fact not included above.....  
 Signature.....Conductor, Badge No.....  
 .....Motorman, Badge No.....

These reports also go before the Commission on Discipline and if gross carelessness has been shown by the em-

ployes they are punished. In cases of damage to property, the employes responsible for it are sometimes required to pay half the damage, there being a deposit of \$50 to cover this.

The conductors are in charge of the cars and are held responsible for the signals to the motormen. At the end of the day's work the conductor turns into the receiver the receipts of the day. The subject of accidents is carefully treated for it requires the utmost diligence on the part of both conductors and motormen to avoid collisions in the crowded thoroughfares, and protect passengers. The majority of accidents occur by passengers falling while boarding or alighting from the cars.

## THE BICYCLE IN WOONSOCKET.

Quite recently a bicyclist who came in collision with one of the cars of the Woonsocket (R. I.) Street Railway Company was awarded \$8,000 damages for injuries received. The company feeling that it must effectually guard against a repetition of such an occurrence issued an order directing motormen "to stop all cars when within a distance of 100 ft. of a moving bicycle approaching a car."

The result of this order is that a small boy in an obstinate mood may easily blockade about all the street cars in the northern part of Rhode Island and adjoining Massachusetts. On March 11, when the order went into effect, the situation was described by the local papers as "humorous (for the cyclist) and lingering (for the passenger);" conductors faithfully obeyed the order and passengers missed their trains.

No doubt the public will grow tired of the extraordinary care which the large verdict for damages makes it necessary for the company to henceforth use in the operation of its cars, and will find a way to keep the wheelmen off of the car tracks.

## THE STEVER RAIL JOINT.

It is now pretty generally conceded that the use of the deep rail has not obviated joint troubles. Results show that while heavy channel bars hold up rail ends more satisfactorily than was possible in chair rail constructions, there is still the tendency to work loose and out, thus involving the tearing up of pavement. Some five years ago, when chair rail construction began to prove such a universal failure, the Stever joint was first used in street railway work, and although handicapped by the fact that in many instances the rail itself was too light for the service imposed, there is yet to be reported the first case wherein one of the thousands so applied has received the least attention or caused a particle of expense.

The claims which the Stever Rail Joint Company makes for its joints are: 1. That it has a larger cross section at the rail end than the rail itself, and is therefore stronger. 2. That the bottom support augmented by two rigid jaw clamps, enclosing almost the entire base of the rail, receives the stresses and allows the bolts to perform their only legitimate duty, which is to hold the joint plates to their work. The first claim is strength and the second is keeping that strength permanently where the stress comes.

## THE PROTECTION OF GRADE CROSSINGS.

In recent issues of the REVIEW we have given a brief summary of the statutes in force in different states regulating the crossings of street railways with steam railroads, and prescribing the conditions under which grade crossings are to be permitted. A crossing being permitted to be made at grade, the legislatures of Ohio and Indiana have enacted that, so far as lines built in the future are concerned, the junior road shall be compelled to "interlock" the crossing. In regard to existing roads the provisions of these statutes are for "interlocking or other safety devices," and perhaps it would be held that the section as to new roads permits the alternative "other safety device."

A number of states, Colorado, Illinois, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Mississippi, New York, Ohio, Texas and Wisconsin, have laws concerning establishing interlocking plants at the crossings of two steam roads. Of these statutes several are merely permissive and provide when such apparatus is installed the roads shall be exempted from the laws requiring stops or reduction of speed at crossings; others make the installation obligatory when it is demanded by one of two existing roads. In Illinois, Indiana and Ohio, the statutes are mandatory as regards roads to be hereafter built, and place all the cost of building and maintenance on the junior road; in Iowa the crossing may be demanded by the senior road and the first cost is to be borne by the junior road, but the cost of maintenance to be apportioned between them. Only Indiana and Ohio, as before mentioned, place electric railways under the same obligation as steam roads. Some of the newer electric railway companies in Illinois have been incorporated under the general railroad law in order to get a franchise for carrying freight on interurban lines, and this no doubt subjects them to the provisions of the interlocking law.

What is believed to be the first interlocking plant at a crossing of a steam and an electric road in which the trolley circuit was included in the interlocking mechanism, was placed in operation November 5, 1893, at the crossing of the Chicago North Shore Electric Railway and the Chicago, Milwaukee & St. Paul. This plant was described in the REVIEW for November, 1893, page 729, and the electrical portion is known as the Gibbs system.

A section of the trolley wire on each of the approaching tracks is separated from the rest of the line by section insulators, and the feeders for these sections are led through the signal tower. When the gates are open the current is on these sections; at the same time the home signal on the steam line is at danger and a derailing switch, 400 ft. back from the crossing, opened. The distant signal, 1,800 ft. away, is also set at danger. When the towerman wishes to close the derailing switch he must first open the trolley circuit, close the gates, and raise a skotch block on the street railway track. The trolley wire immediately above the crossing is never cut out, as it is important that a car on the crossing may always be able to move off of it. The only accident that could occur with this would be by the opening of the steam road with a disabled street car on the crossing.

Several interlocking plants have been installed in Chicago, one at Catlettsburg, Ky., five on the Nassau Electric Railroad in Brooklyn, and one in Buffalo.

The shunting of the current from sections of the trolley wire is the principal feature of the Gibbs system, which is applied by the different signal companies to their interlocking apparatus. The several elements as mentioned above of these interlocking plants are: 1. Distant and home signals and derailing switches on the steam lines. 2. Signals (usually home signals only) and skotch blocks (or derailing switches) on the electric line. 3. The interlocking of the levers controlling these switches and signals with levers controlling the trolley current in sections of the overhead line either side of the crossing.

The details of operation of a double track crossing plant are given below and the arrangement of the electric circuits is shown in the diagram. The details of the circuits will of course vary somewhat in different cases, but in general they are the same.

In October, 1897, the Calumet Electric Street Railway and the Chicago & Western Indiana Railroad jointly installed an automatic and electrically controlled interlocking plant where the two lines cross at Kensington, Ill.; the work was completed and the plant put in operation No-

WIRING OF KENSINGTON PLANT.

ember 15, 1897. This crossing is a particularly dangerous one, the street in which the Calumet tracks are laid sloping toward the railroad from both directions; the grades are 3 per cent on both sides, one being 400 ft. and the other 600 ft. long.

The location of the signals and the arrangement of the electric circuits are shown in the diagram. It has been found best to keep the railroad blocked except when cleared for a train and the street kept clear. One of the three steam tracks is a siding and skotch blocks only are provided at the crossing.

If a car arrive from the north on the south-bound track, it passes over a circuit breaker about 300 ft. from the crossing and enters an insulated section of trolley wire. The controller is left on for say 20 ft. while on this section and then the car is brought to a standstill. By referring to the diagram it will be seen that this has drawn the current from the feeder in the switching tower through a 200-ampere relay back to the trolley section, down the trolley pole through the motors to the ground, completing the circuit. This relay throws in a local battery, which rings the signal bell in the tower. The signalman then drops the semaphore, which has been perviously kept locked. The dropping of the semaphore, which is 150 ft. from the crossing, has auto-

matically locked the whole system, and it is impossible to take the signal away or open any other switch until the car has passed beyond the crossing. The motorman now has the right of way. Within 20 ft. of the crossing he meets another circuit breaker and has now entered a section which crosses the railroad and goes beyond for about 50 ft., being fed from the main feeder and having no connection with the tower or any mechanism whatever, so there will be no danger of a car ever being stalled on the crossing by the tower apparatus getting out of order or failing to work. After passing over this section he enters a third section about 100 ft. long. While going over this, which is upgrade, he has to use the current which is drawn from the tower through the auxiliary feeder that passes through a 200-ampere relay, which operates a local battery and a second relay which unlocks, electrically, the levers in the tower. The towerman is now able to set any switch that is called for.

The north-bound track is operated in a similar manner.

When the railroad has the right of way the street car semaphore stands at block and both derails are thrown open, and until both derails of the street car lines are open it is impossible to close any on the railroad, they being governed by the interlocking mechanism. Having closed the railroad derail and given the right of way, it is impossible to operate the street car lines, which remains blocked until the train has passed.

Should the electrical apparatus in the tower from any cause get out of order or fail to act, there is a set of switches on the local battery circuit that can be thrown over in order to release the locks, leaving the levers free to act.

These switches are enclosed in a locked box with a glass front and the towerman can only get at them by breaking the glass. He then notifies the main office to send men to make the necessary repairs, with an explanation and full report of the cause that led to the necessity of breaking the box. He has then also to throw over two large double

and as an improvement on the present arrangement the latter suggests the following: "Instead of the street car derail being closed and the first or signal section being in circuit in series with a 200-ampere relay, which allows a motorman—if he choose to disobey the semaphore signal to continue and pass over the crossing—my idea would be to have the derail wide open and the trolley section dead, with the exception of passing through a very high resistance relay, sufficient only for signal purposes, but would not allow sufficient current to move the car.

"Now, under these conditions, the towerman having received the signal, would first have to throw the derail switch

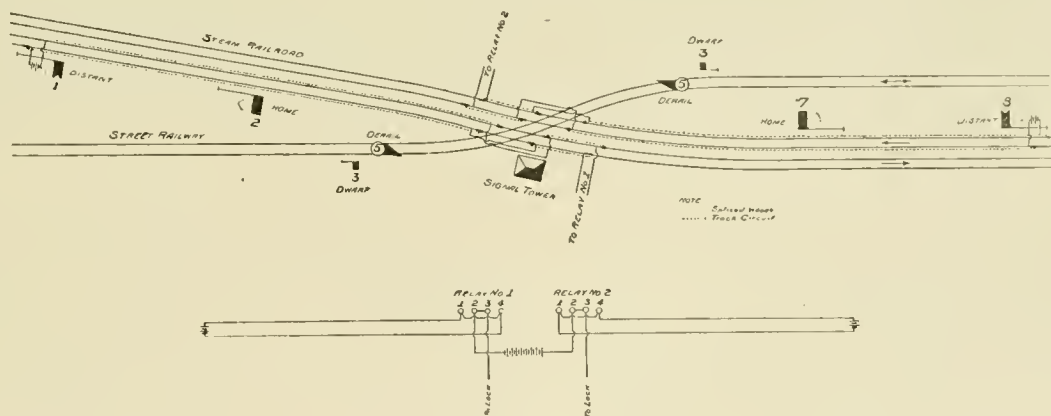

DIAGRAM OF PAINESVILLE CROSSING.

which would, at the same time, throw the trolley section into circuit, following up with the semaphore. With this arrangement a motorman would be compelled to obey the semaphore at all times or he would himself derail his car."

The first crossing of an electric line with a steam road in Ohio to be interlocked, in accordance with the crossing law, was that of the Cleveland, Painesville & Eastern Railroad with the New York, Chicago & St. Louis Railroad (Lake Shore) at Painesville, which was put in operation in February last. Both of the roads are single track; both are

FOR CROSSING WITHOUT TOWERMAN.

throw switches, which release the several insulated trolley sections from the tower apparatus and short-circuit them on to the main trolley feeder, practically making it a continuous trolley wire. The signalling is then done by hand. During the operation of this plant this has only been resorted to once, and this was practically while under test.

The foregoing description was furnished by General Manager Sloan and Master Mechanic Harding, of the Calumet,

provided with home and distant signals and derails, the same as are usually provided for the crossings of two steam roads. The diagram, which was furnished by the courtesy of H. M. Sperry, shows the layout; there are practically no grades near the crossing. The wiring is similar to that in the Kensington plant, the insulated trolley sections taking current through the regular trolley relays of 200 amperes capacity; in operation, however, the derail on the

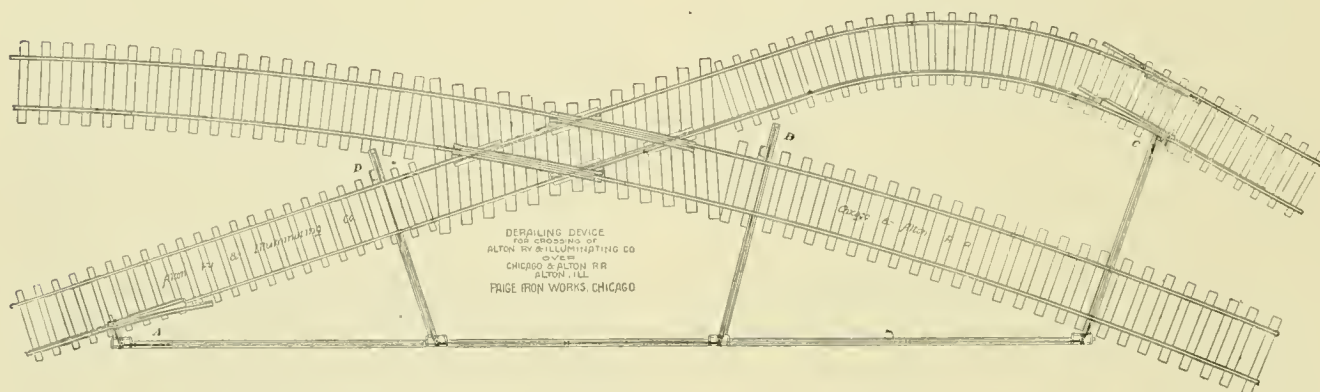

electric line is kept open, so that if the motorman disregards the semaphore he derails his car.

For crossings outside of thickly settled areas where there are few trains one of the signal companies has designed a system which protects the two tracks and reduces the expense to a minimum. The diagram shows a single track crossing two main tracks of a steam road. The regular high semaphore signals, 1, 2, 7 and 8, are placed on the steam railroad. The home signals, 2 and 7, are located about 300 ft. in advance of the crossing, and the distant signals, 1 and 8, are from 1,200 to 1,500 ft. in advance of the home signals. The street railway has two derails 5, and two dwarf semaphore signals 3.

The normal position of signals 1, 2, 7 and 8 is at clear, as shown by the broken lines, the levers in the machine being

One of the plans for protecting grade crossings which is simple and inexpensive is to provide derails on the street railway track which are normally open and are closed by the movement of a lever which is located on the opposite side of the steam track from the derail. The conductor of the street car must cross the steam track and close the derail before the car can proceed. Such an arrangement is in use in Denver and was illustrated in the REVIEW, June, 1897; at the crossings there described blind curves are provided onto which the street car runs, instead of merely being derailed.

The accompanying illustration shows the derailing device made by the Paige Iron Works, of Chicago, and installed at a crossing of the Chicago & Alton Railroad and the Alton Railway & Illuminating Company's road at Alton,

DERAILING DEVICE FOR PROTECTING STREET AND STEAM RAILWAY CROSSING AT ALTON, ILL.

reversed, giving the right of way for trains on the steam road. The normal position of signals 3 on the street railway is at danger, the lever being in normal position, toward the front of the machine, with the derails 5 open.

As it is not intended to employ the regular services of a signalman in a tower to manipulate the levers, but to have them thrown by the conductor of the electric car, it is desirable to arrange the interlocking mechanism so that he cannot change the position of the signals 2 or 7 after a train on the steam road has passed either 1 or 8, for unless this protection were provided, he might change signals 2 and 7 immediately in front of a fast approaching train, and cause a collision, the distance between the home signals and the crossing not being sufficient in which to stop a train that has passed the home signal at speed.

This is accomplished by forming a rail circuit from the distant signals to a point beyond the crossing, as shown by broken lines, from which it is carried to relays in the tower. The third post of the relays is connected to a lock. The interruption of the rail circuit by the short-circuit through the axles of the train causes the locking of the machine, which is not released till the train has passed beyond the crossing.

Another important point is the interlocking of the door of the cabin with the signals, so that the conductor cannot leave the cabin until he has reset the levers to their normal positions. This prevents delays on the steam road which might occur were the conductor to leave the signals set at danger.

III. A hand-operated derailing switch is placed on each side of the steam track and about 50 ft. distant. The lever B operates the switch A, and the lever D the switch C.

### PREPARING FOR THE TRANS-MISSISSIPPI EXPOSITION.

The Omaha & Council Bluffs Railway & Bridge Company is making extensive additions to its equipment in preparation for the Trans-Mississippi Exposition. Contracts have been closed with the General Electric Company for 17 equipments of 57 motors to be placed under 43-ft. cars. A new power house will also be erected. Two 280-h. p. Cahall-Babcock & Wilcox boilers, a 325-k. w. direct connected generator with a Reynolds corliss engine and switchboard have been purchased.

One important question has been a water supply, and this has been solved by sinking two wells. They supply about 50,000 gals. of water per hour. The wells are 75 ft. deep and reach the bed rock of the Missouri river, giving the same character of water as has been supplied from the city mains, but free from mud and dirt. It is clear, has a low temperature and has been used in the boilers over a month with good results. It is intended to run the new engine condensing. As the water comes within 8 ft. of the surface the expense of pumping is trivial. With these added facilities for handling a heavy traffic General Superintendent Dimmock believes that the company can carry all the visitors that may come to see the Exposition.

### IA FLORAL TROLLEY PARTY.

The second anniversary of the organization of the New Orleans Traction Company's Employes' Aid Association was made the occasion of a trolley parade which was as beautiful as it was unique. The association has branches in each of the company's barns and it was arranged that each branch was to display one car decorated with bunting and flowers. The rivalry was very keen but each employe was familiar with the appearance only of his own car until all of them met on Canal street at seven p. m. on March 25. A large crowd assembled and shouted their appreciation as the decorated cars passed with a few cars carrying passengers interspersed.

In each car was a band of music and the marshal and aids of the different branches. Others had men attired in dis-

included a large number of ladies, who had been invited by the members.

Secretary A. H. Ford, of the association, bade the guests of Arabella branch a cordial welcome, and then called upon C. D. Wyman, general manager of the company, to address the employes. Mr. Wyman made a splendid address, which conveyed expressions of congratulations and encouragement of the noble work. He showed that he was heart and soul with them in their pleasures, as he was when their interests were at stake. His speech was received with cheers, and then the fun commenced.

There are in the city seven different branches of the association, one at the Arabella barn, one at the Magazine barn, one at the Prytania barn, one at Poland street station, one at Esplanade street barn, one at the Tchoupitoulas barn, and one at the Canal street car station.

CAR OF CANAL BRANCH, NEW ORLEANS TRACTION COMPANY'S EMPLOYES' AID ASSOCIATION.

guises, which added to the enjoyment of the scene. They proceeded down Rampart street to Esplanade, thence out to Dauphine, and down to Poland street and out to the station. After remaining there a few moments to afford the people an opportunity of closely examining each car, the procession moved up Rampart street to Canal, thence to Camp and up to Newspaper row, where each car stopped and serenaded the various newspaper offices. The approach of the procession was heralded by the discharge of rockets, bombs and cannon crackers, while one of the delegations had a small brass cannon.

The cars proceeded to the Arabella barn which is the terminus of the route, and here the Arabella branch became the host, and entertained their brethren and gave them a glorious time. Refreshments of all kinds were served to the guests, and the members of the Arabella branch showed themselves to be splendid hosts and entertainers. A fine programme had been arranged for the assemblage, which

The exhibit of the Arabella branch was an open summer car most artistically decorated, the design being "Louisiana." Cotton, sugar, Spanish moss and latanier or palmetto constituted the principal portion of the decorations, to say nothing of a wealth of roses and sweet blossoms gathered from the numerous splendid gardens which line the routes of the various lines which have termini in the Arabella barn. The fenders were beds of Spanish moss and roses, while each post of the car was covered with Spanish moss, in which cotton bolls were liberally scattered, giving the decorations a most beautiful and appropriate appearance. Flags and hunting were displayed in profusion all around the sides and ends of the car, while two rows of Chinese lanterns were suspended on each side of the interior. The side step was a bed of moss and roses, while a garland of moss extended all around the car. The interior was brilliantly illuminated with incandescent lamps having vari-colored bulbs, and in front and rear, instead of the headlight, was a cluster of elec-

POLAND BRANCH

MAGAZINE BRANCH.

tric lights which formed the letter "A." At each end, in front and on top of the car, was a large transparency bearing the word "Louisiana."

The car from the Poland street branch seemed to meet with the approval of the majority of the people who witnessed the parade and who declared it the most beautiful of all. That it was a most gorgeously decorated as well as artistically illuminated car was beyond cavil, and it expressed the taste, skill and novel ideas of the designer. The car, as was the other, was an open car, and was surrounded by a red cloth, which formed the groundwork of color. Red and white roses made of paper, with a large number of bouquets of natural flowers, surrounded the car. The posts were covered with red cloth, decorated with flowers, in accord with the remainder. Festoons extended from end to end of the car and across the ceiling, composed of Spanish moss, into which roses had been entwined with twigs of cedar. The fender at each end was a bed of moss, in which roses, cedar and sprigs of heliotrope and other plants had been placed. The lights, 209 in number, were arranged in arches around the sides and front of the roof, while the base of these arches was a line of red and white lights. In lieu of a headlight at each end there was a large circle of white lights, in which was a letter "P" made with red lights. All around the edges of the fenders was a fringe of red and white lights, while along the trolley pole was a row of alternate red and white incandescent

lights. On the way up to Canal street, the Poland branch proceeded to the residence of General Manager Wyman, and presented Mrs. Wyman with a magnificent bouquet of rare flowers and ferns.

The Canal street car was in many respects equally attractive. Although the illumination was not quite as elaborate, the decorations were in every other respect as pretty, and many appeared to prefer them to the other. The subject of the decoration was "Liberty and Commerce," exemplified by appropriate designs and decorations. Red, white and blue lights surrounded the car, while in the seats in the center of the car, and facing each other, was a boy attired in the traditional costume of "Uncle Sam," and a beautiful little girl, attired as the "Goddess of Liberty." Between them was a yacht, full-rigged and with all her courses set, a good imitation of the Defender. The seats were covered with the national flag and on the front fender was a brass howitzer upon a bed of roses. The interior of the car was decorated with festoons of white garlands, extending across the car and from front to rear. Red, white and blue lights illuminated the interior, and each of the posts were elaborately decorated with bunting and entwined with moss, flowers, etc. At each end was a transparency with the words "Our Country" in large letters. Palmetto moss and flowers ornamented the roof of the car and the trolley pole was decorated with small flags and electric lights.

ESPLANADE BRANCH.

ARABELLA BRANCH.

The car of the Esplanade branch represented "Spring." Red, white and blue bunting, interspersed with stars, was artistically draped around this car, while moss roses and palmettoes constituted the remainder of the decorations. The effect was very handsome. Small flags and lanterns formed the interior decorations while numerous bouquets of natural flowers were suspended from the ceiling.

The car of the Magazine branch, the most beautiful of all, with a wealth and profusion of brilliant colors and quantities of natural flowers. The fender was raised in the center so that it resembled the pilot of a locomotive. It was a solid triangular pyramid of choice roses, with electric lights scattered amidst the bed, giving a most beautiful effect. The dashboard at each end was a mass of flowers, white at either end on top of the car, there was a solid arch of flowers, as well as along the sides of the roof. In front and rear, in the way of illumination, was a crescent and star of electric lamps, the crescent being formed in white lights and the star in red. In the middle of each side was a small cluster of white incandescent lights, but the illumination was not quite brilliant enough to set off the really elegant floral decorations of the car. A transparency with the words, "Magazine Branch of the New Orleans Traction Company's Employees' Aid Association," was at either end. On the glass of the headlight was painted a large sunflower. The band on this car is known as the traction band, composed of employes of the company.

The Annunciation and Tchoupitoulas employes selected as a subject "Audubon." The fender of the car was decorated with moss, in which innumerable cotton bolls had been scattered. A deer's antlers were placed over the center of the fender at one end and a handsome pair of horns at the other. Flags and Chinese lanterns were suspended from the ceiling inside the car, and in front a large transparency with the word "Annunciation" was stretched across the car from side to side. Around the top of the car were innumerable small flags crossed in beds of palmetto moss and cotton. The posts were decorated in keeping with the remainder of the decorations.

"Liberty" was represented by the car of the Prytania branch. The national colors predominated everywhere about the car, with red, white and blue lights. A large letter "P," formed with white lights, was at each end of the car, while the fenders were decorated with moss and flowers.

Upon the approach of the procession of cars at the Arabella barn there was another grand display of fireworks, with a discharge of bombs, cannon, crackers, etc. The cars were all run into the spacious barn and switched on side tracks. The men then alighted and went to the rear end of the barn, where a stage had been erected. On each track leading to the stage summer cars had been placed, and these afforded the audience seats from which to view the performance with which the Arabella branch entertained its guests. A brass band furnished the music.

The audience was a very large one, and every available space was occupied. The entertainment was a success in every particular.

March 19 the springs on the governor of an engine in the power house of the Glenwood & Polytechnic College Street Railway at Fort Worth, Tex., broke, and in consequence the two 5-ton fly-wheels burst, wrecking the building and injuring one man.

## POSTAL CARS IN PITTSBURG.

Tracks have been laid in Pittsburg to connect the lines of the Consolidated and the United Traction Companies, and a switch for the accommodation of the postoffice, in preparation for the postal cars which are soon to be put in service. Two postal cars are now building after designs furnished by the Government, and they will carry crews of postal clerks and run over extensive routes. The use of the two cars is said to be in the nature of an experiment, but in view of the experience in other cities there does not appear to be much doubt but that the number will be soon increased.

## THAT FENDER QUESTION.

EDITOR REVIEW:

We are in the midst of a fender controversy, and while I recognize the merits of one or two fenders which I consider good, we have been simply inundated with a swarm of contraptions which the inventors call fenders, until I have been reduced to the desperate condition indicated below:

It is fenders in the morning,  
 And it's fenders noon and night;  
 It is fenders with projections,  
 And fenders out of sight.  
 But the fender which I most need—  
 I'll buy one if I can—  
 Is the fender that will fend me  
 From the fender selling man.

MANAGER.

## A NEW ROAD IN CONNECTICUT.

In Connecticut the projectors of an electric railway have the burden of proving to the satisfaction of the court that the proposed road is a "public convenience and necessity," before it can be built. There is now a contest pending between the promoters of an electric line through the towns of Montville and Waterford to connect New London and Norwich, about 20 miles, and the Central Vermont Railroad, which would be paralleled. The hearing had been set for March 29, but was postponed till April 27 at the request of the Central Vermont, which asked for more time to prepare its case. There are rumors of the latter putting down a third rail and adopting electricity between these cities.

## STRIKE AT SAGINAW.

On March 11 the 62 motormen and conductors of the Union Street Railway, of Saginaw, Mich., went out on a demand for shorter hours. The men set forth that when the pay was recently raised from \$1.34 to \$1.55 per day the hours of labor were increased to 12 and 14, and in some cases 16 hours per day. This road will be remembered as having made quite a figure with its low rates of seven and nine rides for 25 cents. The daily press generously praised the announcement as evidence of what a well-managed road can do if it only will. The trip into receivers' hands was both short and swift, and the long hours were simply a heroic effort to do the best they could with a hard proposition. The strike was settled by a reduction in the hours and maintaining the \$1.55 rate, which was only made possible by the court authorizing a change in fares by increasing the price of tickets.

## STREET RAILWAYS IN PUBLIC HIGHWAYS.

Extract from Report of Secretary of Massachusetts Committee—Effect Upon Density of Urban Population—Locations in Public Highways—Maximum Life of Franchises in Different Jurisdictions—Method of Forming Company and Securing Location in the Street in America and in Europe.

In the REVIEW for January we published a portion of the argument of Everett W. Burdette, before the special committee on the "Relations of Street Railway and Municipal Corporations in Massachusetts" which gave in detail the growth of the street railways in that state, their status in the highway, and the burdens borne by them in the shape of taxes. In February, we published the text of the "Report" which discussed the various questions treated with a view to their bearing on the street railways of that state. As stated in the report the committee collected a great deal of data which are to be published as appendices to the report proper when properly arranged. Three appendices have been published: A, treating of street railway legislation in Massachusetts, locations in public highways, and methods of taxation and franchise charges. B, comprising abstracts of the statutes of various states. C, giving the conditions in various American cities. The following is a copious extract from the report of the secretary which is Appendix A.

Since 1887 the relations existing between the railways and the municipalities and the railways and the public have changed with great rapidity. Formerly the street car was a small affair, drawn by one or two horses, moving at a speed of not to exceed eight or ten miles an hour; now we have large cars, moving at high rates of speed, often exceeding 25 miles per hour when away from the crowded streets of the city. The most important result of the introduction of electricity as a motive power was undoubtedly this increase in speed, which led directly to a great increase in the area served within a given time. It may be assumed that one hour represents the limit to which people are restricted as the time to be spent on the journey from house to work; that is, the limit of the availability of the suburban district as a place of residence. A street car drawn by horses moving at the rate of eight miles per hour could serve an area of 200 square miles, within which people might reach the center of a district by one hour's travel. With electric power and the speed of the cars reaching an average of 15 miles an hour the area which can be served within an hour's journey from the central point reaches 700 square miles, or three and one-half times as great as was the case when horses were employed.

The spread of population due to this increased speed of transit has been very marked, and many benefits accrue therefrom. Instead of being obliged to reside within limited areas, where land is expensive, and rents consequently high, the population may be spread out into districts where land is of less value, and where each house may stand detached from its neighbors. This spread of population over a larger area is also a great advantage to the street railways; for, when people lived within limited urban areas the majority of them were able to walk to and from their work, but now the railways obtain a steady patronage from those who desire to live outside of the heart of the cities beyond walking distance, and must therefore use the railway cars at least twice in each day. Another class which benefits greatly by rapid street car service is the land owner, who finds his fields commanding prices greatly in excess of any which could be obtained for them for agricultural purposes.

As time went on, these suburban street railways were extended; lines starting from different centers of population were connected, and in this way the interurban lines were created. These lines, giving frequent and rapid service between the cities and towns, hold a position in the transportation of passengers similar to, but yet different from, that of the steam railroads. They operate single cars at frequent intervals, making stops at any point at which a passenger wishes to get off or on, and serve more conveniently those people living along the main highways in which such cars are run than do the cars of the steam railroads. On the other hand, the speed being less than that of the steam

railroad and the number of stops very much greater, the time consumed in the journey is often excessive; and a natural limitation is placed on the use of street railways by those whose time is more valuable than the increased convenience due to ready accessibility.

On the street railways the rates of fare are generally lower than on the steam roads for the same distance, since street railway rates are not, as a rule, governed by the distance run. In the case of suburban and interurban lines rates are often established merely by the town boundaries—a plan resting on a wholly illogical basis. It may in general be said of street railways that their rates of fare provide for a long ride for a small cost and a short ride at a relatively high cost, while the practice of steam railroads is governed by the distance travelled.

It is undoubtedly true that any passenger carried the full distance allowed by a street railway for a 5-cent fare is always carried at less than the actual cost to the road, the profit coming from those passengers who use the street cars as a luxury for a short ride, or from those to whom the saving in time in a short ride as compared with walking amounts to more than the sum paid.

Street railway fares in Europe are, on the contrary, based on the theory of the steam railroads, and the rate is governed by the distance traveled. This fundamental difference between the basis on which fares are established prevents any practical comparison between European and American rates, and all such comparisons are of extremely doubtful utility.

The employment of electrically driven cars in the suburban and rural districts, running at high rates of speed upon country roads, has presented an entirely new set of problems for the consideration of the officers of the towns; and it will be generally admitted that they have not always proved themselves capable of dealing with these questions to the advantage of all. Sometimes, in their eagerness to obtain a railway within the limits of the town, grants of locations in the public highways have been given entirely without adequate protection to the interests of the town, the officials thinking only of the benefits to be derived by the people from being placed in close communication with some neighboring town or city. Later they see their mistake, and try to make up for the error by imposing extra requirements when ever locations for extensions are desired. These new requirements may place burdens on the roads greater than fairness should demand; but when a road is already established in a portion of the town, it must make its extensions or see some syndicate build competing lines into its territory and divide the business. The original road is therefore unable to resist demands which are unjust, but which impose light burdens as compared with those imposed by the entrance of a rival, who could jeopardize the whole capital originally invested in good faith. Moreover, the increase in the business of manufacturing electric appliances and the advance in new inventions have, in these 10 years of electric railway operation, so reduced the cost of all forms of apparatus that a road may now be built and equipped for very much less than the cost of a road built only seven or eight years ago; and a new road can afford to offer greater inducements to the town than is the case with a road which, as a pioneer in the development of the industry, has as a part of its capital the cost of the experiments which have led to this marked diminution in the cost of all material. The older road, burdened with a greater capital charge, has not been able to charge off from earnings for depreciation amounts equal to the reduction in value of its equipment due to wear and tear and to reduction in cost. Most roads have attempted to charge off something, but as a rule the amount is insufficient to properly cover the depreciation.

Still worse handicapped is the road which is changed from horse to electric power. The entire plant of the horse railway has

been wiped out, leaving only the real estate and the right to use the streets. Horses, cars, tracks, buildings, in short, everything has had to be sold as old material, and be replaced with new equipment. Expensive machinery has been installed in power houses, new and heavier rails have been laid and wires and poles erected over the entire system. In the cities the demand for the removal of overhead wires has compelled in many cases the building of expensive underground conduits, through which the feeder wires must be taken. The capital represented by the abandoned horse railway system cannot be charged off all at once, and the road must drag along, writing off little by little this depreciation.

It is essential to success that low fares be charged for long rides, and this policy, demanded by the public, forbids the accumulation of any large amount of surplus which might be used for depreciation. The general condition of affairs to-day in this commonwealth and in most of the other states is this—that, apart from the roads located in the larger cities, very few street railways are making a fair return to the stockholders, and writing off anything approaching the proper amount of depreciation; in other words, the public shares with the investor the advantages of the introduction of the improved system.

Much of the friction existing between municipalities and street railways arises from the fact that the authorities in cities and towns learn that other places possibly near neighbors, have obtained more favorable conditions from the railway than they themselves; and in our modern interurban systems it often happens that grants made by different towns to the same road vary in the most essential conditions.

The law of this commonwealth allows boards of aldermen and selectmen to impose restrictions on grants of location; and this word restrictions has been very generally construed to mean conditions, and these officers have imposed conditions and compelled agreements which have in many cases exceeded the powers of the city and town, but, as others are always ready to take the grant if refused, the municipal authorities have remained unchallenged on this point. If the general law had defined accurately what class of restrictions might be imposed by the local authorities, much trouble would have been avoided.

So also with the power of revocation. It probably would never be used harshly by the local authorities to force any railway to remove rails which were serving the public; but since, recently, syndicates and promoters have stood ready to intimate to municipal officers the great benefits that might accrue to the towns if the grant in some particular street or highway should be taken from a road now in operation and the same location re-granted to a new road, the danger to capital and also to the public becomes great, and the arbitrary power of revocation probably needs restraint.

In this country these franchises, or rights to use the public ways, have been granted with great liberality; and, while this system has led to chaos in the legal relations existing between municipal corporations and street railways, this very freedom has led to an unprecedented technical development. In Europe the careful study of the problem, and the rigid restrictions imposed on railways desiring to use the streets, have led to very well defined legal relations, but have restricted technical development to such a degree that it may be said that there scarcely exists in any European country a street railway which approaches in its technical and commercial methods those of an ordinary American city. In England the general law relating to tramways has imposed such burdens that no company has felt justified in making proper extensions; and we find the development of the street railways in London and in the larger provincial cities behind that of cities in the United States with populations far smaller than those of these great towns.

On the continent the matter of grants of location rests on yet another basis. It stands purely on a formal contract, concluded between the municipality and individuals or a company. These continental contracts are invariably for a limited term of years; contain elaborate provisions as to all the details of building and operating the road; provide, so far as is possible, for all conditions which exist, or for contingencies which may hereafter arise; and usually include a clause by which, at the expiration of a given term of years, the entire property of the company be-

comes the property of the city, sometimes free of cost, but always under conditions explicitly laid down in the contract itself.

#### LOCATIONS IN PUBLIC HIGHWAYS.

The right to use the public highways for the construction and maintenance of the tracks of a street railway company is commonly spoken of as the franchise of the company. In strict legal phraseology this is not a correct name for the kind of grant which these companies receive from municipalities to enable them to carry on their business. The franchise of a company is the right which it obtains from the legislature to be a company, and, speaking accurately, these municipal grants are merely licenses to use the surface of the highways, granted by the municipalities and the authority conferred on them by the specific action of the legislature.

The use of the term franchise is now so generally understood to cover these municipal licenses that it will in this section be used in the limited and narrow sense of a grant from a municipality.

This permission to use the streets may be, and sometimes is, given directly by the legislature to a company, not through the intermediary of a municipal corporation. In this country a few of the states have required the organization of all street railway companies by special acts of the legislature, and in such cases it was formerly customary to include the grant of the use of the streets. This was the case in California, in Delaware, in Connecticut, in Maine, in North Carolina, in Oregon and in Vermont. In Connecticut and in Vermont the law has now been amended so that the plans submitted by the railways must be approved by the local authorities, and from this decision an appeal may be taken to the courts, or to the Board of Railroad Commissioners. In California local authorities must now sell the franchise by public auction. In Delaware all companies must be incorporated by special charters, and the local authorities are, in some cases, given a slight degree of control over the streets. In Oregon variations are to be found in the charters of the cities, some of which have power to control their streets, while others have never received the requisite authority from the legislature.

These grants of power made directly by the legislature have sometimes been for an indefinite period, and have not contained any reservation of the power to amend or alter the conditions. Few street railway charters exist in this form, since nearly all have been granted since 1850; and the principle of the Dartmouth College case—that a charter is a contract beyond the power of the legislature to amend, unless such power has been reserved by the terms of the original grant—has been recognized so universally that it may be said that in practically every case the power to amend, annul or repeal at the will of the legislature has been inserted in the charters. A more common practice than that of granting charters to companies of any kind for unlimited terms, reserving the power to amend or repeal, has been their creation for a term of years. In the newer states, whose constitutions are elaborate in form, containing many provisions relating to matters which in the days of the earlier constitutions were considered to be proper subjects for statutory legislation, not for the constitution, this limitation as to time is found in the constitutions.

The length of time for which a charter may be granted varies greatly in different states, and runs from 20 to 99 years. Even in those cases where the life of the charter is limited, either by constitutional provision or by statute, the power to amend or repeal is almost invariably retained by the insertion of a special clause reserving this power to the state.

Far more numerous, however, are those cases in which the legislature, instead of directly exerting its powers of control over highways, has delegated these powers to the local authorities; and either in the charters incorporating the municipalities or in the charters incorporating the street railway companies, power has been given to the local authorities to grant or withhold their consent to the use of the streets for the purpose of laying tracks. In some of the more modern constitutions this power of regulation has been granted to the local authorities by the constitution.

The grant by the local authorities may be for an indefinite period, and their power may be confined simply to refusal or consent. In such cases as, for example, in Connecticut, power is given to the

railway to appeal from the decision of the local authorities to the courts; but in the great majority of the states these franchises are granted by the municipal authorities for a term of years, the maximum term being sometimes fixed by statute and sometimes by the municipal charter. The tendency seems to be towards grants for short terms wherever such limitations are fixed.

Wyoming has restricted the powers of the cities to granting locations for a length of time not greater than 10 years. In other states the terms vary up to a maximum of 99 years.

The table shows the maximum periods for which such franchises may be granted in the several states. Except in cases where the statute makes the time during which the grant in the streets may be made less than the life of the company, these periods show the limit of the charter:

#### Maximum Terms of Franchises.

Alabama	25 years.	Nebraska <sup>1</sup>	no limit.
Arkansas	no limit.	Nevada	no limit.
Arizona	50 years.	New Hampshire	no limit.
California <sup>1</sup>	50 years.	New Jersey	no limit.
Colorado, <sup>2</sup>	25 years.	New Mexico	50 years.
Connecticut	no limit.	New York <sup>3</sup>	no limit.
Delaware	no limit.	North Carolina	60 years.
District of Columbia	no limit.	North Dakota	no limit.
Florida	no limit.	Ohio <sup>7</sup>	25 years.
Georgia <sup>2</sup>	30 years.	Oklahoma	20 years.
Illinois	50 years.	Oregon <sup>8</sup>	no limit.
Indiana	25 years.	Pennsylvania	no limit.
Iowa	25 years.	Rhode Island <sup>9</sup>	no limit.
Kansas	20 years.	South Carolina	no limit.
Kentucky	50 years.	South Dakota	20 years.
Louisiana	99 years.	Tennessee	no limit.
Maine	no limit.	Texas <sup>10</sup>	50 years.
Maryland	40 years.	Utah	50 years.
Massachusetts	no limit.	Vermont	no limit.
Michigan	30 years.	Virginia	no limit.
Minnesota	50 years.	Washington	50 years.
Mississippi	99 years.	West Virginia	50 years.
Missouri <sup>4</sup>	50 years.	Wisconsin	no limit.
Montana	20 years.	Wyoming	10 years.

<sup>1</sup> Sacramento is limited by the city charter to granting a twenty-five year term.

<sup>2</sup> Denver is limited to making a grant for twenty years.

<sup>3</sup> Special charters are often granted for fifty years.

<sup>4</sup> Unless specified in the charter, may only be for twenty years.

<sup>5</sup> Omaha has an exclusive grant for fifty years.

<sup>6</sup> The Greater New York charter limits such grants to twenty-five years, and allows a renewal for twenty-five years more.

<sup>7</sup> An extension is allowed for fifty years.

<sup>8</sup> Some city charters provide for a limitation.

<sup>9</sup> May be made exclusive for a term of twenty-five years.

<sup>10</sup> If not specified in the charter, granted for twenty years only.

In Louisiana an agreement may be made either by a notarial contract or by ordinance; and if this ordinance has been accepted by a company, it becomes a valid contract, and may not be interfered with.

It must be understood that in very many cases the municipal authorities have assumed the power, even when not specifically granted, to limit the duration of franchises in the streets to shorter terms than those expressed in the above tabulation. In Massachusetts a form of grant exists which allows revocation at the will of the local authorities.

Some municipalities have incorporated provisions in their grants, the violation of which void the franchise; and in nearly every state, either by general statutory provision or by conditions inserted in the grant from the local authorities, it is provided that the disuse of a track for a period of time, varying from three months to a year, annuls the right to maintain the track in that street, and it may be ordered immediately removed at the expense of the company. There is often a provision that, if work is not begun within a certain time after the grant has been made, the permission becomes null and void. This clause, which has been introduced in several states, is for the purpose of preventing companies from obtaining charters under which they never intend to build, but merely desire to hold rights in the streets for the purposes of sale to some other company.

In many states the consent of a majority of the abutters, either in front feet or in value, along the line of the proposed railway is requisite before the municipal authorities can grant permission to lay the tracks.

In Illinois and South Dakota this statute takes a somewhat different form from that in other states. In these states the consent must be in the form of a petition addressed to the municipal authorities, asking that a company be allowed to lay a railway through that street.

In the other states it is a consent on the part of the proprietors, given in writing. Those states in which such provisions exist in the statutes are Colorado, Kansas, New Jersey, New York, Nebraska and New Mexico.

The general plan under which an American street railway company obtains its corporate existence and its franchise in the streets is as follows: A number of persons meet together and organize a company, which then takes steps to obtain its charter. This charter is obtained from the state, either under the provisions of a general law which authorizes some state official to issue a charter when certain preliminary steps in the organization have been taken, or under a special act of the legislature. When the charter has been obtained the company is legally complete, and may elect its officers, pay in its capital, build its road, and do business under its corporate franchise; but before the road is built and operated the company must obtain its municipal franchise, and this grant fixing the conditions for the use of the streets must as a rule be accepted in writing by the company. This permission, which is usually granted in a city by the board of aldermen, is often carefully drawn up, and as a rule contains many conditions. The municipality has been given the right to regulate the use of the streets, and this right it exerts to the fullest degree; many times restrictions are inserted beyond the power of the road to fulfil. The promoters of the road are in most cases ready to accept almost any condition in order to get the chance to build, relying upon the probability of finding purchasers for their shares and bonds, and planning to get their profit out of this transaction rather than from the operation of the road. In this way much of the surplus capital found in some of our roads has been brought in; it was issued merely to enable a profit to be made by the original promoters, not to represent the cost of the road. Examples may be found where the total cost of the plant is represented by the bonds issued, and the stock stands for nothing.

In Massachusetts there has been for some years a strict supervision in regard to the issue of shares and bonds, and restrictions often considered burdensome by promoters have been imposed by the Commonwealth. Capital may now only be issued by permission of the Board of Railroad Commissioners, and must not exceed the amount of the actual property of the road. If a floating debt has been created, this must be represented by property before stock or bonds may be issued to pay off the debt. The Board has established a uniform system of accounts, and has power to compel the roads to conform to this.

The municipalities in making their grant have often inserted a great variety of conditions, but these, being in a large measure indirect forms of taxation, will be considered under that head.

The above briefly summarizes the methods employed in the United States; but in Europe entirely different methods exist, and these may be divided into two groups, that of contract and that of municipal ownership. In continental countries roads almost invariably have their rights established by the terms of a definite contract between the municipality and the company, and in England, and to a slight extent on the continent, may be found municipalities which have built or purchased the street railways within their limits.

Considering first those roads established under definite contract, we find very elaborate agreements existing, under which the rights and powers of each party are set forth explicitly. In Germany, where the system of contract is universal, these contracts or concessions enter not only into the question of the legal relations of the roads and the municipalities, and define carefully the interests of each in the surface of the streets, but prescribe, often at great length, all the details of the management of the road, specify the number of trips to be run, the rates to be charged for fares, the hours of labor, the dimensions of the cars, and even the kind of uniforms to be worn by the employees. These contracts are always drawn for a fixed term; and one point which is given especial attention concerns the condition of affairs at the expiration of the contract—a subject upon which

almost all of the limited franchises granted in the United States are absolutely silent. These European concessions specify the amount to be set aside for the amortization and redemption of capital, specify what shall be done in the way of repairs and maintenance, declare what extensions, usually naming the streets, shall be built from year to year, and provide at the expiration of the concession either for the free transfer to the municipality of all the property of the company, or else provide specifically the conditions and the valuation at which the municipality may buy the plant. As a rule, provision is made for the amortization or repayment of the larger part of the share capital, so that at the termination of the concession the stockholders may receive from the sinking fund thus established and from the payments made by the city for the road, the full amount originally invested.

Competition between the firms supplying electric machinery has become, especially in Germany, very sharp, and in their eagerness to obtain contracts for equipments these companies engage in very bitter competition among themselves. Conditions are imposed by the municipalities which are extremely burdensome, and which in many cases will restrict the earning power of the road to such a degree as will make it almost impossible for any considerable amount of profit to be realized by operating the railways; but, in order to take the contract for the equipment of the road away from some business rival, these conditions are accepted, because the contractors do not intend to hold the stock of the company, but to place it on the market as soon as possible.

This competition does not affect the earnings of the manufacturing companies, as the reduction in the price of machinery brought about by competition does in this country, but affects the stockholder who may acquire his stock after the road is built.

The manner of starting a street railway company in a German city follows:

For the formation of a company it is only necessary for a group of persons to associate themselves, and after the adoption of by-laws register the company and its by-laws with a government officer. Such a company or an individual must then obtain permission to use the streets, and on this point the law varies somewhat in different parts of the empire. In Prussia it is governed by the general Prussian statute; in Saxony, by the Saxon code; in Baden, in the Pfalz, in the Rhine Provinces and Rhenish Masses by the French code (Code Napoleon); and in the remainder of Germany by the common law, which is based on Roman law; but, in general, permission to use the streets must be obtained from the local authorities, who by law are the owners of the streets.

It is contrary to both the Imperial code and the codes of the different states to allow the formation of companies by special charters. The police authorities must first approve the permission to use the streets, and this permission suffices if the cars are to be drawn by horses; but in the event of the use of mechanical power of any kind, the state railroad authorities must act with the police authorities. After this approval has been obtained, the consent of the authorities in control of the streets must be had.

All details in relation to the operation of the road, so far as they concern public safety and health, are in the hands of the police, who also, under the terms of the concessions, have the power to see that the contract requirements are lived up to by the road.

The present development of the street railway system in Germany has led the principal cities which now have street railways to desire the conversion of horse traction into electric traction, and many smaller places which have never possessed a street railway have decided that they would like to have one within their boundaries. Under these conditions they let it be known that such a change is desired, and negotiations are begun with some manufacturing firm to build and equip an electric road. After a great many provisional contracts have been submitted, an agreement is finally reached, embodying the conditions agreed upon. The manufacturing company then enters into an agreement with some great banking house, which undertakes to finance the enterprise. A stock company is formed, the stock sold to investors, and the bank and the manufacturers are so and out of any interest in the company, and both have made their profit—one from the machinery it furnishes, the other from its commissions for placing the stock.

In France the construction of street railways is governed by the law of June 11, 1880, which allows the building of railways with the consent of the local authorities in the towns; or, in the case of the national and departmental roads, with that of the state or department.

France has a very elaborate system of public ways, maintained partly by the towns, partly by the departments and partly by the general government. The main thoroughfares of travel between the large places are known as national roads, and are built and maintained by the general government; the roads connecting the principal places in a department are known as departmental roads, and are maintained by the departments. Between the smaller places, and acting as feeders to the national and departmental roads, there exists a system known as vicinal roads, and these are supported by the communes, with aid from the general government.

The law has annexed to it a type of contract, and all contracts must, so far as practicable, conform to this type, and the operation of the railway must be governed by the terms of this contract.

By later decrees of the Council of State very elaborate conditions are laid down as to the methods of construction and operation of railways, and powers are given to the police for their regulation.

In the concessions a provision is always inserted allowing the government to purchase the rights of the concessionaire at any time, and the conditions are laid down under which this purchase may be completed.

All contracts must be completed by the Minister of Public Works.

In Belgium, street railways are governed by the law of July 9, 1875, which in its essential features is the same as the French law of 1880, and contains the same provisions relating to the different classes of roads.

In Holland, the general law of 1887 permits the making of concessions by the local authorities, and requires their approval by the provincial authorities.

In Italy, the law of Dec. 27, 1896, relative to the introduction of mechanical traction on street railways, provides for the making of contracts for a period not longer than sixty years, and in general follows the same lines as that of France.

In England, street railways are established under the terms of the tramways act of 1870, the principal provisions of which are:

A provisional order may be obtained from the Board of Trade,\* either by a local authority or by a company, and this provisional order may cover more than one district. If the consent of the districts within which two-thirds of the length of the line is located has been given, the Board of Trade may make an order covering all the districts, although some may have refused their consent.

Provisions are made for the position of the road in the street and for the rate of tolls to be charged. This provisional order must be confirmed by an act of Parliament within two years. The Board of Trade is given authority to revoke, amend, extend or vary the provisional order, and this action must have the same confirmation by Parliament.

The work must be begun within one year and completed within two years, or the powers given will lapse, but the Board of Trade may extend the time. In the event of a lapse, whatever road has been built is to be regarded as a tramway. A tramway built by a local authority may be leased for operation, or it may be left open for the use of the public and tolls may be collected for this use, but no local authority can be authorized by anything except a special act of Parliament to operate a tramway. A lease made by a local authority which has built a road shall not be made for a longer term than twenty-one years, and non-use of the tracks for three months breaks any lease made under this authority.

\*The Board of Trade in England exercises general supervision over all the public service corporations, and consists of a president, who is generally a member of the cabinet, a parliamentary secretary and a permanent secretary, besides five assistant secretaries, each of whom has charge of some especial department. The Board has a very wide jurisdiction over commercial, marine and transportation matters.

Clauses are to be inserted in the provisional order in relation to the gage of the track, the manner of construction, the authority to open the highway, the repair and maintenance of the space between the tracks and 18 in. on each side; and this work, if not properly done, may be done by the highway authorities and charged to the company. Provisions are made for the protection of underground work in the streets, and authority is given to the owners of this underground work to interfere with the operation of the tramway for the purpose of repairs. Notice must, however, be given to the tramway company of such intended repairs, and any extra expense due to the location of the tramway in the streets must be paid by the tramway company.

Carriages with flanged wheels may be used, and those of the company or the lessee shall be the only carriages with flanged wheels which may use the tracks, unless specially provided for. These carriages must not extend more than 11 in. beyond the wheels.

After the tramway has been open for three years, 20 rate payers or the local authorities may petition the Board of Trade, stating that the public are deprived of the full benefit of the road, and, after a hearing, the Board of Trade may grant licenses to others to use the tracks with carriages approved by the Board under these conditions:

(1) The license shall be for not less than one nor more than three years, renewable by the Board. (2) The license shall be to use the whole or part of the tramway. (3) The license shall direct the number of carriages to be run, the mode and times. (4) The license shall specify the tolls to be paid for the use of the tramway. (5) The license shall allow one person to be authorized by the promoters to ride free on each car. (6) The Board of Trade may at any time revoke, alter or modify a license, for good cause shown.

If a tramway be disused for three months, the tracks may be ordered removed at the cost of the company.

If a company becomes insolvent, the Board of Trade may order the removal of the tracks, unless the same are bought by the local authorities.

Provision is made for a compulsory sale to the local authorities at the expiration of a period of 21 years from the time of opening the road; and if no advantage is taken of the option at that time, no further action can be taken for seven years. The action of the local authorities must be by a majority vote in a meeting at which two-thirds of the total number of members are present, and one month's notice must have been given of the intention to purchase the road.

With the consent of the Board of Trade, a sale of the road may be made by agreement at any time after six months from the opening of the road for operation.

Under these clauses several municipalities have acquired the ownership of the roads within their limits by purchase, while others have built roads under the authority given in the first part of the act.

The local authorities may make by-laws to regulate the rate of speed, the distance apart of the cars, the stopping of the cars, and the traffic on the road where the tramway is laid; and the company may make regulations, by by-laws, in relation to nuisances, and these by-laws may impose penalties, but must have the approval of the Board of Trade.

Penalties are laid down in the general law for obstruction to the laying out of the tramway, for obstruction to the operation of the road and for evasion of fare.

Power is reserved to the local authorities to widen and alter roads in which tramways are laid, and the public is given full right to use the tracks with carriages without flanged wheels.

The local police are authorized to regulate the traffic.

The section of the act which provides that at the expiration of 21 years from the date of a road's beginning operation the local authorities may compel the sale to themselves of the plant of the company, contains these words: "upon terms of paying the then value (exclusive of any allowance for past or future profits of the undertaking, or any compensation for compulsory sale, or other consideration whatsoever) of the tramway, and all lands, buildings, works, materials and plant of the promoters suitable to and used by them for the purposes of their undertaking within such district, such value to be in case of difference determined by an

engineer or other fit person nominated by the Board of Trade on the application of either party."

The interpretation of this purchase clause has been submitted to judicial determination by the highest court under the following circumstances: The London County Council gave notice to the London Street Tramways Company of an intention to acquire its road, and an arbitrator was appointed, who, in his findings, determined that this clause meant the replaceable value of the tracks and property of the company, less a proper charge for depreciation. The company maintained that its property should be treated as that of a going concern, and should be valued at what it was worth for the purposes of rental, and appealed the case.

The decision of the arbitrator was revised and remanded by the Divisional Court of the Queen's Bench, but the Queen's Bench Appeal Court, on the appeal of the County Council, sustained the arbitrator. (Law Reports (1894), 2 Q. B., 189.)

About the same time the city of Edinburgh desired to take over the tramways in that city, and these two cases were taken to the House of Lords for the determination of the meaning of the words used in this section. (Edinburgh:—Law Reports (1894), A. C., 456; London:—Law Reports (1894), A. C., 489.)

The decision of the House of Lords, one justice dissenting, is given mainly on the grounds that the words "exclusive of any allowance for past or future profits" preclude the consideration of the question of rental value, since rental value can only be determined from the amount of the profits, and, as profits from their very nature must be the result of past operations, there cannot therefore be any such thing as present profits. The court, however, considers that the intention of the act is plainly to consider the value of the tracks in their place in the street and as adapted for the purposes of the road—not merely as old material.

Since this decision was rendered another case has been passed upon by the lower courts, and on this appeal to the House of Lords is now pending.

Municipal ownership of tracks may, as provided in the tramways act of 1870, exist without municipal operation; and such is the present condition in many English cities. In London the County Council, after acquiring the tracks and fixed property of the London Street Tramways Company and the North Metropolitan Company, has leased both to the latter company.

A portion of the line of the London Street Tramways Company was acquired by the County Council in 1895, and was leased back to that company at a fixed rental. A proposition was afterwards made by the North Metropolitan Company to sell its tracks within the county to the County Council, and to take a lease of the whole, both of its original tracks and those of the London Company, for 21 years, for a fixed rental of £45,000 a year, and 5 per cent of the increase in gross receipts from the existing lines of the two companies, both within and outside the county, over the gross receipts for the year 1895. This proposal was not accepted, but eventually a lease was made for 14 years, at £45,000 fixed rent, and 12½ per cent of the increase in gross receipts.

Any extensions were to be built by the County Council, and the company was to operate these and pay 6½ per cent on the outlay of fresh capital.

An agreement was also made that the County Council should purchase the buildings, and lease them to the company, the Council to receive as rent 5 per cent on the cost to it of those on freehold land and 6 per cent of those on leasehold land, the Council paying the ground rent.

If a new system of traction should be introduced, the company is required to make, at its own expense, a trial on one mile to be selected by the Council, and if the experiment prove successful the initial cost will be repaid to the company. When such a system has been fully adopted, the County Council is to receive the fixed rent, £45,000, 6½ per cent on the outlay of fresh capital made by it, and four-fifths of any additional profits earned after the shareholders shall have received 5 per cent on their then capital.

Liverpool has just taken possession of its road, the tracks of which were owned by the city; and Manchester is now before Parliament asking authority to operate its cars, the tracks there, as in Liverpool, having been the property of the city. Glasgow,

Sheffield, Nottingham, Leeds and Huddersfield are some of the larger places which operate their street railways, but power to do this has been especially conferred on them by act of Parliament. Birmingham and Bradford are two of the larger towns where the tracks are owned by the city, but are operated by a company.

## THE HOUSTON STRIKE.

On March 15th all employes of the Houston Electric Railway went out and the road was practically tied up until April 1st, when the trouble was settled. The strike is one more evidence of the mischief which the professional agitator works to employes and company alike; and also that an agreement with the Amalgamated Association is expected to be kept in good faith by the street railway but can be violated at will by the union.

On July 5, 1897, a strike arose over the discharge of three men, the outcome of which was the reinstatement of the men (as to the merits of which we are not informed); and an agreement to recognize the union and give preference to union men in hiring; to submit to arbitration any disagreement; and that the contract and wage scale should remain in force for one year.

The present demand was for a reduction of 25 per cent in the working hours with an increase of 33 1-3 per cent in pay per hour and that the manager cause all the employes of the road not already in the union to become such or suffer discharge; and a few other unimportant items. H. F. McGregor, vice-president and general manager, replied that the existing contract had been kept in good faith by the company, that no complaint was made of its violation by the company and that the contract still had four months to run. That to meet its interest and operating charges alone requires an income of \$21.80 per car per day, whereas the earnings in 1897, were only \$18.17 per car per day, which had made a deficit last year of \$35,000. That the earnings of 1897 were \$30,000 less than three years ago, and special paving assessments and judgments aggregating \$75,000 were still unpaid, and \$50,000 more was required for absolutely necessary renewals, and \$50,000 for extensions demanded by the citizens.

Four days later the men went out and on failure to return within time set by the company, their places were declared vacant and new men hired. On March 19th an attempt was made to start the cars with some new men; hostile demonstrations ensued. Rails were soaped, hose pipe and other obstructions laid across the track and the new men violently attacked. H. C. Chase, secretary of the company, took one car and as it left the power house he was struck on the head with a brick and the carriage in which he was carried to the hospital was stoned. He was laid up two weeks but has now recovered.

With great difficulty and under police protection, cots, bedding and food were taken to the new men who camped in the power house. During the following week ineffectual attempts were made to resume service, Superintendent Eels and ex-Superintendent Mundes acting as motormen. On March 27 a resolute effort was made to open the road and cars containing women passengers were stoned. The mayor called for the militia which was obliged to charge the mob with fixed bayonets before it could be dispersed. In the afternoon the Houston Cavalry was ordered out in order to return the cars to the barn. By the 29th 62 men had been

employed, including some of the strikers who returned to work, and a fair service was maintained.

On March 30 the strike was settled upon the following conditions which had been offered several days before by General Manager McGregor.

"That company take back as many former employes as possible. The 49 new men shall be placed on regular run list commencing at foot and going upward until all are placed, then all vacant positions above them shall be assigned to the old men in order of rank. Balance of old men shall be placed on extra list as eligibles and advanced in regular order under the rules.

"That three additional cars will be run during this summer that will give regular runs to nine men; but it is understood that engineers, shop men and track men are to be returned to their old positions.

"That scale of wages be scheduled at 13 cents per hour for the first six months; 15½ cents per hour for one year thereafter; 16 cents per hour thereafter up to three years; from three to five years 16½ cents per hour. After five years' actual service 17 cents per hour with shorter schedules where practicable.

"The rate is offered with notice to the public that the company shall ask equitable relief from the next legislature to meet the conditions under which we operate and the changed conditions relative to paying assessments generally, under the recent decisions of the courts. That all employes who desire to work nine hours where conditions permit may do so at established rates per hour.

"That the company recognizes the individual rights of applicants to be free from coercion. Company will not exercise paternal direction over their personal affairs nor discriminate against union men in soliciting employes. That all regular employes receive free transportation over lines of the company.

"That company will not discharge men for belonging to a union and on allegation of so doing the question will be submitted to arbitration, the committee to be chosen, one man by the company and one man by employes and one chosen by these other two.

"That company will maintain schedule of wages for one year at least, and observe propositions as recited."

Prior to the strike the rate of wages at Houston was 15 cents per hour after six months service. Following is table of wages and working hours in other prominent southern cities.

City—	Population.	Rate per hour.	Hours.
Baltimore . . . . .	434,439	15	....
New Orleans . . . . .	242,039	14	12
Washington . . . . .	230,392	16¾	11
Louisville . . . . .	161,129	12½-16½	....
Nashville . . . . .	76,168	12	12
Atlanta . . . . .	66,533	12	12
Memphis . . . . .	64,495	14	12
Charleston . . . . .	54,955	*12	12
		**12½	
Mobile . . . . .	31,076	12½	12
Birmingham . . . . .	26,178	**13	10-15
		*15	10-15

\*Conductors. \*\*Motormen.

## STREET CARS NOT FOR CRIMINALS.

It has been the custom of the city, county and government officials in Scranton, Pa., to take their prisoners to the jail or courts in the street cars. The United States marshal and his deputies commenced to transport whole carloads of prisoners whenever occasion demanded. The patrons of the street cars strenuously objected to rubbing up against vagabonds, robbers and counterfeiters. In consequence General Manager Silliman has issued an order that under no circumstances should a conductor receive a prisoner as a passenger.

## CARS FOR MONTE CARLO.

The accompanying illustrations show exterior and interior views of a number of cars recently built by the J. G. Brill Company for Monte Carlo. They are in many respects unique and quite out of the ordinary American practice. The cars are 19 ft. 2 in. long over the end panels and

CAR FOR MONTE CARLO.

with the platforms 4 ft. 2 in. long, making them 27 ft. 6 in. over the dashers. The body is 6 ft. 1 $\frac{3}{4}$  in. wide at the sills and 6 ft. 8 $\frac{3}{4}$  in. wide over the posts. The specifications state that the car cannot exceed 6 ft. 10 $\frac{1}{4}$  in. at the widest point. This consequently makes a side with but little curvature. There are four enormous windows to a side, a feature specified by the railroad company in ordering. Short as the body is it is divided into two compartments, one for first and the other for second class passengers. Stationary cross seats accommodate 12 persons in each compartment. As will be seen from the interior view the seats on one side of the aisle are designed for two persons, while those on the other side are single. The two center seats in each com-

VIEW OF INTERIOR.

partment are arranged back to back. In the first class compartment the seats are upholstered and covered with olive plush. In the second class compartment the seats are of cherry slats with high backs. This portion of the car is very plain, but the first class compartment is highly ornamented and finely finished.

The car is mounted on No. 21E trucks. The side frames are made of solid forgings; the outer ends of the frame carry half-elliptic springs. At the axle boxes there are double journal springs as well as a pair of spirals resting on the

frame. The combined action of these springs gives a very easy riding car body as well as great steadiness of motion. The truck is 1 metre gage and 6 ft. 6 in. wheel base. It is fitted with G. E. 53 electric motors. The wheels are 33 in. in diameter, Brill pattern centers with steel tires. The car is fitted with electric brakes in addition to the ordinary hand brakes. There are two sand boxes, two gongs and two electric headlights. The windows have a cherry sash and spring roller curtains. The platforms have Brill folding gates fitted to each opening. The total height from the head of the rail is 10 ft. 9 $\frac{1}{2}$  in. The exterior of the car is finished in a dark olive green. The coat of arms of the principality appears upon the center of the window panel. Taken altogether they have a very striking appearance, and the style of finish is so superior to that of any ordinary European cars that they will attract a great deal of attention on the other side.

## ELECTRICAL EXHIBITION NOTES.

The interest taken in the Electrical and Kindred Industries Exhibition to be held at Madison Square Garden next month is by no means limited to Greater New York, and extends in every direction. Numerous comments have been made by the foreign press, and by journals in different parts of this country. One of the most striking evidences of this interest is to be found in the remarkably large accessions to its membership which the New York Electrical Society has enjoyed since the exhibition was announced under its auspices. In February the secretary announced a list of a round score of new members, and he now states that the applications for March should reach close upon 50.

A special committee of the auxiliary and educational committee has just drawn up on behalf of the Exhibition a plan whereby prizes to the value of not less than \$100 are offered to the pupils in the public and private schools in New York and its vicinity for essays on the electrical exhibition. The essays will be limited to 1,500 words, and will be accepted up to May 18th, the awards being declared and prizes presented not later than May 28th. No contestant is to be over 16 years of age.

Fred Catlin, the manager of the telegraphic tournament, has completed the preliminary arrangements for that contest, and has arranged the classes. Circulars on this subject are ready for general distribution, and there is already a great demand for information on the subjects from all parts of the country. Mr. Catlin informs the management that the entries will probably be more numerous than at any other tournament that has occurred, and thinks that some of the records will be phenomenal.

H. V. Parsell, the well-known banker of New York, who has long been interested in electric disposition work, has kindly placed in the hands of his son, H. V. Parsell, Jr., the electrical engineer, for exhibition, his marvelous collection of galvanoplastic work, done during a long series of years. It may be doubted whether any other amateur could possibly show anything approaching this remarkable collection in beauty and interest.

As showing the incinerating effects of high frequency currents the remains of the eagles illustrated in the March REVIEW will be displayed.

Chief McCullagh, the head of the police force of Greater New York, has evolved a system of communication, which

marks a new departure in the police supervision of any large community, and has promised to show it in operation.

The magnetic separation of iron ore, which Mr. Edison has been perfecting for some years past, will be shown by means of a model built for him by Sigmund Bergmann.

Colonel N. H. Heft, the electrical engineer of the N. Y., N. H. & H. Railroad Company, whose work is so widely known in connection with the successful third-rail line between Hartford and New Britain, Conn., has placed at the disposal of the management blue prints showing the construction of the track and some of the actual material used. The model track from 50 to 100 ft. long, single and double and about 5 in. gage, is now being constructed on Col. Heft's plans, and will be shown in operation during the continuance of the show, the details of the track being imitated as closely as the conditions will allow. Over this track a train of cars will run to and fro continually showing how the current is picked up and delivered to the motor, and how the switches and signals are included in the operation.

## FENDERS IN NEW YORK.

The experience of those street railways which have used fenders on their cars appears to be that those of the basket type projecting in front of the car are the only satisfactory ones. The only objection which has been urged against this type of fenders is that they in effect lengthen the car and strike many persons who would not be touched were there no projecting fender. The accident statistics of the Metropolitan Street Railway, of New York, show that this objection is not well-founded, and that the cars can be operated in the most crowded streets without any increase in the number of accidents because of the use of projecting fenders. This company has placed another order with the Consolidated Fender Company for 350 Providence fenders, that fender having been adopted after giving the subject the most careful consideration.

## WIDE THROWING TROLLEY SPRINKLING CARS.

In most of the larger cities the street railway companies either from choice or agreement with the municipal officials, sprinkle the car tracks. In some instances the burden of sprinkling the whole width of the street has been imposed on the company. It has been found in every case that it is cheaper to purchase a tank or sprinkling car for this work rather than have it done by wagons.

The Miller-Knoblock Company, of South Bend, Ind., has designed a sprinkling car which not only waters the car tracks but sprinkles any street or avenue 100 ft. or less in width. The tank has a capacity of 2,500 gals. and is propelled by two 25-h. p. motors. A sprinkler is placed at each of the four corners of the car and they are controlled by two rocking levers. The width of spray can instantly be reduced and at the same time the mechanism permits a varying quantity of water to be discharged, so as to meet any changes in the width of the road or the speed of the car.

The pump consists of two cylinders, the inner one of gun metal; the outer is of highly tempered steel to withstand high pressures. The pump is operated by an independent differential gear electric motor entirely separate from the movement of the car. Two sprinklers of the ordinary kind are placed below the front and rear of the car for watering

the space between the tracks. This sprinkling car is a radical departure from the usual type and can easily perform a service heretofore impossible.

## A NEW ATTRACTION FOR PLEASURE RESORTS.

The street railway managers welcome any new and novel form of amusement to attract pleasure seekers of the busy cities. The latest novelty in this line for summer resorts is the Buffalo foot cycle. As seen in the cut it is a modernized

BUFFALO FOOT CYCLE.

roller skate but it is so constructed as to give a more pleasant sensation. The foot cycle has a malleable iron frame with the most approved skate clamps and the tires are of

pure rubber molded as hard as is consistent with proper resilience. An improved ankle brace can be provided which moves freely backwards and forwards, but keeps the ankle absolutely rigid sideways. In the illustrated catalog of the Buffalo Foot Cycle Company, 985-995 Ellicott square, Buffalo, N. Y., are many suggestions concerning the management of a foot cycle hall and the varied amusements it affords. Any hall or pavilion, over 25x50 ft. with a smooth floor, will be suitable but a larger one is desirable. There is little difficulty in learning and the amusement will undoubtedly attract and appeal to a very large class of patrons.

## HAZARD COMPANY WILL MAKE COPPER WIRE.

John C. Bridgeman, secretary of the Hazard Manufacturing Company, who has been making quite an extended trip through the west, advises us of an important departure on the part of his company, which is no less than an enlargement of its products by the manufacture of bare and insulated copper wire. The new buildings and machinery necessary for this work are being erected and will be completed and the new plant in operation by July 1. The long and well-known record earned by the Hazard company in its manufacture of wire ropes and cables for street railway and mining purposes is so well established that it is hardly necessary to predict the same reliable wire in copper. The company will draw its own wire, and with the experience in making steel wire, and the new facilities, will be an active factor in the copper wire field.

## MILWAUKEE-WAUKESHA LINE.

Henry C. Payne's new road to Waukesha is well under way, the grading is practically completed, the poles set, and the contracts let for the equipment. The road is 21 miles long to Waukesha, and 4 miles from Waukesha to Pewaukee. It is planned to open the road for traffic July 1. Though not definitely decided upon the cars will probably be equipped with four G. E. 1,000 motors, and a schedule of one hour, including stops, be maintained.

### MERRY-GO-ROUNDS FOR PARKS.

The manager who is seeking for a park attraction will scarcely be able to find anything that will make money easier or more quickly than a well designed "merry-go-round." When properly managed they are veritable gold mines; there is a record of one having earned \$562 in one day, and \$2,850 in a two-weeks' run at a summer resort. The illustration shows a machine which Norman & Evans, of Lockport, N. Y., are under contract to deliver to George P. Kertz, of Pittsburg, by May 10.

This machine has an undulating rotary motion, operating eight cars, designed to represent Venetian gondolas. Each car will carry 12 passengers, thus making the entire seating capacity of the machine, when fully loaded, 96 passengers. The motion combines the pleasant exercise of the well-

SWITCH BACK MERRY-GO-ROUND.

known switch back railway, with the circular motion of a merry-go-round. It is designed to afford pleasing recreation to both young and old. It is strongly and substantially built, insuring perfect safety in its operation. The decorations of the machine are highly artistic, while fine music is discoursed by a military-band organ adjusted to play continually, whether the machine is in motion or at rest.

The whole machine can be packed for transportation on a single flat car, and can be erected at its destination quickly and easily within a few hours.

Although the earning capacity is double that of the ordinary merry-go-round, the price is but little in excess of the smaller machines.

### CONSPIRACY CASE EXPOSED.

On June 15, 1895, Mrs. Jennie Reynolds claimed, in a suit for \$50,000 damages against the Chicago City Railway Company, that she had been severely injured in a collision. She was returning from Manhattan Beach with her husband and friends when two trains collided, throwing the passengers in a heap on the floor. Otherwise the consequences of the collision were not serious. As usual the accident sharks were on hand, and subsequently the company had to defend itself in a damage suit.

A case was worked up and sustained by the most reckless perjury. Mrs. Reynolds swore that in the accident she has received bruises in the abdomen which permanently prevented her from wearing corsets, necessitated several surgical operations, subjected her to fits and divers other

troubles. After the accident she went to St. Paul and lived there with one M. J. Fountain. While there she made application for a divorce and made an affidavit that she had resided in the city for one year. In the damage case she stated that she had only been in St. Paul three days and her accomplice, M. J. Fountain, swore that he had never been in that city. Furthermore, Mrs. Reynolds prevailed upon a Chicago friend, Mrs. Stapleton, to appear as a witness and to falsely swear that Mrs. Reynolds had been living in Chicago last summer.

With great energy M. B. Starring, counsel for the Chicago City Railway Company, and his assistants, collected evidence which convinced them that the case was a fraud. They determined that the reputation of Mrs. Reynolds was very bad, and in several law suits she had been guilty of perjury. They also received a written statement from her husband that these physical troubles antedated the accident.

The documents and witnesses of the defense showed conclusively that many of the sworn statements of Mrs. Reynolds and her co-conspirator Fountain were utterly false. The woman broke down under the testimony arrayed against her and made a confession in open court, admitting in detail that the whole fabric of the testimony upon which her case was based was false. Her attorney, Hiram Blaisdell, then withdrew from the case.

Judge Neely ordered the arrest of M. J. Fountain on the charge of perjury, and recommended that when the grand jury meets to consider his case it shall consider the conduct of Mrs. Reynolds. Mrs. Reynolds was able to secure bonds for her release and on April 3 disappeared. The states attorney will prosecute these cases vigorously. Mr. Starring should be congratulated on his good work in exposing such fraud and saving his company from paying a large sum for damages.

### MAIL SERVICE IN ALABAMA.

The Birmingham (Ala.) Railway & Electric Company, of which J. B. McClary is general manager, is to handle the mails between Birmingham and several towns on the Birmingham and Ensley line formerly served by the "Star route." Hereafter the cities of Ensley, Pratt City and Thomas will receive mail from Birmingham three times a day. The schedule, as arranged, will get the mail to its destination in less than an hour after it is received in Birmingham, which means a big saving of time.

### RECEIVERS FOR DIAMOND TRUCK COMPANY.

The Diamond Truck & Car Gear Company, of Kingston, N. Y., was placed in the hands of Louis B. Hasbrouck, of New York, and John E. Kraft, of Kingston, as receivers on March 25. It is understood that the company is heavily in debt, that it has been operated at a loss from the start, and that no dividends have ever been paid. The receivership resulted from suits by creditors who refused to wait longer. The concern was organized in 1895 with \$50,000 capital, afterwards increased to \$150,000. Liabilities are placed at \$34,000 and nominal assets \$92,000, of which patents are listed at \$51,000 and machinery and patterns at \$11,000. The order was made returnable July 6.

## WESTERN ELECTRIC'S LATEST FANS.

The Western Electric Company has been manufacturing fan motors for the past two years and has placed upon the market 12-in. and 16-in. desk and bracket fans, a ceiling fan and a column fan. The 12-in. fans are wound for 110 volts only; the 16-in. fans and also the ceiling fans are wound for 110, 220 and 550 volts. The desk, bracket and

BRACKET FAN.

ceiling fans are arranged for a switch that allows them to be operated at three different speeds. The ceiling fan has four blades and an attachment for incandescent lamps. The fans can be furnished without this attachment and may also be run with two blades instead of four. The switch is at the base of the motor and of easy access. The column fan is arranged with two blades and has but two speeds.

Exhaustive experiments have been made on these fan motors in order to determine the most economical angle at

DESK FAN.

which the blades should be placed and also the most advantageous size of blades to be used, and it is claimed that these fans give the greatest wind output for the least consumption of electrical energy.

The Western Electric Company has issued a very complete and attractive catalogue of 36 pages, giving in detail description of the working parts of the fan motors together with price lists and complete illustrations of all the motors manufactured by it.

## TEAPOT FARE COLLECTORS UNPOPULAR.

The American riding public uniformly rebels against the system of fare collection commonly known as the "tea pot," and it seems strange with all the excellent portable and stationary fare registers on the market that any manager should consider the use of a system at once cumbersome and undignified, and repugnant to both passengers and conductors. It has always seemed to us the opportunity of working off bad money by people so inclined, was alone sufficient to make the "tea pot" collection too expensive a proposition even if it had any advantages, which it certainly has not. We do not find one redeeming feature in this system of fare collection; collection is the word for the operation is quite similar to the passing of the hat.

The Saginaw (Mich.) "Leader" thus expresses the "grand kick going up among the traveling public" of that city. It says:

"This morning a new system went into vogue on the Union Street Railway Company and by order of the receivers the conductors were all equipped with what might be called 'a nickel-in-the-slot machine.' The machine or box is used for collecting fares and the conductor holds it out like the monkey attachment to a hand-organ holds out his hat for pennies, and the passenger is requested to drop his nickel or check in the box when the conductor will ring him up. It does away with the conductor's report, for when he comes off his run all he has got to do is to turn over the box to the office and his labor is done.

"Under no consideration is he to handle the money of any passenger. The only money which he is to handle is to make change for a passenger and the passenger must then drop his fare in the slot machine. The question is being agitated, will a passenger be obliged to not only pay but work his passage also. It is a hardship that will not be entertained for a moment by the citizens of Saginaw, and in a few days some passenger will refuse to put his nickel or check in the box but will tender it to the conductor and if he refuses to receive it will then return it to his pocket and ask the conductor to put him off the car, and then a law suit will be commenced to test the case."

## INTERURBAN ROADS IN NEW JERSEY.

On March 31, the governor of New Jersey approved the "trolley bill" which provides that the board of chosen freeholders of any county in the state may widen, straighten, change the grade or location, or otherwise improve any public railway in its control and may authorize the construction and operation of a street railway thereon, subject to the consents of the governing bodies of the municipalities through which the proposed road is to pass, and of the owners of a majority of the lineal feet of property along the highway. Franchises are to be limited to 75 years. The company applying for a location must submit a proposition specifying whether the party making the same intends to construct a single or double track street railroad, and if a single track road, the length and location of sidings and switches; the motive power to be used; the rate of fare to be charged; the amount of money to be contributed for defraying the cost of improving the public highway, as proposed by said board, and such other terms as the party making such proposition may be willing to agree to.

## PERSONAL.

John W. Burchinal has been chosen president of the three new electric railway companies incorporated at Cumberland.

F. W. Thompson, superintendent of the Muskegon Street Railway, was a REVIEW caller when in Chicago recently.

George W. Steadman, of Westerly, R. I., has been appointed superintendent of the Pawcatuck Valley Street Railway.

C. E. Lathrop, who has been manager of the Christie Steel Company, has been transferred to Wichita, Kan.

Morgan J. Sweeney has been appointed to superintend the track construction which the Scranton (Pa.) Railway Company has in hand.

J. T. Whittlesey has resigned his position as chief engineer of the Brooklyn Rapid Transit Company's system to go with the John Stephenson Company.

I. B. Walker, chief engineer of the Patton Motor Company, was married on April 6 at Sioux City, to Miss Jessie M. Leach, at the residence of the bride's parents.

Jackson I. Case, president and general manager of the Belle City Street Railway, Racine, Wis., is the new postmaster and took charge of the office on April 1.

Russell B. Harrison, president of the Terre Haute Street Railway, is also quarter-master general on the governor's staff, and has tendered his services in case of war.

J. W. Carson, president of the Sterling Manufacturing Company, New York, and William Tiffany, secretary, spent several days in Chicago, the latter part of March.

W. H. Jordan, chief repairer of the Birmingham (Ala.) Railway & Electric Company, on March 18 received a severe shock while at the top of a repair ladder and fell to the ground, fracturing his skull.

John D. Moore, who for some time has been master mechanic of the Lewiston (Me.) Bleachery & Dye Works, has accepted a position with the Walker Company in the engineering department.

F. W. McAssey, who has been secretary of the Rockford (Ill.) City Street Railway Company, has resigned and gone to Windsor, Mo., to settle the estate of his father. He is succeeded by Charles Lines.

Thos. H. McLean, who recently accepted the office of general manager of the Toledo Traction Company, arrived in that city on March 31 from the City of Mexico, and entered upon his duties the following day.

S. G. Coleman, formerly secretary of the Badger Illuminating Company, has been appointed acting superintendent of the Milwaukee Electric Railway & Light Company to succeed William Church, who has resigned.

J. Paul Baker, secretary of the Baltimore Car Wheel Company, spent several days in Chicago on the occasion of his western trip in March. His company has a large amount of work in hand, and have been working large forces for several months.

C. M. Davis, who has been connected with the Poughkeepsie City & Wappingers Falls Electric Railway Company for 21 years, resigned his position as superintendent to become a selling agent for L. J. Coburn, of the Hudson Valley branch of the New Orange Industrial Association.

H. S. Haselton has been appointed general manager of the Milwaukee & Waukesha Electric Railway, better known as General Winkler's line, the application for franchises having been made through him. Mr. Haselton has for several years been secretary of the Metropolitan Iron & Land Company.

T. Commerford Martin, editor of the "Electrical Engineer," has been appointed by the government as head of the electrical commission to the Paris exposition in 1900. The appointment is a well-deserved tribute to Mr. Martin, who has long occupied a prominent position in the field of electrical engineering.

Oscar C. G. Urban, who until March 26 was superintendent of the Middletown-Goshen Traction Company, Middletown, N. Y., was awakened early the following morning and summoned to the power house, where he found the entire force of the company assembled. He was wanted to receive a diamond stud which the employees presented to him as a token of their good will.

T. H. McLean, vice-president and general manager of the Toledo Traction Company, has made appointments as follows: John F. Collins, superintendent to succeed A. M. Hinckley, resigned; James Yates, superintendent of shops succeeding F. B. Perkins, resigned. The office of purchasing agent, held by O. E. Merrill, is abolished and that work will be assumed by the general manager.

Wm. Ring has been appointed general superintendent of the Baltimore & Northern Electric Railway Company. Mr. Ring has been identified with the electric railway business since its inception, having worked with the Daft and Van Depoele systems from 1886 to 1889. For the next two years he was superintendent of the Lancaster (Pa.) street railways, held a like position from 1891 to 1896 with the Paterson (N. J.) Central Electric Railroad Company, and then was with the Fall River (Mass.) Street Railway Company until the past month.

J. C. Brackenridge has been appointed chief engineer of the Brooklyn Rapid Transit Company's system, vice J. T. Whittlesey, resigned. The track department has been combined with the electrical engineering department, and the chief engineer will be assisted by R. P. Brown, electrical and assistant chief engineer. Mr. Brackenridge has had an extensive experience; he was with the Brooklyn and the Union elevated roads as assistant engineer in charge of foundation construction and track work from 1884 to 1889; with the Phoenix Construction Company, engaged in electrical subway work, in 1889, and with the cities of New York and Brooklyn, as assistant engineer on water works extension, from 1882 to 1892. In 1892-4 he was with the East River Bridge Company. Before his appointment to his present position Mr. Brackenridge was chief engineer of the track department of the Brooklyn Heights and the Brooklyn, Queens County & Suburban roads, and was at the same time engineer of the Associated Trolley Companies of Brooklyn.

## OBITUARY.

We learn with regret of the death of J. K. Waterman, manager of the Cape Electric Tramways, Cape Town. Mr. Waterman was but 37 years of age.

Nelson W. Perry, well known as an electrical journalist, author and engineer, died at his residence in Brooklyn on March 28. Mr. Perry was the evening before experimenting with an incandescent gas burner of his invention, the room being darkened at the time, and reaching for a glass of water took up and drank from a glass containing a solution of bichromate of potassium. The mistake was immediately discovered and remedies applied, but Mr. Perry died the following day.

A test case is to be made of the Nebraska law against officers accepting street railway passes. Capt. Henry P. Haze was arrested at Omaha on April 4 charged with this offence.

## NEW PUBLICATIONS.

The April issue of "Hartshorn's Roller" is just as attractive as the previous ones, and there is no excuse for the trade to remain ignorant of the advantages of Hartshorn's rollers when the information may be acquired from such a source.

The third annual bulletin of the Engineers' Club, of St. Louis, indicates that the society is in a very prosperous condition. With 191 members, well attended meetings and a full treasury, the future of the club is very bright. Richard McCulloch, engineer of the St. Louis, Cass Avenue and Citizens' railway companies, is the secretary.

The American Electrical Directory and Buyers' Manual for the first quarter of '98 is out, and in a very neat and convenient form presents a complete list of the electric light central stations of the country. A classified buyers' list is also given, moonlight schedules, etc.; \$4 per year, quarterly; E. L. Powers, publisher, Monadnock building, Chicago.

The latest publication from the Q & C Company, Chicago, is an illustrated supplement to Catalog C and D, describing the Q & C-Stanwood steel car steps. These steps are made in five different styles, both for open and closed cars, and are now in use on 500 railways. The self-feeding rail drill, compound lever jacks, steel brake shoe keys and portable rail and shop saws are also illustrated and described.

The revised edition of the "Electric Light Supply Catalog for 1898" has been distributed to the patrons of the Western Electric Company, of Chicago and New York. It is a well-bound book of 555 pages, with numerous cuts and complete price lists. The catalog presents a handsome appearance, being in book form and bound in cloth. The general character of the book is such that electrical men will be pleased to place it in their files.

"The Universe" is the cosmopolitan title of a new and attractive weekly published in magazine form, the first number of which bears date of March 8. It is an illustrated newspaper for "young people and busy men and women" and is specially interesting to the street railway fraternity from the reason that its publisher and editor-in-chief is E. J. Wessels, who has so long and successfully managed the Standard Air Brake Company, and who left that position to undertake this new work, which he has long had in contemplation. "The Universe" will discuss current literature, science and art, and the important events of the day. We welcome Mr. Wessels to the army of journalists, and wish for him the largest measure of success.

"A History of the Yerkes System of Street Railways in the City of Chicago" is the title of a recent publication which will be found interesting by street railway men and investors. In the introduction is a brief account of the early street railways in Chicago and their effect in promoting the growth of the city. Then follows the story of the growth of the Yerkes system; the various properties are described in detail, the articles which have appeared in the street railway papers being largely drawn upon, with the result of bringing together in convenient form the data concerning the many companies constituting the system. The book comprises 64 pages and is profusely illustrated with portraits of the men who have financed and built and managed the roads, and with views of the various power houses, etc. There is included, also, a short sketch of Mr. Yerkes' life, and more particularly his business career in Chicago.

A proof sheet of the tickets used by the Detroit, Fort Wayne & Belle Isle Street Railway Company was stolen from the printing office and a plate made from it for printing counterfeit tickets, some of which have been received by the company. Although the printing on the spurious tickets was perfect they were detected by the paper used.

## DATE OF ILLINOIS STATE ASSOCIATION MEETING.

The date for holding the first annual meeting of the Illinois Street Railway Association has been set for June 7, 8 and 9, in Chicago. It was at first intended to hold the meeting a little earlier, but this change has been made to correspond with the date of the National Electric Light Association which convenes here on the dates named. The change will be most acceptable to all, as a large number of members of the Illinois Association will desire to attend some of the sessions of the Light Association, and the further advantage of meeting the larger number in attendance will be gratifying to every one. Secretary Minary is issuing the notices for the convention and it is urged upon every street railway in the state to send at least one delegate. Local committees will plan for suitable entertainment of visitors, and no effort be spared to make the occasion as profitable and pleasant as possible. It is contemplated that all exhibits be made under one roof, and that the business sessions of the two bodies be held in separate rooms.

## MEADVILLE, PA., HAS ELECTRIC CARS.

Meadville, Pa., is an old town, the first settlement having been made 110 years ago, but it has had the blessings of electric traction only for a day. The first car was run over the lines April 7 carrying the officers of the company and a few invited friends. The car was decorated with flags and flowers and met with a hearty reception from the populace, most of whom witnessed the wonders of electricity for the first time. On April 14 the road was accepted from the contractors and opened to the public with due ceremony. A banquet was held in the evening and attended by the mayor of the city, the principal citizens and the friends of the company.

The officers of the Meadville Traction Company are: Frank R. Shyrook, president; Dr. Cyrus See, secretary; Charles Fahr, treasurer; and J. Langstaff Johnson consulting engineer.

## NEW FORM OF RHEOSTAT.

In many particulars carbon is suited for resistance but for rheostats it is difficult to maintain a lasting contact. Between the carbon and the copper, brass or other metal electrolysis results. To obviate this difficulty W. R. Garton, of the Raster Carbon Rheostat Company, has experimented and found an alloy which is free from this effect. The carbon, of special composition, is pressed in strips through a die and these are assembled in frames being alternately insulated by mica and connected by contacts of the special alloy. The rheostat occupies a very small space, the carbon resistance remains constant and will withstand very high temperatures, the contacts remain unaltered and all parts are easily repaired. Rheostats are made for 500-volt circuits and some are so proportioned that a 110 or 220-volt motor for fans and other purposes can be operated on a railway circuit.

The Union Traction Company, of Anderson, Ind., is now carrying mail between that city and Alexandria.

### MOTOR CABS FOR CHICAGO.

It has been pointed out that the conditions in Chicago are naturally favorable to the operation of mechanically propelled vehicles. There are no hills about the city and the boulevard system, with smooth roadways, extends to every part. One merchant has used motor wagons for some time for delivery purposes, but as yet there are few such vehicles for passenger service.

The Fay Livery Company has taken the initiative and will have motor cabs at the railroad stations and at the principal hotels beside providing some carriages for regular livery service. The first two vehicles will be delivered by May 1 and will appear as shown in the illustration. The one to the left is a handsome cab especially adapted for shopping and sight seeing and the one to the right is a brougham closely resembling the usual style. The panel at the back of the cab can be let down and is braced to accommodate trunks and packages.

These electric cabs have recently been designed by C. E.

MOTOR CABS OF THE FAY LIVERY COMPANY, CHICAGO.

Woods, of Chicago, and it has been his intention to not only proportion and place the mechanism to do most effective work but to make few alterations in the form and size of the cabs customarily employed. The storage batteries in the cab are over the rear axle but well forward so that the weight will be partially borne by the front axle. In the brougham the batteries are divided, part being under the cabman's seat and the others over the rear axle. The Willard battery has been adopted, each cell of which is sealed for cleanliness and to facilitate handling. For the cab two 110-volt motors, each of 1.67 h. p. but capable of running at 100 per cent overload, are geared to the two rear wheels. The controller or battery grouper makes three combinations of cell connections, giving three different voltages and running speeds. The motors may also be reversed. The controller handle, shown beside the seat, also operates a band brake which is around a wheel on each motor armature shaft. The steering head, immediately in front of the cabman's seat, is fitted with ball bearings and little difficulty will be experienced in guiding the cab in any direction.

The cabs are designed to be free from noise, the motors being encased, the wheel tires being of rubber, and the motor pinions of rawhide. The batteries can be charged from

any 110-volt lighting circuit and have a capacity such that a run of 30 miles can be made without recharging. The total weight of the cab will be 2,580 lbs., the vehicle weighing 1,350 lbs, the batteries 1,000 lbs. and the two motors 230 lbs.

### NO NEED OF CONSENT OF ABUTTING OWNERS.

March 29 an opinion was rendered in the Common Pleas Court at Cleveland, O., which is of considerable interest because of the many interurban lines in the vicinity of Cleveland. An injunction had been issued at the suit of one Schaff and others to restrain the Cleveland, Medina & Southern Electric Railway Company from laying tracks and erecting poles along certain roads.

The plaintiffs are all owners of farms along which the proposed electric railway is to extend. In their petition they complained that the company was laying tracks and erecting poles along their farms and injuring their property. Their complaint was based on the contention that

they own the land to the middle of the road, and that therefore no tracks could be built without their consent.

The case was argued before Judge Stone, who dissolved the injunction. Judge Stone held that notwithstanding the fact that farm lands extend to the center of the road, a street railway company, after having received a franchise, has the same rights to lay tracks and erect poles as it has in the city, where the lots extend only to the edge of the sidewalk.

He said that the noise of the cars, the dust which they might stir up, and other items of complaint made by the property owners were nothing more than was contemplated by the establishment of the road. The opinion handed down by Judge Stone is based on a decision rendered by the late Judge Ranney from the Supreme bench of Ohio.

An appeal was taken to the Circuit Court, which, on April 4, rendered a decision sustaining that of Judge Stone.

By a traffic agreement between the Long Island Electric Railway Company and the Brooklyn Elevated Railroad Company, entered into March 31, the trip from Park Row, New York, to all points on Long Island may now be made without change of cars.

**Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.**

A street car mail service was inaugurated at Los Angeles, Cal., on April 1.

The Chester (N. H.) & Derry Electric Railway has been awarded the contract for carrying the mail from between Chester, Derry, West Derry and East Derry.

Lovejoy & Sampson, attorneys, employed in several important suits by the Galveston (Tex.) City Railroad Company, have secured a judgment in the federal court for \$2,500 attorney's fees.

The receiver of the Peoria (Ill.) Water Company has sued in the United States Circuit Court to compel the electric railways to put in appliances which will prevent the "current from being grounded."

The Middletown-Goshen Traction Company, of Middletown, N. Y., has been reorganized and is now under the control of the new directorate. Robert Wetherill, of Chester, Pa., is the new president.

The Fox River Valley Electric Railway Company, of Appleton, Wis., is putting up a telephone line between that city and Menasha. It will parallel the track all the way and will be used for train dispatching.

The Nashville (Tenn.) Street Railway Company has built in its repair shops a handsome car. General Manager Connette has secured additional machinery for the shop which enables the building of cars of the most approved pattern.

The Springfield (Mass.) Street Railway Company is increasing the feeder capacity on its Holyoke line; the company is also substituting 10-bench open cars for its old 7-bench cars, 21 of the latter having been retired this spring.

A street railway mail service has been approved by the assistant postmaster general for Superior, Wis. The boxes will be attached to the right side of the front vestibule on the outside. The deliveries and collections will be at short intervals through the day and an excellent service is assured.

When the city of Duluth, Minn., undertook to list the franchises of corporations for taxation as personal property the Duluth Street Railway resisted and made a test case. A decision was rendered in the District Court, April 1, holding that the county auditor could not place franchises on the personal tax rolls.

The New Jersey Electric Street Railway Company has met with strong opposition in extending its line along 2nd street in Passaic, N. J. The track was laid some months ago

but the property owners prevented the planting of the poles and the stringing of the trolley wire. This work has been finished under police protection.

The Guarantors' Finance Company, of Philadelphia, which has financed a number of street railway operations, has assigned on account of financial troubles growing out of the difficulties of the People's Bank. It is said the finance company was a borrower at the bank of upwards of \$500,000 on securities now found to be of doubtful value.

The street railway at LaSalle and Peru, Ill., has long been in trouble; there are numerous judgments against the company and it is now in the hands of a receiver. In March a strike was inaugurated which was brought to an end by the sheriff attaching the company's property for the personal taxes levied on it by the two towns. The receiver claimed he had no money to pay the taxes.

There was some comment in the papers regarding a shipment of dynamite to Cuba by H. G. Williams, president, and W. S. Selwyn, general manager, of the Portsmouth (Va.) Street Railway Company. The gentlemen explained that it was a transaction with a mining firm in Havana and not with the Spanish government, as reported. In fact, the sympathies of the street railway men are entirely with the Cuban cause.

A suit has been brought against the Northeast Electric Railway Company, of Kansas City, by N. D. Williams, the complaint being that while driving he was compelled to use the railway track by the banks of snow and ice and his wagon was struck by a motor car, throwing him from his seat and inflicting serious injuries. The damages were laid at \$2,499.99, this bargain store sum being stipulated to keep the case from going from the court of appeals to the supreme court.

A year ago last November one of the cars of the Port Huron (Mich.) Electric Railway Company collided with a locomotive on the Grand Trunk Railroad and one of the passengers injured was awarded \$1,136 damages. The street railway company was insured in the Guarantors Liability & Indemnity Company but the latter refused payment of claim owing to alleged willful negligence inasmuch as the car was not brought to a full stop before reaching the crossing, as provided by the statute. Suit was brought and after hearing the evidence the judge took the case from the jury and ordered a verdict for the railway company for the full amount of the claim.

At the Electrical Exhibition in New York there will be a competitive exhibit of designs and models made by amateurs. There are to be six classes, each having prizes offered not to exceed \$50, and bronze medals. These classes include models or machines made by minors, instruments of precision, as galvanometers, etc., the practical application of electricity to communication, the application of electrical appliances to domestic service, working drawing of electrical installation, made by a student of an educational institution, and the design of an instrument, made by an instructor, illustrating some electrical law. Further particulars may be obtained from the management, 15 Cortlandt street.

## ECHOES FROM THE TRADE

Elmer P. Morris, of New York, will have 500 sq. ft. of space at the Electrical Exhibit in May and will show a full line of electric railway material.

J. S. Monroe, 1005 Neave building, Cincinnati, has been appointed agent for the R. D. Nuttall Company in the place of Charles A. Cavagua, resigned.

The Siemens & Halske Electric Company, of Chicago, is now making an inclosed arc lamp which is of ingenious design, compact and the shortest on the market.

The Case Manufacturing Company, of Columbus, O., is doing an excellent export business in cranes and hoisting machinery. A shipment of two cranes has just been made to Sydney, Australia.

Business with J. A. Fay & Egan Company, of Cincinnati, Ohio, has increased to such an extent as to justify it in voluntarily increasing the wages of its employes 10 per cent, the raise going into effect on March 21.

The Peckham Truck Company reports that it now has more work on hand than at any time since it has been in the business. At the factory it is working full forces day and night in order to take care of the orders.

The Sessions Foundry Company, of Bristol, Conn., has recently secured an order for about 260 tons of castings for delivery at St. Paul, Minn., for a counter weight street railway system for operating cars over heavy grades.

The New York Electrical Works have been moved from their location in New York to 515-521 Kent avenue, Brooklyn. The old plant, which had been occupied for the past six years, became inadequate for the increased business.

Sanderson & Porter, 31 Nassau street, New York, have received the contract to build and equip the Meriden, Southington & Compounce Street Railway at Meriden, Conn. They will sub-contract for rails, copper, boilers, engines, generators, cars, etc.

A recent issue of the "American Trade" states that George Hopp, 17 South Castle street, Leith, Eng., solicits correspondence with a view to the purchase of electrical specialties, and Robert Stotesbury, 22 Victoria street, Bristol, Eng., regarding engineer's tools.

The Garton-Daniels Electric Company, of Keokuk, Ia., has published an illustrated pamphlet describing the different types of car, pole and station lightning arresters. Price lists are given and a number of complimentary letters from street railway companies are printed.

The Western Gear Company, Milwaukee, has recently added the New England states to the territory in which it is represented by Wendell & McDuffie, 26 Cortlandt street, New York, and 53 State street, Boston. This places all the eastern business in the hands of Wendell & McDuffie.

The New Orleans Traction Company has placed an order for eight interurban cars with the Barney & Smith Company, of Dayton, O. The electrical equipment, consisting of two 50-h. p. 3SB motors for each car, will be furnished by the Westinghouse Electric & Manufacturing Company.

Within the last month the Metropolitan Street Railway, of Kansas City, has been equipping its cable cars with Pintsch gas light appliances, and will eventually have this light on all except

its electric cars. The Pintsch system is also to be put in all the cars of the Manhattan elevated, New York.

President E. M. Hopkins, of the Rock River Electric Railway Company, is reported to have said that the bonds for the construction of the line are meeting with a ready sale in New York. Money will be raised to complete the line this summer. It is expected that the first contract will soon be awarded.

Four orders for the Wood's flexible pole brackets, aggregating 1,653 in all which were received by the Ohio Brass Company in two weeks of last month, would seem to indicate that the flexible style of bracket suspension, and this particular type of bracket are looked upon with favor as the means of supporting the trolley wire.

The Edison-Brown plastic rail bond was used on the Dublin United Tramways for all the principal bonding. Harold P. Brown, manager of the company, reports that the factory has been running at full capacity since the first of the year. Orders have not only been received from all parts of this country but also from Europe and South America.

The American Electrical Works, of Providence, R. I., always embrace the opportunity offered by holidays and festivals to send to their friends an attractive novelty. On Easter they mailed, in lieu of lillies or the conventional colored eggs, an egg plant, with the suggestion that the seed therein contained be planted and a commemorative egg plant raised.

E. H. Layton, representing Elmer P. Morris, of New York, is now in Europe; his address for the next two months will be 20 Lloyd House, Albert square, Manchester. Mr. Morris is one of the old-established men in the business and makes the foreign trade a specialty, particularly the purchase of complete plants for railway and electric lighting stations.

The Miller-Knoblock Company, of South Bend, Ind., makes and keeps in stock commutators for standard street car motors. They are made and assembled by A. W. Morrell's improved process and are guaranteed material and workmanship. Armature coils for the same motors are kept in stock and the facilities are the best for doing all kinds of electrical repairing promptly.

The Westinghouse Electric & Manufacturing Company has just opened a new branch office at Austin, Tex. J. E. Johnson will have charge of the office and of the further extension of Westinghouse business in the southwest. The large contracts which this company has been handling in Mexico and the Texas region have led to the establishment of this new center of electrical trade.

The Port Jervis Electric Street Railway Company, of Port Jervis, N. Y., has let contracts to the Berlin Iron Bridge Company, of East Berlin, Conn., for building a new power house, car barn and steel bridges. The buildings are to be of a very substantial character, fire proof and covered with the company's anti-condensation corrugated iron. The bridges are of the plate girder type.

W. R. Fleming, formerly of W. R. Fleming & Co., of New York, Boston and Philadelphia, has been chosen vice-president and general manager of the Harrisburg Foundry & Machine Works. The company intends to enlarge its plant to facilitate the manufacture of automatic engines. Several new lines of engines, some of which are specially adapted for electric service, will be placed on the market.

In a neat little leaflet the Partridge Carbon Company, of Sandusky, O., has published a price list of the standard sizes of self-

lubricating motor and generator brushes. The sizes required for the standard motors and dynamos of the General Electric, Westinghouse, Western Electric, Steel Motor, Keystone Electric and other companies are given. Orders for special sizes can be promptly filled.

The Philadelphia Electrical Exposition Company will give an electrical exhibition in its building, 818-820 Chestnut street, Philadelphia, beginning June 6, 1898, and continuing one month. Intending exhibitors may obtain full information by addressing the director, William D. Marks, and diagrams showing location of spaces, together with other information, will be forwarded upon application.

The New York Switch & Crossing Company, of Hoboken, N. J., has secured the services of Louis E. Robert, formerly with the Sterling Supply & Manufacturing Company. Mr. Robert's new position is that of secretary of the company, and he will also act as general outside representative. His long experience in the street railway field, and especially in track work, assures his success in the work.

The E. P. Allis Company, of Milwaukee, has received the contract to build six engines costing \$500,000 for the Metropolitan Street Railway of New York. Each engine will be 6,000 h. p., of the vertical Reynolds-Corliss type, and direct connected to generator. The Allis Company recently was given the contract to build a 1,100-h. p. engine for Ludwig Loewe & Co., Berlin, Germany, in competition with the best builders of Europe.

Smith of New York, whose lights for interior and exterior of cars are found in all parts of the world where street cars and steam cars are known, is enjoying that large trade which comes from the manufacture of a good article sold at a reasonable price. His factory has for some time past been crowded to its fullest capacity, is running night and day, and has orders already entered which will keep it going at the same rate for three months to come.

Frank B. Rae has been retained as consulting engineer by the Calumet Electric Street Railway Company and the Crane Elevator Company. Mr. Rae has also organized a company to manufacture motors, batteries and motor-cycles, the patents for which he controls. The company has a capital stock of \$40,000 and the following officers: H. L. Burnham, president; F. B. Rae, vice-president; Paul Synnestvedt, secretary, and C. W. Dickerson, treasurer.

James F. Heyward, who has been so successful as manager of the City & Suburban Railway Company, of Baltimore, established an office in New York the first of this month. He will be located in the Washington Building, No. 1 Broadway, and will act as a consulting expert for railway companies and investors. Mr. Heyward will not handle any investments but rather will confine his attention to the investigation of railway properties with a view to improving the same and to give expert opinions on the possibilities of future development.

The Dallas (Texas) Street Railway & Light Company has received two cross compound condensing 200-h. p. St. Louis Corliss engines made by the St. Louis Iron & Machine Works. The engines are to be direct connected to Westinghouse generators. The St. Louis works have under construction a 1,000-h. p. Corliss engine for the Consolidated Electric Light & Power Company, of Kansas City, also a number of other large engines for lighting, compressor and pumping purposes.

In the new "Catalog C" the automatic shades and curtains for closed cars made by the E. T. Burrows Company, of Portland, Me., are illustrated and described, and "Catalog E" is devoted to curtains designed for summer cars. The workings of the "Climax" swivel tip wire cable curtain fixture and the "Royal" roller tip curtain fixture are explained. The tin spring shade roller and the types of brackets for holding the same are fully illustrated.

The different fabrics used for the curtains, with the varied styles of trimmings and finishings, are also described.

Wendell & McDuffie, of New York and Boston, have recently issued a new catalog which has been carefully prepared with a view to making it particularly useful and convenient for customers. It consists of sheets 6 $\frac{1}{2}$ x9 in. interleaved with cross-ruled blank paper to serve for memoranda, and held together with paper-fasteners so that a single sheet may readily be withdrawn and replaced without injuring the book. Each page is designated a "circular"; circulars A to L constitute a complete index and elaborate codes for ordering by telegraph; circulars 1 to 91 are illustrated price lists of the different kinds of goods handled by the firm.

It is the slipping heel that wears the hole in the stocking, and it is the slipping belt that wears the leather. Belts that slip not only do not drive properly, but they wear out rapidly. A belt that is too tight is overstrained, and will also wear out rapidly. A thoroughly reliable belt dressing is therefore a necessity in every well regulated factory, and probably no dressing has such a world-wide reputation as Dixon's belt dressing and leather preservative, manufactured by the Joseph Dixon Crucible Company, Jersey City, N. J., which has been on the market for over 20 years.

The heavy business so far this year, showing in fact an increase of something like 40 per cent over the business for the corresponding period in 1897, has made it imperative for the Sargent Company, of Chicago, to considerably increase its capacity, and to that end it has recently installed a large 20-ton electric traveling crane from Manning, Maxwell & Moore, in addition to the cranes now operated, and an additional saw of the latest and most improved type, manufactured by the Q & C Company, and rearranging the receiving and shipping departments extensively. In the power house, new engines, dynamos, etc., are about to be installed. The company now has a capacity of about 1,000 tons a month, which will, of course, be greatly increased by the changes now in process.

The Ball Engine Company, of Erie, Pa., is sending to the trade a very artistic little folder entitled "A Modern Engine" which calls attention to the excellencies of the new automatic governor and the automatic system of lubrication for the single cylinder engine.

"The rapid growth of our business is the strongest evidence of the superiority of our mica" appears as a preface to the 1898 catalogue of "Mica" specialties which has been mailed to the electrical trade throughout the United States by Eugene Munsell & Co., of New York and Chicago.

Charles A. Boyd, superintendent of the Walker Company of Cleveland, has resigned his position, to take effect April 12th. He will enter business for himself, doing general engineering, with offices in the American Trust building, Cleveland, O. Mr. Boyd has been with the Walker Company for the past four years, starting as engineer in the railway motor department, having charge of the design and construction. About one year later he was placed in charge of the entire engineering department, and was promoted to the position of assistant superintendent on January 1, 1897. The following March he was appointed superintendent of the Cleveland Works, having in charge both the engineering department and shops.

The American District Steam Company, of Lockport, N. Y., has contracted to construct about two miles of steam heating mains in Erie, Pa., work to be commenced at once. This will be an exhaust heating plant, and will receive the exhaust from the Merchants' & Manufacturers' Light, Heat & Power Company's station, and from the station of the Erie Electric Motor Company. This will give a continuous supply of steam night and day. The two stations have an engine capacity of more than 2,000 h. p., the exhaust from which will heat a large portion of the city, including the public buildings and many residences. In eastern Pennsylvania the same company has also contracted with the

Edison Electric Light Company, of New York, to construct between one and two miles of mains for exhaust steam heating. This company has engine capacity of about 800 h. p.

The Mica Insulator Company, whose offices are at New York and Chicago, with a branch at London, England, recently received from one of the large builders of electrical machinery orders for over 5,000 "Micanite" segments of a large pattern (many of them more than 17 in. in length), and from another leading manufacturer of electrical apparatus an order for 2,000 segments; also from one of the leading motor builders an order for 26,000 segments. This volume of business would indicate that the company's "Micanite" segments are meeting with favor among machinery builders. The company claims that its segments are softer and wear down more evenly than mica segments. Therefore, they give better satisfaction. A sample set of segments for any one of the smaller machines will be furnished free of expense to electrical manufacturers or repair concerns which are desirous of demonstrating the value of the segments.

The Aultman & Taylor Machinery Company, Mansfield, O., manufacturers of the well-known types of Cahall vertical water tube boilers and Cahall-Babcock & Wilcox water tube boilers, has recently secured valuable additions to the erecting force in the persons of W. E. Bickford and J. C. Cooke. Mr. Cooke has been located in the Philadelphia district for the past six years as superintendent of erection for the Babcock & Wilcox Company, of New York City. The Cahall people are to be congratulated on having secured the services of Mr. Cooke, and as he has made the change for his own betterment, no doubt his many friends will be much pleased to learn of his having taken charge of the erecting department for the Cahall people in Philadelphia and New York. Mr. Bickford has been superintendent of erection for the National Water Tube Boiler Company for the past five years, and recently resigned that position to accept a position as erecting superintendent with the Cahall people with headquarters at Mansfield, O.

The developments growing out of electric traction are interesting and constantly increasing in number. One of these is the necessity for competent engineering in the laying out of pleasure resorts, and where there is a demand, so also there always is a supply found to meet it. Frank M. Blaisdell, landscape artist and engineer, of Boston, some time ago realized the field for high class work in this direction, and has made a special study of the requirements of street railway pleasure resorts. To take a tract of unimproved ground, and convert it into an attractive and successful pleasure resort affords opportunities far beyond that of simply clearing out the brush and making a vacant place where people can congregate. And to do this in such a way that future additions and improvements may follow without needless expense, and that when completed the work shall result as a harmonious whole, is the work in which Mr. Blaisdell has already made a reputation. Among the roads for which he has laid out parks are Portland, Me., New Castle, Pa., Newton, Mass., and Fitchburg, Mass.

The Walker Company, of Cleveland, has recently occupied a very handsome suite of offices on the 16th floor of the Commercial Cable building, 18-20 Broad street, New York. Both the foreign and domestic business has been very satisfactory. Orders have lately been received from the Norton & Attleboro Railroad Company, of Attleboro, Mass., for four double No. 4-A-S and two double No. 5-S equipments, beside a 250-k. w. direct connected generator; for two 150-k. w. three phase synchronous motors for the LaCaine Rapids Power Company; for a 700-k. w. single phase alternator from the Buffalo & Niagara Falls Electric Light & Power Company, and for two 400-k. w. belted generators from the Syracuse Construction Company. Among the foreign orders might be mentioned one for two 25-k. w. direct connected generators for Singapore which came through the office of Bagnall & Hilles, of Yokohama, and for Paris, France, 20 double No. 3-S street car equipments; three single No. 3-S and 18 No. 3-N equipments and four 150-k. w. belted generators. The company has also taken a contract from the government to build three disappearing gun carriages for 8-in. rifles.

The Dorner Truck & Manufacturing Company, of Cleveland, was organized in January, 1898, for the exclusive manufacture of single and pivotal motor trucks. The company occupies about 9,000 sq. ft. of (ground) floor space with its splendidly equipped factory; the large machine shop is fitted with all new and modern machinery specially adapted to the truck business, and the setting-up shop with traveling cranes and special tools; in the yard is a large crane for loading trucks onto cars; there are arc and incandescent lights and electric power; thus having every facility, the company will be able to manufacture trucks at minimum cost. The president, H. A. Dorner, started in the foundry business in 1880, and five years later went into the street railway supply and manufacturing business with W. A. Dutton, under the style of Dorner & Dutton, which concern was merged into a stock company in 1893 under the title of the Dorner & Dutton Manufacturing Company, Mr. Dutton selling his interest in 1895 to Mr. Dorner. The same year Mr. Dorner organized the Dorner Foundry Company, in connection with G. G. Arthur and E. C. Dorner; this plant was closed and part of it sold to the Dorner & Dutton Company in April, 1897, and of which Mr. Dorner was manager until he withdrew and organized the present concern. E. C. Dorner is secretary of the new company.

The Boston office of the Pennsylvania Steel Company has been changed to the Mason building, No. 70 Kilby street, at the corner of Milk street. This change has been made necessary by the expansion of the street railway business. Three of the more important contracts recently secured are: 5,000 tons of rails for the Boston Elevated Railway Company; 1,500 tons for the Fall River & Newport Street Railway Company, and 1,800 tons for the Fall River & Providence Street Railway Company. The iron work for the first three sections of the Boston subway was furnished by this company, and lately the contract for the last section has been closed. A list of the street railway and steam road customers of the company in New England would include nearly every one of the principal systems. The bridge and construction department is equally prosperous. The contract for the Southern Terminal station, now nearing completion, involved 10,000 tons of steel. The contracts recently filled are for the Wellesley College Memorial Chapel, a very large apartment house in Boston, and the baseball cage for Harvard University. The company is now supplying the steel for the new power station of the Boston Electric Light Company, which will be one of the largest and finest in the country.

### OAKETTE CAR CURTAINS.

Since the use of railway curtains has superseded the old-time slat blinds so generally the curtain manufacturers as well as the curtain users have constantly endeavored to procure some serviceable and attractive material of which they may be made.

At first woolen terries were used very generally; this material, while most attractive and elegant, when originally made up, owing to its soft surface, soon became dirty through contact with dust, cinders, grimy hands and moisture. Besides, as a textile fabric it very quickly lost its life and color, burned out by the sun shining through glass in the window.

Such a large demand was shortly created that the attention of experts in the textile line was called to the matter, and very shortly waterproof materials of different kinds were placed upon the market. About five years ago the E. T. Burrowes Company, of Portland Me., placed before the trade its waterproof curtain material, oakette. The sale of this material has gradually increased until, at the present time, it is being used in immense quantities by steam and street railways, also for yachts, steamboats and war vessels. Several of the best war ships of the United States navy are equipped with oakette.

While any waterproof material is doubtless superior to a textile fabric, still oakette should not be confounded with similar appearing materials, which its popularity more than anything else has brought into the field. Oakette is made of a single thickness of heavy materials with the waterproof substance applied directly to it; it permeates the whole texture of the goods. We believe that the imitations of this material are made of two thicknesses of cloth cemented together with a rubber cement; continual roll-

ing over the roller in the hot sun naturally causes these thicknesses to separate in places, giving the curtain a blistered appearance. Oakette cannot be scratched or marred with the finger nail; the surface is hard; it is non-absorbent, water-proof, dust-proof, grease-proof, stain-proof, and may be washed with water and sponge; is not affected by heat or cold; will not fade and is particularly durable.

The E. T. Burrowes Company can furnish this material with any pattern of face. The line that it carries has been gotten out carefully and with particular reference to the needs of the trade; the patterns are mostly symmetrical; the colorings are those which are best adapted for service to which they would be put; no attempt has been made at dainty colorings or fancy patterns, but these, of course, can be supplied if anybody requires them. The oakette curtain is superior to any other curtain, and the price is less than if the same curtain were made of a woolen textile fabric. Oakette is fully guaranteed for a long term of years, and samples will be sent by the manufacturers to anyone interested.

### THE WHEELER HEADLIGHT.

The Wheeler Reflector Company, of Boston, is manufacturing a line of dash lights which are meeting with ready acceptance by managers, and the light we illustrate has proved specially satisfactory, as furnishing the name of the route at a point where the public naturally look first, and so clearly and plainly that it may be seen at a sufficient distance. The sign, which is painted in distinct letters, is instantly changed by a simple turn of a knob at the left of the headlight, and when so set cannot accidentally change to any other. The same company is also putting out a

new stationary dash light with true parabolic reflectors, which requires no cutting of the dash. The various styles of lights are furnished for either oil or electric burners.

A committee representing the bondholders of the Madison (Wis.) City Railway Company has purchased the property from the receiver and effected a reorganization. The new officers elected are: F. W. Oakley, president; G. W. Russell, vice-president; H. R. Newcomb, treasurer, and George Shaw, manager. Many improvements to the system are in progress and contemplated, a new car barn being one of the additions.

When a large sweeper of the Waterloo (N. Y.), Seneca Falls & Cayuga Lake Traction Company was being taken into the car house by Superintendent Gray, the brakes refused to work and the sweeper started down the incline near the barn. It ran down the hill and rounded the curve, colliding with a motor car. The motorman was killed, the superintendent, his assistant and the conductor on the motor car were all badly shaken up, bruised and cut.

### WALKER CLAIMS SWEEPING VICTORY IN TROLLEY PATENT CASE.

As we are closing our forms for this issue the news comes of a decision in the United States Circuit Court of Appeals, in the case of the Thomson-Houston Electric Company, appellee, vs. Union Railway Company et al., appellants, which the Walker Company claims to be complete victory in its litigation with the other two big electric companies. If the expectations of the Walker people in this decision are realized, any one can make, sell and use the underrunning trolley. The dispatch states: "The decision was on a motion for a preliminary injunction, but being on a question of law, it is controlling and conclusive with respect to the validity of the patent, and no appeal lies to any higher court."

#### TEXT OF THE DECISION.

This appeal involves the question whether claims 2 and 4 of Letters Patent No. 495,443 for "traveling contact for electric railways," granted April 11, 1893, to the administrators of Charles A. Van Depoole, assignors to the complainant, are void because they are for the same inventions which had been previously patented in Letters Patent No. 424,695. The invention, to adopt the language of an expert witness for the complainant, in a former suit brought upon the patent, "consists generally in an electric railway having an overhead conductor, and a car for said railway provided with a contact device carried by the car so as to form a unitary structure therewith, and consisting of a trailing arm hinged and pivoted to the car so as to bridge the space between it and the conductor, and move freely both laterally and vertically, and said arm carrying at its outer end a contact device capable of being pressed upward by a suitable tension device into engagement with the under side of conductor." The essential features of construction involve the location of the supply conductor above the track and line of travel of the car and contact with its under side; the arrangement of the contact device on a trailing arm, and the maintenance of a constant upward pressure by means of a tension device operating upon a hinged arm. The two claims in controversy are:

2. "The combination of a car, an overhead conductor above the car, a contact device making underneath contact with the conductor, and an arm carried by the car and carrying the contact device, and pivoted so as to swing freely around a vertical axis."
4. "The combination of a car, an overhead conductor above the car, a contact device making underneath contact with the conductor, and an arm on the car movable on both a vertical and a transverse axis and carrying the contact device."

The patent contains 16 claims. The characteristics of the invention and the scope and validity of many of the claims were considered by this court in Thomson-Houston Electric Company v. Hoosick Railway Company (82 Fed. Rep., 461), where we held that claims 6, 7, 8, 12 and 16 were for the same inventions which had been previously patented; and a reference to the opinion in that case will dispense with the necessity for any extended discussion now. Referring to some of those claims we said: "It would be a waste of time to dwell upon the verbal differences in these claims. The changes in phraseology import nothing of substance into their respective combinations. They describe the same thing in different language." It is insisted for the appellants that the two claims now in controversy are for the same combinations specified in some of the claims which were then held to be void. The appellee contends that they are not because they omit to specify any means for holding the contact device in underneath contact with a conductor, and consequently can be construed as covering a sub-combination in which such means are not employed, or if such means must be read into the claims by implication the claims are not limited to the means described in the specification, and that upon either construction they are not the claims of the earlier patent. The court below adopted this view. If the appellants are right no other question need be considered. It will be seen that these claims are for identical combinations except that the arm is differentiated in each by functional characteristics. The specification describes a traveling arm carried by a post on top of the car "which is hinged and should in most instances be also pivoted to the top of the post, although a reasonable amount of looseness in the hinged joint

will answer the purpose of the pivot." When pivoted "it swings freely around a vertical axis," and meets the terms of claim 2. When hinged and loosely jointed it is "movable on both a vertical and transverse axis," and meets the terms of claim 4. We do not entertain any doubt that there must be incorporated into these claims, by implications, means for maintaining the contact device and the conductor in their normal working relations. Without them there is really no "traveling" contact device, and no operative combination; and the claims would cover merely an aggregation of devices which do not co-act unless assisted by some instrumentality which must be discovered and supplied. The function of the arm as constructed and arranged is to establish "moving contact" while maintaining a positive mechanical connection between the vehicle and the conductor. It was devised because as previously mounted the contact device was found to be deficient in capacity to follow the sinuosities and deflections of the conductor while the car was in motion. It can only perform this function by the aid of some instrumentality which holds it constantly in the proper relations to bridge the space between the car and the conductor and keep the contact device and the conductor in electrical connection. As pointed out in the specification, this consists of a tension device operating upon the arm and maintaining a constant upward pressure, thus holding the contact device to the conductor. This tension device, or its equivalent, is an indispensable element of the respective combinations.

That the proper construction of the claims is as thus indicated is evidenced by the proceedings upon interference in the Patent Office. Claim 2 is a literal statement of the issue defined and formulated by the Patent Office between what was then claim 1 of the application and the claims of two interfering applications. Claim 1 was as follows: "In an electric railway, the combination with a suitable contact and the supply conductor suspended above the track, of a car provided with a swinging arm carrying a contact device in its outer extremity and means for imparting upward pressure to the outer portion of the arm and contact, to hold the latter in continuous working relation with the under side of the supply conductor substantially as de-

scribed." In formulating the issue the office omitted as unnecessary, because necessarily implied, the elements enumerated in claim 1 of the application which are not enumerated in claim 2 of the patent. One of these elements was "means for imparting upward pressure to the outer portion of the arm and contact." This element was apparently thought to be indispensable to the operativeness of the combination of the claim as was "a suitable track," an element also omitted.

The appellee concedes that the claims are for combinations specified in other claims of the patent, which by our former decision was held to be void, if they require the construction which we have placed upon them. Indeed, claim 6, which we held to be void, is identical in terms with claim 1 of the interference proceedings, the claim which the Patent Office regarded as embodying the invention covered by present claim 2. The rule of construction which usually obtains hereby the several claims of a patent are to be differentiated, so that effect may be given each, cannot be reasonably invoked in behalf of this patent where so many of the claims are duplicated.

The order granting a preliminary injunction is reversed.

**NEW SLEEPING CAR LINE TO INDIANAPOLIS,  
 LOUISVILLE AND THE SOUTH.**

Commencing May 30, a through sleeping car line will be established between Toledo and Louisville via the C., H. & D. and Pennsylvania lines, leaving Toledo at midnight, arriving at Indianapolis at 8 o'clock in the morning and Louisville about 11 o'clock. This will make the best line that has ever been opened between Toledo, Indianapolis and Louisville. On the return trip car will leave Louisville about 4 p. m., leave Indianapolis at 7:30 p. m., Dayton 11 p. m. and arrive in Toledo in the early morning.

Street cars are again running at Janesville, Wis., after the shut-down for the winter.

## NEWS NOTES.

AKRON, O.—The receivers of the Akron Street Railway & Illuminating Company have received authority to issue \$150,000 of certificates to make needed improvements.

ALLENTOWN, PA.—Col. S. D. Lehr, who has been trying to revive the Kutztown trolley road, has disposed of the franchise to the Allentown & Kutztown Traction Company, which has applied for a charter. The new company will lease the road of the Allentown & Reading Electric Railway.

AMHERST, MASS.—The Amherst and Northampton Electric Railway Company has been refused a franchise by the selectmen of Amherst.

ANACONDA, MONT.—Manager Wharton has let contracts for the grading of the electric railway extension.

ASBURY PARK, N. J.—By order of court the Asbury Park & Belmar Street Railway was sold March 17 to Col. George B. L. Harvey of Asbury Park, and Acton C. Hartshorne of Freehold for \$53,000.

ASHTABULA, O.—Thomas Fricker is one of the prime movers in the scheme for an electric railway between Conneaut and Unionville, for which E. L. Hills, of Jefferson, and A. B. Martin, of Geneva, have been getting right of way.

ATLANTA, GA.—The Atlanta Consolidated Street Railway Company will extend its West End line to Fort McPherson barracks. Other extensions may be made by the company on Lee and Smith streets.

AUBURN, N. Y.—Clifford D. Beebe, president of the Auburn City Railway, has purchased for \$7,000 the large interest of Wilson H. Pixley in the Auburn Interurban Railway, and the latter company will at once construct the contemplated line of the Auburn & Western Company.

BALDWINVILLE, N. Y.—The Baldwinville & Liverpool Railway Company has been granted a franchise to build and maintain an electric railway through the town of Van Buren.

BALTIMORE, MD.—The Baltimore and Washington Transit Company filed a mortgage March 30, upon all its property, to the Guarantee Security, Trust and Deposit Company, of Baltimore, to secure an issue of 1,000 bonds of \$500 each, to be sold to pay for the construction of the road. Of the bonds 100 are to be given to the Montgomery Construction Company, of Baltimore, for the construction of an extension of the road.

BEAVER FALLS, PA.—A repair shop is being fitted up by the Beaver Valley Traction Company.

BENTON HARBOR, MICH.—The Benton Harbor Terminal Railway has been granted a franchise to run its tracks into the city along Tenth street to the canal. George Ellers of New York, and Milton Weston of Chicago, are promoting the road.

BENTON HARBOR, MICH.—A franchise for an electric railway to Dowagiac and Kalamazoo is asked by Col. George H. Allers and Milton Weston, of New York.

BERLIN, WIS.—Right of way for the Oshkosh-Ormo-Berlin Electric Line has been granted by the town of Berlin, and has now to be brought before the Berlin city council.

BIRMINGHAM, ALA.—The Birmingham Traction Company has purchased the North Birmingham dummy line.

BRIDGETON, N. J.—A franchise to extend its line four miles to Falton has been granted to the Bridgeton & Millville Traction Company.

BROOKLYN, N. Y.—Permission to change from horses to the overhead trolley has been granted to the Van Brunt Street & Erie Basin Railroad by the state railroad commission.

BROOKLYN, N. Y.—The Long Island Electric Railroad, at its recent annual meeting, decided to extend the road from Jamaica to Freeport. The new officers are: A. R. Hart, president; Charles A. Porter, vice president; William L. Wood, treasurer; J. C. Von Arx, secretary.

BUFFALO, N. Y.—The Buffalo Valley Railroad Company has been incorporated to build 27 miles of road from the city lines at Clinton street to the village of Java, Wyoming county. Freight and passengers will be carried. The directors of the company are: Luther S. Burt, Steadman Bent, of Philadelphia; Edgar C. Felton, Mason D. Pratt, of Steelton, Pa.; H. P. Bissell, Henry Metcalf, George A. Ricker, and C. W. Ricker, Buffalo; Joseph R. Ford and F. W. Wood, Baltimore; Charles W. Reinboel, Harrisburg, Pa., and Benjamin Watson, Strykersville.

BUNTON, ME.—The promoters of the Saco River Electric Road have issued \$300,000 20-year, 5 per cent gold bonds and floated them with the Massachusetts Loan & Trust Company.

CAPE MAY, N. J.—The Five Mile Beach Railway Company has applied to the borough councils of Anglesea, Wildwood and Holly Beach for the right to build a trolley line through the three resorts, to extend across the shore to the mainland.

CHARLESTON, S. C.—The Charleston & Seashore Railroad has made surveys and will build 7.5 miles of road. Dr. J. S. Lawrence of Charleston is president.

CHARLEROI, PA.—The Charleroi, Bellevernon & Fayette City Electric Railway has been placed in operation.

CHATHAM, ONT.—C. W. Richardson is one of the promoters of a scheme to build an electric railway to Rondeau Park.

CHATTANOOGA, TENN.—The Chattanooga Electric Railway is about to be extended to Rossville, Ga.

CHICAGO, ILL.—The Chicago, Milwaukee & St. Paul Railway Company's trolley ordinance was passed at the meeting of the city council April 6. The ordinance grants the railway company the right to use electric power, compressed air, or other power on its Evanston division from Kinzie street to the north city limits. The company is to pay \$5,000 for the privilege of erecting poles and trolley wires.

CINCINNATI, O.—The contract for the construction of the Cincinnati & Hamilton Electric Street Railway from Hamilton to Cincinnati, has been awarded to Chrisman & Werkel, of Cleveland, the price to be \$350,000. The road will be in operation in July.

CLEVELAND, O.—The Cleveland, Burton & Eastern Electric Railway Company has been organized with \$1,250,000 capital to build a road from the Big Consolidated tracks on Cornell street, through Gates Mills, Chester cross roads and Fullerton, to Lake Punderson, which has been purchased by the capitalists interested, for improvement as a summer resort. Among those interested are E. G. Tillotson, H. Clark Ford, Howard White, R. H. Harmon, Charles L. Pack, and H. A. Sherwin, all of Cleveland. Construction is to begin immediately.

CONCORD, N. H.—The Concord Street Railway asks the council to grant permission to extend its lines in various directions. Main street is to be double-tracked.

CORSICANA, TEX.—A deed has been filed transferring the Corsicana Street Railway (the old horse car line) to B. R. Moffett.

#### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

#### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supply or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that supply. We make no charge for publishing such notices in our DAILY BULLETIN.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8.

MAY 15, 1898.

NO. 5

The "soulless" street railway corporations of Chicago were among the first institutions in the country employing labor to instruct their men that any positions made vacant by enlistment in the army would remain open to them whenever they returned, be the time short or long. Conductors on all lines were also instructed that the uniform of the state militia entitled the wearer to free transportation. Managers of street railways generally throughout the country bulletined their men that their places would be held for all who went to war.

The summer riding opens early this year in most sections of the country, and every indication points to a good season's business. Pleasure resorts are preparing to open June 1 and managers should this year begin to receive some tangible returns on the work and expenditures of the past, in getting these resorts in attractive condition. Several new features are on the market, and an effort should be made to provide as many original and novel attractions as the local conditions warrant.

To us, who are so familiar with the effect upon the value of contiguous property which has invariably followed the building of a street railway, the fact that the English promoters of overhead trolley roads have to combat the fear that they will depreciate property, seems odd. As will be

seen, however, by referring to the letter from our English correspondent on another page, the testimony of those who have been in a position to observe the facts is unanimous in stating that the overhead lines have increased the value of abutting property there, as here.

The annual conventions of the Illinois Street Railway Association, and the National Electric Light Association, both of which meet in Chicago on the same dates in early June, will call out a large attendance. Excellent programs have been arranged; the local committees intend to provide entertainments which will be in keeping with the usual Chicago style, and the occasion is anticipated with great pleasure and interest by the entire railway and electrical fraternity of our city.

It is gratifying to note the growing tendency on the part of companies to not only expose but demand punishment in the case of illegal claims. It certainly is a duty each company owes not only to itself, but to all the others. The determined and successful efforts in Chicago and Brooklyn within the past few weeks, which resulted not only in having the damage cases thrown out of court, but also the indictment of the perjured claimants, is a matter of congratulation, and cannot fail of a salutary effect, for a time at least, in discouraging others from running the risk of detection and punishment.

The manner in which the public each year receives more for its money from street railway companies is well brought out in the Report of the Massachusetts Railroad Commissioners for 1897, an abstract of which will be found on another page. In 1897 as compared with 1896, the number of passengers carried in the state increased 5.6 per cent, while the number of round trips increase 9.2 per cent, and the car-miles run increased 15 per cent. That is, the number of round trips increase two-thirds as fast again as the number of passengers carried, and moreover each trip was on an average 5 per cent longer than in 1896. It is the increase in the facilities furnished the public, which is at a more rapid rate than the increase of traffic that takes the profits that would ordinarily result as the territory becomes more densely populated, and keeps the street railway earnings at a nearly uniform figure from year to year.

Elsewhere in this issue will be found an abstract of a lecture on "Electric Power Companies and Their Relations to Municipalities," by A. E. Lang, president of the Toledo Traction Company, and of the American Street Railway Association, which was delivered at Purdue University, La Fayette, Ind. This is the first of a special course of lectures in the electrical department, which are to be given by men who are at the head in various branches of the many electrical industries; the second lecture in the course is to be that of Mr. Insull, president of the Chicago Edison Company, on May 17. The course is similar in plan and scope to that inaugurated two years ago in the department of railway engineering, save that it covers the electrical field.

It is complimentary to the institution and gratifying to its graduates that men so busily engaged in practical affairs have the inclination, and give the time necessary to take part in this work. The advantages to the students who are thus enabled to look at many questions through the eyes of those

occupying a standpoint quite different from that of the text-writer or instructor, are evident. At the same time it occurs to us that the advantages are to some extent mutual, for this reason: When graduated the electrical men will for the most part find their work with the great corporations such as those managed by Mr. Lang or Mr. Insull, and if the latter can help to train their future assistants, they will secure more efficient men when the time to use them comes.

A reference to the article on "Pleasure Resorts for 1898," in this issue, will show that the vaudeville show is by far the most popular and successful feature for street railway parks, where anything in the way of evening entertainment, other than music, is justified by the patronage drawn to the resort. Music always has been and probably always will be the great stand-by. The favor with which the vaudeville performance is regarded for such resorts is probably due, quite as much as anything else, to the fact that the entertainment consists of a large number of short sketches, so that each number on the program is independent of the others, and a spectator may come in at any time during the evening, without having his enjoyment decreased because of having missed the earlier part of the performance; in this it resembles the concert. Another reason is that while people like to attend the theater they prefer to seek amusement rather than instruction, and the variety show caters to the first. There are a few managers who find, however, that their patrons do not take kindly to any theatrical entertainments, and that electric fountains and fireworks prove to be better drawing cards; but a fountain is such an elaborate affair that its place is in a city park only, and the small road can not hope to make it a financial success. For the children nothing is a better attraction than the old friend of our youth, the merry-go-round; it is always a money-maker. When we remember the severity of the roller-skating epidemic, it is easy to predict that the foot-cycle will ere long prove to be one of the best attractions for summer parks.

The object of pleasure resorts is to encourage pleasure riding, and if the manager can make his park or theater self-sustaining from the gate receipts or by selling privileges he is particularly fortunate; most of them in fact run the park at a loss and recoup themselves from the fares. In a small town the luxury of a park or entertainment at the terminus of the line cannot be afforded and the pleasure riding must be promoted by other means. As people always prefer to make a continuous journey rather than a broken one, a trip over a line with a loop is more attractive than one over a line which comes to an end, the return being necessarily over the identical route as the ride out. Where the town really needs a street railway it will soon need extensions and where these can be arranged so that loops of a mile, or even a half mile or less, on a side will result, the summer evening and Sunday traffic will be greatly encouraged. We have in mind a small road comprising several lines joining at a central point to which extensions were added, and so located that two loops were formed; the traffic was nearly doubled in the next two years, a great portion of the increase being from pleasure riding, to which before there had been but little inducement. In this instance no special accommodations were provided for those who merely wished to take a ride but it appears to us that on roads similarly situated, one

or two cars which would make one or more continuous trips over the entire line, and carrying signs denoting that they were particularly for pleasure riding, could be added with profit. It is always easy for a resident who is familiar with the car service to arrange such a ride, but special cars would appeal to strangers in town who might otherwise fail to avail themselves of this way of passing an hour or two only because they were unaware of the opportunity.

European residents who have never visited America, and who consequently measure the capabilities of our people by existing conditions at home, will hardly be able to comprehend the universal spirit of patriotism which animates the Nation. We have had scarcely any standing among the great nations as a military or naval power, and non-residents cannot believe that a people so devoted to the peaceful and industrial occupations have much out of which to produce a fighting body on either land or sea. The splendid victory of Admiral Dewey should open their eyes, but should the war be prolonged, and even before its close we may expect an exhibition of American skill and courage which will create a sensation. The harder a proposition the more anxious are we, as individuals and a people, to undertake it, and Europe will discover that, while slow to fight, when we do fight it is with the same irresistible force and energy which has swept aside engineering difficulties previously considered impossible to overcome. A million men volunteered at the call for 125,000, and if necessity demanded, five million could be raised in a month; and the rapidity with which they would be transformed into well drilled, disciplined troops could not be equalled by any other country on the globe.

Everybody is interested in the war, and anything which pertains to the army and navy attracts young and old alike. Managers of pleasure resorts have a suggestion in this to add to the features of their parks. One company already has taken the miniature battleship which paraded the tracks mounted on trucks and motors and has placed it on a scow and anchored it out in a little lake on the grounds. The ship is attracting quite as much attention now as it did on land, and other boats of a similar character can be quickly and inexpensively built in any company's shops. Nothing could be better as a Fourth of July attraction, and if an occasional salute is fired, and smoke poured from its stack, the picture would be one to draw from far and near.

While on the subject of war features as attractions, cinematograph and stereoptican views of battleships should not be forgotten. These can be produced at very small expense for each exhibition, and will easily take the place of the expensive theatrical troupes. Those concerns which make a business of furnishing instruments and views have already secured a large number of strictly up-to-date war pictures, and later we may expect photographic scenes of the engagements, as every possible effort will be made to secure views.

The effect of the war on proposed electric railway operations has, of course, been to hang up all which have not previously completed their financing. Of these there are

a very large number, and we all hope for a speedy and decisive action with a final settlement within the next 30 days. This, in the opinion of many competent to judge, seems highly probable. The immediate effect on American stocks, in both the London and home markets as a result of the Manila victory, is taken to indicate the prompt release of money, now hesitating to embark in industrial and railroad lines, which will occur when the war is ended, or even if the time of the end is approximately known.

In our opinion, as events are moving now, our war with Spain should have passed into history within the next 60 days, and quite possibly in less time. To accomplish this, however, it will be necessary for our government to imbibe some of the spirit of the intrepid Dewey, and let its blows fall as quick and heavy. The business interests of the country and the people are anxious for action to be pushed with that intense energy for which the American nation is famous.

When once the end is reached we can pick up the deferred operations where they were dropped on February 15th, and the universal belief is business of all kinds will bound into activity not enjoyed for several years past. As it is, most lines of business are doing finely in spite of war, and many concerns in street railway supplies report larger sales for the current month than any time during the past three or four years.

---

#### COST OF POWER VS. COST OF REPAIRS.

At a recent meeting of the Chicago Electrical Association the question was raised as to whether too much thought has not been given to the efficiency of railway motors as against a low cost of maintenance. Some of the gentlemen present spoke very strongly to the effect that the repairs needed even on modern motors are excessive and that they would not consider it a bad idea if the cost of repairs could be reduced even if the efficiency of the motor was reduced so as to make the power cost more. As the gentlemen involved in the discussion were of considerable experience and hold prominent positions in the electric railway field their opinions bear considerable weight and make the subject worth investigating.

The cost of power is usually roughly considered as 10 per cent of the total operating expense, and this fact is pointed to sometimes to show how small a reduction in the total operating expense a reduction in the cost or amount of power used would make. Nevertheless a dollar saved in power is just as good as a dollar saved anywhere else around a system and very often saving in power can be made without interfering with the service when saving in other directions would cause trouble or dissatisfaction. Furthermore, even if the cost of power is small the cost of motor maintenance is still smaller. The cost of motor maintenance is such an extremely variable quantity from year to year on different roads that no general rule can even approximate this item.

On 18 Connecticut roads reporting to the Connecticut railroad commission for the year ending September 30, 1897, the average cost of repairs on car equipment was \$.00474 per car-mile. The lowest road was \$.0005 and the highest \$.0105, so it will be seen the cost varies enormously. From an inspection of the maintenance figures per car-

mile on a large number of street railways the writer is led to believe that \$.005 per car-mile is not far from an average figure for the maintenance of motor equipments. It may be lower than this on some roads for certain periods but it will usually be made up for by renewals at some subsequent time. It may also be higher than \$.005 due to local conditions or to poor management. In fact the question of management of details in the repair and inspection department has so much to do with the cost of maintenance that it is almost impossible to say what the cost ought to be. Nevertheless assuming as a basis that the average cost of \$.005 per car-mile is about what good management will show, it becomes apparent that to seek for economy in maintenance at the expense of power is hardly a sound financial policy, since power costs from \$.01 to \$.03 per car-mile on well managed roads. A reduction in motor efficiency would necessarily have to result in a saving of a large per cent of the total repair expense to be able to offset the increased cost of power. On a road where power costs \$.01 per car-mile and motor repairs \$.005 a 10 per cent increase in power expense would counterbalance a 20 per cent reduction in maintenance expense, and if power cost more (as it does in the majority of cases) the repair bill would become still smaller in proportion to the cost of power. One thing must be kept in mind in this connection, namely, that to a certain extent inefficiency and high repair bills go hand in hand for the reason that loss in efficiency in some directions manifests itself in heat and this heat destroys insulation. However this covers only part of the question. Other things being equal the larger a motor under a car for doing a given work the lower will be its commercial efficiency, and the less will be the strain on its insulation and mechanical parts, which strains are the cause of repairs. In other words at the present day it is mainly a question of whether it pays to equip with motors large in proportion to the work to be done for the sake of saving repairs at the sacrifice of a higher cost of power, an increased investment in motors and an increased investment in power generating and transmitting plant. It does not appear, with costs of power and maintenance running as they are at the present time, that there is need of any general increase in the size of motor equipments above those usually accepted as standard for common classes of service. There are no doubt places where excessive repairs even with good management point to the advisability of larger motors, but these are the exceptions rather than the general rule. It must be remembered that careful, intelligent attention to, and study of details has more to do with success in keeping up motor equipments than anything else. The quality of the bearing metal, the treatment of commutators, the attention to cleanliness inside the motor case and the conscientiousness of the men employed are of vital importance and upon care or carelessness in these regards much of the variation in cost of motor maintenance under apparently similar conditions depend.

---

The West Chicago Street Railroad Company has seven new 3,000-gal. sprinkling cars, the product of its repair shops. Each car is provided with two G. E. 800 motors.

---

It has been suggested that the elevated railroad companies operating over the Brooklyn bridge rent the bridge cars and take passengers across the bridge at the present rate 2½ cents, the bridge ceasing to operate any cars.

## COUNTERWEIGHT SYSTEM IN ST. PAUL.

St. Anthony Hill in St. Paul is one of the choicest residence districts of the city, and the hilltop view up and down the Mississippi and across its valley is one never to be forgotten. One of the principal means of access, because the most direct, is via Selby avenue, which by a more circuitous route attains the elevation of over 100 ft. which along the river bank only a few hundred feet away rises in a sandstone cliff almost as smooth and straight as a wall.

It has always been difficult of access, and much as transportation was desired the horse car never ventured its ascent. When cable construction was introduced it was gladly seized upon as a solution of the problem, and operation has been very successful with the one exception of the runaway accident about 10 years ago, which cost the company \$180,000. The company has for a long time been extremely anxious to standardize its motive power, and operate entirely by electricity, and but for this short hill section would have done so long ago. For two or three years past all kinds of devices have been presented and rejected, and it was not until the Bronsdon system—invented by M. H. Bronsdon, chief engineer of the Union Railroad, Providence—was brought out,

FIG. 1.—DIAGRAM OF GENERAL ARRANGEMENT.

that the way seemed clear to take out the cable. The construction work is progressing nicely, and when completed electric cars with heaviest loads will travel the grade in either direction in perfect safety and at a good rate of speed. The improvement is one most needed in the St. Paul system; and company and citizens alike are to be congratulated on the change.

The term, compound, used in connection with this particular system refers to the manner of arranging the cable, as will be explained later, the object being to have the weights travel but one-half the distance traveled by the car. The counterweight system is to replace that part of the cable railway now in operation known as Selby Hill, while the entire road is to be equipped with electricity. Cars weighing from 15,000 lbs. to 30,400 lbs. will be operated on a two-minute headway. A grip car will be used to move the passenger cars both up and down the hill. When in operation, the grip car will always be on the lower end of passenger car when on the grade; i. e., the grip car will be behind the passenger cars while ascending, and ahead of passenger cars while descending the grade. The object of this is, that in case the draw bars between the grip and passenger cars

should become inoperative, the passenger car cannot run back down the grade, but will be obstructed by the grip car. The use of the grip car removes the necessity of placing special attachments upon the passenger cars and a car of any weight may be moved over the grade by its use. The grade begins at the foot of the hill with a rising grade of 5.01 per cent and increases gradually to 15.95 per cent to the summit, where it falls to 3.66 per cent. Part way up the grade is a horizontal curve of 199.7 ft. radius. This horizontal curve, extending as it does into the rising grade (or more properly termed the vertical curve), complicates the engineering difficulties in the design of this work. Cable railway engineers will readily understand the difficulty of passing a cable through a horizontal and vertical curve at the same time. To accomplish this, the vertical curve was made parabolic and extended down into the horizontal curve, the lower tangent point of the vertical curve coming near the apex of the horizontal curve. The general arrangement will be about the same as the system in operation at Providence, R. I., which was described in the REVIEW for April, 1896, the only difference being that no draw bar is to be used to connect the counterweights.

Practically all the delays and mishaps of counterweight systems have been caused by the failure of the cable fastenings and counterweight draw bar connections. This does not apply to the "compound system" alone, but to any of the systems of counterweights. As mentioned above, no draw bars are to be used to hold the weights together but the cable is used instead. By referring to Fig. 1 it will be seen that the cable is lapped by itself, extending from the top of the incline down to the counterweight lowest on the grade. The cable, therefore, pulls the weight designated as No. 1 and this weight pushes No. 2 before it. Also, the tension of the cable serves to hold the counterweights together. As will be seen, the cable is fastened at A and passes down the tunnel to weight No. 1 (passing by weight No. 2), around the sheave placed in weight No. 1 and back up the hill to and around the sheaves C, C, at the upper terminal, thence down the entire length of the hill, to and around the sheaves D, D, set at the lower terminal, back up the hill to weight No. 2 (passing by weight No. 1), to and around a sheave set therein, and back to and over the tension sheave where it is fastened to a tension weight in a pit. It will readily be seen, therefore, that (by this arrangement of the cable and counterweights) no draw bar connection is needed to hold the counterweights together. It must be understood that Fig. 1 is not taken from the working drawing but is simply a diagram to show the manner of laying the cable and counterweights.

Reference to the general plan, Fig. 2, will make clear the arrangement of the tracks in general, with the crossovers at either end, and also show the grades and curves. The track rails are to be Johnson 5-in., 80-lb. T, except on the horizontal curve where Johnson 6-in., 92-lb. guard rails will be used; the slot rails are Johnson 7-in., 70-lb. Z-bars. The rails in the conduit for the counterweight are also 5-in., 80-lb. T. All the special work is the Johnson "guarantee."

As explained before, the counterweights move over but one-half the distance that the car moves, and hence the different portions of the conduit differ in construction. On the upper portion, where a track must be provided for the counterweight, the section is as shown in Fig. 3 (a section on E, E, Fig. 2), which shows the construction, with the yokes,

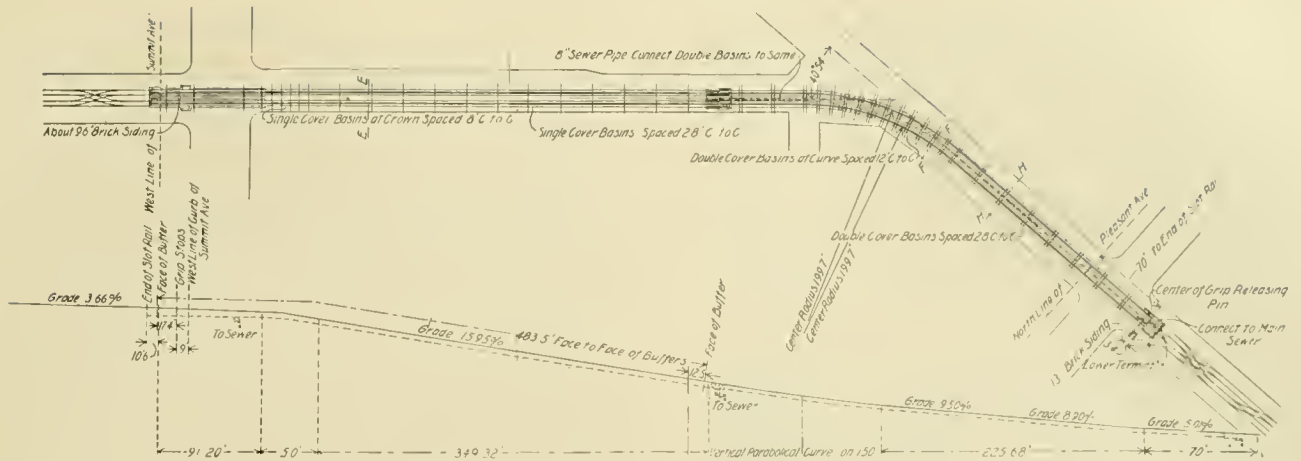

FIG. 2—PLAN AND PROFILE OF SELBY HILL LINE.

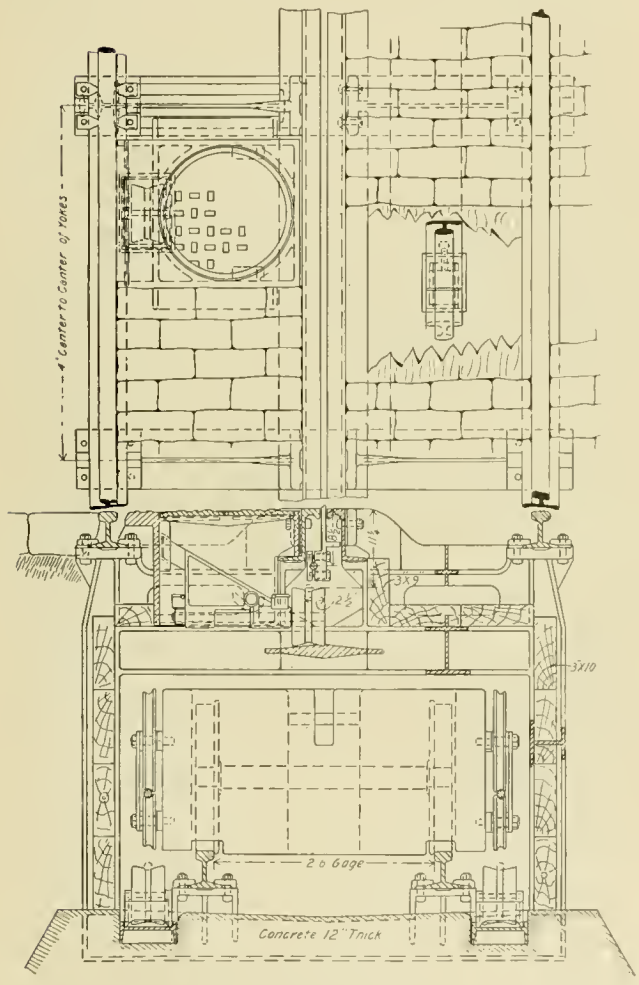

FIG. 3—SECTION ON E, E.

grip, carrier pulleys, counterweight, manhole and wood siding in place. The yokes are of cast iron and spaced 4 ft. between centers.

Fig. 4 shows the construction used on the lower half of the hill excepting at the horizontal curve, which is shown in Fig. 5. Fig. 4 is a section on H H looking up hill, and Fig. 5 a section on F F looking up hill. The basins on the lower portion of the hill are all double cover basins, while those on the upper portion are single cover basins, shown in plan in Fig. 3. These sections (Fig. 4 and 5) show the yokes,

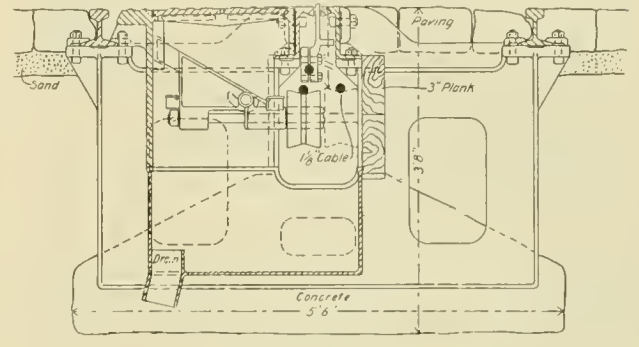

FIG. 4—SECTION ON H, H.

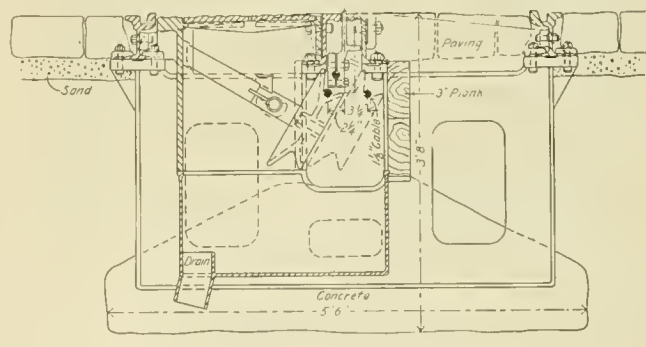

FIG. 5—SECTION ON F, F.

curve and carrier pulleys, manholes, rails, drain and siding as assembled.

Fig. 6 shows the head counterweight, the right hand end being the up-hill end, with the parts assembled. The counterweights are carried on 20-in. wheels, with 3-in. axles. The axle boxes are of the best phosphor bronze and beneath the bronze box is an oil cellar which holds about one pint of oil. In the oil cellar is a wooden feeder which bears against the axle, the whole length of bearing, thus giving continuous and perfect lubrication. Above the boxes is a half elliptic steel spring, to take the shock of uneven track and poor joints. The 48-in. sheave which is placed in the counterweight is provided with a cast steel stud to run upon. This stud is hollow and is filled with oil, which is also fed by a woolen wick, thus insuring continuous lubrication. All bearing surfaces are made large to insure continuous wear. The weight per inch of bearing surface is in no case more than 200 lbs.

The gripping device is entirely automatic in operation and is of the same design as those which have been used in Providence since October, 1895, and have worked with entire satisfaction. The device is shown in Fig. 7. The portion fastened to the cable is a flanged steel casting, comprising a slotted shoe carried above the slot rails and a blade 18 in. long, which projects 8½ in. into the conduit and is permanently clamped to the cable, by means of a plate and nine ¼-in. set screws. The shoe is 31 in. long; in the center is a slot bored out to the section shown at A, Fig. 7; at the

ends the shoe is flared to guide the grip blade into the slot, and at the sides is provided with lugs to which are pivoted the releasing levers. The releasing levers are kept in their normal positions by brass springs, and are tripped by striking pins which are placed at the ends of the incline. The grip blade is 9½ in. from the center of the bearings in the

car to the center of the enlarged lower portion engaging the grip. It is steel casting hung in bearings on the grip car so as to be free to swing sidwise. The automatic working will be readily understood from the drawing.

All the castings and machine work are being furnished by the Sessions Foundry Company, of Bristol, Conn., which probably has the largest and best equipped foundry in New England. It was awarded the contract on March 12, and guaranteed to deliver all material, finished, May 20, thus having but 59 working days to turn out about 270 tons of material and finish the necessary machine work.

For the foregoing description and the drawings we are indebted to Mr. Bronsdon.

POSITIONS FOR ENGINEERS IN THE NAVY.

Among the war measures is an act of Congress for securing volunteer officers in the engineer corps of the navy. The Examining Board meets in Philadelphia to examine candidates, and the successful applicants will be assigned to the grades of acting chief engineer, with the relative rank of lieutenant; acting passed assistant engineer, with the relative rank of lieutenant and lieutenant junior grade, and acting assistant engineer with relative rank of ensign.

The men in actual charge of the engines and boilers are ordinarily enlisted for three years, but at the present time enlistments are made for one year with the proviso that the men may withdraw or be discharged within that time if their services are no longer needed. All applicants for enlistment in the navy must be of robust frame, intelligent, of sound constitution, and free from serious physical defects.

The three grades of "machinists" (the men having charge of the engines) are:

- Chief machinist ..... \$70 per month.
- Machinist (1st class)..... 55 per month.
- Machinist (2nd class)..... 40 per month.

Chief machinists are not ordinarily enlisted but work up to the grade; now, however, a man with first-class marine papers may enlist in that grade.

Candidates for enlistment as machinists must be machinists by trade, know the names and uses of the various parts of marine engines and boilers, and be able to work with machine shop tools. They must be able to write legibly, and understand arithmetic. The age at the date of first enlistment must be between 21 and 35 years. Those who have had one year's experience at sea with marine machinery may enlist as "machinists, first class," and those without experience as "machinists, second class."

Chief machinists will have charge of engine-room watches. Machinists, first class, will be given charge of watches, if there are not a sufficient number of chief machinists on board. Machinists, second class, will be assigned to duty as oilers and water tenders.

For the other ratings, the applicant must be between 21 and 35 years of age and thoroughly understand his trade. The pay is as follows:

- Boilermaker ..... \$60 per month.
- Blacksmith ..... 50 per month.
- Coppersmith ..... 50 per month.
- Plumber and fitter..... 45 per month.
- Fireman, first class..... 35 per month.
- Fireman, second class..... 30 per month.
- Coal passer ..... 22 per month.

The men of all ratings are entitled to one ration (three meals per day). Applicants must present themselves at the receiving ships or navy yards for examination at their own expense. No person who does not understand and speak the English language can be enlisted. Preference will be given to those who can read and write and are of American birth or have declared their intentions of becoming citizens.

The case of the Detroit Citizens' Street Railway Company against the Detroit Electric Railway Company and the city of Detroit was argued before the United States Supreme Court on April 19 and 20, and a decision is expected some time during the current month.

## DON'T WORRY ABOUT OUR ELECTRICIANS.

ELECTRICITY IN WAR.—Now that the United States is (owing, as some people think, to her meddling disposition) within measurable distance of a foreign war, her citizens are seriously beginning to look about and examine whether patriotism and self-confidence are a sufficient equipment for beating a proud nation to its knees. The "Boston Transcript" has published a long article on the necessity of enrolling a body of electrical engineers for service on ships and shore batteries. We are sanguine enough to believe that in an English man of war, at any rate, the proportion of electricians amongst the crew is sufficiently large to eliminate any such danger as long as the ship is afloat—to say nothing of the fact that failure of electrical power is anticipated and its worst consequence guarded against by the alternative hand gearing in all departments. But then with us the citizen is not quite too much engaged in money-making to join either service except as an officer, and with all our shortcomings we can man our army and navy in all departments from the British horn. This is hardly so in the states, and the coming fight—if, alas! it is to be—will present several interesting problems for solution. Will the mercenary foreigner who composes so large a proportion of the United States regular forces earn his salt? Will discipline, so conspicuously absent from the American citizen, be suddenly evolved from the very circumstances which are admitted to be the cause of its greatest strain? These are queries which concern us vitally, for, after all, behind our "thin red line" stands as the backbone of our home defences a "citizen army" not unlike that with which America enters on a war of foreign conquest with a deal of shouting and a light heart.

The above extract is taken from "Lightning," of London, and is a sample of such expressions which are given prominence in the newspapers of England and the Continent, and are reflected in the technical press. As the editors of "Lightning" and other English papers have visited the United States, it is strange that such false views should receive even their passive sanction.

Such criticisms fall under three headings, viz.: The United States government, under the guise of humanity, has inaugurated a meddling foreign policy and is now carrying on a war of conquest. The people of the United States hold money as their god. The American citizen is not amenable to discipline, therefore the army and navy are ineffective.

The first assumption is exceedingly unjust in view of foregoing events. "I am my brother's keeper" is the principle upon which each individual nation as well as the concert of Europe acts. The outcome of the Greco-Turkish war, the partition of Africa, and the dismemberment of China are all evidences of this. The British government was subjected to caustic criticism by the English people because it did not compel by force the cessation of the Armenian massacres. The provocation to interfere in another nation's affairs has been greater in the Cuban question than any that has confronted Europe in a generation. The character of the war is inhuman and great numbers of non-combatants were wilfully caused to perish; the Cuban trade with the United States, which amounted a few years ago to \$100,000,000, dwindled to nothing; the war so near our shores was a constant source of expense and irritation to the government, and as a climax came the treacherous destruction of a United States battleship in Havana harbor. All these combined make it safe to say that no European nation would have suffered with such forbearance as has the United States.

The Americans are essentially an industrial people, but it has been demonstrated many times that they are as ar-

dent and energetic in philanthropy, in war or any other undertaking as they are diligent in business. The greatest expenditures of thought and money for charity and education have not been made in countries of Europe or even in England but in the United States, and the greatest organizations for humanity are to be found in the same place. When, for a righteous cause this energy of the American people has been turned into the prosecution of war, it has been a matter of surprise to Europe. The English found to their sorrow that the Americans, reared in peaceful pursuits, soon made such good soldiers that even Wellington's veterans met with crushing defeat at New Orleans. The campaign against the Spanish-Americans in Mexico was not surpassed by the feats of the British arms in India. Our contemporary must not mistake the "mercenary foreigners" in the navy and army for Hessians. Of course there are soldiers and sailors foreign born, but the vast majority are of native birth. If their loyalty, efficiency and discipline have not been already demonstrated in other trying times they certainly were in the naval battle in Manila bay. The victory of Dewey's squadron was unprecedented in that the enemy's fleet was entirely destroyed in battle without the loss of a ship or man.

The fear of a dearth of electricians for the naval service is illfounded, for the engineers of the United States not only surpass those of any other country in numbers but also in accomplishments. The mileage of the electric street railways in the whole world is insignificant in comparison with that of the United States. Hundreds of electricians have been trained in the construction and operation of these railways. The foregoing statements could be made in reference to the telephone and telegraph business; in fact, this country occupies a front rank in every branch of electrical industry. Even were the United States navy equal in magnitude to the great British navy, our government could surfeit the vessels with engineers. Already through the efforts of a few men, having only the sanction of the government, more than 1,000 electrical engineers have volunteered their services and many are now already serving. If our contemporary will take the trouble to inquire it will find that our equipment consists of something besides "patriotism and self-confidence."

These slighting criticisms are not given, we believe, in the spirit the words would indicate. The Englishmen have a deep sense of justice, a hatred of inhumanity and a love for good government, and it is for these that the present war is being waged. The many sincere expressions of sympathy and good-will which have been general in Great Britain and the friendly attitude of the government are greatly appreciated by all Americans and will tend to bring closer bonds of union in spite of occasional discordant notes.

---

W. H. Patterson, president of the Bloomington (Ill.) City Railway, is a brother-in-law of "Fighting Bob" Evans, of the Iowa. Mr. Patterson was himself for two years a paymaster in the navy, during which time he visited all parts of the world.

---

The following notice was posted at all the car houses of the north and west side systems in Chicago:

Chicago, April 19.—To the employes of the North and West Chicago Street Railroad Companies: The management hereby no-

tifies the employes of the different railroads under its control that any of said employes joining the military or naval service of the United States under a call of the President, in case of war with Spain, will be reinstated in the same place which they vacated, on their return, after being honorably discharged.

CHARLES T. YERKES, President.

Immediately after the declaration of war and the President's call for troops the following notice was posted:

Notice to Conductors: On and after this date conductors are instructed to carry members of the Illinois National Guard free while in full uniform on the cars of this company until further notice.

CHARLES T. YERKES, President.

April 23, the following bulletin was issued by the Chicago City Railway:

All present employes of this company, who are members of any military or naval organization, or who hereafter will enlist in the United States' service during war with Spain, will be re-appointed to the exact position held by them when enlisting or reporting for military service upon returning for duty within one month after being honorably discharged from the United States service.

All assessments levied against members of the Employes' Mutual Aid Association, who enter the government service as above provided, will be paid by this company, during the period of such service.

G. O. NAGLE, Superintendent.

Approved: M. K. BOWEN, President.

Among the tenders received by Colonel Young, of the 1st Illinois cavalry, was that of a pioneer corps of 100 men organized by Chief Engineer Clapp of the South Side Elevated.

A company of 103 men from the Cicero & Proviso Street Railway Company has joined one of the Chicago regiments.

William Barclay Parsons, chief engineer of the Rapid Transit Commission, New York City, is one of the many men with large incomes who are willing to sacrifice their business interests and tender their services to the Government. He is endeavoring to raise a corps of engineers, believing that the difficulties to be overcome in landing troops in Cuba during the rainy season will call for engineers of wide experience.

Capt. Eugene Griffin, vice-president of the General Electric Company, and formerly of the United States Army, has undertaken to organize a volunteer corps of 1,000 electrical engineers and skilled electricians. This corps will assist in the work of the regular engineer corps in planting submarine mines for the protection of important harbors, and will prove especially valuable in the emergency signaling, lighting, etc., which will be necessary in the military operations. The General Electric Company offered to continue on its pay roll such of its employes as wished to volunteer and assured them that their old places would be waiting for them at the end of the war.

Frank W. Hawley, vice-president of the Cataract General Electric Company and of the Erie Canal Traction Company, is another electrical engineer who has tendered his services and offered to raise a regiment of skilled electricians.

The San Antonio (Tex.) Street Railway Company on April 16 posted a notice that any of its employes who may enlist in active volunteer service will, upon their return, have their positions, and during the time they are in actual service their wages will be paid to their families.

C. K. Durbin, general superintendent of the Denver Consolidated Tramway Company, issued an order April 20, which reads:

In the event of war between the United States and Spain, the employes of this company who wish to volunteer their services to their country will be granted leave of absence for one year, and their positions will be held for them for that time.

The Denver City Railway issued a similar order.

This action on the part of street railroads is quite general throughout the country. Among other companies issuing such orders that have come to our notice are the Consolidated, of Detroit, and that at Hagerstown, Md.

William Tiffany, secretary and treasurer of the Sterling Supply & Manufacturing Company, and a prominent society man, has joined "Teddy" Roosevelt's Rough Riders, and is to be a captain, it is stated. Mr. Tiffany is a grand-nephew of Oliver H. Perry, the hero of Lake Erie. He spent several years in the west as a cowboy and became well acquainted with Mr. Roosevelt; there is no doubt about his being a "rough rider," as in addition to his

WILLIAM TIFFANY.

cow-boy experience he has long been a member of a crack polo team in New York.

#### FINE INCREASE AT NEW ORLEANS.

C. D. Wyman, general manager of the New Orleans Traction Company, is making a fine record. For the first quarter of 1898 the earnings are \$332,374, an increase over last year of \$14,688; operating expenses same period, \$190,699, a decrease of \$15,651. This makes the net earnings for the quarter \$141,705, which is an increase over the net in '97 of \$30,339.

Mr. Wyman is building up a fine business in trolley parties, and the demand now runs as high as 10 or 12 for the day and evening. New Orleans has so much of interest to visitors, who can see the sights in no way as satisfactorily, quickly and cheaply, as by chartering a car, it is likely to have the largest day trolley party cars of any city in the country.

A record was made in quick track construction in San Francisco recently. The roadbed was prepared and 80-lb. rails laid on H street, between 28th avenue and the beach, a mile in length, in four hours by 64 trackmen.

## HOW TO PROTECT TROLLEY AND FEEDER LINES.

Some Suggestions from Street Railway Electricians as to Methods for Protecting Overhead Lines from Thieves—Alarms and Annunciator Systems—Carrying High Voltage Currents at Night.

### Trolley Wires Stolen.

The street railway people reported to the police this morning that some time during the night their trolley wires on the Walnut street line outside of the city limits had been cut down and taken away. About four blocks of wire was stolen, valued at about \$100.

Scarcely a day passes that we do not note one or more paragraphs similar to this one taken from the "Milwaukee Sentinel" of April 30. There are now before the writer accounts of thefts of copper wire from the street railways in Eau Claire, Wis., Chicago and Seattle, Wash.

Such robberies generally occur in the early morning hours when the machinery at the power station is shut down and the wires are dead. The wire is taken by junk-men or tramps, as was the case in Eau Claire, Wis., two weeks ago; but it is often stolen by one who has been a lineman or other employe of a street railway company. In one instance three times in as many years a considerable portion of the trolley wires on the same line were cut up into scrap and sold. The loss to the railway company amounted to hundreds of dollars.

Some of the suburban lines have been patrolled for a time to protect the property but this is tedious and costly. The sensible thing to do is to devise some automatic electric system to give an alarm whenever the wires are being molested.

We have written to the electrical engineers of a number of roads and several have responded with suggestions as to how the lines can be adequately protected.

Fig. 1 illustrates the plan suggested by C. E. Flynn, general manager of the Carbondale Traction Company, Carbondale, Pa., who writes thus:

"It has occurred to me, that some protection against the theft of trolley or feeder wire might be derived by arranging a simple alarm system at the power house which could be arranged as follows: A series of five lamps might be con-

nected between the end of the feeder or trolley wire to the rail circuit of any one section, or it could be connected to that part of the feeder or trolley wire that is in danger of being stolen. At the power house the feeder wire could have connection with a small electro-magnet as shown in the diagram; the other side of the circuit would, of course, consist of the rail. Then by means of a storage battery which could be charged during the day time, this lamp circuit could be switched in, either automatically or otherwise after the power plant had been shut down for the night. The electro-magnet should have its armature in such position that the current from the storage battery would hold it up to the poles of the magnet, and the moment that the feeder circuit was opened, the armature of the electro-magnet should drop sufficiently to close a battery circuit in which a gong is connected as per sketch, and this would give warning that the line was being tampered with. In case several separate feeder wires were to be protected, it would be necessary to have a separate magnet, fuse block and switch for each wire to be protected, and in this case it would assist matters to have two additional contact points under each of the magnet armatures, to these contact points a series of lamps could be connected so that when the armature of the electro-magnet of any one circuit should drop and close the battery circuit, making the gong ring, it would also close a lamp circuit that would indicate which feeder wire was being tampered with."

John H. De Gruchy, of the Union Railroad Company, Providence, R. I., writes:

"In considering the protection of suburban lines against theft the cost of the inauguration and maintenance of any method must be taken into account. It is certain that the annual cost of a patrol would amount to more than a year's incidental stealings, the tying up of the line and the expense of repairs resulting therefrom, inclusive.

"The accompanying sketch, Fig. 2, will show at a glance

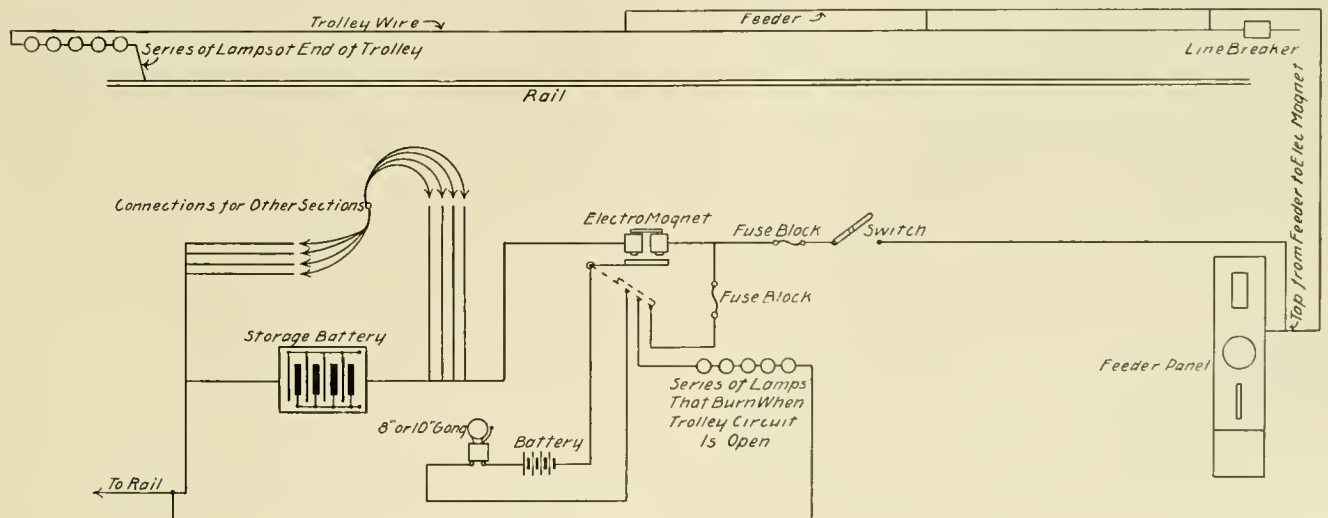

FIG. 1.

the difficulties to be overcome in order to establish an annunciator or bell system which would operate in the event of any part of the line being cut. With trolley taps every 1,000 ft. and the rails connected to negative feeders every 500 ft. an efficient annunciator or bell system would be hope-

opened at A by opening the switch at B, the resistance taken and the distance of the break from the power house approximated."

J. F. Stevens, president of the Keystone Electrical Instrument Company, Philadelphia, writes us as follows: "It seems to us that there are two ways to assist detection of theft of trolley or feeder wires when the power station is shut down at night. The simplest plan would be if a source of alternating current is available, to open all main switches at the switchboard and throw the alternating high tension circuit from the local lighting company, on to the bus-bars, keeping all feeder switches closed. The effect of this would be to give a very severe shock to any one attempting to cut the wire, and after it became known that the trolley wire at night was charged with one or two thousand volts, we think there would be few attempts made to cut wires. By attaching to the bus-bars at the switchboard all feeders, as well as the main line, would be in circuit. It would, of course, be necessary to insert in series with the line sufficient resistance to prevent a heavy flow of current.

"Another method would be to run a small pressure wire from the terminus of the circuit, back to the power house, then having opened the main switches, set in a magnetic device similar to an annunciator, in connection with several cells of gravity battery. In this plan, a circuit would be made from the bus-bars and through all the feeders to the line returning through the small pressure wires spoken of at first, and so long as the circuit was complete, the armature of the annunciator would be held against its magnet, but on breaking the circuit at any point, the armature would be released and a bell ringing circuit thrown in; thus giving a visible and audible notice of a break in the line. An indicator could be arranged for use there in the power house, or at any other point in the city at the option of the superintendent."

Notwithstanding the large amount of territory covered by the Calumet system, of Chicago, the company has had wire stolen but once, and on that occasion it was taken on a short piece of track that was not used at all. In response to our inquiry H. M. Sloan, general manager, states that he has given this subject but little thought because the losses have not made it necessary. He suggests that it might be a good idea to put a small dynamo at a very high potential on the lines at night, but adds that then there would be danger of a wire falling and killing someone, in which case the company would probably have to pay more for damages than all the wire stolen would amount to.

FIG. 2

FIG. 3

FIG. 4

lessly complicated. The detecting value of this would be, no doubt, circumvented by the thieves who could and would willingly exchange a few hundred feet of bell wire for the same length of trolley or feed wire.

"So many multiple connection make it impossible to acquire any adequate protection in this way. The cost, too, might interfere with its adoption.

"If the trolley wire should be cut when the power is off, an arrangement shown in Fig. 3 would indicate that such was the case. The bank of lamps is placed in series with the positive feeder, and will light when the trolley wire strikes the rails. A bell and battery could be used for the same purpose.

"To protect the entire line a magnetic contact maker A, Fig. 4, is required to close the circuit at the extreme end of the line which will be necessary to the object in view. Now find the resistance of the entire line from the station positive to the negative. After the galvanometer reading has been ascertained for normal condition, it is obvious that any tampering with the line circuit either by cutting the trolley wire or the positive or negative feeders will be indicated instantly upon the dial. If a trolley wire breaks the contact can be

FIG. 5.

Bion J. Arnold, of Chicago, writes: "It seems to me, however, that the simplest way out of the difficulty is to leave current on the line all night by means of a small direct connected engine and generator in the power plant. Such an engine and dynamo, having a capacity of from 5 to 10 h. p. would easily keep an ordinary line charged and make it uncomfortable for any meddlers, and it would probably cost less to maintain than any kind of an automatic device that could be gotten up. If the trolley line was operated in conjunction with a storage battery auxiliary, the battery could be left on the line all night, and accomplish the same purpose, and this without any appreciable loss."

Another arrangement is described below, although modifications would have to be made for different systems. As with every other form of alarm experienced men could render it ineffective. A 500-volt battery would probably be the most desirable although that voltage would not be arbitrary. The cells could be located in any convenient place about the station and connected to the switchboard. This battery is charged from the bus bars and then cut out until the generators are shut down and the switches opened. The battery switches connect it through the bus bars to the feeders and lines. In a well regulated system there is little leakage and a battery of small current capacity, not much larger than a special testing set, would serve the purpose and keep the lines at a potential near 500 volts.

An alarm bell, with one or more relays if desired, is in the circuit with the battery and line. This plan would be effective in most cases for there are few persons who have the hardihood to handle a wire charged at 500 volts without proper facilities, and there is little chance of wire thieves being provided with rubber gloves, reels, tower wagons, etc. If a wire should be cut and fall to the ground the circuit would be complete through the line battery and bell and an alarm would be sounded. The expense of the battery would be an item, but its cost would be saved many times in preventing the robbery of a section of wire with the accompanying expense to the company in replacing it, and in the delay to traffic.

Our readers are invited to suggest simple and effective methods for an alarm which can be easily and cheaply installed. In the main lines of the larger cities, of course the lighted streets and police patrol nightly leaves little danger of trouble there; but on outlying sections, and lines reaching out into the suburbs, which often pass for a considerable distance through sparsely settled or unoccupied territory, some system of alarm is greatly needed. And it is not always the electric lines passing through lonely spots in the country that suffer the loss of trolley wire as a recent experience of the Metropolitan Street Railway Company, of New York, proved. This thief had more nerve than wisdom and it led to his fall. One morning during the early hours he went to one of the conduit lines not yet in operation and with a saw cut out a copper feeder cable between two manholes, and carried it away before the eyes of a policeman who thought him an employe of the company. This success led him to return a few days later; but this time the wire was carrying current and the sparks from the contact of the wire and saw ignited the gas in the manhole, causing an explosion. The battered up thief was captured and held under \$500 bail.

Just what the night crew at the power station should do when an alarm comes in, we will not undertake to determine; but would suggest that shot guns have been found quite reliable in announcing the presence of a posse, and that if it were known that such persuasive voices would be heard, there might be fewer occasions for serenades of this character.

#### LADY PRESIDENT FOR THE SUTRO LINES.

The Sutro Railroad Company, of San Francisco, Cal., now has a woman for president. When Adolph Sutro was, some months since, found incapacitated for managing his affairs, his eldest daughter, Dr. Emma Merritt, was the choice of her five brothers and sisters for the guardian of the estate, which is estimated at over \$3,000,000. Mrs. Merritt was graduated from Vassar College in 1877; she afterwards came west and entered the medical department of the University of California, graduating in 1881. After her marriage to Dr. George W. Merritt, she and her husband went abroad and studied in European hospitals for three years. Mrs. Merritt is of a benevolent spirit, having

DR. EMMA MERRITT.

founded the Children's Hospital in San Francisco, and is considered an intelligent and conscientious physician. In order to properly manage her father's estate and preside over the affairs of the road, having been elected president last week by the directors, she has abandoned her medical practice. The main reason why Mrs. Merritt was chosen for that position was because the Sutro estate owns a majority of the stock. She has, in the minds of the directors, proper qualifications for making a successful officer. In an interview with a REVIEW representative Mrs. Merritt said that she knew but little of the affairs of the Sutro Railroad Company, and not having managed an electric road before, she was not sure as to the success of her administration. Mr. Von Rhein, vice-president and since Mr. Sutro's retirement acting president of the Sutro Railroad Company, found that the road required more time than he could spare from his private business and at the meeting of the board tendered his resignation. The Sutro Railroad Company operates a splendidly equipped double track electric street railway between Central avenue and the Cliff House, a distance of about five miles. Mrs. Merritt's administration will be watched with a great deal of interest by the local community, not to mention those who have no confidence in the executive ability of womankind. We expect, however, a vigorous and successful administration.

The Twin City Rapid Transit Company has the contract to carry mail between Minneapolis and St. Paul and the branch offices in the cities. This business has become so great that at times in the day the pouches interfere with the regular traffic and the building of mail cars has been considered. Auditor Castle, of the postoffice department, has recommended that letter boxes be placed on all cars in the two cities.

## THE GLASGOW EXPERIMENT IN MUNICIPAL OWNERSHIP.

Extract from a Paper on Municipal Ownership and Operation of Street Railways in England by Robert P. Porter—The Facts Regarding This Much-Cited Enterprise—Some Misapprehensions Corrected.

Hon. Robert P. Porter, superintendent of the United States Census of 1880, read a paper before the Massachusetts Committee on the Relations of Street Railways to Municipal Corporations, giving his views on the results of the municipal ownership of street railways in Great Britain. A full abstract of this paper has been printed as "Appendix E" of the Committee's Report, and from it we take that portion dealing with the city of Glasgow, lack of space preventing us from giving the whole of Mr. Porter's admirable paper, which was entitled: "Statement in Relation to Municipal Ownership and Operation of Street Railways in England."

Comparisons are made of the street railway systems of Chicago, of Philadelphia, of Boston and of Brooklyn, with those of Glasgow, of Birmingham, of Liverpool and of Manchester, as though there was some similarity or some common point where-in the systems of transit in these cities were comparable. In the same way the deadly parallel has of late been frequently drawn between American cities, and continental cities, with an utter disregard of the entirely different conditions. If those who have filled our library shelves with dissertations on municipal matters had expended half the energy in studying, from a broad and practical standpoint, the development of the up-to-date street railway system of Chicago, with a total mileage actually exceeding that of the United Kingdom, which they have devoted to the "Common Good Fund"\* experiment of three years in horse cars, on 77 miles of track in the city of Glasgow, they might perhaps have discovered some useful testimony. If the ability of these writers had been exercised in perfecting a system of municipal ownership for the network of street railways now under one management, and known as the Consolidated Traction Company of New Jersey, which runs through thirteen different municipalities of New Jersey, each with its own peculiar conditions, we should be in possession of far more useful data as to how municipal operation can be made practical, and the public best served under such conditions, than is afforded in a volume on the disastrous experiences of the town of Huddersfield in municipal ownership and operation of 22 miles of badly managed tramways.

To change the field of inquiry farther west, we have an opportunity to study the marvellously well conceived, equipped and managed street railway undertaking which connects the twin cities of St. Paul and Minneapolis, and brings not only the population of these two important cities together, but furnishes the inhabitants of each an almost perfect rapid transit for a cost lower than that ever attempted in any European territory, of equal area, even though American enterprise pays more than double the rate of wages for its labor. In such a study it might be well to look over a plan of both the Boston and Brooklyn street railway systems, and ascertain exactly what these great enterprises have accomplished for populations numbering respect-

ively 700,000 and 900,000. It has been truly said there is no possible way of ascertaining the average ride of Brooklyn or Boston street railway passengers, but the large areas covered by these cities, and the location of their residence districts at considerable distance from the business centers, make it certain that the average cost of riding is less than the cost of similar service in European cities. In New York we have practically three systems of rapid transit, and, in spite of continued demands for additional methods of transit, the people of the metropolis are taken to and from their homes and from point to point in the city much more rapidly than in either London, Berlin, Vienna or St. Petersburg, and at a lower cost. The bulk of the London traffic goes by omnibus, or over 326,000,000 passengers annually. The tramways carry about 225,000,000 passengers and probably the Underground 200,000,000. It is doubtful if as many people use rapid transit annually in London as in New York, as now constituted. Yet London contains 2,000,000 more population. The reason is that New York is more satisfactorily supplied with the means of rapid transit. The London field should yield 1,000,000,000 passengers annually, and would, if the right system of handling the traffic were adopted. In New York one-third of the passengers last year on one of the surface road systems travelled on transfers, and, as a result, the average fare was reduced to about three and three-fourths cents. The Metropolitan Street Railway Company and the Metropolitan Traction Company, which together form one of the three great systems of transportation of New York before consolidation, paid in 1896, in state and city taxes, rentals, licenses, mileage, etc., nearly \$600,000. Philadelphia has an excellent system of street railways, and one that is not at this moment yielding great profit to those who have brought the innumerable small companies under one management. Between 1891 and 1896 this company paved 271 miles of street from curb to curb, at a cost of \$9,000,000, while the company itself claims to have expended \$14,000,000. The paying dividend tax and car tax, together with the taxes on real estate, are equivalent to a revenue of from \$650,000 to \$700,000 to the city. The history and present condition of the street railway system of Philadelphia has been the subject of an interesting historical and economic study,\* and the conclusions reached by an apparently impartial and capable investigator are that the policy of "manipulating the political machine," which forms, as a rule, the burden of attacks on American street railway corporations, has been abandoned, "and Philadelphia is thus one step nearer the realization of the hope that Mr. Bryce expressed in her behalf after describing her imposing city hall,—that 'the officials who reign in this municipal palace will be worthy of so superb a dwelling and of the city where the Declaration of Independence and the Federal Constitution first saw the light.'"

In St. Louis may likewise be found one of the best equipped street railway systems in the world, giving a good service, carrying passengers, by the aid of transfers, fifteen miles for five cents, and at the same time contributing liberally to the municipality for the lease of its franchise. These are merely some of our larger systems, all, however, the result of recent consolidations, and made possible by the remarkable advance we have made in increasing the efficiency and reducing the cost of motive power. Of course the primary cost of such extensive operations has been enormous, partly by reason of the rapid and successive changes in equipment, partly because of the immense cost in the purchase of small companies, and partly because experiments to perfect the art of rapid transit are costly. The capitalization of these properties is undoubtedly in many cases high, and perhaps the speculative features too great. This, however, will adjust itself in time. The pluck, the courage, the enterprise, the ingenuity which have evolved these magnificent

\*Glasgow Corporation Tramways.—Common Good.—What It Is.—The property and revenues of the Corporation which are not held under special Acts of Parliament nor raised by taxation are known as the Common Good. It is the ancient corporate estate of the Burgesses of the City and Royal Burgh of Glasgow. The lands and property forming the capital of the Common Good were originally gifted to the city under certain burdens, or were purchased by the municipal rulers of the sixteenth century onwards from the proceeds of the imposts charged on all meat and drink entering the city. These proceeds were chiefly invested in land, and to-day a large portion of the revenue of the Common Good consists of feu-duties on the ground originally acquired in this way. The Common Good, although now but a small concern as compared with some of the other undertakings under the charge of the Town Council, performs many important duties. It watches over the interests of the citizens in regard to legislation. It acts as nursing mother to all municipal schemes in their initial stages, by advancing expenses and performing other parental duties until its offspring is able to stand alone. It now consists of the Bazaar, City Hall, St. Andrew's Hall, Old Clothes Market, Bird and Dog Market, Land at Coplawhill, Feus in Gorbals and other parts of the city, Blackhill Lands, the Tramway Undertaking, and other minor items. The net free capital amounts to £363,661 14s 10d (\$1,769,759.86).

\*John Hopkins University Studies in Historical and Political Science. "The Street Railway System of Philadelphia, Its History and Present Condition." By F. W. Speirs.

systems, are both admirable and American. In no other country can be found anything equal to these American enterprises; and, although the investment of \$1,500,000,000 which they represent may look large, the possibilities ahead are ample to make them safe as population expands and receipts increase. To assume for one instant that the same result could have been attained in any other manner is to ignore the facts within the reach of every American citizen. When compared with these results, what have we in Europe?

In glancing at European experiences in street railways, let us first ascertain what has been accomplished by municipal ownership and operation, because so much has been made by writers on this subject in the United States of these experiments. Attention may first be called to the city of Glasgow, because, though a comparatively recent experiment, it is generally conceded to be the most satisfactory. Huddersfield is in reality the oldest British experiment in municipal operation, but the results in that town have been so unsatisfactory that the subject presents but few attractions, and is, as a rule, dismissed with a general tribute to municipal ownership, but with no particulars. Glasgow, however, is different. The facts about Glasgow have been published in great detail, and the three annual reports which bring the operations down to May 31, 1897, are familiar reading to those interested in the subject of municipal ownership. Yet, with all this data before us, there are two distinct views of the municipally operated street railways of Glasgow.

First, we have the view of the advocates of municipal operation, who see in this experiment a great victory for their theory, and who argue that the facts warrant the immediate absorption of such undertakings by American municipalities. Indeed, these advocates go much further than the capable gentleman upon whom devolves the responsibility of conducting the enterprise in Glasgow. The story runs something in this way: After suffering the exactions of a private company for twenty-three years, the Corporation of Glasgow, finding it could not make a satisfactory arrangement or a renewal of the lease with the company, decided, upon the day the lease expired, to equip and operate the tramways itself. To this end it built new and handsome cars, bought a stud of horses, secured ground, buildings and machinery, and, in accordance with the program, put the street railway in operation. This was in July, 1894. Since then traffic has almost doubled, receipts have largely increased, fares have been reduced about half, wages of employes advanced, hours of labor reduced, and a largely enhanced revenue paid the city. Here is a tale familiar to those who read "municipal reform" literature.

The real facts about Glasgow, while indicating that the city has shown commendable enterprise in dealing with a difficult situation unexpectedly thrust upon it, are not of the slightest value to the United States, either as illustrating street railway enterprise or sagacity, or the ability of a municipality to operate such undertakings. On the contrary, a study of the Glasgow management of its tramways is one of the clearest exemplifications on record of the incapacity of a city to deal as thoroughly with such undertakings as private enterprises. I mean, of course, from the stand-point of an American city. When the advocates of municipal ownership propose to transplant the idea from abroad, and rest their case purely on foreign experiments, they must submit to a scrutinizing cross-examination of their principal witness, and not rest the case on a general statement, which, even though technically correct, is in fact absolutely misleading, because of the vastly differing environments. Thus, when these gentlemen announce that Sheffield, a town of 347,278 inhabitants, and Plymouth, a town of nearly 100,000 inhabitants, have, by act of Parliament, taken over their street railways, and that the respective municipalities propose to operate them hereafter, the statement is extremely misleading to the American mind, for this reason: towns of the size of Sheffield with us have in the neighborhood of 200 or 300 miles of track, while places of the size of Plymouth can generally boast of from 75 to 100 miles of street car lines. No one would suppose that the first undertaking means the acquirement, at the expiration of a lease, of 10 miles of worn-out track, most of which was sold as

old iron, together with a few very antiquated steam trams. Yet this is what Sheffield has actually done, and the transaction, including horses, cars, engines, buildings and plants, involved about \$130,000. Nor in the case of Plymouth would the ordinary American mind realize that the statement as respects that flourishing town of 100,000 inhabitants meant the payment of a few thousand pounds to a company of London speculators, who, after securing a franchise to put down tracks and actually tearing up one important thoroughfare, failed to fulfil the contract, and literally compelled the city to complete a portion of the line. Here we have two actual cases in which a bare fact without explanation becomes so nearly a falsehood that it is difficult to define the difference.

In the same way, the extracts from the reports of the Glasgow municipal street railway experiment are just as misleading, when published without proper explanations, and for the purpose of showing a greater capacity for dealing with such problems in Glasgow than exists in cities of a similar grade in the United States. What, then, is the real history of the Glasgow experiment, and wherein may be found its lesson? To understand the Glasgow situation fully, it is necessary to go back to 1872, when the first lines were leased to the Glasgow Tramway & Omnibus Company. These lines were laid by the city, at the expense of the city, and were leased to the company. The total capital expenditure of municipal money on these lines from 1872 down to July 1, 1894, when the city installed its own plant, was \$1,678,776.63. Of this amount, the company paid the city during its twenty-three years' lease, \$980,454.09 towards the cost of construction of the lines, reducing the capital by that amount and enabling the city to enter into possession of a property which cost \$1,678,776.63 at a nominal cost of \$698,322.54. So carefully is this fact guarded in the official reports quoted by municipal ownership advocates that it has never been referred to in any statement of the so-called profits accruing to this undertaking. This item of nearly \$1,000,000 I find entirely omitted from the capital account, and only the sum of £143,495, 16s., 11d. (\$698,322.54) charged up. In addition to this payment of nearly \$1,000,000, the city received as revenue during the twenty-three years of the lease \$1,169,125.28, in name of interest on capital expenditure, and \$223,823.38 as mileage rate, while the sum expended by the corporation for interest on current tramway debt and on sinking fund was \$1,083,302.74; leaving a balance of \$309,645.92, or an annual average during the whole of this time of \$13,462.86, as the mileage rate and profits of the corporation. The advocates of municipal operation have a way of putting this \$13,462.86 against the \$43,798.50 now paid annually to the Common Good Fund, forgetting to add that the average payment runs back to the time when the city had only \$16,867.28 invested in track, and that it steadily increased until for the last thirteen months of the lease it reached \$32,109.16. This would indicate that, with ordinary business foresight, the private company would have been able to pay Common Good Fund at this time even greater revenue. The facts certainly do not warrant the comparison with the average of the twenty-three years of the lease, which is the way it is generally given the American public.

On the first day of July, 1894, the municipality of Glasgow found itself in possession of about 65 miles of single track, which had originally cost the city \$1,678,772.17, but on which \$980,454.09 had been paid by the old company, in addition to the net profit of \$309,645.92 for the Common Good. What would an American city have done under like conditions? Leased the right to a private company to install a first-class electric plant, extending the mileage to 200 or 300 miles of track, for this Glasgow system serves a population of 800,000. This company would have paid the city a good mileage rate for the track, and a much larger sum to the Common Good Fund, together making, for the privilege of carrying 100,000,000 passengers, a sum far greater than that the Glasgow corporation will ever make for the city out of its enterprise. Of more value than all this to the community would have been the service, which would have taken the people into the small suburban places around the city, and, by the aid of low fares for long distances, given them

the benefit of comfortable and cheap homes. What has Glasgow done? With a capital account which May 31, 1897, aggregated \$3,065,741.32, without counting the \$980,000 paid back to the city construction account by the old company, which really represents \$4,046,195.41, Glasgow has, in the latter half of 1894, installed a system of horse cars. In so doing, she has purchased new horses, new cars, bought the ground, built new barns, and in fact, purchased an entire equipment. Naturally, the business-like American asks the question, Why did Glasgow commit this act of folly? And the answer comes promptly, Because the Town Committee of twenty-five members could not agree on a system of mechanical motor. Under like conditions on this side of the Atlantic there would have been a dozen enterprising American firms, ready with bonds to any amount, to take the whole responsibility, and give the people a good service and pay the city a liberal revenue. Yet we are seriously told, by earnest gentlemen, that in the management of rapid transit we have much to learn by studying the situation in Glasgow.

The municipality of Glasgow therefore has in fact upward of \$1,000,000 invested in 77 miles of horse railways and the equipment therefor. It will be noted that the track mileage has not been greatly increased, as it was 31 miles 3 furlongs of double track in 1894, when the city took the roads, and only 32 miles 2 furlongs May 31, this year, when the last report was made. If an enterprising private American firm could not have made more out of this opportunity, both for the corporation of Glasgow and the company, it would indeed be strange.

And now a word in relation to the revenue of this system. The total revenue for the fiscal year of 1897 was \$1,804,897.25. Of this amount \$1,393,210.81 was paid out for working expenses, of which about \$632,000 was paid direct for salaries and wages. The wages paid in Glasgow are a trifle less than half the rates paid for similar employment in New York, and about half the rates paid in cities of the same size in the United States. A forcible illustration of the danger of making comparisons between the results achieved by these undertakings at home and abroad, especially in relation to cost of service, has recently been brought to my attention. Mr. John Young, manager of the Glasgow Corporation Tramways, sent me an official statement of the scale of wages paid employees, which is as follows:—

## GLASGOW CORPORATION TRAMWAYS, SCALE OF WAGES.

	Per day.
Point boys, .....	\$0.28
Horse turners, .....	.34
Trace boys:—	
First six months, .....	.40
Second six months, .....	.44
Thereafter, .....	.48
Horse keepers:—	
First six months, .....	.80
Second six months, .....	.82
Thereafter, .....	.84
(And 24 cents for Sunday morning duty.)	
Sick-horse keepers:	
First six months, .....	.84
Second six months, .....	.88
Thereafter, .....	.92
Car washers:—	
First six months, .....	.84
Second six months, .....	.88
Second year, .....	.92
Thereafter, .....	.96
Drivers and conductors:—	
First six months, .....	.92
Second six months, .....	.96
Second year, .....	1.00
Third year, .....	1.04
Thereafter, .....	1.08

The above rates apply equally to Sundays and week-days.

JOHN YOUNG, General Manager.

Wishing to compare this with the rate of wages paid persons

similarly employed in the United States, the above table was sent to President Vreeland, of the Metropolitan Street Railway Company of New York, with request to furnish similar information for the United States. In reply the following table was prepared:—

## METROPOLITAN STREET RAILWAY COMPANY OF NEW YORK, SCALE OF WAGES.

	Per day.
Point boys or switch boys, .....	\$1.00 to \$1.25
Horse turners or changers, .....	None
Trace boys or tow boys, .....	\$1.00
Horse keepers or hostlers, .....	1.75
Sick keepers or hospital men, .....	1.75
Car washers, .....	1.50
Horse-car drivers, .....	2.00
Horse-car conductors, .....	2.00
Cable gripmen:—	
First year, .....	2.25
Thereafter, .....	2.40
Cable conductors:—	
First year, .....	2.00
Thereafter, .....	2.25
Motor men, electric:—	
First year, .....	2.25
Thereafter, .....	2.40
Electric car conductors:—	
First year, .....	2.00
Thereafter, .....	2.25

H. H. VREELAND, President.

An examination of the rates paid in Glasgow and in New York shows that in every case the American rate of wages is more than double.\*

Deducting the \$1,393,210.81 from the total revenue of \$1,804,897.25, we have \$441,686.44 for rent of one small line, interest on capital, sinking fund, depreciation, written off capital, permanent way renewal fund, the \$43,798.50 payment to the Common Good Fund, and for a general reserve fund. I have shown that nearly \$1,000,000 of the original cost of constructing the track by the city had been wiped out by the private company prior to 1894, so the undertaking is thus, even at the low rate of 2½ per cent interest, relieved of \$24,332.50 per annum, which reduces its interest account to \$67,326.75. A private company, with a capital of \$4,046,195.41, would probably have to pay 4 per cent, or \$161,847.81 per annum interest, instead of \$67,326.75, which is an important saving. The Glasgow Corporation shows hard Scotch sense in writing off \$65,747.30 for depreciation of plant; in setting aside, as it did in 1897, \$72,997.50 for permanent way renewal fund; and in setting aside the remainder for general purposes. A careful examination of these accounts does not indicate that the sums thus set aside are any too great, when we remember that much of the track has been in use for many years, and that constant repairs are necessary. There is, however, another contingency that will surely soon arise, as it is already under serious consideration, namely, an entire change of equipment from horse to mechanical equipment. Under the

\*In this connection the rates of wages paid by the West End Railway Company of Boston may be of interest. The following table has been sent me in response to a request to the officers of that company.

## WEST END STREET RAILWAY COMPANY, SCALE OF WAGES.

Chief inspectors, .....	\$2.75 per day
Inspectors, .....	2.50 " "
Starters, .....	\$2.00, \$2.15 and 2.50 " "
Receivers, .....	\$2.50 and 2.75 " "
Conductors, .....	2.25 " "

Harness cleaners, .....	1.50 " "
Tow boys, .....	9.00 " week
Flagmen, .....	2.25 " day

present act, the Glasgow Tramway has still left and unused borrowing powers of \$781,686.42, which may be utilized for such a purpose; but when that is exhausted the city will have really in the neighborhood of \$5,000,000 invested in a railway system of 32 miles of double track. This, however, is for future consideration; for the present the 800,000 or more people served seem contented with the present track and with horse cars. However the Glasgow experiment may be regarded in Europe, in the United States the Glasgow system cannot be regarded as satisfactory; and a city having such an opportunity, and throwing it away, as Glasgow has done, would be regarded as the man in the parable, who buried his talent in the ground.

A further examination and comparison of the revenue reports of 1896 and 1897 shows that, though the revenue in 1897 was \$177,651.98 in excess of 1896, the working expenses, increasing from \$1,222,026.31 to \$1,393,210.81, practically used up the increased earnings; the amount set aside for interest, depreciation, reserve fund, etc., only showing an increase from \$405,218.85 in 1896 to \$411,686.43 in 1897.

A striking feature of the examination of the accounts of the Glasgow Municipal Tramway experiment, with a view of comparing it with similar undertakings in the United States, is the fact that the actual figures show that, had the same wages been paid labor as in the United States, the total paid out for the year 1897, instead of being about \$632,000, would have exceeded \$1,264,000, making the working expenses exceed the total revenue of the road by \$220,313.56, and left the whole system in a hopeless condition of bankruptcy.

The true history of the Glasgow street railway enterprise certainly indicates that the initiation, in the summer of 1894, of a horse street railway was a mistake, from the American point of view; that the extension of track has been inadequate; that the payment of wages is less than half the sum paid in the United States; and that general expenses are apparently increasing at a greater rate than revenue from traffic. Nor do the figures show that the city is any better off to-day than it would have been under a good lease with a reliable enterprising company, willing to spend the necessary capital to install a modern street railway plant, with mechanical motor and adequate mileage. The old company, bad as it was,—and all companies naturally lack enterprise during the last few years of a lease with little hope of renewal,—wiped out in twenty-three years nearly \$1,000,000 of the cost of construction for the city, which went to the good of the municipal enterprise, but which could have been the source of \$25,000 or \$30,000 clear revenue from a private corporation. The same company contributed \$309,645.92 to the mileage and Common Good Fund. These are all important factors in the problem under consideration, and must be properly accounted for before comparisons of the two systems can be safely and fairly made.

The only question which now remains to be considered is the question of fares. Have the fares been materially reduced? Fortunately, on this point, as on all others, I have a direct statement from Mr. John Young, the capable manager of the Glasgow City Tramways, which he sent me under date of August 9, 1897. Here it is:—

**FARES AND DISTANCES UNDER GLASGOW TRAMWAY & OMNIBUS COMPANY, PREVIOUS TO 1ST JULY, 1894.**

Fare.	Average Distances.
½d. (1 cent),	None.
1d. (2 cents),	.1.12 miles.
1½d. (3 cents),	.1.80 miles.
2d. (4 cents),	.2.20 miles.
2½d. (5 cents),	None.
3d. (6 cents),	.3.23 miles.

**UNDER GLASGOW CORPORATION.**

Fare.	Average Distances.
½d. (1 cent),	.58 miles.
1d. (2 cents),	.1.75 miles.
1½d. (3 cents),	.2.33 miles.
2d. (4 cents),	.3.47 miles.
2½d. (5 cents),	.4.18 miles.
3d. (6 cents),	.5.34 miles.

Mr. Young, as will be seen, has created a halfpenny fare for those who want to ride half a mile, and has increased slightly the distances for the other rates of fare. Mr. Young himself lays great stress on the boon of a halfpenny fare. I fail to see any great advantage in it, except for people in the city districts. As a matter of fact, one can walk half a mile about as quickly as he can wait for these horse trams, which jog along slowly and pull up at each corner. The moment, however, he reaches four miles, or a distance that will take a man from the crowded city to the suburbs, where houses are more plentiful, air better and rents cheaper, the price goes up to two pence halfpenny, or five cents. Much has been done in the way of improvement in various parts of Scotland; but, according to the census of 1891, twenty-two per cent of Scottish families still dwell in a single room each, and the proportion in the case of Glasgow rises to thirty-three per cent. Altogether there are in Glasgow over 120,000 and in all Scotland 560,000 persons (more than one-eighth of the whole population) who do not know the decency of even a two-roomed home. Compare with this phase of Scottish working-class life the fact lately revealed by an elaborate inquiry into the dwelling-houses of our own city of Boston, where rents are high. The number of families dwelling in single rooms was found to be only 1,053, or less than one and one-half per cent, as against Glasgow's thirty-three per cent. It would be difficult to say to what extent a good street railway system would change that condition, though we must realize that the several hundred miles of track have had much to do with spreading population and building up suburban districts.

The average fare last year on the Metropolitan Street Railway was about three and three-quarters cents per passenger, after taking into account the transfers. This sum would not carry you much over an average of three miles in Glasgow. In New York, in Brooklyn and in Boston you can ride a distance of ten or even fifteen miles in almost any direction for five cents. The Glasgow system would simply be impossible in any of these cities, with its six different colored tickets and variegated distances. It may suit the conditions in Scotland, but it would not suit our conditions here. Moreover, it is against all sound principles of rapid transit, which on this side the Atlantic aim to get the people as far out of the city as possible, thus creating business for the street railways, and homes and values for the people. The European system, and especially the British system, seems to be to jog lazily around the cities, pick up the pennies for short distances, and charge such a high rate for the long haul that no public demand is made to extend street railways into districts that may prove unprofitable to the enterprises,—or perhaps I should say undertakings, for there is little enterprise about the British tramway.

While some municipal ownership advocates are eulogizing the system just described, the more advanced undertakings in England are adopting the American plan. Thus the elevated traction of Liverpool has adopted a uniform fare, six cents first class and four cents second class. The Glasgow District Subway, a private enterprise opened since the city has had control of the surface tramways, charges two cents for short distances and four cents all around the city. The London Central Underground Railway I believe has also decided upon a uniform fare of six and eight cents, according to class. This is a wise decision, because the people who ride in the daytime on business can either afford to pay, or, if they cannot, in a majority of cases are furnished by their employers with car fare. It is of much greater importance to afford facilities to those who live on outskirts to enjoy the advantages of better air and cheaper rents. In other places a uniform fare is talked of, but the transfer system has not, so far as my observation extended, been introduced. The facts in the Glasgow case warrant the conclusion that a wide-awake American street car company could have leased the Glasgow tracks when the city took them over, installed a modern system, extended the track, and, with the Glasgow wages, just half those paid at home, carried passengers as cheap, if not more cheaply, than Glasgow is carrying them to-day. It could, furthermore, have assumed all the risk, and paid the city more money per annum, with profit for mileage and Common Good, than it will get by operating the cars itself. If the facts do not indicate

this, those who differ may have a chance to point out wherein these are not reasonable conclusions from the data examined. At any rate, I have been informed of one American syndicate offering to install a mechanical system in Glasgow, and, if granted a reasonable lease, guarantee the Common Good Fund a net income of £50,000 (\$243,325) per annum, the city to assume no risks. This offer may be open at the present time.\* However this may be, the actual results in Glasgow, when put to the American test, in no way indicate that the Glasgow experiment has either solved a problem in street car enterprises, nor is it of the slightest value in pointing out a civic moral, or adorning a municipal ownership tale.

\*It will be noted that Glasgow, at the time of my visit in August, had invested \$4,047,195.41 in its entire street tram car system, including 77 miles of track. In the report of Mr. F. S. Pearson, engineer of the Metropolitan Railway Company of New York, to the city of Liverpool, this well-known authority on mechanical traction estimates (page 48) the cost of equipping with the overhead trolley system 70 miles of single track, with 300 cars and complete equipment, at £911,000 (\$4,433,381.50). Had this course been adopted in 1894, instead of the installation of a horse system, the city of Glasgow would have saved several millions of dollars, and would now have a modern street car system, instead of facing, as the managers are, the problem of installing a new equipment. The detail of this estimate was as follows:—

ESTIMATE OF COST OF EQUIPPING WITH OVERHEAD TROLLEY SYSTEM.

(Seventy Miles of Single Track; Three Hundred Cars and Equipment):

Seventy miles of track, at \$28,469.02 .....	\$1,992,831.75	
Special track work .....	121,662.50	
Extra expense on twenty miles in city district .....	19,466.00	
		\$2,131,927.00
Feeder system, .....	\$ 170,327.50	
Transformers, .....	58,738.00	
Transformer stations, .....	24,332.50	
		253,058.00
Car houses, .....	\$ 194,000.00	
Shops, .....	97,330.00	
		291,900.00
Cars and equipment, 300, at \$2,676.57 .....	\$ 802,972.50	
Snow equipment, .....	29,199.00	
		\$32,171.50
Power station, .....	924,635.00	
		\$4,433,381.50

**BICYCLE BAGGAGE CARS.**

The Long Island Railroad Company was early in the field to cater to the bicycle business and was the first to appoint an official whose duties included the care of the cycling public. In June, 1897, H. B. Fullerton was appointed special agent in the traffic manager's department, to look after the bicycle traffic. During last year 180,000 cyclists were carried; on July 3, between 1 and 4:30 p. m. over 4,000 wheels were checked from Long Island City alone. Mr. Fullerton writes us concerning the methods adopted to increase the business and care for the wheels in transit.

"Cyclists' Paradise," a little hand-book, was published, giving a good map showing the "good roads" and "fair roads" and the various cycle paths which abound on Long Island. It also gave suggestions for tours, routes to all points, hotels catering to the cycling public (and they are many), mileage to all points and extracts from the summer time table. An edition of 15,000 was used and on request was sent to all parts of the United States. It was found absolutely necessary to devise some means for handling wheels quickly and satisfactorily. After careful examination of the various appliances, the one illustrated was selected as best suited for the purpose.

Fig. 1 shows half-sections of round-top and monitor-top cars, and makes clear the manner of suspending the wheels, the positions of the hangers varying somewhat in the different styles of cars. Fig. 2 shows a plan of a 60-ft. baggage

car filled with wheels. The black lines show wheels in holders on the side of the car; the dotted lines those suspended from the roof. The clear passageway is 3 ft. 6 in. wide and the arrangement leaves spaces at all four doors. The number of wheels per car is 136; 68 on the sides and 68 overhead.

FIG. 1.

The Long Island road has six full-length baggage cars so equipped and they prove very satisfactory. The number of wheels per car is somewhat reduced but this method makes absolutely impossible any serious injury or even the scratching of enamel, something that could not be accom-

FIG. 2.

plished in the old method of stacking up wheels loosely in the car and piling others on top.

Besides these regular bicycle baggage cars the company equips its combination and other cars with overhead hooks which enable it to handle the normal week day traffic with ease.

**THE ELECTRICAL EXHIBITION.**

The Electrical Exhibition at Madison Square Garden was formally opened the evening of May 2, in the presence of fully 10,000 people. Dr. Chauncey M. Depew was the orator of the evening. After the oration, he read a message from President McKinley declaring the exhibition open. This was followed by a message from the vice-president.

At Los Angeles, Cal., a few weeks since, a young man attempted to blockade the street railway track and bring the cars to a standstill by a shot across the bow, to the great amusement of himself and companion. He had lots of fun till his ammunition gave out and then he was taken home to sober up. A complaint of assault filed against him was later dismissed.

**MINARY PRESIDENT OF LOUISVILLE RAILWAY.**

J. B. Speed, who for nine years has been president of the Louisville Railway Company, resigned that office on April 20, in order that he might devote more time to his other business affairs, and T. J. Minary was chosen as his successor.

T. J. Minary was born at Versailles, Ky., in 1850, and removed to Louisville in 1869. In 1872 he was chosen secretary of the Central Passenger Railway Company, and four years later was made general manager. In this position he displayed great executive ability and on the consolidation of the five companies into the Louisville Railway, owning and operating all the street railway lines in that city, he was chosen general manager of the new company, which position he has held ever since. He will continue to exercise the duties of general manager as well as those of president, and the recognition of his ability and services is alike gratifying to his street railway friends and the citizens of Louisville.

T. J. MINARY.

**NEW BRIDGE AT NIAGARA FALLS.**

The accompanying illustration shows the progress which has been made in the erection of the steel arch bridge to replace the suspension bridge connecting the New York State Reservation and the Queen Victoria Niagara Falls Park. The distance between the cliffs at this point is 1,268 ft.; the arch of the bridge is 868 ft. long and is connected to the cliffs by steel arms which are 210 ft. and 190 ft. long, respectively. The width of the bridge is 49 ft.; 23 ft. in the center is for a double trolley track. The engineer in charge, and the designer as well, is L. L. Buck, who designed the Grand Trunk bridge two miles down the river, and remodelled the suspension bridges at Niagara.

In constructing the abutments the loose dirt and rock of the debris slope were cleared away until solid rock was reached, and this cut away in step form. On this a foundation of concrete was built. The stones in the abutments weigh from 2 tons to 6 tons apiece. There are four abutments, two on each side of the river, the members of each

pair being 67 ft. apart and each supports one leg of the arch. The shoes of the arch are anchored by eight 3-in. bolts, four of which extend through the stonework into the concrete foundation.

The new arch occupies almost the exact site of the suspension bridge, the only change being to move the American end a little to the south in order to place the abutments clear of the portal of the Niagara Falls Power Company's tunnel. This arch will be the greatest of its class, as shown by the dimensions of other great arches given below:

	Span.	Rise
New Niagara Arch .....	868	150
Louis I, Oporto, Spain.....	566	146
Garabit, France.....	543	170
Pia Maria, Portugal.....	525	121
Eads' St. Louis Bridge.....	520	47
Washington Bridge, New York.....	510	92
Paderno, Italy.....	492	123
Rochester Driving Park .....	428	67
Grand Trunk Arch, Niagara.....	550	114

The rise of this arch is measured from the level of the piers at the skewbacks; the floor is 192 ft. above the water.

**ONE RESULT OF CONSOLIDATION.**

The secretary of the street car union at Detroit is reported as saying, and he says it with regret, that the consolidation of the Detroit Electric with the Detroit Citizens' road has reduced the membership in the local union from 1,200 to about 800. This is a natural result, since by the consolidation the operation of many parallel lines, for the building of which the traffic furnished no justification, was discontinued. The company is also accused of selfish motives in seeking to give the patrons rapid transit, as any decrease in the running time enables the same service to be given in with fewer cars and fewer employes.

**CONDUCTORS SWINDLED.**

A gang of "short change workers" has been operating in Chicago with success. Two or more of these men, well dressed and having the appearance of prosperous business men, will enter a car together. One will offer to pay the fares for himself and companions and present a \$5 bill to the conductor. An accomplice will attract the attention of the conductor and say a few words to him. The first man will then substitute a \$2 for the \$5 bill and hand it to the conductor who, having first plainly seen the \$5 bill and not noticing the difference, will return change for \$5. The scheme has been cleverly worked and the swindlers have escaped.

**LONDON STREET CARS SUPPLY CIGARETTES.**

The proposition has been made to place automatic machines for selling newspapers on street cars, but the experiment of distributing cigarettes in that manner has remained for the North Metropolitan Tramways Company, of London. Two cases are to be placed on each car, one at each end on the outside attached to the hand-rails. By inserting a penny in the slot two ordinary cigarettes will be delivered, or one of superior quality for the same coin. These machines are for the convenience of outside passengers only, as no smoking is allowed in the interior of the cars.

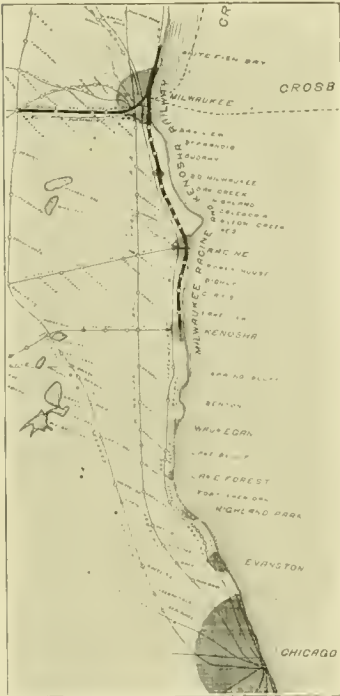

NEW NIAGARA BRIDGE.

### THE MILWAUKEE, RACINE & KENOSHA.

The Milwaukee, Racine & Kenosha Electric Railway Company was organized in August, 1896, with a capital stock of \$250,000, having for its object the building of interurban railways which together with the tracks of the Racine and Milwaukee companies would give a through line from Milwaukee to Kenosha. Work was commenced the following month on the northern section of the line and the first car started January 1, 1897; construction work was pushed on the Kenosha end as rapidly as franchises and right of way could be secured, and this portion of the line was opened in November, 1897.

The company encountered opposition from the Chicago & Northwestern Railway which objected to having its line crossed at grade; after testing their respective rights in the courts the matters in dispute were settled amicably and two subways built under the railroad between Racine and South Milwaukee to avoid crossings at grade. All parties now congratulate themselves on the final outcome. On the southern end of the line two grade crossings with the railroad were avoided by the electric company purchasing its own right of way and not following the highway where the latter crossed and ran on the west side of the railroad. The road there-

fore has not a single railroad crossing excepting that of a spur from the C. & N. W. which runs down to the lake shore and is used for taking out sand only; this of course requires no gates or flagmen.

From Milwaukee to South Milwaukee, 10 miles, the tracks of the Milwaukee Electric Railway & Light Company are used, and in Racine the Belle City Street Railway Company's tracks are used for a distance of 2.9 miles. From the northern limits of Racine to South Milwaukee, 14 miles, and from the southern limits of Racine to the northern limits of Kenosha, 10 miles, the company built its own track; it is expected that a franchise in Kenosha will be secured and the line extended to the heart of the city during the summer. On the southern end of the line the route is quite close to the lake shore, one-third being over a private right of way and a double track line. This portion of the road is nearly free from grades and curves, the worst grades being at the crossing of Pike creek; an iron bridge of 25 ft. span supported on stone abutments was built here. The northern end of the road has many grades and curves; the company has, however, determined to better these conditions as rapidly as it can do so, and will straighten curves and cut down the grades as funds are available for that purpose.

The line is laid with 56-lb. T-rails on ties 6 x 8 in. x 8 ft., spaced 2 ft. between centers; cedar ties are used on straight track and oak ties on curves and at switches. The joints are fished with 4-hole extra heavy angle plates. Atkinson "horseshoe" bonds are used on the north end and Washburn & Moen bonds on the south end of the road. All of the northern section is ballasted with crushed stone, and the work of similarly ballasting the south section is in progress; some 16,000 cu. yds. of stone have been used up to the present time. At the turnouts spring switches furnished by the Cleveland Frog & Crossing Company are used.

The overhead work is carried on a single line of side poles with brackets where the route is in the highway, the track being along the side of the road; and the double pole suspension is used on the private right of way. The poles have 6 in. tops, are 35 ft. long and are spaced 120 ft. apart. From Racine to South Milwaukee there are double trolley wires, No. 00, and from Racine to Kenosha one trolley wire, No. 0000. From Racine north there are two No. 0000 feeders, one 10 miles long and one 7 miles long; from Racine south are two of the same size, one extending the whole distance and the other about two-thirds. Washburn & Moen supplied the wire, and the Ohio Brass Company the brackets, hangers, ears, etc.

On the tracks of the Milwaukee Company that company furnishes the power; a booster was put on this line about 6 weeks ago. On the remainder of the line power is furnished by the Belle City Street Railway, of Racine, and paid for on a car-mile basis.

The rates of fare are: Kenosha to Racine, 20 cents one way, 30 cents for round trip; Racine to South Milwaukee, 30 cents one way, 50 cents for the round trip; from South Milwaukee to the city limits of Milwaukee a 5-cent fare, and from the city limits to the City Hall a second 5-cent fare, is charged, the last two being collected separately and rung up on a register of the Milwaukee Company. When on its own tracks fares are rung up on "International" registers. These rates are just one-half those charged by the steam roads, and were so effectual in withdrawing patronage from the latter, that the Chicago & Northwestern took off its interurban trains between Racine and Milwaukee after the electric road had been in operation for four months.

The map clearly shows the general location of the road. There are no towns other than Kenosha with a population of 10,000; Racine with 30,000, and South Milwaukee and Milwaukee. The intermediate stations, which have received

SQUARE IN RACINE.

names for convenience, are at the switches and turnouts, and are called stations in order to assist in distributing the fares for intermediate distances; the rate between any two consecutive stations is 5 cents. It may be remarked that the question of intermediate fares has been a troublesome one from the fact that the occupants of contiguous farms may in some instances find that one has two fares to pay for a ride which is but little longer than that for which the other pays a single fare.

The trains receive orders by telephone, Andrae telephones being installed, there being booths at the several turnouts or stations; the conductors report only on arriving at South

beginning with the "Ms," Maryland, Massachusetts, Michigan, etc., which names are pleasing to the ear and remind one of the battleships, which we remote from the coast may perhaps imagine cars to resemble in size. One of the new cars, the Maine, is to have a compartment for baggage and express, otherwise it is of the same dimensions as the others. In connection with the car equipment of the road, the Rodgers ballast car, built by the Wells & French Company, Chicago, should be mentioned; Superintendent Nelson states that it is the best investment on the road.

The company has recently built a car barn at the south end of Racine, which is of brick, 51x100 ft., and divided into two parts by a fire wall. There are three tracks, with pits, extending the length of the barn. A lot 600 ft. square was purchased at this point and the offices are shortly to be moved out to the barn, leaving a ticket office and waiting room only in the city.

A short distance below Racine it was necessary to lay a 20-in. sewer along the track for a mile or more to carry off the surface water; this is an expense not usually incident to street railway construction.

The line from Racine to Kenosha is in view of the lake the entire distance, the greater part of the way quite close to the shore, and in summer offers as pretty a prospect as one need desire. There are several points on the line, notably Curtis' Grove and Jacob's Island, the latter, some 20

IN AND NEAR KENOSHA.

Milwaukee, however, if on time; if the car is off its regular time the conductor reports to the office for orders at the intermediate telephones as well.

The company now has nine passenger cars and three more are building; they are all of the same dimensions, 37 ft. over all with seats for 42 persons. They are provided with closets and heated with the Baker hot water system. Card tables are also carried and placed at the disposal of parties desiring to use them.

A controller is placed in the front end only and the cars are turned at the ends of the route; a Y is provided at the Kenosha terminus for this purpose. Six of the cars are mounted on maximum traction trucks, and equipped with two 50-h. p. Walker motors; two are mounted on Peckham No. 14 trucks, and one on Peckham No. 15 trucks. The Peckham trucks are equipped with Westinghouse 38B motors. No. 15 trucks and 38B motors will be placed under the cars now building.

The cars were originally a red color but are now being put through the shop and repainted a dark green, which gives them a handsome appearance, much more pleasing to the eye than the red. Rather a novel feature that has just been introduced is the naming instead of numbering the cars; they are hereafter to be known by the names of states,

SCENES ALONG THE LINE.

acres in area and well wooded, about a mile north of Kenosha, which are very suitable for pleasure resorts, and one or more of them will no doubt be developed in this direction in the near future. Last summer pleasure riding

CURTIS' GROVE AND THE LAKE.

was a source of considerable revenue, and a park on the south end of the line would greatly stimulate this traffic.

The illustrations show Curtis' Grove, a view on Pike creek and scenes in Racine and Kenosha, which give one an idea of the attractiveness of the route.

The line between Kenosha and Milwaukee, from January 1, 1897, to January 1, 1898, carried 400,000 passengers; until July 15, 1897, the northern terminus was South Milwaukee. The receipts during the present year up to date indicate that the number of passengers carried will be fully twice as many as last year, and also that the south end of the line will be fully as busy as the north end. January, 1898, the receipts were two and one-half times as much as for January, 1897.

Cars leave the City Hall, Milwaukee, for Kenosha each hour, and for South Milwaukee every half-hour. In the winter the first car leaves at 7 a. m., in summer at 5 a. m., and the last at 11:20 p. m. Going south from Racine cars

MILWAUKEE, RACINE &amp; KENOSHA CAR.

run every hour; in the morning the second car out starts 30 minutes after the first. When running a six-car schedule two cars are housed over night in Milwaukee, two at the barn of the Belle City road in Racine and two at the company's barn; by this arrangement the first north-bound car starts from the south end of Racine and the south-bound car from the north end, making it convenient for passengers to take the cars.

The projectors of the road were Matthew Slush and A. W. Bishop, and it was owing to their perseverance and hard work that the road was put through, and made the valuable property that it is. They are both old street railway men and have been identified with several similar enterprises, all of which they have brought to a successful issue.

The officers of the Milwaukee, Racine & Kenosha Electric Railway are: Matthew Slush, president; A. W. Bishop and William Grief, vice-presidents; G. J. Hoffman, secretary and treasurer; I. R. Nelson, superintendent; John Skelton, electrician. We are indebted to Mr. Nelson for

NO. 1 SUBWAY, CALEDONIA TOWNSHIP.

courtesies extended and for the photographs from which our illustrations were reproduced.

In connection with the Milwaukee, Racine & Kenosha line the much-discussed through line from Chicago to Milwaukee is of interest, since the former road covers nearly one-half the distance. From Chicago to North Evanston there is the Chicago North Shore Electric Railway. Between Evanston and Waukegan the Bluff City Electric Railway is now building, and already has two sections in operation; one of these is from Waukegan south to North Chicago, four miles, and the other from Fort Sheridan to Highland Park, three miles.

As previously mentioned, the building of a road through Kenosha in the near future is quite probable; this would leave a gap of only 16 miles in the through line, which will probably be built by one or both of the two interurbans, but there are no definite plans in regard to this section as yet.

The reorganization committee of the Metropolitan Elevated, Chicago, has not yet decided upon how the new securities will be issued; it is probable that a scheme will be adopted that will make the fixed charges as low as possible.

## INDIANA STREET RAILWAY STATISTICS.

The accompanying table gives the data for the street railways of Indiana for the fiscal year ending May 31, 1897, as reported to the Indiana Bureau of Statistics. The company at Kokomo has not as yet made a report. Of the 23 companies reporting, one is not operating the road, two (those at Vernon and Jeffersonville) use mules for motive power and the others are all electric roads.

During the year covered by the report no company reduced wages and one, the Ft. Wayne Consolidated, increased the rate for motormen and conductors 1 cent per hour.

In explanation of the large amount for damages in the case of the Citizens, of Indianapolis, it should be stated that this includes legal and court expenses.

## BROOKLYN HEIGHTS ROAD EXPOSES PERJURERS.

Patrick Gorman, the plaintiff in a suit for \$25,000 damages brought against the Brooklyn Heights Railroad Company, and three of his witnesses were at the conclusion of the suit arrested on warrants issued by the judge who heard the case and sent to jail in default of bail charged with perjury.

The plaintiff claimed that on the date mentioned he was driving an ice wagon toward Fort Hamilton when a car of the Brooklyn Heights Railroad Company came up behind and before he could get off the track struck him, throwing him to the street and causing the wagon to pass over him. He claimed that he received injuries from the accident, consisting of a double compound fracture of the lower leg and

The Citizens' Street Railway Company, of Muncie, is capitalized for \$30,000 and has 15 miles of track, all within the city limits. During the year \$22,000 were paid for wages and salaries, and \$35,000 for repairs. There were two fatal accidents; the damage claims paid aggregated \$210.60. Fifty men are employed; the rates of wages, 11 hours constituting a day's work, are \$1.50 per day for motormen and conductors and \$1.25 for laborers.

The Indianapolis & Broad Ripple Rapid Transit Company is capitalized for \$50,000 and has five miles of track, all outside the city. During the year \$8,040 were paid for wages and salaries and \$510 for repairs; on an average 15 men are employed; the rates of wages, 10 hours constituting a day's work, are 15 cents per hour for conductors and motormen and 12½ cents for laborers.

also said that the bones of his ankle were crushed, making him permanently lame.

All the witnesses for the plaintiff testified substantially that they saw the wagon struck by the trolley car. The defendant produced a large number of witnesses who lived on the block where the accident occurred, including two officers, who testified that there was no car on the block at the time the accident happened and that the accident occurred by reason of the plaintiff, Gorman, losing control of his horses, which were running along the street.

The officers said that the horses ran into a telegraph pole, the shock of which threw Gorman out, and that the horses were slewed around upon the sidewalk.

The conspiracy was extremely well planned, the plaintiff imposing on his counsel, ex-Judge Abram H. Dailey.

## ELECTRIC TRAMWAYS IN THE UNITED KINGDOM.

(From our own Correspondent.)

The education in electric tramway matters has proceeded so far in this country that one may take it for granted that the opposition to the overhead wire has almost died out. It is true that there still lingers in more or less remote parts of the country, not even omitting London, a distinct aversion to the adoption of the overhead wire, though it is not too much to hope that even in these places the public will become sufficiently enlightened to permit the introduction of a modern system of electric tramway. It is hardly necessary to say even to American readers that the tramway question in London is very different from what it is in many provincial towns, the general rule being to keep tramways of any description entirely off the principal thoroughfares, consequently the main arteries of the metropolis such as Oxford street and the Strand have not a system of tramways within a mile. Not that the tramways in London do not play a very important part as a means of transportation, but their utility has been chiefly confined to lower class suburbs approached as a rule by mean streets and poor thoroughfares, hence it is always a difficulty to appreciate the argument of the ruling powers that the overhead system was likely to spoil the appearance of the streets.

So determined was the opposition in London against any form of electric tramways that it was generally accepted by electrical engineers that the matter must be allowed to drop for at least some years. Such, however, is not the opinion shared by J. Clifton Robinson, who is laying down an extensive system of electric trams in Middlesborough, and is at the same time the manager of the London United Tramways. Mr. Robinson obtained his enthusiasm for and experience in electric tramways in the United States, and it is to such pioneers that we are in this country mainly indebted for any progress that is made at all in the adoption of electric tramways. In endeavoring to convince the authorities of the many advantages of electric traction in those districts through which the London United Tramway Company's system passes, Mr. Robinson has called in the assistance of the officials of those local authorities in whose districts electric tramways have been in existence for some time. Fortified by these favorable opinions, Mr. Robinson has sought to bring his arguments to bear upon the various local authorities. The opinions that Mr. Robinson quotes are probably nothing more than corroborations of what you have experienced in America, but they are interesting to mention because they clearly show that the somewhat conservative officials in this country are not slow to perceive the manifest advantages of a well designed system of electric tramways. The chief point to which these opinions are addressed is, whether the overhead system would depreciate the value of property? and this undoubtedly is a very important matter considering the districts through which the London United Tramway Company's system passes. The town clerks of the various towns which have already adopted the overhead wire system, however, are clearly against the idea that any depreciation of property follows the introduction of electric tramways. The town clerk of Blackpool states clearly that the Blackpool corporation committee is convinced that there is no depreciation of property. The town clerk of Coventry,

in which town the electric tramway system has been in use for some two or three years, states that the streets through which tramways run are among the most progressive in the city. Two years' experience he states being very satisfactory on the score of safety, health, and efficiency. The town clerk of Dublin states that the overhead trolley traction has increased the value of property along the line from Dublin to Dalkey, moreover he states it to be not more dangerous than horse traction and only one accident has occurred within two years. Opinions from other towns are very similar in character and as I have said before, though opinions in themselves may not be specially valuable to Americans they serve at any rate to show the benefits that have been derived in America from the introduction of electric tramways are being reproduced here.

The question in this country with regard to electric tramways is not so much the difficulty of convincing people of the efficacy of the method, but as to which is the best authority to operate them. It has been shown over and over again in your columns that there is a great disposition on the part of the municipal authorities in this country to put down tramways and work them electrically, in many cases obtaining the necessary electrical energy from a lighting station, and so strong is this feeling among corporations that the local tramway system has been in some cases bought up entirely and is now being equipped for electrical working.

The most striking examples of this occur at Sheffield and Leeds, where the first step taken by the local authority, after the purchase had been made of the tramway property, was to lay down an electrical plant for the purpose of propelling the cars by electricity. Before the advent of electric traction, however, there was a small proportion of ordinary tramways controlled by local authorities. Out of a total of 1,031 miles 367 miles representing 42 undertakings were controlled by local authorities, the remaining 663 miles representing 117 undertakings being worked by companies. The capital expenditure of lines and works belonging to local authorities represented towards the end of last year a sum of £3,222,438 against capital expenditure of £8,177,735 for systems worked and controlled by companies. Apart from the question of electrical working there has been considerable increase in the popularity of tramways as shown by the fact that in 1894 the total number of passengers carried was 616 millions against 788 millions in 1897. There is very little doubt that the introduction of electricity on many of these lines will have the effect of appreciably increasing their popularity.

Although municipalities have shown very great anxiety to equip and operate electrical lines it cannot be said that they have made any very great progress, and we may take it for granted that much of the activity in this direction during the next two or three years will not proceed so much from the corporations as from the companies, and it is somewhat significant as showing the signs of the times when it is popularly stated that the British Electric Traction Company, which is probably the most powerful organization using electric traction in this country, has schemes in hand which will involve a capital outlay of nearly £3,000,000. In the electric tramway systems in actual operation at the present moment, the corporations do not figure very prominently and the total number is under 15 miles against something over 67 miles for companies. The following list shows the comparative difference between the two:

## ELECTRIC TRAMWAYS IN OPERATION.

Municipalities miles.	Companies miles.
Blackpool . . . . . 3.	Bessbrook & Newry . . . . . 3.
Dover . . . . . 3.5	Birminghau . . . . . 3.
Leeds . . . . . 7.	Brighton . . . . . 1.
Southend . . . . . 1.25	Bristol . . . . . 6.
14.75	Coventry . . . . . 6.
	Dublin . . . . . 11.
	Giant's Causeway . . . . . 8.
	Guerusey . . . . . 3.
	Isle of Mau . . . . . 15.
	Ryde . . . . . 7.5
	South Staffordshire . . . . . 8.
	Hartlepool . . . . . 2.56
	67.31

The municipal authorities figure a little more prominently in the lines that are under construction, but even there the proportion is not very much better than in the case of the lines in operation. The following table shows the lines under construction at the present moment:

Municipalities miles.	Companies miles.
Blackburn . . . . . 3.	Blackpool . . . . . 8.
Glasgow . . . . . 3.5	Cork . . . . . 11.
Hull . . . . . 9.5	Coventry . . . . . 5.25
Liverpool . . . . . 3.	Dover . . . . . 40.
Plymouth . . . . . 1.8	Isle of Mau . . . . . 10.5
Sheffield . . . . . 3.	Kidderminster . . . . . 4.48
23.8	Middlesboro' . . . . . 11.
	Norwich . . . . . 19.
	Oldham . . . . . 8.11
	Potteries . . . . . 12.47
	Stoke . . . . . 6.75
	West Hartlepool . . . . . 2.14
	98.70

In fairness, however, to municipalities it ought to be mentioned that at Glasgow the system which is being laid down there will in all probability be followed by a considerable extension over the whole of the system at present owned by the municipality; the same remarks also apply to Liverpool. At the same time it seems a little curious that municipalities of the size of Liverpool and Glasgow that are wholly convinced that electric traction is the best system to be adopted should trouble to make experiments on so small a scale. It is highly probable that the whole of the tramways at present existing in Manchester will be taken over completely by the corporation, and it may be taken for granted that as soon as this is done, electric traction will be applied on a very considerable scale. The extensions of the present electrical plant owned by the corporation are being made with a view to coping with the great demand that will undoubtedly arise.

Turning for a moment to the electric traction schemes that are being carried into effect in London, it is very satisfactory to observe that the near completion of the Waterloo & City Underground Electric Railway and the rapid progress that is being made on the Central London Railway, is having the effect of reviving some of the other underground schemes that were put aside some time ago. Moreover, the schemes that have been resurrected, as it were, have met so far with the approval of the legislature and it will be quite unexpected if two or three schemes that are before the House of Commons at the present moment are not carried into effect. The chief of these is the Hampstead, Euston & Claring Cross Underground Railway, which when completed will be some five miles in length and will tap one of the richest districts in London, and, moreover, will give to residents along the route a means which has never before existed of getting easily and rapidly to the west end of London.

Another important scheme is that of the Brixton & City

Railway which is designed to run alongside the existing City & South London Electric Railway. In this connection a somewhat amusing anecdote was related some two or three days ago and had the effect of causing a mild consternation among financial groups in the city that were deeply concerned in the exploitation of underground electric railways. It was simply to the effect that counsel for one of the new schemes (the Brixton scheme) announced gravely to the Parliamentary Committee that a portion of the existing tunnel of the City & South London Railway was shortly to be devoted to the cultivation of mushrooms. It was not until further inquiry that the fact was revealed that it was a joke on the part of the eminent Queen's Counsel.

The City & South London Railway is making extensions of its line to Islington and the latest inquiries show that it will be ready for opening in about twelve months' time. Considerable credit is due to this company for the manner in which it has combated and fought out the battle of underground electric railways in London. It has had at different times a legislature opposed to it, it has had the vast interests of property-owners along the line, moreover, it has had arrayed against it the authority of the Church, for in one part of the system it was proposed to burrow underneath one of the famous city churches. Still it has persevered and has practically vanquished all opposition with the result that it will very shortly have a most complete system, the extension under erection being all that is necessary to enable the company to pay a handsome dividend.

Before closing this account of the present position of electric traction interests in this country one ought not to omit to refer to the conspicuous success that has resulted in the first few months' working of the Dover electric tramways, because the successful working of this line will have very material influence upon municipalities in extending municipal schemes. The first three months have shown that the corporation has made a considerable profit and that the total cost per car-mile does not exceed 5½d.; and this is particularly satisfactory because the corporation pays a very high price to the local electric lighting company for electrical energy, viz.: 3d. per kilowatt-hour, which is, of course, very much higher than it would have cost them to generate by their own machinery. The next two or three months will show considerable addition to the existing lines. Kidderminster will probably, by the time this article appears, have been opened; Blackpool and Fleetwood will be in operation probably by June; Glasgow will be running electric cars in August; Coventry extensions are well in hand; and before July 10 miles will have been added to the Isle of Man tramways.

More important perhaps than all the Waterloo & City Railway will have commenced to run. Considering the way matters have lagged behind in this country that is by no means bad progress.

### GERMAN ENGINEERING ASSOCIATION OFFERS A PRIZE.

The German Association of Mechanical Engineers offers a prize of 1,200 marks for a plan to lift and turn trains on the elevated electric railway of Berlin. Proposals will be received up to midday October 20, 1898, at the office of the Association, 80 Linden street, Berlin, S. W. The full terms and conditions will be mailed free on application

### WATER POWER IN UTAH.

Mention has been made in the REVIEW of the project to develop power in the cañon of the Ogden river and its transmission to Ogden and Salt Lake City for street railway, lighting and power purposes. Although the plans in all details have not been carried out yet, the plant has been in successful operation for some time. A complete description appeared in the "Journal of Electricity," and we are largely indebted to that article for our data.

Great Salt Lake is about 4,300 ft. above the level of the sea, and to the east the elevation rises to an altitude of 9,000 ft. in the peaks of the Wahsatch mountains. The Ogden river in its course to Salt Lake passes for six miles through a cañon, the fall being nearly 500 ft. The stream drains an area of 360 sq. mi., the volume of water varying from a minimum of 80 cu. ft. to a maximum of 4,800 cu. ft. per second. This has long been recognized as a desirable site for a water power station, but the Pioneer Electric Power Com-

LAYING THE 6-FT. WOODEN PIPE.

pany was the first to put any plans into execution. The surveys were made in 1894 and 1895, and the work commenced in 1896.

It was the intention of the company, not only to generate current to transmit to Ogden, two miles distant, and to Salt Lake City, 35 miles to the south, but also to distribute the power to the mining camps in that region and use the water for irrigation purposes. Ultimately the entire flow of the river will be utilized by constructing a large storage dam and reservoir at the upper end of the cañon, which will have an area of 2,000 acres and a capacity of 15,000,000,000 gals. This great work is not necessary at the present time, and now a small crib dam gives the necessary head for filling the pipe line.

The pipe line leading from the dam to the station is 31,600 ft. long, of which 27,000 ft. consist of wooden stave pipe; the remainder at the lower end is riveted steel pipe. The permissible pressure for the wooden pipe is 50 lbs. per

sq. in., but on the steel pipe it is about 220 lbs. under a head of 440 ft. The line pipe has an internal diameter of 6 ft., which will deliver 250 cu. ft. of water per second, giving 12,500 h. p. available. It was necessary to cut eight tunnels in the rock, the longest of which is 667 ft., and build eight steel bridges and a timber trestle. There are many other novel and interesting details in the hydraulic plant which it is not necessary to mention here.

At the foot of the cañon is the power house, a handsome structure, standing alone in the wilderness. It is 50x135 ft., built of pressed brick with stone trimmings, and having steel roof trusses. A small building to one side is used as a machine and blacksmith shop. There are five Knight tangential water wheels, each being 58 in. in diameter and having 45 bronze buckets. Each wheel has a capacity of 1,250 h. p. at 300 r. p. m. and is direct connected to a 750-k. w. generator. Each water wheel is provided with two flywheels 6 ft. in diameter and weighing 4,000 lbs. These are placed inside of the housing on either side of the wheel and with the armature, water wheel and shaft help to maintain a uniform speed in spite of changes of head and load. On top of the housing of the water wheel is the governor, which is driven from the shaft. The governor is geared to the shaft of a worm wheel which operates an 18-in. butterfly valve. This is used in checking the speed of the wheel by reducing the pressure at the nozzles.

The generators consist of three phase 2,300-volt alternators running at a frequency of 60 cycles per second. They are of the General Electric inwardly projecting pole type with revolving armatures. The current for excitation comes from two 100-k. w. direct current generators running at 500 volts. Both of these are direct connected to a water wheel, and the output of each is sufficient for 10 alternators of the capacity installed.

The generators are connected to the switchboard by three wire 250,000 c. m. cables running through subways under the floor. The generator switchboard extends across one end of the main floor and has seven panels. Five of these are for the generators, one for the exciters and the remaining one for instruments. An alternating current voltmeter, an ammeter and a wattmeter are placed on each generator panel. On the instrument panel are the total load wattmeters, recording voltmeters, water pressure gage, a synchronizer and a ground detector. A small synchronous motor direct connected to a tachometer serves as a speed indicator. Each panel is a slab of marble 36 in. wide and 90 in. high. Two sets of three phase bus bars run the length of the board.

Above the switchboard is a gallery which supports the distributing or feeder board. This board is in two sections, 39 ft. long, and is of beautiful Vermont marble. Each section has six panels, one-half for the primary and the other half for the secondary leads. The lines to Ogden are fed direct from this board at 2,300 volts. The long distant circuits extending to Salt Lake City, 36½ miles, pass to step-up transformers.

Back of the switchboard are nine 250-k. w. single phase transformers which raise the voltage to 16,100. In the transmission to Salt Lake City 2,300 volts are lost. The transformers are ventilated by an air blast coming from two fans driven by small motors. At the sub-station at Salt Lake City transformers reduce the voltage to 2,300 for local distribution. From the sub-station extend two circuits for transmission, one for lighting in the city and one for street

railway and power purposes. The arrangement of the switchboards is such that any generator or set of transformers can be connected to either one of these transmission circuits.

The transmission is over two lines of three No. 1 B & S wire, each transposed every mile. With the present voltage the capacity of the line is 3,000 h. p., but later it is intended to change the transformer connections and raise the voltage to 28,000, which will increase the capacity to over 10,000 h. p. The capacity of the power station will be doubled as soon as the demand for current will justify the move. The building and foundations are ready for five additional units. The transmission line has been carefully designed to prevent any interruption of service and lightning arresters are placed at suitable intervals.

The engineering problems have been carefully worked out by C. K. Bannister, who is chief engineer and secretary of the company. L. S. Boggs has had charge of the electrical features of the project.

Recently a very interesting experiment was carried out to ascertain the limits within which high voltage currents might be used commercially. F. O. Blackwell, of the General Electric Company, connected the ends of the transmission lines together at the distributing station in Salt Lake City and divided the transformers at Ogden, normally used in raising the voltage for transmission, into step-up for the outgoing current and step-down transformers for the incoming current. This gave a complete three-wire transmission circuit of 73 miles in length. The power transmitted amounted to 1,000 h. p., and the voltage at which the transmission was effected reached at times as high as 30,000 volts.

TRESTLE ON WOODEN PIPE LINE.

The current on the return was delivered to resistance vats at the power house, consisting of three wooden tanks.

By careful and repeated measurement with wattmeters at both ends it was ascertained that this power was transmitted with the loss of only 9 per cent, including 4 per cent loss in the two sets of transformers. The drop in pressure due to inductance was practically nil, the capacity of the line being sufficient to compensate for reactance loss.

Continuing the experiment, part of the Salt Lake City station load was run from Ogden, with current at 24,000 volts. This was supplied to about 500 h. p. in synchronous motors and lights for two days, under most severe climatic conditions—rain, fog, and snow alternating. In addition a

severe thunderstorm prevailed all through the night, the lightning arresters discharging repeatedly. Notwithstanding the severity of the conditions under which the test was made, the motors operated without failure and the lights burned without flickering even during the times of lightning discharges. Not the slightest difficulty of any kind developed while this experiment lasted.

By the recent accomplishment of a scheme of consolidation all the electrical plants in Salt Lake City, as well as the transmission plants, supplying current from it to the outside, have been merged into the Union Light & Power Company. The companies thus consolidated were the Pioneer Electric Power Company, the Salt Lake & Ogden Gas & Electric Company, the Big Cottonwood Power Company, the Little Cottonwood Power Company, the Citizens' Electric Light Company, and certain smaller interests.

### INDIANAPOLIS STREET RAILWAY LITIGATION.

For several years the Citizens' Street Railroad Company has been engaged in one of the most notable legal struggles that has found place in our courts, the progress of which has from time to time been reported. The facts on which the suits were based are: The passing of an ordinance in 1880 extending the life of the Citizens' franchises from 1894 to 1901. The grant of a so-called franchise in streets occupied by the Citizens' Company to the City Railway Company for a period of 30 years, beginning in 1893. The passage of the so-called New law by the state legislature in 1897, declaring the rights in the streets to absolutely terminate at the time named in the ordinance giving the franchise. The passage of the 3-cent fare law applicable to Indianapolis in the same year.

One suit between the Citizens' Company and the City Railway Company was decided in the United States supreme court in favor of the former, the franchises granted the latter by the city in 1893 being held invalid, at least until 1901, as the streets in question were already rightfully occupied by the Citizens' Company. In the 3-cent fare case now pending in the United States supreme court the Citizens' Company's claim that the law is unconstitutional has been denied in the state, and up to the present time confirmed in the federal courts.

The Circuit Court of Hamilton County has recently decided in favor of the city in a suit brought by it against the two companies which claim the streets. This resolved itself into a three-cornered fight, each of the defendants agreeing with the city so far as the latter's claims regarding the other company were concerned. The court held that the grant to the City Company, which the United States supreme court decided could not in any event take effect until 1901, was invalid on the ground of public policy, the council not having power to make a contract concerning such matters in 1893 to take effect eight years later. Also it was held that the extension granted to the Citizens' Company, some seven years before the original grant expired, did not involve the same issues, being for a continuation of the service and not a new service. Also the New law was held to be constitutional.

Both companies will appeal from so much of the decision as is adverse to them.

## IMPROVED DEVICES AND METHODS FOR THE SAFE OPERATION OF CARS ON INTERURBAN AND CITY LINES.

(Continued from February.)

In connection with block signal systems for interurban roads the track instrument recently put into use on the Metropolitan West Side Elevated Railroad of Chicago will be of interest. Various complicated contrivances for making an electrical connection by the passage of the wheels of a train have been proposed and put into use from time to time. This one, however, is the acme of simplicity. It is used on the Metropolitan for giving annunciator signals at the stations telling of the approach of trains, but can also be used for block signal purposes. The accompanying drawing will make the plan plain. A piece of timber is laid just outside one rail, and on it is a strip of flat steel  $\frac{1}{8}$  by 2 in. Under the timber is rubber to afford a spring.

METROPOLITAN TRACK CONTACT.

The steel strip on top of the timber is a little above the level of the rail. The annunciator wire is connected to the steel strip and the passage of the car wheels connects it to ground.

The "Hamilton & Dayton Fast Line" between Hamilton and Dayton, O., is operated by two companies; from Dayton to Mianisburg, 11  $\frac{1}{2}$  miles, by the Dayton Traction Company and from Mianisburg to Hamilton, 27 miles, by the Cincinnati & Miami Valley Traction Company. These two companies have the same president and the same general manager, and are soon to be consolidated. Through the courtesy of the general manager, W. G. Wagenhals, we have received a description of the block signal system which has been in use on the line for over a year.

The turn-outs are located about two and one-half miles apart, and at each one is placed a signal box located on a pole sufficiently near the track so that the motorman can throw the switches without leaving the car, although the car must be brought nearly to a stop. The signal box, which is shown in Fig. 1, has a partition down the middle, dividing it into two compartments; in one are placed three and in the other two incandescent lamps, the light from each set being visible from one direction only.

The scheme of wiring is shown in Fig. 2. In each box are two double-pole switches which make contact with a ground wire or with a branch of the trolley wire. The

group of three lamps in one box is in series with the group of two at the next, a No. 12 iron wire being carried on poles to make this connection. Five lamps are used in series to cut down the voltage, since the lamp current is taken from the trolley wire. The life of the lamps may be increased by increasing the number in series; a good light, however, is necessary during the day, especially if colored glass is used in the boxes, to make the signal visible.

The operation will be readily understood from Fig. 2. Suppose a car to approach box No. 1, connections being as shown; both ends of line A are grounded so that the lamps,  $b_1$  and  $b_2$  are turned off; also, since the block A is protected the lamps at  $a_0$  and  $a_1$  are burning, the left hand switch at box No. 0 being on the ground contact. The motorman arriving at box No. 1, throws the left hand switch lighting the lamps at  $b_1$  and  $b_2$ , blocking any car that may be approaching on section C, or following on section A. He next throws the right hand switch, putting out the light at  $a_1$ , and also at  $a_0$ , the station behind him, and opening that block.

If on approaching a switch the box shows a light, as would be the case in approaching No. 3 from No. 2 with the switches set as shown, the car is blocked and must wait till the one in section D leaves the block, either at No. 3 or at No. 4, as its direction may be.

When two cars meet at a turn-out they merely pass and do not change the signals since both are burning, and properly protect the trains.

It is seen that where the lamps in a circuit are not burning the two switches must be either both on the ground

WIRING AND APPARATUS.

connections or both on the trolley connections, and in either case the movement of one switch only is necessary to turn the current through the lamps.

Mr. Wagenhals states that this signal system has been in operation for over a year and has given entire satisfaction. For the benefit of others who may contemplate making similar installations, it may be well to call attention to some of the difficulties encountered by Mr. Wagenhals before perfecting the arrangement. The first switches used gave no end of trouble owing to the fact that no provision was made in the way of a spring or other device to hold the switch lever in position after it was once put there. The present switch is made by a local concern and gives satisfaction; it is shown in Fig. 3. Another source of trouble was the burning of the contacts; this is eliminated in the present switch by making provision for the renewal of the contacts when they become worn.

### RIGHT OF WAY OF FIRE TRUCKS.

Nearly if not all cities have ordinances giving fire trucks the right of way over all vehicles. The only other vehicles on the streets which are sufficiently heavy and moving fast enough to make a collision with a fire truck other than a very one-sided affair in favor of the truck, are street cars. No one doubts but that it is proper for the fire department to have the right of way, but the question has arisen as to which of the parties in recent collisions was negligent and caused the accident.

Some two years ago a fire truck was struck by a street car of the Des Moines City Railway Company and overturned, and the driver, James T. Murfitt, so injured that he was compelled to resign from the service. He sued for damages on the theory that the ordinance giving to fire apparatus the right of way on all thoroughfares within the city was sufficient notice to the street car company and its employes, and that the motorman was guilty of negligence in not stopping the car when he saw the hose wagon approaching.

The case has been decided in the district court, a verdict of \$1,400 being rendered against the company. The court instructed for the plaintiff on the question of the validity of the ordinance, and stated that the question of whether or not the hose wagon could have been stopped should not enter into the case. He instructed that the question for determination was whether or not the motorman could stop the car after he saw the wagon approaching, or from the time he heard the gong striking. To this special interrogatory on this question the jury answered that it believed he could, and that he was guilty of negligence in not stopping it.

These questions have never been raised before in Iowa and the case will probably be carried to the supreme court for an adjudication. In a recent case decided in Michigan the supreme court held that driving a fire truck to a fire so rapidly that on approaching an electric street car track it is impossible to stop in time to avoid a probable collision, constitutes negligence on the part of the driver, although by city ordinances he had the right of way.

The Oneida (N. Y.) Railway Company has won in the suit brought against it by the village of Oneida for street paving.

### EUROPEAN ELECTRIC LOCOMOTIVE.

Electric lines connecting manufacturing concerns with shipping points are being built in some parts of Europe. The "Zeitschrift für Elektrotechnik" describes the latest project of this kind. A narrow gage line was built from a brewery in Zipf, Upper Austria, to the railroad station, and one electric locomotive was put in service to haul the freight cars from the station up to the brewery. The grade is almost continuous, so that after starting no tractive effort is necessary to run the cars from the brewery to the station.

The electric locomotive is radically different from those of American make. It is rather a diminutive affair, a 15-h. p. motor supplying the power. The motor is spring mounted on the axle bearings, the lower portion forming a part of the truck. The motor is bi-polar, series type with enclosed case, dust and water proof. At one end of the motor shaft is the pinion meshing with the gear, which also serves as a crank disc. Two connecting rods extend from the gear

AUSTRIAN ELECTRIC LOCOMOTIVE.

to the wheels, and in this way both axles are driven from one motor. The wheel base is less than 5 ft. and no difficulty is encountered in rounding curves.

The arrangement of the trolley stand and pole is peculiar, being placed on a bracket at one side of the cab. This was necessary, as the railroad passed through tunnels but 9¾ ft. above the rails, and the top of the cab is only 6 in. lower than that. The trolley wire is to one side of the cab and slightly above it. A rheostatic control is used and hand brakes. Very steep grades are encountered, so that the brakes, sand boxes and all the braking mechanism are carefully inspected to avoid accidents. Two seats, back to back, are provided in the cab for a few passengers who may desire transportation.

The voltage is kept at 500 on the trolley line. The current consumption is small, as the motor is generally efficiently loaded in hauling two or three small freight cars up grade. The driving wheels are 27½ in. in diameter, and with a motor speed of 290 r. p. m. the speed is only 6¼ miles per hour.

The policy of the New England states in restricting inter-urban electric roads to carrying passengers only unless legislative permission be secured, is found to inconvenience the patrons far more than the companies themselves. At each session of the several legislatures there are numerous petitions for the privilege of carrying parcels or freight, and the wonder is that a general law has not been passed ere this.

## MOTOR CABS IN LONDON.

The electric cab service, inaugurated by the London Electrical Cab Company about seven months ago, contrary to the predictions of some engineers, is still in operation. Ordinary cabbies are trained as drivers. The cabs have been carefully designed, especial attention being given to a construction as consistent with safety. The storage cells weigh 1,400 lbs. while the total weight of cab including two passengers and the cabbie is only 3,000 lbs. This compares quite favorably with battery cars which weigh about 26,000 lbs. and the cells about 5,000 lbs. In the cabs there are 40 cells with a capacity of 170 ampere-hours and a discharge rate of 30 amperes. The Electrical Power Storage Company has contracted to make all repairs and renewals at the rate of 10 per cent per year of the initial cost of the batteries, which was about \$250 per set. As may be seen in Fig. 1 the cells are beneath the body of the cab, thus giving the vehicle great stability. A 3-h. p. Lundell motor is geared to a countershaft, the reduction being 25 to 1, and from this the rear axle is driven by means of a chain. The motor has double wound armature and fields, two commutators and four poles, so that for controlling purposes it is equivalent to two machines. There are ball bearings throughout. The

FIG. 1.—ELECTRIC CAB.

series-parallel controller is similar to that on a trolley car. The first step in starting connects the two armature windings and the two field windings in series with a small starting resistance to the batteries. This is not a running speed, but is only intended to start the motor. On the second step the windings are still in series, with the resistance cut out. With this arrangement the cab runs at a speed of about three miles an hour. The third step places the armatures in parallel, but leaves the fields in series, and the cab runs at seven miles an hour. The fourth step places the field windings in parallel, and the speed is nine miles an hour. Thus three normal running speeds allow the full energy of the current to be utilized in the motor without any loss by resistance. In the reverse direction from the top position, the series-parallel controller on the first step short-circuits the motor through the starting resistance, thereby braking the cab. On the second step backwards the motor is com-

FIG. 2.—CHARGING STATION.

pletely short-circuited, bringing the cab to a dead stop, and the third step backwards reverses the connections between the armatures and fields, all being in series, to enable the cab to be moved at the slowest speed backwards. One charge will propel the cab about 50 miles at a stated cost for power of 1.5 cents per mile. Fig. 2 represents the charging gallery with the transfer table for conveying the cells from the dynamo circuits to the cabs.

## A NOVEL DAMAGE CASE.

The Brooklyn trolley lines have been accused of all kinds of crimes but it remained for a recent damage suit to provoke the assertion that the home of a law-abiding citizen would be invaded and the household effects destroyed. A woman, whose house is on the 8th street line of the Nassau Electric Railroad Company, served a complaint upon the claim department, alleging that on June 4, 1897, her furniture was damaged to the extent of \$500 due to the current from the trolley wires.

It is claimed that the trolley line in front of her residence fell to the street, was picked up by an inspector and tied to a lamp post. The current was transmitted by the gas pipe into the house and melted a lead water pipe which was in contact with the gas pipe. The water flooded the floors, damaging the furniture and carpets. Although this is alleged to have occurred in June, 1897, it is only at a recent date that the action has been brought. It is needless to say that the company is not worried about this suit, but it shows how versatile the accident lawyers of Brooklyn have become.

## NO LIEN FOR MATERIALS IN BALTIMORE.

The mechanic's lien laws of the several states have in general placed mechanics and "material men" on the same footing in providing that they shall have a lien on property for labor or materials furnished, and the action of the last Maryland legislature in amending the lien law is worthy of note. The amendment applies in the city of Baltimore only and strikes out the words "and material furnished" after the words "work done" in the old law so that now manufacturers, dealers, contractors, etc., have no lien in Baltimore for materials furnished.

The Janesville (Wis.) Street Railway Company is to try a 3½-cent fare, selling 28 tickets for \$1, the same to be used within 20 days.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

**Motorman Cannot be Called as if on Cross-Examination.**

The motorman being neither a party to nor a person having legal interest in, a suit brought to recover from a street railway company for the killing of a child, the supreme court of Pennsylvania holds, in Callery against Easton Transit Company, March 21, 1898, 39 Atlantic Reporter, 813, that the parties suing the company have no right to call the motorman as if on cross-examination.

**Need Not Have Intelligence of Grown Person.**

A boy has such appreciation of the danger of crossing street car tracks as to render him subject to the consequences for a failure to use his reason and senses in an effort to avoid it, the supreme court of Michigan holds, in Henderson against the Detroit Citizens' Street Railway Company, March 22, 1898, 74 Northwestern Reporter, 525, if the boy has sufficient intelligence to appreciate the danger, and has in mind the necessity of taking precautions, it not being necessary that he have the intelligence of an adult or grown person fully.

**Territorial Limit to Right to Use Invention of Employee.**

Under an agreement with an employe whereby if he invents anything of sufficient novelty to be patentable a patent is to be procured in his name at the expense of a street railway company and an assignment made to the company of the rights to use such patent or patents without payment of any royalty, the United States circuit court holds, in Earl against the Metropolitan Street Railway Company, February 19, 1898, 85 Federal Reporter, 214, that the license to the company to use the invention covered by such patent or patents would not extend without the limits of that company, as determined by its franchise at the time of the agreement to other roads afterwards acquired from other corporations, or by new extensions.

**Employment by Another Company Does Not Disqualify Juror.**

The mere fact that a juror in a personal injury case against a street railway company was in the employ of another street railway company, without a showing as to what that employment was, affords no reason, on its face, the supreme court of Wisconsin holds, March 22, 1898, for excusing the juror for cause. The disqualification, it further declares, Kohler against the West Side Street Railroad Company, of Milwaukee, 74 Northwestern Reporter, 568, could only arise upon some showing of fact from which a fair inference could be drawn that his duty as a juror in the case would clash with his duty to the company, or that his relations to the company were such as to be likely to bias his judgment.

**Duty of Motorman in Fog.**

A motorman was injured by a collision with a truck loaded with a "merry-go-around." He sued the company

that owned the truck, and recovered a judgment for damages. The testimony tended to show that there was some fog that morning, and the motorman testified that the headlight did not throw a light more than 20 ft. ahead of the car, so that he did not see the vehicle until within 20 ft. of it, while it required 25 ft. to stop the car. Under these circumstances, the supreme court of Michigan holds, La Pontney against Shedden Company, March 29, 1898, 74 Northwestern Reporter, 712, that the motorman was guilty of such contributory negligence as precluded recovery of damages and required it to reverse the judgment of the lower court. It says that the motorman knew it was entirely proper for drivers of vehicles less easy to be discovered than that with which he collided to be traveling the highway ahead of him, and that he owed a duty to such occupants of the street, as well as to himself, to use care to avoid a collision. It was the motorman's duty, declares the supreme court, to have the car under such control as to admit of its being stopped after he became able to discern objects on the track, and before a collision with such objects should occur.

**Legitimate Use of the Highway.**

The rule is stated by the court of appeals of Kentucky to be that a street railway may be placed and operated upon any part of a public street of a municipal corporation which is used by vehicles without increasing the burden of the servitude, as the right to use the land for street purposes is called, and the owner of the fee, or ultimate title, is not entitled to compensation because of such use of the street upon which his property abuts merely because he is affected by the proximity of the tracks to his property, without proof of special damage resulting therefrom.

Applying this doctrine to the appealed case of the Ashland & Catlettsburg Street Railway Company against Faulkner, the court holds, March 26, 1898, 45 Southwestern Reporter, 235, that there was nothing which would authorize a recovery of damages from the company so long as it built its railway upon the turnpike road, the track having been laid down at grade on the road, the only elevation being the height of the rails, 2 in. or 3 in., the road between the rails being ballasted with gravel and a crossing of 3-in. plank being put on each side of the track, 12 or 15 ft. long, though the east rail was but about 7 ft. from the complainant's building, which was used for saloon purposes, with the space in front formerly utilized for teams to stop on.

If the diminution in the value of this man's property arose solely by reason of the location of the road in front of his property, the court insists that this of itself furnished no ground of complaint, as the whole trend of modern authorities is to the effect that the operation of a street railway is a legitimate use of the highway, and an exercise of the public right of travel.

Justice Guffy most vigorously dissents, contending that, in reversing a judgment for \$665 damages, the majority decision was not sustained by the law and constituted an invasion of the province of the jury as to the finding of facts,

and would be far-reaching in its effects upon the rights of property holders.

---

**Not Inclined to Relax Care Required at Crossings.**

---

Pedestrians have the right to cross over streets and avenues, and it is obligatory upon railway companies in using the streets not to interfere with such right. This duty of looking out for passers-by is greater when cars are approaching a crossing, because at those points people in fact are more likely to be met with, and it is incumbent upon those in charge of the cars to have them under such control, and to run them at such a rate of speed, as to enable those who are crossing prudently to do so, with complete safety.

After laying down these general principles, the first appellate division of the supreme court of New York goes on to say, March 11, 1898, that it is not inclined to relax the rule as to the degree of care required of those managing street cars, as now propelled by new methods, and which in the crowded streets and at the crossings are a menace and a danger to passers-by.

But, while the responsibility and vigilance exacted of those managing the cars is increased, the court declares that it is powerless, without disturbing a long line of well-settled authorities, to absolve passers-by from observing some slight care and caution so as to avoid being injured.

It was unanimously agreed by the members of the court that there was proof given by the party suing which made it proper to submit the question of the railway company's negligence to the jury, because it appeared that the gripman in the management of his car, instead of performing his duty by observing objects ahead of him upon the track, had his attention diverted by looking at some women who were on the sidewalk.

On the other hand, the court, with two members dissenting, holds fatal to a judgment for the party suing, *Martin* against the Third Avenue Railroad Company, 50 New York Supplement, 284, the fact that there was no evidence from which the jury could have been justified in inferring that the man killed did anything, either in the way of increasing his speed or using his eyes and ears, thus manifesting that he was on the lookout for or conscious of an approaching car, or that while crossing the tracks he did ought to avoid the situation from which his injuries flowed.

---

**No-Fender and Motorman Risks Assumed by Employes.**

---

An employe of an electric railway company was run down and killed by one of its cars while he was engaged in the work of clearing away the dirt and refuse which had collected upon the company's track. When the company was sued for damages, for the benefit of his estate, negligence of the company was imputed to its failure to provide suitable fenders or guards for its cars, thereby rendering them unnecessarily dangerous to those of the company's employes who worked upon the track, and also in knowingly employing an unskillful and incompetent workman to operate the car which ran down this particular employe.

So far, however, as the negligence of the company in failing to provide its cars with fenders or guards was concerned, the supreme court of New Jersey thinks it enough to say

that, even if it be conceded that such omission rendered the cars more dangerous to employes working upon the tracks than otherwise they would have been, no liability can be predicted upon such negligence.

It is entirely settled both in the courts of this country and of England, says the court, that if an employe chooses to enter into an employment involving danger of personal injury, which the employer might have avoided, the employe takes upon himself the risk of all the hazards incident to the employment, the existence of which are known to him, or which are plain and obvious, and which he has no reason to expect will be counteracted or removed, and that no action will lie against the employer for injuries to the employe resulting from such dangers. Upon this principle, inasmuch as the fact that the cars of the company referred to were operated without fenders or guards was perfectly obvious, the court holds that if the operation of the railway was thereby made more dangerous, the risk of injury from such danger was assumed as one of the risks of his employment by the employe, as above stated.

As to the duty which an employer owes to its employes in the selection of their fellow servants, the supreme court says, *Chandler* against Atlantic Coast Electric Railway Company, 39 Atlantic Reporter, 674, that it is to use reasonable care and prudence therein; and, if it knowingly employs or retains in its service an unskillful or incompetent workman, it is responsible for injuries received by an employe through the unskillfulness or incompetency of such workman. This is given as the measure of duty of the company with regard to the employment and retention in its service of the motorman in question, so far as concerned other employes.

---

**General Incompetency of Motorman and Private Rules Disregarded.**

---

For evidence of the general incompetency of a motorman, based on the observations of witnesses who had seen him operate his car on prior occasions, to be admitted in the trial of an action brought to recover damages for injuries sustained by a stranger, a traveler on a public street, by being run into, the supreme court of Minnesota holds was error. It says that if the motorman was negligent on this occasion, the company was liable, no matter how competent he was or how habitually careful he had been on other occasions. On the other hand, if he was not negligent on this occasion, the company was not liable, notwithstanding that he may have been incompetent or habitually careless on former occasions.

The sole issue (aside from that as to contributory negligence on the part of the party suing), it further explains, was whether or not the motorman was guilty of negligence at the time of the accident. When the act or omission was proved, whether it was actionable negligence was to be determined by the character of the act or omission itself, and not by the character of prior acts of the party committing it. Were evidence of general incompetency admissible, with equal propriety could evidence of the general carelessness of the party suing be proved, upon the issue of contributory negligence.

Moreover, while there are a few cases which maintain that rules such as those of a street railway company intended only for the guidance of its own employes in the operation

of its cars may be introduced in evidence to show what duty the company owes to the public in the operation of its cars, the supreme court of Minnesota takes the position that the private rules of a company, intended only for the guidance of its employes, and not known to the person suing it, are not admissible in evidence for any such purpose. It declares, Fonda against the St. Paul City Railway Company, February, 1898, 74 Northwestern Reporter, 166, that a company can not, by the adoption of private rules, fix the standard of its duty to others, and that it may, out of abundant caution, adopt rules requiring of its employes a much higher degree of care than the law imposes,—a practice which ought to be encouraged, and not discouraged.

Finally, it holds that the company having omitted to call its motorman as a witness, although within reach and available, the trial judge was, under the circumstances, justified in instructing the jury that in weighing the effect of the evidence actually introduced, they were at liberty to presume that the testimony of the motorman, if introduced, would not have been favorable to the cause of the company.

---

#### Negligence Does Not Excuse from Use of Care.

---

Although the person suing to recover damages for personal injuries may be guilty of negligence, the company sued cannot thereby excuse itself if, by the exercise of due care, its agent could have avoided the accident, after discovering the negligent party in his perilous position. This rule, which has been adopted as an exception to or modification of the general doctrine that a person suing who is guilty of contributory negligence cannot recover damages, the court of appeals of Maryland says is a very just one, as the law will not permit the loss of life, limb, or even property, to be deliberately and carelessly inflicted, when it could by reasonable care and caution be avoided, merely because the injured person was negligent. However, it adds, the rule should not be extended too far, but should be kept within proper bounds.

When it is clear that the person suing was guilty of negligence, there must be evidence from which the jury can fairly and reasonably find the company liable for violation of duty after the person suing has thus negligently placed himself in danger, in order to avoid the legal effect of his own negligence.

To illustrate: the court holds, in the appealed case of Baltimore City Passenger Railway Company against Cooney, March, 1898, 39 Atlantic Reporter, 859, that if a boy 11 years of age, of whom there was no evidence that he was deficient in his mental faculties, did stand for three or four minutes in the center of the track with his back towards the direction from which the car approached, he was clearly guilty of negligence, but that would not justify the motorman in running over him.

On the other hand, if, in point of fact, the boy was not on the track, and not in the way of the car, the court says that there was no reason, so far as he was concerned, to sound the gong. If he intentionally got on the track just as the car reached that point, without first looking to see if a car was coming, he was guilty of contributory negligence; and, if he got on by stumbling and falling on the track too late for the motorman to see him or to prevent running over him, the company was not liable.

The court further holds that it was error to refuse to permit the company to ask its master mechanic whether a boy could "steal a ride" on the car that ran over the one suing by hanging on the ledge on the side of the car, and putting his feet on the truck or bar between the truck and wheel guard, when its theory of defense was that he was injured in that way, though questions could not be propounded with reference to other cars.

---

#### Liability in Maintaining Pleasure Grounds.

---

A Massachusetts statute of 1895 authorizes street railway companies to acquire, hold, equip, and maintain real estate to be used for purposes of recreation and for pleasure resorts, the admission being free.

By virtue of this statute the Lowell, Lawrence & Haverhill Street Railway Company maintained such a place on the line of its railway, which contained a large platform or stage for exhibitions. The company entered into a written contract with a manager, under which the latter furnished and managed various entertainments there, and, among them, an exhibition of markmanship by a man born without hands. It paid for advertising these exhibitions, and carried posters on its cars.

A man by the name of Thompson, having seen an advertisement, was a spectator at an exhibition of markmanship, going to the place on one of the company's cars. Immediately after a shot had been fired, something struck him in the eye. There was no suggestion that he was not in the exercise of due care, or that he was not in the place provided for spectators.

All the appliances were furnished by the manager or the performer, and nobody in the company's employ exercised any supervision or control over the performance. A butt was provided to receive the bullets, and on the evidence the jury might find that the man was struck in the eye by a small fragment of a bullet or other metallic substance which flew from the impact when the bullet hit the butt, though it was not made plain just how the accident occurred.

Thompson obtained a verdict for \$5,045 against the street railway company. This, the supreme judicial court of Massachusetts refuses to disturb, April, 1898, 49 Northeastern Reporter, 913.

It holds that the jury were properly instructed that the company was not responsible unless the exhibition was in its nature such that it would necessarily or probably cause injury to some person present under its invitation, unless guarded against, and the company failed to exercise due care to prevent harm. The fact that the exhibition was provided and conducted by an independent contractor, it says, would not wholly relieve the company from responsibility, provided it was of such a kind that it would probably cause injury to a spectator, unless due precautions were taken to guard against harm.

The court holds that the case was rightfully submitted to the jury, and that the evidence would sustain a finding that the accident happened from a cause that ought to have been foreseen and guarded against by the street railway company. Nor does it consider that the spectator assumed the risk. It says that he might well rely on those who provided the exhibition, and invited him to attend, to take due care to make it safe from such an injury as he received.

#### Power to Prescribe Frequency of Running Cars.

The supreme court of Michigan holds, in *People against the Detroit Citizens' Street Railway Company*, March 15, 1898, that the common council of the city of Detroit had the power to adopt an ordinance, in February, 1897, requiring the street railway company to "provide sufficient cars upon Gratiot avenue so that a 6-minute service shall be given upon said avenue between Mack and Sheridan avenues between the hours of 5:30 a. m. and 10 p. m." In reaching this conclusion, it maintains that the ordinance of 1897 involved was given and accepted with the understanding of all parties to it that the provision in section 4 "that the cars on all lines subject to this ordinance shall be operated as the public convenience may require and the common council order" should control, rather than that that ordinance should be so taken as an extension of the 30-year ordinance of 1862 that its provisions not requiring more than three cars an hour during the day should govern.

If, under the contract relations existing between the city and the company, the former had the right to pass the ordinance of 1897 referred to, the supreme court further holds that the common council had a right to provide a penalty for its violation.

It was said, in substance, that if the power to determine with what frequency the cars should be run was lodged with the common council, the chances were that the public interests would not be subserved, but private spites and hatreds gratified, and that a corrupt council might sap the life blood of industries in cities unless the corporations should "see" the members of the council. But the answer of the supreme court to that is, 74 *Northwestern Reporter*, 520, that it cannot presume that members of a common council are actuated by improper motives, or that their actions towards corporations are actuated by improper motives.

Conceding, however, the above contention to be true, the court says that there would be two remedies. First: The aid of the criminal law should be invoked to punish alike the members of the council whose official acts are influenced by corrupt means, and the corporation which makes use of the corrupt methods to improperly influence official action. The second remedy is for the people to elect honest members to the common council.

The common council acts as the public and municipal agent, and, in the passage of an ordinance affecting subjects of municipal administration, it should and will be presumed that the council acted in the exercise of a judgment upon the facts, and their judgment must control until it has been shown that it has been improperly exercised.

Yet, if it was clearly made to appear that the action of the council was capricious and arbitrary, or that the public convenience did not require the provisions contained in the ordinance, the supreme court suggests that, without doubt, the courts might intervene.

But, without trial, it thinks, no one could say that the provisions of the ordinance were unreasonable.

#### Right to Leave Car Unblocked on Side Track.

A small flat car weighing from 1,500 to 1,800 lbs. was detached from the motor car and left on a side track, in a public highway, at Port Huron, Mich. The car had no brake, and there were no blocks or anything put under or beside

the wheels to prevent the car's being rolled, according to some of the testimony, although the conductor testified that he blocked the wheels with a stone and a stick, which could be removed, however, by the kick of a small boy, if he hit it hard.

A little girl, nearly seven years of age, coming from school saw eight or ten children playing with the car, pushing it a short distance west, and then returning it east, some riding and the others pushing. She climbed upon one end of the platform to ride, and, without having got into the box, either slipped or was pushed in the play from the car, falling in front of the wheels, one of the wheels running over her leg, and causing injuries to recover damages for which the street railway company was sued.

This brings out an interesting decision by the supreme court of Michigan, wherein it reverses a judgment entered against the company and denies a new trial. It says, *Kaumeier against City Electric Railway Company*, March 15, 1898, 74 *Northwestern Reporter*, 481, that the car in question was not dangerous in its construction, which it considers takes the case out of the rule adopted by the supreme court of the United States and the great majority of the state courts relative to leaving a turntable or other like dangerous machinery, likely to attract children, unsecured.

True, the car stood upon a track where it might be moved by several children applying their united strength. So might several children, in the same way, move a wagon or carriage left beside the highway. But the court says that it apprehends that no claim of negligence could be sustained against the owner of such a vehicle if one of the children climbing upon it should fall off, and be run over, even if the wheels were left without blocking. Therefore, assuming that the company left the car without sufficient blocking, the supreme court says that it must be held that this suit could not be maintained against it, for the reason that there was nothing in the case showing or tending to show any negligence on the part of the street railway company.

The court does not think it necessary to say that the little girl was a trespasser in going upon the track there, which was laid along the highway. But it does declare it proper to say that she was a trespasser in any attempt to use the car.

The street railway company had just as much right, is the final assertion of the court, to leave the car where it did as would a farmer have to leave his wagon or carriage upon his own side of the highway, and no one would have the right to move it, except upon the claim that it impeded public travel. The car being rightfully left where it was upon the track, and not being a dangerous thing in itself, the trial court should have directed a verdict in favor of the street railway company.

#### As to Liability for Malicious Prosecution by Conductor.

Assume, for the sake of argument, that a person entitled to ride on a street car without paying additional fare is not only wrongfully ejected therefrom by the conductor for refusing to pay additional fare, but is arrested and prosecuted at the instance of the conductor for violating a city ordinance making it a misdemeanor for any person to ride on a street car without paying his fare, and that from the conductor's acts in relation thereto malice on his part may be inferred,

will the street railway company be liable for the acts of its employe, the conductor, in this regard? The supreme court of Arkansas makes these assumptions, in order to squarely decide the question stated, in the appealed case of the Little Rock Traction & Electric Company against Walker, March 19, 1898, 45 Southwestern Reporter, 57.

There was no proof here of an express authority from the company to the street car conductor to prosecute a passenger for refusing to pay his fare. Moreover, the court declares that there was no connection whatever between his authority to put a delinquent passenger off his car (given expressly under the rules of the company), and thus prevent a further imposition on the part of the passenger, and the authority to arrest him and prosecute him for a violation of the criminal laws in attempting to ride on the car without paying his fare.

But, to prevent this case being set down as an unlikely one of repetition, it is important to notice that the conductor, according to his own testimony, only directed the policeman he called to put the passenger off, while the latter testified that he was directed to arrest him and take him off, and the court thinks that in all probability the conductor never intended to do more than put the passenger off the car, never having the idea of prosecution, malicious or otherwise.

And the court holds that the limited authority of a car conductor from the company to put a delinquent passenger off cannot be enlarged by his calling to his aid a policeman, whose general powers as such are to make arrests and prosecute for violation of the municipal law. Nothing else being said, in such a case the policeman is called in to aid the conductor in the execution of the conductor's powers, and not those belonging to his office generally.

Of course, continues the court, the conductor could have independently, and on his own responsibility, caused the arrest to be made, and could have prosecuted; but its decision is that he could not do so as conductor of the street car, and bind his company, without express authority being shown.

For these reasons, the supreme court reverses a judgment rendered against the company, Justice Wood dissenting.

The contention of the dissenting opinion is that, in order to maintain a suit of this kind against the corporation, it is not necessary to show that its agent, who instigated the malicious prosecution, or at whose instance it was brought about, had any express authority from the corporation to do the act complained of, but that such authority may be and will be implied if the agent in doing the act is acting within the scope of his real or apparent authority.

---

#### Electric Railways in Country Highways.

---

One of the most important legal questions of today, and one that is becoming more and more pressing every day, is whether passenger railways operated by mechanical power can be laid over country highways without consent of, or compensation paid to, the adjoining landowner; or, in technical language, are they additional burdens to the fee?

It is well settled that a horse railway upon a city street, built upon grade, and for the carriage of passengers only, is not an additional burden. So, too, the drift and weight of authority seem to be that the operation of the road by electricity or other mechanical power does not change the nature of the road in this respect, although it is held by

some courts that, if permanent erections in the street interfering with the right of access are necessary for the operation of the road, these may constitute an additional burden.

But that there are many and marked differences between the uses to which a city street is put and the uses to which a country highway is put cannot be denied; nor can it be denied that the uses contemplated when the land is taken for electric railway purposes vary widely, except that both are intended for purposes of travel.

The street railway in its inception is a purely urban institution. It is intended to facilitate travel in and about the city, from one part of the municipality to another, and thus relieve the sidewalks of foot passengers and the roadway of vehicles. It is thus an aid to the exercise of the easement or right of passage; strictly, a city convenience, for use in the city, by people living or stopping therein, and fully under the control of municipal authorities, who have been endowed with ample power for that purpose.

This strictly urban character of the street railways remained practically unchanged for many years, and during these years the long line of decisions grew up recognizing the street railway as merely an improved method of using the street, and rather as a help to the street than as burden thereon.

Time, however, has made changes in conditions. New motive power has been discovered, and it is found that by its use an enlarged city street car may profitably run long distances, and compete to some extent with the steam railway. It is proposed to convert the city railways into lines of passenger transportation, covering long distances, and connecting widely separated cities and villages, by using the country highways, and operating long and heavy coaches, sometimes made up into trains of several cars. Thus, the urban railway has developed into the interurban railway, and threatens soon to develop into the interstate railway. The small car which took up passengers at one corner, and dropped them at another, has become a large coach, approximating the ordinary railway coach in size, and has become a part, perhaps, of a train which sweeps across the country from one city to another, bearing its load of passengers ticketed through, with an occasional passenger picked up on the highway. The purely city purpose which the urban railway subserved has developed into or been supplanted by an entirely different purpose, namely, the transportation of passengers from city to city over long stretches of intervening country.

When this train or car, with its load of through passengers, is passing through a country town, it is clearly serving no township purpose, save in the most limited sense. This through travel is unquestionably composed of people who otherwise would travel on the ordinary steam railway, and would not use the highway at all. Thus, the operation of this newly-developed street railway (so called) upon the country road is precisely opposite to the operation of the urban railway upon the city street. It burdens the road with travel which would otherwise not be there, instead of relieving it by the substitution of one vehicle for many.

These considerations, pointed out by the supreme court of Wisconsin, in the case of Zehren against the Milwaukee Electric Railway & Light Company, 74 Northwestern Reporter, 538, wherein it handed down its opinion March 22, 1898, lead the court to hold that an interurban electric rail-

way, running upon the highways through country towns, is an additional burden upon the highway. However it may regard this development of the urban into the interurban railway, it says that it seems to it utterly impossible and illogical to say that it is essentially the same in its purpose or effects as the mere street railway which it early decided was not an additional burden on the fee. The difference between the two, it explains, is not so much in the change of motive power, as in the entirely different character of the use. Suppose a steam railway corporation were organized to carry passengers only from city to city, and should attempt to lay its track upon the country roads without compensation; is there any doubt, the court asks, but that it would be held that it could not do so? It thinks not.

Even granting all this, it was further argued, in this case, that a distinction should be drawn between a highway in close proximity to a city, or running between the city and a neighboring suburb, and the ordinary country road through a farming district. The suggestion, the court admits, is not without weight, as there is much difference between the practical uses to which the two highways are generally put, the suburban highway very frequently approximating closely to the city street. But while the difficulty in drawing any clear line of demarkation between the two is very great, the court says that if a line be drawn in one case upon the facts of that case, depending upon mere proximity, or upon the manner of use, or the density of population, or the prospect of rapid settlement, or upon all of these circumstances together, it cannot apply to any other case; and the question will always be one of doubt and embarrassment, leading to different conclusions in different courts, whereas, if the line be fixed at the limits of the corporation, it will at least have the great merit of certainty, and be capable of unerring application. Presumably the city limits include the entire urban area, and the court says that it feels, under all the circumstances, that it is the true and proper line.

Furthermore, conceding for the moment that the highway in question should, although outside of the city limits, be treated as a city street, the court holds that the grade cannot be changed by, and primarily for the sole benefit of, a street railway company, and, more particularly, that the latter cannot cut down the highway, say, 8 ft., so that an abutting owner's right of access to his property will be seriously impaired, without the latter's consent and without payment of compensation to him.

#### FIRE AT NEWBURYPORT, MASS.

On April 9, about 9 p. m., fire broke out in the planing mill of the Newburyport Car Company, and quickly spread to the machine shop, dry house and other near-by buildings, which were destroyed notwithstanding the efforts of the fire department. The paint shop was saved, but a new building in process of erection was badly damaged. The loss to the company and lessor was about \$30,000, covered by insurance. It is charged that the fire was of incendiary origin.

Some boys strung a piece of barbed wire across the track of the Pawtucket Street Railway Company at the village of Lonsdale, thinking to have some fun, and nearly succeeded in decapitating the motorman of the car that struck it.

#### FOREIGN ORDERS PROMPTLY FILLED.

The Sheffield letter to the "Hardware Trade Journal," an English publication, details the experiences of an English merchant who wanted goods in a hurry. He cabled to America for a considerable quantity of material, and within nine days it was at Liverpool; on another occasion he cabled for 60 electrical specialties, and though they were not kept in stock, they were promised in 14 days. The correspondent stated that a manufacturer in Sheffield had complained of his inability to secure malleable castings of satisfactory quality or in sufficient quantities without importing them from the United States. Another surprise was the preference expressed by the men in this shop for American-made files, which were used in large quantities.

#### THE ELECTRIC TRAMWAYS IN ROME.

Following the example of Milan, the Eternal City permits the use of the overhead trolley and does not hesitate at the invasion of the Capitol itself. About a year ago three miles of track were laid down, and recent additions bring the total length up to 14.25 miles. Electricity is generated by water power at Tivoli, 18 miles from Rome, and transmitted at an initial pressure of 5,000 volts, the total drop being about 20 per cent. At Rome the current is first reduced to 2,000 volts and then transformed to a continuous current at 500 volts in rotary transformers. These transformers are three in number, each of 80 k. w. capacity. A storage battery of Tudor cells is used in con-

CROSSING THE RUINS OF THE CAPITOL.

nection with the transformers and provides for the fluctuations in the load; during two or three hours in the evening the turbines at the water plant are shut down and the road operated by the battery alone.

The grades on the line are many and some of them are

PIAZZA VENEZIO-SAN PAOLO LINE.

as steep as 8 per cent; the curves vary in radius from 66 to 77 ft. The track is laid with Phoenix rails of girder section weighing 67 lbs. The rails are bonded with double copper bonds; at intervals of 150 ft. there are cross bonds, and every 500 ft. the four rails of the two tracks are cross bonded.

There are 43 motor cars with capacity for 16 first-class

JUNCTION OF VIA BONNELLA AND VIA CAVOUR.

passengers and six second-class, and standing places for eight more on the rear platform. The car equipment is Thomson-Houston.

The illustrations are reproduced from the Railway World, from which the data here given were taken.

The Lake Street Elevated has changed the signal lamps on its line to conform to those used by the Union Loop and Metropolitan Elevated, and will soon be followed in this by the South Side Company. The colors are now red for danger and green for clear.

A BLUE PRINT WINDOW.

A writer in "Engineering News" describes a very convenient arrangement for a blue printing frame which is in use at the Edge Moor Bridge Works. In the blue print room are special windows the glass in which serves as a part of the frame and the labor and annoyance of pushing the frame outside of the window is saved, to say nothing of the exposure to which the ordinary apparatus exposes the manipulator in windy weather.

The window A, B, C, D, projecting from the side of the building, contains the fixed glass E, and the movable frame F, counterweighted by the arm and weight G. The frame F is covered by a bed of cotton wool held in place by a square of ordinary carpeting, and closes up tight against the glass E. The sensitive paper and tracing are simply placed in the proper position on the frame, which is closed up against the glass for printing and lowered for inserting and removing the paper and prints. As all drawings are made upon sheets 26½x35½ ins., the frame F is made just large enough to hold these sheets.

MAY PAY FOR STREET IMPROVEMENTS IN INSTALLMENTS.

March 31, the circuit court of Vanderburgh county, Ind., rendered a decision in the case of the Evansville Street Railway Company against the city of Evansville, the mayor and the common council asking for an order to compel the passing of an ordinance giving the street railway company the right to pay for its street improvements in 10 annual installments, as authorized by the law passed in 1897. The city in its defense had claimed that the old ordinance providing for a single payment by the company was a contract which the legislature might not impair and denied the constitutionality of the law of 1897.

The court held that the company might pay in 10 installments.

It will be remembered that the Terre Haute Street Railway was thrown into a receiver's hands because the mayor vetoed such an ordinance as the Evansville council was asked to pass.

The success with which the interurban line between Milwaukee and Kenosha has met during the 15 months of its operation has no doubt had a great deal to do with stimulating the project for an electric line from Chicago to Milwaukee. With the completion of a road now building north of Chicago, four-fifths of the distance between the two cities will be covered and that interval can not be expected to be left open long.

## PLEASURE RESORTS IN 1898.

What the Street Railways Will Provide for the Coming Season at Their Parks—The Storage Battery Pleasure Boat—The Expediency of Offering Inducements to Societies and Organized Bodies—Experience of the Schenectady Railway Company—New Parks.

With the approach of summer the question of, What shall we do with our parks or pleasure resorts? confronts the managers of those street railways which have these features as an incentive to travel. In making the decision there are a few fortunate ones who need not consider the item of expense and are limited in choosing attractions only by what the experience, of themselves or of others similarly situated, has shown to be successful in providing recreation and amusement for pleasure seekers. Others must economize and will be most interested in learning what may be home-made at small expense, and yet prove attractive features at a resort.

What will prove a success in one city does not always do so in another; the public is fickle in its tastes, but may to a considerable extent be persuaded to like a thing, and here the ingenuity of the promoter has full play. In the succeeding pages will be found some information as to what has been found good, and what poor attractions, some points on what can be made by the company, and what are the plans for the coming summer.

A most attractive feature of a pleasure resort near a body of water, would be mechanically propelled boats. Electric launches would be better suited than any other kind, as the current for charging storage batteries could be conveniently taken from the trolley circuit. The electric launches on the lakes in Jackson Park during the World's Fair were immensely popular and profitable in spite of the great initial cost and the still greater cost of maintenance.

There are few street railway resorts whose patronage would justify the investment of \$1,500 for an electric launch.

BOAT WITH ELECTRIC PROPELLER.

Rather than incur such an expense the boats could be equipped with the batteries, motors and propellers in the repair shop of the company. However, it is not the party boat holding from a dozen to a score of persons that will receive the most patronage but the smaller ones about the size of an ordinary row boat with seats for two or four persons. The number of couples who would ride on the water

would be many times the number of parties, and the expense of such service must be within the means of the average patron of a popular resort.

An equipment has been perfected in Minneapolis by S. N. Smith and T. B. Hatch, of the Monitor Electric Company, by which such boats can be run by an electric motor and propeller, as shown in the illustration. This apparatus is composed of two parts; the propeller and motor hung on the outside at the stern, and the battery placed anywhere in the bottom of the boat. The former can be attached to any boat in a few minutes.

The batteries may be either of two kinds, storage or primary, either of which will run a large-sized row boat four to five miles an hour. The storage battery is in two parts, together weighing about 80 lbs., and will run five hours continuously or seven intermittently. The primary battery is somewhat heavier and will do the same work for four hours continuously, or six hours on intermittent runs such as a pleasure seeker would make on a day's outing, which may, however, be increased to two hours more by a slight additional charge to the old solution. The primary battery costs from 50 to 75 cents per charge, according to the quantity of chemicals purchased and the locality of the purchaser. The charging is very easily accomplished by any one, using water and dry salts or powders.

The propeller and motor are in one part and weigh complete about 20 lbs. The whole is nickel-plated and presents a fine appearance. A fast and slow speed switch is conveniently placed on the cover, which latter hinges back and exposes to view all of the mechanism that requires inspection. The oiling is all done through a single oil-hole which lubricates the whole machine.

Steering is effected by means of a hand wheel surrounding the motor case, the turning of which steers a boat much more readily than a rudder. The boat may be made to turn completely around upon its heel. Reversing is instantly accomplished by turning the wheel half a revolution, thus causing the boat to immediately back up without stopping the motor. The mechanical and electrical details have been very carefully worked out and perfected. The extremely light weight and the power and efficiency are its features. It is practically noiseless, and emits no fumes or vapors. The price of these outfits range from \$100 to \$125, complete for each boat. One of the illustrations shows a boat so equipped going at full speed through the water.

#### Toledo.

The Toledo Traction Company has as a pleasure resort the Lake Erie Park and Casino, which it advertises extensively throughout the state by means of large colored lithographs, so that a stranger in search of amusement need not remain ignorant of where to go. Music is a never failing attraction and a band of 20 pieces gives two concerts daily. The attractions comprise a theater, a merry-go-round, a scenic railway, boating, pony track, mystic maze, swings, etc., and this season a zoological garden, palm gar-

den, aquarium, bowling alley and bicycle track are to be added; of these the zoological garden, aquarium and theater were built by the company. Admission to the park is free to passengers on the railway and a fee of 5 cents is charged for others. All the concessions except the cafe are rented out. The company endeavors to induce excursions of secret, military and business organizations coming to Toledo to hold meetings at the park.

The general manager, Thomas H. McLean, states the experience of the company to be that high-class vaudeville entertainments take best and dramatic companies are failures. He thus tells how to make a summer resort a suc-

SHOWING THE PROPELLER.

cess: "Cater to ladies and children; give only clean, moral entertainments; maintain good order; uniform all attaches; give two performances and band concerts daily; look after the comfort and safety of your patrons; work in conjunction with the steam railroads for excursion business."

## Cleveland.

At Cleveland what is called the Park System of the Akron, Bedford & Cleveland and the Cleveland, Painesville & Eastern Railroad Companies is managed by C. F. Bates, who writes as follows: "We will, this year, operate two parks; one on the line of the Akron, Bedford & Cleveland Railroad, situated 30 miles from Cleveland and five miles from Akron; and another on the Cleveland, Painesville & Eastern Railroad, 16 miles from Cleveland. You will readily see that the long haul from the city makes our condition very different from almost all street railway parks, and consequently our work this year will be entirely experimental. Our equipment will enable us to reach these parks very quickly and we will unquestionably have a very great amount of Sunday school traffic, but we hope that the great natural beauty of our parks, with their especially good bathing facilities, will give us a large amount of transient traffic."

## Duluth, Minn.

The Duluth (Minn.) Street Railway Company has no amusement place on its line other than a pavilion located at the head of its incline railway, the second floor of which is fitted up as a summer theater, the lower floor being used as a restaurant and promenade with balconies looking out upon the lake. The company has not completed arrange-

ments for the coming season, but will probably have operatic, dramatic and vaudeville entertainments as in the past two or three seasons.

## Philadelphia.

John B. Parsons, vice-president and general manager of the Union Traction Company, Philadelphia, states the company has contracted with T. P. Brooks to have his Chicago Marine Band give concerts during the summer at Willow Grove Park, and expects to continue to conduct the park this season, keeping to the same high standard as has prevailed for the past two seasons; no material changes will be made in the matter of attractions.

## Marinette, Wis.

President H. C. Higgins, of the Marinette (Wis.) Gas, Electric Light, Street Railway & Power Company, has had some experience with pleasure resorts, and in his address before the Northwestern Electrical Association recently said: "Do not lay any extra line in order to establish a park, unless you can establish it on the edge of a body of water and a town of not less than 30,000 people to draw from. Do not lay out much money on animals for your park. Do not run vaudeville or other shows unless you are so situated that their transportation will cost you but little. I believe that parks should be enclosed and no one admitted unless he pays car fare." The company's park is conducted along these lines; an admission fee of 10 cents is charged for others than passengers. At the park are a hotel, band stand, dock, bath houses and a fleet of boats, all of which were built by the company. These concessions are rented as a whole. As stated, Marinette proved to be too far from the base of supplies to make vaudeville a success and such shows were abandoned. Now the principal attractions of that nature are band concerts given each Sunday, and base ball games.

## Schenectady, N. Y.

The park of the Schenectady (N. Y.) Railway Company is known as Brandywine Park and is situated on a high and sandy bluff on the edge of Brandywine Lake, 13 minutes' ride from the New York Central Passenger Depot, on the line of the electric street railway, whose tracks run into the park and up to the steps of the main buildings.

The park has been well and securely fenced so that no entrance can be obtained except at the proper gate, at which a ticket office has been erected. The banks of the lake are well shaded with large trees, and have been drained, terraced and sodded; cinder paths have been laid out and plenty of seats and a boat-landing built. The body of the park is laid out with fine cinder walks around the buildings, additional shade trees have been planted and all the surface except that taken up by the buildings, walks and flower beds, made into a beautiful grassy lawn where tennis, croquet, lacrosse or other games may be played.

The main buildings comprise:

A large covered Casino, with stage, dressing rooms and a fine dancing floor 50 ft. by 60 ft. The dancing floor has seats around it, and if it is desired to use the building as an auditorium, chairs and settees to comfortably seat 600 peo-

ple have been provided. The floor is raised 6 ft. above the ground, and with the high sides and projecting eaves dancing or any entertainment can be continued during the heaviest rain, while its steep roof and open sides render it cool and pleasant during the hottest weather. At night it is lighted with arc lamps and several hundred incandescents.

Closely adjacent, a handsome covered refreshment pavilion, with tables, chairs, refreshment counter, ice-box and a separate kitchen or serving room, with stove, tables, sink, etc.

For societies desiring to use or sell beer, a Tivoli or covered beer hall has been erected in a shady portion of the park and surrounded with a lattice fence large enough to allow the use of tables outside the serving counter.

A large, raised open stage with railing, for use of wrestling, boxing or any open air contest, show or entertainment.

Ample toilet facilities have been provided.

Good, strong safe boat-swings have been provided for the free use of the children.

There are two fine running springs on the lake bank, two deep drive wells have been sunk and the company has also installed an electric pump by which the lake water is piped all over the grounds for sprinkling or toilet use.

At night the grounds are brilliantly lighted with both arc and incandescent lamps from the company's own power plant, and attendants are at all times on the grounds to enforce order or prevent the entrance of drunken, disorderly or disreputable persons.

The street cars run to and from the park every 15 minutes from 6 a. m. to 10 p. m., and on holidays, days of picnics, etc., they run every  $7\frac{1}{2}$  minutes until the picnic, etc., is over.

H. S. Cooper, secretary of the Schenectady Railway Company, has very kindly written us at some length regarding the experience of that company in the management of the park. He says:

"This city has many secret societies, labor organizations, religious, philanthropic, and benevolent associations, and pleasure clubs, besides the churches, Sunday school and church societies. We have found our best revenue to come from the annual gatherings of these bodies at our park, and we have therefore fitted it up specially for the accommodation of them. We rent them the park complete with all the privileges, for a sum that will cover the fixed charges, maintenance and operating expenses and depend for our profit on the traffic that such events create. We advertise these events (free) in the cars for some weeks in advance, and on the day that it occurs we advertise it by streamers on the outside of the cars. A special form of contract is used.

"Once or twice a week—on dates when we have no event booked—we give an evening dance from 8 to 11 p. m., furnishing good music, brilliant illumination and a fine dancing floor. On these occasions we make a charge of 10 cents each for the men—the ladies we admit free as an attraction! We insist on perfect order and decent behavior at these, and the past year they were very well attended. The gate receipts about pay the expense of the music and the necessary extra attendants, the profit comes from the hauling to and fro, and the extra traffic comes at a time when other traffic is slack and when it can be handled without extra cars. In addition to these regular dances we give, a few times during the season, 'prize dances,' at which prizes (such as umbrellas, pocket-books, small toilet accessories,

etc.) are given to the best dancers, the award being made either by a committee chosen by the contestants themselves, or by a vote of the spectators, the 'ballot' being the admission ticket for the evening. These prize dances are only given at intervals, as an advertisement and to keep the events from becoming monotonous.

"On every fine Sunday afternoon from 3 to 5 p. m. we give a free concert in one of the buildings. These concerts are either band, orchestral, vocal or a combination of all; in all cases comprising good music by good performers. This has not as yet paid us directly, as the religious element of the town being against it at the start, the attendance has been small; the concerts, however, have proved themselves so unobjectionable—both in matter and in the behavior of those attending—that this opposition is dying out and we will continue them this summer, believing that not only will the attendance increase but that it will be an advertisement for the park, and that it will teach the people to use the cars on Sundays to a greater extent.

"On all other occasions than those noted the park is free to the general public for basket picnics, informal dances, private parties, etc. We tried, during one season, the experiment of making 'non-riders' on the cars pay an admission of 5 cents to the park, but the income from this source was so small, the expense of keeping an entrance-man to collect the admission was so out of proportion to the receipts, and finally, the dissatisfaction at the arrangement was so great that we gave it up, and the only requisite for admission that we require now, is that the person shall be sober and not a disreputable character. We have, this year, under consideration the advisability of charging an admission of 5 cents for bicycles. The facilities for reaching the park on a wheel are so good, and the number of them in use in the city is getting to be so large, that if we do not take some such action, the traffic on the cars—at least the extra traffic caused by the use of the park—will not pay. Of course this would mean that facilities for the safe and sheltered storage of the bicycles must be provided in the park, and this can be done very easily and cheaply in our case, as the buildings are in such shape that bicycle racks may be easily attached to the sides.

"We have provided one end of the dancing hall with a permanent raised platform about 3 ft. high, 12 ft. deep and the full width of the building. This stage has a sheltered outside stairway which leads to some dressing rooms underneath the stage. A few curtains of awning cloth stretched between the pillars at the back and sides and a few light wooden screens, transform this platform into an enclosed stage, and a few home-made footlights and a sliding curtain make it ready for any performance that we or the lessees wish to give. For seats we purchased strong, cheap chairs and settees to seat about 500 persons; these are put on and taken off in a short time through doors in the front of the stage, they being kept under the dancing floor when not in use.

"On days when the park is not leased, light refreshments, soft drinks, ice cream, cigars and fruit are sold in one of the buildings. The privilege is let to an outside party on a commission on profits basis and is fairly profitable in a good season. As in other matters, we insist that everything furnished shall be the best of its kind and sold at the same prices as in the city. This is no hardship to the party

selling, as we furnish free transportation to them and their goods and they are virtually rent-free.

"We have a number of good, strong, safe boats, which we hire at reasonable rates, and in hot weather these are good money producers, but the proximity of a very beautiful river to the heart of the city militates against the free use of the boats, as they are not an 'attraction.'

"We have not yet put in a merry-go-round; principally because we have not had the money to spare; but from our experience with the traveling ones that have been here we think that they are about the best attraction that there is, and shall certainly put one in as soon as we are able to.

"In stage attractions, fireworks, balloon ascensions, water-shows, etc., we have not had a very large experience, and that which we have had has not been favorable to our receipts. Until the usual style of 'attraction' is made more suitable to the purse and the patrons of the average small street railway park, or until we are able to form that 'Amusement League' among ourselves, this company will do little in this line of the so-called 'attractions.'

"From an extended trip among towns of this size, from conversations and correspondence with other superintendents, the writer is of the opinion that it is an easy matter to overdo the amusement business in small parks. The conditions in the larger cities with their congested centers, large floating population, more rapid life and competing attractions, are entirely different, and can be no criterion for the smaller towns, and every manager of a small park that tries to emulate them seems to have come out at the small end of the cash account. We believe that in the smaller towns and cities the best paying park is the one that caters to the social and 'organized bodies' elements, and to the women and children. Such parks do not need to be of very great size; they can be made attractive and kept so at small expense; the capital invested need not be great, and the expense of running should be small. If possible, it should be at a distance from the town—not too far, unless an extra fare for the increased distance can be collected—but so far out that it is not within an easy walking distance from the town. If the town has no river or other body of water within easy reaching distance, the location of the park on such a body of water or the formation of such will be the first and best attraction.

"Our park is not large enough to allow of any athletic grounds or bicycle track, so we concluded to treat it and run it more as an 'assembly grounds,' and to this end have made it as comfortable as possible by good shade, clean, dry, dustless walks, plenty of seats and benches, good toilet facilities and plenty of shelter. We have made it neat and pretty by tasteful buildings, good lawns and plenty of shrubbery and flowers. We take pride in keeping it nice, and find that it pays to do so and that the public appreciates it and aids us in doing so. We allow the fullest and freest use of it in every way and portion, but do not allow it abused. We keep it respectable and find that it pays—and we have just as much of the 'world, flesh and devil' as any town of the same size.

"In our traffic, in the park and the attractions thereat, we have found that it is not wise to be too 'advanced.' The public, as a rule, appreciates more and longer the things that it has reasonably demanded or shown a wish for, and which have been cheerfully and promptly given in response to that wish. They are, after all, only human beings like the rest

of us, and may be spoiled by stuffing as well as starving! By pursuing a policy based on this belief, we have been able to make a success where the other course would have made a failure, we have been enabled to avail ourselves of the experience—both profitable and unprofitable—of our more radical brethren in the amusement lines, and have still several more cards 'up our sleeve' and an unsatiated public on which to play them."

#### Paducah, Ky.

At Paducah, Ky., the street railway has a park with a theater, boats, bathing facilities, chutes for "shooting," etc., all of which were built by the company; none of these are rented. The admission price to the entertainments is 15 cents, though the entrance to the park is free. Orchestra concerts are given every night. Stock companies with specialty teams have been the most successful, though the company has been fortunate in not having any entertainments which proved failures. There is no attempt made to have organized bodies make use of the park.

#### Holyoke, Mass.

In our issue of July last we described the incline railway running from Mountain Park, near Holyoke, Mass., to the summit of Mt. Tom. The Mt. Tom Railroad, which is leased to the Holyoke Street Railway Company, has proved

MT. TOM PAVILION IN WINTER.

to be a success in every way; last year more than 60,000 people were taken up the incline without an accident of any kind. At the summit is a pavilion 76x92 ft. and two stories

high with a cupola 25x31 ft. The first floor has parlors, dining room, kitchen, etc.; on the second floor is a hall with stage, which will accommodate 500 guests. The cupola is used as an observatory, and from it is to be had one of the most beautiful views to be found anywhere. Mountain Park

VIEW OF MOUNTAIN PARK.

is free to passengers, the fare being 5 cents from Holyoke, and from here the round trip to the summit is 25 cents. At Mountain Park are a gravity railroad, merry-go-round, phonographs, photograph gallery, amusement stage, view towers, etc.; all of these were built by the company and are operated by it, only concessions to caterers being rented. Shows of various kinds have been given; minstrels, educated horses, Japanese troupes, vaudeville entertainments and concerts have proved to be the most attractive. One of the illustrations shows a view of the stage, zoo, pavilion, gravity railway, etc., and another is the summit of Mt. Tom in winter.

---

#### St. Paul, Minn.

---

The Twin City Rapid Transit Company, of Minneapolis and St. Paul, has had considerable experience with pleasure resorts and the amusement manager, George R. Folds, writes of the company's plans for the coming season and tells of past years. He says:

"For several seasons we have operated two pleasure resorts; one at Lake Harriet, in Minneapolis, and the other at Como Park, in St. Paul. The former place has a large pavilion, amphitheater and floating stage, which we erected on the edge of the lake on property belonging to our public park board. We have had a great many attractions at this place, including such novelties as Gilmore's Band, South Sea Islanders, all kinds of vaudeville artists, comic opera, etc. We have tried free entertainments and at other times have charged admission. Last season we presented 10 weeks of comic opera for which we charged admission of 10, 15 and 25 cents. This, I think, was quite successful; but we have decided to present no attractions at this park this year but will concentrate our efforts at Como Park, St. Paul.

"Como Park lies between the Twin Cities, or nearly so, and it is the purpose of this company to have a new inter-urban line constructed before July 1, which will pass directly through the grounds so that each city will be a feeder for it. At present, we plan to give free band concerts every evening and probably every afternoon during the summer. We may use local bands part of the time

and quite likely shall engage some large foreign band for a period. We are also now considering introducing certain soloists and presenting other novel features to create interest in our program. No admission to the park is charged.

"Como Park is controlled by the St. Paul Park Board and has a good many acres of ground which are kept in very fine shape. It has a large, irregularly shaped lake, upon the shores of which we now have a pavilion to which we are now building a large open air amphitheater. Minnehaha Falls is now in control of the Park Board of this city and several refreshment pavilions are now maintained just outside the park grounds. We have, occasionally, furnished some entertainment there to attract the public, but we find it a very popular resort without spending much energy to make it so.

"In St. Paul, we connect with a suburban electric road which runs out to White Bear Lake, where many picnics go. The company operating this suburban road has quite a park at the lake where it has built a roller coaster, bath houses, a pavilion and a dancing hall, and where it has also laid out athletic fields and made many other attractive improvements. This suburban company advertises and operates this park itself and we get a revenue from all its passengers. I might also add that in both cities we are fortunate in having the base ball parks situated on our lines and some distance from town."

---

#### Urbana, Ill.

---

How to provide meritorious theatrical attractions at a reasonable price is a problem which managers have in some instances endeavored to solve by forming amusement circuits, whereby better terms could be made with the "teams." B. F. Harris, Jr., president and general manager of the Urbana & Champaign Railway, Gas & Electric Company, is trying to form such a circuit in Illinois and writes us as follows: "A few days since I addressed a letter to about 10 of the roads in the central part of the state suggesting that we get up a little theatrical circuit and employ a theatrical agent in Chicago to get small vaudeville companies for us, so that by giving each company 10 weeks engagement and having the stand one week in each street railway town, we would be relieved of the trouble of getting companies and they would be much cheaper than for single week's engagements. Our idea is to advertise free shows at our amusement park and make the rear half of our theater seats free and reserve the front half for sale at 10 cents each."

---

#### Zanesville, O.

---

All parks have not been successful; General Manager Westcott, of the Zanesville Railway & Electric Company, writes us that it has abandoned the "Gant Park Theater" for this season. The company is now in the hands of Will Christy, receiver.

---

#### Ashland, Ky.

---

The pleasure resort of the Ashland & Catlettsburg Street Railway Company, Ashland, Ky., is attractive in both summer and winter, being very popular as a skating resort in winter. The park is known as Clyffeside and admission is free to passengers on the street railway only, 10 cents being

VIEW OF THE LAWN.

charged for others. The features at the park comprise tree boating, free swings, free gymnasium, etc., all being built by the company. The refreshment concessions are let.

SCENES AT CLYFFESIDE, ASHLAND &amp; CATLETTSBURG RAILWAY, ASHLAND, KY.

There are several new attractions in contemplation for the coming season, and in all probability a bowling alley will be built or the theater enlarged. All of these have proved very attractive to visitors. In the way of shows, vaudeville, aquatic and athletic entertainments have been tried, the vaudeville proving the most popular. Band concerts on Sundays and vaudeville on week-day nights are by far the best attractions. No intoxicants are allowed on the grounds and all questionable characters are promptly ejected, police protection being afforded at all times. The pavilion has a seating capacity for 1,000 people. The park contains 25 acres of hill and table land, five acres being a lake; the Chesapeake & Ohio and the Ashland & Catlettsburg Railroads have flag stations at the park gates, thus making the resort a convenient destination for excursions of various associations and societies; the use of the park is extended to such parties free of charge. The car service of the street railway is excellent, cars passing every  $7\frac{1}{2}$  minutes.

#### Binghamton, N. Y.

General Manager Clark, of the Binghamton (N. Y.) Railroad Company, which is the pioneer in the pleasure resort branch of the street railway business, being among the very

first to provide daily concerts and free entertainments for patrons, writes that the company's summer resorts, Ross Park and the Casino, will be conducted much as heretofore except on a much larger scale.

This summer particular attention will be given to excursion and entertainment features. An excursion agent will be appointed by the management and his sole business will be the soliciting and arranging for excursions, both small and large, from the surrounding territory, work which he will take up in conjunction with all the great trunk lines and their branches, either terminating at or passing through this city. Two mammoth excursions have already been arranged for, namely, the Carbondale Knights of Pythias and the Wilkesbarre Brotherhood of Railway Conductors.

At the park the zoo will be made more interesting by the addition of many "happy families" of animals and birds. The pleasure grounds are being improved under the management of the Park Commission, and in hearty co-operation with the aims of the street railroad.

At the Casino croquet grounds and tennis courts will be

laid out as soon as the weather permits. No improvement will be made on the golf links there, because it is believed that golf is a dangerous pastime when played in the pres-

THE LAKE.

ence of such large concourses of spectators and pleasure seekers as will through the grounds each day. The bicycle track and ball grounds will be placed in the best of condition at as early a date as possible, and even now workmen are engaged in clearing the grounds and fixing up the shrubbery.

It is expected to open the resorts to the public about May 30, and to inaugurate the entertainment season of free attractions on Monday, June 20. The daily band concerts will be commenced June 1, and there has already been secured for the respective resorts a large number of high-class vaudeville acts and sensational novelties. The attractions are always selected with great care, as the company caters almost exclusively to ladies and children.

---

#### Birmingham, Ala.

---

The Birmingham (Ala.) Railway & Electric Company is offering special inducements to churches, Sunday schools, societies and clubs in the matter of picnics and excursions. The general manager, J. B. McClary, has sent us a circular letter from which we take the following data regarding the attractions offered to such bodies:

For picnics there are Hawkins Springs, on the Bessemer division; Avondale, at the terminus of the Avondale & Fountain Heights electric line; Ensley Bridge, on the Ensley division, and East Lake. Hawkins Spring Park is seven miles from Birmingham and six miles from Bessemer. The spring is the largest and deepest in the county. The company has just completed a pavilion, to afford shelter in case of rain and to accommodate clubs wishing to dance. In addition to the points mentioned another park, Pleasant Valley Park, on the Powderly line, can be had on application to the owner.

For the accommodation of trolley parties and excursions the company has the "Royal Red" illuminated car and the "Electra," an open car of especially large capacity. The rates are as follows: For Sunday schools, societies and clubs, the rate to Hawkins Springs and Ensley Bridge is 10 cents for the round trip; East Lake and Avondale can be reached, if as many as 50 or more go in a body, for 5 cents round trip. These rates are from Birmingham. Satisfactory rates are named from East Lake, Pratt City or other suburban cities upon application. The trolley cars, "Royal Red" and "Electra," can be had for \$15 for three hours. A reduction is made in the price of these cars where churches rent them in order to raise funds.

---

#### New Bedford, Mass.

---

The Dartmouth & Westport Street Railway owns and operates Lincoln Park, located between the cities of New Bedford and Fall River, Mass., at which are a theater and casino, merry-go-round, toboggan slide and Ferris wheel; the theater and casino were built by the company. Admission is free to all persons and band concerts on afternoons and Sunday evenings, with free dancing afternoons and evenings, are the chief attractions. The management states that vaudeville shows are the most successful. Concessions are sold to various parties, such as the catering, merry-go-round, toboggan slide and Ferris wheel. The public appears never to tire of dancing and music.

---

#### New Haven, Conn.

---

The Winchester Avenue Railroad, of New Haven, Conn., has at West Haven a park where a merry-go-round, dancing pavilion, maze, bowling alleys, swings, shooting galleries and a number of smaller affairs are among the attractions; all these are let to one person who sub-lets to others. The company has erected an electric fountain and gives exhibitions of fire works once a week. For music an orchestra of 12 pieces is provided which gives concerts of 2½ hours in the afternoon and 3 hours in the evening. Efforts are made to have the annual gatherings of organized bodies held at the park. As to what the experience of the company has been, General Manager Kelsey says that first-class, clean vaudeville shows have proved to be the best (at these the only charge is 5 cents for a seat) and large band concerts and big hippodrome shows have been failures: he makes the following suggestions: "Make people think they are getting something for nothing; have nothing but what is clean and the best of its kind; evening attractions such as illuminations and fire works draw best; give people plenty of outdoor seats and good music, and keep everything neat and clean."

---

#### Norwich, Conn.

---

At the park of the Norwich (Conn.) Street Railway Company there are a theater, bicycle track, bowling alley and merry-go-round; the theater was built by the company. This year music for dancing in the afternoons and evenings, and band concerts on Wednesday and Sunday nights are among the principal attractions. Five cents is charged for non-passengers. The concessions for catering are sold to different parties; liquors are not permitted, however. Variety shows lasting about 1½ hours have been found to be the most successful; any shows that do not last more than one hour have proved failures. Superintendent Adams states that arrangements are made for the annual outings of organized bodies and that the company usually has the G. A. R. gatherings, church and Sunday school picnics and the Labor Day meetings.

---

#### Westfield, Mass.

---

The Woronoco Street Railway Company, at Westfield, Mass., has a park where concessions for a trotting park, photograph gallery, phonographs, etc., are rented to various parties. In fitting up the park the company itself built cages for small animals, seats, swings, etc., and the theater. Admission is free to all. Band and orchestra concerts are given on Thursdays and Sundays. Superintendent Townsend writes that one of the best features was the amateur night once a week, when the best amateur was given a cheap watch, three judges being chosen by the spectators to award the prize. In arranging the variety programs an effort was made to get the largest variety of talent that could be found, but not more than \$75 or \$100 per week was spent for this. Musical teams were secured for Sundays. The experience of the company has been that the proper advertising of the park is extremely important and must be carefully looked after to make the enterprise a success.

## Hot Springs, Ark.

At Hot Springs, Ark., the conditions are different from those at most places, the population being largely made up from visitors from all parts of the world; these visitors must be entertained and for them it is necessary to have first-class and varied amusements. Whittington Park is the property of the Hot Springs Street Railroad Company, and is a tract of 40 acres located in a spur of the Ozark Mountains some two miles out from the city. It is beautifully located and improved; there is a lake fed by springs and stocked with game fish; on the lake are pleasure boats and bathing booths. There is a quarter-mile bicycle track and a base ball field where the league clubs train during the winter and spring. In one of the views of the park is shown Corbett's

which requires that an admission fee be charged: the attractions on Sundays are colored baptizing, Salvation Army meetings, revivals, etc., which draw large crowds. Also for church entertainments and Sunday school picnics the use of the park is given free. No liquor is sold on the grounds but there is a good club house directly across the road so that none need go thirsty. The general manager of the road, C. G. Convers, to whom we are indebted for the illustrations showing the park, states that the park has been a source of large revenue to the company as well as a convenience greatly appreciated by the public, and is of the opinion that any street railway company that neglects to have such a place of amusement at its terminal is missing a good thing. One of the illustrations shows "Sinkiller" Jones baptizing some of the faithful at the park.

SCENES AT WHITTINGTON PARK, HOT SPRINGS, ARK.

ring where it was expected that he would meet Fitzsimmons. Though the fight was not pulled off there the ring remains and is still used; the last fight was in March when Kid McCoy knocked Burley out in the third round. The park is supported by the commissions or gate receipts; the refreshment privileges are leased. The following is an example of one of the week-day entertainments:

1. One-fourth mile donkey race.
  2. 300-yard running, hurdle race.
  3. Half-mile bicycle race.
  4. Quarter-mile bicycle race, boys under 10.
  5. Pie-eating contest by the Jolly Coons.
  6. Climbing greasy pole.
  7. Diving in flour pans by the Jolly Coons.
  8. One-fourth mile running race, open to all.
- Suitable present will be given for each event.  
Dive from 100-ft. tower into 36 in. of water, by Master Raymond.  
Admission, 25 cents.

On Sunday it is endeavored to have nothing at the park

## Los Angeles, Cal.

The Los Angeles Railway Company has no park of its own but provides band concerts at the public park upon its lines every Sunday, and also such attractions as balloon ascensions, high dives, etc., occasionally. The greatest fête in this city is a carnival of a week's duration called "La Festa di Los Angeles," which is always a week of prosperity.

## Kankakee, Ill.

The Kankakee (Ill.) Electric Railway Company has a park where a theater, dancing pavilion, merry-go-round, and swimming and boating facilities are the attractions; all of these were built by the company. The theater and the

refreshment concessions are rented. Vaudeville shows have proved the best attractions at the theater.

#### Davenport, Ia.

At Davenport, Ia., the street railway pleasure resort is let, all the attractions going to the lessee with the park; admission is free to all. The company has built the following: "Chutes," dancing pavilion, rifle range, summer theater, museum, bowling alley and electric fountain. This year new features are to be added, including band concerts, summer opera, cinematograph, etc. A brass band of 15 pieces renders concerts in the afternoon and evening, three days per week, Sunday, Tuesday and Friday. A merry-go-round is also one of the attractions. As to the best shows, General Manager Lardner reports that band concerts draw best on week days and sensational shows attract large numbers of the working people on Sunday. The bowling alley has proved a failure; it is too hot work when there is no beer. Also the expensive theatrical companies are too costly for small towns; cheaper attractions given free pay the best. There are to be a number of annual gatherings of organized bodies which will be held at this park: among the most important of these are the "National Saengerfest" in July and the Union Veterans' meeting in August.

#### Tampa, Fla.

The Consumers' Electric Light & Street Railroad Company and Tampa Suburban Railroad Company, of Tampa, Fla., have two resorts, one of which is leased by the year, at which are pavilions, halls, boat houses, bicycle track, etc. Admission to the parks is free and concerts are among the best attractions. For this season the foot cycle is under consideration as a new feature. General Manager Musing in speaking of the park amusements says: "The greater part of our population being Cubans and Spaniards, we are compelled to cater to them to a certain extent, and therefore we have a variety of sports beside the regulation ones. We also have a pavilion for colored people, located on the Hillsborough river near our water power plant."

#### Grand Rapids, Mich.

The Consolidated Street Railway Company, of Grand Rapids, Mich., has maintained a pavilion at Reed's Lake, about four miles from town, for 10 or 12 years. At the

beginning the only attraction, aside from groves, swings, the lake and the boats, consisted of a military brass band. This was considered sufficient until the last few seasons, when, to draw more people, the company commenced to give small auxiliary entertainments such as a special cornetist or a sketch team, making one short performance in the afternoon and another in the evening.

The demands of the public had outgrown all these, however, as well as the various pavilion buildings erected from time to time, and accordingly last year, when the old pavilion was destroyed by fire, the company constructed a new one, having an available floor space for guests of 30,000 sq. ft., with stage, dressing rooms, orchestra pit and other theatrical adjuncts.

Up to this time the music and specialties had been paid for out of the increased number of car fares, but it is now

LAKESIDE CLUB, GRAND RAPIDS, MICH.

believed there is a better way to both satisfy the public as to more elaborate entertainments and to save a large proportion, if not all, of the cost of the entertainment, by providing opera chairs, and charging a small fee for reserving them for patrons. With this in view several hundred chairs have been placed in the center of the pavilion and directly in front of the stage. The seating is arranged on an incline plane and the chairs are so placed as to leave room for the waiters of the privilege man to pass through the audience, during intermissions, and supply the people with soda water, confections and other refreshments.

Frank Burt, a practical theatrical man and manager of the Lake Erie Park Casino, of Toledo, has booked several companies of players for the Grand Rapids pavilion. Hereafter, instead of short entertainments and long intermissions, there will be longer entertainments and shorter intermissions. A large amount of scenery has been secured and provision made for attractive stage settings. Outside the pavilion a good many other attractions are being secured. Enough tent shows and booths have already been contracted for to make a respectable "Midway."

One of the illustrations is a view of "The Ramona" pavilion, showing the front and side of the building, and another is a view of the "Lakeside Club" house. The latter building is the property of the street railway company, but is leased to a private club having about 900 members. This arrangement is found to make the resort very popular with all

"RAMONA" PAVILION.

classes of people and materially adds to the company's receipts.

G. S. Johnson, president and general manager of the Consolidated Company, is a firm believer in summer resorts as a source of income, and the increased popularity which each succeeding year has brought proves the success of his policy.

## Lake Geneva, N. Y.

No part of the world has been more favored by nature than New York, and for beautiful scenery the central-western lake region holds its own with any other portion of the state. Through this beautiful region runs the Geneva, Waterloo, Seneca Falls & Cayuga Lake line, connecting the towns of Cayuga and Geneva at the northern ends of the lakes of those names. Lake Cayuga Park is the pleasure resort of the company and comprises 50 acres, to which admission is free. A theater, bath houses, boats, merry-go-rounds, swings and a pier running into the lake for 600 ft. are among the attractions to furnish amusement. The catering and carousal privileges are rented. At this park the paying features have been balloon ascensions, fireworks, illuminations and out-door attractions, and the theater has proved a failure, though W. C. Gray, general manager, writes us that all kinds of shows have been tried. He states that the best drawing card last year was what they called a "Night in Japan," when the grove was decorated with some 3,000 lanterns.

## Bangor, Me.

The Bangor, Hampden & Winterport Railway Company at a recent meeting decided to establish a park on the river shore just north of the Gen. Butler homestead, four miles from town. The park will have 800 ft. of water front and be known as Riverside; the attractions will include a theater, tennis and ball grounds, golf links, etc.

## Exeter, N. H.

The Exeter (N. H.) Street Railway Company is planning for a commodious and very attractive casino at its Hampton Beach terminus which will contain a theater with a seating capacity for 1,000 persons, a large dining room, nearly 100 bath dressing rooms, bowling alleys, billiard hall, etc., which promises to make the Beach increasingly popular as a summer resort.

## Oshkosh, Wis.

The Citizens' Traction Company, of Oshkosh, Wis., has invested between \$3,500 and \$4,000 in a 20-acre tract a few miles from the city where a summer park will be established.

## Muskegon, Mich.

The Muskegon (Mich.) Railway Company is another which contemplates engaging in the theatrical business this summer, and will build a large summer theater on the lake front at Lake Michigan Park. One pavilion at the park is to be reserved for dancing. The company has ordered four open cars of Jackson & Sharp to help care for the summer traffic.

## Saginaw, Mich.

At Saginaw, Mich., the Union Street Railway Company has enclosed a portion of Riverside Park and will operate it as a pleasure resort. The remainder of the park will be free to the public. New buildings are to be erected, a loop put in whereby passengers will be dropped on one side and taken up on the other, and a first-class vaudeville show will be conducted on the grounds every afternoon and evening during the season.

## Brooklyn, N. Y.

The Nassau Electric Railroad, of Brooklyn, is making elaborate preparations for the coming season. A cycle track and base ball grounds are being built near the West End depot, Coney Island. The tracks will be moved to the west about 300 ft. so that a clear space 750 by 400 ft. will be obtained. In addition to this an arcade is to be constructed from the depot to Surf avenue, a distance of 200 ft. It will afford thousands of visitors shelter from rain and storm, and privileges will be rented out on each side.

## Charleston, S. C.

The City Railway Company, of Charleston, S. C., has leased all the privileges at its Chicora Park; a restaurant has been built and a number of pleasure boats put on the river. The shooting gallery, bowling alley, pool and billiard rooms, ice cream booths, are all open for the summer, and every effort will be made to make Chicora a leading pleasure resort for the city folk.

## Portland, Me.

The Portland (Me.) & Cape Elizabeth Railway Company, of which H. R. McLeod is general manager, will have a pleasure resort this year of unusual beauty and attractiveness. The company has purchased the Cape Cottage hotel

CAPE COTTAGE CASINO.

property comprising 15 acres. It is on a high and rocky bluff overlooking the entrance to the main channel to Portland harbor and is famous as being one of the most picturesque spots on the New England coast. The large casino, now nearing completion, will afford every facility for the comfort and entertainment of the patrons of the road. The refreshment hall and the balconies, enclosed with glass, have a seating capacity of 400. Over the balconies is a promenade, which affords a fine view of the numerous islands in Casco bay. On the top floor is a large hall for entertainments and dancing, while the billiard room is in the base-

ment. The kitchen is also in the basement. The flight of steps, which may be seen in the cut, leads down to a lower terrace which slopes to the sea beach, a few hundred feet away.

#### La Fayette, Ind.

The street railway at LaFayette, Ind., was a horse road from the Public Square to the northwestern part of the city with branches to the railroad stations, and was built in 1884. In 1887 the motive power was changed to electricity and an extension of a mile and a half to Purdue University in West LaFayette, on the west side of the Wabash river, built. In 1891 the company was reorganized and extensive additions made to the rolling stock and power house equipment; new tracks were laid forming loops, one on the west side of the river circling the campus of Purdue University, and one in the southeastern part of the city. The new lines furnished ready transportation to these districts and made them very desirable for residences, greatly appreciating the value of the property. A trip around the two loops also proved to be a most agreeable one in hot weather and pleasure riding became a feature of the Sunday and evening traffic.

The most recent extension to the line was completed in 1897 and is a line along the river bluff and through a picturesque valley known as Happy Hollow to the Soldiers' Home and Tecumseh Trail, some five miles north of the city.

Tecumseh Trail is as romantic a spot as is to be found in the Hoosier state. The name is particularly applied to a heavily timbered tract of about 20 acres, lying on the bluff, which at this point is at the river's edge. Along the river is yet to be plainly discerned the beaten path along which Indians for generations made their way. Not far above the Trail is Prophet's Rock, from which the Prophet, the wise and wary brother of Tecumseh, chief of the Shawnees, predicted success for them in that campaign which ended in the battle of Tippecanoe in 1811; the battle field is just beyond Prophet's Rock.

Back of Tecumseh Trail on the higher ground is the Soldiers' Home, where are domiciled, according to the season, from 500 to 1,000 veterans of the rebellion. The Trail was the discovery, so to speak, of Col. Richard P. De Hart, who some twelve years ago made his summer home there and improved the place by building rustic bridges, wigwams and log cabins, which last he filled with relics of the Indians and of his own military career. The latch string was always out and many were the parties which partook of the colonel's hospitality, he always proving a most desirable addition at any merry making. When the Home was located, Col. De Hart made a gift to it of a strip 1,000 ft. wide off the southern end of the Trail for an entrance way to the river, and disposed of the remaining tract to the LaFayette Street Railway Company.

The company last summer built a pavilion 40x60 ft. and has now just completed a hotel and theater building which is 50x75 ft., two stories high, with broad balconies on three sides. This building has been leased to George L. Malcus, who will provide the theatrical and musical entertainments. Bathing, boating and fishing are also among the attractions offered.

The superintendent of the company, E. B. Gunn, has thoroughly overhauled the old equipment and purchased some new cars in preparation for the summer traffic.

#### Aurora, Ill.

The Aurora & Geneva Railway Company has made arrangements for a park of 50 acres, to be known as the Mill Creek Park, comprising some of the most picturesque country in the Fox river valley. A pavilion is to be erected, golf links, ball grounds, etc., provided, and it is hoped to have the park open to the public by June first. This park is about half-way between Aurora and Batavia.

#### Waverly, N. Y.

The Waverly, Sayre & Athens Traction Company, of which A. N. Broadhead is president, has a trolley-party car which, among its other attractions, has an orchestrian, thus always having music at hand. This idea is one which might be widely copied with great success.

### A NEW FENDER TESTED.

The accompanying cut shows a fender recently patented by T. H. Campbell and subjected to a number of tests. On the back of the fender is a transverse shaft resting on two hangers secured to the underside of the platform. In front of the fender is a rotating buffer padded with rubber and having two sprocket wheels, one at each end. Endless chains connect these two sprockets on the shaft at the rear

CAMPBELL FENDER.

of the fender. The power is derived from the car axle. On the platform is a tripping device consisting of a dog and plate which is connected to a rod passing back under the car to sliding bearings. When the motorman presses this plate with his foot the fender drops within an inch of the track and the buffer begins to revolve. The fender is ordinarily carried about 6 inches from the track, but can be lifted up against the dash. Dummies have been placed on the track and the fender has picked them up when the car was going 12 miles an hour.

## MINORITY OF PROPERTY OWNERS CAN NOT ENJOIN.

In the REVIEW for April we briefly noted the decision in the case of Shaff and others against the Cleveland, Medina & Southern Electric Railway Company, wherein the plaintiffs, a minority of the abutting owners, sought to prevent the building of the road. Since that issue we have received the text of the opinions in the Court of Common Pleas and in the Circuit Court, where it was taken on appeal; though these are inferior courts the discussion of the principles upon which the decisions are based is of interest to those engaged in building interurban lines.

### IN THE COURT OF COMMON PLEAS.

The case of Michael Schaff and 21 other plaintiffs against the Cleveland, Medina & Southern Electric Railway Company and Joseph Davis, is an actin brought to enjoin the defendant railway company from constructing an electric railway along what is commonly known as the Wooster Pike, a public highway dedicated to public use, and running southeasterly through this county to Medina and Wooster.

It sufficiently appears that the defendant company is duly incorporated and engaged in constructing an electric street railway, along the road I have named, passing through the county districts, the townships and villages between Cleveland and Wooster. It appears also that the county commissioners have granted to this company, so far as they have power to grant, the right-of-way over this highway. It appears, too, that consents have been obtained from a majority of the abutting property owners along this highway; so that so far as the company is concerned, it appears to have taken the necessary steps to entitle it to construct and operate the railroad.

The plaintiffs upon filing their petition obtained a restraining order of this court, and in their petition they allege that in the construction of this railroad they would be injured in their right of ingress and egress of the property abutting along said highway; that the style of construction proposed would seriously interfere with their property rights; that it is, in effect, the taking of their property under such conditions that this company ought to be required to make appropriation before taking possession of the highway, and constructing its tracks along the same.

The complaint which is made, while it varies a little in the affidavits of the different property owners, in the main is not essentially different; they say that the erection of this line on the westerly side of this street would be to seriously affect the value of the property abutting thereon; that it interferes with the hitching of teams in front of their respective properties, that the noise incident to the operation of the cars, and the dust created by the cars running over the line will seriously affect the value of the property. These in the main are the things which they say will cause their damage.

Some general propositions have been announced in a street railway case that I think are applicable in this case. The mere erection of poles for the purpose of an electric street railway, does not, in the judgment of the courts of Ohio, and has not in any case of which I have knowledge, been regarded as constituting an additional burden on the street. For it is the holding of the courts that the operating of a street railway along a public highway is a right consistent with the general uses for which the street is dedicated. The application of electricity as a motive in the operation of cars is regarded as a power properly applicable to street cars over a public highway.

When this case was presented to me I was interested in examining the question with a view of considering whether there was any difference in principal between the use of a country road and a city street. The fee of the land of a country road is in the abutting property owners; the fee of the land in the cities is in the city. Now is there any difference when it comes to the question as to how the street may be used. I think Judge Ranney has made that reasonably clear in the Cummins case reported in the 14 Ohio State Reports at page 524; after speaking of the uses

to which a street may be put, he says: "But while our decisions have been thus liberal, in allowing the general assembly the largest discretion in the management and control of easements acquired for public highways, we have been very careful to say, in the case to which reference has been made, as well as upon other occasions, that they would not be diverted to other purposes than those for which they were acquired; nor enlarged so as to accumulate additional burdens upon the land, or destroy or impair the incidental rights of the owner, appurtenant to his land located upon the street or highway. The distinction lies between those things which fairly belong to the grant, and those which are reserved to the owner, or by law, attach as incidents to his property. For this purpose, there is no occasion to distinguish between lands acquired for ordinary highways, leaving the fee in the owner, and lands dedicated for streets in town, where the fee vests in the municipal corporation in trust to answer the purposes of the use. In either case, the interest acquired and used by the public at large, is an easement, of a definite character and held for the attainment of objects known; and in either case, 'distinct from the right of the public to use the street, is the right and interest of the owners of lots adjacent.'"

It would seem from the quotation that the judge sees no distinction between a country road and a city street when we come to consider the uses to which it may be put.

I have looked over the affidavits in this case and I conclude from the general character of the statements made by the abutting property owners that the matters of which they complain are not of such character as would justify the court in believing that the construction of this road in a general way, under the authorities I have examined, would constitute an additional burden on the street. In other words, I do not think there is a showing here that would justify the court in granting an injunction or in holding that the construction of this road along this street will interfere at all with the reasonable and ordinary use of the street. The road is to be constructed along the westerly side of the street, not in the center of the street and I don't think there may be special instances where there may arise some little inconvenience to abutting property owners in the use of the street. This road is to be laid along near the gutter on the westerly side of the street, with its east rail 16 ft. west of the west side of the brick pavement; that leaves a sidewalk space of about 8 ft. between the westerly rail of the said line and the west side line of the street for the use of pedestrians. The only difficulty that might arise is in certain instances where possibly some business may be carried on, for instance a blacksmith shop where the farmers are accustomed to hitch their teams along the side of the street it would in some manner interfere with them in that regard, but that would be exceptional rather than general. And many of these complaints or at least some of them to which objection is made as constituting an injury—contemplated injury, I think it is plain that in a measure they are fanciful and imaginary rather than real, such as the flying of dust, the blowing of a whistle or the ringing of a bell.

There may be individual cases where the grading of the street may affect injuriously an abutting land owner, and interfere with the ingress and egress to his premises, no such case is made here, and where such a case arises, he will have an adequate remedy at law. It seems to the court from the facts before us that we would not be justified in granting an injunction preventing the construction of this road. The injunction is refused and the petition dismissed.

### IN THE CIRCUIT COURT.

We have been examining this case up to within a very few minutes and have formulated no opinion and shall deliver none, but simply announce the conclusion which we have reached.

The rights of a street railroad to occupy a portion of a highway—whether a street or a public highway, in the country, is quite definitely settled by the Cummins case, and it seems to be thoroughly settled everywhere, that a street railroad located in a highway, in a public highway, is but one mode of travel or transportation upon that highway and if that is all that appears, it imposes no additional burden upon the lot-owner for he is entitled to compensation whether he owns the fee to the center of the street or whether the title of the high-

way or the street is in the public ether, and if the occupancy of the street is a lawful one, then the lot-owner must bear any incidental burden incident to that lawful occupancy of the street. The running of a line of omnibuses upon the street or highway might be some inconvenience to the lot-owner, but he would not thereby be entitled to an injunction to prevent the use in that way. But when the location of the street railroad upon the highway appropriates any substantial property rights of the lot-owner, then the lot-owner is entitled to an injunction to prevent the appropriation of the property right until it has been appropriated in the manner pointed out by the constitution and the statutes.

And it comes to a question of fact, whether the case before us, under the proof, under the testimony upon which the case has been submitted, establishes with such certainty the facts that property rights have been invaded here, as will entitle the plaintiff to an injunction; and we have examined, with a view of solving this proposition, a number of cases that I will read from or comment upon other than to say we have examined the following cases:

35 Minnesota, 112.

27 Wisconsin, 194. That is a case in which the complaint was that the track of the street railroad was so laid as to interfere with the occupancy of a store, by allowing drays to be backed up to the door, and the court held in substance, that the occupancy of a street is not one of easement the lot-owner is entitled to.

50 New York, 206. If we blot out the distinction that is there made in New York between the rights of the lot owner who owns to the center of the street and those only who own the margin of the street, then that case is quite pointed in sustaining the rights of the company. In that case, road property was interfered with. It was alleged that the railroad track ran so near the lot—the owner's lot, as to prevent his driving his carriage up to his sidewalk to a curb, and the court there held that as the title of the street was in the public, the petition with those allegations made no cause of action for an injunction. And so far as we have been able to find, New York is the only state that draws the line between the lot owners—the easement which the lot owner has in the street where he owns to the center or to the margin.

35 California, 325.

3 Philadelphia, 259.

125 Massachusetts, 515.

79 Maine, 363.

91 New York, 145.

All have more or less bearing upon this question, and in none of them under the facts of those cases was it held that the complainant was entitled to an injunction.

We have reached the conclusion that the facts established by the affidavit upon which the case has been submitted, do not so clearly establish the fact that property rights have been invaded here as to entitle the parties to an injunction. We would not hold if it clearly appeared that property rights were being invaded and appropriated here that were protected under the constitution, that an injunction would not lie because the party had a complete remedy at law. Clearly it would be, under these facts, entitled to an injunction. And we refrain from commenting upon the facts, because the ultimate rights of these parties must be settled in a claim for damages. The road, of course, going through, an injunction would be only a temporary expedient to stop it until settlements were made. The ultimate rights of the parties are to be settled in money compensation; the road is to be built, and if these parties are entitled to compensation, they must get it in the way of damages.

And, in view of the doubt we have under proof, we simply say that we think the injunction should be dissolved and leave the parties to any other remedy that they may have; and that will be the order.

The North Chicago Street Railroad Company has decided to issue stock to the extent of \$1,320,000, which is 20 per cent of the stock now outstanding; the proceeds are to be used to take up bonds and pay the floating debt incurred by building new track and changing the motive power.

## PARIS TRAMWAY PLANS.

The city of Paris is about to undertake the construction of a system of tramways, the development being along the second of the lines pointed out by the Massachusetts committee, viz., municipal ownership of the tracks and private operation. The law authorizing the undertaking has been promulgated and the terms of the agreement made last year with General Traction Company made public. This company undertakes to form a special company to operate the lines when constructed, with a capital of not less than 25,000,000 francs (\$5,000,000). The total length of the system is 40 miles, but only 25 miles is at present contemplated, and this the city only undertakes to construct in eight years, which would appear to be ample time.

Some of the details of the agreement with the city are given below. The amount of the loan to be raised for the execution of the first portion of the lines is 165,000,000 francs (\$33,000,000). The company which has obtained the working concession undertakes to employ only Frenchmen, and to have all its plant and rolling stock made in France. The board of directors of the working company must be exclusively French; the company will be permitted to have its depots and works outside the city, but it must pay the octroi duties on the materials employed, as if the buildings were within the city walls; the names of the stations must be of a uniform color, and must be so placed that they may not be confounded with advertisements; the minimum wages or salary to be paid to any of the company's servants or employes will be 150 francs per month, or for workmen engaged temporarily 5 francs per day; the wages must be paid in full during the period of military instruction; the day's employment must not exceed 10 hours, with a whole day or two half days rest weekly, and 10 days' holiday annually without deduction of wages; in case of sickness wages must be paid in full for at least a year; in case of accident, until complete recovery, without prejudice to the indemnity to be paid if permanently disabled, wholly or partially.

The fares are fixed at 25 centimes (5 cents) first class and 15 centimes (3 cents) second class for any distance. Passengers before 9 in the morning may have for 20 centimes (4 cents) a return ticket, available at any hour in the day. Children of the municipal schools are to pay a fare of 5 centimes (1 cent) only when traveling collectively, accompanied by a master. The working company will pay to the city for the use of the lines 10 centimes (2 cents) per first-class passenger, and 5 centimes (1 cent) second class, increased progressively should the number of passengers carried during the year exceed 140,000,000. Children traveling for 5 centimes are not to be taken into account for the payment or the number. The stations and means of access to the platforms to be at the charge of the company, but the platforms are comprised in the work executed by the municipality. The concession is for 35 years, but the city reserves a right of purchase from the year 1910.

An attempt was recently made to wreck a Cleveland suburban car by four men who rolled a section of cast iron water pipe between the rails about 2 a. m., at which hour the cars run at a high speed; a resident of the neighborhood, seeing what they were doing, forced them to remove the pipe.

## CORRESPONDENCE.

MONTREAL STREET RAILWAY COMPANY.

Montreal, April 29, 1898.

EDITOR STREET RAILWAY REVIEW:

I notice in your issue of April 15, under the heading of "Tea-pot fare collections unpopular," an attack on the fare box system of collecting fares. The article is evidently written by one who is not familiar with his subject and the same can be said of the article in the Saginaw paper. The system is neither cumbersome nor undignified, nor is it repugnant to any one except dishonest conductors, who like to feel the jingle of the coin in their pocket, as they know a good percentage of the fares will remain there at the end of the day.

Your statement that it is a good opportunity to work off bad money is too absurd to dwell on, except a road employs conductors that are "blind in one eye and can't see out of the other." It might be well before writing articles of this sort to secure a box from us and see how it is worked, or give intelligent investigation to the subject.

The fare box is the only business like way of collecting fares there is at the present time, and they are used on a great many more roads than you are evidently aware of, and I defy you to find any intelligent manager in the country who has studied the fare box who will not back this statement up.

My time is too limited to discuss the disadvantages of the fare registers as compared with the boxes, but I have yet to meet the man who has studied the question who will say that the registers are better than the boxes. As for the public objecting to putting fares in the boxes, I cannot understand this, as it is only a question of putting a fare into a clean box or into a (very often) dirty hand. According to Saginaw ideas the kickers had better put their church collection into the elder's pockets and not on the plate the next time they go to church, in case they mistake the elder for the monkey attachment to the church organ.

W. G. Ross, Comptroller.

EDITOR REVIEW: With reference to your letter of the 24th of March, offering to send a copy of your book "Street Railway Law," I have to inform you that I already have a copy, but will be pleased if you will send me another for the use of our lawyer, for which I enclose herewith \$1.

With reference to this book, I might inform you that we had a case a short time since in which a cart driver a little ahead of one of our cars looked behind him and then deliberately drove across the track in front of the car, with rather surprising results to himself and vehicle. We defended his action and cited five or six similar cases from your book where judgments have been in favor of the company, and two similar cases in England. The judge, however, decided that he was not going to be guided either by American or English law and gave judgment against us; unfortunately we cannot appeal the case, the amount claimed being too small.

Circuit court cases in this country are not reported and consequently it is impossible to refer to previous decisions with reference to actions of this description.

EDWARD A. EVANS,  
Manager Quebec District Tramway.

In response to the request for a reliable safety brake for long grades, published in our last issue, Patrick Flood, of the mechanical department of the Albany Railway Company, writes us concerning the emergency brake of his invention, with which 75 cars on that road are equipped; he also states that he has recently closed a contract for equipping all the cars of the Cohoes City Electric Railway.

The Kingsland Manufacturing Company, of St. Louis, writes concerning the same matter and states that it is about to place on the market a brake designed for severe service in which it is claimed: There are no shoes on the wheel. There is no slack in the chain, so commonly provided for curves. There are no equalizers or brake beams. The motorman need exert but one pound pressure to control the car where he now exerts four. Friction is put upon the axle, and controlled by a lever instead of the staff and crank or wheel. The lever occupies very little room on the platform and is readily changed from one end to the other. There is no chain to wind up and the car does not have to be in motion to set the brakes.

## A HOME-MADE SAND BLAST.

A sand blast can be used for effective service in the railway shop in cleaning slag and corrosive matter from parts. The fine, sharp particles of sand cut like diamonds and will remove rust, gummed oil spots, surface irregularities, nicks and the like from metal. Initial letters can be cut on plate glass by covering that part of the glass not desired to reach by thick, hard paper or gelatine board. Name plates can be cut the same way. Stencil letters will be required, the sand blast cutting the exposed parts.

Of the various types of sand blasts, the writer has obtained most effective service from the one illustrated, which

is unpatented, and which can be made by almost any machinist. In this device, a hose is connected with the air supply and the air blast governed by a check valve. The sand is in the retort, and the grains fall through the outlet at the bottom, meeting the blast of air at B and are sent to the nozzle D, with great force. The retort is tin and the pipes and connections can be bought at any dealers. A common brass or copper nozzle, about  $\frac{5}{8}$ -in. inlet, is used. Crushed quartz makes the best sand. The air blast is obtained from a blower or from a compressed air chamber which is connected to the pipe C. F.

## POWER STATION OF THE SOUTH SIDE ELEVATED RAILROAD.

The adoption of the Sprague multi-unit system by the South Side Elevated Railroad Company, of Chicago, excited much interest among those connected with electric railways, and it has been generally recognized as a step in advance. The reputation of the men back of the plan and the acceptance of it by President Carter and General Manager Hopkins, men of wide experience in railway affairs, lead many to have much faith in the system. After a consid-

ing engineers for the company, and is a model of convenience, embodying the latest engineering improvements. The location of the station is at the corner of State and 40th streets, alongside the Lake Shore & Michigan Southern Railroad. Besides having excellent coal facilities the station is situated near the center of current distribution. Fig. 1 shows an electric train passing around the curve from 40th street, the power station being to the right in the picture.

The station is divided lengthwise into two large rooms as shown in the plan and section. The building is 200 ft. long; the engine room is 59 ft., and the boiler room 48 ft.

FIG. 1.—A MULTI-UNIT TRAIN.

FIG. 3.—FAN MOTORS AND SWITCHBOARD.

FIG. 2.—ENGINE AND GENERATOR ROOM.

FIG. 4.—MAIN SWITCHBOARD.

erable delay, most of it being occasioned by the power station, electrically equipped trains are now running and the practical operation will soon demonstrate the success of the project, or develop its defects.

On April 20 seven trains were put in operation, alternating with the trains drawn by locomotives, but a portion of these had to be withdrawn to remedy some faults developed in their operation. More cars have been prepared for service and now 36 are running regularly. This number will be gradually increased until the 120 cars so equipped will entirely supplant the steam-driven trains.

As will be noted in the views of the interior the finishing touches have yet to be put to the station, but all four of the 1,200-h. p. units are in readiness, together with all the auxiliary apparatus.

The station was planned by Sargent & Lundy, consult-

wide. In the engine room, Fig. 2, there are four cross compound, condensing Allis-Corliss engines with cylinders 26 and 54x48 in.; speed 80 r. p. m. Each engine will develop normally 1,200 h. p., but will carry a 66 per cent overload. The direct connected Westinghouse generators are of 800-k. w. capacity, giving 1,280 amperes at 625 volts, although the generators are capable of running under temporary overloads of 100 per cent. A Reynolds condenser receives the exhaust steam from each engine. They take water from a tank under the cooling tower outside the station and discharge the water into the top of the tower through a 20-in. pipe. In Fig. 3 are seen four of the five motors which drive the 10 fans of the cooling tower, and the switchboard for these motors. These motors are 6-pole, 600-volt and run at 150 r. p. m. A 30-ton electric crane spans the engine room and is equipped with General Electric motors. Pip-

ing from the compressed air system extends to each generator for cleaning the armatures, etc., the air being furnished from a Westinghouse air pump. Oil is supplied by a gravity system, pipes running to all the bearings from a tank placed near the roof of the station. After being used the oil is filtered and two pumps return it to the tank.

The white marble switchboard is shown in Fig. 4 and is unusually compact for so large a station. The four panels to the left in the picture are each for a generator. Each panel has a General Electric circuit breaker and switches, a 2,500-ampere Weston ammeter and field rheostat controller, the resistance of which is under the floor. The next panel to the right receives the entire current of the station and is designed to carry 8,000 amperes. It has a 750-volt voltmeter and an 8,000-ampere ammeter, a General Electric wattmeter, and a Bristol recording voltmeter. The next panel supplies current to the station. This goes to the five

There are eight water tube boilers tested for a pressure of 300 lbs., the pressure of the station being only 160 lbs. All the high pressure steam valves were furnished by the Crane Company. Two vertical oscillating engines drive the chain grates, the exposed furnace surface of each being 7 ft. 6 in. by 8 ft. 6 in.

The boiler feed water is pumped by three Blake compound feed pumps, 10 and 7x12 in., from either the city mains or the condenser discharge. Each boiler has a hot water meter attached and two meters register the water which is supplied to the station from the city water mains. The steel plate stack is 200 ft. high and 13 ft. 8 in. internal diameter at the top. The plates are ½-in. at the bottom and ¼-in. at the top, with a fire brick lining from 9 in. to 4½ in. built up in the interior. There are two flues extending from the boilers to the stack, one containing two Green fuel economizers, the hot gases being drawn into this one from a

FIG. 5.—COOLING TOWER.

FIG. 6.—BOILER ROOM.

FIG. 7.—COOLING TOWER.

cooling tower motors, the two motors running the coal handling machinery, the crane motors, 200 incandescent lamps and 20 enclosed arc lamps. A recording wattmeter keeps a record of all the energy so used. The four panels to the right are for the eight feeders running out of the station. Each panel has two single pole switches, two circuit breakers with the two ammeters between them.

The five motors mounted in the engine room are connected by shafting to the 10-ft. fans of the Barnard cooling tower, which is notable for its great size. The tower, made by the Wheeler Condenser & Engineering Company, is 64 ft. long, 16½ ft. wide and 34 ft. high, and beneath it is a tank 6 ft. deep. The arrangement of the 20-in. discharge pipe and connections to the tower is plainly shown in Figs. 5 and 7. From each of the five 10-in. branch pipes the hot water is discharged into a header, from which it is sprayed over wire nets which are hung vertically in the tower. The air is drawn in by the 10 large fans and by contact with this air and by evaporation, the water is cooled by the time it reaches the tank in the bottom.

In Fig. 6 may be seen the fronts of the boilers, the mechanical stokers, and the coal tanks in the boiler rooms.

point near the middle of the bank of boilers. This flue is closed when the economizers are not in use.

The station has a complete equipment of coal and ash handling machinery. The coal is delivered from the cars into a hopper and passes through a motor driven crusher. It is delivered by a McCaslin conveyor, made by the John A. Mead Company, New York, to a second conveyor and is carried to the coal bins and tanks above the boiler room. The coal is delivered from the tanks to the mechanical stokers as shown in the interior view of the boiler room. Every pound of coal which passes through the chutes is weighed automatically by a Clark scale. This is the first installation of this apparatus in a street railway power station, but it has been tested in the Edison lighting station in Brooklyn. Every 224 lbs. of coal passing from the hopper into the bucket of the scale act against a weight and lever closing a door to the hopper and the bucket drops down a few inches depositing its contents into the stoker through the chute, at the same time making a record of the load. The bucket is held mechanically until the fireman sees that more coal is needed, and then by means of a rod the catch is tripped and another bucket full deposited. The ashes are collected

CROSS-SECTION OF STATION.

in the same conveyor which handles the coal. They drop into the ash pit beneath the boiler and are dampened before removing. A hopper running on a rail above the conveyor buckets is rolled to the ash pit door and the door opened. The ashes pass into the buckets to be carried to the ash bin.

There are three feeders extending north of the station, two of 1,000,000 c. m. cross section and one of 500,000 c. m. To the south there are two of 1,500,000 c. m., two of 1,000,000 c. m. and one of 500,000 c. m., cross section

All power station, track and feeder arrangements being practically completed the operation of the full equipment of

PLAN OF POWER STATION, SOUTH SIDE ELEVATED RAILROAD, CHICAGO.

cars is awaited with much interest and anxiety for its success. The trains now in operation run very smoothly, which is a great relief from the jerky movements of the locomotives and the acceleration is much better. However, some alterations have been necessary in the electrical equipment. Among others is a change in the form of the contact box which now resembles in appearance a diminutive controller case and top instead of the cylindrical form described in the REVIEW of December, 1897. Some changes should be made in the throttle board for the current consumption per train in accelerating when the motors are thrown in multiple is excessive and will prove a severe tax on the power station. It was hardly to be expected that there would not be some imperfections in the first installations.

President Carter is rapidly bringing the road out of its financial difficulties and the steadily increasing earnings give promise of it once more becoming a dividend paying property.

---

### OBITUARY.

At a recent meeting of the directory of the Columbia Railway Company, of Washington, D. C., a minute concerning the late R. F. Baker was ordered recorded, from which we take the following extract: "Mr. Baker was elected treasurer of the company in July, 1889, and served in that capacity until August, 1893, when he was elected president of the company, and held that office until the day of his lamented death. When he assumed the office of treasurer in 1889, the business of the company was limited, and for several years no dividends had been paid. The success of the company, and its constantly increasing prosperity during all the period of his official connection with it, plainly show the ability with which he directed the policy and plans of the company, and the skill and energy with which he managed its affairs."

---

### NEW PUBLICATIONS.

The Electric Storage Battery Company, of Philadelphia, publishes circulars at intervals of about two weeks giving current information in reference to the installation of storage battery plants for lighting and street railway purposes. The pamphlets are fully illustrated from photographs and diagrams.

A hand book entitled "Electricians' Sheet Insulation Manual," has been published by the Mica Insulator Company, of New York and Chicago. The book contains leaves of the insulating cloths and papers made by the company with a description of the properties and purposes of each sample. The M. I. C. compound is described and two testimonials from leading manufacturers of electrical apparatus are given. The book should be of interest to electricians and will be sent upon request.

"Wonderland, '98," is the appropriate title of the annual publication of the passenger department of the Northern Pacific Railroad, devoted to illustrations and descriptions of Nature's freaks and wonders which abound along the entire length of the road. Notwithstanding the beauty and excellence of past years' "Wonderlands," the issue of this year surpasses them all, and constitutes an ornament which in attractiveness and information makes it an addition to any library table. A copy can be secured on inclosing the amount of postage—6 cents—to Chas. S. Fee, G. P. A., St. Paul, Minn.

Laird & Lee, of Chicago, have just issued in their collection of technical reference books, a "Machinists' and Engineers' Pocket Manual," edited by D. B. Dixon, which is a complete as well as compact work. It includes a compilation of rules and solved problems pertaining to steam engines, boilers, pumps, etc., based on plain arithmetic, together with necessary tables, and data of highly practical value. It embraces also a dictionary of terms used

in steam engineering and electricity. This illustrated volume of 371 pages, printed on excellent paper and bound in leather, in pocket form, is sure to meet with wide and immediate recognition. Leather, with rubber band, and pocket; \$1.00.

---

### PERSONAL.

C. E. Flynn, manager of the Carbondale (Pa.) lines was in Chicago last week.

John Carson, chief engineer of the Duluth (Minn.) Street Railway, was married to Miss Mary M. Fee on April 20.

H. H. Hilborn has been appointed manager of the Berlin & Waterloo Street Railway Company, of Waterloo, Ontario.

C. S. Bidwell, superintendent of the Trumbull Electric Railroad, Warren, O., has tendered his resignation to take effect June 1.

W. M. Jones, electrician of the Oil City (Pa.) Street Railway Company, was on April 7, married to Miss Ayres, of Jamestown.

Charles H. Stoll, president of the Passenger & Belt Railway Company, Lexington, Ky., has resigned that position and will remove to New York to reside.

C. T. Gage, formerly electrical salesman for the Washburn & Moen Manufacturing Company, in Chicago, has taken charge of the St. Paul office of that company.

Russell Harrison, president of the Terre Haute Electric Railway Company, is to be appointed a major in the engineer corps of the volunteer army.

I. Fuyloka, president of the Tokio Electric Railway Company, and formerly professor of electrical engineering in the Imperial University at Tokio, is making a tour of the United States.

C. P. Coleman, formerly general storekeeper of the Lehigh Valley Railroad Company, has resigned to accept the position of purchasing agent of the Bethlehem Iron Company, South Bethlehem, Pa.

G. H. Chapman, superintendent of the City Railway Company, connecting LaSalle and Peru, Ill., resigned when the receiver took charge, and the latter is conducting the operation as well as the finances of the road.

T. M. Steger has resigned the presidency of the Nashville Street Railway and is succeeded in that office by L. D. Tyson, former vice-president of the company, who for some time past has practically been the president.

G. R. Scrugham, of the Creaghead Engineering Company, was a REVIEW caller when in Chicago, recently. Mr. Scrugham, it will be remembered, was for 17 years with Siemens Bros., of London, who are the largest dealers in electrical appliances in the world.

John M. Anderson, of the well known firm of Albert & J. M. Anderson, Boston, was a Chicago and REVIEW visitor last week. The firm has long enjoyed a large business in the west, and the "war scare" has had no effect whatever, the factories continuing to run at full capacity.

R. E. Sheldon, for some time past the second vice-president of the Columbus Street Railway Company, has been chosen president to succeed Emerson McMillin, who resigned in order to "unload responsibilities of corporations." Mr. McMillin retains his interest in the company.

John McFayden, general manager of the Chester (Pa.) Traction Company, was recently given a complimentary banquet by a number of his Masonic friends in Media and vicinity, in appreciation of the many courtesies extended by him since assuming the management of the road.

## ELECTRIC POWER COMPANIES AND THEIR RELATION TO MUNICIPALITIES.

Abstract of an address by Albion E. Lang, President of the American Street Railway Association, delivered at Purdue University.

Consideration of the relation on the part of an electric power company to the station producing the current, on the one hand, and to the community consuming it on the other, opens a field of thought and discussion quite beyond the possible limits of a single paper, and I must, therefore, touch but briefly the outlines of this field, with the hope of thereby suggesting questions that will bring out an interchange of view along practical lines.
