There is a two-fold object which must be accomplished; first, that investment of capital must be made profitable to the investors, and, second, the community must be served in the best possible manner at a minimum cost.

No new or improved electrical equipment of either street railway or light company makes its appearance, that the community does not demand, and the enterprising manager desires to supply. If the company does not respond, the community then demands that it give way to some other company which will do so. Failing in this the cry goes up for municipal ownership. The community gives little thought to the financial condition of electric or even other quasi public corporations, but is ever demanding more—more. This is American, but we are put on our mettle to meet these conditions. How shall they be met?

It was only about 10 years ago that electricity was found to be a practical means of propelling street cars, and it has developed so rapidly in this line, that it has been quite difficult to secure men familiar with the work. Indeed the demand at one time was so great that men were hurried through the shops of the electrical works having acquired but a little practical knowledge, soon to blossom out full-fledged electricians—but in name only. As a result of this hasty and insufficient preparation, these so-called electricians in many instances made mistakes, which were costly indeed, but, nothing daunted, they forged ahead, and succeeded in constructing and equipping many miles of electrical railway all over the country. The insufficient knowledge of electricians was not only evident in the construction and equipment of the railways, but also at the power stations, and at the factories where the apparatus was manufactured. But notwithstanding the crudity of many things in the electrical line and the lack of knowledge in relation thereto, the public was bound to have it, and so property was purchased at enormous prices, a so-called electrical engineer was placed in charge, and the work carried on regardless of expense, and I was about to say—of consequence.

I venture the statement, however, that could some of the owners of street railways using horse power, or some of the capitalists who ventured investment in the earlier electric light plants, have foreseen the almost fabulous sums of money required to convert or construct the same, and the long time they would have to wait—and may still wait, for profits—there would have been much more caution, and much less progress. Once entered upon, there was no convenient stopping place, and in many and many an instance none has yet appeared. But we may say this is American—truly American.

What has been said applying specifically to the street rail-

way plant, is equally applicable to electric lighting plants, so far as the power house, repair shop, and overhead lines are concerned. Each furnishes power useful to the citizen, and each should be made profitable to its owners. As before stated, they are each closely related to the municipality, and the community expects and demands the best possible service at the minimum cost.

How can this be accomplished? It must be borne in mind that many existing power companies, meaning of course street railway and electric lighting companies, have passed through very costly experiments growing out of crude machinery and apparatus they were forced to buy, and inexperienced and incompetent persons employed to install and put the same into operation. Finding that expenses were exceeding revenues, and grasping at every promising improvement offering greater economy, change after change has been made, and is still making, to reach better results, all of which has required increasing capital stock, and the issuing of bonds. There was no other way to avert failure, and avoid the sheriff, and thus many companies have gone forward, piling up debt upon which interest must be paid, and still the end is not yet. Every new plant installed possesses some new features that offer better service, with greater economy, and this forces existing plants to again remodel and change, and create more debt, and consequent increased interest charges.

It is thus plain to be seen, that the cost to the consumer must remain largely unchanged, except in the few communities where the above mentioned conditions have not so largely prevailed. A condition such as this is, of course, unfortunate, both for the community and for the company, and no doubt leads to much discussion of the question of municipal ownership of these properties. Vainly believing that the cost of such service can be materially reduced, and profits proportionately increased, municipalities desire to reap supposed harvest. This I believe to be erroneous under present forms of society and government. I do not believe that municipal ownership of such properties is wise in any sense nor that much will be done in this direction, especially not if private corporations keep pace with the best methods of service and offer reasonable rates. I am one who believes that the community will deal with these corporations fairly, if the corporation will be equally fair with the community. Some corporations are too exacting—too much inclined to reap a harvest of quick return by way of dividends, and provide a rapidly accumulating sinking fund to wipe out original investment.

This method though Yankee-like, and generally called business-like, is not the prudent or wise way of handling corporations, depending on the public for their existence. A better way, it seems to me, is to take the public into your confidence, deal fairly and even generously with it, give the best possible service at the smallest profit consistent with a fair return, on the investment, and reasonable provision for meeting outstanding obligations and future depreciation, in which event the community will deal fairly with you. Citizens should be made acquainted with all the conditions governing properties of this kind, should be informed of the reason for incurring the debts which generally exist, and of the annual and contingent burdens we assume. Fulfilling these conditions fair prices will usually be allowed for transporting passengers upon our railways, and power and light supplied. Where the company is left free to fix its own

prices, no advantage should be taken, but a reasonable and just charge should be made as above indicated. The tendency of the present age is toward lower prices for labor, as well as for the product of farm and factory, and lower interest on money; and electric power companies must meet it.

To do this, no better method can be found than by consolidating under one roof all electric power companies where conditions are favorable. Re-equip with the latest and best types of machinery for generating current, re-arrange circuits for better power distribution, introduce better lamps, repair and keep in good order all the apparatus appertaining to the street railway and light plant. Give the best of service.

There is frequently no other way this can be done but through consolidation, and this can be accomplished without criticism or objection on the part of the community, if followed by reduced cost to the consumer, with first-class service rendered. Corporations, like individuals, sometimes make mistakes, and through miscalculations the expense of construction and operation, or in the eagerness to secure grants, or for various other reasons, they assume these contracts, upon terms, and at rates and prices too cheap to permit giving the best of service, with the result that great dissatisfaction is expressed by patrons and citizens generally, and the warfare between the city and company begins. Furthermore, when such corporations have reasonably profitable contracts, they are sometimes mismanaged by their avaricious owners, scanty service is rendered their patrons, and the result is the same. Again, municipalities, in some instances, through the prejudice or political aspiration of their governing boards, seeking advantage by every method known to their officials, harass corporations, and thus force them to retaliate by giving poor service.

Now, gentlemen, do you perceive the call for your labor and efforts? It is here where your skill is in demand, here where it is your power to work out the problems which will aid in putting this class of property into more profitable operation, satisfactory to owners and the community. The power house, repair shop, cars, track, and lines are the dividend producers, when skillfully and intelligently constructed and operated, and you are needed to carry on this work, needed now—perhaps more than ever before, to pilot safely to a dividend basis, plants of companies already existing. Needed also to wisely inaugurate other enterprises of a similar nature, and thus extend still further the uses and advantages of this wonderful power.

The first consideration of every person as he enters the market to sell his labor, or to invest his money in commercial pursuits, is, how large a return can I obtain, either from labor alone or from labor combined with the investment of capital? Either field is legitimate and proper, but by far the wider is that opened for the sale of labor; and its reward (if the labor be of a higher order), is abundant and certain. Investment of capital with hope of great returns, is speculative and uncertain. If returns are steady they are generally moderate. To rise above mediocre in the sale of labor, one must be either a born genius (which most of us are not), or he must have an ardent love for his profession, and be fully equipped for its practice.

I know of no field more promising than the electrical. In it young men of energy, perseverance and devotion can make a good living, and perhaps acquire a competency. I have briefly indicated some of the problems which will con-

front you when you have entered into active service. It is needless to say that you cannot be too well prepared to meet them. Your ability and education, however, are not the only qualifications necessary to possess in order to succeed. Without an honest, and faithful and constant devotion to the interest of your employer, no permanent success will be attained. You are now acquiring scientific, and as far as possible, practical information in electrical engineering. Some of you will be called to manage electrical properties, to finance them, to look after municipal, county, or state legislation. The broader your information concerning the subject—the higher degree of usefulness you will attain. There is to the student every incentive for faithful, industrious work. The possibilities are unlimited and the reward ample.

---

### OFF FOR THE WAR.

---

On Sunday, May 1, when the 42nd Separate Company, New York National Guard, of Niagara Falls, was ordered to Homestead Plains, L. I., the citizens gave the company a royal send-off. In order that both ends of the city might have opportunity to see the men in line before their departure for the front, Superintendent John C. Brewster offered the service of the Niagara Falls & Suspension Bridge Railway to transport the company and veterans to the north end of the city, where the line was formed. Our illustration

OFF FOR THE WAR.

shows the scene in front of the armory just as the company came out to board the trolley cars. An immense crowd was present, the majority of people in it being hid by the cars. No doubt but there were many similar scenes in New York on May 1, when the troops started for camp, all displaying the patriotism of street railway companies and their efforts to further the cause of the country. One of the notable features of the Niagara parade was the presence in line of two Canadian fire companies headed by the Union Jack and a Canadian band.

---

In order to make the Brooklyn bridge self-supporting, a large portion of the revenue having been cut off by reason of the reduced travel on the bridge railroad, an effort is being made to raise the tolls on trolley cars from 5 cents to 10 cents. The 5-cent rate was fixed by the bridge commissioners who now wish to raise it

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

## Removing a Broken Shaft.

The statement of Lord Chesterfield, "to have a thing well done you must do it yourself," still has its application, sometimes in the street railway business and under circumstances when it might be least expected. That which calls it to mind is the experience of General Manager H. M. Sloan in replacing the 16-in. shaft of a 500-k. w. direct connected unit in the power house of the Calumet Electric Street Railway, it being necessary to take out the original shaft and substitute a larger one. The shaft was broken about the first of the current year, the break occurring in the wheel fit of the governor wheel. Feeling some hesitation in undertaking the work, for which he had not the proper tools, and knowing it would be a difficult matter to handle the shaft, which weighed 14,610 lbs., he thought it would be cheaper to hire a professional, and accordingly let the contract for

500-K. W. UNIT.

the work to a firm which had extensive experience in that line.

In removing the broken shaft, the fly-wheel, which is in two sections, was separated in halves and blocked up; the upper field casting of the generator was also blocked up. It was then attempted to force the shaft out by putting a 300-ton jack between the broken end and the adjacent engine bed, which was held to the armature hub by two long 3-in. bolts; because of improper blocking back of it, the jack was broken.

After waiting several weeks for the jack to be repaired, they made a second attempt and again broke the jack by the pressure applied. Then two 40-ton jacks were placed between the armature and crank disk on the other end of the shaft; this experiment resulted in forcing the disk off and breaking another jack.

At this point Mr. Sloan thought it was time for him to take a hand, as the delay was becoming intolerable, there having been a wait at the start of some weeks for the jacks to be shipped from the east, and then the two delays caused by the breakage. So, after talking the matter over with the chief engineer, D. S. Schrockenstein, they decided to do the work themselves. Within one hour a plan had been laid out and the required material ordered by telephone; this was delivered the following day, and in five hours afterward was put into position. Suitable yokes were put behind the shaft end and the armature, with four bolts, two of 3 in. diameter and two of 3¼ in. diameter, 20 ft. long and threaded with 5 V-threads to the inch connecting them and the nuts tightened up.

For tightening up the nuts a heavy wrench, on the shank of which a piece of pipe 14 ft. long was slipped, was used. To the other end of the pipe blocks and tackle were attached to the floor for pulling down, and blocks and tackle to the roof truss for lifting, and the nuts set up as tight as possible. While the stress was thus on, an iron battering-ram, weighing 1,000 lbs., was swung from the roof truss, and, guided by ropes, tied to either side, was drawn back and swung against a car axle laid along the shaft with its end bearing against the armature hub.

At the first blow there was a crack like that of a pistol and the shaft moved 1-32 in. The time consumed in putting the material into position and getting the shaft started was six hours and a half.

After the first blow it was found that the nuts were stripped and a halt was called until new ones could be made. This being Saturday, to have ordered new forged nuts from the city would have caused another long delay, so Master Mechanic W. A. Harding immediately made a pattern and cast new brass nuts, which weighed 80 lbs. each, the same day, in the company's foundry. Monday morning they started to work again, following up the same process of tightening nuts and using the ram until, at the end of three days, it was out.

On examining the bolts to see if they were suitable for putting the new shaft in, it was found that they were stretched a full thread to the inch, necessitating cutting them off and turning new threads. In threading the bolts, Mr. Harding conceived a plan which facilitated the gaging of the threads and also made it much easier to handle the nuts when the bolts were in use. The bolts being too long to be held between the centers of any lathe at hand, the tail-stock was removed and the shaft supported in a bearing on the bed. When first made, the machinist had tapped a hole in the end and inserted a set screw, which was grasped by the lathe chuck when cutting the thread, thus making it necessary to take it out of the chuck and swing it back in order to try the nut. Mr. Harding first turned down the end of the shaft below the root of the thread for a distance greater

than the length of the nut, and thus provided a resting place for the nut, always in position to be tried, and permitted the chuck to grasp the bolt end. The convenience of this arrangement for an 80-lb. nut is easily appreciated.

Then the bolts and yokes were again put in place over the new shaft end and armature and the nuts set up. In putting in this new shaft a battering-ram of timber, 12 in. x 12 in. x 18 ft., was used against the end, which was put in place in one day and a half, and five hours for getting the material into place, making the time spent on the two shafts 6 days, the delay 2 days, or a total of 8 days. When against this is placed the time spent by the firm having the contract at first, which, including delays, was 3 months, without accomplishing anything, the story is told.

#### Cost of Niagara Power in Buffalo.

The Cataract Power & Conduit Company, of Buffalo, has determined upon a schedule of charges for the power transmitted to that city from Niagara Falls after a thorough investigation by competent engineers as to the cost of power under varying conditions. It was thought unfair to charge strictly by meter or at a lump sum of so much per year, as some power users would take the amount contracted for during the entire day and others would use it intermittently. It was decided that the assessment should be in two items, viz., a charge for service and a charge for power. The charge for service is at the rate of \$1 per kilowatt per month, this charge depending directly upon the amount of power that the company is required to keep available for the lessee. The monthly charge for power will be in proportion to the actual amount used, as determined by the standard meters installed on the premises of the consumer.

The unit of power is the kilowatt-hour and the charge for power will be determined by the record of the meter and by calculation from the following schedule:

For use not exceeding 1,000 units, the rate shall be 2 cents per unit.

For use exceeding 1,000 units, but not exceeding 2,000 units, the rate shall be: For 1,000 units 2 cents per unit, and for the excess 1.5 cents per unit.

For use exceeding 2,000 units, but not exceeding 3,000 units, the rate shall be: For 2,000 units 1.5 cents per unit, and for the excess 1.2 cents per unit.

For use exceeding 3,000 units, but not exceeding 5,000 units, the rate shall be: For 3,000 units 1.2 cents per unit, and for the excess 1 cent per unit.

For use exceeding 5,000 units, but not exceeding 10,000 units, the rate shall be: For 5,000 units 1 cent per unit, and for the excess .8 cent per unit.

For use exceeding 10,000 units, but not exceeding 20,000 units, the rate shall be: For 10,000 units .8 cent per unit, and for the excess .75 cent per unit.

For use exceeding 20,000 units, but not exceeding 40,000 units, the rate shall be: For 20,000 units .75 cent per unit, and for the excess .70 cent per unit.

For use exceeding 40,000 units, but not exceeding 80,000 units, the rate shall be: For 40,000 units .70 cent per unit, and for the excess .66 cent per unit.

For use exceeding 80,000 units, the rate shall be: For 80,000 units .66 cent per unit, and for the excess .64 cent per unit.

These rates are for a three phase alternating current as delivered from the three substations. A few calculations will perhaps put these rates in shape for comparison. If a small consumer used power continuously for 10 hours a day and on an average of 25 days in the month, it will be necessary to

reserve at least 4 k. w., or to allow a margin of 20 per cent, 5 k. w. For these 1,000 units he pays \$20 per month and \$5 for charges for service. The cost will be \$300 per year or \$75 per k. w. used or about \$56 per h. p. per year. This does not seem to be especially low but as the electric motor dispenses with the dirt, help and floor space otherwise occupied, the electric power is preferable.

A comparison of these rates with the cost of power to some of the street railway companies will show whether the rates are entirely fair to the large consumers. Referring to the table on the cost of power on another page, we may take as an example station No. 3. The output of 275,380 k. w. h. would cost at the lowest figure given in the rate sheet, .64 cent per unit, \$1,762. At the very least it would be necessary to reserve 1,000 k. w. for the service. It will be readily seen that the reserve would not necessarily be as great as the present capacity of the station which makes allowances for sudden overloads, repairs, etc. The charge for service would be \$1,000, making a total of \$2,762 as compared with the present expense of \$1,994. If now we assume the efficiency of the rotary converters to be 90 per cent, the cost of the rented power becomes about 1.1 cent per k. w. h. as against .724 per k. w. h. for station No. 3. Whether it would be cheaper to rent power at this rate depends upon the relation the fixed charges bear to the operating expenses; as a rough estimate we should say that the fixed charges would be less than half as much with the rented power. Also there is but little doubt that even a smaller rate would be made to such large consumers.

#### Brazed Copper Steam Pipes.

A very interesting article on this subject appeared in a recent issue of London "Engineering," in which the use and failures of copper pipes were discussed. In order to avoid expansion joints in pipes connecting engines and boilers they must have curves or bends in them. As copper takes "punishment" easily shorter sections of curved pipe could be used if made of that metal, and the extensive use of copper steam pipes on board ships, where space must always be economized, was a natural result. It is stated that of the failures of copper pipe investigated by the Board of Trade, by far the larger number proved to be due to faulty design, the thickness of the pipe being increased to carry higher pressures, without considering that the pipe was thereby made stiffer and needed, therefore, to be longer. An accident on board the steamship *Prodano* in 1891 developed another cause of failure, deterioration of the brazing. The pipe in question had been inspected when new by Lloyd's and nine months later burst, killing four persons. The Board of Trade found that the brazing was defective at the outset, a conclusion combatted by Lloyd's, and pieces of the broken pipe, samples of incrustation scraped from the inside, samples of oil and of an anti-corrosive fluid used in the boilers, of the brazing solder used, and portions of the main steam pipe of another vessel were submitted to a chemist, Professor Arnold, for examination. An examination of the brazed seams of the *Prodano's* pipe showed a change to have occurred in a large proportion of the solder, large areas showing up as a finely-granulated coppery-looking mass. There was not a sufficient amount of the solder from the *Prodano's* pipe available for a chemical analysis

## COST OF POWER FOR ELECTRIC RAILWAYS. Output Measured by Wattmeter in Each Case.

of it, but the solder from the other pipe was analyzed and found to contain but 18 per cent of zinc, the original proportion of zinc being probably 38 per cent. Its spongy condition was shown by the reduction of its specific gravity from 8.24 to 7.45. It was further found that the zinc remaining was completely oxidized, the oxidization resulting, it is thought, from the fatty acids arising from the decomposition of the lubricating oils used in the high pressure cylinder. The suggestions made to avoid the danger due to deteriorated brazing, are use iron or steel pipes (with expansion joints where cramped for space) or possibly the flexible metallic tubing which is on the market.

\* \* \*

### A New Steam Separator.

The accompanying illustrations show the steam separators recently placed on the market by the Hoppes Manufacturing Company, of Springfield, O., in which the effort of the designer has been to secure as great efficiency as possible in the separation of the entrained water from the steam with the least possible obstruction to the flow. With this object in view the interior is made as smooth as possible and all sharp corners or depending ledges have been avoided, as these not only add friction, but worst of all the entrainment would be blown from them by the force of the current and sprayed into the steam again.

VERTICAL TYPE.

As will be seen the steam inlet gradually enlarges into a steam chamber of 10 times the area of the pipe and is then gradually reduced to the original area. No baffle plates or other obstructions are employed and the steam is not required to take on any centrifugal, zigzag or other tortuous motions in its passage through the separator. The moisture is intercepted by the troughs or gutters which are partially filled with water; these also effectually intercept oil. The excess of the en-

trainment is carried to the bottom of the separator by the small pipe shown.

HORIZONTAL TYPE.

ters it passes one of the gutters, and as it ascends on the other side it passes the other.

All of the separators for pipes above 8 in. in diameter are made of flange steel, as are also the combined separators and receivers made by this company on the same plan.

\* \* \*

### Valve Reseating Machine.

The value of a practicable and reliable valve reseating machine is now well-recognized, the saving effected by its use greatly exceeding, in a short time, the cost of the device. Taking the weight of steam discharged per second as the product of the area of the orifice by the absolute pressure divided by 70, the weight per hour with steam at 125 lbs. per gage would be 7,200 lbs. for an orifice 1 sq. in. in area. The cost of evaporating 1,000 lbs. of water into steam at 125 lbs. is probably not less than 12 cents, and may be much more, and hence in one hour an opening of 1 sq. in. would discharge at least \$.86 worth of steam. Of course valves do not have leaks aggregating 1 sq. in. in area, but the calculation shows how a few small leaks may easily waste considerable money.

The Benton valve reseating machine here illustrated, is handled by Wendell & MacDuffie, of New York and Boston, and can be attached to all valves regardless of the size of the thread or of the opening in the valve hood. The valve seat is cut with reversible self-cleaning tools, which may be ground when dull.

The attaching device consists of a block-chuck with gibs placed between the two blocks and the bar to take up the slack. Upon the under side of the blocks is a series of parallel segment-shaped steps, the curved face of each step being threaded to correspond with the threads of valve casings

BENTON VALVE RESEATING MACHINES.

with which the steps are designed to engage. The screw rod opens or closes the chuck jaws.

The outfit also comprises a disc dressing device, the cutters for which are on the inner opposite edges of a V-shaped bar. These cutters or blades are attached to this bar by means of screws that pass through slots in the bar, and thus permit of a rigid angular adjustment of the cutters. It is to be noted that the cutters or blades, by being located on the sides of said bar, have their cutting edges presented on lines tangential and not radial to the valve being ground; hence they do not unduly bite into the valve, and objectionable chattering is avoided.

### BUFFALO & LOCKPORT INTERURBAN.

One of the largest recent railroad deals has just been perfected in New York, where the Buffalo & Lockport Railway Company has been incorporated to operate a street surface railroad between Buffalo, in Erie county, and Lockport, in Niagara county, by way of the Tonawandas. The capital stock of the new company is \$1,000,000 in 10,000 shares of \$100 each. The men named as directors for the first year are as follows: W. Caryl Ely, Frank A. Dudley, of Niagara Falls; John A. Merritt, Frank M. Ashley and S. Curt Lewis, of Lockport; H. J. Pierce, Robert L. Fryer, G. H. Dunbar, Burt Van Horn, of Buffalo. Mr. Ely is president of the new company, Henry J. Pierce, of Buffalo, is vice-president, and Burt Van Horn is to be secretary, treasurer and general manager. Mr. Ely is president of the Buffalo & Niagara Falls Electric Railway Company and is also first vice-president of the American Street Railway Association. Mr. Van Horn is the general manager of the Buffalo & Niagara Falls Electric Railway. One of the very interest-

ing features of the company's plans is that it has secured a lease of the Tonawanda-Lockport branch of the Erie Railroad, and will operate electric cars over it. The company's line commences at the center line of Hertel and Virgil avenues in Buffalo, runs along Hertel avenue to Kenmore avenue, to Delaware street, Tonawanda, to Young street, to Delaware street, crosses the Ellicott creek, Erie canal, Tonawanda creek, to Main street, to Sweeney street, to the Erie Railroad, Lockport branch, thence to the junction of Main and Transit streets, in Lockport, where the line will join the tracks of the Lock City road, which road the Buffalo & Lockport Company will operate, it is understood. The company may also build from the junction of the Erie tracks and Sweeney street in North Tonawanda to the Elmwood avenue and Tonawanda Electric Company, better known as the Kenmore line. Mention is made of extending the present line in Lockport along Hawley street to Glenwood avenue.

The total length of the line is given in the papers of incorporation as 29½ miles. The length of the Erie branch of which the company has secured control, is 13 miles. It runs through Martinsville, Hoffman, Pendleton Center, Hodgeville. Pendleton Center is named as the location of the principal offices of the company. The company expects to get the line in operation during the summer, possibly by July 1.

The Tonawanda-Lockport branch of the Erie has always had a pretty fair patronage, and it is expected that the new road will enjoy a heavy travel. From the composition of the new company it is fair to suppose that connection will be made at North Tonawanda with the tracks of the Buffalo & Niagara Falls road, so that cars may be run from Niagara Falls to Lockport, or from Lockport to the Falls. It is also intimated that the new company will build a line from Lockport to Olcott on Lake Ontario, something Lockport people have wished for many years, as Olcott is their popular short vacation point.

Hon. W. Caryl Ely, who was the chief promoter of the line, in company with Hon. Frank A. Dudley and Burt Van Horn, is recognized as one of the very brightest street railway men in the country. He is admired for the manner in which he maps out his line of action, and the successful way in which he puts through his projects.

The certificate of extension placed on file in the office of the secretary of state states that the extension to Olcott is to commence at Market street, corner of Mill and Exchange streets in Lockport, and run east along Market street to Lake avenue, north to the northerly limits of the city, along the lake road to a point of intersection with the boundary line between towns of Lockport and Newfane, thence northerly to the village of Olcott and within the village of Olcott in an easterly and westerly direction, along the highway, running parallel with the south shore of Lake Ontario, a distance of one-half mile in each direction.

Work on the Detroit, Lake Shore & Mt. Clemens road, which is to connect with the Citizens' at Jefferson avenue, Detroit, and run to McSweeney's club house, a distance of 15 miles along the shore of Lake St. Clair, was begun on April 28. President M. B. Mills drove the first spike at the northern terminus, and the party invited to witness the ceremony then adjourned to a dinner at the club house.

## STATIONS FOR THE BOSTON ELEVATED.

The people of Boston are celebrated far and wide for their culture and even the railway companies cater to their good taste. In order to get designs for elevated stations that would possess architectural symmetry with utility the Boston Elevated Railway Company offered a prize of \$1,000 for the best plans. The engineers of the company, after consultation with J. A. L. Waddell, of Chicago, and other engineers experienced in elevated railway construction, prepared plans for the structure and a typical island station which combined strength, convenience and security and then referred them to 11 prominent firms of architects in Boston.

Each competitor was to offer one design with three drawings showing the side and front elevations and a sheet of details. The cost of construction was not to exceed \$15,000. The company then called in consultation W. E. Baker, general manager of the Metropolitan West Side Elevated Railroad Company, of Chicago, W. T. Goundie, general manager of the King's County Elevated, Theodore Hooper, of New York, and Prof. W. R. Ware, of the architectural department of Columbia College. The drawings were all submitted under designations which did not indicate the designer and the names were in sealed envelopes.

After a careful review of all the points the committee selected the plans of W. A. Longfellow. The stations are to be built in the early French Renaissance style, a side elevation and a perspective being shown in the cuts. In the legislative act the approval of the mayor of Boston was required for all plans showing the form and method of construction and architectural appearance of the elevated stations.

Each station is to be  $12\frac{1}{2} \times 40$  ft. and connecting with a covered platform 160 ft. long. It will be 18 ft. in height from the tracks to the ridgepole and will be reached by a stairway of 38 steps, broken by two landings. The stairway starts from the curbing beside the posts of the structure

BOSTON ELEVATED STATION.

and after rising 10 ft. turns to the right. The passenger enters the station at a lobby, goes past the ticket window and into a waiting room and then to the covered platform to take the train.

The passengers leaving the train on the opposite side of the platform pass directly to a stairway which runs beneath the building. The stairways will obstruct the street as little as possible and yet afford room for the passengers who take the same stairway for either the north or south-bound trains. The plans embody the latest and most approved ideas for

MAP SHOWING BOSTON ELEVATED RAILWAY.

elevated traffic, giving the impression of lightness, symmetry and beauty to the structure.

The location of the 11 stations is shown in the map taken from the "Engineering News." The length of the lines to be built at present time is  $5\frac{3}{4}$  miles and the distances between the stations vary from .2 to 1.08 miles. The dotted portion on the map represents the route of the elevated trains through the subway, two of the subway tracks being reserved exclusively for elevated trains. Between the subway and the elevated structure there will be an incline with a grade of 5 per cent.

At the terminal stations the surface cars will pass up inclines to the level of the elevated trains. These stations will be very spacious, the Roxbury terminal being  $125 \times 700$  ft. The running time between the terminals is to be 22 minutes, with stops of 10 seconds at each station. The cars will be similar to those in Chicago, about 47 ft. long and will weigh 33,000 lbs.

Boston is the only city in the world where both the surface and elevated systems are under the control of the same company. Free transfers are given between the surface and elevated cars so that the elevated lines are designed to carry the express traffic between the center of the city and the outlying districts. The South Boston, East Boston and the Cambridge lines will be constructed at a later date. It will require a year for the construction of the work already planned.

## INCREASED EARNINGS FOR 1898.

In the Review for April, page 220, by a typographical error the earnings of the Schuylkill Valley Traction Company for the first quarter of 1898 were stated to be 12.5 per cent in excess of those for the first quarter of 1897. The actual increase in earnings for the quarter was 15.5 per cent.

The directory of the Albany, Helderburg & Schoharie Electric Railway, which has had an existence on paper for four years, at the last meeting deposed the president, John W. Van Valkenburgh. It is alleged that he unduly delayed the taking of any steps towards building the road.

## A PASSENGER LOCOMOTIVE TRUCK.

An audacious experiment in electrical railroad work is being tried in France which, in many respects, is more in harmony with American than French engineering. The idea is to construct an electric passenger locomotive which shall not only haul a train but shall carry passengers as well. This idea is not exactly novel to American street railway men, but it is to be carried out upon a scale and in a manner which has never been attempted in this country, an ordinary electric car hauling a trailer is the limit of American work in this line.

The French proposition is to build a moderate sized double truck passenger coach weighing complete 96,000 lbs., and provide it with sufficient motive power to utilize the adhesion obtained by this weight. This locomotive is to haul the train and carry passengers. The line is some 200 miles in length and express speed is to be maintained.

The car body for this machine was built in France and

To meet the requirements of the locomotive alone the trucks are built in the most substantial manner. The side frames which also form the jaws for the journal boxes are massive forgings nearly as large as the bars of a locomotive frame. They are deeper but not as thick. The end pieces of the frame are T-irons carried by palms worked upon the side pieces. The seats in these palms are finished and the holes are reamed for taper bolts. Locomotive practice is followed in constructing these trucks and wherever bolts are used they are made taper and the holes are reamed. The swing bolster is held between a pair of angle iron transoms which are bolted to the side frames of the truck. The ends of the angle are cut out and bent so as to form brackets for the purpose. The wheels are of unusual size, being 45 in. in diameter. They are of cast iron and are mounted upon very large axles. These are 7 ft. 6 in. long, and 5 in. in diameter at the wheel fit.

The journals are  $4\frac{1}{4}$  by 8 in. Each truck is furnished with a pair of 150-h. p. motors thus giving the car 600 h. p. The trucks weigh 11,080 lbs. each, the motors 10,000 lbs. per

BRILL LOCOMOTIVE TRUCK.

only a few details are at hand in regard to it. The floor frame is of channel bars. It is 36 ft. 9 in. long and 6 ft. 9 in. wide. The channels are apparently about 10 in. deep. There are six crossings spaced so that the outer ones are 5 ft. 10 in. from the end of the car. No details whatever are given in regard to the body which is carried by a pair of the J. G. Brill Company's No. 27 ("perfect") trucks of the type especially designed to meet the requirements of steam passenger cars. These trucks are quite as great a departure from the common order as the scheme for the car itself. One of them is shown in the illustration.

Under the conditions here presented, these trucks have two very distinct functions. The first is that of the locomotive carrying the propelling machinery, keeping it in alignment and transmitting its pull to cars, etc. The trucks must perform all the essential work of a locomotive engine. Their second function is that of a railway carriage. The car and the machinery must be carried without shocks or disturbance, curves must be passed smoothly and without danger and the load must not exert a destructive action upon the roadbed.

pair and the car body 24,000 lbs., bringing the weight without passengers up to a little more than 66,000 pounds. Lead or iron ballast will be used to get the required load of 96,000 pounds.

So far as the constructive features are concerned, locomotive practice has been followed because it is the best for the purpose. Strength to carry the load, stiffness to resist strains, and weight to secure adhesion, have been provided. In the ordinary electric locomotive, these requirements met, builders appear satisfied and give no consideration to other matters of equal importance. An entirely new departure has been made in the locomotive truck for the French car. Ease of riding was considered of the utmost importance and it was determined to make it ride as smoothly as a carriage should, while at the same time it possessed all the necessary features of strength, stiffness and durability.

In these trucks there are springs over the journal boxes, and the heavy equalizers are carried on links in which are springs of the same capacity as those over the boxes. The equalizing bar is a part of the swing motion and is firmly attached at its center to the spring plank. On the spring

plank are two sets of triple elliptics; quadruple springs would have been preferable but in this case the contract limited the wheel base to 6 ft. and there was only room for triple springs. The spring links carrying the equalizer are hung to the wheel piece a short distance from the centers of the journal boxes; at the lower end is a spring seat and at the upper end the post has a square head under which a hemisphere is finished which, with a cup in the solid frame, forms a ball and socket joint.

The boxes are M. C. B. standard. The brake rigging is nearly the same as that used on heavy steam car trucks; it should be noted, however, that the double brake rod is a feature introduced for clearing the motors which come up very high; this double rod is of pipe and quite light.

### MOTORS FOR THE BROOKLYN ELEVATED.

The Walker Company, of Cleveland, O., has a contract to deliver 50 80-h. p. motors for elevated cars to the Brooklyn Elevated Railroad Company before June 1. Further deliveries will be made sufficient to equip 75 motor cars. On

WALKER 80-H. P. MOTOR FOR BROOKLYN ELEVATED.

account of the fluctuating traffic in the morning and evening on the Brooklyn lines the company has decided to use the Sprague "multiple unit" system and the Walker 20 L motor.

This type of motor has been designed and tested by Prof. S. H. Short, vice-president and engineer of the Walker Company. They were subjected to the severest tests in service on the Lake Street Elevated Railroad in Chicago, and the Brooklyn motors will embody all the advanced ideas gained by those experiments. The cars equipped with two of these motors will have a scheduled speed of 16 miles an hour, including stops.

In appearance and in design the motors resemble generators. The magnet frame is circular, with the four laminated steel pole pieces and pole shoes bolted on the interior. The bearings are all of hard bronze, 10 in. long and 4 in. in diameter. The oil boxes on each side or end of the shaft are filled with oil and contain waste which oils and wipes the bearings, using the same oil over and over again. The oil is absolutely restrained from spilling or dripping and from getting into the interior of the motor.

There is no wire about this motor and all the insulation is mica and asbestos. All the windings on the fields and armature are of bar copper and the armature is built up like

that of a generator, with the windings in deep slots. In every detail it is built to withstand the heavy strains which come upon it in elevated railway service. The motors are mounted on McGuire trucks and the manner of suspension may be noted from the cut.

### OTTUMWA ROAD SOLD.

The Ottumwa (Ia.) Electric Railway was sold April 28 by order of the United States court for \$190,000, and passes into the hands of the Ottumwa bondholders. The plant cost about \$400,000, and by this action the stockholders lose every dollar of their investment. In addition to operating the street railway, this company has heretofore done all of the municipal, commercial and residence electric lighting business in Ottumwa, but we learn it is soon to have a competitor in the light and power business. This part of the business of the old company, it is understood, has been profitable, but their equipment is far from being up-to-date and cannot be operated as economically as that of the newer types. The new company, to be known as the Consumers'

Electric Light & Power Company, expects to put in a complete modern plant, materially reduce the rates to the public generally, besides making special concessions to its stockholders. They also expect to compete for the street lighting business when the present contract with the city expires in about 18 months.

We understand that one of the largest electric companies in the country is interested in the new project and that it also has other strong financial backing, but as the name indicates, it is to be composed largely of consumers of electric light and power. Many of the largest consumers have already subscribed for stock, and we learn that some 300 shares of stock (\$100 each) have already been subscribed. Up to this time the work has been carried on quietly, but it is the intention to push it vigorously in the near future.

A resolution has been introduced in the Buffalo council looking to the adoption of an ordinance providing for 3-cent fares for workmen between the hours of 5 and 8, both morning and evening. If the council has not power to compel this reduction, a campaign will be conducted in the next legislature to secure a special law authorizing it.

## BARNEY &amp; SMITH ELECTRIC MOTOR TRUCKS.

The accompanying illustrations show the Barney & Smith Company's standard electric motor trucks. Fig. 1 is the Class G, which is the standard for single truck city cars. The truck is designed especially for simplicity, strength and durability. The truck frame is entirely of wrought steel, the side frames being composed of two plates of steel securely bolted together with distance castings between the malleable iron pedestal castings which bolt to

plates. This half-elliptic spring is provided on the inside end with a hook bolt which passes down through the truck corner plate with a nut on the under side, by means of which the ends of the car body can be adjusted to a level position should the body from any cause become lower at one end than the other, and by means of this same spring the rocking and pitching to which most cars are addicted are entirely overcome.

FIG. 1.—CLASS G MOTOR TRUCK.

these side frames at, or over the journal boxes, the pedestal castings being free to move on the journal box by the action of the spring. A half-elliptic spring rests on the top of each journal box. In each end of this half-elliptic spring is a slot through which passes a bolt with a "T" head, which bolt passes through the coil pedestal springs to the underside of the spring seat in the pedestal casting; on the lower end of these bolts are the nuts for adjustment.

On the top of the coil pedestal springs rest the spring castings which are fastened to the body spring plate, and upon which the car body rests. The car body is also supported at the end of the truck by a half-elliptic spring, which has its bearing at the extreme end of the truck side frame, on a casting which is securely fastened to the truck frame

The especial features of this truck are the unusually long side truck frame—the length of the spring base against the car body and the half-elliptic adjusting spring at the end of the truck frame just referred to above. Another feature which will be of interest to the railway manager is the small distance at which the car body is carried from the ground, being enabled with this truck to bring the under side of the car body down to 28 in. from the rail with a 33-in. wheel.

One of the great causes of annoyance in the past has been the inability of truck builders to perfect a brake that would work satisfactorily under all conditions. This object has been attained with the greatest degree of success in this truck; the brake is perfect, the braking power being

FIG. 2.—CLASS H DOUBLE MOTOR TRUCK.

equally divided on each wheel, and the brake shoes are interchangeable and easily removed.

The ease and simplicity with which the wheels and axles can be removed is a point not to be overlooked. To accomplish this, it is necessary only to remove the lug at the bottom of the pedestal jaw beneath the oil box, the removal of the wheel and axle being accomplished without disturbing any of the springs in the truck. The truck is compactly built and has very few parts to get out of repair and consequently is maintained at a minimum cost for repairs.

Fig. 2 is the standard Class H pivotal truck, designed especially for suburban and city service where double truck cars are used. The idea in the design of this truck is the height. It is so constructed that the car body is carried very low, and avoids the great height from the rail to the car body, which is made necessary by many of the pivotal trucks in use.

The side plates of the frame are made of one solid piece of soft steel without welds of any kind, and the two plates on each side frame are securely bolted together with distance castings between; over each journal box and between the side plates of the frame is a coil spring so arranged as to carry the weight of the truck frame. On each side of the side frame at the center are the side bearings, which are securely fastened to the ends of the truck transom, which is made of 8-in. wrought iron, and to which are fastened the center plates. The weight of the truck transom and side bearings upon which rests the body bolster of the car is carried by an arrangement of springs, as is clearly shown in the illustration.

This combination of springs gives an easy and uniform movement to the body of the car. These trucks are so arranged with proper connection to the body bolster of the car as to allow the trucks to swivel freely and pass the shortest of curves without difficulty. At the center of the truck are two cross bars to which are fastened the motor supports, and which can be adapted to any kind of motor used.

The same remarks made above in the description of the Class G trucks are equally applicable to the Class H truck; the brakes on these are very simple, and easily kept in repair. Braking power being equally distributed on all wheels, the trucks are able to swivel freely when the brake is set. The wheels and axles can be removed from this truck with the same ease as mentioned above for the Class G truck. The truck is compactly built and is made entirely of soft steel and malleable castings.

The manufacturer of this truck has large numbers of each of these classes in use in different parts of the country, and is receiving expressions of the highest praise.

### NEW ATTRACTIONS FOR PLEASURE RESORTS.

Without doubt moving war views are the most popular attractions at the present time, and among the steadiest running of the moving picture machines on the market is the "Critereoscope," manufactured by J. B. Colt & Co. One of the most important features about the "Critereoscope" is that it may be disconnected from the lantern in a few seconds and regular lantern slides substituted for the "living" films, so that for a moderate outlay an exceedingly attrac-

tive entertainment can be presented. This firm has just moved to greatly enlarged quarters in the new Bancroft building, 3 to 7 West 29th street, New York, and carries an extensive line of pleasure park attractions. A visit to their salesrooms would impress any one with the fact that they are leaders in their line. Among the goods they offer are some of especial interest to street railways controlling pleasure parks, such as the "Critereoscope" and acetylene search lights, which are admirably adapted to illuminating out-door performances and theater stage lighting. The search lights just referred to are also suitable for furnishing light at night for repairing tracks or wherever a strong light is required, being portable, convenient and economical. Further information will be furnished on application.

### CREOSOTED WOOD CONDUITS.

It is a fact long known that wood which is kept continuously wet or dry will last for centuries, but when alternately damp and dry it soon decays. Perhaps the most successful preservative that has yet been used is the dead oil of coal tar with which Bethell experimented as early as 1838. This creosote oil is a distillate of coal tar and is thick, gummy and insoluble, filling the pores of the wood and protecting it from moisture. The Michigan Pipe Company, of Bay City, Mich., is the manufacturer of creosoted wood conduits,

poles, etc. The accompanying illustrations show the ends of sections when ready to be joined. These conduits need no concrete foundation, but only a creosoted plank above and below them, and they are not only cheap and easy of construction but protect the lines in the most effective way. Creosoted poles, cross arms and ties are also manufactured. A wooden casing for steam pipes has proved to effect a great saving in power stations and on steam lines.

### THE PATTON MOTOR AT CEDAR FALLS.

Our correspondent at Cedar Falls, Iowa, under date of May 7, writes that the Patton motor operating on the line in that city is running regularly and doing good work, in spite of miserable condition of the track, which is very rough. This is the machine which, on March 20 and 21, was run with its own power from Chicago to Cedar Falls over the track of the Chicago Great Western road.

Work on the Chicago, Detroit & Toledo Electric Railway was commenced May 1 and its completion is set for October 1. The contract for the roadbed has been let and 400 men are now at work at Monroe.

A conductor and motorman of the Chicago General Railway were held up by two highwaymen and robbed of \$33 and watch. This is the second robbery of train crews near the same point.

**CONDUCTIVITY OF A CAST-WELDED RAIL JOINT AFTER TWO AND ONE-HALF YEARS OF SERVICE.**

In the REVIEW of January last were published the results of a conductivity test made on a new cast-welded rail joint and comparisons made with a bonded joint. J. R. Chapman, chief of the electrical department of the North and West Chicago Street Railroad companies, has watched for an opportunity to test a joint that has been in service for some time. A portion of the joints of the Cicero & Proviso Street Railway Company, Chicago, were cast-welded by the Falk Manufacturing Company of Milwaukee, in No-

FALK JOINT TWO AND ONE-HALF YEARS OLD.

vember, 1895. Recently some of this track had to be relaid and Mr. Chapman made a promiscuous selection of a worn-out rail with a cast-welded joint and the results of the tests are given below. One illustration shows a cross section of the joint which was cut as soon as the test was completed. In the other illustration may be seen the rail, about 15 ft. in length, with the connections which were attached to the dynamo terminals at the switchboard.

**EDITOR REVIEW:**

On December 17, 1897, some experiments were made at the California avenue power house of the Chicago Electric Transit Company on the conductivity of cast-welded joints which had not seen service. With the view of ascertaining whether service, and the action of the elements, would have any effect upon a joint of this character, one was selected

from the scrap pile and subjected to a test under the same conditions as that named above.

The rail used was a 4½-in, 56-lb. girder section. The joint was made in the track in 1895 on the Cicero & Proviso Street Railway, several miles of double track street having been repaired in this way at that time. The rail is now badly worn and pieces are occasionally brought into the yard as scrap.

Readings were taken at five-second intervals for one and one-half minutes, the flow of current through the rail being read by one observer and the drop in potential through 5 ft. of the rail was read simultaneously by another observer. The sample tested was of sufficient length so that one section of 5 ft. carried the joint and the other section of 5 ft. was the continuous rail. The same voltmeter leads were used in both cases and were of such large wire that a correction would be trifling.

The result of the experiment as tabulated below indicates that the joint had practically the same conductivity as the rail.

Test No.	Average Amperes Flowing.	Drop in 5 ft. with Joint, Volts.	Drop in 5 ft. without Joint, Volts.	Drop in Volts per 100 Amp. Flowing.
1	502.6	----	.047	.00995
2	508.9	.048	----	.00943
3	735.8	.065	----	.00883
4	758.4	----	.069	.00910

Temperature of rail during tests, 80° F.

JAS. R. CHAPMAN.

Chicago, May 11, 1898.

The test is particularly interesting to engineers, and will be gratifying to the Falk Company, as confirming the position it has always defended, viz., that time and the passage of current through its joint, would not decrease the conductivity of the joint. Many have contended that a certain amount of oxidization was likely to occur on the surface of contact between the joint and the rail. The high efficiency of the tested joint for conductivity, after having been in track and under constant and severe service for two years and a half ought to be sufficient proof that while the railway, from decrease of cross section through wear, gradually lose something of its current carrying capacity, the joint remains unchanged.

While the test confirms what the Falk people have always insisted on, the result will be pleasing to the many managers using cast welded rail joints, if any of them have, to this time, had any doubts.

SHOWING METHOD OF TESTING.

**REPORT OF MASSACHUSETTS STREET RAILWAYS.**

The Massachusetts Railroad Commissioners' report giving the returns for 1897 shows that 93 companies reported—10 more than in 1896. At the end of the year, 75 of these 93 companies were operating their railways; the lines of 11 companies were operated by other companies under lease or contract; six companies had organized and paid in a portion of their capital stock, but had not begun to build; and one company had been consolidated with another during the year.

During the year 122.66 miles of main line, 14.26 miles of second main track, and 11.47 miles of side track, making 148.39 miles reckoned as single track, have been added to the street railway mileage reported; all but 2.70 miles of this was newly built. This is an increase of nearly 11 per cent over 1896 and makes the total mileage 1,516.64 miles; all of this except 19.91 miles, which are in Rhode Island, are in Massachusetts. Of the total, 13.15 miles were operated by horse and cable, and 11.95 by horse power only. The diagram illustrates graphically the growth of the street railways from 89 miles in 1860 to 1,414 miles of main track

in 1897; the dotted line is total miles of main track and the full line the miles operated by electricity. In the same period the number of companies has increased from 20 to 93.

The average cost per mile of main track (including cost but not length of side track) is shown by the books of the companies to be \$22,755 for construction, \$9,374 for equipment, and \$12,329 for lands, buildings (including power plants) and other permanent property—making the total \$44,458 per mile of main track. These figures furnish but little clue to the cost of any particular railway, which ranges from \$10,000 in a country town to \$97,000 in Boston.

The average capital investment per mile in 1897 was \$44,683; the average for the last 10 years is \$43,804. For the 10 companies that carry over 4,000,000 passengers a year, the average capital investment is \$52,381 per mile; of these the lowest is \$29,399 for the Holyoke company, and the highest \$100,553 for the West End of Boston.

The gross assets were \$67,509,916 and the gross liabilities \$66,483,144, leaving for surplus and special funds \$1,080,030, which is a decrease in the surplus of \$71,063 as compared with 1896. The surplus for 1897 was 3.14 per cent of the capital; the average for 10 years is 3.41 per cent of the capital.

The gross earnings were \$15,898,839, and the expense of operation \$10,904,040; other expenditures were \$4,366,895, leaving \$627,904 for the surplus accounts.

The total amount of cash dividends declared the last year

was \$1,965,243, an increase of \$162,396.50 over the previous year. One company paid 10 per cent; two paid 9 per cent; ten paid 8 per cent; one paid 8 per cent on preferred and 7.5 per cent on common stock; three paid 7 per cent; fourteen paid 6 per cent; one paid 5.5 per cent; four paid 5 per cent; one paid 4.5 per cent; three paid 4 per cent; one paid 3.75 per cent; one paid 3.5 per cent; three paid 3 per cent; one paid 2.5 per cent; four paid 2 per cent; and 43 companies, new and old, paid no dividends.

*Capital Stock, Net Income and Dividends, 1888-1897.*

YEARS.	Capital Stock.	Net Divisible Income.	Cash Dividends Declared.	Percentage on Total Capital Stock.

Averages, . . . . .	68.79	\$5,454	\$0 79	8.54	1.58

ment over the previous three years, but is below the average for the decade.

The total number of passengers carried during the year ending September 30, 1897, was 308,684,224, an increase of 5.6 per cent over the previous year; the car-miles run were 61,577,917, an increase of 15 per cent; the round trips were 6,557,183, an increase of 9.2 per cent; the average passengers per round trip were 47 as against 49 the previous year. Of the 10 large roads the Union, of New Bedford, had the lowest number of passengers per round trip, 26; and the West End road the highest, 58; the average for the ten roads was 50.

The tables give interesting data as to the percentage of operating expenses to gross earnings for the last ten years, the operating expenses and net earnings of the ten large companies for 1897, and the gross and net earnings per mile of main track owned, per round trip, per car-mile, and per passenger.

In analyzing the effect of the density of traffic upon the earning capacity, shown in the table, the roads are divided into three classes and compared with the Metropolitan Company, the most important of the merged predecessors of the West End. These three classes omit the fifteen companies which had been in operation for less than a year, and include the West End (including the Somerville), which constitutes a class by itself; the second class comprises the 48 other companies which paid dividends; the third class comprises the 28 companies which did not pay dividends.

*Gross and Net Earnings from Operation per Mile of Main Track Owned and per Round Trip Run, 1888-1897.*

YEARS.	AVERAGE PER MILE OF TRACK.			AVERAGE PER ROUND TRIP.		
	Gross Earnings.	Expenses of Operation.	Net Earnings.	Gross Earnings.	Expenses of Operation.	Net Earnings.

Averages, . .	29.64	21.37	8.27	5.07	3.66	1.41

*Density of Traffic as affecting Earning Capacity.*

RAILWAY COMPANIES.	Miles Operated.	Capital Investment per Mile Operated.	Passengers per Mile Operated.	Passengers per \$1,000 of Capital Investment.	Per Cent of Dividend Paid
Metropolitan, <sup>1</sup> . . . .	90.88	\$38,903	472,850	12,150	10.00
West End, <sup>2</sup> . . . .	266.67	97,631	647,083	6,628	7.69 <sup>3</sup>
48 companies, <sup>4</sup> . . . .	880.59	33,785	135,616	4,014	5.68
28 companies, <sup>5</sup> . . . .	209.69	28,004	70,895	2,532	-

<sup>1</sup> In 1887. Other companies, in 1897.  
<sup>2</sup> Including the Somerville, operated and practically owned by the West End.  
<sup>3</sup> Average dividend on total preferred and common stock.  
<sup>4</sup> Includes all the companies (except the West End and the Somerville) whose railways had been operated more than a year, and which paid dividends in 1897.  
<sup>5</sup> Includes the companies whose railways had been operated more than a year, but which paid no dividends in 1897.

The 28 companies had been in operation on an average about five years; and the 48 companies a considerably longer time. Based on these figures it is said: "An intending investor in an existing or projected street railway enterprise, will take into account the chances in a series of years of a management and success a little below as well as above the general average. If he desires a regular annual return of 6 per cent on his shares, he ought to be convinced, we think, that the railway will carry year in and year out more than 135,616 passengers per mile operated, and more than 4,014 passengers per \$1,000 of capital investment; otherwise, the probabilities, based on the experience of 48 companies, are that he must be content with a smaller return. Unless it can be demonstrated, moreover, that the railway will carry year in and year out more than 70,895 passengers per mile operated, and more than 2,532 passengers per \$1,000 of capital investment, the chances, as proved by the experience of 28 companies, are that he will receive no dividend at all."

And what is equally important, while the difference between 2,500 passengers and 4,000 passengers per \$1,000 invested is the difference between nothing and 6 per cent in dividends, the data for the West End show that the difference between 4,000 and 6,600 passengers per \$1,000 invested is only two per cent in dividends.

## VANDALS AT HOUSTON, TEXAS.

On the night of April 16 several crude bombs were placed on the tracks of the Houston (Tex.) Electric Street Railway Company. They consisted of soda pop bottles partially filled with powder with a fuse of paper, having parlor matches in the exposed end. One of the bombs was exploded by a car; the rear trucks were lifted off the rail and the car filled with smoke, but no other damage was done.

A week later the attempt to wreck cars by placing explosives on the tracks was repeated. Between the hours of 10 and 12 on the night of April 23, there were five very loud explosions and several of lesser force; the bombs were placed on three of the lines in different parts of the city. The explosions were of greater force than those of the week before and a number of car wheels were broken. The cars were in every instance, except one, filled with passengers and it is fortunate that no one was injured.

The management of the company has offered a reward of \$500 for the arrest and conviction of any of the guilty parties.

## ECHOES FROM THE TRADE

At the Electric Exhibition, Madison Square Garden, one of the exhibits is the Engineering Picture Gallery, which is a new feature of great interest. It comprises a series of eight illustrative and historical wax tableaux, prepared by Dr. Park Benjamin, Prof. F. B. Crocker and T. C. Martin, executed and arranged by the Eden Musee Company. The series includes the First Recognition of an Electric Effect, when the Syrian woman wonderingly perceived light objects flying to her amber spindle; the Mariner's Compass, ascribed to the Chinese and Italians, but probably to be credited to the Finns, in the 11th century; the Earth a Great Magnet, William Gilbert explaining the Terrella to Queen Elizabeth, 1600; the First Conductors or Circuits; Stephen Gray, a Charter-House pensioner in London (1720), experimenting on the conduction of electricity; The Leyden Jar, showing the bottling of electricity and the terrible shock to Dean Von Kleist, Canon of the Cathedral in Cumin, in Pomerania, 1746; The Identity of Lightning and Electricity—when Benjamin Franklin drew down the lightning from the skies, 1752; The Beginnings of the Modern Primary Battery or Voltaic Cell, with Galvani's famous frog experiment, 1791; and the Beginnings of Modern Dynamo-Electric Machinery, showing Michael Faraday's famous experiment, 1831.

Among the notable exhibits are several pertaining to the street railway field.

At the exhibit of the Peckham Truck Company are shown one 14-B short wheel base swivel truck and one of the 14-D swing bolster maximum traction trucks. A Metropolitan special high speed single truck car is displayed. The truck is notable for its long spring base which prevents oscillation, and its rigid center brace which removes the strain of keeping the truck square with the car body. The John Stephenson Company made the car body, and in addition to this it has an exhibit of a model car one-quarter size, which shows all the operations of the conduit system of the Metropolitan Street Railway Company. The Peckham Truck Company also has a 7-B-X excelsior truck in the exhibit of the Walker Company. This truck shows a different arrangement of the cantilever side frame design, a characteristic feature of the single trucks of this company.

In the exhibition of the Walker Company there are two of the new No. 20 L motors mounted; one of the same type dismantled to show construction; two No. 4-A street car motors mounted; type "S" controllers, assembled and dismantled; a street railway switchboard with generator and feeder panels; the new Walker recording wattmeter; a section of the conduit system with a Broadway car in operation; a 50-k. w. belted alternator, and a 50-k. w. lighting generator direct connected to an Armington & Sims engine.

H. B. Coho & Co., of New York, have a fine exhibit of switchboards, panel boards, etc., a 75-k. w. alternator operated by a direct current motor and generating current at 100 and 1,100 volts. In addition the firm represents the American Rheostat Company, the Warren Electric Manufacturing Company, the Eddy Electric Manufacturing Company, the Crown Woven Wire Brush Company, the Otis Electric Company, the Pennsylvania Electric Company and others.

The exhibit of the American Ball Engine Company consists of one of the company's engines direct connected to a 25-k. w. dynamo, which furnished current for an elaborate lighting exhibit and for a multipolar motor, being a complete generating and distributing plant, with applications of current for light and power.

The Samson Cordage Works have sample coils of the "Samson Spot" waterproof cord for trolley, bell and arc lamp purposes.

This display is neatly arranged in a show case in a conspicuous place and attracts much attention.

The Fuel Economizer Company, of Matteawan, N. Y., exhibits a complete economizer set up with sectional asbestos covers, and scrapers for removing soot as though it were in actual service with a 150-h. p. boiler. There are also sections of pipes and headers showing various methods of making joints, and a complete working model with prints and photographs showing installations in several power stations in New York and Brooklyn.

Elmer P. Morris has a display of railway supplies, car couplings, rail bonds, iron and wooden poles, lightning arresters, gears and pinions. A large number of companies is represented, including the Garion-Daniels Electric Company, Keystone Electrical Instrument Company, Simonds Manufacturing Company, Pittsburg Steel Trolley Pole Company and others.

The Consolidated Car Fender Company makes an exhibit of Providence fenders on a standard car for the electrical conduit system of the Metropolitan Street Railway Company. This type is the standard of the Metropolitan company and is being placed on all the electric cars.

One of the Metropolitan cars at the Exhibition has been fitted with registers, brakes, sand boxes, etc., by the Sterling Supply & Manufacturing Company, of New York.

The Keystone Electrical Instrument Company, of Philadelphia, has a complete exhibition of both switchboard and portable instruments at the Exposition. It includes a slate switchboard on which are mounted a full set of the various switchboard types suitable for use in central stations, street railway power houses and in isolated plants. The exhibit also includes a line of ground detectors and instruments designed for series arc light service. Portable testing instruments are also shown. In connection with this exhibit, is a pair of the type "R" instruments mounted on a panel board, showing them in practical service on a working generator circuit. The exhibit is in charge of Elmer P. Morris, 15 Cortlandt street, New York. President J. F. Stevens, of the Keystone Company, was present at the opening of the Exposition and will spend considerable time at the exhibit during the continuance of the Exposition.

Electric street railway systems, recently completed at Cape Town and Port Elizabeth, South Africa, are largely equipped with machinery of American make. In the power station at Cape Town there are three verticle compound engines direct connected to 300-h. p. Westinghouse generators, and one McIntosh & Seymour tandem compound engine direct connected to a General Electric 525-k. w. generator. The steaming plant consists of four 300-h. p. Heine boilers. The crane and the piping of the station was also furnished by American firms. At Port Elizabeth the station equipment consists of three McIntosh & Seymour compound condensing engines direct connected to 100-k. w. General Electric generators, water tube boilers, condensers and pumps, all of American manufacture. All trolley and feed wire was from the factory of the Washburn & Moen Manufacturing Company. The cars were furnished by the J. G. Brill Company. All these contracts were taken in the face of sharp competition and as a result of the prices quoted and the excellent workmanship.

James Partridge, of the Partridge Carbon Company, represents that firm at the Electrical Exhibition and displayed the self lubricating motor and generator brushes made by the company.

Forde Bain, consulting engineer and registered solicitor of patents, has prepared a small vest pocket manual of "Useful Infor-

mation for Practical People," copies of which he has sent to his friends. A limited number of extra copies will be sent postpaid on receipt of five 2-cent stamps.

The International Construction Company, of Detroit, Mich., has lately sent out a neat little booklet entitled "Questions and Answers," giving much valuable information on the cost and material for electric railways. Many convenient and useful tables may also be found.

The New York Electrical Works on May 1 removed to 515-521 Kent avenue, Brooklyn, where, with facilities largely increased they will continue to manufacture standard and special types of trolley fittings. The new shops are equipped throughout with new machinery.

The Standard Underground Cable Company, of Pittsburg, has received a rush order for \$50,000 worth of insulated cable to be used for coast war operations.

The Lorain Steel Company, of Lorain, O., has contracted for 10,500 h. p. of water tube boilers of the Cahall make for its new extensions; 2,500 h. p. of these boilers will be equipped with the Cahall chain grate stoker.

The Peckham Motor Truck & Wheel Company reports that its business this spring is larger than ever before and that to fill orders it has been necessary to put on a regular night crew. The company is making shipments to the following points: Middleboro, Bradford, Coventry and Plymouth, Eng.; Buenos Ayres; Cork and Dublin, Ireland; Zurich, Switzerland; Cleveland, Dayton, Cincinnati and Jewett, O.; New York City, Auburn and New Platz, N. Y.; Natick, Bridgewater, Haverhill, Quincy, Hyde Park, Salem, Fall River and Attleboro, Mass.; Omaha, Neb.; Council Bluffs, Ia.; St. Louis and Webb City, Mo.; Jersey City and Hoboken, N. J.; Indianapolis; Oakland, Cal.; Newport, R. I.; Milwaukee; Bradford, Pa.; Joliet, Ill.; Pensacola, Fla.; Pueblo, Cal.; Meriden, Conn.; Lewiston, Me.

The General Electric Company has just published a very handsomely illustrated pamphlet describing the various types of direct and alternating current lightning arresters.

The Chicago Fuse Wire & Manufacturing Company has entirely re-equipped its factory which was destroyed by fire January 28, and is in better condition than ever before for filling orders for tested fuse wire and links. All fuse wire sent out after May 1 will be packed on trade mark spools and these placed in tin boxes to protect the wire from abrasion. The company carries a full stock of all sizes of wire, strip and links, and shipments are made from the factory in Chicago or from the eastern office, 853 Broadway, New York. W. R. Goodman, manager of the company, says that the great consideration shown the company by its friends in the trade during a few weeks of enforced suspension of business after the fire, is highly appreciated.

W. D. Ray, recently manager of the Everett (Wash.) Electric Railway, has accepted the position of traveling sales agent for Littlefield & Meysenburg, western agents of the Johnson Company. Mr. Ray will handle Steel motors, Dupont trucks and other street railway supplies manufactured by the Johnson company.

Some figures in connection with the new edition of the Electric Light Supply Catalog recently issued by the Western Electric Company may be interesting. The edition weighs 20,000 lbs.; if the catalogs were piled on top of each other they would make a column 1,000 ft. high; and if placed upon the ground end to end they would form a line 6,666 ft. long. The edition is complete containing every well-known device that is used in electric light construction and is so carefully indexed that articles can be found under several headings. Copies will be furnished to the trade upon application.

Albert B. Herrick, consulting engineer, has changed his offices from 150 Nassau street to 120 Liberty street, where he will be

nearer his clients and have more space for increased business.

The Metropolitan Street Railway Company, of Kansas City, Mo., has awarded contracts to the American Construction Company, of Chicago, for one mile of double track and for the welding of 6,000 rail joints. The rails weigh 103 lbs. each and will be welded together.

Kohler Brothers, sales agents for electrical machinery and appliances, in April took the agency for the Northern Electrical Manufacturing Company, of Madison, Wis., for the states of Illinois, Iowa, Missouri, Indiana, Nebraska, Kansas, Kentucky, Tennessee, Michigan, Ohio, Pennsylvania, New Jersey, Maryland, Delaware and District of Columbia; and are now prepared to figure on all kinds of direct current electrical apparatus up to 250 k. w.

The Murray Iron Works Company, of Burlington, Ia., has just published a circular showing half-tone engravings of five domeless, high pressure, tubular boilers adapted to different settings. Attention is called to the necessity of good workmanship on boilers and to the superior facilities possessed by this company.

We have received the sixth annual report of the General Electric Company, showing the business for the year ending January 31, 1898, and including the reports of the executive officers to the stockholders as presented at the annual meeting held May 10. The gross earnings were \$12,524,938; expenses, \$10,727,692; net earnings and net income from securities owned, \$1,853,702. After deducting losses, amounts written off, and \$250,000 reserve for extensions, amounting to \$621,849, there was left \$1,231,852 to apply on the deficit of previous years. In the railway department the money value of the orders for railway apparatus received showed an increase of one-third over 1896. The orders for railway generators aggregated over 60,000 k. w. The average size of the railway motor has increased to 34.7 h. p., while the average railway generator for 1897 was 484.3 h. p. as against 356.3 h. p. in 1896. Among the important railway contracts secured during the year were those for the equipment of the Metropolitan, of New York; the large motor order for the Boston Elevated; and the contract for the substitution of electric traction for cable traction on the lines of the Capital Traction Company, Washington.

The Hoppes Manufacturing Company, of Springfield, O., well known as the manufacturers of the Hoppes live steam feed water purifier and the Hoppes exhaust steam feed water heater, has placed upon the market a new separator, having some new points of interest, a description of which will be found on another page in this issue. This company also manufactures separators and receivers of large dimensions built on the same plan of the separator, and oil eliminators and grease extractors for exhaust steam. A new illustrated catalog is in press and will soon be ready for distribution.

The center of geographical interest is now in the West Indies and the Sargent Company, of Chicago, has aptly taken advantage of this by issuing a set of maps showing the Island of Cuba, the group of islands and the world. The maps are printed in several colors and will prove to be a timely addition to any office. They will be sent to railway men on application.

The shafts for the great engines to be installed in the power station of the Metropolitan Traction Company, of New York, are to be built by the Bethlehem Iron Company. Each shaft will be 37 in. in diameter, 27 ft. 4 in. long with a 16-in. hole through the center. They are to be made of fluid compressed, open hearth steel, annealed and hydraulically forged on a mandrel. This company is the only one in the country which has forges equipped for turning out work of this character and magnitude. The company has very large contracts with the government for guns and gun-carriages and many orders are coming in from private concerns for shafting of all descriptions, both solid and hollow, plain steel and nickel steel. The foreign business has been very extensive, contracts for armor plate for the Russian government are being filled, and prices have been asked on shafting for Japanese war vessels.

The Lake Shore & Michigan Southern Railway Company has just issued an illustrated pamphlet on "The Union Elevated Loop in Chicago;" also a specially prepared map giving a bird's eye view of the Loop and all the elevated railway systems in the city. Every car of all the elevated lines stops in front of the Lake Shore station on Van Buren street, thus affording unequalled facilities for passengers to pass directly from the steam cars to the elevated trains for any part of the city. This station is the Chicago terminus of the "Lake Shore Limited," the most beautiful train in the country, making the run daily to New York in 24 hours.

The motormen, conductors and gripmen of the North Chicago Street Railroad Company are being fitted with new uniforms which are more than usually attractive. The uniform is made of blue cloth from the Warrentown Woolen Company and the coat has a velvet collar with the monogram of the company worked in gold braid near one corner. The company is having gilt service stripes sewed to the sleeves of each employe who has been with the company five years or more. C. F. Orr & Co., 130 La Salle street, Chicago, are making the suits. This same firm is also making uniforms for the West Chicago Street Railroad Company and the Chicago City Railway Company. The latter company will have its employes provide summer as well as winter suits, and these will be made of much lighter material.

Alonzo G. Collins, of Milwaukee, consulting, mechanical and architectural engineer, has removed his office from No. 608 Pabst building to No. 1301 the same building. Mr. Collins makes a specialty of electric light and railway power houses and also of ice-making and cold storage machinery.

On May 1, Rossiter, Mac Govern & Co., removed their principal office to the new Washington Life building, 141 Broadway, New York, and hereafter their entire stock will be carried at their Newark factory and repair shop, 35-37 New Jersey Railroad Avenue. Facilities have been added which enable them to display a large and very attractive stock of electrical machinery.

The Bradford Belting Company, Cincinnati, O., has received from Elmer P. Morris, its New York agent, 15 Cortlandt street, an order for a belt 160 ft. long, 6 ft. 8 in. wide, three hides thick for the enlargement of the Jersey City plant of the People's Light & Power Company. This is the second belt of this size supplied by the Bradford company to the Jersey City plant, and the two are probably the largest belts running under one roof anywhere the world over. The Bradford company is also just equipping the enlarged plant at Norfolk, Va., and has belts 6 ft. wide and over running in many places.

The Westinghouse Electric & Manufacturing Company is to supply the electrical apparatus for the new plant of the Detroit, Ypsilanti & Ann Arbor Railroad Company, consisting of four 300-h. p. generators, three boosters, switchboards, and 10 car equipments, including 40 50-h. p. motors.

Eugene Munsell & Company, and the Mica Insulator Company, of New York and Chicago, have completed arrangements with the George Worthington Company, of Cleveland, to become distributors of "mica" and "micanite." The territory includes the city of Cleveland and adjoining counties. A large stock of India and amber "mica," in the sheet and segments for railway motors, as well as "micanite" plate, segments, rings, cloth, paper, etc., will be carried to supply the electrical trade in that section. Some large orders have been received lately, one for 800 lbs. of mica segments having been received from one railway company.

Wendell, Fay & Co., of New York, have received an order from the Postal Telegraph Cable Company for supplying uniform cloth for the latter company's entire force. Wendell, Fay & Co. have for a number of years supplied all the uniforms for the Postal Telegraph Cable Company, and this order speaks well for the satisfaction which this cloth has given. The color which has hitherto been used for the uniforms of the Postal Telegraph Cable Company has been cadet grey, but the new uniforms will be a sky blue. Large orders for Middlesex cloth have been filled for the use of the United States government.

The Consolidated Street Railway Company, of Grand Rapids, has adopted the Providence fender as a standard after investigating nearly every other make and trying many models on its cars. The Consolidated Car Fender Company will soon complete the delivery of the Grand Rapids order which was for 140 fenders.

The firm of Hill & Howard has been formed to do a general consulting engineering business, and is now located at 35 Manufacturers' Record Building, Baltimore. The firm will furnish plans, specifications, reports, estimates, tests, etc., for water works systems, electrical subways, electric light and power plants and for the transmission of power. Nicholas S. Hill, Jr., is a graduate of the Stevens Institute of Technology, was mechanical engineer of the South Side Elevated Railroad, of Chicago, engineer-secretary of the Sewerage Commission of Baltimore, and chief engineer of the water department. The latter position he has just resigned to take up his new line of work. B. C. Howard is a graduate of Johns Hopkins University in the electrical engineering department, and became secretary and treasurer of the McCay-Howard Engineering Company, general contractor for electrical work.

The Hansell Spring Company has been increasing its business so rapidly it is forced, a second time in two years, to seek larger quarters, and has removed its works and general office from Newark to Ambler, Pa., a suburb of Philadelphia. It is already running in all departments in the new location and full of orders. Two western agencies have been established: J. C. Carry, 1301 Fisher building, Chicago, and L. Scofield, 116 Spruce street, Detroit.

The W. R. Garton Company, of Chicago, reports that business is opening up in splendid shape and that it has closed several yearly contracts. The company is the agent for the Central Union Brass Company, the Keystone Electrical Instrument Company, the Crouse-Hinds Electric Company, the Duquesne Forge Company, the Pittsburg Steel Hollow-Ware Company, the Massachusetts Chemical Company, the Billings & Spencer Company, C. S. Knowles, the United Electric Improvement Company, William E. Kline & Co., Garton lightning arresters, Raster carbon rheostats, Bound Brook trolley bushings, Pittsburg trolley poles, and Morrell's commutator bars, and thus fully prepared to meet the wants of street railways. Some large orders for Keystone instruments and Raster rheostats have been closed, and many street railways are adopting "Armalac" and "Enamelac" as standard insulating paints.

The employes of the Patterson (N. J.) Street Railway, of which Vice-President Hobart is the president, decorated the cars with flags and red, white and blue bunting in celebration of Dewey's victory.

The Pennsylvania Traction Company, of Lancaster, Pa., is making some extensive improvements at Conestoga Park which will add to its attractiveness for the coming season. Brook's Chicago Marine Band gave two concerts at this park on the afternoon and evening of May 12.

The Springfield (Mass.) Street Railway Company has recently moved into new quarters opposite those formerly occupied. When the old offices were fitted up 15 years ago, many of the stockholders thought the management had been extravagant and built on too large lines but they have been happily disappointed.

The Baltimore City Passenger Railway Company has completed the overhead construction on its "Red" and "White" cable lines, and ordered the car equipments, Westinghouse No. 49. As soon as the power house is completed these lines will be operated electrically and the cable will be a thing of the past in Baltimore.

**MAYER & ENGLUND,****10 SOUTH TENTH ST. PHILADELPHIA, PA.****Electric Railway Material and Supplies

The property owners of Union county, N. J., who object to the construction of a trolley line between Elizabeth and Plainfield along North avenue, have organized themselves into the "Union County League." They propose to fight the provision of the Squire electric railway law which stipulates that the franchises shall be sold by the Board of Freeholders.

The Metropolitan West Side Elevated Railroad Company has just distributed folders giving some popular information in reference to the road. This was the pioneer among electric elevated railroads and no expense has been spared in substantial construction and in equipment to insure the safety and comfort of passengers. Statistics show that but one passenger in 7,374,790 is injured, which makes such travel 43 times safer than street railways and 215 times safer than on steam roads. A map is given of the city showing the route of the four branches of the company. On the reverse side is a map of the heart of Chicago, the principal hotels, railroad stations, office buildings, department stores and places of amusements, being indicated in different colors. General Manager Baker is to be congratulated on the taste and usefulness of this publication.

**OPEN CARS WANTED**

G. B. Kerper, general manager and purchasing agent of the Peoples' Railway Company, Dayton, Ohio, advises us that he wishes to buy eight 7-bench or 8-bench open cars of standard gage suitable for trailers.

**IN HER ELEMENT.**

The trolley gun-boat "McKinley," which attracted so much attention during the 1896 campaign, and was illustrated in the REVIEW, December, 1896, now rides at anchor in the lake at Whalom Park, the magnificent pleasure resort owned and operated by the Fitchburg & Leominster (Mass.)

THE M'KINLEY.

Street Railway Company. The illustration showing the "McKinley" is redrawn from one of the views in a handsomely illustrated pamphlet descriptive of the park which was sent us by the superintendent, W. W. Sargent.

Joseph Church, the first superintendent of the People's Street Railway in Scranton, Pa., died in Providence, a suburb of Scranton, at the advanced age of 71 years.

### DEVICE FOR PRELIMINARY SURVEYS.

The accompanying illustrations show an instrument for delineating topographical peculiarities and measuring and recording distances, invented by John Riddell, of the General Electric Company, Schenectady, N. Y. This device is for making the preliminary surveys of military, civil and railroad engineers, and doing the work quickly and at small cost; the instrument makes its own record and a profile is obtained by merely traversing the ground. This device may be attached to any wheeled vehicle, however propelled; the illustration shows it mounted on the horizontal upper bar of a bicycle frame.

It consists, briefly, of a vertical revolving cylinder carrying the record, and a marker moved upwards and downwards by the inclination upwards or downwards of the upper bicycle bar. The metal cylinder carrying the paper for the record is provided at the lower end with a worm wheel engaging with a worm on a shaft running toward the rear of the bicycle and driven by a lace belt from a pulley on the crank shaft. Movement of the bicycle produces, therefore, revolution of the record cylinder, which, as it revolves, unwinds the paper for the record from a small drum. The

FIG. 1.

marker is mounted on a nut on a threaded vertical rod, movement of which raises or depresses the nut and the marking point. The lower end of the rod is fastened to a horizontal disc free to move clockwise or the reverse. Beneath the disc, and just clearing it on each side, are two small discs, at each end of a toothed sleeve, and revolving vertically. Through the sleeve passes the disc shaft provided with a gear wheel meshing into a small gear on the main shaft driven from the crank axle.

Suspended beneath the bar of the bicycle, and consequently beneath the entire machine, is a pendulum having at its upper end a toothed quadrant, meshing into the teeth of the sleeve on the shaft carrying the vertical discs. As the small discs revolve in the same direction, one in contact with the large horizontal disc revolves it clockwise and causes the marker to ascend, the other counter clockwise depressing the marker. The nearer the center of the large disc, the small disc comes, the faster the former moves and the sharper the angle described by the marker. It will be seen that the pendulum hangs vertically whatever be the angle of inclination of the bicycle. If the machine is ascending, the horizontal bar assumes an obtuse angular position to the pendulum, the rear vertical disc is brought beneath the horizontal disc and the marker moves upward;

if a declivity is descended the angle of the bar and the pendulum becomes acute, the forward disc comes into play and the marker moves downward. On the level both vertical discs are out of contact with the horizontal disc and the marker records a plain horizontal straight line.

A part of a record is shown in Fig. 2. The number of feet above the level are shown by the horizontal line, the distance travelled by the length of the record. It is part of a record made on a wheel ridden from the gates of the General Electric Company's factory to the main street of Schenectady.

### 500 CAR WHEELS A DAY.

The Pennsylvania Car Wheel Company was chartered on January 14 and in less than 90 days finished car wheels were turned out from the company's plant. Within that time five acres of land were secured in Allegheny on the banks of the Ohio river and adjoining the tracks of the Pennsylvania and the Pittsburg & Western railroads. The main building, 70x277 ft., was erected: also buildings adjacent for store rooms, pattern shop, power house and offices. The preparations were so well made that in the first run of 20 wheels no defective ones appeared. High grade cast iron wheels both for street railways and railroads are made. At present 200 men are employed and 500 wheels are cast a day. The officers of the company are: President, Joshua W. Rhodes; vice president, W. L. El-

FIG. 2.

kins; secretary and treasurer, C. V. Slocum; superintendent, A. W. Slocum; sales agent, Pittsburg district, J. D. Rhodes; Philadelphia district, J. H. Yardley. The first five were the incorporators of the company. Mr. Rhodes, formerly of the Pittsburg Car Wheel Company, was the prime mover in the organization of the new concern. In his wide experience in selling wheels within 500 miles of Pittsburg, he found it one of the largest fields for the use of car wheels in the country. It seemed to him that Pittsburg should export not import wheels. He acted on the thought, and the result is the splendid plant of the Pennsylvania Car Wheel Company, which will undoubtedly secure a large share of the business in Pennsylvania and New York.

### STREET RAILWAYS IN HAWAII.

The question of rapid transit is agitating the city of Honolulu, and advices indicate that the Hawaiian Government will press the subject. There is now before the House a bill extending the franchise of the Honolulu Tramway Company and also one relating to a new company which it is proposed to organize. The government wishes to make a number of amendments to the bill and has asked that its consideration be postponed.

William Brophy, formerly head inspector of the Staten Island Electric Railroad Company, will soon leave for Mexico to take charge of an electric railway project.

#### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

#### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supply or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that supply. We make no charge for publishing such notices in our DAILY BULLETIN.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8. JUNE 15, 1898. NO. 6

We have at various times commented upon the advantages of electric traction for handling the trains of steam roads at the terminals in large cities, and pointed out that this is probably the most promising field for the application of electricity on such roads. The plans of the Orleans Railroad, of France, for a line connecting its present Paris terminal with a station in a more central part of the city contemplate its operation by electricity; and this is the most recent instance of the appreciation of this motive power for such purposes. This undertaking involves an expenditure of eight million dollars.

For several years the Sunday issues of the daily papers of our large cities have had as a feature an article or a number of articles on scientific subjects, and almost without exception in them accuracy is sacrificed to sensationalism. In many instances the reader knows that the whole thing is a "pipe story" and no harm is done, but sometimes the writer goes so far as to cite authorities, and then the man quoted must come to the front with a denial in order to prevent himself from being the laughing stock of those who know something of the subject. A recent example of such a sensational story is that on the destruction of steel in building foundations by electrolysis, which was published by a Chicago daily. Gen. Wm. Sooy Smith was quoted, and by reason of his prominence in the engineering

profession the article excited much apprehension in the minds of those whose property would be threatened, were the danger real; General Smith has received a number of inquiries from parties owning buildings in Chicago, who had thus had their fears needlessly aroused, and has been much mortified because of the position in which he has been placed. The card from him on another page explains itself.

The daily press of Chicago is now waging war on the street railway interests, and it is quite probable that the article in question was published with a view to arousing antagonism to the street railways on the part of that portion of the public which takes its science from the Sunday paper.

Investors are looking with increasing favor on street railway and interurban securities, and the history of the past year has been such as to warrant this confidence. Much better judgment is being displayed by promoters in projecting new lines than was the case a few years ago when they killed the goose by offering properties which were built long in advance of a supporting demand. Interurbans especially are attracting attention, and will continue to do so as their need and possibilities are better understood. With the freight carrying feature such roads can and actually do create a large business which is impossible to duplicate on urban lines, where the earning capabilities are necessarily limited to the population. Interurbans, on the contrary, are able to create a demand for freight products of which there previously was neither a supply nor demand.

We often hear the manager of a railway or the superintendent of its shop say, when asked as to what make of such and such a thing he uses, "We make them all ourselves, as we find we can make them cheaper." The patent argument in favor of this claim is plausible; by making its own supplies the company saves the cost of putting them on the market and selling them, a large item. But, on the other hand, the manufacturer has a larger plant, and a subdivision of labor as complete as possible, giving the greatest efficiency; he purchases in large quantities; he has great skill and experience (if he is successful); and these things in the aggregate should enable him to save more in the making than he must spend in the selling of his goods.

When the manager says that "he can make it cheaper," he believes himself to be stating the truth, yet that may or may not be the case. It all depends on whether he keeps his shop costs correctly.

We know a company that by its books showed a considerable saving, but when the figures were analyzed it was found that the saving was due to using scrap altogether while specifying new material in the purchased article (the manufacturer would gladly have used scrap, had he been allowed), and moreover that very scrap was charged in at 25 per cent less than the manufacturer would have agreed to pay for it. This effectually wiped out the saving, and in fact left a considerable loss.

The foregoing is merely an instance showing the necessity of keeping shop costs in a manner which will show the whole truth if accurate deductions are to be made from them for the benefit of the company. There is probably no difference of opinion as to such a method being desirable, but there is in practice the widest variation as to methods, and as to the value of the results obtained by them.

A visiting Briton recently facetiously remarked "In my country if one person a year is killed at a grade crossing, the Board of Trade talk of revoking the company's charter; while here you keep ambulances to gather up the dead." Without any intention to make light of a serious question, there is no denying the fact that in England the regulations are most radically stringent, and it is an act of trespass to walk upon the right of way of a steam railroad and the offense is promptly punished with arrest and heavy fine. Undoubtedly in many instances we are much too careless and would do well to exercise more caution. In this connection, however, it is extremely interesting to watch the progress which electric railways are making in Great Britain in overcoming the popular prejudice which raged so bitterly against trolley systems. We note that only a few weeks ago the new electric line between Kidderminster and Stourport, which crosses the Great Western Railway, was permitted to make the crossing at grade.

The opening address of President Insull at the meeting of the National Electric Light Association deals with topics which interest street railway men as well as electric light men. The question of standard as opposed to special machinery is an important one from the points of view of both the user and the maker, and is a question which if late has led to much discussion as to the relations which should exist between the manufacturer, the customer and the engineer.

On the question of compensation for franchises he takes the position that it is matter of indifference to the electric light company because such compensation is merely a tax which must be paid, eventually, by the consumer, however wrong in principle such methods of collecting the tax may be. The same point was made by the Railroad Commissioners of Massachusetts, i. e., that a franchise tax for street railways merely increases the cost of transportation which the passenger must pay. The case, however, is not a parallel one as between electric light service and street railway service; for while in the former instance prices can be raised, the street railway is tied hard and fast with a maximum rate of fare, and the infliction of say a percentage tax of 5 per cent could not in any particular be recovered from the patrons of the street railway, unless it was at the expense of a less efficient and comfortable service, and this is a retrogression which companies and public alike wish to avoid. It is obviously policy and wisdom for all concerned that the roads be allowed to collect such a fare as will enable them to steadily improve the service rendered, both in the quality of rolling stock and the frequency of service.

The operating street railways of the country are generally enjoying a good business, and the summer riding is now well under way. The effect of war has thus far not been unfavorable, while in some cities—those in which troops were or are mobilized and where government contracts are being filled—a marked increase in receipts has resulted. While the inability to place securities on the many projected roads has deprived the supply concerns of several million dollars' worth of promised orders, the regular business for renewals and improvements in existing roads has been good and steadily increasing. If the war could reach its termination by the first of July there would still be time for many of the contemplated new lines to build partly or wholly this season, although few interurbans like to make their start at the end of a summer after the bulk of the pleasure riding is over.

The rapidity with which many of these projected lines could move, would, however, be surprising, as in most cases the estimating and selection has already been made, and the promoters only wait the word that the money is forthcoming to close contracts for practically all needed supplies within 24 hours.

We believe that when the barrier is removed orders will pour in with the inevitable result that manufacturers will be snowed under and annoying delays will result in getting shipment on material.

Capitalists are already beginning to realize that the war will neither have any panicky effect on the country, nor will the opportunity to make big profits on quick turns in the money market occur, and they are each day becoming more convinced that it was a mistake to lock up money which might just as well have been drawing good interest during the past four or five months. Many operators, however, have already secured extensions of time, and will let their work go over to next spring, which will mean a whole year's loss of interest that would have been payable on bonds placed this season.

In these days scarcely a ripple is seen where a few months ago the daily press lashed the waters into foam, as the editorial forces blindly hurled themselves into a denunciation of the universal 5-cent fare. The public press is powerful and eventually victorious only when it works on premises which are right and just; and as the 3-cent and 4-cent fare was neither possible on the part of the companies, or demanded by the public, the agitation turned out a great fiasco.

In a few cities politician aldermen, thinking to make a grand-stand play, endeavored to force low fares. Milwaukee was one of these, but the company promptly defended its rights, and Judge Seaman, of the federal court, has rendered an important decision. The leaders of this agitation are either demagogues who seek personal popularity and place, or men of a single idea who are blind to all arguments which do not lead to the conclusions they wish to reach. Were this not the case it would be incomprehensible how cities could advocate such legislation in the face of the many demonstrations, that the street railways cannot possibly furnish the service they are now giving if their receipts were reduced 20 or 40 per cent.

In this case the court finds the testimony "uncontradicted and conclusive" that the service received to the public of Milwaukee is well worth the present fare; that the company has not received earnings in excess of an equitable allowance to the investors for the means necessarily invested in furnishing such service, and that the proposed reduction would deprive the complainants of property rights by preventing reasonable compensation for service. Confiscatory rates are repugnant to the constitution, and any rate incompatible with income sufficient to meet expenses and yield a fair return on investment is confiscatory.

Calculating the value of the company's property, "based solely on the cost of reproduction," as shown by the expert testimony submitted, and making the most liberal estimates (adverse to the company) the profits amount to but 7.2 per cent on the "fair" value of the property. This is a very strong showing of the weakness of the 4-cent position, because the "cost of reproduction" is not an equitable basis for estimating the value of the property, inasmuch as it does not include the cost of experiments nor the capital necessarily lost when old apparatus is replaced by new.

**DEATH OF JULIUS S. GRINNELL.**

Julius S. Grinnell, who since 1891 has been general counsel for the Chicago City Railway, died suddenly of heart failure on June 8. Mr. Grinnell had gone to the Illinois Trust & Savings Bank for a business consultation and here his death occurred.

Julius S. Grinnell was born in Massena, St. Lawrence county, N. Y., in 1842. His father was Dr. A. H. Grinnell and his mother Alvira (Williamson) Grinnell, both natives of Vermont. Julius was prepared for college in Potsdam (N. Y.) Academy, and was graduated with honors from Middlebury (Vt.) College in 1866. He studied law with William C. Brown in Ogdensburg, N. Y., and was admitted to the bar in 1868. He practiced law two years, and then became principal of the Ogdensburg Academy.

HON. J. S. GRINNELL.

In 1870 he came to Chicago and resumed the practice of his profession. In 1879 he was elected city attorney, he being a democrat and the city administration republican. He was renominated in 1881 and elected by a large majority. Three years later he was nominated by the democrats for state's attorney, and was the only democrat elected in the county.

While state's attorney he prosecuted the "ballot box" cases, the "boodling" cases and the "anarchist" cases.

In 1887 he was elected judge of the superior court and served until 1891, when he resigned to become general counsel for the Chicago City Railway Company.

Mr. Grinnell left a widow and a son and daughter. He was a lawyer held in high esteem by the members of his profession; and was generous, warm-hearted and made friends wherever he went.

**RUSSELL SAGE ON THE NEW YORK RAPID TRANSIT.**

Russell Sage has given out the following statement of the situation: "The action of the Rapid Transit Commissioners in appointing Mayor Van Wyck and Comptroller Coler with Mr. Orr upon a compensation committee to agree upon the amount Manhattan should pay for the West Street franchise is an attempt to throw the responsibility of a reasonable rate upon the mayor and comptroller, and is unwarranted. The taxpayers of this city have been treated shamefully by the commission, which has spent \$450,000 of the people's money and has accomplished nothing. It has dilly-dallied its time away at unnecessary expense, and, instead of making the mayor and comptroller scapegoats for what the commission must know is to come, it should treat the matter in a businesslike manner. A 'hole in the ground' is not feasible, on account of lack of funds, and the only other remedy is for Manhattan to increase its facilities upon a reasonable basis. We are now the largest single taxpayer in New York, and are willing to make further large investments, but for transportation purposes only, and not to regenerate dead real-estate deals."

**ELECTROLYSIS IN A NEW PLACE.**

Several years ago when the electric railway was in its infancy the subject of electrolysis caused a good deal of anxiety, and the daily press devoted a great many columns under the scariest kind of scare heads to telling what enormous damage was to result from the return currents of the railways. The principal sufferers in those days were to be gas and water companies having pipes in streets where the tracks were laid, but recently a new "danger" has been exploited; this time it is building foundations, the steel work in which, it is alleged, is being rapidly destroyed.

The following letter explains itself:  
 EDITOR STREET RAILWAY REVIEW:

In the "Chicago Tribune" of Sunday, April 10, 1898, there appeared an article on the effect of electrolysis on the steel used in the foundations of buildings, in which it was stated that I had made investigations of the foundations of certain buildings in Chicago, and had found that the steel in them was injured and in danger of ultimate destruction by electrolysis.

I have never made any such investigations, and when interviewed by a young man representing himself to be a reporter I refused to express an opinion as to any effect that electrical currents might have on steel used in foundations. All that part of the "Tribune's" article that referred to me was fabrication pure and simple.

The day after its publication I asked the insertion of a card making the proper denial, which the "Tribune" published. One of its editors promised that an article should be prepared and published in the next Sunday's paper making the correction. This was not done, and it is probable that few of the readers of the "Tribune" have seen my card.

As earth saturated with water is a first-rate conductor of electricity, it is only barely possible that a subterranean current might pass through a piece of buried steel under such circumstances as to produce electrolysis, just as there is always a possibility during a thunder storm that a person may be struck with lightning. Further than this I do not believe that the steel in foundations is exposed to the slightest danger from any injurious effects of electricity.

I will feel greatly obliged to you if you will publish this statement, as undue prominence has been given to the false statement of my opinion, and it is doing a great deal of harm.

WM. SOOY SMITH.

**THE MAIL CAR IN PITTSBURG.**

Street car mail service was inaugurated in Pittsburg, Pa., June 1, and became popular with all citizens at once. An average of from 5,200 to 5,600 letters were collected on each trip. The first car to run on Uncle Sam's business was in charge of Assistant Postmaster George W. Wilson and Joseph F. Guffey, superintendent of city delivery.

The system worked without a hitch. The big boxes were unlocked and an empty bag substituted for a full one. The amount of mail handled was enormous, and every employe in the service was kept rushed with business. The Consolidated Traction Company has placed another car at the disposal of the government for the mail service.

The contract for the erection of a new power house 60x150 ft. was on May 11 let by the Omaha & Council Bluffs Railway & Bridge Company to Wickham Bros.

## FIRST ANNUAL MEETING, ILLINOIS STREET RAILWAY ASSOCIATION.

A Successful and Enthusiastic Gathering—Association Firmly Established—Discussion and Study of Power Plants Occupy a Large Part of the Time—Next Meeting September 20 of This Year.

The Illinois Street Railway Association, while the youngest of the state organizations, is by no means the least active and vigorous, and breaks the record by recording an organization, its first annual meeting, and the date set for a third, a special meeting, all in one year. To President Patterson, Secretary Minary and Superintendent Brennan of the Chicago General Railway is largely due the success achieved in getting the Association on its feet and starting it on a promising road of usefulness and long life.

The wisdom of choosing a date co-incident with that of the National Electric Light Association, also meeting in Chicago, was demonstrated in the frequent visits to the state meetings of delegates to the Light Association and the cordial expressions of good will which they brought.

The convention occupied two days, the meeting on June 7 being devoted to routine business, an executive session, and visits of inspection to some of the interesting power plants in the city. In the evening General Manager Hopkins of the Alley L. tendered the members a special train over his road to afford an opportunity to witness the operation of the new system of multiple control and to visit the company's new and extensive power station.

The morning session of the second day was called promptly to order in one of the banquet rooms of the Great Northern Hotel, and the reading of papers was taken up. The reports elicited much interest and discussion, and the several writers were given a vote of thanks. At this session President A. E. Lang of the Toledo Traction Company, and president also of the American Street Railway Association, was present, and while not expecting to speak, did when called on deliver an extremely interesting and suggestive address full of valuable experiences and useful suggestions. The figures he showed of the economical working of his large station plant, made possible by a wise arrangement of the latest machinery, was a positive surprise and shows what can be done in the way of cheap power production.

The supplymen of Chicago were largely in attendance and received a cordial welcome.

The following officers were elected for the ensuing year:

President—W. H. Patterson, Bloomington.

Vice President—D. B. Sherwood, Elgin.

Secretary and Treasurer—C. K. Minary, Springfield.

Executive Committee—W. H. Patterson, Bloomington; D. B. Sherwood, Elgin; C. K. Minary, Springfield; Walter Barker, Peoria; W. P. Cannon, Danville; D. F. Harris, Jr., Champaign, and D. A. Belden, Aurora.

A special meeting of the association is called to meet at Aurora, on September 20, 1898.

The badges with which the local roads decorated their visitors were extremely pretty, being in the form of a button with a car in gold on a black background and the date and initials of the association above and below.

Among the visitors were two ex-presidents of the Ohio State Association, Mr. Lang and Mr. Stewart.

Aside from the direct value of the sessions, papers and discussions, the opportunity for the various managers of the state, who have so many interests in common from an operating standpoint, to become better acquainted is of the greatest importance; and the delegates return to their roads

with new ideas as to improvements and with the solution of many a vexed question which some more fortunate manager has succeeded in solving. The membership is steadily growing and the Illinois Street Railway Association may be expected to be heard from in future and to make a strong place for itself among the several sister state organizations.

## Collection of Fares and Checking Employees.

BY W. L. FERGUSON, DECATUR.

The subject which has been assigned to me to write upon is tickets, transfers and checking conductors. This is a very extensive subject and one that is very important in the successful operation of a street car line. I do not expect to advance any new ideas as it is an old subject, and one that every manager is more or less familiar with, and he also has his own ideas and plans for this part of his work.

In regard to tickets, I believe that tickets sold at a small reduction will increase riding and that is what we, as street car men, want. If a man has some tickets in his pockets, he is pretty sure to use them, but if he has to pay out the cash every time, he is not so likely to ride, especially if he is going a short distance. Then again, they often have no small change at the time, and will not break a bill just for a ride. Another reason is, that if a mother has some tickets she will give them to her children to use, when she will not give them the money; and then they are so convenient. I have known patrons of the line to buy tickets, saying they like to use them as they then never need to bother with change, making it more convenient to them and the conductor as well. It also saves time and that is quite an item to many people. Then again, in selling 12 tickets for 50 cents, they make two rides, which is quite a saving to people who ride a great deal. You all know people will save a street car fare whenever they can. Merchants also often buy tickets to give to their customers, claiming it is a good advertisement. I think a school ticket sold at about two and a half cents, or \$2.50 per 100, will induce parents to allow their children to ride to and from school. I found it increased our business, but you must limit these books not selling to children over 15 or 16 years old, and make them not transferable, that only the persons to whom the book is issued can use the tickets.

The subject of transfers has given me a great deal of trouble as I am running a line which has seven different branches starting from one place, called the Transfer Station, and a great deal of our business is transfers. My first plan was to have one man issue all transfers. This man's duty was to be at the transfer station and give transfers to parties who wanted them as they came in on the different cars. I soon found this would not do, as when business was at all heavy people would come and ask for transfers that had not been on any cars, consequently we were carrying people and getting nothing for their ride. I then abandoned the transfer man and had the conductors issue them. This went along nicely for a while but I soon found we were getting a great many transfers and could see no real cause for it. I commenced to investigate; in a few days I found we had men who were working us for from 50 cents to one dollar per day; they did it in several ways. First, they would date the transfers to suit and give them to their families or friends, this would be done while they were being relieved for their meals or at home. Second, they would get together and exchange transfers. For instance, two conductors would meet at meal time, each punching say five or ten transfers at different hours through the day, then take the same number of cash fares from their receipts for the day and then turn in the transfers instead of the cash. We, of course, could not stand that kind of business. I then tried the plan I am now using, and find it very satisfactory. I now use a

transfer, having them printed so the conductor has only two punches to make and they can be made quickly. They are numbered consecutively in books of one hundred. I charge every conductor with a book in the morning when he starts out for the day, he returns what he has left on his last trip. He must issue them in rotation, the conductor who takes them up turns them in at the transfer station upon his arrival there, putting them in an envelope, marking his badge number and the time he took up the transfers on the back of the envelope. The clerk in the office takes the envelope, opens it, examines the transfers to see they are punched correctly and time not expired. The clerk then places them on file to the credit of the conductor who issued them, so when the day's business is over we have every transfer that has been issued during the day on file, charged to the man that issued them, and then in order to see they are not dated ahead, the clerk runs them over in rotation and examines the date. In order to prevent the exchange of transfers, I have the conductor collect fare and give transfer before collecting another fare, and no transfers are issued off the cars. This plan gives the men to understand you are watching them, and if a mistake is made we know it and who made it. After I adopted this plan it was surprising how our transfer business dropped off. This system is not expensive, it takes only one clerk. I have a lady clerk and in addition to looking after the transfers she makes change for the men, receives and counts the daily receipts and does other work about the office. In addition to this, I use the envelope the conductor turns in, as a trip sheet, having him put down the number of passengers carried each way. I have all transfers rung up the same as cash. If you don't ring transfers you cannot check your line.

Checking of conductors can be done in a great many ways. I think no person should ride without paying a fare of some kind. Never allow your officers or directors to ride without paying something for their ride. I would advocate a pass book and have a ticket taken out by the conductor and registered. You must have something for every ride if you want to check your line satisfactory and have every fare registered whether it be pass, ticket, transfer or cash. I know some lines do not register their transfers. You cannot watch men too close. It is a great temptation for men to take all they can get from a street car company, thinking they are working long hours and are not getting enough pay for their services, and again the public feel considerably the same way. I know of cases where passengers have said to the conductor, "Don't ring them all up, I will not give you away." I consider the stationary register the best, as every one can see if their fare is registered. The register should always be set back at zero at the end of the line.

#### Operation of Street Railways in Small Cities.

BY E. X. LESEURE, GENERAL MANAGER DANVILLE GAS, ELECTRIC LIGHT AND STREET RAILWAY COMPANY.

When our secretary first sent me the notice that I would be expected to prepare and read a paper before this association, on the "Operation of Street Railways in Small Cities." I immediately wrote him that I would be unable to attend the meeting, and suggested that it would be proper and fitting to invite some one else who would be better qualified for the task.

He very politely informed me that when a member of this association was invited to prepare a paper, the only excuse that would be accepted would be death. I believe you will agree that the alternative presented was too severe for me to spare you.

Let me say that the operation of a street railway in a small city, viewed from any standpoint, is beset with many petty annoyances and difficulties, and that consequently a paper on the subject cannot be expected to be entertaining, and also that different conditions existing in different small cities render theoretical operation from a general stand-point out of the question.

I will therefore confine myself largely to the operation of one street railway in one small city, namely the one with which I am connected, in Danville, Illinois. Perhaps it would be proper at this time to state that Danville is a city of about 18,000 inhab-

itants, rather compactly built up, and that we have about eight miles of track.

Coming therefore to the question before us we will take for granted that the conditions are as follows:

That the road has been laid out to take advantage of any local conditions that may exist.

That the roadbed is the best that labor can make it, and that the construction is of the best.

That the equipment is sufficient, and also the best that money can buy. I do not mean that money should be lavishly spent on handsome finishings, but that no money should be spared on the serviceable parts of the equipment.

In no place more than in a small city is the rule true, that the "best is the cheapest." We cannot afford to spend one cent unnecessarily on repairs. It is the matter of repairs and renewals that hurts the small roads. Most any of us can scrape together enough money to pay running expenses, and perhaps enough to pay interest on the investment. To reiterate, the only way I see for a street railway in a small city to be successfully operated, is to buy the best, and take care of it afterwards.

As to the question of power, it must again be the local conditions that govern the matter. I believe that when a street railway company does no lighting or power business that an arrangement should be made with the local lighting company for power. Such an arrangement should be made whereby a small saving would be made to the street railway company, and also allow a small profit to the lighting company.

In our own case, owning the lighting company as well as the street railway, we simply allow to the electric light department a fair price for power, and charge same to the operation of the street railway.

Now comes the question, how many cars shall be run and how shall they be operated. As to the number of cars my answer would be to run as many as possible where distances are short. We have one line on which we find a 20 minute service ample, the people who ride at all being so far from the center of the city that they are glad to wait rather than walk. We have another line running through a part of the city more thickly populated, on which we find a car every 10 minutes is none too frequent. We have tried on this line both 10 and 20-minute service, with the results showing that the more frequent service is the more profitable; people not being inclined to wait long for a car where distances are short as they are apt to be in a small city.

We have another line on which I think one car a week would be sufficient, but as we are compelled under our franchise to run a car every hour, I am unable to give you any data on the subject. Fortunately for us the line is a short one and inexpensive to operate. In a small city we must never lose sight of the fact that distances are such, that the people are not obliged to ride, and consequently we must give them every possible opportunity.

In regard to operating these cars, I would say that I am a firm believer in the system of passing up the nickel. First, on account of the expense of conductors; and in the second place, to maintain discipline, men must be kept busy, and with a conductor and a motorman, with now and then a passenger, it is a hard problem. A good motorman can get practically all the fares, and I think in most instances, if good service is maintained, that the people will not complain at the small inconvenience of putting their fares in the box. On big days, of course conductors will be necessary, but by a little care, good men may be found for these occasions, who are ambitious to blow a whistle and say "Fare."

In our own road we operate eleven cars, and in the operation of same employ seventeen men; the superintendent, 11 motormen, one car-barn man, two car men, a teamster, and a track man. The car-barn man is the first man down, and he sees that all the cars get out all right, cleans up the barn, and helps relieve. Any spare time he may have, he puts in working on repairs to cars, etc. The two car men go to work in the morning in time to relieve for noon, and during the afternoon work at repairs.

These three men therefore do all the relieving for meals.

After the supper relief, the two car men take the cars as they come in, put them over the pits, and go over them thoroughly, to see that they are in good shape. Any car that is not in per-

feet repair, is not allowed to go out the next morning, but another car substituted. We are particular in having this rule enforced, always with the view to keeping down repairs and renewals.

The motormen run last in, first out, work about twelve and one-half hours, and are paid by the day. Our teamster is at the same time our lineman, and does all the work on the line, although we arrange to have the car-barn man also a line-man, so that in case of emergency he can take this work. The track man goes over the track day after day cleaning the curves and crossings. We use a T rail and I am quite sure he saves his wages in the wear and tear on cars, besides the saving in power.

We go over the line every spring taking up low joints, and we endeavor to keep them in as good shape as possible. We try to do all our car repairing and armature winding with our own men; by that I mean that we do not keep any skilled workmen for this work.

We do all our own painting of cars, by borrowing a good car painter from the railroad shops, and he with two cheaper men, does our work. We go over our cars every spring, touching them up and giving them a coat of varnish, repainting them thoroughly when they first begin to show need of it.

In case of heavy snows we open the track with snow plows, and endeavor to get the best paying lines open as quickly as possible, leaving the others until the last, hoping that nature will come to our aid, and bring us a thaw.

The selection and discipline of men connected with a road in a small city is a very important matter, and in our case is left entirely to our superintendent, and upon his judgment depends largely the question of the successful operation of the street railway. His men must be selected, not so much for their ability to do one thing, but for their ability to do a variety of things. A man might be a careful motorman and able to run a car economically and safely, and at the same time be totally unfit for a motorman in a small city where no conductors are used.

Our motormen must be able to run their cars, make change, which is furnished them in packages in amounts from ten cents to one dollar, answer questions, look out for passengers getting on and off, see that he gets all his fares, keep order in the car, and make himself generally useful and agreeable. If he has any time at the end of the line he is expected to sweep out his car and get it clean for his return trip.

The motormen must be firm in enforcing rules and regulations and at the same time be polite enough not to give offense.

In a large city, where everything is bustle and hurry, people expect to have rules enforced; they realize that business could not otherwise be carried on. In a small city we are obliged to have the same rules and discipline, but people are inclined to take advantage of the fact, that at times, some of the rules seem unnecessary, and try to impose on the motormen. Our superintendent however maintains a severe discipline; quite as severe, I presume, as on many larger roads, and I think it is a great advantage to us in dealing with the public. The public soon learns to respect your rules, if it knows that you enforce the same with your employes as well as with the public.

The manager of a street railway in a small town comes in contact with his patrons every day, learns to know them, and considers them his customers, and has to treat them much in the same manner as a merchant in a small city treats his customers.

In regard to the matter of providing some sort of attractions at the end of the line, in the hope of increasing travel, I would say it is a matter which has been tried in several small cities with varying success. We have tried it wherever we could without going to any great expense, and have managed to increase our revenue a little, but generally speaking I doubt whether the plan is feasible. I remember on one occasion we gave a concert at one of our city parks, and in point of attendance it was a success. I think we must have had three thousand people, and my recollection is that we carried but three hundred people each way, or about one-tenth of the people in attendance.

I could go on indefinitely relating the trials and tribulations of the manager of a street railway in a small city, but I know

that each man has "troubles of his own" without being asked to listen to those of another.

In conclusion let me say that I believe from personal experience, that a street railway can be successfully operated in a small city, but only by giving the same careful attention to detail, as is applied on the larger roads.

### The Rights of Street Railway Companies Under the Constitution.

BY CHARLES L. BONNEY, VICE-PRESIDENT CHICAGO GENERAL RAILWAY.

Constitutions are adopted for the protection of the weak and the poor. The strong and the rich do not need constitutions. They have other forces for their protection; therefore constitutions are adopted to establish a political equality for all persons. Judicial tribunals are created in the constitutions, having power to decide upon the reasonableness of all acts of the executive and legislative departments; therefore we should look to the judicial department as the most potent of the three. If the constitutional rights of the poor and weak are violated by a legislature or a city council, an appeal for protection may be successfully made to the courts. Persons have certain rights which a legislative body can not take away, injure or delegate. Legislative bodies may be classed among the strong, because of the power to pass harassing and unreasonable legislation.

The street railway companies of Illinois outside of Cook county have an average of only ten miles of road and are therefore individually weak. Collectively these companies represent less than one-third of the street railway mileage of the state. The independent cross town companies of Chicago represent less than 15 per cent of the state mileage, so that the outside and cross town companies, if combined, represent less than half of the state mileage, leaving the three old Chicago companies in control of more than half the state mileage and with probably 10 times the financial resources and political influences. In Illinois, the three old Chicago companies may be classed among the strong and all other companies in the state among the weak. That is, three companies in the state are strong enough to look to themselves while all other companies must look to the constitution.

The street railway legislation which was vetoed by Gov. Altgeld, the Humphrey bills and the Allen law did not originate from any of the weak companies. Their necessities were not consulted, but it was proposed to appropriate a large percentage of the annual gross receipts of every company in Illinois. There are some companies in the state which have not earned a dividend for years. Such legislation, as to such companies, is unconstitutional, as held by the Supreme Court of the United States in the Nebraska Rate case.

In Chicago we have a mass of oppressive ordinances which are such a rank violation of constitutional rights that their appearance suggests their existence as clubs to frighten the weak and oppress the poor. Ministerial hirelings are vested with judicial discretion and are authorized to arbitrarily execute their own conclusion without trial by jury or any other constitutional formality. Our duty as law-abiding citizens requires us to break up this vile practice. It is short-sighted folly for the companies to endure such oppression when submission to the courts is all that is necessary. Stand firmly on the constitution, rely on the federal courts and defy all unreasonable legislation of the state or the municipality. The more oppressive the legislation the greater the chances of victory in the courts. Public officials who act under illegal laws should in all cases be sued individually for damages, and if possible should be placed under bonds to keep the peace. Such a process of educating public officials is certain in the end to prove beneficial to the companies as well as to the public at large and is promotive of law and order.

The constitution of the United States declares itself to be the supreme law of the land and it guarantees to every one of us, weak or strong, the equality of the laws, the security of contracts and due process of law. Every public official—federal,

state and municipal—has taken an oath to support this constitution. Under it and through the federal court a lowly individual may defy a governor and the legislature, or a mayor and city council, and this national court has never hesitated to set aside legislative acts or city ordinances where rights under this constitution were interfered with. This court has established that a corporation is a person within the meaning of the constitution. It may be noted that the strong corporations very seldom raise any constitutional questions. They have other means of securing protection and it therefore remains for the members of this association to flaunt constitutional defiance to legislatures and city councils.

Under the constitution there are certain things which can be unquestionably required of the companies at all times. Municipal ownership may be obtained by condemnation. The cities or the state can pass reasonable police regulations. That does not imply any serious injury to the property or to the right to continue in the occupation.

This power is so simple that it does not furnish the politicians with material for entertaining speeches. Its general scope has been so well defined that inventive minds of newspapers and civic federations turn rather to untried fields. Politicians and newspaper editors have boomed a new fad—"percentage of gross receipts in consideration of franchises." This implies an annual examination of books—a most uncertain and unreasonable contingency, even from the public standpoint, and a scheme of doubtful legality, unless the state constitution be first amended for that purpose. There are a number of methods under which that percentage plan, if enacted, may be avoided, but it is not wise to go into that at this time. The city of Chicago tried the mileage tax fad. It is now in the Supreme Court of Illinois, en route to Washington for final disposition.

All the courts of the country have sustained a geographical classification as legal—that is, the basis should be territorial and not individual. The courts have also sustained the power to collect a license by a general law, uniform on the class within the prescribed territory. If the newspapers and politicians had no other purpose to serve than to promote the collection of a reasonable amount from the companies, and were not too particular about fostering some untried manner of the collection, the plan of territorial license for each car can be recommended as both legal and simple. If, however, this new percentage fad is forced, let it be with notice that not one cent of tribute will be paid until the cities secure the approval of the Supreme Court of the United States as to the validity of the law.

A great political hubub is now being created over a proposed repeal of the Allen law. The candidate who did not vote for the bill should, of course, vilify the man who did. If he can, he should get elected any way, regardless of truth or merits. That is the depraved condition of our politics. Give these political falsifiers who mislead the people to understand that so long as the street railway business is a constitutional occupation we will continue at the old stand as long as the federal courts are open, even if the Allen law and every act in the statute book is repealed. The legislature and the council are as powerless to murder our occupation as they are to murder our children; both are sacred under the constitution, and are carefully nursed by the federal courts.

On January 17 last, the writer submitted the following bill to your executive committee: (The words *in italics* are from the constitution.)

A BILL FOR AN ACT CONCERNING RAILROADS.

Sec. 1. *Be it enacted by the People of the State of Illinois represented in General Assembly:*

WHEREAS, The General Assembly of 1870 passed a general "law requiring the consent of the local authorities having control of streets or highways," prior to the location and construction of railroads in such streets and highways, and the occupancy thereof, for railroad purposes. And in pursuance thereof such "local authorities" have heretofore and may hereafter "consent" to the location, "construction" and "occupancy" of certain streets and highways heretofore or hereafter "proposed to be occupied by such railroads." And in pursuance of such "consent" certain railroads have been and may be located and constructed in certain "streets and highways" and may now or hereafter "occupy" the same,

Therefore, in consideration of the continued operation of such railroads "under such reasonable regulations as may be prescribed by law," the location, "occupancy" and use of any, all and every such "street and highway" as may have been or may hereafter be given by the "local authorities having control of the street or highways" so used and occupied, is hereby fixed at a period of 99 years.

Sec. 2. Every railroad company heretofore constructed or that may hereafter be constructed in any such street or highway shall be subject to all general police regulations of "the Board of County Commissioners" or Board of Supervisors as the case may be.

Since that time the writer has had occasion to carefully examine the old horse and dummy act, as applied to certain Chicago ordinances but as the conclusions reached apply equally to nearly all the companies of the state, the same are here reproduced.

The city council, on July 30, 1883, passed an ordinance extending the time named for the operation of the railways operated by the Chicago City Railway Company, the North Chicago City Railroad Company and the Chicago West Division Railway Company for the period of 20 years.

An opinion is requested as to the power of the city over these railway lines at the expiration of the 20 year term, in case no further extension of time shall be consented to by the city. Also as to the effect on existing lines of railway in case of a repeal of the so-called Allen law.

1. These railway companies are the creatures of the state, not of the city, and the city is also the creature of the state. Both derive their powers from the same source, and both are limited in their powers. The companies may acquire vested rights as against the state, the city can not. If the state desires to take the franchise of a railway company it must do so by condemnation, in which the trial by jury is guaranteed, but if the state desires to repeal the charter of a city, there is no condemnation, no compensation and no trial by jury.

2. The Supreme Court of Illinois has so repeatedly held that the railway "franchise" comes from the state and that the consent of the city is "a mere license" that the proposition can no longer be questioned. (152 Ill. 185.)

3. Prior to the passage of this 1883 ordinance, the state had issued various franchises to these companies and their successors, for the construction and operation of certain railways, the term of the franchises varying from 50 to 99 years. The only prerequisite in the constitution to the construction and operation of the railway authorized in such franchise then being the "consent" of the local authorities, which consent was properly exercised in the passage of such ordinance in 1883, and prior ordinances.

4. At the time of the passage of this 1883 ordinance the power of the city in this respect was limited to its own character and to the provisions of the horse and dummy act of 1874. The subject of the former act, as expressed in its title, is the city and not the company, while the reverse is true as to the latter act.

5. An analysis of these legislative acts shows a very pronounced distinction between the "location and construction" of the tracks, and the "operation" of the vehicle used. The 20-year limitation is mentioned twice in the state laws, once in paragraph 24, section 63 of the city charter, and again in section 3 of the Horse and Dummy Act. In the former, such limitation relates exclusively to the "locating, constructing or laying a track," without one word relating to "operating" cars. In the latter, section 3 relates exclusively to the right to "locate or construct," all reference "to operating" cars being omitted. In both cases such limitation relates to the consenting powers of the city as to the physical and geographical considerations and not to the franchise power of the company to continue in the authorized occupation. Section 3 says "such consent" that is, consent of the location and the construction, is limited to 20 years. Again, "such consent" is granted on the petition of the company, not the voluntary act of the city. But the company need not petition. Its tracks are already "located," and are already "constructed." Again, "such consent" can not be granted except on 10 days' published notice of the time of presenting "such peti-

tion." If there is no petition there can be no notice, thus the conditions precedent do not exist and the council is without jurisdiction to act. Therefore the city has no power to enact new "terms and conditions." The city, however, can find comfort in paragraph 25, section 63, of its charter, for the legislature has there authorized the city to "change the location, grade and crossings of any railroad."

6. The state laws relating to the "operation" of cars are all distinct and independent of the sections relating to the "location and construction" of tracks. The state constitution declares that railways shall be "under such regulations as may be prescribed by law." "Regulations" has a well defined meaning. The petition of the company; the 10 days' notice and the acceptance of the law are not necessary to the validity of "regulations." Paragraph 42, section 63, City Charter, gives the city power to "license and regulate" all common carriers, which includes street cars. Again, section 4 of the Horse and Dummy Act, gives the city power "to make all necessary police regulations concerning the management and operation of such railroad."

7. No provision can be found in either City Charter or the Horse and Dummy act which directly or indirectly requires any renewal or extension of the city's "consent." No power is granted to the city to impose any new "terms and conditions;" it must confine itself to "regulations." The act does not pretend to prohibit the use of the street and the operation of cars after the lapse of 20 years. It does not impose any penalty on the railroad for continuing such use and operation. It does not give the city any remedy against the railroad for such continued use and operation. A railroad is permitted on the ground of public necessity, and so long as that necessity exists the city could not arbitrarily terminate such use of the street. It may regulate but not destroy.

The writer is therefore of opinion that the wording of the legislative acts mentioned, indicates that the relative position of the state, the city and the railway companies, as to the right to continue in business at and after the expiration of the 1893 ordinance, will be, for all practical purposes, the same as it exists today, subject then, as now, to the power of "regulation." In which case it necessarily follows that a repeal of the Allen law is immaterial as to the power of the companies to pursue the franchise rights already acquired from the state.

All public discussion of the street railway situation proceeds upon the theory of what the law should be and not of the law as it is, and that the companies are unfortunate orphans, anticipating early annihilation unless some charitable Civic Federation or generous public official (of course without political ambitions), should sustain the breath of life at the annual rate of 10 to 20 per cent of the gross receipts.

In order to facilitate the sale of long time bonds, legislation is unquestionably desirable, but Civic Federations, newspapers and politicians are mistaken in the expressed view that legislation is a legal necessity. The companies are in excellent position to patiently ask the municipalities "what are you going to do about it?"

Under present legislation new companies may be formed under the steam railroad act, and as such are authorized to lease any of the old lines built under the Horse and Dummy Act; and, as such, are also authorized to convey persons and property by "animals or by any mechanical power." Such companies can then connect with other companies by lease or operating contract, can extend across county or state boundaries, and can organize an interstate and United States mail business. It is certain that as such lines extend outside of the municipal limits they become outside of the municipal control. Such companies would then pass under the jurisdiction of the state and federal railroad commissioners. These advantages are now at the exclusive option of the companies and can not be interfered with by the municipalities. The provision of the Illinois constitution requiring the "consent" of the municipality, is expressly limited to a "street" railway, and not a railway in the street, therefore it may not possibly apply to general railroads. If a steam railway company may operate its road with "animals or any mechanical power," why should we not prefer to become general railroads operated by trolley, rather than "street" railways

operated by trolley? Whatever the judicial distinction may be, it may worry the cities, but not the companies. We will adopt our choice, and let the other fellow do the walking.

The attitude of the present city administration towards street railways is so entirely political and oppressive, and so devoid of all recognition of now existing rights, or of financial encouragement for the future, that the writer predicts, that within a year every street railway of Chicago will be federalized and the helpless insignificance of municipal arrogance completely demonstrated.

Among those in attendance were the following:

- C. F. Nagle, superintendent, Chicago City Railway.
- D. A. Belden, general manager, Aurora Street Railway.
- J. F. Porter, president, Alton Railway & Illuminating Company.
- J. A. Day, president, Belleville Electric Railway.
- W. H. Patterson, Bloomington Electric Railway.
- B. F. Harris, Jr., president, Urbana & Champaign Railway.
- E. X. LeSeur, general manager, Danville Street Railway.
- W. L. Ferguson, director, Decatur City Electric Railway.
- D. B. Sherwood, Elgin City Railway.
- W. B. McKinley, general manager, Joliet Railway Company.
- C. H. Cobb, general manager, Kankakee Electric Railway.
- W. Patterson, president, Lincoln Electric Railway.
- Walter Barker, president, Central Railway, Peoria.
- R. N. Baylies, president, Rockford City Railway.
- J. F. Lardener, general manager, Tri-City Railway, Davenport, Iowa.
- C. K. Minary, general manager, Springfield Consolidated Railway.
- F. O. Rustling, Bluff City Electric Railway, Waukegan.
- E. D. DuBois, Richmond, Ind.
- C. L. Bonney, vice-president, Chicago General Railway.
- H. M. Sloan, general manager, Calumet Electric Railway, Chicago.
- James R. Burrows, of the City Electric Railway, La Salle.
- A. E. Lang, president, Toledo (O.) Traction Company.
- F. E. Smith, auditor, Lynn & Boston Railroad.

## SALE AT LOCKPORT, N. Y.

The Lock City Electric Railway was sold at public auction in the lobby of the Niagara county court house June 8 at 11 a. m., under foreclosure proceedings brought by the Mercantile Trust Company, of New York. The mortgage under which the proceedings are instituted was given in September, 1893, and default on interest was made on March 1, 1895.

## END OF DETROIT CASE.

May 23 the United States Supreme Court rendered its decision in the case of the Detroit Citizens' Street Railway Company against the Detroit Electric Railway and the city of Detroit, and affirmed the decision of the state court. The case involved the right of the council to grant an exclusive franchise to lay street railway tracks in the city. In 1862 an ordinance was passed giving to the Detroit City Railway Company, of which the Detroit Citizens' Company is the successor, the right to lay railways in streets voted by the council to the exclusion of all other companies. In 1879 this right was extended for thirty years. In 1894 the council passed an ordinance giving the Detroit railway the right to lay tracks on the same streets already occupied by the lines of the other company. The old company then brought suit to restrain the new organization, on the ground that this ordinance impaired the validity of its contract with the city.

## THE EFFECT OF THE WAR.

So far but few of the operating street railways of the country have felt the effects of the war, either to their advantage or to their disadvantage. It is true that projected roads which

the war brings an era of prosperity. Aside from those in the manufacturing centers where there is an unwonted activity because of the heavy demands of the government for supplies, the roads feeling the effect of the war are those near the camps where the troops have been concentrated.

SCENES AT CAMP BUSHNELL AND IN COLUMBUS, O.

had reached the stage where their promoters were ready to put securities on the market are effectually tied up, and they will probably remain so until peace is declared. Among the roads in operation there are not many so situated that

Many of these camps were temporary only, particularly those at the state capitals, the men remaining there only long enough to be mustered into the United States service, and then leaving for the larger camps at the south.

A year ago the regular army of the United States comprised a total of only 27,532 officers and men, and the total authorized strength of the militia of the several states was but 116,000. In April the regular army was increased to

HEADQUARTERS, JACKSONVILLE, FLA.

60,000 men, and two calls for volunteers made, the first for 125,000 and the second for 75,000 men. The work of organizing this army is being carried forward as rapidly as possible, though it is necessarily somewhat slow. The men also must be held in camp until they can be properly equipped, and though the factories are working day and night on government orders the delays will be long in some instances. The public is again learning, what military men have always tried to teach, that no matter how capable a people may be, an army can not be organized and equipped in a day.

In the meantime some few fortunate roads are finding a

gratifying increase in their traffic, because when our friends set out upon a journey, especially when it is a dangerous one, we wish to assist them with their preparations and bid them farewell, and we all wish to see the trappings and pomp of war and listen to the inspiring strains of martial music. Also, a number of steam roads have made a point of running excursions from neighboring towns.

After the president's first call, 10,000 men were concentrated at Camp Bushnell, Columbus, O., all of whom were soon sent to Chickamauga and Washington when the regulars mobilized at those points were moved farther south. W. F. Kelly, manager of the Columbus Street Railway Company, has kindly sent us a number of photographs showing views of the camp and the crowds which the presence of the troops called out. The increase of the traffic on this road amounted to fully 20 per cent, the increase being probably equally divided among the three classes from which it might be expected to come, that is, the soldiers, visitors in the town, and the citizens. This company found the increase in traffic to be greatest in the afternoons and on Sundays. Thirty-five extra cars were found necessary. None of the employes of this company have expressed any desire to enlist, so that no "war orders" have been issued.

The illustrations show a number of scenes at Camp Bushnell and in Columbus.

Thirty-five hundred volunteers were encamped near Des Moines, Ia., and their presence caused a marked increase in the traffic of the Des Moines City Railway, the increase being from citizens as well as from strangers in town. The traffic was heaviest in the afternoons.

At Jacksonville, Fla., there is a large camp, and the riding of the soldiers has caused an increase in the receipts of the company of the Main Street Railroad of over 400 per cent;

SCENES IN THE CAMP AT JACKSONVILLE, FLA.

the camp is located on this road, and if the war continues for any length of time the company will be in the market for more cars. By the courtesy of S. B. Hubbard, president of the company, we have received the views of the Jacksonville camp which are reproduced here.

The Illinois volunteers were concentrated at Camp Tanner, Springfield, Ill.; there were 9,000 assembled at that point. While these men were in camp the local street railway had from 9 to 25 extra cars in service, the travel depending on the number of excursionists in town; Sundays

there since the relief expeditions were decided upon. The street railways have enjoyed some increase in traffic, but the city being a large one the percentage is not marked. The increase in traffic is greatest on Sundays and holidays, but extends over nearly all hours of the day when the weather is pleasant.

Thirteen hundred troops were in camp at Denver, Col., and the Denver Consolidated Tramway Company finds its receipts increased \$150 per day by reason of the extra traffic. This increase in receipts is due to the riding of citizens who

SCENES IN THE CAMP AND PARADE IN DENVER.

11302380

were the big days. The traffic was steady throughout the day when there were strangers in town, and nearly all the increase was from this class. All the troops were ordered away on May 30, but the second call brought others to the camp.

Since shortly after the declaration of war there have been between 8,000 and 10,000 troops stationed at Mobile, Ala., though several regiments have been withdrawn since the first of the month. The increase in the receipts of the Mobile Light & Railway Company was nearly 60 per cent, the heaviest riding being between 3 and 6 in the afternoons.

San Francisco being the point of embarkation for the Philippines, there have been about 10,000 troops stationed

visit the camp, as on April 25 Superintendent Durbin issued an order that members of the Colorado National Guard should be carried free when in uniform.

The accompanying illustrations show scenes in the camp at Denver and were reproduced from photographs taken by W. C. Daniels of that city.

Tampa, Fla., is the starting point for the invasion of Cuba and up to a week ago there were from 20,000 to 30,000 troops in camp at that point. By reason of this the traffic on the street railways owned by the Consumers' Electric Light & Railroad and the Tampa Suburban Railroad Companies has been doubled. The traffic here is heaviest between 6 and 7 p. m.

On July 4, 1898, this nation will be 122 years old and not in many years have events been so propitious for an old-time celebration of the day. The fact that the country is engaged in war, leads our thoughts to turn to past wars, the victories of our fleets fire the popular heart, and the orator of the day should find his task an easy one. But it may be that the "old time" celebration is not what people want; in fact the plans which have been made in many cities and towns indicate that such is the case.

We often hear regret expressed that in these latter days of the Republic, National holidays are not so fittingly observed as formerly, and the pessimist is prone to say that patriotism is waning. Events show, however, that our citizens are as willing as ever to respond to the country's call and we must look for another cause for the changes in the manner of observing the national anniversary.

The rapid growth and material development of the country have brought to pass many changes in habits, manners and thought. Being driven at a higher rate, and working under higher pressure now than formerly, the tendency is marked for men to seek amusement when a holiday brings enforced absence from business. Instead of listening to a speaker who can arouse the strongest emotions to which man is susceptible, and play upon them, the preference now is for rest or amusement. The reason is the same that has caused the vaudeville performance to become so popular an entertainment—the mental strain is less. About all that now remains of the old 4th of July is the noise that the small boy makes, and that remains because boys always have and always will delight in noise.

The Toledo Traction Company will have a balloon ascension in the afternoon and an exhibition of fireworks in the evening at its Lake Erie Park.

At Marinette, Wis., the street railway company contemplates devoting the day to a series of games of various kinds, including boat racing and aquatic sports, and will conclude the entertainment with a balloon ascension, and in the evening give an exhibition of fireworks.

The Norwich (Conn.) Street Railway Company will have bicycle races, concerts, vaudeville performances and dancing, and end the day with fireworks.

At Tampa, Fla., the Consumers' Company will have bicycle races, a ball game, etc., and in the afternoon a sham battle.

The Winchester Avenue Railroad Company, of West Haven, Conn., will have base ball, band concerts, vaudeville shows, electric fountain display and fireworks for special attractions, though this road scarcely need provide anything out of the ordinary in order to ensure a good traffic on the 4th as Savin Rock on the beach of the Long Island Sound

is the great attraction for New Haven and the street railway has all the passengers it can handle on holidays.

In former years the Aurora (Ill.) Street Railway Company has had ball games, balloon ascensions and races, and in the evening fireworks as 4th of July attractions, the entertainments being given at an enclosed driving park and a small admission fee charged. This year the Illinois State Bicycle Meet is to be held at Aurora on July 2, 3 and 4, and the street railway company will not offer any other inducements to stimulate traffic.

The Woronoco Street Railway will have cycle races in the afternoon, including exhibitions of fancy and trick riding, and in the evening fireworks and a band concert. As compared with the attractions provided in previous years, the events will not be so numerous, but will be the best of their kind. It has been the experience of this company that good advertising pays, and it will spend considerable money in giving its plans for the 4th publicity.

The Union Traction Company, of Philadelphia, will have fireworks and special musical features, and in all probability some civic assemblage will meet at Willow Grove Park, the company's pleasure resort, in which event other attractions may be added to those at present contemplated.

At Birmingham, Ala., J. B. McClary, manager of the Birmingham Railway & Electric Company, has provided a program which covers the entire afternoon and evening. It includes a band concert from 1 to 6 p. m., a balloon ascension at 6:30, a concert later, an exhibition of fireworks at 10 p. m. and a ball at the pavilion after the fireworks. There will be 100 cars in service that day. Excursion rates will be given on the interurban lines where the fare is 10 cents or more, but no reduction will be made on lines where the rate is 5 cents.

The Duluth (Minn.) Street Railway which has a pavilion at the head of its incline railway with the lower floor fitted up as a summer theater, will have a band concert and patriotic addresses by popular speakers in the morning, and in the afternoon and evening special bills at the pavilion theater, probably followed by a fireworks exhibition. The management may also arrange for some games in the vicinity of the pavilion but this has not been fully decided upon.

At Binghamton, N. Y., the Binghamton Railroad Company has two summer resorts, Ross Park and the Casino; at the former the Okabe troupe of Japanese, 11 in number, will be the principal attraction, and in addition there will be band concerts and fireworks in the evening; at the Casino there will be a special vaudeville bill, concerts, fireworks and dancing in the evening.

The Keokuk (Ia.) Electric Street Railway for special 4th of July attractions has a Western Association ball game in

the afternoon and in the evening Pain's fireworks spectacle, entitled "The Battle of Manila."

The Bellaire, Bridgeport & Martin's Ferry Street Railway, of Bridgeport, O., is quite fortunate in that it need provide nothing special for the 4th but is already sure of all the traffic that it can handle on that day because Buffalo Bill will be there.

At Harrisburg, Pa., there are three parks lying in different directions from the center of the city with different attractions at each so that the travel should be heavy on all lines of the street railway on that day. At Paxtang Park will be Kane's Opera Company; at West End Park, a firemen's picnic and dancing; at the City Reservoir Park, fireworks and band music.

The Brockton, Bridgewater & Taunton Street Railway Company, of Bridgewater, Mass., has arranged for a week's engagement of the Columbia Pantomime Company at Pilgrim's Park, Lake Nippenickit, the week commencing July 4.

The Camden & Suburban Railway Company, Camden, N. J., in addition to its regular attractions, comprising a pleasure cable railway, carousel, swings, steam launch, row boats and the usual row of midway features, will have fireworks, a sensational aerial novelty and Edison's latest kinetoscope with animated pictures.

The Home Electric Railway, of Baton Rouge, La., celebrates the day by decorating its cars. A program is usually arranged in which the school children take part, but when the legislature is in session the public 4th of July celebration is arranged by it. The legislature sits from the middle of May until the middle of July in alternate years, 1898 being one, however.

At Danville, Ill., the street railway company is not making any effort for the 4th of July; the local lodge of Elks is preparing for a public celebration.

At Albany, N. Y., the city arranges a celebration and the street railway has all it can do to carry the people who wish to ride without making it necessary to provide special attractions.

The Mahoning Valley Railway Company, of Youngstown, O., has a number of resorts along its lines which are conducted by other parties, and at all of these picnics or entertainments will be given so that the railway will have all the business that it can handle without being obliged to undertake the responsibility of the entertainments.

The Omaha Street Railway Company needs not to provide special attractions for the 4th, because there is in that city the Trans-Mississippi and International Exposition. This the people of Omaha say is the greatest show on earth; we would not for a moment presume to dispute this and the street railway may consider itself quite fortunate in having so large and so attractive a special feature in the city during this summer of war and hardship.

The Geneva, Waterloo, Seneca Falls & Cayuga Lake Traction Company will have a balloon ascension, boat racing, band concerts and fire works at its Lake Cayuga Park.

The Ithaca (N. Y.) Street Railway Company has provided the following program at its park for the 4th: Balloon ascension, parachute drop, live turkey drop—"catch the turkey and he is yours," war pictures, vaudeville performance, band concert, fireworks—Dewey at Manila, etc. And after enumerating these as the events which he knows he will

have, Manager Belcher adds, "and we hope, a dry day and plenty of fares."

General Manager Nicholl, of the Rochester (N. Y.) Railway Company, states that the company has nothing special except such entertainments as will be furnished by the proprietors of the resorts at Ontario Beach, Windsor Beach, Sea Breeze and Glen Haven. The city has not as yet done anything in the way of preparing for a celebration.

At Sedalia, Mo., the Electric Railway, Light & Power Company, has for special attractions boating, "chutes," new bathing pavilions, log cabin restaurant where fish dinners are served, band concerts and an open air theater.

At Michigan City, Ind., the Lake Cities Electric Railway looks to the ball game which will be at the ball park at the end of its line to provide passengers for it.

At Piqua, O., the Midway Park is run in connection with the Miami Valley Railway, and it has arranged for the 4th: base ball game, bicycle races, the best vaudeville talent obtainable for the theater, a naval sham battle on the artificial lake, besides the usual features of bowling alley, boating and merry-go-round. The charge is 15 cents for car fare for the round trip, admission to the grounds and seat in the theater. It has been the experience of Bert St. John, the manager, that the best of attractions, low prices and prompt street car service will bring the traffic without fail.

The Columbus, O., Street Railway has no definite plans for celebrating the 4th. After the first call for volunteers, Camp Bushnell with its 10,000 troops proved the great feature of the city, and after these were ordered south the second call brought out 5,000 more early in June; should these men remain in camp over the 4th of July there will doubtless be more visitors than ever on that day and an old fashioned patriotic celebration.

The Newburyport & Amesbury Horse Railway, of Newburyport, Mass., is to have a large bonfire and concerts by a military band for its special attractions.

At Charleston, S. C., the Charleston City Railway Company will have a vaudeville entertainment at its suburban park (Chicora) for its white patrons and at Tuxedo Park (the colored resort) a mammoth colored picnic; in addition there will be a ball game at the base ball park. The 4th is a great day for the colored brethren and they all turn out for parades, picnics, etc., and liberally patronize the street cars.

The Holyoke (Mass.) Street Railway Company will have a special entertainment at Mountain Park, the street railway park at the foot of Mt. Tom, in which fireworks will be a prominent feature. The great summer attraction for the patrons of this road is the Mt. Tom mountain railway which is sufficient in itself.

The Omaha & Council Bluffs Railway & Bridge Company will have no special attractions this year because of the Trans-Mississippi Exposition. General Manager Dimmock makes mention of one feature which his experience demonstrates is a good attraction, one of the best in fact, at all times, and that is good music. Such music, he states, never fails to draw a crowd, but if the concert is poor the public is the first to realize it and remain at home next time.

E. E. Winters, superintendent of the Macon (Ga.) Consolidated Street Railroad, writes that the only extra effort that will be put forth by that company will be to give a matinee at the park theater in addition to the regular performance in the evening. The same course was pursued

last year with very satisfactory results. Where a company has made theatrical entertainments so successful a feature at its park resorts as has this one for the past three years, it is evident that the public appreciate it, and it is a good idea to stick to a good thing. The expense of such an extra performance is comparatively small since the troupe is already on the ground. The Macon Company went to a great deal of expense this spring in enlarging its theater and improving the facilities for handling such attractions.

The Pennsylvania Traction Company, operating between Lancaster, Columbia, Lititz, Marietta, Millersville, and the smaller intermediate towns will have opera at Conestoga Park, a dance at Chickies Park, fireworks, a dance and a variety show at Rocky Springs Park, and races at McGrann's Park during the day and by electric light at night.

The Tri-City Railway Company, Davenport, Ia., contemplate a program which includes: brass band concerts all day and evening, free dancing both afternoon and evening, a day fireworks display, balloon ascension and parachute leap, big free aerial act, vaudeville performances afternoon and evening and an exhibition of fireworks at night.

At New Orleans, the New Orleans City & Lake Railroad, of which C. D. Wyman is general manager, will have special patriotic demonstrations at its "West End" resort, features of which will be a grand concert by the Bellstedt American Band, of Cincinnati, patriotic songs by eminent soloists assisted by a large chorus, and a vaudeville entertainment. There will also be a series of vitascope pictures, including portraits of the prominent generals of the Revolution and of the present war, views of the warships of the American navy, the battle of Manila, and scenes in Cuba, Porto Rico and Spain; and a grand display of fireworks with portraits of presidents of the United States, etc. In the parks of the city special concerts will be provided by the company, together with other entertainments.

The Austin (Tex.) Rapid Transit Company will have an extensive musical program and a ball in connection with the Austin Fire Department. During the day there will be a picnic at the company's park. This is known as Hyde Park and is a beautiful enclosure of six acres with a fine grove in the midst of which is a small lake; here the company has built a pavilion which will seat 1,500 people and which has one of the best dancing floors in the state. During the summer this company gives free entertainments at the theater allowing the troupes a percentage of the car receipts. This arrangement has been found to pay very well.

The Celoron Amusement Company, which has the same manager as the Jamestown (N. Y.) Street Railway, will have among other attractions for the 4th, a league base ball game, an exhibition of fireworks, a balloon ascension and high dives.

The Sacramento (Cal.) Electric, Gas & Railway Company will have bicycle races as the drawing card.

The Norway & Paris Street Railway Company, of South Paris, Me., will have ball games, a picnic dinner at the park, with vaudeville performances during the dinner hour and in the evening; after this there will be dancing and fireworks.

A. W. Lawton, manager of the Colorado Springs Rapid Transit Railway, writes as follows: "We are especially favored by nature, surrounding circumstances and conditions being such that they give us all we can do upon all public holidays. A live corporation owning a fine race course and grounds at the end of one of our lines as well as fine ball

park, which is conducted by the students of Colorado College, both draw good crowds of people at races, ball games and various other sports. At the end of our Cheyenne Cañon line, a company is successfully building up a summer resort, having built a fine casino and a good summer hotel at this point. It has a first-class band which plays in the afternoon and evening in the Casino, the program differing from day to day for concerts; some specialties have also been introduced and sacred music is played Sunday afternoon and evening. Nature has done the rest, there being here two of the most beautiful cañons in the Rocky mountains which attract large numbers of people during the summer season. At the end of our Manitou line is situated the famous Manitou Resort with its numerous soda, iron and sulphur springs, fine hotels, the Ute Pass mountain road running to Pike's Peak, and numerous other attractions which draw large crowds not only from our own city but also excursions from Denver, Pueblo and other places. At the end of our Cheyenne Cañon and Manitou lines there are dances and other entertainments given throughout the week to which we contribute to a certain extent. On the 4th of July it will be unnecessary for us to put forth extra exertions to secure traffic."

The Meriden (Conn.) Electric Railroad Company will have band concerts, a balloon ascension, and fireworks among its special attractions.

The Los Angeles (Cal.) Railway Company makes a point of joining the Citizens' Committee which takes charge of all the general celebrations in that city and this year its plans have not yet been decided upon.

At Portland, Ore., the city has undertaken to celebrate the day on a large scale, and the City & Suburban Railway Company has made a liberal subscription to the cause. Its success seems assured and the company expects all the business it can handle without making any extra efforts for that day.

At Salem, Ore., a celebration to be held at the Fair Grounds under other auspices is expected to be of considerable advantage to the street railways, and makes other attractions for them unnecessary.

At San Francisco nothing is done by the street railways in providing 4th of July attractions for the reason that the climate is much against such outside attractions at this season of the year and also from the fact that every one who can do so leaves the city on such days.

The Concord (N. H.) Street Railway will have vaudeville entertainments and dancing both afternoon and evening at its park, which is called Contoocook River Park. Commencing with June 20 there are entertainments every weekday afternoon and evening, and on Sundays concerts, until September 12. There are no liquors sold on the premises and the entertainments draw the best people in the city. Everything is free to patrons of the street railway.

Manager Ed. E. Coombs, of the Leavenworth (Kan.) Electric Railroad Company, writes as follows: "We have permanent attractions in the Soldiers' Home and Fort Leavenworth; the State Prison is also close by, while the Federal Prison is at Fort Leavenworth. We utilize these attractions by running excursions to Leavenworth, on all the railroads entering here, numbering seven in all. We can almost depend on 5000 strangers and with the program arranged at the Soldiers' Home and the fort, we not only catch the strangers but the citizens as well. We also have large pic-

nic and dancing at the park, together with program consisting of races, ball game, athletic sports, etc., with a fireworks display at night and an electric fountain, which in itself is quite a drawing card."

The Houston (Tex.) Electric Street Railway will offer no attractions of its own as there will be a number of picnics under the auspices of local societies.

The Pottstown (Pa.) Passenger Railway has a superb summer resort, Sanatoga Park, and has spared no expense to make it the most delightful excursion and picnic resort in the Schuylkill valley. There are shady walks, rustic cottages, base ball and croquet grounds, lawn tennis courts, swings, see-saws, toboggan, merry-go-round. There is a lake 2800 ft. long and 400 ft. wide on which is a number of naphtha launches. Overlooking the lake is a large pavilion, with stage, large dancing floor, a smaller dancing floor for

New York, which has for many years made a specialty of the manufacture of fireworks has more recently undertaken to provide exhibitions especially adapted for street railway parks and pleasure resorts and has designed many varieties of such entertainments, ranging from a few candles and flower pots to very elaborate fire pictures, and each of them is an ample return for the cost. This company made a wide reputation by its exhibitions made at Manhattan Beach, "The Last Days of Pompeii," "The Siege of Sebastopol," "The Capture of Vera Cruz," "The Carnival of Venice," "Japan and China," "The Siege of Vicksburg" and a new spectacle called "Cuba" are among the productions specially well known.

If the pleasure resort is near a body of water a night of water fireworks always proves a success. These displays may be given with the fireworks alone or with the intro-

A FOURTH OF JULY DISPLAY.

private parties, broad balconies and promenades; an electric fountain is an additional attraction. On the 4th of July the Good Will Fire Company, of Pottstown, will have an outing, and a brass band and an orchestra have been engaged. At 2 p. m. there will be a water battle on the lake; in the evening a boat carnival and a display of fireworks are the principal features.

The Exeter (N. H.) Street Railway at Hampton Beach will have trotting races, bicycle races, band concerts, swimming matches and fireworks.

At La Fayette, Ind., there will be horse racing and bicycle racing at the Fair Grounds, which are at the extremity of one of street railway company's lines, and at its park, the company has arranged for music, swimming races, fireworks on the river and dancing.

As the reader of the foregoing has remarked, the great majority of managers appreciate the fact that for out-door entertainments and particularly for the 4th of July a first-class exhibition of fireworks is an attraction that can be relied upon. The Pain's Fireworks Company, of Chicago and

duction of a water pantomime which is highly amusing to the young people. And at the present time an evening of set pieces dealing with military and naval subjects is very appropriate. Almost any subject of the day can be given. Battles both on land and on water can be displayed with a wonderful degree of accuracy, and the ships of the American navy or portraits of leading men can be reproduced with absolute faithfulness as to detail. The American flag floating in the air is one of Pain's patents.

It is interesting to note in this connection that over a million people witnessed the water parade during the 1896 campaign in New York, and that the railway companies carried over 90 per cent of them; that over 100,000 persons went to Niagara to see the fireworks at the opening of the bridge there; that the Union Traction Company, of Philadelphia, had an enormous increase in its traffic during the exhibitions of fireworks at its Willow Grove Park, and that the street railways have been the beneficiaries at all of Pain's spectacles.

After considerable experimenting the Pain Company recommends for street railway parks an exhibition lasting

about 50 minutes. It should have its proper proportion of batteries of colored stars, spreaders, showers, floating stars, rockets of various kinds, bombs, packet fires, shells, etc., and set pieces. The latter are made according to the wishes of the purchaser, but a good display may be had for a reasonable cost.

### ANOTHER "COMPOSITE" CAR.

In the January REVIEW the "composite" car now in service on one of the branch lines of the New England Railroad Company was described, and in our March issue appeared a description of a car similar in design now running on the tracks of the C., H. & D. Traction Company. Considering the short time they have been in service these motor cars have attracted much attention and have grown in popularity. The Schenectady Locomotive Works have built another car, almost a duplicate of the New England car, for the Erie Railroad Company.

The illustration, from the "Railway Age," shows the ar-

COMPOSITE CAR FOR N. J. & N. Y. R. R.

angement, there being three compartments—for the engineer, baggage and passengers. The truck, engines and boiler are identical with those described in January. The water supplied is carried in the twin tanks underneath the car body, 1,400 gals. being the capacity. The fuel carried in the boiler magazine is anthracite coal. Westinghouse air brakes are used. The total weight of the car is 114,800 lbs., with 74,600 lbs. on the drivers.

The car is now operating between Jersey City and Haverstraw, N. Y., on the line known as the New Jersey & New York Railroad, which consists of 47.9 miles of road. There is seating capacity for 40 passengers. The operation of the car so far has given perfect satisfaction and seems to carry out the purpose of the designers. It is probable that this type of car will become popular for small feeder lines of the railroads, and it will doubtless come into favor where the steam lines have sharp competition with the trolley roads.

### STREET OR PARK?

Immediately after the Chicago City Railway had received permission from the city council to erect overhead wires for the temporary operation of electric cars over the down-town cable lines, a bill was filed praying that the company be enjoined from placing wires in Michigan avenue from Madison to Randolph streets, that being the east side of the Wabash cable loop. The contention of the complainant was that Michigan avenue was dedicated, with the rest of the

lake front property, for park purposes, and that the erection of poles and wires would be a violation of the purpose for which the street was dedicated. A temporary injunction was granted, and since the electric cars have been brought down town it has been necessary to depend on the cable cars to haul them these two blocks.

This injunction was dissolved on May 26, the appellate court holding that the complainant did not show whether Michigan avenue is legally a park or a street, a showing material to the case. The court added that it does not necessarily follow that land dedicated as public ground must be used as a park.

An amended bill was filed and the case is still pending.

### EARNINGS ON A SILVER BASIS.

The Mexican Central Railroad receives its income in silver and pays its fixed charges in gold; a large portion of its supplies are also purchased in the United States on a gold basis. The earnings (in Mexican currency) for the last six years show a steady increase, from \$4,146 per mile in 1892 to \$6,552 in 1897, an increase of 57 per cent. When this is reduced to a gold basis the figures are quite different and show a steady decrease from 1891 to 1894, since which time there has been an increase; but the earnings for 1897, in gold, were but \$3,129, as against \$3,236 in 1891.

### AN ILLINOIS INTERURBAN ROAD.

The St. Louis, Belleville & Suburban Railway Company commenced operations May 1 and the fact that its capacity has been severely taxed since that time is a guarantee of its success. The road extends from St. Louis 14 miles southeast to Belleville, Ill. The rails are 60 lbs. to the yard and of T section. The trolley wire is No. 000 figure 8 and the current carrying capacity is further increased by four No. 0000 feeders.

In the power station two 500-h. p. Russel engines are connected to two 300-k. w. Walker generators. The boilers have a steaming capacity of 1,200 h. p. The power house is a fire proof structure with steel frame work and tile roof.

The cars are 41 ft. long and each is equipped with two 50-h. p. Walker motors. They are double vestibuled and have cross seats which hold 48 passengers. The cars were built for speed and comfort and are from the works of the Jewett Car Company, of Jewett, O. Record runs have been made of a mile in 70 seconds and 14 miles in 28 minutes, including stops. The rate of fare is 10 cents. The steam roads have cut their rates but on account of the fast schedule the electric cars get the traffic. The road was promoted, financed and built and is now owned and operated by Townsend, Reed & Co., of Chicago. The officers are Fred F. Espenschied, president; George Townsend, secretary, and W. S. Reed, treasurer.

On June 5, Electric Park at the bluffs on the line of this road was opened, free concerts by Knuple's military band and vaudeville entertainments being the chief attractions. The park was brilliantly illuminated, and thousands of passengers were carried that day.

In Leipsig, Germany, but few signs are displayed in street cars and those are all placed on the ceiling.

### SQUIRE LAW TO BE CONTESTED.

The New Jersey law approved March 31, variously known as the "Squire law," the "Bergen scheme," and the "trolley law," has aroused considerable opposition. As stated in the REVIEW for April, this law provides that the boards of chosen freeholders of the several counties may bond the county for the improvement of the highways and then, after proper advertisement, grant franchises over the roads to electric railways for terms not longer than 75 years. The company applying for a location must submit a proposition specifying what the construction will be, the rate of fare, the motive power, the contribution which it will make towards improving the road, etc.

### WIRING FOR DECORATIVE CAR LIGHTING.

BY W. A. HARDING, M. M. CALUMET ELECTRIC RAILWAY.

The Calumet Electric Street Railway, of Chicago, having to supply a very large demand for special cars and trains for trolley parties and picnics, the management has found it necessary to devise methods by which the lamps and bunting, used in decorating the cars, may be quickly put in place and as quickly removed.

In the STREET RAILWAY REVIEW, of August, 1897, there was published an article descriptive of the methods in use at that time; some minor changes shown by experience to be desirable have since been made, and the system of wiring reduced as nearly as possible to a standard, so that a

CALUMET MOTOR CAR DECORATED.

The most strenuous opposition is in Union county, where the board of freeholders is now trying to widen Westfield avenue, contrary to the wishes of the abutting owners. One of the local papers states that as passed by the legislature the act had a provision making it necessary to secure the consent of abutting owners before any action could be taken, and that when approved it was found that this section had been omitted by reason of the blunder of a clerk. For this reason the validity of the law may be contested in the courts.

The annual meeting of the stockholders of the Citizens' Street Railroad Company, of Indianapolis, was held on May 10, and the following gentlemen, all of Philadelphia, chosen directors: William Jay Turner, W. W. Kurtz, R. H. Rush-ton, J. Levering Jones, Joseph S. Neff, B. M. Gaskell and W. C. Houston.

more extended description of the present methods of wiring and connections, and of the arrangements for quickly fitting up and dismantling the cars will probably prove to be of interest to the managers of other roads having to cater to a similar demand.

The cars used by the Calumet are of a special design, having short cross seats with an aisle down the center, very large platforms with an open and unobstructed front dash, and screens permanently fastened on each side; this arrangement does away with the long running foot-board, leaving a short step at each end only. There are 15 of these cars which are in service on regular runs, but are called in when needed for trolley parties.

Each of these cars is wired as shown in Fig. 1, which is a plan of the roof. Down the center is run a No. 6 B. & S. wire, connected to the trolley base through a heavy fuse and

plug connection. At three points on this wire, at the center and near the ends at the hood, are fuse cut-outs; from these are run the several No. 14 B. & S. wires as shown in the diagram and terminating in the 12 contact brackets marked plus (+). Wires of the same size run from the 12 brackets marked minus (—) to the ground wires.

The brass brackets, Fig. 2, have a base 1x3x3/8 in. with a pin projecting, on which is cut a 3/8-in. thread for a thumb nut; they are fastened to the car in the positions shown in Fig. 1 by two screws.

For the tops of the cars the lamps are screwed into sockets, 10 of which are fastened to boards 3 in. wide and 3/4 in. thick. The lamps on each board are wired on two separate circuits as shown in Fig. 3, and staggered so that in the event of a lamp failing only one-half of them will be extinguished. The terminals in the boards are brass plates with holes in the center which make electrical contact when slipped over the brass pins of the brackets on the car.

For the side lights the distance between the positive and negative brackets is 6 ft., and for the end lights, 4 ft. The side strips are all of the same length, and the end strips also, the holes being laid out with a template, so that it is easily

car. On a few cars there are also rows of lights under the hoods.

The large emblems, shields, etc., are hung on the front of the car with brackets, Fig. 5, just as the ordinary oil headlight is hung. Each of the special pieces has plug connections which fit in terminals under the platform and connect to the car circuit. Occasionally, for special cars, a row of lights is placed along the main sill of the car. All of these extra lights are attached to the main trolley party wire on the top of the car. On the party trains two oil headlights are carried, one on each side of the front dash.

When the main cut-out and plug at the base of the trolley stand is opened all the wires, lamps, etc., are dead, leaving only the 10 lamps inside the car which can be used.

To dismantle these cars it is simply necessary to unscrew the thumb nuts and lift off the strips with the lamps and emblems. When removed from the cars the strips, etc., are hung on special racks at the rear of the barn, the lamps remaining in the sockets ready for use again when required.

In addition to the motor cars there are 30 trailers, which are similarly wired. These cars have a seating capacity for

FIG. 1—PLAN OF CAR WIRING.

seen that a very short time is required to slip the strips over the bracket terminals, fasten them down with the thumb nuts, and then by closing plug at the trolley base light up the entire car.

Inside the cars the center oil lamps have been removed and 10 lamps placed on each side. Five on each side are connected to a combination switch and cut-out inside the car, and these lights only are used at night when the car is in regular service. The other 10 lamps are connected to the main trolley party wiring and cut-outs on top of the

40 persons, and have running boards on the trailers.

A party train usually comprises one motor car and two trailers. For making the connections between the motor car and trailers there are plug connections of No. 6 B. & S. wire about 5 ft. long, which can safely carry from 50 to 100 amperes. These trailer connections are not left on the cars when not in use but are cared for by the conductors in charge. The ordinary trailer light circuit, of No. 14 B. & S. wire, is left intact.

Eight double curtains of the three national colors, made of woolen bunting, which will wash (this material has been found to be the cheapest in the end, though more costly to purchase) are threaded on a long 1/4-in. rope as shown in Fig. 6. To attach these to the car the rope is firmly tied to eyelets at each end of the car and slipped over hooks at each post. The divided curtains of two colors are then draped and tied at each post. For inside decorations the common cotton bunting is used. The floors of the large motor cars are covered with carpets, which are in three sections cut to fit around the seat legs, and can be laid very quickly.

A motor car and two trailers have been fully decorated with lights and bunting in ten minutes in order to fill a rush order; this included putting in place six sets of out-

DETAILS OF DECORATIONS.

side curtains and six sets of inside curtains, laying the carpet and fastening on 36 strips of 10 lights each, and a large emblem at the front and rear of the train, with headlights on either side.

PARTY TRAIN READY TO GO OUT.

A single trolley pole is quite sufficient to carry the extra current. The cars do not require as much extra current as might be thought; for instance, on one occasion when 55 cars, 20 motor cars and 35 trailers, were out, the highest reading at the power house, including the extra lamps (about 3,000), was only 800 or 1,000 amperes above the ordinary load, and when the cars got spread out over the system, sometimes fell to only 400 amperes extra. Thus the extra load varied from 20 to 50 amperes per train.

The largest party on the Calumet was that of the Cook County Cyclists' Association, held on September 19, 1896, when there were 20 trains of one motor car and two trailers each. The Knights of Pythias on one occasion ordered 125 cars, but the night being very cold they could use only 11 trains or 33 cars. The Royal League ordered 64 cars for its party but used only 55.

The company is making every preparation for a large business during the coming season, as the location of the road makes it especially suited for such parties. It is a beautiful sight to look up a long stretch of straight track and see these illuminated trains following each other closely as far as you can see, with the surrounding country lighted up as if it were day.

### NEW ROADS IN CONNECTICUT.

In the REVIEW for May, 1897, there were given some extracts from a then late decision of Connecticut Supreme Court as to the status of electric railways in the highways. The ruling of the court (three against two) was that an electric street railway is not an additional servitude on the abutting property. Another case is now before the court, and the New York, New Haven & Hartford Railroad opposes a franchise to the Fair Haven & Westville Trolley Company and pleads an additional servitude. Since the decision rendered last year one of the three judges constituting the majority has died, and another one has declined to sit in the case because he is a stockholder in the trolley company; a

substitute has been appointed and thus with two new judges who have not expressed opinions on this subject it is quite possible that the court may reverse itself.

Up until a year ago the New York, New Haven & Hartford road has successfully fought all trolley schemes in the legislature or in the courts, but realizing that this situation could not continue it undertook to develop the third rail as a rival. The official record from May 24, 1897, to November 1, shows that the daily average between New Britain and Hartford on the electric cars was 2,587 passengers per day, or \$258.70. Prior to the inauguration of the electric service the steam trains had carried 750 passengers per day, the income being \$135 per day. The fare was reduced from 18 cents to 10 cents on the electric cars. This period includes the first few weeks when the third rail was a novelty, but it is quite evident that the third rail system has resulted in a decided gain for the passenger service.

At the present time there are more than 50 miles of trolley roads, including extensions, either under construction or with the right of way purchased, and it is rumored that a third rail is to be laid on the steam line from New Haven to Derby, nine miles.

### CONEY ISLAND LINE OPENED.

The Brooklyn Heights Railroad Company on May 20, formally opened its new route to Coney Island over the Sea Beach Railroad. The details of this consolidation have been given in previous issues of the REVIEW.

At 10:30 o'clock the buffet parlor cars Columbia and Ampere, having on board President Clinton L. Rossister, General Passenger Agent H. W. Kennedy, Chief Engineer Brackenridge, several directors of the Brooklyn Heights Railroad Company, William Berri and various representatives of the press, left the Manhattan end of the Bridge and were run over the structure to the city hall, where a stop was made for some late comers. When all were finally aboard, the cars were run down Court street to Bush street, to Third avenue, to 65th street, where the cars were run down the incline to the Sea Beach tracks.

The actual running time from Manhattan to Coney Island was 51 minutes. Upon arrival there the terminal, with its double track loops and separate tracks to Sun avenue, was inspected, and then the guests were let loose on Coney Island. A stroll along the "Bowery" was leisurely taken, during which the most salient features of that thoroughfare were noticed. As some of the guests evinced a desire to try the steeple chase, the chutes and the other what-nots of the place, they afforded fun for the others, who looked on. After a walk along the beach the party adjourned to "India," where a theatrical exhibition was specially given. After this the gentlemen returned to the cars, where a substantial luncheon was served.

### PENNSYLVANIA STATE ASSOCIATION.

The date for the regular meeting of the Pennsylvania Street Railway Association is the first Wednesday in September, but inasmuch as the American Association meets September 6 to 9 inclusive, the date for the Pennsylvania meeting has been changed to October 19 and 20, in order to avoid a conflict of dates.

## THE RELATIONS BETWEEN THE PURCHASER, THE ENGINEER AND THE MANUFACTURER.

A Paper by William H. Bryan, read before the American Society of Mechanical Engineers.

When an engineering structure of magnitude is to be erected, what general plan of procedure should be followed, in order to insure that the finished work shall be best adapted for the intended purpose, and shall involve the minimum investment of capital consistent with proper construction, and the minimum cost of operation and maintenance?

In the erection of buildings, the precedent of placing the work in the hands of a skilled architect, has long since become well established. In civil engineering, the construction of railways, bridges, and roofs, is universally intrusted to engineers. In the newer branches of mechanical and electrical engineering, however, it has only recently become the practice in this country to engage consulting engineers. The principal reason for this has been that there have been heretofore but few specialists who have devoted their attention exclusively to this class of work. The few well-trained men in these fields early connected themselves with manufacturing or contracting companies, or entered into these branches of work on their own responsibility. The natural disinclination of the purchaser to ask for expert advice from an engineer—however competent and experienced—who is known to be interested in the manufacture or sale of some specialty, and whose opinion is not unnaturally open to the suspicion of bias, left him no course but to proceed on his own responsibility, with results which were often as unsatisfactory to the manufacturer as to himself.

This situation has, however, in a large degree changed, owing to the large number of excellent engineering schools, and the very thorough courses of theoretical and practical training which are there given. These, coupled with the large number of trained and experienced men who have been connected with prominent manufacturing and constructing companies, and with the installation and operation of large plants, have now rendered available the services of many men of thorough technical training, supplemented by years of practical experience in actual construction. Many of these have no connection with the manufacturing, selling and contracting interests, and their judgment is not, therefore, open to the suspicion of bias in favor of or against any special manufacturer.

It is becoming more and more the custom, therefore, to place the same confidence in the consulting mechanical and electrical engineer which has long been reposed in the architect and civil engineer. He is called in at the earliest stages of the development of the enterprise, for advice as to the general outline and arrangement of the scheme, its probable cost, the expense of operation and maintenance, and the returns which may be expected from the investment. He makes a preliminary reconnaissance and report, giving these data. If these are approved, he then makes a more detailed study of the problem, mapping out the general scheme more definitely, selecting the particular system or type of apparatus best suited to the local conditions of service, and preparing general plans and specifications. These he accompanies with more detailed estimates of cost. When these are approved by his principals, proposals are asked for, and when received, the engineer assists the purchaser in canvassing and comparing them, and in selecting that proposal—not necessarily the lowest—which seems best to meet the requirements of the work in hand.

The engineer then assists his clients in drawing up the final contracts, supervises the work during construction, and makes such final inspections and tests at completion as are necessary to determine whether the specifications have been complied with. This has long been the accepted custom in England, where the same difficulty of securing competent and unbiased engineers has not been encountered. No trouble has been met with in that country in applying the same rules to these branches of engineering which are universally followed in other fields.

As might be expected in any new department of engineering, however, the relations between the purchaser, the engineer, and contractor have not always been harmonious. The manufacturer

frequently feels that he has been imposed upon; the engineer is often hampered by incompetent or unscrupulous contractors, and between the two, the purchaser himself is sometimes at a loss for a proper solution of the difficulty. While it is true that most contracts of this character are carried through satisfactorily, it must be admitted that misunderstandings are more frequent than they should be.

The discussion of these differences has recently taken tangible form both in this country and England. In the latter country, the manufacturers and engineers recently met, and succeeded in agreeing upon a number of standard clauses for specifications, which removed many of the objections and criticisms from both points of view. It has been suggested that this work of preparing standard specifications would come properly within the province of the national engineering societies, but if these bodies do not take the matter up, something might be accomplished by the engineers and manufacturers getting together for mutual exchange of views, as was done in England.

The present misunderstandings may be traced to a few serious causes: In the first place, the mechanical and electrical fields of work have, unfortunately, been embarrassed by too great a number of incompetent and inexperienced manufacturers and contractors, poorly equipped for good work, and with but limited intelligence and skill. To these have been added a more than ordinarily large percentage of contractors, who are not altogether scrupulous as to their methods, and whose object is to finish the work in almost any sort of shape which will pass muster. These incompetent, inexperienced, and unscrupulous contractors—though relatively few in number—have detracted from the good reputation of work of this character, and have forced upon the consulting engineer the necessity of inserting in his specifications the most rigid requirements as to the character of workmanship and material, inspections and tests, which would be unnecessary, if it were certain that the work would be awarded to contractors of established reputation, ability and skill.

Furthermore, it has been found that some manufacturers are slow to adapt their designs and patterns to advanced and improved practice. Experience having shown the clear and decided superiority of certain designs, the engineer is justified in embodying them in his specifications, in spite of the fact that some manufacturers will attempt to force the continued use of antiquated forms.

Again, the manufacturers are often careless in making guarantees. Some of them do not hesitate to meet any desired figures, if a competitor does so. Often they will oblige themselves to do what is impossible with the type of machinery they offer, and trust to luck, or careless inspection or testing, to get the work accepted and paid for.

The grievances of the manufacturers have recently taken shape in papers and discussions in the electrical press, and may be briefly summarized as follows:

First.—That the engineer appears unwilling to receive suggestions or advice from the manufacturers, as such action might detract from the "dignity" of his position, and that specifications, therefore, often contain many annoying and expensive provisions, sometimes impossible of fulfillment.

Second.—That the engineer does not always familiarize himself with the facilities and standards of the manufacturer, and thus sometimes calls for special designs which can only be made, if at all, at greatly increased expense; whereas standard apparatus would frequently answer the purpose equally well.

Third.—That if the manufacturer is required to guarantee results, he should not be hampered as to details of design or construction. In other words, the consulting engineer should not tell the manufacturer how he should build his machine, but simply hold him responsible for results.

To these it may be answered, that no harm can be done by full and free consultations between the manufacturer and the engineer. They have a common object in view, namely, the securing of the best results. It is natural that the engineer should reserve unto himself a due degree of dignity, but he should not let this characteristic stand in the way of the best service in the interest of his clients.

The demand for special machinery, however, presents greater difficulties. It should be remembered that electrical developments have been so rapid in recent years—and with them the

construction of special steam engines and appliances—that a large percentage of the work has necessarily been special. Furthermore, this condition must continue, for the reason that the methods of generating and distributing electricity on a large scale, over wide areas, for endless varieties of purposes, have by no means reached uniformity of practice or system, and are not likely to very soon. The necessity for special machinery will, therefore, remain with us indefinitely, and will continue to cover a large percentage of our work. We must not lose sight of the fact that to attempt to carry the idea of standards too far, will surely result in hindering improvements and stifling progress.

I do not desire to be understood, of course, as decriing the use of standard apparatus for that large and increasing percentage of cases for which it is eminently well adapted. The manufacturers deserve great credit for reducing their machines for different classes of service to standards, and the engineering profession is under many obligations to them for doing so, in so thorough and excellent a manner. The reduced cost of standard apparatus—the fact that in using it, one follows precedent—that repairs can be more quickly and more cheaply obtained, and that when secured, the different parts are actually interchangeable, and will fit, and the further fact that standard machines can usually be secured in less time, being frequently carried in stock—all these are points of tangible advantage which no conscientious engineer can afford to overlook. Standard apparatus, however, is only possible when permanency of type and a reasonably constant demand in large quantities is assured. While it will frequently pay the engineer to modify his plans so as to use standard apparatus, there is a point beyond which he cannot go. In such cases he must use special apparatus more closely adapted to his particular needs. All these points must be given the most thorough consideration, and before requiring special work, the engineer must satisfy himself, beyond doubt, that his principal's needs can better be supplied in this manner, even at the increased cost, and in spite of the greater risks which always accompany the use of new and untried apparatus.

The contention that when a manufacturer guarantees results he should be allowed to design and build the machine in his own way, may be granted, in so far as the guarantee can be made to cover every possible valuable feature. When a reasonable number of manufacturers, however, have adopted certain designs and processes of unquestioned superiority, and where these have an important bearing on the life and reliability of the machine, its freedom from annoying interruptions and which reduce or avoid the necessity for close and continual attention, is it proper to write the specifications so as to limit competition to machines of this advanced type?

Contractors frequently object to specifications which include a deduction for delay in completing the work, but which allow no extra compensation for finishing the work earlier than the date specified. When it is possible for the purchaser to make use of the plant at the earlier date, this criticism is well founded. It is usually the case, however, that the earlier completion in no way benefits the owner, because other equally important contracts may not be finished, or because the date of leases or contracts for service from the plant cannot be brought forward. The delay of any one contractor, however, might readily cause the purchaser serious loss.

Another objection made by the manufacturer—and one which is not wholly without justification—is the unnecessarily exacting requirements of some specifications, and the annoyance to which they are subjected by the engineers. It is unfortunately true that our profession has been no more fortunate than others in keeping out of its ranks the incompetent and the unscrupulous. These men have brought disgrace upon the profession, and the objection of the manufacturers to being handicapped by them is well founded. There is, however, no reason now why the purchaser—even though absolutely unfamiliar with work in this field—should make a mistake in selecting an engineer, as a very little investigation will enable him to ascertain the character, ability, and experience of the man under consideration.

The engineer stands between the purchaser and the contractor, and while he may sometimes insist upon his client's rights to an

extent which may appear unjust, he nevertheless recognizes the purchaser's obligations as well, and will see that his end of the contract is equally well maintained. In this way unreasonable requirements may be avoided, prompt payments secured, and the acceptance and settlement made at the proper time and along reasonable lines.

Unfortunately there are some manufacturers who think the consulting engineer unnecessary, and that the business could be better transacted directly between the manufacturer and purchaser. This would be true if the purchaser were always competent to judge of the relative merits of the different systems of apparatus. Unfortunately the agent of the manufacturer cannot always be trusted implicitly as to recommendations, for two reasons: First, he has not the time to give to the detailed study of the problem which the consulting engineer must give in order to make a proper selection; second, his recommendations are too often biased by a desire to sell standard apparatus, or some specialty of his own, which could be used for the work, although less advantageously than something else.

It is here that the engineer serves his client best, in seeing that the proper apparatus is selected, and that it is bought at reasonable figures. The days when the salesman with the glibest tongue did the most business, are fortunately passing away, and the small manufacturer has as good a show to do business with the engineer as one of longer standing, providing his apparatus is clearly the best for the work.

The engineer compares machines on as nearly the same basis as possible. So far as the character of the machine will permit, he requires all proposals to be on the same apparatus. When this is impracticable he specifies capacities, results, and general type or construction, leaving the manufacturers to vary the details in accordance with their own designs and practice. Such proposals, however, should be accompanied by ample data, so that the points of agreement and difference may be clearly brought out. With these data before him the engineer is prepared to analyze the bids, and to make a recommendation based upon merit alone, irrespective of the name-plate which may be attached to the machine.

It is not meant by this that no weight whatever is to be given to long experience and established reputation, as there are many details which cannot be inquired into, and must be left to the manufacturers' judgment. No conscientious engineer, however, will let the mere reputation of a manufacturer carry undue weight.

Early in my own practice I learned, that while elaborate and detailed specifications embodying all sorts of unusual and peculiar requirements, might impress the non-technical reader, and might even gratify the purchaser, they invariably limited competition, and led to excessive prices and annoying delays, and that by purchasing machines as nearly standard as possible, and by modifying the contract to a reasonable extent, to suit the manufacturer in unimportant details, much better terms could be made, without increased trouble to either the purchaser or the engineer.

The contract forms submitted by many manufacturing companies are unfair to the purchaser, in that they are wholly one-sided, and are intended to protect the seller in every way possible, while the rights of the purchaser are given but little consideration. Such contract forms are far too common, and for the credit of the profession, it is hoped that these may be modified, and brought to a more equitable basis.

The ordinary proposals submitted by many companies are equally unfair. Perhaps the most flagrant instance of this is the statement in many bids that they are not effective until approved by an executive officer. Such proposals are not worth the paper they are written on, and should not be considered for a moment by any self-respecting engineer, as they in no way bind the bidders, and their acceptance simply ties up the purchaser. Instances are not lacking where manufacturers have taken advantage of this clause to repudiate bids apparently made in good faith. So common is this practice that it has become necessary to incorporate a clause in the "Notice to Bidders," to the effect that proposals which are not made in good faith will not be considered.

Another unfortunate practice is that which many manufacturers have of asking the return of their proposals and accom-

panying data as soon as the award is made. These papers are necessary to the purchaser and the engineer, to make a complete record of the transaction, and should be retained by them.

On the other hand, it must be admitted that some engineers' specifications are unfair to the manufacturer. The points on which these complaints are based have been given due consideration, and in my own practice have led to the following rules:

First.—When it is desired to permit the bidder some elasticity, and not to require him to adhere rigidly to the specifications, the "Notice to Bidders" contains a clause reserving the right to waive informalities.

Second.—The engineer is made the arbitrator of all disputes, but appeal is always permitted to a referee or referees. If the contractor thinks he is being treated unfairly he may avail himself of this privilege.

Third.—A clause is frequently inserted to the effect that where a special make or type of apparatus is mentioned in the specifications, it is not intended to mean the exclusion of all others, but simply as establishing a standard of excellence. The bidder may substitute other apparatus in his proposal, the engineer reserving the right to judge as to whether the article offered is equivalent to that specified.

Fourth.—Where the work is such that it is impossible to go into details very fully, and where the apparatus is of such a character that different builders offer different types of construction, which accomplish substantially the same results; or where it is desired to secure the benefit of the most recent improvements, a general clause like the following is sometimes inserted:

"While it is believed that the following specifications properly cover the needs of the purchaser at this time, they are not necessarily final. Bidders are invited to submit alternative propositions embodying any other types of apparatus, or other details of construction, which in their judgment may seem as well, or better, adapted to the purchaser's needs."

It is to be hoped that this presentation of the matter may result in a better understanding among all parties interested, as to mutual obligations and responsibilities. I believe I may say for the engineers that they will meet the manufacturers fully half way in an effort to reach a more satisfactory basis of cooperation, and to bring about a higher standard of design, workmanship, and efficiency, and a more uniform and equitable definition of contract relations.

### CO-OPERATION OF STREET RAILWAYS IN CHARITIES.

The REVIEW has frequently had occasion to note instances where a street railway has turned its road over to a social or charitable society for a day, donating the larger portion or all of the receipts as its contribution to the cause. Such action as this has usually had the effect of making the relations of the company and the public more cordial, and has proved a financial success as viewed from the standpoint of the society.

Several applications have been made to the Oshkosh (Wis.) Street Railroad Company for it to co-operate with church societies, and have a trolley day. Mr. Downs, the local manager of the company, has had considerable experience with such features, and in a recent interview gave the following data as to the arrangement usually made by the company. He said: The custom has been for the society that is to operate the road on a certain day to draw up an agreement with the railway company, wherein it is provided that a certain per cent of the gross receipts of the day, 30, 40 or 50 per cent, as the case may be, shall go to the electric company, the balance going to the society. Of course the ladies do not operate the machinery at the power house nor do they serve as motormen, but they serve in the capacity of conductors and handle all the cash. A dozen or two of

the prettiest young women of the city usually act as conductors and from 6 o'clock in the morning until 11 o'clock at night, all passengers will enjoy the presence of the fair ones. It will be giving away one of the secrets of the ladies, but the men should be warned that the lady conductors are not expected to know how to make change and the quarters, halves and dollars that fall into their hands will be quite apt to stay there.

### A RECORDING VOLTMETER.

Recording electrical instruments are in common use but in the ammeters and voltmeters it is necessary to renew the chart each day, for which a record is kept. The figure shows a voltmeter which will keep a continuous record for seven days on one chart. The instrument is the design of John

RECORDING VOLTMETER.

H. Barker, of Cambridge, England, and has been in service for some time. The chart is suitably plotted for time and volts and placed around a drum which rotates at a predetermined rate. By an arrangement of cams the drum is shifted each day and a record is made parallel to the preceding. A pencil is held at the end of a lever arm which is part of the link work operated from an electro-magnet.

The attorneys who brought the foreclosure suit against the Ft. Wayne (Ind.) Consolidated Electric Railway have asked the court to allow them fees amounting to \$62,500. This allowance was contested and a number of witnesses examined in an endeavor to show what would be a reasonable fee.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

**Using Brake Instead of Electrical Apparatus to Stop Car.***Stabeneau v. Atlantic Avenue Railroad Company of Brooklyn (N. Y.), 50 N. E. Rep. 277. April 19, 1898.*

Where a little girl, seven years of age, tried to cross a track, with some companions, on a crossing, when a trolley car was less than 100 ft. away, and approaching at the rate of speed usual in rural districts, and she caught her foot or tripped, and fell, and as soon as she was seen to fall the power was shut off and the brake applied upon the car, the court of appeals of New York holds that no negligence could be predicated upon the use by the motorman of the brake, instead of the particular appliance used to govern the electrical motive power. In the emergency, one of two courses was open to him, and the court considers it impossible to say that the one adopted was not as effectual as the other, under the circumstances, particularly as it appeared by the evidence that a sudden reversal of the electric power sometimes operates, as a witness said, "to blow out the fuse," in which case the power to control is lost. Whether the one or the other means provided for stopping the car should have been adopted was a matter for the exercise of the motorman's judgment, and, though newly employed, the motorman who chose the brake was not shown to be incompetent, and the court maintains that if he erred in the exercise of his judgment, the company could not be held responsible; neither would a failure to have exercised the best judgment have been evidence of negligence.

**Unauthorized Connection with Elevated Road a Legal Nuisance.***Eldert v. Long Island Electric Railway Company (N. Y.), 51 N. Y. Supp., 186. April 19, 1898.*

The second appellate division of the supreme court of New York has affirmed a judgment enjoining a street-surface railway company from erecting, constructing or maintaining, and directing it, within 30 days, to remove, from the center of an avenue 60 ft. wide, a connection made with an elevated road, consisting of a solid embankment or wall of masonry, about 8 ft. in width and 200 ft. long, rising by a gradual slope to a maximum height of 10 ft. above grade, from which point there was an iron structure, supported by iron girders, that connected with the elevated road.

This structure was erected with the consent of the highway commissioners of the town. But the court says that it finds no power resident in the highway commissioners to permit the erection of such a structure, their power, in respect to a street-surface railway company, being limited to granting it permission to extend its surface road or some branch thereof, still on the surface.

It is also of the opinion that a connection between a street-surface railway and an elevated railroad, by an inclined plane, is not a joining or union, in the sense of section 4 of the railroad law, giving every railroad corporation power to "join or unite" its railroad with any railroad before constructed. It therefore holds that the structure in question was unlawfully built, and was a purpresture and a nuisance.

Finally, the court insists that the consent of the property owners being but to a surface road, was no consent to an

elevation above the grade of the highway, and that a consent to the latter must be obtained from the abutting owners, though property owners abutting the road just before the structure was reached might maintain such an action as this, if specially injured by such a structure, illegally built.

**Not Resorts for Business Negotiations or Social Converse.***Atwood v. Bangor, Orono & Old Town Railway Company (Me.), 40 Atl. Rep., 67. March 1, 1898.*

Highways are constructed and maintained for the accommodation of travelers, and not as places of resort for business negotiations or social converse. And, since highways have been subjected to a new mode of use by the introduction of street railways, a still higher degree of attention, vigilance, and prudence is requisite to fill the measure of ordinary care demanded of the traveler. Travelers with teams and proprietors of street cars still have concurrent rights and mutual obligations; but as the cars must run on a fixed track, and rapidly acquire a greater momentum, they must to a reasonable extent be allowed the right of way.

These remarks are made by the supreme judicial court of Maine immediately following the declaration that it was impossible to resist the conclusion that a man was not in the exercise of reasonable and ordinary care and caution who stopped with his team about 6 in. from a street railway track to talk a few minutes with an acquaintance he met coming from the opposite direction.

But the court overruled a motion to set aside a verdict against the street railway company for damages resulting from a collision on the old ground that the motorman might with ordinary care have prevented the collision, and that a person may recover damages for an injury caused by the negligence of a street railway company, although the person's own negligence first exposed him to the risk of injury, if such injury was proximately caused by the company's negligent act, committed after it had become aware of his danger. In other words, if one discovers another to be negligent, he must take precautions accordingly, omitting which he is liable to the other for the damages which flow from such new want of care.

**No Injunction for Stockholder to Help Rival Corporation.***Jenkins v. Auburn City Railway Company (N. Y.), 50 N. Y. Supp., 852. March 26, 1898.*

Two days after taking an assignment of two shares of stock, of the par value of \$25 each, in the Auburn City Railway Company, the new stockholder verified a complaint that was filed praying for an injunction restraining the company from executing a lease of its entire property to the Auburn & Western Railway Company during the term of its corporate existence, in furtherance of a plan to parallel the New York Central & Hudson River Railroad with a street surface railroad from the city of Auburn to the city of Geneva, a distance of some 20 miles. The injunction was issued. But the fourth appellate division of the supreme court of New York, by a divided bench of three to two, now reverses an order denying a motion to vacate the injunction, holding that it should be vacated on account of the well-settled rule

that an injunction will not be granted or sustained against a private corporation in a suit brought by an individual in the interest of a rival corporation. It is pointed out, in the majority opinion, that the stockholder in question nowhere denied the charge that he purchased the certificate, at the instance of the attorneys of the New York Central & Hudson River Railroad Company, for the purpose, solely, of preventing any proceedings that the Auburn City Railway Company and the Geneva, etc., Traction Company might take for their own advantage and benefit. Under this state of the proof, it deems it evident that the action was not brought in good faith by the stockholder, for the protection of his own rights, but was brought by him at the instance of the railroad company, the line of which is parallel with the proposed line of the Auburn City Railway Company, and must be treated accordingly; while the two dissenting members of the court declare that the motive which induced him to purchase his stock and to bring his action in nowise affected his right to an injunction to prevent the corporation from leasing its property and franchises to another company, which they contend had no legal existence because the railroad commissioners refused it permission to construct its proposed line.

#### Care Required at Temporary Curves.

*Dillon v. Forty-second Street, Manhattanville & St. Nicholas Avenue Railroad Company (N. Y.), 51 N. Y. Supp. 145. April 22, 1898.*

Damages were claimed in this case for injuries alleged to have been sustained by a man who was standing smoking upon the front platform of a street car being thrown into the street by the car striking with violence a temporary turnout, which was afterwards shown to have been necessitated by the construction of a sewer under the regular track.

The trial judge told the jury that the allegation of negligence upon which the alleged cause of action was based was the rapidity with which the car went around this temporary curve, and he left it to the jury to say whether the injured man had met the burden of proof that rested upon him to establish that the driver of the car drove unskillfully and too rapidly at the curve, and whether it was by means of that alleged careless and reckless driving that he was thrown from the platform and was injured. That, the first appellate division of the supreme court of New York holds, was a proper submission to the jury.

But it does not stop there. The man swore that he was ignorant of the existence of the unusual condition of the track referred to. The driver must have been aware of it. Standing upon the front platform, as the passenger was, he was exposed to a danger of being thrown off by the sudden striking of a rapidly moving car against the curved line of the track. That was a situation, the court holds, which required the driver to exercise care for the safety of the passenger.

The absence of contributory negligence, it says, could be shown from facts and circumstances, as well as by direct testimony of a witness.

That the passenger was standing upon the front platform of the car, and being, as he said, in ignorance of the situation of the track, his position on the car was not evidence of itself of negligence on his part.

Nor could the manner in which he was standing on the platform, being in the act of turning, or having just turned

around, be said to establish negligence on his part, if he was responding to a call of the conductor for his fare, and his attention was occupied by that.

#### Holder of Transfer Ticket Entitled to Wait for Car With Seat.

*Jenkins v. Brooklyn Heights Railroad Company (N. Y.), 51 N. Y. Supp. 216. April 26, 1898.*

Transfers must be given, upon demand, and without extra charge, by certain street railway companies, to "any passenger desiring to make one continuous trip," under section 104, chapter 676, of New York Laws of 1892. And the second appellate division of the supreme court of that state holds that it is not compatible with the provisions of this statute for a street railway company to make the transfer it gives depend for its operation upon the individual taking a car within 10 minutes, regardless of the condition of the car which it offers for such service.

A regulation that the passenger should take the first car which afforded him a seat or suitable accommodation, the court says, would meet all the requirements of the law, as it would evidence the good faith of the individual in his desire to make a continuous trip; but an arbitrary time limit, applying equally to the feeble and infirm, and which is only sufficient to allow a very narrow choice of cars, it declares, cannot be said to be such a reasonable regulation as the company is justified in making under the law.

The individual may waive his rights, and may submit to the annoyance and discomfort incident to travel in overcrowded conveyances; but the fact that thousands of persons do waive their rights each day does not justify a railway company in establishing a rule compelling people to do so, or to forfeit their rights under the law of the state.

Because the passenger could not change the contract, but was bound to accept the transfer ticket tendered, or none at all, he could not, therefore, be deemed to have given any assent to the conditions imposed, and which limited the right guaranteed by the statute.

In estimating the damages which the passenger may have suffered by being wrongfully ejected from the car, the court suggests that, if he was arrested upon the order of the conductor, and the arrest constituted a part of the act of ejection, it would be proper that the jury should be allowed to pass upon the facts, and to have the evidence before them.

#### Care Required of Street Railway Companies as Common Carriers.

*Lincoln Street Railway Company v. McClellan (Neb.), 74 N. W. Rep. 1074. April 21, 1898.*

The supreme court of Nebraska says that it is settled in its jurisdiction that street railway companies are common carriers of passengers. As such they are bound to exercise for the safety of their patrons more than ordinary care. They are required to exercise the utmost skill, diligence, and foresight consistent with the business in which they are engaged, and are liable for the slightest negligence. This is the liability imposed by the common law on all carriers of passengers for hire.

Moreover, the law presumes that one injured while being transported by a common carrier was injured in consequence of the latter's negligence, and to escape liability it must show that it has discharged the full measure of its legal duty, and was in no wise to blame for the accident. It need

not, however, under the rules of the common law, acquit itself of all blame, and, in addition thereto, convict the person suing it of gross contributory negligence.

One cannot recover for an injury received while a passenger on a street railway if the accident from which the injury resulted was due in part to his own want of ordinary care. And in an action to recover damages in such case, an instruction which informs the jury that, the injury being shown, the carrier, to escape liability, must prove that the passenger was guilty of gross contributory negligence, is erroneous.

The supreme court further holds that section 3 of chapter 72 of the Compiled Statutes of Nebraska of 1897, providing that "every railroad company, as aforesaid, shall be liable for all damages inflicted upon the person of passengers while being transported over its road, except in cases where the injury done arises from the criminal negligence of the person injured," etc., has no application to street railways.

Because it has none, the liability of a railroad company in Nebraska is that of an insurer, while a street railway company is only answerable for the failure to exercise the highest degree of care.

In the common understanding, the court says, too, a railroad and street railway have always been separate and distinct things.

#### Liability in Laying Tracks on Official Grade.

*Bancroft v. City of San Diego (Cal.), 52 Pac. Rep., 712. March 25, 1898.*

Here was an action brought against a city to recover for damages suffered from a change in the grade of a street upon which abutted the property of the party suing. In reversing a judgment obtained by the latter, the supreme court of California says that no liability on the part of the city is created by an ordinance establishing a grade. Ordinarily, the grade must be established at the same time over many streets, in order that they may be so related to each other as to permit drainage. A system must be established throughout a district. However, it does not follow that all the streets must be actually graded at once, and the municipality does not thereby undertake that they ever will be actually graded.

When, therefore, a street railway company, for its own pecuniary advantage, lays its track upon streets which the city is not prepared to grade, and perhaps will never have occasion to construct, the court declares that it is but just that the railway company should assume the liability for such work.

Continuing, the court says that it sees no reason for holding that the railway company is in any sense the agent of the city in the work. The grant of the franchise does not impose upon the company the duty of cutting down or filling up a street. It may do so or not, as its interests prompt. And, when it changes the grade for its own purposes, it must necessarily be at a point where the city has not found it necessary to construct the street or actually change the grade, and has not in the statutory mode declared its intention of doing the work.

In this case, the railway company did not construct a street, but, on the contrary, in constructing a roadbed 23 ft. wide on the new grade established by the city, it ruined the street which had already been made.

For these reasons, the court maintains that, notwithstanding the street railway company had a franchise from the city granting it the right to construct and operate its street railway, and requiring it to place all its tracks on the official grade, it took the privilege yoked with the liability, and was therefore liable for the damages, if any, caused by the work which it did.

#### What is Required at Deep Grades Leading to Railroad Crossings.

*Flournoy v. Shreveport Belt Railway Company (La.), 23 So. Rep., 465. April 4, 1898.*

Persons manning and operating street cars are expected to be careful at the crossings. The company must exercise reasonable care to provide men enough to properly control a train consisting of a motor car and a trailer.

At deep grades leading to railroad crossings, there should be a motorman and conductor aboard the train, and in charge. There was only a motorman, in this case, and the supreme court of Louisiana, which makes these statements, holds that the injuries occasioned by the collision between the street cars and the passing train at the crossing were injuries for which the street railway company must be held responsible to damages. The loss of control of this train, consisting of two cars, a motor car and a trailer, and its gliding down the rails and colliding with a passing railroad train, the court says, were manifestly owing to the inexperience of the motorman, or the absence of an additional man to assist in properly applying the back brakes, and in either case the company was responsible for the injuries received.

Some further light on the same subject is furnished by the case of *Russel* against the Shreveport Belt Railway Company, decided by the same court, the same day; 23 Southern Reporter, 466. It shows that there had been a conductor on these cars, but he had got off a short time before—some distance from the place of the accident—leaving the cars in charge of the motorman alone, who had only had a few days' experience as motorman, and lost control of the cars so that he could not stop or check their sliding down the incline to the railroad crossing.

The court declares that the ordinary care due passengers was wanting.

That a lad who was a passenger on the trail car jumped to the back brake, and tried to help the motorman by applying that, it holds did not have the effect of relieving the company from responsibility.

Nor does it permit it to change its decision against the company that the person suing in this second case jumped off just before the collision and fell on his shoulders, partially dislocating one of them and bruising an arm, while some of the passengers who remained in their seats escaped without any injury.

As abstract law, the court also here says that street car companies must exercise reasonable care to provide a sufficient number of men to properly move and operate their cars.

#### No Suit in Name of Attorney General for Private Ends.

*People ex rel. Moloney, Atty. Gen., v. General Electric Railway Company (Ill.), 50 N. E. Rep., 158. April 21, 1898.*

Notwithstanding the elaborate pleadings and numerous points raised in this case, which was commenced by a bill or information in the name of the people of the state, on the

relation of M. T. Moloney, attorney general, filed in the circuit court of Cook county, March 9, 1896, asking for an injunction against the General Electric Railway Company to prevent it from constructing its railway on certain streets in the city of Chicago, and to restrain the city and its officers from granting a permit, as well as praying that the ordinance involved might be declared null and void, the supreme court finds it unnecessary to enter into a discussion of any other point than whether it was error in the chancellor to dismiss this bill before final hearing, if it was not prosecuted solely in behalf of, and for the interests of, the public, but in the interests of rival companies.

If the information in this proceeding was invoked by rival corporations to prevent the construction of this road, the supreme court says that it was an indirect method of procuring an injunction, such as it has held could not be procured by a private individual, when deciding that an abutting lot owner has no right to invoke the aid of a court of equity to prevent the construction of a street railway.

Where injuries are consequential, merely, it holds that a court of equity is not the proper jurisdiction to enforce a remedy, as a court of law is the proper tribunal for the determination of such questions between individuals and corporations, or between corporations; and that, what cannot be done directly cannot be done by indirection. On principle, it declares, it cannot be held that, where a private individual cannot maintain a bill for injunction in his own name, he may do so in the name of the attorney general, on an information in equity.

And the supreme court further holds that, to determine whether the proceeding is improperly invoked, a court of equity may go behind the parties on the face of the record, to see who are the real parties prosecuting the proceedings, and that this may be done even where the proceeding is in the name of the attorney general; and, if the proceeding is prosecuted and carried on for the exclusive benefit of an individual, or corporation, then the court may order an information in such cases to be dismissed.

Therefore, being convinced, as it says, by the evidence in the record in this case that the inception of this information, its progress in the court below, and what had been done in the supreme court, were in the interest of rival companies, and that, if sustained, it would be preventive of a healthy competition in the interest of the people resident in the territory where the road was proposed to be constructed, the supreme court holds that the chancellor who heard this case properly dismissed the information.

#### Rule Laid Down as to Contributory Negligence in Going on Track.

*Austin Dam & Suburban Railway Company v. Goldstein (Tex. Civ. App.), 45 S. W. Rep., 600. May 4, 1898.*

There was some evidence in this case which had a tendency to show negligence upon the part of both parties: upon the street railway company in running the cars at a high rate of speed, and failing to keep the proper lookout for persons on the track, and in failing to apply the brakes and stop the car to prevent running down the party suing; and, upon his part, in undertaking to cross the track in his buggy under such circumstances as the jury might consider as tending to show contributory negligence.

But the court of civil appeals of Texas says that it has not been able to find any case reported in that state where the

identical question of law raised in this case has been passed on as applied to the operation of street railways. Yet, upon principle, it thinks that, by analogy, that class of cases that lays down the rule upon the question of contributory negligence as to injuries sustained by a person when upon a steam railroad track, is applicable.

It holds that what is required in this as in other cases of this class is the exercise of ordinary care; and, when it is once ascertained that one entering upon the track of a street railway is lacking in caution and diligence, he should be held to the same responsibility as exists in other cases where the party suing may be guilty of contributory negligence.

The fact that the party suing was privileged to use the street, and that, in the exercise of this right, he was not required to observe the same degree of care and watchfulness that would be required in a case where he was entering upon the track of a railroad operated by steam, the court insists, would not lessen the degree of responsibility that attaches to his negligent conduct in exposing himself to danger, if it is clear that he was guilty of such conduct.

Consequently, the court holds that it was error to instruct the jury that the party suing would be excused from the effect of his contributory negligence, in placing himself in a position of danger, if the servants of the street railway company operating the car could have, by the exercise of diligence, discovered his peril in time to prevent running him down, although, in fact, there was no actual discovery, before the collision, of his perilous situation.

To make the case still plainer, the court says that the failure to discover his peril by those operating the car, when by the exercise of diligence it could have been discovered, was conduct which clearly constituted negligence; but this negligence did not excuse that of the party suing, whose own negligent conduct it was that exposed him to peril; the court adding that no recovery can be had in such a case unless a new act of negligence arises upon the part of those operating the train or car, which must consist in the actual discovery of the danger in time to prevent the injury.

#### Liability of Purchaser of Track for Continued Defects.

*Schaefer v. City of Fond du Lac (Wis.), 74 N. W. Rep., 810. April 12, 1898.*

The Fond du Lac Light, Power & Railway Company so constructed and maintained its railway track on one of the streets of the city as to render the street defective and dangerous for public travel. While such condition existed, Elihu Colman, with knowledge of the facts, it is said, purchased the railway track and left the same in the possession of the railway company, under an option to it to purchase the property from him, but without any agreement binding the railway company to remedy the defective condition of the street. After this, while things continued in that condition, a man standing on a high load of lumber, and endeavoring to drive his team across the track, at the point of danger stated, was compelled, by the sudden jerking of his wagon, to take hold of a stake, that he had fixed in a position where he could use it to steady himself, but which broke, he sustaining injuries by being precipitated to the ground, it is judicially stated, without fault on his part, his injury being attributable to the condition stated.

Under these circumstances, the circuit court decided, as a matter of law, that Colman was not liable for the injury complained of, because the defects in the street were not caused by, nor did they arise from, or were they produced by, him. But the supreme court of Wisconsin says that this reasoning hardly meets the facts of this case fully, leaving out, as it does, the element that Colman continued the defective condition of the street by allowing the railway company to hold under him without any covenant on its part to remedy such condition.

The supreme court says that the law is firmly established by the great weight of authority, that as between the owner of leased property and a mere stranger, the owner is liable for any injury to the latter, caused by a dangerous defect in the property existing at the time of the lease, unless protected by a covenant binding the lessee to remedy such defects; and that there is much authority that he is liable anyway, that is, that he cannot shift the liability for known existing dangers onto the lessee by a covenant to repair.

On these grounds, the court holds that Colman and the railway company as well, were primarily liable to the one who had been injured, and that the exhaustion of all legal remedies as to both was a condition precedent to the right of the latter to proceed against the city under the charter thereof, which provides that in all such cases the city shall not be liable till all legal remedies shall have been exhausted to collect the damages from the person or corporation whose wrong or neglect produced or caused the defective condition of the street.

The rule of law particularly established by this decision may be said to be, as stated by one of the judges, that if property, when in such defective condition as to be dangerous to persons lawfully in the vicinity thereof, be purchased by a person with knowledge of the defects, who leases it to another, especially if the lease does not contain a clause requiring the lessee to remedy the defects, and a person so lawfully in the vicinity of such danger, but having no connection whatever with such lessee, be injured thereby, such lessor is liable to such injured party; and he cannot escape liability from the mere fact of the lease to, or possession by, such other person.

#### Right to Make Crossings of Overhead Trolley Street Railways.

*Consolidated Traction Company v. South Orange & Maplewood Traction Company (N. J.), 40 Atl. Rep., 15. March 1, 1898.*

An injunction to prevent one street railway company operating the overhead trolley system from constructing a crossing over the tracks of another, against its consent, and without any offer of compensation for damages by reason thereof, was sought in the above case.

But the court of chancery of New Jersey holds, first of all, that a preliminary injunction cannot be granted upon the ground that the company sought to be enjoined has no right to make its extension across the street because its construction in that locality is unauthorized by law. The only ground upon which one company's right to equitable relief based upon the illegal construction and operation of another's railway can be granted, the court says, is the interference with the authorized business of the company, by competition carried on without authority of law. Such unauthorized competition with the business operated under a

legal franchise is a recognized ground of equitable as well as legal relief.

The only other legal injury which the complaining company could sustain by reason of an illegal extension of the other company's road beyond its authorized limits, the court explains, would be an injury common to the public or to all other owners of property; and such common injury affords no basis for equitable interference on behalf of the individual or property owner, to enjoin the illegal exercise of a public franchise. In such cases, jurisdiction for the purpose of deciding upon such illegal use is to be exercised only upon proper proceedings at law or in equity by or on behalf of the state.

Moreover, if a preliminary injunction against illegal interference with business to which a company has a right is sought, the court insists that the application therefor must be made promptly, which it does not consider is done by waiting in the neighborhood of two months after the other road is in operation, before the bill of complaint is filed.

Nor does the court endorse the second and principal ground upon which the right to a preliminary injunction was based, namely, that the construction by another company of a street railway across the complainant's tracks, and the operation of the former by the trolley system, would necessarily invade the complainant's property rights, as owner of the track and trolley system, and interfere with its franchise of operating its road.

So far as relates to the mere interruption of the operation of a street railway during the period of the construction of a crossing, the court holds that there can be no basis for compensation, for the first company's right to the use of the street must be subject to the right of the public to cross its tracks therein, and to the right of the public authorities to provide for crossing the tracks by any carriages or vehicles which have the right to use the street for travel, and to interrupt the company's operation in such reasonable manner as may be necessary to provide for the construction of the crossing, when the right to cross exists.

As to the permanent changes made necessary in tracks and wires by a crossing, the precise question involved for settlement is said to be new in New Jersey, while even the right to compensation for the taking or use of a street railway company's property such as is purely and necessarily incidental to the crossing of its tracks by street cars, moved either by horse or electric power, in the safest and most approved method, has not been expressly recognized. But there are New Jersey cases which settle that electric street railways, operated by the overhead trolley system with its poles and wires, are not additional burdens upon the soil of the highway, and that these structures may be placed in the public streets without compensation to the owner of the soil, subject to the right of the public of passage and other ordinary uses of a highway. They also settle that a steam railroad lawfully constructed across a public street cannot exclude the public from crossing its tracks by street cars operated by either horses or trolley, except to the extent that interference may be necessary to permit the lawful operation of the steam railroad at the point of crossing, and that without consent, and without compensation.

These principles, the court thinks, control the right of trolley companies (whose tracks are laid longitudinally in the public street) to prevent the crossing of their tracks, and it holds that they can only prevent this crossing so far as

the crossing interferes with or prevents the operation of their roads or the exercise of their franchises.

The right of one street railway to cross another street railway already constructed is the same legitimate use of the highway as the construction and operation of the original road; and the original right to construct and operate a road in the public streets is necessarily subject to all legitimate purposes of crossing.

Nor does the court consider that the fact that the crossing, as proposed, necessitates some actual interference with the tracks and wires as constructed, and to some extent changes thereafter the exclusive use by the complainant company at the crossing, will prevent the crossing by a similar street railway company, without compensation, if made under the proper legislative authority; for these changes are the necessary result of the development of the method of operating electric roads at their points of crossing, and especially when they are such as are made necessary, as the best and safest methods now attainable for the safety and convenience of the public in the operation of both roads at the point of crossing. They are therefore changes and burdens in the use of its tracks and trolley system to which the original right to lay and construct them is necessarily subject, and, in a legal point of view, are different only in degree, and not in character, from the changes in the property and control of its tracks made in the ordinary horse car crossing.

And inasmuch as the complainant company's tracks and wires were originally laid and constructed subject to the right of the proper authorities to disturb them for the purpose of legitimate public travel in the public street across its tracks, and the changes and disturbances are necessarily incident to such crossing, the court holds that these are not the subject of compensation.

Jurisdiction to control the construction of such a crossing, if the parties cannot agree, the court further states, can, undoubtedly, be exercised by a court of equity; and, where the right to construct a crossing exists, it says, a court of equity will, if necessary, and on application of either party, interfere to control the construction. And such equitable jurisdiction relating to the joint use of the public highway would probably extend to the settlement of all questions relating to the construction, operation, and maintenance of the crossing in case the parties did not agree.

Finally, the court declares that the company seeking to make the crossing, of course, has no right arbitrarily to select its own time of erecting the crossing, but is bound, if no agreement is made, to give due notice, both of the time and manner in which the crossing is proposed to be made.

Thus did the court reach the conclusion that, on the merits of the case, the complainant company was not entitled to compensation for damages to its property by the proper construction of the crossing under consideration; and as the crossing, when properly erected, would not interfere with the exercise of its franchises, the application for preliminary injunction on the ground of right to compensation must be refused. And this conclusion, it maintains, agrees with the decisions of the courts of other states, in cases involving the rights of crossing in public streets, so far as it had been referred to them.

Early in May underground conduit cars were placed in operation on the 8th avenue line in New York.

## MOTOR CAR FOR DETROIT & LIMA NORTHERN.

We have previously made mention of the intention of the Detroit & Lima Northern Railroad to place some dummy cars in service in order to increase the number of trips and prepare for trolley competition. The Baldwin Locomotive Works are now building a motor car for this road which is in some respects similar to that built for the Cincinnati,

BOILER FOR DUMMY CAR.

Hamilton & Dayton Traction Company and described in the REVIEW for March. The cylinders are compound  $9\frac{1}{2}$  and  $16 \times 18$  in.; no condenser is provided. The boiler is vertical and self-firing, and is carried on the driving truck forming the center pin of the car. The boiler which is shown in section and plan in the accompanying illustration is 60 in. in diameter and has 630 sq. ft. of heating surface. The fuel is anthracite coal.

## INCREASED POSTAL SERVICE.

The Postal Department at Washington is contemplating a change in the street railway postal service, Chicago, about July 1, which will result in greatly extending it. At the present time there are in this city four street railway postal car routes, all established in November, 1895, and all on cable lines, each with two cars; this service is in charge of the superintendent of the railway postal department. The cost of the service is about \$11,000 per year, which does not nearly pay the expense incurred by the railways in handling the cars.

It is proposed to transfer these cars to the department of collection, and put postal cars on the cross-town electric lines, and connect with the present trunk lines. The estimated cost of the increased service is \$50,000 per year.

**A CONVENIENT CONSTRUCTION WAGON.**

The construction wagon here illustrated has just been completed in the repair shops of the Chicago City Railway Company. The company does all the overhead construction, and line work and this department is under the direction of J. C. Baker, the designer of the wagon. The wagon consists of the adjustable tower, and three compartments for the linemen's tools. The platform rail lowered is 11 ft. 5 in. from the ground, but can be raised to a height of 21 ft. A wire rope is attached to the frame of the wagon and passes under two pulleys beneath the platform and around a windlass underneath the wagon body. A shaft extends from the windlass to the rear of the wagon and the platform is raised or lowered by a crank handle which can be removed.

Under the seat there is a compartment for solder, acid and a fire pot outfit. In the front compartment are kept coils of rope, block and tackle, with hooks for curve and

the work by standing over the hole. As she seemed determined to remain there the workmen started another hole a few feet away. She left her post and stood over the second hole. The workmen left it and went to work again on the first hole. Mrs. Gunn went back and interrupted as before. The work went on in a similar manner during the morning hours, the woman playing tag with the railroad company's workmen, much to the amusement of the crowd who gathered around and watched the fun."

**THEATRICAL ENGAGEMENTS.**

Managers operating parks and using attractions have found that in dealing with theatrical artists it is wise to have a very distinct understanding of the obligations on each side. Manager Wyman, of the New Orleans Traction Company, anticipates differences by printing on his resort letter-heads on which amusement contracts are written the following conditions:

CONSTRUCTION WAGON OF THE CHICAGO CITY RAILWAY.

trolley wire. The doors open at the sides of the wagon. Access to the rear compartment is had by a door at the back. Partitions are arranged along the sides of this compartment for bolts, nuts, washers, hangers, insulators, ears, tools, etc. These compartments are water tight and the tools and line material are in good condition and free from rust. The step in the rear can be folded up. The under-running gear enables the wagon to be turned around in a very small space. A ratchet brake is provided, so that the wheels of the wagon can be set and remain so during the progress of the work. The design is such that the platform, as well as the top of the wagon, which is also used, is thoroughly insulated. The wagon with all accessories weighs 3,750 lbs.

**OBSTRUCTING THE WHEELS OF PROGRESS.**

The Syracuse (N. Y.) & Suburban Railroad has met with considerable opposition in the construction of one of its extensions and the experience of a gang in digging a post hole where it was not wanted is thus described in a local paper:

"It had not progressed far when a woman, who was said to be Mrs. May Gunn, came out of the house and stopped

"Artists engaged at the West End agree not to appear at any other place of amusement in the city previous to, or in two weeks after, this engagement unless by permission of party of the first part or his authorized agent.

"Incompetency, drunkenness or misconduct will be considered sufficient reason for annulling a contract without notice.

"All billing matter, photos, property and scene plat, time of act, must be sent 10 days in advance of beginning of engagement.

"Artists accepting engagement consent to be governed by the rules adopted by the management for the resort."

**WIRE STOLEN IN BROOKLYN.**

May 14 Joseph Blumenstock, 18 years old, with no permanent home, was arrested with a quantity of copper wire in his possession and two days later was remanded for trial, charged with having stolen it from the Brooklyn Heights Railroad Company. According to the story he told the police Blumenstock is the member of a gang who have been stealing from the company for a considerable period.

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

The accident at a central lighting station, at Palmer, Mass., which resulted in the destruction of the station by fire, calls attention to a new danger, or at least one but little appreciated heretofore. The plant was operated by water power and the governor consisted of an apparatus in which oil was circulated under a pressure in excess of 200 lbs. While the superintendent and an assistant were making some adjustments, some part of the governor burst and the oil thrown out was ignited by a stove in the room. The two men were badly burned and the building destroyed.

\* \* \*

The Monongahela Water Company, of Pittsburg, is now engaged in building an elevated track some 30 ft. above the street and 500 ft. long for the purpose of transferring its coal from the railroads to the power house in cars. The elevation is sufficient to permit the coal being dumped into the bins at the boiler house by gravity, and thus it does away with the triple handling of the coal heretofore necessary when it has been stored in the yards. It appears to us that there are many street railway power stations which are large enough to make it economical for the companies to build similar structures.

\* \* \*

Robert Hammond in a paper read at the last meeting of the English Institute of Electrical Engineers, gave a great deal of information concerning the cost of electrical energy in the lighting stations of the United Kingdom. A number of stations show great reductions in cost, the reductions being effected by reason of better systems of working. The figures for the cost per kilowatt-hour in cents are: Edinburgh, 2.26; Manchester, 2.90; Nelson, 3.34; Portsmouth, 3.42; Leeds, 3.46; Whitehaven, 3.50; Liverpool, 3.54; Bradford, 3.62; Glasgow, 3.84; Preston, 3.88; twenty-six stations, including four in London, range from 4 to 6; twenty-nine lie between 6 and 8; ten lie between 8 and 10; eight lie between 10 and 24. These costs include fuel, oil, waste, water, wages, management, rates, rents and taxes. It is predicted that when the output at Leeds reaches 5,000,000 k. w. h. per annum, the cost per unit will be reduced to 3 cents.

\* \* \*

A 48-hour test of the new electric power plant of the Boston Elevated Railway, at Harvard square, Cambridge, was recently conducted by the students of the Massachusetts Institute of Technology, over 100 being employed in the work. This plant represents the latest development in power station practice and comprises three compound condensing engines of 1,800 h. p. each. In the boiler room, electric motors are used for driving the feed-pumps. Economizers are used for heating the feed. The steam pip-

ing is similar to that at the Sullivan square station of the company, the steam being brought to the high-pressure cylinder through a separator, and the piping being beneath the engine, and arranged so that either cylinder may be run at high pressure. The air pumps are of the jet condensing type, run by a separate engine. The test was made as complete as possible and included the auxiliary apparatus.

\* \* \*

The accompanying cut illustrates an electrical steam gage alarm which was described in a recent issue of the "American Machinist." The object sought is to have the ringing of bell announce when the steam pressure falls below or rises above the desired limits. A curved slotted plate is permanently fixed to the face of the gage, and an inwardly projecting T piece is adjustably fastened to it by a bolt and thumb nut. The bell and battery being provided, and both

the T piece and the gage pointer being properly insulated from the body of the gage, one wire is connected to the former and the other to the latter. When the gage pointer comes in contact with the T piece the circuit is completed and the bell rings. If it is desired to have a low pressure as well as a high pressure alarm a second T piece is placed

at the proper point; two circuits with bells of different tones could be used to advantage for the two alarms.

\* \* \*

Some time since we called attention to the fact that many engineers in preparing specifications for boilers insist that bidders rate their boilers upon the area of the heating surface, and that such a requirement is an injustice to the boiler manufacturers. A boiler should be rated according to its steam making capacity, and the steam making capacity of a square foot of heating surface varies greatly according to its position in the boiler. For instance that portion of the heating surface in the firebox of a locomotive is vastly more efficient than the tube surface (1 sq. ft. of firebox surface has been placed as equal to 10 sq. ft. of tube surface), and the rear ends of the tubes more efficient than the forward ends. It also varies with the type of boiler. If this rule of basing the rating on the area of the heating surface be insisted upon, and the recommendation of the American Society for measuring the tube surface be fol-

lowed, a further injustice is done the manufacturer of water tube boilers. The code says that the heating surface of the tubes shall be taken to be the exterior surface, whether they be fire tubes or water tubes. The real heating surface of a boiler is the area exposed to the fire or hot gases, since water is many times more efficient than gases in conducting heat, and the water may be relied upon to conduct away all the heat which the plate or tube receives from the gases. The external area of a 1-in. tube is 17 per cent in excess of the internal area, and the external area of a 4-in. tube is 7 per cent greater than the internal area.

Chas. W. Baker discussed what constitutes heating surface in a paper before the A. S. M. E. and in conclusion analysed the reasons which have been urged in favor of taking the external tube area in all cases.

1. It is alleged that the manufacturer of water-tube boilers has an advantage since he can claim more heating surface with a tube of given dimension. This is true and it is quite proper that he should claim it since he really has.

2. That the external measurement increases the heating surface of the boiler. This is an absurd claim since the capacity is not increased.

3. It is urged that the exterior area should be taken for the sake of uniformity. The practice is not uniform, however, among engineers.

4. It is easier to compute the exterior area since the outside diameter is in even inches. This claim is not deserving of very serious consideration.

**Standards for Engine Testing.**

At the recent meeting of the American Society of Mechanical Engineers two papers dealing with this subject were presented: one by Bryan Donkin, of London, Eng., and one by George H. Barrus, of Boston.

Mr. Barrus points out that it would have been the natural course to determine a general standard method for engine tests, before determining the methods of testing individual types. The society has adopted a standard method for making duty trials of pumping engines (1890), and methods for testing locomotives (1893), and its code for boiler tests adopted in 1885 has just been revised. The recommendation is made that a standard for general engine testing be prepared and the pumping and locomotive standards be revised where it is necessary to bring them all into harmony. This would give the society two standard systems for testing, one for boilers and one for engines.

Mr. Barrus makes the following suggestions for a standard system of testing engines:

"The principal data required for an efficiency test of a steam-engine, are the weight of steam consumed and the amount of power developed. These two elements of data are fundamental whatever the type of engine, and whatever the class of work performed. It is evident at the outset, that a system of engine testing applicable to all engines would be a method of determining these quantities. Consequently, the proposed standard would relate primarily to these two things and to the expressions of efficiency derived therefrom.

"If, for the moment, we pass by the steps required to obtain the necessary data, and take up the problem of bringing into uniformity the methods of reporting the results obtained from different classes of engines, the subject arranges itself in a simple manner. The desired uniformity will be secured if the tabular summary of results is expressed in two sections; the first section dealing with such data as apply to the working of the steam in the cylinders, apart from the peculiarities of the service which the engine performs, and the second section giving the data and results pertaining to the special individual work. Following out this scheme more in detail, the first section of the tabular report would contain all the data of measurements of feed water, of steam used by the jackets and re-heaters, if these were employed, the quality of the steam, the weight of steam used by the auxiliary apparatus, and all the data of the various pressures, temperatures and speed relating to the work of the engine, including the pressures and other data obtained from the indicator cards. It would give the horse-powers developed, the weight of steam consumed by the engine and by the auxiliaries in a unit of time per unit of power, the deductions from an analysis of the indicator diagrams, and the total number of heat units consumed in a unit of time per unit of power. It would also present the standard decided upon for the expression of efficiency.

"The second section of the tabular report would vary with each class of engine. In this section, there might be five sub-divisions, one applying to each main class of engines.

"The classes which suggest themselves to me are as follows:

- "1. Factory engines, or engines employed in the production of power in general.
- "2. Pumping engines.
- "3. Locomotives, (a) shop tests, (b) road tests.
- "4. Engines employed in generating electricity.
- "5. Marine engines.

"In the first sub-division of the second section, that relating to engines for general work, few additional data need be given, beyond those found in the first section. Engines in general are employed in generating power for such a variety of mechanical operations, that the simple expression of efficiency, based on the quantity of heat or steam used per gross or net horse-power per unit of time covers essentially the whole ground. This section might, however, present the data and results of a coal test of the engine, where this was made; in which case, it would give the weight of coal burned, and all the various results depending upon it.

"The second sub-division of the second section, that relating to pumping engines, would present the special data in regard to the work of the water end of the engine, such as the quantity of water pumped, the number of feet lifted, and all the special data which are given in the report of the duty trial committee in Vol. xii. of the 'Transactions.' In this section would appear the results expressed in terms of 'duty,' including the standard based on one million heat units.

"In the third sub-division of the second section, viz., that relating to locomotives, there would be two parts; one pertaining to shop tests and the other to road tests; and in both of these, there would be the special data pertaining to the work of the locomotive, as formulated by the report of the committee on locomotive tests in Vol. xiv. of the 'Transactions,' including the standard of efficiency therein determined, viz., the quantity of so-called 'standard coal' used per dynamometer horse-power per hour.

"In the fourth sub-division of the second section, that relating to engines for driving electric generators, data would be given embracing the quantity and intensity of the current generated, the electrical horse-power developed, and the efficiency of the generator. In the case of railway engines, this would also include the current delivered to the motors on the line, and expression of efficiency based on car mileage.

"The fifth sub-division of the second part, that relating to marine engines, would present such data as pertain specially to marine work, such as the quantity of coal consumed and the results bearing upon it, the speed of the vessel, the slip of the screw, and the tonnage moved a given distance per unit of power.

"The above is an outline giving the main features of one method of formulating the tabular reports so as to secure the objects in view.

"Returning now to the methods of obtaining the data, one of the most important elements of data required is the quantity of work which the steam performs. The work done by the steam in an engine cylinder has in the past been ascertained, and probably will continue to be ascertained, by the use of the steam engine indicator. The reliability of this instrument is the foundation upon which a correct determination of the engine's efficiency rests. How the indicator should be applied, how it should be operated, how its springs should be calibrated and how the diagrams which it produces should be read and investigated, are questions which should be settled by the proposed standard method of engine testing; and to these questions little attention has been given and little required at the hands of previous committees. It may not be out of place to recall the fact that there is no accepted method amongst engineers of calibrating indicator springs; and it seems to me that in the work suggested, investigation and recommendation should be made as to the best mode of dealing with this important subject.

"If the suggested arrangement of the tabular reports be followed, they would be preceded by a similar arrangement of the methods laid down for determining the various data. In the first place, directions would be given for ascertaining the data of the first section, or that applying to all engines, whatever their type; and these would cover the ground with that completeness which characterizes previous reports. Much of the material applicable to engines in general, given in the reports of the duty trial and locomotive test committees would appear in this section, and would there be dealt with once for all. The second section would similarly be divided into the sub-divisions named, and in each of the various sub-divisions complete directions would be given for obtaining the special data applying to the individual case. In the matter of duty trials and locomotive tests, the sub-divisions would deal with all the directions laid down in the previous reports."

Mr. Donkin points out the good work done in formulating the boiler, pumping engine, and locomotive codes, and recommends similar standards for marine engines, factory engines, rotary engines and gas and oil motors.

In an appendix Mr. Donkin gives the preliminary report of a committee of the London Institute of Civil Engineers, which has reached the following conclusions:

"1. That the statement of the economy of a steam engine in

terms of pounds of feed-water per indicated horse-power per hour, is undesirable.

"2. That for all purposes, except those of a scientific nature, it is desirable to state the economy of a steam engine in terms of the thermal units required per indicated horse-power per hour (or per minute), and that if possible the thermal units required per brake horse-power should also be given.

"3. That for scientific purposes the thermal units that would be required by a perfect steam engine, working under the same conditions as the actual engine, should also be stated.

"The proposed method of statement is applicable to engines using superheated steam as well as to those using saturated steam, and the objection to the use of the number of pounds of feed-water, which contain more or less thermal units according to conditions, is obviated, while there is no more practical difficulty in obtaining the thermal units per indicated horse-power per hour than there is in arriving at the pounds of feed-water.

"For scientific purposes the difference in the thermal units per indicated horse-power, required by the perfect steam engine and by the actual engine, shows the loss due to imperfections in the actual engine.

"A further great advantage of the proposal is that the ambiguous 'efficiency' is not required."

Mr. Donkin adds in a second appendix a number of suggestions as follows:

"1. Percentage of Water in Cylinders.—The best way of representing graphically the percentage of water in the cylinder of any steam engine after cut-off is a subject well worth considering. If possible, it should be on the same base line as the indicator diagram.

"2. 'Cards.'—The word 'cards' should, in the writer's opinion, be abandoned in all future reports and discussions on this subject, and the words 'indicator diagrams' always substituted for it. In taking diagrams from steam engines, no 'cards' are or ever have been used.

"3. Steam Engine Indicators, also Gas and Oil Engine Indicators.—The public should know the opinion of this society as to the best types to be used in view of the various speeds (from fifty to five hundred revolutions per minute), and the temperatures of saturated or superheated steam or gas in these motors.

"4. Indicator Springs.—A standard method of testing indicator springs hot in their indicators. Should such be recommended by the committee?

"5. Position of Indicators on Cylinders of Motors.—Attention and advice should be given on the question of placing an indicator, whether on a vertical or a horizontal cylinder. The two ends of a cylinder should never be joined up by pipes. Each end of each cylinder should have its own indicator, and each pipe fixed with as few bends and made as short as possible.

"6. Smoke Scales for Observation of the Degree of Smoke every two minutes during a ten-hour test.—As the question of smoke and its prevention is likely to come with increasing prominence by smoke scales, and standardizing the observations made on it, should, the writer thinks, be dealt with by a committee. The best method hitherto proposed is probably that suggested by Professor Ringelmann with five standard smoke scales, and published in November last in the 'Engineering News.'

"7. Power Required for Driving the Engines Themselves.—When engines are tested, whether using steam, gas or oil, they should, whenever possible, be indicated when driving themselves only, and this information should be added in all tests.

"8. Leakage.—Pistons and valves should be tested for leakage of steam or steam and water, wherever possible.

"9. Temperature of Cylinder Walls.—The temperature of the cast iron cylinder and cover walls should be more often taken in scientific tests, with the best electrical instruments now available. Hence before municipal authorities, the best way of representing the paper by Professors Callander and Nicholson (read before London Institute Civil Engineers this winter) can be referred to as the best on this subject. The temperature of cylinder walls is of great importance as having a large influence on the condensation of steam.

"10. Steam Jackets.—Whenever any parts of cylinders or receivers are jacketed with steam, a small pressure gauge, pre-

viously checked, should be fixed on each jacket, to determine the actual pressure of steam. A small tell-tale quarter-inch cock, opening into the engine-house, should also be provided on the same gage fittings to enable the engineer to see whether air, steam or water comes out when the cock is turned on. In important tests such cocks should be fixed at the lowest and highest parts of each steam jacket."

**HOSE BRIDGES FOR CHICAGO FIRES.**

When a fire occurs in the down town district, in Chicago, on one of the surface loops all the lines of the company using that loop are in danger of being tied up for a long period. Crossover switches are placed on the trunk lines before they come to the loops but this provision is inadequate for the large number of cars. The street car tracks

FIG. 1.—HOSE BRIDGE FOR ELECTRIC LINES.

are more often blockaded by the hose lines than from the burning building or any other cause.

The hose bridge used by the North Chicago Street Railroad Company for the trolley tracks resembles the bridges which are in service in many other cities. It is shown in Fig. 1, and consists of a 2-in. oak plank on either side bound with 3-16-in. strap iron. Four semi-circular holes are cut to accommodate four lines of hose. Tie rods are spaced at intervals to hold the bridge to the proper gage. The bridge is about 18 ft. over all and the inclines are such as to permit the cars to pass over it easily.

It has been a much more difficult problem to design a suitable bridge for the cable tracks. The latest one, which has been perfected by Superintendent F. L. Fuller, is shown in Figs. 2 and 3. The legs of the tripods are 21 ft.

FIG. 2.—HOSE BRIDGE, NORTH CHICAGO STREET RAILROAD.—FIG. 3.

in length and consist of tubing into the interior of which is driven a wooden pole. The bridge proper is divided into two parts each 12 ft. long. The floor is of 7/8-in. plank and the rest of the bridge is constructed of light angle iron. The two halves fit together and are held in place by two long pins.

The bridge ready to be sent to the fire is shown in Fig. 2. As soon as it is taken to the scene of operation the two halves are laid across the tracks and pinned together. The

lines of hose, any number less than nine, are placed in the bridge and a tripod set on each side of the tracks. A block and tackle is attached to an eye bolt in the apex of each tripod and the bridge with its load of hose is drawn up to the proper height. This whole operation can be performed by three men in less than eight minutes. The particular advantage of this bridge is that the lines of hose when filled with water can be lifted into place, which would be a very difficult thing to do with almost any other form.

Two of these bridges are kept in the barn at the rear of the general offices. In the office is located a city fire alarm; and as soon as the gong sounds the location of the fire is determined. If the fire is a serious one the wrecking wagon is sent to the barn and the bridges, which are suspended overhead, are let down into the wagon and quickly dispatched to the proper point. Although designed especially for cable cars the trolley cars pass under it by drawing down the trolley pole. As one fire is liable to blockade nearly all the cars of a system this bridge will save its cost many times over during one emergency.

**OPENING FOR ELECTRIC RAILWAYS IN CUBA.**

Wilfrid Skaife, discussing the "Future Industrial Opportunities in Cuba" in the current number of the "Engineering Magazine" says: "No electric roads exist in Cuba at the present time, but their immediate institution may be looked for. It is a singular fact that the travel on the various coasting steamers, on the vessels running up the small rivers, on the railroads, and on the few 'busses' that run to the suburbs of the larger towns, is very much larger than one would expect from the apparent nature of the people and their means. The writer has constantly been surprised at the over-crowding of these means of travel, and understands, on the best of authority, that the business is a very paying one indeed. The rates charged are usually exorbitant, but the travel goes on even when the possibility of being dynamited en route adds to the general discomfort.

"The writer traveled last winter on a train with pilot engines in front, an armored car behind, and amid the liveliest rumors of trouble on the road, and though there were few first-class passengers, the other cars were filled with people traveling. God knows why! The extension and improvement of steam railways, opening up the country and giving better service, is sure to be a very paying business in the future, while there are a number of towns in which electric roads could be run to advantage, besides Havana itself."

**THE KIDDERMINSTER & STOURPORT TRAMWAY.**

The latest electric railway in England to be put in operation is the interurban line running between Kidderminster and Stourport, two cities of about 25,000 and 4,000 inhabitants. In reference to this road the "Electrical Review," of London, says:

The Kidderminster and Stourport line is not an extensive one, but it is of special interest and importance at the present moment, because, since the American invasion, it may be considered the first line erected by British manufacturers. The steam plant, generators, cars, motors, overhead wire and material all have been made in this country and the Brush Electrical Engineering Company, the principal contractor, is to be congratulated, not only upon the successful completion of the line, but also because it had the good sense to copy some of the best features of American practice.

The British Electric Traction Company, the largest street

FIG. 1.

railway corporation in England, and having projects on hand involving an expenditure of \$15,000,000, received parliamentary permission to construct this line in 1896. The line is single track with turnouts at intervals and a spur at Kidderminster, which runs for a short distance at right angles to the general direction of the road. The gage is 3 ft. 6 in., and girder rails, weighing 75 lbs. to the yard are used. In Kidderminster the track is laid on a bed of con-

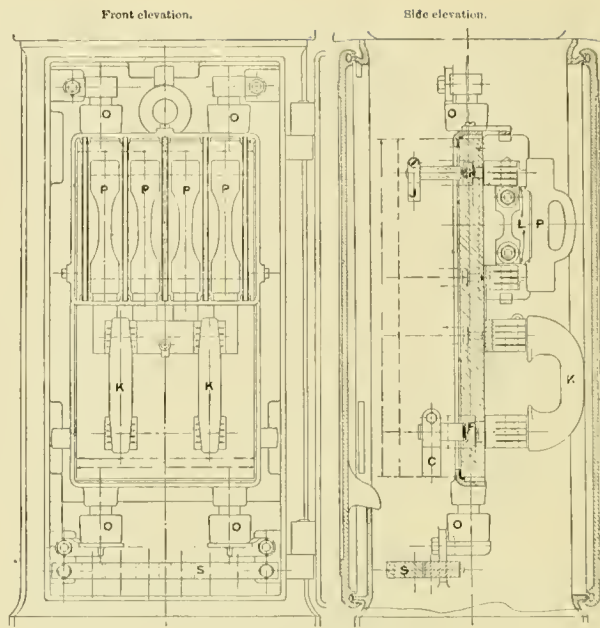

FIG. 2.

FIG. 3.

crete 6 in. thick as shown in the upper section of Fig. 1, but outside of the city the rails are laid on ties with a macadam filling as in the lower section of Fig. 1. Chicago bonds were used and no copper return feeders were found necessary. The line crosses the Great Western Railway at a grade which is very exceptional, but every precaution is taken to make it safe.

o and s, Clamp cable sockets; k, Main switch carrying 400 amperes; o, Oil insulators; s, Section switch; l, Clamp for cables.

FIG. 4.—FEEDER BOX.

The trolley wire is double throughout the entire length to avoid all overhead switches, and they are suspended from brackets from side poles. There are a number of obstructions to prevent the poles being planted all on one side of the road, but the track extends continuously along the same side. To provide for this divergence of the wires from the track the Dickenson side trolley was adopted. The details of the trolley are shown in Fig. 2, and its appearance in operation may be seen from Fig. 3. The trolley pole is a light steel tube 15 ft. long, tapering from 2 3/8 in. to 3/4 in. outside diameter and fitted with a swivel head which permits the wheel to turn and adapt itself to any position of the trolley wire. The trolley base is supported on four insulators.

The trolley wire is divided every half mile by section insulators and connection is made at these points with the feeders through feeder boxes. Two feeders run from the

FIG. 5.

power station, one of 78,000 c. m. and one of 305,000 c. m. cross section. They consist of stranded cables, lead covered and armored and buried in the ground to a depth of 18 in. The feeder boxes, shown in Fig. 4, are 4 ft. 8 in. high and are placed on the posts supporting the section insulators. Each contains two main knife switches in connection with a bus bar, from which there are two cut-out fuses which feed both ways on the double trolley wire. The feeder switches each have a capacity of 400 amperes and each of the four section switches can carry 50 amperes.

The power house is located between the Stour river and the Worcestershire canal, being about a mile from the Kidderminster terminus and  $3\frac{1}{2}$  miles from Stourport. In the boiler room there are two water tube boilers, each having 1,218 sq. ft. of heating surface. A Green fuel economizer of 120 tubes has been installed. Two vertical compound engines, Fig. 5, are direct connected to six-pole 550-volt generators, each having a normal output of 100 k. w. but capable of easily carrying an overload of one-third. The engines are the "Universal" side crank type, having cylinders of 20 and 30 in. in diameter and 12 in. stroke. The engines

FIG. 6.—CLOSED CAR.

are enclosed by a steel casing but can easily be exposed. One of the principal features claimed for this engine is that the fluctuation of the load does not produce water hammering, the engine being automatically self draining. Steam is admitted only on the under side of the high pressure piston, the high pressure cylinder being drained during the down stroke by a valve, while the draining of the low pressure cylinder is accomplished by the piston exposing a number of holes around the cylinder when at the bottom of its stroke. There are two condensers, an abundant supply of water being furnished from the canal. The switch-board is fitted with General Electric and Weston instruments. The two generators and the two feeder panels have the customary switches, ammeters and circuit breakers. Another panel is provided for recording voltmeter and a total output wattmeter.

There are seven closed cars as illustrated in Fig. 6 and three trail cars, Fig. 7. The motor cars are 27 ft. 6 in. over all and 6 ft. 4 in. wide and have a capacity for 24 passengers. The open cars carry 40 passengers. Each motor car has two 15 h. p., four-pole, iron clad motors with spring sus-

pension. The cars are mounted on Brill trucks. Series-parallel controllers are used. Each car is lighted by ten 16 c. p. incandescent lamps. The car barn occupies a portion of the same building that contains the power station. This

FIG. 7.—OPEN CAR.

road, for a small one, appears to be a model in its way and it is safe to predict that it will be a success for it adheres closely to American practice and the engineers have excluded all novelties based on British theory.

### NEW PHILADELPHIA PARK.

The "Philadelphia Record" thus describes the attractions of Chestnut Hill Park, at the terminus of the Union Traction Company's Germantown line, which was opened for public inspection on May 28, after four months of hard labor and an outlay of \$250,000.

The projectors were not only desirous of securing something just as good in the shape of a pleasure resort as could be found in this vicinity, but they were determined to outdo anything of the kind ever attempted. The cheap trolley ride to the site of Chestnut Hill Park is one which thousands of people have patronized for the past two years. Historic Germantown and beautiful Chestnut Hill, through which the trolley line passes, present sights which are picturesque. The cars land their passengers right in the heart of the park, where the landscaper and mechanic have transformed the once fertile farm land into, it is said, a veritable fairyland. The imposing Casino, which will comfortably seat 5,000 people, in which is situated the huge music shell; the lake, with its pretty electric launches and small rowboats; the scenic railroad; the new style toboggan; the colossal floral display; the dazzling electrical exhibition, and the numerous other attractions are some of the features which will doubtless make this one of the most popular family resorts in eastern United States. In the opening of this resort the management has not neglected a feature which is very essential to every summer resort, and that is its music. Kalitz's concert band of 52 pieces will be a fixture during the entire season, and made its local debut by presenting an appropriate patriotic programme, which included all of the old heart-touching war songs, and several new ones, with powder and colored light embellishments. All trolley lines make direct connections with the Germantown and Chestnut Hill trolley cars.

Miss Amy R. Campbell was on May 19 given a verdict of \$5,000 against the Dayton Traction Company by a jury in the federal court at Cincinnati. The suit was for \$15,000 for personal injuries received in a collision between a trolley she was driving and one of the company's cars.

## DECISION ON DYNAMO REGULATION.

## Victory for Siemens-Halske Company.

An important decision has been given by the United States Circuit Court, of the northern district of New York, in the action brought by the Edison Electric Light Company against the E. G. Bernard Company and others. Basing its action on the Edison patent, of September 19, 1882, the General Electric Company maintained that the claims covered the regulation of dynamos by compound windings. The suit was defended by the Siemens & Halske Company, whose many valuable patents would have been put in jeopardy by an adverse decision. The defense was based on the Brush patent for an improvement in dynamo-electric machines, granted July 22, 1879. The suit has been a very long and expensive one, having been commenced, December 23, 1893, argued February 9, 1898, and finally submitted to this court, March 9, 1898.

The decision of the court in part was:

Although this record has been expanded beyond reason and precedent, it will be noted that the real issue is one of the simplest that can arise in a patent cause, viz., whether the patent is invalidated by a single prior patent?

The best evidence of what the patent covers is the patent itself. It states that it is for "a new and useful improvement in regulating the generative capacity of dynamo-electric machines." The claims are for the dynamo in combination with translating devices in multiple arc; but as this arrangement of translators has been well known since 1875, invention cannot be predicated of this element of the combination; indeed there is no pretense that it can be. If invention can be found at all it must, therefore, be in the dynamo.

The combination of the first claim contains the following elements:

1. A dynamo. 2. Translating devices arranged in multiple arc. 3. Field circuit of constant resistance for primarily energizing the field magnet. 4. Another field circuit whose resistance is varied by the addition and removal of translating devices.

The elements of the other claims are substantially similar, and in view of the conclusion reached it is unnecessary to consider them in detail. Claim 3 differs from the other two, in that the shunt circuit must be supplied from the main conductors.

It will be seen that the first claim is not for a dynamo of the Edison type or for the system of electric lighting adopted by him, but, on the contrary, that it is broad enough to cover, and does cover, any dynamo having the described characteristics in combination with any translators in multiple arc.

The Brush patent relied upon by the defendants was applied for 17 months before, and was granted one month before, the earliest date fixed for the alleged Edison invention.

The Brush patent is for an improvement in dynamo-electric machines and has for its object the maintenance in such machines of a magnetic field while the machine is running, whether the external circuit is closed or open.

Without analyzing the patent in detail, suffice it to say that the description is specific, carefully drawn and clearly illustrated by diagrams. The dynamo of the patent is a compound-wound dynamo having a shunt and series coil, the former of high resistance and the latter of low resistance. In some of the figures the series coil is wound over the shunt coil; in others the shunt is wound over the series, and in another figure the two coils are wound on opposite ends of the same core. The dynamo is designed to generate and maintain a sufficiently constant electromotive force and produce an amount of current always corresponding to the amount needed by the devices in the working circuit. Mr. Brush shows his machine in combination with electroplating in multiple arc, and Mr. Edison shows his in combination with electric lighting in multiple arc. This is the principal distinction between the two. If the one multiple-arc circuit be

the equivalent of the other, then it cannot be denied that every element of the patent in suit is found singly and in analogous congeries in the Brush patent and that they are described there so as to be more readily understood, at least to the uneducated lay mind, than in the Edison patent.

Not only is this clear from the Brush patent, but the proof shows that a number of machines were built pursuant to its directions and were commercially used more than two years prior to the date of the application for the Edison patent. These machines exist at the present day, and what is quite remarkable and almost unique in patent litigation is the fact that, in an art which has progressed with giant strides, machines made nearly 20 years ago are not only operative, but practically as successful as when first built. Two of these working dynamos have been introduced in evidence, one by the complainant and one by the defendants. Each is capable of doing the same work now as in 1880.

The complainant's proposition, if sustained, would lead to the conclusion that Mr. Brush, after having obtained his patent in which the dynamo is described as suitable for an electroplating circuit, could have attached the same dynamo to a well-known lamp circuit and have obtained another patent for that, and so on, as often as he changed the character of the translators.

Even though this work required enlargement, adjustment and some change in the winding, it would still be a question of degree within the realm of the skilled mechanic.

To restrict the Brush patent to electroplating would be as unfair as to restrict Edison's to electric lighting. The one illustrates his dynamo in connection with the first-named translating devices, and the other with the second-named devices.

But even were there more doubt as to the correctness of the conclusion reached, the court should still hesitate to enforce a patent in the sixteenth year of its age, and thus lay the entire art under tribute, when the public has had a right to assume that such a system as the defendants are using would not be molested.

The bill is dismissed.

## NOTES FROM ROCHESTER, N. Y.

In the case of the Rochester Railway Company against the assessors of that city, the referee has rendered a decision in favor of the railway company. The railway company raised strenuous objections to having the capital stock of the company assessed, asserting that as a matter of fact the stock had no actual value at the time, and should not have been put upon the rolls at all. The referee found that the company is entitled to have the assessment upon its capital stock wholly stricken from the rolls.

Beginning May 15 the Rochester Railway Company resumed the sale of tickets at 5 cents straight instead of six for 25 cents, as has been its custom for the past year. Reason for the change is given that the increased usage of the bicycle made an inroad on the company's receipts.

The Rochester Railway Company has perfected a lease of the Irondequoit Company's Summerville line for a period of 10 years from April 15 last, the agreement being dated May 10. The Rochester company will pay the lessor \$8,000 in four installments of \$2,000 each. If the earnings exceed \$20,000 a year the lessor will get 50 per cent.

A verdict of \$300 has been recovered against the Metropolitan Street Railway, of Kansas City, by an employe who was injured by over-exerting himself pulling the "gipsy." The suit was for \$10,000.

**A FINE PIECE OF SPECIAL WORK.**

**A SHYSTER DISBARRED.**

The New York Switch & Crossing Company, of Hoboken, N. J., has recently put in place at the new Franklin avenue car house of the Coney Island & Brooklyn Railroad Company one of the largest pieces of special work ever built. There are 16 curves leading to the car house tracks, but as will be seen from the illustration the main track is practically continuous, there being only one switch tapping it. This switch leads to auxiliary rails parallel to the main track rails and 5¼ in. gage to gage, from them, and from the

The "Philadelphia Evening Telegraph" published in full the opinion of the Court of Common Pleas, No. 4, in the proceeding to disbar Samuel Evans Maires, brought by the censors of the Law Association of Philadelphia, and we take from it a few short extracts.

Maires was the attorney of Hesta V. Cook in a damage suit against the People's Traction Company and the Philadelphia Traction Company, in which a verdict for \$8,000 was secured against the latter company. In some proceedings in the Orphan's Court between the mother of Mrs. Cook (the plaintiff having died) and the administrator of her estate, an agreement between Mrs. Henning (the mother of Mrs. Cook) and Maires was made public, under which Maires would get \$7,000 of the \$8,000 when collected.

This agreement amazed the agent of the Philadelphia Traction Company, and he investigated several other claims against the company, where the claimants had been represented by Maires. In one case it was found that Maires had collected \$400, lied to his client and settled with him for \$75. In another one, he collected \$500 from the company, told his client he got but \$250 and settled with him for \$125. In another the company paid \$200 and the client got \$50. In another he collected \$100 and paid the client \$20. In one of two other cases where the company paid \$250 the client got \$75, and in the other \$100. In another Maires got \$75 and the client \$25. In all of these the settlement with the client was secured by telling that the company would only pay a much smaller amount than he had collected.

The court says in part:

Mr. Maires' construction of the agreement in all these cases is best given in his own cross-examination. He said that under the irrevocable power of attorney he had an equitable assignment of the claim, of so much of the fund as might be obtained; that he had an interest which under the power of attorney and agreement gave him the right to say whether the case should be settled or not; that when his clients wanted to make a settlement he considered it a breach of the agreement with him;

GENERAL VIEW.

auxiliary track the curves branch off, as shown in the illustration. The main and auxiliary rails are firmly bolted together at intervals of 4 ft. with cast iron spacing blocks. This piece of work is all of 9-in. girder rails with chrome steel centers bound together with cast iron. In order to keep the main track unbroken the frogs crossing it are elevated on the curves so that the wheels can clear the main rail. It is the intention of the company to extend this system of curves by the addition of six more, and provision for

CROSSING, FROGS AND SWITCHES, NEW YORK SWITCH & CROSSING CO.

this extension was made by the builders so that the new curves may be put down without disturbing any of the work now in place. The illustration shows the type of double frog for crossing the main and auxiliary tracks, the switches, etc., used in this work.

in fact that he was a part owner and had a right to control the disposition of the case. \* \* \* \* \*

If we take Mr. Maires' construction of his agreements to be correct, and that he had an interest in the various claims entrusted to him, then he was a partner with the plaintiffs, and in his subsequent dealings with them has been guilty of the modern

statutory offense of fraudulently converting partnership money. Either way we look upon his dealing, as a champertor, barretor, or dishonest partner, we find no mitigation whatever, no excuse for his conduct.

The cases brought to our attention have given positive proof of that which is frequently heard in ordinary conversation, that there are lawyers who make it a business to hunt up litigation and take cases upon speculation, with the usual result, quarrels with their clients based upon a dishonest and unfair division of the moneys recovered. No lawyer with a proper sense of the dignity of the profession, as well as his own self-respect as a man, will stoop to such practices as have been laid bare in the present proceeding. Not even death can keep these ghouls of society at bay; their emissaries invade the house of mourning; they enter the hospitals; no place is sacred from their intrusion. If any more such exist, it is hoped that the board of censors of the Law Association will continue their laudable efforts until the offender shall be discovered and driven out of the profession.

The assistant or runner who hunts up these cases is a nuisance which should be abated. He participates in the spoils, his share being covered up in the items for investigating, working up cases, and doing detective work. Perhaps these runners manufacture testimony, for in at least one of the cases exposed before us the charge for witness fees is greater than the amount paid to the only witnesses known to the plaintiff. From the number of cases of this kind in which Mr. Maires appears we are led to believe that much of his business was obtained in this improper way.

Some criticism was made upon the action of the Philadelphia Traction Company, Mr. Brown, the counsel for Mrs. Heming, and the censors of the Law Association. In reply thereto it should be said, as it is due to them to say, that their action in this matter has been highly commendable, although exceedingly disagreeable and wearisome. The censors of the Law Association occupied many months in the preliminary inquiry before applying for the present rule. They gave Mr. Maires notice of their meetings, so that he was present, by himself and counsel, and knew everything which was being testified. He was not taken unawares nor by surprise. Nor was anything alleged against him here in court of which he did not have previous and full notice so that he could be prepared to meet the charges.

Upon the facts as developed before us, we are constrained to say that Mr. Maires is unfit to be continued longer as a member of the bar of this court, and that an order will be made striking his name from the roll thereof. A certified copy of this order will be sent to the Courts of Common Pleas, the Orphans' Court, and the Court of Oyer and Terminer and Quarter Sessions of this county.

### RAIL BENDING MACHINE.

The rail bending machine shown in the half tone is in successful operation in the repair shops of the Chicago City Railway Company. It is the design of C. E. Moore and was built entirely in the shops. There are three standard sizes of rails in service and no part of the repair or construction work was more tedious and laborious than bending rails for curves, but this machine has made it a very easy and simple operation.

In the line drawing the jack shaft, gearing and foundation of the machine are represented. The two outer of the three pulleys to the left are loose, but the middle pulley is keyed to the shaft. Two belts run from the shop shafting, one straight and the other twisted so that by the use of the belt shifters the machine can be run either forward or back. The small bevel gear at the end of the pulley shaft meshes with the gear on the vertical shaft which reduces the speed to one third. Upon the upper end of the vertical shaft is the driving roll of the machine.

The machine as a whole is quite simple and consists of few parts. The frame is a box shaped casting weighing 7,200 lbs. and has bearings for three rolls. The driving

roll has already been mentioned and the other two are idlers, and the three are located with reference to each other at the angles of an isosceles triangle. The driving roll is keyed to the vertical shaft, the upper bearing of which is in a cap which is bolted to the frame of the machine. When the rolls are to be changed the nuts are removed, the cap lifted off and the roll taken from the shaft and another

keyed on. The two idler rolls have bearings in two jaws which are moved horizontally in guides with the frame. For the adjustment of each of the jaws there are two 3-in. square threaded screws. Each screw turns in a large brass nut which is a bushing through the frame casting. Any desired curve can be obtained by adjusting the position of these two idle rolls with reference to the driver or fixed roll. The shaft for each idle roll has only a half bearing and can be easily removed by pushing the jaw to the inner end of the guide and removing a pin.

With the jaws fixed in one position the rail will pass through and be an arc of a true circle, but by adjusting and running the rail forward and back any desired curve can be obtained. A compound curve cannot be made without the substitution of another set of rolls, but there is no occasion for such a curve in track work. The two rolls at the right in the picture are for a different sized rail from those in the

RAIL BENDING ROLLS.

machine. The rolls are made of cast iron and are turned up to fit the outline of the rail. The whole machine is pivoted on the vertical or driving shaft as this was made necessary to avoid the posts supporting the second floor of the shop when 60-ft. rails are being rolled. A rail which is being rolled makes a speed of 40 ft. a minute. The whole machine complete weighs about five tons.

To support the rail while it is passing through the rolls, trucks, each having a single pivoted wheel, will be clamped to each end of the rail.

## WATER POWER PLANT AT KIOTO, JAPAN.

Japan was opened to western influence very largely through the treaty with the United States which was negotiated by Commodore Perry in 1854. Since that time, and particularly in the last 30 years, the country has developed in a manner which is without parallel in history. Two years ago she engaged in a war and it was conducted upon principles imbibed from European intercourse; in this war she was victorious and there is as a result a new power in the Pacific which in the future must be reckoned with. This is not true in a military and naval sense only, but in the commercial field also are the western peoples beginning to feel the results of that foresighted policy which has for the last quarter of a century sent the young men of the country to England and America to be educated.

Among the many excellent things which the island country has adopted, by no means the least is electricity. The earliest electric lighting plant, an Edison plant, was installed in 1888 in the palace of the Mikado at Tokio. It is by means of electricity that the value of one of the most remarkable feats of modern engineering was measurably enhanced, and the inhabitants of Kioto, the former sacred city of the Mikado, now read their daily newspapers, by the light of the incandescent and arc lamps and ride through its streets on trolley cars.

The operation of a system of electric street railways in Kioto, is the culmination of the great engineering work just referred to—the utilization of the waters of Lake Biwa. This work has excited the interest of engineers the world over.

Lake Biwa, with a superficial area of 500 square miles in the shape of the Japanese harp—"Biwa"—lies some 6 miles from Kioto, beyond two ranges of hills, the larger known as the Nagarayama, the smaller as Hi-no-oka-ama. Through Kioto runs a water way, known as the Kamogawa, by which boats can pass through the city to tide water at Osaka bay. Lake Biwa lies 150 ft. above Kamogawa and the junction of the two seemed so naturally destined that so far back as the twelfth century projects for bringing the upper waters to the lower were presented; but not until the conservatism of old Japan with its duplicate emperors and its feudal system were abolished could the project receive that consideration which the necessity of assimilating European ideas compelled.

In 1882, 11 years only after the abolition of feudalism, S. Tanabe, a student in the engineering section of the Imperial University, selected as the subject of his graduating thesis the construction of canals joining Lake Biwa to Kioto. The subject was very thoroughly treated—the depth of the canal was laid out sufficient to float the boats on Biwa and fall sufficient to allow of the utilization of the water at Kioto for power, as well as for irrigation, fire and sanitary purposes. This thesis excited the attention of the Government. The proposal came at a very opportune moment, and the work was undertaken in 1885 and carried out on the lines laid down by Mr. Tanabe. It was concluded in 1890.

The canal has a total length of  $6\frac{7}{8}$  miles and is divided into two sections. The longer is  $5\frac{1}{4}$  miles long, and carries the waters of Biwa through the hills to the suburbs of the town. The shorter one connects the suburbs to the

center of the city where it connects with the Kamogawa waterway.

The first part of the canal runs from the Lake to the Nagarayama hills, a distance of 600 yds. Through these it passes in a tunnel 12,680 yds. long, and continues in the open another 4,837 yds. to the Hi-no-oka-ama. Through this range it passes in tunnels 137 yds. and 934 yds., respectively, until it reaches the head of the incline.

The constant flow in the canal, available for power and irrigation is 300 cu. ft. of water per second, of which 250 cu. ft. is devoted to power purposes, while the remainder is diverted into another canal for irrigation purposes.

Between the canals is a difference in level of 150 ft. As first laid out locks were to be employed, but this plan was changed and an inclined plane railroad substituted. This is 1,800 ft. long with a gradient of 1 in 15. This railroad is operated by means of a cable having a cradle car at each end. When a boat is to be sent down from Biwa to Kamo-

ELECTRIC CAR IN KIOTO, JAPAN.

gawa, it is slid on the cradle and dropped down to the lower canal. Here it is poled off and the cradle car is then ready to receive another boat for elevation to the upper canal and the waters of the lake. When the cars are started, i.e., one from the lower canal and the other up the short reverse incline at the top, the 50 h. p. motor operating the cable is fully loaded but when the car reaches the main incline the boats are balanced and the load on the motor reduced to 5 h. p.

At the time the canal was projected the possibility of utilizing the power which the difference in level would give, was confined to the employment of water wheels. Before the conclusion of the work, however, the experiments in power transmission by electricity made in America and Europe had aroused attention in Japan, and the use of electricity was decided upon if the reports of Messrs. Tanabe and Takagi, who were sent over to study the question, should turn out satisfactory. The report proving favorable, very complete electrical equipment was ordered from America. This water power electrical transmission completed in 1891, was not only the first in Japan, but also one of the first of the notable ones in the world.

The pipe line consists of three pipes each  $35\frac{1}{2}$  in. in diameter and 1,376 ft. long. The power house is not placed at the foot of the incline, but some 400 ft. from the bottom, in a large pit excavated for the purpose. The water wheels are of Pelton manufacture, and there are now 20 in the station, placed in rows on each side of the tail race, which runs through the center. These wheels are of 120 h. p. each under a head of 100 ft., and are 8 ft. in diameter. They are controlled by ball governors and deflecting Pelton nozzles. In addition to the 2,400 h. p. in the Pelton wheels, 600 h. p. more is available in the length of Kamogawa. This has five locks at each of which a 120-h. p. turbine will be located, when the demand for power warrants the extension.

The station is built in steps, the wheels occupying the lowermost, the countershafts the intermediate ones and the dynamos the top. The wheels are belted to the countershafts and these in turn are belted to the generators.

The electrical equipment, first started in July 1891, with two Edison 80-k. w., 500-volt machines, now consists of a number of generators giving current as follows: 435 k. w. direct current at 500 volts. 250 k. w. single-phase alternating current at 1,000 and 2,000 volts. 240 k. w. two-phase alternating current at 2,000 volts. 240 k. w. three-phase alternating current at 2,000 volts.

The Kioto Canal Power Company, or the Sui-Ri-Jini-usho, operates the power transmission and distribution. Previous to the completion of the work the Kioto Electric Light Company had started a three wire electric lighting installation, with four Edison dynamos. The authorities have decided that the Power Company should control the distribution of the current for power purposes, and the Electric Light Company that for lighting purposes, the former arranged to install the single phase alternators in its station.

The canal Power Company is now furnishing current to 1,000 h. p. in motors operating cotton mills, etc., and is engaged on the installation of some 700 h. p. additional. Its latest development is the establishment of an electric street railway system in Kioto. This is a trolley system on purely American lines. The service is carried out by 26 cars, each equipped with two G. E. 800 motors, and K2 controllers. The overhead system is carried in places on span wires, in others on brackets. The rails are of American manufacture bonded with Chicago rail bonds.

---

### IMPROVED PORTLAND CEMENT.

---

At a recent meeting of the Western Society of Engineers, John W. Dickinson read a paper upon "Improved Portland Cement," of which the following is a short abstract.

A perfect Portland cement is a product consisting of an intimate mixture of lime and clay-bearing materials, with the elements in exact and perfect proportions and free from any deleterious or even adulterating substances, all burned to a perfect clinker and the clinker ground to an absolute flour. Should the raw materials, even if of perfect composition, not be in a finely divided state or not intimately mixed, the chemical union of the different elements which should be accomplished by heat, is impossible, and the resulting product is simply calcined clay or calcined lime and not unground Portland cement as it should be, and it would

be immaterial how finely such so-called clinker was ground, it could never be Portland cement.

Marked improvement has been made in the last few years in the preparation of the raw materials. Instead of going to the kilns in a coarse, unmixed condition and with the different elements varying from 3 to 5 per cent as was the former practice, and unfortunately is today in many mills, such precision is used in the best mills, that the raw materials are brought to a condition approaching impalpability, then thoroughly mixed and by the use of improved methods and competent supervision, the proportion of the chemical elements, viz.: lime, silica and alumina, are so controlled that the variation never exceeds  $\frac{1}{2}$  of 1 per cent. Great advance has also been made in burning. Bear in mind that the lime and silica in a Portland cement must all be chemically combined by heat, and to effect this combination, a great heat is necessary when the fluxing elements, alumina and iron, are kept at their proper minimum, and no product of the kilns that has not been thoroughly cindered and consequently chemically combined should be used with the clinker making the finished cement, and it is safe to state that owing to the improved process of burning adopted in the past few years, the proportion of underburnt material coming from the kilns has been reduced from 25 per cent to 30 per cent, to less than 5 per cent, and in some cases the product of the kilns is invariably perfect clinker. The higher the percentage of combined lime the stronger the cement, and owing to the improved methods employed both in preparation of raw material and in burning, the lime has been increased from about 55 per cent of the total to an average of 60 per cent, and in a few cases the entire process is so perfect that 65 per cent of lime is successfully incorporated.

But it is probably in the matter of grinding that the greatest advance has been made. Perfect clinker is sufficiently hard to scratch glass, and it is evident to anyone that will take two pieces of clinker, say the size of large diamonds, and wet the surfaces, that on putting them together no bond will result. Now, if we break up one of these pieces and attempt to cement together even the smaller particles, we find that these are no more cement than the larger pieces. By taking the residue on the 50—100 and 200 sieve, it will be found that the so-called cement represented by such residue is equally inert. Some investigators have reported slight strengths from the residue obtained by taking the intermediate of the 150 and 200 sieve, but I am positive that the strength thus obtained was wholly owing to the cement flour that adhered as dust to the coarse particles.

By improved grinding machinery 85 per cent of flour is secured, instead of only 60 per cent, as was the case 10 years ago. As adobe was superceded by lime, lime by natural cement, natural cement by Portland, so have the coarsely ground bicalcic-silicate Portlands of 10 years ago been practically supplanted by the fine-ground tricalcic-silicate cements.

Cement work suffers more from careless and mischievous attacks during the first month than in any future twelve, so the quicker a cement sidewalk, floor, or foundation is hard and out of danger of attack from any source, the better, and it has been the aim of the American manufacturer to produce a cement that will get its maximum strength in the shortest possible time.

Data were submitted showing the relative strength of an American and of imported Portland cements as determined by several engineers, and they showed in every case the marked superiority of the former.

In the lines of improvement mentioned, viz.:

1. Better preparation and more accurate mixing of the raw materials.
2. Uniform and complete incineration.
3. By fine grinding.

This country has taken the foremost position, equalling at least in the first particular any other country and in the second and third easily leading the world.

In the discussion a number of points were brought out.

The boiling test is the most accurate in determining soundness and stability. Any cement that will remain intact in boiling water for eight or ten hours is permanent, and there is not the slightest possibility of any cement standing this test ever showing any but the fluctuations in test due to climatic and other conditions, even as natural rock, which must be presumed to have attained the maximum strength, varies at different times.

In the present specifications, of architects at least, the requirements are based upon the kind of cement used 10 or 20 years ago, when concrete made of, say, one part cement, three parts sand, and three of crushed stone was satisfactory. With the better grades of German and American Portlands, it is believed that one part cement and four or five parts sand, and four or five parts of crushed stone to one of mortar is sufficient.

Reference was made to the slag cements and some instances of their use in foundation and wall work under trying conditions and with satisfactory results.

### TUNNEL EXCAVATING MACHINE.

The work of constructing the tunnels of the London Central Railway, which are now nearing completion, has been materially advanced by the use of an excavating machine, especially designed for the purpose. The rotary cutters failed in hard clay soils containing chalk and large stones, and a new cutter was constructed by the contractors, Walter Scott & Co., and described in "Engineering" of London.

It was essential that the machine be able to excavate

can be withdrawn so that hand work can at once be resumed whenever conditions demand it; and it must be so constructed that the direction of the shield can be controlled and the lines and bevels conveniently checked.

A side view of the machine is here given. It runs on a track 6 ft. 3 in. gage with an opening beneath it 5 ft. 8 in. high, sufficiently large to admit the small cars used in conveying the earth to the surface. A 25-h. p. motor is mounted at the back end of the carriage and connected to the shafting by a worm and gear, driving the endless chain, raising and lowering the cutters and propelling the carriage. As the excavating buckets run at a comparatively high rate of speed, especial care has to be given to the feed. All the levers and wheels for the control of the machine are within easy reach of the operator, who stands on a small platform at the side of the machine. The bucket ladder is fitted with a screw extension device for tightening up the bucket chain. The buckets are really scrapers and each has four or five teeth, placed alternately, chisel-shaped and fitting into recesses cast in the back of the buckets. Cast steel was first used in these buckets, but as one or two were broken, gun-metal has since been employed with better results.

In operation, the excavator is brought up to the face and scrapes out all that it can reach in a space 18 to 24 in. beyond the front of the shield; the area covered being shown in the accompanying diagram. The machine is then run back 10 or 12 ft. clear of the face and the shield is pumped forward, the cutting-edge bringing down the earth not touched by the excavator. This insures a clean cut and no cavities. The iron lining is next erected and bolted up and the excavator is again set to work. While the machine is not as large or heavy as experience shows would be desirable, the only stoppages have been due to the breaking of buckets. As it is, the saving over hand-labor is very considerable, and an average advance of three 20-in. rings is made in 10 hours, with eight men at the face, including the machine operator.

### A PECULIAR ACCIDENT.

May 26 a workman on the South Side Elevated, Chicago, dropped a tool which made electrical connection between the third rail and a large gas pipe carried on the structure. A hole was burned in the pipe and the gas ignited. The fire department was called out and traffic between the downtown terminus and 33d street was blocked for over two

TUNNEL EXCAVATING MACHINE, LONDON CENTRAL RAILWAY.

through beds of hard clay, chalk formation and not be damaged by large boulders; the earth must be delivered at a height sufficient to drop it into cars; it must not form an obstacle to any other tunneling processes, and such that it

hours. The wiring in several cars was burned out and the cars set on fire. A few days previous to this another one of the cars was set on fire by arcing in a portion of the electrical equipment.

# ACCOUNTANTS' DEPARTMENT

Chairman C. N. Duffy, of the permanent committee of the Accountants' Association on "A Standard System of Accounts," together with his associate members are steadily working on their big undertaking. In order to secure additional data to work on and guide the committee, the following letter is issued which deserves not only the careful study of every manager and accountant, but a prompt and full response. The deluge of demands upon the time and attention of officials often leads them to neglect appeals of this kind, with which they fully intended to comply, and it is urged that the importance of this work deserves an immediate and special recognition. The committee is exceptionally strong and well qualified for the task they have consented to assume, and were it simply a matter of personal compensation we know no one of them would undertake it for anything short of a very large amount. As a matter of fact the street railway interests of the country could well afford to pay \$10,000 rather than not have this work done. The several gentlemen, however, are freely giving their time and labor and experience without any hope of personal remuneration, and purely for the general good to all. Hence we repeat, the appeal of the committee, not for money, but for a little information, deserves the unqualified assistance of every road, for every company in the country will be benefited by the results. The letter referred to is as follows:

St. Louis, May 20, 1898.

Dear Sir: The permanent committee of the Street Railway Accountants' Association of America, on "A Standard System of Accounts" begs leave to acknowledge the receipt of your reply to the circular postal card of W. B. Brockway, secretary, sent out Jan. 15, 1898, relative to the adoption of the standard system of accounting, as recommended by the association at the convention held in Niagara Falls, N. Y., October 19-22, 1897, which reply was forwarded to the committee by Secretary Brockway for the use of the committee.

From the 31 replies received by Secretary Brockway, it would appear that the standard system as recommended by the Niagara convention is, in the main, satisfactory, and in its general features very closely conforms to the system used by the different street railway companies, which are members of the Accountants' Association. This, together with the fact that a number of street railway companies, some of them the largest in the country, put the standard system as recommended by the Accountants' Association into practical operation, on January 1, 1898, and have found it practical, and in the main satisfactory, although there is room for improvement in many of the minor details, may be regarded as a cause for congratulation by the Accountants' Association, and is the first practical step taken to have a standard system of street railway accounting adopted and used.

Some of the members were good enough to point out objections to the standard system, giving their objections in detail and their reasons for the same, together with some

ideas and suggestions of their own. This is the kind of criticism and assistance that the committee stands most in need of. With that end in view, we call upon you to co-operate with the committee and give us the benefit of your ideas and experience, with such criticism as you may see fit to make, as it is our ambition to do all in our power to perfect the standard system recommended by the Accountants' Association, secure its adoption and use by every member of the association, and have it endorsed and approved by the officials of every state in the United States who exercise any supervision over the books and accounts of street railway companies in their respective states.

Will you kindly assist the committee by replying to the following questions, so that we may have your reply on or before July 1, 1898:

1. Has your company adopted the standard system of accounts?
2. Has your company found the standard system practical and satisfactory?
3. Has your company found objections to the standard system; if so, please state them in detail.
4. What suggestions can you offer or what criticisms can you make to perfect the standard system?
5. On what date did your company put the standard system into operation?
6. On what date does the fiscal year of your company close?
7. Do the state officials of your state exercise any supervision over the books and accounts of your company?
8. If your company has not adopted the standard system, has the matter been considered at all?

Your prompt reply will be gratefully appreciated by the committee and will materially aid it in the work.

Very respectfully,

C. N. DUFFY,  
WM. F. HAM,  
J. F. CALDERWOOD,  
H. L. WILSON,  
H. J. DAVIES,

Committee.

Please address all communications to C. N. Duffy, 3820 Easton avenue, St. Louis.

Mr. Duffy advises us further that Henry F. Billings, chief clerk to the Railroad Commissioners of Connecticut, has signified to Elmer H. White, of the Hartford Street Railway, that he will be present at the next meeting of the Committee.

Two verdicts, one for \$5,000 and one for \$8,000, were recently recovered against the South Covington & Cincinnati Street Railway Company in one week.

A Brooklyn motorman fainted when he ran his car over what he thought was a man on the track, which proved to be a dummy of straw.

## THE LARGEST STORAGE BATTERY INSTALLATION.

The conditions governing the installation of a storage battery in a central station are similar whether the current be used for lighting, power or street railway purposes. The functions of the battery are that it shall be a voltage regulator and act as a reservoir giving an economic load for the generating machinery and returning the energy to the circuit when most needed. A problem presented itself to the Chicago Edison Company, which has demanded the attention of many street railway managers, viz., at a certain time in the day there was a peak in the load requiring more current than could be efficiently generated at the stations. The alternative lay between the addition of more engines and dynamos or a storage battery.

In the winter time the peak of the load comes on about 4:45 p. m. lasting from  $\frac{3}{4}$  to  $1\frac{1}{4}$  hours and being 12,000 amperes above the normal load. This maximum in the downtown district increased from 36,000 amperes in 1896 to 44,000 amperes in 1897 and will reach 55,000 amperes this coming winter. The arrangement of the stations and the distributing system was very favorable to the installation of a battery, both financially and from the standpoint of its effectiveness. The battery installed is the largest in the world, and has a capacity of 22,400 ampere-hours at an 8 hour rate and will be able to discharge 11,000 amperes for about  $1\frac{1}{4}$  hours. It consists of 166 cells, 60 of which are end cells, 83 on each side of the three wire system. This large number of end cells is required to meet the wide conditions of pressure. The battery is called upon to deliver 140 volts on each side at the end of discharge and in case of an emergency to deliver current at the maximum of 120 volts on each side when fully charged. Each cell contains

END CELLS IN BATTERY ROOM.

87 plates, type "H" made by the Electric Storage Battery Company, of Philadelphia. The positive plates are of the standard Manchester type and are  $15\frac{1}{2}$  by 32 in. Each tank is  $21\frac{1}{2}$  in. wide by  $79\frac{3}{4}$  in. long by  $43\frac{7}{8}$  in. high and weighs 6,200 lbs. The total weight of the battery exclusive of conductors is 1,029,200 lbs. The tanks are constructed of 2 in. ash lined with 5-lb. sheet lead. Each tank is sup-

ported on 10 double petticoat insulators resting on tiles laid on the acid proof floor.

The current is carried from the Harrison street station to 139 Adams street, the site of the original plant, over a trunk line 3,500 ft. in length and then distributed. The old Adams street site was therefore a very favorable point for a battery installation, since a large trunk line investment

REAR PORTION OF BATTERY ROOM.

was avoided. Moreover, the center of load of the system has been gradually moving farther away from 139 Adams street, so that for good regulation at time of maximum load in winter with feeders varying from 800 to 3,000 ft. in length, either a booster system or a large outlay in copper had to be considered. The battery is located in the basement of the office building of the company at 139 Adams street. Precautions were taken to see if the footings of the columns supporting the floors above would be sufficient to sustain the weight of a duplicate installation in the future. New footings were necessary and the building temporarily was shored up. The question of permanency in every detail was the first consideration as the size of the installation and the limited area and head room made alterations in the future out of the question.

The matter of sub-drainage, surface drainage, supports for the cells, as the building is not piled and is on soft ground, the floor and protection of the columns and iron beams supporting the upper floors of the building and the ventilation, were most carefully investigated. A sub-drainage system of 3-in. tile pipes laid in concrete was installed and surface drainage lead pipe laid in sand draining several lead lined sumps and both draining into a large sump at the extreme south end of the room, which is emptied by a lead lined centrifugal pump and discharged to the sewer.

To prevent settling five 4-in. 1 beams were laid crosswise under the cells, the space between being filled with concrete. Over this a few courses of tarred felt were laid.

The floor is of vitrified shale tile, 10x11x2 in. laid in a mixture of 70 per cent of asphalt and 30 per cent of coal tar. The bottoms of the columns are encased in lead. The columns were carefully cleaned, then treated with a galvanic varnish and afterwards encased in wire lathing and covered with an alkaline cement plaster and then covered with a

coating of anti-acid paint. All of the walls and ceilings are treated with the same plaster and are rendered impervious to acid fumes.

For ventilation two ducts on opposite sides were run the entire length of the room, one for blowing in fresh air, the

VENTILATING DUCTS IN BATTERY ROOM.

other for exhausting. This affords several cross currents of air and effectually removes the gases which are conveyed to the roof and blown to the outer air.

The end cells are connected to the end cell switches by lead covered copper bars  $6 \times \frac{1}{2}$  in., supported by insulators resting on iron girders strung between the columns of the building. The main connection of the battery consists of two copper conductors giving a sectional area of 6 sq. in. The lead coating of the copper is a special feature which

FEEDER AND STORAGE BATTERY SWITCHBOARDS.

renders the copper impervious to the action of the acid and gases.

There are three end cell switches on each side of the system. These switches have 30 points and are capable of carrying 2,750 amperes each. The connection between the

30 contacts and the bus bar of the switch is made by a laminated copper brush travelling on a screw operated by a  $\frac{1}{2}$ -h. p. series motor. These motors are put into operation by push buttons on the controlling switchboard, but are stopped automatically when the brush reaches the mid point on the contact block by an automatic device which breaks the motor circuit and short circuits the armature. The method insures the positive action of the end cell switch without requiring attention of the switchboard operator. These switches are provided with a hand wheel for hand operation if desired. The gear wheels are provided so that the three switches can be geared together and operated as one switch, thus giving a capacity of 8,250 amperes on each side of the system.

The controlling board is connected to the bus bars of the end cell switches by 12 cables of 1,500,000 c. m. each. On the controlling board there are three single pole switches for each end cell switch enabling it to be connected to either the main, auxiliary or charging buses. Each end cell switch has an indicator on the controlling panel operated mechanically by light shafting and gearing which shows the operator the exact position of the traveling brush on the end cell switch at all times. On each panel of the board there is a 30 point voltmeter switch connected to a low reading voltmeter, which enables the operator to take the voltage of the end cell switches.

One of the important features in connection with the battery installation is the method of charging without the use of boosters, which are ordinarily employed. The method of charging this battery is to operate a pair of 200-k. w. machines in the Harrison street station at about 180 volts, which is the voltage required for charging, and send the current over a portion of the trunk line to the battery station. The voltage regulation of the dynamos being effected by an automatic control of the field resistance by means of small motors, which are controlled by the operator in the battery station at Adams street, small lead covered cables being run from Adams to Harrison street connecting with the motors controlling the field boxes. These generators which are used for charging are not generators specially made for the purpose, but are the same ones which at other periods of the day are used to feed into the main bus bar of the station, thus saving an investment of about \$15,000 in boosters as well as providing a system of charging, which is very much more economical than the one in which boosters are employed.

The battery will be kept in circuit at all times during the day time in summer, keeping the engines at the central station working at the most economical point, the battery being ready at any time to take care of any sudden increase in load which may occur in the system, as well as taking care of the peak in winter time, for which purpose it was primarily purchased. By maintaining the battery on the circuit continuously the necessity for regulation of pressure at the central station is very much lessened.

In a paper before the National Electric Light Association on "General Distribution from Central Stations by Direct Currents," L. A. Ferguson, general superintendent of the Chicago Edison Company, has this to say on the subject of storage batteries:

One of the advantages to be derived from the use of direct current distribution as distinct from alternating current dis-

tribution, is the employment of storage batteries. They may be adopted for use in various ways, in sub-stations in outlying districts where the load factor of the district is very small, in the central stations themselves to deliver the entire output during period of minimum load, at the centers of distribution for discharging during the peak, as auxiliaries in rotary transformer sub-stations for discharge use at the time of the maximum load in the main central station. In addition to any one of the various ways which the battery may be employed, it always acts as a reserve, guaranteeing the consumer good service, in much the same manner as a bank surplus is a guaranty to the depositors in cases of financial emergency.

Storage batteries when installed in central stations or centers of distribution are usually connected to the main bus and allowed to float on the system taking a charging current from the bus or discharging into the bus according to the load on the system, the generating units being worked at such load as will insure the best efficiency of the entire system.

Batteries are economically valuable in connection with the distribution of direct current in systems whose load curve has an average peak width of not more than two hours, since the investment required for storage batteries to carry the peak having an average width of less than two hours is less than the investment required in steam and electrical machinery to do the same work. The storage battery also has the same value that exists in the case of moving machinery as a reserve in meeting sudden increases of load, provided such increase of load does not continue for a sufficient period to wholly discharge the battery and insufficient time remain for recharging before the ordinary

load peak of the system appears at the regularly appointed time. Such a condition is rarely and I might say almost never met with, although in rare instances we may approach this condition.

The steam and electrical machinery is rated by the horse power

or kilowatt, and the duration of the load peak does not influence the value of the investment since the machinery may be operated for the full 24 hours at its maximum capacity. The storage battery, however, is rated by the h. p.-hour or k. w.-hour, and the investment is nearly directly proportional to the number of hours during which it discharges the maximum capacity, so that if we required the battery to be prepared to carry the full peak prolonged for seven or eight hours every day the investment in battery would be enormous as compared with steam and electrical machinery to furnish the same kilowatt hours output. Illustrative of such contingency, let me refer you to the load diagram marked "D," representing the load in the business district of Chicago, December 20, 1897. This is a very extraordinary curve, illustrating the limitation of the storage battery and the possibility of its being rendered ineffective had the early

morning peak extended to the arrival of the regular afternoon peak, without affording sufficient time for recharging the battery.

The storage battery has a very distinct value, which is seldom recognized and employed to its full advantage, when located at the central distributing point of a system with feeders radiating to various points in the net work. The battery may be provided with two or more end cell switches, so arranged that they may be connected in multiple and feed into the main distributing feeder bus, or they may connect also to one or more auxiliary busbars with a different number of cells in series, feeding into each bus thus providing two or more potentials at the center of distribution. It will be found that when only one pressure is maintained at the center of distribution during the time of maximum load of a large district that the pressure at the ends of the short feeders will be somewhat higher than the standard and they will be overloaded, and at the end of long feeders the pressure will be lower and the feeders underloaded, although the pressure variation at other times may be negligible. Under such conditions the storage battery becomes exceedingly valuable, for by arranging it to operate at two or more potentials, the long feeders may be connected during the time of maximum load to the auxiliary bus or buses and additional current forced over them, utilizing their full capacity and maintaining a uniform feeder end pressure by means of an investment in end cells very slight as compared with the investment in additional feeders and mains required to accomplish the same result.

## A NEW UNDERGROUND ROAD IN PARIS.

The Orleans Railroad operates about 4,300 miles of track in the west and southwest parts of France and has its Paris terminal in the extreme eastern part of the city at the Place Valhubert. Inasmuch as the travelling population lives in the opposite part of the city the company wishes to prolong its line some  $2\frac{1}{2}$  miles to the Quai d' Orsay as indicated by the heavy line on the accompanying map. This involves an expenditure of about \$8,000,000.

The new road will have two tracks and will drop from the Vallhubert station on a grade of 1.1 per cent towards the Seine. Here the river banks are in two stories, an upper quay or roadway, and a lower quay used as a dock or wharf for canal boats. A belt 9 meters wide has been secured on this lower quay, and the line will follow this in the open for 650 meters. It will be an underground road beneath the upper quay for the remainder of the distance until it reaches the terminus under the Cour des Comptes. Openings in the wall side of the quay facing the river will afford light and

MAP OF PARIS SHOWING EXTENSION.

ventilation. The rail level is about that of the normal height of the water; any seepage water in times of flood will be gathered in a sump and drained out.

The road follows the line of the Quai's St. Bernard de la Tournelle, de Montebello, St. Michael, des Grands Augustins, de Conti, Malaquais and Voltaire to the Quai d' Orsay, passing the bridges, Ansterlitz, Sully, de la Tournelle, de l' Archeveche, au Double St. Michel, Neuf, des Arts, du Carrousel, Royal, and Solderino. From the Pont Sully to the Petit Pont the underground construction will be a masonry arch nine meters span for a length of about 900 meters. From this point, for another 500 meters, the upper roadway will be carried by a metallic arch and for the balance of the distance the masonry arch construction will be resumed with a span of about 8 meters.

About half way between the Place Valhubert and the Quai d' Orsay, between the Petit Pont and the Pont St. Michel a station will be built, known as the station du Pont St. Michel. The Quai d' Orsay station—the terminal station, will lie between the buildings of the Caisse des Depots et Consignations and the Palais de la Legion d' Honneur and between Pont Royal and the Pont de Solferino. It has been designed by M. Sabouret, chief engineer of the Central

Service. The Orsay station will have fifteen tracks, any one of which can be used for arriving or departing trains. According to the present plans, the three tracks nearest the river will be used for side tracks, the next four tracks for the long distance departing trains, the next two for arriving and departing suburban trains, the next two for arriving long distance trains, the next two for arriving and departing suburban trains and the last two for station service.

It is possible that at a future date the Western Railroad of France and the Belt Railroad of Paris may bring their terminals to the proposed new station and thus unite the three systems.

The present plans are for the operation of this underground road by electricity, making the generating station (which will be at Vallhubert station) of sufficient capacity to move four 200-ton trains.

In order to investigate heavy electric traction as practiced in this country, M. E. Solacroup, assistant chief engineer of material and traction, M. Sabouret, chief engineer of the central service, and Messrs. Liberty, Fernenville and Walton, made a tour of inspection, visiting New York, Chicago, Baltimore, Cleveland, Niagara Falls, Buffalo, Boston, Schenectady and other cities. At Schenectady the General Electric Company arranged a special test on its experimental track. A motor car of the Nantasket Beach pattern, equipped with four G. E. 55-175-h p. motors hauling a train which with the motor car weighed 320 tons was used.

The question of rendering the third rail innocuous after the passage of the train having been brought up, the General Electric Company arranged an exhibition of its method of effecting this result. A section of the third rail was measured off and divided into sections in lengths varying from 30 ft. to 500 ft. Connections were made between these and a system of automatic switches, and the conditions of the General Electric system of surface contact, almost exactly reproduced. By this system, the arrangement of circuits is such that the sections into which the rail is divided may be of any length from that of a few feet to any number of miles, that is any section of the conductor rail will be alive only when the train itself is running over that section. Pilot lamps were used as a visual means of indicating which sections were alive.

Before the French engineers left New York a banquet was tendered them at Delmonico's.

## DECORATION DAY IN ITHACA, N. Y.

On Decoration Day the Ithaca Street Railway Company provided an elaborate and varied entertainment at its Renwick Beach Park on Lake Cayuga, which proved to be a great success. The program included:

- 11 a. m.—Cornell crew in practice.
- 2 p. m.—Variety performance in pavilion.
- 3 p. m.—Balloon ascension; thrilling parachute drop of one mile.
- 4 p. m.—Great war pictures; comedy; music.
- 4 p. m.—Base ball game on Percy Field; Cornell vs. Columbia.
- 7:30 p. m.—Ithaca Band, selected music.
- 8 p. m.—Performance, war pictures, etc.
- 8:30 p. m.—Fireworks; elaborate display, special set pieces, etc.

## AN INTERESTING SOUVENIR.

Benjamin J. Weeks, superintendent of the Quincy & Boston Street Railway Company, has sent to the REVIEW a polished granite disk some  $3\frac{1}{2}$  in. in diameter and  $\frac{3}{8}$  in. thick which was cut from a sleeper used in the construction of the first railway built in America, completed October 7, 1826, leading from the granite quarries of Quincy to the Neponset river. At the meeting of the Massachusetts Street Railway Association, held in Quincy in July last, the Quincy & Boston road presented similar blocks to the delegates.

## EXCELSIOR SELF-OILING TROLLEY HARP.

We show in the accompanying illustration an improvement in trolley harps. The manufacturers state that this harp has been adopted by the Rapid Railway Company, the Mt. Clemens Fast Line, and the Sandwich, Windsor & Amherstburg Railway after a trial of 30 days. The former company states that "it was used on one of the fast cars having two 75-h. p. motors geared to 50 miles per hour, and that it ran 7,652 miles with one oiling and showed no wear of any parts." The latter company states that "after 30 days there was enough oil left for another 30 days, that there was a great saving of oil and labor, and no leakage on top of cars."

SELF-OILING TROLLEY HARP.

It would seem from this that this trolley harp would supply a long felt want.

The company also states that it believes, with oil of proper consistency, and with axles  $\frac{3}{4}$  in. to  $7\frac{1}{8}$  in. in diameter, they will run 60 days with one oiling; it considers the axle at present used,  $\frac{1}{2}$  in. in diameter for a 6-in. wheel, too small for the best results. It is prepared to make quotations on harp, wheels and bushings, complete or separately, also to supply harps with larger axles and bushings.

Referring to the cut, each side of harp holds one ounce of oil. C is the main reservoir; A the auxiliary reservoir; D, filler plug; E, feed to axle; H, felt to prevent rapid flow of oil; B, passageway through which oil passes to auxiliary reservoir when trolley is reversed at the end of a trip. After long use the harp can be blown out with steam and cleaned, by simply taking apart and blowing a jet of steam through the filler plug, D. Any further information will be cheerfully given by the maker, the International Specialty Company, 113 7th street, Detroit, Mich.

## TEA-POT FARE COLLECTORS AGAIN.

The Union Street Railway Company, of Saginaw, Mich., George B. Morley and Homer Loring, receivers, has found the "tea-pot" system of collecting fares a source of trouble.

On April 1 the receivers adopted the Mehling fare box system, the operation of which requires the passenger to deposit his own fare in a metal safe carried by the conductor. Some objections were made by passengers to the use of these safes and a number of them refused to deposit the fare in the safe, but tendered it to the conductor. Thereupon the receivers had posted in the cars notices forbidding the conductors to receive fares, and informing passengers that they must deposit their fares in the safe or be ejected from the cars. The refusal of M. C. L. Kitchen to deposit his fare led to his ejection, and he applied to Circuit Judge Wilber, one of the judges of Saginaw county, for leave to sue the receivers for damages.

The petition for such leave alleged that the fare boxes or safes were an unreasonable regulation and that their use ought to be prohibited by the court. After a full hearing, Judge Wilber made an order sustaining the receivers' right to use the fare boxes, holding that they were a reasonable and proper regulation, and dismissed the petition.

The conductors objected to the safes on the ground that they were a reflection upon their honesty, and so distasteful were they to some of them that they persistently refused to collect the fares with them and to ring the number on the register. Conductor John C. Smith, during the time he used the box, persistently refused to register the fares collected, there being an average of 12 per cent difference between the fares in the box and the number registered. He was warned by the receivers that unless he complied with their requirements and operated the box properly he would be discharged. Notwithstanding this warning Smith continued to refuse to ring the fares properly, and the result was that he was laid off for one week without pay.

Smith presented a petition to Judge Snow, the other circuit judge for the county, asking that he be allowed pay for the week he was laid off, and also that the court make an order compelling the receivers to stop the use of the Mehling system and to return to the old overhead register system. Both of these orders were made by the court on May 2, the receivers being directed to return to the overhead register system of collecting fares within 10 days.

The case was taken to the supreme court, it granting an order directing Judge Snow to show cause why his order should not be set aside, and suspending its operation temporarily.

The case is both unique and important, and the decision of the court will determine to what extent the employes and patrons of a street railway company may dictate its management. In this respect it is of interest wherever a street railway system is in operation.

The Wilkesbarre (Pa.) & Wyoming Valley Traction Company has discontinued the sale of books of 100 tickets for \$4, and will hereafter sell 100 loose tickets for \$4.25.

It is stated that Louis Enricht and Paul E. Hirsch, of Chicago, will sue the Cañon City & Cripple Creek Electric Railway for \$200,000 damages, because of their arrest by parties connected with the road.

## RECENT ELECTRIC RAILWAY PATENT DECISIONS.

Two patent cases of importance were decided in May, one was the series-parallel controller case decided May 19 in the United States Circuit Court for the district of Connecticut, and the other the railway motor suspension case decided in the United States Circuit Court of Appeals, second circuit, May 17.

The first of these promises to be far-reaching in its effects. In the early development of electric railroading, it was found advantageous to employ at least two motors upon a car. Various plans of regulation were adopted, some depending upon varying the amount of field magnet winding included in the circuit or changing the mutual relations of a plurality of coils on one field magnet or the relations of two motors bodily; others relying upon the varying of a dead resistance included in the motor circuits. This latter, known as the rheostatic method of control, was very wasteful, since all the energy which was converted into heat in the rheostat was in reality lost and this loss was practically perpetual and also represented a considerable percentage of the total energy of the motor circuit. The method of varying the internal resistance of the motor by varying the connections of the coils avoided in a large measure this waste of energy, but notwithstanding its economical advantages it was not generally adopted because the practical disadvantages involved in frequently changing the relations of the coils during active work more than counterbalanced its economies. Mr. Sprague probably did as much work as any one upon that principle, confining his changes, however, to the field coils; but he finally abandoned it and went back to the old rheostatic method because it was found that changing the connections of the field coils was accompanied by the production of such high induced electro-motive forces and inrushes of current as to break down the insulation of the field-coils and the armature. The cause of this difficulty was not apparent at first and it took some time to find it out. The same high inductive voltage also produced excessive sparks at the brushes and caused other damage to the armature and the switch. Theoretically the advantage of the series parallel method is available only where two motors are used and the controller can take care of the armatures as well as of the field magnets and so effect a change of the motors bodily from series to multiple. Hopkinson in 1881 and Curtis and Crocker in 1882 had proposed to utilize the series parallel principle by connecting the circuits of a motor so as to vary the internal resistance, but so far as known never reduced their ideas to actual operation. Condict supplied the remedy and this may be stated briefly to be the provision that at the time of changing the circuit connections the controlling switch shall act to automatically introduce into the circuit a "dead" auxiliary resistance, and then when the new connection has been effected, shall gradually and automatically cut the resistance out. The function of this resistance is to reduce the current flowing so that at the time of making a change in the motor connections, the current is small compared with what it would be if these resistances were not inserted. This resistance is then gradually cut out of circuit.

The fields may be changed from a position in series with each other, or in parallel, as a whole, or two coils on each

field may have changeable connections of a similar character, and the motors as a whole (both fields and armatures), may also be arranged as entireties, either in series or in parallel.

For variations in speed of less extent than are involved in the greater changes of circuit connections, the auxiliary dead resistances may be utilized, and these more delicate gradations of speed may be effected by intermediate movements of the controller handle.

Condict pointed out two uses of combined "live" and "dead" resistances as his invention; (1) the temporary use of artificial resistances as a means of protecting the circuit and the apparatus at the time of shifting circuit connections, in making or breaking contact; and (2) the temporary use of supplementary resistances, at times when circuit changes are not necessarily in progress, for producing variations of resistance and consequent variations of speed of the motor, which could not be conveniently made by circuit changes only.

Since the introduction of the Condict method of series-parallel control it has superseded all other methods, and it is safe to say that practically every street car controller to-day employs it. The decision, therefore, rendered by Judge Townsend sustaining the claims relating to this method of control goes far towards placing the practical control of the electric railway business in the hands of the General Electric and Westinghouse Companies, who control the patent.

The decision on the spring suspension of the motors is also an important factor entering into the future of railroading. All manufacturers of electric railway motors have thus far found it necessary to flexibly support one end of the motor and to sleeve the other end upon the axle of the car. There is no obvious way of avoiding the patent. This decision, in connection with the decision on the controller patent, promises to be of great value to the General Electric and Westinghouse Companies to which the rights of both patents belong. It has been remarked that it was possible by a sufficient expenditure of time and money for litigation, to ultimately defeat any important patent, and the more important and valuable the invention, the more difficult it has been found to secure to the inventor his just reward. The encouragement afforded therefore to inventors generally, and to those engaged in the development of the electrical arts, by these two decisions will be considerable.

---

## PICTURES OF NAVAL BATTLES.

One of the features which attracts the most attention at the New York Electrical Exhibition is the Edison projectoscope, by means of which what may be termed picture reports of the war are reproduced. A film taken at Havana shows the "Funeral of Nine of the Maine Victims"; it comprises over 2,500 pictures. F. Z. Maguire, who is representing the projectoscope at the Exhibition, states that one of the company's representatives will be among the first to land in Cuba, and that as one of its men was at Hong Kong when Dewey sailed for the Philippines it is the natural supposition that we shall soon have a realistic picture of the battle of Manila. It is needless to say how such a scene would thrill the beholder at this time. As a pleasure resort feature it is one of the best.

**Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.**

The New Jersey Electric Railway has won in a \$10,000 personal injury suit recently brought against it.

The Citizens' Street Railway Company, of Muncie, Ind., has granted a substantial increase in wages to its motormen and conductors.

The Joliet (Ill.) Railway Company is making a number of changes at its power house and adding new generators, engines and boilers.

An experimental train equipped with dynamos for lighting driven from the car axle is now in operation on the Chicago, Rock Island & Pacific Railway.

The contract to construct the Catcetin & Myersville (Md.) electric railway has been awarded to F. S. Douglas, who expects to complete the work by August 1.

The plan proposed in the city council of Buffalo for a lower fare will have to wait till the legislature meets, as the street railway has an agreement with the city for a 5-cent fare.

B. F. Stewart, of Chicago, sued J. A. Henry, formerly the president of the Joliet Railway Company, for his commission in negotiating the sale of the road, and was awarded \$8,850.

The common council of Niagara Falls has, after about a year's consideration, denied a franchise to the Tonawanda Street Railway Company to lay tracks through certain streets in that city.

The Massachusetts Railroad Commissioners have recently issued a special report upon the plans for providing better street railway terminal and transfer facilities at Harvard square, Cambridge.

The Decoration Day crowd at Oshkosh, Wis., was very large but the transportation facilities proved ample. Manager E. E. Downs, of the Citizens' Traction Company, so arranged the schedule that excellent service was rendered.

G. D. Chapman and M. J. Meyers have been appointed receivers for the Syracuse & East Side Railway Company as a result of foreclosure proceedings instituted by the bond holders on account of the non-payment of interest. The property will be sold.

One Bramwell, alias Clark, who tried to pass himself off at Quincy, Ill., as a Pinkerton detective, was taken to Kansas City, Mo., where he was wanted on the charge of stealing \$2,000 worth of copper wire from the Metropolitan Street Railway.

The Red Bank (N. J.) & Long Branch Electric Railway Company has passed into the hands of a receiver. At the

request of President Greenburg, J. E. Degnam was appointed receiver. The road has been losing money constantly, the opposition to its construction and its great initial cost doomed it to failure. It will likely pass into the hands of some of the large trolley companies.

The directors of the Palmer & Monson (Mass.) Street Railway have bought the Forest Lake property, about 5 miles north of Palmer, and if the consent of the Railroad Commissioners can be obtained will transfer it to the company for a pleasure resort.

The Fox River Valley Electric Railway Company, of Appleton, Wis., is experiencing some difficulty in keeping the embankment, which carries its road over the slough, in repair. Muskrats dig holes in the clay, which are enlarged by the rise and fall of the water in the lake.

It is reported that the Metropolitan Company, of New York, had made a contract for the equipment of the 28th and 29th street line with the Hoadley-Knight motor. Twenty cars are to be put on, to be supplied with power from a newly erected station in West 23d street.

The Manhattan Elevated, of New York, must soon raise over two million dollars by a sale of bonds. The floating debt has in two years increased to \$1,136,729; and in addition it has to pay land damages. There are now in litigation taxes to the amount of over \$914,000.

The Monongahela Street Railway Company, on May 20, let the contract for the construction of the Homestead and Duquesne boulevard, including tracks between Homestead and Munhall. One fare will be charged from Pittsburg to Braddock and Homestead and two fares to McKeesport.

The Consolidated Street Car Company, of Fort Wayne, Ind., invited the children of the orphan asylums in the city to take a ride over the company's lines and see all the attractions at Robinson Park, including a theatrical performance especially prepared for them. On the succeeding day a like treat was given the newsboys of the city.

By reason of some dispute between the Toledo Traction Company and the Toledo, Bowling Green & Fremont Railway Company, as to the terms of the contract under which the latter operates cars over the tracks of the former, there was a lively war for a few days last month. It was attempted to keep the Bowling Green cars off the city tracks.

George J. Gould, president of the Manhattan Elevated Railway Company, New York, has accepted six of the seven franchises offered to the company by the rapid transit commissioners at the rental of  $\frac{1}{2}$  of 1 per cent of the gross passenger receipts. The company refuses to accept the Amsterdam avenue underground line at any price.

Announcements for the summer quarter, giving an outline of the course of study at West Virginia University, Morgantown, W. Va., have been sent to those interested. W. S. Aldrich, professor of mechanical engineering, calls attention to the fact that the university carries on its educational and scientific work throughout the year without interruption.

The San Francisco & San Mateo Electric Railway Company recently awarded the prizes in its semi-annual merit contest; five conductors received medals and \$5, and five motormen received medals and \$10.

Attorney-General Hancock, of New York, granted permission to the minority stockholders of the Kings County Traction Company, of Brooklyn, to begin suit for the appointment of a receiver to dissolve the company.

It is again reported that the Third Avenue Railroad Company, New York, will substitute the electric conduit for horse car traction. Plans are being prepared and the work will doubtless be completed within the year.

The inventory of the personal estate of the late George Handy Smith, ex-state senator, of Philadelphia, shows assets of over \$235,000, consisting for the most part of street railway stocks of Philadelphia, Pittsburg and Baltimore companies.

Willow Grove Park, the pleasure resort of the Union Traction Company, of Philadelphia, was opened for the season on May 28. The company has issued an attractive souvenir, a handsomely illustrated brochure, containing a fund of interesting information about the park and environments.

The Central Trust Company, of New York, has secured a judgment in the Federal Court for \$22,750 damages against John C. Hubinger, the principal owner of the Keokuk (Ia.) Electric Railway & Power Company; the litigation grew out of the purchase of the road, which was sold under an order of a state court and purchased by Mr. Hubinger.

The gross earnings of the Brooklyn Rapid Transit Company for the month of May have shown a gratifying increase over the corresponding time in 1897 and 1896. The receipts were \$528,324, which is more than \$40,000 above those of a year ago. For the 11 months, ending May 31, the earnings were \$5,095,189, being \$272,000 more than last year and \$440,000 more than in 1896.

A Cincinnati street car struck John Benson, a man 64 years of age, and carried him for 100 ft. on the fender. He was taken to the hospital with bruised arms and knees but he was very cheerful and had great confidence in his vitality. He said, "It was partly my fault but they can't kill old fellows like me so easily." He then combed his hair, brushed his clothes and returned to his home.

There are many articles lost on street cars and never claimed, and the companies usually have large quantities of such articles packed away in a store room. Instead of accumulating them the Metropolitan West Side Elevated Railroad Company, of Chicago, holds them for 90 days after the end of the month during which they are found and then returns them to the conductors or guards who sent them to the office.

Two of the graduates at Vassar, this year, came from families well known to the street railway fraternity. Miss Roberta McCulloch, daughter of Capt. Robert McCulloch,

general manager of the National Railway System, St. Louis; and Miss Bean, daughter of W. Worth Bean, president of the St. Joe & Benton Harbor road. Both young ladies ranked high and graduated with honors. The graduation was attended by Mr. and Mrs. Bean and Mrs. McCulloch.

General Manager Hippee states that only two employes of the Des Moines City Railway enlisted on the first call, though the second call will probably take a number of others. The company issued the following bulletin:

"Any employe of this company who desires to serve the Government in military or naval organizations can, upon his proper release from such duty, and his return, have the position he now occupies with this company, or an equivalent one without any change in his standing."

### CAR REPLACER.

The car replacer, which is here illustrated, is one lately designed by L. W. Olmstead, which is said to operate very satisfactorily and greatly facilitate the work of getting a derailed car back onto the track. The block is of well-seasoned hardwood, 26 in. long, 9 in. wide, and of a thickness to suit the height of the rail; it is beveled for 13 in. at one end, and 4 in. at the other, leaving a level surface 9x9 in. on top. The

CAR REPLACER.

block is covered with boiler plate, held in place by counter-sunk bolts, which pass through the block and through nuts at the back, and terminate in spiked points. On the flat surface is a conical-shaped spool of chilled cast iron, held in place by a pin, but free to turn. In using the replacer it is so set that the flange of the wheel or the outer edge of the tread, as the case may be, will strike the spool slightly to one side of the center, and cause the latter to turn, throwing the wheel onto the rail.

### OHIO STATE ASSOCIATION MEETS.

The Ohio Street Railway Association held its annual meeting at Columbus, on June 9th. The attendance was good, but the reading of papers was this year displaced by discussions on practical questions without the preparation of the usual reports. A change has been made in the constitution by which the membership, heretofore limited to the executive officers of roads, is now extended to include superintendents and electricians. With this departure it is expected by next year to very greatly stimulate the work and increase the membership roll.

The local street railway officers made the visitors welcome, and entertained with a dinner and rides in special cars.

Officers elected are: President, S. L. Nelson, Springfield; vice-president, John S. Flood, Steubenville; secretary and treasurer, Charles Currie, Lima; the executive committee, in addition to the above officers, Judge W. A. Lynch, Canton; Thomas H. McLean, Toledo, and A. A. Anderson, Youngstown.

Next year's meeting will be held at Springfield, on June 14, 1899.

**MAIL CARS RECOMMENDED FOR KANSAS CITY.**

A recommendation will be made to the postoffice department at Washington for the annexation of the old territory of Westport to the Kansas City postoffice for free delivery purposes. The department will be advised that the present Westport office should be made a sub-station, that more carriers should be employed, that additional clerks should be engaged to expedite the business, and that contracts should be entered into at once with the street railway companies for the carrying of mail from the postoffice to the sub-stations of the city during the day.

**PARK FIRE IN CINCINNATI.**

A fire, which started during the afternoon of June 7 in the grotto building in the northeast corner of Chester Park in Cincinnati, caused a loss of \$20,000 and threatened for a time to destroy all the buildings in that beautiful resort. From the grotto building the fire spread to the merry-go-round, to the Edison Wargraph building, to a part of the amusement building and to the coral reefs. The car barn of the Cincinnati Street Railway Company adjoins this part of the park. The building is of stone and resisted the heat of the flames but the clock tower with the clock was destroyed as may be seen in the illustration. Other buildings, including the theater and scenic railway tower, were seriously damaged and but for the strenuous efforts of the fire department the flames would have been communicated to other buildings. The managers of the resort state that arrangements have been made to continue the performances in temporary structures and the buildings destroyed will be reconstructed at once.

**DEATH OF M. W. HALL.**

Our readers, and particularly those who are members of the Accountants' Association, will learn with deep regret of the death of M. W. Hall, secretary of the Camden & Suburban Railway, Camden, N. J. Mr. Hall has not been able to attend his office for several months on account of a long and serious illness. He will be remembered most pleasantly by the happy and impartial manner in which he presided at the organization meeting of the Accountants' Association, in Cleveland, where he endeared himself to all by a gentle courtesy and earnestness that

had much to do with the success of that meeting.

**AN INTERNATIONAL STREET RAILWAY.**

The Niagara Falls & Clifton Suspension Bridge Companies have leased the electric road privileges of the upper steel arch bridge across the Niagara gorge to the Niagara Falls Park & River Railway Company, of Canada. It will be recalled that the arch is to have double tracks, and the railway company will erect a station on the New York State end. This road runs along the top of the high bank on the Canadian side from Slater's Point above Chippewa to Queenston, opposite Lewiston. By means of the new connection it will be in close touch with the great crowds in both of the free parks at Niagara, the New York State Reservation on the one side and Queen Victoria Park on the other. The privilege thus secured is a most important one, and it would seem that the Niagara Falls Park & River Railway Company will catch the cream of all Niagara travel. The tracks on the bridge are expected to be ready by July 1, and about that time the cars will begin to run across the gorge, thus making an international line.

A package containing what are thought to be dynamite bombs was recently found in a New York elevated car.

FIRE AT CHESTER PARK, CINCINNATI.

## NATIONAL ELECTRIC LIGHT ASSOCIATION.

Twenty-first Annual Convention — A Number of Papers of Interest to Street Railway Men — Alternating Current Distribution — Standard and Special Machines — Public Control and Private Operation.

The 21st convention of the National Electric Light Association was held in Chicago June 7, 8 and 9. The beautiful banquet hall of the Auditorium Hotel was the place of the meetings, which were all well attended. No less than 230 delegates and visitors were present and many of these took part in the interesting discussions which accompanied the papers.

The president of the association is Samuel Insull, president of the Chicago Edison Company. The other officers are: First vice-president, A. M. Young, Waterbury, Conn.; second vice-president, George R. Stetson, New Bedford, Mass.; secretary and treasurer, George F. Porter, New York; master of transportation, C. O. Baker, Jr., Newark; executive committee: W. R. Gardener, G. A. Redman, H. A. Wagner, John A. Seely, A. J. DeCamp, E. H. Stevens, F. A. Gilbert, W. W. Bean and W. McLea Walbank.

Some of the papers contained information regarding the generation and distribution of electric current, which is as pertinent to street railways as to lighting. Such extracts of the papers we reprint. The subject of alternating currents excited much more interest and discussion than any other topic before the convention. This is also a matter of importance to street railway men, for alternating currents are coming into use as a means of power transmission. The engineers who are planning the new interurban lines are all considering the advisability of building but one power station and using alternating current transmission. One of the interurbans out of Chicago which is nearing completion has an alternating current transmission with rotary transformers at suitable points for conversion to direct current to be distributed and used in the car motors.

The trend of the discussion in the convention seemed to be that it was best to use a direct current for distribution, but a great saving could be effected by alternating current transmission over considerable distances. The lack of a suitable motor was a serious barrier to the application of alternating current for power purposes. While it would hardly pay to change the machinery in the large central stations now furnishing current the stations in the future will have alternating current generators and the current will be transmitted to the vicinity to be used and there converted to direct current for local distribution.

There were no facilities provided for exhibits, but several of the electrical companies had headquarters at the hotel. The Westinghouse Electric & Manufacturing Company elaborately decorated its rooms on the parlor floor with flags and national colors and exhibited pictures and pamphlets describing the apparatus manufactured. The General Electric Company and the Electric Storage Battery Company also had attractive rooms, where representatives welcomed friends and visitors.

The social features of the convention included a banquet, tallyho parties for the ladies during the day, inspection of electric plants in the city, theater parties, carriage drives, etc.

Officers for the ensuing year were elected as follows: A.

M. Young, Waterbury, Conn., president; E. H. Rollins, Denver, Col., first vice-president; F. A. Gilbert, Boston, Mass., second vice-president; George F. Porter, secretary and treasurer; C. O. Baker, Jr., master of transportation; Samuel Insull, Samuel Scovil, E. H. Atkinson, F. A. Copeland, John A. Seely, A. J. De Camp, E. H. Stevens, W. W. Bean and W. McLea Walbank, members of executive committee.

The Northwestern Electrical Association has usually held its meetings at a convenient summer resort, so that members might combine their summer outings with the business of attending the convention. This year this association planned a lake trip from Chicago to Duluth, holding the convention en route, and the steamer "Northwest" left June 10, the day after the National Electric Light Association held its last meeting, and many of this latter association took advantage of the opportunity offered to go on the excursion.

### President Insull's Address.

After a brief introduction Mr. Insull proceeded to discuss a number of the questions which are of great importance to the electrical industries, street railway as well as lighting. He said in part:

#### STANDARD VS. SPECIAL MACHINERY.

A matter which has called forth during the last year considerable discussion is the question of the use of standard apparatus and the tendency towards the specification of special machinery on the part of electrical engineers. This course is not by any means confined to large work, but is followed by some engineers whether they are designing a small isolated plant or are projecting a large modern central station. It would seem to me to be of paramount importance to the manufacturer and user that both should co-operate in eliminating as far as possible from the business the necessity of building and using special types of machinery. This can only be done by the adoption of standard specifications for various standard types of apparatus. A committee of the American Institute of Electrical Engineers has already taken this subject under consideration, and I believe that we will be serving alike the interests of the manufacturers and users of electrical apparatus if we will take some action with a view to co-operating with the Institute and other bodies in this matter. In drawing attention to this subject I speak with an appreciation of the position of both manufacturer and user, having had more or less connection with the manufacture of electric apparatus and the manufacture of electric current. Constant duplication of parts resulting in constant duplication of a given piece of machinery means, as any manufacturer will tell you, constant reduction in cost. Variation from a given type means increased cost and even the wiping out of an apparent profit. In the last year or so there has been a great deal of discussion in England prompted by the success of American manufacturers in obtaining large contracts for electric traction work in Great Britain, and the inquiry has often been made, how is it possible for American electrical manufacturers, with high wages against them, to compete with English builders, whose scale of pay to their workmen is on a very much lower basis. If you will examine into the amount of electric traction machinery manufactured in this country under a system of constant duplication and

the use of special tools, and then visit the electrical establishments on the other side of the water and note the tendency there towards specializing each particular job, you will soon recognize that the reason for low cost and consequently low selling price on this side of the ocean, is brought about by the fact that in America this class of work is largely designed by the manufacturer, and as a natural result is the duplicate of something already produced, whilst on the other side of the Atlantic the builder of the machinery works from the plans of the electrical engineer, which necessitates his producing something different to fill each different contract. In one case the machinery is really manufactured; in the other case the builder runs a jobbing shop. Unfortunately during the last few years American users of electrical apparatus have somewhat departed from the pursuance of what is really a fundamental principle of American manufacture, namely, the use of existing types which are turned out in large quantities with special tools with a view to the lowest possible cost of production. The electrical engineer for the purchaser has been permitted to draw up specifications which have tended towards the specializing of apparatus, necessarily interfering with rapid manufacture and low cost of the product. The disadvantage to the manufacturer is apparent. It is turning our large electrical works from manufacturing establishments into jobbing shops, cutting down their capacity, increasing their labor cost and lengthening the time that it takes to produce a given article. Looking at it, therefore, from the point of view of the manufacturer, the capacity of his plant is reduced and consequently his interest and general expense cost is higher; his labor cost is increased; and if he finds himself unable to increase his selling price, his shop must be run at a loss instead of at a profit.

The user is necessarily interested in low cost of production on the part of the manufacturer, as he cannot expect to purchase apparatus except at prices which yield a return to the maker. From this point of view alone it would seem to me to the interest of the user that he should co-operate with the manufacturer with a view to standardizing apparatus, eliminating unnecessary variations from a given type and providing specifications for machinery calling for a given capacity at a given efficiency. Such a course would lead to low cost of manufacture and consequently low selling price, coupled with rapid production.

Another objection to special apparatus is the expense and delay in obtaining duplicate parts in case of break-down. The fear of delay under such circumstances often necessitates the user carrying the duplication of his plant to a point entirely unnecessary when standard apparatus is used. Capital investment and consequently interest cost is thus increased, not only by the purchase of apparatus which of itself is expensive to build, but also by the duplication of investment which I have pointed out must of necessity follow.

A further point which should be borne in mind in connection with the lack of standard specifications is the opportunity that it gives to the unprincipled manufacturer to dispose of his second-rate apparatus to the uninitiated. We talk of a machine having a given capacity; but under what conditions should it operate to develop this capacity and how often does it occur that a dynamo machine is rated entirely too high and at the cost of its efficiency? How much miscellaneous material used in connection with the industry is absolutely unfitted for the purposes for which it is sold? Surely all of us, manufacturers and users, are interested in maintaining the highest possible standard of work and eliminating alike from our central station systems and the installations for our customers worthless appliances whose only recommendation is their apparent cheapness, whereas, as a matter of fact, they are really the most expensive that can be bought, because they are unfitted for the purposes for which they are intended. \* \* \* \*

I do not want my remarks on this subject to be taken as in any way censuring the many electrical engineers who have by their special training and natural ability done so much to develop the industry with which we are connected. From my experience I am satisfied, however, that from the point of view of the user, the designing engineer who adapts his requirements to

the standard apparatus of a first-class manufacturer, is able to produce a plant of more satisfactory character and more economical to operate than that designed by those engineers whom I regret to say are sometimes influenced by the desire to use machinery which they can claim as their own handiwork rather than use something that would be quite as satisfactory and has the advantage of being the regular product of an established manufacturer. \* \* \* \*

#### PUBLIC CONTROL AND PRIVATE OPERATION.

A subject of growing importance to a number of our members is the question of the public ownership and operation of the undertakings now operated by electric lighting companies. The agitation in connection with this subject has called forth a great deal of discussion, partly by those interested in it simply with a view to extending the influence of political parties, and partly by serious disinterested thinkers who believe that the best interests of the greatest number are to be obtained by the creation of a municipal socialism, which, if carried to its logical conclusion, must ultimately result in municipalities performing, with others, such public service work as we are engaged in, and also in producing the food we eat and the clothes we wear. To those occupied in the management of electric lighting properties it does not seem possible that the movement in favor of municipal operation of electric lighting plants, based upon the assumption that a municipality can produce electricity cheaper than, or even as cheap, as a private corporation is well founded. We all realize, from the close attention we have to give to our own affairs, that self-interest and the necessity of getting a return on our investment are the first essentials to the economical administration of large enterprises. While I do not pretend to claim that electric lighting companies are beyond reproach, I wish to point out that many of the evils complained of as pertaining to corporate management are the direct results of the enforcement of unwise conditions through legislative action. Ill-advised efforts are often made by legislative bodies to secure advantages in the direction of control which cannot be obtained without giving an equivalent in protection to the industry. This causes the investor to feel that his property is being attacked and compels him to resist such legislation. The result is a feverish agitation, crimination and recrimination, between the would-be improvers of municipal government and the owners of corporate properties without reaching a conclusion satisfactory to either. The fallacy of the so-called reformer's theory results from looking only at what he calls the injurious effects of corporate management without taking into account its indisputable benefits. He does not seek for the cause of the trouble. If reformers will take accurate account of all the points in the problem they will discover that the evils complained of result from errors in legislation designed to determine the relations between municipal bodies and electric lighting companies. It seems to me that the claim that municipal operation is the universal cure for all diseases for which electric lighting companies are supposed to be responsible, merely proposes the substitution of political in the place of industrial management. This raises the question: Is the administration of municipal affairs in the various cities throughout this country so economical as compared with the management of private industries and the class of service rendered so efficient as to justify the increasing of the burdens already imposed upon municipal government? It appears to me that a correct division of power and responsibility requires political government to control private industrial management. Where political government and industrial management are merged into one interest, the power of control is seriously impaired, since a political administration cannot be reformed without overturning the party in power.

I cannot bring myself to the belief that the citizens of this great country are in fact opposed to large aggregations of capital in corporate form, as such aggregations are absolutely necessary to the operation of all great undertakings by private enterprise. It is as impossible to operate such vast affairs with individual capital, as a personally owned business, as it is for us to live without municipal, state and national governments. The misunderstandings which from time to time occur between com-

munities and the managers of electric lighting companies will, to my mind, disappear entirely if the relations between the two are correctly founded on the basis of public control with corresponding protection to the corporations operating this industry. It would seem to me to be a very proper function for this association to address itself to educating the public to a definite legislative policy which will be fair to the municipalities, securing to the public the best service at the lowest possible price, and protect corporations by giving them franchises, which, while conserving municipal control, will insure to the investor the permanency of the undertaking.

#### COMPETITION IS NOT THE TRUE REGULATIVE FORCE.

It is supposed by many who discuss municipal affairs that the granting of competitive franchises for public service work is the true means of obtaining for users the lowest possible price for the service rendered, whereas, as a matter of fact, the exact opposite is the ultimate result. This is proved by results in all large cities where the most severe competition has taken place. Acute competition necessarily frightens the investor, and compels corporations to pay a very high price for capital. The competing companies invariably come together, and the interest cost on their product (which is by far the most important part of their cost) is rendered abnormally high, partly owing to duplication of investment and partly to the high price paid for money borrowed during the period of competition. The selling price of a service should be based on its cost, and in any business such as public work, where the investment is large and the annual turnover is comparatively small, if the item of interest be unnecessarily augmented, it must be reflected in the price paid by public and private users.

While it is not supposed to be popular to speak of exclusive franchises, it should be recognized that the best service at the lowest possible price can only be obtained, certainly in connection with the industry with which we are identified, by exclusive control of a given territory being placed in the hands of one undertaking. In most European countries public service operations enjoy exclusive franchises, under proper control, and are able to obtain capital for their undertakings at the lowest commercial rates, thus materially affecting the cost of their product, of which interest, as I have already stated, is necessarily so great a part. In order to protect the public, exclusive franchises should be coupled with the condition of public control requiring all charges for services fixed by public bodies, to be based on cost, plus a reasonable profit. It will be found that this cost will be reduced in direct proportion to the protection afforded the industry. The more certain this protection is made the lower the rate of interest and the lower the total cost of operation will be, and consequently, the lower the price of the service to public and private users. If the conditions of our particular branch of public service are studied in places where there is a definite control, whether by commission or otherwise, it will be found that the industry is in an extremely healthy condition, and that users and taxpayers are correspondingly well served.

#### COMPENSATION FOR FRANCHISES.

When prices for services are based on cost it matters not whether in the establishment of a system of legislative control provision is made for paying a portion of the receipts direct to the municipality. If the public demands a percentage, surely we can afford to pay it, as it would simply be added as an item of expense on which our selling price would be figured. If the public does not demand a percentage, this selling price would be proportionately less. It is simply a question as to whether our municipal bodies prefer to raise a portion of their income by taxing their citizens through the agency of public service corporations, or whether they prefer to raise that portion of their income by collecting it direct from citizens themselves. Revenue raised by a percentage on gross receipts of the electric lighting business would, at the present time, however, seem to be somewhat unfairly obtained in cases where the selling price is subject to legislative control and based on cost of service, as the result would be that a small minority of citizens using electricity would be forced to contribute largely to the public revenue, whereas the benefits enjoyed therefrom would be to the advantage of the whole community.

#### TAKING PRIVATE PROPERTY FOR PUBLIC USE.

Another point that should be included in a proper scheme of public control is a condition under which the municipality would have the right to purchase the undertaking. Such a right should include a direct obligation on the part of the municipality to purchase the property at a fair price whenever it is thought desirable that the industry should be operated by the municipality. The possibility of the exercise of the right of purchase by the municipality would of itself make it to the interest of the owners of the property to do their full duty in their relations to the public. On the other hand, if a community licenses a corporation to perform a certain public service, and if that corporation invests its money and develops its business, surely it is unfair for that community to go into the same line of public service work itself without first purchasing the existing plant. If this is not done the value of private property will be destroyed without just compensation being made therefor in an attempt to secure a public benefit. I do not believe that the people as a whole are so unfair as to demand that such a course shall be taken.

My recommendations on the subject, which I have just presented, are by no means original. Most public service corporations in Great Britain are run on practically the bases indicated, and in more than one state in the union corporate legislation has taken the same direction.

I would summarize the position which I think we should take on this subject in just two sentences.

First—Franchises granted to public service corporations should secure them the same degree of protection in their rights to their property as is enjoyed by other investments.

Second—Public control of charge for service based on cost plus a reasonable profit, and eliminating the factor of competition, is the proper safeguard for the interests of users, taxpayers and investors.

#### General Distribution from Central Stations by Alternating Currents.

BY HERBERT A. WAGNER.

Ever since the installation of the first few pioneer alternating current central stations, just ten years ago, we have heard it predicted with persistent reiteration that for the distribution of current for lighting from central stations direct current was a thing of the past and that in a few years the alternating current transformer system would hold the field without a competitor.

To many, this prediction may seem to have been fulfilled, considering the enormous number of alternating current plants, compared with direct current, that have been installed, and the remarkable impetus given to electrical industries by the development of alternating currents.

The great success achieved in the transmission of power by polyphase alternating currents in the last three years, has but strengthened this general belief, and left fewer champions to adhere to the direct current cause.

These great achievements, I say, have led the enthusiast to think all progress confined to alternating systems of distribution. Deeper investigation, however, shows that while in point of number the alternating current stations, reaching into the thousands, completely overshadow those of direct current, there are few really large stations, outside of water-power plants, that are today employing alternating currents for distribution, and that while enormous investments have been made in direct current stations in our larger cities, comparatively small amounts have been invested in alternating current work.

The alternating system was heralded as providing a means of distribution with a great reduction in first cost of plant, and for years the development of the system has been made with this the principal end in view. On the other hand, direct current distribution in the form of the Edison three-wire system, has been steadily and intelligently developed to the highest standard of economy of operation, simplicity and permanence. In the same city, alternating current stations have not, as a rule, been successful in competition with three-wire stations; their service has not been as good, and their profits have been smaller.

I may startle many by stating frankly the discouraging fact, which has been barely whispered at times, that, judged by the standards of the magnificent Edison properties in many of our larger cities, few alternating current central stations in the United States have been a success. Do not imagine that this damaging admission, however, is an indication of any loss of faith on the part of one who has been identified with alternating current work since its *début*, as it were. Far from it. The fault lies, not with the alternating current itself, but with its application. Its few apparently inherent deficiencies, such as the difficulties of operating motors and arc lamps, have been shown to have been only awaiting discovery and development, and were at our disposal almost as soon as these important divisions of central-station service were operated with success from the Edison three-wire system. These can, therefore, hardly be held responsible for the difference in the commercial results obtained with the two systems.

As I have said, the ends in view in the development of the two systems have been radically different. The one was to produce a given amount of light for the minimum of investment; the other was to provide a permanent investment that would render the maximum of profit. These standpoints in general mark the difference between the manufacturer and the user, and we find these two systems developed in this way—one almost entirely by the manufacturer, and the other by the combined efforts of the various users. The results are the natural effects of progression along these lines.

Few opportunities have we had of comparing the two systems from the same standpoint and under like conditions. The purpose of this paper is to show the alternating current applied from the same standpoint, compelled to fulfill the same conditions, and then to compare the results with the best produced with direct current.

To better contrast the different methods of distribution, we will review briefly those in general use before describing the most recent developments.

The early alternating current stations were installed on the principle that the drop in lines with distribution at 1,000 volts was so small that it was practically negligible. Two wires were accordingly run out from the station, passing along those streets where light was to be furnished, and lights were connected at any desired points between the station and the farthest end, without reference to such trifling considerations as difference in potential. Distribution was attempted in this way for years, and in many places is still in operation. Lines are even being constructed today without any notion of a system of feeders and mains, although an almost perfect system for the maintenance of uniform pressure was in operation in many Edison stations before the first alternating station was in existence. Fortunately for the operators of such models of simplicity, the current delivered has usually been so small in quantity that with the proverbial No. 6 wire, which seemed to possess virtues not affected by distances, the difference of pressure between neighboring customers rarely exceeded 10 per cent.

A few more enlightened experts—plants were always installed by experts in the early days—eventually conceived the novel idea that if the drop, a little of which they had discovered by that time, could be confined to a greater extent to those portions of the lines where there were no lights, some might be spared from the lighting districts. A few feeder lines were therefore stuck in here and there to boost up the pressure where it was lowest.

The regulation was all effected by means of the dynamo field rheostat, and the pressure indicated by a voltmeter on the secondary of a transformer whose primary was connected to the bus bars on the switchboard. A few lamps were also often operated by the same transformer to light the switchboard or other parts of the station. The station attendant was, of course, in absolute ignorance of the pressure at any point on the lines where lamps were used. The pressure was therefore usually run high enough to be on the safe side. The attendant was sometimes instructed to let his voltmeter needle follow gently the manœuvres of his ammeter, as there was thought to be a more or less intimate connection between volts and amperes and the volts ought not to be allowed to get too far behind.

If any one ever breathed a suggestion of pressure wires, it was probably his last breath. At any rate, he was never heard of again. What! pressure wires with alternating current? Preposterous idea. Alternating and progression were considered almost synonymous terms. Antiquated ideas must be abandoned.

This faintly whispered need might, however, be heard again, so, to meet the emergency, a compensating voltmeter was produced that could be adjusted for any drop in the lines. It was ingeniously arranged so that a small series transformer in the main line would send currents opposing those operating the voltmeter, thereby making the needle or index drop back approximately proportionately to the current in the line. This device was a great help, and caused the drop in lines to jump into prominence at once. It would be quite perfect if the drop in alternating current lines were proportional to the current, but it is not. The power factor of ordinary alternating current systems is usually quite low at light loads, and, except with very small wire, an ampere may therefore produce much more drop proportionately at light load than at heavy load.

In Europe it is, to some extent, the practice to use transformer sub-stations with low potential distribution from these points. Transformers are cut in and out at these sub-stations by attendants according to the demand for current. It is doubtful if, after paying interest on the investment in property and housing for these transformer stations, together with the investment in instruments and switches required, and the attendants' wages, there is very much saving effected. \* \* \* \*

Comparing the cost of individual transformers and high-potential distributing mains with the three-wire system of mains at low potential, we do not find a great difference in first cost in favor of the alternating. We do find, however, that the Edison feeders for the same distance cost about 31 times as much as for alternating current at 1,100 volts, 125 times as much at 2,200 volts, or 500 times as much at 4,400 volts. It would then appear that if we could apply alternating current to the feeders at high potential and transform down for the mains, we might reach the lower first cost of the ordinary alternating current system and possibly retain all the best features of the direct current. To accomplish the former, the transformers must be provided at a small proportion of the cost of the alternating-current feeder, and to do the latter, they must not increase the average losses in the system. It is obvious that we could with alternating current move our station to any reasonable distance from our centre of distribution, and at comparatively small additional cost for feeders. The whole problem then seems to come down to transformer efficiency and means of regulation.

To consider the matter of regulation first. We see at a glance that we cannot use the direct current method of regulation by supplementary bus bars, but we can use the booster method, and can, moreover, apply a static booster to each feeder to regulate within any desired limits and with as small gradations as necessary. In fact, the booster method of regulation was first applied to alternating current distribution, and operates with much less average consumption of energy than either the supplementary bus or direct current booster method. In this important consideration we can therefore improve on and simplify direct current methods.

The means of regulation having been in this way provided for the feeders, it remains to be considered what we shall do to eliminate the effects of transformer drop. As we have determined on a secondary low potential, three-wire distributing system of mains, we can altogether dispense with high potential mains and limit the high potential to the feeders. If we do this, we can conveniently have the transformers of the same unit capacity as the feeders, and arrange each with its primary connected to its independent feeder, and its secondary feeding into the three-wire mains. We know that the effects of our feeder drop are eliminated if we regulate by pressure wires from the feeder ends. In the same way the effect of our transformer drop may be eliminated by bringing pressure wires from the secondary terminals. The feeder drop and transformer drop therefore become one, and are cared for in the same way. We can even secure better general regulation than with the direct current system, as we have a better form of feeder regulator and have eliminated the effects of transformer drop.

Now, to return to the transformer itself and its efficiency. It is evident that, with this system, the transformer capacity need be no greater than that required for maximum station load, instead of more than twice that amount or nearly equal to that required for the total number of lamps connected. This at once doubles the average load on our transformers, and raises the average efficiency. It also incidentally reduces the first cost of transformers in still greater proportion. We also know, however, that transformer efficiency at light loads is dependent on the iron loss, and that this is interdependent with the regulation or drop. If we can increase the drop, we can increase the iron loss, and thereby greatly increase the average efficiency. Having provided against any interference with the regulation of the system by the transformer drop, we can afford to increase that to the heating limit of the copper. In this way, a 100-k. w. transformer can be built with an average efficiency of over 98 per cent. The entire transformer loss can, moreover, be more than made up by the less loss in feeders, which we would naturally have with alternating current.

We have thus eliminated the two features in which the ordinary alternating current system of distribution has been inferior to the direct current, and have provided means for obtaining better regulation and higher efficiency at a very much less cost of installation than with the direct current system.

This system was conceived several years ago, and it has since been my good fortune to have an opportunity to install a system

formers can be readily maintained at all times if desired. This is a very important consideration when very heavy loads or overloads are to be carried. The distribution of load on any large system is constantly changing as new customers are connected, and in large Edison stations certain feeders often become so overloaded that it is found necessary for their safety to put resistance in series with them to force some of the current to other feeders. The possibility of overloading any individual feeder beyond its share is absolutely provided against in the system described.

In the figure are shown four curves of station distribution efficiency. No. 1 is that of a representative Edison three-wire, direct current station. No. 2 is the new alternating current system described. No. 3 is the usual alternating current system employing separate transformers for each customer or for adjacent customers, the best modern transformers being used. No. 4 shows the same system, but with the average transformers found on the lines of most existing stations. These curves were plotted from the following data obtained from actual practice.

	No. 1. Per cent.	No. 2. Per cent.	No. 3. Per cent.	No. 4. Per cent.
Feeder loss .....	24	8	10	10
Main loss .....	2	2	2	2
House wiring loss .....	1	1	1	1
Transformer loss, iron .....	..	.23	6	12
Transformer loss, copper .....	..	2.7	1	.5

Total loss at maximum station load .....	27	13.93	20	25.5
Efficiency at maximum station load .....	78.7	87.9	83.3	79.6

The efficiencies of distribution at assumed average loads are shown to be as follows:

	No. 1. Per cent.	No. 2. Per cent.	No. 3. Per cent.	No. 4. Per cent.
Load, 25 .....	94.1	95.8	78.4	66.6
Load, 20 .....	94.8	96.2	75.3	61.4
Load, 15 .....	96.1	96.5	70.3	54.3
Load, 10 .....	97.3	96.4	61.9	45.1

At maximum load it will be noticed that the efficiency of alternating current No. 2 is 10 per cent higher than No. 1, the direct current. This means that the same energy can be delivered with 10 per cent less capacity in generators, engines and boilers, or a difference of 10 per cent in the first cost of generating plant. It is pertinent to remark here that alternating current generators also have a much greater margin for overload for short periods than direct current generators. The efficiency at average load, or the all-day efficiency of the No. 2 alternating current system, is also shown to be appreciably higher than the direct current. In large central stations the average load is generally found in practice to vary from about 15 to 20 per cent of the maximum, and it will be noted that from 12 per cent average load up, No. 2 curve for the special system of alternating current distribution shows a higher efficiency than the direct current. \* \* \* \* \*

Several large three-wire, direct current Edison stations are beginning to employ alternating current to extend their lighting territory beyond that possible or profitable with low tension current. This is a recognition of alternating current which would not have been considered for a moment a few years ago. They now propose to use alternating current to transmit their energy at high potential to a distant substation, where it will be transformed to a lower pressure and then again transformed by means of rotary transformers to direct current, which is in turn distributed over the three-wire Edison system as if generated in the ordinary way. This is a very beautiful and instructive application of alternating currents, and ingeniously designed machinery. It gives the manufacturers a chance to sell additional machinery, swells the company's real estate investment and gives work to the unemployed to operate the substations.

The loss in the conversion to alternating current and back is about 15 per cent in addition to the loss in static transformers and lines. This distribution might be accomplished without the additional machinery.

CURVES OF DISTRIBUTION EFFICIENCY.

of this kind on a large scale, which is now in very satisfactory operation. It is laid out exactly as a three-wire Edison system would be, except that there are no subfeeders. A network of mains is planned as if for use with direct current. The feeders are all designed for 110-k. w. maximum load at 1,100 volts, and at each feeder end is placed a 110-k. w. transformer feeding into the three-wire network in the same manner and at the same points as with the direct current system. The transformers are located in manholes of suitable design. From the secondary terminals of each transformer, pressure wires are run back to the station. Each feeder has an independent regulator by which the pressure can be raised or lowered. There are no primary mains, nor any connection whatever between the primary feeders. The regulators perform two functions. They are used to maintain the proper pressure as indicated by the voltmeters and also to divide the load between transformers in any way desired as indicated by the feeder ammeters. It is possible to shift the entire load from one transformer and feeder to an adjacent transformer in this way without sensibly affecting the pressure on the system, and an equal division of load between trans-

A much higher efficiency of distribution, and better regulation, could be secured by using the alternating current system as it is, without transformation to direct current, and everything could be controlled from the main station without employing labor or apparatus at substations. Why do they not use it so? They say that many things cannot be accomplished as well with alternating current. If that is a challenge, we will accept it and try conclusions with them. Let us then anticipate these various objections and see what they amount to.

We have already seen how a properly designed system of distribution for alternating currents may be made to exceed the direct current system in efficiency, taking the latter under its most favorable conditions. If we then add to the usual losses in the direct current system the losses in double rotary transformation and in static transformers, the very great difference in favor of the alternating current is still more marked.

It has been shown how very simple and reliable regulators can be provided for each alternating current feeder, which will secure the closest possible regulation over any range desired, and this can be effected at a loss of less than one per cent. Such close regulation can only be secured with direct current by the use of a number of generators connected to auxiliary bus bars, or by connecting the feeder ends to adjustable resistance connected between the busses of two or more generators. The first cannot be realized in a rotary transformer station, and the last is quite wasteful of energy. Regulators placed on the alternating current feeders of the rotary transformers control alike the pressure on each rotary, and all the direct current feeders supplied by the same, in exactly the same way as field regulation does on a direct current generator. Such regulation can only be effectual with a number of small rotaries not operated in multiple. The best regulation can, therefore, undoubtedly be secured with the alternating current system. \* \* \* \*

#### MOTORS.

The greatest argument used against alternating current used to be that it would not run a motor. It has long ago proved that it can, and that without a commutator. This subject now brings us to multiphase systems. There are two of these systems in general use, the two phase and the three phase. Other systems are but modifications of these and will be mentioned as such. Motors can be operated with equal facility and efficiency on either system and have many distinct advantages over direct current motors.

For long distance power transmission the three-phase system shows an economy in copper; but for lighting, or for lighting and power combined, it is not at all well suited. I might say that where lighting is a distinct feature, and first class service is to be rendered from a large station, the three phase system cannot be used successfully. On even the best generators, the windings are so entirely interdependent that a change of load on one phase will affect the pressure on the other two; but a defect even worse is the impossibility of regulating the phases independently for drop in the feeders if the load happens to vary on any two. Any regulator placed in circuit with one phase will effect about the same change of pressure in the adjacent phase within the usual limits of regulation. Regulation is then a question of the best possible averages, and at best is but guesswork. With the feeder and transformer drops found economical in practice, it would be practically impossible to keep the pressure sufficiently constant for high efficiency lamps. The complication of wiring is also very serious, especially if the Edison three-wire system is used for distribution, as six wires would then be required, forming six circuits that must be kept balanced.

The two phase system is subject to the same objections unless the two phases are used separately for lighting, in which case we have the complication equivalent to twice the number of generators and feeders.

For good regulation and simplicity, the single phase system cannot be equaled by any multiphase system.

The so-called monocyclic system is a modified two-phase system in which current is distributed for lighting on a single phase circuit only, and a third wire carries current in quadrature to the first, which, in connection with the first, is transformed to a three phase relation wherever it is desired to operate motors. The regulation of this system can be made al-

most as good for lighting as the single phase, and can be as simply effected. The third wire adds complication, but no balancing is required, as all the lighting is done from single phase on two wires. If low tension, three-wire distribution is attempted with this system, a fourth wire must be used for power distribution. \* \* \* \*

#### STORAGE BATTERIES.

Here we come to the direct-current advocate's last and greatest stronghold. To this he retreats with great confidence of safety. We may ask first whether storage batteries have yet been proved to be a valuable adjunct to the central station, cost and maintenance considered. It is true they are being tried by several large stations, and we watch eagerly for the results. They equalize the station load to a greater or less degree, and cut down the generator capacity for the peak. Are they, however, cheaper than generators, engines and boilers of the same capacity? Are the losses in transformation less than the cost of a few more attendants? Is their maintenance less expensive than that of generating apparatus? These questions can not as yet be answered in the affirmative. But if the battery man's most sanguine hopes be realized, what then? If rotary transformers are good enough for the direct current man to use to change the direct current to alternating current, transmit a good proportion of his load to a distance and transform again to direct current, why should not the alternating current man use them to charge his batteries and then to transform their output back to his pet form of current? Loss in transformation, do we hear some one say? Not any more than with our contemporaries' long distance transmission system, and, in this instance, they are small and unimportant, we are told. There is at least one station in the country where storage batteries are being used in this way, and I believe with success, as storage batteries go. \* \* \* \*

In summing up, we find the following marked features in which the alternating current, properly installed, has been shown to have pronounced superiority over the direct current:

- Highest possible efficiency of distribution and operation.
- Best regulation.
- Largest territory desired readily supplied from one station.
- Comparatively small cost of feeders, effecting enormous saving in investment.
- Least cost of real estate.
- Cost of installing and operating sub stations entirely avoided.
- The only system in which all classes of service can be supplied from one type of generator.
- Greatest flexibility.

#### Lachine Rapids Plant and the Cost of Producing Power for Generating Electricity Therefrom.

BY W. MCLEA WALBANK, MANAGING DIRECTOR.

In order to allow of a fair comparison with other plants, of the cost of producing power for generating electricity from the Lachine Rapids plant, the writer considers it desirable to give a brief outline of the hydraulic as well as the electrical equipment of these works.

The world renowned Lachine Rapids, as you are all doubtless aware, are situated on the St. Lawrence river, a short distance from the city of Montreal. The idea of converting the wasted energies of these turbulent waters and harnessing them for the use and convenience of man, was not new. As far back as 1866, a company was formed, whose object was to erect dams and construct large hydraulic works, about a mile lower down the river, than the site of the present power house; the object being to induce factories to establish their works at the rapids, for at that date, the possibilities of electric transmission had not been demonstrated. The scheme, however, never materialized, and since then various projects have from time to time been talked of, but never matured.

In the fall of 1895 the Lachine Rapids Hydraulic & Land Company, Ltd., commenced its operations. The directors commenced work, only after having fully satisfied themselves upon the difficulties to be encountered and overcome, and carefully studying the question of back water, frazil and anchor ice, and went in with a determination to succeed.

The company was honestly formed without "ground floors" or "subcellars," with a bona fide capital, on which every share represents \$100 cash. This, the writer considers, has direct bearing on the cost of producing electricity, because a company, handicapped by what is called watered stock, or exorbitant promoter salaries, has to pay interest on money it never had the use of. Having therefore formed a company on a solid and firm financial basis, the property fronting on the Lachine Rapids and controlling the waterpower privileges was secured, and operations for the development of the water power commenced.

HYDRAULIC DEVELOPMENT.

The hydraulic plant consists of a main dam and power house, 1,000 ft. long, and a wing dam and guard pier, 5,000 ft. long, forming a head race or basin, with an average depth of 12 ft. in low water. To secure this it was necessary to divert the waters of the St. Lawrence and lay bare the bed of the river for a distance of over a mile and remove over 400,000 cu. yds. of rock.

The main dam which is constructed of a series of isolated cut stone piers, with head gates and stop logs, furnishing in all 36 flumes and three waste weirs, at the same time, forming foundations for the power house and turbine sheds.

The total development will, when completed, consist of 72 vertical turbine wheels and 12 generators. The wheels are con-

speed of 76¼ r. p. m., discharging 235.33 cu. ft. of water per second they developed 300.84 h. p., showing an efficiency of 81.32 per cent, which would make the total possible output of the power house about 16,000 k. w.

COST.

Perhaps the greatest obstacle to a fair comparison of electric current produced by water power, as against the same current produced by steam, is the first cost. In the former case, especially if a large water power is to be developed, the expense of the whole installation, such as dams, head and tail races, etc., has usually been made at the commencement, while perhaps only a fraction of the power thus obtainable is at once used, therefore making a very much larger capital cost per unit, than with a steam plant, which need only install the power necessary for immediate demand and continue increasing or adding thereto, as the demand therefor offers.

In this case it was necessary to spend about one million dollars in hydraulic development. This million dollars is able to furnish over 20,000 h. p., whereas it will be some time before we will be able to convince the public of the advantages to be derived from the use of electricity, which is no easy task, as anyone familiar with the subject will testify.

The 5,000 h. p. from a commercial point of view, will have for

DIVISIONS 3 AND 4 OF MAIN DAM SHOWING POWER HOUSE AND TURBINE SETTINGS.

nected in series of six, by gearing, to a horizontal shaft, at the end of which a generator is directly connected. The completed power house will contain 12 such sets. The arrangement is shown in the accompanying illustration.

Of the total installation, 48 wheels are already in place, and the power house, head race, tail race, and dams are completed.

ELECTRICAL EQUIPMENT.

Each dynamo house will contain four three-phase General Electric alternators, wound for 4,400 volts at full load, and two direct current exciters at 120 volts. There will be in the total installation three such dynamo houses, containing in all 12 dynamos and six exciters, each exciter being capable of exciting four machines. Each dynamo house will have its own switchboard, of blue Vermont marble, of the very latest design, so arranged that each circuit may be operated from the switchboard of either power house. The floors are of slate and the building of solid brick. The current is generated at 4,400 volts, avoiding the use of step-up transformers, is transmitted over bare copper wire strung on iron poles to the city of Montreal, a distance of about five miles, to the sub-stations, where the pressure will be lowered to 2,300 volts, and by means of sub-station switchboards, subdivided into the desired units and distributed partly through underground conduits, and partly by overhead construction, throughout the city of Montreal, and its suburbs, where there is a population of over 300,000 people, offering a fine market for light and power. Of the total equipment, one-third is already installed.

TOTAL POWER.

The wheels were tested at the Holyoke testing flume, on April 16 and 17, 1897, and developed at full gate, as follows: With a

the present at least, to be charged with all the expense of the hydraulic development of over 20,000 h. p.

In estimating the cost of producing power from the Lachine Rapids, the writer does not take into consideration the cost of distributing power, for this would be the same in either case, whether the prime mover was a water wheel or a steam engine. He will therefore confine himself to the cost of developing water power and delivering that power on the bus bar at the sub-station, exclusive of the generator. He will add the cost of the transmission line from the source of power to the sub-station in the city, because this is directly attributable to water power plants, as it would not be necessary in the case of a steam plant, unless it were for transmitting power from a coal mine to a city or following the practice laid down by the Brooklyn Edison Company, in locating its power house at a point convenient for obtaining coal and water at reduced prices, using high tension transmission and converting by rotary converters, at various substations. There will also be included, the step-down transformers to reduce the pressure to that required for local distribution, about 2,000 volts. He will also charge the water power with the drop or loss in power from the rapids to the sub-station.

The writer therefore considers, in justice to the Lachine Rapids plant, it would be necessary to give, first, the cost per kilowatt per year, for the portion of the plant at present installed and connected to generators ready for operation, and second, what the cost will be per kilowatt per year, when the whole water power development is in operation.

1. The total cost of water rights, dams, hydraulic machinery, power house, transmission line, step-down transformers, etc., is \$957,200.

The power developed is 4,000 k. w. at the generator. Allow-

ing 10 per cent loss, there will be delivered at the sub-station bus bar, 3,600 k. w., which is equivalent to \$263.83 per kilowatt, capital cost. This at 6 per cent would be equivalent to \$15.95 per k. w.

Depreciation on \$300,000 which will more than cover the cost of that portion of the plant subject to depreciation, rated at 5 per cent and spread over 3,600 kilowatts would be equivalent to \$4.17 per k. w.

Operating expenses, including labor, repairs, insurance, etc., amount to \$10,275 per annum, which is equivalent to \$2.85 per k. w.

This makes a total cost on a 24-hour day basis \$22.97 per k. w. per year.

2. The total cost per kilowatt with the whole water power plant in operation. Before giving these figures, the writer would like to explain that the figures herewith quoted, are reliable for the cost of the completed plant, inasmuch as the same is at present under contract with reputable firms, the Lachine Rapids Hydraulic & Land Company, having a limited time, in which to order the works completed.

The total capital cost with 72 wheels installed will be \$1,113,273. The power developed, after deducting all losses will be 13,500 k. w. at the sub-station bus bar, equivalent to \$82.46 per k. w. capital cost, which at 6 per cent represents \$4.95 per k. w. per annum.

Depreciation per kilowatt will equal \$1.68 per k. w.

Operating expenses, including labor, repairs, oil and waste and insurance, if taken upon the same basis as already existing, will amount to \$20,453, equivalent to \$1.51 per k. w.

This makes a total for a 24-hour day \$8.14 per k. w. per annum.

It will be noticed that the operating expenses, as well as the depreciation, per k. w. in the latter case is very much reduced and it is a remarkable feature, how constant the operating expenses are, even at present, being practically the same with full load as with no load.

In connection with these figures, it might be stated that coal used in Montreal and vicinity, is what is known as Nova Scotia coal and costs \$3.50 per ton for run of mine.

The writer would also draw your attention to the fact that the capital cost cited in each of the foregoing cases, includes money paid for real estate, of which the company owns over some eight million feet fronting on the Rapids, intended at some future date to form the site of a suburban town and which it is hoped and expected, will return the money expended in developing the water power above referred to.

### CONCLUSIONS.

From the foregoing, the writer trusts that he has shown that where reliable water power can be obtained within reasonable distance from power centers, it can be made to produce cheap electric current to say nothing of the great advantages the city must derive therefrom, not only commercially, but viewed from a sanitary standpoint as well, as the use of electric power thus generated, is the best smoke consumer yet invented.

### Analysis of the Cost of the Generation and Distribution of a Unit of Electricity.

BY CALVIN W. RICE.

It is the intent of the paper to show what has been done, what is being done, and what is therefore possible, rather than to give theoretical tables. It is the intent also to show the advantage of watching each one of the various items which go to make up the total cost, and, by pointing out the proportions of each to the whole, to aid one in the discovery as to which particular items are disproportionately large in his plant.

Before taking up the consideration of the cost of operation of a plant we should first consider the plant itself.

In America the variation in the investment per kilowatt is \$200 to \$750 per kilowatt capacity installed. In a few cases the figure is below \$200, and in a few as high as \$1,000; but in the great majority of cases the cost is below \$400.

In this respect American practice is ahead of that of Great Britain and the Continent, where the majority of plants have a total investment of over \$500 per kilowatt installed.

The figures on some railway plants in Chicago give the cost to be less than \$75 per kilowatt. I think these figures refer to stations alone, whereas the corresponding values for lighting plants include distributing systems also.

The importance of keeping down the investment per kilowatt need not be emphasized.

The principal items that go to make up the total investment are real estate, steam or water power plant, electric plant distributing system and minor details.

In the first item we naturally find a great variation in the different plants. In country towns it runs as low as \$25 per kilowatt, and in cities as high as \$150 and over. In other words, there are some plants where the investment in real estate alone is greater per kilowatt than the entire investment is in others.

The investment in steam plant varies from \$20 to \$60, with figures on the electric plant slightly greater.

It is needless to say that the location of the plant ought to be considered with reference to all influences, each considered separately and reduced to a common method of comparison, i. e., the dollars and cents value per year of each consideration.

For instance, in a large city which I visited a couple of weeks ago I observed a new station being erected not over 1,000 feet from a river, yet five or six 1,000-h. p. non-condensing engines were being installed. It is reasonable to assume that the convenience of that site to the main street of the city had a greater dollars and cents value than the consideration of condensing plus the difference in value of the land, as the company had the option to sell the present power site to the government and to buy a river site for less money.

In buying the steam and electric plant, however, it is essential to consider reliability above every other consideration. In emphasizing this point to make it the end sought while considering the merits of boilers, engines, water wheels or generators, it should be viewed in its broadest sense. It is of assistance in examining bids on electrical apparatus or engines, to compare the prices per pound, and weight in pounds per kilowatt or horse power, and in considering boilers, heating surface and pounds per horse power, as well as price per pound.

The various methods of rating apparatus and of stating ability to stand overloads are very confusing to the purchaser, and comparisons by pounds develops features not otherwise noticed, but worth considering carefully.

Having decided whether or not it is economical to use simple compound or condensing engines, decision as to the boiler pressure will follow as a matter of necessity, and will in turn decide in part whether return tubular or water-tube boilers will be advisable. The price per horse power of boilers is now not widely different.

The advantage of direct connecting over belt or rope drive is now recognized, so very little need be said. The amount of saving has been very carefully sought by Mr. Crompton, and in 23 of the largest English works the results have been tabulated as follows:

\*The table shows that the cost of fuel averages 4% higher where the dynamos are rope-driven than where the dynamos are direct-driven by high-speed engines.

Great stress is nowadays put upon high efficiency, and while this is important, reliability should be the principal feature.

In the present day of good design there is at best little to be gained in absolute efficiency but the cost of energy, and the popularity of electric light and power will be very much affected, according as it is reliable.

Good regulation in the station is more important than high efficiency. Good regulation in the station means ability to use high efficiency lamps.

The use of 50-watt instead of 58-watt lamps means a saving of 14 per cent directly in the lamps and in the copper losses. Relatively this increase in efficiency is much greater than is possible in any of the various types of boilers, engines or generators. Therefore the governing of the engine from no load to full load, and the regulation of the generators with load thrown off and on, should be carefully determined.

The value of accessories in the reliability of the plant and the reduction of labor and attendance is important. These accessories are as follows:

- I. Feed-water appliances:
  - (a) injectors.
  - (b) steam pumps.
  - (c) electric pumps.
- II. Boiler appliances (steam or electric):
  - (a) forced draught.
  - (b) mechanical stokers.
  - (c) super-heaters.
  - (d) coal handling and storage.
  - (e) ash conveyors.
- III. Cranes:
 

Mechanical or electrical.
- IV. Auxiliary electrical apparatus:
  - (a) boosters.
  - (b) station motors.

It is not ever advisable to drive the exciters from a motor taking current from the main generators on account of fluctuations being multiplied.

But under certain conditions the feed pumps, coal and ash handlers, overhead cranes and stokers may be driven with success and economy by either alternating or direct current electric motors.

Electricity as delivered at the switchboard is generated with economy and can be used more advantageously than steam. \* \* \*

The price charged per unit is made up of cost and profit.

The cost may be subdivided as to

I. Generation and distribution; II. Maintenance; and III. Management.

It may again be divided into (a) material and (b) labor; (a) representing (1) fuel, (2) water and (3) supplies; (b) representing (4) wages and (5) superintendence.

II. Maintenance is made up of (6) material, (7) wages and (8) superintendence, and

III. Management, may be subdivided as to (9) directors, (10) salaries and (11) expenses.

As we compared total cost of plant per kilowatt and found it on the average to be under \$400, calculations as to cost of operation of plant per unit output per year gives that figure to be, on the average, under 50 cents. That is, on the average, it requires 50 cents worth of plant to generate and distribute one kilowatt per year. \* \* \* \* \*

There is another point to be learned, namely, the percentage of units generated which are unaccounted for. This percentage is even greater in gas companies, and it is interesting to watch the reports from year to year and to see the improvement in this matter. The Massachusetts report of all the gas companies of that state gives the exact number of feet unaccounted for in each company. These items, added together, in 1897 amounted to 285 million feet. One gas company lost 36 per cent of its output, and quite a number over 20 per cent.

The largest percentage of unaccounted-for units in the English electric stations generating over a million units appears to be 12½ per cent. Quite a number having an output of 500,000 units have 33 per cent. One station loses 47 per cent.

These figures with respect to electric lighting are not comparable with gas, for the reason that we allow the larger portion of the loss as necessary to the distribution. I have no doubt

but that a great saving may be made in our stations if attention is brought to this feature. \* \* \* \*

In comparing street railway with lighting stations we find that the average efficiency of the lighting is less than half the railway companies', also that the average of these railway stations is above the highest efficiency of the 1896 report, but was equaled in 1895 in the report of one lighting station only.

---

## NO FOUR-CENT FARE FOR MILWAUKEE.

May 31 Judge Seaman in the federal court rendered a decision holding invalid the ordinance of the city of Milwaukee compelling the Milwaukee Electric Railway & Light Company to sell six tickets for 25 cents. The court does not go into the question of the power of the city to prescribe reasonable regulations as to rates of fare; this is assumed for the purpose of deciding this case, and the ordinance held invalid because the rate of fare fixed is unreasonable.

The court found that the enforcement of the 4-cent fare would operate to materially reduce the net revenues of the company, and reduce them below the point fixed by equitable and constitutional considerations.

The proposed reduction would deprive the company of property rights by preventing reasonable compensation for service. Confiscatory rates are repugnant to the constitution, and any compulsory rate which will not give an income large enough to meet expenses and yield a fair profit is confiscatory.

---

## YERKES ON FRANCHISE EXTENSIONS.

A rather unusual meeting was held at the Palmer House, in Chicago, June 9, under the auspices of the Civic Federation, a self-constituted body to protect the public interests of the city. The attitude of this body has been decidedly antagonistic to the street railway companies. An invitation was extended to C. T. Yerkes, president of the North and West Chicago Street Railroad Companies, to present the street railway side of the argument in reference to franchise extensions. N. A. Partridge first spoke to the audience accusing the companies of corruption in dealing with legislative bodies, stock speculation and false reports by manipulating the book keeping. He favored monopoly and consolidation of all the companies in one city and private ownership and operation of the railways. Mr. Yerkes won the attention and sympathy of the audience by his plea for fair play and investigation. He explained many of the points raised by Mr. Partridge and pointed out the error in many public fallacies. He said that his companies had spent \$8,000,000 in the last four years having faith that the people of Chicago would not call for any legislation that would mean confiscation of this property. Mr. Yerkes was given close attention and generously applauded.

---

It is rumored that all the surface street railways in New York are to be consolidated and preparations are being made with that in view. The Third Avenue Railroad Company has received permission to change some of its lines to the underground system and the Metropolitan Traction Company is about to apply for a permit to operate all its remaining lines by the conduit system. It is thought there would be economy in operation to generate the power for all these systems at one station and have the entire management under one head.

and returning, under "in." "Transfers Received" includes all transfers, those that are free as well as those for which a charge is made. The transfers are assorted and examined at the office of the treasurer. "Free" means the number of free riders, such as policemen and firemen on each half trip. "Tickets Received" represents the amount in tickets, counting them at 4 cents each; the sixth of a cent is settled at the office. "Cash" needs no explanation. "Total" represents the amount of tickets and cash and "Total Passengers" represents all the passengers on the half-trip, which when compared with the inspector's report gives a check on the conductor. Passes and employes' transportation are coupon tickets which are treated as transfers.

On the back of Form No. 1, which is a sheet 6¼ in. wide and 8½ in. long, is the record of the number of transfers issued, and a ruled form for entering the names and

ing him the conductors' books (Form No. 1), money and tickets.

The principal receiver adds the returns from the different offices together and makes his report to the treasurer, on Form No. 6, which is 4 in. by 5½ in., entering his money on a bank deposit ticket which is turned in with the report. The treasurer has in his office a book in which the total cards previously mentioned as being filled out by the conductors are entered and the receiver's report must agree with this.

The accounts in the treasurer's office are kept according to the method recommended by the committee of the Street Railway Accountants' Association.

## THE ENGINEERING CHEMISTRY OF BOILER WATERS.

A Paper Read by Henry Leffmann before the Engineers' Club of Philadelphia.

Pure water is an artificial product of the laboratory, and is so difficult to prepare and preserve that its properties can hardly have any practical importance. Natural waters always contain substances in solution and suspension, varying from mere traces to very large amounts. The effects and uses of water are dependent upon the character and amount of the materials present. When the wholesomeness or physiologic effects are to be determined, the important points are the nature and amount of the mineral ingredients and the character of the organic life; but when the applicability of a water to steam-making purposes is to be determined, the action of the dissolved gases becomes important, while the organic matter, living or dead, has no practical importance unless the amount be unusually large or it be exceptional in character. Many other technical uses for water, except that of steam-making, may come under the supervision of the chemist, but they are of less practical moment.

For the study of natural waters it is convenient to arrange them into groups, and although this classification is for use in the determination of the wholesomeness, it will not be amiss to note it. The groups are four—viz.:

*Rain-water.*—Water precipitated from the atmosphere under any conditions, and, therefore, including dew, frost, snow, and hail.

*Surface-water.*—All collections of water in free contact with the atmosphere, whether in motion or at rest.

*Subsoil-water.*—Waters not in free contact with the atmosphere, but percolating or flowing through soil or rock at a moderate distance below the surface, derived in large part, if not wholly, from the rain or surface-water of the district.

*Deep-water (artesian-water).*—Water accumulated at considerable depth below the surface, from which the subsoil water of the district is separated by one or more difficultly-permeable strata.

Rain-water collected in the open country is usually nearly pure, but in cities it may contain much objectionable matter.

Surface-water is usually well adapted for boiler purposes, except for its liability to turbidity. It usually contains only a small amount of dissolved solids and but little carbonic acid.

Subsoil-water, which is that obtained from springs and ordinary wells, is usually clear, and contains notable amounts of solid matter.

Deep-water is variable in character, even with a limited area; and approximately the same depth waters of markedly different characters will be found. Deep-waters are apt to be rich in dissolved solids, but there are many exceptions to this. Iron compounds and sodium chloride are often present in considerable quantity, sometimes so great as to unfit the water for any household or technical use.

The suitability of water for boiler purposes must be considered with reference to the two properties of corroding and scale-forming. These are, to some extent, antagonistic, since the deposit of material on the iron will, of course, protect it. Experience shows that waters of very high purity are by no means always

TRANSFER, CAPITAL TRACTION COMPANY.

badge numbers of the policemen and firemen who ride free, and the time of day when they ride. These are entered each half-trip by the conductor.

At the end of each half-trip the conductor puts his transfers in an envelope, 5 in. by 3 in., on the back of which is a printed form with blanks for entering the train and trip numbers, the time and the number of transfers, the name and number of the conductor. These envelopes are turned in to the receivers at the end of each half-trip; the receiver has a case of pigeon holes (one for each conductor) in which he files the envelopes until the end of the day when he puts a rubber band around them and sends them to the treasurer's office.

Every trip the conductor makes his returns to the receiver, who enters them in a large book, on each page of which are printed duplicates of the conductor's book, and at the close of the day the conductor fills up a card, Form No. 2, and called a "total card." The total cards are given to the superintendent who sends them to the treasurer's office. The superintendent has a case of pigeon holes in which he keeps the transfers and punch to be issued to each conductor. He also keeps a book in which he registers the number of the transfers given to each conductor at the beginning and returned at the close of his day's work, and from this book an improperly issued transfer can be traced to the conductor who issued it.

Form No. 3 is 5 in. by 9 in. with 28 lines, and is used by the superintendent in his daily returns for transfers that are sold for 2 cents each. Form No. 4 is 7½ in. by 12½ in., on which the superintendent keeps his record of the free transfers issued to the conductors in the morning and the number returned at the end of the run.

Form No. 5 is 14 in. wide by 12 in. long, on which each receiver makes a daily report to the principal receiver, send-

the best for boiler use. In general, it may be said that the corrosive qualities are due to the water molecule itself or to the oxygen and carbonic acid present in solution. More rarely, we have organic or mineral acids, and these, especially the latter, are highly objectionable. Organic acids of somewhat indefinite character result from oxidation of vegetable matters, especially the cellulose and lignin of wood-fiber; hence, waters collected from swampy regions, in which there is necessarily much decaying vegetable fiber, may contain organic matter in a corrosive form, practically acid, although perhaps not corresponding exactly to the strict definition of that term in modern chemistry.

The water supplied to Sheffield, England, is derived from peaty moorlands, and sometimes has a strong action on iron. In one stage of the flow the acidity is equal to about  $\frac{1}{2}$  of a grain of sulphuric acid to the gallon. As these acid-like substances are often not volatile, the concentration of the water in the boiler greatly increases the corrosive action. Even when the organic substances are not capable of acting as direct corrosive agents, they may indirectly determine the oxidation of the iron. The laboratory affords us more than one instance of the formation of a body being promoted by conditions favorable to its combination when formed, and it seems possible that any organic matter which is readily converted into acids by moderate oxidation would be capable, under the joint action of free oxygen and a distinctly positive body, such as iron, of forming a soluble iron salt, although neither the oxygen nor the iron alone would accomplish the action.

An important commercial process may be cited as an example of this: Finely divided vegetable matter, such as sawdust, is readily converted into potassium oxalate by heating with caustic potash; and from this product oxalic acid, one of the strongest acids known, may be obtained. Vegetable matter is not converted into oxalic acid by the action of air alone or mild oxidizing agents.

Some years ago, when studying the Anderson process of purifying water, I had occasion to note an action which seemed to be explicable on this theory. A sample of water was received from the neighborhood of Norfolk, Va. It was deeply colored with organic matter. On agitating it with iron-turnings in a partially-filled bottle for a few minutes, a bulky precipitate was formed, and on filtration a colorless water was obtained, tests of which showed that 97 per cent of the oxidizable organic matter had been removed. It seems probable that somewhat similar action would occur in a boiler, and that a material corrosion of the iron would ensue, for in the experiment noted above a notable amount of the iron was converted into ferric oxide.

It is hardly necessary here to speak of the injurious action of mine-waters. In most cases they owe their acidity to sulphuric acid derived from the oxidation of pyrites, and exercise a powerful and constant corrosive effect on iron, even in the cold.

I have lately had occasion to examine two waters which have marked corrosive qualities, although they do not show excess of organic matter or marked acidity. They are of somewhat different composition. One contains about six grains of solid matter to the gallon, the other about nine. Their corrosive effect is exerted on other metals than iron; indeed, with regard to both samples, the most serious complaint is that the soldered joints in the lead-lining of the flush-tanks are destroyed. One of the samples was sent with the information that everything was corroded except the copper portion of the ball on the valve-rod. This statement led me to suspect the presence of a copper salt, but none was found. Copper and lead salts will prove very corrosive to iron. The quantitative examination of these waters has shown that in both the amount of magnesium and chlorine is high in proportion to the other solids. This suggests the view that the corrosive action is due to magnesium chloride, as noted below.

The corrosive action of the soluble chlorides on common metals is well known. Practically only sodium chloride and magnesium chloride come into consideration. Sodium chloride is present in almost every sample of water, but in surface and subsoil-water, unpolluted with sewage, the quantity is usually less than one grain per gallon. In deep-waters the amount is often quite large. Thus, in the well (over 400 ft. deep) on Black's Island, just below the mouth of the Schuylkill river, the sodium chloride exceeds

50 grains per gallon. Such a water would be expected to exert a decidedly corrosive action.

Magnesium chloride is generally considered a highly objectionable ingredient by reason of its liability to a reaction with water, by which hydrochloric acid is formed. It is known that magnesium chloride can not be obtained pure by evaporating its solution in water; the residue will contain some magnesium oxide, while hydrochloric acid escapes. The water takes part in the reaction.

Some experiments that I have made indicate, however, that this reaction does not occur until the solution becomes concentrated. However, we must bear in mind here the principle that has been stated in connection with the effect of organic matter, namely, that the presence of iron may promote the reaction by offering an opportunity for the action of the chlorine. The experiments of evaporating magnesium chloride in glass, porcelain, or platinum vessels do not represent the conditions in practice, and the reaction

might occur under conditions which would not bring about the former reaction.

To be on the safe side, some chemists have advised that the magnesium and chlorine determined in the analysis should be so expressed as to show the maximum amount of magnesium chloride that could be produced from the water, and thus determine the upper limit of a corroding effect from this source.

Even supposing we have no substances in the water capable of acting directly on iron, it is not likely that any boiler will escape some corrosion, for commercial forms of metals are not usually homogeneous, and the contact of water containing appreciable amounts of mineral solids will establish a polarization which one portion of the iron will become the positive plate in a voltaic couple and suffer corrosion in consequence.

The gases dissolved in water are usually nitrogen, oxygen, and carbon dioxide; the last is assumed to exist as carbonic acid. Nitrogen is regarded as without effect, but the others are important. Spring-water of high class—that is, containing very little dissolved solids—often produces marked corrosion. Some years ago one of the large trunk-line railroads had much trouble from boiler-corrosion on a division which was supposed to furnish excellent water. The road had a well-equipped laboratory, but the chief of that department assumed that the corrosion was due to free acid. He held to this view stubbornly, and in defense of it had numerous analyses made and considerable volumes of the water evaporated in order to concentrate the acid which was not there. The examination showed that the corrosion was due to the dissolved oxygen, probably assisted by the carbonic acid. The water contained so little scale-forming material that no protecting film was formed on the iron, and hence it was exposed to the direct corrosive action of the water and the contained gases.

The solubility of oxygen in water is greatly diminished by heat, while chemie activity is increased. Hence, the cold water charged with oxygen entering the boiler has this oxygen released from solution and it attacks the iron. The corrosion is, therefore, apt to be most marked at the point at which the feed-water enters. The presence of the free oxygen and its increased activity probably also assists the corrosive action of the carbonic acid. The reaction

is unlikely, but

is not improbable; indeed, it is supposed to occur in some cases in the Anderson process for purifying water.

When the amount of scale-forming ingredients is sufficient to produce a film on the iron, it is protected from such immediate corrosion, and we are reminded of the conditions which occur in the human mouth—the decay of the teeth and the deposit of tartar are antagonistic conditions and do not occur at the same spot.

Two other influences toward corrosion may be mentioned:

Unpolluted waters usually contain but small amounts of nitrates, but waters drawn from shallow wells in populated districts generally contain notable quantities, probably in the form of calcium and magnesium nitrates. These are corrosive salts,

and, as the determination of the nitrogen existing as nitrates is easily made by modern methods, it should not be omitted by the analyst. If the proportion exceeds a few parts per million it should be given consideration.

The fatty oils may lead to the production of corrosive substances. These often contain free acid, and the proportion may be increased in the boiler since high steam decomposes the fats and oils, producing a fatty acid and glycerol. The mineral oils are hydrocarbons and are not subject to such decomposition, and hence are not likely to form acids. In fact they exert rather a reducing action and might restrain corrosion.

Turbid waters should be filtered before being used in boilers. If filters using alum are applied, care should be taken that an excess of alum (or aluminum sulphate) be not used, as decided corrosion might be produced.

The scale-forming ingredients in water are principally the compounds of calcium and magnesium. Usually the amounts of silica and iron are not sufficient to produce marked deposits. Calcium and magnesium exist in natural waters principally in the form of sulphate, carbonate, or chloride, and the amount and character of the scale will depend, to a great extent, upon the form of combination. Magnesium and calcium carbonates are but slightly soluble in pure water, but are rendered much more soluble by the presence of free carbonic acid. This is usually expressed by saying that the substances form soluble bicarbonates, but the term is little more than a form of words. Whatever be the condition, it is well understood that it is disturbed by the removal or neutralization of the free carbonic acid, when all but the small quantity of the carbonate, soluble in the pure water, is precipitated. In the ordinary use of water, the removal of the carbonic acid is brought about by the heating, and deposits of the carbonates promptly take place. The amount of such deposit is, therefore, independent of the concentration which the water suffers.

Magnesium sulphate is freely soluble in water under all ordinary conditions and need not be further considered. Calcium sulphate is one of the most objectionable ingredients in boiler-water. Although often described as an insoluble salt, it is soluble in cold water to the extent of over 100 grains to the gallon. At the boiling-point it is somewhat less soluble, and at temperatures decidedly above this, say 300° F., which corresponds to about 60 lbs. pressure, it is nearly insoluble. Now, it is a well-known principle that insolubility controls chemie interaction. Hence, water containing calcium compounds and sulphates would be expected to form a precipitate of calcium sulphate in such amount as to exhaust one of the ingredients that are needed to form it—that is, until either the Ca or the SO<sub>4</sub> is used up. Possibly the presence of considerable amounts of chlorides or potassium or sodium carbonate would mitigate this condition, but in most instances, I think, it will be safe to apply the same rule that is given for the estimation of magnesium chloride, namely—base the judgment on the maximum amount of calcium sulphate that the water could yield under any condition.

In response to an inquiry, Dr. Dudley has kindly given me an outline of the method used in the Pennsylvania Railroad laboratory at Altoona for the approximate determination of scale-forming ingredients. The total solids are determined in the usual way, the residue is treated with dilute alcohol (50 per cent) and the undissolved matter is designated scale-forming material. The method is found to be satisfactory in its application.

Any condition that promotes the insolubility of the calcium sulphate will, in some measure, represent the effect of heat, and hence the amount of precipitation obtained by adding alcohol to the concentrated water will be of value in determining its incrusting tendency.

Although the various materials which deposit in boilers are often collectively designated as "scale-forming," yet as is well known the different material differs much in the character of the material deposited. The carbonates produce a soft scale, calcium sulphate a hard scale.

E. F. Smith has called my attention to the fact that some manufacturers at Manayunk, Philadelphia, have been obliged to abandon filters requiring alum on account of the marked increase of hard scale which is brought about. This is easily explained: the alum introduces a notable amount of sulphate into the water.

Probably aluminum chloride could be substituted with advantage in these filters.

In that portion of the deposit in direct contact with the hot iron, the precipitated magnesium carbonate becomes converted by the combined influence of the heat and water into magnesium hydroxide and carbonic acid.

Hence many boiler-scales show notable amounts of magnesium hydroxide without necessarily indicating that it is due to the decomposition of magnesium chloride.

Perhaps, at the end of this exposition of chemie principles, you may be inclined to say with the Mikado, "All this is very interesting, but we come upon an entirely different matter." Engineers can not control the laws of nature, and often have no choice of water. The question is then what may be done to remedy the objectionable conditions. Turbidity may be easily remedied by filtration. In the technical uses of water a mere straining effect is needed; the removal of bacteria and the mere opalescent suspended matter is not necessary, hence less care is required in the operation of the filtering apparatus than when sanitary questions are involved. I have already called attention, however, to the danger of the too free use of aluminum salts.

When corrosion is due to free acid it may be easily overcome by the use of alkaline substances, among which caustic soda and soda-ash would be most generally applicable. The corrosion due to the decomposition of the magnesium salt would be benefited by almost any of the methods adopted to prevent scale, which will be considered later. The corrosion due to dissolved oxygen will be materially reduced by heating the feed-water, and also by arrangements for not allowing the water to come directly in contact with any highly heated spot.

The prevention of scale is secured in various ways. The magnesium and calcium carbonates that may be held in solution by carbonate acid are all precipitated by the removal or neutralization of that acid. The former may be accomplished by the heating of the water, or even by exposing it in thin layers to the action of air; the neutralization can be brought about by the addition of some basic substance. One of the oldest methods is the addition of slaked lime, calcium hydroxide, which, by converting the carbonic acid into an insoluble carbonate, precipitates both itself and the carbonates in solution. Caustic soda will also accomplish this.

The precipitation of calcium sulphate can not be so easily accomplished. It is soluble in water to the extent of over 100 grains to the gallon. It does not owe this solubility to any other substance, and it is not much less soluble at the boiling-point. If the precipitation is to be accomplished by heat alone, it must be under decided pressure, as exhaust steam will not produce the same effect as it will with dissolved carbonates. Calcium sulphate being a most objectionable ingredient, much attention has been given to the methods of removing it or preventing it forming hard scale. The older remedies mostly involved the use of organic matters which acted by interfering with the crystallization of the sulphate, and thus rendered the deposit pulverulent or at least friable. Much organic matter, however, in a boiler may cause corrosion or priming, and we find a tendency at the present day to the use of direct precipitating agents, among which may be mentioned trisodium phosphate and sodium fluoride. Both these substances convert all calcium and magnesium compounds into insoluble flocculent precipitates, yielding also highly soluble and non-corrosive sodium salts. They seem to meet the practical issues very well, and are in extensive use.

#### AWARDED TO THE ALBANY CONSTRUCTION COMPANY.

The contract for the construction of the Albany, Helderberg & Schoharie electric railway was awarded, June 2, to the Albany Construction Company. The latter company has agreed to build the 40 miles of railway through the state of New York, at \$10,000 per mile, and to begin the work June 13. The road is a highly desirable one, and the route, through the heart of the state, is likely to be a profitable one.

**DUQUESNE FORGED GEARS.**

The Duquesne Forge Company, of Rankine Station, Pa., has just placed on the market a complete line of forged steel gears and pinions which are unique in their construction. The method of construction is quite different from anything else on the market and is well shown in the accompanying illustration. The blanks for the rims are first rolled as any structural shape would be, cut into proper length, bent to the desired curvature, and fastened to the cast steel centers by two pins at each end as indicated in the cut. The two halves are then faced, bolted together and the teeth cut. So made the gears are much lighter than the ordinary gear and are free from blow holes. The Duquesne Forge Company will furnish blanks to street railway companies which desire to cut their own gears.

The bolts are readily accessible and a gear can be removed from an axle with any common wrench without difficulty. This type of gear is meeting with favor and the repeated orders from the same customers prove the substantial claims of the makers. The Duquesne Company is represented in Chicago by the W. R. Garton Company.

**UNDERGROUND CONDUITS.**

Whenever the street railways are called upon to lay feeders underground it is necessary to select a conduit which has high insulating properties, is durable, and will not cause abrasion to the cables, is proof against frost, heat, water and acids, and can be easily and quickly laid. The Standard

SALT-GLAZED CONDUITS.

Fire-Proofing Company, of Perth Amboy, N. J., offers such in its salt glazed conduits. They are manufactured of the finest quality of fire clay, properly dried, thoroughly and uniformly burnt and heavily glazed inside and out. As may be seen in the cut the ends of the sections are provided with holes for the use of iron dowel pins, which assist in the alignment and strengthen the joint.

The Warren, Brookfield & Spencer Street Railway Company, of Brookfield, Mass., is now building a new power station and car house.

**SERVICE TEST OF STREET RAILWAY BRAKE SHOES.**

The Sargent Company advises us as follows regarding tests made by the Chicago City Railway of the Sargent "Diamond S" and Congdon brake shoes. One car was equipped with two "Diamond S" and two Congdon shoes, the former averaging 20 lbs. and the latter 19 lbs. when new. These were applied on December 10, 1897. On April 28, 1898, the "Diamond S" shoes were removed, averaging in weight 13½ lbs.; average loss per shoe 6½ lbs. On the same date the third pair of Congdon shoes was removed; average loss in lbs. per wheel 20%. Average weight of Congdon shoes removed 12 lbs.; average loss per shoe 7 lbs. The "Diamond S" wore out three sets of Congdon shoes showing a ratio of wear in weight in favor of the former of 3.21 to 1.

On the second car four "Diamond S" shoes were applied and ran from December 10 to May 6, showing an average loss by wear per shoe of 6⅛ lbs. for nearly five months service. The "Diamond S" also gave the better result in stopping the car quickly and smoothly.

**MALLEABLE IRON JAW FOR BRAKE RODS.**

B. Haskell, superintendent of motive power of the Chicago & West Michigan Railway, has designed malleable iron jaws for certain parts of the brake rigging on freight cars, whereby a considerable saving in blacksmith work

JAW FOR BRAKE RODS.

is effected. This jaw was described in a recent issue of the "Railroad Gazette." The end of the rod is first put through the cored hole A in the jaw, and is then heated in the forge and bent so that it can be drawn back through the opening B. The end of the rod is turned down to prevent the jaw from slipping on the rod. In this way brake rods can be fitted up quickly and no skilled labor is required.

**AN ARMY AND NAVY**

Memorandum book is what you have been wanting. The Northern Pacific has it. It contains out of the Maine, Map of Cuba, List of United States and Spanish Naval Vessels, Interior Drawings of a Battle Ship, Illustrations of United States and Spanish Ships, Glossary of Navy and Army Words, Table of Distances, Commanders of United States Ships and Army Corps, List of United States Regiments and Their Commanders and other information very useful and valuable at this time.

The book fits the vest pocket and is up to date. Send Chas. S. Fee, General Passenger Agent, N. P. R., St. Paul, Minn., ten cents and the book is yours.

## PERSONAL.

Paul Seevers, superintendent of the Muscatine (Ia.) Electric Railway Company, resigned June 1.

R. L. Rand has been appointed to succeed William Fisher as superintendent of the Brunswick (N. J.) Traction Company.

E. Kessler, general manager of the Richmond Traction Company, of Richmond, Ind., called on the REVIEW when in Chicago recently.

Thomas H. McLean, general manager of the Toledo Traction Company, was a caller at the REVIEW office when in Chicago the early part of the month.

I. R. Nelson has resigned his position as superintendent of the Milwaukee, Racine & Kenosha Electric Railway. His successor is John Blott, of Cleveland.

A controlling interest in the Citizens' Street Railway, of Mattawan, N. Y., has been purchased by John T. Smith, S. K. Phillips, E. L. Tompkins and W. J. Conklin.

D. A. Belden, general manager of the Aurora (Ill.) Street Railway Company, is quartermaster of the 3rd brigade, Illinois National Guard, with the rank of major.

A. C. Woodworth, president of the Consolidated Car Fender Company, Providence, spent a few days in Chicago the early part of this month, while making an extended western trip.

Capt. Frank S. De Ronde has been given leave of absence from the Standard Paint Company, and has enlisted for the war. He is now in command of a company in camp at Sea Girt, N. J.

E. W. Rockafellow, of the Western Electric Company, who was stationed at Camp Townsend as 1st lieutenant in the 47th New York, has been promoted and is captain of Company M in that regiment.

Ernest X. Le Seure, general manager of the Danville (Ill.) Gas, Electric Light & Street Railway Company, was a REVIEW caller when in Chicago last month, and reported that his company is making extensive improvements and building a line to the new Soldiers' Home.

L. O. Williams, who has for a long time been paymaster for the treasurer of the Lynn & Boston road, has left street railway service to become treasurer of the Ft. Worth & Rio Grande Railroad, with office at Ft. Worth, Tex.

Charles N. Wilcoxon has left Muncie, Ind., and assumed the general management of the Citizens Electric Railway, Decatur, Ill., on June 1. The citizens of Decatur will find Mr. Wilcoxon a progressive officer and pleasant gentleman.

F. C. Armstrong, representing Dick, Kerr & Co., of England, is on a tour of inspection through the United States and stopped for several days in Chicago. On his return home Mr. Armstrong will be the London representative of the company.

George B. Kerper, general manager of the People's Line, Dayton, O., accompanied by Mrs. Kerper, called on the REVIEW while in the city. They also spent some time at Lake Geneva, the guests of Chicago friends, having a fine summer residence at the lake.

At the annual meeting of the Dayton, Springfield & Urbana Electric Railway the following officers were elected: President, Col. Fred. Colburn, Charleston, W. Va.; vice-president, J. S. Harshman, Enon; secretary and treasurer, John G. Webb, Springfield

W. J. Hart, who has been connected for eight years with the street railways of Saginaw, Mich., as manager of the Union and later manager of the Interurban, has resigned and will be the manager of the new Detroit, Lake Shore & Mt. Clemens Electric Railway with headquarters in Detroit.

A. A. Anderson general manager of the Mahoning Valley Railway Company, Youngstown, O., has been chosen manager of the Trumbull Electric Railroad connecting Niles and Warren. The proposed consolidation of these lines will not be effected, though they will henceforth be under the same management.

F. H. Talbot, who was in charge of the mechanical and electrical departments of the shops of the Lake Street Railroad Company, of Chicago, has accepted a position with the Walker Company. He is an erecting engineer, and is now overseeing the equipment of the new motor cars of the Metropolitan West Side Elevated Railroad Company.

F. E. Smith, who, as auditor of the Lynn & Boston Railroad, ranks among the foremost street railway accountants in the country, stopped in Chicago on his return from an extended trip in Texas. He was in attendance upon the sessions of the Illinois Street Railway Association, where he was warmly welcomed and also visited the meetings of the National Electric Light Association.

Albion E. Lang, president of the American Street Railway Association, and of the Toledo Traction Company, has returned from an eastern trip of inspection during which time he spent several days at Old Point Comfort. It is not expected that the war will have any effect on the time or place of the annual convention which meets in Boston early in September. Mr. Lang says all the indications point to the largest and best convention in the history of the Association.

W. L. Ferguson, who has been closely connected with the street railway interests of Decatur, Ill., for the last 15 years and manager of the consolidated system since 1892, resigned on June 1, to become general manager of the Richmond & Eaton Traction Company, which is to build an electric line from Richmond, Ind., to Eaton, O. The employes of the City Electric Railway Company, where Mr. Ferguson has been for so long, presented him with a handsome cane as evidence of their good wishes and kindly feelings. At the recent meeting of the Illinois Street Railway Association, Mr. Ferguson read a paper on "Collection of Fares and Checking Employes."

R. C. Brown resigned his position as superintendent of the Halifax Electric Tramway to become assistant chief engineer of the Metropolitan Traction Company, of New York, and has been succeeded by Fred A. Huntress, who was his assistant. When Mr. Brown's resignation was accepted the directors adopted a resolution reciting that his management had "resulted in the installation of a system of electric lighting and tramway service in the highest degree efficient, which efficiency is due in a very large measure to the ability and competency of Mr. Brown," and the president and secretary were appointed a committee to present him with a testimonial on behalf of the company.

## OBITUARY.

Charles B. Pratt, president of the Worcester (Mass.) Consolidated Street Railway Company, and ex-mayor of Worcester, died at his home on May 10. Mr. Pratt was prominent in banking and insurance circles.

John J. Shipherd, a well known Ohio street railway operator, died suddenly at his home in Cleveland, June 1, of stomach trouble and bronchitis followed by heart failure. At one time Mr. Shipherd was interested in roads at Columbus, Ft. Wayne, Ind.; the Cleveland City and several others, and was understood to be worth a million dollars. All his property, however, was

lost during the recent financial depressions, and left him hopelessly in debt. His business reverses have weighed heavily upon him, and probably are chiefly responsible for his failing health and death.

## NEW PUBLICATIONS.

A supplement of essential information concerning the United States Navy has been published under the name of the Scientific American Special Navy Supplement, by Munn & Co., 361 Broadway, New York. A historical sketch is given of the birth and growth of the new navy, from 1883 to 1898, together with 90 illustrations of our ships, all of which are accurately classified and described. Many of the pictures are half tones and wood cuts. The supplement is handsomely bound, and may be purchased, by mail, for 25 cents.

"Coal Catechism" is the title of a recent work by William Jasper Nicholls, M. Am. Soc. C. E., published by the J. B. Lippincott Company, Philadelphia. It comprises 218 pages, with index; 12-mo. Price \$1.50. The author states in the preface that the book is intended "for that great number of intelligent readers who have no technical training, and yet who prefer to seek knowledge by reading special subjects rather than fiction." In justification of the catechetical form used he says no better method has been devised for imparting a thorough knowledge of a subject, especially to those young students in our schools and colleges who desire special instruction, or to those who have not received the necessary training for systematic study. In all there are 20 chapters dealing with the origin, geology, history, geography, production, classification, development, preparation, transportation, properties, etc., of coal, and the whole constitutes an elementary but comprehensive handbook of the subject. The typographical work is good and the book is attractive in appearance.

## BUFFALO TRACTION COMPANY TRANSFERRED.

The Buffalo Traction Company has changed control, it being claimed by some that the Buffalo Railway Company either directly or through some of its heavy stockholders as individual purchasers of Traction stock now holds the helm. General Manager Littell in the local papers positively denies that his company is the purchaser, and states that with the 4-cent fare hung around the neck of the Traction, his company could do nothing with the property. If the two properties could be united under the management of the old company, it would be a most desirable thing both for the roads and the public, for transfer privileges would undoubtedly be granted if the city council will raise the Traction's 4-cent fare to 5 cents, which it should be very glad to do.

## WILL ENTER WASHINGTON.

The Chesapeake Beach Railway is now all but completed from the District of Columbia's line to Chesapeake Beach, and will gain an entrance into Washington through an arrangement made with the Capital Traction Company. The Chesapeake Company has leased the Alexandria branch of the Baltimore & Ohio road, and has arranged to run its cars over the tracks of the Capital Company to the navy yard gate. President Otto Mears, of Denver, Colo., has announced that the third rail system will be used for the passenger line. A power house will be built at Patuxent, and \$1,500,000 expended on improvements at the beach to make it one of the finest resorts on the Atlantic coast.

## NEW CONTACT SHOE FOR CONDUIT ROADS.

In the operation of the electric conduit railways in Washington it was found that some alterations could be made in the traveling contact or current collector to insure better operation. G. B. Coleman, general manager of the Metropolitan Railroad Company, and J. W. Duggan designed and patented the form of contact shoe here shown. It was found that if the lead wires were inclosed in fiber strips the insulation became affected by dampness and a short circuit was liable to occur. In the new shoe the insulated wires are exposed so that the insulation will quickly dry out. A special feature is that there is a duplicate set of main leads

CONTACT SHOE FOR CONDUIT ROADS.

which can easily and quickly be connected should the first pair be burnt out or damaged from any cause.

The figures show the front and end elevations of the contact. The main leads extend down the vertical bars and are held firmly in place by insulated tubes which are secured to the frame by U-shaped clamps. The attachments on the upper end of the wires are for connection to the car cables. The lower ends pass through recesses in the contact blocks and are fastened by binding posts, counter-sunk in the contact blocks. The contact blocks or shoes are fastened to fiber blocks and these are pivoted to two oppositely disposed arms and held in position by springs.

The present plans of the New York City street railway companies contemplate the banishment of the horse within the next two years.

The New Castle (Pa.) Traction Company has let the contracts for building an extension to its car barns. Eight new summer cars have just been purchased from Jackson & Sharp.

## FOREIGN FACTS.

Between Haspe and Gevelsburg a light electric railway will be built by the Hagener Strassenbahn Aktien Gesellschaft of Hagen, Germany.

George White, managing director of the Bristol Tramway & Carriage Company, was recently elected president of the Bristol (Eng.) Stock exchange.

An electric tramway will be built in Cognac, France. Manufacturers should address M. Jules Brisson, Maire de la Ville de Cognac, Charente, France.

Barcelona, Spain, hopes to have the electric cars in operation by the coming summer. Permission to equip the Ensanche line with electricity is also sought by the Barcelona Tramways Company, of London, Eng.

A light electric railway will be built at Dortmund, Germany, to operate in connection with the street railway. The line will carry passengers between Dorstfeld and Lutgendortmund. Plans have been prepared by the Allgemeine Lokal & Strassenbahn Gesellschaft.

Twenty American electric street cars were recently delivered in Berlin and 100 more have been ordered. They are required immediately and the order was therefore placed with an American firm that was able to deliver them in Berlin at the same price and in about one-fourth of the time required by German manufacturers.

The street railways of Marseilles will soon be extended till the city shall have 84 miles of track, and all the roads are to be equipped with electricity. A power station, for the generating of an 8,000 h. p. force may be erected, and other improvements made to place Marseilles on an equality with Paris in point of rapid transit.

The electric tramways now under construction in Cork, Ireland, are due to be in service July 1. The power plant includes three Babcock & Wilcox boilers and three McIntosh & Seymour side crank tandem compound engines. There are to be 18 double-decker cars each to be fitted with double motor equipments and series parallel controllers.

The rapid building of railroads in China is creating a demand for all sorts of railroad equipments, and American firms are getting a majority of the orders. A firm in New York recently shipped over \$5,000 worth of machinery to Shanghai. The Canada Manufacturing Company has shipped to Shanghai one pair of car wheels as samples.

The Mexican Electric Tramways Company, Limited, has been registered in London with a capital stock of £500,000, for the purpose of building and maintaining rail, tram and other roads, telegraphs and telephones. Two of the stockholders are W. Martin, Avondale Manor Road, Richmond, and H. W. Brown, 79 Highland street, Beckenham, near London.

The city of Mainz, Germany, will operate electric railways, entirely abandoning the horse car system. Two new systems are to be installed, on one line the storage and on the other the overhead trolley. The South German Railroad Company is arranging with the state authorities to extend its line. This company will establish a road connecting Mainz with Wiesbaden, and another from Mainz to Eltville.

Theophilus Liefeld, United States' consul at Freiburg, Baden, Germany, writes that an electric railroad system and central power station for electric light and locomotive power will probably be built immediately in that progressive city of 55,000 inhabitants. The chances of American manufacturers in the field, he says he believe to be unusually good. Bids should be addressed to the committee on underground structure, Freiburg, and delivered before July 1.

It is predicted by Hugo Donzelmann, United States consul to Bohemia, that that most productive state in the Austrian Empire will soon be modernized by systems of electric railways to comprise many city and interurban lines. The horse car line in Prague is to be equipped with electricity and extended, and the city of Pilsen is to be furnished with an electric railway. The consul affirms that the new field will be one of profit to American manufacturers.

The Compagnie Generale des Omnibus, in Paris, France, will meet the overpowering competition of the new electric railway systems of Paris, by the establishment of mechanical traction on a first installment of 15 tramway lines, so selected that the total expense will not exceed 25,000,000 francs (\$5,000,000). It is further offered to apply mechanical traction to a second installment of 10 lines if the city of Paris will pay the principal of an issue of bonds to the extent of \$3,000,000.

Three electric railways are projected in the vicinity of Hiogo (Kobe). A line will be built from Kobe to Amagasaki, 15 miles distant by a company with \$249,000 capital. Another line is to be built between Amagasaki and Osaka, and will be five miles long, supported by a capital \$149,900. Address Mr. Shinyemon Konishi, of Itamicho, Kawabe-gun, Japan. The third line is to run from Kobe to Armina, 15 miles. The company has a capital of about \$150,000. Address Mr. Ki-Ichiro Naka, of Arino-mura, Arima-gun, Japan.

At a recent meeting of the Channel Bridge Company, in Paris, M. Thevenet le Boul, chief engineer of the Ponts et Chaussees, explained a new method proposed for crossing the channel between France and England. The plan consists in rolling on a bridge submerged to the depth of 15 metres below low-water mark, an immense platform emerging above the water. It is to be propelled by electricity and capable of carrying four railway trains. The Compagnie de Fives-Lille has made a careful study of the project and has expressed a belief in its practicability.

American manufacturers feared, at first, that the existing war between the United States and Spain would have a disastrous effect as regarded certain large foreign investments in which considerable capital was involved. The danger threatened the manufacturers of electrical railway materials more than it threatened others. The steamer Etruria recently brought satisfactory reports concerning England's confidence in the United States, and the danger of war as affecting the American market is averted. It is expected that more English contracts are soon to be awarded for execution in America.

The Dublin United Tramways Company will accomplish the substitution of electricity for horse traction upon many of the tramways in Dublin, and the rebuilding and extension of the lines that adhere to the old system. The Clontarf line, which is already run by electricity, will be extended. Horses are being displaced by the electric system on the line from Haddington road to Nelson's Pillar, and thus an electric tram service is being established from Dalkey to Dolymount, a distance of 14 miles. This work will be finished within two months, as will the line through Pembroke Township. It is estimated that these improvements will cost \$360,121.

American manufacturers will equip a new storage-battery traction system in Ostend, Belgium. This city is a residence of the king, and a fashionable resort, but has never had a street railway system. The generating plan of the projected railway will consist of a 60 h. p. compound high pressure engine, connected with a Westinghouse multipolar dynamo of 38 k. w. capacity, making 600 revolutions a minute and producing a current of 280 volts. Storage batteries will equip the cars, and a run of 40 miles can be made before recharging is necessary. It will require two hours to recharge the batteries. A complete Westinghouse system, with switch boards, will be placed in the generating station. The cars will run at a speed of from 10 to 12 miles an hour in town, and from twenty to thirty miles an hour in the country.

**NEW ELECTRIC PASSENGER COACH TRUCK.**

W. A. McGuire, president of the McGuire Manufacturing Company, Chicago, and John W. Cloud, have patented a pressed steel truck for steam and electric passenger service. The McGuire Company controls its manufacture and sale for street railways.

The truck throughout is of steel, excepting the brake shoes. The sides and bolster are made from heavy boiler plate flanged steel. The swinging bolster is of low carbon

bit of room between the axles and the transoms, so that there is not an unoccupied space of two inches in any part of the interior of the truck. In the case of the Alley Elevated and Brooklyn Bridge all the springs are carried upon the outside of the frame, on or under the equalizers, while in the Cloud truck it should be noted all the springs are carried on the inside of the frame, with the exception of those shown in the cut, over the journal boxes, and no equalizers are used.

The truck has gone into use very rapidly in steam railway service, several thousand having been put into use last year. It is claimed for them that they are the strongest trucks in

SIDE ELEVATION OF MCGUIRE-CLOUD TRUCK.

cast steel, and the truck is specially designed to meet the heaviest requirements of modern service. The patented points cover the method of mounting the springs over the journal box outside and inside the frame. The rocker housing, which carries the elliptic springs and serves the same purpose as a swing bolster, or, rather, permits the bolster to rock laterally with a motion that is claimed to be easier than the old swing hanger style. The elastic brake hanger also

use, and, while they are only 5 ft. 6 in. wheel base, they ride as easily as a six-wheel sleeper coach truck.

This truck is well adapted to meet the requirements of steam railroads that propose introducing electricity into their suburban service. The long experience of Mr. Cloud and the McGuire Manufacturing Company well fits them for designing a truck of this kind, and their latest production should find a ready place in the market.

HALF-SECTION AND HALF END ELEVATION.

combines the release spring and is an absolute preventive of kicking brakes, which is so objectionable in a passenger coach. It will be noticed that the position of the elliptic springs is quite unique in this, that the support upon which they rest is suspended from the transom and takes up all the space between the wheels on either side of the truck, this being necessary in electric railway practice to make room for the motors. The trucks built by the McGuire Manufacturing Company for the Alley Elevated and Brooklyn Bridge are of the same wheel base, and the motors take up every

**OFFICERS OF THE NORTH JERSEY.**

At the regular meeting of the North Jersey Street Railway Company, which, as noted in our April issue, has leased the properties controlled by the Consolidated Traction Company, of Jersey City, the following officers were chosen: President, E. F. C. Young; vice-president, David Young; secretary, Wilbur F. Johnston; treasurer, E. N. Hill; auditor, E. D. Hibbs. The Consolidated Traction Company turned over its property on June 1.

## ECHOES FROM THE TRADE

The John Stephenson Company has received an order from the Brooklyn Heights Railroad for 70 closed cars for fall delivery.

The Baltimore Consolidated Railway Company has purchased 20 new cars of the Brownell Car Company, which are being fitted with trucks built by the Baltimore Car Wheel Company.

James H. Harris, Chicago agent of the Heine Boiler Company, has sold to the Toledo Traction Company two boilers of 574 h. p. each, for addition to its plant; boilers to be delivered by August 1.

The Cramp-Hoadley Company, New York, agent for the Green-Wheelock engine, has issued a descriptive catalog showing the valve gear in detail and a number of large installations, including street railway plants.

The Toledo Traction Company has ordered 17 closed cars, with 20-ft. bodies and vestibuled on one end which will make a handsome addition to the equipment. These cars will be mounted on the trucks designed by C. E. Moore, master mechanic of the Chicago City Railway.

The Standard Paint Company, of New York, is doing a good business in its P. & B. compounds, tape, varnish and ruberoid motor cloth. These are widely used by the manufacturers of street railway apparatus and in the repair shops of many street railway companies with entire satisfaction.

The Joseph Dixon Crucible Company, of Jersey City, sent out its monthly calendar for June calling attention to the merits of Dixon's silica graphite paint which is recommended as equally useful for metal and woodwork, trolley poles, bridges, stacks, boiler fronts, and iron construction work in buildings.

The firm of Waterlow & Sons, London, has been incorporated with \$750,000 capital for the manufacture of street cars and rolling stock of all kinds for electric steam, gas, oil and horse railways. The work will be located at Preston and in future tramway work great efforts will be made to secure home orders.

The Wheeler Reflector Company, 18 to 24 Washington street, Boston, advises us that it is meeting with much success in selling the dash headlights which have been described in recent issues of the Review, many orders, both new and repeat, having been received from street railways in various parts of the country.

The Augusta Electric & Construction Company has recently been organized to carry on an electrical supply business at Augusta, Ga. Mr. McDonald, formerly the manager of the local telephone exchange, is general manager, and B. R. Mitchell, who has long been in the supply business, is superintendent of construction.

The Christensen Engineering Company, of Milwaukee, has completed arrangements with R. W. Blackwell, 39 Victoria street, Westminster, London, S. W., to act as agent for the company in the United Kingdom. The Christensen air brakes have a world-wide reputation and with the activity in tramway matters in the British Isles a good business is anticipated.

The American Electrical Works, of Providence, R. I., which may always be relied upon to conceive something appropriate, as a souvenir of Memorial Day sent to its friends a fine steel plate portrait of Abraham Lincoln, and as a most appropriate sentiment of the day the immortal address delivered by him at the dedication of the National Cemetery at Gettysburg.

A party including Messrs. Lockwood and Smith of the Anacostia road, Washington, D. C.; B. R. Stare, Sherman, Texas; E. D. Du Bois, Chicago, and a REVIEW representative, inspected the new Patton motor which has since been shipped to Chattanooga. A successful and satisfactory run of about ten miles was made, and two loaded freight cars switched to demonstrate the power.

In an attractive pamphlet from the R. Woodman Manufacturing & Supply Company, of Boston, are described the Bates numbering and line dating machines. The numbers run from 1 to 99,999 and there are four different styles of type. The line dating machine gives the month, day and year for nine years. The machines are attractive in appearance, durable and convenient to operate.

E. R. Richards, first lieutenant First infantry, National Guard of Missouri, the representative of the J. A. Fay & Egan Company in St. Louis having been called out with his regiment, John B. Temple has been sent from Cincinnati to take the place vacated by Mr. Richards in St. Louis, and Phillip J. Fraker has been called from Buffalo to Cincinnati to take the place vacated by Mr. Temple.

The new South Bend Street Railway Company just purchased the South Bend Street Railway and the South Bend & Mishawaka Railway, which is to be the nucleus of a very large system, and it has decided to use the McGuire standard solid steel frame truck on all lines, and has placed the order with that company for the first installment. The competition for this part of the equipment was very strong.

The Electric Storage Battery Company is issuing about twice a month circulars describing installations of chloride accumulators in central stations for trolley regulation, in isolated plants, etc. These circulars give minute details of the method of installing and operating the batteries, and of the results being obtained from them. The circulars may be obtained upon application to any of the offices of the company.

The Simonds Manufacturing Company, of Pittsburg, reports an excellent spring trade and that the shop has been running overtime for many weeks; in addition to the regular work on gears, pinion, bearings, and other railway supplies the company has been doing much special work of large design. It has built a number of wheel grinding machines and is now building some special work for several large orders.

A circular has been received from the J. G. Brill Company describing and illustrating sprinkling cars for street railways. For the standard a tank of 2,500 gallons capacity is used substantially mounted on a four-wheel truck. An 1,800-gal. tank or a 5,000-gal. tank can be furnished although the latter must be mounted on a pair of trucks. For suburban use a motor driven rotary pump is mounted on the platform so that the tank can be filled at any point where a supply of water is convenient.

The Michigan Manufacturing Company, of Ypsilanti, has issued a novel circular descriptive of the Sweet rail drill made by it. It is in the shape of a hand with the index finger extended to impress the reader with a few facts concerning the drill which has a remarkable record for speed. A 1½-in. hole has been put through a 5⁄8-in. web in 64 seconds, and on a road recently built one man drilled 6,500 13-32-in. holes in the webs of 65-lb. T-rail in nine days. A ball thrust-bearing is a feature of the drill.

"Fatigue of Metal in Wrought Iron and Steel Forgings," by H.

**MAYER & ENGLUND,****10 SOUTH TENTH ST. PHILADELPHIA, PA.****Electric Railway Material and Supplies  
OF EVERY DESCRIPTION.***We carry a Large and Complete Stock of Everything needed for the Construction,

P. J. Porter, of the Bethlehem Iron Company, South Bethlehem, Pa., is an illustrated pamphlet of 55 pages (a reprint from the Journal of the Franklin Institute) treating of this subject and the manufacture of hollow steel forgings. The author has long been connected with one of the largest forges of the country, and is thoroughly familiar with his subject, which is treated in a very interesting manner. Copies may be obtained of the company.

The Pantasote Company, New York, has received some large orders lately. The Metropolitan Traction Company, of New York, has ordered Pantasote car curtains for 325 open cars, the Nassau Electric Railway Company, of Brooklyn, for 70 open cars, The Brooklyn Heights Railroad Company for 100 cars, and 100 enclosed cars, Kings County Elevated Railroad for 41 cars, the Milwaukee Electric Railway & Light Company for 36 closed cars and in addition curtains are to be furnished for 500 steam cars.

The Buffalo Foot Cycle Company has sent out a price list and discount sheet, also showing the two styles of foot cycle, the Buffalo model and the W. S. Cleveland model. The company has recently received an order for 500 pairs of foot cycles through its agent, A. L. Cunnard, Melbourne, Australia. There are already several foot cycle academies in Melbourne and Sidney, and it is said that "His Excellency" Lord Brassy, governor of Victoria, has pronounced foot cycling the most healthful and life giving of all in-door exercises.

The Pawtucket Brass Foundry, of Pawtucket, R. I., Vulcan Foundry Company, proprietor, has closed a contract with P. P. Crafts of 190 Congress street, Boston, for all the line material to be used in the construction of the Lewiston, Brunswick & Bath Street Railway of Brunswick, Maine. This road will be 30 miles long, and the pipe body brackets are specially designed to suspend two trolley wires 5 in. apart. Much interest is attached to the building of this road, as its construction will embody many new features in electric railway equipment.

The motor cars for drawing the Brooklyn elevated trains across Brooklyn Bridge are now building in Chicago, and are being equipped with Christensen air brakes. The system is similar to that on the South Side Elevated, except that a vacuum instead of a pressure is maintained to operate the brakes. The vacuum pump connected to a 500-volt motor is encased under the car. A vacuum of 26 in. is maintained in six cylinders and this is automatically regulated through the agency of pressure diaphragms. A test was recently made of the pump, cylinders, etc., on one of the cars under construction and proved satisfactory in every way.

Norman & Evans shipped to Geo. P. Kretz a steam switch-back merry-go-round to be placed in Schenly Park, Pittsburg. It reached the city in time for Decoration Day but it was late in the afternoon before operation began. It attracted much attention, being visited by thousands, many going away without being able to take a ride. It was a success in every way and the receipts amounted to nearly \$700. The company reports a good foreign trade, one galloping machine having been sent to South America and one to the French West Indies. The war is interfering somewhat with domestic trade, but it is still better than last year.

The Hoppes Manufacturing Company, of Springfield, O., has just published a new catalog of its live steam feed water purifiers, exhaust steam feed water heaters and steam separators. The catalog fully illustrates and describes these pieces of apparatus and gives full directions for their installation and proper care. A feature that will command the serious consideration of steam users who have not equipped their plants with Hoppes apparatus is the list of those using it. References are given to 290 users of the live steam feed water purifiers with an aggregate capacity of over 138,000 h. p., and to 430 users of the exhaust steam feed water heaters with an aggregate of over 180,000 h. p.

The Dorner Truck & Manufacturing Company, of Cleveland.

O., is now building its new types of trucks: "Criterion No. 11" single, and "Criterion No. 15" pivotal swing bolster. Within the last 60 days this company has built trucks for the following roads: Citizens' Street Railway, Fort Scott, Kas.; Dunkirk & Fredonia Railroad, Dunkirk, N. Y.; Owosso & Corunna Street Railway, Owosso, Mich.; Schuylkill Electric Railway, Pottsville, Pa.; Springfield Railway, Springfield, O.; Cleveland Electric Railway, Cleveland City Railway, Cleveland, O.; Akron Street Railway & Illuminating Company, Akron, O.; Phoenix City Railway, Phoenix, Arizona. A number of orders for foreign shipment are also on hand.

The Chicago, Milwaukee & St. Paul Railroad Company has expended \$250,000 in the elaborate equipment of two new trains, for the "Pioneer Limited" service between Chicago, Milwaukee, St. Paul and Minneapolis. The trains were built by the Barney & Smith Car Company of Dayton, O., and are of extraordinary splendor. Each train consists of mail, express and baggage cars, standard and compartment sleepers, dining and parlor cars, day coaches and reclining chair cars. The cars are superbly furnished in the empire fashion, are lighted by electricity and fitted with buffet and smoking compartments of new designs and costliest decorations. The Pioneer Limited service went into commission May 22.

The Allen & Morrison Brake Shoe Company, of Chicago, advises us that the Chicago City Railway has just completed a test of the Allen-Morrison composite brake shoe and reports its life in that service to be from four to five months, with a saving of one-half in tire wear and increase of 50 per cent in braking power, the test showing all and more than the makers claimed for the shoe. The company is sending out test shoes all the time. The company has been in existence little over three months and as the test shoes wear so much longer than it claimed there is but little to report. On street railroads and elevated there has not been a complaint and the fact of the various roads ordering goods is proof of their superiority. A new steam surface road shoe will soon be out.

The W. R. Garton Company, of Chicago, has moved to new quarters in the Ashland block, where it can give better attention to its patrons. This concern has been in a position to solicit orders for a short time only and is particularly gratified at the success which it has met. For the last 60 days the factory making Raster carbon rheostats has been busy with orders from the Garton Company. The company has also placed orders for Billings & Spencer drop-forged commutator bars, Keystone instruments, Garton lightning arresters, Pittsburg trolley poles, Columbia covered wire and street car gongs, made by the Pittsburg Hollow Ware Company. The business in Crouse-Hinds switches and Bound Brook graphite bushings is very satisfactory, and a number of large orders for the Ohio Brass Company's goods have been promised.

Among the new articles being produced for street railways must be taken into consideration the new line of badges that the well-known firm of Childs & Co., of Chicago, is making. These badges have already been adopted by the large West End corporation of Boston, the Union Depot of St. Louis, the Memphis Street Railway, the Chicago City Railway, and the Lindell Railroad. The badge they are making is something entirely different from the ordinary conductor and motorman's badge. Instead of being a common piece of German silver nickel-plated, on which the conductor can erase the number at will, the badge is composed of fiber and metal so made that the number of the conductor or motorman is as prominent as a felon on the thumb. They have just issued a very handsome catalogue illustrating these badges, and if readers will address Badge Department, S. D. Childs & Co., of Chicago, that concern will gladly send a line of samples and full particulars.

The Consolidated Car Fender Company, of Providence, R. I., reports the steadily growing favor of its fenders by the many companies already using them, and a gratifying increase in the number of roads adopting fenders. The Metropolitan Traction

Company, New York, is equipping its entire system with the Providence fender, and finds its operation entirely satisfactory. One president who tried several fenders before adopting the "Providence," writes the manufacturers: "It is the only fender, and is a positive necessity, not a luxury." One or two of the sometimes several serious accidents most roads experience in the course of a year cost quite as much as an entire fender equipment, while the interest charges on the expense of fenders is only a fraction of the damage account saved. As purely a business investment the money put into fenders cannot be spent to as good advantage in any other way, says President Woodward, and he shows scores of letters from managers using his fenders, in proof of his assertion.

The Consolidated Car-Heating Company, of Albany, N. Y., advises us as follows:

"Judge Lacombe, of the United States Circuit Court for the southern district of New York, on May 26 granted to the Consolidated Car-Heating Company a preliminary injunction against the Gold Car Heating Company and Gold Street Car Heating Company, restraining the latter companies from manufacturing or selling their new style electric heater. The injunction is suspended until November 1, but in the meantime the defendants are put under heavy bonds and the suspension does not prejudice in any way any future action which the Consolidated Car-Heating Company wishes to take to enjoin purchasers of the infringing apparatus. The sweeping decisions obtained last summer in the United States Circuit Court and Circuit Court of Appeals, in which the Consolidated Car-Heating Company's patents were broadly sustained, were used as a basis for the motion for an injunction. This decision still further strengthens the electric heating patents of the Consolidated Car-Heating Company."

The American Brake Shoe Company of Chicago has recently been incorporated and has acquired the "Diamond S." brake shoe patents; William D. Sargent, of the Sargent Company, is president. The company has been organized to maintain a careful inspection of the product of all the licensees manufacturing under these patents, and thus secure to the railroad companies using the shoes a continuance of the good results obtained from the "Diamond S." shoes as made by the Sargent Company. It is also intended to provide inspection of brake shoes in service, giving railroads the benefit of the services of experts. Many inquiries have been received for these shoes from parts of the country remote from Chicago, and the following licensees are now prepared to fill orders, and the American Brake Shoe Company to guarantee their product: The Sargent Company, Old Colony building, Chicago; Security building, St. Louis; Endicott Arcade, St. Paul; 537 Mission street, San Francisco. The Ramapo Iron Works, Hillburn, N. Y., and Havemeyer building, New York City. Parker & Topping, Endicott Arcade, St. Paul and Albina Foundry Portland, Ore., Central Brake Shoe Company, Ellicott Square, Buffalo, and Havemeyer building, New York City.

The interest which managers of foreign lines take in our roads and in American street railway supplies is illustrated in the following letter from the superintendent of the tramway at Sydney, N. S. W. The plant is a part of the "New South Wales Government Railway and Tramways." C. F. Orr & Co., Chicago, to whom the inquiry is addressed, are probably the largest manufacturers of street railway uniforms in the world, their Chicago contracts alone calling for nearly 10,000 suits yearly:

"Gentlemen: On page 96 of the STREET RAILWAY REVIEW, for February, I observe your advertisement with regard to uniforms for street railway men. Could you kindly let me have any illustrated catalogues or pamphlets of your goods?"

"I would inform you that we are operating about 100 miles of tramways in and about the city of Sydney, a great proportion of which is dealt with by steam motors, some 6½ miles are worked by electrical traction, whilst at an early date it is contemplated to convert the whole of the present steam service to electricity. During last year we lifted upwards of 72 millions of people.

"Both the Railways and Tramways are controlled by three Commissioners, on behalf of the Government. Our staff consists of about 1,500 men."

Among the recent orders received by the Walker Company may be mentioned the following: One 250-k. w. belted railway generator and four double 4-A-S-1000 railway equipments, for the Holland (Mich.) & Lake Michigan Railway Company. One 50-k. w. direct connected lighting generator for Russell & Co., Pittsburg, Pa., to be shipped to Sewickly, Pa. One 250-k. w. belted generator for Norton & Taunton (Mass.) Street Railway Company. One 30-k. w., d. c. generator ordered by S. M. Fischer, Chicago, for the Patton Motor Company. One 30-k. w. generator for W. A. Johnson Electric Company, Toronto. One 200-k. w., d. c. generator for Lewiston Electric Light Company, Lewiston, Idaho. Two 225-k. w. belted railway generators for the Wheeling & Elm Grove Electric Railway Company, Wheeling, W. Va. United States Ordnance Department six 10-in. disappearing gun carriages for coast fortifications. The following orders for foreign shipment have been received: Edgar C. Moxham & Co., New York City, for Manaos Railway Company, Brazil, three 130-k. w., d. c. railway generators. Through agents in Japan, Bagnall & Hilles, Yokohama: One 75-k. w. railway generator and switchboard apparatus and two double railway motor equipments, of 3-S-800 motors. Through London Agency: Fifteen double equipments of 33-S-800 motors and type SL controllers. Two 120-k. w. railway generators with switchboard apparatus. Five double railway motor equipments of 3-N-800 motors.

Pain's Fireworks Company has received the warmest testimonials from the street railway and casino companies which have had it give fireworks at their resorts. An officer of the Atlantic Coast Electric Railway writes as follows: "The displays of Pain's Fireworks Company at Pleasure Bay, N. J., during the past season were eminently satisfactory both to our company and to the thousands who enjoyed them." Speaking of the value of the fireworks to Manhattan Beach in a letter to the value of the fireworks to the Manhattan Beach in a letter to Mr. Pain, Austin Corbin, one of the owners, said: "In closing with you your contract for the coming season, I take pleasure in assuring you of the satisfaction we all feel in the continuance of your connection with Manhattan Beach. During the past 20 years you have constantly raised the standard of your pyrotechnic displays to meet the advancing requirements of the public; and in making our arrangements with you from year to year, we have never troubled ourselves as to what you had decided to produce, or how you intended to produce it, so certain did we feel that your efforts would be directed to attain the highest degree of artistic merit. The best evidence that the popularity of 'fireworks' has not diminished, and that you command as hearty a welcome as ever from the American public, appears in the result of last summer, when, although the country had not yet recovered from its recent financial depression, your receipts exceeded those of any previous year." Vice-president Hobart, after the great marine parade in New York harbor wrote to "applaud the skill and inventive genius" which the pyrotechnic display evidenced. The western office and branch works are at 17-19 River street, Chicago, H. B. Thearle, manager.

Our own correspondent in Brussels sends us the following: Young and active gentleman, agent of several important American firms, would like the agency of a firm making electrical specialties for street railway purposes. Address Victor Dourin, 28 rue de la Montagne, Brussels, Belgium.

John Graham, of Wilkesbarre, Pa., who still retains his connection with the Wilkesbarre & Wyoming Valley Traction Company, on June 1, became the controlling spirit in the Bloomington (Ill.) City Railway, and has reorganized the management as follows: President, A. E. Demange, Bloomington; vice-president, John Graham, Wilkesbarre; secretary, William E. Gray; treasurer, J. F. Evans; and general manager, ex-Postmaster John Eddy, of Bloomington.

The 12 miles of track and the plant will be improved by the expenditure of \$50,000 in additions to rolling stock, power house, and new track work.

The energy and success which Mr. Graham has displayed in

## NEWS NOTES.

previous operations is indicative of what the city of Bloomington may expect of him in his latest undertaking. The city should and undoubtedly will gladly co-operate in extending liberal and broadgaged assistance in the new work and operation of the road.

A general assignment of A. Weston & Co., of Painted Post, N. Y., was made on June 6, and with it was filed a deed of the Weston Engine Company, to A. Weston, of all its property. The assignee states that the firm will pay dollar for dollar. Mr. Weston, the senior partner died on June 2.

George E. Pratt has taken a line of street railway specialties and gone into business for himself, with office in the Betz building, Philadelphia. Mr. Pratt's long connection and large acquaintance in railway work and supplies will undoubtedly put him in command of a fine business from the start. Among his specialties is a line of trolley wheels, harps, bonds, etc., which are being brought out by the well known Ajax Company, whose famous metal is used on the Empire Express of the New York Central.

---

### IF YOU LEAVE HOME

---

for the summer, go where you will find, almost literally, a new world. Such a spot is Yellowstone Park. There is no place like it in the South, nor elsewhere. You will be astonished at what you see and learn there. A month's outing in those mountains, 7,000 feet above the sea level, in an atmosphere pure and invigorating, would add years to your life. There are four modern hotels, good roads—maintained by the U. S. Government—for riding, driving or cycling; riding horses and pack trains. Geysers, canyons, mud springs, lakes, cataracts and cascades in large number, are crowded into a space 51 by 62 miles in size. If you cannot afford it, you wrong yourself by not going there. If you cannot afford it, then go to beautiful Leech Lake in Minnesota, a new and popular resort. New hotels, fine fishing and hunting, and good boating at reasonable rates. Send Chas. S. Fee of Northern Pacific Railway, St. Paul, Minn., six cents for Wonderland '98 that describes by pen and picture both resorts. Mention where advertisement was seen.

The president of the city of warsaw, Poland, desires bids for the supply of current for railways and electric lighting.

The council committee on tramways and the borough engineer of Hastings, after examining the tramway systems of Glasgow, Sheffield and several cities on the continent, reported that the trolley system was the best adapted to Hastings and recommended the construction of two lines aggregating 4½ miles in length.

Niort, France, proposes to have electric railways and lights. Inquiries should be addressed to Monsieur le Maire de la Ville de Niort, Deux-Sevres. Consul Jackson of Cognac also reports that a movement is on foot to connect La Rochelle with La Pallice by an electric railway 2.5 miles long. Address P. W. Moreh, Chamber de Commerce, La Rochelle.

The British Electric Traction Company has completed the plans and placed contracts for the conversion of the line of the Dudley & Stourbridge Company between Hart's Hill and Stourbridge into an electric system. A site has been purchased and arrangements made for a power station to supply current to this line.

An electric tramway system is proposed from Rome to Genzano with a branch to Rocca di Papa, 26 miles long in all. The generating station will be located in the center of the system and will consist of five 120-h. p. gas engines connected to 1,200-volt direct current dynamos. The scarcity of water is the cause of the adoption of the gas engines. Each motor car is to be equipped with two 35-h. p. motors and will have one or two trailers, as the necessity demands. The speed of the cars will be 9 to 18 miles an hour, the steepest grade being 9 per cent.

AKRON, O.—The lines of the Akron Street Railway Company will be purchased by General Sam Thomas, of New York city, W. D. Chapman, general manager.

ALBANY, N. Y.—The Albany Day Line Steamboat Company has surveyors at work upon its proposed electric line to the Catskill mountains.

ANDERSON, IND.—The Union Traction Company has absorbed the Clodfelter inter-urban line, for the price of \$100,000, the latter road having been the property of the Indiana Traction Company. Both companies were building trolley lines between Anderson and Marion, but the line begun by the Indiana Company will now be abandoned, and that of the Union Company completed. Charles L. Henry, general manager Union Traction Company, Anderson.

ALLENTOWN, PA.—The construction of the Allentown & Kutztown Electric Railway will be commenced as soon as bids can be advertised and the contract awarded. The road is estimated to cost \$180,000; its officers are H. J. Schmick, president, and George Misch, secretary, both of Philadelphia. The line will connect Allentown and Kutztown.

ANNISTON, ALA.—It is reported that the Anniston Electric Company will sell its road and plant or increase the capital stock and reorganize with the purpose of enlarging and improving the plant. The road was purchased by its present owners, in 1896, from Howard W. Sexton, trustee, and a portion of it was changed to trolley. Mr. Sexton is president of the controlling company.

ARGOS, IND.—It is proposed to build an electric line between Argos and Danville, Ill., to connect Bourbon, Lake Maxinkuckee, and Winamac. Dr. Sears, of Plymouth, Ind., is chief promoter of the road.

ATLANTIC CITY, N. J.—It is reported that a company of Philadelphia and Atlantic City capitalists will be incorporated with a capital of \$2,000,000, to build an electric line between the two cities. The line is estimated to be 57 miles long. Officers, temporarily elected, are Senator J. J. Patterson of Philadelphia, president; A. C. Welhous, of Lancaster, Pa., secretary.

AUBURN, N. Y.—The plan to connect Auburn and Seneca Falls by an electric railway is revived. A year ago the Auburn City road, the Auburn & Western, and the Geneva, Waterloo, Seneca Falls & Cayuga Lake Traction companies, after consolidation, applied to the state railroad commissioners for a franchise for a road between Auburn and Seneca Falls. The project was defeated by an injunction obtained by the New York Central. The injunction has recently been dissolved, and the road may now be constructed.

BALTIMORE, MD.—The City Passenger Railway Company and the Central Railway Company will solidify their traction systems, by connecting the roads in a number of places. Bids are being received for the necessary construction. Walter S. Franklin is president of the City Passenger Company.

BALTIMORE, MD.—The Consolidated Railway Company's car barns were consumed by fire, May 29, and 130 box cars were destroyed, causing the company a loss of \$250,000, which is fully covered by insurance. Presumably the road will be in the market for rolling stock, and ready to award contracts for the erection of a new car house, at once. William A. House, general manager.

BALTIMORE, MD.—The Maryland Electric Railway Company has been granted the right to lay tracks on the Philadelphia road. The railway, which is projected to go to Belair, will be required to provide its own bridges, and its rights are shared by the Baltimore & Gunpowder Company, the two companies using the same tracks.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

**DOES THE MANAGER WANT ANYTHING?**

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8. JULY 15, 1898. NO. 7

The article on "Guards for Open Cars" on another page, will have increased interest because of the recent Georgia decision, also reported in this issue, affirming a judgment for \$1,000 and costs in favor of a passenger who was injured by a car on a parallel track, he having alighted on the wrong side.

We were impressed the other day while riding several miles on a street car, with the uniform courtesy and strict attention to their work of the car crew. Old people were assisted on and off, strangers were politely and intelligently informed as to where and how their destinations could be reached, and even the old woman on the front seat who savagely shook her umbrella at the conductor as a notice to stop was recognized by a polite bow, and she was given plenty of time to get clear of the car before the two bells. Whatever may be the good intentions of the management as to the right treatment of its patrons, the fact remains that fine cars, the best machinery that money can buy and all the advantages which make toward comfort and safety cannot compensate for carelessness, indifference and want of politeness on the part of these employes who come in actual contact with the public, and who therefore to a large extent are regarded by the patrons of the road as its representatives. We do know that no position can be more trying to a man's temper, than falls to the lot of the conductor. During the day he must come in contact with from four to seven hun-

dred people, and inevitably of this number are always some ill-natured persons. When a man meets several such in rapid succession it requires considerable poise to escape the contagion. But this is part of the conductor's business—to retain a gentlemanly bearing where others fail to do so, just as the good soldier must carry a cool head under the most trying circumstances. We believe as a rule the street railway employes of the country are a credit to themselves and their companies, but an occasional reminder from the manager, of the great importance of a courteous bearing cannot come amiss, in encouraging the men to maintain a high standard of conduct in the discharge of their trying duties.

"Our road has created a new coming and going, and has not had to depend for its business upon the traffic formerly handled by the steam railroads." These are the words of the manager of an interurban line, and his terse phrase of "a new coming and going" is the essence of the evolution going on throughout the country. It is a business which previously had no existence; the people lacked the facilities, hence they remained at home: because they remained at home acquaintance was limited; because acquaintance was limited the value of an interchange of ideas and experiences was neither understood nor appreciated. And so one might go on weaving a long chain of conditions which the electric car severs with its first trip, instilling a new life and impulse into the community. And this electrifying of whole counties is most aptly defined when we say it is the "new coming and going."

According to a statement in one of our foreign exchanges the electric railways of Europe in 1898 have an aggregate length of 1,422 miles. Of this Germany, France, Switzerland, Great Britain and Italy have 1,210 miles; Germany has almost one-half of the grand total, having 707 miles; France is second with 247 miles; Switzerland third, with 91 miles, and Great Britain and Italy have each a trifle over 80 miles. The total increase in electric railway mileage over that in 1897 is 516 miles, and for the five countries named is 449 miles. The percentages of increase in these countries are: Germany, 77; France, 42; Switzerland, 86; Great Britain, 23, and Italy, 14 per cent.

There are in operation on all electric roads 4,514 cars as against 3,095 in 1897. Of these Germany has 2,493; France, 664; Switzerland, 237; Great Britain, 220; Italy, 311.

We have once or twice reminded managers that they cannot make a better investment than to bind the complete volumes of the REVIEW, each year, and place them on a convenient shelf for reference. It is a complete history of the experiments, achievements, successes and failures of all important matters pertaining to the street railway interests. Our special attention is called to this the day on which these lines are written. The manager of a large road in New England during a call expressed the value which cannot be reckoned in dollars alone, of his files of the REVIEW which date back to the first issue. Time and again, he remarked, has he had occasion to seek data on questions which required immediate knowledge, and for which he desired to show a good authority on the subject, and in such emergencies his files have rarely ever failed him.

The same day we received three letters, one from Ohio,

one from New York and one from England, each writer in need of information on entirely different matters, and in each instance we were able to refer to numerous articles which completely covered the case. Scarcely a day passes but we have one or more such requests for information; sometimes from persons who are new in the work, but usually from managers and others who have been long connected with railway operation. The telegraph also brings similar demands, and where the sender has his file at hand it is quick work to refer him to what he needs. On the other hand where no file is available, and the back numbers long since exhausted valuable time is lost in making a copy of the article, and even then, it lacks the force and influence which always pertains to the printed page.

We repeat, those of our readers who fail to preserve and bind their numbers are depriving themselves of a source of help which when the time of necessity comes, would be worth more than the cost of binding an hundred volumes.

The Massachusetts General Street Railway bill, which became a law the latter part of June, is in many respects as important as it is unique: for it marks a radical departure. While some of the provisions seem severe to operators of western roads which have a much less densely settled population, many eastern managers appear to approve the measure. It will, at least, have the effect of definitely settling several vexatious and constantly recurring, mooted questions, and there is always a grim satisfaction in knowing the worst. The provision which enables the Board to "grant a location" where one town opposes a line desired by two or more other towns is a most excellent one. We publish a full synopsis of the act in this issue.

"The \* \* \* company would increase its business and please the public if it would improve its service in this respect."

These are the closing words of an article in a local paper in a city of about 60,000, in which is set forth in courteous terms the great necessity of improving the destination signs on the cars. There evidently was no disposition on the part of the paper to "roast" anybody: it was not apparently trying to find fault or belittle the excellent service rendered, but its editor recognized the need of an improvement in the direction noted. It calls attention to the fact that the day signs are small and of the same color as the car body, and that at night no colored lights are used.

The manager undoubtedly will now take the matter up and if he is as good a manager as we think he is, will lose no time in correcting existing conditions. What impresses us is, not the local instance cited, but the importance of being so closely in touch with the reasonable wants of our patrons, as to anticipate such requirements, and disarm criticism by affording the least possible occasion for it. We believe, also, that some managers are inclined to do too little riding on their own cars, leaving that duty to assistants. However occupied the business hours, that manager who fails to frequently travel his own lines in his own cars, and in that way literally getting close to the public even though he does not enter into any conversation, deprives himself of a vast amount of valuable information he ought to possess. Many of the demands of the daily press are either unreasonable or absurd, but as a rule the public is reasonable and appreciative to a larger degree than is currently supposed. Hence we say, it is the duty of every manager to do his best to furnish as efficient a service, and as pleasing accommoda-

tions as the earnings of his road will justify, and to anticipate those improvements which are bound to come in time, rather than to wait until the very last minute of grace and reluctantly be forced.

A well fed lion is not apt to bite.

The "Electrical Engineer," of London, in commenting editorially on an article "How to Protect Trolley and Feeder Lines" from the REVIEW, concludes in this manner:

These seem to us to be preventives, but we wonder where the police spend their nights if such bulky stuff as trolley wire can be freely taken away.

It is evident from this that our contemporary does not comprehend the conditions in American cities nor the extent of the electric railways. It is no reflection on the police departments of our cities that precautions have to be taken to prevent certain sections of line and trolley from being stolen.

The thickly settled portions of our cities and towns have long since enjoyed the benefits of electric traction. The city limits are by no means the bulwarks beyond which the electric lines cannot extend. It is safe to say that the greater portion of the mileage of new electric railways built during the past year or two and which will be built in the future will be entirely beyond city boundaries. There are hundreds of miles of electric railways entirely outside the protection of municipal authorities and passing through sections where the uniform of a policeman is never seen. In nearly every city the street railway company has one or more pleasure resorts usually located in some picturesque place on a river or lake or in the rural districts. With the exception of the summer season these lines often stand idle and in unfrequented localities may easily fall a prey to wire thieves.

The progressive spirit of the railway companies which causes them to construct lines into sparsely settled districts and operate cars at a loss has contributed more than any other factor to the territorial expansion of our cities. It is not necessary for the inhabitants to be cooped up in tenement houses as they are in London, Liverpool and Glasgow, for cheaper rent, fresh air and comfort can be secured in the outlying districts tapped by the trolley lines.

Chicago offers an example of what transportation facilities will do for a city. There are over 1,000 miles of street railways, all except 88 miles being operated by electricity. The 1,900,000 inhabitants are scattered over an area of 188 square miles which is one and one-half as great as the area of London with its four and one-half millions of people. Every independent company in Chicago has extended its lines beyond the profitable area and the passenger receipts of some cars barely pay for their operation without including interest charges, office expenses, etc. At first thought this might appear to be poor business policy but from several years' experience the companies have found that houses are soon built in the wake of a trolley line and traffic grows with great rapidity. One of the small electric railway companies whose lines run through the suburbs, reports an increase of 270 per cent in traffic during the past year. Routes that did not pay expenses two or three years ago are paying dividends now. Of these lines many are outside police jurisdiction and cannot be protected as is city property.

Considering the parsimonious franchises authorizing the construction of 20 or 30 miles of street railways to serve an English city of 500,000 it is not difficult to understand why our contemporary does not grasp the extent and development of electric railways in American cities.

On another page will be found the text of Judge Seaman's opinion in the Milwaukee 4-cent fare case to which brief reference was made last month. The counsel for the city made the stock argument of the advocates of ruinously low rates of fares, i. e., the lower rate will so increase the traffic as to make the business profitable, and presumably placed the matter in as strong a light as possible. It was ill-received, however, the court saying of the effort, "No reliable basis is furnished and the argument is too speculative for acceptance." In summing up the testimony as to the value of the property, Judge Seaman says: "I am satisfied that the property of the complainant (the street railway) represents a value, based solely upon cost of reproduction, exceeding five million dollars. And I am further satisfied that this amount is not the true measure of the value of the investment in the enterprise. It leaves out of consideration any allowance for necessary and reasonable investment in purchase of the old lines and equipments, which were indispensable to the contemplated improvement, but of which a large part was of such a nature that it does not count in the final inventory. No allowance enters in for the large investment arising out of the then comparatively new state of the art of electric railways for a large system, having reference to electrical equipment, weight of rails, character of cars and the like—of which striking instance appears in the fact that the electric motor which then cost about \$2,500 can now be obtained for \$800; so that work of this class was in the experimental stage in many respects, and the expenditures by the pioneer in the undertaking may not fairly be gaged by the present cost of reproduction."

The "Indianapolis News" of June 18, 1898, contained the following editorial:

"There promises to be a most curious ending to the fight in Milwaukee between the street railway company and the people. The Milwaukee council enacted an ordinance requiring the company to sell 25 tickets for \$1. The company carried the matter to the courts. It claimed that a 4-cent fare was unremunerative, and introduced evidence to sustain its contention. Judge Seaman, of the United States district court, agreed with the street car company on its showing; declared the ordinance null and void, and gave as a reason for his decision the ground taken by the United States supreme court in the Nebraska maximum rate case, that railway corporations are entitled to a fair return on the value of their property. The city of Milwaukee appealed the case to the higher Federal courts, and now the street railway company has voluntarily conceded a 4-cent fare, on condition that the city withdraw its appeal. Thus the company tacitly admits that its contentions before the United States district court were not true, and incidentally the company places Judge Seaman in a rather awkward position. When the case was in court, the company announced its annual maximum net earning capacity was \$269,000. The judge placed the valuation of the company at \$5,000,000, and then found that the earnings would not justify a reduction of fare. The general impression in Milwaukee is that the road is not worth anything like \$5,000,000, and only recently the corporation protested against a local assessment on its property of \$2,800,000 for taxation purposes. The Financial Chronicle's street railway supplement for 1895 shows that the Milwaukee Company reported gross earnings of \$1,315,963 and net earnings of \$487,375, or nearly double the maximum net earning capacity asserted to the court. The voluntary action of the company would seem to prove that the court had made a mistake or had been deceived, but we imagine that the people of Milwaukee are not sorry at the outcome of the litigation."

While we believed the foregoing to be a rank falsehood we submitted it to Messrs. Sullivan & Cromwell, the general counsel for the Milwaukee Electric Railway & Light Com-

pany, and were favored with the following reply, under date of June 27:

"It is not true that 'the street railway company has voluntarily conceded a 4-cent fare, on condition that the city withdraw its appeal.' No such overtures have been made to the city."

The statement of the "Indianapolis News" that the company reported its net railway earnings for 1895 as \$487,375 is literally true, but as used it is well calculated to mislead the lay reader. The amount given is merely the difference between the "gross earnings from operation" and the "operating expenses" and is the amount known as "net earnings from operation," not all of which is necessarily available for interest and dividends, as any business man will readily appreciate.

There is much that might be said upon the text set forth, but as it is all so obvious there is no need for the comment. It is the spirit illustrated in it, that has so greatly diminished the influence of the daily press.

## NEW YORK STATE ASSOCIATION.

The sixteenth annual convention of the New York State Street Railway Association will be held at the Hotel St. George, Brooklyn, on September 13 and 14. G. Tracy Rogers, president of the Binghamton Railroad, is president of the association; he was elected to this office in 1894 and has been re-elected each year since then.

Among the subjects covered by the papers to be presented at the coming meeting are:

- Points on the care of dynamos.
- The use and abuse of transfers.
- How can we increase our receipts?
- Low joints; how to prevent them.
- The power station from an economic standpoint.
- The office; suggestions for records, reports, etc.
- Track bonding; how can we obtain the best results?
- Street railroad versus the state; the relation to each system for single track roads.
- General track construction; the most approved method of freight and express service on suburban and interurban lines.
- Are air and power brakes on electric cars practicable?
- The most approved plan of long distance power transmission.
- The best method of preventing accidents.
- Pleasure resorts as a means of stimulating travel; are they profitable?
- The effect upon street railroads of the application of electricity to steam; possibilities and advantages from an up-to-date street car service and why the rate of fare should not be reduced.
- Daily inspection of car equipment and how can we accomplish the best results?
- Receipts from other sources.
- How to obtain best results from sale of advertising privileges, power, etc.

The Paris (Tex.) Gas & Electric Light Company has been sold to D. H. Scott, who will make improvements and build an electric railway.

The Third Avenue Railroad Company, of New York, is now at work on the plans to change the Dry Dock, East Broadway & Battery Railroad and the Forty-second Street, Manhattanville & St. Nicholas Avenue Railway systems to the electric conduit. The advisability of converting the Third avenue cable line to electric conduit during this summer is also being considered.

B.B. C. - 414

GUARDS FOR OPEN CARS.

Since the open cars were put in service it has been found desirable in some cities to place some kind of a guard on the side of the car next to the parallel track. Passengers are very careless in alighting from cars, seldom looking ahead or behind to see if there is danger from any approaching vehicle. If this were otherwise it would be much more convenient to leave both sides of the car free for the ingress and egress of the passengers as is done on single track lines. On double track lines having a loop or a Y

FIG. 1.—CHAIN OR BAR ON PHILADELPHIA CARS.

at the termini it is easy to place some fixed screen or bar along one side. Where there is only a switch and it is deemed necessary to close first one side and then another of the car a suitable and convenient device is more difficult to obtain.

FIG. 2.

FIG. 3.

On many lines it is the practice to hang the wire screens or gates on hooks and at the end of the line they are removed, carried around to the other side of the car and put in place. This occasions serious delay when traffic is heavy and a large number of cars are running. Frequently if an extra pair of gates were placed beside the track at the terminus of the conductor from each car could remove the gates from his car, lay them on the ground and hang the extra pair on the hooks of the car, thus avoiding the necessity of carrying them around the end of the car. The gates can more readily be carried across the track after the car has pulled out.

Some simple and inexpensive devices are in service on a number of systems. The Union Traction Company, of Philadelphia, employs two kinds, a chain and a horizontal bar. In Fig. 1 both the bar and chain are shown. At each end of the bar is a loop of band iron that passes around the rod which supports the roof above the platform. The

FIG. 4.—BAR ON BALTIMORE CARS.

bar slides up and down inside the standards of the car. The chains are placed between each standard and are fastened to a casting, as shown in Fig. 2, by hooks.

The Cleveland City Railway Company has either a loop or a Y at the end of each line and has removed the inside step altogether. A 2-in. pipe has been placed in sockets attached to each post and also fastened to the dash board at each end of the car at about the height of an armrest.

At Montreal the cars are nearly all single ended and

FIG. 5.

FIG. 6.

turn on loops or Y's. A wire screen is fixed on the inner side. The Boston Elevated Railway Company does not consider it advisable or desirable to close the sides of open cars under the condition existing in Boston. Several devices have been experimented upon in the shops and it has been decided that any guard to be effective must either screen the running board or provide for its being turned so that persons cannot ride on the inner side of the car.

The Mahoning Valley Railway Company, of Youngstown, O., closes the inner side of its open cars with a long wooden guard rail, about 3/4 in. thick and 3 in. wide which rests in castings on the inner side of each post, Fig. 3. These guard rails extend the whole length of the car and are changed from one side to the other at each end of the

line by lifting the rail across the car. By placing them on the inner side of the car standards the change is very easily and quickly made. The rails are carried about the height of the backs of the seats. Occasionally a passenger will dodge out beneath them but the company feels that anyone so doing takes upon himself the responsibility for injury.

On the city lines of the Capital Traction Company, of Washington, operated by the conduit electric system, no attempt is made to close the cars on the inner side. For

from getting on and off the wrong side of the car it is hardly satisfactory.

On the cars of the Baltimore Consolidated Railway Company guard rails are placed as shown in Fig. 4. The position of the rail in service is indicated by the full lines and by the dotted lines when raised to offer no obstruction. Fig. 5 is from a detailed drawing showing the method of holding the rail in place when raised. A is the brass spring which holds the rail, B is a brass casting to keep the rail in

FIG. 7.—OPEN CAR OF METROPOLITAN STREET RAILWAY COMPANY, NEW YORK.

the cars on the trolley lines in the suburbs a small bar is run through the brass handles on the inner side and it is changed with little difficulty at the termini.

Most of the lines of the Union Railroad Company, of Providence, are single track and no provision is made for closing the inner side. The Cincinnati Street Railway Company makes no provision for closing the inner side of its electric cars, but on the cable cars there are no running boards on the inner side and the platforms are guarded by several brass rods parallel to the floor. The Market Street Railway Company, of San Francisco, does not attempt to close the inner side of open cars or to prevent the passengers from getting on or off on either side. In New Orleans the side step cars meet with little favor and the New Orleans Traction Company is gradually changing its open cars by cutting an isle through the center, closing both sides

place, C is the wooden guard rail, D is the brass grab handle holder and E is a rubber cushion attached to the lower side of guard rail and rests on the lower grab handle sockets when the rail is down. There are four of these rubber cushions for each rail. The car steps are also hinged so that the inner one can be lifted as shown in the dotted lines of Fig 6. The step is held up by flat iron hooks  $\frac{1}{4}$  in. thick and  $\frac{7}{8}$  in. wide.

Fig. 7 is taken from a photograph of an open car used by the Metropolitan Street Railway Company, of New York. The front platform is guarded by iron gates but the entrance guard consists of an ash rod extending from corner post to corner post and sleeved at each end around the post grab handles. The post grab handles are extended to the height of the water table for the purpose of accommodating these entrance guards and allowing sufficient head room for the egress and ingress of passengers. The rod is held in position at the top by gravity catches let into the post. The step irons are hinged allowing the step board

FIG. 8.—STEPHENSON GUARD RAIL.

with an ornamental wire screen about 4 ft. high, enlarging both platforms and putting on platform steps. This style of car receives general approval and the weather is so mild all through the year that a car of this type can be used both winter and summer. The Nashville Street Railway uses a rope run through the grab handles on the inner side. While this is a cheap method and prevents the passengers

FIG. 9.—BAR ON NORTH CHICAGO CARS.

to be folded against the vertical portion of the step iron. These open cars together with this device were built by the J. G. Brill Company. The cars on the Broadway cable road have also been equipped with this device.

When so ordered by the street railway companies the John Stephenson Company makes a very simple device for preventing passengers from getting on or off an open car

on the wrong side. It consists of a long rail which slides up and down between the grab handles and side posts of the car. One of these rails is on each side. The car shown in Fig. 8 is going in the direction of from right to left of the picture, and the rail on the left hand side of the car is shown "up" so the passengers can get off on that side. This rail is held in place by small brackets which are set into the side posts and held up by springs; by compressing the

FIG. 10.—WEST CHICAGO OPEN CAR.

springs the rail is pushed above them and they snap out and hold the rails in place. The photograph shows the rail on the other side "down." It is held in place by resting on the lower attachment of the grab handles.

The means taken by the North Chicago Street Railroad Company for preventing passengers getting on and off the wrong side of the car are very simple and effective. The hand bar on each post extends from the middle of the seat to the roof with rounded corners top and bottom. A round wooden bar, the length being the distance between the two outer posts, has a brass casting at each end and two at intermediate points with eyes large enough to be passed over the corners of the handle bars. The bar when not in service is slipped up and over the top horizontal support of the handle bar and remains under the eaves of the roof. When

FIG. 11.

in use it is let down and rests on the lower horizontal support of the handle bar, making it difficult for anyone to get into or out of the car. A detail of the brass casting and bar is shown in Fig. 9.

The guard adopted by the West Chicago Street Railroad Company is shown in Fig. 10. An ash strip  $\frac{3}{4}$  in. thick and 3 in. wide slides up and down on the inner side of the grab handles. A gravity catch at each end post holds the strip up in place. When the guard is down the step is raised as may be seen in the picture and is held in position by two flat iron hooks.

The open cars of the La Fayette (Ind.) Street Railway Company have eight posts on a side and a wooden bar is cut off the exact length between the end posts. A slide is made for this bar on the inside of the posts by bolting angle irons on the end posts and two pieces of strap iron,  $\frac{3}{4} \times \frac{1}{4}$  in., at

FIG. 12.

two intermediate posts. At the lower ends the iron bands are turned and bolted so as to hold the bar about the level of the backs of the seats. When the side of the car is to be opened the bar is raised up just beneath the roof and held in place by an iron pin inserted in a hole in each endpost.

A novel form of guard is in service on the open cars of the Troy City Railway Company. A net (Fig. 11) 60 in. wide and the length of the car is stretched along the inner side of the car and held in place by hooks at the end and bottom which fasten into eyes on the end and center posts. This form of guard is easily handled for the conductor gathers it into his arms as he unfastens the hooks and carries it to the other side of the car, unfolding it as he puts the hooks in the eyes.

The Laclede Car Company, of St. Louis, has two types of sliding guard rails which it places on open cars when so ordered. The rail is made of wood, about 1x3 in., and ex-

FIG. 13.

tends from corner post to corner post, one on each side of car, and slides up and down between the posts and grab handles. It is held in place under the water table, when not in use, by automatic springs. To accomplish this it is necessary to make the grab handles extra long and place the upper bracket above the water table, as shown in Fig. 12. The rail is secured to the grab handles by loose brackets which slide on the tubes of the handles, one of these brackets being placed on each corner post and two on intermediate side posts. When not in use the guard rail is held in place under the water table by automatic springs, two on each side of the car.

Another guard rail used is made of 1-in. bronze tubing, secured to the posts with suitable brackets, and made in two sections so as to be drawn out from the ends, and provided with pins to prevent tube from coming out. This style of guard rail is shown in Fig. 13 with the tube partly drawn out on one end. Brackets are placed on each post on both sides of the car so that the tube can be used on either side.

Folding steps are also used in addition to the guard rails, arranged so that step can be folded up and fastened in that position to prevent passengers from getting on.

**DEATH OF DR. EVERETT.**

Dr. A. Everett, of Cleveland, died at his home on June 17 from a complication of organic diseases. Dr. Everett was born in Liberty township, Trumbull county, Ohio, November 24, 1821, and was therefore in his 77th year at the time of his death.

DR. A. EVERETT.

In 1860, Dr. Everett became interested in street railway matters and foreseeing the growth of Cleveland acquired a controlling interest in the East Cleveland road, which began operations in that year with two miles of track on unimproved streets and four small

bobtailed cars. Under his management extensions and additions were soon made and system grew until in 1892 it comprised over 50 miles of track and 200 cars. The change from horse to electric traction was begun in 1888. Dr. Everett remained closely identified with this company and was its president when it was consolidated with three other companies to form the Cleveland Electric Railway Company, which was organized in 1893.

**EUROPEAN ELECTRIC RAILWAYS.**

The following table showing the aggregate mileage and number of cars of the electric street railways of Europe is taken from the "Industrie Electrique," the lengths being reduced to miles instead of kilometers:

Country.	Mileage.		Cars.	
	1897.	1898.	1897.	1898.
Germany .....	399.2	797.0	1,631	2,493
France .....	173.5	246.5	432	664

**MASSACHUSETTS GENERAL STREET RAILWAY BILL.**

**Three Kinds of Tax—Corporation, Franchise and Excise Tax—Corporation Tax Prorated on Mileage Basis—Snow Question Definitely Fixed—Important Provision for "Grant of Location."**

The General Street Railway bill passed by the Massachusetts legislature of 1898 is regarded by conservative men as one of the best of its acts. The relations between street railways and the communities were growing more strained, and numerous bills were introduced, and very valuable time of the legislature taken up every year as the result of such strained relations. In 1897 Senator Irwin, chairman of the committee of street railways, concluded, after many months of effort, that no committee of the legislature could properly investigate the subject and prepare a proper bill, the result was a bill introduced by him, "To provide for the appointment of a committee to investigate the subject of the relations between street railways and municipal corporations." The governor appointed Hon. Charles Francis Adams, Hon. W. W. Crapo and Hon. E. B. Hayes of Lynn, as the committee, and it was universally recognized as a strong board.

Mr. Adams investigated the subject abroad, and Mr. Crapo and Mr. Hayes investigated it in the principal cities of the United States and Canada. Later the committee gave extended hearings at the State House, at which appeared the public, mayors, city solicitors and selectmen of the different cities and towns, and representatives of the street railway companies, and all of them had the fullest opportunity to be heard. (See argument of Mr. Burdett, STREET RAILWAY REVIEW, January, 1898, p. 5). As a result of the investigation the committee presented a report (See REVIEW, February, p. 117) and a bill to the legislature which is the first official report upon the subject made by the government of any state or country. The report is a model of its kind and together with its valuable appendices (See REVIEW, April, p. 263; May, p. 294.) is a volume of reference which should be in every library in the country. The report and bill were referred to the street railway committee, and the latter committee also gave extended hearings at which the governor's committee appeared and testified. After the hearings were closed, a sub-committee from the street railway committee, the governor's committee and a committee from the street railways met and went carefully over every section of the bill. As a result of all the labors, Senator Irwin drew up the bill which is, substantially, now the law.

The provisions of the bill do not seem to be clearly understood, notwithstanding the publicity which it received, therefore, a summary of its principal features may be in order. There are three kinds of taxes referred to in the bill: a corporation tax, a franchise tax and an excise or commutation tax. The first changes the present method of distributing corporation taxes in so far as they apply to street railways.

At the present time corporations pay taxes to the state treasury and such taxes are distributed to the several cities and towns of the commonwealth where the stockholders reside. So much of the tax as is assessed upon shares of stock held by stockholders who reside outside the commonwealth is retained by the state treasury. Under the new law such

taxes are levied and collected in the same manner as hitherto, but they are distributed to the cities and towns wherein each company is operated in the proportion which the tracks operated in each city and town bear to the whole system of each company. To illustrate: If a street railway company operated 20 miles of tracks, 10 miles in one city or town, and 5 miles in each of two other cities or towns, and it paid \$4,000 in state taxes, the first would receive \$2,000 from the state treasurer and each of the two others \$1,000. This will be of great benefit to cities like Lynn, Fall River, Taunton and Worcester, inasmuch as the stock of the companies of the above cities is owned principally outside the state.

The franchise tax is rated according to the dividends paid by the companies over and above 8 per cent. For such amounts of dividends as the companies pay over 8 per cent,

as tracks are usually upon the sides of highways and snow is not removed by teams. Substantially, then, the cities have placed upon them the expense of teaming snow away or making the streets safe for public travel. In the debates, some seemed to think that all expenses for repairs of tracks and for removal of snow and ice were to be taken from the street railways and placed upon the cities. The repairs of streets and removal of snow in teams will be only nominal, while in the cities, that care of streets at such times as they may get out of order when the street railway companies are doing no work in connection with the same.

To meet the expenses of the items of repairs and snow, a commutation tax is imposed upon the companies of substantially 2 per cent on the gross receipts of the city roads, and of 1 per cent of the gross receipts of the smaller companies.

LOADING TRANSPORTS AT TAMPA.

they will be required to pay a similar amount into the state treasury. This money will be retained by the state treasury and will not be distributed according to mileage.

The third or commutation tax is the one which appears least understood. The governor's committee recommended that the opportunities for friction between the municipalities and the street railway companies should be removed so far as possible, and with that in mind, recommended that the dual responsibility for the maintenance and care of streets should be discontinued. To accomplish that the act provides that the surface of the streets shall be cared for in condition and materials, by the local authorities. When the companies build or rebuild tracks, or make any changes in tracks, all work in connection therewith shall be borne by the companies and shall be performed to the satisfaction of the local authorities. The local authorities also take care of snow and ice after its removal from the tracks by the companies. This expense to the towns is only nominal inasmuch

Inasmuch as such payments are not intended to be an additional burden upon the companies, but only in lieu of expenses borne by the cities and towns which were previously borne by the companies, the percentage figures are estimated. It is provided, however, that if the actual facts show that the percentage is too high or too low, the municipalities or the companies may petition the Board of Railroad Commissioners for a hearing at any time after three years, for a new rate, and such rate will remain fixed for another period of three years. If, however, any city or town in which a street railway is operated by a company which operates in several cities and towns should feel that it were not getting a proper proportion of such commutation tax, it can, at any time, petition the Board of Railroad Commissioners for a hearing and adjustment. The commutation tax is also distributed in each city and town in proportion to miles of track operated in such city or town bears to the whole track operated by the company. The street railway companies

claim that the 2 per cent tax is from 1 to 1¼ per cent greater than the actual expense placed upon municipalities, and the governor's committee stated that their own figures were in excess of actual expense.

In addition to the foregoing general taxation features, there are other features of the act possessing more or less interest. One is, that in case the local authorities may revoke locations, such revocation shall not go into effect until approved by the Board of Railroad Commissioners. The second is where a location has been granted, if a majority in value of property owners along said location, or at least 10 persons should object, they may petition the Board of Rail-

## THE BUSY SEASON AT TAMPA.

Tampa is situated at the head of Hillsborough Bay, an arm of Tampa Bay on the western coast of Florida, and is some 200 miles north of the southern extremity of the peninsula. It has a population of about 20,000, having had a rapid growth since 1890. While Tampa has long been a popular winter resort, the magnificent Tampa Bay Hotel being a short distance from the city, it had never before so large an addition to its population as was caused by making it the principal point of embarkation for the military expeditions sent against Cuba and Puerto Rico.

SCENES AT TAMPA, FLA.

road Commissioners, and the location thus granted cannot be built upon until after approved by said Board. The third is, if the authorities of an intervening town should refuse a grant of location and thereby prevent two or more towns from being connected by street railway service, the Board of Railroad Commissioners may grant a location.

The Boston Elevated Railway is excluded from the act, and is a class by itself under its amended charter of 1897, except with respect to the distribution of state taxes. In that respect the state tax is distributed to the cities and towns according to length of track.

All in all the act is considered a step in the right direction, and one which inaugurates principles entirely new in dealing with street railway properties.

Up to June 1, more than 20,000 troops had been concentrated at Tampa and as many more have been added since then. Sixteen thousand of these were sent to Santiago under General Shafter about the middle of June and the later expeditions further reduced the number. But Tampa will no doubt remain one of the most important camps until the war is over.

Considerable delay in embarking troops at first resulted because there were not sufficient facilities for storing the provisions and other supplies, which had to be transferred from the railroad cars directly to the transports. The government, however, engaged all the store rooms and warehouses that were available and the congested condition of the railroad yards was much improved.

The street railway system of Tampa comprises the Consumers Electric Light & Street Railroad Company and the Tampa Suburban Railroad Company which is closely con-

ly taxed to carry the traffic, especially in evenings, between 5 and 8 p. m.

By the courtesy of George D. Munsing, superintendent of the street railway companies, we have received the photographs of the camp scenes and the map which are reproduced here. The map shows the location of the troops which it will be seen are encamped in all parts of the city. One of

MAP OF TAMPA STREET RAILWAY LINES.

nected with it, both companies being at present so unfortunate as to be in the hands of a receiver. For the last three months, however, the traffic has been more than doubled and we trust that this prosperity may continue long enough for the receiver, Chester W. Chapin, to resume the use of his old title of president.

Notwithstanding the popular impression that Florida is a low, flat country, the Consumers Company makes use of water power, having built a dam across the Hillsborough river at a point indicated in the accompanying map. This map shows the location of the street railway lines which aggregate 30 miles, all operated by electricity. The equipment comprises 27 motor and 3 trail cars, which have been severe-

CUBAN VOLUNTEERS—TAMPA.

the most interesting of these pictures is that showing a company in one of the regiments of Cuban volunteers organized in Tampa. The others are scenes in camp showing the brave soldier boy at home and, an equally important member of military society, his faithful though at times obstinate ally, the army mule. Two of the views show the line of transports tied up at the wharf and troops en route to take ship for what are at this writing (though we hope not for long) foreign ports.

## CONSOLIDATION AT TRENTON, N. J.

It is announced that the Trenton Passenger Railway Company is about to consolidate with the Ewing Passenger Railway Company, the Mulberry Street Railway Company and the Pennington Avenue Passenger Railway Company. The new company will be called the Trenton Street Railway Company.

These separate companies were organized to prevent an injunction stopping the work of extending the Trenton Passenger Railway; the differences with S. K. Wilson, one of the stockholders of the company who objected to the extensions, have been adjusted and the consolidation will result.

TRANSPORTS BOUND FOR CUBA.

## DECISION IN THE MILWAUKEE 4-CENT FARE CASE.

The Milwaukee Electric Railway & Light Company and the Central Trust Company of New York, as trustee of the railway company's mortgage, filed bills in the Circuit Court of the United States for the Eastern District of Wisconsin, for the purpose of determining the validity of the so-called 4-cent fare ordinance of the city of Milwaukee, and praying for an injunction against the enforcement of the provisions of said ordinance on the ground that the ordinance was unreasonable, in that it would deprive the railway company of the right to charge 5 cents per passenger for a continuous ride upon its cars, and also upon the ground, as more particularly set forth in the bill of the trust company, that the city of Milwaukee did not have the power under its charter to pass an ordinance regulating the fares of street railroads in the city of Milwaukee.

A preliminary injunction was obtained upon the filing of the bills, which was continued during the pendency of the action. Testimony was taken and the cause submitted on final hearing in April, 1898.

Messrs. Sullivan & Cromwell, of New York City, represented the Milwaukee Electric Railway & Light Company, and associated with them were Messrs. Miller, Noyes, Miller & Wahl, of Milwaukee. Messrs. Butler, Notman, Joline & Mynderse, of New York, and James G. Flanders, Esq., of Messrs. Winkler, Flanders, Smith, Bottum & Vilas, of Milwaukee, represented the trust company.

The cause was submitted after argument on final hearing to Hon. William H. Seaman, United States district judge for the eastern district of Wisconsin, sitting at circuit, who rendered the following opinion:

The main controversy in each of these actions is whether the ordinance of June 11, 1896, unreasonably fixes rates of fare which would deprive the complainant of its property without due process of law, and thus violates the fourteenth amendment to the constitution of the United States. A further question is raised by the bill filed on behalf of the bondholders, and is pressed by argument in support of both bills, whether the municipality had power to regulate rates beyond the provisions contained in the several franchises which are vested in the complainant street car company limiting only to a 5-cent fare. Both contentions are of serious import, involving on the one hand consideration of the rights of the community in respect of a great public utility and interference with acts of municipal control, which are presumptively inviolable, and on the other hand affecting the preservation of private rights of property where investment has been made in a great undertaking of public nature on the faith of existing and probable conditions, and where, by reason of its nature, there can be no withholding of operation by the company, even if unremunerative (*Ames v. U. P. R. R. Co.*, 64 Fed. Rep., 165, 177; *Wright v. Milwaukee Electric R. & L. Co.*, 95 Wis., 29, 36).

Further investigation has confirmed the impressions stated at the hearing that the constitutional question was so clearly presented by the pleadings and testimony, and was so distinctly of federal cognizance, that it should be first considered. Certain rules to interpret and apply the limitations of the constitution in this class of cases are well settled by decisions of the supreme court. If the state of facts shown by the evidence clearly establishes a case of impairment within these rules, it will be unnecessary to pass upon the complicated question of general power, as one of first instance, calling for the interpretation of various statutes and ordinances.

The ordinance under consideration provides that tickets shall be sold, good for one fare, including one transfer, "in packages of six for 25 cents, and 25 for the sum of one dollar," thus making a reduction of the regular 5-cent rate to all who so purchase tickets. Assuming, therefore, without so deciding, that the general power to fix and regulate the terms and rates to be charged subsists in the municipality—namely, that by delegation it became vested with, and still retains, the full extent of legislative power undoubtedly possessed by the state—there can be no inquiry here as to the wisdom or good policy of exercising the

power so delegated, that being a matter of municipal discretion, over which the courts have no right of supervision or review. Nor is it open to inquiry in this case whether there is a public demand or need for the enactment, or whether it is just and reasonable in all its provisions, except for the single purpose of ascertaining its infringement of rights which are guaranteed to the complainant by the constitution.

Upon this record it must be taken as true that enforcement of the ordinance would operate to reduce materially the net revenues of the street car company. There is effort on the part of the defendant to show that the probable increase of passengers through the method of commutation tickets would make up for the reduction in rate, but no reliable basis is furnished and the argument is too speculative for acceptance; whilst on the part of the complainant the testimony is founded upon practical and varied experience, and clearly shows it to be improbable that any increase in travel would yield receipts over and above the additional expense necessarily entailed to offset the decrease in gross receipts appearing *prima facie* from the reductions in fares. The claims are that a loss of income would result of "somewhere between 10 and 15 per cent of the gross earnings," and estimates are presented by several witnesses of a net loss ranging from \$87,000 to \$140,000 per annum. It is sufficient for the present consideration that the ordinance must be regarded as a measure which reduces the rates of fare materially and consequently would impair materially the net revenue produced by the property, and no analysis of the testimony upon that point is necessary; nor is any attempt required to state, even approximately, the amount of loss.

The law which must govern when the facts are determined is concisely and pertinently stated in the opinion by Mr. Justice Harlan, speaking for the supreme court in *Smyth v. Ames*, 18 Sup. Ct., 418, 426, as follows:

"In view of the adjudications these principles must be regarded as settled:

"1. A railroad corporation is a person within the meaning of the fourteenth amendment, declaring that no state shall deprive any person of property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

"2. A state enactment, or regulations made under the authority of a state enactment, establishing rates for the transportation of persons or property by railroad that will not admit of the carrier earning such compensation as, under all the circumstances, is just to it and to the public, would deprive such carrier of its property without due process of law, and deny to it the equal protection of the laws, and would, therefore, be repugnant to the fourteenth amendment of the constitution of the United States.

"3. While rates for the transportation of persons and property within the limits of a state are primarily for its determination the question whether they are so unreasonably low as to deprive the carrier of its property without such compensation as the constitution secures, and, therefore without due process of law, cannot be so conclusively determined by the legislature of the state, or by regulations adopted under its authority that the matter may not become the subject of judicial inquiry."

And this opinion reviews the line of decisions upon the subject and clearly approves the application of the same doctrine to legislative regulation of charges, over toll-roads, in *Covington, etc., Turnpike Co. v. Sandford*, 164 U. S., 578, 594. Therefore it must be regarded as established beyond question that the power to regulate the rates of fare, which is here assumed to rest in the municipality, is subject to these limitations: (1) That there is reasonable need on the part of the public, considering the nature and extent of the service, of lower rates and better terms than those existing. (2) That the rates and terms fixed by the ordinance are not clearly unreasonable in view of all the conditions. Neither of these considerations is independent of the other, and, although the public interest is of the first importance, the test is not what is desirable upon the part of either, but

what is reasonable in respect of the rights of both. As stated in *Smyth v. Ames*, supra; "What the company is entitled to ask is a fair return upon the value of that which it employs for the public convenience. On the other hand, what the public is entitled to demand is that no more be exacted from it for the use of the public highways than the service rendered by it is reasonably worth." So in *Covington, etc., Turnpike Co. v. Sandford*, supra, it is clearly held, in the same view of mutual consideration, that it is neither the right of the corporation to subject the public "to unreasonable rates in order simply that stockholders may earn dividends," nor of the public to have the use of the conveniences thus furnished, except "upon payment of such tolls as in view of the nature and value of the service rendered by the company are reasonable;" but that "each case must depend upon its special facts;" and the reasonableness of rates must be measured by all the conditions, including, of course, the reasonable cost of operation and of maintenance "in good condition for public use, and the amount which may have been really and necessarily invested in the enterprise."

The difficulties presented in this case do not therefore rest in any doubt as to the general principles which must be observed, nor in ascertaining the actual facts disclosed by the testimony as a whole, so far as material to this controversy. Although the testimony on the part of complainant makes a volume of 1,445 printed pages, and that of the defendant 163 pages, the only substantial contentions of fact relate to items of expenditure and claims of credit, by way of depreciation presented on behalf of the complainant, as entering into the showing of net revenue, and to the present or reproduction value of the plant. And it may be remarked in passing that this testimony is so well classified and indexed with such fair summaries in the briefs that the task of examination has been materially lightened. But the sole embarrassment in the inquiry arises from the wide divergence which appears between the actual and undisputed amount of the cash investment in the undertaking and the estimates on either hand of the amounts for which the entire plant could now be reproduced, in the view that the line of authorities referred to do not attempt to define or specify an exact measure or state of valuation, and leave it within the principles stated, that "each case must depend upon its special facts." Therefore, the two-fold inquiries of reasonableness above indicated are of mixed law and fact and start with the presumption in favor of the ordinance (1) that the prevailing rates exacted too much from the public, and (2) that those prescribed are reasonable.

1. Are the terms and rates fixed by the company excessive demands upon the public in view of the service rendered? The Milwaukee Street Railway Company, of which the complainant is the successor in interest, was organized in December, 1890, for the purpose of establishing an electric street railway system which should cover the entire field for the city of Milwaukee. There were then in operation five distinct lines, owned separately, operated mainly by horse or mule power, each charging separate fares and having no system of transfers. It is conceded that the service was slow and antiquated, was not well arranged for the wants of the city, and was generally inadequate and unsatisfactory. As the old lines occupied the principal thoroughfares, and the public interest prevented the allowance of double lines in such streets, the improvement could not be made effective unless those lines were purchased or in some manner brought into the proposed system. They were gradually acquired, at prices which may appear excessive when measured by results, and during the ensuing period of about three years the work of installing the new system was carried on, involving an entire reconstruction and rearrangement of the old lines and extensions, new and improved equipments throughout, at an expenditure of over \$3,000,000, aside from the cost of the old lines. As a result, at the time the ordinance was adopted, the mileage of tracks had increased from the previous aggregate of 110 miles to 142.89 miles, reaching every section of the city with shorter and better routes, and furnishing 38 transfer points, with a universal transfer system—a feature of special value to the public, as a single fare of 5 cents gives a maximum length of ride more than double the old arrangement; the service was improved in speed and regularity 50 per cent or more, with better cars and less inconven-

ience, and it appears beyond question that it was generally more satisfactory and economical from the standpoint of the public. In other words, the service was materially enhanced in its value to the public, without any increase in either normal or maximum charges, affording rides for 5 cents which had previously cost two, and even three, fares; and against all these advantages there appears only a single benefit extended by three out of the five constituent companies which is not given under the new arrangement—namely, in the sale of commutation tickets—an emission for which there seems to be plausible excuse and offset in the universal system of transfers, aside from the other advantages. Surely, therefore, no imposition upon the public appears through any comparison between the old and the new service and rates. Nor does it find any countenance in comparison with either service or rates which prevail in other cities, for it is shown in this record, and is undisputed, that the 5-cent rate is almost universal; that commutations are exceptional in cities of like class, and arise out of exceptional conditions which are not fairly applicable here; and that instances of lower rates are so clearly exceptional that they cannot have force for any affirmative showing of reasonableness in the instant case. Nevertheless, with the burden of proof on the defendant, these considerations are not controlling, unless it further appears that the earnings of the company are insufficient, in view of the amount which may justly be regarded as the investment in the undertaking to warrant the making of rates and terms which are more advantageous to the public. The interests of the public in its highways are paramount, and, if the service can reasonably be afforded more cheaply in Milwaukee than in other cities of like class, the community is entitled to the just benefit of any possible conditions which may tend to that result. The issue in that regard must be met under the second branch of inquiry, but I am clearly satisfied that this first question must be answered in favor of the complainant, if the evidence sustains its claim that lower rates would be confiscatory, and not compensatory.

2. Are the earnings of the property insufficient, in view of all the conditions, to justify this reduction in the rates of fare? Solution of this inquiry depends upon the showing (1) of earning capacity at existing rates and (2) of the "amount really and necessarily invested in the enterprise," and upon the conclusion (3) whether the ratio of return upon the investment is excessive. In the statements which are referred to both parties have adopted a ratio, so far as necessary, to separate the electric-lighting plant owned by the complainant, so that the statements which follow relate exclusively to the street-railway plant, except where otherwise mentioned.

(1) The question of earning capacity is confined by the testimony to the results of three years' operation, being after the system was fairly installed and inclusive of the year in which the ordinance was adopted—namely, 1894, 1895 and 1896. It is suggested on behalf of the defendant that these years were exceptional, for one cause and another, and are not a fair criterion for future earnings under more favorable circumstances, but the suggestion is without force in this case, because the ordinance operates upon these very conditions, and must, of course, be predicated upon them—upon existing facts and not upon mere future possibilities—and so determined the instant case, cannot affect rights under new conditions.

The proofs on the part of the complainant furnish in detail from the books of account the gross earnings, the various items of expense and of charges for which deduction is claimed, excluding any payments of, or allowance for, interest on the bonded indebtedness, and state the net earnings as follows:

In 1894 .....	\$ 64,868.77
In 1895 .....	269,202.30
In 1896 .....	100,628.81

For this showing, it appears that deduction of \$247,324.88 is made in 1894 for "depreciation," being the amount apportioned in that year to meet the alleged annual loss by physical depreciation of the plant, to keep the capital intact. No such deduction is made in 1895 and 1896, because not shown in the books, although it is insisted that like credit is due in each year for the purposes of this case.

The defendant concedes the correctness of the showing as to

the gross earnings, but disputes certain large items, for which deductions are made in the above statement, corrects some items and denies that any allowance should be made for depreciation. Aside from the fact that report and statements of financial condition made from time to time by the company omit many of the deductions here asserted, these contentions on the part of the defendant rest solely upon the books of account kept by the company, and the testimony of Mr. DeGrasse, stating his conclusions as an expert accountant from examination of such books, with the following result as to net earnings:

In 1894 .....	\$387,074.70
In 1895 .....	479,621.11
In 1896 .....	66,520.99

But this total for 1896 erroneously includes an allowance of \$160,550 paid for interest on bonds, which should be excluded on the basis assumed, and would make the net earnings for that year, on his computation, \$227,070.99. In this statement, the allowance for depreciation in 1894 is excluded by Mr. DeGrasse, because that item was, in fact, charged off upon change in the system of bookkeeping. He also excludes large amounts of undoubted expenditures, upon the hypothesis that they belong to "construction account," as covering permanent improvements, and not to "expense of maintenance," as stated; rejects certain payments as accruing on account of previous years; and certain sums apportioned and charged off to meet damage claims; and makes correction as to taxes, for which the book entries were made in advance upon estimates by way of apportioning the expenses of the year, pending litigation and other causes. However valuable this testimony is for analysis of the bookkeeping methods and for correction of certain charges, it is clearly insufficient, without other support, to contradict the undisputed testimony, both positive and expert, on the part of complainant, which verifies substantially its contention upon the disputed subjects of deduction; namely, that the expenditures so charged were largely, if not wholly, of such nature as to justify deduction for "maintenance;" and that depreciation is a well-recognized fact in all such plants, for which allowance must be made to save the capital from impairment, without regard to any question of its entry upon the books.

Making allowances for maintenance alone in accordance with the analysis presented by the expert witnesses Goodspeed, Coffin, McAdoo and Beggs, taking in each instance the estimate most favorable to the defendant, I am satisfied that the defendant's claim of net earnings must be materially reduced, and that the largest amounts which can be assumed upon its theory excluding any allowance for depreciation, except that for 1894 the "maintenance" allowance is increased as indicated by all the witnesses, was necessary, would be approximately:

In 1894 .....	\$230,000
In 1895 .....	340,000
In 1896 .....	115,000
	\$685,000

making the average earnings per year, say, \$228,333.

In reference to the element of depreciation, the witness Beggs gives the following lucid explanation: "I think experience has demonstrated that the utmost life that can be expected from the best roadbed that can be laid today would be, at the outside, 10 to 12 years, when it would have to be almost entirely renewed. The Milwaukee company is in that condition today, which, because of the different periods that the track went down, and due to the fact that it was not all put down at one time, that it could now commence—must of necessity commence—to lay about 12 miles of track annually, being about one-twelfth of its total mileage, and will be required, whether it wishes to or not, to lay that amount annually hereafter, and will thereby be keeping the tracks fairly up to the standard. The same applies, I might say, to the equipment; in my estimate I have calculated that the Milwaukee company must do this year, which, as a matter of fact it is doing, what it did last year, in other words, put on not less than 20 of the most modern, best-constructed equipments, thereby keeping its standard up to the minimum it has now, of 240 equipments; because I think it is fair to assume that the average life of the double equipment

taken as a whole will not exceed 12 years; the life of the motor being somewhat less than that, and that of the car we hope may exceed it possibly several years; I mean the car bodies, but that, in the main, we hope that we will get an average life of twelve years out of them; so, taking 20 equipments annually, you would keep to your standard of 240 equipments, which is absolutely necessary to maintain, to operate the Milwaukee Street Railway; I mean, cars complete with motors and complete electrical equipment."

For the causes thus stated, within general rules which are well known, it is manifest that this element must be taken into account before it can be determined that earnings derived from a plant are excessive; and in the same line there is much force in the argument of counsel that consideration should also be given to the factor of depreciation by amortization of franchises, as all the franchises in question terminate in the year 1924. The latter, if allowed, would be a matter of simple computation, but a just measure, of physical depreciation seems, to some extent, although only partially, involved in provisions for maintenance; and, whilst the testimony is very full and instructive upon this subject, it does not save from serious difficulties in the way of stating a definite ratio or sum for such allowance. I am, however, clearly of the opinion that neither of these elements is essential to the determination of this case, upon any aspect presented by the testimony, and leave it so far open that it may serve as an important factor of safety in either view.

(2) As to valuation: For purposes of the company the value of property, including both railway and lighting plants, appears to have been placed at \$14,250,000, represented by the issue of bonds for \$7,250,000; preferred stock, \$3,500,000, and common stock, \$3,500,000; but this aggregate was clearly excessive, after excluding the electric lighting department, and on no view can it be taken as the basis for the present consideration. The statements of the actual cost of the constituent street-railway properties, including the cash investment for improvements, are necessarily complicated from the fact that payments were partly made in stocks and bonds, and the aggregate amount varies according to the ratio of valuation placed upon the bonds alone, in two statements, on which the stock is excluded, and in one statement, which values both stock and bonds—the minimum being \$9,024,107.85, and the maximum \$11,313,829.84. The former amount was subsequently modified (p. 465, Complainant's Proof), making the statement of cost \$8,885,644.17, and as this excludes any valuation of stock, and places the value of the bonds at the discount which was agreed upon between the parties, and which also seems fair, it may justly be taken as representing the true amount invested. But adoption of this purchase amount does not meet the issue, as it is the value of the investment, and not the amount paid, which must control. On the other hand, both parties introduce testimony placing valuations upon the various items of the plant as it exists in fact, upon the basis of its reproduction value. This amount, as stated by the witnesses for complainant, aggregates \$5,153,287.76; whilst on the face of defendant's proofs the value of the tracks and equipment is placed at \$2,358,799, the real estate and buildings being valued separately, and the highest valuation of the real estate being \$236,949, and of the buildings \$208,449, making the aggregate \$2,804,197. It appears, however, that these estimates on behalf of the defendant omit 27 miles of track, many parcels of real estate, and other items so that counsel for defendant concedes that this aggregate should be increased to \$3,679,631. The wide difference in these amounts is mainly due to divergence in the estimates upon tracks and equipment, as the amounts on real estate and buildings, after allowance for the omissions, would appear higher on the valuation submitted by the defendant than those of the other side. For the valuation of tracks and equipment the defendant relies upon the estimate made by Mr. Partenhelmer, a witness of apparent ability and experience as a street-railway contractor engaged in business at Chicago, but his examination of the plant was cursory, being made within three days, and could not give the detailed information upon which a just estimate for this inquiry must be based, and it is conceded that he left out of consideration many important items (aside from the error in mileage), which should enter in and would greatly increase his amount. Both upon its face and by reference to other sources of information

this estimate is far below any fair valuation for the purpose in view, either at the sum stated by the witness, or with the additions conceded on behalf of defendant, the former amount being in fact \$320,000 short of the actual cash expenditures by the company for construction and equipment. Opposed to this the estimate for complainant is made by Mr. Clark, an expert of distinction in this line, who gave weeks to the examination, with the aid of a corps of assistants, and presents the results in detailed statements, so that his testimony and estimates impress me as well founded; and they are supplemented and supported by the testimony of Mr. Coffin, Mr. Payne and other witnesses, and by comparative showing of mileage valuations in Massachusetts which appear in the noteworthy system of reports published by that state. I am satisfied that the property of complainant represents a value, based solely upon the cost of reproduction, exceeding five million dollars. And I am further satisfied that this amount is not the true measure of the value of the investment in the enterprise. It leaves out of consideration any allowance for necessary and reasonable investment in purchase of the old lines and equipments, which were indispensable to the contemplated improvement, but of which a large part was of such a nature that it does not count in the final inventory. No allowance enters in for the large investment arising out of of the then comparatively new state of the art of electric railways for a large system, having reference to electrical equipment, weight of rails, character of cars and the like—of which striking instance appears in the fact that the electric motor which then cost about \$2,500 can now be obtained for \$800; so that work of this class was in the experimental stage in many respects, and the expenditures by the pioneer in the undertaking may not fairly be gauged by the present cost of reproduction. Of the five million dollars and over paid for the acquisition of the old lines it would be difficult, if not impossible, from the testimony, to arrive at any fair approximation of the share or amount of tangible property which enters into the valuation in this inventory. It does appear that the roadways required reconstruction with new rails and paving; and that the amount stated was actually paid by the investors is undisputed, making their investment nearly nine million dollars. How much of this may be defined or apportioned as the amount which was both "really and necessarily" invested in the enterprise" (vide *Covington, etc., Turnpike Co. vs. Sanford, supra*) I have not attempted to ascertain, except to this extent, that I am clearly of opinion that at least two million dollars of these preliminary expenditures are entitled to equitable consideration, as so invested beyond the reproduction value, if the valuation of the investment is not otherwise found sufficient for all the purposes of this case; but no opinion is expressed in reference to the remaining \$1,885,644.

(3) The final inquiry whether the net earnings shown are in excess of or equal to a just return upon the investment, presents no serious difficulty under the premises above stated.

Assuming five million dollars as the basis of investment the ratio of earnings would be as follows: (1) At the extreme computations of defendant the yearly average would be \$364,000, which would yield 7.2 per cent; (2) at the complainant's figures, after adding the corrections for taxes, the return would be 3.3 per cent; (3) at the amounts which are above stated as my deductions from the testimony, the yearly average being \$228,333, would make 4.5 per cent.

Assuming seven million dollars as the basis, the ratio of earnings would be upon each of said version as follows: For the first, 5.2 per cent; for the second, 2.3 per cent; for the third, 3.2 per cent.

The interest rate fixed in the bonds issued by the company is 5 per cent; the rate which prevails in this market, as shown by the uncontroverted testimony, is 6 per cent for real estate mortgages and like securities. If the five million basis be adopted, surely a better rate must be afforded for the risks of investment than can be obtained on securities of this class, in which there is no risk. Upon the basis of seven million, which is more logical and just, the 5 per cent named in the bonds is clearly not excessive, and should be accepted by a court of equity as the minimum of allowance; and even upon the defendant's partial showing the return would be less than one-quarter per

cent above that, with the large margin for depreciation left out of account.

I am of opinion that the testimony is not only convincing in support of the material allegations of the bill, but is uncontradicted and conclusive that the improved service received by the public, with the universal system of transfers, is well worth the 5 cent rate charged therefor; that the company has not received earnings in excess of an equitable allowance to the investors for the means necessarily invested in furnishing such service; that enforcement of the ordinance would deprive complainants of property rights by preventing reasonable compensation for its service; and that, therefore, the ordinance clearly violates the constitution of the United States and is invalid. Decree must enter accordingly, and for an injunction as prayed in the bill.

### UNION STREET RAILWAY STATION IN WASHINGTON.

---

When the Capital Traction Company, of Washington, D. C., extended its line in M street, about 18 months ago, to the north end of the Aqueduct Bridge, which connects with Virginia, and affords the only convenient means of access to Fort Meyer (the government cavalry station) and contiguous territory, one of the conditions was that the station building at the terminus of the line should be such as to admit of its use by other lines for car storage and for a passenger depot. The most available site for this union station was the west half of the block bounded by Prospect avenue, 35th, M, and 36th streets; this is on a steep hill directly north of M street, the rise being 60 ft. in the block which is only 250 ft. long.

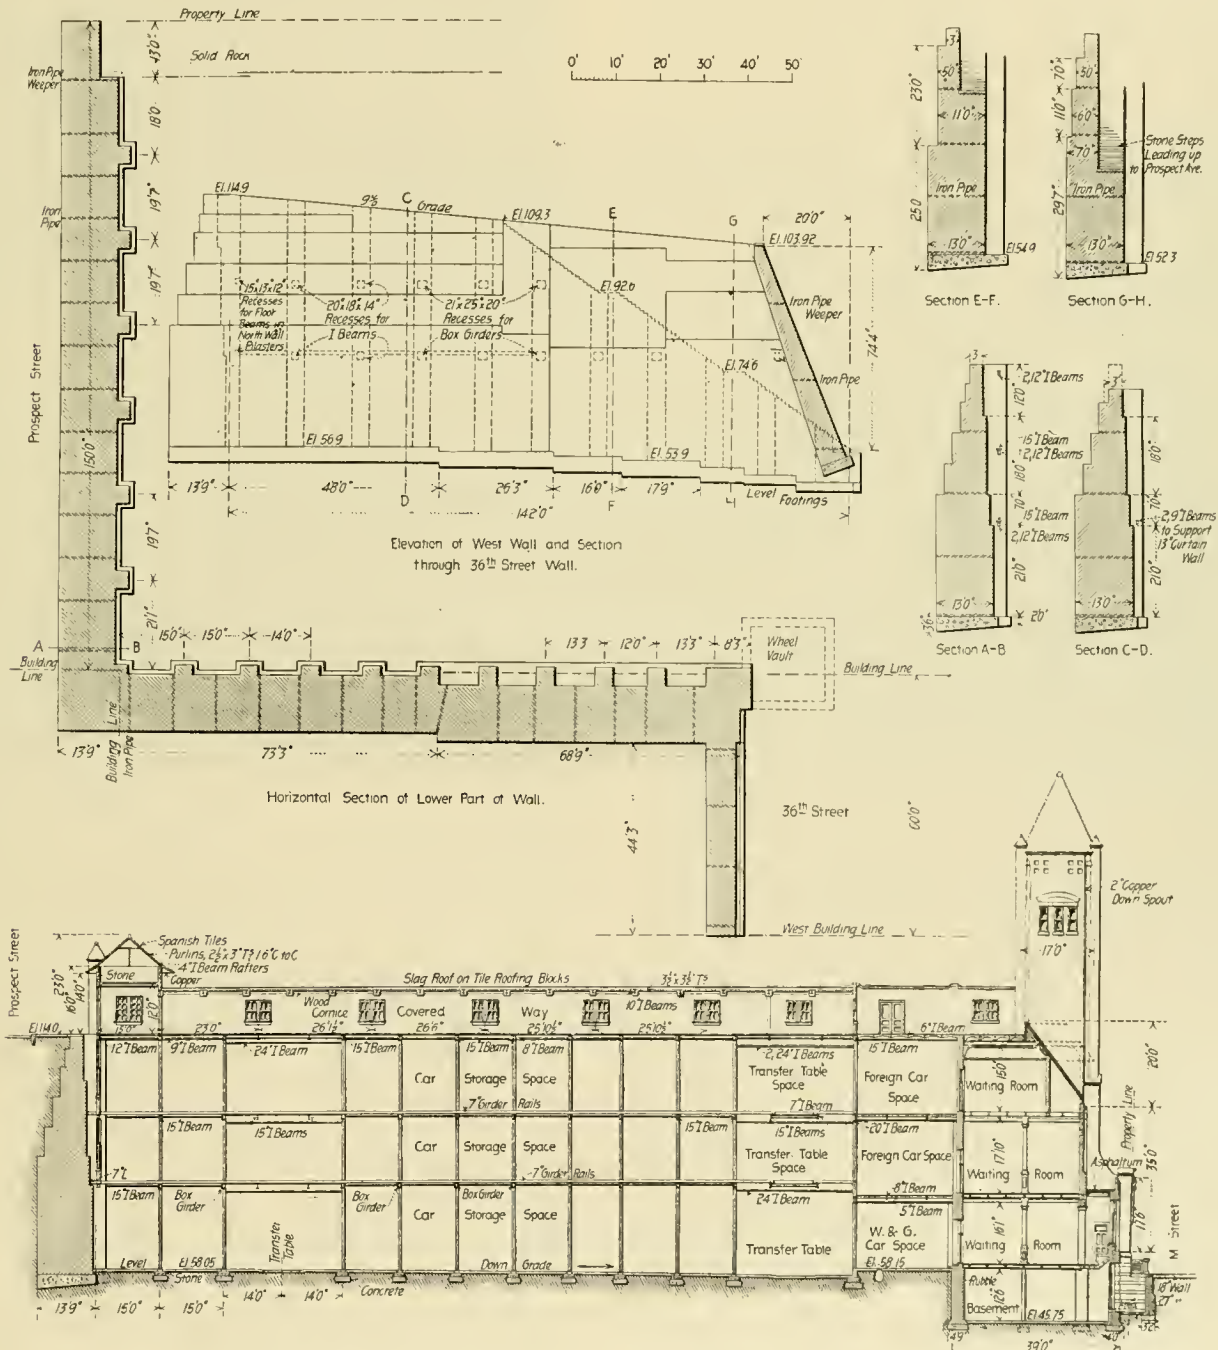

To give as much room as possible for the storage of cars, the Building Department permitted the retaining wall along Prospect avenue to be built under the sidewalk as an "area wall," and the wall of the building is on the property line. After some discussion between the company's architect and the city Building Department as to dimensions it was decided to build the retaining walls of concrete, 13 ft. thick at the base, with brick pilasters 4 ft. x 4 ft. at intervals of from 13 to 20 ft. As an additional precaution box girders were used on the second and third floors abutting against the east and west walls, thus bracing them against each other. These girders were figured both as columns and as girders to resist, besides the strains from floor loads, a thrust of 200 lbs. per sq. ft. of wall surface. Girders and I-beams were built into the pilasters parallel to the walls upon which the curtain walls were built to form the exterior of the building. In this way "areas" were left between the curtain and retaining walls which serve the double function of ventilating shafts and light wells. The inclined wall forming the foot of 36th street, and that portion along the stairway were built of squared rubble (Blue Gneiss) for appearance sake. With the exception of this street wall the walls were all built in trenches; that is, the proper location of the walls being staked out three trenches, intersecting at right angles, were started and carried down to about 3 ft. below the level of the finished first floor. The rock in the trenches was solid and almost without seams and had to be loosened by blasting, and this was true of the entire mass over the whole site except for a few feet of surface soil and rotten rock on top. Against the interior face of the trench walls wooden forms were placed and concrete was filled in, the pilasters, already mentioned, being built at the same time of hard cherry brick laid in 2 to 1 Portland cement mortar. The actual rock face formed the other side, and all irregularities and cavities

made during excavation were filled in solid with concrete. As the filling-in progressed numerous "weepers" of 2-in. wrought-iron pipe were placed in the wall. After the removal of the framing the east wall, which was to be exposed to view from the interior of the building, was given a coat of cement plaster. After the completion of the walls the excavation of the interior portion was begun. In this work some 90,000 cu. yds. of material, nearly all rock, was drilled, blasted and hauled in wagons across the river and dumped upon the south approach of the Aqueduct Bridge. The excavation measured from outside of west wall to outside of east wall about 194 ft., and was about 247 ft. the other way.

The building proper is three stories high, 242 ft. deep, and has a front of 180 ft. It is built of brown mottled brick,

with white stone trimming and steep-pitched red tile roofs. The tower, which contains passenger elevators, is 140 ft. high, and is capped with a steep red tile roof. The flat roof of the portion used for car storage is on the level of Prospect street in the rear, and was designed with an idea of its possible future use as a summer roof garden. In the center is a covered passageway leading from the Metropolitan railway on Prospect street to the elevators in the tower. That portion of the building facing on M street is devoted to terminal offices of the various railways, and waiting and toilet rooms for passengers making transfers. These rooms are handsomely finished in red oak wainscoting, delicately-tinted walls, panelled ceilings of stucco with rich corners and decorations, granata floors, ornate black iron grills and stair

UNION STATION OF THE CAPITAL TRACTION COMPANY, WASHINGTON, D. C.

railings. The entire lower floor is occupied by the terminal arrangements of the Capital Traction Company.

Directly in the rear of the waiting rooms, on all three floors, are long corridors, 25 ft. wide, with space for two car tracks and necessary switches for the use of foreign cars which may enter the building. These will be brought in on steel trestles, those from the lower level onto the second floor, and those from the higher level onto the third floor, the lay of the land in the vicinity being such as to make this possible. As most of the suburban lines during the hours of slack traffic run their cars at comparatively long intervals, it is believed that the Union Station will prove a great convenience. In the rear of the waiting rooms and track space already mentioned are located the car storage portions. This space is the full width of the building and 177 ft. long, and except for a central light shaft, 19 ft. 7 in. wide, the space from ground to roof is occupied by the storage tracks, 12 in number, on each floor. Transfer tables across the entire width at either end and car elevators are also provided. The floors in the car storage portion are somewhat novel. In this work 7-in. 85-lb. grooved girder steel rails are used, spaced 4 ft. 10 in. c. to c., resting upon I-beams. Between the rails the Ransome system of concrete fireproof flooring was built. This floor weighs 28 lbs. per sq. ft., and was calculated to stand a safe load of 175 lbs. per sq. ft. Previous to its adoption a test was made to determine its strength; it failed under a load of 12,160 lbs. resting upon a block which has an area of 1 sq. ft. The final failure of the test floor resulted from excessive deflection.

The entire work of design and construction was under the direction of D. S. Carll, chief engineer and superintendent of the Capital Traction Company, and Waddy B. Wood, architect. The foregoing data and the illustrations were taken from the description of the station published in a recent number of "Engineering News."

---

### OPENING OF THE INTERNATIONAL STREET RAILWAY.

The first international electric railroad between the United States and the Dominion of Canada has been opened across the Niagara river at Niagara Falls on the new upper steel arch bridge, the tracks being controlled by the Niagara Falls Park & River Railway of Canada. This railway is destined to be another tie in the bond of union and friendship which has grown to such magnificent proportions between the peoples of the United States and Dominion during the present year.

The first electric car to cross the Niagara chasm on its own wheels and by its own power was car No. 19 of the Niagara Falls Park & River Railway on the evening of Thursday, June 30; the hour was about 7:15 p. m. Few people were aware that the important event was to occur, and so the passage of this first car was witnessed by but a small number of persons. The conductor in charge was John Barker, and the motorman was R. W. Murray. The car was decorated with the Stars and Stripes and the Union Jack. About 7 p. m. the car ran through the switch from the main track of the road on the Canadian side, and onto the one completed bridge track. It was boarded by J. C. Rothery, superintendent of the road; Manager Phillips, Superintendent Dill and Treasurer Bostwick of the bridge company, John Bost-

wick, Engineer R. S. Buck, S. J. Smythe, president of the bridge company, John Houp, foreman of the bridge work, and representatives of the press. The new track on the bridge was found to be very smooth and all the officials were delighted. The car was placed in regular service that evening, and on Dominion Day, July 1, and on July 4th, carried a very large number of people. It is evident that the regular patronage of the car will be heavy.

THE NEW NIAGARA BRIDGE.

At present a stranger's ticket to cross the bridge will entitle him to a ride across the bridge in the car without paying extra fare, but citizens will be forced to pay an additional 5 cents, owing to the fact that residents cross the bridge at a cheaper fare than strangers. The opening of the bridge road is another link in the proposed belt line around the gorge.

---

### SUNDAY CARS IN CANADA.

At Toronto, June 15, County Judge McDougall quashed the indictment against the Toronto & Mimico Electric Railway Company for running cars on Sundays. The decision is due to the finding that the indictment was faulty in two particulars. It was based on a section which is an amendment to the Lord's Day Act, and then asks for a penalty as provided under the criminal code, which, the judge holds, cannot be consistent, as the breach of the statute should be punished in accordance with the provisions of the Lord's Day Act, but as there is a difficulty in bringing up a corporation under the latter act, according to the holding of Judge McDougall, the point will probably be carried to the court of appeal for adjustment. It was also found that the prosecution was delayed beyond the statutory limit.

---

The common council of Salinas, Cal., has passed a resolution declaring its intention to grant a 20-year franchise to the Salinas Railway Company, allowing the use of the steam motor.

---

The conductors employed by the Cincinnati & Miami Valley Traction Company have petitioned General Manager Wagenhals to establish white duck suits as the regular uniforms during the hot summer months.

## A MARYLAND INTERURBAN.

The Frederick, Thurmont & Northern Railway Company is the name of a projected electric interurban which is to run from Frederick, Md., 30 miles north through Thurmont to a point on the Pennsylvania line near by the famous Gettysburg battlefields. The road is to be a connecting link between this historic place and Washington, D. C. It will pass through the richest and most beautiful sections of Frederick county and connects two towns of 1,200 inhabitants each. The power station will be located at Thurmont, and the construction work will be pushed with vigor. The officers are as follows: Col. L. V. Baughman, president, Frederick; Isaac S. Annan, first vice president, Emmitsburg; Alex. Ramsburg, second vice president, Lewistown; Charles C. Waters, secretary, Frederick; Dr. F. B. Smith, treasurer, Frederick; R. A. Rager, engineer, Frederick, and Wm. H. Hinks, counsel, Frederick.

## STREET RAILWAY NOTES FROM THE ANTIPODES.

From Our Own Correspondent.

The death of William Don, the workshops manager for the Melbourne Tramway Company, occurred on March 8, 1898, after a rather prolonged illness. The deceased was born at Brechin, Scotland. In 1866 Mr. Don emigrated to the United States, where he was engaged for 18 years in street railway work. After filling many important positions in American street railway workings he came to Australia in 1884 under contract to the Melbourne Tramway Company, for which concern he superintended the erection of the present car and machine shops and also the making of the cable cars and dummies that are now in general use in this city.

Mr. Don was thoroughly respected by all in the company

STREET RAILWAY TRAIN IN BENDIGO, VICTORIA.

## NEW QUARTERS FOR BOSTON ELEVATED.

The company has moved its offices from the cramped and narrow rooms in which a portion of the business of the West End Company has been carried on for more than ten years to the spacious quarters in the Converse building at the corner of Milk and Pearl streets. The company occupies eight of the ten stories in the building, thus affording ample room for the immense work which the company will have to carry on and allowing it to concentrate its entire force, which was scattered around in no less than five buildings all over the city, into one building. The new building is considered an excellent location for the offices of the company. The rooms are all well lighted, airy and cheerful, and equipped with all modern appliances of the most approved character.

The Montpelier (Vt.) & Barre Electric Railway was opened on June 28.

and well liked by all the employes at the works, and as a mark of true respect and good feeling in which he was held by all with whom the deceased had business and other connections there were fully 350 persons in attendance at the funeral.

In Adelaide, South Australia, the horse car is the only street railway conveyance at present. There are several private companies but the lines are old and worn out and are equipped with antiquated rolling stock. I hear on authority that the Government of South Australia intends to take over the street railways and equip them for mechanical traction, probably for electricity, though this has not as yet been decided. So there is hope yet that the third important capital in Australia will "get into line" and be worthy of its name and have a creditable street railway system. At present the firm of Duncan & Fraser, of Adelaide, does all in the car building and repairing line for the various companies, for

whom in the first place they built the cars. An Adelaide car is shown in the accompanying illustration. This firm is a large importer of American woodwork and ironmongery

CAR IN ADELAIDE, SOUTH AUSTRALIA.

for the construction of all kinds of vehicles for light and heavy draught.

During a brief visit made recently by your correspondent to the island colony of Tasmania (long known under the name of Van Dieman's Land) a call was made at the depot of the Hobart Electric Tramway Company for the purpose of inspecting the plant. These privileges were readily granted to me by the genial gentleman, A. C. Parker, who is the general manager for the company. After looking over the power station and grounds I was supplied with photographs of what I had seen and some notes upon the line in general.

The Hobart Electric Tramway Company, Ltd., is now nearly six years running; the Siemens overhead electrical contact system is employed. The generators are coupled to Willan's central valve engines. There are four Marshall boilers of the multitubular type; only two of these are used at the one time, thus allowing for the cleaning of two while the others are in use.

The total length of single track laid over the three sections up to the present is 9 miles. There are 20 cars used in the service; each car is capable of seating 48 passengers, but at times the cars are taxed with as many as 110 persons in and on each car.

INTERIOR OF POWER HOUSE, HOBART, TASMANIA.

Some of the grades of roads immediately out of the "city center" of Hobart are very steep, and a grade of 1 in 16 is not unusual around the Tasmanian capital and first port; this is evidence that the actual working part of the system is thorough and complete in detail. While outside Hobart one day I watched one of these cars mount a 1 in 16 grade having from 50 to 80 passengers aboard; the progress was rather slow with the electric car, but it was certainly what many horses only could have accomplished with severe strain and at a walk. A remarkable fact is that during all the time the company has been running its cars no accidents or stoppages have occurred.

The total population of Tasmania was on December 31, 1896, estimated at over 166,000; Hobart, the capital, had 24,000, and Launceston, second city and port of the colony, 17,200.

Launceston is the only city in Australia that has water power available for lighting and power purposes and the lighting plant there is so driven. It is said that there is suf-

IN FRONT OF POWER STATION, HOBART.

ficient power at the local falls, known as the Cascade Falls, for driving machinery to work a street car system, which at present is entirely lacking, the residents having only dirty cabs or wagonettes as public street conveyances to go from the city to the suburbs and for use in the city itself.

Hobart has only gas for its illuminant, but I find soon there will be an electric lighting plant installed (the machinery from England and America is now out on the road) by the local gas company, which had, I noticed at time of my visit to the Tasmanian capital, in course of erection a brick power house and necessary buildings for the new undertaking and which were being prepared to place the machinery directly it arrived.

The work of putting down the new electric line in George street, Sydney, N. S. W., is being done at a snail-pace, and it is as clear as daylight that the contractors (who should have had all completed by end of 1898) will not have finished laying down the new system till within about a year after their contract time.

Bendigo, Victoria, is the only city or town outside Melbourne that has a mechanically worked street railway in that colony. The city in question is the first one of importance in Victoria with respect to gold output ever since that field was opened.

The Bendigo Tramways Company, Ltd., is purely a local concern of local capital and enterprise. Much of the car material used by the company is from the United States. There

are five steam motors built by the Baldwin Locomotive Works, of Philadelphia; three other steam motors engaged on the line are from the Phoenix Foundry, Ballarat, Victoria. There are 14 passenger cars, most of them being on

SCENE ON THE HOBART ELECTRIC TRAMWAY.

double trucks; they were constructed originally for an electric accumulator system, which was tried first in Bendigo, but was found to work unsatisfactorily, owing chiefly to the very heavy grades (over 1 in 16) on some parts of the road traversed. The cars can carry 60 passengers each, but are seldom taxed to that capacity, as Bendigo, like the whole colony of Victoria, suffers for want of an industrial "work-while-you-can" population. The fuel used by this company is coke, which is found to be clean and not more expensive than coal.

F. W. N. KING.

## APPLICATION BLANKS.

Application for the position of motorman on the cars of the Chester (Pa.) Traction Company is made by filling out the blank, the items of which are given below. A similar blank is used for conductors. The questions cover every important point of information about an employe which it is desirable for the officials of the company to keep on file. Each applicant must be vouched for by two citizens of Chester, to each of whom the company sends one of the second blanks. These forms have been recently adopted by John MacFayden, superintendent of the Chester Traction Company. On the blanks there is ample room after each question for an answer in writing.

Chester, Pa., ..... 189..

CHESTER TRACTION COMPANY.

Sir:—I, the undersigned, respectfully ask to be appointed Motorman, and, therefore, state as follows:

1. My full name is.....
2. I was born at.....
3. I was.....years old on the.....day of....., 18...
4. I now reside at....., and have lived there.....
5. My last previous residence was....., and I lived there....
6. I have resided in Chester since.....
7. I am a single—married—man, and have to support myself, wife and..... children, and.....
8. Do you use intoxicating liquors?.....
9. My trade and occupation is.....
10. I was employed last by.....
11. Is it your intention, if appointed Motorman, to continue permanently in the service of the Company, and to discharge all duties faithfully and honorably?.....

12. Are you a citizen of the United States?.....
13. I refer for recommendation of my character to the following persons:

NAME.	ADDRESS.
.....	.....
.....	.....

14. I have had the following experience in railroading:.....
- My reasons for leaving my last position were:.....

\*The undersigned, each for himself, certifies, on his honor, that he has known the above named..... for.....years last past; that he knows him to be the same person who executed the foregoing statement; that he is well acquainted with his habits of life; knows his present place of residence; believes the aforesaid statement signed by him to be strictly true and correct, and vouches for and endorses him as honest, sober, steady and industrious.

\*To be signed by two citizens of the City of Chester, with their occupation and place of residence.

General Appearance. Weight. Height. Complexion. Hair. Eyes. Remarks:.....

N. B.—This application must be returned to the company's office within one week from date, or it will be canceled.

### CHESTER TRACTION COMPANY.

General Superintendent's Office, Strictly Confidential.

Chester, Pa., ..... 189..

Mr.....

Dear Sir:—Mr..... has made application to me for the position of..... on this Company's lines, and as we understand that you know of him and his habits, we take this means of requesting your opinion as to his responsibility, by answering the questions found below. The men employed by this Company in the moving of their cars will have entrusted to them the comfort and safety of our patrons, and we wish to employ only sober, honest and trustworthy men. We ask your assistance to this end, and assure you that your replies to these questions will be treated as a personal matter and will not be made known to applicant. Thanking you in advance for the favor I am

Respectfully yours,

.....Gen'l Supt.

How long have you known this man, and under what circumstances?

Can you vouch for his honesty and truthfulness?  
Does he gamble, or associate with loose women?  
What is his reputation in the community? Is he industrious and reliable?

Does he use intoxicants? Has he ever attended bar?  
Is he loud-mouthed or profane?

Have you any knowledge of his being discharged from a former position? Give full particulars.

Is he, to your knowledge, afflicted with any physical disability or incurable disease?

Has he ever been placed under arrest? If so, give full particulars.

What do you know of his associates?  
Can you recommend him as worthy of the confidence of this Company, and one to whom the care and welfare of their patrons may be safely entrusted?

(Signed) Name.....

Date.....189.. Address.....

The Brooklyn Heights Railroad Company, Brooklyn, N. Y., was robbed of \$1,000 at the Halsey street depot, June 2. When the strong box, in which the depot receipts are kept, reached the bank and was opened it was found to contain nothing but old brass. One of the employes of the road is suspected of the theft.

**THE ZERMATT-GORNERGRAT MOUNTAIN RAILWAY.**

One of the most interesting and instructive railway undertakings of the year is the Zermatt-Gornergrat mountain railway operated from a three-phase alternating current circuit. Zermatt is a small village of 500 inhabitants in the Canton of Valais, near the southern boundary of Switzerland and on a branch of the Jura-Simplon railroad. It is at the base of the Gornergrat and is a favorite resort for tourists. This project was conceived shortly after the Jungfran railway, both of which have excited world-wide interest.

The question of power was of primary interest, but the numerous waterfalls made the application of electricity desirable. After the engineers had studied the problem it was decided that polyphase alternating currents would prove most economical in transmission and the use of three-phase motors on the locomotives was advocated. Brown, Boveri & Co. had made the plans for the street railway system in Lugano and were satisfied with the operation of the alternating current motors on the cars. A test was then conducted on a portion of the new Gornergrat railway which fully justified the adoption of the motors on the new line. The objection to two trolley wires over each track is not a serious one with the mountain road, as the speed of the cars does not exceed 5 miles an hour, and the road passes through no thickly settled places.

Fig. 1 is a map of the line and a profile of the roadbed. Beginning at Zermatt it extends 5.7 miles to the summit of Gornergrat, which is 10,791 ft. above sea level. The first 1,000 ft. of track is level; it then crosses the Visp on a bridge of 98 ft. span. From the bridge there is a grade of 12 per cent for nearly a mile and the road crosses over the Findelbach. About 300 ft. below this bridge is the power station, as shown in Fig. 2. After crossing this bridge is a

The "Zeitschrift für Elektrotechnik," of Vienna, gives the following information in reference to the design and construction of the road. Each train will consist of an electric locomotive and two cars with a capacity of 110 passengers. This makes the weight of a train unit about 30 tons. There

FIG. 2.—POWER STATION.

will be three trains in operation on the line and it is calculated that 160 h. p. at the motors will be required for each one. If there are three trains in service there will be one at least going down while the other two are ascending. Assuming an efficiency of about 60 per cent for the generators, transformers, transmission and motors, 510 h. p. should be developed at the turbines.

It was decided to install three 250-h. p. water wheels of American make direct connected to generators through flexible couplings. The speed is to be 400 r. p. m. The water wheel governors are very sensitive, keeping the speed constant with variations in the load of 50 per cent. The head of water available is 330 ft.

The alternating current generators have stationary armatures and 12-pole rotating field magnets. The current is generated at 5,400 volts with a frequency of 40 cycles per second. The field current for the alternators is generated by 15-h. p. direct current dynamos coupled direct to the shafts of the alternators.

The current is transmitted to the various transformer stations at the voltage generated and reduced to 540 volts for distribution on the line. There are three of these stations, each of a capacity of 180 k. w. The current is transmitted from the power station on three wires of No. 3 B. & S. gage; this line does not follow the road but takes the shortest cut across the country. The voltage is reduced to 540 volts at the transformer stations and passes to the line through feeders of No. 0 wire. The two trolley wires are suspended 16 in. apart above the center of the track and the rails form the third branch of the circuit. Chicago rail bonds are used in connecting the rails.

From an electrical standpoint the details of the locomotive are of greatest importance. Fig. 3 shows the truck with the motor and gears mounted thereon and Fig. 4 is an outline drawing of the parts of the locomotive. There are two synchronous three-phase 90-h. p. motors for each locomotive. The motors have wound armatures or rotors, contact rings, six poles and a speed of 800 r. p. m. The reduc-

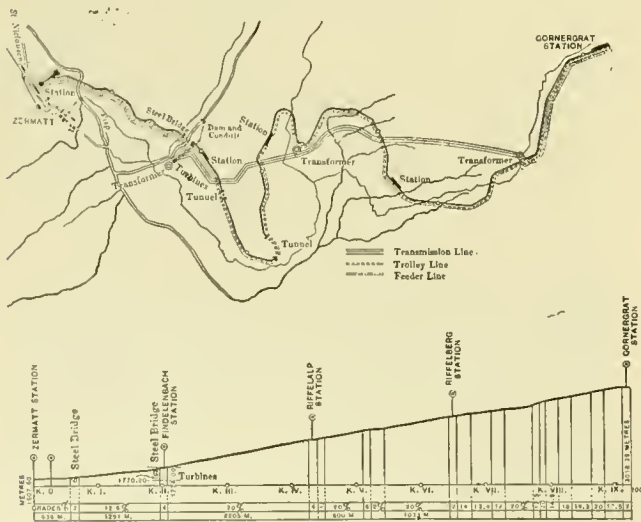

FIG. 1.—MAP AND PROFILE.

grade of 20 per cent which, with exception of the stations and a few stretches, continues to the end of the line. At five points along the road tunnels had to be driven, the longest being 380 ft. The total rise in the whole distance is 6,849 ft. The rails used are 4-in. Vignolles and between them an "Abt" rack is fixed. The track is 3 ft. 3 3/8 in. gage.

tion through the gearing is 12 to 1. Above the motors is arranged a resistance common to both and the speed is controlled by cutting this in and out of the rotor circuit. Above the rheostat is a switch for opening the car circuit. There is a double set of current collectors on top of the car to provide for the heavy currents taken at times. The motors are mounted on the truck, as shown in Fig. 3 (one motor is not in place), with pinions at either end of the shaft which engage with the two large gears, which in turn drive the gear on the axle. There are two driving axles and each motor works separately upon an axle.

Owing to the excessive grades extreme precautions had to be taken with the brakes and two independent sets are provided. The first system is operated by hand and each can be applied by hand upon the two driving axles independently of each other. The friction band brakes applied to wheels on the motor shafts, see Fig. 3, are operated by one of three different ways: by hand; automatically, so soon as the car exceeds a certain speed; and whenever the current is interrupted from any cause. This is accomplished by means of a solenoid which, so long as the current is passing through it, loosens the brake but throws it on the instant the current stops. The motors also have a powerful braking effect.

In going down grade the motors can be controlled in two different ways. They may be connected in the same manner as going up grade with the resistance inserted in the rotors or the rotor windings may be short circuited. The train has the same speed going down hill as going up; they have to keep in step or in synchronism with the alternators. The motors act as generators going down hill and return current to the circuit. It was necessary to make provision for this at the power station, for if all the trains on the line were descending the locomotive motors would generate so much current that the alternators at the station would run as motors from the line currents. A load resistance is automatically inserted in the circuit when the alternators exceed a certain speed.

The fact that the motors will return energy to the line

FIG. 3.—TRUCK.

was demonstrated by experiments last November on a completed portion of the line a mile in length. During the tests a fully loaded train was run down hill with the motors connected as generators and the train maintained the same speed as in going up grade without any application of the brakes. The excess current was absorbed at the power station by a water rheostat. The test also showed that a locomotive hauled a fully loaded train over every grade evenly

and smoothly, and when the rotor resistance was out of circuit the speed was independent of the grade or load.

The cars, station, buildings, etc., are all lighted by electricity, there being small transformers at the stations to

FIG. 4.—LOCOMOTIVE.

reduce the transmission voltage to 540 volts. The lamps on the cars are connected three in series. This important work will be completed by July 1 and will be the first electric rack railway driven by three-phase alternating currents. However, this will be followed in a short time by several similar roads, such as the Jungfrau and the Stansstadt-Engelberg. The successful operation of the Lugano street railways and the preliminary tests on the Gornergrat indicate that multi-phase alternating currents can be employed both in the operation of mountain roads and ordinary street railways, and there may be important developments in the future along this line.

#### CLEANING CAR GATES.

Previous to the building of a large barn this spring many of the cars of the Calumet Electric Street Railway Company, of Chicago, were constantly exposed to the weather. In preparing for the summer traffic no less than 175 cars were to be overhauled and painted. The gates on these cars were covered with rust which proved very difficult to remove. A rattler was designed by the master mechanic, W. A. Harding, and made in the repair shop. It is 30 in. square and 22 ft. long with bearings at each end and a disk support in the center. The rattler is constructed of 2-in. planks reinforced by wrought iron bands. The bearing at each end consists of a short piece of pipe secured to the end of the box and bearing in old motor brasses. An old W. P. 30 motor with double reduction gears furnishes power to rotate the rattler. One side of the box is removed and 13 gates inserted, each separated by a wooden strip. A ton of gravel is in the box. The side is bolted on and the motor started operating the rattler at 12 p. m. The rattler is run all day with one charge of gates, and when they are removed every trace of rust is gone. The actual cost of the machine was less than \$30 and it will easily save its cost in labor.

It is again reported that plans are brewing for the consolidation and sale of all the street railways in Seattle, Wash., but no definite announcements have as yet been made.

## SOME GRAPHICAL DIAGRAMS USED IN THE OPERATING AND ACCOUNTING DEPARTMENTS.

The manager of a business must be familiar with the details of all departments and with the effect which a change in the details will have upon general results. Wastes and useless expenditure occur in the details; a comparison of general results may show their existence because in the aggregate they amount to a large sum, but to tell just where they lie and how to curtail them the details themselves must be examined. All results in operation or accounting appear at one time or another as figures, and when called upon to analyze a mass of figures and from the many facts thus expressed draw inferences and formulate rules for future guidance a man needs all the labor saving devices that can possibly be brought to his aid. Mere numbers cannot, especially if they be of considerable magnitude and there are many of them, convey their full meaning to the average mind. The most effective way of showing relative magnitudes is by plotting them to scale and if they follow or do not follow a regular law of variation the fact is readily made apparent when the locus is drawn.

The value of graphical diagrams in all experimental scientific work is too well known and too highly appreciated to require any demonstration. With the scales of the rectangular co-ordinates aptly chosen the resulting diagram speaks volumes; it serves to check the work and to show where lie the critical points which may with profit be further investigated.

In the power house the readings taken from the volt, ampere, and watt meters at frequent intervals during the day give a sheet full of figures which require time and much mental arithmetic to appreciate. When these same figures are plotted, showing the changing value of these quantities as the time varies, the eye takes in the result at a glance. Continuous graphical records of these quantities and also of the engine speed are quite commonly taken and in many instances duplicate recording instruments are upon the desk of the manager as well as upon the switchboard.

Generators and motors have their "characteristics" and engines their efficiency curves, which are the graphical expressions of the physical laws in accordance with which they act, the result of experience, thus shown because more convenient to apply than when shown in tabular form, or the curve expressed by an equation.

To show the receipts, the various expenditures, etc., for a given year and compare them with similar items for previous years nothing serves better than curves.

Above all the use of diagrams permits a condensation that can be obtained in no other way, and the results from operation for a period of 10 or 20 years may be shown on single sheet where they are readily accessible and easily comprehended.

In what has preceded reference has been made to only the most common form of diagrams; i. e., those in which two variables are taken as co-ordinates and a line drawn through the several points when located, the form and position of the line showing the relation that successive values of the quantity plotted have to each other, as well as their absolute values. But colors as well as forms appeal to the eye and there are many diagrams in which use is made of them. These are rather to make a convenient record of facts, than for comparison. Thus in keeping permanent

records of car repairs different colors may represent light repairs, heavy repairs, varnishing, repainting, etc.; each individual car having a line to itself designated by its number, the other dimension of the paper is available for a record of time.

Closely akin to diagrams is the car board where by means of numbered holes and colored pegs or tags, or of colored and numbered blocks, a record, temporary in character, however, is kept of the rolling stock.

Such schemes for exhibiting the condition, earning capacity, cost of operation, etc., and the general history of the motive power and car equipments have been used on nearly all steam roads, each road generally working out its own system. These records to be of value must be kept up to date and the weak point in the system has usually been that the clerk had other duties also, and the record must wait until there was nothing else to be done and was generally a month or more behind. Also when the earnings fall off and it is necessary to decrease the office force, the record clerk is among the first to go and among the last to return when business improves.

It may in some instances be urged that the time spent by the head of the department in referring to the original records and which might be saved by the use of graphical digests is not more valuable than the time of the clerk who makes the diagrams. In other words a \$200 man might spend one-fourth of his time hunting through original records and the company be no worse off, if the services of a \$50 man could thereby be dispensed with. But this argument we do not believe is a serious one.

In a paper read before the Northwest Railway Club some time since by Tracy Lyon, master mechanic of the Chicago Great Western Railway, treated of the application of graphical charts to railway records as developed by that road. Each department carries a series of running charts covering the figures in which it is most interested. One is the monthly sheet, so called, covering in its width 10 spaces, each representing a year and subdivided into months, on a scale of one year to 1½ in., and with 30 horizontal lines to the inch, each fifth and twenty-fifth line being heavier for convenience in counting. The other is the daily sheet, which differs only in that its width covers one year instead of 10 and there are vertical lines for each day, with heavier lines each fifth day and at the beginning of each month. Upon these sheets are plotted all sorts of things, and they are valuable for reference and furnish an ideal index for a great deal of matter that is usually not to be got at.

For the pay roll data some 40 monthly sheets are bound together and on the first page is plotted the total amount of the pay rolls of the department for each month since 1890. On the next page, month by month, are plotted in groups three general subdivisions of this total, covering the pay roll of the principal shops, division stations and smaller stations respectively. On the following pages are shown still further subdivisions, including the total pay rolls of each department in the shops and each station by itself. Each one of these is carried out again by showing, grouped together on succeeding pages, the amount paid to each class of men in each department of the shops and at each station. This makes quite a book, but imagine the relief in having such

a map of present and past events to turn to when some question is brought up involving the amount of money which it is justifiable to spend at a certain point. The alternative of a pile of dusty old pay rolls, anywhere up to a foot high, is not pleasant to contemplate and somewhat hopeless. The diagrams, on the contrary, show at a glance just how many hostlers or car cleaners, for instance, there have been at a given station at any time for years back and just what wages they have received.

There are six different things that the master mechanic wishes to know about his locomotives: 1. When turned

FIG. 1.—RECORD OF ENGINE.

out of the shop and the extent of the repairs made. 2. The cost of these repairs. 3. The mileage per month. 4. The times when taken out of service for repairs. 5. The cost of running repairs. 6. The number of failures against the engine. Fig. 1 shows an individual engine diagram: The shop record and failures are shown in the upper portion of the sheet, the character of the mark indicating the extent of the repairs and its position the date or dates when a failure occurred or when it entered or left the shop. Mileage made is indicated by a horizontal line drawn at the proper distance above the mileage base line. The cost of repairs is shown by enclosing the requisite area in the lower right hand corner of the space allotted to the month, each small square representing \$10.

Fig. 2 shows a record of the shopping of coaches. Coach 211 was given a general overhauling (indicated by a block three lines high) between March 1 and the middle of April, 1896, and was painted and varnished, the old paint being

FIG. 2.—RECORD OF COACHES.

burned off (B). On January 1, 1897, eight months after, it received light repairs, being in shop for a matter of a couple of weeks, and was varnished only. The blackened edge to the right of the blocks indicates paint and varnish, the line alone varnish only. This car was washed with soap (W) in August and May, and was again shopped for light repairs and varnished in December, 1897. Coach 213 was taken in for light repairs in April, 1897, because of being damaged in service and before its usual time, the cross hatching indicating this. Coach 214 was held for a few days in May, 1897, for light repairs, but was not painted or varnished, only washed.

From such a chart one can obtain a very good idea in a few minutes of the probable condition of the equipment, and

if a car is neglected or overlooked, attention is quickly called to the fact. It is not necessary to draw off any figures to determine what cars are to be shopped during the coming month. A glance down the line is sufficient. It gives, too, as in the case of the engines, a permanent record of each car as well as a record of the number of cars shipped each month.

In the master mechanic's office of this road the records kept are:

BY MONTHLY CHARTS.

Pay Rolls—In summary and detail.

Coal—Cost per mile. Miles to 1 ton. Tons per 10,000 ton-miles. Percentage of excess over allowance by divisions.

Locomotives—Number in service. Number in store. Total mileage. Total cost repairs. (Labor. Material.) Cost repairs per mile. Failures—In detail. By divisions. By classes. By engines. Total. Number of engines handled at each roundhouse. Cost of handling per engine. Cost of wipers and dispatchers per mile. Cost of oil and waste per mile. (Different kinds of oil.) Miles to one pint and one pound. Cost of supplies per mile. Cost of sand per mile.

Cars—Cost of repairs, passenger cars and freight cars. (Labor and material.) Cost of oil per mile. Cost of waste per mile. Shopping of passenger cars. Shopping of cabooses.

Engineers—Each man's record. Oil—Good or poor. Coal—Percentage of excess over allowance. Marks or suspensions.

BY DAILY CHARTS.

Locomotives—Shopping, cost repairs, mileage, etc. Number held at principal shops for general repairs. Estimate of cost of such repairs. Number held each week at division shops. Number turned out each week at division shops. Washing out of boilers. Metallic packing used on each engine. Inspection of nettings and ash pans.

P. V. Burington, secretary and auditor of the Columbus (O.) Street Railway Company, has kindly furnished us with a sample diagram used by him for recording the number of passengers carried hourly on each of the company's lines. This "day card" as it is called has upon it in addition to the graphical record, the data from which the record was plotted as will be seen by examining Fig. 3. The figures under

FIG. 4.

the hours are understood to mean 30 minutes each way. The locations of the points on the line are determined by the totals which appear under them.

The conductor's card (Fig. 4) has a column showing the time at which the car arrives at each end of its run, outward and inward; also, it shows the number of passengers, from which figures the day card is made up.

Mr. Burington writes: "We do not work up these sheets daily, but at such times and for such periods as we may desire to test the heavy or light loading of cars at certain hours. These sheets have been found of considerable value to us, in answering claims made that our cars were overtaxed, particularly in the usual busy hours of the day. In determining the question of overloading, the matter of a proper proportion of short hauls must be considered as a deduction from the total number of passengers carried any considerable distance."

For three years the Chicago City Railway has kept a permanent record of the shopping of its cars on large sheets of cardboard, suitably ruled for the purpose. There are 16 of these sheets placed in frames, two in a frame; the eight frames are hinged to one side of a closed cabinet, so that they may be swung out for inspection and at other times kept where they will be out of the way and not gather dust. Each frame (inside measurement) is 26 in. wide and 36 in. high. On these sheets each car is given two spaces about 3/4 in. square, each ruled into 16 small squares by finer lines, and the number of the car placed above it. The four horizontal rows of small squares represent the four quarters of the year and the row in which a mark is found indicates the quarter of the year in which the car was in the shop. The small squares in each horizontal row when colored indicate the nature of the work done on the car. Thus: black indicates construction; dark blue, reconstruction; green, repairs; red, painting; yellow, retouching and varnishing. When a car is built, it is given a space on the

board and the first square in the proper row painted black, the second red, and the third yellow.

Different kinds of cars, cable grip, cable trailers, closed motors, etc., have different sheets. It was mentioned that each car was given two squares; this is to keep the record for two years together. The 16 cards have sufficient room to show the record for four years for all the cars, and the arrangement of two years only on any one sheet gives at least a two years record of the cars at all times.

The same company has also a number of diagrams on which are platted each month data which experience has shown are often needed for reference. There are at present five sets of diagrams used; they are framed and hang on the walls of the superintendent's office. The frames are 20 in. by 33 in. inside measurement, and the diagrams 16 1/2 in. by 20 in. Cross-section paper ruled with lines 1-10 in. apart both ways with every tenth line heavy, is used for these diagrams. This scale is convenient for plotting the items which are always shown vertically; horizontally each month has a space of 1 in. allotted to it, though only monthly totals are plotted. This scale is found to be a very good one.

One set of diagrams, which we will call "A," show financial data by months for a period of three years, each year being shown by a line of different color. This sheet is divided by heavy horizontal lines into sections 2 or 3 in. wide and the following quantities shown, plotted to suitable vertical scales:

- Car-miles run.
- Gross receipts.
- Total expenses.
- Net earnings.
- Receipts per car-mile.
- Trainmen's wages per car-mile
- Total cost per car-mile.
- Per cent of operating expenses to total.
- Total cost of motive power.

The second set "B" is displayed in the same frame as "A," and was designed to show the expenses as distributed over the various departments. These sub-divisions were:

- Department of time tables (includes wages of trainmen, etc.).
- Supervisor, subdivided into: Street. Car House. Horses. Power houses.
- Track department.
- Track department, pay roll.
- Electrical department.
- Mechanical department.
- Mechanical department, pay roll.
- General office.
- Fixed charges.

This set served its purpose admirably until changes were made in the organization, when this subdivision was no longer suitable and only a few diagrams of this set are now kept up.

July, 1897, three other sets of diagrams were started showing power house and barn expenses in a similar manner.

Set "C" gives the cost of cable power on a car-mile basis, the items being:

- Fuel.
- Maintenance.
- Labor.
- Supplies.

Total expenses.

There are three cable power houses and different colored inks are used to distinguish them, as all three are placed on the same sheet. For different years different styles of lines (full, dotted, etc.) are used.

Set "D" exhibits the cost of electrical power on a kilowatt-hour basis, the items being the same as for set "C." Different colors of ink are used to distinguish the two electrical power houses

Set "E" shows the car house expenses, five colors of ink being used for the five car houses. The items shown are:

- Number of cars operated.
- Car-miles operated.
- Cars repaired at car houses.
- Total cost of material.
- Cost of material per car-mile.
- Pay rolls.
- Labor per car-mile.
- Material and labor per car-mile.

These various forms were worked out and arranged by President Bowen.

The Boston Elevated Railway does not make use of graphical diagrams in the accounting department, but a brief reference is here made to some of its blanks and forms, which we have received by the courtesy of H. L. Wilson, auditor of the company, because they suggested a simple diagram which would enable the data to be conveniently exhibited for purposes of comparisons extending over a long period.

The "schedule of operating expenses" furnishes an index to the accounts. A comparison of the operating expenses is kept in a large book and by an examination of it one can tell the amount of each account for any month or combination of months, and any extraordinary expense will at once attract attention.

For exhibiting the business to the directors the auditor makes a monthly report. This is a six page form, each page

being 8½ in. wide by 14 in. long, but only the four inside pages are used for the accounts. Two pages show summaries of the earnings and operating expenses under appropriate headings, and opposite each of the items are entered four amounts: 1. For the current month. 2. For the same month of the previous year. 3. For the number of months of the fiscal year which have expired. 4. For the same months of the previous year.

The other two pages show a condensed balance sheet having opposite each item three amounts: 1. To October 1. 2. For — months. 3. Total.

For the operating department, which comprises nine separate divisions, the car earnings per mile run are abstracted twice a month, giving those in charge of the department a thorough knowledge of what each line is doing and whether the facilities are sufficient. This abstract for each division is made on a sheet 16 in. by 21 in. folded down the middle, and gives the round trips, miles run, receipts, and average receipts per mile, and per passenger for each route in the division.

These totals from the nine division abstracts are recapitulated on a separate sheet, which shows the earnings for the horse and electric lines by divisions, under the same headings as the single sheets.

For comparison with the previous year the division totals are arranged on a sheet 10½ in. by 16 in.

The pay rolls are compared week by week on a blank, which shows the number of men and the amount of the pay roll. The pay roll is itemized so as to separate the station and car service, maintenance of electrical equipment, and road department, of each division; the operation of the several power houses; emergency crews, shops, yardmen, watchmen, harness department, electric linemen, etc., and the general offices.

These forms suggest to us a simple form of diagram, which could be applied to the accounts and would show comparisons for any desired period in small compass and give two things one usually wishes to know, how the totals

## WEST END STREET RAILWAY.

### Schedule of Operating Expenses.

#### General Expenses.

##### SALARIES, OFFICE AND GENERAL EXPENSES

- No. 1 Salaries, President, Vice-President, and Clerks
- 2 " General Manager and Clerks
- 3 " Treasurer, Paymasters and Clerks.
- 4 " Receiver, Clerks and Collectors.
- 5 " Auditor and Clerks.
- 6 " Purchasing Agent and Clerks
- 7 " and Expenses, Storekeeper and Dept. Clerks
- 8 Supplies and Expenses, General Offices.
- 9 Telephone Repairs and Expenses.
- 10 Fare Registers
- 11 Stationery, Printing and Advertising
- 12 Subscriptions and Gratuities.
- 13 Miscellaneous Expenses.

#### LEGAL EXPENSES

- 14 Salaries and Expenses of Attorneys.
- 15 " Claim Agent and Clerks
- 16 Expenses Claim Department

#### INSPECTION.

- 17 Services of Inspectors.
- 18 Inspectors' Fares and Expenses.

#### INSURANCE

- 19 Fire Insurance Premiums
- 20 Railway Insurance Premiums.

#### RENTS.

- 21 Rent of Land and Buildings
- 22 Rent of Oilier Roads (Trackage only)

#### Maintenance of Track and Buildings.

##### MAINTENANCE OF TRACK

- 25 Superintendence, Engineering and General Expenses Road Department.
- 26 Labor, Repairing Track
- 27 " Paving Track
- 28 " of Trenches, Road Department.

- 29 Labor of Watchmen, Road Department.
- 30 Timber and Ties
- 31 Rails and Fastenings
- 32 Frags, Switches and Guard Rail
- 33 Paving Blocks
- 34 Sand, Gravel and Cement for Track Repairs.
- 35 Maintenance of Cars and Vehicles for Track Repairs.
- 36 " of other Track Tools and Equipments.
- 37 Use of Horses for Track Repair.
- 38 Miscellaneous Expenses of Track Repairs.

##### MAINTENANCE OF BUILDINGS, ETC

- 39 Repairs of Stables and Horse Car Houses
- 40 " of Electric Car Houses and Repair Shops.
- 41 " of Power Stations (Exclusive of Equipment)
- 42 " of Miscellaneous Buildings.
- 43 Maintenance of Trenches, (Including Water Pipes)
- 44 " of Miscellaneous Fences, Sewers, etc

#### Maintenance of Equipment.

##### MAINTENANCE OF CARS AND VEHICLES.

- 47 Superintendence and General Expenses of Car Shop.
- 48 Repairs of Horse Cars.
- 49 " of Box Electric Cars
- 50 " of Open Electric Cars
- 51 Miscellaneous Car Repairs (Including Signs)
- 52 Repairs of Trucks for Electric Cars
- 53 " of Frames, " "
- 54 Transfer of Electric Motors and Trucks for purposes other than Repairs.
- 55 Repairs of Snow Plows and other Snow Equipment
- 56 " of Cargages, Wagons and Vehicles.

##### MAINTENANCE OF SHOP EQUIPMENT

- 59 Repairs and Renewals of Machinery and Tools for Shops. (Exclusive of Power Stations)

##### MAINTENANCE OF HORSE AND HARNESS EQUIPMENT

- 60 Renewal and Depreciation of Horses.
- 61 Shoeing and Veterinary Expense
- 62 Repairs and Renewals of Harness, Blankets and Robes.

##### MAINTENANCE OF ELECTRIC EQUIPMENT

- No. 64 Maintenance of Steam Equipment of Power Stations
- 65 " of Electric Equipment of Power Stations
- 66 " of Feeder Conduct.
- 67 " of " " Cables
- 68 " of Overhead Feeder Lines.
- 69 " of Poles
- 70 " of Overhead Lines
- 71 " of Track Wiring
- 72 " of Motor Armatures.
- 73 " of " Gearing
- 74 " of Motors, Miscellaneous
- 75 " of Rheostats and Controlling Mechanism.
- 76 " of Trolleys.

#### Transportation Expenses.

##### SUPERINTENDENCE AND GENERAL EXPENSES OF TRANSPORTATION

- 80 Superintendent of Routes and Clerks
- 81 Division Superintendents and Clerks
- 82 Inspectors and Aids
- 83 Station Recorders and Register Inspectors
- 84 Station Receivers and Register Inspectors
- 85 Miscellaneous Transportation Expenses

#### INJURIES AND DAMAGES.

- 86 Damages to Persons by Horse Cars
- 87 " " by Electric Cars
- 88 " " Property by Horse Cars
- 89 " " by Electric Cars
- 90 " and Gratuities to Employes
- 91 Miscellaneous Damages.

#### ROAD EXPENSES.

- 92 Labor, Washing Holes and Flagging Cuts
- 93 " Track Cleaning and Switchmen
- 94 Sanding and Watering Track (Labor, Sand, Fuel, Bores, etc)
- 95 Oil for Trunk.

#### SNOW EXPENSES.

- 96 Labor, removing Ice and Snow
- 97 Tracing Ice and Snow (Hired Teams)
- 98 Salt for Tracks
- 99 Tools and Miscellaneous Snow Expense.

##### CAR HOUSE AND STABLE SERVICE

- 100 Stable Superintendence (Wages, Stable Foremen, and Stable Inspector)
- 101 Superintendence Electric Car Houses (Foremen and Clerks)
- 102 Horsies, Feeders and Harness Cleaners.
- 103 Floormen and Shifters
- 104 Teamsters and Expressmen.

##### PROVENDER AND BEDDING.

- 106 Hay, Grain and Miscellaneous Provender.
- 107 Bedding for Horses

##### STABLE AND CAR HOUSE SUPPLIES AND EXPENSE.

- 108 Fuel Lights and Electric Lamps for Car Houses and Stables
- 109 Furniture, Fixtures, and Tools, for Car Houses and Stables
- 110 Water for Car Houses and Stables.
- 111 Miscellaneous Supplies and Expenses of Car Houses and Stables.

##### CAR SERVICE AND EXPENSE

- 113 Conductors, Horse Cars
- 114 " Electric Cars.
- 115 Drivers, Horse Cars
- 116 " Motorcars.
- 117 Drivers, Tow Cars.
- 118 Electric Lamps, Lubricating Oil, Waste and Miscellaneous Car Expense

##### ELECTRIC MOTIVE POWER

- 120 Steam and Electric Superintendence and General Expense
- 121 Labor for Power Account
- 122 Fuel for Power Account
- 123 Oil for Power Account
- 124 Water for Power Account
- 125 Miscellaneous Supplies and Expenses for Power
- 126 Power Hired
- 127 Power Sold

##### USE OF HORSES

- 119 Fuel for Horses (Coal, Wood)

All questions in relation to charges for the above accounts must be referred to the Auditor for settlement.  
H. L. WILSON, Auditor,  
Boston, Oct. 1, 1895.

compare, and how the percentages of the total compare for several items.

For a record by months covering a period of several years a scale of 3 in. to the year is probably sufficiently large; this would allow  $\frac{1}{4}$  in. between the vertical lines, each of which would represent one month. For the vertical scale 10 lines to the inch would probably be suitable for most purposes. To facilitate counting each 12th vertical line and each 10th horizontal line would be made heavier than the others.

Fig. 5 will serve to illustrate the idea. Suppose that the expense to be analyzed falls naturally into six items. The ratios which these items bear to each other or to the total

FIG. 5.

will in most cases vary from month to month, and a comparison of these ratios would show if any of the items have grown unduly, and direct attention to the special points which look as if further investigation might be desirable.

To effect this comparison readily lay off two heavy horizontal lines (10 in. apart with the scales we have assumed) so that there will be 100 small divisions between them. Then express the six items in percentages of the total and plot each of them, using the lower heavy line for the datum line for Item 1, this line for the datum line for Item 2, etc. This will result in a diagram similar to Fig. 5. The relative magnitude of each item is the height of its portion of the diagram. Any change in this relative magnitude shows in the convergence or divergence of the two bounding lines.

The total of the account would be plotted on the same sheet, making the vertical scale dollars instead of percentages.

To apply this to say, the "schedule of operating expenses," it would be convenient to have a book of these sheets. On the first sheet would be the grand total shown by a line the several points on which are entered from month to month and the relative proportions of the totals of the four grand divisions shown below it.

The next four sheets would show absolutely the totals for the grand division, and relatively the sub-heads under them.

Succeeding sheets would continue the sub-division, giving the sub-heads absolutely and the items relatively. This could be carried as far as it was found desirable or profitable to go.

The Helena (Mont.) Power & Light Company has leased property of the Montana Central Railway Company to be used for a base ball park.

A SIMPLE POSITIVE BLUE PRINT PROCESS.

In a letter to "Engineering News," John D. Isaacs, of the Southern Pacific Railway Company, San Francisco, describes a simple and practical process for making positive blue prints, that is, prints having blue lines upon a white ground, which is used in the draughting rooms of that company. Such prints are very desirable where plotting or coloring is to be added.

The process is thus described: The tracings are made with strong black lines using Higgins' "American White Label" India ink. A paper negative is first made on ordinary photographic silver printing out paper, such as Solio, or Kloro paper. The paper used is the "Victor Special" brand, which can be had in rolls 25 in. by 30 ft., and is not expensive. To make the negative, cut the paper one-half inch larger each way than the tracing; place the tracing in an ordinary blue-printing frame, face up—that is, with the side drawn upon away from the glass; on this place the paper face down, so that the inked lines and the sensitized surface are in contact; then print in the sun to a dark coffee color. The print is soaked in water until drippings from it are no longer milky. It is then placed in a fixing bath made up about as follows (exactness is not important): Hypo-sulphite of soda, 1 ounce; water, 25 ounces.

The print will change in this bath to a uniformly light mahogany color or dark buff. After becoming uniform in tint, it is left in the bath five or ten minutes longer. It is then removed and washed for half an hour; then allowed to dry thoroughly, after which it will be much darker. When thoroughly dry the back of the negative should be given three good coats of the following varnish: Canada balsam, 1 part by volume; spirits of turpentine, 3 parts by volume; alcohol, 2 parts by volume. Apply quickly with a sponge. Let each coat dry before applying another. Work in a warm room.

The result is a fairly transparent negative (reading backwards) of a non-actinic color, with clean white lines and figures, from which the positive blue prints are made on ordinary blue-print paper. Printing takes about twice as long as in the case of those ordinarily made, from a tracing, but several negatives can be made from one tracing if many prints are required. When through printing we file the negatives with the tracings, for future use.

The best method of getting the time of exposure for making the negative is to try one or two scraps of the paper first under the tracing and note the time giving the best negative; after which, uniform results can be had without difficulty. At this season of the year (May) the printing requires three and a half minutes in the sun in the middle of the day, under a clean tracing. If here and there a line or figure in the negative is indistinct from bad contact in the printing frame, it may be easily "doctored" by scratching with a pin-point or other sharp point through the gelatine surface of the paper after the negative is otherwise finished. A fresh fixing bath should be used for each batch of negatives made. Before making the positive blue prints, test a small scrap of the blue print paper by washing before exposure to the light. It should wash clean, leaving no bluish cast to the paper. Soaking and washing the paper negatives, as above, may be done in the blue-print washing tray in which blue prints are being washed, as the two processes do not affect each other.

## NOTES FROM DENVER.

A new park has been opened in Denver, called Chutes Park, by a company closely allied to the Denver Consolidated Tramway Company, and it is the intention to make it one of the finest pleasure resorts in the west. At present there are two chutes, two roller coasters, amphitheater, race track and bicycle track; a large lake is an additional attraction. There are also numerous fruit stands, candy booths, etc. A theater, restaurant and zoo are soon to be added. "Shooting the chutes" is new in Denver and at first the people were afraid to venture the trip; now, however, they can't be held back.

Prior to opening this park the street railway route on which it is located could never be made to pay operating expenses, but the park business has made it a paying line. On Sundays, holidays and pleasant evenings the traffic has been so heavy that it was necessary to run cars on a headway of one and one-half minutes. The Tramway Company has advertised the park extensively and is now reaping its reward.

The Tramway Company has relaid all of its 15th street line, both Upper and Lower 15th streets, and is now engaged in relaying the Colfax avenue line with 60-ft., 75-lb. rails. Colfax avenue was formerly a cable line, and when electric traction was adopted it was soon found that the track was too light for the heavier cars.

The illustration is from a photograph of a curve in the loop at 15th and Arapahoe streets, taken when the work

SPECIAL WORK, DENVER.

was put together for inspection. This loop was described in the REVIEW for February last. The 15th street, Colfax avenue and Broadway track is of the same construction, and it will be used in all new work.

The accompanying picture shows "Tramway Billy," who is the company's pet. He is 10 years old and one of the smartest dogs that ever was; he has been with the company ever since the first cable was started on Broadway, and now lives near the South Denver loop, the terminus of the Broadway short line.

Originally there were four cable lines; Broadway cars were painted orange; Colfax avenue, white; 18th avenue, blue, and 22nd avenue, green. In the old days "Billy" would take regular trips over the various lines, visiting the

different barns; he changed cars at the points he found most convenient and never failed to get the car he wanted, knowing it by the color. On the grip cars there were short seats running lengthwise at the front end beside the gripman, and "Billy" usually occupied a seat there when aboard. Of course all the officers and men knew "Billy."

When waiting for a car he always stands on the right

"TRAMWAY BILLY," OF DENVER.

corner, like any other passenger, and makes it a point not to become mixed up in street fights. Now he is getting old and the cars bother him to some extent, as there are 24 lines and the cars are all of one color. The four old lines never trouble him, as he remembers them, but the cars on the other 20 lines disconcert him. Whenever a motorman or conductor sees "Billy" waiting in the street he calls the line and "Billy" waits till he hears the line he wants. Recently the writer was standing at the loop, watching "Billy" waiting for a car; several passed but he made no move until a motorman called "40th street, Billy," when he wagged his tail and climbed aboard.

He wears a nickel-plated collar with the name "I am your Bill" and is known to half the people of Denver.

## AN ELECTRIC RAILWAY IN ALGIERS.

Some of the colonies of the European powers possess a more progressive spirit in railway affairs than the mother country, this being especially true of England and street railway extensions are much hampered in the French cities. The first electric railway in Algiers has been built by the French Thomson-Houston Company and is 4.7 miles in length. There are 18 motor cars in service each equipped with two G. E. motors specially designed to suit the 3 ft. 5½ in. gage. A partition divides the car into two compartments for two classes of service. There is seating capacity for 20 passengers and standing room for 20 more. The power station contains Corliss engines belted to three 200-k. w. dynamos. The system is operated at a voltage of 500 to 550.

The La Fayette (Ind.) Street Railway Company has just placed on its Soldiers' Home and Tecumseh Trail line two 10-bench open cars made by the Brill Company.

## STORAGE BATTERIES.

The history of storage batteries down to a recent date has been an almost unbroken record of failures. The progress has been slow compared with the advancement made in the facilities for generating, transmitting and applying electricity. The storage battery has been known for 40 years and its utility has long been recognized. It has been applied in many ways but in service has invariably developed inherent defects. Nevertheless this branch of the science has been given careful attention by many able electricians and their efforts are now beginning to show in a practical way.

Although storage batteries is the name in common usage in this country they are also known as accumulators or secondary cells. The latter name was first applied to make a distinction from the primary cells. In speaking of the electric storage battery it is not intended to convey the idea that the electricity is actually stored, but rather by the passage of an electric current chemical changes result in the plates and this reaction can be reversed, discharging an electric current. As far as the chemical properties, the connections and the current and electromotive force per unit area of plates are concerned the storage batteries are similar to primary batteries, but the great point of advantage is that after discharge the materials are brought back almost to their original state.

The parts of a cell consist of the positive and negative plates, the electrolyte or fluid and a containing jar or box. The electrolyte is generally a dilute solution of sulphuric acid, and lead has been found the only suitable metal for the plates. The positive plate consists of a lead support called a grid or frame on the surface of which is a coating of peroxide of lead, and the negative plate is of pure lead in spongy form. The lead peroxide at the positive electrode and the lead at the negative electrode form the so-called active material and undergo the chemical changes. The grids not only serve as a backing to the active material, but also act as conductors of the current. The lead plates are connected in parallel in two sets, one positive and the other negative, the positive and negative plates alternating. The general arrangement of the parts of a cell may be noted in Fig. 1.

The lead and sulphuric acid batteries are divided into two classes: those with plates of the pasted or Faure type and those of the electrolytic or Planté type, both of which are largely represented in commercial work and will be described later. There are the lead-copper cells with the positive plates coated with lead oxide and the copper negative electrodes immersed in a solution of copper sulphate. Another kind has the same positive plate, but with a negative zinc electrode and a sulphate of zinc electrolyte. The alkaline cell has a positive plate of porous copper, negative plate of iron gauze and the battery liquid is sodium or potassium zincate. These batteries each have their strong points and have been employed in practical work more or less in Europe, but in this country the lead-sulphuric acid cell is the only one in common use.

In the lead batteries the positive plate is the source of weakness and has been the center of attention of inventors. As a rule these are one of three general forms. The active material is held in undivided masses supported by a surrounding grid, the active material being first molded to the desired form and the grid afterwards cast about it. The second class includes those plates whose surface is covered with a thin

layer of active material deposited by electrolysis. The third class consists of those plates in which the active material is thinly spread over the surface of a number of independent metal pieces which are held together by a supporting frame.

The efficiency of a storage battery depends very largely upon the rates of charge and discharge and in most cases is about inversely as the time. The losses in the cells are due to the formation of chemical compounds in charging that return no energy in discharging; some energy is dissipated in heat, and in producing oxygen, hydrogen, ozone and hydrogen peroxide. There are also losses from local action in the active material and between the grids and the active material. Under the most favorable conditions these losses amount to 10 per cent and greatly increase with rapid discharge rates. At the Edison station in New York an average

FIG. 1.

daily efficiency of 85 per cent is attained, and in a battery plant in Hanover, Germany, the efficiency is 78.4 per cent. These are lighting stations and not subject to the sudden and extreme fluctuations of a street railway station.

When electric traction was being introduced it was claimed that the storage battery would prove the solution of the problem. In theory it did present many ideal conditions. It provided a self-contained motor car with no outside accessories as trolley lines, feeders and bonds for the transmission of the current. The electric current could be generated in a station free from overloads and troublesome peaks at certain times of the day, and thus the station need only be of minimum capacity for the work required. Ingenious apparatus was devised for removing and replacing the batteries in the cars. As early as 1880 experiments along this line were made in London and their partial success encouraged further tests in Paris, Brussels, Birmingham and Hamburg. Similar work was also carried on in New York, New Orleans, Washington and Dubuque, but the short life of the batteries and the enormous expense of renewing the positive plates resulted in failure. So long as the storage battery car received the direct attention of experts in that line they were moderately successful, but the batteries quickly deteriorated under the care of the ordinary railway employes.

lbs. loaded. With the battery on this car it makes 10 round trips a day, covering 96 miles. The average speed is 9.3 miles an hour, but 14.25 miles per hour is the best performance. During one month the car made a mileage of 2,883. The average consumption of energy was 27.6 watt-hours per ton-mile, or nearly three-quarters of a horse power per car-mile.

In connection with tests of storage batteries on cars and elsewhere the General Electric Company has recently introduced an instrument, Fig. 4, for this purpose, which will greatly facilitate the collection of accurate data. It is a recording storage battery meter, which is simply an adaptation of the Thomson wattmeter to such service, the mechanism being very similar. The meter is provided with a single indicating dial needle moving over a horizontal semi-circular dial, which shows at a glance the amount of energy available in the battery. The accuracy and durability of the instrument have been maintained from its prototype with

FIG. 4.

additional precaution against injury from shock and vibration.

The armature will rotate in either direction and give accurate readings, thus the instrument indicates the amount of energy which passes into the battery while being charged and the energy withdrawn is subtracted. To compensate for the loss in the battery the meter runs slow in charging and indicates the amount of energy available so that when the battery is discharged the needle points to zero. Such an instrument would be of value attached to any kind of conveyance with storage batteries, for the operators can tell at any time the energy in the batteries and the proper time for re-charging can be ascertained with accuracy. These instruments are made for any size to order; the standard size reads for a current of 50 amperes.

Although it is certain that the application of storage batteries to street cars and vehicles will not meet with failure as in the past, yet they still remain bulky and heavy for such work. Their great field of usefulness now seems to be in the power station as an auxiliary to the generating machinery, and this phase of the question will be discussed in a succeeding number.

## GRAY AIR BRAKE.

C. A. Gray has patented an air brake for street cars which is shown in the accompanying sketch, together with arrangement of the compressor which is driven by an eccentric from the axle. The brake cylinder and valve chest are shown in section and their operation will be readily understood. When in the position shown, air from the reservoir

GRAY AIR BRAKE.

is admitted to both ends of the brake cylinder; to apply the brakes the valve (which is connected to levers at both ends of the car) is thrown to the right and opens the left hand end of the brake cylinder to the atmosphere, when the unbalanced pressure in the other end throws the piston. The release is effected by throwing the valve over and exhausting the other end of the brake cylinder. Of course the application is gradual or sudden according to the quantity of air that is permitted to escape.

## NEW MEMBERS OF THE ACCOUNTANTS' ASSOCIATION.

W. B. Brockway, secretary of the Street Railway Accountants' Association of America, advises us that since the list of new members was published in the REVIEW for February, the following companies have joined the Association:

The Market Street Railway Company, San Francisco.

The Oakland Transit Company, Oakland, Cal.

The Compania Ferrocarriles, Mexico, Mex.

The Haverhill & Amesbury Street Railway Company, Haverhill, Mass.

These are all important companies and the fact that they have become members of the Association is a gratifying indication that its work is appreciated, and gives further assurance of its continued growth and prosperity, and brings the membership up to nearly seventy.

## EUROPEAN INTERNATIONAL TRAMWAY CONVENTION.

The secretary of the Permanent International Union of Tramways, F. Nonnenberg, advises us that the next meeting of the Union will be held at Geneva on August 25, 26 and 27. The list of the topics which will be discussed was sent to members over a year ago and a translation was published in the REVIEW for May, 1897. Among the excursions which have been arranged for the delegates is a trip on the lake, including a visit to the Tramway de Montreux and ascension of Glion by the cable railway; another excursion is the ascent of Mt. Salève, near Geneva.

**STANDARD GEARED AIR BRAKE.**

The accompanying illustrations show the improved axle-driven air brake for street cars upon which the Standard Air Brake Company has been working for some time past. It is specially designed to meet the requirements of high speed interurban service, one of which is that for durability the compressor must be used only when it is needed; the capacity of the pump is ample to supply air for all the many stops when the car is in city service.

In fitting a car it is preferable to place the pump, reservoir and brake cylinder as close together as possible and thus reduce the pipe required to a minimum. Installations have been made with only 7 ft. of pipe under pressure, exclusive of the gage pipe.

The driving mechanism consists of a split gear fastened

FIG. 1.—SECTION AND SIDE ELEVATION OF PUMP.

to the car axle and meshing with another gear running free on the pump shaft and forming one member of a friction clutch. The friction clutch comprises a number of plates, half of them free on the pump shaft and half of them fixed to it; when pressure is applied the plates are forced together and the pump shaft is rotated, but without starting shock. The necessary pressure is applied by the governor through a shipper, yoke and collar on the shaft.

The case is dust proof and contains all the driving parts except the pump and governor, which are bolted rigidly to it. Inside the pump and case is about one gallon of oil, which gives thorough lubrication of the working parts.

The pump is double acting, having a piston cast hollow and in one piece, within which are the crank, crank brass and ways. The bearings, subject to the thrust of the piston, are inside and quite beyond the reach of dust. The suction and discharge valves are in the cylinder body and are provided with movable seats to facilitate repairs. The suction and discharge ports are cored to one inlet and one outlet respectively, and the heads of the pump are not encumbered with any valves or piping. This construction renders the pump easy of access, and no pipe connections have to be disturbed in examining or cleaning. Under the suction valves are means for lifting them by exhaust air just before the operating mechanism throws the clutch into engagement, thus relieving the latter at that instant of any load.

The governor consists of two cylinders of different diameter, in one casting, fitted with two pistons correspondingly, which constitute the operator, the larger portion and cylinder being twice the area of the smaller. The two pistons

are also one casting, and in the center is attached a shipping lever for operating the clutch. Above, and bolted to the larger cylinder, is the valve chamber of the governor proper, which controls the air to the large cylinder of the operator. Within the valve chamber is a brass slide valve attached to a hollow valve stem, one end of which is a piston against which the air pressure in the chamber acts in overcoming the pressure of the spring within the hollow valve stem.

The air pressure is always in the smaller cylinder, which holds the clutch in contact, and is also at all times in valve chamber, acting on piston against the spring. When the air pressure reaches a predetermined maximum pressure, it overcomes the resistance of the spring and moves the hollow valve stem, which draws with it the slide valve, opening a port which permits the air from the valve chamber to enter the larger cylinder, which, being twice the area of the

FIG. 2.—GOVERNOR.

smaller one, forces the shipping lever in the opposite direction, consequently disengaging the friction clutch, and the pump remains at rest. When the air pressure drops to a predetermined minimum pressure, the air in the valve chamber of the governor has not pressure enough on the piston on the hollow valve stem to resist the force of the spring, consequently moves back in the opposite direction, drawing the slide valve with it until it opens the port from the larger cylinder to the exhaust. The air pressure which held the

FIG. 3.—OPERATING VALVE.

clutch out of engagement is released, and, since the air pressure is always on the smaller cylinder, this throws the clutch into engagement again, through the shipper lever, and the pump recharges the reservoir to maximum pressure.

The reservoir is of the cold weld type and absolutely air tight. The brake cylinder is the ordinary hollow spindle type, attached to the floating lever.

The operating valve is bolted to the brake cylinder head, obviating pipe connections, and all danger of leaks, which were a common source of trouble when operating valves were placed one on each platform with a double line of pipe the entire length of the car. The valve has a cast iron body, in which is the brass valve operated by means of a steel spindle. The reservoir pressure is in this chamber at all times and holds the slide valve in the "off" position.

There are three ports under the slide valve, a small port for service stops; a large port for emergency application of the brakes, and an exhaust port. The lap of the slide valve is long enough to cover both the service and emergency ports at the same time. The exhaust passes from the emergency port under the hollow slide valve to the exhaust port and is carried by piping to the chamber of the governor spring and also under the suction valves in the

arc of 180° and the movement is conveyed to the operating valves by means of a rod, chains and bell crank lever under the floor of the car. By a movement of 90° the service port is opened; 170° gives the emergency stop. The instant the handle is released the air pressure on the piston in the operating valve opens the exhaust port. The handle is removed upon changing ends and the staff remains locked in the release position. By putting the handle in emergency position and withdrawing it as far as possible the brake can be left applied.

### ELECTRICITY FOR SWITCHING.

Electric locomotives for switching and yard hauling have been put in service at the Arlington Mills, Lawrence, Mass., superseding the steam locomotive formerly in use.

The electrical installation consists of a small generating plant and two electric locomotives, one of the box type and the other a platform car. The generating plant consists of

ELECTRIC SWITCHING, ARLINGTON MILLS.

pump; and from there it passes by the suction valve "lifts," and out to the atmosphere through the inlet for the suction. The exhaust from the brake cylinder, therefore, performs two functions. It lifts the suction valves of the pump so that there is no load when the friction clutch makes its contact, and also, in going to the chamber of the governor spring, acts with the latter, and, partially equalizing the air pressure on both sides of the piston, the spring forces the hollow valve stem over and with it the brass slide valve, so that the air in the large cylinder of the governor exhausts, and the clutch is thrown into engagement, and the pump restores to the reservoir the air that was used in making the previous stop, the car having run about 40 ft.

A feature of this apparatus is the short periods for which the compressor is in operation. In Jersey City and Brooklyn it is running less than one-fourth the time, and between Jersey City and Newark, where there is a long stretch with few stops, the compressor is in operation for not over 400 ft. in 25,000 ft.

The platform equipments consists of a 3/4-in. cold rolled iron staff within a piece of 1-in. iron pipe supported by the dash-rail. On top is a pressure gage, and immediately under it is the handle. This handle moves altogether through an

a standard G. E. 75-k. w. 500-volt railway generator belt driven by an Armington & Sims high speed engine.

The box car locomotive used for hauling material about the yards is equipped with two G. E. 800, 27-h. p. motors and series parallel controllers. The platform locomotive is used to haul trains of loaded cars from the yards to the main line, and empties from the line to the mill tracks, and to do all the drilling in the yards. The equipment of this locomotive consists of two 50-h. p. G. E. 1,200 motors with the necessary series parallel controllers. In hauling heavy trains it is assisted by the box car locomotive. Together they are able to handle trains of 30 to 40 empties, or 12 to 14 loaded cars, with comparative ease and celerity. To give the necessary adhesion to the more powerful locomotive to enable it to handle heavy loads six tons extra weight is placed on the platform.

The entire cost of the electric plant is stated to be but little in excess of the yearly rental heretofore paid for the steam locomotive.

Fredonia, N. Y., has had a siege of smallpox, and during a short time trolley connections between that village and Dunkirk were discontinued.

**A FLORIDA COMBINATION CAR.**

The question of keeping a summer and winter equipment of cars is not the same in the southern cities as it is in the north. Open cars are suitable and desirable for service for the greater part of the year, but during the rainy season,

INTERIOR OF CAR.

when a storm unexpectedly blows up, the rain comes down in torrents. The open cars with curtains afford inadequate protection from the weather under such conditions. Geo. D. Musing, general manager of the Consumers' Electric Light & Street Railway Company, of Tampa, Fla., has designed and built several cars to fulfill the requirements.

ends of the car. There are three doors on each side and side steps are provided. A special hanger has been designed for the storm doors which enables them to be moved noiselessly and without difficulty, and the doors will stay wherever placed. The cars are mounted on Brill trucks and equipped with General Electric motors.

The cars were built at Ybor City and are constructed entirely of Florida woods. The frame is of heart pine, and the interior is handsomely finished in native ash and cypress. When the troops concentrated at Tampa these cars were put to a severe test. As many as 150 passengers were carried at one time on one of these 26-ft. cars. The operation of the cars has been so satisfactory in every particular that Mr. Musing has received several inquiries from different parts of the country, with the result that cars will be built for a number of roads in southern cities.

**CONVICTED OF PERJURY.**

In the REVIEW for April, page 270, were given the details of a conspiracy against the Chicago City Railway which had for its object the prosecution of a personal injury suit against the company. The plaintiff, Mrs. Jennie Reynolds, and one of her witnesses, Milton H. Fountain, were indicted for perjury. Mrs. Reynolds forfeited her bonds and is now in Canada. Fountain was convicted June 16 and sentenced to the penitentiary.

**NEW LINE AT BIRMINGHAM, ALA.**

Early in June the Birmingham (Ala.) Railway & Electric Company began running its cars to Powderly, superseding the steam dummy service. On the occasion of the official

COMBINATION OPEN AND CLOSED CAR, TAMPA, FLA.

They are already in service, and now that the rainy season has set in they have had a practical test and have proved in every way superior to the ordinary open cars. When all the end windows and the doors are open the car is cool and airy, but these can be quickly shut, making it practically a closed car.

The car contains eight seats so arranged to afford accommodation for 40 passengers, two of these seats being at the

opening two special cars containing the officers of the company and over 100 invited guests were taken over the line. Refreshments were served and on their return the party was photographed. Resolutions of thanks to the company and to J. B. McClary, the general manager, for the part taken in developing the street railway system, and of congratulation upon the successful completion of this line were unanimously adopted.

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

The reason why it pays to heat the feed water by live steam taken directly from the boiler has lately been the subject of discussion in England. That there is an economy in using live steam heaters has been shown experimentally and generally admitted, though the reason why taking a given number of thermal units from the boiler in the steam and restoring a necessarily smaller number of thermal units in the feed should result in an economy of 10 or 20 per cent was far from evident. Mr. Kilkardy found a gain of 10 per cent from the use of his heater, and in the 10 years since that time the use of live steam heaters has enormously increased.

At the 36th meeting of the Institute of Naval Architects (English), M. Normand presented a paper in which was shown an economy of 20 per cent by a method of heating the feed devised by him. He took the steam from the low-pressure cylinder of a compound engine about mid-stroke, and attributes the gain to two causes: 1. The use of steam which has already done work, which saving may amount to from 10 to 14 per cent. 2. The circulation in the boiler is improved and the passage of the water over the plates more rapid. It is the second gain which is due to the hotter feed such as we have with live steam heaters. In discussing this paper McFarland Gray, as reported by "The Engineer," said: "The reason why the Belleville economizer was so efficient was that the boilers proper had nothing to do but to make steam. As much as two hundred years ago Captain Savary had patented an invention which went to the root of the whole matter. He used two boilers; he heated his feed water to boiling point in one, and made his steam in the other. Some little time ago Drutt Halpin was surprised to find that an economy of 16 per cent was realized by the use of one of his heaters at an electric light station. Steam, when the load was light, was blown into a great tank of water under pressure, and the heat was stored and utilized subsequently when the load was heavy. There was no apparent theoretical reason why an economy of fuel should be effected, but, as he said, 16 per cent was obtained. Lest there should be a mistake, Professor Unwin was called in and made a trial at Margate, and found a saving of 19 per cent. There was actually a great economy effected by taking live steam out of a boiler to heat the feed, and for some time this was inexplicable. At last he found the solution, which was that when water at the boiling temperature was brought into contact with heating surface it was much more efficient in taking up heat than was cold water. At Margate they found that the chimney temperature was reduced by very hot feed, other things being the same. There should be no heat given to the water in the boiler but latent heat. Much the same thing had, he believed, been said by Professor Elliott some years ago."

In an editorial commenting on this, "Power" points out

that such substances as ether, which boils at or below the temperature of the body or of the surrounding atmosphere, produce in evaporating the sense and effect of cold by withdrawing heat from the surrounding bodies. When the water in a boiler is already at the temperature due the steam pressure it is in a state similar to ether when held in the hand, and capable of absorbing heat much more rapidly than if its temperature were only raised, and it is said: "The effect appears then to be due to an improvement in the efficiency of the heating surface by the use against it of a fluid capable of absorbing heat at a more rapid rate than does water below the boiling point, in much the same way that an improvement in efficiency by the use of enforced circulation is due to the more rapid carrying away of heat from the plates by the circulating water."

## Double-Acting Automatic Stop Valve.

The accompanying illustration shows a stop valve for steam boilers which will close automatically whenever the boiler pressure falls below that in the steam main, and also when the pressure in the main falls considerably below that in the boiler. The valve is made by a Glasgow firm, McFarland & Co., and was described in "The Engineer," of London, from which we take the illustration.

These valves are fitted and worked like the ordinary stop valves now in use. There is on the outlet branch an ordinary screw-down valve operated by the hand-wheel. Above this, and mounted on an outer spindle, or sleeve, is a loose, movable piston, having two surfaces, an upper and lower, on which the pressure of the steam acts. This piston, which is an easy fit in the chest, is provided, as shown, with Ramsbottom rings.

In the bottom of the piston valve ports are formed, and on the inner ledge of the bottom of the piston sits a loose disk valve, which forms a steam-tight face over the ports in the piston. The outer sleeve or spindle is attached to a testing lever, so that by working the lever the piston is moved, and its good working conditions insured.

When the stop valve is opened the steam passes through the ports in the piston valve and lifts the non-return valve up against the end of the stuffing-box, holding it in that position, and at the same time exerting its pressure on the upper and lower surfaces of the piston valve when passing to the engine. In the event of a rupture to the surface pipe, and an outburst of steam, the pressure in the pipe and on the upper surface of the piston valve is released. The valve is instantly moved up against the non-return valve in its raised position, and the supply is shut off. The engraving shows the automatic piston valve in the open position, and the dotted lines in the closed position. While the steam is flowing to the engines the loose non-return valve mounted on the outer spindle is, of course, held up against the end of the stuffing-box. Should the pressure in any of the boilers be reduced, due to a burst tube or an explosion, the direction of the flow of steam is reversed, and the steam in seeking to pass from the other boilers into that which is damaged, acts on the back of the non-return valve and shuts it on its seat on the piston valve, thus isolating the damaged boilers from the remainder. The arrangement therefore acts both for a ruptured pipe and a damaged boiler, the automatic piston valve being moved up against the non-return valve and shutting off the supply when the pipe is ruptured, and the non-return valve is shut on its seat on the piston valve when any one boiler in a group is damaged.

### The Hanging and Setting of the Horizontal Fire-Tube Boiler.

Orosco C. Woolson, of New York, presented a paper at the last meeting of the American Society of Mechanical Engineers which had the foregoing for its subject, and as a subtitle, "A Philippic on the Common Method, and a Method of Remedy." The "Philippic" is very interesting but we must content ourselves with a brief abstract of the points made against the common methods. Any four-point suspension is condemned because it may become a three-point suspension and the fact not be discovered except by accident. Side brackets and rollers are seldom properly placed, and the rollers are prone to become twisted and introduce the friction they were designed to avoid. If side brackets are to be used the bearing surfaces should be planed, and when put in place doped with a mixture of tallow and black lead. It is wrong to build the brickwork close about the boiler and thus prevent any motion unless

the setting be carried along. Buck stays as commonly used have no function except to crack the brickwork.

The second portion of the paper is given in full below :

Figs. 1 and 2 show a method of hanging and setting a horizontal fire-tube boiler which I believe to be superior in every particular.

First.—Hang the boiler at three points only. The rear point is to sustain two-thirds of the total weight of the boiler, and becomes the swinging point.

Second.—This rear point is to sustain its load entirely clear of the brickwork, upon cross channels which rest, at their extremities, on steel uprights.

In the center of this crossbeam there is located a cast iron saddle in which the swinging-pin rests, and from this pin a steel strap is suspended, which spans at its lower end a heavy steel equalizing bar to which it is connected by steel pins also. At the extremities of the bar there are pinned steel links, to which the weight of the rear portion of the boiler is hung. It is obvious, therefore, that there is no influence exerted by this arrangement, except to swing the boiler, leaving it perfectly free to go and come, as influenced by expansion and contraction. By the interposing of this equalizing bar we avoid any possibility of bringing strains or distortions into the shell of our boiler, or side thrusts into our brickwork, if for any reason the loaded foundations or side walls should settle, and there is less likelihood of getting the boiler out of its exact position when removing the blocking, and we are also enabled to raise or depress the rear end of the boiler to accommodate piping, blow-off, etc., with ease and accuracy by removing or adding the necessary shims under the center saddle, and when finished it is not susceptible of being tampered with. No planing or tooling of any kind other than the drilling of pinholes is necessary for this construction.

Third.—The two forward supports each carry one-sixth of the total weight of the boiler, and consist of steel ears reaching out from the shell and resting upon long cast iron shoes set out flush with the outside walls, thus bringing this weight of the boiler upon the red brick walls and entirely off the firebrick lining of the furnace. These ears are masoned solid into the brickwork, thus fixing the boiler against any fore and aft movement at this point. The shoes are made the depth of a brick and three bricks in length, providing thereby a very liberal distribution of its load. In setting these shoes it is simply necessary to bring one side flush with the outside wall, and wedge and point it up

snug under the steel ear, the ordinary mason work being sufficiently level for these plates. All the rest will take care of itself. Where two or more boilers set in one battery, the aforesaid ears lap by one another on the same sole plate and are bolted together to afford a maximum resistance for the furnace buck stay anchorage. These ears are riveted or bolted in between heavy steel angle irons, which are riveted to the shell, when the boiler is erected, but are shipped separate from the shell.

Fourth.—The set of buck stays shown alongside of the furnace wall are anchored at the bottom in the usual manner, but at the top their anchor bolts hook on to the ears of the shell, thus avoiding a long rod over the top of the shell (long rods not yielding to the "breathing" of the boiler when heated up and cooled down), and always preserving a tight hold of the brickwork, keeping it snug up to the boiler under all conditions of expansion and contraction of

on Fig. 3 at A and A'. Over the short leg of this beam laps one leg of an angle iron which is riveted to the rear head of the boiler. This angle iron is cut just the length required between the side walls of the combustion chamber; the vertical leg near the extreme ends is cut to a pattern, and these ends turned down flat with the horizontal leg; this turned down portion fits round the curve of the boiler head, thus altogether forming a tight joint. The long leg of the cast iron beam forms a buttress over against which the back arch is sprung, thus forming an arch not only laid in the proper direction, but provides liberal head room on the sides as well as in the middle of the boiler. The first engineer to use this style of arch beam was, I think, I. V. Holmes, but it is improved by having a series of depressions on the long face as shown. With these depressions the brick arch gets a better anchorage, not only to stand its own weight and the sand filling above, but the occasional weight of the workman who

FIG. 1.—HANGING AND SETTING FOR HORIZONTAL TUBULAR BOILER.—FIG. 2.

the shell, for brickwork is quite capable of accommodating itself if you will only give it a chance.

Fifth.—After providing perfect means for the movement of the shell, fore and aft, it would avail us nothing if we are to brick the shell in solid in the usual way (but we are not), for every rivet head and lap serves to anchor the shell in the brickwork as mentioned before, resulting in cracking and general dilapidation of the walls. To overcome this I rivet a heavy 3-in. Z bar to the shell on each side. The outer face of this bar is straight and smooth, and up against it I bring the inside face of the furnace wall, and over the top of this Z bar carry two courses of brick to within an inch or two of the shell of the boiler, thus closing the joints as plainly shown on the drawing. Bearing in mind that the rear point of suspension exerts no influence to crowd the boiler sideways, it is logical to assume that its movement, fore and aft, will be perfectly free from the brickwork on the sides.

Sixth.—With the above arrangement alone we will not yet be free of all brickwork, for a rear cross wall must be considered. Therefore we provide a heavy V-shaped cast iron beam placed across the back chamber, securely masoned in at each end. This beam is placed away from the boiler head about  $1\frac{1}{4}$  inches. This is shown in large scale

finds it necessary to stand upon it. Back of this arch, on the outside of the rear cross wall, is placed a buck stay, anchored by bolts extending through to the upright steel supports. This takes the thrust of the arch, which will then last indefinitely.

The foregoing completes a combination of iron and brickwork for hanging and inclosing a boiler of any size and even any number of them, leaving them free to take such position as heat and cold demand without straining any part or crowding the brickwork out of shape, and furthermore permits the removing of the fire brick lining without disturbing the main setting, and if for any cause the entire brickwork is required to be removed it can be done without interfering with the position of the boiler, for the rear suspension with the two-thirds load takes care of itself, while it is simply necessary to suspend temporarily the forward light load by catching the steel ears through the buck-stay bolt holes, thus leaving full clearance to work below.

The following are accessories which I have found to possess practical merit, Fig. 3:

First.—Where a blow-off pipe is preferably located at the rear, I use a fire-clay sleeve, which can now be readily procured in the market, being made of different sizes and pro-

vided with male and female ends. Simply slip on a few of these over the blow-off pipe, first placing in a little fire-clay paste between the ends, forcing them together and holding them there by a collar and set screw.

These sleeves will preserve the pipe, located as it is in the hot gases, for a great length of time, doubtless as long as the boiler will last. It is shown on Fig. 3, and is marked B and B'.

Second.—The cleaning out door and frame is simple and cheap, but perfectly air-tight. This is shown in detail on Fig. 2, and is marked C and C'.

There is an annular recess on the face of the frame about  $1\frac{1}{4}$  in. wide and 9-16 in. deep, into which is filled fire-clay

FIG. 3.—DETAILS OF SETTING.

paste when the door is ready to be closed. The inside face of the door, around the edge, has cast on it a half round bead, which, when the door is closed, forces itself into the fire-clay and forms an absolutely air-tight joint, regardless whether the casting is smooth and true or otherwise. No tooling is necessary.

At the two corners of the door opposite the hinges are riveted studs on which lipped straps fit instead of a latch. These have been found better than a latch, which requires to be forced together a certain degree before it will catch, but the strap and stud can be screwed up till the joint is made snug and then left.

Counter-sinking a spot in the back of the door for the lip of the strap to fit in assures the strap standing in its proper place whether a man closes up the door in the light or in the dark. Furthermore, it is a very cheap door to make, besides being air-tight. It is not necessary to apply clay every time the door is opened and closed, for it will be found that this clay will not easily drop out.

Third.—The feed head shown in detail on Fig. 2, and marked D and D' is, I think, a great improvement over the common perforated pipe. It produces what could properly be termed a film feed as distinct from a spray feed. My object is to avoid the discharge of a large body of water and yet maintain the necessary volume, and at the same time prevent as much as possible a liability to choke up or get out of order in any way. The one shown here is, in my estimation, correct for a reliable feed head or nozzle, and is withal simple and cheap.

The cut showing the side elevation of the boiler gives a pretty clear idea of the chambered and perforated arch over the fire door. This is made up of special arch brick. Some eight years ago I designed this arch for a plant which had had great difficulty in getting an arch to stand twelve

months. There has been no trouble since. The peculiarities of bridge wall construction and such other details as go to make up a substantial and practical setting I will not go into here, for most engineers have their own ideas, and time is too fleeting to argue minor matters about a boiler installation.

\* \* \*  
**Oil Filter for Boiler Feed-Water.**

At the Buffalo Convention of the American Water-Works Association, June 14-16, 1898, Dabney H. Maury, Jr., superintendent of the Peoria (Ill.) Water Company, presented a paper describing the difficulties met with in endeavoring to filter the condensed steam in the plant of which he has charge, and the filter finally constructed.

Over two years ago it was decided to use the condensed steam, adding as little fresh feed water as possible in order to reduce the amount of scale deposited in the boilers. Gravity filters were decided upon because the air-pump returning the water to the hot-well was already so loaded that a pressure filter could not be used.

Filters were tried in which it was attempted to separate the oil by means of sponges, cotton waste, straw, hay, excelsior and coarse cloth, but without satisfactory results. It was then decided to try sand and coke and two old cocoanut-oil tierces were fitted with the necessary inlet pipes, strainers, outlets, valves, etc., and into one was placed about 4 ft. in depth of screened sand, while the other was charged with 1 ft. of powdered coke on top of 3 ft. of sand. The effluent from these crude filters seemed slightly better than the raw water but the improvement was hardly noticeable. The results seemed to show, however, that a much slower rate of filtration might be successful, so a sand filter consisting of three compartments, each of twice the area of one of these tierces, was designed and ordered built.

The new filters were put in operation August 27, 1897. A steel tank is divided into three equal compartments, known respectively as Filters Nos. 1, 2 and 3. All these filters are generally used at once. When one requires cleaning it can be shut out and cleaned without interrupting the use of the other two. The area of each filter is about 12.25 sq. ft. Filter No. 1 contains crushed quartz, while filters Nos. 2 and 3 contain screened sand. The depth of quartz and sand in each filter is about  $3\frac{1}{2}$  ft. The raw water is raised by the air pumps from the condensers through the 3-in. pipe at the right of the tank into the 12-in. cast-iron distributing pipe over the filters. This water is freed from air by the two risers shown. Three 1-in. valves, A1, A2 and A3, admit the raw water through a gridiron of perforated pipes to the top of the sand. In the bottom of each filter are 30 strainers connected to the 2-in. outlet pipe. These strainers are simply brass cups threaded at the bottom with  $\frac{1}{2}$ -in. male pipe thread, and covered on top with fine brass wire gauze stretched and soldered, for strength, over heavier wires, which in turn are soldered to the cups. The 2-in. valves, E1, E2 and E3, regulate the outflow from the filter to the hot well. The  $1\frac{1}{2}$ -in. valves, D1, D2 and D3, control the clean water from the city mains used to wash the filters, while O1, O2 and O3 are  $\frac{3}{4}$ -in. valves on the steam line used when necessary for heating the wash water. Plugs in the 3-in. line at B1, B2 and B3 are employed instead of the more costly and cumbersome valves for opening or closing the overflows or wastes from the filters while washing. The overflow or wash water runs out through the pipes on the

left of the tank to the sewer. While washing, the sand is from time to time stirred with a hoe or paddle. For taking samples of the effluent, while the filters are running, the three 1/4-in. angle valves, C1, C2 and C3, are provided. These valves control 1/4-in. pipe lines tapped into the outlet pipes inside the filters and terminating at their outer ends just below and behind the effluent pipe line. To take a sample from Filter No. 1, for instance, the 2-in. outlet valve, E1, is closed, and the 1/4-in. angle valve, C1, is opened, and the water flowing from the quarter-inch pipe is caught in a bottle or other suitable vessel. The tank is supported on a framework of oak resting on concrete foundation. A steel ladder gives easy access to the board platform from which the upper parts of the tank can be readily reached.

Before this filter was put into service, and during the period in which we were trying to use as much condensed

Approximate total condensed steam, 34,865,000 lbs.  
 Percentage of fresh water in total feed water, 9.2 per cent.  
 Percentage of condensed steam in total feed water, 90.8 per cent.

Analysis of Fresh Water, Grains per Gallon.

Nitrate of potassium.....	0.617

 Silicic acid ..... 0.810

Total ..... 26.137

Water is remarkably clear and contains nothing in mechanical suspension. Hardness of fresh water, 20° by Clarke's scale.

Kind of oil used in cylinders, Kellogg's opaque anti-corrosive cylinder oil.

Total cylinder oil fed into main engines, 48 gallons = 192 qts. = 0.7 qt. per day.

All of this oil went into the engine cylinders and passed thence through the condensers to the filters, except such oil as may have been caught by the condensers.

Total cylinder oil fed into auxiliaries, 46 gallons = 184 quarts = 0.67 quarts per day.

An unknown proportion of this oil was removed by the Austen separator on exhaust pipe line from auxiliaries to hot well and did not get into the boilers.

Average temperature of condensed steam entering the filters from the air pumps, 56° F. This low temperature is due to the low temperature of the condensing water (50° F.) and to the large area of condensing surface. The water generally leaves the filters several degrees warmer than it enters.

Number of washings of filters in 276 days: Filter No. 1, 11 washings; No. 2, 9; No. 3, 11.

Average number of days each filter ran without washing, 26.7 days.

Time consumed in washing as follows: Water is allowed to run slowly from the city mains with a little steam if necessary for about 1 1/2 hours. The sand is stirred at intervals for a few minutes at a time. The washing is done by the regular fireman on duty at the time.

Area of each filter, 12.25 sq. ft.

Depth of sand or quartz, 3 1/2 ft.

Rate of filtration: In lbs. per hour, 7,426; in gallons per hour, 89.5; in cubic feet per hour, 11.88; in gallons per acre per 24 hours, 2,546,024; in vertical inches per hour, 3.87.

Cost of filter for concrete foundation, oak frame, steel tank, screened sand, crushed quartz and such pipes, valves and fittings as were not in stock.....\$135.00

Estimated value of material used from stock..... 55.00

Total .....\$190.00

Most of the pipe fitting was done by the regular pumping station crew; all other labor is included in the first item.

Repairs to boilers since filters have been in service, none.

Repairs to filters, none.

Annual saving in boiler compound, \$175.

Estimated annual saving in coal, due to absence of oil and scale, 10 per cent of coal bill, \$400.

There is also a large annual saving in repairs to boilers and in boiler cleaning, but the actual amount of this is difficult to estimate.

Observations of the working of the filter show that at first, after cleaning, the filtration is not as thorough as after the filter has been running a few hours. This is doubtless due partly to the fact that the sand is loosened up by the washing and requires time to settle again and close the

SAND FILTER FOR CONDENSED STEAM.

steam as possible instead of fresh water, the oil in our boilers was giving constant and very serious trouble. The lowest row of tubes in each boiler buckled up from 4 to 7 ins., and leaked almost without exception. It was necessary to shut down at least once a week and swage up, and frequently to renew the tubes in this row. There was little or no scale in the boiler, but a brown gummy or viscous coating was found, especially near the bottom of the rear water leg and in the lower tubes. Since Aug. 29, 1897, the record is very different. There has never been a shut down to repair a boiler, and no new tubes have leaked. Boilers are kept under steam constantly day and night from two to four months, and when opened show only a soft scale of a maximum thickness a little greater than that of blotting paper.

Below follows a detailed statement of the conditions under which the filters and boilers were operated:

Period covered, August 29, 1897, to May 31, 1898, 276 days.

Actual time pumps and filters were running, 4,695 hours.

Approximate total evaporation of feed water by boilers, 38,383,000 lbs.

Approximate total fresh water, 3,518,000 lbs.

voids, and partly to the fact that the film of oil formed over the top of the sand after the filter has been running a short while, materially aids the filtration. It was difficult to tell whether the sand or the quartz was the more efficient filtering medium, but it is believed that the best results under equal rates of filtration were obtained from the quartz. In every instance, however, it was noted that slower filtration increased the efficiency of the filter. Before making the filter several prominent filter men were consulted and they stated that no patents would be infringed by its construction.

**A HIGH SPEED MOTOR FOR SUBURBAN SERVICE.**

The different kinds of service rendered by the city, suburban and elevated lines of the electric railways require the development of motors suited with respect to power and speed for each grade. The motors on the Nantasket Beach and the Hartford, New Britain & Berlin lines of the N. Y., N. H. & H. R. R. Co. and those for the electric locomotives in

FRONT OF MOTOR—CASE CLOSED.

the Baltimore & Ohio tunnel are very heavy and powerful. The motors on the Cleveland, Painesville & Eastern Railway and the Lorain & Cleveland Railway are not so large but operate the cars at a very high rate of speed. These, together with many other railway motors which have replaced steam locomotives on elevated and surface roads, are the product of the General Electric Company, and have invariably given satisfactory speed, greater capacity and better satisfaction than the locomotives.

Exhaustive tests on motor cars and locomotives have been made to obtain reliable data for determining the best form of construction necessary to meet the different requirements. The data secured from these experiments and from the operation of the various roads formed the basis for the development of a new motor especially adapted for medium heavy railway work, as required for suburban and elevated railways. It will be known as the G. E. 51-B and will have a rated capacity of 80 h. p. A double equipment of these motors with a gear ratio of 2.27 will propel a 20-ton car at a maximum speed of 26 miles an hour on a level track.

The frame of the motor is of cast steel made in two bowl-shaped halves bolted together, being dust and water proof. In the upper casing there is a large opening, which has a

dust proof cover held in place by a cam locking device, for the inspection of the commutator and brush holders and for replacing the brushes. A hand hole in the lower frame at the commutator end permits the removal of any foreign sub-

MOTOR WITH ARMATURE DROPPED FOR REMOVAL.

stance in the bottom of the motor. The upper support of the linings for the armature bearing is part of the upper half of the motor frame; the lower support is a cap bolted to the upper support. The armature can be held in the upper half while the lower part of the frame is dropped but it may be

MOTOR WITH LOWER HALF OF CASE DROPPED.

removed with the lower half. The cored recess between the inner ends of the lining and the motor frame is occupied by a combination thrust collar and oil guard, an open space being left at the bottom for an outlet for oil, thus preventing any grease from working into the motor windings. Felt wicks extend through the lining and convey a continuous supply of oil to the shaft. The armature bearing is 3x6<sup>3</sup>/<sub>4</sub> in. at the commutator end and 3<sup>1</sup>/<sub>4</sub>x9<sup>1</sup>/<sub>2</sub> in. at the pinion end.

The axle bearings are 9 in. long and a diameter to correspond to the shaft.

The motor has four laminated pole pieces with projections supporting the coils which are slipped over them. They are secured by bolts passing through the frame and fastened with nuts on the outside. The field coils are of copper ribbon wound on metal spools and insulated between turns with asbestos.

The armature is of the iron-clad, hollow core type 16 in. in diameter and 10½ in. long. The core is built up of well annealed laminations provided with ventilating ducts, the laminations being assembled directly on the shaft. The core has 37 slots, each slot containing three insulated coils giving the armature 37 sets of coils with 111 leads, corresponding to the number of bars in the commutator. Each armature is subjected to a test with alternating currents at 2,500 volts. The pinion is made of cast steel with machine cut teeth, and bored for a taper fit on the armature shaft.

### COMBINATION CARS IN NEW YORK.

The combination car, shown in the illustration, is an innovation on the lines of the Third Avenue Railroad Company, of New York. The car was built in the shops of the company and is intended to take the place of the trailers, one small open and a small closed car, such as are run on the lines in the summer time. It is also intended in this way to comply with the rule of the board of health which requires that a certain number of closed cars shall be run on each line, even during warm weather.

The car is made up of a 16-ft. body of a closed trailer car and a small open grip car. It is 25 ft. between truck centers and 41 ft. over the bumpers. The grip truck which is under the closed portion has a 4-ft. wheel base, and the rear truck a wheel base of 3 ft. 9 in. with inside bearings. Outside bearings could not be used on the rear truck on account of the swing of the truck which interfered with the side steps.

COMBINATION CAR BUILT FROM OLD CAR BODIES.

Both gears and pinions are from the General Electric Company's gear plant at Lynn.

The commutator is 11½ in. in diameter with 111 segments built up and securely clamped on a malleable iron shell. The segments are of the best hard drawn copper 6¼ in. long with a wearing depth of 1 in. To insure perfect insulation every commutator is tested with 500 volts direct current between adjacent segments, and 5,000 volts alternating current between the segments and the shell.

The brush holders are of cast brass and each is arranged to hold two carbon brushes which slide in finished ways and are pressed against the commutator by independent pressure fingers giving a uniform pressure throughout the whole working length of the brushes. The brush-holders are offset ¼ in. to prevent the wearing of grooves in the commutator and are clamped to a well seasoned hard wood yoke filled with moisture proof compound bolted to the top magnet frame and easily removable through the opening over the commutator.

Mounted on 33-in. wheels the clearance between the bottom of the frame and rails is 3 in.; that between the bottom of the gear case and rail is 4 in.

The closed portion of the car has a seating capacity for 20 passengers and the open part for 25. The combination car is a very comfortably riding one and is welcomed as a substitute for the trail cars as it obviates the jerking and bumping together of the cars in starting and stopping.

### TROLLEY CARTAGE IN CHICAGO.

The Chicago General Railway, which has some 30 miles of track so located that it intersects no less than 17 of the steam railroads entering the city, and with a line to the Stock Yards, has under consideration the organization of a department to conduct a trolley line cartage business from the many factories along its lines to the depots of the railroads. It is proposed to construct switch tracks into all such factories and along the steam tracks of the railroads, and use flat cars of from 10 to 15 tons capacity in conducting the cartage business.

The Rochester Railway Company has adopted the portable fare box on the University and Lyall avenue cars.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

**Remedy of Judgment Creditor is to Levy upon Franchise.**

*Williams v. East Warcham, Onset Bay & Point Independence Street Railway Company (Mass.), 50 N. E. Rep., 646. May 18, 1898.*

The supreme judicial court of Massachusetts holds that the remedy of a judgment creditor of a street railway company is not, under the law of that state, to have a receiver appointed, but is to levy his execution upon the franchise of the company, and the rights and privileges thereunder, "so far as [they] relate to the receiving of toll," and upon "all other corporate property real and personal," and a sale thereof, pursuant to section 31, and following sections, of chapter 105, of the public statutes of that state. It takes this position, because it thinks that a street railway company is a corporation authorized to receive toll, within the meaning of sections 30-35 of said chapter 105, in which respect it says that it cannot distinguish it from a railroad corporation.

**Rushing Across Track in Rear of Passing Car.**

*Greengard v. St. Paul City Railway Company (Minn.), 75 N. W. Rep., 221. May 9, 1898.*

The evidence here made a case of an adult, in the full possession of all his faculties, with knowledge of the situation and the attendant risks, with ample opportunities to ascertain the approach of cars, with nothing to distract his attention, and without any necessity or even occasion for taking chances, rushing hastily across one track, at a point not a street crossing, in the immediate rear of a passing car, without knowing, or taking any reasonable means to ascertain, whether a car was approaching from the opposite direction on the other track. This, the supreme court of Minnesota holds, so conclusively showed contributory negligence on his part that a judgment entered in his favor must be reversed and one entered for the company, regardless of the verdict of the jury in his favor. Nor does it consider that the fact that the car coming up on the second track may not have given any signal of its approach at the street crossing over half a block away at all tended to excuse the man's conduct.

**Lien for Engines but Not for Construction of Electric Road.**

*Frick Company v. Norfolk & Ocean View Railroad Company (U. S.), 86 Fed. Rep., 725. March 16, 1898.*

The United States circuit court of appeals holds that a mechanic's lien law, such as that of Virginia, giving a prior lien to all persons furnishing "engines . . . necessary to the operation of any railway, canal, or other transportation company," includes engines furnished for the purpose of generating electricity for the propelling power on an electric railway, and that such engines are not a part of the permanent construction of the railway so as to be embraced within a supply lien law.

It also holds that where a railway company furnishes all the materials, a person who furnishes the work and labor necessary for grading the roadbed, laying tracks, and erect-

ing trolley poles and wires, at so much per lineal foot or per mile of track, using his own tools for the work, is a "contractor" with the railway company, and not a "laborer," within the meaning of statute giving a prior lien to "laborers," and, likewise, not entitled to a lien under a supply lien law.

**Agents Can Dicker Away in Settling Claims.**

*Kane v. Chester Traction Company (Pa.), 10 Atl. Rep., 320. May 16, 1898.*

After negotiations for a settlement had been carried on over a period of several weeks, if not months, where \$1,000 had at first been demanded, and \$100 had been offered, to settle a claim for personal injuries, a compromise was at last effected, a formal release under seal being executed. But dissatisfaction grew upon the claimant, owing to a belief that she ought to have got more, and that her injuries were greater than she had thought. She then went into court, and endeavored to have the release set aside on the ground that it had been obtained from her by fraudulent representations made by the agent who settled the claim with her—assented to, if not actively participated in, by a supposed friend of hers, whom she had brought in as adviser—that if she went to law she would get nothing, etc. Referring to this, the supreme court of Pennsylvania says that it is quite probable that the agent was not over nice in his mode of urging the delays and disadvantages of a lawsuit, and the small amount the claimant might actually receive, even out of a substantial verdict. His methods may have been overzealous, but, the court says, they were not shown to have amounted to fraud. If the claimant had been a merchant selling goods, and the company a purchaser depreciating their value in the dicker, the court goes on to state that it could not say that the latter had exceeded the license allowed by the standard of commercial honesty, and that there was no reason to hold these parties to any stricter rule.

**Duty in Regard to Inspecting Harness.**

*McKnight v. Brooklyn Heights Railroad Company (N. Y.), 51 N. Y. Supp., 738. May, 1898.*

Judge Gaynor holds, at a trial term of the supreme court of New York, in Kings county, that, in view of the fact that it is common knowledge that there are certain defects from wear and tear in the straps, buckles and fastenings of a harness which may not be discovered with the exercise of reasonable care when it is upon a horse, especially by a cursory or limited examination, a street railway company owes to its drivers the duty of reasonable care in the inspection of harness in the stable; and that the employment of competent persons to make such inspection does not fulfill its duty. It remains responsible for the actual making of such inspection, and liable to the drivers for any negligence of its inspectors in the making of the inspection.

Nor can exemption from this liability be attained, he further holds, by promulgating a rule requiring drivers to examine the harness before starting out. How much of an ex-

amination can be made by them is a question of fact. They are not by such a rule made responsible for the consequences to themselves of all defects in the harness, but only of such defects as the rule contemplates, viz., such as can with reasonable care be found by such an examination as they are given opportunity to make. The employer cannot shift upon its employes its responsibility for injuries to them from defects in appliances from wear and tear, by devolving on them the duty of inspection, without giving them time and opportunity to make such inspection as will reveal the defects.

#### Duty Owed to Passenger Permitted to Stand on Step.

*Schaefer v. Union Railway Company (N. Y.), 51 N. Y. Supp. 431. May 6, 1898.*

Whether it was contributory negligence for a man who had boarded a crowded car and could not maintain a position on the platform to take one upon the step, the first appellate division of the supreme court of New York holds, was clearly a question for the jury to determine, under all the circumstances of the case. On the other hand, it declares that the company, having received him as a passenger and permitted him to stand upon the step, owed a duty to take reasonable care that he was not exposed to unnecessary danger. And, upon the fact that the car was permitted to go down an incline at a very high rate of speed; that it was crowded with passengers, inside and out; that while going at that rate of speed it struck a curve; that the passengers had no warning of the approach of the curve; and that the car lurched so that several passengers besides the one suing were thrown down, it says the jury might well have predicated negligence on the part of the company. No evidence was given in this case by the company except the testimony of its claim agent to the effect that the conductor and motor-man were required to make reports of anything and everything which occurred during their trips, but that in this particular case they neglected their duty, and he never heard anything about it. This, the court suggests, may have been important as explaining the reason why the company gave no proof about the accident, but otherwise it was of no consequence in the case, which, under the circumstances, must stand upon the evidence presented by the party suing.

#### Consent of Property Owner Does Not Cover After-Acquired Property.

*Taylor v. Erie Passenger Railway Company (Pa.), 40 Atl. Rep., 316. May 9, 1898.*

Certain owners of property fronting on a certain road granted to the Erie City Passenger Railway Company and its lessees the right to occupy and extend their line of railway, with the necessary turnouts, and to operate the same through and along said road "in front of our respective properties, to Trinity Cemetery," the company being released from all claims for damages for the occupation of said road, or so much thereof as might be necessary for the right of way for tracks, and from any and all other damages such property owners might sustain by the construction of said railway and its operation which might be unavoidable by its construction and operation. But this permission, the supreme court of Pennsylvania holds, was effective only as to the respective properties owned, by the parties who gave

it, at the time it was given; and that a person who had signed it, on subsequently buying other property on the road, would have all the right to object to the extension of the railway in front of the latter property that his vendor would have if still the owner of the same, and to make his objection effectual with an injunction.

It also holds that, although the fact that the company had constructed its railway in front of certain property in 1889 and had used and operated it since without objection gave it the right to there continue its railway as so constructed, and the right to continue the use and operation of the same, this did not give it any right to construct an additional switch, or to remove and enlarge one previously constructed in front of said property, so as to increase the damages thereto, without the consent of the owner.

#### Municipalities Have No Inherent Power to Confer Exclusive Privileges.

*Detroit Citizens' Street Railway v. Detroit Railway (U. S.), 18 S. C. Rep., 732. May 23, 1898.*

The supreme court of the United States holds that the common council of Detroit had no inherent power to confer upon the Detroit City Railway Company, by an ordinance passed in 1862, the exclusive authority to construct and operate railways on and through the city streets and avenues for a period of 30 years, which an ordinance of 1879 purported to extend for 30 years from that date.

Nor does the supreme court consider that such power was derived from the tram-railway act under which the company named was organized, and which provided that all companies or corporations formed under it for the purpose of constructing and operating railways in and through the streets of any town or city in the state "shall have the exclusive right to use and operate any street railways constructed, owned or held by them: provided, that no such company or corporation shall be authorized to construct a railway . . . without the consent of the municipal authorities, . . . and under such regulations and upon such terms and conditions as said authorities may from time to time prescribe." It maintains that to confer the power on a municipality to grant an exclusive privilege to occupy its streets for railway purposes such power must be given in language explicit and express, or necessarily to be implied from other powers, which was not done in this case.

To conclude with, the supreme court says that easements in the public streets for a limited time are different, and have different consequences, from those given in perpetuity. Those reserved from monopoly are different, and have different consequences, from those fixed in monopoly. Consequently those given in perpetuity and in monopoly must have, for their authority, explicit permission, or, if inferred from other powers, it is not enough that the authority is convenient to them, but it must be indispensable to them.

#### Must Pay for Injuries Caused by Flames Frightening Passenger into Jumping From Car.

*Poulsen v. Nassau Electric Railroad Company (N. Y.), 51 N. Y. Supp., 933. May 24, 1898.*

Unanimously does the second appellate division of the supreme court of New York affirm a judgment for \$7,500 dam-

ages for injuries sustained by a woman who jumped from an electric car while it was still in motion because of flames flashing high up out of the controller box at the front end of an open trolley car.

In defense, the company undertook to establish that the controller was a standard appliance, in use, and properly so, throughout the United States; that no system of inspection can prevent flashes escaping from the box containing the controller; that even new controllers of this standard type will produce these flashes; and that, in the ordinary use and management of such controllers, particles of dust or grease collected therein will cause such flashes.

But the court thinks that this explanation "did not explain." After making all due allowances, it emphasizes the fact that it was not shown that there was any inspection of the car in question at any time during the day before the hour of the accident, let alone any before it left the depot on the trip in question, while the controller itself was out of order, as was easily discoverable, and was discovered right after the accident.

It also considers it a significant fact that the motorman was not called as a witness, and that no explanation of his absence was offered—a fact which the jury were entitled to consider in judging of the cause and character of the flashing or flaming which alarmed the passenger.

And it suggests that another ground upon which negligence may have been imputed to the company arose out of the fact that, after the flashing or flaming began, the motorman permitted the car to continue its course without stopping to ascertain the cause of the flame, until a new element of apprehension was introduced, namely, the burning out of the fuse.

The court says that the jury were entitled to take this last matter into consideration in passing upon the company's negligence; so that whether the accident was caused by failure of inspection and the consequent use of a car of which the controller was not in good order, or whether it resulted from the continuing motion of the car after its dangerous condition might have been and was discovered, the jury were justified in assuming the company's negligence.

Nor does the court consider that the fact that other passengers remained in the car conclusively established contributory negligence on the part of this one in jumping.

#### Where Trolley Poles May and May Not be Placed.

*Snyder v. Ft. Madison Street Railway Company (Ia.)*, 75 N. W. Rep., 179. May 10, 1898.

The supreme court of Iowa takes the position that streets are designed for public uses, among which are the construction and operation of street railways; and if they are so constructed and operated as not to affect prejudicially the rights of the public, nor to interfere with the proper use of the street by others, no burden not contemplated by dedication of the street is placed upon it. In such cases the kind of power used in operating the railway, it considers, is wholly immaterial.

That trolley poles and wires might be so erected and arranged as to have the effect of being a permanent obstruction of the street for the benefit of the street railway that would necessarily interfere with the proper use of the street by others, it says, is undoubtedly true, but the mere fact that the spaces they occupy cannot be used for other pur-

poses, it insists, does not show an improper use of the street. They are designed to aid in the rapid, convenient, and economical transportation of persons from place to place, and thus to facilitate the use of the street by the public for whom it was intended.

It follows, the court holds, that an abutting lot owner has no sufficient ground to complain of the erection and maintenance of street railway poles in the street in front of his premises if they are properly placed, and this is true whether he owns what is technically termed the fee of the street or not.

On the other hand, it holds that a petition stated a good cause of action which alleged that a pole was placed in front of certain property without necessity therefor, to annoy the owners, and to injure and depreciate the value of the property, which it had done, causing great damage to them, and would continue to do, if not removed, obstructing the enjoyment by them of their property, for which they had not been compensated. And if these averments could be proved, it says, they might recover damages for the injuries sustained; but they were not compelled to resort to that remedy, as they might have recourse to an action for the removal of the pole, if its location was not only injurious, but unnecessary.

Still, the court does not want to be understood as holding that a property owner may dictate the location of poles in front of his premises, nor that he may recover damages, however trivial, which may be caused by their location. It says that the railway company has the right to so place its poles as to secure the best results for its railway, provided that it so places them as not to cause any unnecessary injury. The injurious consequences which it must guard against are those of a substantial character.

The placing of poles in front of property, it goes on to say, is seldom desired by the property owner, and may in some slight degree interfere with the use of his property, as by obstructing the view from it; but for such injury alone he would rarely, if ever, be entitled to relief. The placing of a pole in a walk or roadway, however, or in front of and near to an important window, if the pole could as well be placed elsewhere, might afford ground for relief.

And, after all, the court says it cannot undertake to lay down general rules which would govern all cases. Each case, of necessity, must be decided according to its own facts.

#### Liability for Negligent Killing of Dogs on Track

*Citizens' Rapid Transit Company v. Devo (Tenn.)*, 45 S. W. Rep., 790. Feb. 9, 1898.

In the earlier law books it was said that "dog law" was as hard to define as was "dog Latin," but the supreme court of Tennessee declares that day has passed, and that dogs have now a distinct and well-established status in the eyes of the law. Giving vent to a bit of sentiment, it says, they are the negro's associates, and often his only property, the poor man's friend, and the rich man's companion, and the protection of women and children, hearthstones, and hen-roosts.

Holding this view, it will readily be understood that it would affirm a judgment holding a street railway company liable for the killing of a dog when it was convinced that the company was guilty of negligence in the killing of the dog, or in fatally injuring it so that it was an act of humanity for the owner to kill it.

It holds that it was not error in the trial judge to charge that the street car company must have sufficient employes on its cars to operate them in a careful manner, so as to prevent damages or injuries to persons and animals that might go upon the track, and was liable for a failure to do so; the question of what number would be sufficient being left to the jury, under all the circumstances. And this charge, it says, was called for by the fact that the motorman had stated that the reason he did not see the dog sooner was because he was looking around at the passengers to see if any desired to get off, the conductor having left the car after it passed from the more crowded portion of the track nearer the city, the motorman being at the time the only employe on the car, which was being run on a track laid on a turnpike which was a public thoroughfare much used.

Nor does the court consider that it was error to charge that, inasmuch as the street car was laid on the roadway and on the same level with it, the dog was not a trespasser if he went upon the track, inasmuch as the dog was not improperly on the highway. Additional scope would seem to be given to this point because, while the dog was running along 150 or 200 yards in front of its master, it had stopped in the center of the track to "point" some birds.

And although the jury might unquestionably take into consideration common knowledge and observation about the habits and qualities of dogs, the court insists that it was going too far to say that the motorman might rely upon the quickness and celerity of the dog, and thus absolve himself from all duty and care to prevent the accident.

Upon the question of value, the court holds that it was competent to admit evidence of the dog's pedigree and of the qualities and performances of its ancestors. And it finds no fault with evidence that was introduced showing that the dog had had the distemper and that this added to its value 100 per cent.

The amount of the judgment against the company, which the supreme court affirms with costs, was \$250. And had the jury found that the dog ought not to have been killed, the court says its owner would still have been entitled to damages for his injuries, the action being for both the negligent injuring and killing of the dog.

---

#### Liability to Passenger Struck While Alighting from Wrong Side of Car.

---

*Atlanta Consolidated Street Railway Company v. Bates (Ga.), 30 S. E. Rep., 41. Jan. 21, 1898.*

There is some apparent conflict in the authorities as to whether the relation of common carrier and passenger exists after the passenger has alighted from the car, and before he has had opportunity of passing over and beyond a parallel track of the company's line. But the supreme court of Georgia holds that the relation certainly exists while the passenger is in the act of alighting. It maintains the doctrine that the relation of common carrier and passenger exists between a street railway company and a passenger until he has reached his destination, and has had a reasonable opportunity to alight safely from the car; and that the carrier, during this period, is under a legal obligation to use extraordinary diligence, on behalf of itself and its agents, to protect the life and person of the passenger.

This doctrine of extraordinary diligence, it goes on to state, is not only applicable to the agents of the carrier on

the car on which the passenger is traveling, but also to its agents having control of another car, approaching on a parallel track, after the latter have discovered that the former car was about to stop for the purpose of discharging passengers, who might alight dangerously near such parallel track.

To the ordinary traveler upon foot, the court holds, the motorman on the approaching car is bound to exercise only ordinary care and diligence, while to the company's passengers he is bound to use extraordinary care and diligence, at a street crossing. Especially is this the case when the motorman knows, or has reason to believe, that passengers are about to alight from the car that has stopped, and that they might alight dangerously near the track upon which he is running.

The habit or practice of the passenger suing the company as to his manner of departing from street cars on other occasions, either before or after the injury complained of, the court holds, cannot be legitimately considered by the jury as throwing any light upon his conduct at the time he was injured.

It having been alleged that one element of negligence which resulted in the passenger's injuries was that the street railway company knew it was dangerous to allow passengers to alight from a car on the side next to its parallel track, yet took no steps to prevent it, the court holds that it was not error to admit testimony showing that the company had placed no ropes, guards or other protection to prevent passengers from incurring this danger; the question as to whether such omission amounted to negligence being left entirely to the jury.

A rule of the company requiring its motormen to keep their cars under full control on approaching all street crossings, and, when there is a car standing at a crossing, taking on or letting off passengers, or if they see that they are about to meet a car on a street crossing, to slow up and see that the track is clear before attempting to pass, the court also holds, is admissible in evidence, as tending to show that the company regarded such a point on its line, when being approached by one of its cars, as more or less dangerous to passengers and others.

On the other hand, it holds that where it appeared from the testimony that the hearing of the passenger suing the company was impaired, and it was inferable that for this reason he did not hear the approaching car that struck him, it was not error for the trial judge to instruct the jury that "the fact that he was partially deaf, if such was the fact, would not affect or lessen the degree of care required of him; that care being the degree of care which every prudent man would exercise under the same or similar circumstances," which would not imply that he was required to exercise only that care which a prudent man who could hear would use, but which a prudent man in the same condition as to the impairment of his hearing would exercise.

Judgment for \$1,000 and costs, against the company, affirmed.

---

#### Adoption of Box System of Collecting Fares a Proper Safeguard.

*Morley v. Snow (Mich.), 75 N. W. Rep., 466. May 24, 1898.*

The receivers of the Union Street Railway Company of Saginaw, Mich., have been granted, by the supreme court of Michigan, a mandamus requiring the circuit judge to va-

cate an order requiring the discontinuance of the use of the Mehling box system of collecting car fares from passengers.

This box is a metal safe, of convenient size, carried by the conductor, into which the passenger is required to deposit his fare, at which time the conductor presses a button which rings a bell and registers the fare. At the end of the day the box, with the transfer tickets, is handed by the conductor into the office, and becomes his settlement with the company.

To one conductor, it was so distasteful to use the box, that he applied to the circuit court for relief, not only upon the ground that it reflected upon his character, but that it gave rise to controversies with passengers and was objected to by them, as well as that it was beyond the power of receivers to require. And the circuit court granted his prayer, maintaining that to require the use of the box was not a proper regulation, as it was not a thing to be used in the manner in which it was used, and that its use tended to ostracize from society the employes who had to use it, by branding them as not to be trusted.

But the supreme court thinks that the conclusion reached by the circuit judge was wholly unwarranted by the facts. It says that conductors of street cars deal with a great number of persons, some of whom are entering and leaving the cars frequently. It often happens that change must be made, and there are opportunities for mistakes. It is not unreasonable to assume that, like persons in all callings, some of the employes of street car companies will yield to temptation, when presented. Every one at all familiar with business upon a large scale knows that it is desirable to have it so systematized that mistakes or fraud in its conduct shall not occur. Officials, both of the state and nation, and all officers charged with the management of banks, railroads, and other corporations, are surrounded by checks and safeguards calculated to do away with the possibilities of frauds or mistakes. The cash register is to be found in most places of business. Upon the elevated roads, in the large cities, the passenger pays his fare before he enters upon the platform, over which he must pass to get admission to his train. Every one recognizes the checks and safeguards, as proper to be used, and no one has a right to regard them as an imputation upon the honesty of any individual using them. Their use is simply a recognition of what all know to be a fact, with humanity constituted as it is—that, in the conduct of a large business by many persons, there is a liability to make mistakes, and a possibility of the commission of frauds. The Great Teacher, in that prayer which is the model of all prayers, prayed, "Lead us not into temptation, but deliver us from evil." It can readily be seen how the unintelligent or dishonest might object to these checks and safeguards, but it is difficult to understand how the honest and intelligent should object to any practical method which would reduce the probability of mistakes, or the opportunities for the commission of fraud, to the minimum.

The supreme court also holds that an active receiver, who is required to manage a going concern like a system of street railways or a railroad, must be clothed with considerable discretion, and that he may do such things, in the ordinary course of business, as to him, in good faith, seem necessary to render the business of the road profitable and successful. He is not only the arm of the court, but he represents, in a sense, the creditors and the stockholders of the road. Nor does it consider that but very few courts, if they

had the time to do so, possess the necessary knowledge to enable them to successfully manage a system of street railways.

Applying these principles to the case in hand, the supreme court holds that the receivers in question had acted only within the scope of their authority, on a point with regard to which the court should not interfere, and that if they were not competent to deal with such a detail, they should be removed, and some one competent appointed.

### REWINDING RAILWAY GENERATOR ARMATURES.

The illustration was taken from a photograph of the interior of the Cedar avenue power station of the Cleveland Electric Railway Company. The armature is from a 500-k. w. generator and was being rewound by the W. H. Elliott Electric Company, this being the third one repaired for the same company this year. Exceptional facilities are pos-

500-K. W. RAILWAY GENERATOR ARMATURE REWOUND.

sessed by this company for doing general repair and heavy electrical work. A specialty is made of rewinding armatures, fields and transformers, refilling and making commutators and building apparatus for experimental work. The president, Mr. Cartwright, was the pioneer in this line of work, having established a repair shop for electrical apparatus in Cleveland in June, 1887. The secretary and treasurer, Mr. Haukey, has charge of the chemical department, and although a new man in the electrical field is rapidly extending his acquaintance. The business of the company is very extensive, orders coming from every part of the country. Two large armatures have been shipped to the Salem Consolidated Company, Salem, Ore.; an order from Jacksonville, Fla., has been filled, and an armature has been shipped to the New York & Ohio Company, Warren, O. The works are now operated by both day and night shifts and it will require six weeks to fill the orders on hand.

## AN IMPROVED ELEVATED CAR TRUCK.

The adoption of heavier motors under the cars of the Lake Street Elevated Railway Company, of Chicago, necessitated alterations in the trucks or the substitution of a new one. Frank Hedley, general superintendent, has given the subject his attention for some time and has designed a new truck and brake rigging. The trucks were built at the works of the Siemens & Halske Company and have given entire satisfaction in operation.

The frame is of cast-steel. The transom, which consists of two pieces of steel plate, is riveted to the frame. Four 21-in. links support the swing bolster and their length gives the car an easy motion. The tie-bar at the end is bent downward to give room for the draw-bar. Each wheel has to sustain about 7,000 lbs. The boxes are designed to carry two helical springs which give great flexibility and easy motion to the car body. The wheels are 33 in. in diameter and the wheel base is 6 ft. The truck is not only simple in construction and accessible but a large amount of room is provided for the motors. This is an essential feature for the two G. E. 55 motors, each of 175 h. p., require all the space. The motor casing clears the ties by 3 in.

For this truck it was desirable that the brake rigging have no cross bars, for they would interfere with the repair and inspection of the motors, and prevent an equal pressure being exerted by each brake shoe. One-half of the brake is hung independently on each side of the truck, a bracket being riveted on the frame in front of each wheel and the brake shoe is suspended by a link, as may be seen in the illustrations. The two levers are connected by two

adopted as standard on the Lake Street Elevated cars, as it has been proven to be suited in every way to the arduous service and requires practically no attention.

Each motor car has but one driving truck, and so the entire tractive effort for the whole train comes from one truck. If the rails are clean and dry no trouble is experi-

LEACH SANDER.

enced from the wheels slipping, but with snow or ice on the track or on a damp day the use of sand would be an advantage. One of the motor cars has been equipped with a sanding device and tested. A sand box is placed over the driving truck and four pipes lead down from it beneath the

TRUCK AND BRAKE FOR LAKE STREET ELEVATED RAILWAY.

rods, one on either side of the wheel. The outer end of each of these rods is flat and has the holes for adjusting the brake shoes as they wear.

The kick spring is long and flexible and offers little resistance to the action of the air brake, but is strong enough to quickly release the shoes. This brake rigging has been

car body. At the end of each pipe is a Leach sander, such as is commonly employed on locomotives, and shown in the cut.

A pipe is connected to the air brake system near the engineer's valve in the motorman's cab and extends to each of the sanders. From the sanders four 1/2-in. pipes run to

the pivot of the truck and each is connected to a pipe, which delivers sand to the wheels, by a hose 14 in. long, which allows for the motion of the truck and car body.

When sand is to be used the motorman opens an alarm valve and the air passes to the sander, where the film of sand is broken and then blown into the delivery pipe. It acts on the same principle as an injector. The pipe in front of the sander has an upward turn which prevents the sand from clogging at that point. The sand passes out of the delivery pipe and is blown directly on the rails under the wheels.

The results in using sand have been gratifying. Without the sand a train of cars was accelerated to a speed of 24 miles an hour in 32 seconds. Under the same conditions with the use of the sand the same speed was attained in 16 seconds.

### JOHN'S ELECTRIC HEATERS.

Some recent improvements have been made in the "H. W. J." electric heaters. These heaters have been on the market for a number of years and are at the present time extensively used by street railway companies, both here and

PANEL HEATER.

abroad. The illustrations show the panel heater and the switch in their latest forms. The principal advantage claimed for these heaters is that they have a very large radiating surface for the heat generated and hence avoid very hot or overheated wires or surfaces and dangerous temperatures. All the heaters are in operation at the same time and give a very effective and economical distribution of the heat.

The heaters are attached to the faces of the seat panels by screws and special separating washers of waterproof asbestos are furnished to provide an open ventilating space  $\frac{3}{8}$ -in. wide between the panel face and back of heater. Connections are readily made with the heater terminals by leading wires through small holes bored in the panels and all wiring is concealed back of the panels under the seats. No cutting of the woodwork is necessary.

SWITCH.

The "H. W. J." switch provides three degrees of regulation. It is a double break knife switch specially designed with reference to simplicity, high insulation and durability. Its action is positive in all cases. Closing the knife blade locks the switch in position preventing any movement of the regulating handle. The regulation in the "H. W. J." system is effected by reducing the heating surface equally in all heaters.

The Baltimore Consolidated Railway Company has purchased the uncompleted line to Ellicott City from the Columbia & Maryland Company.

### NEW HOLLOW-CHISEL MORTISING MACHINE.

The accompanying illustration shows one of the most powerful and reliable machines of its kind ever placed upon the market. It is made by J. A. Fay & Co., of Cincinnati, and known as their No. 4 vertical hollow-chisel car mortising machine. Great care has been exercised in the design to make a machine strong, simple and efficient, and one that produces its results without the necessity of laying out the work or cleaning the mortises.

The frame is massive and made in a cored form with a wide base. The housing is gibbed to the frame, with provision for taking up wear, and has a lateral movement, actuated by a lever, for moving the chisel to its required position.

FAY HOLLOW-CHISEL MORTISING MACHINE.

above the timber. The chisel-ram is gibbed to the housing and carries the boring spindle that prepares the material for the chisel thrust; the proper tension is kept on the belt driving the boring spindle by a self-adjusting binder. Stops are provided to regulate the vertical travel of the ram for the depth of mortise and the lateral movement for its width; the maximum vertical movement is 16 in. and the lateral, 14 in.

The table for supporting the material is 4 ft. 6 in. long; it is operated by a hand wheel, rack and pinion, and provided with stops to regulate the length of the mortise; there is also a vertical adjustment. The chisel-ram has a reciprocating motion produced by reversing friction and gearing. The auxiliary boring attachments are placed one on each side of the frame at such distances from the chisel as will permit of adjusting them to an angle of  $30^\circ$  in either direction.

The Milwaukee-Waukesha line is now in operation on a half-hour headway; the fare is 35 cents, round trip 50 cents.

## PARK SCENES FROM ALABAMA.

In the article on street railway parks and pleasure resorts in the REVIEW for May mention was made of the attractive parks of the Birmingham (Ala.) Railway & Electric Company. J. B. McClary, general manager of the company, has very kindly sent to the editor of the REVIEW three large and handsomely framed groups of photographs which now adorn our offices, showing scenes along the lines of the company and at the parks. With them Mr. McClary sent the following letter:

"You have done a great work for the street railways by encouraging them to build parks and run summer theaters.

## QUICK CONSTRUCTION WORK.

On June 13, Judge Ball in the superior court refused to enjoin the Chicago City Railway from stringing temporary trolley wires in Michigan avenue from Madison street to Randolph street, this being the final outcome of the suit instituted by Montgomery Ward.

The fact was telephoned to the offices of the company at 2020 State street, and within 1 hour and 30 minutes from the time the message reached Superintendent Nagle the electric cars were operating around the loop thus completed. The work done comprised the placing of wires for the two blocks in Michigan avenue and at the two curves.

SCENES IN THE PARKS OF THE BIRMINGHAM RAILWAY & ELECTRIC COMPANY.

We have profited by your suggestions and desire to show our appreciation, in a measure, by presenting you with a lot of views of our parks, framed, suitable for your office. If you will honor these pictures with space on your walls the writer will be highly gratified."

The accompanying engraving is reproduced from one of the groups. Four of the views were taken in Avondale Park, the terminus of the Avondale & Fountain Heights electric line; three others show scenes at Hawkins Spring on the Bessemer division; the last two pictures are of the dancing pavilion and the lake at East Lake Park.

## CONNECTICUT GRADE CROSSING CASE.

The supreme court of Connecticut on June 17 rendered its decision in the case of the New York, New Haven & Hartford Railroad against the Fairhaven & Westville Railroad (electric) which sought to cross the former at grade. The court allows the claim of the steam road for damages for crossing its tracks at grade, and the case is distinguished from that decided a year or more ago in which it was held that an electric railway in general is not an additional burden on abutting property.

### IMPORTANT MEETING OF COMMITTEE ON STANDARDIZATION.

The permanent committee on a standard system of accounts, working under the Street Railway Accountants' Association of America, and which is doing a large amount of hard work in anticipation of the September convention in Boston, has been called to meet at the Manhattan Beach hotel, New York, on July 18. In addition to Chairman C. N. Duffy, the committee includes W. F. Ham, Brooklyn; J. F. Calderwood, Minneapolis; H. L. Wilson, Boston; H. J. Davies, Cleveland; W. B. Brockway, secretary of the association, will also attend. A full attendance is promised and a thorough consideration will be given to the data collected by the several members.

The railroad commissioners of the various states also have an association, and at its meeting last year appointed the following committee to prepare a proper classification of constructing and operating expenses of street railways, similar, so far as possible to the classification of the same accounts of steam railroads. This committee consists of the following: Wm. O. Seymour, railroad commissioner of Connecticut; Ashley W. Cole, Albany; R. S. Cauler, Columbus, O.; H. M. Kochersperger, president railway accounting association, New Haven; M. Riebenach, assistant comptroller Pennsylvania Railroad, Philadelphia; H. D. Bulkley, comptroller B. & O., Baltimore, and N. H. Heft, N. Y., N. H. & H. R. R., New Haven

The Accountants' committee has invited the railroad commissioners' committee to meet with them, and the invitation has been most courteously received and several of the gentlemen have signified their intention to be present, and their satisfaction at the opportunity of this joint conference with men prominent in the active and actual work of street railway accounting. The suggestions from both sides and the joint conference cannot fail to be of very great advantage to every street railway in states where the commission has to do with both steam and street railways

The interest taken by the commissioners' committee in the work of the Street Railway Accountants' Association and especially in the work of the Committee on Standardization, is very gratifying, and the gentlemen pronounce the progress already made and the plans which are being worked out, as highly creditable and praiseworthy.

The meeting will be called to order promptly at 9 a. m. Monday, by Chairman Duffy and the work will probably occupy several days.

### SHOOTING THE RAPIDS.

So far as exciting attractions are concerned, it is probable that the Gorge Road at Niagara Falls has the call on all the electric roads in the country. Its route lies along the wildest part of the lower Niagara and the very nature of the locality tempts the daring of people. Those who like excitement can find it there in plenty. Within the past month Mr. Evans, of the Youngstown & Lewiston road, has attempted to establish a canoe route between the Devil's Hole on the Gorge Road and the quaint old village of Lewiston, the terminus of the two roads mentioned. In order to get expert men at the paddles, Mr. Evans secured the services of Chief Flying Cloud and Chief Cherry, and the picture herewith shows them in the act of shooting the rapids below the Devil's Hole in their canoe. These Indians came

from Sault Ste. Marie, where they had had extended experience. At this writing the route has not proved to be one of any great attraction for Niagara tourists, but as it is very new as yet, it will have time to grow on the people. That part of the river below the Devil's Hole is quite wild in places, and the waves toss high, while the many currents add to the excitement and weirdness of sweeping through the gorge in a canoe.

Still another incident that has drawn travel to the Gorge Road during the past month was the two trips that Robert Leach made through the rapids in a barrel. On Leach's first trip he used a wooden barrel, and this time he was taken

SHOOTING THE RAPIDS.

from the water in an eddy just above the whirlpool on the Canadian side. His barrel was lost after he had landed. During the week he had a barrel constructed of steel, and on the Sunday following his first trip he again started out to conquer the wild waters of the gorge. This trip was a great success. He was soon hurried through the rapids to the whirlpool, his barrel standing the waves nobly. He passed four times around the current in the pool, and was finally towed ashore on the north side and on the Canadian shore by four men who swam out to the barrel. Leach was in good condition. He had stood the trip well. His barrel had wooden heads, and was well ballasted. In making the trip he was swung in a hammock on the inside. The length of this barrel is 7 ft. Its diameter at the ends is 3 ft. 6 in., and in the center 3 ft. 9 in. The steel of which it is made is 3-16 in. thick. His first trip through the rapids was made June 12 and the second on June 19.

### REORGANIZATION OF THE NASSAU COMPANY.

All the Brooklyn street railway companies, whose lines were leased by Nassau Electric Railroad Company, have been consolidated and the reorganization will result in a saving of \$200,000 a year. Application has been made to the state railroad commission for permission to increase the capital stock to \$15,000,000, a million and a half of which will be reserved for improvements in the eastern districts.

## STORAGE BATTERY RAILROADING.

BY E. R. GILBERT, GENERAL MANAGER CHICAGO ELECTRIC TRACTION COMPANY.

The storage battery plant and equipment of the Chicago Electric Traction Company, or as it was formerly, and perhaps better known, the Englewood & Chicago Electric Street Railway Company, has been fully described in the REVIEW and in this article it will not be my intention to describe it again in technical detail, but rather to touch upon its advantages and disadvantages in comparison with street railways using other systems of propulsion. It is now the only storage battery road in successful operation in the United States, and, on that account, my experience as its manager will doubtless be of interest to street railway men.

The road was designed and constructed by G. Herbert Condict, to whom the largest part of its mechanical success is due; but as is usual in all new developments, experience brings to light many points for improvement. Some changes have already been made and others are in contemplation, which will undoubtedly reduce the operating expenses per car-mile below the figures given in this article. Moreover, the plant was designed for the operation of 50 cars but for commercial reasons it is found advisable to run but eight regular cars on week days, although on Sundays and holidays as many as 40 are used, including trailers, so that it is not operating at its maximum efficiency.

Owing to the weight of the cars, which is about 15 tons, they cannot be started and stopped as quickly as a trolley car which weighs but eight or nine tons, and at first thought it would seem that the liability to accidents (the "bugaboo" of all managers) would be increased. My experience shows however, that this is not the case for the last year our accident account is only two-thirds of one per cent of the gross receipts. This is extremely low, the usual rate for a suburban trolley line being about 2 per cent. I account for this rather surprising figure on the theory that, as the motormen are fully aware of their inability to stop quickly, they are more on their guard to avoid accidents, always passing vehicles with the power shut off, giving them a better opportunity to use the brakes. The weight of the cars shows to good advantage on account of their being able to coast faster and farther than would otherwise be the case.

In connection with this point, we have found that an entirely different training is necessary for a storage battery motorman than for one who operates a trolley car, and we prefer to break in green men rather than employ those who have been used to an overhead system. The principal point we have to drill into them is to coast as much as possible. As a record of the condition of each battery is kept when it leaves the barn and when it returns, an accurate report can be made out of the amount of energy each motorman has used on his trip and such a report is posted every day in the trainmen's room, with the best man at the top of the list. This system excites considerable rivalry in the men and produces excellent results.

Contrary to all expectations, we met with excellent success in handling snow storms last winter. We have but one plow and one sweeper for 26 miles of track, but not in a single instance were we unable to have our road clear before the other suburban lines got through. Until we had a little

experience with out snow machines, we had some trouble, as we could only tell by trying, how much work they were capable of doing with one charging of the batteries, and therefore had one two "push-ins," as we call them, but after the men became accustomed to their use, they were able to get more work out of them than I have ever seen accomplished with machines operated by trolley. On account of their great weight—the plow weighing 22 and the sweeper 26 tons—there is little danger of their leaving the track, so that it is safe to "buck" drifts with the plow, a thing which is rather risky with a lighter machine. In one case, we cut through a drift 7 ft. high and several hundred feet long in this way.

Our longest round trip is 22 miles. With a good rail, this is easily accomplished without a change of batteries; in fact, we have had cars run as far as 40 miles with one charge, but the conditions for such a long run are so often unfavorable that it has been found advisable to change batteries every half trip or 11 miles, the power plant being located in the center of the system. By doing this all danger of a "push-in" is avoided and the cars are able to carry trailers and make the trip under all conditions. Passengers do not seem to mind in the least, the slight delay caused by changing batteries. The average length of time required for changing is 1¼ minutes.

It is a popular belief that a storage battery car cannot operate successfully on grades. This may be true if they are frequent and steep. Our roadbed is nearly level the entire length of the system with the exception of one hill about 300 ft. long with a grade of 9½ per cent. The cars easily climb this without assistance, with a dry rail. In one instance, two loaded trailers were hauled but in order to prevent the danger of accidents and slipping, a counterweight system is provided. It is found to be unnecessary to use this except with a slippery rail. I hope to be able to cut this grade down to about 7 per cent. Then the counterweight will become superfluous.

Our cars average over 200 miles per day each, at an average speed of 12 miles per hour. Passengers, one and all, agree that riding on them is much more pleasant than on any other system, as the cars ride very smoothly, owing to their weight without the unpleasant noise of the trolley or the jerking of the cable system. The advertising resulting from these conditions is worth considering.

An element of importance is the fact that the whole line cannot be shut down at once, as all cars are independent of each other. There is no necessity for a wrecking wagon, as a wrecking car can always be sent out, as on a steam road. The steam plant is also more independent than on a trolley road, as it can be shut down two or three hours without interfering with the service in the least. Current for lights in the office, barn, and power house is taken direct from the batteries; therefore, there is no necessity to run the plant all night. It is closed down at 11 p. m., although the last car does not reach the barn until nearly 1:30 a. m. The load on the engines and dynamos is always constant.

I now come to the points of disadvantage. On account of the fact that every car must come to the barn for a fresh battery after every few miles of travel, branch lines cannot be operated economically. On this road we have a branch line which could be operated with one-half the number of cars if they did not have to come to the barn after every trip. If the branch were large enough to warrant the expense a subcharging station could be put in, but it is not in this case.

E. R. Gilbert, general manager of the Chicago Electric Traction Company, has been identified almost continuously with street railway operations ever since he started in practical work. He was

E. R. GILBERT.

born and received his education in Hartford, Conn., leaving there to work in the factory of the Eddy Electric Manufacturing Company at Windsor. Starting at the bottom of the ladder as a shop hand he finally became manager of the Boston office before he left the employ of the company. The Hartford Street Railway Company secured his services as purchasing agent and from there he went to Philadelphia to take up the duties of general manager of the Holmesburg, Tacony & Frankford Electric Street Railway Company. Thus far his experience had been with trolley roads, but when Mr. Condit resigned as manager of the Englewood & Chicago Electric Railway Company, Mr. Gilbert was called to Chicago to fill the place. Under his management the road has had a period of prosperity such as it has never experienced before.

Wear and tear on trucks, wheels, roadbed and special work is very much heavier than on a trolley system because of the great weight of the cars. We use an 80-lb. girder rail and all crossings, etc., are made extra heavy, but even then the cost of maintenance is very great.

Acid fumes from charging batteries is one of our greatest enemies. The barn is so arranged that the cars stand directly over the batteries. This is so that any car may be "loaded" while in the barn. The fumes have a most damaging effect upon nearly all material. Insulation is continually eaten off the cables; brass work corrodes faster than it can be cleaned; car curtains have to be renewed every year; paint and varnish do not last long, and even the woodwork itself shows signs of being affected. This could all be avoided by storing cars in a building separate from the batteries; but of course the advantage of being able to put in batteries in the barn, would then be lost and much time consumed in moving cars about by pushing and pulling them with a motor car.

A few figures from our records for the year ending July 1, 1898, will perhaps be of interest. In obtaining figures on trolley systems for comparison, I have taken advice from several trolley managers to whom I am indebted, and have also used figures which I obtained myself when in charge of a trolley road similar in length and car service to this one.

The depreciation of the batteries is 2 cents per car-mile. The depreciation of the batteries takes the place of the depreciation of overhead work and railbonding on a trolley road. This latter item on a road similar in length to this one would amount to about \$4,325 per year.

The men required to operate the batteries take the place of a line gang. Our total operating expenses average 8 2-3 cents per car-mile, ranging from 7 cents in summer to 10 cents during the most severe winter weather.

Operating expenses will undoubtedly be cut down as the service required grows toward the capacity for which the plant was built, and compares very favorably even now, with those of a trolley system. I see no reason why a storage

battery system under fair conditions cannot be operated fully as cheaply as a trolley line.

In reference to first cost, the storage batteries and their equipment together with the extra heavy roadbed are matched against the overhead construction and railbonding. Figuring on a basis of \$4,750 per mile for line construction and railbonding, the difference in cost on this particular road would be only about \$25,000 in favor of the trolley system. This estimate is made on a service of 20 cars, with the same length of line that we now have.

To offset the slightly greater expense in the construction of a storage battery road, is the unquestionable advantage of having no overhead work of any kind to mar the appearance of the streets through which the road runs.

## A WELDED RAIL BOND.

The bond shown in the illustration is manufactured by the Payne Welded Bond Company, of New York, and has a number of characteristics which strongly recommend it. Being welded to the rails there is excellent mechanical and electrical contact and it can be placed on the web under the fish plate, the base or below the head of the rail. The bond has been subjected to careful tests and demonstrated that there is practically no drop through the contracts.

The bond was also tested in connection with one of the best known mechanically attached bonds; 750 amperes were passed through the rails in each case, and the loss in volts read at the joints by the voltmeter as follows:

Mechanical bond, No. 0000 wire,	loss .....	.090 volts.
Two feet of rail .....		.006 volts.
Welded bond and two feet of rail .....		.014 volts.
Welded bond .....		.008 volts.

Although the Payne bond contained but 8 oz. of copper to 38 oz. in the mechanical bond the former had but 8.8 per cent of the resistance of the latter. The Payne bond has also passed satisfactorily through the test of service, having been used for two years on the 100 miles of trolley road of the Brooklyn Heights Railroad Company, on the Brooklyn, Queens County & Suburban Railroad and on the Brooklyn Bridge. The bond in use in Brooklyn consists of 10 pieces of No. 34 copper, 2x5 in. with a contact area of 1x2 in.

Judge Holcomb, of the circuit court of the United States for the eastern district of New York, in a suit brought by the Paynes for infringement, upheld the patents, and a decree was entered to that effect, so that the company's patents are well established.

## A PROPOSED MAINE INTERURBAN.

A corporation has been formed to construct an electric road from Fairfield to Benton Falls, Me. Freight as well as passenger business will be conducted as there is a large pulp mill at Benton Falls without railroad connection. Freight cars will be hauled direct from the Maine Central Railroad to the mill. J. T. Richards, of Gardiner, and C. D. Brown, of Portland, and others are interested.

## SOME PHASES OF THE RAPID TRANSIT PROBLEM.

Read before the American Institute of Electrical Engineers by Albert H. Armstrong, June 28, 1895.

The rapid transit problem, in congested districts, has to deal with the transportation of passengers at a high average speed with frequent stops, and even in suburban traffic where the stops are less frequent, the schedule speeds have been so increased by the ability of the electric motor to accelerate rapidly, that trains hardly reach full speed before it is necessary to apply the brakes. As running at a constant speed does not occur in rapid transit service where stops are at all frequent, it becomes of the greatest importance to carefully investigate the subject of train acceleration in order to determine the method of running a train from station to station with the least expenditure of energy.

Problems in train acceleration may be divided into two broad classes: 1.—Where the road is level and

2.—Where grades exist or where an artificial profile is made in order to take advantage of down grades at starting.

Modern passenger cars demand a dead weight of approximately 550 lbs. for each passenger carried, or, in other words, only 20 per cent of the total weight of a loaded motor car is a paying load. When it is considered that in rapid transit service with frequent stops, over 80 per cent of the total energy output of the motive power on level roads is required to accelerate the train, it is evident that in this class of service the rolling stock requires the greatest attention.

To avoid undue complication, the following discussion has assumed that train friction is a constant quantity at all speeds, as at the low maximum speeds—20 to 30 miles per hour—reached in practice with frequent stops of two or more per mile, the error introduced by assuming a constant friction rate will be small and will not at all alter the conclusions arrived at.

The following constants have been assumed as representing average operating conditions:

Length of run, 2,000 ft.

Length of time train is in motion, 75 seconds.

Schedule speed, 16.65 miles per hour, including 10-second stops, or 85 seconds total time.

Traction effort, 100 lbs. per ton total, to be maintained uniform during acceleration of the train.

Braking effort, 150 lbs. per ton constant throughout the period of braking.

The train friction being 15 lbs. per ton, reduces the effective accelerating force from 100 to 85 lbs. per ton, corresponding to a rate of .927 miles per hour per second.

With this data a simple acceleration curve, as in Fig. 1, may be calculated, the train reaching a maximum speed of 28 miles per hour in 30 seconds, when power is shut off and the train allowed to coast with a retardation due to friction of .1635 miles per hour per second for 31 seconds to the braking line, when it is retarded at a uniform rate of 1.635 miles per hour per second and comes to rest in 75 seconds from time of starting.

Owing to the greater efficiency of the run, the train is allowed to coast after reaching its maximum speed rather than to allow it to continue at a uniform speed with just sufficient power supplied to overcome the train friction loss.

It is obvious that the train could be accelerated at a different rate than that corresponding to 70 lbs. per ton and still make the same length of run in the same time, the length of time occupied in coasting depending upon the rate of acceleration, being a maximum with an infinite rate, that is, with the train starting with a certain initial velocity. A minimum rate of acceleration is reached when no time is left for coasting, that is, when brakes are applied as soon as power is shut off.

In Fig. 2 such a set of curves has been prepared showing a train covering a distance of 2000 ft. in 75 seconds, as before, but accelerating at various rates from that corresponding to 62.8 lbs. per ton as a minimum up to an infinite rate, or starting with an initial velocity of 25.2 miles per hour.

As the area enclosed by time as abscissa and speed as ordinates represents the distance covered, this will be a constant quantity for the fixed distance of 2000 ft. assumed, and curves

of Fig. 2 are thus constructed with the same enclosed area for each rate of acceleration. The fact is plainly brought out that with a low rate of acceleration a much higher maximum speed is demanded than would be the case if the rate had been increased, and a curve may be plotted by joining the maximum speeds reached for different accelerating rates, as shown.

A friction of 15 lbs. per ton has been chosen as being that of an average train composed of a motor car and three or four trailers and weighing about 120 tons. With heavier and longer trains this rate may be reduced to as low as 7 or 8 lbs. per ton, while for a motor car alone, the rate may be as high as 30 lbs. per ton, due to friction of motors and gearing. The braking effort of 150 lbs. per ton is also chosen as representing what can be done on an average by a train equipped with air brakes and operating at half the slipping coefficient of the wheels.

It is advisable in rapid transit service to keep the maximum speed reached by the trains as low as possible, as this class of work generally calls for a short time-interval between trains where the utmost precautions are necessary to keep the trains a safe distance apart. In fact, the maximum speed required for a given run practically determines the time-interval between trains, as the train headway should be at least five or six times the length of time required to bring a train to rest from its maximum speed with normal braking force applied.

A second reason for higher rates of acceleration lies in the fact that with rates of acceleration approaching the minimum no margin is left for errors of judgment of the motorman, as little or no time is left for coasting, and the rate of acceleration per ampere input is continually varying with the changing passenger load and hence with an overload it becomes difficult to maintain schedule speed.

A third and most important objection to the use of a low rate of acceleration lies in the saving of energy for the run by the use of a higher rate.

Neglecting  $I^2 R$  and core losses of the motors, a set of energy input curves per ton weight of train may be plotted as in Fig. 2, assuming for simplicity that motors are series wound, operate all in multiple and are so geared that starting resistance is entirely cut out at the various maximum speeds reached in the various runs, that is, that no accelerating is done on the motor curve. A constant impressed e. m. f. is assumed, and starting resistance is supposed to be cut out proportional to the motor speed, thereby keeping the current and torque constant.

Thus it is seen that accelerating a train with the minimum rate calls for the highest maximum speed, demands nearly the least current input and also demands the greatest waste of energy in the brakes, as the speed is a maximum when brakes are applied.

The areas enclosed by the various energy time curves represent the comparative amounts of energy required for the run for the different rates of acceleration and these are plotted in Fig. 2, which compares the energy input and the average energy consumption for the run of 2,000 ft. in 75 seconds for all rates of acceleration from the minimum corresponding to 62.8 lbs. per ton up to infinity.

For convenience the average energy rates are plotted in terms of watt-hours, and the curve shows that while the minimum rate of acceleration corresponding to 62.8 lbs. per ton calls for an expenditure of 83.5 watt-hours per ton weight of train, this is reduced to 56.5 watt-hours by accelerating with a rate corresponding to 70 lbs. per ton, to 42.7 watt-hours with 100 lbs., and finally reaches a minimum value of 32.5 watt hours if the accelerating rate is pushed to infinity.

Thus the energy required for the run of 2,000 ft. in 75 seconds may vary from 83.5 to 32.5 watt-hours per ton of train weight, a decrease of over 60 per cent, depending upon the rate of acceleration used.

The curves in Fig. 2 are worthy of careful study, and similar curves afford a means of determining the proper rate of acceleration and hence motor equipment, gearing, etc., to use for a given set of conditions. The limiting factor in the more rapid rate of acceleration of a train is the current input required. Thus, if the rate of acceleration be carried to abnormally high values, the local demand for current becomes so great that either the loss in the feeders more than offsets the reduction in energy consumption at the train, or else the interest on the increased feeder investment is not offset by this energy reduction.

There are other limiting factors governing the rate of acceleration in the size and weight of motors, which are limited in the current they can carry without undue sparking and heating. Thus it will be found that the rate at which a train accelerates, largely determines the cost of feeders, size of motors and generators, both in regard to current and thermal capacity, and also fixes the safe headway between trains.

The error made in accelerating at or near the minimum rate is clearly brought out. For example, the current consumption per ton is the same for 62.8 lbs. per ton or 85 lbs. per ton; as, although 85 lbs. calls for the greater tractive effort, the torque per ampere is so increased by the lesser maximum speed demanded that the current input is the same in each case, hence the feeder considerations are the same in both cases, while the energy consumption shows a reduction from 83.5 watt-hours per ton with 62.8 lbs. to 47.5 watt-hours, or about half, with 85 lbs. per ton.

Referring again to Fig. 2, it is obvious that a similar set of curves may be plotted for a run of 2,000 ft. for any other length of time than 75 seconds, and Fig. 3 gives such a set of curves plotted for lengths of time ranging from 41 seconds, as a minimum possible, up to 210 seconds. The minimum time in which

with no coasting, is thus the curve of maximum input for a run of 2,000 ft. for any length of time. Also the curve c-d, being the locus of the various coasting lines, that is, of no braking effort, is thus the curve representing the minimum possible input.

To compare the amounts of energy required for rates of acceleration other than the maximum and minimum, a set of curves has been prepared in Fig. 4 giving the energy consumption for a run of 2,000 ft. on a level track for any rate of acceleration and for any length of running time, the constants being 15 lbs. per ton friction rate and 150 lbs. per ton braking effort. For convenience in comparison, the energy of consumption is reduced to watt-hours per-ton mile, and speed is expressed as average speed in miles per hour while train is in motion or equaling schedule speed if the train loses no time in stopping. The dotted curve A-B is the maximum energy curve corresponding to the curve A-B of minimum rates of acceleration in Fig. 3, and the curve c-D represents the minimum amount of energy possible for the different speeds and is described by an infinite rate of acceleration.

The curves of maximum and minimum energy consumption approach each other and coincide at a speed of 33.3 miles per hour,

FIG. 1.—ACCELERATION CURVES.

FIG. 2.—SPEED AND ENERGY CURVES.

FIG. 3.—SPEED CURVES.

it is possible to make a run of given length is determined by the braking effort, in this case assumed to be 150 lbs. per ton, the train reaching a maximum speed of 66.5 miles per hour in zero seconds with an infinite accelerating force and being retarded throughout the entire running time of 41 seconds at the rate of 1,635 miles per hour per second, corresponding to a force of 150 lbs. per ton braking effort.

The constants assumed in these curves are the same as before, 15 lbs. per ton friction rate, and 150 lbs. per ton braking effort applied uniformly until the train comes to rest at a distance of 2,000 ft. from the start. While the braking effort determines the minimum length of time for the run, the friction rate imposes a limit upon the maximum rate of acceleration possible for length of time greater than 128 seconds for 2,000 ft. run. That is, a train accelerating with an infinite rate and coasting the entire length of 2,000 ft. would come to rest in 128 seconds with no energy loss in the brakes, and any longer interval of time occupied in the run would require some finite rate of acceleration at a maximum. This is pointed out in Fig. 3, where for a run in 210 seconds the maximum rate of acceleration possible is .175 miles per hour per second, corresponding to 24 lbs. per ton. No train in practice would require such a long time as 210 seconds, nor would it be possible to make a run of 2,000 ft. in 41 seconds, but these curves have been carried out to show the limits for a given set of conditions.

As the energy lost in braking is proportional to the square of the speed when the brakes are applied, the curve A-B, Fig. 3, being the locus of the minimum rates of acceleration, that is,

corresponding to an energy consumption of 298 watt-hours per ton-mile, this value being the greatest amount of energy that can be expended on the run with 150 lbs. per ton braking effort.

All energy values are net, that is, they represent the amount of energy required to accelerate the train plus energy lost in overcoming friction, and hence take no account of any losses occurring in actual operation in the motors, rheostats, gearing, etc.

Fig. 4 shows the economy resulting from properly proportioning the accelerating rate to the schedule speed and distance traveled. For example, a train accelerating with a tractive effort of 100 lbs. per ton and making 20 miles per hour average speed, not including stops, will require 127 watt-hours per ton mile, which would be reduced to 65 watt-hours per ton mile if the tractive effort had been increased to 150 lbs. per ton, or, in other words, the generator capacity would be but half as large for the same service.

The curve of 300 lbs. per ton tractive effort is interesting as it represents about the maximum speed attainable with modern apparatus for a distance of 2,000 ft. with the assumed constants of friction and braking effort. Assuming the entire weight of the car to rest upon drivers, about 300 lbs. per ton would be available for traction without slipping the wheels on an average track, so that an average speed of 26½ miles per hour is the highest that could be obtained over a distance of 2,000 ft., not allowing any time whatever for coasting.

All previous curves have been based upon the assumption that trains are allowed to coast after reaching maximum speed, and also that acceleration is carried on at a perfectly uniform rate until power is shut off, but in practice this assumption may

be modified somewhat, the starting resistance being cut out before the maximum speed is reached, and the latter part of the acceleration carried on at a constantly decreasing rate upon the motor curve.

Another method would be to accelerate at a constant rate until maximum speed is reached, then continue this speed constant by supplying motors with just sufficient power to overcome train friction. This latter method of train acceleration, however, demands such a considerable increase in the amount of energy required for the run that it has not hitherto been considered.

The three methods of acceleration are illustrated in Fig. 5, showing the three forms of speed curves, *a-a* accelerating at a constant rate and coasting after maximum speed is reached until brakes are applied, *b-b* accelerating at a constant rate and continuing at full maximum speed until brakes are applied, and *c-c* accelerating at a constant rate until starting resistance is cut out and further acceleration allowed to continue at a constantly decreasing rate with constant full line potential at motor terminals until maximum speed is reached, when train coasts until brakes are applied.

value of 30 watt-hours per ton-mile, that is, the minimum energy expressed in watt-hours per ton-mile expended for a given run will be double the friction rate. The actual factor is 1.98 and forms a very convenient method of determining the net energy consumption for any speed and train weight if the friction rate be known. Thus, assuming the light load efficiency of a railway motor, including gear loss, to be 75 per cent, a friction rate of 15 lbs. per ton would demand an input of 40 watt-hours per ton mile, corresponding to an input of 1,200 watts per ton weight of train at, say, a constant speed of 30 miles per hour.

A number of interesting conclusions may be made from the foregoing investigation of the operation of trains upon a level track.

1st. The rate of acceleration determines the energy consumption for a given run, and since this energy consumption decreases with increased rate of acceleration, the train should be brought up to speed as quickly as possible and allowed to coast to secure the minimum energy input.

2nd. The maximum current input during acceleration increases with the rate of acceleration, and hence limits the rate at which a

FIG. 4.—SPEED-ENERGY CURVES.

FIG. 5.—SPEED CURVES.

FIG. 6.—ENERGY CURVES.

Curve *a-a* reaches the highest maximum speed but wastes the least energy in the brakes, and hence is the most efficient run mechanically, curve *b-b*, the constant speed method, being the least efficient.

As these three curves were plotted from the speed torque curves of an actual motor, it is instructive to compare the watt-hours consumed for each run with series parallel control, operating two motors in series, then in multiple. To this end a set of energy input curves have been plotted in Fig. 5, showing that curve *c-c* requires the least maximum energy input, while curve *a-a* requires the greatest amount.

The area enclosed by the energy time curves is a measure of the average energy consumption for each run, and their respective values reduced to watt hours are:

- a. Constant current and coasting, 147 watt-hours per ton.
- b. Constant current and not coasting, 160 watt-hours per ton.
- c. Constant current and acceleration on motor curve, 126 watt-hours per ton.

Hence, of the three methods, curve *c*, making use of the acceleration due to a series motor curve, not only requires the least maximum current input, but also requires the least average energy input to the motors for a given run and hence is the form of curve used in the majority of actual runs. Although the energy given out by the motors in run *c* is greater than in run *a*, as evidenced by the higher speed at which brakes are applied, yet this extra work is done so much more efficiently, owing to the smaller starting resistance loss, that the total watt hours input becomes less.

Whatever form of acceleration curve be used, the results arrived at in Fig. 4 will not be greatly modified if similar forms of curves are compared, and, being expressed in terms of actual work done, may be used for any run with a factor expressing the efficiency of acceleration: that is, the ratio of actual work done to the total energy input.

It will be noted that all curves of Fig. 4 approach a minimum

train can be accelerated with a given feeder loss or feeder investment.

3rd. In order to reduce the average energy consumption and also the maximum current input to a minimum for a given run, a due amount of acceleration should take place on the motor curve after starting resistance is cut out, hence a motor should be carefully proportioned for the work it has to do.

4th. A normal amount of coasting should be permitted after power is shut off, partly to provide a margin to allow for errors of judgment of the motorman, but largely because this is the most efficient method of accelerating a train. On no account should the maximum speed be continued by supplying the motors with just sufficient current to overcome train friction, as this method of accelerating is extremely wasteful and inefficient.

Having discussed various methods of accelerating, it is interesting to follow out the problem, and determine the actual efficiency of transporting passengers by our modern methods of travel. It has been pointed out that only 15 to 20 per cent of a fully loaded train consists of a paying load, and with an average load as carried throughout the day this percentage will be reduced to 10 per cent or less, that is, nine-tenths of the energy consumed in moving this train at a constant speed is wasted. But in rapid transit work a train seldom attains a constant speed, due to the frequent stops and high schedule speed, and at least ten times the energy required to overcome friction alone must be expended in accelerating the train, only to appear as heat in the brake shoes when bringing the trains to rest. That is, considering the friction work of the train as the only useful work done, an efficiency of only 10 per cent is reached in the average run. But only 10 per cent of this friction work is useful in moving passengers, hence the actual passenger efficiency is reduced to less than 1 per cent of the total energy delivered to the train during acceleration.

When it is considered that further losses occur in operation in the motors and their method of control, in the transmission lines

and generators of an electric traction system, it will be appreciated that the present method of transportation, with its efficiency of a fraction of one per cent, opens a wide field for improvement. This applies with greater force to rapid transit service using steam locomotives as a motive power, as the dead weight carried per passenger is greater with a steam locomotive than with a motor car, and the efficiency from the coal pile is much less. Hence some means of reducing the large loss, due to accelerating the train is desirable, and this is found in the adoption of an artificial profile, as followed out in a large underground road now building, using down-grades in starting, and up-grades to retard the train when stopping.

The ideal profile would provide for a down-grade at starting sufficient to do the work of acceleration and with an up-grade to do the entire braking required, thus leaving only the friction energy to be supplied by the motive power. Such a road would operate at 100 per cent efficiency, neglecting the dead weight of train carried and considering total friction work as useful work.

Reduced to practice, this ideal grade must be modified considerably. The per cent grade used is limited partly by the rapidity of acceleration that may be imparted to the train without discomfort to the passengers and partly by the available tractive effort of the motive power, which must be sufficient to haul the train up the grade in case of necessity.

A second modification occurs in the necessity of having stations placed on a level track, and since a train has an appreciable length, it must travel its own length before the last car is off the level and the full effect of the grade is felt. Thus, during the first period of acceleration the rate is comparatively small and must be furnished by the motors, resulting in a material reduction in the energy gain in the theoretically ideal profile. An artificial profile can only be secured on elevated or underground roads, and a double track road necessitates two separate overhead structures and the underground road must consist of two separate tunnels with unlike profiles.

Assuming two stations to be on the same level, there are two forms of profile that may be assumed with a given maximum difference in levels, as shown in Fig. 6. Profile A consists of a down-grade with a level track at each terminus equal to the length of train operating over the road, while profile B consists of a down-grade and up-grade equal in length and percentage with a level track connecting them, and also a level track at each station equal to a train length.

In practice a perfectly symmetrical profile, as in B, will not be possible, as the level tract connecting grades must be replaced by a slight grade to provide for drainage in tunnel roads, this grade preferably opposing the direction of movement of the train.

In order to ascertain the behavior of a train upon the two forms of profiles and to determine the most efficient form of grade, a series of curves have been plotted upon the following assumptions.

Length of run total, 2,000 ft.

Train friction, 15 lbs. per ton constant.

Braking effort, 150 lbs. per ton during time brakes are set.

Running time, 75 seconds.

Length of train, 200 ft., corresponding to an average train of four to five cars.

Tractive effort, as supplied by motors, 100 lbs. per ton. (This effort being supplied irrespective of added effort due to grades.)

No running is assumed to take place on the motor curve, and train is supposed to coast after reaching maximum speed.

Motors are controlled by the ordinary series-parallel method, starting with two motors in series and throwing them into multiple, the starting resistance being supposed to be cut out uniformly so that 100 lbs. per ton motor effort is maintained constant while current is on.

Due regard is paid to the fact that the tractive effort due to grade depends upon the proportional length of train off the level track at the stations, and hence is a constantly increasing quantity until the entire train is on grade.

A grade of four per cent has been chosen for the down-grade in A, and for both down and up grades in B; and energy consumption plotted in Fig. 6 for different lengths of grade.

Thus for a run of 2,000 ft. in 75 seconds, the energy input with series parallel control is 40.75 watt-hours per ton for a level track, which is reduced to 27.8 watt-hours in curve A with a length of 500 ft., 4 per cent grade and 22.6 watt-hours per ton

in C, with the same length of 4 per cent grade, that is, with the same vertical fall.

A length of 500 ft. of 4 per cent grade calls for a vertical fall of 20 ft. which is not excessive in practice, hence by the use of a profile similar to B, Fig. 6, the energy consumption for a given run may be reduced as much as 40 to 50 per cent from that required on a level track.

With proper proportioning of the gear ratio of the motor allowing some acceleration on the motor curve, this saving in energy consumption could even be exceeded, so that a rapid transit road, especially a tunnel road, properly laid out with an artificial profile, could operate with a very much less energy consumption than an existing surface road.

In conclusion it may be pointed out that the electric motor is eminently adapted to rapid transit service, owing to its ability to accelerate rapidly; and for tunnel work especially, it has no rival, adding to its high efficiency of operation its perfect immunity from smoke and gases.

### HEROIC EXAMPLE FOR RAILWAY MEN.

The portraits are here given of the conductor and motor-man in the employ of the Chicago General Railway Company who heroically repelled the attack of three highwaymen. On the 10:10 p. m. trip, June 22, east bound on Laffin street, the car was approached by three men and the speed was slackened for them to get aboard. As the third man stepped on the platform he caught the door-pull and staggering as if falling closed the door. Conductor E. L. Stickney caught him to prevent his falling but quickly realized his mistake when the supposed passenger covered him with a revolver and ordered "Hands up quick and make no noise."

E. L. STICKNEY.

TIMOTHY MCAULIFFE.

The conductor pushed the revolver aside and seizing the man threw him off the car. The two other robbers came to the assistance of their fallen comrade with revolvers ready for service. The conductor boldly attacked the second one and forced him off the car while it was going at a high rate of speed. The third man snapped his revolver but fortunately for the brave conductor the cartridge failed to explode and then the robber dealt him a blow on the head with his revolver, inflicting a slight scalp wound. The motor-man, Timothy McAuliffe, and a passenger came to the conductor's assistance in his unequal fight and threw the third highwayman from the car. The conductor stepped to the lower step of the car, revolver in hand, and was shot at by one of the robbers. He returned the fire four times, two of the bullets striking one of the men, very seriously wounding him. The police captured all three of the bandits and they are bound over to the grand jury. This successful resistance will likely put a stop to hold-ups on the Chicago General Railway whose lines run through some outlying districts.

## LIGHTNING ARRESTERS.

An Address before the Northwestern Electrical Association, on board S. S. Northwest, by A. J. Wurts.

My attention has been recently called to the numerous inquiries which are being made for information regarding the protection of electrical apparatus against lightning. At the recent electrical congress held in Geneva, a special effort was made to collect reliable data from the central stations scattered over Europe. A little more than a year ago the Elektrotechnische Verein, of Berlin, offered a considerable prize in money for the best paper among its members on the subject of lightning arresters. Not long ago the president of a large power transmission plant in the west wrote to me, asking whether in my judgment I thought it feasible to operate a power transmission plant through thunder storms, adding that prospective stockholders and customers were expressing considerable doubt regarding the possibility of continued service in a section of the country where thunder storms were frequent. My answer was in the affirmative, and I pointed to the successful operation of power plants in various parts of the west, more particularly to the plant of the Telluride Power Transmission Company, which has now been operating for many years without any interfer-

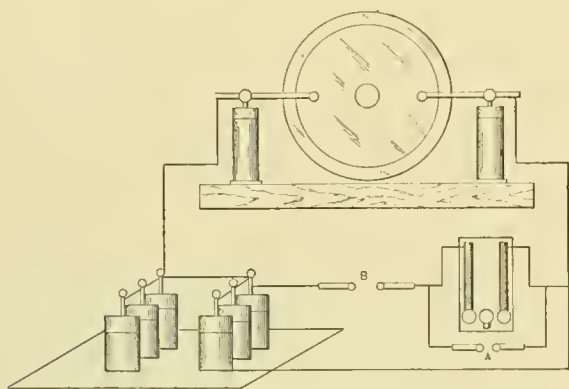

DIAGRAM OF APPARATUS.

ence whatever from lightning, and now, although I have written quite a number of articles bearing upon this subject, I am once more asked for my views, which it is needless for me to say are always gladly given.

The subject is long when treated from beginning to end, and as our time is limited I will confine my remarks more especially to the testing of lightning arresters, with the idea of giving central station men the benefit of my experiments and leaving them finally to draw their own conclusions. I have been led to dwell on this particular part of the general subject of lightning arresters by reason of some experiments which I have made on a lightning arrester, recently placed on the market, and which has been called a "short gap" lightning arrester; and as this particular instrument has but one air gap, although placed in series with what has been termed by the manufacturers of the arrester a "low resistance," and as the Westinghouse arrester for the same kind of service has three gaps, the inference is that the latter is comparatively speaking a "long gap" arrester.

Inasmuch as it has always been generally accepted that lightning arresters should have good copper connections between line and ground, with soldered joints and a thoroughly good ground plate, it seemed to me at the onset rather strange and inconsistent that one should deliberately place in the lightning arrester itself, a resistance, which, compared to the lightning arrester connections, was not a "low resistance" but a very high resistance. Furthermore, it was claimed for the short gap lightning arrester that it would break down at a much lower e. m. f. than other devices having more than one spark gap. This statement although true is very misleading; for the breaking down e. m. f. of a spark gap is in no wise dependent upon

the resistance which may be in series with that spark gap. For instance, the lightning arrester in question has 60 ohms in series with its spark gap, but the breaking down e. m. f. of this gap would be just the same if the resistance in series were a thousand or a million ohms. What has the breaking down e. m. f. of a lightning arrester to do with this subject? In my judgment, none whatever. It seems to me that dynamo e. m. f. and dynamo current are absolutely foreign to the primary function of a lightning arrester which is to carry off disruptive discharges with the least possible resistance. We might put the question this way: Does the breaking down e. m. f. of a spark gap lightning arrester, bear any relation to the resistance which that lightning arrester may offer to the passage of disruptive discharges? My experiments indicate that it does not, at least as far as permanent resistances are concerned. By permanent resistances I mean resistances which *conduct* disruptive discharges, such as German silver wire or a choke coil, in distinction from resistances which may be *broken down* by the passage of disruptive discharges, such as air and other insulating fluids. I think it will be obvious to anybody who has given this matter the slightest consideration that a disruptive discharge might easily break down a single spark gap of  $\frac{1}{2}$  in., or a number of spark gaps aggregating the same distance, which would have a very high breaking down e. m. f. Whereas, it is also quite obvious that a very small spark gap connected in series with one thousand or several thousand ohms might have a very low breaking down e. m. f., but such a device would offer a relatively higher resistance to the passage of disruptive discharges. I now invite your attention to the following experiments.

In determining the resistance of a lightning arrester or the strength of insulating material with reference to lightning by using the disruptive discharge itself, I have placed in shunt to the object whose resistance is desired a secondary or shunt path whose resistance may be easily adjusted and made to balance any resistance placed in shunt with it. For example, referring to the diagram representing a static machine, a battery of Leyden jars and a circuit which may be established through an initial spark gap B and through a lightning arrester or other device, in shunt with which a variable spark gap A is connected. The length of the variable spark gap A is to be the measure of the resistance which the lightning arrester or other device will offer to the passage of disruptive discharges under the conditions of the test. In making this experiment the apparatus is connected as shown and the A gap is at first closed, then as the sparks begin to pass the A gap is gradually increased until a balance is established between the path through the arrester and the path through the A gap, such that the sparks will pass indifferently through one or the other. The length of the A gap may then be said to be a measure of the resistance which the lightning arrester offers to the passage of disruptive discharges.

In making these measurements with a double pole, "short gap" lightning arrester, shown connected in the diagram, and which has 120 ohms in series with two spark gaps, I have found the value of A to be 9.32 in.; whereas, when a similar test is made with a Westinghouse double pole lightning arrester, which has six gaps in series, the value of A was found to be only 3.32 in. Thus, the resistance which the "short gap" lightning arrester offers to the passage of disruptive discharges is three times greater than that offered by an arrester having three times as many gaps. Furthermore, it was noticed that the sparks which passed through the "short gap" lightning arrester were very small, compared with those which would pass through a gap or series of gaps without resistance, and the sound which was emitted by the spark over the short gap arrester was also insignificant, indicating that the amount of discharge which passed was relatively small and that the path must necessarily be restricted in some way; and this conclusion was verified in the following manner:

Referring to the diagram, the A gap was removed, the static machine was driven at a constant speed and the number of discharges which passed through the "short gap" lightning arrester in a given time was counted. The "short gap" arrester was then replaced by the Westinghouse arrester and the same test repeated, with results as follows:

Tets No. 1.	No. of Discharges.	Duration Minutes.	Rate per Minute.
Westinghouse . . . . .	50	5	10.0
"Short Gap" . . . . .	62	5	12.4
Test No. 2.			
Westinghouse . . . . .	40	5	8.0
"Short Gap" . . . . .	55	5	11.0

It will be noticed from the above that the rate of discharge for the "short gap" arrester is greater than that for the Westinghouse arrester, and in my judgment this difference is due to the presence of a high ohmic resistance in the "short gap" arrester, and the reason of this high rate is that the "short gap" arrester owing to its high resistance cannot completely discharge the battery of Leyden jars, consequently it requires less time to recharge and the discharges occur more frequently, but the quantity of the static charge which passes through the arrester is relatively small. In service this feature is liable to cause a splitting of the discharge, causing one part to pass through the arrester and the other through the insulation of the system.

Now, to further show that the method of using a variable shunt gap to measure the resistance which a lightning arrester offers to the passage of disruptive discharges is reliable, I attempted to verify the results already obtained, in which the resistance of the "short gap" arrester was found to be three times that of the Westinghouse, by placing three Westinghouse arresters in series and then connected this series in shunt to one short gap arrester. Upon the passage of disruptive discharges I found that the three Westinghouse arresters in series just balanced the single "short gap" arrester, thereby verifying the previous results and again demonstrating that the resistance of this particular lightning arrester was three times as great as the Westinghouse, and in general, that an ohmic resistance such as here used provides a relatively poor path for the passage of disruptive discharges.

These results are not altogether in accordance with some of the popular ideas regarding lightning arresters and disruptive discharges, the prevailing idea being that if a spark can jump through even a very short distance of air, a few ohms connected in the circuit could not materially increase the resistance of the path for the discharge. It is generally granted that disruptive discharges are oscillatory and that coils offer a very high resistance to the passage of such discharges, but that a few ohms resistance should considerably impede the passage of the discharge may be somewhat new to central station men, and I desire to offer the following explanation of this phenomenon.

Let us bear the following points in mind. Air is easily moved out of the way. An ohmic resistance such as we have been talking about is fixed as far as the current flow is concerned, and the discharge is oscillatory, at least, it is generally accepted as such. Now, when a disruptive discharge passes over a spark gap without resistance in series, the work which the discharge has to do is simply to remove the air of the spark gap which obstructs its passage, and this being done by the first oscillation, the air is perforated as it were and the path is then free for further oscillations to complete the discharge; whereas, when an ohmic resistance is connected in series with such spark gap, although the spark gap itself may be broken down as before, still the ohmic resistance remains in the circuit and each oscillation has to take place through it, thereby enormously increasing the actual work which must be performed before complete discharge can take place. I would call the simple spark gap arrester a "free path" arrester and the arrester having a resistance in series, a "restricted path" arrester.

Perhaps the following illustration will make this idea a little more clear: Let us imagine two empty water pipes, one having in it a thin glass diaphragm, the other a thin steel diaphragm, in front of which is a strong steel diaphragm with a small hole in it. Now with a sudden rush of water through the first pipe the glass diaphragm is instantly shattered and the path is free for the further and complete discharge of the water which may follow; but with the second pipe, although the glass diaphragm may be shat-

tered by the first on-rush of water, still the steel diaphragm remains as a permanent resistance for all the water which may follow.

Having placed these ideas before you, I will leave them that you may draw your own conclusions.

Finally, I wish to call your attention to some remarks which I have noticed recently in our technical literature. In one instance it is stated that the high insulation which we are now using increases the danger from lightning, that some years ago, when a poorer quality of insulation was used, the lightning had a better chance to leak to ground through this weak and otherwise defective insulation. I take exception to any such statement as this, for the simple reason that experience does not warrant it. I am sure that many of you will remember how that our shellaced cotton insulation on smooth body armatures was in constant danger from burnouts during thunder storms; whereas with our modern apparatus and higher grade of insulation the trouble from lightning is comparatively rare. If there could be any such thing as a leak of the static discharge to earth, certainly this leak would take place from our trolley wires through the many lamp circuits as well as the copper circuits through motors and armatures to earth.

In another instance the bold statement is made that "at the present day the most satisfactory and effective method of protecting is that one in which a grounded wire is strung in proximity with the line wires." It seems to me very curious that this method is not universally adopted if so satisfactory and effective. The statement hardly requires further comment.

Referring now to the rules and requirements of the National Board of Fire Underwriters on lightning arresters, I will read the following: "Must be connected with a thoroughly good and permanent ground connection by metallic strips or wires having a conductivity not less than that of a No. 6 B. & S. copper wire, which must be run as nearly in a straight line as possible from the arresters to the earth connection." It seems to me that this rule which provides for thoroughly good and low resistance connections, to be consistent and to have real value should also include some specification regarding the resistance which the lightning arrester may offer to the passage of disruptive discharges.

On another page of these rules I found as follows: "In no case should the ground wire from a lightning arrester be put into iron pipes, as these would tend to impede the discharge." Personally, I am very curious to know whether this last statement is based on theory or actual test. As I had made many other tests indicating that such an iron pipe would not impede the passage but really assist it, I determined to make this particular test, and found as had been anticipated, that the presence of the iron pipe actually helped the discharge, that is, lowered the resistance of the wire passing through it. I think the reason for this is, that the iron pipe acts as a short-circuited secondary.

## CORRESPONDENCE.

Our April issue contained a description and illustration of the handsomely decorated cars which the boys in New Orleans fitted out on the occasion of their annual celebration. The article called out the following courteous expression:

New Orleans, May 31.

EDITOR STREET RAILWAY REVIEW:

In behalf of the Board of Managers of the New Orleans Traction Company Employees Aid Association, I desire to transmit to you their united thanks for the very flattering words contained in your issue of April 15.

With best wishes of our association, I remain,

Yours respectfully,

C. E. HINGLE, Secretary.

An attachment of \$50,000 levied upon the franchises of the East Oakland (Cal.) Street Railway, has been dissolved.

## ELECTRIC TRACTION FROM AN ENGLISH POINT OF VIEW.

At the third annual convention of the Municipal Electrical Association held in London on June 10, the subject of Electric Traction was treated in separate papers by R. C. Quin, borough electrical engineer of Blackpool, and J. E. Stewart, borough electrical engineer of Derby. Mr. Stewart, in his paper, advocates the adoption of the trolley system, the combination of the lighting and traction generating stations, and the municipal ownership of both. The following is an extract from Mr. Quin's paper on "Electric Traction":

It goes without saying that the subject of Electric Traction is so important and extensive that it is impossible to deal with it comprehensively in a paper of this description. The author proposes, therefore, to set forth as briefly as possible the salient points of the subject.

**Road.**—In the author's opinion the road, or permanent way, is one of the chief factors which determine the success or failure of any electric traction undertaking, inasmuch as its condition will have a much greater effect upon the maintenance costs, and consequently, the financial result, than would probably be the case with any other system of traction.

Considerable difference of opinion seems to exist as to how this track should be constructed—whether the rails should be 43 lbs. per yard as upon the Giant's Causeway line, or 92 lbs. per yard as upon the Blackpool line—whether the gage would be 3 ft. or standard gage. The weight of the rail must of course be proportioned to the weight of the cars running thereon, and to the soil upon which the rails are laid; but it would appear to the author that the present practice errs too much on the side of lightness. It will be admitted on all hands that smooth running is essential to the longevity of the rolling stock; and that this cannot be attained without rigidity of construction, smoothness of running surface, and accuracy of gage.

In order to insure these desirable ends it is essential, in the first place, that the track should be well laid on a good solid foundation, accurately gaged, and substantially cross-tied. The usual cross-tie for tramways purposes is  $\frac{1}{2} \times 1\frac{1}{2}$  in. strap hammered round at each end, and threaded and bolted through the web of the rails; but at Hamburg—at which place it has been the author's privilege to investigate the permanent way construction—things are done on a decidedly better plan. Here, the rails, which weigh 106 lbs. per yard, are cross-tied by an I-shaped girder, 4 in. deep, which passes under the bottom flanges of both rails, and is secured at each end by two substantial and adjustable chairs. These ties are placed about 6 ft. apart.

The rails also are not butt jointed, but have a half and half lap joint, with a longitudinal cut through the web about 10 in. in length. The fish plates securing these are 2 ft. 10 in. long fastened by six  $\frac{7}{8}$  in bolts. The fish plate on the tread side of the rail passes under the bottom flange as far as the web. This class of rail joint is one which, in the author's opinion, very nearly approaches the ideal. It has unbroken running surface, is rigidly constructed, and has a large rail to rail contact. The cross-over roads at Hamburg are also of unique construction. At these points the groove of the rail is gradually shallowed until at the actual crossing point it is  $\frac{3}{4}$  in. as against  $1\frac{1}{4}$  in. at other parts of the rail. The flange of the wheel projects one inch; hence at these points continuity of running surface is attained by riding on the flange of the wheel.

**Generator.**—Shall it be high speed, slow speed, direct coupled, belt, or rope driven:—if with the latter shall the fly-wheel be placed upon the engine or the dynamo? On the question of fly-wheels, the author begs to state his opinion that the fly-wheel should be left at the factory, as there is quite sufficient fly-wheel effect in a tram car. The author further ventures to suggest that what is required is not so much uniform speed of the engine, or uniform c. m. f. of the line, as uniform motion of the tram cars, and in his experience neither of the former are absolutely essential to the attainment of the latter.

Slow speed engines, direct coupled and belt driven alike, are doing good service in traction work both in this country and on the Continent. But of these, so far as regards modern plant, he cannot speak from personal experience. He has within his charge for lighting purposes, however, engines varying in speed from 80

to 5,000 r. p. m. The traction plant is of the latter order, i. e. direct coupled, Parson's steam turbines, electrically governed. These turbines have been working since June, 1897, to the present time and seem well adapted for the purpose. Their efficiency is extremely good; the attention and cost of maintenance at present extremely small; while the automatic regulation is everything that could be desired.

The extent to which this range of regulation is called upon depends of course in a very large measure upon the weight of the cars, the number of starts per hour, the gradients, and finally, the starting gear.

**Motors.**—The motors for traction purposes should certainly be of the enclosed type, as far as possible watertight; and their capacity such as to enable them on an emergency to develop, for short periods, at least three times their normal power. The truck, carrying the motor or motors, should be rigid in construction;—flexibility being given solely to the supports of the car body and of the motor. The efficiency of a traction motor, though of course an important point, is not of such great moment as with stationary motors. The question of weight as well as efficiency has to be considered; and the question, after all, amounts solely to how much power it will require to move the total weight of car, equipment and passengers, a given distance at a given speed, on a given length of track. The efficiency, again, should be greatest at certainly not more than three-quarters of the maximum power of the motor, or preferably at its usual working load.

The arrangements for oiling should be such that while giving efficient lubrication, oil should not be able to obtain access to the inner portion of the case. Certain makers of traction motors now cover the bottom coil of the field magnet with sheet lead. This is a good preventive of failure due to the access of moisture, dirt or oil; but it would be better if these could be entirely excluded.

In the author's experience, the weakest point in a traction armature is at the junction of the winding and the commutator.

There seems at present to be no settled practice as to the number of motors to be fixed upon a car. The author considers, however, that two motors should always be installed—either of which should be sufficiently powerful to take the car home in case the other breaks down. Further, that the starting arrangements should be such that the two motors are placed in series with a resistance and with one another at starting, and that under normal working conditions they should be in parallel; series wound motors of course being used.

The tram cars in the author's charge are at present all driven by worm gear. The worms are steel,  $4\frac{1}{4}$  pitch, having three parallel threads. The worm wheels are gun metal. The whole is contained in an oil case; the worm is fitted with end thrust ball bearings. Worm gearing, if well fitted, is efficient; but the wear and tear are great so that it does not long remain in an efficient condition. The worm gear is now being replaced by single reduction gear.

The nature of the controlling gear has an important bearing upon the economic working of a traction system. It has not only an immediate effect upon the revenue account but affects also the life of the motors and of the generators, not to speak of the comfort of the passengers. Moreover, with good controlling starting gear, the maximum current taken momentarily by the car is considerably reduced, and with many cars working, and therefore many cars starting simultaneously, the amount of generating plant is most appreciably affected.

Within the author's experience, cases have arisen under working conditions of the maximum current being eight times greater than the normal; this of course being with crude starting gear. If this maximum were not to exceed the normal by, say, 50 per cent—and it certainly need not—the necessary amount of generating plant would be very considerably reduced.

As bearing upon the question of the effect of controlling gear upon the life of motors, an incident which happened not very long ago may perhaps point a moral. A certain car, fitted with a series resistance and multiple contact switch as starting gear, stood upon a heavy gradient. The engineer in charge ventured to start the car, the immediate effect of which was to burn out a motor armature. On a second occasion under similar circumstances he again attempted to start, but this time burnt out the armature of one of the generators. But not to be beaten he repeated the operation under somewhat different conditions. The car was now equipped with a series parallel controller—the me-

tors being the same. On this occasion he was successful, as on all subsequent occasions when this experiment was tried.

**Cars.**—Double deck cars are almost invariably used in England for urban tramway purposes. The practice, however, on the Continent is just the reverse. With the exception of Paris, single deck cars seem to be the rule. The correct size of a car and the number of passengers it should carry, are questions which cannot be settled until the conditions of traffic are known. If the line is double throughout a large number of cars can be conveniently worked. If it is a single line and loops, the workable number of cars becomes limited, and their capacity therefore must be proportioned to the requirements of the traffic.

If the amount of traffic varies within wide limits during certain portions of the day, or at certain seasons of the year, it would appear to the author advisable to attach trailers to the motor cars at those times, rather than to carry a heavy dead load of car weight the whole time. While on this point the author would suggest that some better unit of efficiency working might be established than the cost per "car-mile." What is a car-mile? Is it a trailer car carrying 15 passengers and weighing three to four tons; a motor car carrying 30 passengers and weighing seven to eight tons; or a motor car carrying 80 to 90 passengers and weighing anything up to 23 tons? He would suggest "ton-mile" as a better unit.

**System of Feed.**—The preceding remarks apply with equal force to all methods of electric traction, but the most debatable feature in the question is the means to be adopted of conveying the energy from the generator to the motor. The trend of technical as also of public opinion in this country appears to be in favor of overhead. It is, the author believes, admitted by all that it is the cheapest method, but some have qualms as to its sightliness and safety. These points it is obvious with a little skill and forethought, can be easily provided for. Strong posts of ornamental construction are now obtainable, and when used for the joint purpose of lighting the street and supporting the overhead conductor cannot be objected to by the most critical. The overhead line must always be in evidence, but it is remarkable how accustomed one can become to it, so much so as not even to notice its presence. The best means of ensuring safety is good work—first-class materials, and sound construction. The gage of the trolley line should not be less than No. 000 S. W. G., although No. 0 B. & S., appears to be the general thing on the Continent. Two overhead conductors should be provided even for single line and loops, being, the author considers, cheaper in the end than spring frogs and other expedients. Section blocks should not, under any circumstances be placed in curves, also they should be provided (when trolleys are used) with guard cheeks to prevent the trolley wheel jumping the line when passing.

The span wire system of support appears best suited to high rates of speed, and is convenient in narrow streets where supports can be attached to the houses, but it necessitates a great number of straining wires at curves which are not slightly. The life of the overhead line is greatly affected by the class of contact making apparatus which is employed. Certainly, the life appears longer with the rolling wheel than with the sliding bar. Whether the advantage which the bar has at curves and junctions sufficiently compensates for this, the author cannot say.

With a trolley line well erected and fitted with guard cheeks at cross-overs and junction frogs, there should be little risk of the trolley wheel jumping the line, but nevertheless such a contingency must be provided for. In the first place, the trolley head when free from the line should not be able to rise to any great extent from its working position. In the second place should it happen that the trolley jumps the line when the car is proceeding at high speed and the head of the trolley locks against one of the supports (either bareket arm, or span wire) something must give way. What will prove to be the weakest link cannot of course be given for certainty, but, should it happen to be the trolley standard, accidents are likely to occur. The author suggests that it would be best to provide the weakest link in the shape of a loose trolley head, and that this trolley head should be anchored by an insulated cord to the trolley arm, say three feet from the top end. The only result then of the locking of the trolley head would be its dropping free from the arm.

It is necessary with telephone or telegraph wires crossing the overhead conductor to provide some means for preventing these wires, in the event of their falling, from making contact with the overhead conductor. There are two ways of doing this: the first

is to fix an insulator such as a wood or other moulding, on the top of the conductor at those points; the second to suspend above the trolley line one or more guard wires. These latter seem to be preferable, as in practice the wood moulding works loose and makes considerable noise by vibration when the cars are passing. The guard wires should be stranded and capable of withstanding as great a stress as the trolley line itself. They should, the author also considers, be efficiently connected to earth. If this is so, a telephone wire coming in contact with the overhead line and the guard wire causes a short circuit and a cut at the generating station.

With overhead system a rail return is almost invariably used, and therefore the question of bonding and of the earth circuit should be considered at this point. For all practical purposes the conduction from rail to rail by fish plates and bolts must be neglected, and it becomes necessary to provide electrical bonds across these rail joints of the same equivalent area as the rail. The rails the author is now using have an area equivalent to 1 sq. in. of copper. The bonds consequently should have this section. Under these circumstances it is preferable to use two bonds, as 1 sq. in. section would be inconvenient.

The heads of the bonds should have a contact area of at least  $2\frac{1}{4}$  sq. in. and should be of such construction as not to render them liable to work slack. It is a good thing in calculating the fall of potential upon a given line to allow 20 per cent for increased resistance due to the slackening of the bonds. Even with this bonding, unless the disposition of the gas and water mains has been carefully considered, the Board of Trade limit of stray earth current is likely to be exceeded.

If a gas or water main crosses the track or approaches the vicinity thereof, and from that point takes a shorter route to the neighborhood of the station earth than do the tramway rails; or has along that line of route a less resistance than the corresponding tramway return it will take a greater proportion of the current than is allowable; then, parallel to that gas or water main, an insulated conductor should be laid from the point of the tramway rails above-mentioned to the negative terminal of the dynamo.

**Accumulators.**—The accumulator system of traction certainly possesses very great advantages—the principal of which is that the service of cars is not dependent on the maintenance of one system of feed, each car being entirely independent; but we have carefully to consider at what cost this independence is obtained. The crux of the whole question is the cost of carrying a useful load of passengers a certain distance, and for this purpose it is as well to see how the question is affected by the adoption of storage cells. There are three heads under which additional expenditure is entailed—first, the interest upon the additional capital required for the installation of the cells and also their depreciation—second, the cost of propelling the additional dead load—third, the inefficiency of the cells.

With cars running all day with one charge, the weight and cost of cells are both very great as a comparison of the cars used in Dresden for overhead line only, and of the cars at Charlottenburg for accumulators, will testify. Dresden cars carrying 40 passengers weigh eight tons: Charlottenburg cars carrying 42 passengers weigh 23 tons. In both cases the useful load of passengers is approximately three tons. The cost of the accumulators used on the latter cars is about £750 per car.

The cost of traction accumulators varies from £75 to £125 per ton, the former figure being for rapid charging and discharging short-distance cells.

The author was much interested in the statements made by Mr. Epstein in his Institution paper (on the authority he believes of the Hanover Tramway Company) that the cost of the accumulator system of working there was only .4 cent per car-mile greater than the overhead system; and he must confess when making his recent visit to Hanover, he did so with the intention of ascertaining how that .4 cent was arrived at. To a certain extent he was unsuccessful, the cost of the maintenance of the cells not being obtainable; but he believes that the figures which he has obtained are sufficient to effectually disprove that statement.

There is in Hanover one line of rather less than 10 miles, worked entirely by accumulators—the cars working that line being also equipped for the overhead, so that they are interchangeable with cars working on the combined system. They weigh  $11\frac{1}{2}$  tons and carry 36 passengers. The time occupied in running

this journey exclusive of charging and stoppages is 45 minutes. The cells are charged at two stations en route, at one of which eight minutes charge is given at constant potential and at the other 25 minutes. The accumulators are placed under the seats, each car being fitted with 208 cells of Tudor type, and there are three plates in each cell. The weight of these cells is approximately two tons, and the installation cost of each car \$1,000. The energy taken per car-mile on this track was 1.5 k. w. hours. Although the maintenance cost of the cells was not obtainable the average life of the cells was given at about 18 months, and, moreover, additional cars have to be provided on the accumulator line as several cars are always occupied charging.

There is also another line at Hanover worked on the overhead system. Here the cars carry 32 passengers and weigh six tons. The energy taken per car-mile of these latter cars was .68 k. w. hours. On the combined overhead and accumulator system, with cars similar to those in use on the accumulator line, the energy taken per car mile was 1.37 k. w. hours. Leaving the initial cost of the accumulators out of the question, there is the effect on the revenue account to be considered.

With rapid-charging low-capacity cells (which are really the only ones worth considering), the weight of cells for a five miles' journey with one charge is about one ton for every 3¼ tons of car and passengers. Therefore with a car and passenger load of 13 tons we must have four tons of accumulators. As every ton-mile on a given road requires the same expenditure of energy, it follows that the energy given to the motors to propel this car will have to be increased approximately 30 per cent.

Opinions differ as to the efficiency of these cells, but generally the users of them consider that the watt-hour efficiency is about 60 per cent and the author does not think the figure is far wrong. Therefore the energy of charging these cells has to be increased 117 per cent owing to their inefficiency and weight. Further, the wear and tear of the road and cars is increased by the additional weight.

The life of the plates of the cells is variously given by the users as from one to two years, by the representatives of the makers as from two to three years; but the majority of the users do not find much difference between the life of positive and negative plates. The cost of the maintenance of cells is given by the various Tramway Companies using them at from 1½ cents to 6¼ cents per car-mile, and the author thinks a fair average may be taken at 3 cents. Assuming the cost of current to be 1½ cents per k. w. hour and .7 of a unit to be taken without cells, figures the author does not think advocates of accumulators will cavil at, the cost of energy with the overhead system would amount to 1.05 cents, and with accumulators to 2.28 cents, or an additional cost of 1.24 cents.

This added to 3 cents for the maintenance of the cells per car-mile gives us the additional cost of 4.24 cents, neglecting the extra wear and tear of the cars and road.

Now consider the capital cost. The overhead system per mile of double track costs complete, including bonding of the rails, steel posts (on span wire or bracket system) about \$8,000. If these posts are used for street lighting purposes, the cost of the posts should be divided equally under the two heads reducing the overhead cost to \$4,870 per mile of double track, with a 2½ minute service and cars travelling eight miles per hour there will be six cars on the mile section, and, with the weight of the accumulators given, each car would cost \$1,500 to equip, or \$9,000 per mile of double track.

Again, if charging stations were adopted with say 15 minutes charge, six additional cars would be required at an additional cost per mile of \$2,800, making altogether a sum of \$11,800 per mile.

With a slow service of cars the initial cost of the accumulators would probably be less than the overhead, but the additional cost of 4.24 cents per car-mile (with only 20,000 miles per car per annum) capitalized, is equivalent to the sum of \$17,750 bearing 5 per cent for each car running.

The conclusions arrived at by the author all tend to the opinion that in the present state of electric traction engineering there is but one good and reliable, and cheap system, and that is, the overhead. Where a combination is necessary and conditions are favorable, overhead and conduit combined comes next in order of merit. That as at present constructed accumulators are not, from a commercial point of view, a satisfactory solution of the traction problem.

## WOMEN AS CONDUCTORS.

A press dispatch from Chillicothe, O., under date of June 13, thus announces the inauguration of a system that is as yet a novelty in this country:

The electric street car line of this city adopted a new method of conducting business today by placing lady conductors on all its cars. Heretofore the cars had been in charge of the motorman and the fare deposited in boxes. Now the passengers will have their wants attended to by handsome young women, as only those of fine personal appearance have any chance of getting a job. Each lady is compelled to wear a ribbon on her hat with the word "Conductor" inscribed on it.

In reply to an inquiry the general manager of the Chillicothe Electric Railroad, Light & Power Company, J. P. Myers, confirms this report and states that the result has been a clean service and largely increased receipts. Prior to employing women no conductors were used on the cars except on such days as there were large crowds, and then the company would take such pick-ups as it could get, who always lacked experience and gave very unsatisfactory service.

Young women could be secured at a price that the company could afford to pay, and accordingly were hired. They work 10 hours a day with every seventh day off. When on duty they wear uniforms comprising blue skirts, shirt waists and sailor hats with the badges to designate their positions.

At first there was some little criticism of the company but this has been overcome and the women as conductors have come to stay. They were carefully chosen and the success of the experiment is attributed largely to their good behavior.

## INDIANAPOLIS THREE-CENT FARE CASE.

July 1, the supreme court of Indiana overruled a petition for a rehearing in the case of the city of Indianapolis against John N. Navin. This is the test case brought by the city against Navin because he refused to pay a 5-cent fare on the Citizens' Street Railroad, thus violating a city ordinance. This was the method taken to bring the merits of the 3-cent fare controversy before the state courts without putting the city in contempt of the federal court. (See REVIEW for June, 1897, p. 384, and p. 417.) In July, 1897, Judge Showalter, in the United States circuit court, refused to vacate the injunction issued in April restraining the enforcement of the 3-cent fare act because he held it unconstitutional. (See REVIEW for August, 1897, p. 513.)

In its late decision the Indiana supreme court says:

"We are constrained to adhere to our original opinion that the act in question, even if local and special, is not in contravention of any of the provisions of the constitution of this state as contended by the appellant. As to questions arising under the constitution of the United States, we should be constrained to follow the adjudications of the supreme court of the United States without in any wise considering whether such a construction should or should not commend itself to our independent judgment, but upon the requirements of the constitution of the state we are not at liberty to set aside or discard our own views, because of the fact that they do not meet with the concurrence or approbation of any other court however high, or any judge however eminent."

The result is that Mr. Navin will not be punished under the city ordinance, but he will nevertheless pay 5 cents when he rides, at least until the United States supreme court renders its decision on the appeal from Judge Showalter.

In a rear end collision of trolley cars on the Nostrand avenue line in Brooklyn five passengers suffered injuries.

## THE BUFFALO RAILWAY STORAGE BATTERY.

The Buffalo Railway Company has been using its new storage battery for some time, and is well pleased with the results. The battery was installed by the Electric Storage Battery Company, of Philadelphia. It occupies the ground floor of a new brick building especially constructed for it, the size of which is 40x90 ft. at the foundation. It is a one-story, fireproof structure, and stands at the south end of the company's power house on Niagara street. The battery room has a concrete floor and the tanks rest on double petticoated porcelain insulators, which stand on frames, the frames resting on insulating brick laid on the floor.

The capacity of the battery is 1,200 h. p.-hours. It consists of 270 cells, all in series, with 41 plates in each cell. The size of the plates is 15x15½ in. The positive plates weigh 24 lbs. each, and the negative plates 16 lbs. The outside dimensions of the tanks are 59⅞x21½x24¾ in. The tanks are not filled with plates, sufficient room being left so that the capacity of the battery can be increased two-thirds without new tanks being installed. There are ventilators in the ceiling by which the gases are carried from the battery room. A current of fresh air enters the battery room near the floor, and by this means the ventilation of the room is made most perfect.

The battery is operated in connection with the steam plant from 7 a. m. to 7 p. m.) and in connection with the converters during the night hours until it is fully charged. The converters are used in connection with the transmitted Niagara power, of which the Buffalo Railway Company now takes 2,000 h. p.

During the first few hours of the night the battery and converters take the load. From about 9 p. m. to 1 a. m. the

was made by the Western Electric Company and was furnished by the Electric Storage Battery Company. It has a capacity of 3,000 amperes at 70 volts, and performs the duties of regulating, charging and distributing the current of

BOOSTER FOR BATTERY.

the battery. It has two commutators in parallel, and the density of the current under the brushes under full load is under 20 amperes per sq. in. The booster is direct connected to a six-pole, 220-k. w. Western Electric motor. The diameter of the armature is 30 in.; the diameter of the commutator is 24 in. and its length 10 in. The booster proper is also a six-pole machine, the commutators being 29 in. in diameter by 21 in. long. The outside dimensions of the whole unit are 12 ft. 6 in. x 6 ft. 7 in. x 7 ft. in height; the total weight is about 45,000 lbs.

The ends of the battery are connected by leaded copper

MAIN SWITCHBOARD.

BOOSTER SWITCHBOARD.

BATTERY ROOM.

converters are charging the battery from the Falls line. It will be seen that it acts as a regulator on the steam plant during the day. The greatest demand for power comes about 6 p. m. each day and this demand the battery assists in meeting.

In connection with the battery a booster is used, which

bus bars to cables just inside the battery room walls, and the cables run to the switchboard. The switchboard stands on the gallery in the main room of the power house. It is made of black marble and is equipped with differential ammeters to show whether the battery is charging or discharging. Also with differential voltmeters for the purpose of

throwing the battery in parallel with dynamos or converters. A reversing switch connects with the shunt field of the booster for the purpose of changing the polarity of the booster to facilitate the charging and discharging of the battery.

There are two double pole switches, one for throwing the battery in parallel with the dynamo or converters, the second for throwing the battery through the booster or direct to earth, as circumstances may arise.

The power house of the Buffalo Railway Company is a model of neatness, and the care displayed in all parts is much to the credit of the superintendent, Thomas Henning. Mr. Henning is very much pleased with the new battery and its work.

### CENTER OPENING CAR FOR LIVERPOOL.

One of the greatest novelties, especially to American eyes, for street railway use is the center opening car recently designed and built by the J. G. Brill Company for the Liverpool

ing seat in it with reversible back so that the seating capacity is only diminished by two, this seat occupies the side opposite entrance. The open compartment is 13 ft. 10 in. and the closed compartment is 12 ft. 8 in. long; the width over the posts is 6 ft. 10 in. Both the platforms are provided with electric headlights; the dashers are 40 in. high and are continuous. The entrance to the platform is through a door in the V-shaped bulkhead, which forms the end of the car.

The constructive feature in which the builder will be most interested is that found in the vestibule where the side sills have to be entirely cut off, the support being a very strong iron frame work; this is shown under the lower step. The space between the two trucks beneath the step is covered by a screen in order to prevent people from slipping under the car between the trucks. The car is interesting because it is specially designed to meet the requirements of the service where a great many difficulties were encountered; the width and length were both limited by city ordinance, and in spite of this the seating capacity has been made 36. The

CENTER OPENING CAR FOR LIVERPOOL ELECTRIC TRAMWAYS.

Electric Tramways Company. It is 33 ft. over the dashers with end platforms only 21 in. long, the ends of the car being recessed so as to give the motorman room. The idea in its construction was to make a car which should take the place of the ordinary double deck horse car used in that city. It was desired for the sake of speed to have all the passengers on one deck and at the same time it was necessary to keep the car within the length of the ordinary horse car and its team. It might therefore be called a double deck car run tandem; the open compartment being placed on the same level as the closed, and the entrance made between the two.

The windows of the open part are closed by curtains in the usual way, no sash or blinds being employed. The closed compartment does not differ materially from the ordinary street car used in this country. The inside finish of the open part is quite plain, slat seats without coverings being used, and in the roof the carlines are exposed. The closed compartment has a bird's eye maple ceiling of three ply veneer and the seats and backs are covered with Wilton carpet; the trimmings throughout are of solid bronze. The sash in this compartment are arranged to raise 4 in., a plan which is finding considerable favor abroad.

The open platform or vestibule between the two has a slid-

standing room is of course small from the American standpoint.

This type of car was really made possible by the use of the "Eureka" maximum traction trucks; these give a very short wheel base which is very necessary in England because the percentage of curves to tangents is much larger than in this country, and hence a short wheel base is a great saving of power. The important feature however is bringing the body low and so using a single step. The speed in English cities is so limited that the double deck car, though much liked, cuts the average daily mileage down to a point where only a small profit remains; this car, so low that only a single step is needed, brings the mileage up as high as is possible with the limitations.

The officials of the new electric railway between Meriden, Conn., and Southington have proposed to the Meriden Electric Railroad Company that a connection be made between the two roads. President Heft has the matter under consideration. The rates of fare would be higher if the two railways operate independently but with an agreement between them it will be a great convenience to their patrons and encourage traffic.

### THE NEW DORNER TRUCKS.

The accompanying illustration shows the improved motor truck, "Criterion No. 11," made by the Dorner Truck & Manufacturing Company, of Cleveland, O. This truck has a wheel base of 7 ft. 6 in. and a spring base of 16 ft. which can, however, be changed to suit. There are half-elliptic springs over each journal box; on each side of the box are helical springs held in place by a frame suspended from the side bars; at the ends are four elliptic springs to prevent the car from oscillating.

The side bars go over the top of the journal boxes, a stronger construction than when they are bent around the boxes, and one that permits the removal of the wheels and axles in a few minutes, as when the side bars are beneath the journal it is necessary to take out all the bolts from the sill plate to remove the axles. The spring posts are so held as to give just enough side motion to take curves easily at high speed.

"CRITERION NO. 11" TRUCK, DORNER TRUCK & MANUFACTURING COMPANY.

The method of holding the helical springs is such that in case of breakage, they can be replaced by detaching the spring frame from the side bars; this is a new feature, and such repairs do not demand a pit or elevator.

To detach the truck from the car the spring posts are released from the brackets, which are riveted to the sill plate, and it is unnecessary to take out the bolts in the sill plate.

The truck is simple in design; malleable iron is used in place of cast iron; the brake is powerful, pulling on all four wheels alike. The boxes can be used either for grease or oil and a new dust guard which is very efficient is used.

### NO FREE TRANSFERS FOR ATLANTA.

Two years ago the city campaign in Atlanta, Ga., was fought on the issue of "free transfers on the street railways" and the advocates of free transfers elected their candidates. Accordingly the council passed an ordinance to the effect that after May 1, 1897, no street railway should charge more than 5 cents for a ride between any two points on its system, and should give free transfers. The Atlanta Consolidated Street Railway Company had opposed the ordinance, and after its passage the Old Colony Trust Company as trustee for the bondholders of the railway and one of the bondholders asked for an injunction against the city and the rail-

way company to prevent the enforcement of the ordinance.

The case was heard in the United States circuit court and the injunction granted in June, 1897. An appeal was taken and on May 31, 1898, the United States circuit court of appeals for the fifth circuit, affirmed the ruling of the lower court.

The city claimed the power to pass the ordinance from four sources. The claims were all disallowed, the court holding:

"1. Under the charter of the city of Atlanta there is no power given the general council and the mayor to pass and enforce the said transfer ordinance.

"2. The charters of the Atlanta Street Railway Company and the West End & Atlanta Street Railroad Company of which companies the Atlanta Consolidated Street Railway Company has become the purchaser and successor, do not make the rates of fare on the Atlanta Consolidated Street Railway Company's lines subject to the initial control of the mayor and general council of the city of Atlanta.

"3. The statute of the state of Georgia (Georgia Laws, 1890-91, Vol. 1, page 169) ratifying and confirming the incorporation of

street and suburban railroad companies, or any other acts of like nature, to which our attention has been called, do not give the right of regulating and fixing fares and transfer of street railways in the city of Atlanta.

"4. Under the constitution of the state of Georgia, which prohibits any street railway company from building upon the streets of a city, without its consent, and under the reservations made by the city of Atlanta in its ordinances granting such consent to the Atlanta Consolidated Street Railway Company, the power is not reserved to the city of Atlanta to pass any ordinance which it sees fit to compelling the Atlanta Consolidated Street Railway Company to give transfers and issue transfer tickets between the several lines of said company. These conclusions, and the reasons for which are found in the opinions of the circuit court on the demurrage disposes of this appeal. The decree of the circuit court appealed from is affirmed."

### OF INTEREST TO TRUST COMPANIES.

The supreme court of Illinois has affirmed the decision of the lower court in the case of the Lake Street Elevated Railroad, of Chicago, against the Farmers' Loan & Trust Company, of New York. This suit was brought to enjoin the latter company from foreclosing a mortgage for \$7,475,000. The holding is that the Farmers' Loan & Trust Company was not competent to serve as trustee because it failed to deposit \$200,000 with the state auditor of Illinois as required by law. This ruling is one which may affect all foreign trust companies doing business in this state.

## PERSONAL.

Joel Hurt, of Atlanta, is a candidate for alderman in Lis ward.

J. T. Funk on July 1 entered upon his duties as superintendent of the Louisville Street Railway.

C. W. Smith, president of the Los Angeles & Pasadena Electric Railway, has lately returned from an extended eastern trip.

H. R. Gowdy, recently of the Suburban, Unionville, Conn., is now chief engineer of the Meridan & Southington interurban.

William Ginnavan, for 15 years with one of the Baltimore lines, has become superintendent of the Red Bank (N. J.) electric railway.

John C. Dolph, of New York, eastern agent for the Forest City Electric Company, was married June 8, to Miss Rena Dickerson, of Brooklyn.

P. T. Corliss has been elected secretary of the Camden & Suburban Railway Company, Camden, to fill the vacancy caused by the death of Mr. Hall.

A. O. Kittredge, editor of "Accounties," New York, favored us with a call. He came to Chicago to deliver an address before a local association of accountants.

Charles S. Butts has charge of a surveying party on steam road work, and has headquarters at Ishpeming, Mich. He will return to street railway work in the fall.

W. E. Case, of Binghamton, N. Y., has been appointed superintendent of the Waverly Electric Light & Power Company in the place of G. N. Tidd, who has resigned.

George C. Ewing, who has been in the street railway supply business with offices at 8 Oliver street, Boston, is a sergeant in Company F, First Volunteer Engineer, U. S. A.

William E. Ham, secretary of the Nassau Electric Railroad, Brooklyn, recently entertained a party of 50 friends with a special trolley car ride, and at the Knickerbocker Field Club.

Edwin Warner, of Nashville, on June 25, succeeded Edward Lilly as secretary of the Chattanooga Electric Railway. Mr. Lilly resigned to become auditor of the Chattanooga Rapid Transit Company.

A. Langstaff Johnston, the well known consulting electrical engineer, of Richmond, Va., who is now completing the construction work at Mendota, Pa., was a REVIEW caller during his visit to Chicago last week.

William S. Prayton, of the New York office of the General Electric Company, was married on May 3, last, to Miss Alice Wait, of Ithaca, N. Y. Mr. Prayton is a Cornell man and passed through the Schenectady works before entering the New York office.

Henry C. Benaugh has been appointed superintendent of the Savannah (Ga.), Thunderbolt & Isle of Hope Railway. On leaving the Nashville Street Railway, where he has been for ten years, Mr. Benaugh was presented with a gold watch and chain by the employes.

B. L. Dickinson, superintendent of the Worcester (Mass.) & Marlborough Street Railway, was recently called out of bed to attend to a breakdown at the power house; when he arrived he found the employes of the company, who presented him with a watch and charm.

Wm. O. Hands, recently superintendent, and C. W. Mills, electrician of the Northeast Street Railway, Kansas City, have resigned to take Ohio and eastern states territory for a newly invented gasoline lamp specially suited for park illumination. They called on the REVIEW while en route to Cleveland.

George F. Chapman has been made general superintendent of North Jersey Street Railway Company. Mr. Chapman was formerly superintendent of the Elizabeth branch of the Consolidated Traction Company, of Jersey City, now leased by the North Jersey, and is succeeded in that office by James Smith, of Orange.

John J. Fitzpatrick, who for the past seven years was connected with the late Judge Grinnell, general counsel for the Chicago City Railway, has resigned to engage in the practice of law on his own account, a step he has contemplated for some time. His many friends will wish for him, and expect, a successful and brilliant career.

Capt. J. T. Jones and family, of Buffalo, have gone to Germany for a four months' visit. Captain Jones is president of the Niagara Falls & Suspension Bridge Street Railway Company. Last year he sought relief in Europe for heart trouble, and was so affected that he has returned for continued treatment. His numerous friends will wish him a full realization of all his hopes.

J. O. Haddox has resigned his position as superintendent of the Louisville Railway Company, of Louisville, Ky. Mr. Haddox has been connected with the above company for the past sixteen years, rising from the position of office boy to that of general superintendent. He is a young man of marked ability in street railway management, having a practical knowledge of all its different branches, and it is only a matter of a short time until he is identified with some one of the large street railway systems of the country.

## NEW PUBLICATIONS.

The June issue of the "Canadian Electrical News," of Toronto, was a special number, attention being given to the electrical features of Montreal where the eighth annual convention of the Canadian Electrical Association was held June 28, 29 and 30. The Cataract Power Company's works were illustrated and described, a map showing the lines and offices of the Bell Telephone Company in Canada was given, portraits were shown of prominent electrical men including two street railway managers, which together with the other contents illustrated the rapid developments of electricity in Canada.

The street railway guide to Eastern Massachusetts and Rhode Island, published by Robert H. Derrah who has been connected with the West End Street Railway Company for the past nine years, is the most complete of any like publication which comes to our notice. It contains a map showing 1,368 miles of electric railway and in addition gives complete tables of routes, rates of fare, distances, etc. The edition for '98 has 160 pages of reading matter describing all the principal points of interest along the lines of the railways, illustrated by 90 half-tone cuts. For anyone desiring to take business or pleasure trips through the many cities and towns in this section the guide will be a great help. Price 15 cents.

We have received "American Street Railway Investments," the financial supplement of the "Street Railway Journal," and commonly known as the "Street Railway Red Book" for 1898. This is fully up to the high standard of previous years and gives the data for 1897; most of the reports bear the date of April, 1898. On pages 1 and 2 are tabulated the gross receipts of 175 of the principal companies for the last two years; the companies are in five groups according to their gross earnings. From these tables it appears that the street railways of the country have just about held their own in 1897. The operating statistics and balance sheets are presented in tabular form and the returns for previous years given so that reference to previous additions are not necessary to make comparisons.

The earnings of the Montreal Street Railway Company show a very creditable increase over those of a corresponding time last year. For eight months preceding June 1 the receipts were \$902,000 or \$80,680 more than eight months of the preceding year.

**THE UNCONSCIOUS OWNERSHIP OF AN IMPORTANT KEY.**

**A Plea for the Introduction of Goods Traffic on Our Suburban Tramways.**

Abstract of a Paper read before the Canadian Electrical Association, by  
W. T. Bonner, Montreal.

The first consideration in exploiting any new suburban tramway is the possible or available passenger traffic. That being found inadequate to guarantee a fair return on the cost of installation and maintenance, the project is usually abandoned for the reason that only passenger traffic can be considered, owing to the high cost of handling goods traffic at the terminals. While a motorman and conductor are sufficient to handle a two or three-car electric train for passenger traffic, with very little expenditure of time or assistance for loading and unloading, all railways under present systems require a large additional force to conduct the hundreds of details attending the reception, checking, loading, transferring, unloading and proper delivery, in good order, of either car lot or package freight.

It is not the railway investors alone who suffer the effects of this handicap, but the property owners also, since the latter have no recourse, while the capitalist has but to seek other more profitable fields for investment.

It may therefore be conceded that the whole subject presents two phases of commercial economy, viz.:

(a) From the standpoint of the agriculturalist and land owner; how best to provide a means for increasing the value of remote but otherwise valuable agricultural lands, and at the same time retain present value of adjacent property by converting it from market gardens into residence and manufacturing sites.

(b) From the standpoint of the capitalist and manager of railway properties; how best to increase the earning capacity of existing or proposed suburban lines.

With the ever increasing centralization of population and commerce, inaccessible property becomes less valuable; all land, whether barren or fertile, suffering alike, according to its distance from the centre of demand for farm products, which we call markets. Such distance is not always measured in actual miles, but rather in accessibility, since in our day we find frequent examples of the paradoxical long and short haul rates. The Minnesota and Manitoba farmers will deliver their wheat at the seaboard at a lower cost per bushel than the farmer who may live a hundred miles off the coast. The eastern farmer may have just as fertile land as his western competitor, but he is handicapped by having to haul his wheat 40 or 50 miles over poor wagon roads to reach the nearest railroad.

In either case, the terminal charges, including the cost of loading the produce at the farm, is approximately the same, but the difference in cost of haulage per ton-mile by railroad and wagon road is so tremendously in favor of the former that without such facilities the farmer may as well retire from business. It has been stated as a fact that to transport a ton of coal from Buffalo to Chicago costs no more than to move the same quantity of coal across the sidewalk in either city.

While railroads have changed the character of suburban passenger traffic, they can never entirely supersede the common road for freight, since every ton carried by them must be delivered over a highway at one or both terminals.

The following table shows the results of actual observations on the cost of moving a load of one ton a distance of one mile on level roadways, with different pavements and under average conditions:

Iron Rails .....	1.28 cents per ton-mile
Asphalt .....	2.70 cents per ton-mile
Stone, paving, dry and in good order.....	5.33 cents per ton-mile
Stone, paving, ordinary condition.....	12.00 cents per ton-mile
Stone, paving, covered with mud.....	21.30 cents per ton-mile
Broken Stone, dry and in good order....	8.00 cents per ton-mile
Broken Stone, moist and in good order...	10.30 cents per ton-mile
Broken Stone, ordinary condition.....	11.90 cents per ton-mile
Broken Stone, covered with mud.....	14.30 cents per ton-mile
Broken Stone, ruts and mud.....	26.00 cents per ton-mile
Earth, dry and hard.....	18.00 cents per ton-mile

Earth, ruts and mud.....	39.00 cents per ton-mile
Gravel, loose .....	51.60 cents per ton-mile
Gravel, compacted .....	42.80 cents per ton-mile
Plank, good condition.....	8.80 cents per ton-mile
Sand, wet .....	32.60 cents per ton-mile
Sand, dry .....	64.00 cents per ton-mile

On rough roads the load a horse can draw is much diminished—it is estimated that while a horse can pull 6,270 lbs. on a level track, on a 10 per cent grade he can draw but 1,630 lbs.

From the table and statistics gathered by official bureaus it is calculated that the average cost of transportation by animal power is 25 cents per ton-mile and where such a high rate exists, land must diminish in value. A forcible illustration is the fact that a Long Island farmer, 50 miles from New York city, where potatoes were jobbing at 80 cents to one dollar per bushel, was recently obliged to sacrifice his entire crop, because it would not pay to haul it to market.

The measure of benefit which any improvement in production in one community bears to another community, depends entirely upon the transportation facilities between the two places. Recently a customer came into our office from one of the interior mining districts. We estimated the plant he required would cost \$1,255. To help him out all we could, we eliminated every possible item not absolutely essential to the proper working of the plant, and allowing also for erector not being required, we found we could reduce our price 10 per cent, making the net total \$1,130. But how insignificant our discount appeared when we learned the freight from Montreal to the mine would cost \$1,248, notwith-

FIG. 1.—BONNER RAIL WAGGON.

standing no part of the route required mule-back transportation. Although farther distant from Montreal, the same plant could be transported to Vancouver for less than \$250.

Concentration of population and production requires for the better equalization of supply, and price of materials and provisions, that such centres must be provided with commercial veins and arteries which shall quickly and cheaply transport or exchange urban and suburban passengers and commodities. While long haul rates of transportation by railroads and steamships have been wonderfully cheapened, there still remains a space of fifteen to twenty-five or even forty or fifty miles surrounding every commercial centre, which has never been covered by any cheap method of transportation. Such distances are beyond the possibility of cheap or efficient service by animal power, and the terminal charges and bulky plant required, preclude any possibility of much reduction in railroad tariffs. What we require, therefore, is a new system of transportation which shall be alike available for freight and passengers.

In 1894 the writer promoted a scheme for uniting one of the large commercial centres on Lake Erie with several surrounding counties by a system of electric railways which would combine both freight and passenger traffic. The arrangement was such that the farmers anywhere along the line would secure the immediate benefit of the higher city market rates for their produce, as well as competitive selection and prices for supplies. Local and sub-stations were to be established at frequent points along the line where the farmers could deposit their produce to be forwarded by next train to a central clearing house in the city from whence it could be delivered at once to the consumer. The scheme

was to be co-operative in a measure, the subscribers to receive the first benefits. Telephone connection was to be established between the city and farm residences through the company's local stations, and direct orders for goods from the city merchant could be received by wire and despatched by next train out. Only samples, or a very limited supply of staple goods, were to be kept at the local stations, the principal stock to be maintained at the central clearing house, and by the various city merchants who belonged to the syndicate. Electric current for light and power was also to be supplied to consumers along the line. In short it was proposed to so unite city and country by wire and rail that all would enjoy equal facilities for obtaining supplies.

Unfortunately the financial depression of that year so handicapped our efforts that we were unable to carry out the project, but those who gave the subject most careful consideration at the time still expect to see some such system as the above in general use.

The latest development in the line of providing for goods traffic on electric tramways came to the writer's notice some months ago in the shape of a combination vehicle, so constructed as to be readily convertible for use upon any ordinary roadway or upon a railroad track. It can be shifted from one to the other at will, without the necessity of reloading or rehandling the contents between points of shipment and destination. The idea is not altogether new, but the application will no doubt impress you all as novel in the extreme.

Notwithstanding the similarity of names the writer begs to disclaim any connection with the introduction of this scheme, but

FIG. 2.

nevertheless the principle involved certainly commands attention.

The Bonner Rail Wagon Company, organized about a year ago, states in its prospectus that it will build rail wagons and operate them through leases or franchises granted to interurban electric railroads. It is proposed that such roads shall be equipped with any stipulated number of rail wagons, thus enabling them to supply patrons at any point along their lines, or at the terminal stations.

Figure 1 illustrates the integral parts of the combination vehicle. The wagon proper is patterned after the ordinary improved road wagon, modified, of course, for the special nature of the service contemplated. The running gears and springs are of standard construction, having a carrying capacity of from three to seven tons, depending upon the class of freight to be carried.

The rail truck is not materially different from the car truck in general use upon our electric railways, except that it is provided with special attachments for automatically gripping and supporting the wagon proper. The truck is exceedingly simple in design and very light in proportion to its strength, being constructed entirely of wrought iron and cast steel.

Figure 2 illustrates a train of five wagons drawn by a familiar-looking electric locomotive en route across the country.

Such a system as this would at once render accessible endless acres of fertile interior lands, and open them up to the systematic energy of the thrifty market gardener, the dairyman and the fruit grower. Improved conditions would result to the truck farmer, who would no longer be obliged to spend his night in long weary drives in order to reach the early market. Instead, his day's harvest would be transported to town during the night by electric rail wagon while man and horse refresh themselves in sleep.

Thus would we increase the market value of distant agricultural lands, and at the same time retain present values of nearby property. With the increase of land values and production, must also come increased traffic for existing or proposed suburban railways.

## WIND STORM AT CINCINNATI.

On June 24, a severe wind storm swept over the Ohio valley doing much damage in Cincinnati and the vicinity.

CAR BARN DAMAGED BY WIND STORM.

Among the buildings damaged was the car barn of the Cincinnati, Newport & Covington Street Railway, a portion of the roof being carried away as shown in the accompanying illustration.

## THE DUPLEX CAR.

One of the interesting exhibits at the coming convention at Boston will be a car so made as to allow the sections to slide into the roof much the same as a roll top desk. It combines a perfect winter and summer car in one and can be opened and closed at will to suit all conditions or sudden changes of weather. The Duplex Car Company, which has its offices in the Postal Telegraph Building, New York, has been perfecting this type and now has manufacturing arrangements which ensure prompt deliveries. Such cars in taking the place of two equipments, effect a great saving in first cost, maintenance of car bodies, motors, trucks and appliances as well as simplifying the question of storage and insurance. Such a car when placed on the track would be suitable for service the year around. While it is an advantage to the company it also adds to the comfort and convenience of the passengers who can raise and lower the panels at will.

During the past year or two the cars have been put through some severe tests on several New York and New England roads with entire success. The strength and durability of the car can not be doubted as these have stood the service as well as the other cars. This type can be made even more substantial than the standard car. The posts are in one piece curved from sill to sill, thus dispensing with the joint at the roof.

## FENDERS FOR CHICAGO AND WASHINGTON.

The Chicago city council which a few months ago passed a fender ordinance which failed to stick, has again tried its hand and passed an order for the equipment of all cars with basket fenders by September 1.

In Washington, D. C., the District Commissioners have changed the police regulations and making a ten dollar fine the penalty of any motorman or conductor running a fenderless car.

**OBITUARY.**

M. W. Squiers, who was one of the pioneers of Chicago and superintendent of the North Chicago Street Railroad Company early in its history, died in this city June 20. He was 66 years old and leaves a widow, two daughters and three sons.

Captain John A. Williamson, one of the pioneer street railway men in Cincinnati and the Kentucky cities across the river, died at his residence on July 8, in Newport, where he has lived since 1833. He was born at Portsmouth, O., July 9, 1826, and was a pilot on the river when a young man. He was afterwards the owner of the Cincinnati and Newport ferry and was president of the company which constructed the Newport bridge. He operated the horse car lines between Cincinnati and Newport for twenty years and negotiated the consolidation of all the lines on the Kentucky side of the river.

**NEW LINE BETWEEN MINNEAPOLIS AND ST. PAUL.**

The first trip on the Como interurban line was made on July 1 by Thomas Lowry, president of the Twin City Rapid Transit Company, Vice-president C. G. Goodrich, General Manager W. J. Hield and a party of 20 which started from Minneapolis in a special car. Leaving Como Park station the line skirts the south end of the park and then passes directly through it and on Langford avenue to the fair grounds. From this point until the old county road is reached Langford avenue is followed. The line passes within a short distance of the experimental station, through St. Anthony Park and then on the county road until it reaches and connects with the line in Minneapolis known as the Como and Kenwood. The scenery along the line is picturesque and it is expected that the attractions at Como Park will draw large numbers of visitors.

**FREIGHT ON TROLLEY CARS IN PITTSBURG.**

The committee on corporations of the Pittsburg council has reported favorable on ordinances granting to the Pittsburg, Oakland & East Liberty, the Citizens' Passenger Railway and the Central Traction companies, all leased roads operated by the Consolidated Traction Company, the right to carry packages, produce and freight. No more than 50 freight cars can be operated on each line and no car can be stopped at one point longer than five minutes. The charters of these three companies are the oldest in the city and are the only ones which provide for such privileges. The scheme if carried out will be a boon to many business houses and those living in outlying districts and will in no way interfere with the rapid transit of passengers.

**PRIVATE RIGHT OF WAY FOR WISCONSIN ROAD.**

The promoters of the electric line to be built connecting Oshkosh, Omro and Berlin, Wis., have asked for franchises from the towns of Algoma, Omro, Rushford, Nepeskun and Berlin and are trying to secure from the farmers a strip of land 15 ft. wide through their property. It is believed that this will be readily granted as the electric line will greatly enhance the value of property besides furnishing splendid transportation facilities to that locality.

**SPECIAL LAKE SHORE TRAIN TO CONVENTION.**

The Lake Shore & Michigan Southern Railway proposes to run a special train from Chicago to Boston to accommodate western delegates to the Street Railway Convention, which opens Tuesday morning, September 6, and lasts four days. The leaving time is set for 10.20 a. m. Sunday, September 24, which will bring the train into Boston early Monday afternoon, in ample time to get settled at hotels before evening. The train service for this trip will be the finest sleeping, dining and buffet cars, and every possible comfort will be provided for. Delegates from Ohio and southern points will join the party at Cleveland, and others at Buffalo and Albany. The route will be over those famous lines, the Lake Shore, New York Central, and Boston & Albany, than which there are no finer in the world.

Passengers coming over the Big Four will have their through sleepers attached at Cleveland. The party promises to be a large one, and special pains will be taken to make the trip a highly enjoyable one. The full details will be announced in the August REVIEW, and in circulars which will be sent out by the Lake Shore officials in a few days.

**CHICAGO CITY RAILWAY'S BIG CAR ORDER.**

President Bowen, of the Chicago City Railway, has given an order to D. W. Pugh, representing the Stephenson Company, for 100 closed cars 20 ft. body. The interior finish will be cherry. Both ends will be vestibuled, with doors. The McGuire truck will be placed under 65 cars, and the remainder mounted on the new truck invented by Master Mechanic Moore. The motor equipment will be Westinghouse, the order having been secured by Maurice Coster, Chicago manager. Columbian heaters will be placed in each car.

**ELECTRICITY ON THE CONSOLIDATED.**

It is stated that President Clark, of the Consolidated Railroad, has given orders that the plans and work on the Warren and Bristol branch for operating it by electricity be pushed as rapidly as possible. Future competition from trolley lines brought about the change. Experience from the two electric lines now operated by the Consolidated Railroad will be of great value in preparing the plans. The power station will be located at Warren, R. I., and the line will extend southeast on the peninsula to Bristol and north-west to East Providence where connection will be made with the Union Railroad Company, of Providence.

**AN ARMY AND NAVY**

Memorandum book is what you have been wanting. The Northern Pacific has it. It contains cut of the Maine, Map of Cuba, List of United States and Spanish Naval Vessels, Interior Drawings of a Battle Ship, Illustrations of United States and Spanish Ships, Glossary of Navy and Army Words, Table of Distances, Commanders of United States Ships and Army Corps, List of United States Regiments and Their Commanders and other information very useful and valuable at this time.

The book fits the vest pocket and is up to date. Send Chas. S. Fee, General Passenger Agent, N. P. R., St. Paul, Minn., ten cents and the book is yours.

## ECHOES FROM THE TRADE

The Jackson & Sharp Company is building a car for the Dodge Kinetic Motor Company.

The Okonite Company, New York, is sending to its friends an artistic picture handsomely framed.

H. H. Lowe, of Clinton, Mass., has the contract for the new car house of the Worcester & Clinton street railway.

J. M. Atkinson has been on a trip to New York and the east and has closed several good orders for his flexible horse shoe rail bonds.

H. N. Ransom, the New York agent of the Consolidated Car Heating Company, is taking a well earned vacation of three weeks.

The Western Gear Company, Milwaukee, is extremely busy and operating its works day and night, with a large number of orders in hand.

Orders recently received for "Chicago" bonds, made by Washburn & Moen Manufacturing Company, are quite large and come from all parts of the world.

A. C. Vosburg, of the New Process Rawhide Company, Syracuse, reports a highly satisfactory condition of business in steadily increasing orders for rawhide pinions.

The Pennsylvania & Ohio R. R. Co. has been granted a franchise by the commissioners of Lake county, to build an electric railway from Painesville to Conneaut, in Ohio.

Reports come to us that numerous street railway companies, in all parts of the country, are finding that foot cycle "academies" are highly profitable attractions for summer resorts.

The Westinghouse Electrical & Manufacturing Company has sold 76 double equipments of motors to the Cleveland Electric Street Railway Company; they are of type 49, 35 h. p.

The C. W. Hunt Company, New York, has issued two handsomely illustrated catalogs describing the Hunt cable and the Hunt automatic railway for handling coal, merchandise, etc.

The Duplex Car Company formerly at 147 Franklin street, Boston, has opened an office at 253 Broadway, New York, which is in charge of W. B. Crittenden, vice-president of the company.

Frank A. Lapham, general sales agent of the Cleveland Frog & Crossing Company, was in New York during the last week in June and was successful in getting a very large order for special work.

Mayer & Englund, Philadelphia, have been appointed agents for the American Rail Joint Company in the territory comprising New Jersey, Pennsylvania, Maryland, Virginia and the District of Columbia.

J. A. Hanna, of Chicago, western agent for the Peckham Company, spent several days in New York recently. From the sales made it is evident the Peckham trucks are as popular in the west as in the east.

The American Rail Joint and Manufacturing Company, of Cleveland, O., has appointed Wendell & Macduffie, 26 Cortlandt street, New York, and 53 State street, Boston, its agents for New York and New England.

J. W. Gardner, recently connected with the Stirling Boiler Company, and for a long time western manager for Manning, Maxwell & Moore, has accepted a position with the sales department of the Sargent Company.

Elmer P. Morris, 15 Cortlandt street, New York, reports an increase in both home and foreign trade. The extension of the foreign business necessitated the services of a correspondent who is familiar with several languages.

John High, selling agent for the Pantasote Company, spent two weeks at Saratoga where the conventions of the Master Mechanics' and the Master Car Builders' Associations were held, and secured several large curtain orders.

W. D. Sargent, president of the American Brake Shoe Company, sailed on the Britannic, July 6, for Europe, to make arrangements for the manufacture of the "Diamond S" brake shoes in several European countries, including Russia.

A. S. Littlefield, president of the North American Railway Construction Company, Chicago, reports closing contracts with the Metropolitan Railway, of Kansas City, for the construction of one mile of double track, and 6,000 cast welded rail joints.

By reason of the extreme rush of business John A. Brill, of the J. G. Brill Company, is so closely confined that he is unable to serve as a director of the General Electrical Automobile Company, as was generally given out at the starting of that organization.

The Sargent Company announces the largest month's business in patented brake shoes in the history of the company, for June, 1898. It is extremely busy in the steel department and running to the full capacity, with prospects of heavy business throughout the year.

The latest catalog from the Walker Company is one entitled "Some Lighting Plants," describing briefly and illustrating by half tones some of the fine isolated lighting installations of that company in hotels and office buildings in New York, Cleveland and elsewhere.

An extremely interesting and attractive booklet is "Electrical Expertism," by an expert. Forée Baiñ, Monadnock building, Chicago, is the expert and in this book he points out a few of the reasons why one about to install an electric plant should consult an engineer.

The General Electric Company will have an exhibit at the Twentieth Triennial Exhibition of the Massachusetts Charitable Mechanic Association in October. This, it will be remembered, is to be in the hall where the American Street Railway Association holds its conventions.

The Patton Motor Company, 340 Dearborn street, Chicago, has issued an illustrated catalog describing the application of the Patton electric motor system to suburban and interurban railways. Some interesting data are given, taken from severe tests and with the motors in service.

In abstracting the proceedings of the Municipal Electrical Association (England) the "Electrical Review," London, says: "The nearest approach to a satisfactory rail joint is the Falk joint, and it does not seem improbable that a cast joint of this type will, sooner or later, come into general use in England."

Business is very brisk with the Sterling Supply & Manufac-

turing Company, several large consignments of registers having been made, and orders are booked for overhead material. The secretary, Mr. Tiffany, and two of the office force, have enlisted in the army, which throws a great deal of work on Mr. Carson.

The Jackson & Sharp Company, Wilmington, Del., is completing an order of nine-bench open motor cars for the New Castle (Pa.) Traction Company, and an order of double truck closed cars for the Sea View Railway Company at Narragansett Pier, R. I. Twenty double-deck cars have recently been shipped to South America.

The Peckham new "extra heavy double trucks" have recently gone into service on the following roads: Cleveland, Berea, Elyria & Oberlin Street Railway, Cleveland; Dayton & Western Traction Company; St. Louis & Belleville Suburban; and Omaha & Council Bluffs. From each of these roads reports come of excellent service and perfect satisfaction.

The Baltimore Consolidated Railway Company, on June 23, ordered 150 cars to replace those burned in the fire at Irvington. The contract for 75 convertible cars went to the J. G. Brill Company, Philadelphia. The Brownell Car Company, of St. Louis, is to build 75 closed cars. The Baltimore Car Wheel Company furnishes all the wheels, and the Westinghouse Company the motors.

The Toledo Traction Company has recently ordered of the Barney & Smith Car Company 14 closed cars for September delivery; they have 20-ft. bodies, vestibuled at the front end and with rear platforms 4 ft. 6 in. long. They will be fitted with Columbia stoves. The company has also ordered 10 trucks of the McGuire Manufacturing Company and 16 fare registers of the Sterling Supply & Manufacturing Company.

G. E. Pratt has been appointed representative of the Ajax Metal Company, Philadelphia, manufacturer of journal bearings, trolley wheels, harps and electric metal supplies, and has taken in con-

nection therewith the agencies of the Forsyth Brothers Company, of Chicago, maker of car curtains and fixtures, and the Jackson & Sharp Company, Wilmington, Del. Mr. Pratt's office is room 1103, Betz building, Philadelphia.

The Ball Engine Company, Erie, Pa., has issued a new catalog (11) descriptive of its automatic cut-off engines for electric lighting, electric railway and general manufacturing plants, which comprise simple and tandem and cross compound horizontal engines and simple and compound vertical engines. Both direct-connected and belt driven units are shown. The pamphlet has 40 pages and is typographically perfect.

The Crane Company, of Chicago, through G. A. Hurd, has lately closed contracts for piping and valves from the Bluff City Electric Railway Company, Chicago, and the Indianapolis Electric Light & Power Company; it also has orders from the North American Chemical Company, Bay City, Mich.; the Imperial Electric Light Company, St. Louis; the Deering Harvester Company, Chicago; Hegeler Zinc Company, La Salle, Ill., and others.

W. S. Cleveland, manager of "W. S. Cleveland's Greater Massive Minstrelsy" and "George Wilson's Model Minstrelsy of the World," was obliged to refuse a very flattering offer for a month's engagement of these two shows (the latter half of July and the first half of August) at the Willow Grove Park of the Union Traction Company, Philadelphia, because his season does not open until August 1, and the August contracts are all closed.

The Walker Company, on account of rush of work and consequent need of additional space, has found it necessary to add to the large machine shops it already possesses at the Cleveland works. These machine shops alone consist of three bays each 400 ft. long and the addition will consist of a fourth bay. Work is being rapidly pushed and the new bay will be shortly completed and ready to receive the large machine tools which are to be placed there.

Eugene Munsell & Co., of 117-119 Lake street, Chicago, are sending to their western customers a very neat blotter, on which are embossed the Cuban and American flags, under which are the words, "Victorious on Sea and Land." The printed matter beneath these words refers to the rapid development of a great business in a great city and that they don't need any better advertisement as to the superiority of their "Mica" or service rendered.

The Babcock & Wilcox Company reports sales for the first six months of 1898 as greatly in excess of first 10 months of 1897. A notable order which it is now filling is that for the 96th street power station of the Metropolitan Street Railway Company, New York. This order for 15,000 h. p. of wrought steel type boilers is the largest stationary boiler order ever placed. Previous sales to the Metropolitan Company amount to 7,500 h. p. Sales to electrical industries in 1898 to this date aggregate 37,511 h. p.

The Calumet Electric Street Railway Company of Chicago, is replacing the 11 Detroit dynamos in its power station with four 250-k. w. Walker generators. These will be belted to four cross compound condensing Buckeye engines which have been driving the old dynamos. The new machines, together with the General Electric 800-k. w. direct connected unit, will give ample power for the heavy summer traffic. The switchboard will be reconstructed and a General Electric 5,000-ampere recording wattmeter will be placed on the station panel.

The Charles Munson Belting Company has taken the entire ground floor at 22 to 36 Canal street, Chicago, in addition to the upper doors, which it has occupied for a number of years. The Chicago house is under the management of the secretary, A. E. Grotzinger. The electrical and railway departments are in charge of Col. J. H. Shay, who has a very extensive acquaintance among the trade. Among recent sales are two 60-in. belts to the United Electric Company of Washington, D. C., and one 60-in. belt to the street railway at Danville, Ill.

The Goubert Manufacturing Company, 14 and 16 Church street, New York, has secured from the Metropolitan Street Railway Company, of that city, the contract for feed water heaters for the mammoth power station being erected at 96th street and East river. The first installment consists of 30,000 h. p. in six heaters, horizontal type, and rated at 5,000 h. p. each. They are to be placed between the low pressure cylinders and the condensers. This is said to be the largest single order for feed water heaters ever placed in this or any other country.

Frank C. Randall, eastern selling agent for the Christensen Engineering Company, has obtained some very good orders for air brakes. Among others may be mentioned one from the Lowell, Lawrence & Haverhill Street Railway Company, the brakes to be used on the suburban cars running between Lowell and Lawrence and Lowell and Haverhill; one for the equipment of the suburban cars of the Brockton & Taunton Street Railway Company, and additional orders for the electric cars on the three divisions of the New York, New Haven & Hartford Railroad.

There has been a growing demand among belt users for a more convenient form of belt dressing than the paste. The Joseph Dixon Crucible Company, Jersey City N. J., is now placing on the market a solid belt dressing in round bars, about 8 in. long and 2 in. in diameter. It makes a package convenient to the hand, and easy to apply even to fast running belts. The company does not claim that the solid dressing is as good a preservative of the life and elasticity of the leather as the Dixon paste, but it is quick to apply and quick to act, and that is what is wanted by the general run of belt users.

The Billings & Spencer Company, of Hartford, Conn., has published a new list of drop-forged lake copper commutator segments for all standard sizes of street railway motors. Full sized cuts representing the form and dimensions of all the standard commutator segments for T. H. Edison, General Electric, Westinghouse, Walker, Steel, Short, Rae and Ganz street railway motors are given. The number of divisions, the angle of segment, the

weight of single segment, the chord for 1 in. radius are printed on each cut. The catalog is complete and will be of value to every street railway electrician.

The annual meeting of the stockholders of the Siemens & Halske Electric Company of America was held on June 16 at its offices, Monadnock block, Chicago. Nearly the entire capital of the company was represented at the meeting and the following gentlemen were elected directors of the company: Chas. T. Yerkes, Martin Maloney, John R. Bartlett, R. Suydam Grant, Charles E. Yerkes, E. A. Moore, B. W. Grist, Howland Coit, W. L. Elkins, Jr. The new board of directors was organized and the following gentlemen were elected officers of the company: Chas. E. Yerkes, president; W. T. Block, secretary and treasurer; C. F. Marlow, assistant secretary and assistant treasurer; B. W. Grist, general manager; Martin Maloney, Chas. E. Yerkes, J. R. Bartlett, executive committee.

In the "Series-Parallel Controller Case," decided in favor of the General Electric and Westinghouse Companies in the United States circuit court for the district of Connecticut, Judge Townsend, on June 13, denied a motion for a rehearing, and on June 16 entered a decree for an injunction to prevent further infringement of certain of the claims, and an order for an accounting; as to certain other claims, not infringed, the bill was dismissed. In the "Electric Railway Motor Suspension Case," an injunction against the Nassau Electric Railroad was ordered June 29, in the United States circuit court for the eastern district of New York, the opinion in favor of the General Electric and Westinghouse companies having been handed down in the court of appeals, May 17.

The directors of the General Electric Company, at their recent meeting, voted to recommend to the stockholders a reduction in the share capital of the company, both common and preferred, of 40 per cent. This settlement, while satisfactory to the common stockholders, is regarded as particularly favorable to the preferred shareholders, inasmuch as it will render unnecessary the taking of any steps for the liquidation of the company, in which event the preferred stockholders would receive only the same amount as the common stockholders, and no back dividends. The plan now adopted contemplates the payment from the surplus earnings of the company as they are hereafter made, of the accrued dividends in the preferred stock.

On the new basis \$1,275,000 will be required annually to pay 7 per cent upon the preferred and 6 per cent upon the common stock. The stockholders' meeting will be held at Schenectady, August 16, at noon.

## IF YOU LEAVE HOME

For the summer, go where you will find, almost literally, a new world. Such a spot is Yellowstone Park. There is no place like it in the South, nor elsewhere. You will be astonished at what you see and learn there. A month's outing in those mountains, 7,000 feet above the sea level, in an atmosphere pure and invigorating, would add years to your life. There are four modern hotels, good roads—maintained by the U. S. Government—for riding, driving or cycling; riding horses and pack trains. Geysers, canyons, mud springs, lakes, cataracts and cascades in large number, are crowded into a space 54 by 62 miles in size. If you can afford it, you wrong yourself by not going there. If you cannot afford it, then go to beautiful Leech Lake in Minnesota, a new and popular resort. New hotels, fine fishing and hunting, and good boating at reasonable rates. Send Chas. S. Fee of Northern Pacific Railway, St. Paul, Minn., six cents for Wonderland '98 that describes by pen and picture both resorts. Mention where advertisement was seen.

A serious collision occurred between two trolley cars on the single line of the interurban between Corapolis and Carnegie, Pa., due to the failure of a signal lamp to work. The motorman of one of the cars was severely though not fatally injured and five of the passengers were more or less hurt.

**HALE FARES**

WESTERN UNION BLDG. CHICAGO, ILL.

The Tonawanda Electric Railroad Company has made another application to the common council of Niagara Falls for a franchise to run through various streets in that city. The matter will be considered on July 25.

One of the conductors of the Atwood street line of the Consolidated Traction Company, of Pittsburg, while leaning out of the side of his car was struck on the head by a car passing in the opposite direction and fatally injured.

The Tarrytown, White Plains & Mamaroneck electric railway, connecting these towns on Long Island Sound and the Hudson river is completed and in operation. The franchise permits the company to carry both freight and passengers.

The new line of the Quincy & Boston Street Railway to Weymouth Landing was formally opened to the public, June 11, and the occasion was duly celebrated by the railway and municipal officials and the residents along the line.

President Henry Fisher, of the Southern California Power Company, has purchased a controlling interest in the Redlands Street Railway Company and it is expected that the road will be extended and equipped with the electric system.

The interurban road between Newport, R. I., and Fall River, Mass., is now in operation. It required two hours for the first car to run between the two cities on June 19, but the regular schedule time will be 30 minutes less than that.

The stockholders of the Northern Traction Company have elected J. W. Lovett, of Anderson, Ind., president and W. W. Huffman, manager. The electric line will be built from Michigan City, Ind., to Laport. The capital stock is \$150,000.

President John L. Heins, of the Coney Island & Brooklyn Railroad Company, has purchased for \$60,000 the property of the Vanderveer estate in Coney Island, and a handsome terminal for the company's cars will be erected immediately on this site.

A dangerous-looking article, believed to be a dynamite bomb, was left on a car seat of one of the Capital Traction Company's cars, in Washington, D. C., by a mysterious stranger. No damage resulted, and the thing was delivered to the police.

Postmaster Hutchins, of Cleveland, is in Washington, urging the postal authorities to establish street railway mail service in Cleveland. It is said that mail cars will soon be running on the street car lines of that city if the wish of the citizens be regarded.

The initial trip on the Fox River Valley Interurban line between Neenah and Appleton was made June 19 and the line is already doing a good business. The cars are large double truck, interior finish in oak, and were built by Barney & Smith, Dayton.

July 4 and 5 were very heavy days for the Exeter (N. H.) Street Railway, and Superintendent McReel has received hearty congratulations upon the way in which the traffic was handled. Nearly 18,000 fares were registered each

day, and in addition the baggage cars were placed at the disposal of the doctors and used to bring to Exeter those killed and wounded in the severe storm.

The Birmingham (Ala.) Railway & Electric Company issues an eight-page vest-pocket folder, giving the time tables of the various street railway lines of the company and lists of the public buildings, churches and places of interest that may be reached by each.

On application of Thomas Lowry, one of the stockholders of the Duluth (Minn.) Street Railway Company, President L. Mendenhall was appointed receiver. This action was taken as a step in the reorganization made necessary by excessive capitalization.

After a spectacular performance at Clear Lake, Ia., three trains of the Mason City & Clear Lake Traction Company were returning home heavily loaded. There was a rear end collision and about 20 passengers slightly injured. The cars were badly damaged.

The Middletown (Conn.) Street Railway Company opened its Lakeview Park, at Crystal Lake, July 4. There are 15 acres in the park; the company will build a theater and all arrangements have been completed for the entertainment of visiting crowds.

The Milwaukee, Racine & Kenosha Railway Company has added some improvements to Piper's grove which is naturally a beautiful tract of land just north of Berryville. It is expected that many picnics and excursions will go there this summer, especially from Racine.

One of the Brooklyn trolley cars met with an unique accident a few days ago. While passing beneath the elevated railway structure the trolley jumped the wire and caught in the trough and the entire top of the car was pulled off much to the surprise and alarm of the passengers.

The gross earnings of the Brooklyn Rapid Transit Company's system for June, 1898, show an increase of \$85,033 over June, 1897, and \$107,520 over June, 1895; the earnings from operation for the year ending June 30, show an increase of \$352,984 over 1897, and \$541,594 over 1896.

It is practically assured that during the coming fall, the trolley line on the West Chester (Pa.) turnpike will be extended from Newtown Square, its present terminus, to West Chester, a distance of 10 miles. This will give continuous trolley connection between Philadelphia and West Chester.

The Charleroi, Bellevernon & Fayette Electric Railway Company has leased from the New York & Cleveland Gas Coal Company a 60-acre tract of land a half mile from Speers, Pa., for a pleasure resort. The railway line was extended to the park to accommodate the 4th of July traffic.

A broken chain was the cause of a serious accident near St. Elizabeth's government asylum for the insane, Washington, D. C., on July 10. An electric car on the Congress Heights road collided with a horse car on the Anacostia line; one man was killed and between 25 and 30 persons injured.

## THE BOSTON CONVENTION.

The American Street Railway Association Will Meet September 6th to 9th—Seventeenth Annual Gathering—Association Returns to the City of Its Birth—Fine Programs Prepared of Papers, Discussions and Entertainments—The Exhibits Will Be More Numerous and Displayed Under Better Conditions Than Ever Before—A Large Attendance from All Parts of the Country Assured—Attracted by the Opportunity to Study the Model Street Railway System of Boston, and Incidentally Combine Recreation with Work—Great Preparations Made to Entertain the Ladies.

It is especially pleasing that the convention this year should meet in Boston, for here it was, seventeen years ago, that the American Street Railway Association was organized. Great and undreamed of changes have come to both the city and the street railways during these years, until, in the present advanced developments, neither could scarcely recognize the other. Then, animal was practically the only motive power; and even the most progressive ones groped blindly in the dark for some steam power to supplant the faithful horse. A multitude of strange devices have come and gone; even the cable, once the object of great expectations, has had its day and is already in its decadence. Instead of barns, and watering troughs, and feed cutters, we will see and study some of the finest electrical installations in the world.

The official home of the convention is always a center for gatherings outside of the regular meeting hours, and this will be found at the Brunswick Hotel. The officers of the Association, and a large number of delegates, will stop here and at the Hotel Vendome, adjoining, which is under the same management. Rates at the various hotels will be found in another column.

Program of papers to be read at the sessions of the A. S. R. A. is also published in full on another page, and the subjects for reports and discussions are practical and timely topics. The opening session will be on Tuesday morning, September 6, in Paul Revere Hall, in the Convention building.

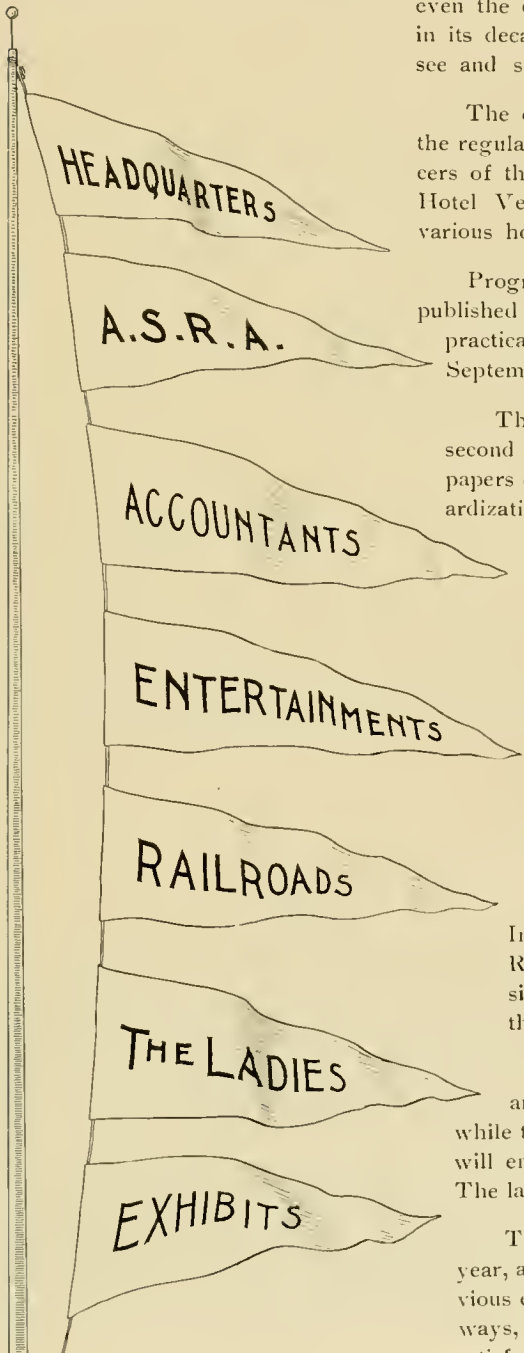

The meeting of the Street Railway Accountants' Association of America is its second annual gathering, and a large attendance is promised. The program includes papers on subjects of direct interest to accountants, and the important work of standardization of accounts so ably begun will be still further continued and perfected at this meeting. The members will also share in the entertainments and excursions provided for the American Association.

The local committees, realizing what a lively interest will be taken by visitors in the sights peculiar to Boston, and especially those points of historical renown, have provided a series of trips and entertainments that will occupy every spare minute outside of the routine duties and work of the convention, and which will give the guests a very satisfactory idea of Boston. Among the good things provided is a trip to Lexington, and on another day, an old fashioned clam bake, something the Association has never had; the nearest approach being the southern barbecue in Atlanta.

The railroads have made the usual concessions of a fare and a third for the round trip, subject to the established rules of the traffic associations. In purchasing tickets be sure to ask for the rate made the American Street Railway Association, not forgetting to have your tickets properly countersigned at Convention Hall before returning. The hour and place for doing this will be duly announced by Secretary Penington, and bulletined at the Hall.

The largest possible attendance of ladies is urged, and for their comfort and entertainment the local committees have made great preparations, so that while the gentlemen are engaged in the work of the convention the visiting ladies will enjoy numerous trips and rides. A shopping tour is also one of the features. The ladies will, of course, participate in all the excursions taken by the delegates.

The facilities for displaying the various appliances were never as good as this year, and the supplymen have accepted the opportunity in an effort to outdo all previous exhibitions. The space available permits of commodious aisles and passageways, and there will be no difficulty in getting near enough to exhibits to inspect them satisfactorily.

# BOSTON

## 1623 A BRIEF HISTORICAL SKETCH 1898

The old town of Boston was built on a peninsula some 780 acres in area, lying between the Charles river and that arm of Massachusetts Bay known now as Boston harbor. The Indian name of this peninsula was "Shawmut," meaning living fountains. The early Norse navigators are credited with having explored the Bay, and also the Dutch; Capt. John Smith visited Boston harbor and made a very creditable map of it; in 1621 Miles Standish and a party from the Pilgrim settlement at Plymouth explored the harbor, and while they were favorably impressed with the locality they made no effort to secure it. The first English settler was the Rev. William Blackstone, an Anglican clergyman who came in 1623 and laid out a farm and orchard on the site of the future city. Three other men settled on land now actually part of the city; these were David Thomson, "Gent.," who located on an island in the harbor; Samuel Maverick, a young man of property and education, who built him a house and fort on Noodle's or Maverick Island, now East Boston; and Thomas Walford, a blacksmith, who lived on the peninsula where Charlestown grew up.

In June, 1630, a fleet of ships landed at Salem (armed with a royal charter for the Colony of Massachusetts Bay) and the 700 colonists under the leadership of John Winthrop proceeded to settle on the site of Charlestown, Salem not proving to their liking; the water on the Charlestown peninsula not being good, the colony soon removed to Shawmut, known to the adjoining English settlers as Trimountain.

This name is the origin of the modern Tremont. It came from the three hills, Beacon, Copp's and Fort, which commanded the waters of the harbor and the surrounding hills also.

On September 17, 1630, at a meeting of the Court of Assistants it was officially ordained that the name of the settlement should be Boston, after Boston in England, which was the native place of some of the most prominent of the colonists. From this date the municipal life of Boston begins.

Your Puritan is an excellent thing in the way of ancestors, but it would seem that he made a bad neighbor; at any rate Blackstone, who at first welcomed the new settlers, disliked their stern manners and severe discipline and soon removed to Rhode Island. His rights as first occupant were recognized by the newcomers, and in 1634 Edmund Quincy, Samuel Wildbore, and others, were

authorized to levy a tax of £30, which was paid to Mr. Blackstone for his interests.

John Winthrop was the first governor of the colony and served as such for 12 of the 19 years that elapsed between the settlement of Boston and his death. Of him Josiah Quincy said: "Had Boston, like Rome, a consecrated calendar, there is no name better entitled than that of Winthrop to be registered as its patron saint."

Boston grew rapidly and trade relations were opened with the other colonies and with foreign ports, but the cause of education was not neglected and in 1642 the first commencement was held at Harvard College when "nine young men of good hope performed their acts so as to give good proof of their proficiency in the tongues and arts."

The political history of Boston, from the middle of the 17th to the middle of the 18th century, is largely that of Massachusetts; it tells of the unsuccessful effort to found a commonwealth wherein an established church would be the strong ally of the state; and of the struggle waged with the royal governors for the vindication of the principles of local self-government, and no taxation without representation.

The part that Boston took in the Revolutionary War is too well known to require comment; the stories of the Boston Massacre, and of the Boston Tea-Party are as familiar to Americans as the Declaration of Independence. The investment of the city by Washington, resulting in its evacuation by Gage and the departure of Howe, March 17, 1776, ended the fighting so far as Boston itself was concerned, but it was a dismal looking place, having borne the brunt of the first fierce struggle.

At the close of King Philip's war Boston had 6,000 inhabitants. By 1760 the city had grown to 25,000 and was probably the largest and certainly the most important town on the continent. This importance was due to its foreign commerce, its trade and industry, its accumulated capital, and the fact that it was the central point of the most compact population to be found on the eastern seaboard. The return of peace in 1783 found the city shorn of many of the attributes which had made her the foremost town of America. The population of 25,000 had sunk at the time of the siege to 10,000, and when peace came had risen to only 12,000. Military occupation, sickness, and the withdrawal of the

FANEUIL HALL (QUINCY) MARKET.

Visitors to Boston for the first time find themselves with hundreds of other tourists anxious to visit the interesting historical places which surround the "Hub," for every year there are thousands of persons who come here to study the romantic history of the Puritans from the day of their landing at Plymouth up to the more modern times. Then there are treasured landmarks of the Revolution.

Here were born many of our noted men, such as Samuel Adams, John Hancock, Chief Justice Sewall, Cotton Mather; Boston has been the home of the artists Copley, Stuart, Allston, Hunt; and of poets here were born and lived within an hour's ride, Longfellow, Lowell and Whittier. Here, too, was the birthplace of Julian Hawthorne and of Edward Everett; the home of Prescott, the historian; of Oliver Wendell Holmes, Phillips Brooks, Gilbert Haven, George Ticknor and many others. A walk about the city from any point will soon bring one to some place of which history speaks. A ride into the country, either to the north, south or west will take the pilgrim in a very few minutes to other fields, the scenes of heroic deeds of our forefathers.

Among more modern buildings that interest the visitor there are Boston's Public Library, the most complete of its kind in this country, the State Capitol and the new Court House. Then there are the active navy yard at Charlestown and Harvard University in Cambridge.

One of Boston's present historians says that one should at least spend three days in Boston proper to gain the personal knowledge of the historical riches to be found there. Even then one will be able to spend only a very few minutes at any one place.

First of all there is Faneuil Hall, the "Cradle of Liberty," of which everyone who ever glanced inside of a school history has learned something. It can be reached easily from all parts of the city as all lines of cars make a common center within five minutes walk of it. It is situated in the market place just off the lower part of Washington street, and it is from here that the tourist is advised to start.

Faneuil Hall was built in 1742, by Peter Faneuil, the rich Huguenot merchant, and presented to Boston for a market and town-hall. Smibert, the pioneer portrait-painter, served as architect. After burning, in 1761, it was rebuilt, partly by lottery funds, and dedicated by James Otis, the patriot orator. Here is Healy's great painting of Webster in the Senate, answering Hayne; and fine oil-portraits of Faneuil, Samuel Adams, Andrews, John Quincy Adams, Wilson, Washington, Everett, Hancock, Phillips, Burlingame, Preble, Strong, Choate, Sumner, Paine, Knox, Warren, Lincoln, and Rear Admiral Winslow; and busts of John and Samuel Adams and Daniel Webster. The handsome clock was presented by the school children, in 1850.

Faneuil Hall early won the title of "The Cradle of Liberty," for here the patriot orators of the province denounced the Brit-

ish tyranny before great assemblages of citizens. In retaliation the Fourteenth British Regiment was quartered here, in 1768; and in 1775-76 the Royalist garrison established a theatre here. Here occurred the state dinners to Washington, the Count d'Estaing, Lafayette, Jerome Bonaparte, Kossuth, the Prince de Joinville, Lord Elgin, Lord Ashburton, Talleyrand, King Louis Philippe, and other magnates; the receptions to Andrew Jackson and George B. McClellan; the lying-in-state of Anson Burlingame, and many public meetings, addressed by Wendell Phillips, Sumner, Everett, Channing, Otis, Webster, Hillard, Garrison, Beecher, Jefferson Davis, Evarts, Long, Reed, and other illustrious tribunes of the people. Every patriot, and every student of history will find a profound interest in this venerable Temple of Freedom.

The old state house in the middle of State street, at Washington street, with its pitched roof and quaint belfry, nestles quaintly low and dark amid the gigantic ten-story buildings which surround it, making a most effective contrast. Here was the site of the colonial market-stand; and from 1637 to 1711 it was occupied by a wooden Town House and Provincial Capitol, erected from the bequest of the eccentric Captain Keayne, with an open-sided market on the ground floor and the court and council rooms above, supported on Doric columns. The Town House burned in 1711, and was replaced in 1713 by the present building, whose inner parts, however, were ravaged by fire in 1747. On this spot presided Endicott, Leverett, Bradstreet, Sir Edmund Andros, Sir William Phips, Lord Bellamont, Dudley, Burnet, Shirley, Pownall, Bernard, and other royal governors; and here the loyal Provincial Legislature obeyed the Crown. The accession of the British sovereigns and the Provincial governors were proclaimed from the east balcony, "with Beat of Drum and Blast of Trumpet;" and the cupola was illuminated on rejoicing days. The lion and unicorn of England still adorn the gable overhead; but the sun-dial has been replaced by a clock. For half a century the Honorable Provincial Council, and its successor, the State Senate, met in the eastern hall, amid the royal portraits and insignia, and the House of Representatives occupied the western hall. Here, John Adams said, "the child Independence was born," when for 14 years the fiery eloquence of Otis and Quincy, Warren and Cushing, Hancock and Samuel Adams, was directed against British rule. The stamp act was publicly burned here; in 1768 a British regiment was quartered in the building, with cannon pointed at the doors. In 1770 the Boston massacre took place beneath the windows; and the British soldiers engaged therein were tried in the building. Here Generals Gage, Howe and Clinton held their councils of war.

From these portals Washington reviewed the triumphal entry of the Continental army; on July 18, 1776, the Declaration of Independence was read from the east window; and the proclama-

tion of peace in 1783. Here the State Constitution was planned; Hancock, the first governor elected by the people, inaugurated; and the Count d'Estaing and the officers of the French allied fleet received.

The legislature met here until 1798, when it marched in procession to the new State House on Beacon Hill. In 1835 William Lloyd Garrison was hidden here from the mob which had broken up an anti-slavery meeting, and was seeking to slay him. Here was opened the first public town library in American, in 1657. The first Episcopal services in Boston were held on this site, for half a year, in 1686; and the old South Church worshipped here for an equal period. From 1820 to 1830 the Grand Lodge of Masons of Massachusetts occupied most of the building, and here

removal of the British regiments, after the massacre, Warren here spoke to a packed house, including crowds of royal officers in uniform; and when one of these held up a handful of bullets, as an answer to the orator, Warren replied only by dropping his handkerchief upon the leaden threats.

In 1775 the pews were removed, and the church became a riding hall for the Queen's Light Dragoons, with gravelled floor, leaping bars, a sutler's shop in the gallery, and reserved galleries for admiring spectators. "Strange that the British, who so venerate their own churches, should thus have desecrated ours," said Washington, standing in the east gallery, after the redecoats had

After two centuries of occupancy of this site, it grew too noisy and too remote for religious services, and the Old South Society moved to Copley square, and the building became the city post-office, from 1872 to 1875. In order to prevent the destruction of the church for business purposes, a committee of 25 women paid \$430,000 for it, to be preserved as an historic monument; of this sum, Mrs. Hemenway gave \$100,000. The Old South Work centers here, and is a very successful plan to encourage the study of American history, by lectures, leaflets, discussions and prizes.

they entertained Lafayette. From 1830 to 1839 the city government occupied the building. In 1881 it was reclaimed from commercial uses, and carefully reconstructed as "hallowed by the memories of the Revolution." It was then placed in the care of the Bostonian Society, a thousand men of local pride, to be kept open for public homage, and to receive a museum of Provincial antiquities. The museum includes thousands of articles, and is the most important and interesting of its kind in America.

The Old South Meeting House, at Washington and Milk streets, belonged to the Third Congregational Society, which in 1670 erected here, on the site of Governor Winthrop's garden, a cedar church. Here Sir Edmund Andros installed the unwelcome Church of England; here Chief Justice Sewall on Fast Day begged God and man to pardon him for his evil share in the witchcraft trials; and here Benjamin Franklin was baptized, on the day of his birth across the street.

In 1730 the present brick edifice was built, wherein occurred the dramatic event commemorated in Longfellow's Ballad of the French Fleet. In perilous times, sentries on the tower watched the harbor and sea for the sailing in of hostile fleets. Whitefield's consecrated eloquence full often resounded in this great hall, and for 150 years the Election Sermons were preached here.

In time the meeting house became "the Nursery and Sanctuary of Freedom," when the revolutionary town meetings overflowed Faneuil Hall, and adjourned to this much larger auditorium, and were addressed by Otis, Warren, Hancock, and other patriot orators. Thus many thousands assembled here to order the royal frigate Romney from the harbor, in 1768. Demanding the re-

The church is open daily (25 cents fee) and its interior architecture, the galleries where Washington walked, the window where Warren entered, the sounding-board, and the other fine bits of Provincial work, are of great interest. Here also are collections of curiosities and antiquities, the old Spanish cannon in the entrance, the colonial fire-place and equipments, personal relics and autographs, portraits and engravings, old papers and books, chairs, cradles, clocks, spinnets, spinning wheels, umbrellas, fire-backs, foot-stoves, wool-combs, lanterns, warming pans, kettles, embroidery, samplers, spoons, china, muskets, swords, tomahawks, canteens, powder-horns, pistols, calashes, chapeaus, and shoes.

The church is partly clad with English ivy, and the tower-clock attracts more glances than any other in New England, rising as it does from the very heart of the Puritan City.

King's Chapel is another antique edifice that is worth visiting. The heavy portico was built in 1789 from funds partly raised by an oratorio in the Chapel at which George Washington attended. The interior is singularly old-English, even to the reading desk below the quaint, lofty pulpit (older than the church). The organ was brought from England in 1756 and bears a golden crown

and mitres. Here the pews occupied by Charles Sumner, Oliver Wendell Holmes and others are still pointed out to visitors. The high square pews are upholstered in red and half of them are facing away from the minister. The singular embrasured windows on School street gave point to Mather Byles' quip, "I've heard of the canons of the church, but I never saw its portholes before."

Richard Grant White says: "It is the perfect model of a New England meeting house of the highest style. It delights the eye by its firm, symmetrical proportions; and its octagonal spire, springing from an airy eight-arched loggia, is one of the finest of its kind, not only in this country, but in the world. Nothing more light, elegant, or graceful could be found."

The Liberty Tree stood near the southeast corner of Essex and Washington streets, where a large carving representing it may be seen high up on the front of 630 Washington street. The ground about and under the great elm, Liberty Tree, was called Liberty Hall, and here the 300 Sons of Liberty held their public meetings and festivities and organized revolution, during the last years of British rule. Their signal flag floating from the staff extending through the branches summoned the patriot bands; and many a fiery speech was heard here, many an effigy of a hated Royalist

hung from the branches; the British garrison had the tree cut down in 1775. The Liberty Tavern long occupied the site. Here now stands the office of "The Pilot."

The site of the Boston massacre is marked by a wheel-shaped arrangement of the paving-stones in State street, where Exchange street crosses. Here, the British main guard, provoked by missiles and epithets, fired upon the people, and killed and wounded nine persons. A bronze tablet on the Merchants' National Bank says: "Opposite this spot was shed the first blood of the American Revolution, March 5, 1770." Boston Common has a monument to this event.

West street leads westward, by various music, candy, flower and other shops, and the Universalist Publishing house, at No. 30, to Boston Common, at the ancient site of the whipping-post and pillory. At 13 West street, Hawthorne for years courted Sophia Peabody, to whom he was married here in 1842, by James Freeman Clarke, who in 1864 officiated at his funeral; Shreve's great jewelry store occupies the entire building at West and Tremont streets.

The Boston Tea Party is commemorated by a large bronze tablet about six feet above the sidewalk, on the Atlantic avenue front of Luce & Manning's wool warehouse, at the corner of Pearl street. It bears an animated relief of the attack on the tea-ship, and borders of tea-leaves, with the inscription: "Here formerly stood Griffin's Wharf, at which lay moored on Dec. 16, 1773, three British ships with cargoes of tea. To defeat King George's trivial but tyrannical tax of three pence a pound, about ninety citizens of Boston, partly disguised as Indians, boarded the ships, threw the cargoes, 342 chests in all, into the sea, and made the world ring with the patriotic exploit of the Boston Tea Party."

"No, ne'er was mingled such a draught  
In palace, hall or arbor,  
As patriots brewed and tyrants quaffed  
That night in Boston harbor."

The Province House long since yielded to the ravages of time, and but little remains to it except the massive north wall, three stories high, with deep arches. Its masonry is partly covered by a sheathing of wood. This fragment may be reached by descending to the end of the first rubbish-laden alley, four or five feet wide, diverging from Province street, south of School street, or it may be seen, close at hand, and with more ease and decency, from the rear window of the store at No. 321 Washington street.

The Province House was built in 1679, and served as the official residence of the Provincial Governors from 1716 to about 1790. It was a gambrel-roofed brick house, with a cupola crowned by a copper statue of an Indian with glass eyes, a balcony whence the governor's speeches and proclamations were delivered, and a fine reception hall. In front extended a broad lawn, with oak trees. The house was built by Peter Sergeant, a rich London merchant, and bought by the Province in 1716. In 1811 the building was granted to the Massachusetts General Hospital, which leased it in 1816 to David Greenough for 99 years. For many years it was a playhouse for negro minstrels, until its woodwork was burned

"WASHINGTON ELM"—CAMBRIDGE.

out in 1864. Hawthorne's Legends of the Province House is interesting reading. Near this locality is the lofty Boston Tavern, for men.

Down on Salem street stands Christ church, of which much has been written, as it was prominent in the early history of the state. From the window of the fine spire the old sexton displayed the famous signal lanterns, April 18, 1775, which told that a raiding expedition was leaving Boston headed by the British general, and Paul Revere, waiting on the Charlestown shore, spurred his horse onward, alarming the sleeping countryside. In the vaults of the church rests Major Pitcairn with other British officers killed at Bunker Hill.

Longfellow's house, on terraces in broad and pleasant grounds, was built in 1759, by the Tory Colonel Vassall, of brick covered with wood. It was occupied by Washington during the eight months of the siege of Boston, and by Longfellow from 1837 to 1882. His family dwells there now. The general's office and the poet's study were in the first-floor room, toward the college. "Hyperion" and "Voices of the Night," were written in the chamber overhead, the sleeping-room of Washington and Longfellow. Across the street is the Longfellow Memorial Park, to keep open the view to Charles River. Lowell's house, Elmwood, farther out on Brattle street (the ancient "Tory Row"), was built in 1760, and occupied by Lowell for many years. He died here in 1891. Some of his best poems and essays came from the third-floor room.

Just back of Phillips', on Exeter Place, dwelt Theodore Parker, the famous Unitarian divine and reformer. Gilbert Stuart's house and studio were at the south-east corner of Essex and Edinboro streets (at No. 59 Essex street).

Wendell Phillips' home stood at the corner of Harrison avenue and Essex street, where a tablet on a tall yellow building bears this inscription: "Here Wendell Phillips resided during 40 years devoted by him to efforts to secure abolition of African slavery in this country. The charms of home, the enjoyment of wealth and learning, even the kindly recognition of his fellow citizens, were by him accounted as naught, compared with duty. He lived to see justice triumphant, freedom universal, and to receive the tardy praises of his former opponents. The blessings of the poor and friendless, and the oppressed, enriched him. In Boston he was born, Nov. 29, 1811, and died Feb. 2, 1884. This tablet was erected in 1894, by the order of the City Council of Boston."

Samuel Adams' home was a two-story wooden house with a garden, at Winter street and Winter place. Its site is marked by a tablet on Shepard, Norwell & Co's, dry goods store, thus inscribed: "On this site once stood the home of Samuel Adams, who bought it in October 2, 1803. In grateful memory of the Father of the Revolution, this tablet is placed by the Massachusetts Society of Sons of the Revolution, 1893."

Franklin's birthplace, at No. 17 Milk street, is marked by a bust of the great philosopher. No. 19 Milk street is the home of the Massachusetts Commandery Military Order of the Loyal Le-

THE OLD BELFRY—LEXINGTON.

gion, and of the Society for the Prevention of Cruelty to Animals.

John Winthrop's home was near the present 286 Washington street, where a bronze tablet marks the site, where also dwelt John Norton and Samuel Willard. Winthrop's house was torn down for fuel, by the British garrison, in 1775.

The Old Corner Book Store, at Washington and School streets, on the site of the house of the strong-minded heretic, Anne Hutchinson (a relative of Dryden, the poet), was built in 1712, and contained an apothecary's shop from 1712 to 1796, Thayer's dry goods store from 1796 to 1816, and then a pharmacy run by James Freeman Clarke's father. Since 1828 it has been a book store, where Ticknor & Fields held sway from 1833 to 1865, when the place was the favorite resort of Hawthorne, Hillard, Emerson, Agassiz, Sumner, Lowell, Longfellow, Whittier, Holmes, Whipple, Thoreau, Howells, and other literary men. Here Dickens and Thackeray used to browse among books, when in Boston. Oliver Ditson began his career at a little music counter here in 1833. The shop is still frequented by the local writers and readers.

The birthplace of the Republican party in Massachusetts was

Trinity (Phillips Brooks) Church

Spiritual (Christian Scientists) Church

CANOPY OVER PLYMOUTH ROCK—PLYMOUTH, MASS.

in the room over No. 40 School street, where Sumner, Wilson, Bird, and other radicals assembled the leaders of the anti-slavery wing of the broken Whig party. Farther up School street appear the City Hall, King's Chapel, and the Parker House. As Washington street approaches the Old State House, in the region of railway and steamship ticket offices, obscure alleys diverge, very familiar to the Bostonians, but mysterious enough to strangers within the gates. On the left they lead to Court square, between the City Hall and the old Court House. Young's is nearly hidden behind the Roger's building, which stands on the site of the First Meeting House from 1640 to 1808.

The Bell-in-Hand is a curious old tavern-sign projecting into the crowded and noisy Williams Court (which Rufus Choate pronounced "ignominious but convenient"), back of the Herald building. It marked the ale-house of the town-crier, on Congress square, until 1854, when it was brought hither, with other pictures and paraphernalia. Here the visitor may see the sanded floors, pewter tankards, and quaint old pictures of the Provincial era.

King's Chapel Burial Ground lies between the Chapel, the City Hall, and the Historical Society; bronze tablets on the gates bear interesting inscriptions. The keys may be obtained at the Board of Health office, in the Old Court House. The cemetery dates from 1630, when Captain Welden was "buried here as a souldier, with three volleys of shott." In the north part is the tomb of

John Winthrop, the founder of Massachusetts, and his son and grandson, both governors of Connecticut; also, of the Olivers; Lady Andros; Governor Leverett, who died in 1679; Thomas Brattle, the richest merchant in New England; Jacob Sheaf, and his widow's second husband, Rev. T. Thatcher, and the four pastors of the First Church, Cotton, Davenport, Oxenbridge, and Bridge. In the northeast, near the old charnel-house vault, is the tomb marked: "Hear . sleeps . that . blessed . one . whose . life . God . help . us . all . to . live . that . so . when . Time . shall . be . that . we . this . world . must . leave . we . ever . may . be . happy . with . blessed . William . Paddy." The cemetery has the graves of Judger Adams and Wait Still Winthrop, Oliver Wendell and Thomas Dawes. Capt. Roger Clap, died in 1690, longtime governor of the Castle; Maj. Thomas Savage, in 1682, "the fiter of Indians;" John Winslow and his wife, the Mary Chilton who was the first woman of the Mayflower company to set foot in Massachusetts; and Charles Bulfinch, the architect. There are 18 coats-of-arms carved on these gravestones, and many strange inscriptions appear on the hundred tombs. The closing scenes of "The Scarlet Letter" occurred here, where Hester and Dimmesdale were buried.

The Granary Burial Ground was opened 1660, on a part of Boston Common; planted with trees in 1830; enwalled with iron and ivy-clad portal in 1840; and provided with bronze memorial tablets on the gates in 1882. More illustrious dead are there than in any other Boston cemetery; among them John Hancock, Samuel Adams, and Robert Treat Paine, signers of the Declaration of Independence; eight governors, including Bellingham, Dunmer, Sumner, Sullivan, and Gore; Lieutenant Governor Cushing, Chief-Justice Sewall, Mint Master Hull, Paul Revere, Peter Faneuil; Jeremy Belknap and other divines; Mayor John Phillips, and Uriah Cotting. Franklin erected here a monument to his parents, which was replaced in 1827 by the high gray pyramid in the center. John Hancock's grave is marked by a tall marble monument, set up by the Commonwealth in 1895, and bearing his medallion portrait; it is near the church. His was the first and bold name signed on the Declaration of Independence. Toward the Tremont building were buried the victims of the Boston massacre and also many Huguenots.

Copp's Hill Burial Ground, on Hull street, is opened from 8 to 12 and 1 to 6:30 daily, and visitors can buy a descriptive pamphlet and be guided by the vendor. It overlooks the Charles river and contains many trees, and the tombs of the Sigourneys, Greenwoods, Snellings, Lorings, Hutchinsons, Grays, Eliots, Mountforts and other great families, besides many a grave whose fluttering flag tells of a hero of the War of the Rebellion. Every one goes to see the grave and monument of Cotton Mather, the illustrious Puritan divine, and the author of "Magnalia Christi Americana." It is a slab of brownstone on a vault of brick, in the southeast corner.

The Central Burying Ground, near Boylston street, on the Common, dates from 1756. Gilbert Stuart, the portrait painter of King George III., King Louis XVI., and President Washington, is the most illustrious of those buried here; his tomb is No. 61. Many British soldiers were buried in trenches in and around this

Custom House

Court House

cemetery, whose venerable and forgotten tombs are overarched by trees.

Mount Auburn, the first garden-cemetery in the world, dates from 1831, and covers 136 acres of beautiful hills, dales, flower beds and ponds. In this cemetery are buried 32,000 persons, among them Agassiz, Spurzheim, Bowditch, Asa Gray, Ticknor, Sparks, Felton, Fields, Palfrey, Willis, Pierpont, Quincy, R. C. Winthrop, Burlingame, Channing, Rufus Choate, T. W. Parsons, Dorothea Dix, Fanny Fern, Dr. Howe, and the Universalist apostles, John Murray and Hosea Ballou; Phillips Brooks is near the

Kearsarge which sunk the Alabama; Governors Rice and Gaston, Col. Joseph Williams, Martin Millmore, the sculptor; Linus Childs, the eminent lawyer, and Rev. A. A. Miner.

Bunker Hill monument, in Charlestown, built in 1825-42, of Quincy granite, is 30 ft. square at the base, and 221 ft. high. The top is reached by 294 steps, and superbly overlooks the city and the sea, and the far mountains, Wachusett and Monadnock. Here are two quaint Provincial cannons. Dexter's statue of Warren is in the lodge and Story's noble bronze statue of Colonel Prescott stands in the main path. On a June night of 1775 Prescott led his

old chapel; Lowell to the left of the gateway; Longfellow and Parkman, on Indian Ridge; Holmes, on Lime avenue; and Sumner, Everett, Edwin Booth and Charlotte Cushman, near the far-viewing tower on the hill.

Forest Hills Cemetery contains over 204 acres and asleep there are many noted men. A fine bronze tablet marks the grave, on Eliot path, of Gen. William Heath who issued the first general order of the Revolution, and also the last general order at the disbandment of the Revolutionary army. On the summit of Mt. Warren in a lot in the shape of a half moon, the ashes of the famous General Warren with other members of his family have been re-interred. Among the others buried there are Major General Dearborn, Admiral John A. Winslow who commanded the

1,500 New England volunteers here and fortified; and at morning was attacked by 4,000 royal troops, whom he and Putnam repulsed twice; and then they stormed his redoubt. The British lost 1,154; the Americans 441. Charlestown was burned during the fight. Massachusetts sent more troops into the armies of the Revolution than did all the southern colonies united.

In Charlestown, which is a part of Boston, is the Charlestown Navy Yard which ranks well up with the navy yards of the country. There are always between 300 and 3,000 men at work making repairs to some of our warships. In the very near future this is to be the largest torpedo-boat station in the world. Then there is to be a tremendous stone dry dock of sufficient size to take in the largest warship. In the yard there are many relics of the

past war and the commandant at this station is, in times of peace, always pleased to have visitors call at the yard so long as they do not interfere with the workmen there.

The Boston Public Library, situated on the west side of Copley square, is the most costly and artistic library building in the world, and is by far the largest library in the world for free circulation. It was opened in 1852, largely by the efforts of Everett and Ticknor, and the building was finished in 1895, having cost over \$2,500,000. It was designed in the pure, stately and elegant style of the Italian Renaissance. It is of pinkish-grey Milford granite, and faces on three streets, with a conspicuous roof of brown Spanish tiles, and a cloistered courtyard inside containing a lawn and fountain. The building covers  $1\frac{1}{2}$  acres. The

WITCH HOUSE—CAMBRIDGE.

grand stairway with colossal marble lions commemorating the dead of the 2d and 22d Massachusetts Regiments in 1861-65, leads to Bates Hall, an immense reading room occupying all the Copley square front with a barrel vault ceiling and rich furnishings. The library has very rich special collections about costumes, Spanish literature, music, mathematics, patents, architecture, New England history, Shakespeare, etc., each in a special hall. It contains about 680,000 volumes.

Trinity Church, on Copley square, is the most artistic and impressive church in New England. Phillips Brooks was its rector from 1869 to 1891. The society dates from 1728; the present church from 1877. It was designed by H. H. Richardson, in the Romanesque architecture of Southern France and Spain. The chief external features are the outlying chapel; the quaint cloisters, containing the ancient stone tracery from a window of St. Botolph's Church, in English Boston; the rich Galilee porch, built in 1894-95, and the vast and impressive central tower, suggested by one at Salamanca, and rising to a height of 211 ft., with a width of 46 ft. The ivy-clad walls are of yellowish Dedham granite and brown sandstone, and the huge tower-roof is of red Akron tiles. The interior is marvelously rich, with a chancel 57x53 ft., and many English, Parisian and Tiffany stained-glass memorial windows, and the famous Biblical frescoes by John LaFarge, including Jesus and the Woman of Samaria. This majestic building cost over \$800,000, and is all paid for. The services are "low." E. W. Donald is rector. The north cloister doors are opened daily, from 8 to 4 (Saturdays, 8 to 12), to admit visitors.

The State House occupies the terraced crest of Beacon Hill, facing the Common. It was built in Samuel Adams' governorship, in 1795-98, on John Hancock's cow-pasture (bought for \$4,000), with Bulfinch as architect. Crowning the highest of Old Boston, it is a very noble landmark from distant points on sea and land. The high dome was covered in 1874 with pure gold-leaf (renewed since), and may thus be recognized, shining brightly, from leagues away in the coast and rural counties. The new State House Extension, much larger than the original building, and of finer materials, but similar architecture, stretches northward. It was built 1890-95, at a cost (with land) of \$5,000,000, with fine marble colonnades, and a central courtyard. The chief feature is the Representatives' Hall, in Italian Renaissance architecture, elliptical, with mahogany finish, Corinthian columns, a domed ceiling of glass, frescoes by Frank Hill Smith, and the

famous wooden codfish, 5 ft. long, hung up in 1784, in the place of one placed in the Representatives' Hall before 1730. The fish is emblematic of one of the chief sources of the wealth of Massachusetts. The State Library, of 90,000 volumes, has a spacious reading room, whose balcony overlooks the crowded northern suburbs.

This was the first State library in America. The book-shelves are of steel. Here may be seen nearly 300 flags of the Massachusetts troops in the Rebellion, very sacredly guarded; Sir Francis Chantrey's esteemed statue of Washington, set up in 1828; Ball's excellent portrait-statue of John A. Andrew, the War Governor, erected in 1871, at a cost of \$10,000; busts of Washington, Lincoln, Sumner, and Vice-President Wilson; the venerable portraits of dignitaries, and the handsome old-fashioned Senate Chamber; weapons and trophies from Lexington and Bennington, and other interesting pictures and antiquities. On the outside terrace stands Powers' statue of Webster given by popular subscription in 1860, and Emma Stebbins' statue of Horace Mann, the educator, given by the school-children in 1869.

The peculiar front of Tremont Temple, on Tremont near School street, attracts the eye of the passer-by, for a building of its height is seldom seen with a plain, windowless front wall, and the odd Venetian effect of this blank surface also lends much to its beauty. Built primarily for religious purposes it houses beneath its roof the main auditorium with a seating capacity of 2,500 and five other halls of various sizes, with a large number of committee rooms, parlors, etc.

Being a church of the people the income to carry on its grand work is raised by different methods; an important source of revenue is the rental of nearly 100 business offices and stores which are located within its walls. The present Temple is the fourth which has stood on this same spot, the three others having been destroyed by fire. Tremont Temple was dedicated in 1896 and cost \$500,000. It is absolutely fire-proof in construction. Its foundations are laid 30 ft. below the sidewalk and it is built on the modern steel frame plan. It has an electric plant of its own, is heated by steam throughout, and with its two elevators, telephone system, restaurant and other features is one of the most convenient office buildings in the city.

The Suffolk County Court House is in Pemberton square, formerly an aristocratic residence-quarter (opened in 1835), a few rods from Scholly square up Beacon Hill. It is an immense granite building, erected in 1887-94, in German Renaissance architecture, at a cost (including the land) of \$3,828,000. There are four open court-yards and a great number of spacious court rooms, with durable, simple, and dignified furnishings. A handsome ves-

ESSEX STREET AND INDIA HALL—SALEM.

tibule of yellow Tunis marble leads to the great hall, a really noble apartment, with Indiana limestone pillars and rich decorations. Here are 16 strong and impressive limestone statues, by Domingo Mora, of Spain, representing Legislation, Religion, Rea-

HARBOR AND TOWN OF MARBLEHEAD, MASS.

son, Wisdom, and other attributes. The great hall is paved with black and white marble, and wainscoted with polished Maine granite, a beautiful stone.

White Ionic columns support the third gallery, above which bends the arched ceiling of yellow and gold, with armorial frescoes. Elevators run to the upper floors, and the probate, superior, municipal, criminal, and supreme courts; and to the Social Law Library (founded in 1804), a fine hall 180 ft. long, with 30,000 books, and portraits of eminent jurists.

The City Hall, on the north side of School street, east of King's Chapel, is a substantial and fireproof Renaissance building, of white Concord granite, erected in 1862-65, at a cost of \$500,000, and filled with commodious rooms for the many and costly municipal departments. On the lawn in front stands Ball's bronze statue (erected in 1879) of Josiah Quincy, the great mayor (in 1823-28), also a congressman (1805-13) and President of Harvard (1829-45). The drapery is heavy, but the portrait is good. Here, also, stands R. S. Greenough's fine bronze statue of Franklin, erected in 1856, from a popular contribution of \$20,000, and dedicated by R. C. Winthrop. The verd antique marble base has four interesting bronze reliefs: on the south the boy Franklin, learning to print; east, signing the Declaration of Independence; north, drawing electricity from the clouds; and west, signing the Treaty of Paris, in 1782, ensuring American independence.

The postoffice, covering more than an acre, between Milk, Devonshire and Water streets, was erected in 1869-85, of Cape Ann granite, at a cost of \$6,000,000. The eastern front is crowned by two fine and highly commended groups of colossal statuary, in Vermont marble, by D. C. French. The right-hand group shows Science controlling Electricity and Steam (a crouching slave); and the left-hand group shows Labor protecting the Fine Arts (a vase bearer), and the Family (a woman and child). The time ball on the eastern dome drops every noon by telegraphic signal from the Harvard Observatory.

The Sub-Treasury, on the second floor, sometimes contains over \$10,000,000. The Pension, Internal Revenue, Treasury Agents, Naval Pay, and other offices are in this building.

Steiner Hall, at 162 Boylston street, is situated entirely below the surface of the ground; it is elliptical in shape with the stage at one end. The architectural treatment of the hall is carried out in the style of the Italian Renaissance. The decorations of the architectural surfaces, cornices, pilasters, mouldings, etc., are

very chaste and delicate in treatment. The pilasters are surmounted by handsome Corinthian capitals. The frieze of the cornice has a handsome festooned sign of conventional fruit alternating with flowers. The color scheme is very artistic and refined, in quiet taste, the predominating tone being a delicate ivory contrasted with a very delicate color on the walls of sufficient depth to relieve the ivory and give warmth to the whole. The ornamental portions are brought out by a moderate use of gold leaf. As there are no windows in the hall the light is entirely artificial, but so cunningly arranged that all parts of the hall are as bright as day, yet all suggestion of glare is removed. This effect is produced by concealing incandescent bulbs in recesses of the frieze and stage arch, whereby an equal radiance of soft, mellow light, devoid of any shadows, is diffused throughout the auditorium. The acoustic properties of the hall are as perfect as it is possible to have them, and the same may be said of the ventilation and heating. The seating capacity of the hall is 600. It is absolutely fire-proof, and, from its unique location, underground, completely sound-proof.

Quincy Market (the official title is "Faneuil Hall Market"), is a two-story granite building 535 ft. long, with a dome and Doric porticos, crowded and surrounded with stalls rich in all varieties of delicious food, meats and game, fruits and vegetables, and (at the east end) a great diversity of fish and other sea-food. Longfellow came here, and of it said: "The mingled and delicious odors of the vegetables, and the sight thereof, transported me straightway to France." There is a peculiar guild pride among the sturdy and stalwart marketmen, and when they march in political or other processions, in long, white frocks, squadron after squadron of horse, and company after company of foot, the sight is an impressive one.

The theater district extends a block northward on the narrow and picturesque Washington street, including three famous playhouses, with two more on its edge. This is one of the most crowded and busy thoroughfares in the world, with its narrow and huddled sidewalks, and a roadway traversed by thousands of vehicles. The sharp curves and bends reveal singular and piquant architectural effects, in the many varying colors and styles which characterize the adjacent buildings. The scene is especially brilliant just as the theaters are out, and the playgoers throng the way.

Chinatown in Boston is a cleanly and interesting district, in-

BUNKER HILL MONUMENT.

CHARLESTOWN NAVY YARD—FROM BUNKER HILL MONUMENT.

habited by an industrious and frugal people. In going up Beach or Essex street we pass along the edge of the Chinese quarter, where Oxford street and place are crowded with Mongolian homes, the central point of the 3,000 Asiatic Bostonians. They have on Harrison avenue a score or more of stores—for tea, Celestial groceries, china, dress fabrics, incense, teak articles, books, fire-crackers, and other Asiatic wares. Here are restaurants where chop-sooy, chow-mein, and Chinese teas and wines, and rice whisky are served over teakwood furniture; a joss-house and Christian mission, and a very large Masonic lodge; besides, hidden fan-tan and opium joints, often raided by the police.

Out in Cambridge is Harvard University, the illustrious crown of American education and which was founded in 1636 by the legislature. It has 4,000 students, with medical, dental and veterinary schools in Boston, and academic, law, divinity and scientific schools here. Its property equals \$12,000,000. The yard covers 22 acres and there are 22 buildings. The handsome \$10,000 gateway gives entrance between Harvard Hall, built in 1765, and the ivy-clad Massachusetts Hall, built in 1720, which was once a barracks for Revolutionary soldiers. Out on Cambridge Common, where the students gather for pleasure, stands a noble elm facing the entrance of the Shepard church. It was under this elm that Washington took command of the army. And here are many of the spoils of war.

The Clark family noted as the famous lens makers are dead, but their names and lenses will live forever. Over in Cambridgeport off Brookline street the Clark factory, a low building, is still in operation. Every astronomer in the world knows this family, and the world was greatly advanced in this art by this illustrious firm of Alvan Clark & Sons. Alvan Clark died in 1887 and one son, George, had died several years before. Alvan Clark, Jr., died June 9, 1897.

The senior member of this firm began lens making by accident. He was a portrait painter and a good mathematician. When 40 years of age an optician asked him to figure out the proper curves for a lens and he did so. Finding that opticians knew very little about lens he began experimenting. His first venture was a 5-in. refracting lens with which he could see the rings of Saturn. The first big glass turned out was an 18-in. object glass for the Michigan University in 1860, which finally went to Chicago. The second, in 1870, was a big lens for the Naval Observatory at

Washington; the third, a 30-in. glass for the Pulkova Observatory in Russia; the fourth a 36-in. glass for the Lick Observatory in California.

Mr. Yerkes wanted a 45-in. glass, but Mr. Clark satisfied him with one measuring 41½ in. Twelve years ago the block of glass was taken from the furnace of M. Mantois, Paris. It weighed 600 pounds and cost \$800. Mr. Clark began work on it in 1892. For two years it was ground by emery powder which was reduced in fineness as the operation proceeded. For another year it was polished with jeweller's rouge and beeswax until the lens was considered finished.

Mr. Clark, Jr., was himself a practical astronomer and made several discoveries.

In the near vicinity of Boston there are many historical places of which New Englanders are exceedingly proud to speak, and show to visitors. Lexington and Concord are easily reached by trains, and even street cars. In Lexington there is a boulder that marks the line of the minute-men; then there is the house in which were Hancock and Adams asleep when Paul Revere came dashing into the town and aroused them from their slumbers to take up arms.

There are tablets showing where the British rallied on the Concord road. The six mile road to Concord has many more tablets showing where the Americans harassed the British on their advance to Concord. In Concord there is the old North Bridge which was the scene of the Concord fight, when 400 Middlesex men drove away three companies of British light infantry. On one side are the graves of the British and the old monument, and on the other the picturesque bronze statue of the Minute-man. In the Sleepy Hollow Cemetery are the remains of Hawthorne and Emerson.

Out in Watertown is the U. S. Arsenal, where the government is making the largest kind of gun-carriages which are used in the defences of our coast at the present time.

A trip to Plymouth is considered a necessity, as here was laid the corner stone of the Republic. Plymouth rock is on the shore of the town and the upper part of the canopy which covers it contains some of the remains of the Pilgrims who died during the first winter. Burial Hill, the site of the fort built in 1621, contains the graves of the great Pilgrim leaders. On the way down on the steamer one passes Brant Rock, where Daniel Webster lived and is buried.

## THE STORY OF BOSTON.

BY LILLIAN WHITING.

The story of Boston is a spiritual romance. It is a tale of aspiration regarding all that makes for the higher life—which is the essential life—and privation regarding all conditions of self-indulgence and ease. No one can read, unmoved, the records of the founding, of the development, and of the growth of Boston. It is the most marvelous commentary on all the significance of life; and tracing it backward no one need wonder that this city has always stood for intellectual vigor and moral greatness.

It might well seem, indeed, that the Lord had given his angels charge concerning this city of the Puritans. Yet the story also reveals to us how subject to error are the judgments of men, and

somewhat peculiar civilization that Boston has developed? For it cannot be denied that, as a city, it has a certain unique quality of individuality which inspires a special interest.

The story of Boston really begins in London, on July 28, 1629, when a group, including John Winthrop, Thomas Dudley and Richard Saltonstall pledged themselves "to cross the seas under God's protection," and "continue to inhabit there;"—a resolution ratified the next month before the court at Cambridge, and soon afterward fulfilled—John Winthrop being chosen as the leader and governor. So they set forth.

It was on September 17, 1630, that Governor Winthrop looked

GATEWAY ENTRANCE TO HARVARD UNIVERSITY—CAMBRIDGE.

that there are pages in her history—those on which are recorded the dragging of Garrison through the streets—that one would fain efface from her records. Morality is, however, a progressive science, and the descendants of the men who mobbed Garrison have placed a statue of the great agitator in the heart of the choicest residence district of Boston.

Looking backward to the summer of 1629 one sees that Boston has had her definite periods of history. She was planted in prayer and devotion; she was developed amid early hardships which invigorated her moral power; her general life, even when she was a primitive Puritan town, had always a certain stateliness as was befitting the people of "quality and eminent parts." The aristocracy of character has always prevailed.

The story of Boston is crescendo in interest and her development has proceeded at an always accelerating rate. The past decade has concentrated the progress of the preceding fifty years, and the half century before held in solution the progress of the entire century, and more, that had passed since her founding. Shall we glance briefly at the determining causes of the

across the Mystic river and declared "that Trimontaine should be called Boston" in memory of the English town where the Rev. John Cotton preached. To this date Boston traces its birthday. In the present Tremont street is retained the old name of Trimontaine, from the three hills more prominent in those days than now.

In the midst of all their hardships and privations, John Winthrop wrote to his wife: "We are in Paradise where we enjoy God and Jesus Christ. Is this not enough?"

In 1637 there arrived in Charlestown, the Rev. John Harvard, who died one year later, but whose brief residence produced far-reaching results, for it was he who founded Harvard College, making a gift of £800 (\$4,000), which laid the foundation of the present great university which has grown from this small beginning. It is a curiously impressive event in our history to see this young clergyman—for he was only thirty years of age—come to a new country, give the money to found a college in the wilderness, and die the next year—as if his work were then finished, as it was, so far as this part of life goes.

In a story of destiny it is often curious to see how a certain group will be included among the dramatis personæ, each with

t

the first church, on whose parson windows is still inscribed a covenant which was drawn up on October 10, 1633. The coming of Rev. John Cotton led to his being followed by one of his most devoted parishioners, a woman whose strong individuality impressed itself on the life of the colony. This was Mistress Anne Hutchinson, the Mary Livermore of her day. Governor Winthrop characterized her as "a godly woman and of special parts, who had lost her understanding by occasion of her giving herself wholly to reading and writing; whereas, if she had attended to her household affairs and such things as belong to women and had not gone out of her way and calling to meddle in such things as are proper for men, whose minds are stronger, she had kept her wits, and might have improved them usefully and honorably in the place God set her."

Mistress Hutchinson was as irrepressible as Lucy Stone or Susan B. Anthony, and she brought to bear a strong and determining influence. She was essentially a modern woman, three centuries in advance of her times. She had the same wonderful power to attract, to impress, to influence people and events that is so peculiarly held by Mrs. Livermore. Anne Hutchinson was a born mystic, a transcendentalist, and a holder of a belief not unlike that now springing up under many phases and names, everywhere recognized as that of the highest interpretation of spirituality. She believed in the direct intercourse between the individual and the Divine spirit, which the Puritan clergy held to be a sacrilege and a heresy. They regarded the doctrine of "inner light" as a peculiarly objectionable heresy, and when Mistress Hutchinson "claimed to have evolved a knowledge of the Divine will from her inner consciousness" they denounced it as blasphemy. She was a born social leader, and as the only life of that day was the religious—there being no newspaper, no dances, parties, theatres, concerts, or libraries—nothing but the Sabbath ser-

VICES followed by the church meetings and the Thursday lectures. Mistress Anne called together her woman friends ("females," in the quaint phraseology of the day), and preached to them, giving them an enthusiastic version of the Rev. John Cotton's latest sermon, with sundry original additions of her own. She became the fashion, the craze, the fad of her day. But the stern and narrow Puritan spirit rejected her; has not the world always stoned its prophets?—and after her banishment she betook herself with her family to the mouth of the Hudson river, in which region she was killed by the Indians, as is well known. Her home in Boston was on the site where the Old Corner Bookstore now stands.

The eighteenth century was a very important determining period in Boston life. Benjamin Franklin was born in January of 1706, on Milk street, his father's home being on the site now occupied by the office of the Boston Post. Cotton Mather, who had become a minister of the Second Church in 1684, died in 1728, but his influence permeated the entire century and it is, indeed, in the air today. In this great divine were united the names and the characteristics of the Mathers and the Cottons. His father was Dr. Increase Mather, pastor of the North Church and, later, president of Harvard. His mother was Maria Cotton, a daughter of the Rev. John Cotton. Cotton Mather was born in Boston in 1663, and, in the quaint phraseology of his biography, "when he was half a year short of nineteen he proceeded master of arts, and received his degree at the hand of his father who was then president." His tomb at Copp's Hill is the most noted one in the grounds, and the heavy slab of stone covering the vault where lie the bodies of the Rev. Drs. Increase, Cotton and Samuel Mather, bears simple inscriptions of names and dates. During this century Peter Faneuil gave to the city the hall now bearing his name; the first newspaper was founded; and the settlement presented the appearance of an active trading town. The cows were still pastured on the Common; but the social life held its rigid traditions of etiquette, and the ladies went their rounds in a chaise with one horse, attended by a colored servant, and in the early evening, after tea, for all Boston dined at mid-day, they walked on the Mall; and "those not disposed to the evening lecture" adjourned to one another's houses. Great regard was paid to what they termed "gentility." Their ideas of entertainment are typified by a record in Judge Sewall's diary, which runs:

"I went today to look at my vault. It was an awful but pleasing treat. Having said 'the Lord knows who shall be brought hither next' I came away."

Social rivalries were not unknown in these times. That sturdy patriot, Samuel Adams, said of John Hancock, whose display of wealth he indignantly denounced; "John Hancock appears in public in the state and pageantry of an Oriental prince. He rides in an elegant chariot attended by four servants in livery."

The Boston of Revolutionary days is so familiar in all history that it may here be passed with little reference. During those years the story of Boston was identical with the story of the nation. It was a vital part of the national progress and has become as familiar as the alphabet. The local patriotism was strong and fervent; and at the close of the war there set in a new era of progress whose trend became distinctively that of intellectual and literary culture.

In the early years of the nineteenth century there was born in Boston a group of the most remarkable men and women. The period of their activities is well named the "golden age" of Boston. Nor, indeed, can their names or influence be held in any local restriction. They belong to their country and to the world.

William Lloyd Garrison, who was destined to play so potent a part in national progress, was born in Boston on December 10, 1805. In his earliest youth he became conscious of that work to which he was divinely commissioned, not only that of the enfranchisement of the colored race, but of freeing his country from that "sum of all villainies," human slavery. The wealth, influence and social prestige of his native city were against him. Little did he consider it, for is not one with God a majority? In an obscure room up many flights of stairs this youth of nineteen set up the type of his paper, "The Liberator." He called meetings and proclaimed his message. The story of those days when Garrison, and Wendell Phillips, Lydia Maria Child, and the little band of brave reformers who gathered around them held their meetings in Boston—entering by back doors, leaving by circuitous routes, and literally taking their lives in their hands—is a subject for the tragic muse.

St. Bo-  
d), was  
op Mr.  
ame to  
own as

Meantime newspapers were established; a railroad was built from Boston to Worcester and another projected southward to run through Dorchester, which brought out vigorous demonstrations of remonstrance. The residents of Dorchester declared that a railroad would be the ruin of business. Lney Stone, when talking of the opposition to woman suffrage, used often to relate with glee the indignant alarm felt by the people at the prospect of a railroad. "The cattle and the sheep grazing on the plains would be frightened to death," they said, "and the milk would be ruined." This curiously conservative element has always persisted in Boston, from the time of the remonstrance against a steam railway to that of the present season against a ten-story building on Copley square. There was a vigorous remonstrance against the slightest encroachment on the Common for the purpose of a needed thoroughfare in the rapidly growing city; there was a remonstrance against granting a charter to Radcliffe College (which, happily, did not prevent its being done); and remonstrance meetings of women, protesting against political duties, consume, apparently, more time and energy than all the political duties they could undertake in a lifetime.

erty transfigured by qualities of intellect and spirit; the other that of inherited wealth and its attendant refinement of external environment. The majority of men whose names are the glory of New England have belonged to the former. Dr. Edward Everett Hale says that his boyhood belonged to the time when a gentleman could do anything, and there was no task he might not ennoble. Emerson cut wood during his college life to assist his progress. Plain living and high thinking was a badge of culture. Again, there were those who were born in the purple—sons of inherited wealth, and among these were Wendell Phillips and Robert C. Winthrop. Independent of any necessity of earning a living, Mr. Winthrop had all his time to devote to the culture of his scholarly tastes. He belonged to a family whose name was one of the illustrious group of Bradford, Endicott, Winslow and Winthrop. His ancestry includes many eminent names. Robert Charles Winthrop was born in Boston on May 12, 1800, and graduated from Harvard in the famous class of '29. The achievements of his life were purely those of statesmanship, which differs very widely from politics—and as a statesman it is perhaps critically true that he barely missed greatness, or, at least, the

WHITTIER'S HOME—AMESBURY.

all over it in ten minutes." The great literary era was opening.

It will be remembered that a remarkable group of men and women were born within the first quarter of the nineteenth century. Edward Everett was born in 1794; Amos Bronson Alcott in 1799; Robert C. Winthrop in 1809; and within the next decade Hawthorne, Lydia Maria Child, Theodore Parker, Emerson, Margaret Fuller, Longfellow, Whittier, Mary Livermore, James Freeman Clarke, Dr. Holmes, Sumner, Dr. Benjamin Pierce, Wendell Phillips and other notable persons were born, and before 1825 Lowell, Whipple, Motley, Lucy Stone, Julia Ward Howe, Edward Everett Hale, Col. Higginson, James T. Fields, Abbe Morton Diaz, and, in the late years of the decade, 1830-40, were born Phillips Brooks, Louise Chandler Moulton, Louisa Alcott and T. B. Aldrich.

Not all these were born within the city limits of Boston, but all are, practically, Boston people, as this city was the general scene of their activities; but all, save Mrs. Howe, were of New England birth, and she is so identified with Boston as to be a part of its life.

A remarkable character among this unparalleled group was Hon. Robert C. Winthrop. He was almost the last of a distinguished type of New England life. There have been two distinctive and contrasting types of life here, each of which has contributed to the fruition of latter-day culture. The one that of material pov-

erty, Clay, Webster and Sumner have tame more purely national. Mr. Winthrop was all his life a conservative; with faultless taste, with intellectual power, with eloquence and elegance of address, with great charm of manner; but the one grain of magnetism—or of madness perhaps—that is required for greatness was lacking in his symmetrical character. Whatever the impediments, however, in his nature and temperament to the bringing a decisive influence to bear on the country at large, Mr. Winthrop was an ideal private citizen. His life was marked by scholarly pursuits in classic study, in historic research, and in literary enjoyment and appreciation; by a fine religious sense, by moral dignity, and by social grace. His home was a center of exquisite courtesy and gracious hospitality. On Washington's birthday, each year, it was his custom to receive every person, man, woman or child, who cared to come to his house. It was an occasion so unique as to live forever in the social history of Boston. The manner of Mr. Winthrop suggested the French nobleman. A nobleman of the Faubourg St. Germain might have received all Paris as Mr. Winthrop did all who in his own city came to greet him. He had two homes, a town house in Marlborough street and a beautiful estate in Brookline. They are both historic homes in which are gathered associations from the days of John Winthrop, his ancestor, and they abound in books, art and beauty in all forms.

Perhaps his  
f in any one  
. All the lat-  
of Massachu-  
ed him. Yet

Mr. Winthrop was a communicant of Trinity Church and he was a warm and devoted friend of Phillips Brooks, who for over twenty years was his rector. He had been married three times. When the last Mrs. Winthrop died, some ten years ago, Dr. Brooks was in New York on the eve of sailing for Europe; but he returned and conducted the funeral services, sailing a week later. Little would anyone have then dreamed that Mr. Winthrop, who was already in his eighty-second year, would outlive his rector, who was some thirty years his junior.

Mrs. Julia Ward Howe, who, though a native of New York city, became a Bostonian by adoption, and one of the most im-

"These two gentlemen, Dana and Allston, were very intimate, and Mr. Dana had much to say concerning Allston's pictures, which he considered as far above the work of any painter of his time."

"It was Mr. Dana of whom Margaret Fuller said that 'he had the charms and defects of one whose object in life had been to preserve his individuality unprofaned,' was it not, Mrs. Howe?"

"Very likely," she returned. "The remark is applicable."

"Do you regard his estimate of Mr. Allston as one altogether merited, Mrs. Howe?"

LOWELL'S HOME—CAMBRIDGE.

port

Ho

and Orthodox Congregational form of religion prevailed. The Episcopalian was scarcely prominent. Margaret Fuller was holding her 'conversations,' Emerson giving his early courses of lectures; some sort of musical society performed a Beethoven symphony.

"In the delightful general tone of society there was a decided flavor of culture. In fact, Boston had already won elsewhere a reputation for pedantic learning and blue-stockingism that it did not desire, nor deserve. Latin had formed part of the school education in good private schools, and Prof. Bach's residence here had introduced a good deal of Italian literature, so that the young ladies whom one met were often students of Virgil and Dante.

"Modern' languages were less spoken than in New York, in which place the possession of several languages had been considered a desideratum in education. People were studying German, but not very generally. Margaret Fuller and her pupils gave to it much attention.

"The social influence of Cambridge was more appreciable than now. Unless I am much mistaken, the society people in both places met more frequently than is now the case. The elder Dana, the poet, was living, and it was thought a privilege to meet and discourse with him.

"Mr. Allston was entombed—yes, I think entombed is the proper word," continued Mrs. Howe, smilingly, "in his studio in Cambridgeport, where only Mr. Franklin Dana, a man of eminent learning, possibly a few other intimates, knew the secret of entrance. People talked a great deal of his great picture, 'Belshazzar.' I remember that the fact of his unrolling it after many years was learned with deep interest. He began this great picture and left it unfinished. No doubt he did some work on it in his last years.

Allston

of the  
orded

th' in

his art, but concluded that the prophets and sibyls are for the Michael Angelos, the beautiful in Mr. Allston's dominion."

"Did you visit this exhibition, Mrs. Howe?"

"Yes, I remember we came over from New York to study its most important works. I think Emerson, in the portion of the life of Margaret Fuller written by him, describes how she saw what she desired to see, and made others read her own meaning into it."

"Had Theodore Parker begun to make his impress on the thought of the age during this period?"

"Yes, it was about this time that he preached that memorable discourse on 'The Transient and the Permanent in Christianity,' which was so very generally disapproved in the religious world."

"Did the social life differ essentially from that of the present, Mrs. Howe?"

"There was a certain reserve which characterized its hospitalities and general intercourse. In the Boston of that time the gentlemen of business did not go far from the city in the summer, and there were a number of very beautiful country seats in the neighborhood. Strangers coming to the city with proper introductions were invited to visit families at their country residences, on which occasions they were generally entertained with fruit and wine, the afternoon tea being then undreamed of.

"Nahant was the favorite seaside residence. The atmosphere of the city was quite distinctly recognized, it seems to me, as a little apart from the high road of business and fashion. The climate, perhaps, stimulated the nervous system, and generated an over-activity, which reacted on itself, not yet having found a vent beyond the narrow limits of old scenes and belongings.

"I first knew the city as a stranger—this quiet, formal, self-restraining Boston, but a little later, penetrating further into the spirit of the place, I found the fiery enthusiasms for art and let-

ters and reforms, out of whose development the best part of the modern Boston has come."

"You have certainly seen and studied the process of evolution that has resulted in the Boston of today, have you not, Mrs. Howe? Indeed, if it you might well say, 'all of which I saw, and part of which I was.'"

"I have lived, certainly," she replied, "to see a time in which rejected stones hewn and polished by God's hand, have come to be recognized as corner-stones in the practical religious buildings of the age. I remember when it was a discredit to hear Theodore Parker, and now how happy are they esteemed who have heard him. Brook Farm was once looked upon as a most amusing caricature. But when the world learned something about Hawthorne, George Ripley, William Henry Channing, John Dwight, and George William Curtis, the public heart bowed with remorseful homage before the ruined threshold of what, with all its shortcomings, was a blameless temple to ideal humanity."

Nothing could photograph more vividly the Boston of the period lying between 1840-70, than these reminiscences of Mrs. Howe.

There is nothing in all the city more typically Bostonian than the Athenæum, the library belonging to a private corporation of the stockholders, which is gathered in a classic brown stone building (erected in 1837) in Beacon street near Tremont. In it the portraits of dead and gone Bostonians look down from the walls and their busts stand on pedestals around three sides of the long gallery upstairs. The Athenæum is the surviving representative of the transcendental period, and holds in its atmosphere untold traditions and pictures of the great and gifted, whose special resort it was.

Henry James has laughed at the enthusiasm of the early Bostonians over the "attenuated outlines" of Flaxman who first represented foreign art to them; and the visitor of today cannot but smile to remember the serious devotion with which Margaret Fuller sat down day after day, before the few casts of sculpture and the paintings of Allston which were then in the Athenæum, to record her "impressions" of them in diary form. The Bostonians of the transcendental period took themselves very seriously. Chronologically, that period in its especial sense lay between 1830 and

by the German study and reading that took such hold on Margaret Fuller, James Freeman Clarke, Frederic Henry Hedge, George Ripley, Elizabeth Peabody and others in the decade of 1830-40. In the latter year "The Dial" was started; and there lies before me now, as I write, an autograph letter from Emerson to Elizabeth Peabody, without date, but necessarily written between 1840 and 1843 (as the Dial only lived three years), which runs:

"Can Miss Peabody oblige the Dial (just ready for extreme unction), so far as to send the first of these two proofs directly to the printers? On page 480 occurs the phrase, 'a dead leveller.' Is the phrase a considered one? I don't like the sound of it very well but it may be right."

Channing's influence was a potent one, reaching from the early years of the century; Theodore Parker also began to be felt as a great power about 1840; he was the Savonarola of his day. Thoreau and Bronson Alcott were unique personalities and a law unto themselves. "The acorn-eating Alcott," wrote Emerson of him to Carlyle, yet no one ever more fully appreciated another than did Emerson his Socratic neighbor. About 1840 the famous "Brook Farm" experiment was inaugurated, and its constitution stated its aim to be "to promote more effectually the great objects of human culture," and "to establish the external relations of life on a basis of wisdom and purity."

In 1841 Hawthorne wrote from Brook Farm to a friend:

"I have milked a cow. The herd has rebelled against the usurpation of Miss Fuller's heifer and whenever they are turned out of the barn she is compelled to take refuge with me. She is not an amiable cow, but has an intelligent face and a reflective cast of character."

Margaret Fuller was not so much, merely or even mostly, the literary woman, as she was a great force in life. Some one recently, in writing of her, asserts that she was not only the greatest woman of letters in America, but the only one who has ever produced work of any consequence. This had led, not unaturally, to contradiction, and the scale has been dipped even more extravagantly the other side by writers who seem to be devoid of any true recognition of her real greatness. A close student of profound original power, of a wide and exquisite culture, a thoroughly trained and philosophic mind, and a gift that can, perhaps, be described only as divination, made Margaret Fuller a supreme power in the forces of progress. But to point to her pub-

consisting of the "Summer on the Lakes," "The Drama," "Woman in the Nineteenth Century and Life Within," and "At Home and those books alone and claim that they sur-  
other woman of our country, is a claim that antiated. There is in her writings the qual-  
e is a power of spiritual insight; a depth and ough for which, indeed, too high apprecia-  
laimed. Yet, on the other hand, she lacked  
expression; and, in short, the true view of  
perhaps be that she was one of the greatest,  
t exalted spirits ever sent into this world.  
is a constant conflict with conditions, but  
opportunity gave her adequate scope for the  
rtial self. Her literary work, too, is the work  
l just after her fortieth birthday, and whose  
thirty was almost entirely occupied in teach-  
chievement, "The History of Italy," was lost

1850; and the death of Margaret Fuller in July of 1850 marked a definite close to its activities, while its spirit permeates the air today

Transcendentalism was a spiritual impulse greatly stimulated

of the intellectual cult of that period, were  
outward life. It is authentically recorded  
e, having bought a broom, carried it home  
g across the Common, and that Julia Ward  
Motley, walked home from a ball. Mrs. Ed-

with F. Whipple was a pretty story of a visit of herself and her husband to the Hawthornes in the red house at Lenox, when Mr. Hawthorne and Mr. Whipple went out to the garden and picked currants for tea, and Mrs. Hawthorne made biscuit, while Mrs. Whipple laid the table. But were not currants and biscuit and tea a feast for the gods when the Hawthornes and the Whipples sat down to this nectar and ambrosia?

The poet Longfellow had married the daughter of a wealthy

house—Miss Frances Appleton—who was of the more formal social caste; although there were not then, any more than now, any very definite lines separating cults and cliques in Boston. There has always been great intersection among the social circles because the intellectual aristocracy is a recognized one, and during the past twenty years it is that which has held the greater social prestige. Still, the prestige of wealth and caste counted for something and the young and then unknown poet owed somewhat of widening horizon to his having married into a prominent family, although later they owed to him the larger claim for social prestige as his fame became world-wide. Mrs. Longfellow was a woman of great charm and of special literary culture, and the old "Craigie House" which they occupied added another to the literary homes for which Boston was the most noted city, at that time, in the entire country. Social life grew more elaborate in its entertainments in the Boston of 1850-60, and the anti-slav-

was called after her return from Europe, who introduced into Boston a much freer and fuller social life, giving her Thursday evening and Saturday afternoon receptions, serving tea and cake only—an innovation on the more formal customs that had prevailed in the city.

The Otis house was the center of brilliant social life and to Mme. Otis strangers of rank and distinction invariably brought letters. It is to Mme. Otis that is due the making Washington's birthday a legal holiday. For years on that day she opened her house for a public reception. The spacious rooms were decorated with the national colors; filled with flowers sent by friends, and all day long the throng of citizens, high and low, rich and poor, poured through its portals, each welcomed with that high-bred grace which so distinguished her.

With the exception of the great Mary Livermore and of Kate Field, no woman of this country was ever, perhaps, so ardent a

LONGFELLOW'S HOME—CAMBRIDGE.

ery excitement flamed, and to a great degree dominated other interests.

And then the Civil War came on, and there arose a remarkable woman. A grande dame of society came to the front, Mrs. Harrison Gray Otis, who took entire charge of the work of the sanitary commission in Boston. Mrs. Otis was the daughter of a wealthy China merchant—the species of mercantile activity in which the great fortunes of Boston were largely made—and she had received the most extended education and exquisite culture that the best masters and opportunities for travel and society could give. While still a young girl she made a brilliant marriage, the Otis family standing among the highest in the land. Her husband died in their early married life, and she took her four young sons to Europe for their better education in art and languages. She was herself an admirable linguist, speaking four or five languages, and she had been presented at half the courts in Europe, and had a social distinction which she took naturally—she had been born to it—and she was withal, the most ardent patriot.

The Otis mansion was on the corner of Joy and Mt. Vernon streets, and is now extended by several stories into the air, and known as the "Gray Chambers." It was Madame Otis, as she

patriot as Mme. Otis. She assumed charge of all the goods and money for the sanitary work in Boston, and for three years she never missed a single day of being at her post in the large building on Tremont street, from ten to three, save on Sundays and holidays. She established a "Bank of Faith" for voluntary contributions, and over one million dollars, not one penny of which was solicited, flowed in. While her work had not the marvelous scope which characterized Mrs. Livermore's during the Civil War, as Mrs. Livermore's was national and that of Mme. Otis restricted to the New England states, it was of the same generous and noble quality which so signally immortalized that of Mary Livermore.

The literary homes of Boston were a signal feature of the city. The home of Prof. George Ticknor, the Spanish historian, stood on the corner of Park and Beacon streets, and there for forty years a splendid and gracious hospitality prevailed. After fifteen years at Harvard, Prof. Ticknor was succeeded by the poet Longfellow, and in 1835 he went abroad with his family, remaining four years and sharing the social life of courts and nobility. It was at the Ticknor house that Lafayette was entertained when in Boston, at a little Sunday night supper which

Prof. and Mrs. Ticknor gave for him, and which is still famous in Boston annals. It included among other guests, President and Mrs. Quincy, of Harvard, Mr. and Mrs. Daniel Webster, and Mr. Prescott. Previous to 1840, very few Bostonians left their homes for the summer; but the Ticknors always went to Nahant or Portland to visit the Prescotts at their country house at Pepperell; and later the custom of having a summer home became more general. Mr. Longfellow had a cottage at Nahant; Mrs. Julia Ward Howe a country house near Newport, where one day, when Tennyson's poem, "In Memoriam," first appeared, George William Curtis and Charles Sumner journeyed to Newport to Mrs. Howe's home to read, with her, the wonderful new poem that moved a nation.

Fashion never enthroned herself in Boston to the degree in which most cities have given her tribute. The genius loci was unalterably polarized toward other aspirations than those represented by chiffons. An amusing and typical instance of this spirit was recently related with glee by the victim of the joke. With the moral zeal of the true Bostonian, a lady remarked one day to her maid that external adornment was of very little value and that she herself did not rely at all upon her clothes.

It is difficult now to even faintly imagine the excitement that this parody on Poe produced on its appearance in an evening paper.

One of the charming features of the literary Boston of the scarcely vanished past, was that of the Sunday evenings at the Whipples' during the lifetime of the gifted critic. Here was something more like the salon than is often seen in these days. Mrs. Whipple's exquisite tact, as well as her fastidious taste, drew a circle at once eclectic and exclusive—guests drawn together by the only true law, that of spiritual gravitation. In the golden age of Boston it was Lowell and Longfellow and Greene and Pierce and Emerson; Dr. and Mrs. Howe; the Alcotts; Mr. and Mrs. Fields; the Hawthornes; Ole Bull and his graceful wife; Edwin Booth, and the witty Autocrat; Dr. Bartol, the gentle mystic; James Freeman Clarke, serene and spiritual; Miss Anne Whitney, of an almost classic majesty of presence; the winning and gracious Louise Chandler Moulton, whose poems charm a multitude of readers; Miss Lueretia P. Hale, and in still earlier days, Sumner and Governor Andrew.

Wendell Phillips went little into society. There was no house but that would have felt itself honored by his presence, but he

LONGFELLOW'S STUDY.

"And what was inimital

In the de- feature in weekly Mon

T. Sargent, in *Chestnut Street*. It was the most intellectual galaxy that America has ever seen. Here assembled Emerson, Longfellow, Lowell, Whipple, Alcott, Dr. Hedge, John Weiss, Thomas Starr King, Whittier, Mrs. Livermore, Julia Ward Howe, Garrison, Wendell Phillips, Lucy Stone, Mrs. Moulton, and many others of the lights of the day. Sherwood Bonner (Mrs. Katherine McDowell) being invited to one of its meetings, quite transcended the privileges of a guest by writing a parody on "The Raven," but at a quarter of a century's lapse of time one is disposed to look leniently on the discourtesy, because of the wit. It opened thus:

"Dear friends, I crave attention to some facts that I should mention  
About a club called 'Radical' you haven't heard before;  
Got up to teach the Nation, was this new-light federation,  
To teach the Nation how to think, to live, and to adore;  
To teach it of the heights and depths that all men should explore,  
Only this and nothing more."

Mrs. Julia Ward Howe was thus characterized by this audacious rhyme:

"Then a lady fair and faded, with a care-worn look and jaded,  
As though she saw the glory of the coming Lord no more,  
Crushed the British lion's roaring by a reverent outpouring  
Of a faith forever soaring unto heaven's golden door;  
She was listened to intently by each member on the floor,  
For her genius they adore."

cial work for human- de a certain sacrifice e light of duty. ipples, and his most was written from a ipples by Sumner.

A poet of rarest gifts; a student whose rewards were rich and noble in the directions he pursued; a man of fine and exquisite tastes, of delicate sensibilities was Dr. Parsons. As a literary man he ranks among the few of our greater authors; he found his peers with Lowell, Whipple and Longfellow. As a scholar, with Prof. Charles Eliot Norton. His translation of Dante is one with genuine claim to perpetuation in literature. His poems, comparatively few in number, hold sacred fire. On his altar burned the living coal.

In his chair of Belles-Lettres at Harvard, Prof. Norton has impressed upon successive classes of students an understanding and a reverence for the fine arts and for poetry and the higher literature. To attend his lectures was in itself considered by Harvard students as a liberal education. His distinction of manner, his charm and graciousness, and his sincere and unaffected interest in the individual welfare and progress of the students won their entire confidence and commanded their admiration, and his recent retirement is greatly regretted.

The eminently conservative character of Lowell's mind is indicated by a remark made in a letter to Mrs. Howe more than thirty years ago. It was during his editorship of the *Atlantic*, and she had sent him a poem, which he declined with the asser-

tion that no woman could write a poem, and that Mrs. Browning's efforts were a conspicuous illustration of her failure to be a poet. Mr. Lowell added in this note to Mrs. Howe that he would gladly accept a prose article from her. There is no question but that Mr. Lowell was always under the old order of things, believing that the woman was subservient to the man.

Mr. Lowell had the ethical radicalism of the moral enthusiast and the social conservatism of his age and generation.

In August, 1860, Lowell wrote to Hawthorne a letter introducing Mr. Howells, and here is the picture he drew of the great novelist thirty-eight years ago.

"He wants to look at you, which will do you no harm, and do him a great deal of good. His name is Howells, and he is a fine young fellow, and has written several poems in the Atlantic, which of course you have never read because you don't do such things yourself and are old enough to know better."

Mr. Lowell will be remembered as the poet and man of letters who became a citizen of the world. Wherever literature is loved,

life, were his, and its vitality was shed upon thousands of other lives of those who yet never clasped his hand or looked upon that keen, joyous, thoughtful and spirituelle countenance. Fame crowned him at many of her portals, and honor, troops of friends and showers of good wishes brought their tribute. He built him yet "more stately mansions" as the swift seasons rolled, and he represents to us all that is noblest, most generous and harmonious in the literary history of America. His home "on the water side" of Beacon street was a hospitable one. His library was on the second floor looking out on the Charles river, and here, in the closing years of his life, he received his friends sitting enthroned among his books. In the drawing room down stairs hung the famous portrait of "Dorothy Q" with the British officer's sword thrust through the canvas. Both Dr. Holmes and Mr. Lowell led very ideal literary lives when one comes to think of it. The conditions into which both were born were the best possible for literary development of a high order, and each was fortunate in what was withheld as well as in what was given.

THE OLD MANSE—CONCORD.

wherever patriotism is held as a pious virtue, wherever human progress is seen as an individual and national ideal, the name of James Russell Lowell will be enshrined.

Other phrases are needed to characterize Dr. Holmes. He had the most electric personality, recognizing with the lightning swiftness of intuition the keynote to any scale of elective affinities. He was not so much magnetic, as magnetism impersonated. He was so much more alive than other people. The term "old age" was a misnomer to associate with the genial, brilliant Autocrat. The waters of Helicon were to him the fabled spring for which Ponce de Leon sought in vain, and it might have been said of him in his last days, as truly as when Lowell wrote the lines fifty years ago:

'His are just the fine hands, too, to weave you a lyric  
Full of fancy, fun, feeling, or spiced with satiric,  
In a measure so kindly you doubt if the toes  
That are trodden upon are yours or the foes.'

Poet, wit, scholar, romancer, critic and scientist, surely nature was in a bountiful mood when she crowned with all her gifts his beaming and benignant life. The sunshine of all the summers since that auspicious 29th of August, 1809, sifted into his

Mr. Lowell always reverted with love to his early home, one of pure and lofty ideals with modest competence and inspiring associations. Rev. Dr. Charles Lowell, his father, was a typical early New England divine, in whom great and genuine goodness was a distinct and positive genius. Mrs. Edwin P. Whipple has related how Dr. Lowell was often seen at night with his lantern, traversing the muddy and crooked paths of the poorer parts of his parish, seeking out those in need of a word, or of material aid. Rev. Dr. Bartol, the venerable transcendentalist, who, at the age of nearly ninety, is still in fairly serene health and activity, was the junior colleague of Dr. Lowell in the pastorate of the Old West Church.

The mother of James Russell Lowell was a woman of sensitive and poetic nature, and of imaginative power. A student curious in tracing heredity would perhaps ascribe her son's poetic gift to the strain of romance in her, coming as she did, from a family in Orkney, with the wild picturesqueness of its life in her temperament. Elmwood, the home of the Lowells at Cambridge, is well known to all students of our literary history. It is a pleasant, unpretentious house, with elms in front, looking over the east side of Mount Auburn cemetery at the back. Two drawing-rooms—if so stately a name could be applied to them—are on

one side of the hall, with doorways on either side the fireplace, connecting them. Mr. Lowell's library was the front room on the second floor—a library rich in classics and rare volumes. The estate is still in possession of members of his family.

The home of the poet Longfellow on Brattle street, in Cambridge, is always a shrine of pilgrimage. The old "Craigie House" it is still called, and there Miss Longfellow, the eldest and the only unmarried daughter, lives, while on either side the two married sisters, Mrs. Dana and Mrs. Thorpe, have built their pretty houses—all on the same lawn. Mrs. Thorpe (Annie Longfellow) married a brother of Mrs. Ole Bull, and Mrs. Bull, who for so many years occupied Mr. Lowell's house—Elmwood—has now built a house of her own on Brattle street, very near the Longfellow estate, and a house that is one of the most luxurious and elaborate in modern New England architecture.

Boston is especially fortunate in her neighboring towns easy of access, beautiful to know, and of all these Concord is the one most enshrined in the classic associations. The spirit of the town in keeping green the memory of its world-famed citizens is admirable. The Fitchburg road (the route to some of the most charming and picturesque scenery in all New England) has such admirable train service to Concord that one finds it easier to go than to stay at home. Trains convey one from Boston to Concord at almost any hour of the day in from thirty to fifty minutes, and reaching the little station the first thing that meets the eye is Thoreau street. Instantly one feels in the atmosphere of classic association. The beautiful town library, its interior lined with the busts of "Concord authors"—Emerson, Hawthorne, Thoreau, and the Alcotts—with others of fame, is a grateful expression of the enthusiastic devotion with which the village cherishes its great and its good. A little walk past an old graveyard, whose moss-grown stones bear dates of two centuries ago, brings one to the public square wherein the soldiers' monument stands, and from which two roads branch, one on which stands the home of Emerson, and still farther on the "Orchard House," and "The Wayside," and another from which one approaches "Sleepy Hollow" cemetery. It is here that one makes his pilgrimage. Here is the spot that is as much a classic in the world's history as the famous region of the lake poets in England, or the heath where the witches appeared to Macbeth, or the spot in Florence whereon stood the house in

LOWELL'S STUDY.

which Dante lived. For the name of Emerson is second to no other in the entire history of the world, and his grave will be forever a shrine of sacred pilgrimage.

In the calm beauty of a golden summer afternoon, climb the sloping heights of "Sleepy Hollow". Approached from the main thoroughfare (on the south) the roads and paths wind upward over varied slopes.

Emerson's grave on the crest of the highest hill in Sleepy Hollow cemetery, is only twenty minutes' walk from the station.

If one chooses he may drive; but in that he misses the pleasure

of sauntering through the town, with its wealth of historic associations. One may like to walk leisurely past the house where for some years Mr. Alcott lived with the family of his married daughter, Mrs. Pratt. The home of Judge Hoar and the old graveyard are on the main street of the village. The home of the well-known author, lecturer and political economist, F. P. Sanborn, is at the west end of the town, on the river. Mr. Sanborn went to Concord the year that he graduated from Harvard, and here he has lived, the neighbor and friend of Emerson and of Alcott, during their lives, and he has always been actively engaged in the life of literature and reform. Aside from Mr. Sanborn's home the chief interest of Concord is at the east end of the town. From

CUSTOM HOUSE—SALEM.  
(Where Hawthorne Wrote the Scarlet Letter).

Monument square three roads fork, branching in different directions; on one of these is the "Old Manse" which was built in 1765, for Rev. William Emerson, the grandfather of Ralph Waldo Emerson. Mr. Emerson married Phoebe Bliss, the daughter of a clergyman, and died a few years afterward. His widow became the wife of Rev. Dr. Ezra Ripley, who, in 1778, planted the apple orchard that still stands, extending back from the house to the river. Almost all the old ministers of New England have been entertained under the roof of this ancient house. The small, square study, where so many sermons have been written, and where the traditional ghost used to appear, is still kept as it was a hundred years ago, and it is said that still, late at night, the door-latch is lifted and the door opened by an unseen hand. In the rooms above the dining-room Emerson wrote his "Nature" and Hawthorne his "Mosses from the Old Manse". In another chamber (called the "Saints' Rest") the walls bear written inscriptions from many of the aged priests who have slept there.

The home of Emerson, a modest white house with great chestnut trees guarding the gate, is now that of his daughter, Ellen, who has never married, and who is a household saint in Concord. Emerson's library is kept as he left it, and in the dining-room hangs a classic engraving which was Carlyle's wedding gift to Mrs. Emerson.

The grave of the great mystic and poet, in Sleepy Hollow cemetery, is marked by an immense boulder of rose quartz. A bronze tablet bears the inscription:

RALPH WALDO EMERSON  
Born in Boston, May 25, 1803  
Died in Concord, April 27, 1882.  
"The passive mother lent his hand  
To the vast soul that o'er him planned."

By his side lies his wife, and the grave of the little son, Waldo, in whose memory he wrote the "Threnody," is next his own.

Almost adjoining are the lots wherein lie Hawthorne; the Alcotts, father and mother and four daughters; Thoreau and Emerson. Three generations of the Emersons are buried here, and the various inscriptions recall curious bits of local history and tradition.

Another name which was a vital part of Boston, Boyle O'Reilly, can now be read only in the hearts of the people, and on the beautiful sculptural memorial by French, placed at the head of Boylston street in the Back Bay Park. Mr. O'Reilly was peculiarly and pre-eminently a man of large relatedness, if one may so

call it, to life. Not only in his natural and inevitable relations to a large and complicated business, to his family and nearer friends, and to general society, but to all humanity. No person could be so obscure, or so degraded, or so utterly outside the pale of what might seem some use in life, as to be outside the

WHITTIER'S HOME—DANVERS.

active sympathies of Boyle O'Reilly. If one were in need, that was all the passport required to his sympathy, his counsel and his assistance. He left the deserts to be judged by the All-Seeing, and asked no credential of those whom his goodness benefited.

Although there is a new Boston, a greater Boston, indeed, a new Boston of modern architecture and taste, yet there still abound the old-fashioned houses whose exterior suggests to the passer-by nothing of the beauty within. Of these are the houses of Robert Treat Paine, ex-Governor Claflin, Mrs. Whipple, Mrs. Fields, Rev. Dr. Bartol, and the late Mrs. Hemenway. With all her vast wealth she lived in a house on Mount Vernon street, of which the only particular impression the passer-by would gain would be that it must be a "roomy" mansion. Ten chances to one, indeed, if the casual pedestrian even noticed it at all. Yet within it was a home fit for culture and high taste. That is what one would have said on entering it. One would not have thought: "This is a fitting home for a woman of fine tastes and high life"—high life in Boston not meaning precisely what it does when the term is used in Punch. Noble works of art, paintings, sculptures, books, adorned Mrs. Hemenway's spacious and beautiful house where extensive and charming hospitalities prevailed, and where all that could minister to the finer flavors of life were gathered for comfort, for use, but in no sense for display.

A French visitor in Boston solaced himself by writing a book about the social life of the modern Athens in which the quality of frankness, at least, cannot be said to be lacking. He found Boston society provincial and said so. He alleged that most interesting and important people are not "in society," and that the alleged "smart set" comprise a few families who entertain each other, and marry each other continually, and whose companionship is as devoid of inspiration as possible. The arraignment is a formidable one, and it is, at the worst, very cleverly made. The question is, is it true? When the assertion is made that the most interesting and important people are not "in society", one cannot but recall the old truism that where MacGregor sits there is the

head of the table. In those gatherings where President Eliot, Dr. Hale, Mrs. Howe, Dean Hodges, Dr. John Fiske, Prof. Josiah Royce, Mrs. Whipple, Mrs. Agassiz, and others of representative people who stand for something—in those gatherings where they are to be met, is there not "society", and the best of it? Why must social life par excellence be regarded as a matter of spectacular festivity? Why is not a quiet dinner, or reception,

more thoughtful or gifted order of a Bradley-Martin ball? "Society of humanity," well said Kate Field; "some days it will be." Not only should we assist at the prophecy, but also admit that "society" is merely a life of representation—in dining and in the standard of life.

Wealth in Boston does not seem to be as beautiful as dinners; there are beautiful toilets, there is charm—what you will—but those are not used by it. There still lingers in it is not to be mistaken for provincial standard in Boston is that of an ideal carried to what it is sometimes insisted upon to enter within the gates calls narrowness is standard is held high and so absence to all social relations.

Whittier's wealth in Boston does not seem to be as beautiful as dinners; there are beautiful toilets, there is charm—what you will—but those are not used by it. There still lingers in it is not to be mistaken for provincial standard in Boston is that of an ideal carried to what it is sometimes insisted upon to enter within the gates calls narrowness is standard is held high and so absence to all social relations.

Trinity square, is open every day and is always a place visited by the tourist and stranger. The Museum of Fine Arts and the Public Library, together with Trinity and the "Old South" Church, combine to make Copley square the architectural representative of Boston. Trinity has been most fortunate in securing for its rector—the immediate successor of Phillips Brooks—the Rev. Dr. E. Winchester Donald, a man not less remarkable than his celebrated predecessor. His philosophic

WHITTIER'S STUDY—DANVERS.

breadth of thought, his noble culture, his sympathetic and winning personality, render Dr. Donald one of the salient forces in the life of the Boston of today.

Any attempt to portray Boston that did not include the name of Rev. Dr. Edward Everett Hale would be, indeed, the play of "Hamlet" with Hamlet left out. As a great divine, an eminent man of affairs, a noted counsellor in all municipal interests; the friend, the citizen; no less, also, one of the most widely read of the Boston authors, Dr. Hale's personality and influence are unbounded.

The Public Library in both its intellectual and artistic aspects is more and more the center of interest. Its mural paintings rival in interest the galleries of the Museum of Fine Arts; its stately and noble reading-rooms, Bates Hall, the periodical room, the newspaper room, the fine arts room and other departments and specialties; its active hospitality, its beauty, glow and charm, are simply magnetic. Too much could hardly be said of the unvarying courtesy, the helpful kindness of Mr. Knapp, curator of Bates Hall, and of the heads of the other departments in the delivery room, the periodical and newspaper rooms. Yet with every recognition of the very rare quality of Mr. Putnam's staff, in their various responsible positions; with every recognition of the spacious, splendid buildings—a dream of beauty without and within—one must come back to the center of it all; to him whose firm touch upon the mainspring holds its elaborate mechanism true to its course—the Librarian, Herbert W. Putnam. The splendid building, with all its treasure of literature and art, might almost relapse into a mere literary mausoleum were it not for the spirit that informs it with life and light and irresistible energy.

The Lowell Institute is another important institution of learning in Boston, being, indeed, a "People's College". John Lowell, a son of the man for whom the city of Lowell was named, died in Bombay in 1836, at the early age of thirty-nine, and he left half of his fortune (\$237,000) to found a course of annual lectures on natural and moral science, political economy and literature, to which, after putting aside ten per cent of the income of this fund, each year, the remainder of the income should be devoted. Mr. Lowell wisely provided that no part of this fund should be devoted to building purposes. Not the external appliances, but the inner significance, was his aim. The Lowell Institute (whose lectures are given in Huntington Hall of the Institute of Technology) was opened by Edward Everett on December 1, 1839, and during the sixty years of their course the lecturers who have appeared on this platform have represented the most eminent men of various nations, in science, ethics, political and social economy.

The traditionally crooked and intricate ways of Boston are only objectionable to the un-Bostonian mind. It is the barbarian who dwells afar from the Frog-pond and out of sight of the Gilded Dome who demands unerring rectangles in his thoroughfares. (If the Gilded Dome were within his range of vision, he wouldn't be an outer barbarian, of course.) The Mayflower-landed, colonially-descended intellect regards a blind alley with the respect that Mark Twain's guide gave to "Ze great Christopher Colombo". No wandering minstrel from afar need ever feel that Boston has really taken him to her heart—oh! no, her mind—until he is initiated into the mysteries of the alley, whose holes and escapes, so to speak, are the joy of the Bostonian heart, and the delight of the Bostonian feet that skip nimbly through them after the native custom of jugglery.

Now, to the outer barbarian that all but invisible passage from Washington street to the locality ambitiously termed "City Hall avenue," via Young's Hotel, is a "route obscure and lonely." (No, there is no intention of adding the succeeding line that Poe added.) But the native modern Athenian rejoices in this byway. He darts through it at the rate of a mile a minute, and dodges his fellow Athenians on the way with the celerity and an agility that is no less admirable than it is startling.

Again, does the initiate wish to go from the middle of School street to the middle of West street? The stranger within the gates would take the long and decorous route on either Tremont or Washington; but the man to the manner born sagaciously betakes himself through the alley by the Parker House, emerging at Bosworth street; nimbly skips down the stone steps back of

Horticultural Hall, into another truly Bostonian passageway, crosses Bromfield street, hies him into Bromfield court—an Italian settlement dropped into the heart of Boston—makes a thoroughfare of a business house opening on both streets, and arrives at his destination in a hop, skip and jump fashion that is highly edifying. It is a picturesque mystery dear to the Bostonian heart, and on no consideration would he exchange it for prosaic rectangles.

Boston, like Paris, has her Quartier Latin, where the most interesting things happen. There is a semi-Bohemian region in which are located several studio buildings and other artistic or semi-literary headquarters, which is a part of the city that is very much alive. On the new land, the buildings all new, it is yet adjacent to and adjoining the old part of the city. It is not far distant, geographically, from the fashionable portion; it is within a half dozen blocks of Commonwealth avenue, of Beacon

BATES HALL.—PUBLIC LIBRARY.

street; but while these thoroughfares are monotonously quiet, with the decorous rows of private residences, broken now and then by an apartment hotel that vies with palaces in luxurious fitting-up, this artistic Latin-like quarter abounds in students who pour out of its clubrooms or restaurants in great numbers; with artists, men and women, who perhaps live in their studios, make their matutinal coffee over a gas stove, and dine at the students' restaurant; in lecturers; in the followers and practitioners of occult science, and mental healing; in spiritual mediums—what you will. You will perhaps be accosted on the sidewalk by a neatly dressed woman with refined courtesy of manner, who offers you a card bearing the legend, "Divine Science Home." You may be favored with a gratuitous copy of "The Prophetic Star-Gazer;" you may be gently entreated to attend a lecture on the "Science of Creation from the Standpoint of Vibration;" or invited to a course on "Psycho-Physics;" you may be asked if you understand "mental chemistry;" you may be informed of the private lectures given by Siddi Mohammed Tabier; you may be privileged to enter into the mystic atmosphere of the "Oriental Circle," where you listen to discourses on the "Gods of Egypt and the Book of the Dead;" "The Mahabhrata and the Ramayana," or "Reincarnation of the Vedas." Lecturers in this quarter discuss such topics as "Primal Force," "The Bondage of Mortal Sense," and "What is Death?" A daintily gowned young

woman sitting in a club parlor in this region was asked if she believed in thought-transference. "O, I am far beyond that," she replied airily; "I am in the sphere of intense vibration." There is one house where its fair mistress proclaims herself "Daughter of the Druids," and where she gathers a circle of the faithful about her on afternoons and lectures to them on "Symbolism." She has a room fitted up with maps and charts of the most extraordinary description. The signs of the zodiac; the supposed aspect of the universe at different periods of creation; representations of the stages of evolution in man, and other strange signs and designs of which it is difficult, alas, to grasp the meaning.

All this is the picturesque region of Boston. It is very much alive and is, indeed, "an atmosphere of intense vibrations." Here congregate artists to whose mind views on Impressionism and Realism constitute a legitimate *causis belli* over which they

limitations of space. The hall was crowded with eager listeners, and the power of Mrs. Eddy revived the memories of Anne Hutchinson and made itself a part of the apostolic succession of fervent idealism which is inseparable from Boston life and which is its dominant characteristic.

A remarkable factor in the development and progress of Boston has been the work done in the Institute of Technology. This institution, which General Walker well insisted should rank with Harvard University in educational importance, has made itself a centralizing force in scientific progress and intellectual advancement in every direction. Huntington Hall is used for the Lowell Institute lectures as well as for the special work done in the Institute of Technology, and the great audiences that gather every season at the Lowell Institute courses are the most visible link between the old and the new periods in the history of Boston.

HAWTHORNE'S HOUSE—CONCORD.

wrangle as the elder theologians of New England did over "original sin" and "foreordination."

An unique feature in Boston is that of the "First Church of Christ, Scientist," in the Back Bay; the first church in the world to be erected by the sect of that name, and which holds as pastor the Rev. Mary Baker Eddy, the founder of the sect which had its origin in Boston. The auditorium seats some fifteen hundred.

The rise and progress of this sect has been a curious feature in Boston life; its inception being the Sunday afternoon meetings of about a dozen people held in a parlor, in 1877-78, when Mrs. Eddy first entered on her work here. Three or four years later she founded her "Metaphysical College," where she gave morning lectures to an audience, often numbering three hundred—at the rate of one hundred dollars for twelve lectures, and many were turned away or obliged to wait on account of the

The new Boston, architecturally and geographically, is as impressive on one side as is the new thought, customs and general life on the other. All that part of the city lying west of Charles street has been literally "made" by filling in the land, within the memory of men still living. Indeed, in the year 1880 Dartmouth street was the western extremity of the city, and it is almost incredible that the miles of noble and beautiful architecture beyond and the spacious splendor of the Back Bay Park, with its chain of thirty miles of driveway, the most splendid park system of America, is the growth of the past eighteen years.

"Sweet records, promises as sweet," are words that recall themselves to one in contemplating the story of Boston; the city founded in prayer and nurtured in faith and aspiration; the city of ideas and ideals; the growing center from which radiates that energy and power which well entitles it to be called the Athens of America.

## THE BOSTON ELEVATED RAILWAY COMPANY.

## A MODEL ROAD.

Of the many attractions of the city of Boston, the "suburbs" are perhaps the chiefest. Hardly any city in the United States is so fortunately situated. The man of business can with ease leave his office in the center of the city and within 15 to 30 minutes be at his home in a place surrounded by trees, by the seashore, or in the midst of farming land, where it is hard to realize that a great city is within so short a distance. Nothing has had more to do with bringing about this possibility of suburban homes than the system of street railways, which is one of the finest in the country.

When one considers the geographical situation of Boston this statement seems surprising, for there is hardly a city in the

WILLIAM A. GASTON,  
President.

United States where the street railway business is conducted with more difficulty. Boston streets are proverbially narrow and crooked, and there are very few main thoroughfares. The ordinary winters are most severe. Supplies cost more than in other cities and the rate of wages is higher. The public expects and demands a higher grade of service than is given in most places. But in the face of all this Boston has, with one exception, the largest street railway under one management in the country.

The Boston Elevated Railway Company controls all the street railway lines in Boston and 10 other cities and towns in its suburban district. These cities and towns have a population of 782,845. The mileage of surface lines is 305, all of which are operated by electricity, except 2.8 miles. To operate this vast system seven power houses for generating the electric current are required. There are 2,648 cars and 5,100 employes. Last year 196,332,239 passengers were carried, of which 172,554,513 were revenue passengers and 23,777,726 were free transfer passengers. The passenger earnings were \$8,536,285.83 and the operating expenses were \$6,213,708.56.

The Boston Elevated Railway Company took possession of the property of the West End Street Railway Company October 1, 1897, under a lease for 25 years, and is making preparations to build elevated lines on plans now under way and to be completed at an early date.

The history of street railroading in Boston dates back to 1856. Previous to that time all the bridges leading into Boston were toll bridges and many of the roads leading into the city were turnpikes on which tolls were charged. Between Boston and

Cambridge there was a regular line of omnibusses running every half hour during the busy part of the day, but at other times the service was uncertain and irregular, the vehicles often becoming stalled in the muddy streets. The service between Boston and other suburban towns was no better. It is difficult to realize that within the comparatively brief period of 42 years such a complete revolution has taken place. It is not too much to say that the street railway has been a great factor in completely changing the habits, conditions and civilization of the community. It is the street railway that has made suburban Boston possible.

The Cambridge Railroad was the first street railway to be operated in Boston. At the time that the first car ran, March 26, 1856, the company had under construction 10 miles of single track. When the line was opened for traffic five miles were operated. The rail used at that time weighed about 60 lbs. to the yard and was of the groove head pattern. The gage was the standard. The car equipment consisted of 10 box cars with 16-ft. bodies, built by Eaton, Gilbert & Co., of Troy, N. Y. The company owned 165 horses when the line was opened. These were purchased from the company which operated the omnibus line, it having sold out its entire business to the street railway company. The cars ran from the corner of Pearl and Main streets, Cambridgeport, to Cambridge street, Boston, a distance of about two and one-half miles. The hours were from six in the morning until eleven at night. The fare was 8 cents. About the last of April, 1856, the line was opened to Harvard square, Cambridge, increasing the length of the line three and one-half miles and the fare was increased to 10 cents. For its first year's work the company carried over 1,000,000 paying passengers.

In September, 1856, the Metropolitan Railroad Company opened a line from Boston to Roxbury and in its first year carried 8,000,000 paying passengers. It immediately became apparent that

OFFICE BUILDING OF THE BOSTON ELEVATED RAILWAY CO.

there was a demand for local transportation facilities larger than anyone had supposed. The success of the Cambridge and the Metropolitan Railroads led to the construction of new lines by them and the extension of the lines already in operation. Other corporations were formed and opened territory adjacent to those in operation, and others were established as competing lines. At one time there were no less than 18 different companies, each operated separately. There seemed to be an epidemic on the subject, and the value of a street railway franchise was greatly exaggerated. Numerous charters were obtained which were never used and many small roads were built long in advance of any sufficient demand to justify their cost.

After a time, however, consolidation brought the number down to five. These were the Metropolitan, the South Boston, the Cambridge, the Highland, the Middlesex and the Lynn & Boston companies.

The Metropolitan Railroad was the largest and carried the greatest number of passengers. The Highland was of the greatest benefit to the community. Its management introduced a much better style of car than had ever before been used in Bos-

SAMUEL LITTLE,  
President West End Street Railway.

ton. Great care was exercised in selecting polite and competent employes and they were the first to appear in uniforms. Many of its lines paralleled those of the Metropolitan Railroad and in some cases its cars ran over the tracks of the same road. The cars were always kept clean and neat, inside and outside, and when one could get to his destination as well by one route as another the Highland was the one chosen.

A large share of the credit for Boston's famous park system is due to the Highland Street Railway. The first link in the chain of the great park system was West Roxbury Park, later Franklin Park and now Franklin Field. That portion of the park was near the end of the Highland Railway's line at Grove Hall, Dorchester. The company extended its line to what is now the entrance to the park near Oakland Garden, and by influence brought to bear upon the city authorities, aided by public opinion, was instrumental in the purchasing of the land by the city.

The Highland Railway was consolidated with the Middlesex Railroad under the title of the Boston Consolidated Street Railroad.

In 1886 two street railway companies were chartered under the general laws, the incorporators being the same men. These roads were known as the West End and the Suburban. The original incorporators started as a land company, with the idea of uniting Beacon street (Brookline), and Beacon street (Boston). In Brookline the intention was to widen that part of Beacon street into a boulevard and in this way increase the value of the land. It was also planned to have street railway tracks in the center of the boulevard which would run into Boston over Beacon street and connect there with the rails of the Metropolitan Railroad Company. This road was known as the Suburban.

The general consolidation of the street railways of Boston took place November 11, 1887. The originator and leader in the matter was Henry M. Whitney and he became the president of the West End Street Railway Company, the result of the consolidation. It was mainly through him that Beacon street was widened and that the controlling interest in each of the Boston street railways (except the Lynn & Boston Railroad) was purchased. As soon as the consolidation was completed it was seen that some new system of motive power must be adopted.

There were at this time 1,584 cars, 7,500 horses and 224,648 miles of single track. The directors saw that with the ordinary increase in traffic, etc., it would be impossible to operate the consolidated roads with horses in years to come. That they were right is shown by the fact that with the present business if horse power were used exclusively it would take 18,000 horses. With a knowledge of Boston's streets it will at once be seen that were horses used today the present business could not possibly be handled.

Careful investigation was made of the cable system. The difficulties of using that system in Boston were very serious, owing to the crookedness of the streets and the large number of draw-bridges; and when petitioned for the right to use it, the several city governments were very reluctant to consent. While this question was under general discussion, it was reported that the overhead electric system had been proved a success in Richmond, Va.; and on investigation the report was so far substantiated that the West End Company determined to try that system on its new line on Beacon street. It was a street admirably adapted for the purpose. Considerable opposition to the granting of the right to use overhead wires was made, but was finally overcome by an agreement to use the underground system on the Back Bay. The conduit proved a failure; but the overhead system gave so much satisfaction that a general right to use it in Boston was granted in 1889.

#### OFFICERS.

Colonel William Alexander Gaston, the president, is a son of ex-Governor William Gaston and Louise (Beecher) Gaston, and was born in Roxbury, Mass., May 1, 1857. His early education was obtained in private schools and in the Roxbury Latin School. He graduated from Harvard in the class of 1880, and subsequently from the Harvard Law School. After admission to the bar he began practice with his father and Charles L. B. Whitney, entering into partnership with them October 1, 1883. His present partner is Frederic E. Snow, under the firm name of Gaston & Snow, and they have a very large practice. He is regarded as one of the ablest members of the Suffolk bar and has given much attention to corporation law.

Mr. Gaston is a director of the Manufacturer's National Bank and a trustee of the Proprietors of the Forest Hills Cemetery; he is a member of a number of clubs—the Somerset, the Puritan and the Athletic Club of Boston, the Country Club of Brookline, the Commodore Club of Maine, and other associations. He was a member of the staff of ex-Gov. William E. Russell. When the Boston Elevated Railway Company was organized he was elected its president, which position he now holds, and the successful organization of the company is conceded to be due to him more than any other man.

General William Amos Bancroft, the vice-president, was born April 26, 1855, in Groton, Mass., and is the son of Charles and Lydia Emeline (Spaulding) Bancroft. He comes from the old colonial stock, the Bancroft and the Spaulding families both being descended from English immigrants who landed in Massachusetts about 1640. In farm work and in country sports young Bancroft laid the foundation of a vigorous constitution. He attended the public schools and the Lawrence Academy in his native town, and afterwards Phillips Exeter Academy, New Hampshire, from which he graduated in 1874. He matriculated at Harvard College in 1878, and graduated from the Law School. He was admitted to the Suffolk bar in 1881. When in college he became noted for his athletic prowess, and was captain and stroke oarsman in the victorious Harvard University crews of 1877, 1878 and 1879, the victories being largely due to his energetic management. Later, for about five years, he was the "coach" of various Harvard crews. When a college freshman

Electrical Engineer.

JULIUS E. RUGG,  
Superintendent of Transportation.

CHARLES F. BAKER,  
Superintendent of M. P. & M.

he enlisted as a private in the Cambridge Company of the Fifth Regiment of the State Militia, and after being promoted through the several grades became company commander in 1879, and commanding officer of the regiment in 1882. For several years he was the senior colonel in the militia and was made brigadier general and commander of the Second Brigade in July, 1897. Under his command company, regiment and brigade have reached a high standard of efficiency. In 1889 the Fifth Regiment was detailed, on account of its high standing, as escort to the state delegation on the centennial anniversary of Washington's inauguration in New York.

Thirteen years ago General Bancroft started in the street railway business as superintendent of the Cambridge Railroad. It was a horse railway and was in competition with the Charles River Street Railway. About 15 months later he became superintendent of the two companies which were united under the name of the Cambridge Railroad. During this time he had good success in the operation of the two companies and a number of changes were made for the advantage of the public, of the companies and of the employes.

In the winter of 1887 occurred a strike of about 600 employes who went out between lights leaving the company with 1,800 horses on its hands, and six men, a woman and a boy in the stable to look after the horses, and a few repair shop hands

at which ex-Governor Greenhalge was first nominated. In 1891, he was elected president of the New England Alumni of Phillips Exeter Academy. He was also president of the Mayor's Club of Massachusetts, the Cambridge Club and the First Volunteers Citizens Association, of Cambridge.

John T. Burnett, secretary of the company, was born in Southboro, Worcester county, Mass., April 23, 1868, and is a son of the late Joseph Burnett, of Southboro. He was educated at St. Mark's School, Southboro, and was a member of the class of 1891, Harvard University. He was a member of the Dickey and Basty Pudding Clubs, played on the freshman football team that beat Yale, and was manager of the University baseball nine of 1890. For three years he was with the Old Colony Trust Company after leaving college, was appointed assistant postmaster of Boston July 1, 1893, and acting postmaster upon the death of the postmaster, Colonel Coveney. He was elected secretary of the Boston Elevated Railway Company in January, 1897.

William Hooper, treasurer of the company, was born in Boston in 1855. He graduated from Harvard in the class of 1880. For three years he was associated with the Amoskeag Manufacturing Company, leaving it to go with the Pacific Mills. He was treasurer of the Fiskdale Mills, treasurer of the Atlantic Cotton Mills and auditor of the Calumet & Hecla Mining Company. He assumed his present position January, 1898, which is the

G. A. KIMBALL,  
Bureau Elevated Lines.

besides. He kept the cars running except for three days. The cars commenced running on a Saturday, stopped running the following day, Sunday, commenced running again Monday morning and have been running ever since. The men with whom he dealt at the time, those who went out on the strike, afterwards talked with him personally and all save a very few admitted that they had made a mistake in striking.

After the West End Street Railway Company absorbed all the street railways General Bancroft was appointed roadmaster of the entire system, superintending the first construction of the electric lines of the West End Company. As a street railway superintendent his administration was eminently successful, and energy, firmness and tact, together with his manner of handling the great strike in 1887 brought him into prominent notice. In 1890 he left the street railway service with the good will of its employes and returned to the practice of law. In the fall of 1881 he was elected a common councilman and the following year was elected a representative to the legislature and was re-elected in 1883, and again in 1884. In the fall of 1890 he was elected an alderman of Cambridge and the following year re-elected. He served as president of the Board and chairman of the Finance Committee during both years. Elected mayor in 1892, he served for four successive years as chief executive. In 1893, while mayor, he was made an overseer of Harvard University and in the same year presided over the Republican State Convention

only official position he now holds in any company. From November, 1893, to January, 1898, Mr. Hooper was a director and member of the executive committee of the West End Street Railway Company.

Charles Spencer Sergeant, second vice-president, was born in Northampton, Mass., in 1852, the son of George and Lydia (Clark) Sergeant. His father was born in Stockbridge, Mass., which has been the family home since the settlement there in 1735 of his great-great-grandfather as a missionary to the Stockbridge Indians.

He was educated in the public schools of Northampton and graduated from the high school in 1868; in that year began his business career in the employment of the First National Bank of Easthampton. In 1872 he entered the steam railroad business as paymaster and cashier of the Marquette, Houghton & Ontonagon Railroad Company, and was also associated with various iron companies and engaged in the iron smelting business.

In 1876 he came to Boston to take the position of chief clerk of the Eastern Railroad Company, subsequently being appointed general auditor. In December, 1887, when the West End Street Railway Company came into possession of the several street railways centering in Boston, he was offered and accepted the position of general auditor of the company, subsequently being made second vice-president, and in November, 1892, being ap-

pointed general manager, which position he held until the lease to the Boston Elevated Railway Company.

Julius Erastus Rugg, superintendent of transportation, comes of sterling old New Hampshire stock, being the son of Capt. William S. Rugg, of Rindge, N. H. At eighteen years of age he became a country school teacher, like many other New Hampshire men who have risen to positions of trust. Coming to Boston four years later, he became a conductor on the Chelsea and Boston cars, and after a year's faithful service, was put in as receiver in the street railroad office in Chelsea square, where he remained for three years, leaving the position to become super-

intendent of the Lynn & Boston Railroad. After four years with this corporation, he left to become superintendent of the Highland Street Railway Company in Roxbury, where he remained for 14 years in charge of what was known at that time as the most progressive street railway in the country. Upon the organization of the Boston Consolidated Street Railway he became its general superintendent, holding the position two years. Mr. Rugg then went to Minneapolis as general manager of the Minneapolis Street Railway Company, but after a year in the west, he received a call, as the ministers say, to become general manager of the Citizens Traction Cable & Electric Company, of

Pittsburg. After serving that corporation with credit for seven years, he returned to the scene of his first successes, and became general superintendent of the West End Street Railway Company. After two years, the lease of the West End Company to the Boston Elevated Railway put him in his present position.

Probably the quality which has led to such advancement in Mr. Rugg's career has been his progressiveness. Always striving to be not only up to date, but looking ahead, and keeping in touch with all improvements in street railway work and methods, he has introduced many valuable improvements in the street railways with which he has been connected. He introduced snow scrapers on cars and double-end snow plows while superintendent of the Lynn & Boston Railroad. In the Highland Street Railway superintendency he introduced roller boxes on cars, cross-seat open cars, improved high-wheel snow plows, cased windows in box cars in cold weather and other devices for the comfort of passengers and to attract traffic. He was the first to put uniforms on conductors and drivers, in 1872, and first made use of a cash register in Boston, in 1876. Under his charge the Citizens Traction Company was made a model cable road in its organization and operation. Believing in co-operation with employes, he organized the first Relief Association for street railway employes in Boston on the old Highland Street Railway, and also organized an association of the same kind in Pittsburg. Respected and liked by his superiors and by the men in his charge, he has become widely known as a successful and able street railway man.

Charles F. Baker, superintendent of motive power and machinery, was born in Shoreham, Vt., in January, 1855. The family moved to Wisconsin when he was small, and young Baker secured a position in Milwaukee, where he learned the trade of an engineer. He has since had a varied experience as a mechanic

and engineer, and has held many important positions. He is well known among the street railway companies of the country, and to manufacturing corporations as well.

In the year 1893 he came into the employ of the West End Street Railway Company of Boston, serving as master mechanic. Under his direction and supervision four of the power stations of that company, those at Dorchester, East Boston, Charlestown and Harvard street, were built and equipped. The extension of the company's lines demanded the entire remodelling and enlargement of the Central power station of the West End Street Railway Company, and some notable improvements, among which is an improved system of handling coal in the station, were introduced under his direction. When the Boston Elevated Railway Company secured its lease of the property of the West End Street Railway Company, Mr. Baker went with the new corporation to take his present position.

Henry F. Woods, who is the head of the bureau of purchase of the Boston Elevated Railway, was born in Hillsboro, N. H., February 22, 1832. At the age of 18 he went to Boston and engaged as clerk in a grain store; later he was associated with Hicks & Hathaway, flour, grain and provision commission merchants. In 1869, a new firm, Hathaway & Woods was formed, and continued till 1887.

Mr Woods has held various offices in the town and city of Somerville, as well as in the Boston Board of Trade and the Commercial Exchange, being president of the latter when it was united with the Produce Exchange under the name of the Boston Chamber of Commerce, of which he is still a member. He was one of the originators and directors of the Charles River Street Railway, later united with the Cambridge Horse Railway; he continued as a director till the road was absorbed by the West End Company.

Mr. Woods was purchasing agent of the West End Street Railway Company for 10 years and holds the same position with the Boston Elevated.

H. L. Wilson, auditor of the Boston Elevated Railway Company and president of the Street Railway Accountants' Association, was born in Boston in 1862 and received his education in the public schools of that city. From the time he was 16 years old until 1887 he was connected with several mercantile and importing houses. His progress in the business world was not such as to satisfy the young man, so he concluded to seek his fortune in the west. Accordingly he went to Kansas City and joined the auditor's force in the office of the Metropolitan Street Railway Company, where he obtained his first experience in railway accounting. In 1888 Mr. Wilson was offered and accepted the position of head of one of the departments in the auditor's office of the West End Street Railway Company, of Boston, and in 1891 he was elected auditor which position he held until the lease to the Boston Elevated when he became auditor of this company.

### ROLLINO STOCK.

The Boston Elevated Railway Company operates about 1,200 closed cars and 1,200 open cars; these cars are from the shops of several makers, among them the Barney & Smith Car Company, the J. G. Brill Company, the Brownell Car Company, J. M. Jones' Sons and the Stephenson Company. Twenty-five-foot bodies are now the standard in closed and nine benches on open cars; the former seat 34 passengers, and the latter five on a bench. All platforms on box cars are open, no vestibules being used, but the platforms are each guarded by two gates; open

GIRDER RAIL SECTIONS, 1897.

cars have no guards. Fenders are all of one type and attached to the car, the so-called "Cleveland" pattern being adopted.

Series-parallel controllers and double motor equipments are used on all 20-ft. and 25-ft. box cars in winter and on 10-bench and 25-ft. cars only in summer. Others use the rheostat control and single motor equipment in summer; these include the 20-ft. box and 7 and 8-bench open cars. All cars have electric lights, headlights of the company's own design and make. Electric heaters are by law required in all closed cars, and these have been largely furnished by the Consolidated Car-Heating Company, of Albany. Fare registers are mostly of the "Security" type, made by the St. Louis Register Company. Electric bells are used for signalling the conductor on both types of cars. The cars are mounted on trucks of various makers; among them are the Baker, Barney & Smith, Bemis, Brill, Peckham, Taylor and West End trucks. The E. T. Burrowes Company's curtains are used on over 400 of the Boston cars. E. F. De Witt & Co. have equipped many of the West End cars with their sand boxes.

Westinghouse No. 12 and No. 12A, and Walker motors are largely used.

A large number of snow plows are required and kept in the various car houses; of these there are 13 Taunton double track share plows. There are no electric sweepers. The company has a large equipment of special cars, such as mail, parlor, freight, motor and coal cars.

Minor car and truck repairs are made in the car house pit rooms, but in case of heavy damage cars are sent to the car shops. Here also all cars are repainted once a year, and old cars are rebuilt. At the equipment shops on Albany street new cars

are equipped with trucks and electric apparatus, and all old cars refitted. The care and repair of signs, glass, doors, cushions, etc., for 2,400 cars keep a large force of men at work constantly. Armature repairs are made in the company's shops on Albany street.

Cars and trucks in ordinary use are cleaned at the car house, wash and pit rooms. Each car is inspected every day. All motors are opened or dropped once a month and at such times trucks

SPECIAL WORK AT DOVER AND WASHINGTON STREETS.

are overhauled. So far as possible trucks and motors of each type are concentrated at certain houses to lessen the variety of spare parts carried and facilitate repairs.

On account of the narrow streets the width of the cars is limited to 8 ft. Truck centers on long cars are 14 ft. apart. Swivel trucks of 39-in., 48-in. and 62-in. wheel bases are used; short trucks have wheel bases of 6 ft. 6 in.

The long cars seem to be preferred in Boston to any other style. They take up less room per passenger, in the street, require no greater operating force and are more roomy and healthful and ride easier than the shorter cars.

### TRACK.

In track construction a 9-in. girder rail is used laid on a tie plate 1 in. thick with 2x1 1/2-in. tie-rods 5 ft. apart. The paving blocks used are 12 in. long, 4 in. thick and 8 in. in depth, and are laid either on gravel or a concrete base.

September 30, 1897, the company had 25,000 ft. of electrically welded rail in service.

All special work and guard rail is cleaned twice a day and in freezing and snowy weather this work is kept up continually. Except on the most important streets, nearly all track repairs

SPECIAL WORK AT BOYLSTON, WASHINGTON AND ESSEX STREETS.

are made during the day time. When special work is put in, the work has almost always to be done at night so as to delay traffic as little as possible. In many cases when laying new rails work is done both day and night.

The weight of the rail used is the same throughout the city, about 95 lbs. per yard, furnished in 1894 by the Johnson Company, and in 1898 by Wm. Wharton, Jr. & Co. Where the track runs through park reservations and not on the highway, a 7-in. T rail is used. This is set on a 1-in. tie plate so as to give 8-in. depth of lean for a width of 25 ft. which the company maintains. The best known type of special work, 10-in. construction, that can be found on the market is used by the company. This work was nearly all built by the Johnson Company and Wm. Wharton, Jr. & Co.

In snow cleaning, sleds are used to carry off snow plowed in the congested parts of the city while in the suburbs levellers are

Eagle street, near Chelsea creek, East Boston; the "Charlestown" on Hamblen street, near the Mystic river and Malden Bridge, Charlestown; the "Dorchester" on Freeport street and Dorchester Bay, Dorchester; and the "Harvard" on Boylston street, Cambridge, near the Charles river.

These stations supply current to lines as follows:

Allston: Brighton, part of Brookline and into Newton.

Central: The city proper, South Boston and parts of Brookline, Roxbury and Jamaica Plain.

East Cambridge: Parts of Cambridge, Charlestown, Somerville, Medford, and at times, part of the city proper.

East Boston: East Boston and Chelsea.

used. The track cleaners used are those made by the Van Dorn & Dutton Company.

### POWER STATIONS.

The Boston Elevated Railway Company operates seven power stations in the Metropolitan district, the lines being with three exceptions within a radius of six miles from the City Hall. It is about 13 miles by the company's lines from the end of one of the north-westerly to the end of one of the south-easterly lines fed by these stations. The extreme distance apart of these stations is about six miles.

The names and location are the "Allston" on Braintree street, Allston, near Cambridge street and the Boston & Albany Railroad; the "Central" on Albany street, near the South Bay and Waltham street, Boston; the "East Cambridge" on North street, and near Millers river, East Cambridge; the "East Boston" on

Charlestown: Parts of Charlestown, Medford, Somerville, Malden and Everett.

Dorchester: Dorchester and part of Roxbury.

Harvard: Cambridge, Watertown, Arlington and into Newton, Brighton and Brookline.

The aggregate nominal capacity of the present engine equipment of all stations is about 30,950 h. p. Some of the stations are large enough for additional units in both engine and boilers and others are equipped to their full capacity.

There is quite a variety of engines of different makes. Boilers in all but two stations are of the Babcock & Wilcox make. All stations but one are located on tide water.

The following is a detailed description of each station in the order of its erection:

The Allston power station was designed and built in 1888-9, and stands today as originally equipped except that one genera-

tor has been added to each of the four engines and the coal handling facilities have been improved.

There are now four Armington & Sims high speed, simple, non-condensing engines of 200 h. p., each belted to two bipolar 75-k. w. and one bi-polar 62-k. w. generator. Six boilers of 150 h. p. with the necessary feed water heaters, feed pumps, steam and exhaust piping, complete the mechanical equipment.

Coal is brought by the company's electric coal cars carrying eight 1¼-ton automatic, self-dumping boxes, which upon arrival are either dumped into the coal shed or taken into the boiler room and there dumped in front of the furnaces; in either case this is done by transferring the boxes with a swinging crane

This station is used only in the winter season to help out during the period of excessive loads, which always taxes the capacity of the stations in this region. This is due to the use of heavier cars in winter with a larger motor equipment than that used in summer to carry the same number of passengers, also to the use of electric heaters and snow plows.

The Central power station was designed and built in 1889-90-91 under the direction of F. S. Pearson, chief engineer, and William G. Preston, architect. The chimney, foundations for machinery and all the interior equipment up to 1895 were planned and built under the direction of F. S. Pearson, L. J. Hirt, assistant engineer, and H. P. Quick, chief draughtsman. As originally de-

to an overhead trolley track running through the shed and boiler room. Coal is hauled from the Central power station wharf several times daily. This station is shut down completely during a large portion of the year and its load taken by the Central and Harvard stations.

In 1889 a small station was installed at the Hinkley Locomotive Works on Harrison avenue to furnish power while the larger and main Central station was building. Five McIntosh & Seymour 200-h. p. tandem compound engines were installed with two 62-k. w. generators each, and boiler capacity to correspond. Later the boilers were removed when the main station boilers were erected, larger fly-wheels were put on the engines and two more generators belted to the same wheels. Still later five more McIntosh & Seymour engines which had also been used as temporary equipment in the main boiler house were reinstalled here with four generators each. In this shape the station now stands, having a total capacity of 10 engines and 40 generators or about 2,000 h. p.

signed there were to be six triple-expansion engines belted through counter shafting to 18 multi-polar 500-k. w. generators. These were eventually put in, but while waiting for them to be designed, tested and perfected, there being nothing of the kind in existence, there was installed a temporary equipment of 48 multi-polar 80-k. w. machines, the largest then on the market. When the station was completed as originally designed, there was wonderful elasticity and provision for emergencies in the arrangement, but its complications and waste of power, brought out so prominently by the development of the multi-polar direct connected generator, led to a change in 1895 and 1896. Under the direction of C. F. Baker, master mechanic, the six triple-expansion engines were enlarged and attached to generators of suitable capacity. The shafting, belt tighteners and old generators were removed and cross-compound engines of large power installed in their place, largely increasing the capacity of the station without adding to the structure. The boiler plant, however, was enlarged, the pumps and piping systems re-organized

and simplified, so that the station as it stands is thoroughly modern and as economical to operate as any of the later stations.

The station has an ultimate nominal capacity of perhaps 20,000 h. p., although at present, machinery of only about 13,000 h. p. is installed in the engine room. There are six Reynolds-Corliss 1,600-h. p. triple-expansion, horizontal, condensing engines, making about 80 r. p. m. The cylinders are 23, 36 and 52x48-in. stroke. The fly-wheel is 24 ft. in diameter. There are independent air and circulating pumps of the Reynolds-Corliss vertical pattern, all working under 180 lbs. initial pressure, and surface condensers. There are two Reynolds-Corliss 2,000-h. p. cross-compound, horizontal, condensing engines with cylinders 32

pumps and boilers in the order named. All water of condensation except that from the condensers is returned to the boilers.

Two oil pumps for filling the gravity tanks, an air compressor, blower, motors and shafting for the pumps and economizers complete the outfit of the engine room. A feature worthy of note is that one motor with countershaft furnishes power for the six geared pumps, the blower, air compressor and two sets of economizer tube scrapers cleaning 2,080 tubes.

All the electrical controlling apparatus is grouped at the front end of the station on a gallery commanding a view of the whole engine room. Both underground and overhead feeders lead from the feeder gallery where are 15 vertical panels and 15 table

and 62x60-in. stroke with 24-ft. fly-wheels making 75 r. p. m.; also independent circulating pump and jet condenser of the vertical pattern. The latter two engines have feed water heaters, Stratton separators, built by the Goubert Manufacturing Company, and independent steam connections to each side so that either side can be operated under high pressure with the other disconnected.

All engines have practically indestructible plate fly-wheels weighing 60 to 70 tons. All have intermediate re-heating receivers, free exhaust, and circulating condensing water connections. The latter is taken from South Bay by 36-in. cast iron pipes having the necessary fish traps, check valves and screens, and connections are made direct with all condensers.

The feed water is handled by a series of six electrically-operated gang pumps of the four-plunger pattern, piped to heaters, economizers and boilers and connected with city water pipes by the usual methods. Water goes through the heaters, economizers,

panels, the latter of the Westinghouse pattern. In a separate building near the station is a complete set of testing apparatus for underground cables.

Next to the engine room and on either side are Green economizers, one set for each bank of boilers. Over them are the oil tanks, filters, etc.

The boiler house contains 24 Babcock & Wilcox 250-h. p. boilers connected in pairs and six Babcock & Wilcox 500-h. p. double decked boilers, similarly coupled. They are connected by iron flues and uptakes with the economizers and chimney.

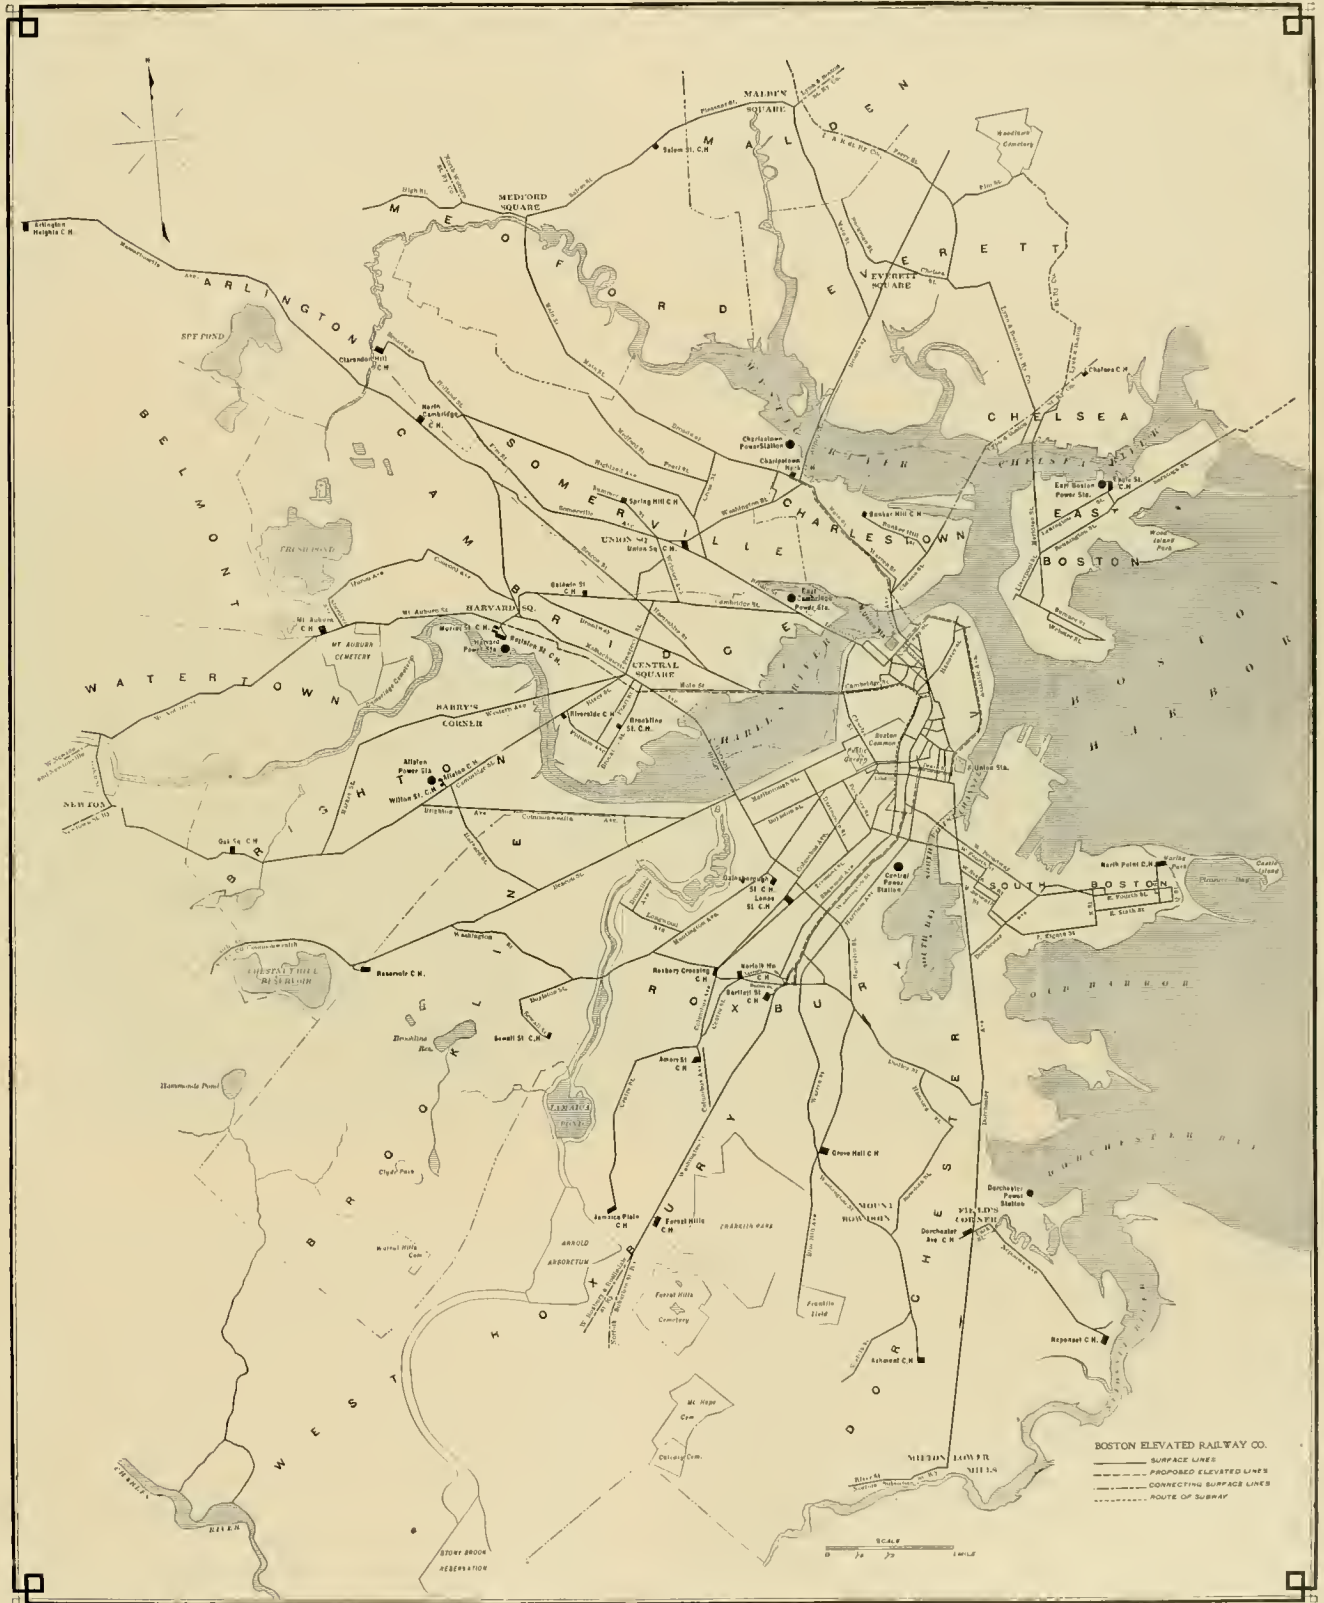

The coal handling facilities at this point are unique and economical. Stokers are not used. Coal is delivered at the wharf on Albany street by schooners and barges and is hauled from the wharf into the boiler room by an electric mining locomotive with two automatic Hunt side dumping cars attached. The haulage is about 950 ft. at the farthest on a narrow gage track.

Coal is taken from tunnels under the coal pile on the wharf

and after crossing Albany street, at grade, the cars cross the scale platform at the gate house where all the coal is weighed. Then the train rises on a gentle grade to the boiler house, passing down through the center on a trestle  $2\frac{1}{2}$  ft. high, and delivers

On the wharf the methods of handling coal are no less interesting. A traveling bridge crane with a span of 150 ft. between tracks, does all the handling of coal between the vessel and the cars. In the cab at the water end of the crane is a motor with

coal at any point required, no trimming being done at all. Ashes are taken out by the same cars and dumped on either side of a spur track. From here, at a profit to the company, they are carted away for filling.

friction drums, gearing, etc., which controls all the movements of the bucket, dropping it into the barge, picking up the coal and dumping it at any point under the crane, generally over the tunnels through which the coal passes by chutes to the cars.

Coal can also be picked up on the wharf and transferred to any part of it by the same mechanism. The lateral movement of the bridge crane is for convenience in unloading from any part of a vessel and is controlled by a separate motor. From the wharf also coal is hauled by cars to different car houses in the system and to the Allston and Harvard power stations.

The smoke stack at this station is the largest and highest in the vicinity of Boston, being 252 ft. from the yard to the top and 13 ft. 8 in. inside diameter of flue. It is well protected by lightning rods and there are no facilities for reaching the top.

The East Cambridge power station was designed and erected at the same time as the Central station, under the direction of Mr. Pearson, and although originally there were installed 20 multi-polar 80-k. w. generators belted to the engines, there are now 7 multi-polar 500-k. w. belted in the same manner to two 1,400-h. p. and one 600-h. p. Reynolds-Corliss triple-expansion en-

giner. It was designed by F. P. Sheldon, mill engineer, of Providence, R. I., and has a nominal capacity of about 750 h. p. The equipment consists of three 250-h. p. tandem, compound, horizontal engines direct connected to three 200-k. w. generators. This is the first direct connected plant installed by the company. There are four vertical 250-h. p. boilers with flues direct to an iron stack. There are no economizers. Two Deane circulating pumps and independent jet condensers, a feed-water heater and two steam feed pumps form the principal auxiliary apparatus. Water is taken from the river for condensing purposes. Coal is delivered by teams from neighboring yards and handled in the usual manner for such small plants. Feeder and machine panels with the usual devices for measuring the current are installed here as in all the stations of the company.

The Charlestown power station was designed under the supervision of C. F. Baker, master mechanic, and H. P. Quick, chief

gines. The former has cylinders 23, 36 and 52x48-in. stroke with 28x10-ft. 7-in. fly-wheels double belted to counter-shafting and this in turn to three of the generators. The smaller engine has cylinders 16, 25 and 36x48-in. stroke with 26-ft. fly-wheel belted to one generator. Although built for 500-k. w., these generators are now rated at 240-k.w. only. Massive belt tightening machinery is used and two cranes cover the whole station.

The boiler plant consists of 10 Babcock & Wilcox 250-h. p. boilers coupled in pairs and connected by iron flues with two Green economizers. Nearly all the piping in the station is in duplicate. There are independent air and circulating pumps, surface condensers, steam and power feed pumps, inspirators and an extensive oiling system, feeding the machinery by gravity. The power pumps, machine shop shafting and economizer scrapers are operated by a 62-k. w. motor. Condensing water is taken from the river near by through 30-in. pipes with check valves, traps, etc. The chimney is 225 ft. high and has about 5,000 h. p. capacity. Coal is handled by the ordinary methods, no special machinery being installed.

The East Boston power station is a small brick station completely isolated from all the other stations of the company so

draughtsman. Built in 1895, it was laid out for an ultimate capacity of about 6,000 h. p., the chimney, a 10x200-ft circular brick structure, being of this capacity. The station as built contains only two units, each of 1,000 h. p. nominal rating. They are Reynolds-Corliss cross-compound, horizontal, condensing engines with cylinders 26 and 50x48-in. stroke, making 90 r. p. m. and direct connected to 800-k. w. generators. They are equipped with the Reynolds vertical air pumps and condensers, Stratton separators, feed water heaters, Schutte's automatic exhaust valves and have besides, re-heating receivers, separate steam connections to both high and low pressure cylinders with starting, reducing and automatic stop valves. There are salt water connections with the Mystic river, the pipes having combined check and stop valves and fish traps at each condenser. At the river end of the intake pipe, the bell mouth is enclosed in a timber box with wire screens, all held firmly in place by piles at each corner. The bottom of the intake is below mean low water and as the tides at this port have an average variation of about 10 ft. it means quite a high lift for the injection water. In the boiler room are installed three 500-h. p. Babcock & Wilcox boilers and a Green economizer. The boiler feed water is handled by a steam pump

and inspirators. The station has a complete oil system comprising pump, storage, filter and service tanks. Coal is discharged at the end of the pier several hundred feet out in the river, being hoisted by steam, in tubs, and discharged direct into Hunt automatic side-dumping cars which run by gravity to the station yard and dumps, returning by the action of a counter weight. From the coal pile, it is wheeled in, weighed and discharged in front of the furnaces.

The station is of brick with Guastavino tile arched roof and has a 7-ton traveling crane. The machine and feeder panels are on the main floor in front of the engines. The fly-wheels have "indestructible" rims of wrought iron plates with cast iron spokes and centers.

The Dorchester power station was designed by C. F. Baker and H. P. Quick, and built in 1896 on the shores of Dorchester Bay. The station is of brick and may be called the company's standard design. The boiler and engine rooms are under separate roofs, although the two rooms adjoin, being separated only by a brick partition. The roofs are of the Guastavino type, made of fire proof tile arches of large span, from 2 in. to 4 in. thick

Coal is delivered by vessels at the end of a long pier and is discharged by the buckets first into a push cart which in turn dumps into a Hunt automatic side-dumping car on a lower level. This runs by gravity to the boiler house and there dumps, where it is wheeled in by hand. The electrical instruments are located with the office on a gallery giving a clear view of the engine room. Below are the toilet, locker and test rooms, all built of steel and fire proof construction.

The Harvard power station was designed by the company's engineers and built in 1897. This station although similar in general design and equipment to the Dorchester and Charlestown stations embodies some novel features and requirements made necessary partly by its location on one of the principal streets and parkways of the city of Cambridge, and partly by its distance from the sea. It is built for an ultimate capacity of 7,200 k. w. Space is provided in the present structure for four of the six 1,200-k. w. units, but only three are installed at present. The engines are of the Reynolds-Corliss make, cross compound, condensing, of 1,800 h. p. capacity, having cylinders 28 and 56x60-in. and running 60 r. p. m.

covered with asphalt and paper and supported by light steel trusses. The chimney is of brick, circular in section with 10 ft. flue and a height of 200 ft., surmounted by a cast iron cap and well protected with lightning rods.

The equipment of the station consists of two cross-compound, horizontal condensing engines of 1,500 h. p. each, direct connected to 1,000-k. w. generators. The station has a capacity of three units in both engines and boiler room. The engines are 26 and 50x60-in. and have fly-wheels of special indestructible design. Condensers, feed-water heaters and Stratton separators are used. Independent steam and exhaust connections are supplied to each cylinder so that either side can be used separately. Salt water is taken from the bay in a manner similar to the Charlestown station. A novel feature is the return of the salt condensing water through an open channel under the furnace ash pits carrying the ashes out of the station and depositing them within the timber bulkhead enclosure for filling.

In the boiler room, there are four Babcock & Wilcox 500-h. p. boilers connected by a brick flue to a Green economizer with bypass underneath and thence to the chimney through a connecting flue of brick. Three sets of dampers are provided, those in the chimney being connected with the damper regulator.

Feed water is handled with a power pump belted to a counter shaft and this in turn to a 15-h. p. motor. The economizer scraper mechanism is operated by a separate motor of the railway type.

Vertical condensers of the jet type are used and all the other auxiliary apparatus is similar to the Dorchester power station except that gang feed pumps of different make are used, operated by the same motor that runs the economizer scrapers. The boilers are six in number of the Babcock & Wilcox 500-h. p. double-deck type with extension furnaces and combustion chambers, a requirement adopted in view of the well known objection to the smoke nuisance in residence districts. Green economizers are used and so placed that they will be exactly in the center of the boiler plant when the ultimate capacity is installed.

City water is used in the boilers here as well as in all stations. Condensing water is taken from the river and discharged there also. The two pipes are arranged with cross connections and valves so placed in a gate house that below these valves they are interchangeable as intake and outlet. The scouring action of the overflow from both of these pipes enables the company to dispense with the usual crib and screens at the pier line, no structure being allowed in the river at this point. The coal handling facilities here have been designed to meet especial conditions not previously met. Although coal could be brought up the river, it was found cheaper to haul it by electric car from the Central power station dock. Objections to the unsightliness of a coal pile also determined the method of storing the coal so brought. Consequently an elevated inclined track spiral in form was built, starting at the street and ending over a timber coal pocket. Into this, coal is dumped from the hopper cars. From

the pocket it runs by chutes into Hunt cars which are pushed by hand into the boiler house, weighed, and then placed in front of any boiler. Ashes are removed by the same cars and used for filling around the coal pocket.

The electrical installation is on a gallery at one end of the station. It is noticeable that no wires are visible leading from the station, they being underground, a precaution against fire which removes an unsightly object from the street. Underground conduits carry the Cambridge feeders for a long distance from the station, but the feeders which connect this station with Allston are overhead.

A description of the stations such as the foregoing would not be complete without a few words on the general method of tying the stations together. All the stations except the East Boston have inter-station feeder connections. Switches are so placed and feeders so arranged that lines in certain districts can be operated by any one of the nearest stations, or those stations can be connected up in multiple with the lines and they are frequently run in this manner.

Trolley wires are divided up into a large number of sections insulated from each other, each controlled by switches in pole boxes, near by, so that in case of trouble on any section, the others may be operated. Of course, in case of fire, feeders might have to be cut rendering it difficult if not impossible to operate all other sections except that affected, but this has been well provided for in the construction of underground conduit for feeders through some of the closely built residential districts or fire hazardous districts where a large number of wires would be a menace. There are conduits from the Central station down town, from the Dorchester station intercepting some main lines, from the Harvard station to Harvard square and vicinity, and from Craigie Bridge through some of the narrow streets of the West End.

In case of the inability of one station to hold the load on a feeder, the matter can often be arranged by ordering the same feeder switches in another station closed, the two together holding the load until the trouble is located or the load decreases. If some of the smaller stations were shut down, the load might be held for a short time by the surplus power of the larger stations, but if the reverse should happen it would be necessary to pull off cars or send gangs out to shut off certain sections of wire which might be the cause of trouble.

At night, as the load gets rapidly lighter, all stations except the Central are gradually shut down and the most distant lines are then fed through the several station bus bars by means of the inter-station connections to the same.

The operation of all stations, the shifting of loads, and the troubles of all kinds interfering with the fixed running order of the stations are in charge of the superintendent of power stations.

#### CAR HOUSES.

The company has 37 electric car houses built for the most part on the same general lines so far as conditions allow. Variations in the size of lots, in the position of streets and track approaches, in the city or town requirements where situated always affect the design more or less. The car houses are located in Boston, Brookline, Cambridge, Arlington, Somerville, Medford, Everett and Chelsea.

The buildings are arranged in nine divisions, each under the control of a superintendent who is responsible to a superintendent of transportation.

The structures are mostly of wood, or wood and brick combined, the rules being to have all inflammable material enclosed with brick walls, fire doors and shutters.

There are however nine all-brick buildings. The largest single structure is the Grove Hall car house which is 23 tracks wide and 10 cars deep with two transfer ways and two pit rooms, and a storage capacity of 192 25-ft. cars all on one floor. The North Point car house at South Boston has however with its two story house and several buildings and yard tracks in one group covering nearly three acres, a total storage capacity of 337 cars. Next in size is the Bartlett street group with 168 cars capacity including the company's paint shop of 58 cars capacity. On a 25-ft. car basis the Lenox street house holds 133 cars, the Salem

street (Medford), Armory street (Boston), and North Cambridge houses, 125 each; the Forest Hills, 120; Dorchester, 103; Oak square, 100; Park street, 97; Reservoir (Brookline), Charlestown Neck, Neponset and Jamaica Plain, each 92. There is one house holding between 70 and 80, six between 60 and 70, one between 50 and 60, three between 40 and 50, four between 30 and 40, six between 20 and 30, making a total capacity of 2,986, while contemplated additions will bring the total well over the 3,000 mark. In fact while this capacity for the most part is figured on a basis of all 25-ft. cars, there are about 1,500 shorter cars in use, so that the actual capacity with mixed cars is about 3,500.

Many of the car houses were built by the various street railway companies of which the present system is a consolidation, and these have been altered to suit the condition of electric traffic and would not in most cases be pointed out by the company as models of their kind. Some of the best and latest have been mentioned.

The basis on which the more modern houses are laid out is upon the following requirements. A large operating space in the front part with waiting room, lobbies, offices, etc. at one side, and a wash room for two cars on the other side or in the center. Between this and the pit room a transfer way; back of this way a pit room with shops at one side such as stock, blacksmith and boiler rooms; a building provided with fire partition walls, heavy plank floors throughout, cross monitors for light and ventilation and plenty of doors and windows for light and fire exits, and if possible entrance to all the tracks from the street so as to avoid transferring cars inside the house.

Each house is in general provided with a waiting room, offices for foreman and starter, separate lobbies for conductors and motormen, stock room, blacksmith shop, boiler room, oil house and space for sand, salt and coal. Each house is heated by steam, lighted by electricity, and has ample water supply, drainage and fire service systems. The latter usually consists of several lines of hose on both floors and roof, supplemented by pails of water and hand extinguishers. Five of the largest houses, Grove Hall, Park street, North Point, Charlestown Neck and Lenox street, are equipped with an elaborate dry pipe sprinkler system comprising, besides the sprinklers covering every square foot of area, a system of roof hydrants, a wooden storage tank of 40,000 gallons capacity heated by steam and a pump house equipped with a motor-driven rotary pump, automatic valves and all necessary connection to city service and tank.

In addition to the foregoing equipment there are installed in each house an electric flush transfer table, a boiler of 60 h. p., a forge and several cranes and hoists. Coal and stock are now handled by the company's cars. Each house is surmounted by a handsome clock and the company endeavors to make the buildings attractive and free from any nuisance as many of them are in the residential districts.

#### EMPLOYES.

In Massachusetts a state law limits the hours of labor of conductors and motormen to 10 hours of actual work, to be done within 12 hours. For a day's work the regular rate of payment is \$2.25 with an extra amount per hour for work done over time.

Violations of rules are punished by reprimand, suspension or discharge. All promotions are made according to seniority of service and fitness for the position. No prizes of any kind are offered.

The visiting manager cannot fail to be impressed with the high standard of discipline in force, and the excellent quality of the men selected to serve as conductors and motormen. And this favorable impression is not the result of any special admonition to be on good behavior during the few days the passengers with buttons are in the city and riding upon the cars. On the contrary what our readers will see is the regulation day in and day out performance of duty, and how this very desirable result has been achieved is perhaps best told in a circular letter issued by the company. Applications are so constant and numerous it was found necessary to have a general statement which would serve to answer all. Here it is:

The excellence of the conductors and motormen employed by the Boston Elevated Railway Company is frequently a subject of favorable comment by visitors to our city, but the public generally do not know what pains are taken by the company to secure suitable men.

In the first place, the wages paid are of the highest and the hours of the best, 10 in 12, established by law. In the next place, the time has gone by when even the president of the company or any of its directors undertake "to put a man to work," upon request.

Some years ago an Employment Department was established with a superintendent and clerk who give their entire time to hiring men. The process is of the most searching character. The requirements are that both conductors and motormen shall not be less than 21 or more than 45 years of age; that their eyesight and hearing should be perfect; that their height should be not less than 5 ft. 4 in., for conductors, and 5 ft. 6 in. for motormen; that they should not have lost any of their fingers or thumbs, and in the case of the conductors that they should possess a common school education and should furnish a bond with two real estate owners as sureties, each in the amount of \$300.

Motormen must be able to read and write the English language.

When applicants enter the Employment Department the superintendent selects those whose general appearance as to cleanliness and deportment is favorable, and who in manner, in address, in conversation and in apparent honesty of purpose in applying for the position, commend themselves to his judgment as being worthy of further examination.

Their eyesight and hearing are then tested and the names of those to whom they refer are taken, together with the time and length of employment by each person or concern given as a reference.

These references must cover a considerable period previous to the date of application and must be prima facie satisfactory.

An application blank is then filled in, signed and sworn to. This application contains the representations of the applicant as to various matters deemed pertinent by the superintendent. The persons or concerns referred to by the applicant are then written to and if satisfactory replies are received as to the applicant's antecedents and as to his character, he is accepted.

He is then assigned to a division where he is instructed by one man until he is considered by his instructor competent to perform his duties. He then goes on one or two trips on each route in the division. This period of instruction takes about a week for a conductor and about nine days for a motorman. He is then sent to the Employment Office again for examination. The examination for a conductor is a written one and consists of questions upon the rules prescribed for running cars and is supplemented by oral questions on special points relating to the enforcement of rules and the sale and reception of checks, etc.

The examination for a motorman is upon the rules for running cars and also the proper way to use the rheostat, controller and brake; also upon cutting out motors and upon slight repairs that could be made on the street without delaying traffic. The applicant must demonstrate how not to abuse the apparatus of a car and how not to waste power.

If unable to pass the examination, he is sometimes given a second trial, but if he finally fails he is rejected. If, however, he passes the examination satisfactorily he is given employment on probation for three weeks.

During this period he is watched by the foreman of his station, by the inspectors and starters, who are furnished with blanks giving his name, number, date of appointment, date of examination and when his probation period expires, with instructions to ascertain where the man is at work each day and to note his conduct and ability to perform the duties required of him.

If the reports are favorable and the division superintendent considers him a suitable person to be employed, he is finally hired.

All this means that only pretty good men can get on the cars as conductors or motormen, and should deter hundreds from applying, because they do not possess the necessary mental, moral or physical requirements.

The system, however, does result as a rule in the selection of intelligent, competent and urbane employes, the best of whom in time are sure to be advanced, for a trained street railway man commands a good compensation.

In the operation of cars division superintendents have charge in their several divisions. They also have an oversight of track repairs, overhead line work, care of cars, etc. The car house work is divided and there are two sets of men. One attends to pit work and the other to floor work. Both are under the same foreman. Pit work includes all the mechanical work such as repairs of cars, motors, controllers, brakes, etc. Floor work consists of cleaning cars, operating transfer tables and keeping the car houses clean. The watchmen and boilermen are included in the floor work division. There are 184 men employed in the pits and 171 on the floors.

Each car house has a "starter" who has charge of the running out of the cars on schedule time. A force of "inspectors" are stationed along the different routes covering the entire city whose duties are to keep the cars properly spaced and see that the men observe the proper rules. In case of blockades, break downs or the like these inspectors take charge.

#### FEEDER SYSTEM.

The work of maintenance and construction on all overhead lines is performed by the company through the following organization: In the department of wires and conduits under the general supervision of a superintendent of wires, the work is carried on subdivided into seven emergency crews and a central construction and maintenance crew. The railway system is divided into seven districts in which emergency crews are stationed, acting under the supervision of the superintendent of the division in which the crew may be located. The crews numbering from four to seven men each are in charge of foremen whose duty it is to direct the work, account for all material used, keep all records of calls and labor and see that the rules of the company are faithfully observed. The quarters of the crew are connected by telephone with all the offices, power stations and street boxes belonging to the company, and also with the fire alarm system of the city or town in which the crew is located. It is the duty of the emergency crews to keep the trolley lines in their respective district in good repair, answer all emergency and fire alarm calls, and when not out on calls or maintenance duty, they must hold themselves in readiness for calls at any hour of the day or night. Comfortable quarters are furnished the men where they are supposed to remain on duty, each putting in six days out of seven.

The crew is furnished with a plan showing all the feeder and trolley lines upon which they may have occasion to be called. Trolley sections are shown giving the switch boxes by which they are controlled, and every detail showing the relation of feeders and trolley wires, and of the different power stations, which may be feeding into the district. Each crew has at its command an emergency wagon, a folding tower wagon, and a pair of horses.

Besides the emergency crews there is the main construction force, made up of from 60 to 80 men. All new construction work and heavy maintenance work is performed by this force. This crew, made up of inspectors, linemen, groundmen and laborers, is divided into three gangs, one whose duty it is to work on feed wires and poles, another on trolley wires, and the third on underground conduit and cable work. The scope of the department of wires and conduits embraces the supervision and maintenance of over 13,000 poles, nearly 300 miles of trolley wire, over 425 miles of feeder and return wires, and about 10 miles of underground conduits, aggregating nearly 130 miles of duct and carrying some 230 miles of feeder cables and return.

Heavy cylindrical three joint poles in sizes ranging from No. 1 to extra heavy No. 4 are used throughout the system, excepting where joint ownership exists with an electric lighting or telephone company, and here square hard pine poles are used.

The trolley wire used throughout the system is No. 0 hard drawn copper of a conductivity averaging about 97 to 98 per cent. For overhead feeder lines a flexible 500,000-c. m. wire is now used almost entirely in the layout of new lines.

In span wire construction a No. 4 galvanized iron wire is used

in preference to the old construction with three-ply No. 11 wire. All trolley line materials such as hangers, ears, pull-offs, frogs, crossovers, etc., are of composition metal and mostly of design based upon the experience of the road. The Aetna type of insulator, made by the Albert & J. M. Anderson Company, is generally used.

Each division has a wrecking wagon to move on immediate notice of a break-down or other accident to a car on the track.

For general repairs of track each division has its own set of men. New construction and extensive repairs are done under the direction of the superintendent of tracks.

The superintendent of car shops has charge of the repair shops which are situated at Roxbury on Washington street, near Bartlett street.

Time tables and routes are arranged and approved by the superintendent of transportation.

Division superintendents make daily, weekly and monthly reports to the superintendent of transportation and all complaints

amount of pleasure travel. The officers are: President, A. F. Breed; vice-president and clerk of corporation, E. Francis Oliver; treasurer, Charles Williams; auditor, Fred E. Smith; general counsel, Proctor M. Warren; general manager, R. C. Foster.

Second to be joined with the Boston street railway system, and second in point of importance, is the system of the Quincy & Boston Street Railway Company, which operates cars through the city of Quincy, and the towns of Weymouth and Milton. The road is interesting as having part of its roadbed on the route of the first steam railway run in America. The total mileage of the Quincy & Boston Street Railway is 27.39 miles of single track. Through its connections, with which the operation of through routes is possible, cars are run from the Boston boundary line, at Neponset, to Nantasket and other summer resorts on the south shore, a large revenue being derived in summer from the operation of these through routes. The principal office of the company is at Quincy, Mass., from which the lines of the street railway radiate in every direction. The officers of this

Laying Vitrified Clay Conduit

West End Cement Lined Pipe Conduit

Trench Ready for Ducts

are referred to and investigated by him. Applications for extra or special cars are made to the same official.

## SUBURBAN CONNECTIONS WITH THE BOSTON ELEVATED RAILWAY SURFACE LINES.

With the development of population in the suburbs of Boston and the surrounding cities, it was only natural that other lines should be connected with the surface lines of the Boston Elevated Railway Company. The first of these was the Lynn & Boston Railroad, which connects with the tracks of this company in four places, and is the only system running its street cars into the heart of the city over the tracks of the Boston Elevated Railway Company. The Lynn & Boston Railroad Company operates some 163 miles of single track, the center of the system being in Lynn, where the general offices are located, at 333 Union street. Lines of cars are run in the cities of Lynn, Boston, Chelsea, Everett, Malden, Salem and Woburn and the towns of Hamilton, Beverly, Danvers, Marblehead, Melrose, Peabody, Revere, Saugus, Stoneham, Wenham and Swampscott, connections being made with the Boston surface lines in Boston, Chelsea, Everett and Malden. The territory covered by the Lynn & Boston Railroad includes, in addition to the thriving and populous cities and towns named, many of the famous summer resorts on the north shore of Massachusetts Bay, places of historic interest, and Lynn Woods, an important part of the Massachusetts State Park system, which is reached by lines of street railway on both sides. The company enjoys an especially large

company are: John R. Graham, president; Fred H. Smith, treasurer and clerk of corporation; Roger H. Wilde, auditor; B. J. Weeks, superintendent.

One of the more recent lines to be connected with the surface lines of the Boston Elevated Railway Company is that of the Commonwealth Avenue Street Railway Company, which operates some 11 miles of single track, connection being made at the boundary line between Boston and Newton. The line runs through a reservation boulevard for about five miles, to Norumbega Park. This is a large park and pleasure resort owned and controlled by those interested in the street railway company. It is on the Charles river, and while its establishment, some years ago, was looked upon with some doubt, as an experiment, it has been a great success, the travel to this resort on Sundays and holidays being very large. The officers of the company are: Adams D. Clafin, president; Leonard D. Ahl, treasurer; William H. Coolidge, clerk of corporation and general counsel; L. H. McLain, superintendent. The offices of the company are at Newtonville.

The district to the south of Boston has recently been brought into connection with the city by establishment of two electric lines, connection being made with the Boston Elevated Railway Company by both lines at Forest Hills. The West Roxbury & Roslindale Street Railway Company operates cars in that portion of the city of Boston south of Forest Hills, commonly known as the "West Roxbury district," and also in the town of Dedham. This company has about ten miles of single track, and owns and

operates a public park, known as Westwood Park, which has recently been opened. The cars of the company run past the Stony Brook Reservation, which is a part of the State Park system. The general offices are at Roslindale, Mass. The officers are: Thomas T. Robinson, president; Frederick H. Terrell, treasurer and clerk of corporation; George W. Rounds, superintendent. The other line from Forest Hills is the Norfolk Suburban Street Railway Company, which also makes connection with the Boston system at Milton Lower Mills. This company operates about 11½ miles of track in the city of Boston, Hyde Park and Dedham, with offices at Hyde Park. Like the other line, it runs near the Stony Brook Reservation, which it crosses, just before entering Dedham. The officers are: James D. McAvoy, president; Galen L. Stone, treasurer and clerk of corporation; Thomas F. Fannce, auditor; Charles F. Jenney, general counsel.

At Medford connections are made by the Boston Elevated Railway Company with the North Woburn Street Railway Company running through the towns of Winchester and Woburn. This street railway has 7½ miles of track, and offices at North Woburn. The officers are: A. F. Breed, president; David H. Sweetser, treasurer and clerk of corporation; John S. Brackett, superintendent.

The Arlington & Winchester Street Railway Company operates 3.13 miles of track through the towns of Arlington and Winchester, connecting with the tracks of the Boston system at Arlington. It has general offices at Wakefield, Mass. The officers are: Charles F. Woodward, president; George A. Butman, treasurer and clerk of corporation; Charles F. Heath, superintendent.

In the district lying to the west of Boston is the city of Newton and many populous towns, the city of Newton embracing a dozen pretty villages, generally spoken of collectively as "The Newtons." All these are connected with Boston by means of the surface lines of the Newton Street Railway Company, the Newton & Boston Street Railway Company, and the Wellesley & Boston Street Railway Company, lines being operated by these corporations in the cities of Newton and Waltham, and the towns of Watertown and Needham. Connections with the Boston system are made at Newton and Watertown.

## THE ELEVATED LINES.

The street railway conditions in Boston are peculiar to that city and from some standpoints they will soon be the most perfect of any large city in the world. The elevated road, the subway and practically all the surface lines in Boston will be under the one management. The surface lines radiate from the business center to all resident districts in the city and suburbs. To relieve the congested traffic concentrated in a small area the subway was constructed, and in order to further improve transportation facilities the elevated lines are to be built through the center of the city.

The Boston Elevated Railway Company was incorporated in 1894 and last year additional powers were granted by the Massachusetts Legislature in an amendment to the original act. The company was authorized to construct an elevated railway, lease the subway for 20 years and lease and operate the lines of the West End Street Railway Company. At each station free transfers must be given and connection made between the surface and elevated cars. At the terminal stations the surface cars will ascend an incline, having a grade of 5 per cent, to the elevated structure, and throughout almost the entire length of the elevated road it will be paralleled by surface lines beneath the structure.

The present plans, which have been approved by the Massachusetts Board of Railroad Commissioners, include the immediate construction of seven miles of elevated road which, with the 11 stations to be built, will involve an expenditure of \$5,000,000. Contracts have already been let for structure, about 1,800 ft. in length, on the new Charlestown bridge. The third rail system of electric traction will be used in operating the elevated cars, which in construction and equipment will closely resemble those now in service in Chicago. Two general forms of structure will be adopted. For narrow streets a double row of posts set at the curb lines will support longitudinal and transverse half-lattice girders. In broad streets the columns will be placed just far

enough apart to permit the surface cars to run between them.

It is expected that all these comprehensive plans will be carried out within the coming year. The operation of the elevated road with over 300 miles of surface lines will be with one exception the largest street railway undertaking in the world. The same success with which the West End Company has been managed may confidently be anticipated for the newer and greater company.

### OFFICIALS OF THE BOSTON ELEVATED RAILWAY COMPANY.

William A. Gaston, President.  
 William A. Bancroft, Vice-President.  
 John T. Burnett, Secretary.  
 William Hooper, Treasurer.  
 E. G. Ware, Receiver.

## THE BOSTON SUBWAY.

The Boston subway is far-famed for the boldness of its conception, the engineering difficulties, and its ultimate success, both in construction and operation. The subway is a tunnel, underground passageway 9,498 ft. long, under several of the principal streets, built by the city and leased for a term of 20 years to the West End Street Railway Company. It is by far the largest underground passageway for railways in the world, the four-track portion having a cross-sectional area of 707 sq. ft.

After the introduction of electric traction the cars from all parts of Boston and its suburbs centered in one downtown district, one-quarter mile broad and about one mile long. The two main thoroughfares between the northern and southern portions of the city were Tremont street and Washington street, narrow and tortuous highways. No more serious difficulty ever presented itself to the street railway and municipal officials than the enigma of relieving the congested traffic in this small area. The Boston Transit Commission finally decided that a subway system would be the best solution. An appropriation of \$7,000,000 was made for the work, but the cost has been \$1,500,000 less. The West End Railway Company, or its lessee, pays yearly 4½ per cent of the net cost of the subway, equips the subway with tracks and apparatus, furnishes all power used therein, and bears the expense of repairs and maintenance. The city sold 3½ and 1 per

cent bonds and the surplus goes into the sinking fund. From the passage of the Subway Act by the legislature and its acceptance by the city in a special election in July, 1894, to the completion of the work there was a stubborn opposition to the project on sentimental, as well as financial grounds, for it was considered an encroachment on the historic Common. The first spadeful of earth was removed in the presence of Governor Greenhalge, on March 28, 1895, and after 29 months of continuous and unremitting labor its completion was witnessed.

It was essential that the subway be close to the surface and not low-level tunnel, as it passes through the great shopping district ready means of ingress and egress must be provided without obstructing the streets already narrow and crowded. Work had to be carried on without undue interference with the network of sewers, electric conduits, water and gas pipes under the streets and with the ordinary street traffic. Great care was exercised not to undermine or weaken the foundations of the valuable buildings along the route.

For convenience in construction the subway is divided into 12 sections. Sections 1, 2 and 3 consist of a two-track subway commencing at the incline at the Public Garden west of Charles street and extending to the intersection of Boylston and Tremont streets. The four-track subway begins at this point and runs un-

DESCENT OF SUB-SUBWAY.

UNDER BOYLSTON-STREET MALL.

der the Tremont street mall to Temple place, where the tracks separate to form the Park street station. In this part of the tunnel the roof is flat, supported by brick arches turned between I-beams with diagonal struts connecting the vertical and horizontal beams across the corners. The two-track subway is 24 ft. wide; the four-track is 48 ft. across, the roof being supported in the middle by a row of steel columns.

Sections 4 and 5 consists of two two-track inclines, and a length of two-track subway which finally runs into two separate single-track subways; one, for the south-bound cars, is 39 ft. below the surface and the other, for the north-bound cars, is 17 ft. above it, but the two converge into a double barrel subway, both being brought to the same level before reaching Eliot street. Tremont street, being but 32 ft. between curbs and a very busy thoroughfare, it was deemed best to tunnel 1,085 ft. of section 6, and this was done, the shield being from 6¼ ft. to 13½ ft. below the surface. The open inclines are lined with retaining walls on cement foundations. The maximum grade in the subway is 8 per cent and there are several others of 5 per cent.

The 5.3 miles of single track are laid with 85-lb. T-rails which are bonded with two No. 0000 wires and cross connected to 500,000-e. m. cables returning to the station. To avert any danger of derailment a 43-lb. steel guard is bolted to the inside of each rail. The foundation is of broken stone ballast, 12 to 20 in. deep, upon which chestnut ties are laid. Figure 8 trolley wire, with a cross section of 360,000 e. m., is carried in an inverted trough of eypress wood which is fastened to the iron work of the roof and insulated with sheet rubber. Hangers of special design are spaced 12 ft. apart. Drains are provided beneath the tracks

which carry the water into dry-wells, from which it is removed to the sewers by means of rotary pumps operated by G. E. motors, automatically started and stopped. To insure perfect ventilation 8-ft. fans, run by 500-volt motors, exhaust the air from the subway and deliver it to eight ventilating chambers leading to the exterior. The whole underground construction is of stone, brick and iron.

Entrance to the subway is through handsome granite, glass-roofed structures, located two or three blocks apart, and down a flight of 30 steps. Tickets are sold at three different offices at each station and collected by the conductors before the cars emerge from the subway. The platforms are smooth, artificial stone and between the tracks is a barrier of netting to prevent passage back and forth across the tracks. The stations are lined with white enameled brick which reflect the light from the arc lamps, making it as light as day. The subway is lighted by 600 incandescent lamps, connected in series of five and spaced at equal intervals on three circuits, and by 75 arc lamps of the constant potential type, five in series on a 500-volt circuit. The electric heaters are located in the ticket offices. An electric block signal system is also installed. All the stations are connected with the other parts of the railway system by telephone.

For ordinary traffic about 5,500 car-trips are made each way in the subway each day, and on the first day after the opening over 200,000 passengers were carried through it.

G. G. Crocker, chairman of the Boston Transit Commissioners, and H. A. Carson, chief engineer, were ably assisted in this great work by C. S. Sergeant, general manager, and C. F. Baker, master mechanic, of the West End Street Railway Company.

SCOLLAY SQUARE, JULY 15, 1897.

INCLINE IN PUBLIC GARDEN.

## THE ASSOCIATION AND ITS WORK.

The American Street Railway Association having, after 17 years, returned to Boston, it is fitting to devote a few words to that first meeting and to the work which the Association has accomplished in the meantime.

Though nominally the American Street Railway Association this year meets in Boston for the second time it is really the first convention there, as the meeting at Young's Hotel in 1882 was only to effect an organization.

Under the date, November 8, 1882, H. H. Littell, then superintendent of the Louisville City Railway Company, issued a circular

reports of these committees the convention adjourned and a meeting of the Association immediately called, there being 35 companies which had joined the Association. The Association ratified the organization and adjourned. After the meeting the delegates were entertained by the street railways of Boston at a banquet, and at all subsequent meetings the banquet has been one of the most pleasant features.

A complete list of the cities where the conventions have been held and the presiding officer is as follows:

Boston .....	Moody Merrill .....	1882
Chicago .....	H. H. Littell.....	1883
New York .....	William H. Hazzard.....	1884
St. Louis .....	*Calvin S. Richards.....	1885
Cincinnati .....	Julius S. Walsh.....	1886
Philadelphia .....	*Thomas W. Ackley.....	1887
Washington .....	Charles B. Holmes.....	1888
Minneapolis .....	George B. Kerper.....	1889
Buffalo .....	Thomas Lowry .....	1890
Pittsburg .....	Henry M. Watson.....	1891
Cleveland .....	John G. Holmes.....	1892
Milwaukee .....	D. P. Longstreet.....	1893
Atlanta .....	Henry C. Payne.....	1894
Montreal .....	Joel Hurt .....	1895
St. Louis .....	H. M. Littell.....	1896
Niagara Falls .....	Robert McCulloch .....	1897
Boston .....	Albion E. Lang .....	1898

\*Deceased.

Each of the annual conventions has been the occasion of the presentation and discussion of technical papers on subjects in which the street railway men were interested, and these papers have been preserved in the published "Reports" now 16 in num-

A. E. LANG,  
President.

ber letter to the street railway companies of the United States and Canada, requesting them to send representatives to a convention to be held in Boston, on December 12, 1882.

It was the original intention of Mr. Littell to have the officers of 10 other companies join him in issuing the call, but he yielded to the suggestions of the others that a circular signed by a limited number of companies might engender prejudice amongst those others which had not been asked to join, and signed the call alone.

As a preliminary to the National Association of street railways, it was thought that an Ohio State Association would be highly desirable and November 12, 1882, a call for a meeting was issued by R. B. Hopple, vice-president of the Cincinnati Street Railway Company, in behalf of the Cincinnati companies. The proposed meeting was held at Cincinnati, November 22, 1882, and delegates from the companies at Cincinnati, Cleveland, Columbus, Dayton and Toledo united to form the Ohio State Tramway Association, delegates from which attended the Boston meeting.

On the appointed date Mr. Littell called the meeting to order at Young's Hotel in Boston.

Moody Merrill, president of the Highland Street Railway Company, of Boston, was chosen chairman of the meeting, at which there were present 56 delegates representing 55 roads. A committee was appointed to draw up constitution and by-laws, and a committee on nominations. After the convention had adopted the

T. C. PENINGTON,  
Secretary.

ber. Many of the topics of vital interest then are now obsolete, but others, for instance, "The Use of Salt," are almost as much alive today as in the time of animal traction.

In 1883 and 1884 the papers presented at the conventions were reports of committees of three men each; in 1885 the committees comprised but two men; and ever since (save in a few instances) but one man has constituted the committee, though his paper is still officially known as a "report."

## OFFICERS A. S. R. A.

The officers of the Association are:  
 President, Albion E. Lang, president Toledo Traction Company, Toledo, O.  
 First Vice-President, W. Caryl Ely, president Buffalo & Niagara Falls Electric Railway Company.  
 Second Vice-President, John A. Rigg, president United Traction Company, Reading, Pa.  
 Third Vice-President, Edward G. Connette, general manager Nashville Street Railway, Nashville, Tenn.  
 Secretary and Treasurer, T. C. Penington, treasurer Chicago City Railway, Chicago, Ill.

The Executive Committee comprises the president, vice-presidents and—

Robert McCulloch, vice-president and general manager Citizens' Railway, Cass Avenue & Fair Grounds Railway and St. Louis Railroad Companies, St. Louis, Mo.

C. Densmore Wyman, general manager New Orleans Traction Company, New Orleans, La.

Henry C. Moore, president Trenton Passenger Railway Company, Consolidated, Trenton, N. J.

John M. Roach, vice-president and general manager North Chicago Street Railroad Company, Chicago, Ill.

Robert S. Goff, president and general manager Globe Street Railway Company, Fall River, Mass.

W. C. ELY.

JOHN A. RIGG.

E. G. CONNETTE.

ROBERT MCCULLOCH.

C. D. WYMAN.

What has been done at these previous meetings will be found of great interest to the modern manager, especially if he wish to look up the history of a subject, and to enable him to find these data we have compiled a classified index. This comprises titles of papers, and discussions, with some abstracts of the sub-heads, compiled from the reports, and constitutes an epitome of the 16 separate tables of contents (aggregating nearly 50 pages), arranged alphabetically with a few of the most important cross-references, and will repay the time spent in its perusal.

In March, 1884, the Association undertook the publication of the most important legal decisions which affected street railways, and these were published for several years at the rate of one each month. They are now published three or four times each year.

The membership statistics of the Association show an interesting phase of the development of the industry, illustrating the tendency to centralization found everywhere in this country at the close of the century. The Association left Boston 16 years ago with 35 members, and the number steadily increased to 205 in 1892, when the high-water mark was reached. From 1892, one number of member companies has decreased, the decrease being due almost entirely to the consolidation of companies, the interests represented by them having vastly increased, and in 1897 the membership was 161—just what it was in 1859.

The figures are as follows:

Year.	Members.	Year.	Members.
1852.....	35	1890.....	169
1853.....	62	1891.....	184
1854.....	74	1892.....	205
1855.....	125	1893.....	197
1856.....	141	1894.....	187
1857.....	153	1895.....	173
1858.....	157	1896.....	160
1859.....	161	1897.....	161

The decrease in membership does not by any means indicate a decline of the power and influence of the Association; quite the contrary. The number of delegates of member companies in attendance at the Niagara Falls convention was 287, which is considerably in excess of the attendance at any preceding annual meeting. In addition to this the number of suppliers, visitors and representatives of non-members is on the increase, all of which betokens a widening scope for the work of the Association.

J. M. ROACH.

R. S. GOFF.

## PROGRAM.

## TUESDAY, SEPTEMBER 6.

10 a. m. Meeting called to order by President Lang.  
 Roll call.  
 Invitation extended to join the Association.  
 Address of the President.  
 Report of the Executive Committee.  
 Report of the Secretary and Treasurer.  
 Paper—"The Comparative Earnings and Economy of Operation between Single and Double Truck Cars for City Use." Richard McCulloch, electrical engineer Cass Avenue and Citizens' Railway Companies, St. Louis, Mo.  
 Paper—"Municipal Ownership of Street Railways."  
 Afternoon. Trip to Concord and Lexington.  
 Evening. Reception at the Hall.

## WEDNESDAY, SEPTEMBER 7.

9:30 a. m. Paper—"Maintenance and Equipment of Electric Cars for Railways." M. S. Hoskins, electrician Columbus Street Railway Company, Columbus, O.

Paper—"The Carrying of United States Mail Matter on Street Railways." W. S. Dimmock, general superintendent Omaha & Council Bluffs Railway & Bridge Company, Council Bluffs, Ia.

Appointment of Committee on Nomination of Officers and Next Place of Meeting.

While the convention is in session the visiting ladies will be taken to the various points of local and historic interest.

Afternoon. Excursion down the harbor with clam bake at Nantasket Beach.

## THURSDAY, SEPTEMBER 8.

9:30 a. m. Paper—"To What Extent Should Railway Companies Engage in the Amusement Business?" W. H. Holmes, general manager Metropolitan Street Railway Company, Kansas City, Mo.

Paper—"Inspection and Testing of Motors and Car Equipment by Street Railway Companies." Frederick B. Perkins, electrical engineer Toledo Traction Company, Toledo, O.

Election of Officers.

Drive through the park for the ladies.

Afternoon. Trip to Plymouth.

7 p. m. Annual Banquet at the Hotel Brunswick.

## FRIDAY, SEPTEMBER 9.

9:30 a. m. Paper—"Cost of Electric Power for Street Railways at Switchboard; Both Steam and Water." R. W. Conant, electrical engineer Boston Elevated Railway Company, Boston, Mass.

Report of Committee on Standing Rules for Government of Conductors and Motormen.

Unfinished Business.

Installation of Officers.

Adjournment.

Shopping trip for the ladies.

Afternoon. Trolley excursion to Norumbega Park.

## COMMITTEES.

## GENERAL.

C. S. Sergeant, 101 Milk street, Boston, Chairman.  
 E. C. Foster, 333 Union street, Lynn.  
 J. E. Rugg, 101 Milk street, Boston.  
 C. S. Clark, 8 Oliver street, Boston.  
 A. A. Glasier, 104 Ames building, Boston.  
 C. Q. Richmond, North Adams.  
 John R. Graham, 280 Washington street, Boston.  
 Robert S. Goff, Fall River.  
 P. L. Saltonstall, 28 Exchange building, Boston.  
 E. P. Shaw, 316 Exchange building, Boston.  
 F. H. Dewey, Worcester Consolidated Street Railway Company, Worcester.

## ON ENTERTAINMENT.

P. L. Saltonstall, Boston, Chairman.  
 H. F. Eldredge, Portsmouth.  
 A. B. Bruce, Lawrence.  
 C. C. Pierce, Boston.  
 C. E. Barnes, Boston.  
 C. W. Wilson, Boston.  
 J. F. Shaw, Boston.

J. H. Goodspeed, Boston.  
 J. H. Cunningham, Boston.  
 B. J. Weeks, Quincy.  
 W. W. Sargent, Fitchburg.

## ON HALLS, HOTELS AND REGISTRATION.

E. C. Foster, 333 Union street, Lynn, Chairman.  
 John F. Morrill, Quincy.  
 J. N. Akarman, Worcester.  
 J. H. Studley, Jr., Boston.  
 J. E. Rugg, Boston.  
 W. F. Pope, Boston.  
 R. N. Wallis, Fitchburg.  
 H. B. Parker, Boston.  
 A. E. Smith, Springfield.  
 George F. Seibel, Taunton.

## ON EXHIBITS.

W. F. Pope, 104 Ames building, Boston, Acting Chairman.  
 H. F. Woods, Boston.  
 E. C. Foster, Lynn.  
 C. F. Baker, Boston.  
 E. P. Shaw, Jr., Boston.  
 Franklin Woodman, Haverhill.  
 R. S. Goff, Fall River.  
 J. H. Studley, Jr., Boston.  
 Maurice Hoopes, Lynn.  
 A. C. Gardner, New Bedford.  
 Edwin S. Webster, Boston.  
 Charles S. Clark.

## ON TRANSPORTATION AND INFORMATION.

Julius E. Rugg, Chairman.  
 N. H. Heft, Boston.  
 H. B. Rogers, Brockton.  
 J. F. Wattles, Boston.  
 Fred H. Smith, Quincy.  
 A. E. Gordon, Boston.  
 N. E. Morton, Lawrence.  
 C. E. Woodward, Wakefield.  
 Winthrop Coffin, Boston.  
 H. H. Reed, Fall River.  
 H. F. Grant, Boston.

## BANQUET.

A. A. Glasier, Chairman.  
 W. A. Baneroff, Boston.  
 Prentiss Cummings, Boston.  
 C. S. Clark, Boston.  
 E. P. Shaw, Boston.  
 E. C. Foster, Lynn.  
 S. M. Thomas, Taunton.

## HOTEL RATES.

Leading Boston hotels have made the following rates to attendants upon the convention. The first five hotels are all within five minutes' walk; the others are reached by cars which pass the entrance to the hall:

Brunswick, American plan, \$4 per day and up.  
 Vendome, American plan, \$4 per day and up.  
 Thorndyke, European plan, \$2 per day and up.  
 Nottingham, European plan, \$2 per day and up.  
 Victoria, European plan, \$2 per day and up.  
 Turaine, European plan, \$2 per day and up.  
 Parker, European plan, \$2 per day and up.  
 Young's, European plan, \$2 per day and up.  
 Copley Square, European plan, \$2 per day and up.  
 The Brunswick is headquarters, and the Vendome, under the same management, is near by.

## REVIEW HEADQUARTERS.

The office of the REVIEW at the convention will be in space No. 232, Convention Hall, which will be found next to the Bureau of Information, and directly opposite the main stairway leading to the Association meeting rooms on the second floor. We shall be glad to have our friends drop in, occupy the easy chairs and make themselves generally at home.

## CONVENTION BUILDING.

The Association has never been quartered as nicely as it will be this year; indeed, the question of a suitable place and adequate space for exhibits has become so much of a problem that it is one of the requisites in selecting the convention city. The earlier date this year—early September instead of late October,

termed, as it is practically all above the street level and well lighted by windows. The freight entrance is 17 ft. wide by 11 ft. 6 in. high.

There is an abundance of electric power at hand, plenty of light by day and night, and such exhibitors as are obliged to work all night installing will have no difficulty in doing so. As the building will be ready one week in advance of the opening day of the convention, there will be no excuse for delay in getting exhibits set up. The tracks of the Boston & Albany road extend to the building, which will greatly facilitate shipping in and out and save the usual loss of time and expense in cartage.

A new feature which will be highly appreciated will be the Bureau of Information on the main floor, where mail may be received and sent and telephone service found. A telegraph

THE CONVENTION BUILDING.

as heretofore—will insure delightful weather, and exhibitors will not feel the necessity of taking out extra life insurance before starting to install their displays.

The building selected is admirably adapted to the requirements, having been erected expressly for the annual industrial exposition of the Massachusetts Charitable Mechanic Association, where each October a notable exhibit lasting several weeks is made of the leading industrial products of New England. The building, which is at 99 to 149 Huntington avenue, is within walking distance of the Brunswick and Vendome and other hotels, and is reached by cars from all parts of the city.

The business sessions of both the American and Accountants' Associations will be on the second floor, reached by passing through the Exhibit Hall. The American Association will occupy the beautiful and commodious Paul Revere Hall, and the Accountants' Association will hold forth in the banquet room.

Exhibits will be better and more numerous than ever, and over 60,000 sq. ft. of space has been taken. When it is remembered that 40,000 sq. ft. was the most available heretofore, the magnitude of the display will be better realized. A classification has been made under which all cars, trucks and machinery in operation will go into the basement, which, however, should hardly be so

office will be in operation day and night; this is also on the main floor.

W. F. Pope is acting chairman for the Committee on Exhibits, Mr. Clark having gone abroad on account of ill-health.

## WHO WOULDN'T BE A SALESMAN?

"No, sir," exclaimed the irate manager, as a man entered the office with a queer looking model under his arm, "you can't sell this road a patent duplex, double back action, self dumping fender. We have experimented with 34,256 different fare registering contraptions, and have bought brakes enough to break the company. Of heating dingusses, why, good Lord, man, we have stoves that heat the Arctic region in the prospectuses, and freeze out everybody but the bondholders in practical use. Once for all, sir, we are not in the market, not even for a device that will light, collect fares, throw off drunken men, and keep flies off the motorman's nose." The irate manager then drew a long breath, slammed down his desk, and departed in high dudgeon, leaving the poor fender man speechless with astonishment.

The Street Railway Accountants' Association of America meets on the same dates and under the same roof as the American Street Railway Association, and with this gathering writes Vol. II, in the records of its interesting history. The business sessions will occur in the banquet hall of the Mechanic Association building, on the same floor and convenient to the meeting place of the American. Delegates are entitled to travel on the special railroad rates made the parent association, which are one and one-third regular fares for the round trip. Official headquarters will be at the Brunswick hotel near by.

The business sessions have been planned to conform as nearly as possible to those of the American Association, to enable members to join in the various trips of inspection of power plants, etc., and the entertainments, for which purpose the badges of the American Association will be furnished and worn. Accountants are urged to bring their ladies, for whom the local committee has provided a delightful program of entertainment.

The Association, which was organized in Cleveland, March 23 and 24, 1897, with 25 members, is growing rapidly in strength and influence and now numbers 67 members, including five in Canada and Mexico. Like the American, membership is vested in the companies, not individuals, although any member company may send as many representatives as it desires, and any company not a member is invited to send duly accredited representatives, who will be gladly welcomed. The scope and purpose of this Association is much better understood today than it was a year ago and is receiving the encouragement and hearty approval of the best managers and presidents in the country. The business-like and methodical manner in which the Association works, the energy and ability it displays, and the greatly to be desired results it is achieving make it deserving of the encouragement and support of every road in the land.

The officers, particularly the secretary, and the Permanent Committee, of which C. N. Duffy of St. Louis is chairman, have done a vast amount of hard work and have earned the thanks of every company and manager.

During the year the Association has lost by death three representatives:

Morris W. Hall, secretary of the Camden & Suburban road, Camden, N. J. Mr. Hall died after a prolonged illness. He was chairman of the organization meeting at Cleveland.

James A. Stratton, secretary and treasurer of the Birmingham Railway & Electric Company, Birmingham, Ala., died in February of this year.

Charles Blair Reavis, auditor and treasurer of the Augusta Railway & Electric Light Company, Augusta, Ga., died very suddenly on August 2, of Bright's disease. He took an active part in both the Cleveland and Niagara Falls meetings and was third vice-president last year.

The papers to be read will be excellent and the discussions following of interest and value; the two features, however, this year will be the exhibit of forms and blanks, and the report of the Permanent Committee on a Standard System of Accounts. The splendid work of the committee last year has been further supplemented and continued since last convention. The several members have devoted a great amount of personal time and effort to the perfection of what was so auspiciously inaugurated, and have spent an entire week in session in New York, beginning July 18. As a result of this work the committee will report in favor of changing the four general headings to three—Maintenance, Transportation and General. The accounts (39) under each general heading remain unchanged.

Accounts 8 and 9 were consolidated into one account. The cost of depreciation and renewals of horses was transferred from Account 8, "Renewals of Horse and Vehicle Equipment", to Account 31, "Stable Expenses". "Renewals of Vehicle Equipment" was consolidated with Account 9, "Maintenance of Miscellaneous Equipment", and in the consolidation of the two accounts Account 9 became Account 8. An account is provided for Legal Expenses in connection with damages and another account for other legal expenses, as recommended by the Niagara Convention. "Taxes" Account 39 is classed as an Operating Expense Account, so that Operating Expenses would mean all expenses except Interest.

The analysis of each account was carefully gone over and much improved, the aim of the committee being to make the analysis as plain and comprehensive as possible, and yet brief. An alphabetical index of items with the number of the account to which each should be charged has been prepared.

The form of Annual or Monthly Report was changed to conform with the new arrangement of "Taxes" as an Operating Expense, when it was formerly classed as a "Deduction from Income", the same as "Interest on Funded Debt", or "Rentals of Leased Lines", otherwise the form of Annual and Monthly Report was not changed, as the committee felt satisfied that it could not be improved upon.

The Executive Committee will hold its annual meeting in the Hotel Brunswick on Monday, September 5, at 7:30 p. m. The program for the rest of the week is as follows:

#### Tuesday, September 6.

10 a. m. (Mechanic Association Banquet Hall.)

Opening Business Session—Reports of officers. Appointment of committees, etc.

Paper—"Statistics; Their Use and Abuse," E. D. Hibbs, auditor North Jersey Street Railway Company, Jersey City, N. J.

#### Wednesday, September 7.

10 a. m. (Mechanic Association Banquet Hall.)

Paper—"Car Mileage; How Arrived At and Its Use," A. H. Ford, secretary and treasurer, New Orleans Traction Company, New Orleans, La.

Report of the Permanent Committee on "A Standard System of Street Railway Accounting, Covering the Classification of Operating Expenses, Classification of Construction and Equipment Accounts and Form of Annual Report."

Chairman—C. N. Duffy, secretary Citizens Railway Company, St. Louis, Mo. H. L. Wilson, auditor Boston Elevated Railway Company, Boston, Mass. Wm. F. Ham, secretary Nassau Electric Railroad Company, Brooklyn, N. Y. J. F. Calderwood, auditor Twin City Rapid Transit Company, Minneapolis, Minn. H. J. Davies, assistant secretary Cleveland Electric Railway Company, Cleveland, O.

#### Thursday, September 8.

10 a. m. (Mechanic Association Banquet Hall.)

Report of the Permanent Committee on "A Standard System of Street Railway Accounting"—Continued.

#### Friday, September 9.

10 a. m. (Mechanic Association Banquet Hall.)

Informal discussion of questions relating to Street Railway Accounting. Leader—R. Lancaster Williams, treasurer Richmond Traction Company, Richmond, Va.

Closing Business Session—Report of Convention committees.

Election of officers for 1898-1899.

All papers and reports are subject to the fullest discussion and ample time is allowed.

The Exhibition of Blanks and Forms will be in charge of the following committee:

Chairman—F. E. Smith, auditor Lynn & Boston Railroad, Lynn, Mass. G. E. Tripp, treasurer Lowell, Lawrence & Haverhill Street Railway, Lawrence, Mass. R. N. Wallis, treasurer Fitchburg & Leominster Street Railway, Fitchburg, Mass.

## OFFICERS.

President—H. L. Wilson, auditor Boston Elevated Railway Company, Boston, Mass.

First Vice-President—E. D. Hibbs, auditor North Jersey Street Railway Company, Jersey City, N. J.

E. D. HIBBS.

P. V. BURINGTON.

A. H. FORD.

J. M. SMITH.

H. L. WILSON.

Second Vice-President—P. V. Burington, secretary and auditor Columbus Street Railway Company, Columbus, Ohio.

Third Vice-President—A. H. Ford, secretary New Orleans Traction Company, Ltd., New Orleans, La.

Secretary and Treasurer—W. B. Brockway, auditor Toledo, Bowling Green & Fremont Railway Company, Toledo, Ohio.

The Executive Committee includes the officers and William F. Ham, secretary Nassau Electric Railroad Company, Brooklyn, N. Y.

H. J. Davies, assistant secretary Cleveland Electric Railway Company, Cleveland, Ohio.

F. R. Greene, secretary Chicago City Railway Company, Chicago, Ill.

J. M. Smith, comptroller Toronto Railway Company, Toronto, Ontario.

## SECRETARY BROCKWAY.

W. B. Brockway, who has so acceptably filled the laborious position of secretary of the Street Railway Accountant's Association since its organization, was born in Coldwater, Mich., but was reared in the east. He has had experience in all branches of railroading, having been engaged in such work for 13 years, 11 years of which were with steam roads and two with electric lines. He is now assistant secretary and auditor of the Toledo, Bowling Green & Fremont Railway. Mr. Brockway was married to Miss Elizabeth Priest in Toledo, October 10, 1894, and has one daughter.

The Concord (N. H.) Street Railway has joined the Accountants' Association, and Secretary Brockway has received promises from several other roads which will become members at the Boston meeting. The Association is gratuitously doing for its members a work which would cost any one road by itself several thousand dollars, and the very reasonable dues (only \$10 per year) give larger returns for the amount invested than any road can possibly obtain in any other way. While the papers will give a very complete report of the meeting, there is a great deal in the discussions which the Association reserves from general publication. All this, however, is printed in its annual report in book form, and these are numbered and registered and cannot be furnished to any but accredited members. Hence every road should join.

W. B. BROCKWAY.

W. F. HAM.

H. J. DAVIES.

FRANK R. GREENE.

## VINTAGE OF '98.

"We had an amusing experience years ago, in the old 'horse car days,'" remarked a superintendent who has seen more than a quarter of a century of active street railway service. "It was 'way back in the 70's. We had a sale of worn-out horses, which brought from \$5 to \$20 a head, and one of the fellows who bought a five-dollar steed afterward repented and claimed it had been misrepresented to him. As a matter of fact, there had been no representations of any kind. The horses were tagged with their selling price and turned into a pen for buyers to select from. The amount involved was too small to bother over and we would have refunded his money but for the abusive language in which he couched his demand.

"Well, he went away off to the farther end of town and entered suit in a little justice shop with the call set for 7:00 a. m. At the appointed time I was there and, as it happened, took three witnesses along, which, with myself, made four. He had two of his friends, neither of whom had been near the sale.

"The justice called 'time' and we went at it. The court didn't have a case very often and was bound to make the most of it. You would have thought five thousand dollars were involved instead of five; and the dignity of that court—well he belonged on the supreme bench, that's certain. One, two, three hours passed and we had used up more time than several such horses were worth. Our side said one thing and the other fellows as persistently and unanimously said it wasn't so. Finally the little old judge closed the arguments, summed up each side for us, and while gravely declaring that there evidently were at least three liars before him, and maybe four, whom properly he should fine for contempt of court and dissimulation, he concluded to decide in our favor as our witnesses were in the majority. And so the costs were a horse on the other fellow."

"The superintendent of an 8-mile road, who moreover was track foreman, tie inspector, chief and staff of overhead repairs, head armature winder and entire clerical force, had a weary look as he dropped into a chair after a hard day's work in handling the circus day crowd. He had the appearance of a man who was in doubt as to whether life was worth living or not.

"You are all played out," we remarked, "what you should do is to take a rest; go on a vacation, and stay away a month."

"Vacation! rest!! a month!!! Say, you don't seem to be acquainted around here. Been working this line for eight years, day in and day out, with nights and Sundays, until my children have grown up and hardly know me when we pass on the street. Last year I did think it was time to make a break, so I went to the president, who runs a bank, and suggested, as I had not had a day in seven years, and needed a change of air, that the company ought to give me a vacation."

"How long a vacation do you think you would require?"

"The way he said it induced me to reduce the request from the two weeks I had intended to ask for, to one. He thought it all over for a few minutes and then reluctantly said:

"Well, I guess you can have a week, but you better stay around where we can call you handy."

This superintendent had another of those hard-proposition small roads, where the directors are well up in farming and hardware and paper hanging, but what they have yet to learn about railroading would make several years' copy for the REVIEW.

The superintendent was a progressive, hard-working man well deserving a larger field of usefulness and who was making herculean efforts to keep the cars going and the road out of a receiver's hands. He was the whole executive and had it all to do. At last, by the closest economy and personal missionary work, he had reduced the expenses to a point beyond which it was impossible to go, and had increased the

earnings until the second dividend was actually paid. Then he concluded it was time to do something for himself, and at the annual meeting requested a small increase in his brief salary. The proposition was shocking to the astute board which thereupon went into executive session for two hours. At the end of that time the president gravely announced that in the judgment of the board the increase was not advisable but they had concluded to promote him and that his title thereafter would be "general manager."

"Yes, I've heard numerous stories about obstinate property owners who tried to stop the wheels of progress by threats, injunctions and standing in the trolley pole holes," said a determined-looking superintendent, "but did you ever try blowing them up with dynamite? Well, I did, and it works fine."

"You didn't actually kill them, did you?" asked one of the party.

"No, but we came within two inches of it. You see the line—it was a road down in New England—was surveyed for some two miles of the route along the beach road. On one side was the beach and on the other handsome residences and pretty lawns. Most of the people wanted the road and we had no trouble until we came in front of a place owned by a very wealthy and influential man. He said the road should never pass his door, and backed up his assertion with 200 pounds of Yankee determination. We said little but kept on until one day we reached him, and, as luck would have it, one of our heaviest blasts came right in front of his house. We managed to get the hole drilled and while we were ramming in the charge he rushed into the house and brought out a chair which he placed directly over the fuse. He declared we should never fire the charge without blowing him up too, and relied upon his well known social position to protect him. The boys looked scared, but there was no help for us so I gave the order and one of the men touched off the fuse. Then we all withdrew to a safe place and left him sitting there, bare-headed, in the hot sun. The perspiration began to ooze as he ordered us to come and put the fuse out. But we didn't, and as it slowly grew shorter and shorter I began calling out the number of minutes she still had to burn. The situation grew decidedly strained, neither side being willing to give in, but finally he looked down at the remaining two inches which began to sputter, and he suddenly changed his mind and, leaving the chair, made a wild rush. He just got out of range when the charge exploded, blowing the chair to bits and hurling rocks in all directions. That settled it and we won the day."

"That reminds me," said the man from Jersey, "of a somewhat similar case down our way a year ago. We were building an interurban and struck a tough proposition in the shape of an old Jersey farmer, who threatened to kill the whole construction gang before a single tie went down. He mounted guard from daylight to dark in his front yard and marched back and forth with a shot-gun which looked as big to us as a rapid fire gun on a man-of-war. We concluded to leave a gap there and went on and finished all the track but 200 feet. Then we came back and the old man was ready for us. The men refused to get in range, for the old fellow would draw a bead with both barrels cocked and moving his gun first one side and then the other, kept the road covered. After a consultation the foreman and I fixed it up for one of us to go in and engage the old man in conversation while the other made a detour and crept up in the rear. So we braced ourselves and under a white handkerchief as a flag of truce, and with no little trepidation I worked my way toward him. He kept pointing the gun at me and threatening to shoot if I came another step nearer, but the men were all looking on and I couldn't very well back out, much as I wanted to. I got up within 10 feet and finally engaged the old man in an argument, but he kept an eagle eye on the force and every time one moved he would take a bead on him. The foreman was all this time crawling up behind, and, after a few minutes which seemed like hours to me, suddenly jumped upon the

## PROMOTED HIM TO G. M.

hard-working man well deserving a larger field of usefulness and who was making herculean efforts to keep the cars going and the road out of a receiver's hands. He was the whole executive and had it all to do. At last, by the closest economy and personal missionary work, he had reduced the expenses to a point beyond which it was impossible to go, and had increased the

enemy and threw his arms around him. At the same instant I sprang forward and grabbing the barrel, pulled it from the stock. The old man saw the game was up and with a merry twinkle in his eyes said, 'Well, I'm beat, but I was mighty fearful it might go off and kill some on ye.' When we examined the gun both barrels were empty and it was so old and rickety it would have been as much as any one's life was worth to attempt to fire it."

Some one had mentioned pleasure resorts and big Sunday riding, when a superintendent from an eastern state smiled, and

**HOW HE KEPT SUNDAY.**

burned his thumb with a lighted match while he related an instance in his own experience. "It was several years ago," said he, "when the resort craze first

struck the roads, and we had for president one of our big stockholders, a man who was a great stickler for proprieties. In fact it was about all he could stand to see the cars run on Sunday at all, though he eased his conscience by riding on the line twice a day to church, although he lived only three blocks and the headway was so long he could have walked in one-fourth the time. When we talked park he took at once to the scheme, as a fine place for Sunday School picnics, and a sort of philanthropic breathing place for the man of daily toil. After the park was open he discovered that while the Sunday School picnics—what few there were—went on week days, the aforesaid man of daily toil and his numerous family persisted in staying away during the week, but turned out en masse Sunday, coming early in the morning, and bringing a lunch, and with the kids rolling on the grass under the trees until evening. The result was the line carried a big business Sundays and taxed our equipment to the limit. This was a poser. We couldn't abandon the line or the park either, for that matter; and the old man was full of grief at this desecration of the day. But when I made a deal with the city to furnish a free sacred concert every Sunday afternoon with a full brass band, the case became desperate. He called me in and wanted the concerts declared off, but I explained we couldn't very well back out, as the agreement was made in good faith, and besides the mayor, whose pet scheme the band concert was, did not love us any too well, anyway.

"Well, the president 'mulled' it over all the week and finally, at 5 p. m. Saturday, he came in smiling. He had got out of Egypt to the promised land, and announced he had brought in his resignation, which was neatly written out and duly filed with the secretary. And what do you think? Well, bright and early Monday morning he came in and withdrew his resignation. He kept this up for several weeks, resigning every Saturday night and withdrawing it early Mondays, so he managed to get over the Sabbath with a pretty clean conscience, while his wicked superintendent and the boys were working rush trips all day long.

"After a while one of the directors who didn't like the old man any too well, got on to his scheme, and they called a director's meeting for 11 p. m. Saturday night. The president was out

spending the evening and came home tired, and retired without reading his notice of the meeting. In fact he mislaid it without opening the envelope and forgot all about it. So when he sailed in Monday a. m. as usual and asked the secretary for his resignation, which by this time had become pretty nearly worn out, he was pleasantly informed the board had accepted it and he wasn't in it. Well he tried to make a row, but the story leaked out and his friends made so much fun of him he concluded to take a trip, and when he returned informed the board he guessed he had more work than was good for him and so resigned from the directory and stepped out."

**LAKE SHORE TRAIN SERVICE TO BOSTON.**

Those of our western readers who have ever journeyed over the famous Lake Shore and New York Central, will be likely to follow the same route in going to the Boston convention this year. These two systems, now practically one, are probably the best railroads in the world, and for delegates to Boston special provisions and concessions are made.

The rate of one and a third fare for the round trip has been secured, and these tickets will be good going on the "Limited" as well as other trains. Special sleepers have been reserved for the street railway people and will run through without any change from Chicago to Boston. The train carries all the modern conveniences of dining, observation and buffet, library and smoking cars. It leaves Chicago at 5:30 p. m. daily, and those leaving Sunday evening will be in Boston at 9 p. m. Monday evening.

A large delegation, however, will go on the "Boston Special," which leaves Chicago at 10:30 Sunday morning, reaching Boston at 3 p. m. Monday. This train will attach, at Cleveland, cars from St. Louis, and receive further additions from Ohio and Indiana points, Buffalo, Syracuse, Rochester and Albany. It will give a fine opportunity for renewing acquaintances and nothing will be wanting to make the trip enjoyable.

Reservations or further information can be had of F. M. Byron, General Western Agent, or H. J. Rhein, City Passenger Agent, 180 Clark street, Chicago.

**QUINCY, ILL., ROAD SOLD.**

The Quincy Horse Railway & Carrying Company, now operated electrically, has been sold to a party of capitalists from Portland, Me., who will soon elect a new board of directors and re-organize the company. Improvements will be made, and already an order has been placed for 12 double (No. 49 Westinghouse) motor equipments.

Knoxville, Tenn., is to tender a public reception to the Baltimore capitalists who recently organized the Knoxville Traction Company and consolidated the railway, electric light and power interests in that city.

### A PROMINENT STREET RAILWAY MAN.

Hon. Edward P. Shaw, treasurer and receiver-general of Massachusetts, has long been an enthusiastic advocate of electric interurban railways, and it is largely through his efforts that recent progress in this line in Eastern Massachusetts is due. The present development of electric railway interests in New England exceeds the most sanguine expectations of most men, but it is only the fulfillment of the predictions of Mr. Shaw.

Mr. Shaw has been and is now interested in a large number of interurban roads, and through the firm of J. F. Shaw & Co., of which he is a member, has helped to build many of them. During the past year this firm built the road connecting Fall River, Mass., and Newport, R. I.; that from Taunton, Mass., to Provi-

dence, and connecting with the Brockton, Bridgewater & Taunton, giving a 38-mile ride without change of cars; the Salem & Wakefield line, connecting Salem with Wakefield, for Lowell, Nashua, Boston, etc.; and the Southbridge, Marlborough and Framingham road, connecting at Marlborough with the Worcester & Marlborough (built last year) and making a through line from Framingham to Worcester.

At the present time one may take electric cars at Newburyport, Mass., and ride to Nashua, N. H., Boston, Brockton, Taunton, or to Providence, Fall River, Newport, R. I., New Bedford, or Nantasket Beach. In fact, one can ride a whole day on the electric cars in Massachusetts making but few changes.

Mr. Shaw says of the industry: "I know of nothing that gives anywhere near as much for the money spent as the electric railway gives its patrons."

### STERLING SUPPLY & MANUFACTURING COMPANY.

The Sterling Supply & Manufacturing Company, New York, of which J. H. Carson is the progressive head, has continued during the past year the same expansion in its business which made for it so notable a record in '97. In the various lines of registers, brakes, fenders, sand boxes and over-head material fully twice the amount of business has been done this year, that was done last season; and last year's business was a record breaker. The company's large and excellent manufacturing facilities and the high standard maintained in all of its products have held old customers for large renewal orders and secured many new ones.

Street railway and supplymen have been watching with interest and pride the gallant conduct of William Tiffany, secretary of the Sterling Company, in his experiences as a member of the Rough Riders. It has been a surprise to other countries that

young men of wealth and high social distinction like Mr. Tiffany, should exchange the pleasures and comfort of home and society for the dangers and privations of the soldier's life. Mr. Tiffany has been ill with fever and while at one time dangerously low with the fever, at this writing is making rapid progress toward recovery, for the early attainment of which all his many friends are hopeful.

### THE THORNDYKE, BOSTON: POPULAR EUROPEAN HOTEL.

There are always a large number of attendants upon the convention who find it much more convenient to use a European plan hotel, owing to the irregular hours and distant points at which they are obliged to dine. Those in charge of exhibits especially find difficulty in reaching their hotels during the usual meal hours, and the result has been they are compelled to pay twice for each meal. For those who desire the European plan The Thorndyke, conducted by G. A. and J. L. Damon, will be found to meet their wants admirably. Good rooms for one or two persons range from \$1.50 to \$2.00 per day up. The location is opposite the Park street depot of the Old Colony road, and within very convenient walking distance of the convention hall. Reservations for rooms may be made by letter or wire.

### QUICK CONSTRUCTION IN NEW YORK.

In reconstructing the lines of the Metropolitan Street Railway Company, of New York, for electric traction it has been the policy of the company to obstruct the streets for as short a time as possible. President Vreeland placed horse cars on the completed sections until the whole line was ready for the motor cars. As an example of rapid work the following results were accomplished after 13 days work on the Sixth and Eighth avenue sections: 10.2 miles of old track, 21,000 ties, 3,500 rails, and 3,600,000 cu. ft. of earth removed; 65,000 ft. of pipe and conductors replaced and 170,000 ft. of feeder duct laid. This was accomplished by 6,200 men with 400 carts and 550 horses.

### NEW SOUTHERN UNION STATION FOR BOSTON.

The Boston Terminal Company, under authority of an act passed by the Massachusetts legislature two years ago, is now building what will be the largest railway station ever constructed. The station has fronts on Dorchester avenue, Summer street and Cove street. It is to be used by all the roads entering the city from the south and southwest and also by a few branches found north of an east and west line through the city.

Together with the train shed the station will be 700 ft. long and 650 ft. wide, with 28 tracks. There will be, in addition to these, underground tracks for the suburban service.

### BUCKLING OF TRUSSES ON BROOKLYN BRIDGE.

On the evening of July 29, when traffic on the New York & Brooklyn Bridge was quite heavy a sick horse caused a blockade of the trolley line and a great many of the electric cars were brought to a stop on the bridge, and it is stated that the regulation as to a distance of 102 ft. between cars was entirely disregarded. Before the cars commenced running the four main trusses buckled slightly, without causing serious injury to the bridge, however, or making it dangerous for the cars.

It is believed that the stress imposed by reason of expansion because of the excessive heat had as much to do with the buckling of the trusses as the heavy loading.

The Camden (N. J.) & Suburban Railway Company is vigorously opposing the paving of six of the principal streets of Camden with sheet asphalt, and has so far been successful.

**BOSTON HUBLETS.**

When it was proposed, a few years ago, to lay a track across the sacred common, Rufus Choate thundered forth in the following words, now famous:

"Here you may go, when vernal breezes blow and drink in all the charms of reawaking nature, but grant the prayer of the petitioners and what will you have? The roar of the railroad train, the rattle of machinery. Vesuvius, Stromboli, Cotopaxi, hell itself, gentlemen."

The opening of the subway was felt by merchants on the street where formerly the cars travelled on the surface. Fewer

the feeble colony already stretching up the hill sides and over the plains."

Church and state were evidently on an harmonious footing in 1781, for in that year one of the churches borrowed the tub from the fire engine and brought it into the sanctuary to administer baptism by immersion.

The first printing press in America was set up at Cambridge in 1639 having been brought over from England and it was under the charge of the president for many years. The first thing printed upon it was the Freeman's Oath.

people on the street; less trade. On rainy days the subway is less patronized; the explanation being that people avoid walking in the wet to the entrances.

A local historian many years ago in recounting the transformation of the city in its early days writes:

"Twenty years after its settlement wonderful changes had occurred; tangled thickets had given place to pleasant streets, dark forests to smiling gardens, and barren wastes to fruitful fields. Log cabins and tents of cloth had been exchanged for large dwellings and convenient stores, some even of brick and tile and stone. Wharves stretched into the harbor, and ships of various nations rode at anchor in the bay. The little cluster of buildings closely nestled between the three hills covered with forts and batteries of cannon, like overtopping towers guarded

The first newspaper ever published on the American continent. "The Boston News Letter," issued on April 24, 1704, was printed at Harvard College.

The authorities of Denver, Colo., have abandoned all effort to force the street railway companies to obey a fender ordinance passed last fall, as they believe that it is unconstitutional.

"Trips by Trolley and A-Wheel Around Hartford" is the title of a booklet published by E. M. White and H. O. Warner. A map showing the system of the Hartford Street Railway Company and its connections is inserted. A historical sketch of the city is given and all the interesting points in and about the Connecticut capital are described and finely illustrated.

Business Manager.

#### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

#### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VJL. 8.

AUGUST 15, 1898

NO. 8

When the 56 officials who organized the American Street Railway Association met in Boston on December 12, 1882, the street railway business of that city, and all others in the country with the exception of one, was conducted with animal power or steam dummies. San Francisco had its cable system, and Chicago had set the date for the inauguration of its first cable line. Two-horse cars had found their way into the larger cities, but for the most part the monotonous tinkle of the bob tail car kept time to the jingle of the nickel as it wig-wagged down the several inclines to the bottom of the fare box. At each end of the car the tin lamps dropped oil upon the patient public which literally sat in darkness, and in the winter a cheap quality of hay formed a sort of mossy bog through which the passenger stumbled to a seat. About three miles an hour was the speed, and there was ample time to wait for the old lady a block away, and for good-byes and courteous salutations on boarding and leaving the car.

Little wonder that in those days people had time to live to a good old age, enjoying the living, and departing with the satisfaction of a life well spent.

\* \* \*

In those days there were numerous competing lines in every large city, and the rivalry for business and extensions was very active and in not a few instances quite bitter. One of the problems which confronted the proposed association was how to mix these antagonistic elements without an explosion. But it was done, and one of the features of the American Association, in which we all take great pride, is the unbroken harmony of feeling and action which has prevailed all through the years. Now and then a breeze has ruffled the waters, and once or twice the weather looked squally; but in every case the storm passed around, and the convention closed with a bright sunset and a rainbow on the disappearing clouds.

Few fully realize or appreciate the magnitude to which, from its modest beginning, the Association has attained. Its conventions rank among the few largest in the country, and its exposition of appliances far surpasses them all, and puts the American in first place. The expenditure in time and money on the part of exhibitors each year, easily represents the profits on over a quarter of a million dollars of sales, and has reached a point where no longer the street railway press need urge attendance and inspection by the visitors. Without this exhibit the annual gathering would be—well, to say the least, a very tame affair.

\* \* \*

The study of the Boston lines will afford an unusually fine opportunity, as the conditions of operation are in many respects to be found in no other city on this continent. The business streets, which were originally cow paths and short cuts, are both extremely narrow and tortuous in their wanderings. Indeed it is said a stranger has to exercise great care or he will meet himself coming around some one of the numerous contortions called thoroughfares. But with all the improvements Bostonians and all who love the dear old city—and who does not?—could wish, there is very much others might copy to advantage. The street railway problem has been one of the most difficult to solve, and could never have been satisfactorily worked out under the old condition of many companies. Consolidation of lines in Boston has been everything to the public, and has brought nothing but good results and improvement. The same is also true wherever consolidations have been effected.

\* \* \*

It does not seem possible that the transformation from the old horse car regime to the infinitely better in every way electric service could have been brought about in so short a time; and it at once reflects the enterprising character of the American manager to whom failure is an unknown quantity, and the inventive and engineering ability of those who have had to devise and build and supply. Both are typically characteristic of the genuine American spirit, and we may all take a just pride in the industry which enlists our thought and effort, and which calls us together once each year.

\* \* \*

The dozens of suburban lines which feed into the city and have thrown a veritable spider web of tracks over eastern Massachusetts will constitute one of the valuable subjects for study and inspection. The densely settled character of the country, with hundreds of villages and towns, each a link in the chain of industry connecting the larger cities, has made possible the successful operation of so many lines. The business of these towns is largely interdependent, and the thousands of workers in the factories who also use the trolley car when they ride on pleasure, constitute a patronage both large and steady and form a basis for the enormous business handled by these interurban roads. One may not only cover the larger part of eastern Massachusetts in an electric car, but cross the borders into Rhode Island, Connecticut, New Hampshire and Vermont. And new lines are being constantly added.

\* \* \*

We anticipate a large attendance from the west. Some have thought the distance would prevent a few from going, but the indications are that large delegations will attend. As a matter of fact he who misses one of these conventions has lost something he can never regain.

\* \* \*

Secretary Penington has wisely followed the precedent set last year, and held the program of papers down to seven reports. This gives abundant time for discussion which is even more valuable than the report itself as it gives the experiences of so many individuals. This discussion can also be further improved if delegates will make some preparation before leaving home in the way of looking up the actual figures, and come prepared to give their views in the fewest possible words. In this way a much larger number of speakers could be heard, and there would be less aimless wandering from the subject than has occurred at some meetings. As a rule the convention can learn more in a discussion where five men are heard in 10 minutes than where one occupies the same amount of time.

The two subjects which will probably enlist the most attention are the paper on single and double truck cars for city work, and that on pleasure resorts. The first is decidedly a mooted question, and a great diversity of opinion exists. Many excellent managers have thus far been really unable to make a satisfactory decision. As to pleasure resorts, some roads have made a fine success, while others have as miserably failed. It would seem that we now have spent sufficient time and made enough experiments to be able to recognize those conditions which warrant the operation of a resort, and the forms of amusements which can be successfully used. In other words, what is good in one instance has failed in another; and it is evident that the widely varying local conditions must form the basis of decision. At the same time we ought now to be able to make an intelligent diagnosis of each case and to compound the proper remedy.

Will the time ever come when women conductors and motor-women will be employed to any general extent? A year or two ago there would have been no uncertain sound in the negative reply which would have been given. The very fact that there is any doubt as to the future in this respect, is an evidence that it yet may be. We have all heard for years of the young lady conductors and their acceptable work, on the street cars in Chili, and other South American lines; and we surely dare not entertain the thought that American girls are in any way inferior to their sisters of the far south. The range of woman's work, or rather the work performed by women, has broadened so greatly and rapidly during the past 10 years that the doors of few educational institutions are longer closed to her, and she has established a place for herself in almost every avenue of business, trade and industry. With all her ability, and with every motive of generous recognition of ability she has already earned or may deserve, we cannot but feel that woman's greatest work is, or should be found in the home, and not in supplanting those who are the natural providers and heads of families. Two small roads in Ohio have already placed women on the rear platform, and the experiment of teaching another to handle the controller and brake on an eastern road a few months ago demonstrated, at least in her individual case, the requisite ability and physical strength to perform the task equally as well as is being done by men.

It would seem that the future decision will rest largely upon the male employes themselves, and if the change is brought about it will probably be through their own acts of conduct and in attempts to do the work for which the company has already hired a manager.

The war is ended, and the country, proud of the unparalleled work of its navy and of the splendid achievements of the land forces, will now devote itself with undistracted vigor to the various occupations of peace.

If we except the loss of life, for which no gain can ever compensate, the results of the conflict cannot but be in the highest degree beneficial to the nation. The world has had the scales removed from its eyes, and Americans, and American shipping, and American products will be recognized every where as belonging to the first class. Our navy will, it is hoped, speedily be increased so that in point of size it will be in keeping with its quality, and with the magnitude and dignity of the country; our standing army will probably not be less than 100,000 men; and we shall be better prepared for action, which is ever the greatest safeguard against international difficulties.

The performance of American built vessels, and all the manifold machinery necessary to their successful manipulation has so clearly demonstrated the quality of American engineering products, that the markets of the world will welcome our industrial products of every kind, with the same high regard with which they have long accepted our meat and grain. As never before, it can be said, "The world is ours." Already American money and brains are putting in motion the wheels of foreign trade of which they little dreamed six months ago, and in proportion as we push our manufactured products to the attention and adoption of new markets will our prosperity broaden and increase.

A few months ago, it was an honest question as to whether Boston would be a suitable place for our convention. (This was in ante-Dewey days.) Now we gather with the clouds of war disappearing, and with all the bright prospects of peace and such a renewal of industrial activity in sight as has not been ours in several years. Capital which was still timid at the close of the years of depression, and again driven into hiding by the war, has seen it come and go without an opportunity to make fortunes in a day, and will now soon be competing with itself for choice lines of investment; and with an abundant offering of money as is sure to be, interest rates will fall, and new enterprises will be able to secure funds and come into actual existence. Among such will be a large number of street railway operations, and every indication now points to such a deluge of orders as will fill up the street railway supply concerns to the limit. We predict delay in securing cars and all the construction accessories for those who are forced to wait and place their orders after the first of the year.

The events which have occurred since our last gathering are written on the brightest pages of the history of our country or the world; and those deeds of valor have quickened the whole nation and make us proud as never before to claim that title, greater than any royalty can boast, "I am an American."

On another page will be found a letter from President W. B. Rockwell, of the Staten Island Midland Railroad Company, giving the details of an attempt to defraud his road by August Krause, alias John Schaeffer, and stating that by reason of having seen the man's portrait in the REVIEW he was enabled to detect the fraud. The method pursued by Krause is to loosen the screws fastening one of the grab handles to a car and then make it pull loose when he attempts to leave the car, thereby causing alleged severe injuries to himself. He has now been detected in this four times: September 28, 1895, in St. Paul, Minn., as John Cramer; March 25, 1897, in Canton, O., as John Miller; August, 1897, at Joliet, Ill., as August Krause; July, 1898, on Staten Island, N. Y., as John Schaeffer.

Quite recently three other swindlers who have successfully defrauded insurance and transportation companies have been detected, and the details of their methods will also be found in this issue. There is a lesson for all companies to be found in the history of Rice, the last of this trio. His method was to present claims whenever possible but withdraw them if he could not effect settlements promptly. The natural disposition of the average manager is to let a case of this kind drop if his own company is saved from loss, instead of investigating it and bringing the culprit to justice. By reason of this too lenient policy Rice has been enabled to attempt the same scheme no less than 40 times.

The description of the generating machinery and the distribution lines of the Chicago & Milwaukee Electric Railway will be of interest to electricians and street railway men in general. It represents a radical departure in interurban practice, and, if as successful as expected, will be the prototype of many other lines. The transmission of alternating currents at 5,500 volts effects an enormous saving in copper. In the absence of the many large feeder lines the exterior of this power station presents a peculiar view. Three wires about the size of those on telegraph lines conduct the current for the sub-stations. The installation of storage batteries at the sub-stations gives an economic load for the rotary converters which is highly desirable in alternating current operation. The arrangement for having transformers and a rotary converter mounted on a truck to be substituted for any injured sub-station apparatus renders unnecessary the duplication of the machines. Although there are a number of electric railways receiving power from high voltage alternating current transmission this is the pioneer road for which the current for transmission is generated in a central steam plant and carried at a high voltage to sub-stations placed at suitable points along the route. Much credit is due the promoters and engineers of the company for carrying out this bold plan which if successful will be of inestimable value in furnishing data for projected interurbans of great length.

## THE CHICAGO & MILWAUKEE ELECTRIC RAILWAY.

On July 1 a portion of the Chicago & Milwaukee Electric Railway was put in operation. Although this line is not yet complete and is now being operated by means of a temporary electrical equipment in the power house, it is thought that the plans for the complete installation, which have been developed by Bion J. Arnold, the consulting engineer for the company, represent such a radical departure from ordinary electric railway engineering practice as to justify a brief description at this time.

The line may be called an interurban road. It runs through the chain of Chicago's most beautiful suburban districts lying along the shore of Lake Michigan between Evanston and Waukegan, east of the tracks of the Chicago & Northwestern Railway Company. When the road is completed it will be hard to imagine a more delightful ride than it will offer. Beautiful suburban and country homes are scattered all along the way. The southern portion of the road, which is not yet completed is to unite the suburban towns of Evanston, North Evanston, Wilmette, Kenilworth, Winnetka, Lakeside, Glencoe, Ravinia and Highland Park. The road is now completed and in operation from the northern limits of Waukegan to the southern limits of

Highland Park, a distance of 18 miles. The government reservation at Fort Sheridan, the university at Lake Forest, the camping grounds at Lake Bluff, the manufacturing districts at North Chicago and Waukegan, and the beautiful bluffs and ravines all along the route lend interest to this portion of the road. The route is thirty miles in length and parallels for the entire distance the Chicago & Northwestern Railway. The name of the road would seem to indicate that it might eventually connect Chicago with Milwaukee.

In the building of this line the engineer was confronted with the same problems that are usually connected with the installation and operation of a high-speed, long-distance suburban electric road. The burdensome investment in copper feeders which would have been necessary to operate the road by means of one direct current station situated at the center of the line made this system prohibitive. The inefficiency in operation of two power stations for a road of this size or of a booster system operated from one power house was recognized. What was wanted was a system of generation and distribution which would represent a minimum amount of first investment, which would be capable of being added to as the load increases in a manner consistent with the original installation, which would operate with a fair degree of economy from the start, and at the same time be capable of the highest operative efficiency when eventually completed.

MAIN POWER STATION C. & M. RY., SHOWING TEMPORARY INSTALLATION OF TRANSFORMERS AND ROTARY CONVERTERS.

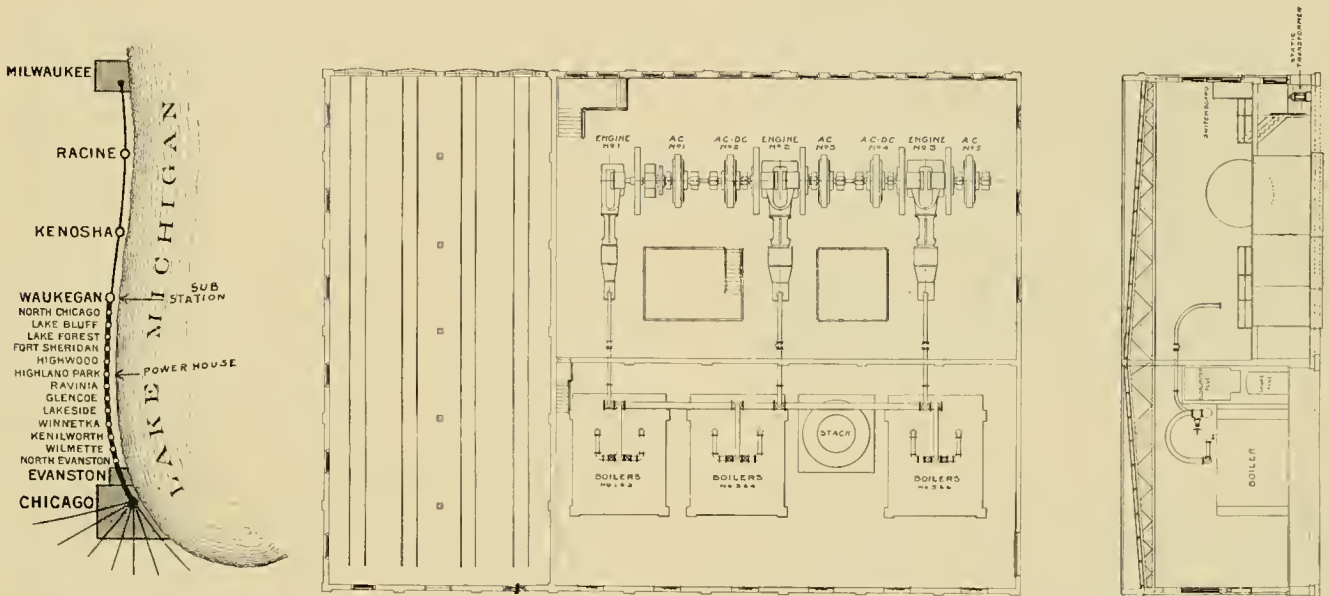

The plan which was adopted and which was thought to combine all these advantages consists of a combination direct current and three-phase alternating current distribution system with a generating station placed at the center of the line. The sections of the road adjacent to the power station are supplied with direct current from the power house itself. Sections of the line at a distance from the power house get their supply of current from sub-stations. These sub-stations each contain a rotary converter, consisting of a three-phase alternating current motor and a direct current generator combined in one machine. The sub-station motors are supplied with power over a high tension transmission line consisting of three small copper wires extending back to the power house. The direct current from each sub-station is distributed to the trolley by means of the usual system of feeders extending in both directions. The location of these sub-stations and their distance apart is governed by the conditions of traffic and somewhat by the nature of the grades along the line. There is no reason why a road 100 miles in length should not be operated by this scheme from one power house located either at the center of the gravity of the system or upon a site possessing peculiar advantages of rail and water

The line is at present operated as a single track road, except in Highland Park where a double track is laid and a block signal system has been adopted to insure safety in operation. Of the 14 cars now operated, ten are new 32-ft. cars, and four regular city railway cars built by the J. G. Brill Company, of Philadelphia. Two fine standard interurban railway passenger coaches, and two combination passenger and baggage coaches each 44 ft. long, with two 50-h. p. motor equipments mounted on the Peckham double standard railway truck are now building.

These cars are expected to maintain an average speed of 25 miles an hour. The fares charged are about one-half the rates upon the Chicago & Northwestern for the same distances.

The plan of the power station is shown in the illustration.

The boilers are of the Cahall-Babcock & Wilcox type, made by Aultman & Taylor. Each boiler has a rated capacity of 250 h. p., and they are set in batteries of two each in such a manner as to be entirely independent of the brickwork. The boilers are thus free to contract or expand, and the brickwork may be entirely removed and replaced if required without disturbing the boilers or connections.

MAP OF LINE AND PLAN OF MAIN POWER STATION.

facilities. The small investment required for copper will appeal to the investor, while the possibilities of economies of fuel and labor due to the concentration of the power generating apparatus into one station makes the proposition an equally promising one to the engineer. The development of this road and the economic results of its operation will therefore be awaited with considerable interest.

As shown upon the map, the power station is located at Highwood and the sub-station for the operation of the northern portion of the road is situated near the southern limits of North Chicago. Connecting the power house with the sub-station is an eight mile, 5,500 volt, three-phase transmission line of three No. 8 wires. From the sub-station the No. 00 trolley wire is reinforced by a No. 0000 feeder extending four miles south and a No. 000 feeder extending 3½ miles north. The subway, near the sub-station by means of which the electric cars pass under the Northwestern tracks, is an interesting piece of engineering not yet completed.

In the construction of the track 65-lb. T-rail and 75-lb. girder Johnson rails all in 60-ft. lengths are used. The overhead work is of the side pole method of construction in the outlying districts, with center iron poles through the business district of each suburb. The high voltage line wires are supported on glass insulators carried on wooden cross-arms on the side poles. Each pole is painted, while those carrying the alternating current lines have a danger notice stenciled upon them.

A steel stack of sufficient capacity to handle the escaping gases from eight boilers is to be placed so as to be flanked on either side by four boilers. Three of these boilers are now installed. Fuel economizers will be placed at the back of each battery of boilers, with the by-pass flue beneath. Streater slack coal is used and is delivered in front of the boilers directly from the cars. The furnaces are of the down-draft type. The supply of feed water is taken at present from the city mains, and is fed to the boilers by means of the Q & C system of boiler feeding.

The engines of the plant are of the horizontal tandem compound Corliss type, and run at 125 r. p. m. The cylinder dimensions of the one at present installed are 17 and 30 by 36 in. This engine was made by the Filer & Stowell Company of Milwaukee, and is rated at 400 h. p. The fly-wheel weighs 40,000 lbs. and is 14 ft. in diameter. The governor of the engine is of the Provell inverted type and is fitted with automatic safety stops to prevent the engine running away. This stop blocks the governor balls up except in the event of the governor belt breaking. The device is arranged so as not to need handling at the starting or stopping of the engine.

The present engine is of the side crank type. Future additions of engine units will be of the center crank type and will also be of double the rated power of the first unit. Each engine is also designed in all its parts so as to be capable of standing an overload of 100 per cent. This provision is made for emergency service, when the engines can be made to develop a power great-

ly in excess of their rating by admitting high pressure steam into the receiver through a reducing valve.

The unique feature of the power station, however, is the electrical equipment. Two different types of generators are employed: Generator No. 1, which is installed next to the engine No. 1, is an alternating three-phase G. E. machine. It has a capacity of 250 k. w. at 125 r. p. m. This generator has 24 poles, and, therefore, delivers a three-phase current of 25 cycles per second.

BOILER ROOM, C. & M. RY.

This current is generated at a potential of 5,500 volts, ready to be delivered directly to the transmission lines without the use of transformers. Generator No. 2 is a combination generator. It is also of 250 k. w. capacity, and runs at 125 r. p. m. It can deliver its out-put either as direct or as three-phase current. It has but one armature, but the windings of this armature are connected on one side to a commutator and on the other side to collector rings. The potential of the direct current end is 600 volts while the three-phase current is delivered at a voltage of 380. The generator can deliver an out-put up to its rated capacity of 250 k. w. from either the commutator or the collector rings. It can thus be used to supply current directly to the trolley passing in front of the power station, or can be used to operate the motors in the sub-stations, or for both purposes at the same time, dividing the load in proportion to the demand. It will be noticed that generator No. 2 is of considerable lower voltage than generator No. 1. When the three-phase current from this generator is transmitted to the substation it is necessary to raise its potential from 380 volts to 5,500 volts. This is accomplished by means of static transformers placed in the basement as shown. These transformers are cooled by a blast fan operated by a 1-h. p. induction motor. Generator No. 3 is to be a duplicate of generator No. 1.

The engines and generators are connected by means of the "Arnold system," which has been adopted by so many power stations that the details of the connections it involves have become familiar. Each generator is mounted on a quill or hollow shaft; suitable couplings connect this solid shaft with either the engine shafts or the generator quills in such a manner that each generator can be operated by more than one engine. Thus, engine No. 1 can run either or both generators No. 1 and No. 2, while engine No. 2 can be used to drive four generators when they are eventually installed. In case of a break-down of any engine, the other engines in the plant can be made to carry an in-

crease of load by the method already described. This system, then, insures the same reliability that is usually secured by investing in a reserve unit, but by means of a much less original investment. This system is also particularly adapted to a station of this character, containing, as it does, two different types of generators. When the load is light the road may be operated from one alternating direct current generator, and this is always available from two engines.

As the demand for the current varies the load may be transferred from one engine to another, or all engines may be operated in unison, which is important when working alternating generators in parallel. As each generator is mounted on independent bearings, it is possible, if occasion should arise, to operate generator No. 2 as a rotary converter, or even to connect generators No. 1 and 2 so that they could be used in the same manner.

In case of a break-down of one engine this generator may be connected to the other engine. To secure this same reliability with the ordinary direct connected independent unit station, another engine and generator unit would have been necessary, as in such a plant an accident to an engine cripples the entire unit.

The plan for the sub-stations is shown in one of the illustrations. These sub-stations are to contain the static step-down transformers, the rotary converter and a storage battery. It will be noticed that the electrical equipment of the sub-station is not in duplicate. This has been considered unnecessary as it is intended to mount the machinery needed for a sub-station, static step-down transformers and one rotary converter, upon a truck fitted with motors. In case of break-down at any sub-station the battery can be relied on to supply current for several hours, during which time the portable reserve sub-station equipment can be taken to the crippled station and be connected ready to operate until the repairs have been made.

The storage battery in a sub-station of this character has many advantages. It supplies all the sudden and excessive demands for current, due to the fluctuating load, peculiar to a road of this kind, operating few and heavy trains. The rotary converter can be made to carry a fairly average load, and in turn the generating machinery at the power house can be operated under constant conditions. This feature of steady load cannot fail to contribute to the fuel economy of the generating station. As the station is relieved of the necessity of supplying the occasional maximum load by the ability of the sub-station batteries to respond for short periods to an excessive demand, machinery of much less capacity is required in the power house than if the batteries were not used. A correspondingly reduced investment is required in transmission lines and rotary converters. To these

PLAN OF SUB-STATION.

advantages may be added one more, which is peculiar to the alternating-direct current system of distribution. The effect of the self induction of the alternating current motors in the sub-stations compels consideration of "leading" and "lagging" currents, which may become extremely troublesome. The best condition for operation is when the power factor of the circuit is unity; that is when the apparent energy is equal to the real energy. The strength of the motor field can be adjusted at any given load so as to neutralize the inductance of the line, and leave the current nearly in phase with the e. m. f. If the motor can operate at or near this given load, the power factor will not depart far from unity, and the circuit will act like a continuous current line. If the load varies, however, to any great

extent, the resulting "false current" may compel the transmission over the lines of a current greater than that really required to operate the motor. The storage battery, by furnishing a reservoir to which energy may be given or from which energy may be taken as the load varies, enables the rotary converter to carry a practically steady load, and thus the accumulator contributes much toward maintaining an electrical balance in the alternating current circuits. As the road is extended and the traffic becomes heavier, the conditions of the service will probably make the installation of a battery at the main power house a desirable investment.

The original projectors of this line were C. E. Loss & Co. who were also the contractors and builders. The Chicago & Milwaukee Electric Railway Company was organized to purchase and operate this property. The officers are as follows: G. A. Ball, president; A. C. Frost, vice-president and treasurer; Geo. M. Seward, secretary and auditor, and R. S. Ives, general superintendent.

A WORD ABOUT BRAKE SHOES.

A safe, quick acting and effective braking apparatus is an absolute necessity for urban street cars because they operate in crowded streets where inability to stop quickly will often be followed by a number of damage suits. It is equally a necessity on interurban electric lines, though there may be less danger of collision, because the higher speed demands a better brake. Every element of the braking mechanism is important and the last element, the brake shoe, is just as important as the others, though it has been to a great extent overlooked. If the shoes wear quickly, the cost of shoes is high; if they are hard they cut the wheel, and wheels cost more to replace than brake shoes; if the wheel is locked it makes a flat spot and must go to the shop to be reground.

An ideal brake shoe would therefore have a high coefficient of friction to give a quick stop; must not cut the wheel; should not wear rapidly, to keep down the cost; it must not block the wheels; and, above all, it should be safe. The American Brake Shoe Company is now introducing to the street railway trade the "Diamond S" brake shoe, which has these desirable qualities. It is made by pouring cast iron about a bundle of expanded soft steel strips, which combination gives a shoe eminently strong and safe. The questions of friction and wheel locking appear to be settled by the tests of these shoes made on the M. C. B. brake shoe testing machine by the engineer who made a majority of the M. C. B. tests. The accompanying diagram is from his report and compares a cast iron shoe (No. 7) with a "Diamond S"

GRAPHICAL COMPARISON OF STOPS.

shoe (No. 6) under similar conditions. It will be remarked that the "Diamond S" shoe gave a stop 18 per cent shorter, and what is most important, the pressure tending to lock the wheel (shown by the height of the diagram) is no greater towards the end of the stop than for the plain cast iron shoe.

As to the wearing qualities, we are advised by the Chicago General Railway Company that the average life of a plain cast iron shoe under its cars is 17 days and that of the "Diamond S" 75 days.

The "Buffalo Courier" reports a collision between a bicycle and an electric car moving at high speed. Both the rider and wheel were picked up by the fender; the wheel was knocked off after 40 or 50 feet, but the rider who was carried until the car stopped was uninjured.

ELECTRICITY ON THE MIAMI & OHIO CANAL.

In accordance with an act passed at the last session of the Ohio legislature, W. G. Wagenhals, who was until very recently general manager of Cincinnati & Miami Valley Traction Company, operating an electric line between Dayton and Hamilton, has been granted the privilege of experimenting with electric traction on the Miami & Erie Canal. If the experiments are successful, Mr. Wagenhals is to receive the exclusive right to operate boats by electric power for 25 years.

Mr. Wagenhals saw the opportunity to make this application of electric power when he went to Dayton, two years ago, and made some preliminary trials which convinced him of the practicability of the plan. An ordinary motor car towed two boats loaded with 80 tons each at a speed of 10 miles per hour, with an expenditure of 20 amperes. This proved to be too high a speed as a wave 3 ft. high was thrown ahead of the boats and forced the water over the banks. Six miles per hour was entirely practicable, however.

The canal is 250 miles long, connecting Lake Erie with the Ohio, and was built at a cost to the state of \$8,002,680; it is 60 ft. wide and 4 ft. deep. The map shows the cities and towns which it connects. This work has been falling into decay, because the towing by mules is too slow and costly; efforts to use steam have failed because the propellers did not give satisfaction in such shallow water.

The illustration shows the latest design of motor for this work: it is to weigh 20 tons and is 6 ft. over all. Where the tow-path

ELECTRIC LOCOMOTIVE FOR CANAL TRACTION.

runs under lift bridges the current will have to be taken from a conduit as there is not head room for a trolley line.

Mr. Wagenhals presents these figures regarding the investment: "Taking 1886 as an ordinary year the state statistics show gross earnings of over \$190,000 between Dayton and Cincinnati alone. With electric power it can be operated for one-half this amount, leaving \$95,000 for the interest on an investment of \$850,000 which it would require to equip the canal between Dayton and Cincinnati. If this amount was earned with mule power and a small number of boats, good service and good management will surely greatly increase the business."

The success which attended Mr. Wagenhals' administration of the roads with which he has been connected, is a guarantee that this enterprise will also succeed.

### FORGED STEEL SPLIT AXLE GEARS.

The Duquesne Forge Company, of Pittsburg, Pa., is now making under patents a forged split axle gear, illustrated herewith, in which the tire or flange is a rolled steel channel section. The channels are rolled from large ingots which makes a homogeneous, well-worked product free from blow-holes and imperfections. It is stated that these wheels compete in price with the best steel castings.

Fig. 1 shows a cross section of the steel channel bar and one of the channels as it comes from the dies bent to the desired curvature. Fig. 2 shows the steel cross arms; attention is called to the cut showing the arm bent under the hammer. Such a test is convincing that any possibility of breaking arms which will submit to such a test has been removed. Fig. 3 shows the combination of tire and cross arm. These cross arms are placed in position after the tire comes from the dies. They are forced into position and permanently set at the hammer; when the forging cools these cross arms are practically iron and iron at the joints and held so tightly in position that they can only be removed by reheating the tires. These sections are next taken to machines and faced off, after which they are placed in special machines where each section is bored and countersunk, after which bars of  $\frac{3}{4}$  in. cold rolled steel are driven through them and headed up as shown; the joint thus secured first by shrinking the cross

FIG. 1—STEEL CHANNEL BAR.

FIG. 2—STEEL CROSS ARMS.

FIG. 3—CROSS ARM AND TIRE.

FIG. 4—WHEEL COMPLETE.

arms into the tires and second by these finished rivets driven cold with a strong driving fit, makes a joint which is solid beyond question and which cannot be disturbed in service. These joints have been submitted to the most severe tests under heavy hammers without disturbing them and wheels which have been in operation for 15 months are as tight as when first put on the car. Fig. 4 shows the wheel complete and ready for service. The manufacturers of these wheels claim many advantages for them, the chief of which are the following:

The wheels are stronger and 15 to 20 per cent lighter than corresponding cast wheels. Owing to the manner in which they are made it is impossible to have defects in the tires which are uniform in quality whether furnished in large or small lots and will wear evenly. The absence of the two extra spokes, present in all cast wheels, is more than compensated for in the additional strength gained in this wheel by its depth of flanges in the tire section. The absence of the spokes allows greater freedom in use of the wrench in adjusting the wheels on the axles.

The first wheels put in service, after more than a year's steady running, show scarcely any wear and tear; the manufacturers confidently expect that the wearing qualities will prove superior to the best casting that can be made on account of the ability to secure the same uniform quality of material in the teeth at all times.

Huntington, L. L., exhibited its appreciation of the introduction of the trolley car by a parade and demonstration, and the electric cars were operated free of charge all the first day. The trolley line supersedes a horse car road and charges a fare of 5 cents to the Long Island depot instead of 15 cents, the rate on the horse cars.

### NEW ROAD FROM BUFFALO TO THE FALLS.

The Buffalo, Tonawanda & Niagara Falls Electric Railroad Company on Saturday, July 16, opened for traffic a new extension of its lines. This new line begins at the corner of Tonawanda and O'Neil streets on the northerly limits of the city of Buffalo and follows O'Neil street to Niagara street, thence along Niagara street about one mile to a ferry on Niagara river, which runs between the terminal of this new extension and various resorts on Grand Island. This line will be farther extended along Niagara street to the village of Tonawanda and will prove to be a very popular electric line between Buffalo and Niagara Falls, as it follows the high banks of the Niagara river the entire distance in full view of the beautiful scenery of that river and Grand Island. Henry B. Smith, of Bay City, Mich., is the principal stockholder in this company.

### COMMUTATOR BUILDING.

One of the many new industries to which electricity has given birth is that of commutator building. The many thousands of electric motor cars in use together with the still greater number of public and private lighting and power plants have made of

commutator building and repairing an important industry. One of the oldest established and widely known firms in this field is F. E. Homer & Co., Cleveland, O.

Their care in construction, and the use of only the best raw materials has earned for the firm a most enviable reputation. Their customers are widely distributed and numerous, and they have many testimonials to the wearing qualities of their commutators. They report prospects as being good for a brisk fall business, and the number of orders booked for new commutators so far, as being far in excess of any previous record for the same month.

### CENTRAL UNION BRASS MATERIALS.

The Central Union Brass Company, of St. Louis, has met with most gratifying success in the sale of its goods for electric railways. The "Gem" line material made by it has proved to be very popular, as is not surprising, since it was designed by the company's electrical engineer who designed the emergency trolley clamp, adopted by many roads as standard. Wood's lightning arrester is one of its new products now being put on the market; it is simple in construction and has successfully stood the most severe tests applied to it.

The company desires all interested in its goods to have its latest catalogs and will be glad to send them on application. The W. R. Garton Company is the Chicago agent for the Central Union Brass Company.

The West End Traction Company, Pittsburg, has completed its new power station at the Point; there are two 1,000-h. p. Westinghouse generators.

**DEATH OF ADOLPH SUTRO.**

Adolph Sutro, ex-mayor of San Francisco and principal stockholder of the Sutro Railroad Company, died on August 8, at the age of 68 years. His life has been a most eventful and picturesque one. His father's wealth being destroyed in the German revolution of 1848, the young man left his home to seek a fortune in the new world. He was educated for an engineer and went to California to engage in mining. For nine years his labors brought little return, but after he planned the famous Sutro tunnel for the Comstock lode in Nevada and carried it to

ADOLPH SUTRO.

a successful completion he became immensely rich. Much of his wealth was invested in property in San Francisco and he became the greatest land owner in the city. He was philanthropist by instinct and many benefactions stand as monuments to his generosity. The Cliff House, the Sutro baths, the finest in the world, the children's play grounds near Golden Gate Park and the Sutro Historical Library have all been given to the city by him. In 1894 he was chosen mayor on the populist ticket. In order to provide additional transportation facilities to the Sutro Heights he built and operated the Sutro Railroad.

**REMARKABLE EXPANSION OF THE PINTSCH LIGHTING SYSTEM.**

The Pintsch system of car lighting has made wonderful progress, especially during the past 10 years, during which time the number of cars so lighted has trebled; so that in 1898 there are 85,600 cars equipped with this light. While the steam cars greatly exceed the street cars using the Pintsch light, the total of cable and electric cars so lighted runs into several thousand. The diagram is a graphical illustration of the progress made in the application of the Pintsch lighting system on the railroads of the world.

YEAR.	CARS.
1883	11,422
1885	17,600
1887	26,100
1889	35,096
1891	45,300
1893	54,175
1895	64,800
1898	85,600

**THE WABASH TO CONVENTION.**

The Wabash railroad officials have for several years past taken such special pains to look after the comfort of street railway delegates, both individually and collectively, that the road may fairly be said to have secured a large number of them as "regular customers". Assistant General Passenger Agent Palmer and N. C. Keeran, the Chicago city passenger agent, each year give the convention trains their personal attention, and the result has been a delightful trip, with little left for the passenger but to enjoy his ride to the utmost.

This year the announcements of the Wabash include a copy of the new brochure "The Continental Limited", which is one of the neatest and most attractive pieces of railroad advertising ever issued by any company. The Wabash train for Boston, which delegates going that route will take, is scheduled to leave Chicago at 12:02 noon, Sunday, September 4, reaching Detroit at 8:30 the same evening; Buffalo at 5 a. m., Monday, and destination at Boston at 5:50 Monday afternoon, in ample time for dinner.

Special sleepers will be reserved on this train for the exclusive use of the street railway party, including a special car for ladies, and all meals will be served en route on the new Wabash dining cars. The route is via Niagara Falls. For those who cannot leave Sunday noon, through sleepers are attached to the train leaving Chicago at 11:30 p. m., which arrives at Boston at 10:20 Tuesday morning, in time for the opening session. Returning trains leave Boston at 9:30 a. m. and 7 p. m. daily, departing from the Fitchburg depot. Further details or reservations may be had by calling on or addressing N. C. Keeran, City Passenger Agent, 97 Adams street, Chicago.

**TRACKS BENT BY HEAT.**

By the courtesy of Henry M. Williams, of Fort Wayne, Ind., we have received photographs, two of which are here reproduced, showing the tracks of the Fort Wayne Consolidated Electric Railway as bent by the heat on July 8, last. It was necessary to

STREET RAILWAY TRACKS BENT BY HEAT.

change the grade of the street, and as soon as they were uncovered the heat of the sun so expanded them as to kink them as shown.

**THE FLAG WON THE DAY.**

A contractor from the Keystone state related his experience last June in erecting a pole line along the Pennsylvania railroad, where the railroad officials with a force of 25 section hands attempted to prevent the work. There was one curve pole which was especially necessary, and the fight centered here. After considerable fighting the pole was raised, but the rub was to keep it there. Finally one of the trolley road men managed to climb the pole and drawing an American flag from under his coat nailed it to the "mast" and the day was won. The other crowd did not dare pull the pole down.

## IN THE PHILIPPINES.

The "Philadelphia Record" speaks of the street railway system of Manila as follows: "If Manila falls without a bombardment, and the city preserves to any degree its public works there will be a home-like influence felt by the invading army, particularly the Pennsylvania volunteers, when they ride through the streets of Manila in street cars, which were built in the city of Philadelphia. The total street car equipment of the 'Tranvías de Filipinas' was built by the J. G. Brill Company, Manila being one of the numerous foreign cities equipped with Brill cars. Cuts are shown illustrating both styles in use, the closed cars being 12 ft. length of body, are about the same length as the one-horse cars which but recently have disappeared from Filbert street. Their weight complete and in running order is less than 2,700 lbs. each, and they are drawn by the Philippine horses (each about the size of a Newfoundland dog). The grades on the line being numerous and the pulling capacity of the horses very slight, the ingenuity of the Brill officials was taxed to its utmost to furnish rolling stock to meet the requirements of the service. The open cars are 13 ft. 6 in. long over dashers and have a seating capacity for 20 passengers. The cars are marvels of strength and extreme lightness of weight."

BRILL CARS AT MANILA, PHILIPPINE ISLANDS.

## OIL FOR ROADBEDS.

A number of railroads are making the experiment of spraying their roadbeds with oil to keep down dust also incidentally preserving the ties and preventing the growth of vegetation in the ballast. It is possible that the interurban electric roads, especially those running over a private right of way, may find it advantageous to make this use of oil.

The method was invented by J. H. Nichol, assistant engineer of the West Jersey & Seashore division of the Pennsylvania, and it was first used on that line in April, 1897. It has also been used on the Long Island Railroad, the Philadelphia, Wilmington & Baltimore and the Boston & Albany.

The oil-spraying train consists of a sprinkling car, a tank car of oil and a locomotive which makes a speed of about four miles per hour and supplies compressed air or steam to aid in ejecting the oil. In the sprinkler-car, built by the Long Island Railroad, a 4-in. pipe runs the length of the car and may be connected to the tank car at either end; the sprinklers are three lengths of 2-in. pipe, perforated with slits 1-16 in. by 3 in. One of these pipes is 8 ft. long and suspended across the car near the center 5 in. above the rails; the other two, projecting on either side, are 7 ft. long and hung so that they may be given any desired angle with the vertical. There are also hand sprinklers to reach otherwise inaccessible portions of the roadbed. The rails are protected from the oil by shields 20 in. long placed under the sprinklers.

On the Long Island about 2,000 gals. of oil is used per mile. C. L. Addison, general roadmaster, states that one application penetrates the ballast to from 1 to 2 in., it being expected that one spraying per year for four years will thoroughly saturate the ballast. The oil used is non combustible and when first applied has a slight odor, not offensive, which is lost after a few days.

## FLAG RAISING AT NEW ORLEANS.

On July 12 there was a flag raising at Audubon Park, New Orleans, under the auspices of the Crescent City Railroad Company; this company's lines are operated by the New Orleans Traction Company, of which C. Densmore Wyman is general manager. The flag, a national ensign 18 ft. by 30 ft., and the pole, 110 ft. high, were the gifts of the street railway to the Audubon Park Commissioners.

The flag was raised in the presence of 7,000 persons, and on the platform were several hundred school children. Mr. Wyman made the presentation speech, being called upon at the last moment to take the place of Judge Lawrence O'Donnell, who was unexpectedly called away. In the course of a very happy address Mr. Wyman said:

"We love this glorious flag not only because it is in itself beautiful, not only because it waves over a land magnificent in its reaches and glorious in its future, not only because it tells the story of struggle and endeavor on the tented field, but we love it because it sings far and beyond a song of human freedom. We love it because it means that every man under its folds is a free man, able to work out his own birthright, descended not according to any human progeniture, but from the God who made us."

J. W. Gurley, president of the Park Commissioners, accepted the gift, and was followed by the orator of the day, Charles F. Buck, who commenced his speech with these words:

"The significance of that flag has already been so well expounded to you that I can do no better than to introduce myself to you with a sentiment taken from the American poet, George T. Morris, a song to our banner:

"The union of lakes and the union of lands,  
The union of States none can sever;  
The union of hearts and the union of lands,  
And the flag of our Union forever."

Music was a feature of the afternoon, and in the evening also there was a concert; the stand was brilliantly illuminated by electricity. At 9 o'clock there was an elaborate exhibition of fireworks provided by the company.

## ELECTRIC LOCOMOTIVES AT THE TAMPA CAMPS.

George D. Munsing, general manager of the Consumers' Electric Light & Street Railroad Company, of Tampa, Fla., advises us that his company has handled several hundred cars for the government at the Tampa camps, using one of the motor cars for a locomotive; the street railway connects with the railroads. The motor cars have been used for handling the trains loaded with siege guns; one of these cars equipped with two G. E. 1,000 motors has hauled trains of 25 empty cars and five loaded cars over grades that stalled a 30-ton steam locomotive.

The post office department has announced that the embargo is raised and mail will be forwarded to Spanish points.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

**Burden on Objector to Prove that Requisite Consents Have Not Been Obtained.***O'Brien v. Buffalo Traction Company (N. Y.), 52 N. Y. Supp. 322. June 18, 1898.*

The fourth appellate division of the supreme court of New York holds that in an action brought to restrain the construction of a street railway along a certain street on the ground that the requisite amount of consents have not been obtained that the burden is on the plaintiff to prove on the trial that fact.

**Courts Cannot Review Official Action About Locating Street Railways.***Silsby v. Lyle (Mich.), 75 N. W. Rep. 886. June 18, 1898.*

The Michigan statute provides that street railway companies may extend their roads through townships by the consent of the supervisor and highway commissioner, and the statute confers upon them the power to consent to regulations in reference to the construction, location, and operation of the portion of the road in the township. In this case, Silsby and another applied to the supreme court of the state for a writ of certiorari, as it is called, to review the action of the circuit court denying a writ of mandamus to compel Lyle, the commissioner of highways of the township of Bridgeport, to consent to the proposed route of a road through that township, the reason given for his refusing his consent being his nonapproval of the route through the township. But the supreme court denies the writ, on the ground that the power to locate the road is by the statute lodged in these township officials, and courts have not the power to review their action.

**Half Interest in Judgment Can be Assigned to Attorneys in Ohio.***Pittsburg, Cincinnati, Chicago & St. Louis Railway Company v. Volkert (O.), 50 N. E. Rep. 924. April 19, 1898.*

The supreme court of Ohio holds that legal services rendered by an attorney in the prosecution of a suit to judgment in the court of common pleas, and a promise to perform further services if error proceedings should be instituted in the circuit or supreme court, constitute a valid consideration for an assignment of one-half of such judgment, and the contract is not champertous.

Such assignment will convey to the assignee a property right in the judgment. This right is not enforceable in a suit at law at the instance of the assignee against the judgment debtor only, but may be enforced in equity.

It is not in the power of the judgment debtor, after knowledge of such assignment, therefore, further holds the court, to compromise the debt with the assignor alone and thus defeat the claim of the assignee to recover one-half of the proceeds of the judgment.

**Negligence of Driver Not Imputable to Guest in Case of Collision.***Bergold v. Nassau Electric Railway Company (N. Y.), 52 N. Y. Supp. 11. May 24, 1898.*

The second appellate division of the supreme court of New York holds that it was reversible error to charge the jury that the plaintiff in this case was chargeable with the negligence of the man driving the horse attached to the buggy in which she was struck by an electric street car, as she undertook to direct his movements, in telling him to slow up in approaching the car track. The court says, in explanation, that the law contemplates that a person, to be chargeable with the conduct of another, must have the power or authority to control, and such power or authority cannot be assumed in the case of a woman who accepts

an invitation to ride with a gentleman in his own vehicle, where he assumes to act as driver and to control the horse; and that the mere fact that this woman was on her guard, and uttered words of caution to the driver, did not constitute such direction and control of his actions as the law contemplates, to charge her with the responsibility for his negligence. The rule is different where the driver is the servant or agent of the person injured, or where both parties are engaged in a common employment.

**Does Not Depend on Statute to Hold Transfer Passenger Entitled to Wait for Seat.***Jenkins v. Brooklyn Heights Railroad Company (N. Y.), 51 N. Y. Supp. 868. May 7, 1898.*

A supplemental opinion to that reported on page 378 of the STREET RAILWAY REVIEW of June 15 has been called forth from the second appellate division of the supreme court of New York, by a motion for reargument, based upon the assumption by the member of the court who wrote the original opinion that section 104 of the railroad law of the state of New York applied to the facts of the case. But the court denies both the motion, and that it rested its determination on that assumption. It says it thinks that the contract between the passenger and the company, arising out of the payment of his fare, and the subsequent voluntary delivery to him of a transfer ticket, it being assumed that the company owned or operated the line on which fare was paid and the car on which the transfer was presented, it being its agent who gave the transfer ticket and its conductor to whom it was presented, entitled the passenger to passage upon the first car of the company which came along on the street to which the transfer was given, in which he could find a seat; and this wholly irrespective of the provisions of section 104 of the railroad law.

**Commissioners Cannot Review Their Own Determinations.***People v. Board of Railroad Commissioners (N. Y.), 51 N. Y. Supp. 781. May 4, 1898.*

Under a statutory provision such as that of section 100 of the railroad law of the state of New York, which authorizes a change of motive power for any street surface railroad upon the approval of the state board of railroad commissioners and the consent of the owners of one-half of the abutting property, the third appellate division of the supreme court of New York holds that, the conditions of the law having been complied with and the board having once approved of a change of motive power, it cannot thereafter, in the absence of express statutory authority, reopen and reconsider or review the case.

One reason given for this is that it is the general rule that officers of special jurisdiction cannot sit in review of their own orders, or vacate or annul them. It might be that the railroad commissioners ought to have the power to reconsider or review their action, says the court, but that is a question for the legislature. Nor does it pretend to discuss whether the state might not, by appropriate legislation or judicial proceeding, intervene.

But the court says that the general rule is that where there is a grant to a corporation from the state, or in pursuance of authority given by the state, of a franchise or privilege in the nature of property, and the grant is accepted, it cannot thereafter be revoked against the consent of the corporation, unless there is a right reserved sufficiently broad to accomplish the purpose. And it holds that, in this particular instance, the Forty-Second Street, Manhattanville & St. Nicholas Avenue Railway Company, when it obtained the consents of the property holders, as required by the statute, and the approval of the board to change its motive power from horse power to an underground electric system, on acceptance acquired a privilege in the nature of a franchise, entitled to protection under the rule applicable to such cases.

### Early Municipal Resolutions Do Not Obligate to Surrender of Roads.

*Potter v. Collins, Commissioner of Public Works (N. Y.), 50 N. E. Rep. 413. May 10, 1898.*

The court of appeals of New York has answered in the negative the question certified to it by the first appellate division of the supreme court of the state as to whether, independently of and without giving any effect to chapter 478 of the New York Laws of 1874, the Eighth Avenue Railroad Company is under obligation to surrender, convey, and transfer to the corporation of the city of New York, whenever required so to do, the railroads built on the routes described in resolutions of the common council approved July 20, 1851, and adopted December 13, 1852, respectively, the first of which resolutions required the execution of an agreement to do it, upon payment of its cost and 10 per cent. in addition; and it denies that, independently of said chapter 478, the city has any legal right to require the surrender, conveyance or transfer to it of said roads, or either of them.

Of more or less general interest, it may be noted that the court holds that the resolution of 1851 was void because it undertook to authorize the laying of railroad tracks in the city streets and avenues, or attempted to grant a right to an exclusive interest in the streets, while all that the municipal corporation could do, within the provisions of the general railroad act of 1850, was to assent to the construction of a railroad. What it tried to do, the court says, the legislature, possessing a supreme authority over the public territory, within constitutional limitations, could, of course, do; but to attribute such a power to the municipal corporation would be foreign to the concept of such an administrative agency of government. Nor could such municipal action be defended upon the ground that it constituted a license. As well say that the creature could create as to assert that such corporations, in the guise of a license, could endow an association of persons with rights and powers which would enable it to use the public streets for private gain, to the same extent and with like effect as if possessing the franchise or privilege which the sovereign power alone could grant.

### Liability for Conductor Stumbling and Throwing Passenger Off Running Board.

*Whalen v. Consolidated Traction Company (N. J.), 40 Atl. Rep. 645. June 20, 1898.*

The party who brought this action to recover damages testified that, while a passenger standing upon the running board of a crowded trolley car, the conductor, who had passed by him several times collecting fares, somehow stumbled, though he did not know how, and caught hold of him by the shoulder, in trying to catch the upright, and threw him off the car.

On this state of the case, the court of errors and appeals of New Jersey pronounces a nonsuit erroneous.

The court says that by taking his stand upon the outside running board of the car, the passenger assumed the risk of such dangers as were obviously incident to that position, while the company, by accepting him there as a passenger, owed to him the duty arising out of that relation. Consequently, while one of the obvious dangers of his position was that resulting from the use of the board by the conductor, the court insists, it would nevertheless be competent for the passenger to show that in the manner of using it the conductor had been guilty of a breach of the company's duty towards him, which would lie in a lack of due care on the part of the conductor as he passed along the board, which would, under the circumstances, be the only breach of duty chargeable against the company.

When a passenger in charge of a common carrier shows that he was injured through some defect in the appliances of the carrier, or through some act or omission of the carriers' servant, which might have been prevented by a high degree of care, the jury have the right to infer negligence attributable to the carrier, unless the carrier proves that due care was exercised. And the court thinks that it is certainly not irrational to infer that the conductor, who had passed so often over the same place under apparently the same conditions without stumbling, on this occa-

sion stumbled through a failure to exercise that high degree of care required of him. At any rate, it holds, to preclude the jury from drawing such an inference, the company should have been called on to explain the true cause of the occurrence.

### Not an Unlawful Construction on the Highway.

*Miller v. Lebanon & Anurville Street Railway Company (Pa.), 40 Atl. Rep. 413. May 16, 1898.*

Recovery of damages for the death of a child killed in some unexplained manner, after stopping at least 5 ft. away to let an electric car pass, was sought on the ground that the company had placed on the highway an unlawful and dangerous construction, which caused the death of the child. At the place where the accident happened, the tracks were laid by direction of the township supervisors in a trench, so that the tracks were 8 in. lower than the surface of the road, because it had apparently been their intention to change the grade of the road at that place, and they desired the tracks laid so that they would be level with the surface of the road when the change was made.

The theory advanced at the trial was that the company had no authority, even if directed by the supervisors, to make the trench in which its tracks were laid; that the sloping side of the trench nearest the roadway, in connection with a mound of earth formed by passing wagons by displacing and throwing up the dirt between the traveled part of the road and the car tracks, increased the danger to any one who might fall on the highway near the tracks; that, if the trench and mound had not been there, the child, when she fell, would have remained on the surface of the road, and not have rolled down under the wheels of the car.

But the supreme court of Pennsylvania holds that, in following the direction of the supervisors, there was no violation by the company of its duty to conform to the grade of the road in laying its tracks. This was what it was attempting to do. It would have been folly to have laid the tracks to conform to a surface which was to be changed the next day or the next week.

The difficulty of proving how the accident happened, the court further holds, did not relieve the parties suing of the burden of proving that it was caused by the negligence of the company, which they failed to do. And it affirms a judgment in favor of the company.

### Care Required in Attempting to Switch Cars from One Track to Another.

*Stierle v. Union Railway Company (N. Y.), 50 N. E. Rep. 419. May 10, 1898.*

The obligation of carriers of passengers to exercise the highest degree of care which human prudence and foresight can suggest, the court of appeals of New York holds, exists only with respect to those results which are naturally to be apprehended from unsafe roadbeds, defective machinery, imperfect cars, and other conditions endangering the success of the undertaking.

In every case the degree of care to be exercised is dependent upon the circumstances, and, if the accident is attributable to the existence of defects in the road, or in the mechanical appliances availed of for the operation of the road, by reason of which there was a possibility of loss of life or limb to the traveling public, the strict rule requiring the highest degree of human skill would be applicable.

The common carrier is not an insurer of the safety of its passengers, but it is, and properly should be, bound to use its utmost skill and vigilance to guard against the possibility of accidents from the condition of its road and of the machinery used in the transportation of passengers.

Applying these principles to the case before it, in which the party suing alleged that he was injured because of the negligent manner in which the driver of the street car on which he was a passenger attempted to move or switch the car from one track to the other in order to cross a bridge that was being repaired, permitting the use of only one track, the court holds that the company was liable only for the failure of the driver to use that skill and care which would be required of an ordinarily careful and prudent man.

Justices O'Brien and Vann dissent on the ground that the reason which requires the exercise of the highest degree of care by a carrier of passengers with reference to roadbed and machinery extends with equal force to the use of the roadbed and machinery in the operation of cars, and that there should not be a higher degree of care required in providing appliances than in using them.

#### Individual Liability in Wrongfully Changing Grade of Streets.

*Berkson v. Kansas City Cable Railway Company (Mo.), 45 S. W. Rep. 1119. May 24, 1898.*

This was an action begun to recover damages to abutting private property, charged to have resulted from a change of grade of a street; the Kansas City Cable Railway Company, the Kansas City & Independence Railway Company, and James Lillis, being made defendants. The jury found against the cable-car company, assessing the damages at \$3,500, in accordance with which judgment was entered against that company, and in favor of the other two defendants, from which judgment all of the defendants appealed.

This leads the supreme court of Missouri, division No. 1, to say that if the jury found that the cable car company was guilty of a tort, in the nature of a trespass, in entering upon and changing the grade of the street in front of the plaintiff's property, it was liable for the entire amount of damages caused by its act, without reference to the question as to who else or how many others participated in the same wrong, because between joint wrongdoers no right of contribution exists, so that one cannot be heard to complain that all guilty of the wrong have not been included in the same action, or included in one common judgment as the result of its prosecution.

The court further justifies the rendition of the judgment against the cable car company alone, on the ground that the jury could hardly have resisted the conclusion, from the evidence, that the Kansas City & Independence Railway Company was a mere substanceless corporate creation, used to conceal from view the real operator, the cable car company.

#### Against Walking on Track Longitudinally.

*Gluhartin v. Luckawanna Valley Rapid-Transit Company (Pa.), 40 Atl. Rep. 322. May 16, 1898.*

While city passenger railway companies have not an exclusive right to the use of the parts of the streets occupied by their tracks, the supreme court of Pennsylvania says that they have a right of way and a right to an unobstructed track for the passage of their cars. In the use of their tracks their rights are superior to those of the public. The convenience of the individual in the use of the part of the street to which the cars are confined must give way to the convenience of the public who use the cars.

The use of electricity as a motive power by street railway companies has greatly increased the danger to those who drive or walk on city streets. Many uses of streets which were formerly comparatively safe are now extremely dangerous. Of the increased danger all persons who use the streets must take notice, and a high degree of watchfulness and care is required of them.

With these principles in mind, the court reverses a judgment for personal injuries rendered against a street railway company in a case that was tried for the claimant on the theory that she had a right to walk on the track longitudinally, and that if she was vigilant in watching for the approach of a car she had done her whole duty, a view adopted by the trial judge. The track was a single one, with turnouts, in a city street. She lived on the street, and was returning home at night, choosing to walk on the track because the surface there was hard and smooth while the carriage-way was dusty and the sidewalks uneven in places.

The motorman did not see her until she was struck—from behind—and he stopped the car within its length. It also appeared that the headlight was not burning, and that the gong was defective, and did not always ring.

But the supreme court says that a reasonably prudent person

would not have been on the track, under the circumstances, especially knowing that a car was coming behind, and that it could not be heard on account of other noises in the neighborhood; and that she was guilty of negligence in being there. Her right to use the track was subordinate to that of the company.

#### DEATH OF CHARLES B. REAVIS.

Charles Blair Reavis, ex-vice president of the Street Railway Accountants' Association, one of its organizers and always a

C. B. REAVIS.

most earnest and enthusiastic worker; and auditor of the Augusta (Ga.) Railway & Electrical Company, died suddenly at the Augusta city hospital on August 2, of Bright's disease. His death will bring sadness to every member, as it has to the city of his home, where he had a very large circle of friends. His illness lasted only a few days and was not thought to be critical until the last few hours. His wife was visiting her parents in Kansas City at the time and did not reach Augusta until after his death. Mr. Reavis was only 34 years of age. He was born at Warrensburg, Mo., in 1864 and was associated with Col. Dyer in Kansas City for a number of years, afterwards accompanying him to Augusta to take the position which he held up to the time of his death. He was married two years ago to Miss Mary Wells of Kansas City, and both were present at the convention last year. He will be greatly missed by the Accountants' Association, where his opinions were highly regarded, and his genial disposition made everyone his friend.

#### DECISION AS TO ADVERTISING RACK PATENT.

About a year ago the Newton (Mass.) Street Railway Company was enjoined from using certain advertising racks in its cars, the U. S. circuit judge holding them to infringe upon U. S. letters-patent No. 380,096, granted in 1888 to I. H. Randall, and controlled by the American Street Car Advertising Company.

An appeal was taken to the circuit court of appeals, where a decision was rendered July 19, 1898, in which the court said: "While we entertain doubts where the complainant's device involves invention or patentability, yet admitting that both were found in it, the patent must be held so close and narrow that it is not infringed by a structure that cannot be described in the language of the patent as an article complete in itself adapted to be readily attached to the car at the place specified, or in the language impressed upon the patent office, a rack 'complete and in condition to receive the cards when not fastened to the car.' We are clear, therefore, that the respondent's structure does not infringe."

This is probably the last that will be heard of litigation about advertising mouldings in cars.

#### TAKING UP TRACKS.

The Helena (Mont.) Power & Light Company succeeded to a street railway franchise granted in 1891, and continued to operate the road until recently, when it desired to stop the service into the addition to the city known as Lenox, and remove the track.

Two citizens of Lenox sought to enjoin this action but have been defeated in the lower court, the judge holding the franchise grant to be permissive, and not by its terms imposing any obligation to continue the car service for the whole term of the grant.

## THE SWEET TRACK DRILL.

The accompanying illustrations show the Sweet track drill made by the Michigan Manufacturing Company, of Ypsilanti, Mich.

First is a view of the drill which is capable of drilling holes up to 1 in. in diameter. The records for speed are three 1/2-in. holes in a 5/8-in. rail web in 64 seconds, and 6,500 13-32-holes for bond wires in 65-lb. rails in nine days, one man only working the drill. The wheels may be used as a truck to move the machine, a very convenient arrangement.

Below is a section of the improved end bearing which has been applied to this drill; it was adopted only after the most careful trial of many other devices and demonstrated it to be the best for the purpose. The hand lever is

provided with a slot in which works the pivot, 5. This pivot is held in place by a set screw in the rear end of the link, C, which in turn is attached to the backward extending part of the socket at 7; 2-2 is the cup or socket, in which the oval steel piece, 1, is firmly fastened. 1-1 is the end of the drill shaft, also steel. B is an elliptical shaped piece of steel and turns freely between the two points of contact, thus effectively dividing the friction; 3-3 are pins attached to 2-2, which work freely in a groove cut on the drill shaft, and are merely to keep the shaft in position as the lever is moved forward or back. As the lever is so moved the end of rod with the link C, raises or lowers, thus preventing binding of the cup on the end of the shaft.

## SAND BOXES FOR STREET RAILWAYS.

The illustration shows a sectional view of a sand box made by the Ham Sand Box Company, of Troy, N. Y., and known as the Ham sand box, style 4.

In this design the box is placed inside the car and thus is overcome the only objection urged against style 3, that is, that being under the car, it might draw moisture. The spout and lever project through one hole in the floor and connections to the lever can be easily made. The points of superiority claimed for this device are: It has no valve or worm gear; it will

not leak; it has few parts; water can not be driven up the spout to wet the sand.

The operation is readily understood; the lever pulls the hoe forward and a spring throws it back; by alternately pressing and releasing the lever a fine stream of sand is delivered.

Of eastern roads using the Ham boxes may be mentioned the Newport Street Railway; the Commonwealth Avenue, Boston; the Union Street Railway, New Bedford; the Bristol and Plainville. They are also in use on the Richmond (Va.) Traction Company's cars, and the cars of the Glasgow Corporation road, Glasgow, Scotland, have recently been equipped. The 100 cars now building by the Stephenson Company for the Chicago City Railway are to be fitted with the style 3 box; this selection was made after a thorough trial. H. A. Whitman, 200 Lake street, Chicago, represents this company in the west.

On August 17 the General Electric Company, at a meeting of stockholders in Schenectady reduced its capital stock to \$20,827,000 a decrease of about one-half.

## PROVIDENCE FENDERS ON 5,000 CARS.

The Providence fender and wheel guard is now installed and in actual daily operation on more than 5,000 electric and cable cars, a number which is several times that of all other types of fender combined. The fact that no road which has once adopted the Providence has ever been known to take them off or change, and that all are constantly increasing the number as new cars are put on, effectively tell the story of their efficiency and practicability. General Manager Woodward informed our representative, when in Providence a few days ago, that he is now equipping cars in five cities and that the works have been crowded right up to the full capacity for several months past, and additional manufacturing facilities will certainly be necessary in the near future if only a part of the promised orders are received. Mr. Woodward says: "Our fender is not quite as cheap in first cost as some, but it is the best; gives no trouble in getting out of order; can always be absolutely depended on to do its work; and in the end is really the cheapest."

A complete exhibit will be made at the Boston convention.

## THE MOTOR SUSPENSION CASES.

The Walker Company, Cleveland, O., sends us under date of July 13, the following:

"We beg to call attention to a letter recently mailed to you by the General Electric Company, dated Schenectady, N. Y., June 1, 1898, and signed C. A. Coffin, President.

"This letter concerns a decision made by the U. S. Circuit Court of Appeals of the Second Circuit, upon a patent issued to Frank J. Sprague for an improvement in electric railway motors.

"The statements made in this letter we believe to be willfully misleading, and we feel it necessary in justice to ourselves and to the many users of street railway apparatus to correct the false impression so widely circulated.

"The motor suspension now used by the Walker Company is not the suspension that came to trial, and the statement made in the letter that 'practically every form of motor suspension now in use' is an infringement of patents controlled by the General Electric Company, is erroneous. We present for your consideration the enclosed statement of the situation, believing that it will be of sufficient interest to command your attention.

S. H. SHORT, Vice-President."

The illustrations are taken from the circular accompanying the foregoing and show two suspensions. The circular in part is as follows: By referring to the specifications of the Sprague patent itself it will be seen that the motor was journaled to the axle rigidly and supported at its nose, or at that side of the motor

farthest from the axle, by spiral springs attached to a cross bar resting on the side bar of the truck. We give a diagram of this suspension which will be seen conforms with the description given in the patent. The Walker suspension now in general use is not the suspension which was in question in the case referred to in the letter. It is entirely different from the Sprague suspension and is a great improvement over it in that the motor itself is not journaled to the axle, but has its weight supported directly over the axle through spiral springs. These springs take up all of the jar and hammer blow exactly at the point where it will do the most good. The nose of the Walker motor at that side of the motor farthest from the axle is supported rigidly upon a cross bar which is attached to the side bar of the truck. This rigid suspension is of great value, as it keeps the motor from rapidly oscillating up and down during the acceleration and braking of the car. One of the main objects of this method of suspension is to prevent this oscillation which so often breaks and wears out the cables passing from the car body to the motor.

## THE ELECTRIC RAILWAY FIELD IN SOUTH AMERICA.

Prepared Expressly for the STREET RAILWAY REVIEW by the Philadelphia Commercial Museum.

The progress of electricity has attained to a remarkable vigor in Buenos Aires and the Argentine generally within a recent period, and it is promised that within the next four years the power wire will have completely displaced the horse as the source of propulsion throughout the whole of the street car lines. There are now nine horse "tramway" companies operating over 230 miles of streets. These lines employ about 5,000 men and nearly 10,000 horses.

Early in June last a representative of La Metropolitana Tramway Company proposed to the municipality to change the tractive power from horses to the trolley system. He promised that the feeder cables should be under ground, divided into sections of one kilometer. The power would be furnished from a plant now being constructed by the Berlin Electrical Company. The latter company has organized a subsidiary company for the special purpose of extending the transmission of power, by electricity, throughout Argentina. The company is known as the German Transatlantic Electric Company, and has the backing of the German Transatlantic Bank at Buenos Aires, which practically organized it. The German Electric Company, it should have been stated, recently purchased the property of the La Metropolitana line, obtaining the company's equipment and the right of way of over 21 miles of streets through a busy part of the city, for what is considered the low price of 1,400,000 pesos (about \$300,000).

Within the last three months petitions for concessions for electric roads have been presented to the municipality by quite a number of people. The applications embraced both the trolley, underground and accumulator systems. A Mr. Müller asked for permission to establish a system to be worked by accumulators between the new slaughter yards and Flores Palermo and the southern part of the city. The River Plate Electric Light & Traction Company presented four or five petitions for the use of the overhead system in different sections.

A petition by one Victor Nicolutti, for the construction and working of a line for freight and passengers by steam or electricity between the new Mata Deros and the termination of the Anglo Argentine Tramway Company in Floresta, has been favorably reported by the Public Works Department of the municipality. The conditions upon which the department will grant the concession are: That the land required by the line shall be purchased by the concessionaires and converted into public streets; that the line shall be doubled, and road guards placed at every crossing. The concession would run for 20 years, after which the material and land would revert to the municipality without payment.

Among other proposals for the application of the electric system presented, was one from T. R. Betzell for a road to run from Plaza Mayo through the streets of Victoria, Martin Garcia, Iriala, California, and Vieytas to Paseo Colon and as far as Barracas Bridge. The applicants offered to adopt the electric system, to water the streets during the summer, to begin work within four months after the contract is signed, and finish within a year, and to deposit \$10,000 as a guarantee. They ask for 60 years concession and place the fare at 10 cents.

Another applicant for the construction of an electric line is E. Rodriguez, who has applied for concessions for about all the streets in the city. A petition by A. Parcus & Co, for the construction of an electric system has been denied, the petitioners having furnished neither plans nor data. James G. Killey is one of a number of applicants who want permission to go through the Paseo de Julio, one of the principal thoroughfares of the city. His proposition is to build two underground lines, one to run from the Plaza de Mayo through Bolivar and Caseros streets to the Constitution Depot, and the other from the Plaza de Mayo through Reconquista and Paseo de Julio streets to the Retiro.

Among the work which is now being prosecuted is the construction of a section of the Buenos Aires Electric Tramway from Calle Montevideo to the Recoleta. The line will run through

Retiro Station and its present terminus will be at Plaza de Mayo. It is expected that by the end of the year the line will reach Belgrano.

Some time ago the A. Heymenann Company obtained a concession for a system of elevated "tramways". For some reason or other not stated in the latest advices, the concessionaires have been unable to execute their project and the concession has been declared lapsed.

The people of Buenos Aires are very much exercised just now regarding a report made by Dr. Bahia favoring the use of a bare copper wire for the neutral three-wire system by the German Electric Light Company. The director of public lighting has emphatically objected to the use of a naked wire and petitions have poured into the Intendente and the City Council from the gas and electric light companies protesting against the use of the bare wire. Acting upon the report of Dr. Bahia the Intendente gave the German Company permission to use the bare wire and the local electricians have split into two camps on the question.

The report of the director of the Anglo-Argentine Tramways for 1897 shows receipts for the year of \$1,063,005 against \$1,030,540 in 1896, and working expenses of \$778,840 in 1897 against \$708,170 in 1896. The increase in the working expenses was due to a rise in the price of horse feed. The lines paid a dividend of 75 cents per share for the year.

The shareholders of the City of Buenos Aires Tramway Company at their general meeting discussed the matter of substituting electrical for horse traction. The conclusions arrived at will be regarded as rather antiquated by Americans. These were that the "principal or only recommendation of electric traction is its increased speed; that this was rendered impossible on most of the company's lines by the heavy and slow traffic which encumbers the streets; that there was danger from the electric train in a narrow street on account of its greater length and the sharpness of the curves, and electric traction will be found to have advantages in suburban traffic only."

A correspondent writing about the traction system of Rosario, a city of 55,000 people up the Plate from Buenos Aires, says: "The days of tramways worked by horses in great cities are drawing to a close, and soon the miserable tram horse will be seen no more. The time is fast approaching when they will all be worked by electric power, to the great comfort and convenience not of passengers only, but also of the non-traveling public. All the dirt and most of the noise will be done away with and the cost after the first will be less. We may, perhaps, some day, possibly before long, see all the tram lines of Rosario united into one company, under one management and worked by electricity."

In view of the progress being made in electrical and mechanical works in Argentina a number of gentlemen connected with those operations have agreed that the time is opportune for the establishment of an Institution for Mechanical and Electrical Engineers. At the present time there is no place in which foreign engineers can meet and discuss questions of the day. The only "center" is that known as the "Centro de Ingenieros Nacionales", whose doors are opened only to those who hold an Argentine University diploma. The formation of a new institution is a foregone conclusion. Electricity is making rapid strides in the country and there are a number of engineers connected with the electric light companies, of which there are about ten in the country, the telephone, the electric traction, and telegraph companies, and the different steam railroads.

There is a possibility that in the future the magnificent water power derived from the strongly flowing rivers that rise in the Andes will be utilized for the generation of electricity for use of many light railroad systems throughout Argentina. Something has been said about exchanging electricity for steam power on one of the steam roads, but nothing definite on the matter appears to be known.

The court at Duluth, Minn., has directed its receiver in charge of the street railway to withdraw the order requiring its men to be in uniform if they wish to ride free, a badge being deemed sufficient identification; he upholds an order that the men shall not eat lunches in the cars.

FANEUIL HALL—THE CRADLE OF LIBERTY.

### INTERESTING SERVICE OF THE FALK CAST-WELDED RAIL JOINT.

The raising of the net-work of steam railroad tracks at Clark and 16th streets, this city, involves one of the most difficult engineering problems encountered by any road. The Clark street line of the Chicago City Railway which formerly crossed these steam tracks at grade, has been shut down already several weeks, and will not get into operation for some time to come. When it does the car tracks will use the street grade and the steam roads will pass overhead and underneath.

As the Clark street line has become one of the main arteries of the City Railway since the adoption of electricity, and will carry upwards of 200 cars per hour a good portion of the day, the company has taken advantage of the enforced blockade to relay its tracks, which otherwise would not have been renewed for three years to come. This track being taken up is of 52-lb. Johnson girder, 4½ in. high, and was laid nearly 10 years ago, when the service was exclusively by horse cars. When electricians went on the joints quickly went down, and the wear of the entire track was greatly aggravated by the hundreds of teams loaded with the heaviest kind of freight for the numerous freight houses along Clark street. Three years ago it was about decided to take up this track and relay with new rail when the Falk Company proposed to extend the life of the track by cast-welding the joints. This was done being among the first of old rail to be so jointed. The result has been in every way satisfactory, and were it not for the importance of the line and the objection to shutting it down when the time comes to renew, the present track would have answered for probably three or four years more. But it will be taken up now and a heavy 7-in. section put down. The question what to do with the old rail taken up which is too good to scrap, has been solved in a very unique manner. Every alternate joint will be sawed out, leaving a rail about 58 ft. long with one cast-welded joint midway. This rail will be laid on a line of lighter travel, and the new rail ends made by the sawing will be cast welded and when so laid will be good for several years' use. It will readily be seen what the saving to the company will be by this means.

The new 35th street line of the same company has been cast-welded, without the addition of any rail bonds, Electrician Knox having become satisfied that the conductivity of the Falk joint is

more than ample. Our readers will recall our published test of the conductivity of these joints made a few months ago by Chief Electrician Chapman, of the Yerkes system. He took up some old joints from track, and tests showed a surprisingly high degree of conductivity, sufficient for all ordinary purposes. The joints he then tested had been made by the earlier method of cleaning the rail ends before welding, which is far inferior to the system now employed by the Falk people, which is to clean the rail end by means of portable sand blast just prior to the welding and which cuts away every foreign substance and leaves a bright and clean surface to join and weld. The 35th street line just mentioned was prepared with this sand blast and the results are highly satisfactory.

The Falk Company is now working on a large contract for the Metropolitan in Kansas City, where the joint is in great favor, as indeed it proves to be wherever it is tried. The foreign work this season has been large, and the joint is rapidly growing in favor abroad.

### WATER AND OIL CHEMISTRY.

Two enemies of economy in the power station are bad feed water and poor lubricating oils. It is quite obvious that no single compound can be made which will prove efficacious in removing boiler incrustation or in preventing the formation of scale or corrosive action, because such formations and corrosive actions result from the use of waters different from each other. The mineral salts have different physical and chemical properties, and the percentage of injurious ingredients varies in different waters. Surely such conditions require to be intelligently investigated before a remedy is applied, and each case should be diagnosed separately before prescribing for it.

The Dearborn Drug & Chemical Works, of Chicago, are manu-

LABORATORY OF THE DEARBORN DRUG AND CHEMICAL WORKS.

facturing and analytical chemists, and have proceeded along such lines as these, meeting with great success. They have an extensive laboratory and when called upon to treat a bad boiler water, first analyze the water, and write a prescription. The prescription is sent to the works, recorded and numbered, and the compound made; it can be readily refilled when wanted. The compounds made are of purely vegetable composition, analytically prepared to meet the requirements of the mineral ingredients and other objectionable constituents of the water, the percentage of each mineral salt governing the percentage of the antidotal ingredient of the compound. By these methods there is no excess or deficiency of any part of the compound, every pound being utilized in the reaction taking place; there is no mechanical, unknown or unlooked for result obtained from the use of these goods.

The oil question is also handled in an intelligent manner. This company makes the Dearborn oils, each one named for a fort, and the qualities of the different oils adapt them for different uses. The Dearborn Drug & Chemical Works are oil chemists and inspectors to the consumer, and prepare special formulas to suit the requirements that may be presented in each individual case. Unless boiler compounds and lubricating oils are carefully chosen for the work to be done it is idle to expect satisfactory results.

**STREET RAILWAY MEN WHO HAVE DIED SINCE LAST CONVENTION.**

Each recurring convention, marking as it does another mile post in the path of time, brings with it the feeling of regret and sorrow for friends whose familiar faces we shall see no more. The following is a list of those in active street railway work, or intimately connected with it, whose death has occurred since the last convention meeting:

Lemuel Ammerman, president, Lackawanna Valley Traction Company, October 8, 1897.

Dwight S. Smith, Jackson (Mich.) Street Railway, November 11, 1897.

John Savage, superintendent, Detroit & Oakland road, December 1, 1897.

Ross Mackenzie, Nelson, B. C.

David W. Dickson, president, Philadelphia Traction Company, December 13, 1897.

J. Willis Kettlestrings, purchasing agent, North Chicago Street Railroad Company, December 29, 1897.

O. B. Shallenberger, consulting electrician, Westinghouse Electric & Manufacturing Company, January 23, 1898.

John S. Pugh, of the John Stephenson Company.

Burr K. Field, vice-president, Berlin Iron Bridge Company.

H. W. Johns, president, H. W. Johns Company, February 8, 1898.

James H. Rhotabamel, Columbia Lamp Company, St. Louis, February 17, 1898.

William J. Ashmead, Ajax Metal Company, February 26, 1898.

James A. Stratton, secretary and treasurer, Birmingham Railway & Electric Company, February 28, 1898.

Denis Doren, general superintendent of construction, Western Union Telegraph Company.

Frederick Krutz, former president New Orleans Street Railway Company.

Li. Col. H. C. S. Dyer, president, Colorado & Cripple Creek Electric Short Line Railway.

J. K. Waterman, manager, Cape Electric Railways, Cape Town.

R. F. Baker, president, Columbia Railway Company, Washington, D. C.

Charles B. Pratt, president, Worcester (Mass.) Consolidated Street Railway Company, May 10, 1898.

John J. Shipherd, Cleveland, June 1, 1898.

Julius S. Grinnell, general counsel, Chicago City Railway, June 8, 1898.

Morris W. Hall, secretary, Camden & Suburban Railway Company, Camden, N. J.

Dr. Azariah Everett, former president, East Cleveland Railway Company, June 17, 1898.

E. H. Bennet, president, Babcock & Wilcox Company, June 27, 1898.

M. W. Squiers, former superintendent, North Chicago Street Railroad Company, June 29, 1898.

Charles O. Richardson, treasurer, Worcester Construction Company, Worcester, Mass., July 6, 1898.

Capt. John A. Williamson, former superintendent, Cincinnati, Newport & Covington Railway Company, July 8, 1898.

J. H. Rafferty, secretary, Waterloo (Ia.) & Cedar Falls Rapid Transit Company, July 20, 1898.

Charles B. Reavis, auditor, Augusta (Ga.) Railway Company, August 2, 1898.

Adolph Sutro, San Francisco, Cal., August 8, 1898.

William H. Blood, division superintendent, Brooklyn Heights Railroad Company.

**SANDUSKY, O., ROAD SOLD.**

The Sandusky (O.) Street Railway was sold on July 9, by the receiver, to Judge Bentley, of Cleveland, the legal representative of Thomas Wood's Cleveland and Norwalk syndicate, which has in view building a line to Lorain. The bid was \$60,024, exactly two-thirds of the appraised value; no other bids were made as Judge Bentley's principals had secured provisional control of 90 per cent of the stock and bonds.

**CHRISTENSEN ENGINEERING COMPANY'S SUCCESSFUL AIR BRAKE.**

When it is remembered that this company made its introduction of air braking apparatus at the Niagara Falls convention, less than one year ago, the number of installations which have been made and their uniformly successful operation constitutes

WHERE WE RODE LAST YEAR.

a record quite remarkable. It is a strong testimonial to the fact that experimentation has been done quietly and in advance of putting on the market, instead of rushing into sales and correcting the mistakes later. While the Christensen Company very honestly admits it does not claim absolute perfection, it does guarantee what it believes to be by far the best air brake for street railway work in existence, and the improvements which time brings to all machinery will doubtless be of minor character, for the brake has proved its efficiency in that final and only absolute test—hard daily service.

METROPOLITAN TRAIN—CHICAGO.

Our readers who attended the Niagara Falls convention will never forget the thrilling ride down the Gorge—the finest ride in the world, and our illustration will recall afresh the pleasures of the trip. Incidentally the cut will also show one of the cars equipped with the Christensen air brake. If there ever was a place where absolute safety is essential it is here. In this case an axle compressor is used.

Another and entirely different class of service is illustrated in the train of cars on the Metropolitan Elevated in Chicago, a road entitled in its construction and operation to take first rank as the model elevated road in the world. General Manager Baker is not much given to writing testimonials, but speaks in very high terms of the excellent work of these brakes on his road.

The reader would at first thought scarcely look to the mount-

MILWAUKEE CAR WITH CHRISTENSEN EQUIPMENT.

ains of Colorado for the most advanced type of equipment, when so many roads in "the states" are still operating under the time honored system of the hand brake. Our illustration of two of the cars on the Cripple Creek District Railway shows the type of heavy car used and also indicates the steep character of grade which prevails from one end of the line to the other. In addition high speed is required, which makes an air brake, not a matter of choice, but necessity. The operation of an air brake is rendered more difficult by reason of the high altitude, yet these 20-ton passenger cars, and the heavy freight cars loaded with ore are handled with the utmost ease and certainty, and the general manager of the road, L. D. Ross, writes: "The question of braking the cars as they descend the mountains was one wherein some railway engineers apprehended we would meet with trouble, but so far not the slightest difficulty has occurred. With the Christensen air brake we are able to make whatever speed we desire."

Nor is the brake one of those prophets without honor in its own country. Milwaukee, the place of its manufacture, has 10 equipments on the recently completed Waukesha line. These are independent motor equipments and are working beautifully. Twenty sets are also working on the Suburban Railroad, Chicago, one of the Yerkes lines, which runs from the terminus of the Lake Street "L" to La Grange. Some other installations on

AT CRIPPLE CREEK.

well known lines are: 4 on the Fox River Valley, Appleton, Wis.; 16 on the Cleveland-Berea road; 3 on the Akron, Bedford & Cleveland; 4 on the Union Traction, Anderson, Ind.; 11 on the Lowell, Lawrence & Haverhill; 9 on the Taunton & Brockton; 5 on New Paltz & Walkill Valley, Pa.; 6 on Brooklyn Elevated and 6 on the N. Y., N. H. & H., under direction of Col. N. H. Heft. Also one compressor on a Belt Line locomotive of the B. & O.

The largest installation to date, however, is the equipment of the 120 cars on the South Side Elevated, Chicago, known as the "Alley L", under whose cars are placed Christensen No. 1 compressors, making each car complete within itself.

Starting with an empty reservoir, 90 lbs. of air is pumped into the reservoir in two minutes and thirty seconds. It requires about an 8 lb. reduction on train line for a good stop when the brakes are properly adjusted, which means a reduction of 1½ to 2 lbs. on a storage line.

The capacity of each compressor is 9 cu. ft. of free air per

T. & B. STANDARD CAR.

minute; 85 to 90 lbs. of air is carried in storage reservoir, and the maximum pressure on train line is 70 lbs.

By means of an automatic electric switch controller, uniform, maximum or minimum pressures are controlled. The Christensen Company's engineers' valves are used throughout the system.

The exhibit at Boston will be one of the most important of the exposition, and will offer much to study and inspect.

It was a Boston newspaper man out of whose fertile brain the following emanated: "The relation between electric power and the house fly nuisance does not seem apparent, but it is claimed, nevertheless, that the most hopeful sign of the abatement of flies in cities is to be found in the substitution of electricity for horses on the street railways. Practically all flies are bred in stables, it is said, and therefore the fewer stables the fewer flies."

## A NEW FARE REGISTER.

A very interesting little machine and one which is sure to attract much attention at the Boston convention, is a new fare register, the invention of George F. Rooke, of Peoria, Ill. It would seem as if all the possible new ideas and variations in fare registers had been long ago exhausted, but the device which Mr. Rooke has brought out is both simple and in some principal features entirely different from anything yet produced.

It consists of a small, portable, automatic register, carried in the hand of the conductor. When not in use it is conveniently suspended on a bracket attached to a strap, made to go around the neck of the conductor.

In collecting fares the conductor passes the register in front of the passenger, who inserts his fare in the opening at the top. The insertion releases the mechanism, which automatically takes the fare through a slot and deposits it in the palm of the hand that holds the register. The passage of the fare through the register automatically records it, and sounds an alarm, and it is impossible to pass a fare through the chute without registration and ringing the bell. As the fare passes through instantly the conductor has it in his possession at once, in fact as speedily as if the fare had been placed in his hand, and gives him the same opportunity to examine it to guard against bad coin. He then transfers it to his proper change pocket just as he would do with a stationary or the usual portable register.

When collecting, the device is carried in the hand, having a chute running through from top to bottom. It fits comfortably

THE ROOKE FARE REGISTER.

into the hand, so that the lower end of the chute rests on the palm of the hand. In the opening at the top each passenger deposits his fare. While the entrance is open, and when the fare is entered, the releasing mechanism is operated by the coin, by which the entrance of the coin passage is closed, and by the same action the lower end of the chute is opened to allow the coin to fall into the same hand by which the register is held. The operation also causes the recording of the fare and the ringing of a bell. The coin once entered cannot be taken out, but must pass through into the conductor's hand. The closing of the entrance of the coin passage, or chute, after the receipt of each coin, prevents another coin entering until the mechanism is reset by the conductor. The resetting of the device, after the passage of each fare, which is very simply done by the conductor pressing the index finger, puts the register in position for recording each succeeding fare, and at the same time opens the entrance ready for the receipt of the next fare. The machine is so constructed that it cannot be tampered with in any manner without detec-

tion, having a seal attached to the inner construction, the record thus kept by two independent counters being exact, and correctly representing the fares collected. These counters are fastened directly to the mechanism, the figures showing through the openings on either side of the case, same being covered by heavy crystals. They are positively interlocking with the mechanism in such a way that the register cannot be used without tuning

REGISTER IN OPERATION.

the counters, the connections not depending on any springs or ratchets, but being positive in their action.

The machine is not only much smaller than the present portables, but correspondingly lighter to carry, and can be used equally well with either hand, as most convenient. The extreme simplicity of the internal mechanism reduces wear and consequent repairs to a minimum; and continuous and severe tests demonstrate an exceedingly long life for these registers. They will not be sold outright, but leased on reasonable terms.

A strong company has been incorporated to manufacture the machines, and includes some of the best business men in Peoria. C. A. Jamison is president; Arthur Keithley, vice-president; L. Seltzer, secretary; and G. F. Rooke, treasurer and general manager.

Mr. Rooke will have the machines in operation in Exhibit Hall and invites the most critical inspection.

## STRIKE AT SYRACUSE.

At noon on August 5 the employees of the Syracuse (N. Y.) Rapid Transit Company quit work, effectually tying up the road. The strike resulted because the men demanded the recognition of the National Association of Amalgamated Street Railway Employees, which the company would not concede, and because of dissatisfaction with a recent order requiring a deposit of \$25, a physical examination and that conductors carry \$5 worth of Lakeside Railroad tickets (this is a connecting suburban line) for which they must pay. There was also complaint made about the uniform regulations.

The road was tied up for two days and a half, work being resumed on August 8. The men waived their demand for the recognition of the union, on the company agreeing to receive a committee of the employees; the \$25 deposit rule was rescinded so far as present employees are concerned; the other rules in dispute continue in force.

Robert Pearson, a farm laborer, while driving a hay rack collided with a car on the Metropolitan Street Railway, near Toronto, Ont.; the motorman of the car was badly injured and Pearson was arrested on the charge of "causing grievous bodily injury by wilful misconduct and neglect."

## THE TURNER SAFETY WATER TUBE BOILERS.

The accompanying illustrations show the Turner safety water tube boiler, made by the Turner Engineering Company, of Bucyrus, Ohio. This boiler was designed with the view of getting the highest general efficiency that is possible, having due regard

to cost of attendance, repairs and depreciation, as well as the cost of fuel; and, moreover, to do this in any plant without requiring additional investments for economizing plants and other aids to efficiency. The heating surface is liberal, that is, the boiler rating is on a basis that leaves a large margin for increase of steam production without the efficiency falling off; tests

SECTIONAL VIEW.

made when the boiler was working 50 per cent above its rating show a drop of only 2½ per cent under the efficiency at rated load.

The sectional view shows the arrangement of the drums, risers, water return, feed heater, etc., as well as the furnace arches and the path of the hot gases. The height and the length of the boiler are the same for all capacities, only the width varying; the drums being of the same diameter, and the tubes and fittings of the same length and diameter, greatly simplifies the building and maintenance.

The upper drums are 40 in. in diameter, with the normal water level a few inches below the center. This gives a large storage capacity for the steam and a large area for the liberation of the steam, which, together with the fact that the escaping steam has to rise through only a shallow body of water, en-

FOR CLEANING TUBES.

END OF LOWER DRUMS.

dures drier steam than is to be had with many types. The upper surface of the drums also provides large super-heating areas. The

large supply of water which the lower drums give this boiler as compared with header types makes it more capable of responding quickly to sudden increased demands for steam.

The improved circulation is one of the most important features resulting from the design. The upper drums are connected, but the lower ones are not, so that the steam formed in each bank of

SIDE DOOR.

tubes is part of a separate circulation. At the back of the setting is placed a bank of horizontal tubes through which the feed water is forced on its way to the rear lower drum; this heats the feed and reduces the temperature of the flue gases.

As the feed is introduced into the rear one of the lower drums only, the greatest deposit of sediment occurs there and that drum will need to be blown out much more frequently than the forward one. This greatly protects the front bank of tubes, which are exposed to the greater heat, thus keeping their efficiency up over a very long period. Each is provided with a separate blow-off. The drums are all provided with man-holes, so that an attendant may readily get at the tubes to clean them. There are special castings in the side of the setting with holes for introducing a steam pipe for blowing soot from the outside of the tubes.

The good design, high grade material and careful workmanship insure a safe boiler.

## H. W. JOHNS' EXHIBIT AT THE CONVENTION.

The H. W. Johns Manufacturing Company, New York, will have an interesting exhibit of its electrical materials in a space situated near the main entrance to the exhibition room. The company has added new designs to its list of electric car heaters for next season, which will attract the attention of visitors. Other novelties will appear among the samples to be shown of the well-known molded mica insulated trolley line devices and the more recent shapes of "Vulcabeston" repair parts for motors and controllers. The collection of Vulcabeston samples of commutator rings, brush holder bushings and controller parts will afford an excellent opportunity for those interested to note the dissimilarity in the shapes and sizes of these insulating pieces designed by the various manufacturers of electrical apparatus for similar purposes.

During the past year the company has been very successful in selling its all-steel trolley bracket for wood or iron poles and has recently adopted a simple method of providing a certain amount of elasticity or flexibility in the arm for the purpose of counteracting the injurious effects and wear on the car and wire when subjected to the blow dealt by the passing trolley wheel. This will also be on exhibition.

The following representatives of the Johns Company are expected to attend the convention: H. A. Reeves, Chicago; H. C. Spalding, Boston; Messrs. Berry, Craue, S. G. and J. E. Meek, from the New York office, and J. W. Perry, and possibly D. T. Dickson, Philadelphia. There is also a strong probability that Messrs. Hatch and Lucomb, respectively the president and secretary of the Johns-Pratt Company, Hartford, Conn., will be found inside and outside of the company's space, as heretofore.

## ANNUAL MEETING OF "THE SYNDICATE."

The annual meeting of "The Syndicate," an organization of street railway officers and supplymen, was held at Reading, Pa., on Saturday, July 16.

The members and candidates for admission arrived early and were met at the train and escorted to the offices of the railway company. It is stated that a conspiracy was on foot to waylay the treasurer, A. W. Ash, but this was frustrated and Mr. Ash was escorted by a special guard—two of Reading's police force. The Ringgold band was on hand to furnish music.

At noon "The Syndicate" paraded through the principal streets, after which they were entertained at lunch by President Rigg, of the United Traction Company. President Charles Bragg presided as toast master. Harry Carson, William Heulings, Col. Giles Allison, ex-Judge Wylie, of Lebanon, Jacob Wendell, and H. J. Kenfield, of the REVIEW, responded to toasts.

After lunch special cars took the party to Carsonia Park, where they attended the theater. This was followed by a ride about the

Hill & Norristown Railway; R. M. Douglass, general manager Schuylkill Valley Traction Company, Norristown; William Heulings, of the J. G. Brill Company; John H. Yardley, Pennsylvania Car Wheel Company; C. J. Harrington, representing Elmer P. Morris, New York; Robert Randolph, Sterling Arch Light Company, New York; H. J. Kenfield, of the REVIEW.

The newly elected officers are: C. A. Bragg, president; John Graham, Wilkesbarre, vice president; J. A. Rigg, secretary; E. W. Ash, treasurer, and Alvan Markte of Hazleton, chairman of the executive committee.

## EXHIBIT OF FARE REGISTERS.

Among the enterprising manufacturers whose exhibits have in recent years been a feature of the annual conventions of the American Street Railway Association is the New Haven Car Register Company, New Haven, Conn., whose famous "New Haven" fare registers are so widely and favorably known

"THE SYNDICATE," READING, PA., JULY 16, 1898.

city and at 6 p. m. the visitors began to leave for home, all expressing themselves as having had a most enjoyable outing.

The list of those in attendance is as follows: Ralph Moore, of the General Electric Company, Philadelphia; Clifford L. Pullen, of the Philadelphia Car Wheel Works; J. Wendell, of Wendell & MacDuffie, New York; Giles Allison, of the Hildreth Varnish Company, New York; John Grabam, Wilkesbarre; Alvin Markle, Hazleton; E. W. Ash, Girardville; Charles Bragg, of the Westinghouse Electric & Manufacturing Company, Philadelphia; Louis S. Kite, of the Trenton Malleable Iron Company; A. V. Arrow-smith, Reading Electrical Construction Company; G. M. Keim, and F. K. Flood of the Reading & Southwestern Street Railway; John Rigg, president United Traction Company, Reading; S. P. Light and F. E. Meily, Lebanon & Annville Street Railway, Lebanon; C. C. Long, S. E. Riggs and M. C. Aulenbach of the Metropolitan Electric Company, Reading; J. B. Price, Lehigh Traction Company, Hazleton; E. H. Davis, general manager Williamsport Passenger Railway Company, Williamsport; J. W. Perry and William Chapman, of the H. W. Johns Company; J. H. Carson, general manager of the Sterling Supply & Manufacturing Company, New York; J. C. Lugar, general manager Roxborough, Chestnut

throughout the United States and foreign countries. This company advises us that it intends making a complete exhibit of the various styles of single, double and triple registers, embracing all the latest features, at the Boston convention and will exhibit especially a double register intended to check dishonest conductors from turning in transfers instead of the cash fares collected; and also a double register intended for use on cars running over two connecting, but independent lines. Each side of this register is complete and perfectly independent of the other side; each road having its own side of the register which its conductor securely locks upon leaving the car. These registers will undoubtedly attract much attention at the convention as they evidently will meet the needs of a large number of roads throughout the country. The New Haven Car Register Company has been very successful with its machines which have been adopted by a very large number of leading roads and the registers will be found on a large number of roads in the vicinity of Boston and on over 70 per cent of the roads throughout New England, which is certainly a very fine showing. We congratulate the company upon the success it has achieved and extend to it our best wishes for continued prosperity.

### INSPECTION CAR WITH PORTABLE TURN TABLE.

The Detroit Electric Railway Company being designed as a competitor of the Detroit Citizens Street Railway Company with an independent system of tracks covering the same territory as the former, there are many points where the tracks of the two systems cross and no connecting curves are provided. After the Citizens Company commenced operating both systems these crossings proved to be quite an annoyance to the manager, Mr. du Pont, as he made his frequent inspection trips in a special car and could not pass readily from one line to another.

To overcome the difficulty, Mr. du Pont decided to fit his private car with its own turn table, and accordingly securely fastened a hydraulic jack in the center of the truck (a du Pont truck) between the motors. The plunger is 8 in. in diameter and 16 in.

INSPECTION CAR OF GENERAL MANAGER A. B. DU PONT, DETROIT.

### FORT WAYNE DECISION.

The "Fort Wayne (Ind.) Sentinel" of July 13, gives a lengthy abstract of the opinion rendered by the Allen county circuit court in the Fort Wayne Consolidated Electric Railway case, from which we take the following:

Judge O'Rourke completely exonerated Frank Dellaas Robison and severely arraigned John J. Shipherd and the Cleveland bankers for alleged fraudulent misappropriation of bonds and money. Some \$990,000 of bonds now held by the Guardian Trust Company, of New York, and Cleveland banks are ordered held in trust for the railway company. The road is to be sold, but the sale will be delayed as the banks will continue the legal fight.

Mr. Robison has long sought to buy the Fort Wayne Consolidated by paying the actual indebtedness owed, and if this decision is affirmed he will have the opportunity.

### BIG FIRE IN PITTSBURG.

The large car barns, on Franktown avenue, of the Consolidated Traction Company, in Pittsburg, were entirely destroyed by fire in the morning of July 24. There were 35 cars burned, involving a loss of \$50,000, and the value of the building and equipment destroyed amounted to \$80,000 in addition to the cars. All the damage is covered by insurance. The fire probably started in the paint shop, on the second floor. Very little delay in traffic was occasioned, as there were plenty of cars in stock and the Home-wood barn just completed was immediately occupied.

### NEW ELECTRIC LINE AT NEW ORLEANS.

July 16, the first regular electric car was run over the New Orleans City & Lake Railroad (which is operated by the New Orleans Traction Company) to West End on Lake Pontchartrain, the line having previously been operated by steam dummies. Eight double-truck cars, 28-ft. body and 39 ft. over all, made by the Barney & Smith Car Company, were put in service.

The initial trip was made with a car load of prominent citizens who were entertained at luncheon by the company at West End. Nearly all the gentlemen present made short speeches and were unstinted in their praise of the enterprise of General Manager Wyman.

long and has a bell-shaped base 20 in. in diameter. The plunger is held up by a lever, hooked under the side bar of the truck, and close beside the jack is a reservoir capable of holding about seven gallons of oil or water. At the side of the truck and convenient for the operator is a pump 2 in. in diameter by 3 in. stroke. With this pump one man using a 6-ft. lever can easily lift the car in a few strokes. For convenience in carrying, this lever is made up of two 3-ft. pieces which telescope and fit into a socket on the pump. When it is desired to turn the car at an intersection, where the curves do not suit, the car is placed with the plunger in the center of the intersection, the hook holding the plunger is released, and the pump operated till the car is lifted so that all the wheels are clear. The car may then be swung on the plunger as a pivot. When the wheels are over the rails it is desired to run on, the car is lowered by opening a valve between the plunger and the reservoir. The plunger is then lifted and hooked in position and the car is ready to be started. The whole operation requires only about a minute, so that regular cars need not be held.

The illustration shows the car as lifted for swinging.

The Citizens' Traction Company, of Oshkosh, Wis., has been adding new attractions to its park at Lake Winnebago. Music has been provided on Sundays, a new bath house has been opened and a number of hot air balloons have been sent up with several dollars worth of street car tickets attached.

## NEW PUBLICATIONS.

"Electricity for Machine Driving" is the title of an interesting pamphlet by the Westinghouse Electric & Manufacturing Company, in which are given some of the reasons why electricity should replace belts for machine shop distribution.

The Babcock & Wilcox Company has just issued the thirtieth edition of its book "Steam". This book has been for years one of the standard works on water tube steam boilers and on boiler practice generally. The present edition contains much new matter. It is beautifully printed and illustrated and substantially bound, and is sent free to anyone in any way interested in the generation of steam.

"Through the Garden of Canada" is the title of a publication by the Hamilton, Grimsby & Beamsville Electric Railway Company, and the views of the beautiful vineyards and orchards in Ontario near which the interurban road runs certainly justify such a heading. Photographs are shown of the cars, power house and line of the company. The cars are especially noteworthy for their large size, comfort and finish. A. J. Nelles is the manager of this prosperous system.

The 21st edition of Duncan's Manual of Tramways, Omnibuses & Electric Railways has been received. This is a volume of 400 pages containing abstracts of the accounts of 136 home (United Kingdom) and 37 foreign companies in which English investors are largely interested. In addition is a directory of the directors, officials, firms and individuals connected with these companies; extracts from the Tramways Act and By-Laws are also given. Published by T. J. Whiting & Sons, Ltd., 7a South place, London, E. C. Price, 3s. 6d.

We have received from the publishers, Baudry & Co., Paris, "La Traction Electrique," by André Blondel, professor of electricity in the School of Bridges and Roads, and F. Paul-Dubois of the Paris Municipal Service, and shall publish an extended notice of it in a future issue. This is the most complete treatise on the subject that has come under our observation; it comprises two volumes, large octavo, and contains over 1,700 pages with 1,014 illustrations. Price: 50 francs (\$10).

A catalog, illustrating and describing the "American" fuel economizer, has been issued by Broomell, Schmidt & Co. It is very complete and clearly sets forth the advantages of the economizer, with particular reference to the Broomell and Burpee patents which are used in the manufacture of this economizer. It is claimed that by heating the water from the waste gases, purifying the water, and preventing scale from forming in the boiler tubes a saving of from 10 to 20 per cent can be effected in the coal pile. A complete system of fans and engines for producing mechanical induced draft is also manufactured by this company.

The annual "Souvenir of Binghamton", published by the Binghamton Railroad Company in the interest of the city and incidentally to stimulate street railway traffic, is more pretentious this year than anything attempted before. Half-tone views are given of the principal public and private buildings, churches, residences, and of the various interesting features of the railway system. One plate gives an excellent likeness of President Rogers, Treasurer Rogers and General Manager J. P. E. Clark, to whom much credit is due for the fine street railway service of the city. The souvenir is a model of its kind and the workmanship is of the best.

The Milwaukee Electric Railway & Light Company has issued an attractive pamphlet entitled "Scenic Trolley Rides" which is full of interesting information concerning Milwaukee and towns and cities connected by electric railway to the metropolis. Views of many of the details of electric railway operation, the business districts, public buildings, large manufacturing plants, residences, pleasure grounds and parks are interspersed among reading matter in a very artistic manner. A large insert gives a

New England Blockhouse

bird's eye view of Milwaukee and the lake region of southeastern Wisconsin. The contents were compiled by O. M. Rau, electrician of the company.

An extremely valuable and instructive work for Americans and Japanese who are interested in both languages is the new and second edition of the Standard Verbalist, edited and published by W. Araki, Osaka, Japan. The work comprises two volumes, one devoted to commercial, the other to conversational terms, giving all the words, phrases and sentences most commonly used. The two volumes comprise some 300 pages and contain several thousand terms and idioms. The Japanese equivalents are printed opposite the American expressions. Mr. Araki, who is a personal friend of the editor of this publication, is a young man of great promise, and a fine linguist. He has served his government most acceptably in various commissions, including interpretation during the making of the peace treaty between his government and China, and afterward on a mission to this country collecting data and mechanical exhibits for the National Museum at Tokio. He is highly qualified for the work he has undertaken, and has rendered a signal service in his new book.

It is expected that the Easton, Palmer & Bethlehem electric railway, 12 miles in length and connecting the cities of Bethlehem, Pa., and Easton, will be in operation by September 15.

The government has granted a right of way across the Pike's Peak reservation to the Colorado Springs-Cripple Creek Electric Railway Company. The work on the electric road which will connect the two cities will be pushed to completion.

The Albany, Helderberg & Schoharie Railway Company has been reorganized, and the following officers elected: President, W. H. Burgett, of Boston, in place of John W. Van Valkenburgh; directors, R. Schermerhorn, of Brooklyn, in place of Jacob Keleh, of Gallupville; C. E. Bibber, of Boston, in place of Mr. Loucks, of Bethlehem; Herbert Smith, of Boston, in place of F. C. Hnyek; Charles F. Perkins, of Boston, in place of Harrison Finkle, of Reusselaer.

Very peculiar methods are sometimes employed to obstruct the construction of trolley lines, and the North Jersey Street Railway Company had a recent experience. A grocer in Montclair objected to a trolley pole being planted in front of his store. When the hole was dug he hired a man to jump into it and paid him a dollar an hour to stay there. The construction boss coaxed and threatened him to no avail and finally paid him \$10 to get out, and the pole was set.

The Connecticut farmers in the vicinity of Hartford appreciate what it means to have a trolley line service. As it has been difficult to obtain a franchise along the country roads many of the farmers are offering rights of way across their fields to the traction companies. These shrewd Yankees understand that the trolley car means not only a cheap, quick and frequent passenger service to the city but also facilities for sending eggs, butter, milk and vegetables to market.

Boston in 1790

## PERSONAL.

J. M. Blatt, of Cleveland, has been appointed superintendent of the Milwaukee, Racine & Kenosha Electric Railway.

J. D. R. Baldwin, of New York, has been chosen president of the General Electric Railway Company, Chicago.

Robert Jordan, a nephew of Mr. Sutro, has been appointed superintendent of the Sutro Railroad, San Francisco.

James Butler has been made general superintendent of the Bridgeport (Conn.) Traction Company.

Robert Miller, superintendent of the Springfield (Mass.) Street Railway Company, has resigned because of ill health.

Robert T. Lee, of Newport, R. I., has assumed his duties as superintendent of the Springfield (Mass.) Street Railway Company.

Charles F. Uebelacker, engineer and assistant manager of the Peckham Motor Truck & Wheel Company, was a REVIEW caller last month.

Thomas H. McLean, general manager of the Toledo Traction Company, called on the REVIEW a few days ago while in Chicago on business.

J. C. Hale has been appointed assistant superintendent of the Milford (Mass.), Holliston & Framingham Street Railway to succeed H. E. Reed.

G. A. Loring has been appointed superintendent of the San Francisco & San Mateo Electric Railway, to succeed S. B. McLenegan, resigned.

A. R. Hallowell has resigned as superintendent of the Gloucester (Mass.) Street Railway Company; his successor is Mr. Reed, formerly of Allstone.

W. H. Foss, until recently an inspector for the Biddeford & Saco electric line, has been appointed superintendent of the new road at Webster, Mass.

Eugene Klapp, for some years of the engineering department of the Alley L. Chicago, is second lieutenant in the second volunteer infantry, now at Fort Sheridan.

E. E. Downs, manager of the Oshkosh (Wis.) Street Railroad Company, and Harry I. Weed, attorney for the company, called on the REVIEW when in Chicago recently.

Charles Lahuer has been appointed assistant superintendent of the Chippewa Electric Railway Company, Eau Claire, Wis.; he has been with the company for 11 years.

E. F. Hebard, formerly connected with the Consolidated Traction Company, of Jersey City, has been chosen general manager of the Dayton & Miami Valley Traction Company.

W. W. Annable, superintendent of the street railway machine shops at Grand Rapids, Mich., is the inventor of a chainless bicycle now being made by a Grand Rapids firm for the season of 1899.

G. P. Paul, manager of the Ottawa (Ill.) Street Railway Company, has resigned his office to accept a position in St. Louis. He has done much for the railway system and service in that city.

W. A. Clayton, secretary of the San Francisco & San Mateo Electric Railway, has been made the chief executive officer under the supervision of the vice-president and general manager, J. A. Buck.

President Dyer, of the Augusta, Ga., road, had started for Cuba at the time of the death of his auditor and assistant, Mr. Reavis, but turned back just as he was about to sail from New York.

Isaac N. Thomas, of Wilkesbarre, Pa., has been chosen president of the Geneva, Waterloo, Seneca Falls & Cayuga Lake Traction Company, to succeed W. S. Grant, Jr., who resigned recently.

J. R. Carrier, of Boston, has been appointed superintendent of transportation of the Syracuse (N. Y.) Rapid Transit Railway Company. This is a new office made necessary by the increase in traffic.

Chester P. Wilson, who has been general manager of the Sioux City Traction Company for several years, resigned on July 9. He returned to the east and it is stated will soon go to Eu rope to engage in business.

N. B. Kellogg, formerly chief engineer of the power station of the Syracuse (N. Y.) Rapid Transit Company, resigned last month; before leaving he was presented with a scarfpin and watch charm by his associates.

W. M. Tuohy, of Butte, Mont., has been appointed general manager of the Electric Railway, Light & Power Company, of Anaconda, succeeding John S. McGroarty. This property is controlled by the Anaconda Copper Mining Company.

E. F. Chapman, superintendent of the Zanesville (O.) Railway & Electric Company, has resigned to engage in telephone work in Cleveland. C. W. Foote, general manager of the Citizens' Traction Company, San Diego, Cal., will succeed Mr. Chapman.

W. G. Wagenhals resigned as general manager of the Cincinnati & Miami Valley Traction Company on August 3, and will devote himself to a number of personal enterprises, among them that of developing electric traction on the Miami & Erie canal.

A. L. Stone has resigned as secretary of the Oakland, San Leandro & Haywards Railway Company and the directors have chosen S. B. McLenegan, formerly superintendent of the San Francisco & San Mateo Electric Railway Company, to fill the vacancy.

Marcellus Hopkins, general manager of the South Side Elevated, Chicago, was injured on July 28, while inspecting the tracks. He was caught between passing trains on a curve and buffeted between them, receiving a severe scalp wound and several bruises.

Ichisuke Fujioka, consulting engineer of the Tokio Electric Railway Company and several other electrical companies in Japan, sailed on the Campania, July 16. Mr. Fujioka has been in America several months and will spend some time in Europe before returning home.

Officers of the Orange & Passaic Valley Railroad Company, the new owner of the Suburban Traction Company, Orange, N. J., have been chosen as follows: President, Col. Charles A. Sterling; vice-president, William Scherrer; secretary and treasurer, John H. Ely. Mr. Ely will also be general manager.

R. M. Douglass, general manager of the Schuylkill Traction Company, had his hand lacerated in an accident at Norristown, Pa., July 25. While taking a construction car loaded with poles down a steep grade the brakes on the motor car failed to hold, and a runaway resulted; the cars left the track and struck a wagon and team. One of the men in addition to Mr. Douglass was severely injured.

Frank M. Byron, for several years past city passenger agent of the Lake Shore road in Chicago, has been appointed general western passenger agent to fill the vacancy caused by the death of Cyrus K. Wilber. Mr. Byron has a large acquaintance among street railway officials in the west, who remember him most pleasantly in connection with their trips to conventions, and will be gratified at this recognition of his ability.

### OBITUARY.

William H. Blood, division superintendent of the Brooklyn Heights Railroad Company, died at his home in Brooklyn after suffering from diabetes. He has long been engaged in railroad and railway work.

J. H. Rafferty, secretary of the Waterloo & Cedar Falls Rapid Transit Company, died at Waterloo, Ia., on July 20, after a brief illness. He was prominent in the business affairs of that section of the state, and at the time of his death he was promoting an electric railway from Manchester to Colesburg.

C. O. Richardson, the pioneer street railway builder in Worcester, Mass., died from a stroke of apoplexy at the age of 65 years. He was a man of large business interests and had accumulated a comfortable fortune as a street railway builder and a paving contractor. Mr. Richardson belonged to many religious, social and benevolent organizations and was very charitable.

### SHORTEST TROLLEY LINE ON RECORD.

The San Francisco & San Mateo Electric Railway Company was asked to build a branch line from its road to Mount Olivet Cemetery, but declined to do so. The directors of the Cemetery Association then decided to organize a railway company. The work on the line, which is to be 2,500 ft. in length, has commenced and will be completed in four weeks. One car will be sufficient to carry the traffic and it will run between 8 a. m. and 6 p. m. A transfer system has been arranged with the San Mateo company.

### A GOOD ANNUAL REPORT.

The yearly meeting of the directors of the Pittsburg & Birmingham Traction Company was held in Pittsburg on August 9. The report compiled by Secretary Rogers showed that during the year 8,612,027 passengers were carried, and the operating expenses were 39.56 per cent of gross receipts, or 9.31 cents per car-mile; \$30,000 was paid out in dividends and a surplus of \$23,634 was left from the year's operation. The old officers were re-elected.

### SPEED IN BINGHAMTON, N. Y.

July 19 the common council of Binghamton, N. Y., passed an ordinance fixing the maximum speed of electric cars in the city at six miles per hour on bridges, nine miles in the central portion of the city, and 12 miles elsewhere. The preamble stated that the old ordinance, in force since 1894, "has been demonstrated by experience to be impracticable and unworkable, not meeting the requirements of the traveling public and not consistent with the demand for reasonable and safe rapid transit."

On July 30, 200 members of the Third Avenue Railway Employees' Mutual Relief Association had a bicycle parade; the procession was led by a squad of bicycle police and a band.

### PLOWING UP MACADAM PAVEMENT.

Until a few weeks ago 35th street between Michigan avenue and Grand boulevard, a distance a trifle more than one-quarter of a mile, was a part of the South Park system of Chicago, and the Chicago City Railway was therefore prevented from having a through cross line on this street. Satisfactory arrangements were made, however, and the South Park Board vacated 35th street and accepted 33rd street for the connecting link between the two boulevards.

The railway company at once proceeded to lay its tracks, quick work being desirable because some opposition was developed among the owners of the abutting property. The contract was

PAVEMENT PLOW.

let to Clift Wise, who pushed the work rapidly, employing a force of 200 men.

The old roadbed consisted of 14 in. of blast-furnace slag, on which was Joliet gravel with a top dressing of broken stone, making the whole 20 in. deep; having been in service for several years it was very hard. This had to be taken out to a depth of 14 in. for the width of double tracks, and for this work four pavement plows, or, as they are called by the men, "go-devils," were used, thereby reducing the force needed by several hundred men. The "go-devil" is a pointed plow, as shown in the illustration; on the beam is a shoe which, sliding on the ground, sets a limit to the depth of the cut. On this work eight horses were used to each plow, four abreast at the plow and two teams tandem in front of these four. A crew of 10 men is required, three at the handles, three to hold down the beam, and four drivers.

The tracks were laid with 90-lb. grooved girder rail.

### HIS REPORT.

The following is from a motorman's report, as sent to his superintendent, in explanation of an accident. It is a good sample of many such: "I was running my car down First street at a fair rate of speed and had the car in good control, when the man rushed out from the sidewalk and jambed his head into my car."

### MAMMOTH FOREIGN ORDER FOR WALKER COMPANY.

The Walker Company has an order from its Paris agents, "Exploitation des Procédés Electriques Walker," for 500 electric street car equipments, 1,000 motors, 1,000 controllers, 500 trolleys, and details. It amounts to over \$500,000 and is one of the largest single orders ever received; the apparatus will go to various parts of Europe.

FRANKLIN'S BIRTHPLACE, BOSTON, 1706.

## WESTINGHOUSE FOREIGN ORDERS.

A shipment of engines and generators is being made to the Metropolitan Supply Company, of London, by the Westinghouse Machine Company, and the Westinghouse Electric & Manufacturing Company. Each of the three engines has a capacity of 2,500 h. p. and is of the vertical compound marine type and weighs 210 tons. Direct connected to each engine will be a two phase alternator delivering current at 500 volts. The efficiency at full load is calculated to be 95 per cent. At the end of each

WESTINGHOUSE 2,500-H. P. ENGINE FOR LONDON.

engine shaft will be a direct connected direct current multipolar exciter to furnish current for the fields.

The Westinghouse Machine Company is doing a large gas engine business and the engines, ranging from 10 to 200 h. p., are giving great satisfaction. An engine of 700 h. p. which is the largest in the world has recently been completed. The engine in tests has developed a brake horse power on 11 cu. ft. of natural gas.

This company has also made arrangements for the manufacture of the Parsons steam turbine. One has been built and is operating a 200-h. p. alternator at the company's plant.

Frank Riedle, of Chicago, one of the promoters of the Michigan City (Ind.) electric line has failed and the Chicago Title and Trust Company was appointed receiver. Mr. Riedle is a real estate dealer and is said to be worth \$75,000.

## THREE-PHASE TRAMWAYS IN ENGLAND.

(From Our Own Correspondent)

The greatest interest is being taken in this country in an extensive system of electric tramways which has just been opened to the public. The line connects three very important districts in the North of England, and the plant that has been erected possesses more than usual interest because it constitutes the first system in which three-phase generators, with rotary converters, have been adopted in this country. It is true that the Dublin & Clontarf lines have been for some time operated on the three-phase system, but in this case motor generators were employed, and to English engineers that purely American product, the rotary converter, is entirely new. The line is not more than 6½ miles in length, and the track is double for the greater part of its length.

There is a very special reason why three-phase apparatus has been adopted: the Board of Trade insists that the fall in potential in the return shall not exceed 7 volts, and it is obvious that with a considerable number of cars working on a line this would be greatly exceeded if special arrangements were not made to overcome it. Near one end of the line, therefore, a three-phase generating plant has been erected and a high pressure current of 2,500 volts is conveyed by separate mains to two sub-stations in which rotary converters feed into the line at a voltage of 500. From beginning to end the whole of the plant is American, the central power house is occupied by three three-phase alternators, each of 300 k. w. capacity, running at a frequency of 25 cycles of 94 revolutions per minute. The engines are of the Reynolds-Corliss horizontal cross-compound condensing type, of 400 h. p., made by E. P. Allis & Co., of Milwaukee, and the generators have been supplied by the British Thomson-Houston Company, and made in America by the General Electric Company. The fields of the alternators are excited from the 500-volt bus bars. To supply light to the engine room and to start work in the morning a battery of the Tudor type has been supplied, consisting of 260 cells. For charging the accumulators a booster is connected in series with the 500-volt bus bars.

In addition to enabling the system to conform to the Board of Trade regulations, the three-phase distribution has enabled the promoters to avail themselves of a suitable site where water and fuel were easily obtainable.

The feeder cable which transmits the three-phase current from the central power house to the sub-station consists of two concentric cables, in each of which are three conductors of copper, suitably insulated, each copper conductor having an area of 50 sq. mm., or .0775 sq. in. The current at the sub-station is reduced by step-down transformers of 80 k. w. capacity to 320 volts, and this current is then passed into the alternating current side of a rotary converter from which a direct current of 500 volts is drawn to feed that portion of the line supplied from the sub-station. That section of the line contiguous to the main generating station is supplied by two four-pole rotary converters of 200 k. w. capacity, running at 750 r. p. m. A novel feature of the main station equipment, as far as English practice is concerned, is a combination of the static and rotary transformers for charging the batteries. The charging current is passed through the rotary and the voltage raised from the line average, 500 volts, to a maximum of 650 volts for charging.

There being no direct current primary generator in the station, it became a problem how to charge the batteries for supplying exciting current for the high tension three-phase generators. This was solved in the following manner: A rotary converter was designed to supply the difference between the line voltage and the variable voltage required for charging, and combined with this is a static transformer having a ratio of transmission of 330 to 80 volts. The transformer was designed with a large amount of leakage between the primary and secondary conductors, the leakage being adjusted so that by changing the phase of the armature current by a variation of the field current of the booster the transformer ratio is varied, and consequently the voltage on the collector rings. In this way it is possible to vary the voltage on the continuous side of the rotary from 40 volts to 150, the charging current being 60 amperes.

The steam raising plant in the main power house consists of

three Babcock & Wilcox water-tube boilers and these are equipped with a mechanical stoker worked by an electric motor. The power house being erected close to the river Tees, coal is taken direct from the barges by electric hoists provided with an automatic grab and is discharged into a receiving hopper where it is weighed, being then taken by a conveyor and carried to the storage bunkers inside the station. The most interesting feature to English engineers in the construction of the system has been the rapidity with which the outside work has been carried on and it will no doubt have a very marked effect upon new systems. It must be interesting even to American engineers, who are remarkable for the rapidity with which they equip lines for electric working. The Royal assent to the construction of the Middleborough lines was given on the 5th of August, last year, ground was broken for the new line at the Norton terminus on September 1, last, but so rapidly was the work carried on that the entire permanent way of 15 miles of track was completed in less than six months. This reduced the interruption of the general traffic on the streets to a minimum and actually within 18 months of the completion of the negotiations with the local authorities the lines have been opened in full working order. It need hardly be pointed out that matters as a rule move so slowly in this country that the period between consulting the local authorities and finishing the system is usually three years.

The tracks are laid on a gage of 3 ft. 6 in., and are paved with Winstone and granite in some parts of the system, and with scoria blocks in the town of Middleborough.

The progress of the work was viewed with the greatest interest by the community, and as six gangs, of 70 to 100 men were working at one time on the line, the scene was generally an animated one. The first process was to remove the old tramway line and to clear out to the required depth of 14 in. the breadth of roadway to be used. Following in every case the excavating squad, came the concreters, who laid down a solid foundation 6 in. deep of Portland concrete. Concrete laid to level was then ready for the platelayers, who proceeded to the actual track laying.

The steel rails in 36-ft. lengths are 6-in. girders of 92½ lbs. to the yard. At every 10 ft. the rails are tied to gage by steel bars; the joints are secured by specially designed fishplates. The bonding throughout is done by means of Columbia bonds and at intervals of 120 ft. the tracks are further cross-connected by copper.

The gradients generally are easy, but one or two sections are fairly severe, one portion being 1 in 18. In the towns the overhead wire is suspended by center poles, the remainder of the route being fitted on the side pole and bracket system. The overhead wire is of 000 gage, divided by the usual section insulators. Half-mile section pillars are arranged and in these are placed switches so it is possible to cut out a section of trolley line or feeder as may be desired without interfering with other parts of the line.

The cars have been specially designed in America for this service, and are each capable of seating 60 passengers. They are mounted on four-wheeled bogey trucks and each truck carries a G. E. 800 motor, and at each end of the car is a K2 series parallel controller.

The whole of the system has been designed by H. F. Parshall, of the British Thomson-Houston Company. The system is owned by the Imperial Tramways Company, the managing director of which is J. Clifton Robinson, whose pioneering work in electric traction I have referred to on former occasions. This gentleman has not only been responsible for importing the best electrical plants from America, but he has brought over from the United States methods which cannot help but have the greatest effect upon the successful initiation of electric tramway enterprise in this country. It is claimed, apparently with reason, that this tramway system is the most complete that has been erected in this country and it will serve as a model for future lines.

A correspondent advises us that for weeks past the American flag and the Union Jack have been floating side by side on the power house of the new electric railway at Thornaby-on-Tees, England.

## THE GRAB-HANDLE MAN AGAIN.

THE STATEN ISLAND MIDLAND RAILROAD CO.

STAPLETON, STATEN ISLAND, N. Y., July 15, 1898.

EDITOR STREET RAILWAY REVIEW:

Thinking you will be interested in knowing when you are of service to your subscribers, I write to inform you of a fake case of damages tried on us only yesterday.

The man making the claim had his arm done up in a sling, and had it bandaged so tight that it was purple. One leg was also bandaged up in the same way. He claimed that in alighting from one of our cars the grip handle pulled off, and was the cause of his falling off the car with such force as to result in these injuries.

The face of the man seemed familiar; we kept studying it, trying to make up our minds where we had seen it, and finally remembered a similar grip handle accident case, which was exposed in one of your issues; and, upon referring to the back numbers of the REVIEW, we found, in the September issue of 1897, on page 559, the picture of the man. We thus identified him and were kept from being imposed upon.

AUGUST KRAUSE, alias JOHN CRAMER, alias JOHN MILLER, alias JOHN SCHAEFFER.

We started out to get a police officer to put the man under arrest, but before we could get hold of one the man had taken to his heels and run.

John seems to be a favorite name of his, as I notice that he nearly always gives his first name as John; this time he gave it as John Schaeffer. It would seem that this man would stop trying this same kind of blackmail, having been caught now four times. Yours truly,

W. B. ROCKWELL, President.

(As this man is still pursuing his swindle we feel justified in again publishing his portrait, which appeared in the REVIEW for September, 1897.—Ed.)

## CORRESPONDENCE.

CHESTER TRACTION CO.

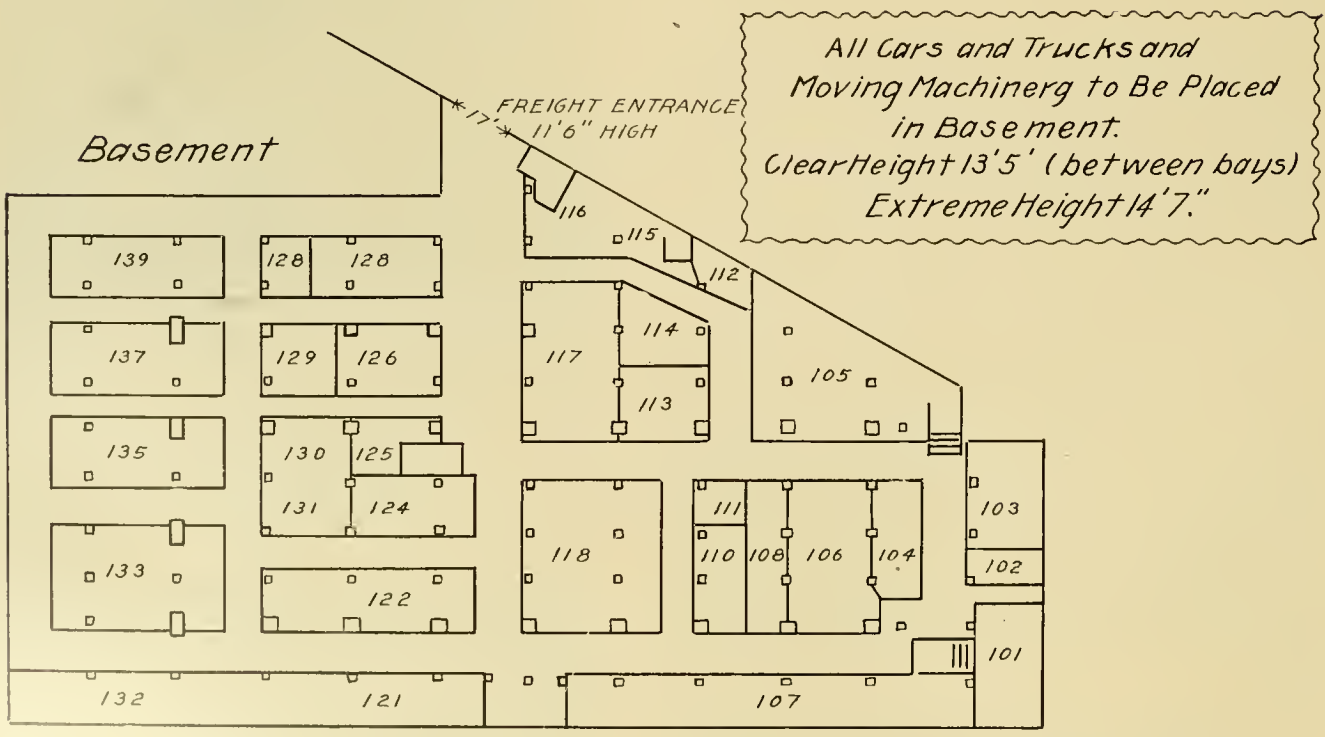

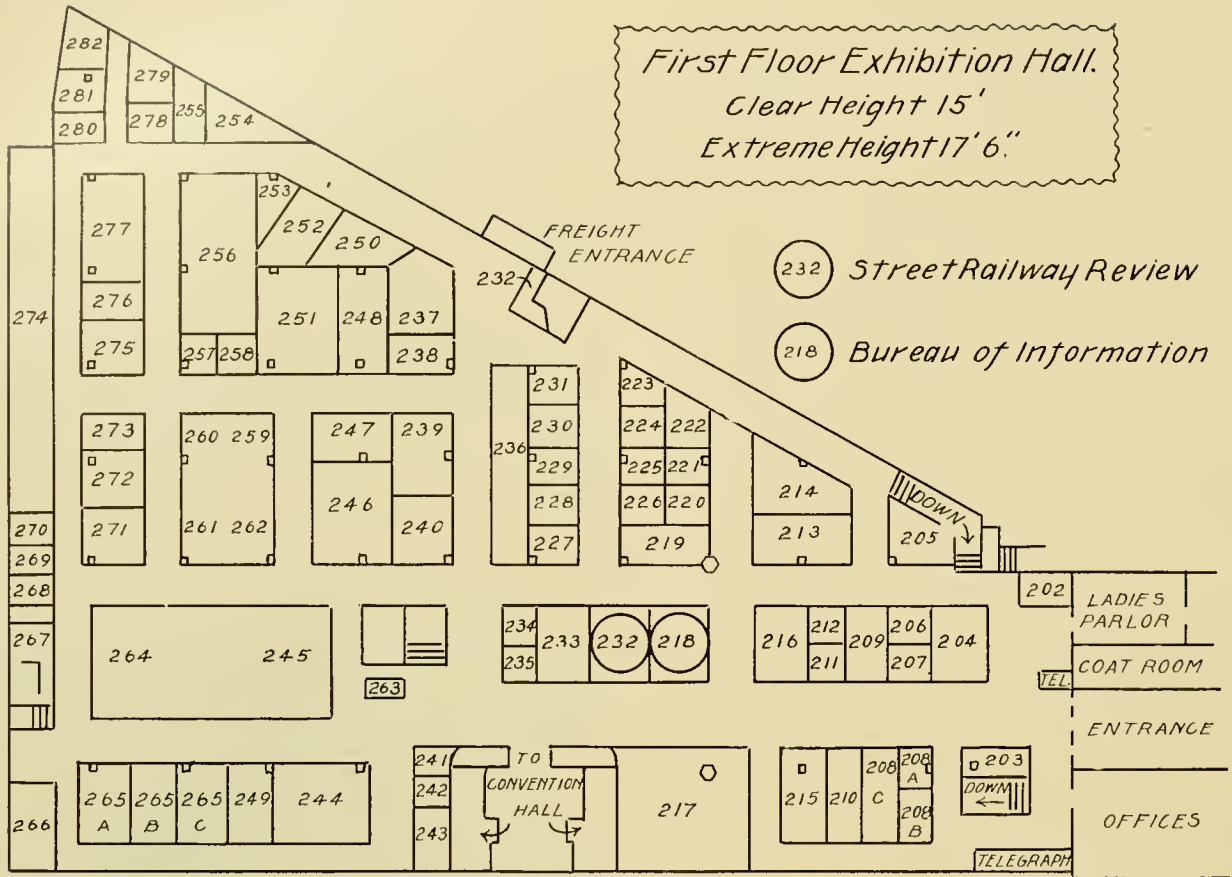

CHESTER, PA., July 30, 1898.

EDITOR REVIEW:

Regarding the application blanks used by our company, and published in the July REVIEW, I desire to state that I do not wish to claim any credit whatever for originating these very efficient blanks.

I understand that they were got up by Robert F. Fox for use by the Scranton Railway Company, of which he was at that time the general superintendent, but has since become general manager of the Wilmington and Chester Railway and Traction Companies.

JOHN MACFAYDEN, Superintendent.

## LIST OF EXHIBITORS AT THE BOSTON CONVENTION.

BASEMENT.		
Space No.	Name.	Sq. Ft.
102	McCardell, West & Co.	220

### THE BUREAU OF INFORMATION.

One of the important departments of the Convention will be the Bureau of Information, arranged for by the Committee on Transportation and Information.

This will be in charge of Robert H. Derrah, of the Boston Elevated Railway Company, whose knowledge gained in preparing the Derrah's Street Railway Guide to Eastern Massachusetts, will be found especially useful. A space containing some 240 sq. ft. has been reserved for the information booth, and this will be handsomely fitted up with rugs and furniture, with writing materials, etc., for the use of delegates and street railway men. In the booth will be a library of guide books, not only of Boston, but of Concord, Lexington, Plymouth and other places which many of the delegates will wish to visit. There

R. H. DERRAH.

will also be a case containing folders of all the railroad companies, with maps of Boston and surrounding cities. A special telephone will be put in this booth, in addition to that in the main building, so that if any delegate wishes information which cannot be furnished by those in the booth, they will soon be able to supply the want. This is the first time in the history of the Association that anything of the kind has been provided, and it is believed that the Bureau of Information will prove one of the valuable features of the Boston Convention.

Another road which started out full of promises and ambition to achieve success with a 4-cent fare is filled with sorrow and regret, and is imploring the city council for relief from conditions which it voluntarily assumed. For each 5-cent fare a check was given the passenger, and five of these checks were exchangeable for another ride. Now when transfers and improved service are desirable and demanded, the company finds itself unable to comply.

## BOSTON TRADE NOTES.

Meaker fare registers will be noticed in the cars of the Lynn & Boston road.

The Barney & Smith Car Company has 90 of its closed motor car bodies and 48 of its class G trucks on the Boston road.

McCardell, West & Co., Trenton, N. J., have one of their Trenton trolley wagons in service on the West End road.

The Crane Company, of Chicago, has a large number of its valves in the different power houses of the Boston Elevated.

S. D. Childs & Co., of 140-142 Monroe street, Chicago, furnish all the badges used by the West End Street Railway Company.

The Mica Insulator Company advises that its products have been furnished to the Boston roads and have given the best of satisfaction in every instance.

All the winter cars of all the roads in and around Boston have been equipped with the "Reliable" track cleaner, made by the Van Dorn & Dutton Company, Cleveland.

The Standard Underground Cable Company, of Pittsburg, has furnished a very considerable portion of the 230 miles of the feeder cables laid by the Boston Elevated.

An order for plastic rail bonds, made by Harold P. Brown, has been filled for the Boston Elevated Railway Company after the bonds had been subjected to a careful test.

The Dayton Manufacturing Company, Dayton, O., furnished all of the brass trimmings in 90 of the West End cars which were built by the Barney & Smith Car Company.

The Boston Elevated has 33 of the Taunton double track snow plows; and the Lowell & Suburban five. Taunton plows will also be found on the Wakefield & Stoneham road.

The Boston Elevated has a large number of the Q & C portable rail-sawing machines in use, and also some of the large power machines for rail cutting in the repair shops.

The Lynn & Boston Railway Company has adopted the Peckham "extra long" truck as the standard and has about 200 in operation. The West End also has Peckham trucks under some of its cars.

In the various power stations of the West End system there are Green fuel economizers aggregating over 6,000 h. p.; those in the Harvard station are fitted with the latest improved circulating valves.

Both the Boston Elevated and the Commonwealth Avenue companies have been extensive customers of the R. D. Nuttall Company, and have a large number of its trolleys, gears and pinions in use.

The Siemens & Halske Electric Company has manufactured dynamos and motors for the Boston Public Library, City Hospital, Massachusetts Charitable Mechanic Association and other private corporations in the city.

Almost without exception the electrical apparatus in the power houses of the Boston Elevated Railway Company was made by the General Electric Company. There are also a large number of General Electric motors on the Boston cars.

The Partridge Carbon Company will be represented at the convention by its secretary, J. S. Speer, who will exhibit a line of self lubricating motor and generator brushes and will gladly explain their many virtues to the visiting street railway men.

The Michigan Pipe Company has filled large orders for creosoted wood conduit to the New England Telephone & Telegraph Company for the underground cables in Boston.

A. G. Hathaway, of Cleveland, O., has furnished the West End road, Boston, with 27 single and two double Hathaway patented transfer tables; the Lynn & Boston and the Quincy & Boston have each two single tables and the Newton & Boston one.

Over 3,000 transfer ticket punches have been furnished to the Boston Elevated Railway Company by the R. Woodman Manufacturing & Supply Company. Large orders for these punches have been filled for the Lynn & Boston and other street railways about the city.

The John Stephenson Company has built cars for the street railways in Boston from the earliest horse car days to the present time. During this last spring an order for 30 standard 25-ft. closed cars was filled by this company for the Boston Elevated Railway Company.

The Crouse-Hinds Electric Company, of Syracuse, N. Y., has its "Syracuse" changeable electric headlight in service on several of the roads running out of and near Boston. This light is reliable, neat in appearance, efficient, costs nothing for maintenance and is very convenient to handle.

Elmer Chickering, who is the official photographer for the Mechanics' Fair, will have headquarters in the Mechanics' Building during the Street Railway Convention. He is one of the best photographers in Boston and will be glad to do the photographic work for the street railway men and exhibitors.

Two of the new geared axle-driven air brake equipments of the Standard Air Brake Company are in use on cars of the Commonwealth Avenue Street Railway Company. The Standard Company is represented in New England by Edward E. Pet-tee and John J. McCutchan, room 1008, No. 60 State street, Boston.

The R. D. Nuttall Company a few weeks ago sent to its friends and customers copies of R. H. Derrah's "Street Railway Guide" for eastern Massachusetts. This book embodies in convenient form the information that visitors at the convention will wish to know and should prove to be one of the best souvenirs that could be devised.

The Wheeler Reflector Company, with headquarters at 21 Washington street, has its electric headlights on the cars of the Commonwealth Avenue, Quincy & Boston, Lowell, Lawrence & Haverhill, Worcester & Suburban, Newton & Boston, Wellesley & Boston and a large number of other street railways in eastern Massachusetts.

The Christensen Engineering Company, Milwaukee, has its air brake apparatus on a number of Massachusetts roads; among them there are eight straight air equipments on the Brockton Street Railway, and 11 on the Lowell, Lawrence & Haverhill, all with independent motor compressors. On the New York, New Haven & Hartford electric lines are six equipments with No. 2 compressors.

In the power station of the Boston & Newton Street Railway Company, which operates a series of suburban roads connecting with the Boston Elevated system, there are four 200-h. p. Westinghouse compound engines. The Westinghouse Machine Company also furnished the steam loop system for draining the piping and automatically returning the water of condensation and entrainment to the boilers.

The Westinghouse Electric & Manufacturing Company has filled orders for the Boston Elevated Railway Company for 261 No. 3, 25-h. p. street car motors, 165 special 25-h. p. motors, 514 No. 12A, 30-h. p. car motors and switchboard apparatus. For

the Newton & Boston Railway, two 12A, 25-h. p. car motors, and two 200-k. w. belt driven generators. For the Commonwealth Avenue Railway, 82 No. 12A, 30-h. p. car motors and two No. 38B, 50-h. p. motors.

George A. Parmenter will exhibit at the convention several of his patent automatic fenders and wheel guards. A special feature of the Parmenter fender is a mechanism by which it can be moved back under the car some 8 in. when in danger of being damaged. Over 2,000 of these fenders are already in successful operation. The company's general office and works are at Cambridgeport, Mass.

Among the exhibits will be found one of the Duplex Car Company's new cars made by the Briggs Carriage Company, of Amesbury, Mass. This is a summer car and a winter car in one, the windows and flexible sides slide into the roof and can be lowered or raised to suit the weather; thus it will be seen it takes the place of a double equipment. Cars are now being turned out for a number of roads.

The Skeen Electric Switch & Signal Company, of St. Louis, last month equipped the Taunton & Brockton Street Railway with its automatic block signal system. This is an interurban line, single track with turn-outs, and as the cars make quick time a reliable signal system is highly important. Mr. Rogers, the general manager of the road, has expressed himself as much pleased with the working of the Skeen system.

The E. T. Burrowes Company advises us that its curtains have been adopted as standard for the open and closed cars of the West End Street Railway Company. Curtain No. 41 is used on the box cars and No. 482 on the open cars, there being in all 400 cars equipped. All the suburban railways about Boston, including the Lynn & Boston, the Commonwealth Avenue, the Quincy & Boston and Newton roads use car curtains manufactured by the E. T. Burrowes Company.

The Walker Company's exhibit at the Boston convention will comprise: Section of Walker underground conduit system with car in operation; Walker No. 15 L railway motor in operation; Walker No. 15 L motor open to show construction; Walker No. 33 S motor mounted; Walker No. 33 S motor open; set of 33 S armatures in various stages of construction; set of 33 S motor parts; Walker standard trolley; Walker standard railway switchboard panels with wattmeter; "S" controllers in operation; solenoid partitions, open and in operation.

The "Monarc" enclosed arc lamp is being manufactured and introduced to the trade by the Albert & J. M. Anderson Manufacturing Company, of Boston. The lamp is simple and substantial in construction and but 22 in. over all. Although occupying a small space, ample insulation and large radiating surfaces have been provided. The carbons are  $\frac{1}{2}$  in. diameter and 12 in. long, with good contact surfaces in the lamp. The arc is so enclosed that the combustion of carbon is reduced to a minimum and the lamp will burn for 150 hours without retrimming, which is easily and quickly done. Every part of the lamps can be readily removed and replaced. The class B lamps are for multiple series lighting on trolley circuits and have a resistance of  $6\frac{1}{2}$  ohms to each lamp. Clear outer globes and alabaster inner globes are furnished with the lamps. The well-known high standard of the Anderson products is a guarantee as to the excellence of the "Monarc."

The "Monarc" Lamp.

The Bemis Car Box Company, Springfield, Mass., is still doing business, and plenty of it, at the old stand, which has made it a familiar name to all street railway men. In addition to the Bemis patent journal box, the specialties include gongs, car coup-

plers and the Bemis journal oil. Its new double trucks are giving excellent satisfaction, and are running under some of the cars of the Newton & Boston. The officers of this road recently wrote Mr. Bemis that many patrons of the road wait for these cars on account of the easy riding qualities of the Bemis trucks.

The Pearson car replacing jack, made in Boston, is in service on more than 200 electric railways in the country, 27 of which are in Massachusetts, among them being the Boston Elevated, the Commonwealth Avenue, the Lowell & Suburban and the Quincy & Boston. The Pearson Jack Company has received a number of testimonials from street railway managers indicating that the jacks give good satisfaction. The Athol & Orange Street Railway Company writes April 22, 1898: "Your favor of the 21 inst., at hand; we have six of your jacks in use and find them of great value to us in replacing our cars on the tracks, saving us time and trouble." The Leominster & Clinton Street Railway Company writes April 16, 1898: "In reply to yours of the 14, would say that we have your replacing jack on this road, and we would not be without them, as we consider them the best jack there is in the market."

The "Monarch" track cleaner has completed its first year and it is remarkable that only one feature required changing, and that a very unimportant one. The cleaner has great merit, and the most practical superintendents have found it to be all that the manufacturers claim for it. Its adaptability to all styles of cars and platforms is a very strong argument in its favor, but more than this is the fact that it is so constructed that it combines both strength and lightness, so that the most unreasonable abuse has failed to weaken or break it. The motorman has absolute control over the action of the cleaner: The apparatus is made by the Monarch Stove & Manufacturing Company, Mansfield, O., and will be on exhibition at the convention, in charge of Charles N. Wood, who has had a very nice business from its sale in the New England territory. This exhibit will be well worth the attention of managers and car builders who wish to solve the snow problem, where a rotary plow is not a necessity.

The American Rail Joint & Manufacturing Company, Cleveland, has planned a very interesting display of joints, which will include 25 samples of full sized joints and short rails. The rapidity with which these joints can be laid is shown in a letter from Van De Mark & Hill, the constructing engineers of the new Detroit, Lake Shore & Mt. Clemens line, a road connecting the two cities with about 20 miles of track. They report that with only three men on joints, working 10 hours a day, they averaged between 600 and 700 joints daily, and add: "We would further state that our track is laid on a very soft, clay ground, and owing to the difficulty in securing gravel for ballast, we have been compelled to run our heavy construction train over this track without ballast or tamping of any kind for over two months. We consider that this has given your joints about as severe a test as they could be put to, and as yet we have to find the first joint that is broken or has become loose. Our construction train consists of a 20-ton locomotive, and from 8 to 10 standard size flat cars. This train has been run over the track at the rate of from 15 to 50 miles an hour, four to five times a day.

"We consider these joints a success, and that they are doing everything that was claimed for them, if not a little more."

Col. W. E. Ludlow, general manager, will have charge of the Boston exhibit of his company.

The Cumberland Valley Railroad Company, which is controlled by the Pennsylvania Railroad, obtained a controlling interest in the Harrisburg & Mechanicsburg Electric Railway, and it is announced that the line to New Cumberland from Harrisburg will be completed at once.

## LOOK OUT FOR THE FAKE ACCIDENT FRAUDS.

Exposure of Three Daring and Clever Schemes—Two Have Broken Ribs and Work the "Loose Screw" Game—The Other Sprains His Ankle to Order—How It Is Done.

Through the courtesy of O. B. Stuart, of the Chicago office of the Union Casualty & Surety Company of St. Louis, we are enabled to present some data as to the methods of three swindlers who have been successfully imposing upon various transportation companies as well as insurance companies.

Two of these men work what might be called the "loose screw" game, and so far as we know have only attempted it on steam roads, though one might think that the street cars would offer an equally good field. The method is for the two men to enter a train at a terminal station as soon as the gates are opened, and loosen one of the screws fastening the iron plate sunk in the floor at the point where cock for cutting of the steam supply is located. The screw is loosened until it projects half an inch or so. When the conductor comes to take up the tickets the men tell him that one of them stumbled over the screw and falling against a seat hurt his side, and also sprained his ankle, but express the belief that the matter will not prove serious. A few days later word is sent to the company and a visit from its surgeon is requested. The surgeon arrives and finds a badly swollen ankle and a fractured rib; and on his report a settlement is generally made by the company.

These two men have usually given the names of R. H. Davenport and Gilbert J. Moffett, and claimed to be artistic salt decorators (they decorate windows with magnesium sulphate and beer); sometimes one is injured and sometimes the other; the one who is not injured always serves as witness.

Davenport has a claim against the Union Casualty & Surety Company. Mr. Stuart had learned from another insurance company that about a month previous the same man had met with another accident, on a railroad train between South Chicago and Chicago. He investigated the matter and found that the Illinois Central Railroad had paid R. H. Davenport \$100 for injuries received in stumbling over a screw in one of its cars on May 23, 1898, and that the Chicago, Rock Island & Pacific had paid the same man \$200 for injuries received in stumbling over a screw November 29, 1897. Also the Chicago, Milwaukee & St. Paul had paid Gilbert J. Moffett \$150 for injuries received by stumbling over a screw in a car at Racine, Wis., in April, 1898; Davenport was the claimant's witness.

It has been discovered that each of these men has an un-united fracture of one rib, so that the examining surgeon always finds a broken rib. The swollen ankle is probably produced to order by bandaging the leg or by injecting croton oil into the joint; this latter method is the one followed by one Pascoe who served a term in the New York penitentiary, having been convicted of defrauding transportation companies.

The third man referred to is known as Edward Lanse, C. F. Powers, Robert P. Smith, Charles Rice, C. F. Rice, Frank Kramer, Thomas Wright, Harry Bidwell, being at present in jail at Saginaw, Mich., under the name of Rice. His method is to secure accident policies and then sprain his ankle on alighting from a street car, or by stumbling in the gangway of a steam boat. When injured he makes a claim against the insurance company and also against the transportation company; if the company asks too many questions the claim is usually dropped and he gets another sprain somewhere else.

Rice rents no less than five postoffice boxes in Saginaw, two under the name of Powers, the others as Rice, Smith and Stanley; in addition to these it is known that he has at least six others, one each at Lansing, Mich.; Bridgeport, Mich.; Colima, Mexico; Centerville, Ia., and Paine's Station, Mich. He is thus enabled to give various addresses, the mail being forwarded from one office to another.

Rice meets with his accident and at once goes home and wraps a rubber bandage some 3 in. wide and 3 ft. long around his leg above the ankle, leaving it in place for 24 hours or as long as he can stand the pain and then sends for the company's surgeon. When the surgeon arrives he finds a foot so badly swollen that really no thorough examination can be made, but it looks bad, and the case is passed.

Rice's witnesses are his wife, whom he claims is his sister, and her brother. Her maiden name was Scherping and her first husband was named Stanley; both she and her brother are used as witnesses twice, once as Scherping and again as Stanley.

In January, 1898, Rice secured \$75 from an insurance company, on March 25, 1898, he got \$150 from another, and July 19, 1898, \$100 from a third, all for sprains. His wife states that she believes he has successfully defrauded about 40 insurance, street railway and steamboat companies. Among the street railway accidents mentioned in a memorandum found among his papers and evidently made to refresh his memory as they give the date, town, name and age claimed on each occasion, are the following:

Apr., 1897, C. Rice, Saginaw, Mich. ....	36 yrs.
May, 1897, Frank Kramer, Ottumwa, Ia. ....	34 yrs.
July, 1897, Thomas Wright, Rock Island, Ill. ....	39 yrs.
Nov., 1897, (name illegible), Cincinnati, O. ....	30 yrs.
Mar., 1898, C. Rice, Lansing, Mich. ....	38 yrs.

Mr. Stuart did some very pretty detective work in connection with the Rice case. He went to Saginaw to investigate the claim made against his company by "Edward Lanse," when his man was known in Saginaw only as Rice. Arriving at noon, he had by 3 o'clock located Rice's house, interviewed his wife, searched the premises, found his private papers buried under the barn, and located the man in the county jail where Rice is now held for assaulting his wife. Rice has confessed the last fraud.

## SMITH'S NEW FIVE-LAMP HEADLIGHT.

Smith of New York, he who has a world-wide reputation for all kinds of railway illumination, not only keeps on making the large variety of excellent lamps enumerated in his big catalog, but constantly brings out new things. His latest is a 5-lamp headlight, in which the cluster is mounted on a swinging standard

for adjustment as desired. The cut readily explains the plan. These headlights are meeting with satisfaction, particularly on interurban and suburban lines, where high speed and the absence of street lights require a strong light. They are also found admirably adapted to construction work, being so easily carried and connected up and throwing a powerful light.

## ECHOES FROM THE TRADE

Alonzo G. Collins, M. E., Pabst building, Milwaukee, is making plans for remodeling the steam plant of the B. J. Johnson Soap Company, Milwaukee, which will include a 100-h. p. boiler and an addition to the boiler house.

The American Improved Rail Joint Company, Monadnock building, Chicago, has the contract for cast-welding the 18th street and the Leavitt street lines of the West Chicago Street Railroad; the company is also working on the Kansas City, Mo., lines, having two outfits there.

The Corning Brake Shoe Company has been doing an excellent business of late, orders for no less than 9,000 brake shoes being booked during July from New York city alone. The Joshua Hendy Machine Works, of San Francisco, will be the representatives of the company on the Pacific coast.

The American Rail Joint Company, Cleveland, has appointed Julian L. Yale & Co., Rookery building, Chicago, agents for the west and northwest. The Chicago office has recently closed a large order with the West Chicago Street Railroad, which is the fourth order received from that road.

The Joseph Dixon Crucible Company has issued a new edition of "Graphite as a Lubricant," revised and enlarged. It contains many valuable suggestions to engineers on the subject of lubrication of nearly every form of machinery. A summary of tests is given which shows the efficacy of graphite for lubrication.

The Westinghouse Electric & Manufacturing Company and the Baldwin Locomotive Works are co-operating in the manufacture of electric mine locomotives. The locomotives are made in sizes from 20 to 150 h. p. and are equipped with Westinghouse motors, rheostat controllers, fuses, lightning arresters, electric headlights, etc.

George A. Cragin, general southern agent of Washburn & Moeb, has been sending out from Galveston, to his many friends, one of the neatest and most unique desk souvenirs we have seen in a long time. It is one of the few which are sure to find a permanent place upon the desk, and every time we look at "her" we remember him.

The J. G. Brill Company has delivered to the Chattanooga (Tenn.) Rapid Transit Company three new cars for suburban service. These cars are of large size and handsomely finished. The trucks are built so that electric motors can be mounted, but it is now proposed to use the Patton motor cars on these lines and have the new cars for trailers.

George D. Munsing, manager of the Tampa, Fla., road is now building some of his combination cars, described in the July REVIEW, page 459, for double equipments. They are to be 34 ft. long, seating over 50 passengers; they will be mounted on du Pont trucks, equipped with electric brakes. They are designed for a speed of 25 miles per hour on suburban lines.

Merchant & Co., Incorporated, Philadelphia, are makers of high grade roofing plates, bright plates, solders, babbitt and mixed metal, "Gothic" shingles, "Spanish" tiles, etc., and have recently issued their 1898 illustrated catalog and price list which will be found very interesting by those in the market for metal roofing, lathing, etc., or the machines for working the same.

Elmer P. Morris, 15 Cortlandt street, New York, as announced some time since, has added a foreign department and offers his

services to foreign buyers of American electrical apparatus in purchasing, inspecting, shipping, etc. A small commission is charged for this service, and foreign customers will get the benefit of the lowest net prices and all rebates which the makers offer.

The Baltimore Car Wheel Company is to furnish the trucks and wheels for 150 cars recently ordered by the Baltimore Consolidated Railway Company. This is the third order received by the company from this road since its organization in June, 1897, when the Baltimore Traction Company and the City & Suburban Railway Company were consolidated; the three orders aggregate 230 trucks.

We have had several requests for information as to the whereabouts of R. Graham-Woodward, who came from San Francisco and opened an office at 26 Cortlandt street, New York. There are quite a few people, including the landlord, who would like to renew his acquaintance. He attended the last convention with a bicycle holder for street cars, and appeared to be a gentleman. He turns out to be a beat.

The performance of the U. S. S. Oregon in making a voyage 14,500 nautical miles (16,700 statute miles) in 80 days, and then reporting at once for active service has excited the admiration of all engineers, and shows the excellence of her machinery. The crank shafts, line shaft, thrust shaft and propeller shaft are all hollow forgings, with a 6-in. hole through them; they were made by the Bethlehem Iron Company, South Bethlehem, Pa.

The brilliant successes of American arms in Cuba will be followed by commercial achievements equally as gratifying so soon as peace shall be arranged. Even now there are straws visible indicating the wind of commerce; one of these is an order for a 100-h. p. plant, comprising Westinghouse engine and generator, boiler, pump, piping, etc., received by the Westinghouse Machine Company. The plant is to be installed at Santiago de Cuba.

We are in receipt of a letter from the J. G. Brill Company, advising us that it is about to bring suit against the Peckham Company, as it has in the past against others, for infringement of the patents on the Brill maximum-traction truck, which was first introduced by the Brill Company in 1888. With the rapid increase in large cars there has grown up during the past two years a large demand for the Brill "Eureka" maximum-traction trucks, which are giving great satisfaction and already are standard on a large number of roads.

The Walker Company has the contracts to furnish forty 500-h. p. alternators to the Union Carbide Company, of Chicago. An order for 20 of these machines was first received, which is stated to be the largest single order for alternating machinery ever placed; and a few days later Mr. Short, vice-president of the Walker Company, visited Chicago and closed the contract for a duplicate order.

The General Omnibus Company of Paris has decided upon the erection of two power houses; one for compressed air at Billancourt, and one for electricity at Vincennes. The latter will furnish current at 500 volts for charging the accumulators used on some of the company's cars. Babcock & Wilcox boilers will be installed in both plants. The Omnibus Company now has tram cars operated by the Rowan and the Serpollet steam motors and by compressed air, and will install overhead, underground and surface contact electric systems.

There is by far more creosoted wood conduit used in carrying the street railway feeders and cable in Philadelphia than any other form of conduit, and this has been furnished by the Michigan Pipe Company. This form of conduit has been extensively used for electric lighting, telephone and telegraph wires service and for all the wires owned by that city. The company reports that it has sold large quantities of creosoted wood conduit to the New England Telephone & Telegraph Company for the underground cables in Boston and other cities in New England.

The Hingham (Mass.) Street Railway Company wrote to Harold P. Brown that the plastic rail bonds, which have been in use for the past two years and a half, are as good as new, and that tests have shown that the bonds give practically an electrically continuous rail. The manager of the Bennington & Hoosic Falls reports that one mechanic with three laborers put plastic bonds on from 60 to 70 rail joints a day. This bond has been adopted for the new lines of the Union Railroad in Providence, the inter-urban roads around New Bedford, Framingham and elsewhere. The following table shows the results of tests of rail bonds made February 15 to 17, 1898, at the power station of the Boston Elevated Railway Company by the electrical engineer, Roger W. Conant:

90-lb. rail joint with plastic rail bonds under both angle plates. 12 in. between centers.			90-lb. rail joint with two West End No. 0000 copper bonds. Raile and plates new and rail ends touching. 12 in. between centers.		
Amperes.	Volts.	Temp. of Bond.	Volts.	Temp. of Bond.	Volts with angle plates removed and rails separated.

The Electric Storage Battery Company, of Philadelphia, through its western manager, Frank H. Clark, in July closed a contract with the South Side Elevated Railroad Company, of Chicago, for two storage batteries, each of 700 h. p. capacity, one to be installed in the power house at 12th street, and the other at 61st street. Each battery will be installed with tanks and bus bars sufficiently large to permit of an increase to double the present capacity. The batteries will be placed in parallel with the line, and will be used to take care of the fluctuations and maintain practically a constant potential at extreme points on the line. This will be the largest storage battery installation that has been made for feeder regulation. The batteries are expected to be in operation by September 15.

The No. 2 universal wood worker, made by the Egan Company, 322 to 342 West Front street, Cincinnati, is what may be called a car shop necessity. It is simple and easy of adjustment, and will do almost any kind of work; it will make glue joints; plane "out of wind;" chamfer; cross-gain; groove; cut straight; circular or elliptical moldings; tongue and groove; corner; plane taper; raise panels; miter; rabbet; will rebate and joint window blinds at one operation; make serpentine and wave molding; table joints; fluting and beading on corners or face of balusters; plowing; rip and cross-cut sawing; boring; routing, etc., etc., in fact the variety of work is limited only by the ingenuity of the operator. This machine will also plane out of wind up to 1 1/2 inches wide, and square one edge up to 4-inches thick at one operation.

The Eagle Iron Foundry, of Corry, Pa., is prepared to fully answer a troublesome question often asked by the operating officials of railways, i. e., "Where can we get a brake shoe that

will give satisfaction in all respects?" This foundry has spent years, and a great deal of money, in perfecting special mixtures of metals; it is the owner of Martin Ressler's patented iron mixtures. Among its specialties are brake shoes which give the best possible results in wear of shoes and saving of tires. These shoes are comparatively soft, but have a minimum mileage record of 12,000 miles, and no cases of broken shoes have ever been reported. The mixture is one of Mr. Ressler's. The Eagle Foundry brake shoes are recommended by the Oil City Street Railway, the Erie Electric Motor Company, the Jamestown Street Railway, the Jamestown & Lake Erie Railroad, the Western New York & Pennsylvania Railway, and the Buffalo Railway.

## VESTIBULES.

J. P. Sjoberg & Co., of New York, manufacturers of wood work for repairing and rebuilding cars or for new cars complete, are making vestibules which can be added to cars not so fitted.

The vestibule projects a few inches over the dash to avoid moving the controller box, although the brake rod has to be moved back about 10 in. to allow clearance for the handle. The general appearance of the vestibule is shown in the cut. The Consolidated Traction Company, of Jersey City, and the North Hudson County Railway Company, of Hoboken, N. J., equipped a large number of their cars with these vestibules last fall.

The illustration shows the patent sash and blind spring, made by this company; it is of high carbon steel, tempered and plated

SJOBBERG VESTIBULE.

in light bronze or nickel to suit the trimming on the cars. These springs are flexible and will always keep their shape and elasticity; they work easily and will not catch in the guiding strips. Large orders have been received for these springs.

Roger Williams' Church in Salem 1633

**THE PECKHAM NO. 15 TRUCK.**

The accompanying illustrations show the Peckham No. 15 swivel truck and one of the interurban cars mounted on them. This truck is designed for heavy and high speed interurban and elevated railway service and is built heavier throughout than the standard No. 14 and No. 14 A types. The two sets of bars forming the middle of the side frame, are placed farther apart to permit the swinging of a nest of half elliptic springs between them. The bolster is built up in truss form of two flat bars of a thickness and width suitable for the car bodies to be carried, and these bars are carried by adjustable posts. Secured to the top bar of

menting in this direction the action of the yoke springs located directly over the journal boxes. The motors are supported upon the transoms which are rigidly secured to the side frames of the truck which in turn are provided with corner brackets or braces to keep the truck in alignment. The brakes used on this truck are the double lever style and are very powerful; the journal boxes are the M. C. B. standard.

These trucks are used on a number of interurban roads among which may be mentioned the Milwaukee, Racine & Kenosha and the Cleveland, Berea, Elyria & Oberlin. The car shown is one on the latter road; the body was built by G. C. Kuhlman & Co.; it is equipped with the Christensen air-brake.

INTERURBAN CAR MOUNTED ON PECKHAM NO. 15 SWIVEL TRUCKS.

the bolster are "King" side bearing springs to provide for a slight rocking motion of the car body. The bolster is supported at each end on one or more half elliptic springs, depending on the weight of the car body to be carried and the ends of these springs are carried in universal M. C. B. links, which permit of motions both longitudinal and transverse, thus permitting the span of the springs to increase as the load comes on them, and at the same time acting as links providing for the transverse swinging of the truck bolster. These links are supported upon the side frames by coil springs making three separate sets of supporting springs, the bolster half-elliptic, the bolster link coils, and the journal box coil springs, between the car body and rail.

The top bolster is guided between the upper bars to prevent

The substitution of electricity for steam on the railroads of Switzerland is receiving consideration and an important experiment in this line is now being carried out. Water power is abundant, affording a cheap supply of electricity while only coal of poor quality can be obtained and that at a high price. A water power is being developed near Thun and the current will be transmitted to the railroad over which electric cars will be operated.

F. H. Treat was in July re-elected president of the Wilmington & New Castle (Del.) Railway Company. The treasurer's report for 11 months showed receipts of \$40,000 and expenses of \$26,000, a very gratifying statement for a 6-mile road.

PECKHAM NO. 15 SWIVEL TRUCK.

motion in a direction longitudinal with the car body. These guides serve to transfer the draft of the motors from the trucks to the car body. The location of the half-elliptic springs between the bars of the side frames permits the drawing down of the bolster to the narrowest permissible width, thus shortening the wheel base of the truck. This location of the elliptic springs also imparts to them the properties of an equalizer, permitting any of the wheels to rise independently of the car body and supple-

G. J. Smith, master mechanic of the South Covington & Cincinnati Street Railway, Covington, Ky., was a caller on the Review when in Chicago recently.

Col. W. E. Ludlow, president of the American Rail Joint & Manufacturing Company, Cleveland, was a caller at our office last week. He reports the outlook for new business excellent.

## NEW YORK STATE ASSOCIATION.

The 16th annual meeting of the Street Railway Association of the State of New York will be held at the Hotel St. George in Brooklyn, on September 13 and 14, 1898. It is the custom of this association to submit a list of topics for discussion to the various companies with a request that representatives choose a topic and prepare a paper on it.

The list of subjects is printed below, but at the time of going to press we have not a complete list of the assignments.

Storage Battery  
 The Repair Shop  
 "The Third Rail."  
 Municipal Ownership  
 The Care of Dynamos.  
 "The Metallic Circuit."  
 General Track Construction  
 The Standardization of Trucks.  
 The Use and Abuse of Transfers  
 Points on Financial Organization  
 Pointers on Store Room Accounts.  
 Ties; Their Life and Preservation.  
 Daily Inspection of Car Equipment.  
 Long Distance Power Transmission  
 Suggestions for Car Mileage Records.  
 Signal System for Single Track Road  
 Pleasure Resorts; Are They Profitable?  
 "By Products at Power Station." T. J. Nicholl, Rochester  
 The Organization of Street Railroad Employes.  
 Fenders; Their Advantages and Disadvantages  
 How Can We Increase the Efficiency of Employes.  
 The Use of Air and Power Brakes for Electric Cars  
 Track Bonding—How Can We Obtain the Best Results?  
 Freight and Express Service on Interurban Electric Lines.  
 Possibilities and Advantages of Interurban Electric Roads.  
 Low Joints—How to Remedy Them; How to Prevent Them.  
 Accident Insurance; the Best Form; Can We Insure Ourselves?  
 Municipalities vs. Street Railroads; Their Relation to Each Other.  
 The Use of Individual Fare Boxes; Are They Practicable? M. M. Fenner, Fredonia.  
 Removal of Snow and Ice; From a Practical and Economic Standpoint.  
 The Prevention of Accidents; the Best Means of Accomplishing This End  
 Rails—Their Construction from a Scientific Standpoint. Results of Chemical Analysis. A. J. Moxham, Johnstown, Pa  
 "Receipts From Other Sources." How to Obtain Best Results From Sale of Advertising Privileges, Power, Etc.

The Baltimore street railway companies report their park tax, 9 per cent of the gross earnings, for the quarter ending June 30, 1898, as follows: City Passenger Railway, \$25,951.09; Consolidated, \$36,951.09; Central Railway, \$4,695.

The Baltimore City Passenger Railway Company is to issue \$2,000,000 more stock. The proceeds will be used to pay for the Central Railway Company's lines, electrifying the Red and White lines, installing new power house machinery, and to constitute a reserve for future improvements.

## ELECTRIC SWITCHING LOCOMOTIVE.

The McGuire Manufacturing Company is building two electric switching locomotives for the General Electric Company, one to be used by the New York Sugar Refining Company, New York City, and the other to be used by the Hoboken Railroad, Warehouse & Steamship Connecting Company, Hoboken, N. J. They

MCGUIRE ELECTRIC LOCOMOTIVE.

are to be equipped with G. E. 51 motors inside the wheel base, equal to 200 h. p.; the wheel base is 5 ft. 6 in. and the wheels are 36 in. in diameter. The total weight is 28,000 lbs. Each locomotive is to be equipped with Westinghouse air brakes, locomotive bell and a 5-in. air whistle.

## A CATALOG ON MICA.

A neat and interesting catalog has been published by the Mica Insulator Company. For an introduction is a short pictorial history of mica, showing how this important insulator is mined, sorted and trimmed by the Hindoos of India. A description is then given of the manner of splitting and re-assembling the raw laminations of the mica crystals resulting in a homogeneous material, micaite. Useful tables are also given including resistances, break-down voltages, etc., of a number of insulators. Some instructive articles are printed on "Physical Properties of an Insulator" and "Field Spools." Micaite plate, cloth, paper, commutators, segments, rings, and other specialties of the company are described. One striking feature showing the extent of the street railway business of the country is a list of commutator insulators for 51 types of railway motors.

**A STANDARD BOSTON CAR.**

The accompanying illustration shows one of the 9-bench open electric motor cars of the Boston Elevated Railway Company. This is one of 75 such cars recently built by the J. G. Brill Company, following the Boston standard drawings and specifications. It has the Brill patent malleable iron seat end benches and is mounted on the Brill No. 21 B truck, better shown in the other engraving. Within the last 18 months this road has purchased upwards of 400 of these trucks.

In connection with Boston and the Brill Company it is interesting to recall that John A. Brill sold to the General Electric Company a truck which was one of the first independent motor trucks ever built. It was put in operation on the Boston & Revere Railroad and was in successful operation for many years; it is believed to be in operation today.

The gross earnings of the Brooklyn Heights Railroad Company for July were \$572,116, an increase of \$82,653 over the corresponding month last year.

W. H. Holmes, vice-president and general manager of the Metropolitan Street Railway Company, Kansas City, Mo., has offered to give \$500 and raise \$500 more among his friends for an ice fund to furnish ice to the poor.

A new company, the Quebec, Montmorency & Charlevoix Railway Company, has taken over the entire system of the Quebec District Railway Company. Bonds amounting to \$1,500,000 have been sold to Hanson Bros., of Quebec; some \$350,000 will be expended in improvements and extensions.

**RAILWAYS OF SAGINAW TO BE SOLD.**

In the case of the Boston Safe Deposit & Trust Company against the Union and Consolidated street railway companies of Saginaw, Mich., an order was filed August 13 authorizing the sale of the property of the Consolidated Street Railway Company. The court also authorized the sale of the Union Street Railway after November 26. The bondholders of the two companies are trying to come to some agreement in order to consolidate the two systems.

**TEAPOT COLLECTORS DISCONTINUED.**

After the decision of the supreme court of Michigan (REVIEW, July, p. 470), the announcement of the receiver of the Union Street Railway Company, of Saginaw, that the teapot fare boxes would be dispensed with during the summer season of heavy traffic, is in the nature of a surprise. The reason given is that the conductors would be exposed to danger in so collecting fares on the foot boards of crowded cars.

The Delaware (O.) Electric Street Railway on August 4 gave the first of a series of evening pleasure excursions over the several lines of the road; it proved popular and there will be two excursions each week so long as the traffic justifies them.

On July 4, the Cleveland roads carried 282,896 passengers; of these the Big Consolidated had about 150,000; the Little Consolidated, 111,000; the A., B. & C., 9,000; the Cleveland & Painesville, 6,000; the Lorain & Cleveland, 4,900; the Chagrin Falls, 2,350; the Cleveland, Elyria & Oberlin, 5,000.

### A SPLENDID RUN.

John I. Beggs, general manager of the Milwaukee railway and light systems, is making some notable improvements in his lines, nearly a million dollars having been recently expended. Recently he opened the new line to Waukesha, 26 miles long, connecting that city with Milwaukee. A few days later, and long before the track construction men were through, he made a run, starting from Kenosha and reaching Waukesha by way of Milwaukee, covering the distance of 61 miles in two hours and 25 minutes. In view of stops for railroad crossings, slower speed through several cities and towns, and a considerable portion of unsurfaced track, Mr. Beggs has good reason to consider his run a record breaker.

Receiver R. B. Baer, of the Galveston City Railway Company, reports a balance of \$7,388 from the June operations. This gives a total surplus of \$39,579 on hand.

The Patterson (N. J.) Railway Company paid \$10,726.28 in settlement of a judgment given three years ago on account of a trolley car cutting off the leg of a five year old boy.

The postmaster at Kansas City has been conferring with the officers of the Metropolitan Street Railway Company in reference to mail cars which are much needed as the facilities for handling mail are inadequate at present.

L. R. Cummings, a conductor on the Cicero & Proviso electric line, Chicago, was killed while collecting fares on a crowded car July 17; he swung out on the rear step and was struck on the head by a trolley pole in the middle of the street.

July 21, the street car service of Sacramento, Cal., was interrupted by reason of low water in the American river at Folsom, 20 miles away, where the power is generated. Arrangements were made to use the steam power so long as the low water continues.

C. Townsend Blake, Philadelphia, who makes a specialty of handling railroad bonds, has recently sold an issue of \$100,000 of first mortgage 6 per cent bonds of the Mason City & Clear Lake Traction Company of Mason City, Ia. These bonds were sold in Boston.

**EVERYTHING IN STOCK. SEND FOR CATALOGUE.**

**A MONSTER GENERATOR FOR BOSTON.**

The commutator illustrated is for the largest generator ever designed, which will soon furnish current for the lines of the

WALKER MAMMOTH COMMUTATOR.

Boston Elevated Railway Company. This machine, which is now in the process of construction at the works of the Walker Com-

pany in Cleveland, has a rated capacity of 2,700 k. w., or approximately 4,000 h. p., but will be capable of carrying an overload up to 5,000 h. p.

There are alternating current generators which are rated as high as 5,000 h. p., but it should be remembered that these are high speed machines and operated by water turbines, while the Boston dynamo will run at 75 r. p. m., thus necessitating a greater size and weight than any other generator ever constructed.

The total weight of the Boston generator will be about 300,000 lbs.; the armature alone weighing 115,000 lbs. and is 15 ft. 6 in. in diameter. The shaft on which this mass of copper and iron is to revolve is 3 ft. in diameter. There will be 24 poles. The outside diameter of the commutator is 8 ft. 9 in.; the outside dimensions of the whole machine on the foundation will be 25 ft. At normal load the generator will give an output of 4,500 amperes at 600 volts, this being sufficient to operate 300 loaded street cars.

The field magnet is 21 ft. 8 in. in diameter. In this field magnet lies the chief difference between this generator and the smaller ones of this type. Instead of being of cast iron the field frame is of steel, cast hollow and provided with hand-holes, one for each pole. The poles are of laminated wrought iron as in all Walker railway generators but they are bolted into this frame instead of being cast into it. The hand holes referred to give easy access to the bolts holding the poles in place.

The Walker Company has many railway generators of 1,600 k. w. capacity in successful operation; among them being those in the Kent avenue power station, Brooklyn; in the power stations of the Union Railway Company, New York; and the Metropolitan Railway Company, Kansas City; but Boston will have the distinction of having the Titan of them all.

The Hazard Manufacturing Company, Wilkes-Barre, Pa., has commenced running its new machinery for making 6-ft and hard drawn copper wire, and will shortly be producers of insulated copper wire of all kinds.

**TROUBLE IN MARKET STREET, SAN FRANCISCO.**

Market street, the main business artery of San Francisco, has been occupied by four parallel street railway tracks, the two in the center of the street being cable tracks and the others horse tracks. Since the Market Street Railway Company succeeded to the companies that formerly occupied this street it has made but little use of the two horse car lines, cars only being run to satisfy the conditions of the ordinance so as to hold the franchise and keep out competitors from this street.

July 25, 1898, the Board of Supervisors of the City and County of San Francisco passed a resolution reciting that the Market

MARKET STREET, SAN FRANCISCO.

Street Railway Company was maintaining two of its four tracks without legal authority, and ordering their removal, the superintendent of streets being directed to take them up if the company did not do so by August 6. The company, under date of July 29, protested against this action and notified the Board, the members thereof, the mayor and the superintendent of streets, that it would hold them jointly and severally liable for any damages that it may sustain by reason of the removal of the tracks. The company states that it operates the tracks in question strictly according to the terms of its franchise.

The inference is that this protest is to fix the liability upon the city and its officers, if the company should be damaged by reason of a competing line making use of the portion of the street now vacated.

Another point of difference between the city and the company is in regard to the paving of the space occupied by the tracks. The company by direction of the city put down basalt block pavement when the street was improved, and this being in good repair, it declines to tear it up and substitute bitumen on a concrete base.

A large power plant is being erected near the coal deposits of Cañon City, Colo., current being transmitted to Cripple Creek for railway and mining purposes.

The stockholders of the Toledo, Bowling Green & Fremont Railway Company at the regular meeting accepted the resignation of F. J. Hoag, as president, and elected Edwin Jacoby to fill the vacancy. The matter of extension was also considered, as the franchise provides that the line shall be extended five miles by December 30.

In December, 1894, after competitive trial lasting 15 months, E. F. DeWitt & Co., of Lansingburgh, N. Y., equipped 175 cars for the West End road with "common sense" sand boxes, which are reported as in good condition at the present time. This firm has also had 14 equipments in service on the Gloucester Essex & Beverly Street Railway for three years.

## NEW CARS OF INTERESTING TYPES.

The Cleveland, Painesville & Eastern Railroad is just putting in service some interesting open cars of large size and rather unusual construction. They are intended for high speed (45 to 50 miles per hour), and are constructed in an unusually substantial

weight. In all parts of the car care has been taken to reduce the weight as far as possible without sacrificing strength. The car side up to the level of the window openings is of the usual steam car style somewhat modified because there is much less than the usual depth.

The dimensions are as follows: Length of the body, 42 ft.;

CLEVELAND, PAINESVILLE & EASTERN CAR.

manner. One of these cars is shown in the accompanying engraving. In appearance there is a curious blending of steam and street car features. The roof and hoods for example are of the street car type. The platforms combine the features of steam car steps with the street car dasher and headlight. But the steps are fitted upon one side only of the car and the platforms are intended to be occupied by passengers. For this reason the door is placed at one side of the center next the steps and on the other side of the platform a seat is placed. The platform of course has but a single opening. The construction is unusual and very strong. It was designed by the J. G. Brill Company of Philadelphia who built the cars.

All the floor timbers run through to the crown pieces except the sill next the step. This brings the platform level with the car floor and produces an exceedingly solid structure with a minimum

width at the widest points, 8 ft. 5 in.; length over the buffers is 51 ft. 8 in.; length of platforms, 4 ft. There are two steps with 13½-in. risers; the lower one is 18 in. from the head of the rail, making the total height to the platform 45 in. The buffers are of the Brill continuous angle iron pattern.

The cars are mounted on "Perfect" trucks (Brill No. 27); they have 33-in. wheels with a 6-ft. wheel base.

There are 26 cross seats with stationary backs. The seats are large and comfortable, and are spaced 2 ft. 8 in. The car will seat 54 persons including the platform seats. There are 12 windows or openings on each side which may be closed by spring roller curtains. Telephone boxes and annunciators are provided, the road being operated on telephone orders.

The Metropolitan Street Railway, of New York city, is now putting in service a number of cars built by the J. G. Brill Com-

COMBINATION CAR—METROPOLITAN STREET RAILWAY, NEW YORK.

*This is one of the oldest and most competent motormen on the Commonwealth Avenue Street Railway Line. . . .*

*He states that he is always "thankful that his cars are equipped with WHEELER HEADLIGHTS" That they are the "brightest, the lightest, and that they light ahead farther than any other"*

*And that he feels "perfectly safe on the darkest nights with these headlights."*

*See them on hundreds of suburban cars, at the exhibit hall, or at our office, 24 Washington St., Boston.*

*WHEELER REFLECTOR CO.*

pany which are of a novel type. Their introduction upon a road handling such a heavy traffic will be watched with interest. The principal reason for the adoption of the combination type, a modified California car, is the order of the board of health which provides that one car in every four shall be closed.

The general type is shown in the engraving. The closed body is of the same style as the standard closed car of the road but shorter. The open portion is of the same character as the open cars which the company is using.

The new combination cars are 35 ft. 11 in. over the crown pieces. The width over all is 7 ft. 2½ in. The rear platform is 3 ft. 6 in. long, the forward platform, that on the open end, 3 ft. 8 in. There are five reversible seats and two stationary, one of the latter being outside the bulkhead. There are folding steps on each side like those on the ordinary open cars but contrary to the usual practice these are carried the full length of the car, and give the conductor means of reaching the open portion from the platform at the opposite end without passing through the closed body, a hand rail being provided on the body for the conductor to take hold on. The top of the sill is 33 in. from the head of the rail which gives a rise of 18 in. to the first step and 15 in. from this step to the floor of the car. The step is but 3½ in. higher than the step of a closed car, and the floor of the car is carried 1½ in. lower than that of the ordinary cars.

The closed compartment is 11 ft. 2 in. over the corner posts and has longitudinal seats covered with Wilton carpet. There is space on the seats for 14 persons. The open portion of the car seats 35 making the total seating capacity 49. White ash slat seats and backs are used in the open part. The finish in the closed compartment is ivory ash with wavy maple headlinings.

ESTABLISHED 1848.

Westinghouse Building, PITTSBURG, PA.  
18 Cortlandt Street, NEW YORK.

1225 Betz Building, PHILADELPHIA, PA.  
542 The Rookery, CHICAGO.

507 Security Building, ST. LOUIS, MO.

The cars are mounted upon "Eureka" maximum traction trucks with 30-in. driving and 20-in. pony wheels. The total wheel base of the car is 17 ft. 6 in., and that of the trucks 4 ft. There are two G. E. 1000 motors.

Outside the cars are finished in the standard cream and orange of the road. The ornaments and lettering are of aluminum leaf. The open portion of the car roof is provided with a gutter which has a dip at each end and in the center, the water coming down through the grab handles and being carried away below the running board by an extension pipe.

It is thought that these cars can be run the year round and thereby accommodate smokers in the winter. Several roads have deemed this idea practicable and have ordered sample cars for the purpose of testing it.

### IMPROVED EXCELSIOR SELF-OILING HARP.

The International Specialty Company, of Detroit, Mich., within the past few months has been introducing on many of the large electric railways of the country a self-oiling trolley harp, which has been described in the REVIEW.

Owing to the many different conditions in wiring and switches which have been met, the form as originally made was not practical under all conditions. A change has been made in the form, overcoming every objection that has presented itself, and the harp, as shown in the accompanying illustration, is a thoroughly practical device.

The form is almost identical with the harps now in use. The

wheel is so protected that the motorman cannot in any way get the wheel on top of the wire; and under the lowest bridges, the overhead wire cannot rub on any part of the harp. The chief claim made by the manufacturers are that there is a large saving of oil; the

axle being constantly oiled preserves the standard graphite bushings now in use; there being little wear and hence no vibration, the wheels will last much longer.

The oil will not fly off the lub from centrifugal motion, proper flanges protecting the same. The principal trial has been on the Rapid Railway of Detroit, which has cars with double 75-h. p. motors geared for a speed of 50 miles per hour, and the report of this road after a 30 days' trial was that with one oiling they made a run of 7,652 miles without refilling cups and with no indication of wear on any of the parts of the trolley harp.

This harp will be on exhibition at the Boston convention and can be seen at the exhibit of Charles N. Wood. The company will be glad to give further information and send circulars to those desiring them.

The American Impulse-Wheel Company, of 120 Liberty street, New York, has published a very attractive catalog, illustrating and concisely describing the Cazin impulse-wheel of the type commonly known as "hurdy-gurdy." Figures are given for different styles of turbines and water motors. The Lombard governor, for regulating the speed of the water wheels and the one recommended for the larger sizes, is also shown. This company is prepared to furnish not only water wheels, but pipe, belting, valves and other accessories for large water power plants furnishing current for large transmission and railway purposes.

Business Manager.

### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 8. SEPTEMBER 15, 1898. NO. 9

Prior to this year the Association was bound by an iron-clad by-law which designated the time of its regular meetings as the third Tuesday in October, which the same it always religiously obeyed and in consequence gave the delegates and supplymen some bad days on several occasions when the weather man sent an early winter, and no means were available for efficiently heating the convention and exhibit halls. After agitating the matter of so amending the by-laws as to permit the time of meeting to be chosen earlier or later, according to the latitude and climate of the convention city, the Association at the Niagara Falls meeting amended Article VII so as to read "between September 15 and December 15 of each year," instead of "the third Tuesday in October."

Everyone applauded the change because for the last three years October has been uncomfortably cold—an even stronger word would be more applicable to Montreal. It was not anticipated, however, that, after being given so much latitude in selecting the date, the Executive Committee would be obliged to execute a "conp" and hold the meeting 10 days earlier than the limit. But such was the case, the early date being obligatory because a suitable hall could not be secured in Boston at the time wished. The convention was not "legally" the regular meeting but by a unanimous vote the convention decided to consider it so, as will be noted in the proceedings.

The weather, after the morning of the second day, could not have been more perfect, and had the meeting been held a month later we feel sure that the sea breezes would have been found to detract from the pleasure of the excursions, rather than add to it, as was the case.

We heartily approve of giving the Executive Committee full power in choosing the meeting time, and think that this year's experience shows that a mistake was made in imposing the conditions, which it has been found necessary to violate.

The supplymen were better housed than ever before, and for the first time everyone got all the space he asked. The result of this was that the exhibits were not crowded together, as at previous conventions, and greater opportunity was afforded for the artistic arrangement of the apparatus and goods shown. The exhibitors took advantage of this and gave us a display that we believe has never before been equaled at our conventions.

Does it pay the supplyman to place an exhibit at the convention? Everyone of them with whom we talked at Boston said that it does pay in one way or another. In several instances nearly all of the apparatus shown was sold before the convention closed, and we were advised of several large orders taken, though exhibitors do not, as a rule, expect to get many orders at the conventions. As one gentleman expressed it: "We don't do any business here, but I shall hear of enough new business to keep my salesmen busy for the next six months; and it is the exhibit which brings me in contact with these men who are to be in the market in the near future."

The topics discussed at the Boston meeting were all timely, as evidenced by the discussions.

In Mr. McCulloch's paper on single and double trucks were presented data on the very points which the manager about to invest in new rolling stock for use under conditions where he has a choice of either kind, is anxious to know. In discussing this paper Mr. McCormack, of Brooklyn, said: "The double truck cars increase the patronage to such an extent that we have had to shorten the headway." This statement was made as apropos to the claim made for double truck cars that their use enabled the headway to be lengthened. If all managers could be assured that they would have the same experience as Mr. McCormack, the double truck would be the one to use.

Mr. Dimmock's paper on street railway mail service and the animated and interesting discussion which followed make it evident that the Association here has a splendid field to do some work of great benefit to the street railway interests. We believe that Mr. Sergeant reached the meat of the mail compensation question when he said that Congress needed enlightenment, and did not fully comprehend the possibilities of the street railway mail service. The able committee appointed to consider this question will, no doubt, accomplish results of value.

Mr. Hopkins' paper is one which will receive the careful attention of those having to do with the care and repair of electric cars.

In treating of pleasure resorts Mr. Holmes gave his experience in Kansas City, and laid before the convention the details as to one set of the "local conditions" which, to so great an extent, determine what a street railway shall do in the amusement line. Mr. Holmes quoted Gen. Hancock's statement of the tariff question as applicable to this subject, and from the remarks of some of the gentlemen who discussed the paper, we infer that they regard Gen. Sherman's definition of war as also applicable.

Mr. Perkins presented an able paper on the inspection and testing of electrical car equipments, and it is to be regretted that the lateness of the hour prevented a general discussion, as it is one which greatly interests the practical man and doubtless valuable data would have been thus placed on record.

We believe that a more valuable paper than that of Mr. Conant has never been presented before the Association. It is a paper so full of meat and so technical that it was idle to think of submitting any discussion of it at the meeting after merely hearing it read. It is a cause of regret that the policy of the Association does not permit the technical papers, at least, to be

printed and sent to the members in advance of the meeting, for in that event opportunity would be given to submit discussions of them which could not fail to be of interest.

At no previous convention have the entertainments and excursions provided for the visiting delegates been better managed or proved more enjoyable. The hosts at Boston were the members of the Massachusetts Street Railway Association, and under the management of the committee on entertainment, ably directed by its chairman, P. L. Saltonstall, of Boston, they arranged a number of excursions which will henceforth constitute a standard, and, we fear, a hard one to surpass.

Only three delegates were present at the Boston meeting who were participants in the organization meeting, seventeen years ago. The new faces each year testify to the constant change in attendance, and comparatively few are left of the "happy family" of old horse car days, when the same ones could be confidently counted on each year. With the change to electricity the gathering has become just as distinctively one of young men, as the gray heads predominated up to that time.

We notice each year a steadily increasing attendance on the part of heads of departments, such as chief engineers, master mechanics and head electricians. Time was when the conventions were for executive officers and held little of interest for the other departments. That is rapidly changing and we are confident that no company will fail to get large returns on the money spent in sending its men to the Boston meeting. These gatherings are fairly bristling with ideas and experiences and many of the best of them are never heard on the platform or published in the reports.

The mayor of Denver, who vetoed an ordinance for a line which the people wanted, has had the satisfaction of seeing it passed over his head with scarcely a dissenting vote. His position was unjust and untenable and unpopular and the rebuke will probably set him to thinking. The time had expired on a suburban line which has never paid, but had made heavy losses. Hundreds of workmen had bought little homes on this line because the land was cheap. One of the big companies offered to accept the road and run it if the franchise was extended. The mayor tried to hold up the road and would have seen the tracks removed and several hundred families lose their all, rather than yield.

Next year Chicago. We have no Lexington, or Concord, Bunker Hill, or in fact any hill at all, but we have a great big hearty welcome waiting, and it will not diminish in size as the months go by. The Chicago delegation had scarcely returned from Boston before the selection of committees was discussed, and by the time this reaches our readers a convention organization will be well under way. Chicago is central; its railroad facilities are the best in the world; we have plenty of good hotels, and hope to see not less than two thousand at the '99 convention.

The convention of the Accountants' Association was successful in every way, and the sessions well attended, notwithstanding the date was an unfortunate one for eastern men, with many of whom the fiscal year closes October 1. The membership is growing rapidly, and interest in the work constantly increasing. The committee on standardization have performed a most laborious work, in a highly creditable manner. A permanent collection of forms and blanks has been started, with a librarian in charge, and this will be made a valuable feature, accessible to all members.

The department devoted to law, under the head "Recent Street Railway Decisions," we have been compelled to omit from this issue of the REVIEW by reason of the reports of the three conventions, the A. S. R. A., the Accountants', and the New York State, taking so much space. The same is true of the Power House Department. Next month we shall endeavor to make up for this temporary deficiency.

Following closely upon the convention of the A. S. R. A. came the 16th annual meeting of the Street Railway Association of the

State of New York, which was held at Manhattan Beach, September 13 and 14. This organization is the most powerful and influential of the state associations and is but one year younger than the National. Its meetings are always well attended and papers of value to the industry are to be counted upon with certainty. This year was no exception, and we print in this issue several interesting papers read before the New York Association.

## THE BOSTON SUBWAY.

The \$5,000,000 subway interested strangers more than any other one thing, and well it might. Many visitors took the ride simply for pleasure. The through service from end to end was inaugurated only three days before the meeting, but no one would guess it had not been in operation for months. Indeed, so perfect were the arrangements that out of the 6,000 cars which passed through the subway on September 3, only one car was switched to the wrong track. Only those of our readers who have "done" the subway can realize what this statement means. At the Park street station from 5:30 to 6:30 p. m. the sight is wonderfully interesting. Cars on four tracks follow one another in a solid train, while the station platforms contain several hundred people. Four and five cars are loading on each track simultaneously and notwithstanding the army which pours down the broad entrances there is no confusion, though a great deal of bustle and hurry. It is the one place in Boston where the pedestrian forgets the dignity of his daily walk and participates in a real, genuine, western rush. "This subway is a mystery," remarked an elderly Bostonian, as she was directed how to transfer, and "mystery" is quite expressive to the stranger, though it is simple enough when one knows how. All the arrangements are perfect and the force of ticket sellers and starters is ample, and all the men are thoroughly qualified. The total length of subway is 1 2-3 miles, with 5 miles of track. Cars travel at a speed of 30 miles an hour. It was commenced March 28, 1895, and completely opened September 3, 1898. It is owned by the city and rented to the company.

## PENNSYLVANIA STREET RAILWAY ASSOCIATION.

The seventh annual convention of the Pennsylvania Street Railway Association will be held in Scranton October 19 and 20. The association will convene in the Board of Trade rooms on Wednesday, October 19, at 11 a. m. At this meeting the usual annual business of the association will be transacted, including the election of officers for the ensuing year.

Scientific papers on subjects of special interest to the association will be read and discussed and methods for the promotion of the general interest of street railways will be considered. On the second day a series of entertainments will be provided for the members and visitors of the association, including an excursion over the lines of the Scranton Railway Company. An interesting programme has been arranged and will, in due time, be published and mailed to members of the association and street railway people generally throughout the state.

All street railway companies in Pennsylvania are eligible to active membership and all manufacturers or dealers in street railway supplies are eligible to associate membership in the association, the membership fee in each case being \$25. Those desiring membership with the association can acquire the same at once by remitting membership fee to S. P. Light, secretary, Lebanon, Pa. Members of the association are urged to send as many representatives as possible to the convention, and those who have not yet joined are also cordially invited to attend and participate in the exercises and entertainments of the seventh annual meeting.

The headquarters of the association will be the Hotel Jermyn, the rates of which are \$2.50 per day and upwards; other hotels and rates are: Hotel Rudolph, \$2.00; Hotel Terrace, \$2.00; Scranton House, \$2.00; St. Charles Hotel, \$2.00, and Westminster Hotel, \$1.50 per day.

All communications should be addressed to S. P. Light, secretary, Lebanon, Pa.

## THE BOSTON CONVENTION.

**A Grand Success—The Seventeenth Annual Meeting Combines Pleasure with Work—Facilities for Sessions and Exhibits Unusually Good—Fine Weather—Large Attendance, and Bostonians Are Most Generous Hosts—Next Year, Chicago.**

Boston proved an ideal place for the convention, and Boston people by a variety and completeness of entertainment which could not have been improved upon, made a never-to-be-forgotten impression on her visitors. The weather, which is always so important a feature in the success of the convention, was uniformly pleasant; for while the first day was a trifle mild, the heat was less intense than in most parts of the country, and the second day brought a cool change which made going about a joy, and sitting in convention sessions less exhausting.

The convention was certainly a great success from every standpoint; the business sessions were well attended and full of interest; the exhibitors had nothing to ask; and the numerous entertainments were so varied charming and delightful, that the time was crowded to the limit with engagements. The ladies were specially attended to by local committees, and were on the go continually. The wish of every visitor was to remain longer, and all returned with regret that the stay must be so short.

The two Associations met simultaneously, the American in the Paul Revere Hall, and the Accountants' in the ladies' parlors on the same floor. Exhibits occupied first floor and basement, and while there were perhaps a smaller number of new devices than usual, nearly all exhibits showed improvement over a year ago,

We of the west are especially pleased that the Association should honor Chicago with its presence next year, and while the contrast between Boston and a city scarcely two generations old places us at a disadvantage, Chicago can promise a hearty welcome and a good time.

Tuesday, September 6.

President Lang called the meeting to order at 11 a. m. and announced Mayor Quincy, of Boston, who made the following

### ADDRESS OF WELCOME.

Mr. President and Gentlemen of the American Street Railway Association: It gives me a great deal of pleasure to welcome you to the city, and to express the hope that the deliberations of this large meeting of the American Street Railway Association may be both pleasant and profitable. The size of this gathering, the wide extent of the representation in this convention, the financial magnitude of the interests involved, affords a striking illustration of the rapid development which is taking place in the electric transportation interests of the United States. They have today won a position as one of the greatest—as one of the most important—interests of the country. Civilization really may be said to have had its inception with the first knowledge on the part of primitive man to command some form of transportation. Civilization begins when man acquires a power of transporting himself and of transporting goods, and civilization progresses as the command of mankind over the forces of transportation, beginning with transportation in its most primitive form, increases and grows.

One great revolution occurred when mankind learned how to handle the force of steam, and how to apply it to the great work of moving passengers and moving freight. But just as steam transportation had nearly reached its limit, just about as the means of steam transportation had been practically perfected, this new force of electricity makes its advent upon the scene and it, too, is harnessed in its performance of the work of civilization; and instead of becoming directly, at any rate, a rival of steam, this comparatively new force of electricity finds its application, so far as transportation is concerned, upon different lines. While these lines may hereafter extend, making electricity directly a rival of steam, for many of the purposes for which steam is used, up to the present time steam and electricity have divided between them two somewhat different fields of transportation; and electricity has not yet displaced steam but has filled in a vacant part of the field. It has added to the facilities of transportation which the human race has possessed and it has supplemented in a more important respect the working of steam which is primarily applied to transportation over long distances, to the connecting together of states and cities at a distance from each other; it has supplemented that work by the only less important work of developing the inter-municipal and intra-municipal means of communication, and I think the economic and social results which are to follow from the development of the electrical street railway are only second in importance to those which have followed from those of the development of the steam railroad. I think the street railway has progressed far enough in its evolution, although it has by no means filled its full field in this country, or reached the limit of its usefulness—it has progressed far enough to enable us to see that it is an important agency in the promotion of civilization. It has immensely extended the movement of the people and very

C. S. SERGEANT,  
President-Elect.

and from the amount of time delegates spent in studying the display one may readily judge how important this feature of the convention has grown to be.

A detailed report of the doings of the American Association follows, and in another portion of this issue will be found a report of what the Accountants' accomplished.

The Association is in better financial condition than at any time in its history, and its management has greatly improved during the last few years. President Lang made an admirable presiding officer, and the faithful work of Secretary Penington was appreciated.

The election of C. S. Sergeant, of the Boston Elevated Railway, was a well deserved compliment to that gentleman, to his company and to the city. He possesses every qualification for a presiding officer, and will fill the president's chair with dignity and discretion.

CARNegie FUND.

largely that class of the population who do not travel long distances over steam railroads. It has brought the railway system into the small communities. It has connected the village and the town with the larger city and with other villages and towns by a network of secondary communications, and it has, through these facilities increased in a very important degree the facilities of civilization. For what does civilization consist of except in the command of mankind over the forces of nature, and in his increased ability to make all the forces of nature subservient to his own good and in man's increased ability to transport himself wherever he may choose to go. Life consists of action, and the more we increase the facilities on the part of mankind to move its individual units from one point of the earth's surface to another point, the more we extend civilization in the higher sense of the term.

Electric railways tend to bind together the various cities and the various towns and the various communities into which mankind is divided into a great unit of communities, all of which understand each other better through the new facilities and cheap facilities for moving about, which have been brought to the world by this comparatively new agency of electricity. And so I am glad to welcome this convention today as representing a new and potent force which has come into the world by the advancement of mankind. For it seems to me that it is no exaggeration to say that the electric street railway in the stage of development it has reached in this country at least fulfills that position and is entitled to that recognition. Therefore, I am sure that it is profitable and advantageous for those who are engaged in different parts of this country in the practical administration of this new agency of civilization, in the practical control of this new force of electricity in making it subservient to the needs of man, to come together and compare notes and examine the progress that has been made in different places in the art and science of street railroading, and that they should confer about the problems, mechanical, electrical and financial which affect the business of street railroads more or less everywhere, and that they should come into personal contact with each other, become acquainted with each other, and gain that sense of comradeship and good fellowship which comes from being engaged in a common occupation.

I am confident that this street railway convention, the largest and most important, I believe, which has been held up to the present time, with its mechanical and electrical exhibits, and with the important matters which are to come before it for consideration, will accomplish something for the still farther progress of this great interest and this great industry. The people of Boston are always glad to welcome these national conventions. Boston has a great electric street railway system. Not only has she one of the very greatest and I believe one of the very best street railroad transportation systems to be found anywhere in the world, but we have, in the suburbs of Boston, in that chain of cities and towns which encircle Boston proper, which constitute Greater Boston, embracing as it does a million people or more within its limits, we have in these outlying cities and towns as well highly developed systems of suburban and of inter-urban street railway transportation. I am sure, therefore, that this Association could not have selected a better center in which to hold its gathering this year, in which to take account of the progress that has been made in electric street railway work during the last year, and in looking forward to the progress that is still to be made, than in this city of Boston. I can only wish that your visit may be pleasant as well as profitable, and I can only say in conclusion that if there is anything which the city of Boston, as a corporation, or the citizens of Boston individually, can do to make your stay here a pleasant one, I am sure that it will be very cheerfully done. I trust in your deliberations of the progress of the interests with which you are associated, you will find, as I know you will find, that substantial and material progress in the development of this great interest has been made during the past year; and that you will be able to see before you in the new prosperity, in the wave or period of prosperity which we all believe awaits this country during the next few years, that you may be able to see large returns in your street railway business and an inducement for the application of still

further capital and still further enterprise for the still greater and more extensive development of this beneficent agency of civilization. (Applause).

President Lang: Mr. Mayor, I am sure that I express the sentiments of this organization when I say that we are glad to be with you. On behalf of the members of this Association I tender to you our thanks for the very cordial welcome you have extended to us and for the interesting remarks you have made.

President Lang: The next order of business will be the calling of the roll. I will say that the executive committee has decided to make a departure in the method of calling the roll. We will consider the roll called by accepting the registration at the door as the evidence of the companies represented and the gentlemen who represent them. The next order of business is the reading of the minutes of the last meeting, and unless objection is made, the minutes will stand approved as printed. We will now give an opportunity to companies represented, that are not members of the association, to acquire membership.

The following companies then joined the association:

Elmira & Horseheads Railroad Company, Elmira, N. Y.

Portchester Traction Company, Portchester, N. Y.

Portland & Yarmouth Electric Railway Company, Portland, Me.

Portsmouth Street Railway Company, Portsmouth, Va.

G. B. Kerper, Dayton:—Mr. President, I desire to offer the following resolution:

Whereas, the executive committee of this association, at its meeting held in Boston January 25, and 26, 1898, owing to its inability to secure a proper hall for the annual meeting of the association at another time, issued its call for the meeting of the association to be held in Boston September 6-9, 1898.

Resolved, that the action of said executive committee be, and the same is hereby approved, ratified and confirmed, and this meeting is hereby declared to be the regular annual meeting of the association for the year 1898;

Resolved, that all of the business of the association be proceeded with at this meeting in accordance with the by-laws of the association applicable to regular meetings called and held within the dates provided by paragraph 7 of said by-laws.

The resolution was seconded by Mr. Hamilton, of Chicago, and was unanimously adopted.

#### PRESIDENT'S ANNUAL ADDRESS.

We are today, for the seventeenth consecutive year, assembled in furtherance of the objects of our association, under conditions most favorable to a pleasant and profitable meeting; for we are in the house of our father, the city of our birth.

As the presiding officer of the association, and in the name of the street railway men of Boston, I bid you a hearty, sincere and joyous welcome.

Amid the circumstances of this meeting, our thoughts naturally turn to the time, the persons, and the conditions existing when the association was formed. Some then present are with us today, and whether residents of Boston or not, certainly experience a pardonable pride in the growth and achievements of the association, as shown by its published proceedings and emphasized by the large number in attendance.

Of the Boston people who were present at the outset, Calvin A. Richards, president of the Metropolitan Railroad Company, now a part of the Boston Elevated system, was a conspicuous and active member. In 1884 he was elected president of the association, and those who knew him best feel a deep grief that death has robbed us of a member whose welcome, if present, would know no bounds.

As I trace this history of the association from its inception, I am convinced that its founders, in the words of Emerson, "built better than they knew," for is it not remarkable that they should have chosen a name and set forth in our constitution the objects of the association so wisely and well that no material change has been required to adapt them to present conditions, which are so radically different from those then prevailing.

The constitution then, as now, says: "The object of this association shall be the acquisition of experimental, statistical and

scientific knowledge relating to the construction, equipment and operation of street railways," etc.

The need for experimental knowledge in connection with a mule goes without saying, and statistical and scientific knowledge with reference to harness, cars or strap rails sounds very ancient as compared with engines, boilers, generators, girder rails, vestibuled cars, lightning arresters, ohms, volts, watts, amperes, etc., the familiar subjects of today. I do not mean, however, to belittle the value of the investigation, discussion and association of the earlier days, because there are too many veterans present (and I might myself be called one), who can testify to the great benefit derived therefrom. It does seem, however, that the necessity for holding meetings in different cities was greater formerly than now, for in order to know very much about what others had done or were doing we had to go to them, whereas now we can see almost everything in connection with our business in the room below, except the mercurial portion known as the state legislature, common council, tax gatherer and ubiquitous damage lawyer, so called.

That this is a fair inference is also shown by the records, for the second meeting was held in Chicago, which then, as now, claimed to be the metropolis of the West, but disputed by St. Louis. While it was doubtless an enjoyable meeting, Chicago was apparently too much of a shock to the nervous systems of our Eastern members, so it was determined to return East the following year, and New York was selected. Of course, New York never fails to interest, but there is one obstacle always difficult to overcome in meetings at that point, which is that one cannot remain long enough to see it all. What the delegates failed to find there, however, they looked for the year following at St. Louis, and it proved so good that they naturally looked for more nearby, hence next sought out Cincinnati. Cincinnati, as was expected, proved to be ideal, but the East offered so many attractions in the contest for location that Philadelphia captured the convention following.

Dignified and made bold by the Philadelphia meeting, the cry became, "On to Washington." The pleasure and profit of that meeting cannot be doubted, but the West was evidently becoming jealous, and to secure another meeting played its trump card and Minneapolis won out. It goes without saying that this meeting was profitable to the association as well as to the good people of Minneapolis. Electricity as a motive power was at that time so far advanced that all knew it was bound to come. Its discussion consumed nearly all the time of the meeting, and we left the Minneapolis people more strongly impressed than ever before that they had made no mistake in adopting electricity as a motive power and that they wanted still more of it.

In journeying to Buffalo the following year the association was well repaid, for much progress along electrical lines was found, and it undoubtedly stimulated the movement further in this direction, hence a dash was made for Pittsburg the following year. No one will ever forget that great concern, the Westinghouse Electric and Manufacturing Company, which was then and is still so energetic and progressive in the electrical field, and which proved to be such an interesting feature of the meeting.

In going to Cleveland for our next meeting, we did wisely, for we there found roads and power houses further advanced towards the goal of perfection than could perhaps at that time have been found at any other place in the country. At the Milwaukee meeting the year following we were met with the most extensive display of electrical apparatus witnessed up to that time, presided over by scores of ever-watchful, energetic and intelligent supplymen, and our meeting proved to be unusually profitable. By this time we were all so firmly established on the electrical foundation that to see an electric road or inspect electrical appliances was no novelty, but, still searching for greater things, we turned towards Atlanta. We not only found a great exposition of the products of the country here assembled, but very much in the electrical line to interest us. The cordiality of our reception by the people was a crowning feature of this meeting.

In turning our steps toward Montreal a year later, we endeavored to give of the good things we had seen and experienced at former meetings, and to acquire further knowledge from our

Canadian brothers. It was the first attempt at holding a meeting beyond our borders, and for various reasons was slimly attended; still it was not void of profit, for it revitalized the association to such an extent that the meeting at St. Louis the following year was unusually interesting and valuable. Having had a foretaste of the place we, of course, were eager to return, and our reception by the people could not have been more cordial. It was left for Niagara Falls, however, to overshadow what up to that time had been considered great, and to reveal to us the vast in electrical units and in nature. We also found the manufacturers and supplymen present in abundance, and our meeting there was voted a success in every particular.

I have thus briefly recounted our movements and spoken of the motives which it has seemed, from the best information at hand, prompted the association in selecting its places of meeting, and the value of such selections and other reasons why the association has grown to its present proportions and standing. Its growth and experiences, like all such organizations, have not been without some severe trials, but unlike the prodigal son, we have wasted none of our substance in riotous living, but have improved at each successive step, and now reach home; not only the birth place of the association, but the home of the electrical industries in a larger sense, perhaps, than any other locality in the world. The people of Boston not only furnished money with a lavish hand to carry forward the work of developing the subtle power now so useful to us and all mankind, but also much of the brains and energy needed to make its use practical. Of this fact one circumstance will bear witness, and it is that C. A. Coffin, a Boston man, is still retained at the head of the largest electrical manufacturing corporation in the United States, if not in the world.

Having laid in this city the foundation of the splendid structure we have since reared, it is very proper that we should return and dwell therein for a few days. Everything gives a promise of this being the largest meeting in our existence. If we do not make it one of the most valuable, the fault will be with ourselves. Let us hope to leave such an impression that the Boston people will say: "It was good to have them with us."

In the growth and development of our association and the business we represent, let us not forget the priceless and unrivaled assistance rendered by the technical press. Without a spokesman, a guardian ever faithful to our interests as they have been, our progress would have been much slower and our pathway exceeding rough. All honor to these devoted publishers and editors.

Nor must we for a moment forget (if we could) the indefatigable supplyman, for he is the noblest Roman of them all. It is his courage, foresight and energy in taking up the new and useful article, and pressing it upon our attention, that helps to effect economies. We may sometimes be prematurely persuaded, but that is not the fault of the supplyman; it is simply one of the arts of his trade necessary for us to learn. But, seriously, without them the meetings of our association would be materially weakened and lost much of their interest and value. Let us then not fail to give them and their exhibits all the attention and examination time will permit.

The executive committee has prepared a very excellent list of papers to be read, and I trust that all will join in giving them generous discussion. Some of the writers of the papers have told me that they expected more benefit would be derived by members from discussion than from the paper itself. This should be inducement enough to keep all in constant attendance. Bear in mind that in so doing we are also promoting the best interests of the association, as well as honoring the writers of the papers, which is their due and our duty. While on this subject, let me here call attention to the necessity of having at our meetings papers which will interest all the members—not only the mechanical and electrical engineers, but the general managers and even presidents of companies. We need all these officials with us at every convention, hence we must provide something of interest to them.

Each and every member must be made to feel that he has been benefited by attending our conventions, and likewise the company represented, or our association will cease growing. As a

result of our deliberations economies should follow without injury to the public service, all of which will tend toward a further realization of the objects of our association which are "the establishment and maintenance of a spirit of fraternity among the members" and in the largest degree "the encouragement of cordial and friendly relations between the roads and the public."

Under the head of general business, as provided in our by-laws, or at some other appropriate time, a sort of experience meeting or informal discussion of all subjects relating to our business should take place, where each member shall feel free to ask any question that occurs to him upon which he desires information, and some one stand ready to answer

I venture to suggest a few subjects arising almost daily, where in this way very helpful information could be obtained, viz.,

"The Suburban Railroad; on what terms and conditions should they enter over our tracks and how can their building be encouraged?"

"The issuing of transfer checks or tickets and how abuses connected therewith can be limited."

"The equipping of buildings with automatic sprinklers and the economy resulting therefrom."

"The cast or electric welding of rail joints, and the saving effected in current and cars."

"The discussion or agitation of municipal ownership of franchises and the most intelligent way to treat the subject."

"To what extent companies should engage in the amusement business and the best methods of conducting the same."

"A comparison of the cost of materials and supplies and expenses of operation."

"How best to promote the interests of employes and in return secure from them the highest degree of service and loyalty."

These and many other subjects of kindred nature considered in this manner would awaken great interest

I desire to call attention to our fellow workers and associates, the Accountants' Association, which hold their meetings simultaneously with ours each year, and are even now in session in another part of the building. The whole business of the street railway revolves around the accountant's office, and many of us can attest the value of having efficient persons in charge thereof. It is with the hope of enabling them to make their services more valuable to their respective companies that the association was formed, hence they should receive every assistance it is possible for us to render. I bespeak for them your cordial co-operation.

In closing I wish to thank our efficient secretary and the executive committee for their cordial aid and support during the year, and to assure the members of the association of my great appreciation of the honor of being called a year ago to the office of president.

Mr. McCormack (Brooklyn): Mr. President, I move that the members of this association give a rising vote of thanks to the mayor of Boston for his kind address of welcome to this association. Carried.

The President: The next business in order will be the report of the executive committee, which will be read by the secretary.

Secretary Penington then read the minutes of the meetings of the executive committee during the year, the principle features of which were as follows:

Authority to pass on papers to be read shall be vested in the president and secretary.

That allotment of banquet tickets be two to each member company where two delegates are present, and one ticket for member companies sending but one representative.

That writers of papers be requested to limit their reports to 30 minutes.

Members two years in arrears for dues to be reported to the association.

To recommend for adoption by the association the following rules of order:

1. No member will be recognized by the president unless he shall announce distinctly his name and address.

2. Speeches will be limited to 10 minutes unless the time shall be extended by the convention.

3. Members who desire to offer resolutions or other matters to be considered by the convention are requested to submit them in writing over their signatures, to the secretary.

Mr. Ely offered the following resolution, which was adopted by the Committee:

Pursuant to authority conferred upon this committee by the convention of 1897, an investigation of the question of Municipal Ownership has been instituted, and in response to inquiries sent out by the secretary, much valuable data and information upon the subject has been secured. But owing to the extent of the field necessary to be covered, and also to the desirability of absolute accuracy in the evidence to be presented, and in order that the form of its presentation shall be such as to order of arrangement, conciseness of detail, etc., as to render the same of the greatest value, it has been thought best to ask for further time in the matter and your committee would therefore recommend that the subject be left in the hands of the committee until the next annual convention, and in the meanwhile any member so desiring may have access to the data in the possession of the secretary in its then existing form.

It was made a matter of record that for the first time in the history of the Association, every officer and member of the Executive Committee were present at the meeting September 5-6, in Boston.

Mr. Hamilton (Chicago): I move that the report of the Executive Committee be received and approved; and the recommendations presented be concurred in, and that the thanks of the association be extended to the officers and Executive Committee for the very able manner in which they have conducted the business of the association for the past year.

The President: We will now listen to the report of the secretary and treasurer.

Mr. Radel (New Brunswick): I move that the report of the secretary and treasurer be received and adopted. Carried.

The President: We will now take up the committee reports. The first paper is:

## COMPARATIVE EARNINGS AND ECONOMY OF OPERATION BETWEEN SINGLE AND DOUBLE TRUCK CARS FOR CITY USE.

By Richard McCulloch, Electrical Engineer, Cass Avenue & Fair Grounds and Citizens' Railway Companies, St. Louis, Mo.

Before beginning a discussion of this subject, it would be well to define what is meant by single and double truck cars, as these terms are often very loosely used. In this paper a single truck car will mean one in which the body rests upon a truck, the axles of which are parallel with one another and at all times perpendicular to the center line of the car. In a double truck car the body is pivoted upon two independent trucks, each of which swings underneath the body with perfect freedom. Fig. 1 is a photograph of an ordinary single truck, and Figs. 2 and 3 show different forms of double trucks.

Double trucks for electric cars are of comparatively recent adoption. All of the early electric cars were equipped with single trucks and in this, horse car and cable car practice was followed. As the single truck was first on the ground, and at present largely has possession of the field, it will be assumed that in this case of the double truck versus the single truck, the double truck is the plaintiff and must submit the weight of evidence.

Double trucks were first applied to cars in the desire to use longer bodies than has been customary. In the use of a single truck the best practice has been to limit the wheel base to about 7 ft., as a greater distance than this would cause the wheels to bind in curves. Assuming that the body of the car is 20 ft. long and that the platforms project 4 ft. beyond the body, the end of the platform would overhang the axle 10½ ft. This is as great an overhang as is customary, although single truck cars have been built with bodies longer than 20 ft. In this case it is necessary to provide extension springs on the trucks to check the oscillation of the car body. With a very long car body, however, the oscillation is not entirely overcome by this device, and the rocking becomes very disagreeable to passengers and very disastrous to the car and track. Twenty-two feet may be arbitrarily established as the limiting length of the body of a single truck car, and if we wish to use car bodies longer than this, we must adopt some truck which will avoid oscillation and which will pass around curves without undue use of power. The double truck accomplishes this, and it was to enable longer bodies to be used that it first came into use.

The truck which was first used for long street railway cars was an adaptation of that used by the steam railroads. This truck contains four wheels of equal size, and is pivoted over the center. It was soon discovered that for street railway use, this form of truck had two very objectionable features: first, that the floor of the car must be high enough above the rail to allow the wheels to swing freely under the car; and, secondly, the motor being geared to one axle of the truck, only 50 per cent of the weight of the car was available for traction. The latter is a serious objection on roads having grades.

From what has been said it will appear that the single truck is the truck for short cars, and the double truck is the truck for long cars. Therefore, a discussion of the relative merits of these two types of trucks will involve a discussion as to the relative merits of long and short cars. Also, as it is customary to supply long cars with cross seats and short cars with longitudinal seats, we have instead of the comparatively simple subject of single trucks versus double trucks, which has been assigned to your committee, the more complicated struggle between the short car with single trucks and longitudinal seats, and the long car with double trucks and cross seats.

It will be assumed in the discussion which follows that the road possesses the characteristic city travel, a load curve of which is shown in Fig. 4. It will be noted that two very pronounced peaks occur in this load curve, one in the morning from six to nine and the other in the evening from five to seven. It is at these times that the capacity of everything is tried, while

Richard McCulloch was born in St. Louis county, Missouri, in 1869. His education was received in the public schools and Washington University, of St. Louis, taking the degree of mining engineer in 1891. While in college he worked in every department of street railway business during vacations and at odd times. Mr. McCulloch was a member of the United States Geological Survey in Missouri, Arkansas, Indian Territory, Colorado and Montana. During 1891-92 a year was spent in the service of the Mexican National Smelting Company, and the next year was devoted to an expert course in the shops of the General Electric Company in Schenectady and Lynn. In 1893 he was appointed engineer of the Cass Avenue & Fair Grounds Railway, and since then has been the civil and electrical engineer for the consolidated management of the St. Louis, Citizens and Cass Avenue & Fair Grounds roads, of St. Louis, and has had charge of the electrical reconstruction of the Baden, Southwestern and Citizens Railways.

RICHARD McCULLOCH.

Louis, and has had charge of the electrical reconstruction of the Baden, Southwestern and Citizens Railways.

the load curves of all city roads resemble each other, it is evident that local conditions will to a large extent determine the kind of car which the railroad company will operate. Some of these local conditions are, the class of people who constitute the passengers, the location of the road with reference to the established lines of travel, the amount of pleasure travel received by the road, and the keenness of competition with other roads. The last is an important condition, because a road is sometimes forced to adopt certain measures for its protection which it would not adopt under any other consideration. In this discussion we will assume that it is to the interest of the road, even if no immediate competition exists, to use all reasonable endeavors to please its patrons, because this policy will render the road more ready to meet competition when it arrives.

Before the advent of the electric car, the horse car had become such an established institution in this country that certain standards as to track and rolling stock had become fixed. In the matter of rolling stock, the size of the car had always been limited by the ability of two horses to draw it. When a mechanical motive power replaced the horses, this limit disappeared, and almost the first improvement made in rolling stock was to in-

operation of larger cars cut down the number of cars, this account may be reduced in nearly the same ratio as the size of the car is increased. There are many other reasons why the size of cars has been increased, such as the increased volume of traffic due to the higher speed and enlarged territory of the street railroads, the greater comfort demanded by the traveling public, the increased power available for the operation of cars, etc., but it is probable that the present tendency toward the increased size of car bodies is with a view of operating larger units and fewer of them.

A line operating small cars seating 28 persons on a headway of three and one-half minutes would give the same service from a standpoint of seating capacity if it operated large cars seating 40 persons on a headway of five minutes. Manifestly, this latter service would be preferable from the railroad standpoint for the reason just given, and the question is, would the service be equally acceptable to the passenger? In this comparison we are assuming that the larger car is the more desirable vehicle in which to ride. Would the pleasure of the ride compensate the passenger for the greater length of time which he would have to wait? This is a question which must be solved by each manager for his particular road, as its correct solution depends largely upon local conditions over which he has no control. The scrutiny with which a passenger chooses a street car varies with the length of his proposed ride. If the ride is to be short, he takes the nearest car without reference to comfort; but if he is to ride a long distance, he will walk past several lines in order to choose that one on which he will have the most pleasant ride. The car question then becomes a more serious one, with long roads and with roads catering to a pleasure traffic. It has usually been accepted that on those roads having a purely business traffic, the proper car is the short one operated on short headway. The author, however, is of the opinion that even in this case the long car operated upon somewhat longer intervals would be desirable. It has often been observed that where a line operates two sets of cars, a passenger will allow several cars to pass him in order to patronize that type of car which suits him best. This has been observed even in the busy hours of night and morning when it would be fair to assume that passengers would be hurried and likely to take the first car which passes.

One of the most serious questions occurring in street railway

FIG. 1

crease the size of car bodies. Instead of bodies 16 ft. long, electric cars were built with bodies 20 ft. long, and now this length is being increased to 28 and 30 ft.

The expense of the average city road may be divided up as follows:

Maintenance of way and structures.....	4 per cent.
Maintenance of equipment.....	7 per cent.
Conducting transportation .....	52 per cent.
General expense .....	8 per cent.
Fixed charges .....	29 per cent.

It will be noticed that the item "Conducting transportation" is more than one-half of the total. This is largely made up of the wages of conductors and motormen and is proportional to the number of cars operated. Hence, it follows that if we may by the

practice is the problem of how best to take care of the rush of travel which comes morning and evening. With our present methods, there are only two ways of taking care of this travel: The first, by increasing the number of cars or units in service; and the second, by increasing the capacity of each unit. The latter method consists of attaching a trailer to the motor car, and where this is done, it is usual also to increase the number of units in service. On first thought there would seem to be no better method of increasing the capacity of a road than by the use of trail cars. They are easily attached and detached, they are in service only when necessary, and they do not require the assistance of additional train-men. An examination of the trailer system, however, will reveal the fact that it possesses serious defects. The trailer is not automobile and requires the services

of men and horses to attach it to the cars and to move it between the car sheds and the motor cars. The opening between the motor and the trail car increases the danger of accident both to passengers and conductors. The number of entrances and exits is increased and this augments the work of the conductor in

5. The use of trailers.
  6. The seating arrangements and convenience of exit and entrance.
  7. The preferences of passengers.
- These relations will as far as possible be reduced to a money

FIG. 2.

keeping track of his fares and increases the danger of his missing some of them. If an extra conductor is placed on the trailer to collect fares, a great portion of the gain due to the trailer system is lost. The use of trailers throws an additional stress on the motors, as a heavy weight is added to the train which is not available for traction. The trouble is intensified as the load on the trailer increases; it makes the train more unwieldy in handling, and is largely responsible for the difficulty in starting and stopping quickly and in making schedule time.

To obviate the necessity of using trailers, a large car equal in seating capacity to the combined capacity of the motor and trail car may be operated. This system, however, introduces the dis-

advantage of the operation at all times of the day of a seating capacity needed only during a few hours of the day. It also increases the size and weight of the cars and the average power required to operate them.

In order to compare the relative economies of single and double truck cars, their advantages and disadvantages will be discussed with reference to the following points:

1. Wear and tear on trucks.
2. Wear and tear on motors.
3. Power required.
4. Wear and tear on track.

which amounts to 26 per cent of the time, trailers are attached to these motor cars. Open trailers are operated in the summer months and closed trailers during the winter. The average seating capacity of the unit, estimating the trailer as a part of the car during the time that it is operated, is 35 seats, which approximates the seating capacity of the double truck car very closely. The motors in use on the single truck cars are W. P. 50.

The number of cars operated is obtained by dividing the daily car mileage by 115. It is necessary to do this because the average mileage per car on the two roads is different. The comparison is thus between 70 single truck cars and 47 double truck

cars. The number of cars operated is obtained by dividing the daily car mileage by 115. It is necessary to do this because the average mileage per car on the two roads is different. The comparison is thus between 70 single truck cars and 47 double truck

FIG. 3.

cars, each car making 115 miles per day. The road operating the double truck cars has the greater density of traffic. The single truck car with the trailer attached is shown in Fig. 6.

#### WEAR AND TEAR ON TRUCKS

It is evident that since a car equipped with double trucks has eight wheels and one equipped with single trucks has four, the

FIG. 4.

former will be the more expensive to supply with wheels. Table I shows the comparative replacement and cost of wheels and brake shoes on the two roads for one year. Table II shows the comparative cost of maintenance and repairs of trucks and motors for two years. It will be noted that while the cost per car is much greater on the road using double trucks, the cost per passenger is always the same. It would not be fair to assume from these figures that the cost of maintenance of trucks and motors per passenger is almost the same, no matter what sort of truck is used, because these figures result largely from the fact that in this particular case the double truck car carries the greater number of passengers, but an inspection of the table will emphasize the advantage of the large unit as compared with the small one. It will be seen by a reference to Table I that the greater part of the increased expense of maintaining the double trucks is due to the renewals of wheels and brake shoes.

In examining the relative strength of the various parts of

FIG. 5.

trucks, the side pieces may be compared to a beam supported at two points and carrying a concentrated load. The deflection of such a beam is proportional to the third power of the span; and in the analogy, the span corresponds to the wheel base of the truck. Therefore, the shorter the wheel base, the stiffer the truck side, and in view of its long wheel bases, it is evident that the single truck is at a disadvantage in this respect. For instance, a truck side where the wheel base is 4 ft. 6 in. is 3.76 times stiffer than a truck side of equal section where the wheel base is 7 ft.

#### WEAR AND TEAR ON MOTORS.

Table II, to which reference has already been made, gives the comparative expense of inspecting, repairing and maintaining the motors of double and single truck cars. As in the case of the trucks, it will be noted that while the expense per car is much greater in the case of the double truck car, the expense per passenger is nearly the same.

Table IV gives the relative weights carried by the different cars, when empty, seats full, and car crowded. It will be noted that while the percentage of weight available for traction in the case of the maximum traction truck remains constant, in the case of the motor and trailer it falls off as the number of passengers increases, and is especially small if the trailer is proportionately more heavily loaded than the motor car.

#### POWER REQUIRED.

Table III gives the power required to operate the different cars, and is the average of a long series of wattmeter tests. In making these tests, the wattmeter was placed on a car in actual service and allowed to remain through the entire day. An examination of the tables will reveal the fact that the power required for the propulsion of the car and the care and repairs which the motors demand are much greater in the case of the double truck

FIG. 6.

car. But if the number of passengers be taken into account, it is seen that the power and the cost of maintenance are roughly proportional to the number of passengers carried with either style of truck.

#### WEAR AND TEAR ON TRACK.

The wear of the rails of a street railway track is due to the grinding action of the wheel on the rail, and this is proportional to the weight on the wheel, but is intensified by the dirt on the rail, which causes the wheel to slip, and acts as an abrasive agent after the slipping has begun. The weak point of a street railway track, however, consists of the joints and the openings in the special work. The energy of the blow which the wheel strikes as it passes a low joint or a crossing is equal to the product of the weight of the wheel and the height of the drop. Therefore, on any given track both the wearing action of the wheel and the destructive action of the wheel are proportional to the weight which rests upon it. If the number of wheels under a car be increased, the number of blows which a low joint receives is also increased, but the intensity of each blow is diminished. Double trucks are at no disadvantage as compared with single trucks in this respect, unless the weight of the car be increased. Due to the shorter wheel base, double trucks go around sharper curves and go around the same curve with less output of power and less wear on the rail than single trucks. The double truck fell into disrepute when the maximum traction truck was first exploited on account of its liability to leave the track. This was due to the small amount of weight which was placed on the small wheels. It is now customary to place 30 per cent of the

TABLE I  
Comparison of the cost of wheels and brake shoes on Double and Single Truck Cars for the year 1907

	Average No. of Wheels used per car per year			Cost per car per year			Total Cost per Car per year per 1000 passengers	Wheel Mileage	
	33"	30"	24"	Wheels	Labor in Replacing	Brake Shoes		33"	24"
Double Truck Cars (47)	8 72		7 06	\$77 92	\$17 36	\$11 70	\$106 98	\$0 17	17,264
Single Truck Cars (70)	8 26	1 00		\$30 50	\$7 90	\$1 20	\$40 60	\$0 38	25,829

The Double Truck Car has four 33" wheels, four 24" wheels, and eight brake shoes.  
The Single Truck Car has four 33" wheels and four brake shoes.  
Average daily car mileage = 115.

TABLE II  
Comparison of the cost of repairs and maintenance of trucks and motors on Double and Single Truck Cars for the years 1906 and 1907.

	Average payments per Car per year	Truck Repairs		Motor Repairs		Total

Double Truck Car.	36	110	33500	70	70	70	653	792	1150	214	358	344

Note— Each passenger is estimated at 130 lbs.

weight on the small wheels, and with track in fairly good condition, no difficulty is encountered in keeping cars on the track.

### THE USE OF TRAILERS.

In the case of the two roads under discussion, the road operating single truck cars attaches trail cars to the motor car for two trips in the morning and two trips in the afternoon. For the entire year, trailers were operated on 26 per cent of the trips. Allusion has already been made to the use of trailers. The advantage of the trailer on this particular road arises from the fact that the load peaks are unusually sharp. The use of the trailer increases the capacity of each unit during the heavy hours of morning and evening travel and during rush travel due to baseball games and races. On this particular road the motormen and conductors are paid 10 cents per trip extra for all trips when a trailer is attached to the motor car. This expense largely offsets the value of this arrangement. There is no question but that the use of the trail car increases the number of accidents, for two reasons: first, because the trailer is another car; and second, because the opening between the motor and trail car is a dangerous one for a passenger boarding or alighting from the car. It is impossible to estimate the money value of this accident liability, because in the case of many accidents it is difficult to determine what proportion of the damage was due to the trailers. Trailers must be switched at the ends of the roads and at the car sheds, and require men and horses for this purpose.

The use of trailers also entails other expenses, such as car heating, cleaning, repairing and car license, which should be charged against the trail car system. To counterbalance all these disadvantages, the only advantage which the trail car system possesses is its flexibility.

### THE SEATING ARRANGEMENTS, EXITS AND ENTRANCES.

As has already been stated, the cross seat is used almost so universally in connection with the double truck car, that it is fair to consider the economy and efficiency of cross seats and longitudinal seats in connection with the discussion. There is no doubt that the cross seat is preferable from the passenger's standpoint, and the reasons for this preference are not difficult to analyze. Passengers often travel in pairs, and the cross-seat gives a privacy to their conversation which is not possible with the longitudinal seat, the jerks due to the stopping and starting of the car are less disturbing to the passenger when he is seated facing the direction of motion, and the cross seat renders it easier to look out of the windows.

If two car bodies of the same size are taken and cross seats installed in one and longitudinal seats in the other, the car body equipped with the cross seats will have the narrower aisle. This induces two disadvantages in the cross seat car; one, that the crowded capacity of the car is less; and the other, that when the car is crowded, the time consumed in loading and unloading is increased. The latter difficulty will be the more serious, the shorter the haul and the greater the number of stops.

In the early days of the double truck car, it was customary to mount the body high enough so that the wheels would swing under it. This gave the car a very unsightly appearance and made it difficult of access. Three steps were necessary to reach the platform, and as these steps were steep, this form of car was particularly objectionable to ladies. By the use of the maximum traction truck with 33-in. wheels, however, it is possible to lower the floor to within 37 in. of the rail. By dropping the platform 8 in. below the floor of the car, it is possible to reach the platform by the use of a single step 14 in. above the rail. This renders the car as easy of access as the single truck car. In the opinion of the writer, the fact that the car floor may be made so low in double truck cars is the chief advantage of the maximum traction truck.

It has been attempted to facilitate the loading and unloading of large cars by providing exits and entrances other than the rear door. This practice, however, brings about what is perhaps a more serious disadvantage, as it gives the conductor more than one door to watch, renders it difficult for him to keep track of his fares, and increases the liability of his starting the car before a passenger is on or off.

### THE PREFERENCE OF PASSENGERS.

The preference of passengers to which allusion has already been made, is undoubtedly in favor of the double truck car. In cities where the entire street railroad system is controlled by one company, this point may not be considered of value, because passengers are obliged to ride in whatever conveyance the company chooses to furnish. However, the experience of roads which have changed their rolling stock from small, single truck cars to large, comfortable double truck cars, is that the travel has shown an immediate increase. Part of this increase has been drawn from parallel roads, but part has been a created traffic. As the accommodations increase, more people ride, and the regular patrons ride oftener. The street car ride, instead of being regarded as a necessary evil, comes to be looked upon as a pleasant part of the shopping expedition, the visit, or the picnic. How great this created traffic will be depends upon the class of patrons served by the road and upon the terminal facilities of the line. The extremes of society, the very rich and the very poor, are not good riders, and it is probable that a road serving either of these classes entirely would get very little return for additional accommodations. The greatest increase would come from those who are now the best patrons of the street railroads, the fairly well-to-do middle class.

In this paper the writer has not attempted to prove that either the single truck or the double truck car is the better type. He has merely attempted to discuss the subject to bring out the

strong points and the weak points of each type in such a way that the results may be applied to special and local conditions. Outside of the question of the economy of operation, there are few roads on which the use of attractive, easy-riding, double truck cars would not create a pleasure travel, especially in the summer season. In a general way it may be stated that the single truck car is more suitable for short hauls, dense traffic, many stops and low speed. On the other hand, the double truck car is more suitable for long hauls, high speed, few stops, and pleasure travel. In the existence of either extreme condition it would not be difficult to decide which car to use. It is in dealing with intermediate conditions that the manager must use his judgment.

The President: This paper is certainly a very interesting and able paper, dealing with a subject in which we are all interested. Now let us hear your views on the question.

Mr. McCormack (Brooklyn): Mr. McCulloch states in the paper that with the use of double truck cars it would be possible to lengthen out the headway. I wish to state that on our heavy lines we have had between three and four hundred double truck cars and in not a single instance have we been able to lengthen out the headway. The double truck cars increase the patronage to such an extent that we have had to shorten the headway. One thing more, and that is when it comes down to standing loads and moving crowds yesterday (Labor Day) I noticed on the cars seating 40 passengers going to Coney Island that the average was 65 on the register. With a double truck car, and a seating capacity of 60, it is nothing unusual to see 128 and 130 on the register, so you can see when you want to move large crowds, what the difference is with a double truck car compared with the single truck car. There are 178 double truck cars running in the service on one line, and you can imagine what the travel is on that line.

Mr. Dimmock (Council Bluffs): What is the headway?

Mr. McCormack: The headway on the Court street line, running from New York direct to Coney Island, is less than a minute. On the 3d avenue line it is three minutes, nearly all day, and part of the time 2 minutes. The headway from 65th street to Coney Island, where all the Coney Island cars converge, is about 20 seconds.

Mr. Sloan (Chicago): The double truck cars are certainly coming into practice and favor, and it seems to me the main question is the question of traction. I have had no experience with double truck cars, and I would like to know whether anyone who has had experience with them knows anything about using four motors instead of two to get the maximum traction. It is a subject we should know more about, because in the use of the double truck cars we are replacing the two motors with four.

Mr. Beggs (Milwaukee): I think Mr. McCulloch has so thoroughly presented the case that there is very little to be said upon it, particularly in behalf of the plaintiff. I do not think that the writer of the paper evinced any partiality as between a single and double truck car; but it is very evident in what direction the sympathies of the writer of the paper lie. In the city of Milwaukee we have for three years been experimenting particularly with the advantages and disadvantages of single and double truck cars. In 1896 there was put upon the system 20 double truck cars with maximum traction trucks. These cars were equipped with 18 double seats, seating 36 persons. A year ago, the early part of 1897, in view of our experience of a year in the use of the cars, we enlarged somewhat upon them, improved the trucks to some extent, we thought, by abandoning the maximum traction truck and so building the frame of the car as to in that way obviate what had been with us a very serious difficulty, namely, the forward wheels leaving the rail. We use 30-inch wheels to accomplish it. We increase the length of the car and seat 40 passengers by placing in double seats. During the present year we have benefited by our experience still further and increased the length of the car; that is the body, and enlarge the seating capacity, without increasing the length overall, which is 41 ft. over bumpers, and maintain virtually the same size of platform so far as the accommodations to passengers is concerned in crowds, by increasing the length of the body 1 ft., slightly moving the seats together and reducing

the amount of the bumper in front of the dash so that with our present car which we have, so far as our service is concerned, there is little left to be improved upon. We seat 44 passengers, having 22 double seats.

Of course, the question as to the use of the double truck car is determined by local conditions. Our double truck cars, for the climate of Milwaukee, are to a great extent a necessity. Because of the large open spaces and our short summer season, it is almost impracticable to maintain the duplicate equipment necessary for summer and winter service. I do not know anyone now in the service of the company who has not been converted to the use of the double truck car, and we have arrived at a standard. There are many reasons existing for the adoption of a standard car with us; the short summer season, the likelihood of chilling winds coming up and cold rains at any time in the warmest days of summer. We now have a car that suits us 12 months in the year. We have not had any difficulty with the matter of traction. We use a 33-in. wheel in our present equipment we are having built, and still maintain only a distance of 32 in. from the rail to the bottom of the sill, and that was one of the difficulties we had to overcome. We did that by giving considerable attention to the matter of construction and framing of the car to permit the 33-in. wheel to readily pass around our shortest curves. We are so thoroughly convinced as to the advantages of the double truck car that we are gradually permitting all our single truck cars to be worn out and scrapped as their life is brought to an end.

We have found that the use of the double truck cars has greatly increased the traffic; in other words, the people would wait for a double truck car on certain lines. We are compelled to place some of the single equipment on at times, but the people will wait on the streets where the two types of cars are run on the same lines, for the double truck car, for the reason that the riding is much more comfortable. Our double truck cars on our lines ride almost as smooth as a railroad sleeping car. That, of course, depends largely on the character of the track; but on a large portion of our lines, particularly on those lines where we are putting on the heavy equipment, we are having the connection between the rails cast-welded at the joints and we are doing away with the rocking and pitching motion of the car, and are enabled by the use of the double truck to make much higher speed, and that is the tendency of roads all over the country. We have to make higher speeds. We brought our average up within two years certainly a mile an hour. Our average speed now is somewhat in excess of 9 miles per hour. We would not be able to do that with a single truck car, because the oscillating motion and the liability of the pitching to displace the trolley wheel, whereas with the double truck cars we seldom have such an experience.

As to the matter of wear and tear, we believe the weight of evidence is in favor of the double truck car. While we have doubled the number of trucks and doubled the number of wheels to maintain the blow on the wheel at crossings and special work is so much easier that it does not wear the trucks nearly so much, and we find that our repairs of springs is possibly 75 per cent less on the double truck cars than on the single truck cars. We have been able on our lines, and I, of course, recognize the difference of conditions between Greater New York and our less populous cities, been able to increase our headway on most of the lines on which we have placed the double truck cars. In other words, we try to regulate the headway of the double truck cars to meet the general conditions during the larger portion of the day, and during the rush hours in the morning and evening, particularly in the evening, we either shorten the headway one-half or throw in intermediate cars, but still maintaining the regular headway of the regular equipment of the line; so that, so far as the city of Milwaukee is concerned, we are very strongly impressed with the very great advantages of the double truck car, many of which have been referred to indirectly in Mr. McCulloch's able presentation of the case, and we experience other advantages, which are governed by local conditions, and would not apply possibly in all cities, even of the same population.

A question was asked as to the four motor equipment. I might say that during the present year we have had 10 interurban cars constructed, running between Milwaukee and Waukesha

Beach, and the city of Waukesha, a distance of 26 miles or slightly in excess. These cars were carefully constructed after complete investigation, and the possession of all information we could get from electrical engineers, and based on this and our own experience and judgment, we have equipped them with four 1000 motors, geared to make 26 miles per hour, weighted with 40,000 lbs. Our double truck cars are possibly the heaviest in use anywhere in the United States. They weigh about 35,000 lbs. With these four motor equipments we have no trouble from lack of traction whatever, and we are beginning to believe that in the very near future it will be advantageous for us to equip all the double cars with four motors. We have some grades we are climbing with our double truck cars 33-in. wheels, running as high as 6 and 7 per cent. They do it with a little difficulty at certain times, certain conditions of rail and weather; but with our four motor equipments we have no difficulty whatever in climbing the grades and in getting, we believe, very superior service.

I think, Mr. Chairman, that the case of the plaintiff, which Mr. McCulloch has been pleased to term the double truck car, was so ably presented in his paper that it does not need any other advocate for it, and I should rather have denominated the double truck car the defendant, because there have been so many attacks made upon it. I can only say, so far as we are concerned in the city of Milwaukee, the double truck car has come to stay. The character of the population you are serving has much to do with the discrimination that is shown in the selection of a car to ride in. Some sections of the city do not pay much attention to it, and there are other sections that discriminate, and just as you cater to the pleasure and comfort of riders, we find the traffic increases on those lines. We have what we might call a mechanic district in our city, which uses our Third street line, which was equipped during the present year, and there is a marked increase on that line. I might say, as indicating the economy of the double truck, that on certain lines equipped two years ago with the double truck cars, we had previously maintained a headway of four and a half minutes, and by the use of the double truck car and the greater speed obtained together with the greater number of passengers accommodated, this line, running through the better portion of the city, we have been able to gradually lengthen out the headway to 6 minutes, without any complaint from our patrons. You can readily understand what that means in reduced equipment. Quite recently, within the last three months, by a further increase in the speed, on long time—our policy is to run long lines from one extreme of the city to the other for the comfort of passengers, and to avoid transfers—we have recently cut off another car and still maintained the same headway of 6 minutes by increasing the speed and making the trip in 90 minutes instead of 96 minutes. I might say that in the same way on the 3d street line, the line last equipped, we hope by the increased speed that we will be able to maintain, by the use of these double truck cars, over the oscillation single truck cars, we will be able to take off two of the 16 cars on the line and reduce the number to 14. This is one of the very great economies which we are realizing throughout the system by the use of these double truck cars. We are able to run at very high speeds on our lines from Milwaukee to Waukesha with these double truck cars, whereas with a single truck car it would be hazardous to run the cars at such speeds and they could not be kept on the track. The experience of the city of Milwaukee is strongly in favor of the double truck car. The latest improved truck permits us to use the 33-in. wheel, with the same facility as the 30-in. wheel, no greater height from the rail; and I think as soon as our necessities are known the manufacturers of trucks and cars will accommodate themselves to the new conditions and many obstacles will be overcome.

Mr. Bean (St. Joseph): I move that the report be received and spread upon the minutes and a vote of thanks extended to Mr. McCulloch for his able paper. Carried.

The secretary read a letter from Henry M. Watson, president of the Buffalo Railway Company, regretting his inability to be present at the meeting.

Mr. Kelly (Columbus): It has been suggested that all the members of the association who were present at the organization of the association in Boston in 1882, will rise.

W. Worth Bean, St. Joseph, Mich., George B. Kerper, Dayton, O., and Julius E. Rugg, Boston, were the only members present.

On motion of Mr. Kelly meeting adjourned to 9:30 Wednesday morning.

#### Wednesday Session.

President Lang called the meeting to order at 10:30 a. m. and announced the first paper of the session:

#### THE CARRYING OF U. S. MAIL MATTER ON INTER-URBAN AND STREET RAILWAYS.

By W. S. Dimmock, General Superintendent Omaha & Council Bluffs Railway & Bridge Company, Council Bluffs, Ia.

During the meeting of this honorable body at Niagara Falls last year, I had the honor of making a few remarks with a view of bringing about a discussion upon the subject of electric railways carrying the United States mails; and while the discussion was brief for the want of time, it was at least the means of getting the subject before you during this convention, and the only error the executive committee has made, is in not giving this paper to some one with a wider experience and more competent to lay the subject before you than I am; however, I consider it an honor for anyone to be called upon to address this convention and a duty which no one can afford to shirk so long as he is a member of the association; therefore, if in my attempt to lay a few brief statistics before you, I am able to bring forth some good discussions from the more experienced members, I feel the result will be a benefit to the association and the electric railway earnings in general.

There is probably nothing, or one might say, no one thing which is of more importance to the perfection of an absolutely satisfactory mail service than the saving of time; the electric canceling machine and the numerous contrivances of the manufacturers' craft employed in the handling of mail matter, all aim at the one end, economy of time. This is probably the most potent argument in favor of the electric car service for the transmittal of mail matter to and from depots, sub and suburban stations to the main post offices. As a general proposition the schedule time of the electric cars is absolutely to be depended upon; experience has demonstrated that the list of casualties likely to interfere with the progress of a car upon its designated route is smaller than that which often hinders the wagon service. In the case of the Omaha office, where I have had the best opportunity for observation, a noticeable gain is made in the service between Omaha and Council Bluffs, a distance of five miles, and Omaha and South Omaha, of the same distance; here the advantage is not confined to the saving of time but in the increased number of dispatches it is possible to make; the frequency and regularity of time on the electric car lines makes it possible to dispatch mail matter from one office to another, or from main office to sub-stations, to the best possible advantage, since the time can be regulated by the dispatching office at will in order to make certain outgoing trips of carriers, which might be impossible to reach if the regular running time of the regular mail trains must be considered, or the possibility of using the wagon service; before the use of the car service for this purpose, and when the railroad had to be depended on for the transmittal of mail between Omaha and Council Bluffs, Omaha business men frequently asserted that it was easier and more satisfactory to transact business by letter with Chicago than with Council Bluffs; almost as broad a statement might be made in regard to South Omaha. As an example of the difference made of the two modes of service, the Denver fast mail which reaches the Omaha office via the electric cars at 4:18 p. m., gets into the hands of the city distributors from 10 to 15 minutes sooner than when the wagons are depended on; this means the handling of an immense number of letters which reach the carriers in time to be taken out on their last afternoon trip, thereby being delivered to the patrons of that office on the afternoon of the same day, instead of the following morning and preventing a delay of something like seventeen hours. This great advantage of course relates to letter mail,

W. S. Dimmock was born in Sandusky, O., and received his early education in Cincinnati. In 1873 his business career began as a telegraph operator and station agent on the Ohio & Mississippi Railway. He filled various positions with the Mississippi Central, Wabash, Hannibal & St. Joe, Burlington, and Union Pacific Railways before his appointment as auditor and private secretary to the general manager of the Pacific Telegraph lines at Kansas City. This company was absorbed by the Postal Telegraph Company and Mr. Dimmock became manager at Omaha. In January, 1894, there was much dissatisfaction over the management of the interurban line operated by the Omaha & Council Bluffs Railway & Bridge Company, and he was chosen general superintendent. Mr. Dimmock believes in steam road practice on electric interurbans and was one of the first to advocate double trucks. He is largely responsible for the excellent service of his lines.

W. S. DIMMOCK.

responsible for the excellent service of his lines.

which is the first to be considered; the advantage is obvious if you happen to be in a position to observe the difference in time when the letters are conveyed by the cars as contrasted with that at which the wagons deliver the papers brought by the same train; in the interim between the two deliveries, the letters have been tossed on the table, back stamped and have found their way into the deft hands of the distributors and are being rapidly thrown to their ultimate destination.

One can only realize the vast importance of 10 or 15 minutes under certain conditions when he has missed a train by five minutes, or realize what can be accomplished in the same time after he has watched the distributing of a fast mail; what hours and days are to man, moments are to letters. A clerk in the Omaha office said to me recently: "The return to wagon service from the electric car system would be a plunge backward into the dark ages, which I trust we shall never experience." Mailing clerks and distributors alike, are unanimous and even enthusiastic in their commendation of the electric cars as a means of transit for mail matters so far as I am advised. Where sub-stations are supplied from a main office, the advantage of the cars admits of no question; the time saved in the actual transmission of the mail, to and from, is about one-half, so that where carrier service enters in as a means to be considered, the patrons of the outlying districts are given an immeasurably better and more satisfactory service. When this great system shall be utilized everywhere for the collection of mails over the cities, when the actual labor of "working" and routing of the mail shall be performed on the postal electric cars as they thread their way through the very heart of commerce, and a letter finds its way yet warm from the hands of the writer, to the depths of the mail pouch, then it will seem as if system could reach no higher pinnacle of development, unless, indeed, we learn to transmit mail sacks by the very lightnings of Jove.

Again I wish to make another comparison of time saved by using the electric railways to carry mails. Before the electric line between Omaha and Council Bluffs undertook to handle the mails between these cities, the mails left the main post office by wagon and were conveyed to the depot of the Union Pacific Railway, which is a distance of a mile in Omaha and one and eight-tenths miles in Council Bluffs, where they were then conveyed by train across the river, a distance of five miles. The Union Pacific at this time had about 11 trains in 24 hours, and part of these trains at night after business hours were over for the day, thereby making the mail service so very unsatisfactory that the public began to clamor for the mail to be carried by the electric railway from the time the road was open. We finally made a contract with the government to carry the mails between the two cities, and the public discovered at once that we were transporting these same mails from Council Bluffs to Omaha in the same time that it formerly took to deliver the mail by wagon from the Council Bluffs post office to the Council Bluffs depot; thus

saving the time consumed by the Union Pacific train between the cities, and time consumed by wagon from depot to post office in Omaha. In fact the mail was probably in the hands of its owners and in some cases answered long before it had crossed the river by the old route. Or a man could mail his letter in Council Bluffs, walk to Omaha and wait for its delivery under the old system, while the new route makes it possible for him to mail a letter when he goes to his office in the morning and get his answer by noon. No doubt an investigation would prove the same conditions exist in nearly every state in the Union at hundreds of places. This being true, we have shown the value of the service.

Now let us investigate the compensation. After it was discovered that the electric railways could handle the mails with so much satisfaction to all concerned, the managers of the railways thought they saw a great protection during strikes, etc., in the government, and were ready to carry the mails at most any price, but I believe experience has taught us, through some of the strikes in the east, that they did not find the protection anticipated. The electric railway managers were figuring on the basis of what the government had done for the steam roads during such troubles, and, while seemingly the comparison was a good one, it was erroneous from the fact that a mail car could be attached to an engine hauling 10 or 15 coaches of passengers and this one train would perhaps clear up the traffic for hours, while with the electric roads where the headway is anywhere from two to five minutes in large cities, where strikes are liable to occur, one train carrying the mail which the government would protect would make no more impression upon a congested travel than would one drop of water in the ocean, therefore it can be shown that the only benefit received by the companies for carrying the mails on street and interurban railways is the compensation allowed by the government for the same; hence the railways should work with an end in view to make this compensation enough to justify them in looking upon the carrying of mails as a profitable earning, and one which should receive their careful attention. It is true the government has made some effort to arrive at the cost of carrying the mails, but in doing so, if you will read the report of the committee to the postmaster-general, under date of June 25, 1896, which the government at Washington will furnish you upon request, and which contains a great deal of valuable information, you will see the report treats mostly upon finding out what expense the railways are put to in handling the mail, and not upon how much the value of the same is to the public. This report makes an allowance of 3 cents per mile for carrying pouches upon electric trains, while in the same report it is stated as follows: "The closed pouches upon the street cars should be compared with the star service which it replaces," and in the same breath the government states that "the star route service costs 4.94 cents per mile" while it recommends 3 cents per mile only for the electric service with its increased speed, more prompt and reliable handling; and, in fact, a superior service in every sense of the word. Following this statement, they also say, "It is gratifying to report the improved service will not materially increase the expenditures of the post office department." Why? Because we, the managers, have allowed them to dictate to us what we should have dictated to them, and they offer us for a better service less than they have paid for the same service by wagon, simply on the grounds that said service costs us but little, if anything; yet in figuring what it costs us, they do not take into consideration, as a rule, any expenses for damages, general expenses, and especially fixed charges. Where the regulation wagon service in various cities is costing the government 15.7 cents per mile travelled, it only offers the electric companies 16 cents per mile for a 16-ft car, and at the same time claims the service would be far superior and said car would take care of the natural increase for years to come. Does it not look unreasonable for it to dictate to the railway companies such terms when the service is so much superior to the wagon service? Why, in Council Bluffs it pays more for the wagon service to haul the mails to and from the depot, a distance of 1.8 miles, than it pays the steam road for hauling it from Council Bluffs to Omaha.

Why? Simply because the steam roads are post roads and compelled to carry the mails as the government dictates, while in the wagon route it is dealing with an individual and it is impossible for it to make a contract for any such unreasonable terms.

When the Omaha & Council Bluffs Railway & Bridge Company first closed the contract with the government for carrying mails between Omaha and Council Bluffs, the government allowed this company \$100 per month, and was satisfied it was getting value received, until other electric roads commenced to carry the mails more for protection than revenue, when the government immediately took advantage of the time and opportunity to make an investigation, of which the report of June, 1896, was the result, which reduced our compensation to \$50 for nearly the same service. Had the American Street Railway Association handled this matter in the past, as general managers and passengers agents of steam roads handle their affairs, the result of the government committee's investigation would have been different.

No doubt the companies spoken of in the committee's report to Postmaster-General Wilson under date of June 25, 1896, where they give information as to the cost of carrying mails and operating mail cars, have since then learned through experience that their estimates were entirely too low, although given in good faith at the time. The Chicago City Railway states that the revenue derived for running mail cars barely pays the expenses. Nearly every manager with whom I have communicated is dissatisfied with the remuneration. And here allow me to add that the running of mail cars in large cities like New York and Chicago is of vastly more importance to the government than it is willing to admit; while on the other hand to run these cars on regular trains is annoying to the passengers from the fact that where they are supposed to stop at sub-stations, connecting points, etc., the passengers are annoyed by the wait of a minute or so, and the result is the car is run as a special exclusively for mail, making it more costly to operate, and yet the government is basing the compensation upon the same basis as postal cars for steam roads; and we, as managers of electric roads, are allowing it to be done with all statistics before us to prove that the steam roads are not securing the remuneration they should. To prove this I respectfully refer you to some excellent articles in detail upon this particular subject in the "Railway Age," published at Chicago, December 31, 1897, and March 11, May 20, and May 27, 1898. It would be worth the time of any member of this association to procure and digest the articles referred to, as time would not permit of repeating them in full here. Congress has already appointed two commissions to investigate this subject known as the Gardner-Hubbard commission of 1877, and the Elmer commission of 1881. These commissions made elaborate reports advocating increased pay based upon speed and space. The recommendations were not acted upon for the reason that the railroad companies themselves, without extra pay, have been found to increase their speed and enlarge their space, and thus the government has actually received these advantages under the operation of the law as it stands. The steam roads had done more than their part, while the government took advantage of it and refused to act. The government has always been in the position of a beggar regarding facilities demanded of the steam roads for handling the mail.

In December, 1897, a great cry went up from Washington as to how the steam railways were swindling the government. This led to an investigation, and had I time I would like to quote the results of that investigation in detail. Suffice it to say, that this charge was ably answered by E. P. Ripley, president of the Santa Fe, and the charge denied by the Chicago "Times Herald," and the sum and substance was that the government was making thousands of dollars off the railways through the arrangements of only weighing mails every four years and obtaining car space unpaid for. For illustration, in these statements sent out from Washington, it was claimed that the amount paid by the government to the Erie road for the transportation of mails had been sufficient "to pay a dividend of 6 per cent per annum upon all the stock of the road." The stock of that road is \$150,000,000;

6 per cent per annum would be \$9,000,000; the total mail pay of the Erie road is less than \$500,000. Such statements as these place this matter in a false light, and, if after years of experience the steam roads are not in a position to obtain proper rates for the handling of mails, what will be the condition of affairs between the electric railways and the government if no effort whatever is made upon the part of the management of electric railways to look after this matter now? I realize that it is a hard matter for the government to make a flat rate to cover all roads and the local condition pertaining to each road; but as it has attempted to do this, I claim that it should have made the rate flat-tering enough to the electric railroads to make them become at least interested in the subject, and that 3 cents per mile for pouch service and 16 cents per mile for 16-ft. cars, which are fast becoming obsolete and replaced by cars from one-third to twice as large, is not enough. The government will naturally take advantage of the larger cars as it did where advancement compelled the steam roads to increase size of cars, speed, etc., but I doubt if it will increase the compensation for electric roads or take this question into consideration when figuring on cost of operation.

It is not for me to say how much we should receive, but for the members of the convention to take up the subject by discussion and work it out. This class of service is in its infancy; it will grow from year to year and after a while be worth thousands of dollars to us annually, and what we do today and what we neglect is laying the foundation for the government to work upon in the future. Then it behooves us to be on the alert and lay the foundation of the compensation so well that the government cannot tear it down when the time comes to declare the electric roads as post roads, etc.

For the present we are compelled to abide by the appropriation of congress and the rates made by it; but the question before us is how can matters be improved upon to benefit the electric railways in the future; very easily and a little patience of time. This convention represents as many millions of dollars of investment, I believe, as any other body of men coming together each year in this country. They are men whose power can be felt in every community. In unison there is strength, and if you, gentlemen, will take up this subject, discuss it thoroughly, and when you have reached an understanding, go home and lay the matter before the congressmen from your districts, convincing them of the good the electric railways can be to the public in carrying the mails, as well as themselves, to their very door promptness, frequency and dispatch, even though these homes may be in the rural districts surrounding our cities and towns, and it will only be a question of time until the influence of these efforts is felt at Washington, and something more substantial than glory and patriotism will be our reward for carrying the United States mails.

Mr. Sergeant (Boston): Mr. President, I should like to say a few words on the subject of this paper. I have been very much interested in this matter, and I heartily endorse all that the writer has given us. I have some data of our experience in Boston, which I thought might be of interest to the members. In 1895 our company in Boston was approached by the Post Office Department to see what could be done in the establishment of a trolley mail service, but as the writer of the paper has said, there was not sufficient money available for the purpose, except funds left over from the "wagon fund." We undertook to inaugurate the service, and take what revenue might be gotten by a transfer from this fund, as a test of the feasibility of the scheme. This was the first city in which the trolley mail cars were handled in the same manner as the steam railway mail cars, that is, with a messenger and clerks to assort the mails on the car. We began in 1895 with seven mail cars which we equipped, and for the information of the association, I will present a memorandum which I have concerning our trolley mail cars.

The trolley mail service was inaugurated May 1, 1895, and the night service June 3, 1895.

The number of trips made is shown in the table:

Year.	Week	Days.	Sundays.	Holidays.	Per Year.
1895 (at first).....	43		18	18	
1895 (later) .....	43		20	20	12,670
1896 .....	47		20	20	14,315
1897 .....	47		19	21	15,409
1898 .....	47		19	21	15,517

In 1895 the yearly mileage was 130,000 miles; in 1898 it will be upwards of 170,000 miles.

There were originally 12 stations, to which have been added one at Charlestown, January 1, 1897, and one at Roxbury Crossing February 1, this year, on which date also a pouch service was established between Somerville and West Somerville. Connections have always been made with the Boston & Albany and Providence depots, and Union Station; 16 men are constantly employed, eight conductors and eight motormen.

Out of about 45,000 trips run (to January 1, 1898), there were 360 failures or irregularities, or about 8-10 of 1 per cent, and that was almost wholly due to the snow and the consequent blockading of teams in the narrowest streets.

Seven cars handle 100,000 pieces of mail daily. The system is under the supervision of the New England superintendent of railway mail. In other cities the trolley and cable service is under control of the local postmaster. The general superintendent of railway mail of the United States, in his report for 1895, says: "In Boston, by reason of the fact that the street car lines are all under one management, we are able to move mail from one suburb to another, as, for instance, from North Cambridge and Cambridgeport to Brookline, by direct transit, the mail not being compelled to pass through the main office. There is probably no city in the country where the benefits of this service will be as great as in Boston, with its densely populated suburban districts, all of which have heretofore been more or less restricted in their mail accommodations by reason of their mail having to go through the city post office. By the present system the railway post offices centering at Boston, can 'pouch' to the street car lines all mails for suburban points reached by them; and the street car lines in turn can gather up all the mail from suburban points and pouch it direct to the departing trains at the various depots."

The first practical illustration of a street railway post office was in Boston. Other cities had street railway mail cars first, St. Louis and Brooklyn, where the mail was simply carried in bulk and delivered the same as if by teams, not being worked in transit; but Boston street railway cars were the first to be patterned after steam railway cars, with racks and all appliances for working the mails in transit, transferring, so to speak, so much working space, and clerks, from the main post office to the post office on wheels, thereby losing absolutely no time in handling matter, and enabling the business man to get his mail early in the morning rather than late in the afternoon, with nearly a whole day saved for him. One car is equipped with an electric cancelling machine, with a capacity of 2,000 cancellations an hour.

Let us follow a car to North Cambridge, and touching Park Square, Cambridgeport and Cambridge post offices en route. Take the first trip in the morning, where the postal clerk receives from the general office all the accumulations of mail which arrive during the previous evening from all parts of the country. Upon arriving at Park Square station (the train from New York, with all mail from the South and New York State arrive at 5:30, this mail is delivered direct to the postal car, and the contents opened by the clerks and assorted for the carriers. Upon the arrival of the car at Cambridgeport, a 15-minute run, the mail for that station is about all ready for delivery to the carrier. This also applies to Cambridge and North Cambridge. Now this car receives all mails collected at the various stations and assorting it in the car, inward, for all outgoing trains, so that when it reaches stations en route for Boston, the mail is all ready for immediate dispatch.

Each car handles nearly five and a quarter million pieces of mail, or a total of 36,561,170 pieces for the seven cars in a single year.

I thought, Mr. President, that these facts might be of interest in showing that the mail service, as carried on here, is not merely carrying it from a station to the post office, which method

we investigated and decided could not be done to advantage, and which is virtually being done by pneumatic tube service here, but our method is practically a traveling post office, and each car is practically a branch of the general post office in Boston, which receives mail from the trains and assorting the mail and gives it to carriers, so that without question the average suburban mail here is two or three hours earlier in its delivery than it would be without this service.

What the writer of the paper says about the question of compensation I think is very true and important. I believe that something might be done by the association. We have never received a compensation which has more than paid our running expenses. I think that at any rate that should be fixed in an arbitrary manner, so much a car-mile for carrying the mail, is entirely unfair. It all depends, it seems to me, on the conditions; what service is rendered, what the character of the service is, whether combined with passenger service or whether it is done with independent cars, and what the local conditions of expenses are. For example, I know that there are some street railway lines whose gross receipts from passenger business are not equal to our operating expenses for conductors and motormen in Boston. I have no hesitation in saying that the average expenses here per car-mile for conductor and motorman run to about 7.5 cents. The hours for labor are 10 hours in 12, fixed by law, and the compensation is \$2.25 per day, and 30 cents an hour for trippers.

In some other cities the conditions are quite different; possibly they pay higher wages. On the other hand, some mail routes are one straight away suburban route where a rate of 10 cents a mile would be a good rate compared with one at 30 cents a mile where the conditions are like those in Boston.

I feel, Mr. President, that what our Congress may need is enlightenment, that they do not comprehend the fact that the street railway service is better than the steam railway service and is of a different character, and something which is such a public benefit that it would be a pity to have it stopped, and yet which is something we cannot afford to keep on unless we are properly remunerated. I am not without hope that something may be done through our Association by getting at the conditions of service through the secretary, in correspondence with different cities. That might be done in an official way to find out what the various conditions are under which different roads, which are members of our Association, are carrying mail, and what, if anything, they are willing to do in the shape of concerted effort to bring these facts before the members of Congress who have to do with these matters. Our Post Office Department is like all government departments, it only sees so many general things and not all the details that go to make up expenses and perfect service, but I believe it means to be fair, and if the true facts are put before it we shall probably be able to get a reasonable compensation for this service. I am obliged for the opportunity of saying a few words, and hope that some action may be taken by the Association that will benefit us.

Mr. Beggs (Milwaukee): I have listened to the paper which has been read with a great deal of interest, more particularly in view of the fact that the Milwaukee Company, at the present time, is going through the preliminary stages of establishing a mail service upon our lines, which has up to this date not been instituted, not even to the extent of carrying the pouch.

I may say for myself that I have not been enthusiastic over it, because of the fact that it did not seem to promise a profit; and I think, as has been truly said in the paper, that the amount of protection that the various roads expected when they were established as mail routes has not been of the advantage to them that they hoped for, and it was because of the advantage that many of these roads expected to derive because of carrying the mail, that induced them to fix an entirely inadequate rate of compensation to be paid by the government. The government took that rate of compensation fixed by the first few roads upon which mail was carried, and attempted to establish that as the basis of compensation to all roads whose services they require. I had presented to me by the post office officials at Milwaukee, the report of the second assistant postmaster-general, in which I found that there had been paid, not 16 cents per mile, but in many cities the rate paid per mile, as shown by the report for the year 1896, I think is about 11 cents per mile for postal car

service, or an amount considerably below that which it costs to operate a car over the line, and yet that car is supposed to be given the right of way at all times in order to make the service satisfactory; and in making inquiries about this matter, I found that the wagon service was costing nearly double what they expected to obtain a very much superior service for; and it seems to me that it is high time that this Association, in its capacity as such, should support a committee who would take this matter up with the government and establish some fair basis of remuneration, based, as Mr. Sergeant has suggested, upon the varying conditions. There are kinds of service that could be given in one city that might not be possible in another. In Milwaukee we could displace the wagon service because we controlled the entire street railway system, and the peculiar location of the various lines, reaching to all the suburbs and running directly through the city, east and west and north and south, they propose there to do away with much of the earlier collecting service by having districts in certain sections of the city and the carriers serving as collectors of mails, collecting the mail in certain districts and bringing it to one central point where the mail car passed and which would pick it up periodically throughout the day, thereby reducing the number of collectors required.

As to the question of carrying mail pouches on the regular cars of the system, I seriously question its advisability. It may possibly be necessary in some of the smaller cities. I am free to say for the Milwaukee Company that I do not favor carrying mail pouches on the platforms of our cars. The platforms, as we all know, are too valuable to use to carry a mail pouch at 3 cents a mile, and it would very greatly inconvenience the patrons on the line, many of whom insist on using the platforms whether you like it or not. It seems to me that if this Association would appoint a committee to take this matter up in behalf of the street railways of the country that committee could confer with the government officials and establish some fair basis of remuneration, not simply for the purpose of having street railways established as mail routes, but as in the case of steam railroads, a source of revenue and profit. I think now is the proper time to do it, because the street railway mail service is established in a comparatively small number of cities. I understand that in Cincinnati, as Mr. Sergeant has stated, the cost of running the mail cars is about what is received from the government, without any profit, or compensation for the wear and tear or anything of the kind. I think the suggestion made by Mr. Sergeant, that a committee of this Association should be appointed to take this up with the government for the purpose of having a fair rate of compensation, is an excellent idea, and it would be one of the most practical things that this Association has done for its members up to the present time.

Mr. Farson (Chicago): I have been impressed with this thoughtful and practical paper of our friend from Omaha. It is a question that will grow upon us from month to month, because, as has been stated, this service is just in its inception. When the street railway mail service is once started, there is no danger of going back to the old system, because the people will insist on the very best service obtainable. It is especially desirable for the large cities, because it gives a man an opportunity to send a letter in the morning and hear from it during the day, so that immediate action can be taken. It is an important matter to the street railway interests, for the reason that they should be reasonably and amply compensated for all the service rendered. The suggestion of the appointment of this committee is especially in point. Such committee could be appointed, and act under the direction of the Executive Committee, to collect from the different members of the Association such facts as may be necessary for them to have. We can by acting unitedly secure more forcible and intelligent action. I would, therefore, move that a committee of five be appointed by the chair to act under the directions of the Executive Committee and communicate with the different members of the Association, and get all the facts before them, keep the Association advised of their proceedings, and that they have authority to confer with the post office authorities.

Mr. Beggs seconded the motion.

Mr. Robert McCulloch (St. Louis): I once stated for the in-

formation of the Association that one of the roads in St. Louis made a contract with the government to carry the mail, and had two cars built especially for the purpose. The compensation was entirely inadequate for the service alone, not counting the investment in special cars. The company expected to derive a benefit by being able to designate its road as a U. S. mail road, and it had the inscription made on their cars, "U. S. Mail." As soon as the cars appeared on the streets, at the suggestion or interference of somebody, no one knows who, the government required the sign to be taken off of all the cars.

Mr. Dimmock (Council Bluffs): After an investigation and a conference with a number of government officials, I think the secret of our success will lie in acting together as a body, and in the fact that we are not post roads. They treat us now as they would a contract with an individual, and if the committee will keep that point in mind it is in our power to dictate to them the terms that we will make, instead of their dictating to us. That point is a critical one, and if we allow the present rates to continue, there will come a time when they will demand of us to carry the mail at the rates the same as they pay the steam roads, as mentioned in the paper, and that point should not be lost sight of. It is the most vital point in the whole subject.

Mr. Payne (Milwaukee): Recently I had an interview with some of the department officials, the postmaster-general and assistant postmaster-general in regard to this subject. I found these gentlemen much interested in this question, but the difficulty with them is the lack of funds. The trouble lies back of the department. It lies in the appropriation available for this purpose; and you will have no difficulty, I think, in getting a reasonable compensation from the departments if a sufficient appropriation is made by Congress. I think the trouble lies largely there, and I have no doubt that if the committee from this Association will take the matter up and present it properly to the committee on appropriations having in charge the post office appropriation that you will secure a very large increase. I have found the department officials willing to investigate the situation in the various cities and to act as far as the means at its command will allow; and I have no doubts that the methods proposed will be the proper ones to pursue. But, of course, it will require the committee selected, if they hope for success, to visit Washington and press the claims of the street railroads on the proper committees of Congress, before it takes up each individual case with the department. I am thoroughly in accord with the resolution, but the committee will find that it will have more to do than gather statistics and information. It will be necessary to go to Washington and present the case to the proper committee of the House of Representatives.

Mr. Farson's motion was then put to vote and carried; and the president announced that he would appoint the committee later.

#### EQUIPMENT AND MAINTENANCE OF ELECTRIC CARS.

By M. S. Hopkins, Electrician Columbus Street Railway Company, Columbus, O.

An ancient king of fable offered a rich reward to the courtier who could tell a story that would last forever. To him who undertook it and failed the price was his head. Were this merry monarch living today he might gratify his wish by asking, "How shall I best manage my street railway?" and all his newspaper editors, councilmen, and other subjects would at once undertake the task, for it is a matter of common knowledge that everybody can manage a street railway much better than it has ever been managed.

The modern king of finance is daily asking this question of his hired subjects, and unless the answer is expressed in dividends the story is at an end and the head of the manager is the penalty of failure. To attempt to discuss all of the various elements entering into the composition of a successful street railway would be a continued story and not within the province of this paper.

What is the best electric equipment to purchase and how can it be made to render the best service at the least cost, is a question which daily confronts the street railway manager and one

M. S. HOPKINS.

M. S. Hopkins is a native of Henderson, Ky., where he received his education in the grammar and high schools, and entered the civil engineering department of that city. In 1890 he was employed in the shops of the Minot Electric & Machine Company, Columbus, O., but left that company to take up electric railway construction in Columbus for the Thomson-Houston Company. At its completion he became shop foreman for the Columbus Consolidated Street Railroad Company, and when it was reorganized he was made electrical engineer, which position he now holds. Mr. Hopkins was a charter member of the Engineers' Club, of Columbus, and was secretary for two years. He has been associate engineer in the construction of several electric lines in Ohio and is chief engineer of the Lancaster (O.) Traction Company.

on which he is constantly seeking advice. There can be no answer which is applicable to all street railways, and no especial merit is claimed for the views set forth other than that they are the result of experience and born of repeated failures and successes.

#### CAR EQUIPMENT.

No fixed rule can be laid down for the selection of equipment, as climatic conditions, character of traffic, frequency of headway, conditions of roadway, municipal regulations and grades are all elements which determine what the equipment may or should be.

#### CAR BODIES.

For years car builders have attempted to devise a car body which would be equally durable in both summer and winter, but judging from the character of equipment now in use on the majority of roads, such a car has not yet been produced. The combination car with movable parts is not satisfactory for winter use, is troublesome, noisy and cold, and is lacking in many of the essential features of the open car for summer service. The open cross seat car of the barge type with running boards on the side seems by far the most desirable type of car for summer service, affording the largest seating capacity and the best facilities for receiving and discharging passengers, which is a great advantage in city service. Considering all features, the box car with side seats, large windows, wide end door to the side of center, roomy platform and vestibules closed on one side, seems best adapted to the average conditions of winter service. While the vestibule types closed on one side is not so convenient for the handling of large crowds, yet the additional safety afforded on double track roads should receive full consideration even at the expense of convenience. In localities where winters are accompanied with snow fall and freezing weather, the vestibule affords protection to passengers, and motormen and conductors are able to render very much more efficient service.

The long car body seems to be growing in favor with the railway manager, due to the comparatively small increase in operation, in comparison to increased carrying capacity, and its allowing of the increase of headway or decrease in number of cars run, resulting in a large decrease in operating expense per passengers carried.

The purchaser of car bodies should have a clear conception of the details of car construction, and specifications should set forth clearly the essential features—minor details of interior finish and decoration being left to the manufacturer.

In the construction of box car bodies the trusses should be as deep as possible and great care taken to secure a perfectly rigid fastening at end of sill, as the slightest deflection throws an undue stress on joints and framing of car body.

Where side sills are plated on outside with steel plate, all season cracks should be thoroughly filled with a thick mixture of lead and oil, and the entire surface given a heavy coat of oil paint before the plate is put on. It is hardly necessary to say that all joints should be well leaded and protected from moisture.

A heavy steel roof rafter in one piece should be put in at every post, and a saving in maintenance will be made by having platform floors of oak or maple.

The trolley stand should be mounted on a trussed support, which will distribute the stress to the ends of car as much as possible.

Ash seems to be almost universally used in post and light framing of cars. This is probably due to the difficulty in securing the grade of oak necessary, the lighter weight of the ash and the greater ease with which it is worked. Yet in spite of these difficulties, oak is far preferable, being stronger and more elastic and will give a much longer life.

#### TRUCKS.

Under the average conditions, a 22-ft. closed car or an eight reversible seat open car body should be the limit for a single truck. Although there are single trucks which will carry a longer body fairly well, yet the increase in maintenance will in most cases warrant the use of double trucks. The local conditions should govern the type of double truck used, the bolster type in most cases being preferable for long cars on high speed, suburban service, while for city service, where heavy grades and quick starts demand maximum traction, and short curves make it necessary for the wheel to turn under the sill, the bicycle type must necessarily be used. This type of truck is no longer an experiment, and while it possibly requires more careful inspection and adjustment, very efficient service can be secured from trucks of this type.

Trucks should be made up of a small number of parts; cast and malleable pieces should be the lightest consistent with strength. Springs should be so arranged as to prevent oscillation, and give an easy riding car under all conditions from no load to full load, and when the style of truck is of such design as to prevent the use of an under truss, the spring base must be exceptionally long and end springs so arranged as to relieve stress on car sills.

The brake mechanism should be so designed that the stress will be equally distributed on all parts throughout its range of movement. Pins should be of ample size to provide for wear. The slider method of support for brake beam will be found more satisfactory than the loop support. The minimum amount of friction should exist between brake staff and shoe, and release springs must be as light as possible.

#### ELECTRICAL EQUIPMENT.

In the selection of electrical equipment the main point is to secure equipment of ample capacity and proper design for service required. In a railway motor, the mechanical and electrical features which influence its maintenance should receive very careful consideration. The bearings should be large and lubricated by oil from below and cup grease from above, and so designed that drip from bearings will fall outside of frame. The armature must be so constructed as to permit shaft being pushed out without disturbing the commutator and winding.

I am glad to note that the importance of light weight and slow peripheral speed of armature has been recognized in recent design of railway motors. The inertia or fly-wheel capacity of armature should be the smallest possible consistent with the work required. Engineers differ as to the best method of suspension. From a theoretical standpoint, the cradle or side bar suspension has the lead. The dead weight is largely removed from axle, thereby eliminating to some extent the hammer blow on rail joints, decreasing the wear on axle brasses and securing the better alignment of gears; yet, in practice, the nose suspension is still preferred by the writer, as the car starts more smoothly—the weight of motor on spring supports overcoming the jerk and quiver so common in other methods of support. The specifications for railway motors as drawn up by leading manufacturers of today, amount to practically nothing, and would suggest that the purchaser of motors in his specifications clearly define the rating heat limit and efficiency.

The series-parallel controller is in most respects a satisfactory device, the chief objection being the narrow range of speed on running notches. Specifications for resistance should provide that the last two points of resistance be of sufficient capacity

to allow of their continued use as running notches, especially where cars are operated in city service.

There are several types of magazine fuse boxes or cut-outs and single cut-outs using a special fuse, which possesses a number of points of merit. Without going into detail, it is the opinion of the writer that under average conditions the standard magnetic blow-out fuse box, using a link fuse, is preferable.

Each car should be equipped with a thoroughly reliable lightning arrester. Points to be noted in selecting this device are as follows: The kicking coil should always be installed; the air gap, which should be as small as possible; a positive and quick device for interrupting the current after discharge, and which will not be injured by discharge; a non-inductive resistance in the main circuit which will limit the flow of current and thereby prevent the opening of circuit breaker at the station when several arresters operate at the same time.

One of the most puzzling problems brought before the manager today is the amount which should be expended in the maintenance of old equipment before it should be replaced by new. To the average master mechanic this would seem a simple problem of making a careful estimate of the difference in cost of maintenance of the old and new equipment, due consideration being given interest on money invested in new equipments, and its increased efficiency. And yet, after the master mechanic has conclusively shown that by putting in new equipment a marked saving can be made in cost of operation, the manager has to consider the financial condition of the property, the advisability of increasing the investment, the possibility of doing so, and whether there are not other departments of the road where a greater saving can be made by increasing the investment. One should go slow in putting in new equipment, as new apparatus may at first seem to be void of the main defects inherent in old equipment, yet when put in operation, other defects occur which under the varying conditions may prove even more disastrous than the old.

#### MAINTENANCE OF EQUIPMENT.

The cost of maintaining equipment depends on various complex conditions, some of which are beyond control of the manager, and others for which he should be directly responsible. Heavy grades, numerous railway crossings, sharp curves, dirty and unpaved streets, imperfect and poorly constructed equipment, long and severe winters, all affect cost of maintenance unfavorably and are beyond control of the manager. But the character of men who operate the cars, the manner of operation, the way in which repairs are made, and the character of men engaged in repairs, and the material used, are the controllable elements and in most instances the chief features affecting cost of maintenance.

#### CARE OF EQUIPMENT IN CAR HOUSES.

Generally one of the following three methods are used for daily inspection of car equipment, namely: Inspection of cars each trip; inspection of equipment at night by motor inspectors; inspection of equipment during the day by motor inspectors and repair men.

In regard to the first case, that of the trip inspection, I would say that in the present degree of perfection attained by manufacturers of railway equipment, trip inspection should not be necessary, and excepting on interurban lines operating at high speed over long runs, is of doubtful value. It is expensive, requiring the services of an inspector who is necessarily a man of some ability, for each line of cars. The period of time for making this inspection is necessarily very short and the entire time is taken up in mere inspection—little or no opportunity being afforded in which to make repairs.

In regard to night inspection, the experience of the writer has been such as to absolutely condemn such a method as expensive, slovenly and unsatisfactory. It is impossible to make a thorough inspection of cars at night, no matter how well lighted the car house may be, and the efficiency of the work done by the men is very far below that of the work during the day. Therefore, when local conditions will admit, inspection of cars during the day seems by far the most advantageous.

We will assume a car house station, from which 25 or more cars are operated. There is usually one general foreman in

charge of this station. His duties are chiefly those of the transportation department, but he should be a man thoroughly conversant with the usual trouble which may occur in the operation of the equipment, and know how to direct minor repairs. It would of course be better if he were able to personally superintend the actual work of repairs, but it is usually very difficult to find men who are good mechanics and likewise efficient in the transportation department.

For making inspection and running repairs such as should be made in car houses, it is a safe rule to have one man to seven cars. It is, however, important to have a man in all car stations, known as chief inspector of that division, who is thoroughly conversant with practical electrical and mechanical matters. This chief inspector should have under his care for inspection and repairs seven cars, and also have direction and supervision of the other two repair men who care for the remaining 18 cars.

It is important that the responsibility for the proper repair of cars be definitely located, as nothing is so demoralizing to the force of motor inspectors as to have a case of trouble arise and not be able to trace the responsibility at once to the proper source.

The duties of these men should be to make a daily inspection of every car assigned to them, starting first with their motors, examining the grease in the cups, the brushes, cleaning the motors, examining the connections, etc. They should remove the covers from their controllers about once in three days and oil the cans very lightly with vaseline or grease, remove any blisters which may have appeared on the contact points and carefully examine the adjustment of contact fingers. Too much emphasis cannot be given to the inspection of all brake rigging, and very thorough inspection should be made daily from the brake-handle to the brake-shoe, and the brakes tried by inspectors before car is placed in service. A broken brake-chain or worn-out shoe, a broken brake-clutch or a broken brake-pin are things that should never occur through neglect, and if an accident of this kind does occur, the cause should be immediately traced and the responsibility located. Economy in maintenance should never be exercised at the expense of absolute safety, and brake-chains, pins and shoes should be discarded long before the danger point is reached.

The general public forms its opinion of maintenance of equipment by the little things on the interior of the car, such as a screw loose in the back, a broken strip on the car floor, loose register pulley, broken hand-strap, broken glass, rattling glass, and hundreds of other little things which make the fittings of a car body. Repair men and inspectors should be so trained that in passing through the car on their inspection they should note any little thing of this kind at once, and the rule should be that they should stop and repair it at once, for if allowed to wait till some other time the repair is usually neglected entirely.

The actual repair work done by these inspectors should be all the work possible to be done without the use of machine tools, or which, if done by them, will not require the loss of car from service for a period of more than two hours.

If during this inspection the motor inspector discovers trouble which is beyond his ability to repair, he should fill out a repair slip and send the car with the slip at once to the repair shop, stating the nature of the required repairs, assuming that the repair shop is run as a separate department from that of the car barn. If the nature of the trouble is such as not to immediately incapacitate car for service, but which requires the service of the repair shop department, he should fill out the blank as above noted and send same to the foreman of repair shop, but this notice to the repair shop foreman should in no way release the motor inspector from the responsibility of the successful operation of the car. If the repair shop foreman is unable, owing to press of work, to take the car off the road at once, it is the duty of the motor inspector to continually watch the development of this trouble, and if at any time he thinks the trouble has so developed that the car is not safe for successful operation, he should leave it out of service and so notify the repair shop foreman. If the repair shop is still unable to receive car at the shop, he would then make a personal examination of car and assume responsibility for its further operation.

The question as to how often car equipment should be taken to the shops for a general inspection and overhauling, and to what tests the electric equipment should be subjected at the time of inspection, are subjects on which electrical engineers differ widely. Considering the average conditions and assuming that equipment is in good condition, it is the opinion of the writer that the taking of cars to shops once every six months should maintain the equipment in good condition and assure its efficient operation.

#### MOTOR BEARINGS.

Bearings should be run "close" at all times; the time of their renewal being determined by the effect of the wear on the gear and pinion, as the wear on these parts is largely affected by the wear of the bearings. After a series of tests covering quite a period of time, as to the wear of various materials used in motor bearings, the writer feels warranted in making the statement that either the best grade of babbitt or brass bearings should under the ordinary condition give a longer life than six months, and when a bronze bearing of the proper mixture is used and properly lubricated, a life of 12 months can safely be expected. The method of lubrication largely influences the life of brasses. The writer has, after long tests with various lubricants, discontinued the use of grease entirely on armature brasses, and in most cases on axle brasses, a good grade of engine oil, supplied through wicks, being more satisfactory and economical.

In order to reduce the maintenance of brasses to a minimum, the use of phosphor bronze is strongly recommended. Street railways operating 25 or more cars will find it economical to cast and machine their own brasses. This may be discouraging to the supply men, but it means money on the right side of the ledger when the expenses are footed up. A small brass furnace can be cheaply erected, and after suitable jigs which can be attached to any lathe have been provided for boring and turning, the cost of casting and boring is very little more than the cost of re-babbiting, especially where babbitted brasses are machined after boring, while the life of the bronze bearing is far in excess of that of any babbitt yet tried.

Rough and burnt commutators are too frequently the cause of expensive motor repairs and usually indicate imperfect motor design or inexcusable neglect. Well designed motors in good condition, even under the hardest service, provided, of course, the average work is within the rated capacity of the motor, should not require turning oftener than once in eight months. There is nothing that so well indicates to the practical man the conditions of the motor as the condition of the commutator. Whenever the commutator shows signs of burning or blackening, steps should be at once taken to prevent it. It is not advisable to try to prevent this by the continual sanding of commutator by motor inspectors, though the occasional cleaning up of the commutator with sand paper is necessary with all motors. The causes of trouble of this character are so numerous that mention is made of only a few of the more important.

The kind of brush used is an important factor. Brushes should be soft, close grained carbon, treated with a good lubricating compound—one which does not flow too freely from the heat from the motor and which will not burn and carbonize on commutator. The price of brush is not a material consideration, as a brush which is slightly superior to another will prove economical even at quite a large increase in first cost. The tension on the brushes is, as a rule, too light in railway motors. It is a common belief that heavy tension causes wear of commutator, but experience has shown that the actual wear of the commutator due to friction of the brush is very small, and that increased tension will in some cases materially decrease the sparking which causes the greatest wear. Improper alignment of brush-holders frequently causes sparking. In recent practice the use of side contact springs on brushes has been generally abandoned. On motors carrying heavy currents this spring is quite essential, as excessive heating of the brush is caused by limited contact in the holder.

Commutator insulation should be made of what is known as the built up mica segments of the very softest grade of amber mica. A hard, clear mica should never be used in a commutator, as this mica will not wear away as fast as the copper and there

is nothing so disastrous to the life of the commutator as high mica insulation.

In some motors it may be necessary to change the winding of armature and field coils in order to avoid the burning of the commutator. First, determine by actual experiment what change in winding is necessary, and then equip with the new winding every armature or field that comes in burned out. This will permit of change being made without any great expense, as the greatest part will be borne by the maintenance charge.

#### THE ELECTRICAL TESTING OF RAILWAY EQUIPMENT.

Elaborate systems for the periodical testing of insulation on railway equipment seem to be growing in favor with some electrical engineers, but the practical value of these elaborate tests is not fully demonstrated. Experience has shown that tests of this kind are very misleading and frequently cause the tearing down of equipment which under ordinary conditions, had no tests been made, would have continued in service for a long time.

Judging from my own experience, it is neither necessary nor advisable to periodically test the insulation on the equipment, but to make such tests only in cases where motors are not working properly. The proper training of motor inspectors as to the little points about railway equipment which clearly indicate trouble with motor, will in nearly all cases locate trouble due to weak insulation, so that it can be remedied before any serious damage has resulted to any other part of the equipment.

All armatures and field coils repaired should be carefully tested as to resistance and insulation to ground, and on all armatures having coils repaired, new commutator put on or commutator turned, resistance between commutator bars should be very carefully measured; using, preferably, a portable Wheatstone bridge testing set, capable of showing clearly a variation in resistance of 1-1000 of an ohm. This is one of the most important tests to be made, as more burn-outs of armatures are caused by the slight short circuiting of coils, due to solder, acid, or copper turnings bridging over the insulation under the leads than from any other cause, which can only be located by a test of this kind. Any mistake in connecting up the leads or a bad joint will at once be detected before any damage has been done. For testing insulation to ground, I consider a first-class magneto of 10,000 ohms resistance all that is necessary.

#### TRUCKS.

The design of trucks varying so widely, very little can be said in a paper of this kind as to detail of maintenance, other than to say that all joints should be kept perfectly tight, and where they do become loose, parts should be swedged out and refitted. All bolts should be fitted tight, and nuts secured by lock washers. Soft gray iron inset with plugs of soft steel has, in the opinion of the writer, never been equaled for brake-shoes. The material giving the greatest amount of friction against a chilled surface should always be used regardless of cost.

Much has been written of late on the subject of car wheels, their wear and alignment, and still street railway managers are careless about their wheels. Too much care cannot be given to the sizing and alignment of wheels, and the pressure with which they are forced in the axle. At least 50 per cent of the wheels removed from the cars throughout the country are caused by broken or sharp flanges, or a broken wheel. The use of sand largely influences the life of wheels. It could not be said that a sand box should in no instance be placed upon a car, but where it is possible to successfully operate without them, sand boxes should be discarded and other means used for sanding the track. It is in most cases far more economical to fit up a special car, capable of carrying a large amount of sand, and sand the track for say 100 ft. before each point where a stop is likely to be made, and on grades and in places where the track is exceptionally slippery to sand the rail for its entire length.

#### REPAINTING OF CARS.

The experience of the writer has clearly demonstrated that it is satisfactory to repaint cars without removing all of the old paint. Patent varnish removers, sealers, etc., are a snare and a delusion. The writer has found the following system of repainting cars to be quite satisfactory: First, remove all old paint by

softening it with a blow-pot just enough to allow it to be scraped off with a broad putty knife, not allowing flame from the blow-torch to at any time strike the bare wood. Sand surface off well with block and sand paper. Where any new work has been put in, it should be first primed with a coat of boiled oil and a little lead and allow it to stand for not less than four days. Dashes and all iron work should be thoroughly cleaned with strong alkali and primed with a coat of linseed oil put on boiling hot and allowed to thoroughly harden; giving one coat of oil and lead before color. If surface is rough, plaster with lead on this coat. Allow it to thoroughly harden and sand with block; then lay on two coats of flat lead, two coats of color, color varnish, stripe and ornament, finish with one coat of rubbing varnish and one coat of finishing varnish. The main object in the painting of cars should be to secure a hard, smooth surface which will hold out the varnish with the very smallest amount of material; the thinner this surface is the better. Care should always be taken where plaster is used, to make it as thin as possible, and lead coats, color and varnish should all be carefully tempered, so as to set alike, as most cases of cracking of paint are due to want of proper tempering of lead and color coats.

A car painted in this manner, should not require repainting for from six to seven years, if properly cleaned and varnished. Cars should come into the paint shop, even where the best grades of varnish are used, once every eight or ten months, and be thoroughly washed down with pumice and strong soap and given a coat of finishing varnish. The life of the varnish largely depends on the care given to cars in the cleaning department. Cars should be sponged off daily with clear water; any accumulation of dirt removed as far as possible by the use of a chamois skin and sponge—care being taken to rinse grit off before rubbing with sponge or chamois. Once every 30 days a car should be thoroughly washed down, using a good grade of soap. If impossible to remove dirt and stains from surface of cars with finer grades of soap, strong soap may be used, it being found that the injury to varnish resulting from the use of this soap once every 30 days will be more than offset by the saving in cleaning and touching up when taken into the paint shop for re-varnishing.

In the selection of designs for painting of cars, the plainest and neatest design should as a rule be selected. No lettering should be done on panels as this greatly increases the maintenance of paint shop department. The signs should in all cases be put upon sign boards, especially made for the purpose.

The inside of cars should be thoroughly cleaned and rubbed down with pumice stone every second time the car comes into the paint shop to be re-varnished. There are a number of so-called ear cleaners on the market which are rather a detriment than an advantage to the outside surface of cars, but which may be used to advantage on the interior of cars, especially around the sash. Special observation of the interior of the car will show that the varnish first commences to disappear around the sash—moisture from the windows gathering around the mould which holds window sash, first discoloring it and gradually working into the sash itself. A car-cleaner which is largely made up of oil and dryer if used about once a week on the window sash and moulding, will be found to be a great advantage. Three years ago four new cars were selected and a car cleaner used weekly on the windows of three of these cars, and today not a stain is to be seen on sash or mould, the cars having been re-varnished twice during that time.

After a number of trials of various floor paints and paints mixed especially for the purpose. The conclusion has been reached that there is nothing equal to pure white lead and linseed oil and suitable color for the floors of all cars. The majority of ear floors are stripped, and it has been found impossible to find any material hard enough to stand on the top of the strips of a car floor, while almost any material will stand the wear, but not the moisture, between the slats. It is therefore very evident that the best paint for this purpose would be one which would best preserve the wood in the floor of the car from the constant moisture to which it is subjected.

As to the ear roofs, the main object is to put as little material

as possible on the canvas of ear roofs, and that material should be elastic and yet withstand the action of the weather. Great care should be used in the tempering of paints for roofs. Avoid painting roof one time with one kind of paint and the next time with another, for this will invariably, in the long run, crack and require the renewal of canvas on the roof. In a number of cases it is customary to use slush or any old thing which happens to be in the paint shop for painting roofs of cars. This is a great mistake, for no paint is too good for the ear roof—the best white lead and oil giving the best results.

Unquestionably the trucks of the cars should be painted with a good grade of lead paint, as it prevents rust, decreases renewal of bolts and adds greatly to the general appearance of the car. A handsomely painted ear body, mounted on a dingy, rusty looking truck, has, to say the least, a half finished appearance.

Mr. Sloan (Chicago): Mr. President, the main points in the paper just read have been very thoroughly covered, I think, but there are some of the details with which I do not entirely agree. For instance, the gentleman states that he utterly condemns night inspection. With us night inspection works quite satisfactorily for several reasons; the main one being that we change our brushes every night. Every motor brush is changed each night. It works well on the commutators and results in very little burning down of the commutators. I have had commutators in for a year with not  $\frac{1}{8}$  in. wear, and I believe it is entirely due to the fact that we change the brushes every night. I think a car cannot be overhauled too often. With us it goes on constantly. When a motor comes in with the armature burnt out, the truck is run from under the car and another truck already prepared is run in to take its place. In that way we inspect our trucks frequently, and find it works satisfactorily.

Mr. Hawken (Camden, Me.): I am sorry the writer of the paper is not here, as I wish to ask him a question on an important point in regard to the series control of running motors. The electric people have always advised a certain point for hill climbing and efficiency of running the motor, and it has been stated that the series point with the fields in shunt has been the most efficient point, and one question that I wished to ask Mr. Hopkins was that I noticed that the rear motor on this point does about all the work, and the forward motor does very little. I know of one road in particular that uses this point very largely, and it has a great deal of trouble in burning out armatures, and I should like to know from some of the gentlemen here which is really the most efficient point in running the motors on series connections. I have made it a point for climbing hills to use the last notch on the series control with the motors connected in series-parallel. I find that the most efficient point to run them, and the armatures have a long life.

Mr. McCormack (Brooklyn): If there are no further remarks on this paper, I move that a vote of thanks be returned to Mr. Hopkins for presenting such an able paper. I learn from Mr. Kelly that Mr. Hopkins was unavoidably detained, as he had intended to be present and read his own paper; and I think a vote of thanks should be tendered to him.

The President: Gentlemen, W. Caryl Ely, the first vice-president of the Street Railway Association of the State of New York, has an invitation to extend to this Association, and he will now be given an opportunity to present it.

Mr. Ely (Niagara Falls): Mr. President, and gentlemen of the Association: The annual convention of the New York State Street Railway Association will be held at the Manhattan Beach Hotel next Tuesday and Wednesday; and in behalf of that Association, and upon the suggestion of G. Tracy Rogers, its president, I take pleasure in presenting to you the invitation of that Association to such of you who may be able to do so, to meet with that Association next week; and in that cool place, amid the singing of the murmuring waves, we may be able to get cooled off after the fatigues of this occasion.

Mr. Goff (Fall River): I move, Mr. President, that the thanks of the Association be extended to the New York Association, through Mr. Ely, for the very kind invitation to meet with it next week. Carried.

The President: The secretary has some communications in

regard to the place for holding the next convention

The secretary read letters from the Detroit Citizens' Street Railway Company, the Detroit Electric Railway Company and the Fort Wayne & Belle Isle Railway Company, Detroit, inviting the Association to meet in Detroit next year

Mr. Holmes (Kansas City): I would like to introduce Colonel Morse, who will extend an invitation to this convention to hold its next meeting in Kansas City.

Mr. Morse (Kansas City): Mr. Holmes this morning suggested advantages which Kansas City has as a place for holding the next convention, and we extend a most hearty invitation to the Association to meet there in 1899. We trust that the invitation will be favorably considered by the Association

The President: These invitations will be received and referred to the Committee on Nominations for consideration. I will now name that committee: W. Worth Bean, of Michigan, chairman; D. G. Hamilton, of Missouri; E. C. Foster, of Massachusetts; W. F. Kelly, of Ohio; J. R. Chapman, of Illinois; Henry C. Payne, of Wisconsin, and E. H. Davis, of Pennsylvania.

The secretary announced that special cars would be in front of the Hotel Brunswick at 2 p. m. to take the delegates to the wharf to board the steamer at 2:30 p. m. for Nantasket Beach.

Mr. Kelly moved to adjourn until 9:30 o'clock Thursday morning.

#### Thursday Session.

President Lang called the meeting to order at 10:30 a. m.

The President: The International Association of Factory Inspectors is now in session at the House of Representatives. It has been suggested that we send them an invitation to attend our sessions and to inspect the exhibits.

Mr. Robert McCulloch (St. Louis): Mr. President, I move that such an invitation be sent. Carried.

The President: We will now take up the first paper on this morning's program.

### TO WHAT EXTENT SHOULD STREET RAILWAYS ENGAGE IN THE AMUSEMENT BUSINESS?

By Walton H. Holmes, General Manager Metropolitan Street Railway Company, Kansas City, Mo.

When I consented to prepare a paper for this convention on the subject selected for me by the executive committee, namely, "To What Extent Should Street Railways Engage in the Amusement Business," I did so with great reluctance, knowing full well that the conditions to be met with in the numerous cities where street railways are an important public agency are so widely different as to present a different problem in almost every instance, and, except from a very broad view of the subject, to render comparisons altogether impossible. But in spite of these inherent difficulties on the subject, I feel that some general principles may be extracted from street railway experience which may be advantageously employed in correctly solving a problem which must arise in nearly every locality where street railways exist. I have not hesitated to ask for the experience of others, and I beg to acknowledge, in the outset, the many valuable responses which I have received from street railway managers for whose judgment I entertain the highest respect.

Street railways are peculiarly an urban agency. They were born of the wants and convenience of a city population and the development and growth of travel are so closely associated with the growth and prosperity of the municipality, that street railway managers can never be too zealous and active in every public enterprise which is designed and well calculated to stimulate municipal expansion and civic pride among its citizens. This is notably an age of progress in every line and in all directions. The ideal city of a few years ago is no longer considered adequate in its appointments for the welfare of its inhabitants. Every up-to-date city in the land has come to acknowledge that it owes a larger duty to those who live within its boundaries than merely to afford police and fire protection. The comfort and pleasure of its inhabitants must now also be considered and looked after,

Walton H. Holmes was born in Kansas City, July 6, 1861, his father being the pioneer street railway man of that city. Shortly after the death of his father in 1875 he became a clerk in the office and afterwards rose to the position of superintendent and vice president. He was instrumental in having the horse lines of the Grand Avenue Railway Company converted to cable in 1886, and became president of the company. At the consolidation of the cable roads in 1894 he was chosen president of the Kansas City Cable Railway Company. In the further consolidation with the Metropolitan Street Railway Company Mr. Holmes was made vice-president and general manager, which positions he still holds. Mr. Holmes' life has been devoted to the street railway business, but he is notably public spirited and no public enterprise has been undertaken in recent years to which he has not devoted considerable time and in

W. H. HOLMES.

which he was not a conspicuous figure.

and this tendency and demand of the age have crystallized and taken form in providing parks and squares for the comfort, pleasures and entertainment of the great body of the people and drives and boulevards for those who are more favored in the distribution of worldly goods. These public pleasure resorts are an important factor in the question under discussion. Wherever established, they are preferred by the people, who justly regard themselves as proprietors, and hence it is that many street railway companies which undertook to supply an obvious public want in this direction a few years ago, have found this particular occupation gone and only a small number of the important systems of the country any longer maintain these parks. The demand has regulated the supply.

But the street railways have a great and peculiar interest in these public parks. It is our mission, as a public agency, to render them as accessible and useful to the people as possible; and to this end it must be apparent that by a reasonable expenditure of money towards the amusement and entertainment of the people in their own resorts, street railway travel can be stimulated and the health and welfare of the community greatly promoted at the same time. Results are more easily obtained by encouraging a natural tendency of the kind referred to than by efforts to entirely create business through independent and artificial means. With rare exceptions, commissioners of these public parks look upon them as the inheritance of the people and regard it as a solemn duty to encourage the efforts of the street railways to render them as accessible and pleasant for the inhabitants as possible, and are only too glad to have their own endeavors in the same direction supplemented by the street railways.

Public parks are usually numerous and scattered in different localities and in this lies a great advantage to the street railway over the maintenance of a private resort of its own. In the one case travel becomes congested with the increased danger of accidents and maintenance of a surplus amount of idle equipment for a large portion of the year, while in the other, public patronage is more generally distributed where it naturally belongs and serves to keep better employed the standard equipment of the line without much additional expense or risk

With reference to parks and similar resorts, I therefore think it may fairly be deduced that street railways have generally found their maintenance on private account to be ill-advised and unprofitable except in a few localities where locations are such as to warrant more than the ordinary 5-cent fare, and that the best results are to be secured by intelligent aid of the public municipal authorities in their efforts to render their own resorts attractive, pleasant and entertaining to the great body of the people. The same thing is obviously true with reference to large buildings of a quasi public character intended to afford accommodations and facilities for conventions, entertainments and exhibitions on a large scale. In my judgment, such enterprises when judiciously conceived and undertaken, may well receive substantial encour-

agement from street railways to an extent which would warrant representation being accorded to them on the board of managers. I consider such representation important in the interest of the public as well as of the street railway, because both have an apparent and common interest in keeping the price of admission to such buildings down to a figure which will keep them always popular in fact as well as in name, and so a stimulant of travel on the street railroad.

Street railways have seldom undertaken to foster other than cut-of-door amusements and these are always attended by the risk of bad or unseasonable weather and the like, which frequently entails heavy loss. Cars must be accumulated in large numbers where such attractions are being presented in order to take the people away at the proper time, thus greatly increasing the cost of car service and some times necessarily retarding the tide of regular travel at other places with the attendant loss. Such enterprises frequently engross much valuable time of the chief managing officers which would otherwise be expended in other directions. These and kindred considerations which will readily occur to the experienced railway manager are very potent reasons why the companies should not themselves engage in the amusement business. Many of these things are impossible to estimate in dollars and cents, and so it is that street railways are every day coming to realize more and more forcibly that the business to be relied on for profits is that which follows the natural channels and can be handled in the usual and ordinary way.

I need hardly say that some of our large cities have reached a point where the ideas advanced in this paper have no practical application. With some of them, the problem is not how to create or stimulate travel, but rather how to best handle and take care of the patronage which is already at hand. Then again, there are many small cities which have not yet attained to that important rank which justifies the public authorities in undertaking to provide for the pleasure and amusement of the people at large. Street railways thus located have frequently found it profitable in a degree to supply this want on their own account, and to them the views here presented are likewise of little practical importance. I have considered more particularly that large class of cities which occupy the middle ground between these two extremes and where it has seemed to me there is opportunity for the profitable and practical application of sound principles of street railway management in the particular under consideration.

Where amusements are to be provided or encouraged at all, general experience shows that there is little or no difference of opinion as to the character of entertainment which ought to be furnished. The view entertained is well nigh universal that expenditures in this behalf should be moderate in amount. The best and most satisfactory results have generally been obtained from such attractions as novelties in the way of music like noted bands or other musical combinations, vaudeville, athletic sports, base ball where the city is large enough to have membership in an important league and to support a first class club, foot ball and other similar out-of-door entertainments.

In many of the southern and western cities visitors are few and business comparatively dull in the summer season, with much of the resident population sojourning at the seaside or in the mountains; and half-holidays with business houses generally closed are by no means infrequent. This condition means light travel on street railways unless some inducement outside of the ordinary is offered to those who have remained at home. Amusements and entertainments of the kind to which I have referred have been found to be well adapted to this purpose, and in many instances have proved to be undoubtedly profitable to the street railway.

It has occurred to me that perhaps I may be expected to say something of my personal experience extending over a period of many years, leaving my intelligent hearers to make such application of the same to their own conditions and environment as to them may seem advisable. During my service as a street railroad man, Kansas City, where I have always operated, has grown from a city of 30,000 to upwards of 200,000 inhabitants,

and consequently opportunities have been afforded me of viewing the business in a number of varying stages of its evolution.

In the early days we began in a modest way by providing a small natural park with music and attractions which were not very expensive. As the city grew and lines were extended, both urban and suburban, we established and maintained for a number of years two high class and well improved parks, one being located within the city boundaries where it could be reached for a fare of 5 cents, and the other on a suburban connecting line where the round trip fare was 15 cents in addition to the street car fare. At both of these parks flowers were extensively cultivated and displayed and amusements of many kinds were furnished, such as bathing beach, boating, dancing, vaudeville, music, light opera, balloon ascensions, and the like. No charge was ever made for any of these except for the use of bathing suits and boats and a small admission fee to the light opera. In the way of music, we have furnished some of the most famous hands which have visited this country and have frequently played so distinguished an artist and soloist as Signor Liborati and his band for weeks at a time. We have found the public taste in such matters capricious, demanding a frequent change of programme, and, as time has passed, a higher order of entertainment. On the whole our efforts have been appreciated and the patronage has been generous, but it is difficult to say whether the profits have been sufficient to justify the immense amount of energy exerted in this direction, and we have finally altogether abandoned the maintenance of any such places by the company. Two parks, one city and the other suburban, are still maintained by independent corporations, at which, outside of boating, bathing, etc., music has been the only attraction furnished the present season, except a summer opera for entrance to which a small admission was charged. We pay these park corporations a stipulated sum for furnishing our patrons with the free privileges of the parks. Meantime Kansas City has begun establishing its own public parks and as they become sufficiently improved to be generally used, it will be the policy of our company to encourage their use by the people in every reasonable and legitimate way.

We have always given liberal financial support and encouragement to the maintenance of a professional base ball club, and have always found the returns from this source satisfactory and I believe profitable.

Our company has given liberal financial aid and encouragement to the fall festivities which are of annual occurrence at Kansas City. They consist of a night parade by a local organization known as the "Priests of Pallas," representing, by a series of fantastic floats, scenes from history or mythology and a flower parade; and grotesque carnival parade in the day time on successive days, under the auspices of the "Kansas City Carnival Krewe." In these parades, many brass bands from the section of country tributary to Kansas City are employed to take part. The festivities extend over a period of several days and are the means of assembling a large concourse of strangers in Kansas City. They are universally regarded as bringing much trade and business to the city, and I am confident our company makes no investment in the way of amusement and entertainment to the public which brings better returns.

A noted military chieftain (General Hancock) spoke of the tariff question as a local issue, and such, in a large measure, I have found the subject assigned me for this paper; and I can only hope that something of what I have said may prove to be of local use to many of you.

The President: I will ask Mr. Wyman to open the discussion on this paper.

Mr. Wyman (New Orleans): Mr. President, at your request and by reason of my desire to accede to the same rather than because I think there can be very much said that will not to a certain extent traverse the grounds that Mr. Holmes has so admirably gone over in his paper, I wish to perhaps only re-emphasize some of the points that he has made, and I do so very willingly because I have had a considerable amount of experience on both sides of this question. I have always be-

lieved, and was very positive in my belief for many years, that a strict railroad man should stick very closely to his line of work, and that he had very little freedom or time for going into the amusement business or any other sort of business that was not intimately connected with the daily operation of his cars, the management of his power plant and that style of business and methods that pertain specially and particularly to the working of his road. Therefore I have always said:—Keep out of it; don't go into the establishment of parks and the engagement of actors and actresses, musicians and all that sort of thing; do not establish skating rinks; let someone else in the dramatic line, some impresario or manager do it. If you do it at all, lease it out to him, encourage him in some way, but do not manage it yourself or try to run it.

I have discovered, however, that as Mr. Holmes very truly says, local conditions affect this matter to a very large extent. I have also discovered the truth of the old adage that if you want a thing done well you have to do it yourself, and my experience with the persons who are engaged in the purveying of public amusement to the people is that they are not altogether the most reliable people in the world, and that it is a pretty good thing for you if you want to establish amusements upon that line, to take them under your own control and management.

I have also found in a great number of cities where I have had both official and friendly relations with the company and its representatives, that this promoting of amusement enterprises was a very good method of stimulating the business of the company. Now, Mr. Holmes very rightly says that it was a proper thing for the street railway companies to aid in the development of the municipal improvements like public parks, etc., and on that score there is a philanthropic and humanitarian work which we can do in this matter of amusements, especially during the summer seasons, for it is true that the universal custom in almost all cities is to close the theaters and places of amusement during the summer, and the wealthier classes of people very often to a large extent leave the city for some summer resort, and the other class, the class from which we derive the major portion of our income, are left without amusements and healthful entertainments and pleasant outing resorts other than places like a simple plain field, or in many instances a pleasant park, but they want something more. Therefore, on the humanitarian side of the question we can say that we are public benefactors by furnishing amusement for the people.

Further than this, it has been in some cities not the custom in hot weather for people to go out much in the afternoon and the evening, in the southern cities this is particularly true. With the sun beating down, fairly warm, but not so warm as you have it here in the north even, we find that our people do not go out in the day time, in the afternoon, and they were not accustomed, as a rule, to go out much in the evening, but to visit from door to door, neighbor to neighbor, sitting on the galleries, as we call them in our country, and getting cool and not getting out circulating about very much. Now we of the southern land have been trying to replace this practice with what we thought was better for them and incidentally for us, and we have provided, in quite a large number of the southern cities, places of amusement, with music and attractions of one sort and another, by which we have cultivated to quite an extent the outgoing of the people in the evening. That local condition may not prevail in many cities, but it exists with us; but we have found in the last two or three years, by having some of the resorts such as have been mentioned, open in the evening, with music and attractions, the people are commencing to go out and travel has been greatly increased. Therefore, upon that time, wherever a habit of insularity on the part of the people exists, these amusement resorts, if well conducted, clean and pure in all their surroundings, and in what is presented, will surely cultivate travel.

Now, so far as the congestion of travel, which Mr. Holmes speaks of on my particular line is concerned, I do not think that I fear that to a great extent. We are always willing to have a good deal of congestion in running a street railroad. It is always to be remembered that if a resort at the end of some particular line shall, for the time being, congest the travel upon that line, in a great many instances we use that line as a feeder to the others. In one city with which I am familiar, there is

one line, at the terminus of which is a resort of this character; but while the cars are leaving at a minute or half-minute and sometimes 20 seconds, headway upon that line, when it reaches the central part of the city the people immediately disperse to the other lines and the other lines get a large benefit therefrom. Fortunately the transfer system is not so extensively used as to preclude the other lines from getting some revenue. To that I think very often the congestion which we suggested as being possibly injurious is not so harmful as one might think. Further than that the constant keeping before the people of a suggestion of pleasure, or interest, or something to amuse, of something to relieve the tedium of business is a most beneficial thing.

One thing we must always remember, that is that street railroad riding is, after all, a habit. As a habit it is growing. We can all look back a few years when general riding was not so usual, when people walked a little more than they do now; when we sent out messages, not by telephone but by messenger, and he walked. Now all these different improvements that we are introducing in the way of finer cars, of higher speed, of better facilities and last of all, amusements, perhaps one of the most recent innovations, it means a constant tendency to increase the habit of street car riding; and I believe that anything that has that trend and tendency is certainly very beneficial.

As regards the details of these things, we might discuss them ad libitum, as how they should be conducted, etc., but that is mechanical, and will easily suggest itself to the mind of almost any manager. The main question is—does it pay? I think it does, and for the reasons I have suggested.

Vice-President Ely: Are there not some other members present who will discuss Mr. Holmes' paper? The convention would be very glad to hear from them.

Mr. Davis (Williamsport): I ask if there are any roads which keep their statistics concerning their amusement business separate and apart from their general business, showing exactly the amount of their travel which is due, as near as they can tell, to the amusement feature of their business. The experience in Pennsylvania among the small parks is that the profits derived from the amusement business is not in proportion to the risk of the money spent, and in quite a majority of places, the rule is, that it is almost impossible for the manager to separate the hot weather travel on amusement lines from the travel due to the entertainment or park itself.

Mr. Holmes (Kansas City): I will show that as far as Kansas City is concerned, where we have the out of town parks, we have kept careful records of the business, because we sell tickets to the park, and I would be glad to talk that over with anybody or send him information. I recently received a letter from Mr. Goodrich, of Minneapolis, who has a great deal of experience in the railroad business, and especially in the matter of parks. At Lake Harriet they have a nice pavilion, and they are relieved of the expense of maintaining the park entirely, and Mr. Goodrich is firmly of the opinion that it does not pay their company to employ a band of music or any other attraction for that park. I can easily understand why it would not, because in our northern cities, and Kansas City is almost one, as compared with New Orleans, our summer season only lasts probably two and a half months, and we are compelled to depend upon the weather for our business. If the nights are cool travel is very light.

Speaking for Kansas City, I am convinced that we had better let the city furnish the parks and we contribute towards the music and attractions in the park. The real difficulty in establishing public parks in Kansas City was due to the fact that the street railroad companies had been quite liberal in providing parks. The people expected the companies to do it, and it is hard to overcome that feeling. The people would say:—What is the use of our being taxed with a lot of parks and their maintenance when the street railroad people will do it? But these conditions are changed, and we now have a beautiful system of parks laid out for our city; and the company looks forward to great pleasure travel, contributing something to its support in the way of amusement.

Mr. Beggs (Milwaukee): I quite agree with the general trend of Mr. Holmes' paper. In our own experience, for some years we have in the public parks of the city band concerts of which the street railroad company paid the entire expense, the city

having no fund, as is the case in many cities. I thoroughly agree with that form of entertainment, and in behalf of our company we have a standing offer to duplicate any amount of money expended by the city, or raised by public spirited citizens for the purpose of giving music in the parks. Our experience, however, for two years, was that where we paid the entire expense, as we did, taking the daily receipts of the particular lines leading to the resorts in which these entertainments were provided at the sole expense of the company, that we never got back at the outside more than seventy-five cents for each dollar spent. While we seem to have an increase of gross receipts, which increased our gross receipts tax likewise, and made us seem to be doing an abnormal business, so far as dollars and cents left in our treasury went, we were the losers.

I am glad to hear this question discussed at this time, because we are having urged upon us now by individuals a scheme by which we would be called upon to put up a large amount of money for the parks by maintaining special amusements of this kind. From my experience and observation in various cities, I do not believe that it pays a street railway company to go into the amusement business. I think there is a great deal of misapprehension many times as to the manner in which this money is spent, by concentrating all the energies in this direction in one particular point of the city and giving amusements at that place. They fail to recognize that much of the money spent there might have been spent in other sections, and with better effect; not to give so much special prominence to one point. I think our experience this year where we have spent no money whatever on public entertainment has convinced us pretty thoroughly that that we are very greatly the winners by a refusal to contribute the entire amount necessary. I do believe in promoting the public parks of a city as maintained either by the municipality or by public spirited citizens, but I do seriously doubt whether any of these expensively maintained resorts pay the companies that promote them. I think it is because they have not carefully analyzed the total cost nor the effect upon the general system, and if the same enterprise had been expended in improving the facilities for travel, in making the cars more cheerful and comfortable and improving the roadbed, it would bring much larger returns than in spending it for a couple of hours of diversion in the afternoon or evening.

Mr. Harrington (Camden): We have a park and we have had considerable trouble due to the fact that people would come to the park and take the best seats, and would not ride on our cars. The park is very near the city and in order to guard against that we furnish the ticket on the car to each passenger desiring to go to the park, and charge 10 cents entrance fee to others. This method effectually shut out the objectionable element and by the use of the ticket we determined the number of people going to the park. We find that while our travel is increased, owing to the expense of operating the park, we received from the park income about 70 per cent of what the park costs to operate. The travel on the road, of course, is increased, and we can tell from the tickets just the amount. We think we are making some money, but whether we would make the installation and furnish the park if we had to do it over again is a question.

Mr. Farson (Chicago): The coming railroad manager who will be highly esteemed will be the man who not only gives his attention to reduced cost of operation, to the question of the very best electrical equipment, to the manner of the very best handling of his cars, to seeing that his track is kept in the very best condition; but he will also devote a large part of his thoughts to the question of stimulation of travel. As has been well stated, the matter of riding on the cars is a question of habit, largely, and in many cases today where roads are operated at a loss, or just about even, or a small profit, a little attention to this line would mean dividends to the stockholders. From the standpoint of a stockholder I am very much interested in this question. It seems to me that the practical operators of roads could take this question up and study it from all its points of view with great interest to people who own the stock. Conditions, of course, vary. In many small towns of 10,000 to 30,000 people, a little attention paid to the operation of a park, either directly by the company or by inducing some one to operate it for you,

would mean today a dividend to the stockholders. Street railways, like other institutions, need leaders, and not followers. At the head of these institutions should be broad minded, wide awake, up to date men who will study carefully the conditions in which they are situated and use their effort and their energy for the purpose of bringing money into the treasury of the company.

Mr. Clafin, Boston: We of the Norumbega Park, to which Park you gentlemen are invited, have had a very different experience from some of the gentlemen who have spoken. We have adopted a different system from most of the street railway parks in Massachusetts, and it has certainly been a great success for the park and the railway. We have adopted the practice of charging an admission fee for the park and discriminate in favor of our railway patrons. Our railway carries its patrons a distance of  $5\frac{1}{2}$  miles for 5 cents. We sell on our cars for 15 cents a round trip ticket, which includes admission to the park. We charge people going on foot or bicycle 10 cents admission. The result is that the railway patrons get admission for 5 cents and the other people pay 10 cents. That has a tendency to bring passengers to the railway company, and it has been a great success with us. The result has been that the park has maintained itself and costs the railway company nothing whatever for its maintenance. The revenue derived from the road has been net. Our line is a small one, but the patrons there have been worth nearly 600,000 fares to us, at 5 cents each, as the result of the park's entertainments. The admission to the park is through a registering turnstile, and we know where the patrons come from. This statement may be of interest as showing circumstances where a park can be made to maintain itself as an enterprise, and the railway not be put to any expense. The admission fee is small. We furnish theatrical entertainments, have a zoological garden, band concerts and other things, and manage to make the admission fee pay the entire expense, and also the interest on the money invested in the park, and the railway company gets its revenue net.

Mr. Lang, Toledo: I want to offer a few suggestions that may be of value. Our city has 140,000 inhabitants. We are conducting a place of amusement on the lake shore about  $5\frac{1}{2}$  miles from the center of the city. It was not established by our company, but is now controlled by it because we have purchased the road that built it. I had some misgivings about the value of the enterprise when it was started. We rectified some of the mistakes; one of them was that they started it on too large a scale, and did not charge any admission. At the outset a person who paid the street railway people 10 cents could get to the ground and obtain free admission and a free seat in the casino building where vaudeville and like comedy entertainments were given from 2 to 4 in the afternoon and again from 8 to 10 in the evening. The ride on the cars included a seat in any part of the house. At the same time they sold all kinds of soft drinks and had various amusements on the grounds. When it came into our possession we found it was losing money. It was said to have cost in the neighborhood of \$65,000 in land and buildings, and finding that it was running behind we imposed an admission fee of 5 cents, which makes it correspond to what the gentleman from Boston says, 15 cents for the round trip and admission to the grounds, and the patrons were registered by turnstiles, so that we knew at all times how many persons were going in. In addition to that, instead of giving free seats in the main part or body of the house we put in reserved seats, for which we made a charge of 10 cents. We found that was working so well that we went into the gallery and put in reserved seats in the first two rows. The people of our city and friends of ours said we were making a great mistake in imposing this admission fee of 5 cents and charging for reserved seats, but we tried it and it has been eminently successful. We have boxes that will seat four persons which sell for 25 cents. We found this last year that we came out a few hundred dollars ahead of the operating expenses, but we run the casino company as an entirely independent company, without any relation to the railroad company at all. It increased the earnings of the railroad companies about \$40,000 last year. This year the casino company will net about \$6,000, counting the fair depreciation upon the buildings, and the railroad company will increase its earnings

over \$50,000. Now I realize that conditions differ in different places. What would be a desirable thing in Boston or New York might not be so desirable in another place of smaller population and vice versa. But if any of you are further interested in this subject, I will be glad to give you any additional information I can, and hence will not take any more time of the convention in making further remarks.

Mr. Davis, Willamsport: The practice has been in Boston and in New England for the railroads operating parks to furnish amusements and rely upon their car fares alone to reimburse them for their working outlays. I would like to have the experience of the managers of these parks as to whether they think it is profitable, and how long such parks have been operated at a profit.

Mr. Wyman, New Orleans: I do not like to weary you in this matter and I am not from New England. In New Orleans we have the advantage of a long season. From the middle of April to September, and usually a supplementary season during the month of September. This year the park closes on the 18th. We charge nothing for admission to our grounds. We have a resort on Lake Pontchartrain about six miles from the city. We have a round trip car fare of 15 cents. The grounds are very extensive, large hotels on either side which we own, and a large platform, a pier, bathing houses, boat houses, and of course any one who uses the bathing houses or the boats has to pay extra, but the general thing is free. We provide a very fine band, our weekly pay roll for amusements running from \$2,000 to \$2,200. The park has been operated as expensively as that for the last two or three years. We did not begin in such an expensive manner. We went at it in a small way, but finding it profitable, we have increased every year. We have chutes and merry-go-rounds and all sorts of things of that kind. We keep an accurate record of our operating expenses and our receipts, keeping the road entirely separate from any other road, keeping an accurate record of all the cost of expenses at the beach, and we find that our proportion of receipts to expenses varies little from the ordinary electric road. In winter we do not do so well. Our operating expenses run from 70 to 90 per cent of the gross receipts, and that includes the winter time when the people do not go out, but we run the road all winter. Of course we have some rentals there, and we find we are amply repaid by the travel. We charge nothing for entrance to the park to any one who may come in a carriage—it is at the end of the Shell Road—and we allow everyone free and absolute access, and it is our impression that the fact that it is there helps us. We carry a man 12 miles for 15 cents and give him a good show in the matter of good music and other things, as good as he can get anywhere else for half a dollar, and the people are inclined to come.

Mr. Holmes, Kansas City: I notice a gentleman in the audience who was with our road in Kansas City for four years and laid out the first park for our company. He has had a good deal of experience with parks since that time, and we ought to hear from him. I refer to Mr. Chapman.

Mr. Chapman, Chicago: I am somewhat rusty now on the amusement business, but I can give a little experience at Grand Rapids, Mich., where the lines were converted from cable and horse cars to electric, and a very pretty park was constructed at the lake, where the average haul was four miles from the center of the city. We commenced, as nearly as everybody else has done, in a small way. The first attractions were merry-go-rounds and things of that kind. It gradually became more and more expensive, better music, and unfortunately more and more bicycles, so that while the patronage largely increased the expenses increased in much greater proportion. Since I severed my connection with the Grand Rapids property they have found it advisable to build a small auditorium, and they help out their roads by charging admission to the reserved seat section of this auditorium, allowing the people to stand on the outside without extra charge. They furnish attractions costing them from \$400 to \$600 a week, and are making the amusement feature more successful than it ever was before, since the days of the introduction of the bicycle. Before that time it was very satisfactory.

Mr. Bean, St. Joseph: I see Mr. Fred W. Thompson, of Muskegon, Mich., in the room, and I suggest that we hear from him.

Mr. Thompson, Muskegon: Mr. President, I came to listen, not to talk. It is true that we have a park at Muskegon, and also pavilions and theatrical attractions. The last three years we have conducted the attraction part of it on a little bit of a stage attached to the main building and have found it fairly profitable. This year we went to an expense of \$2,000 and built a properly constructed addition for theatrical entertainments with 584 reserved seats and the stage lighted by electricity. Up to this year we allowed everybody in the park without any restrictions. This year we allowed no one in the pavilion unless they purchased tickets on the cars. They may go into the old part of the building, which has flat bench seats with a capacity of 700, for the fare. The reserved seats cost 5 cents extra, and this year we have more than paid the cost of our theater from the reserved seats. The increased travel in the months when the weather was fine was \$1,000. A good park with good attractions in my opinion will be a paying venture for a street railway company.

Mr. Cahoon, Elmira: One point does not seem to have been touched upon by any of the speakers, and that is the increased liability to accidents. If we increase the travel by means of amusements or parks or entertainments, in carrying the greater number of people we are thereby inducing to go to these places, we certainly increase very materially the chances for accident; and it would seem to me that in the matter of expenses the question whether these parks pay or do not pay, the matter of damage suits and of the liability for damages that are incurred should be considered. I think that would open up a profitable field for discussion. This amusement question is becoming a very vital one, especially to the smaller roads. The road which I represent is of that class. We have a city of about 45,000 inhabitants and at the end of our line is situated a public park. We cannot control any of the privileges, but we can pay all the expenses for having amusements there, and unless we do that we do not get any travel there to speak of. The question of damages has come up on two occasions, and I think largely on account of the greater number of passengers carried incident to the amusement. I should like to hear something of the experience of others, and as to whether they reckon there is a profit in the amusement business, taking this question of damages into consideration.

Mr. Jones, Memphis: It seems to me the whole question is one of locality and conditions. Take the case cited by Mr. Wyman. He has a resort there which was there before the electric road was put in. I have often paid \$5 for a carriage to drive out there. It is a beautiful place. The more advantages he gives the people the better his patronage. Take a park in Boston. I do not see how a park could be profitable here, because the season is short unless you have a park which people will visit in the afternoon. If you expect people to go to a park in the afternoon at New Orleans and Memphis, it would be an absolute failure, because they do not go out at all except in the evening. We think we can do more in that line by having a park for the reason that our season lasts about eight months. Our people begin to go out in the evening early in April; and I have seen the temperature on Christmas Eve, 78 degrees with us. We think that sort of a place would be better than it would be up here. I think the question solves itself down to one of local conditions.

Mr. Heft, Meriden: I am glad to observe the gentlemen living up to the traditions of street railway men by being honest and coming here to tell us the truth. We are operating a park that we inherited when we bought the road. The people had spent about \$45,000 on the park. They had put up posts to tie their horses to, put launches and boats on the lake that everyone might take a ride, and they built a casino and a switch-back road. They provided baseball grounds, and all these things were free to every man who chose to enter there. I want to say to you that when the balance sheet was figured up the end of the year we found that our experience has been about the same as the gentlemen from Milwaukee, and I think the street railway men of today have run mad on this question of amusements, providing everything without any recompense whatever, and if we are going to make these parks pay, they must be run upon a business basis, the same as a gentleman over there on the left (Mr. Clafin) who charges an admission fee. We must not forget that when we add to the receipts we add to the operating expenses

of the road, and all these things must be figured out, or at the end of the year we shall be short. I am very glad to hear from the gentlemen on this question; and it seems that the only men who make any money, with the exception of Mr. Wyman, who lives in the sunny South, where everything comes to you free, are those who charge an admission to their parks.

The President: As there seems to be no further discussion on this question, we will now take up the report of the nominating committee. Mr. Bean, the chairman of the committee, will present the report.

Mr. Bean presented the report, which was as follows:

President, Charles S. Sergeant, second vice-president Boston Elevated Railway Company, Boston.

First Vice-President, Henry C. Moore, president Trenton Passenger Railway Company, Consolidated, Trenton, N. J.

Second Vice-President, Ernest Woodruff, president Atlanta Consolidated Street Railway Company, Atlanta, Ga.

Third Vice-President, Walton H. Holmes, general manager Metropolitan Street Railway Company, Kansas City, Mo.

Secretary and Treasurer, Thomas C. Pennington, treasurer Chicago City Railway Company, Chicago

Executive Committee (in addition to the president and vice-presidents):

Albion E. Lang, president Toledo Traction Company, Toledo.

George E. Yuille, second vice-president West Chicago Street Railroad Company, Chicago.

Frank Jones, president Memphis Street Railway Company, Memphis, Tenn.

John I. Beggs, general manager Milwaukee Electric Railway & Light Company, Milwaukee.

Ira A. McCormack, general superintendent Brooklyn Heights Railroad Company, Brooklyn, N. Y.

Place of next meeting, Chicago.

Respectfully submitted,

W. Worth Bean, Chairman.

E. C. Foster,

Ernest H. Davis,

Jas. R. Chapman,

H. C. Payne.

Mr. Shaw, Boston: I move that the report of the committee be accepted and that the secretary be authorized to cast the ballot of the Association for the gentlemen nominated. Carried.

The President: I appoint as tellers Mr. Chapman and Mr. Ely.

The tellers reported that the ballot had been cast unanimously for the gentlemen nominated, and the president declared them duly elected.

Mr. Farson, Chicago: May I not compliment the committee on this admirable report and the splendid selection of officers; and also upon its selection of Chicago for the next place of meeting. I may say on behalf of the street railway people of Chicago that we will do everything in our power to make the convention interesting, profitable and instructive. We will welcome you, gentlemen, with open arms. Applause.

The President: I will appoint as a committee provided for in the motion of yesterday, regarding the carrying of United States mail matter on street railways, the following gentlemen: John T. Burnett, Boston; Henry C. Payne, Milwaukee; Ira A. McCormack, New York; D. G. Hamilton, Chicago; W. S. Dimmock, Council Bluffs

The president read a letter from the Boston Elevated Railway Company inviting the delegates to visit any or all of the various power plants, shops, car houses, etc., of the company, and stated that special instructions had been issued to have particular attention shown to the visitors.

"The Chutes" on Huntington avenue extended its courtesies to the delegates. A letter was read from D. B. Dyer, of Augusta, Georgia, regretting his inability to be present at the convention; and a similar letter from Past President C. B. Holmes.

The President: I have been informed that T. Y. Dzushi, chief of finance and manager of stores of the Imperial Government Railways of Japan; and K. Sugahara, chief engineer of the Kobu, and of some street railroads soon to be built in Japan, are in the room, and have been attending this convention since

it opened; and I think that in some way we should express our pleasure in meeting them.

Mr. Ely, Niagara Falls: I move you, Mr. President, that the privileges of the floor be extended to these gentlemen and that they be invited to address the convention. Carried.

Mr. Sugahara: Mr. President and Gentlemen: It is a great privilege and honor to have the pleasure of meeting you on this memorable occasion, and to occupy a seat in this national convention of street railways in this great country. I desire to express my sincere gratitude for your hospitality extended to me as well as to my friend, Mr. Dzushi. Indeed, it is very difficult for me to express my feeling and sentiment to my heart's wish, because I am not accustomed to your language. However, I believe it will be some entertainment to you to know that an alien from the Land of the Rising Sun ventures to speak in broken English instead of her flowery and poetic language.

Japan is achieving a great deal in her material progress and is striving to accomplish in rapid succession what she learns from abroad. Your Commodore Perry opened our gate toward western civilization some 44 years ago, and today your generous discoveries and inventions lead us hand in hand to the march of material civilization, for which we are greatly indebted to your people and country. To tell you of my experiences regarding the construction of street railways in Japan, I wish to inform you that I was the first engineer of a private company which has built steam street railways for passenger traffic in Tokio in 1896 and since then. I am naturally devoted to the investigation of street railway construction, and you can hardly imagine how interesting and helpful it is to me to be present in this great convention.

The progress of our street railway system is very slow, and they are in a primitive stage as yet. For instance, they are only about 60 miles in length and most of them depend on horse power, except the Kioto and Nagoyo electric lines. Several electric railways, however, have been projected in different cities and towns throughout the country. We are firm in our belief that in the near future Japan will be found a network of electric street railways. Should I engage in Tokio street railways after returning home and apply the knowledge I have gained here, I shall be very much indebted to you all, and must pay cordial thanks. We have about 40,000 of "jinrikisha" and 90,000 of wagons drawn by men for the means of transportation in Tokio which greatly interferes with the progress of street railways. Notwithstanding these difficulties, Tokio horse car railway companies pay on the capital invested 30 per cent dividends annually, and our steam road company 13 per cent. We have no doubt that to build street railways in Tokio is one of the most promising enterprises. It is my great desire that our country shall progress in such a degree that when any of you shall come to Tokio you may go to any place in the city by street cars, not by jinrikisha, and that our country may be seen as one of the industrial countries of the world, not only as a country of beauty and curiosity such as Kioto and Nikko.

Thanking you again for your kind privilege given us, and hoping you all may enjoy the blessings of health, liberty and prosperity, I beg to conclude my remarks.

The President: Gentlemen, I am sure that I express the feelings of all the members of this association when I say that it is a great pleasure for us all to meet you. I take pleasure in presenting to you a badge that will admit you to all our sessions and every exhibit in the building, and I believe to every home in the city of Boston. I trust you will carry these with you with our best wishes. I also desire to present you with tickets to the banquet tonight, and we will be glad to have you join us at that time.

Mr. Dzushi: Gentlemen: It affords us great pleasure to meet you here. I desire to express our hearty thanks for your kind invitation.

Mr. Payne, Milwaukee: I desire on my own behalf and I have no doubt on behalf of all the members of the Association, to return to the members of the Massachusetts Street Railway Association and to members of the local committees, and all those who have interested themselves in entertaining us in the city, our sincere thanks for the magnificent manner in which they have done their work. I think it is not too much to say that the ar-

rangements for this convention have not been excelled in any place where we have met, certainly not where I have been in attendance upon the meeting. It is but proper that we should make known our feelings in that regard, and I offer a resolution that the secretary be instructed to tender to the persons the heart-felt thanks and appreciation of the members of this Association. Mr. Chapman seconded the motion, which was duly carried.

Mr. Payne, Milwaukee: One thing more. I do not know whether it is the proper time, but I think the members of the Association will desire to place upon record their appreciation of the manner in which the officers during the last year have performed their duties; and I therefore desire to move that the thanks of the Association be tendered to the retiring president and the other members of the executive committee of the Association.

Mr. Payne put the motion, which was unanimously carried.

President Lang: I thank you very much, gentlemen, for this expression. We have only done our duty, and we hope the result of our labors will be beneficial to all who attend our meetings, and all who may read the report of the meeting when published.

Mr. Ely, Niagara Falls: I move that a special vote of thanks be extended to the members of the ladies' reception committee who have been so untiring in their efforts to the entertainment of the visiting ladies, and who have expended so much time and pains in making their stay pleasant there. Carried.

The Secretary: I will announce the names of some new companies that have joined the Association since the opening of this meeting:

Warren, Brookfield & Spencer Street Railway Company, Warren, Mass.

Brockton, Bridgewater & Taunton Street Railway Company, Boston, Mass.

Providence & Taunton Street Railway Company, Taunton, Mass.

Milford, Holliston & Framingham Street Railway Company, Framingham, Mass.

South Chicago City Railway Company, Chicago, Ill.

St. Joseph Railway Heat, Light & Power Company, St. Joseph, Mo.

Fair Haven & Westville Street Railway Company, New Haven, Conn.

The President: We will now have the next paper:

#### INSPECTION AND TESTING OF MOTORS AND CAR EQUIPMENTS BY STREET RAILWAY COMPANIES.

By Frederick B. Perkins, Electrical Engineer Toledo Traction Company, Toledo, O.

In discussing this subject I have decided to speak of inspection and testing separately. The work of inspection is to be attended to principally in the car houses, with a small amount of attention while cars are in service. The testing is to be done in the repair shop. In no direction can a railway company save money, or increase dividends more rapidly, than by having its equipments thoroughly inspected by competent men, working systematically under intelligent direction.

After a car has been through the repair shop and is again placed in service, it is naturally supposed to be in first class condition. It comes then under the immediate supervision of one or more men, presumably the day and night foreman, whose duty it is to keep that car in good condition for so long a time with as little expense as is possible. These men should be thoroughly acquainted with every detail of that car. Instead of examining cars once in 30 or 60 days, a daily inspection is necessary.

I have thought it expedient for the purpose of setting forth my views on inspection, to describe the work as being carried on in a modern car house containing 50 equipments, and arranged for the easy handling of the cars, so that no extra help will be required for that purpose.

In dealing with the inspection of cars in this car house, we believe better results can be obtained by giving to each man

FREDERICK B. PERKINS.

Frederick B. Perkins was born in the Old Granite State June 27, 1865, and was educated in the public schools of Concord and in the New Hampshire Conference Seminary at Tilton. He was in the insurance business with his father until 1889, when he entered the shops of the Thomson-Houston Company, at Lynn. He was with this company for two years, doing considerable construction work for the West End Street Railway, of Boston, and for the Duquesne Traction Company, of Pittsburg. In February, 1891, he became general superintendent and electrical engineer of the Toledo Electric Street Railway Company. When it was consolidated with the Toledo Traction Company he was chosen electrical engineer, which position he still fills.

some particular branch of the work, rather than assigning to him a certain number of cars, and expecting him to do all the work required thereon. For instance, it is safe to assume that the controllers will be kept in better condition if the responsibility of a good repair be placed with one man only, than would be the case were this branch of the work made a part of the duties of several workmen in conjunction with all the other repairs found necessary. If this be true in regard to controllers, it will be found equally pertinent to all the other items of car inspection. There is also this advantage—the men will carry the tools and material for one particular kind of work only, whereas, if they had a multiplicity of duties to perform, it would necessitate their having a large assortment of tools and material, or wasting considerable time in going back and forth to the stock-room.

In this modern car house five men will be required. This estimate includes only the repair men proper and not the foreman of the car house, whose duties in connection with handling of motormen and conductors, sending out cars and similar work would require so much of his time, that he could only have a general knowledge of the work of inspection in the car house. Two of this number would be required to grease and inspect the motors, one to keep the controllers in repair, one to take care of the trolleys and to assist in the care of trucks and car bodies, one to have charge of the truck and car bodies.

The most vital parts of the equipments are the different parts of the motor, viz.: armatures, fields, bearings, brushes and brush-holders. The care of this part of the equipments should come under the head of greasing; and on the manner in which this part of the work is done depends, to a large extent, the frequency with which the cars will break down while in service; and also the amount of repair necessary to keep them in operation. Often times the most ignorant and cheapest men are given the place of greaser. On the contrary, it is a position where intelligence and thoroughness are imperative. In order that he may have sufficient time for thoroughness in detail, he should not be expected to ring alarms or attend to other matters of a miscellaneous nature; but should be held responsible for his own particular work.

The car should pass into the greaser's hands the first day after it is on the road and every second day thereafter. He should examine thoroughly the brushes, brush holders, gears, pinions, bearings and commutator. Of these parts, the care of the bearings and commutator is the most important and should therefore receive the greatest amount of attention. The manner of caring for the bearings is very simple. They must be well supplied with grease or oil and care must be taken that they are kept free from dust and grit and also that the grease feeds properly.

In the matter of the care of commutators, electricians seem divided in their opinion as to whether they should be sandpapered or not; personally, I am not in favor of it. Instead of temporarily fixing the commutator by sandpapering it, and thereby simply putting it in shape for one more day's work, I would get at the bottom of the trouble and either make a commutator (by some preparation of mica and copper which will not spark) or if the trouble lies deeper, remedy it by remodelling the entire motor,

This may seem to be a heroic measure but the end will justify the means.

I think, however, that usually the trouble is not in the commutator, nor with the motor, but in either the brushes or brush holder, or both; and it is probable that with proper adjustment, and with proper care and treatment we should find the trouble obviated, and sandpapering of commutators unnecessary. When speaking of the treatment of brushes, we refer to a treatment of oil or something similar.

The writer has personal knowledge of a large road where common brushes were used without any treatment or care except to replace as needed, and it seemed as if the man who used the most brushes was given the credit of taking the best care of his motor. The average life of brushes on this road and the above conditions with the commutator sanded every day, was six days. Subsequently, the sandpapering was stopped entirely, and the brushes were removed every six days and properly treated in oil. The life of brushes under this treatment was increased from six days to from 40 to 60 days. The trouble with commutators which before had been great, was reduced to a minimum, in fact almost entirely averted. It is possible that under some heavy conditions, the practice of sandpapering must be kept up but it must be accomplished in a different manner, and must be applied sparingly instead of indiscriminately.

Not later than every fourth day, every controller and switch comes under the notice of the man who has charge of these parts. The main point is to clean thoroughly, using a little vaseline on the contacts. The parts that are worn should be touched up with a file, or should be sandpapered and if badly worn, should be replaced, so that at least every fourth day the controllers will be sent out in first class condition. This man can also examine the car wiring, lamp fixtures, headlights and all similar parts.

The fourth man will have the care of the trolley poles and wheels. These should be carefully looked over each night and oiled if necessary. The man who attends to this part of the equipment will also have considerable time to devote to general inspection of the car bodies and trucks under the direction of the general inspector. Under the scrutiny of these two men should come all the details of a car body, such as grab-handles, window-catchers, curtain fixtures and similar parts. These should be carefully attended to each day, in so much as the reputation of the road will suffer in direct proportion as the attention to these small details is neglected. For the public is exceedingly exacting as regards the manner in which its comforts are catered to in these minor details; and the degree of excellence which characterizes this part of the work, will be largely instrumental in moulding and fashioning its opinion of the road and of its servants in management.

The matter of car cleaning will not be considered in this paper as it is not directly connected with the subject in hand.

After having touched upon the subject of the matter of inspection in the car house, we have to deal with outside inspection, that is, inspection on the road by the inspectors, motormen and conductors. It may be a good plan to have outside inspection, and it is often advantageous if not carried too far, but I do not believe it is desirable to have a large force. For this reason but very little of the time devoted to this line of inspection is really used in looking over the equipments, but must necessarily be consumed in getting from one car to another and in waiting for opportunities, and most of the trouble located by these inspectors is not of such a nature as to require immediate attention; and if it were, the inspector could not make the necessary repairs without taking the car to the car house.

Troubles of a serious nature, such as would require immediate attention and taking the car out of service, should be easily detected by the motorman or conductor, and reported at once to the proper official. It may not be entirely irrelevant to speak here of the relation of motormen and conductors to the inspection of cars. It has been proved that it is usually a waste of time, and very little has been accomplished by attempting to instruct motormen and conductors other than in the simplest ideas of electrical problems; for while on some roads there may be a number of old motormen who have a fair idea of electrical equipments, and

whom it would probably be safe to allow to locate existing trouble, it would be difficult to draw the line between the men competent in this direction and those wholly lacking in such knowledge. I know of nothing more distasteful to passengers unwillingly detained, than sitting in a car impatiently waiting while a motorman works over some part of the equipment in a vain endeavor to locate some trouble, the very nature of which he has not the faintest idea; and quite likely, at the same time, intertonging with the movement of several other cars.

Of course, contingencies might arise where men would be justified in attempting to locate trouble on their cars, but, as a rule, they should not be allowed to do so, as the practice is wrong. If they clearly understand the brake mechanism, the right manner in which to apply the power to the motors, how to use the cut-out switch in the controller, and have a clear conception of the general rules as promulgated by the company, this will be about as far as it is profitable to teach them.

But while we may not allow them to make repairs, or experiment with the equipment, we must educate them to the necessity of being able to immediately detect any unusual or threatened condition, and to at once report the same. In fact, they must be made to feel that it is their first duty to report everything that is working to the possible detriment of the company, and if we properly impress them with the importance of these details as outlined above, we shall have established a means of quickly locating trouble on the road; and that without the aid of special inspectors.

Next comes the matter of testing. The service which we will obtain from our equipments depends largely upon the manner in which the repairs are made. If the repair work be rushed through with the idea of going over as many cars as possible in a short space of time and with little or no regard for the thoroughness of the work, we must expect the necessity for repairs to increase to an alarming extent. If, on the other hand, we make our repairs with the idea that work thoroughly done will have a tendency to greatly decrease the liability to breakdowns while the cars are in service, and correspondingly reduce the amount of work to be done in the repair shops, we shall naturally consider the best means not only of doing the work, but of definitely determining its condition when finished.

To do this properly, we must resort to our testing (and we use the word "testing" in a broader sense than it usually signifies). For example, all material furnished, such as tape, mica, paper, etc., must be kept up to the standard, and to accomplish this, everything used should be carefully examined, or, under our classification, tested.

We must begin testing in the purchasing department. In the purchasing of supplies a great deal of trouble is often occasioned by changing the kind of material furnished. This is probably more noticeable in the case of small roads. Now, while there may be no great difference in the quality of goods furnished, or if any one of the many different brands were used exclusively, it would give satisfaction, yet the very fact that many different kinds are used has a tendency to produce a lack of carefulness in the details of the work which will almost invariably show in the general result. This will be noticeable in several ways. The workmen will take one of the following views of the matter; he will either think the management is careless in the matter, and, as a consequence, he will immediately commence to drop from the former high standard of work; or, he will think that there is nothing essential about the quality of the material used, and acquire the pernicious habit of utilizing anything which may happen to be handy.

When a workman once detects what seems to him to be a lack of thoroughness in any part of the work which has to do with his department, you have at that moment allowed to enter that department a spirit of carelessness, which will develop very rapidly; and, unless quickly suppressed, will in a short time produce disastrous results.

To attain to a condition of thoroughness in any line of work, may have called for the performance of a great deal of hard labor, the expenditure of much time and money, and the exercise of patience, skill and forethought, but how slight a relaxation of

vigilance on the part of some official trusted with the maintenance of the good condition acquired, can, in an incredibly short space of time, undo the good work accomplished; and cause a retrograde movement along the lines which had promised so favorably.

If, however, we have to allow only one kind of material in the repair shop, the question naturally arises as to how we can avoid being behind the times in the matter of different kinds of supplies; and also in the manner of their use. The answer is we must have an experimental room, and here must be tested samples of all supplies and material before being contracted for by the purchasing agent. I do not mean to say that this room must necessarily be entirely separate from the repair shop, as this would naturally require a large amount of machinery which we already possess, and would not care to duplicate. But this room must be considered by the employes as one in which they are not directly interested other than as they are required to work on some portion of that which is being tested; but the special testing and all the instruments for the same must be in a separate department; and if it is not possible to have a separate room, at least a part of the repair shop should be partitioned off for this work, as the amount of time wasted by the employes of the shop attracted from their regular duties by the testing of some part of equipment or material on the floor of the repair shop proper, would, if saved, more than compensate for the expense incurred in the creation and maintenance of such a room.

Having thus arranged this separate apartment for practically all testing purposes, and having impressed upon employes and workmen that herein will be settled all questions relating to work done and material used, we have accomplished one of the results aimed at, in that we have prepared ourselves to impress upon the men that any material placed in their hands for use in repairs, has previously been thoroughly tested; and this will, we think tend to raise the standard of work, as any results of poor workmanship on their part cannot then be laid to faulty material; we thus give them an incentive to conscientiously deal with established and known good material.

We are now able to take anything in the line of new material or any new ideas regarding the use of the same, or any electrical problems which may arise, and ascertain their value without interfering in any way with the regular work of the shop or of the employes.

It is neither necessary nor desirable that the workmen should know the merits or defects of whatever comes to the testing room. On the contrary, there are some of the employes who should be allowed to become familiar with a great deal of the work of this room. They will not only be more valuable for the knowledge thus obtained, but some of the work must of necessity be delegated to some other person than the electrical engineer. But at all times it must be made plain to them, that the room is distinctly a separate department having no connection with their ordinary work.

Having now provided for our testing department, and establishing its relation to the purchasing of supplies, and to the employes of the repair shop, what machines and instruments shall we need in its equipment?

A high and low reading direct current voltmeter; one having a double scale reading from 1 to 750, and from 1 to 15.

A direct current ammeter reading from 1 to 100.

A low reading ammeter would be very convenient many times but is not absolutely necessary.

A 50,000-ohm magneto bell, an alternating current voltmeter and some handy testing set will make an outfit of instruments with which we can do all the testing required.

If the alternating current is not within reach of the car house, we must procure a small dynamo and produce it ourselves. A very small machine, say 2 h. p., would be sufficient for all the needs of the testing department. If this machine is designed for about 100 volts, it would be most convenient for our use. With a few small transformers wound for 2,000 volts primary and for either 50 or 100 volts secondary, we are prepared to furnish any voltage within a range of from 5 volts to 10,000 volts.

The man who has this part of the work in charge can very

easily and cheaply arrange the details of installation of the wiring, etc. He can also make some resistance coils and many other pieces of apparatus which will greatly facilitate the quick testing of whatever may be sent to this department.

What shall we test? First, everything that goes into the repair shop. By doing this we shall be sure to keep all material up to the standard, which means an absolute guarantee against breakdowns caused by poor material. In this way we raise the standard of workmanship.

Second, all supplies which go to the foreman of the car houses. In connection with this matter we are of the opinion that in the testing room should be decided the manner of treating brushes, the length of time they should be used before being removed from the motor, the manner in which they should then be cared for, their final disposition, the proper attention to be given the trolley poles, the length of time they ought to remain in service, their condition when removed, and many other similar questions should not be left to work out their own solution, or dependent upon the feelings or judgment of the various employes and workmen, but should be definitely determined and decided in our testing department.

Many may be of the opinion that we are carrying system beyond necessary limits in thus definitely and positively arranging these details; but why should we allow several different men to use material in whatever manner they may individually see fit, to treat brushes as their fancy may dictate, to regulate the tension of trolley poles in accordance with their own feeling at the time rather than by any fixed standard, and various other matters which might be mentioned along these lines.

Third, all finished material such as armature coils, insulation for controllers, commutators and brush holders. We do not necessarily need to test every piece, but enough to satisfy ourselves that the general order of work is kept up to the standard.

Fourth, all armatures, fields, commutators and controllers as they are being made or repaired. One illustration will be sufficient to show how the testing may be carried on in this branch of work.

An armature is wound and ready to be connected to the commutator. With a small wire we connect all of the top leads together. With the bottom leads, each separate from the other. With a magneto or testing set we find the insulation of the complete armature is not right. First, we cut the small connecting wire on the top leads in several places, then by testing each of these parts we locate that portion of the armature which is bad; then, by removing the wire we will test each coil separately until we find the weak one. Next, by the use of our transformers we obtain three or four thousand volts which we apply to this one coil. If it stands the test, we may allow it to go through; and if not, it can be replaced. If we should find that the trouble extended to a large portion of the armature and indicated moisture in the coils, we may, by the use of this same transformer, obtain 25 or 30 volts; and by connecting the armature to the commutator with the exception of one end of one coil, then connecting one side of the 25-volt circuit to this end, and the other side of the circuit to the commutator bar left vacant, we may apply the current for the purpose of drying the armature. With this advantage, the heat will be generated in the core and the armature will dry from the inside instead of from the outside.

With similar tests on all finished parts sent out from our repair shop we have almost wholly removed the chances of failure in service, and have unquestionably added to the length of life which may reasonably be expected from our equipment.

By running a few wires from our testing room to that part of the shop where the cars are brought in for repairs, we are able to reach every part of the equipment in a quick and thorough manner, and it is probable that if a few tests are made on every car that comes to the shop, many troubles will be located before they have sufficiently developed to become serious. Hence, the time required to make tests will add nothing to the pay roll, while the benefits derived may be many. All cars should be brought to the repair shops thoroughly overhauled and inspected at least twice a year.

In determining what shall be the standard of the work in the

different branches of the shop, or finished material, and of cars in service, I do not believe there can be any fixed scale. But that, as we proceed with our testing and inspection, we shall gradually raise the standard of our work and it will only be a short time after adopting a thorough method of doing the work, that many of the daily perplexities will have been eliminated.

Mr. Chapman, Chicago: In view of the lateness of the hour, I move that this paper be accepted, with the thanks of the convention, and filed without discussion. Carried.

The President announced the trip to Plymouth, in the afternoon, and the annual dinner in the evening, after which the meeting adjourned.

### Friday Session.

The President called the meeting to order at 10:40 a. m., and announced that the first business would be the paper:

## COST OF ELECTRIC POWER FOR STREET RAILWAYS AT THE SWITCHBOARD, BOTH STEAM AND WATER POWER.

By R. W. Conant, Electrical Engineer Boston Elevated Railway Company, Boston, Mass.

It is my privilege to be able to communicate to you facts and figures bearing on the operation of 44 power stations located at the important street railway centers throughout the country. These figures cover for the most part the operation of the stations during the past year and were obtained through the kindness of members of this association as well as from experience on the roads in Boston. The aggregate capacity of power stations represented is 98,387 k. w. or 131,800 electrical h. p.

The total cost of operation for the production of power alone from these stations during the past year has been \$1,825,000 and if the power had been produced by all at as low a cost as it was in a number of the more economical stations the saving for the year would have amounted to \$443,300. It is the chief purpose of this paper to explain the "If," and to obtain some idea of its size.

In what has been published on this subject there are a great variety of opinions as to what should be included in the cost of power, and also as to whether the basis of comparison should be the car-mile or kilowatt-hour, this latter being due to the fact that up to within a few years there has been no reliable instrument, adopted by street railways for the measuring of their output. The car-mile basis is not a fixed standard. A car-mile up hill takes a great deal of power, while a car-mile down hill should take none and may be made a source of power.

In the analysis of costs of operation of power stations of various sizes and types, it is first necessary to adopt a standard for the unit of power. We have seen that the car-mile is unreliable. Recording wattmeters are at present constructed which will measure the output in k. w. h. They can be made to give results which are accurate within a very small per cent. This statement is abundantly verified by actual experience and is gradually becoming universally recognized. It is no doubt difficult for one who has been accustomed to figure cost of power production on a car-mile basis, to reconcile himself to the k. w. h. It should however be very easy for the steam engineer who is accustomed to deal with h. p. since the k. w. h. equals 1.34 electrical h. p. h.

It was evidently the idea of your executive committee in limiting the title of this paper to cost at the switchboard to abolish the car-mile and adopt the k. w. h. as the unit of power. And in comparing the costs from the various stations I shall use this unit. For the benefit of those who are accustomed to considering the costs per car-mile, it will be interesting to know that on many roads a car-mile takes just about 1 k. w. h. This is not true where grades and equipments are extremely heavy, in such cases two or three times this amount may be required.

In the costs of power, whether it is produced by steam or water, should be included the fixed charges as well as the cost of operation. Under fixed charges are: interest, depreciation, insurance and taxes on the capital invested in the land, buildings and machinery of the power station.

Roger W. Conant, electrical engineer of the Boston Elevated Railway, was born in Gloucester, Mass., November 26, 1869. He graduated at the Massachusetts Institute of Technology in 1891, having pursued the course in electrical engineering, and after graduation immediately engaged with

R. W. CONANT.

the West End Railway Company. He was the electrical engineer for this road during 1896 and 1897 and until the Boston Elevated assumed the management, since which time he has been with the new company, having charge of the department of electrical engineering.

Under operating expenses are fuel, labor, supplies, repairs, superintendence and general expenses.

In both the fixed charges and operating expenses the component items vary between widely different limits, and it becomes impossible to construct a law that will predict the cost under all circumstances.

On the other hand, for one who has had experience it is comparatively easy to predict what the power ought to cost under a given set of conditions. What it will cost must, of course, depend on management as well. In view of the variety of the circumstances governing these costs, I have deemed it advisable to establish, for purposes of comparison a standard plant whose conditions are fixed.

It is not my intention to imply that the performance or equipment of this station, which I shall employ as a standard, is ideal, or could not be bettered, but rather to assume equipment and performance based on facts obtained from stations in actual commercial operation during a long period of time.

As this station is described, its performance may seem to border on the ideal, and there is no question but that its performance is consequent on favorable circumstances, very nearly we may say test conditions. It is, however, in my opinion best to err on this side rather than on the other in establishing a station for comparison.

I shall assume the station to be located on the water front, the exact spot is unimportant, but since this association has chosen Boston as its meeting place we can consistently locate the station here as well. I have fixed the capacity at 3,600 k. w. The building erected on firm ground requiring but little piling or filling; building and chimney are of brick.

For equipment; three cross compound condensing engines, cylinders 28 in. and 56 in. by 5 ft. stroke; speed 80 r. p. m.; 150 lbs. steam pressure; three 1,200-k. w. direct-connected generators; six water tube safety boilers, 500-h. p. each. Economizers and exhaust feed water heaters, electrically driven feed pumps and coal handling apparatus. Such a station would cost to install as follows:

### CAPITAL INVESTMENT.

Building, foundations for engines and boilers, chimney,	
coal handling apparatus .....	\$120,000
Engines and condensers, heaters, separators and piping..	91,500
Feed pumps and economizers .....	18,000
Boilers and flue connections complete .....	61,000

Generators and switchboard complete .....	73,800
Land and docking facilities .....	17,000
Engineering and sundries .....	5,000

Total .....\$386,600  
 or about \$107 per k. w. capacity.

To obtain the figure for fixed charges, I assume interest at 6 per cent, insurance and taxes 3 per cent, depreciation 2 per cent, total 11 per cent, which makes an annual fixed charge of \$42,526.

I shall assume that this station produces 10,500,000 k. w. h. per annum; dividing the annual charge by this figure gives .4 cent per k. w. h. for the fixed charges. The depreciation is not intended to cover repairs which will be included under operating expenses. The 2 per cent assumed for depreciation is to establish a sinking fund against the time when the station will have to be entirely replaced by one of more modern and economical design. Time of replacement being taken at 50 years. A few years ago the time of replacement should have been assumed much shorter, owing to the imperfect design of power station apparatus then existing. But with the present advanced state of the art improvements cannot be expected to develop as rapidly

Before arriving at the cost to produce power from this station, it will be necessary to obtain the operating expenses.

In making comparisons between stations of different sizes and types the cost of labor is the most perplexing item

Some stations operate with two shifts, others three. Some have engineers paid at different rates and men which appear on the records of some are in a capacity which in others is absent or replaced by men of another class and rate of pay. I therefore give the following method of analysis of the labor item when gives satisfactory results when applied to station operation.

I can illustrate the method, and at the same time derive the operating expenses by applying it to our standard station. It is assumed that this station operates with three shifts of men, the duration of each shift being eight hours. This makes the shift hours per day 24 or 8,760 for the year. The same number of shift

hours would of course be obtained by two shifts of 12 hours each, as is the case with some stations. For the three shift station, the first two probably would have the full complement of men, while the third would not, as the station might be shut down on that shift. But as there is considerable inspection, cleaning and overhauling, this shift requires almost as many men, though their rate of pay may be less. The highest rates of pay would be on the shift of heaviest load. The crew to operate the standard plant would be about as follows: Two engineers, one oiler, one helper, two firemen, one coal passer; total, seven men per shift.

The average rate of pay per man is taken at 27 cents per hour. This would be calculated from an actual station by dividing the total amount paid for wages, including chief engineer's salary, by the product of the number of men operating with the hours each has worked. The number of men per shift for this station being 7, I will divide this figure by 3.6 which is the figure expressing the capacity in 1,000 k. w. units. This division gives 1.94 as the number of men per shift per 1,000 k. w. capacity. This figure will vary with the type and size of station, as we shall see later. The fractional part of the man of course only appears in figuring.

Multiplying the 1.94 by the rate of pay, 27 cents, gives 52 cents as the cost of labor per hour per 1,000 k. w. capacity. This multiplied by 3.6, the number of 1,000 k. w. capacity, gives \$1.87 as the total cost of labor required to operate the station per hour.

It will further aid in the analysis of the labor item to introduce the load factor. As this term is sometimes employed in a different sense from that used in this paper, I shall define it to be that per cent which when multiplied by the capacity of the station in k. w. and by the shift hours for the period, gives the k. w. h. output for the time considered. I take as the load factor for this station 33.3 per cent, average, for the year. You may remember that in the consideration of the fixed charges I gave as the k. w. h. per year 10,500,000, which is 33.3 per cent of 3,600 k. w. multiplied by 8,760, the shift hours per annum.

It has been shown above that \$1.87 is the average cost of labor

to operate the station for one hour, and if we obtain the average k. w. during the hour, which is k. w. h. for that period, a simple division will give the figure for the cost of labor per k. w. h. The load factor gives the means of obtaining the k. w. h. and by multiplying 3.6 by 1,000 and 33.3 per cent gives 1,200 as the average k. w. for the hour, or k. w. h. for that period. Dividing \$1.87, cost of labor to operate the station per hour, by 1,200, gives .157 cents as the cost of labor per k. w. h. But 3.6, the figure representing the capacity, was used as a multiplier in obtaining both the cost of labor, \$1.87, and 1,200 k. w. h. It therefore disappears in the division and the expression for the cost of labor per k. w. h. is made independent of the capacity of the station to that extent. The rule then for obtaining the cost of labor per k. w. h. for any station is to multiply the rate of pay of the men by the number of men per 1,000 k. w. capacity, and divide by the product of the load factor times 1,000.

The use of this method will be illustrated if we compare the cost of labor per k. w. h. in the first two columns of Table I. It is .157 for the standard and .56 cents for station No. 1. It is rather difficult to account for this great increase until we notice that the men per 1,000 k. w. is 4.7 as against 1.94. The rate of pay and load factor also enter, as I shall show later.

I have constructed a diagram which gives the results of this expression for cost of labor for all usual rates of pay, load factors and men per 1,000 k. w. This diagram is based on a rate of 27 cents per hour, and there is also given a reduction table when gives the per cent to be added or subtracted for other rates than this. To illustrate its use, suppose we have a station whose equipment requires five men per shift per 1,000 k. w. capacity. During a month of high output it might operate at a 30 per cent load factor. On the diagram following 5 up to 30 gives cost of labor at .45 cents per k. w. h. In a lighter month the station might operate at a 15 per cent load factor. Following 5 up to 15 gives .9 cents, or twice as much for labor per k. w. h.

To further illustrate the use of this diagram let us consider that the equipment of our standard station is cut into so many units

that it required 3.7 men instead of 1.94. Price of labor and load factor being 27 cents and 33.3 per cent respectively; 3.7 followed on the diagram up to 33.3 per cent, gives .3 of a cent as against .157 cents for standard.

The cost of fuel is the next item to be considered in the operating expenses of the standard station. Considering coal as the fuel used its cost per k. w. h. depends on the price per ton and on the efficiency of the station which is best expressed in lbs. coal consumption per k. w. h. The coal for standard station I have assumed to be clear bituminous, costing \$3 per short ton delivered.

As to the efficiency, I am able to quote from tests in which I was personally engaged on a station of the same size and similar equipment.

The duration of the test was 45 hours, made under actual conditions of railroad service during the day, and at night the load was kept on the station by means of a water rheostat. I will say here, however, that the test on the steady night load did not show any great gain in efficiency, due to the fact that the day load of the station was steadied by feeding in with others. The average efficiency of transformation i. h. p. to e. h. p. at the switchboard was 90 per cent. The steam consumption of the engines was 14.5 lbs. per i. h. p. h. This record on a later test has been lowered. The boiler evaporation was 9.4 lbs. water per lb. of coal from actual conditions. The coal used was New River bituminous. The economy of the station, represented by the coal consumption in lbs. per k. w. h., was 2.3. I have assumed 2.2 for this figure for the standard station.

Reducing price per ton to price per lb. and multiplying by 2.2 gives .33 cent as the cost of coal per k. w. h. This appears in Table I., under cost of fuel. As an illustration of what the cost would have been had the engines required more steam, say 26.6 lbs. per i. h. p. h., as might be the case with a non-condensing engine. Referring to the fuel diagram and considering the electrical efficiency, boiler evaporation and price of coal to remain the same, 26.6 to 9.4 lbs. water per lb. of coal gives 3.8 lbs. coal per k. w. h. Following this line down to horizontal \$3 coal line and vertically

LABOR

FUEL

upwards from this point to cost of fuel in cents per k. w. h., we obtain .57 cent, were the efficiency of transformation 100 per cent; but since it is assumed to be but 90 per cent, 11 per cent has to be added to this cost, as shown in the reduction table. This gives the cost of coal per k. w. h. .63 cent as against .33 for the condensing engine.

There remains to be included in the operating expenses for this station, water, oil, small supplies, repairs, superintendence and general expense, which I have estimated at .093 cent per k. w. h. The total operating expense foots up to .58 cent, which added to the fixed charge of .4 cent makes the total cost of power from standard .98 cent or very nearly 1 cent per k. w. h.

Before comparing the costs from the various steam plants I will review briefly the circumstances governing the production of power by water.

The application of water power to street railways has the following points of advantage. In plants operated under any but very low heads the generating machinery may be installed at a less cost than for steam. Also the fuel expense disappears as well as a portion of the cost of repairs. A part of the labor expense will be saved inasmuch as no engineers, firemen or coal handlers are required.

The main disadvantage in the application of water power to street railway operation lies in the fact that generally railroad power stations are quite distant from water falls, and that it is very expensive to transmit the electrical energy to any considerable distance. The distance of transmission being hundreds of miles for the majority of street railways. That it may be made more profitable to employ water power when its location is nearby the road and the price of coal is high also, there can be no doubt.

The cost to produce power from water is often compared with the cost to produce from coal on the basis of continuous operation for 24 hours a day. For street railway service this method gives a false impression since it implies that the machinery is working at its full capacity for 8,760 hours per annum or 100 per cent load factor; as a matter of fact for street railroad service a load factor of 33 per cent is high.

To look at this from another point of view: the demand for power for street railways cannot be increased at will, as it may be in a manufacturing concern. In the latter if it is found advisable to run night and day at full capacity, instead of 16 hours, there is produced a correspondingly greater amount of the product, be it flour, steel rails or carbide of calcium, and this output is produced at a correspondingly decreased cost per unit.

For street railway service on the other hand there has to be installed sufficient generating machinery to take the peak of the load.

This is usually three times the average and is only of a few hours duration each day. If it were necessary or profitable to use this full capacity continuously for other industries, it would be possible to do this with very little increase of labor, no increase of fixed charges and the additional expense of producing the greater output would be merely the coal and a slight increase of supplies and repairs. This combination is the feature of the Niagara work.

When the expense of transmission shall have been decreased by the successful employment of higher voltage, it will then become a problem as to whether it will not be profitable to produce power from a steam plant located at a coal mine, coal costing in this case but 80 cents a ton. This would bring the cost of fuel down to .12 cent per k. w. h., as against .33 cent for standard plant. Further this expense would only continue for the comparatively small number of hours that the plant would have to be operated for street railway service. This might be better economy than to pay the fixed charges that would accrue from the expensive development of water powers at possibly much greater distances.

It is to be noticed in this connection that the cost of installing the steam station would be considerably less when located at the coal mine, since it would then be unnecessary to equip with the most economical and expensive machines.

Water power produced in various parts of the country varies greatly in its cost. It is reported that the electrical energy so produced costs from \$14 to \$32 per annum per k. w. continuous output. This expense is largely made up of fixed charges, which increase

rapidly as the expense of making the necessary improvements is greater. The standard steam plant produces power with \$3 coal for \$29, and with 80 cent coal for \$22 per k. w. per annum, which compare very favorably with the above for water power.

A disadvantage occurring in the use of water power is that in some cases, on account of certain periods of low water, an auxiliary steam plant has to be kept in reserve, which is of course an additional expense.

There can be no general rule given that will determine whether it is more advantageous to use water or steam power. Each case must be figured by a competent engineer and decided on its merits.

The great majority of street railways being operated by steam I shall not dwell longer on water power, as there is still considerable ground to be covered in the consideration of the steam stations.

I have compiled and classified the data on representative ones throughout the country; Tables I. and II. give the results.

The general arrangement of the tables is as follows: Each vertical column contains the data for a different station during a stated period. Each station is represented by a number which appears at the head of the column, only a portion of the table is exhibited to you on the large diagram, for obvious reasons, but I will describe the different items as they appear in the completed table. The first column is headed S, for Standard Station, following down the column first comes the capacity expressed in multiples of 1,000 k. w., 3.6 meaning 3,600 k. w. The number of units of engines, 3; ditto for generators, 3; number of units engine per 1,000 k. w. capacity is .83, obtained by dividing 3 by 3.6; ditto for generators, .83. The next line under "Type" is a description as to whether the engines are belted or direct connected to the generators; B for the former, and D. C. for the latter. The two lines marked S. C. T. and N. or C. refer to engines, simple, compound or triple; nonecondensing or condensing; as in standard C C is compound condensing.

The period during which the averages are taken is given in days. Load factor is in per cent. Inserted in the proper place under costs are the per cent S, and per cent total, which figures represent the per cents the items bear to the corresponding ones for standard, and to the total operating expense respectively.

The number of shifts, duration in hours and shift hours, together with the rate of pay of men in cents per hour, and number of men per shift per 1,000 k. w. capacity complete the data necessary for the analysis of the cost of labor. Costs are all expressed in cents per k. w. h. Opposite Fuel, lbs. of coal per k. w. h. and price, which is in dollars, per short ton, are the necessary figures to analyze the cost of fuel per k. w. h. Kind, A or B, refers to anthracite or bituminous.

Repairs, supplies, other than coal; that is, water, oil, waste, lamps and miscellaneous, as well as superintendence and general expenses are treated as one item hereafter called general expense.

As a supplement to the tables, in order to more clearly illustrate the relation of the costs, I have constructed diagrams, in which these are represented by shaded lines.

It will be noticed that these shaded lines are of various heights their height corresponding to the cost of the power in cents per k. w. h. The solid black indicates the cost of coal; the white portion cost of labor, and the upper shaded portion, general expense. These which are operating expenses are laid out above the line, and the lower shaded portion indicating fixed charges is plotted below the line. The distance from the base line O up to 1 represents 1 cent and the magnitude of each item is denoted by the length of its block. The diagram for Table I is laid out in six groups, one group for each station. The first or left hand column in each group represents the costs for the standard station. You will notice that its total length, including interest, is about equal to the distance between O and 1 so that including fixed charges the cost of power per k. w. h. per annum for the standard station amounts to about 1 cent. It also appears that the fixed charges are approximately equal to the coal. Labor is roughly about half the coal, and general expense about half the labor. These proportions are simple and easily remembered and we might expect them to hold approximately for stations under similar governing conditions.

I shall next call to your attention station No. 3, whose equipment differs from the standard as follows: It has two units instead of three. Each generator is 800 k. w., making a capacity of about half that of the standard. The generators and engines are direct connected, latter being compound condensing, smaller of course than one standard, but in other respects similar. Three 500-h. p. water tube boilers, economizers and heaters complete the important part of its equipment.

Shaded group No. 3 indicates the cost of power for this station. At the extreme left is standard. The next column showing costs per k. w. h. averaged for one year. At the extreme right of the group is the average for a light month and at the left of this is the month of high output. It is to be noticed that the total cost of operation for the year is somewhat greater than standard. Coal expense practically the same. Labor and general expense somewhat higher. Coal expense being the same does not in this instance indicate that the economy of the station is as good, as by referring to the table, it will be seen that the lbs. of coal per k. w. h. is 2.61 as against 2.2 for standard. This increase is, however, nearly balanced by the reduction in the price per ton which was \$2.60 as against \$3 for standard. It might be expected that on account of the diminished size of the station the labor expense would be larger, on account of requiring more men per 1,000 k. w. An examination of the table shows, in fact, that the men per 1,000 k. w. is nearly double what is required for standard. This would double the labor expense, providing the rate of pay and load factor remained the same, but by a coincidence the rate of pay is lower and the load factor enough higher to bring the labor expense down to nearly standard figures. To illustrate the effect of a high load factor in reducing the cost of labor per k. w. h., it will be interesting to look at the next shaded column for this station, which represents the cost during January. In this month the load factor was 59, against 46 for the year, and it will be noticed that the labor is reduced to less than the standard. The reduction in the total cost for this month, as against the yearly, is also apparent, and this is due principally to the reduction in labor.

It will be seen that the coal expense is but slightly less and seems not to be much reduced by the increased load factor. The explanation of this lies in the fact that the station is tied in with others which keeps its load from fluctuating even on the low load factor. This will be still further exemplified by referring to a light month, the column at the right of the group gives the costs for September during which the load factor was 43 as against 59 for January. The coal expense is still further diminished, and by reference to the table, will be found to be due to an increase in the efficiency of the station. This might be found to be on account of not having to force the boilers. The increase of labor due to the low load factor is to be noticed.

I wish to say at this point that it is impossible for me, in the limited time, to give you more than a general idea of the large number of interesting facts which may be obtained by careful study of the tables.

Plant No. 2 is somewhat larger than the last and is equipped with two 1,000-k. w. generators direct connected to compound condensing engines. It has also economizers and heaters. Its costs are in column No. 2. In looking at the yearly average it will be noticed that the total costs rise above the standard, and is due to an increase in labor and general expense. Coal, as before, is the same, the decreased efficiency being balanced by the lower price per ton. Examining the table with a view to accounting for the increase of labor we find the load factor approximately the same as standard, but an increase in the number of men per 1,000 k. w. This is accounted for by the smaller size of the station. General expense is greater, as would be expected. A glance at the shaded diagram representing the heavy month for this station gives a nice illustration of the effect of the high load factor which is 51 as against 33 for the year. It is to be noticed that the coal is practically the same, the reduction coming in the other two items.

This brings the total cost for the month below standard. In the light month with a low load factor of 28 per cent, the labor increase is very apparent.

I shall now present the costs of operation of a large station.

Its equipment consists of six 1,200-k. w. generators direct connected to triple condensing engines, two 1,500-k. w. generators direct connected to compound condensing engines, and an auxiliary plant of forty 62-k. w. generators belted to compound non-condensing engines and only used in case of emergency. Economizers, heaters and electric feed pumps complete the important part of the equipment.

Shaded group No. 4 indicates the costs for this station. The yearly average shows that we are approaching standard figures in labor. This item is not much less as the units are only slightly greater capacity. Load factor, rate of pay, and men per 1,000 k. w. correspond very closely with standard. The general expenses and coal bring the total somewhat higher. General expense is high on account of the heavy repair account. The station is about eight years old and repairs are heavy, due to replacing of worn out parts. The decrease in efficiency, as shown by lbs. of coal per k. w. h., might be shown by a test to be due to old boilers.

The plants just considered have all been direct connected. Station No. 5 is a belted plant a little more than one-half the capacity of the standard, equipped with seven 340-k. w. generators belted to a countershaft, to which are belted three triple condensing engines. The auxiliary apparatus affecting the economy of the station, being economizers and feed water heaters. Shaded diagram No. 5 represents the cost of a year, and also for the heavy and light months. During the three periods the coal expense remains about the same, but there is considerable variation in the other items, due principally to the change of load factor.

Notwithstanding the high load factor, 52 per cent, the labor for the year is still above standard. This would be expected from the multiplicity of parts to look after in a belted countershaft station. The reduction of general expense and labor in the heavy month is due to the load factor of 64 per cent.

Diagram No. 6 represents the costs for a belted plant of about one-fifth the capacity of standard. Its equipment is 12 generators belted to four simple high speed non-condensing engines. There are feed water heaters but no economizer. High coal consumption is the feature of this diagram. The cost of fuel alone for the year being equal to the total operating expenses for standard. Labor is also high, and the total cost of power per k. w. h. is nearly double the operating expense of standard. This station furnishes a good illustration of the effect on the cost of power of a simple non-condensing belted equipment. It is to be remarked also that this plant has the benefit of a high load factor.

It will now be interesting to turn our attention to a small direct connected station which is numbered 1. This operates about 30 cars. It is equipped with three 200-k. w. generators, has compound condensing engines, heaters, but no economizers. It does not feed in with other stations, as do those which have been previously mentioned, and has a very fluctuating load, as may be imagined in the operation of so small a number of cars. This station is just one-sixth the size of the standard, and it will be noticed that the column representing its operating expenses is about twice as high. The great increase is in the labor, although the station is operated by a corporation which has had a vast amount of experience in railroad work. Can we account for this increase in labor? By referring to the table we find the rate of pay of men is practically the same as standard, the load factor is low, 22 per cent, as against 33.

Referring to the heavy month for this station, which has the benefit of a 30 per cent load factor, we find that the labor is reduced, but it is still a long way from bed-rock figures. The examination of the table discloses the fact that the increase comes in the men per 1,000 k. w., being about 2.5 times the standard figure. The station records show the following men operating: On the first shift two engineers and one fireman; second shift, one engineer, one oiler and one fireman; third shift, one engineer and one fireman. Can this number of men be reduced? In a station whose equipment requires that the boilers be hand fired it is to say the least, difficult to imagine that the boilers could be operated with less than one fireman per shift. The secret, then, for the large number of men per 1,000 k. w. lies in the small capacity. These same men could look after a station of greater capacity.

I shall next give the costs on plant No. 12, whose figures are presented in Table II. This plant is about a third the size of

standard. It does not feed in with other stations. Its generators are belted to three tandem compound condensing engines which operate under steam pressure of 110 lbs. It has water tube boilers averaging four years of service, heaters, but no economizers. A good quality of bituminous coal is used, which costs \$2.93 per ton. By reference to the table it will be seen that this station produced power to the extent of 23 per cent of its capacity during the past year at 1.49 cents per k. w. h., including fixed charges. The operating expenses alone amounting to a little over 1 cent. The total cost of operation for the year was \$23,000, of which \$12,610 was for coal. Water costs this station nothing and the labor was about one-half the coal bill. By referring to the shaded

ed diagram No. 12 it will be seen that the coal and labor are both much higher than standard, and if standard performance had been reached a saving of \$10,000 would have been made in the operating expenses for the year. An analysis of the items is given in column No. 12 of the table, and by comparing with standard the differences may be readily seen. I do not wish to be understood in making these comparisons that it would necessarily pay to make the changes required to effect this saving, my present idea being to bring clearly before you the differences.

Station No. 13 is an interesting combination of cheap coal, simple non-condensing engines direct connected to the generators together with a high load factor. Its capacity is 70 per cent of the standard, major part being three 800-k. w. generators, the smaller unit is 200-k. w. It produced power to the extent of 42 per cent of its capacity at .95 cents per k. w. h. inclusive of depreciation and fixed charges. The depreciation is charged in at 5 per cent on a capital expenditure of about \$60 per k. w. The total expense for the year was \$92,617.28, which is made up of—

Labor .....	\$15,453.25
Repairs and renewal of steam plant.....	1,839.69
Repairs and renewal of electrical plant....	56.71
Fuel .....	44,780.94
Water .....	4,405.40
Oil, waste and lubricants .....	1,881.53
Tools, appliances and supplies.....	634.23
Taxes .....	1,945.65
Insurance .....	2,146.94
Interest .....	11,472.94
Depreciation, 5 per cent on \$160,000.....	8,000.00
	<hr/>
	\$92,617.28

The analysis of these items is given for comparison with standard in column No. 13 of Table II. The shaded diagram shows labor for this station to be equal to standard, principally on account of high load factor, the other differences are also appar-

ent. It is interesting to note that the road operated by this power station used on an average of about 1.3 k. w. h. per car-mile. Total car-miles for the year was 7,207,308, about 10 per cent of this mileage being trail cars. There are other interesting data about this road which time will not permit me to review.

Plant No. 15 is an interesting example of what a multiplicity of units will do for labor, the figure being 6.3 men per 1,000 k. w. The effect of this would be much more apparent on the color diagram were it not for the high load factor and low rate of pay.

Plant No. 16 is of 600 k. w. capacity. The cost for power for

past year was \$53,000. Load factor is the same as standard. Standard operates to produce about double the output for the same figure. Station No. 28 is 1,400 k. w. capacity, has slow speed condensing engines, heaters and economizers. The feed water leaves economizer at the high temperature of 158 degrees. The engines are simple belted to the generators and coal costs but \$1.63 per ton

Plant No. 29 is a compound condensing slow speed belted station of 1,900 k. w. capacity and feeds in with another station. The coal costs \$3.86. Plants 30 and 31 are operated by the same corporation as 29.

No. 32 is a combination of two power houses feeding into the same system. These stations are interesting because these costs are for the past year, and since then these two stations, as well as smaller ones operated by the same company have been consolidated into a large water power plant, from which power is transmitted at 13,000 volts. The two steam stations shown in column 32 have five triple expansion condensing engines. This road operated on about 1.4 k. w. h. per car-mile. The coal costs \$3 per ton. The water power plant which replaced the steam has not been in operation long enough to enable its costs to be given.

Station No. 33 has rather a tall column, due principally to its low load factor of 16 per cent.

Station No. 34, operated at a lower cost than standard on account of the high load factor 57 per cent reducing the cost of labor and low price of coal \$1 per ton.

No. 35 is a plant of 1,200 k. w. capacity, interesting on account of the fact that it has but one unit. It operates with 2.1 men per 1,000 k. w., a load factor of 37 per cent coal, costing \$1.24 per ton. Its costs are quite a little lower than standard

No. 37 is a record breaker in the opposite sense. It is of slightly greater capacity than No. 35, but has three engines and 11 generators which require eight men per 1,000 k. w. capacity. It has a load factor of but 11 per cent during 151 days from January 1

to May 31, 1898. The effect of this on the cost of labor is very apparent.

No. 40 has a capacity of 9,200 k. w. It is direct connected, has economizers and compound condensing engines. Anthracite coal is burned, costing \$1.60 per ton. This plant operates at less than standard figures.

No. 42 is a belted plant, compound non-condensing engines, heaters but no economizers. It has a good load factor, but the effect of the belted and small units shows in all three items.

No. 43 is a combination of alternating and direct current apparatus. It has a low load factor of 15 per cent, the effect of which is noticed on the labor.

No. 44 is a 6,000 k. w. station and although belted, has large compound condensing engines and economizers which, with coal at \$1.60, brings the cost of fuel below standard figures.

It will now be instructive to take a general survey of the color diagram for all stations in table No. 2. No. 37 towers above all the rest. Standard is at the extreme left. Coal in No. 37 is greater than the total operating expense for standard. This station pays \$1.75 per ton, but it uses 7.3 lbs. per k. w. h. Compare this with No. 35, about the same size plant, paying \$1.24 for coal, and using but 4.7 lbs. per k. w. h.

I can hardly ask you to compare the labor, but it is easily seven times as large in 37 as in 35. The local factor of 11 per cent as against 37 per cent would make this item three times as great and men per 1,000 k. w. 8 as against 2.1 would again increase the cost of labor three times. The higher rate of pay in plant No. 35 prevents the discrepancy being greater.

Let us look along the line for high coal cost. No. 16 seems to bear off the palm in this respect; \$3.30 per ton and 5 lbs. per k. w. h. accounts for this. For strikingly low cost we have Nos. 34, 35 and 40.

But I am afraid that I hear somebody remark that I am making comparisons that may result in unfavorable criticism, and that I promised not to do, and therefore I will let the diagrams and tables speak for themselves, and assure you that they will reward careful study.

Mr. Beggs, Milwaukee: I would like to ask whether there will be a reproduction of these tables which accompany the report in the minutes of the meeting.

The Secretary: The tables will be reproduced and everything given in full.

Mr. Sergeant, Boston: Mr. President, I move that the thanks of the Association be tendered to the writers of all the papers that have been presented to this meeting.

Mr. Goff, Fall River: I feel that in relation to Mr. Conant's paper, I would be remiss in my duty as a member of the Association if I did not urge that it should be specially recognized as a most valuable piece of work. Mr. Conant has devoted a very great amount of time to its preparation, and he deserves every credit for the work; but it is a paper of such a nature that we cannot discuss it here. We can discuss it after we have it before us in the printed report of the proceedings, but I feel that there should be a special mention of Mr. Conant's name in this connection.

Mr. Beggs, Milwaukee: I desire to reiterate what my friend has just said. I took occasion to give my personal thanks to Mr. Conant. From my experience as a manager of electric light and street railway plants, I thoroughly appreciate the vast amount of labor which he has expended upon the tables in compiling the data from various companies which is not always placed as clearly as it might be before persons who are going to perform a service of this kind. Mr. Conant's paper is worthy of special mention. It is hardly practicable to discuss the paper in this meeting. It is rather a paper which we can take up with our technical men, our engineers and men in charge of power houses, and I believe if the paper is thoroughly considered it will result in a large saving of money to every railroad company which takes the subject up in that way. I desire to second all that has been said in regard to the importance of the paper, and the careful manner in which it has been prepared, also for the way in which it was presented to this meeting.

Mr. Sergeant's motion was put and carried.

Mr. Conant, Boston: I wish to thank the members of the Association for their very kind words and also for their uniformly courteous replies which I have received from them when I have sent requests for this data.

The President: We will now take up the report of the Committee on "Standard Rules for Government of Conductors and Motormen," of which W. J. Kelly, of Columbus, O., is chairman. I understand that Mr. Kelly is indisposed this morning.

Mr. McCormack, Brooklyn: Mr. President, I am a member of the committee, and have been looking for Mr. Kelly, our chairman, who has formulated a set of rules and regulations for the government of conductors and motormen to submit to the convention. It was the intention of the committee to ask that the rules as formulated be submitted to the convention, and we would ask that the committee be continued for another year, and that the sum of \$200 be given to the committee to have the rules printed and mailed to the Association in order that any suggestions or criticisms might be made; and after it is printed, if any members of the Association desire to adopt the rules in part or in their entirety, they can do so. It was our idea that after the rules are printed and subjected to this criticism that the Association can pass on the adoption of the rules next year. The committee thinks that the rules should be taken up separately and a discussion had on each rule and each rule adopted or rejected by the convention, somewhat in the same way that the standard code of rules was adopted by the Superintendents' Association of steam railroad men.

Mr. Goff, Fall River: I move that the committee be granted the extension of time asked for, and that we appropriate the sum of \$200 as it requests. Mr. Beggs seconded the motion, which was adopted.

The President announced that it was the desire of the Secretary that members of the Association should indicate topics upon which it would be desirable to have papers prepared for the next convention, and that they should also suggest a person who would prepare the paper.

Mr. McCormack, Brooklyn: I offer a motion that the thanks of the convention be given to the press of Boston for the intelligent manner in which they have written up the proceedings of the convention. Carried.

The President: The only remaining thing for us to do is to install the newly elected officers, and the installation of the officers is usually represented by the installation of the President. I will appoint Mr. Chapman, of Chicago, and Mr. Davis, of Williamsport, a committee to escort the newly elected president to the chair.

The Secretary then read the names of all the officers elected.

The President: Gentlemen: It is needless for me to introduce Mr. Sergeant to you, but I desire to say that I appreciate the high honor you conferred upon me a year ago in electing me to this office, and I bespeak for Mr. Sergeant your kind and considerate attention to his communications. If you do as much for him as you have done to make this Boston meeting a success, we shall have a splendid meeting at Chicago next year.

President Sergeant: Gentlemen and Members of the American Street Railway Association: I wish to thank you most heartily for my sudden elevation to office. I feel proud to be permitted to serve you for the coming year. I cannot hope, perhaps, to give as good an administration as my immediate predecessor, Mr. Lang, whose efforts in behalf of the Association I am sure you all appreciate, and the success which has crowned these efforts, and the long line of past presidents, is one which fills the mind of a new incumbent with some embarrassment, based on the idea that there is a standard which must be upheld.

As to this Association, I feel strongly that it has a great work to do, that its meetings are not merely a pleasant vacation, that it is not called together merely for the purpose of reading and discussing the papers, but I believe in the complex relations which are continually coming forward as between the committees and the municipalities and the state governments and the street railways, that much is to be gained by concerted action. Certainly in Massachusetts we have benefited very greatly from the fact that our street railways have pulled together for what they know was right and they have succeeded, after a struggle covering many years, in obtaining a settlement which I suppose

looked at from all sides could be called a fair settlement of the relations of the street railways and the community. I hope that the trial which is being made here of this new plan, by which the oppressors of the street railways in a great many communities have been shown by an act of the legislature how far the street railways are liable to perform work which is not in the line of street railway practice, and by which the street railways themselves are compelled to pay a portion of their receipts for the benefit of the highways. It seems to me that all this work which has been done is instructive and is the beginning of a proper recognition of our industry over the whole country. I assure you, gentlemen, when I first went into the street railway business, particularly in the operating department, I was perfectly appalled; it seemed to me I was in an unlawful business, and everybody was down on the street railway, for it was hampered and troubled by one requirement and exaction after another, and when we made complaints, the answer to it all was: "You are in the public streets, you encumber the streets, and you must pay for it." How much better it is to know what we have to pay for than it is to be put to such payment that may devolve upon us in the judgment of some subordinate road department official in some municipality. I think in such ways as that, and in this matter which was taken up the other day, of the mail service, simply in having our case presented, in order to get proper recognition, the Association has a field, perhaps greater than any it has yet filled, and I can only say in closing that so far as it lies in my power to further the work of the Association and benefit the interests of street railways, I shall certainly do so. I thank you very much, gentlemen, for the honor.

Ex-President Lang: I now declare the newly elected officers to be duly installed, and take pleasure in handing to the new presiding officer the gavel, with my best wishes.

President Sergeant: I believe that the constitution of our Association provides that the newly elected officers shall enter upon their duties after the annual meeting is adjourned. And it seems almost as if some duties were about to be forced upon me, I suppose for that reason a motion to adjourn would be in order.

Mr. Goff, Fall River: I move you, Mr. President, that we now adjourn to meet in Chicago in 1899. Carried.

---

### THE EXCURSIONS.

#### Boston a Royal Entertainer—Trips by Land and Sea—A Multitude of Pleasures.

When in session the conventions buckled down to hard work, but when the work was finished for the day our hosts occupied every minute with some new delight and pleasure. Boston and its immediate surroundings are so full of places of rich historic interest that the cream of them was scarcely skinned in the five days which her guests had to spend. The excursions and side trips, however, were so admirably planned and carried out that visitors were treated to the most delightful pleasure trips without any thought or care other than to be on hand at the leaving time. At no convention have the excursion schedules been so faithfully carried out as here. The entertainment, from which nothing was left which could possibly be suggested, was given by the Massachusetts Street Railway Association, with the Boston roads, of course, at the head of the list, but a large number of officials of companies in adjoining cities served on committees. It would be a genuine pleasure to recite at considerable length the details of the excursions, but even then no pen or brush could ever portray the indescribable charm of the quaint surroundings of Concord or the patriotic atmosphere of Lexington, hence we will content ourselves with a brief outline of the various trips.

Every attention was provided for the visiting ladies and a large local committee met the guests at the several hotels Tuesday morning and a general introduction followed. In the afternoon all went to Lexington and Concord, in special cars to the depot and a special train to destination. About 1,000 were in this party. The first stop was Lexington, where the historic land-

marks on the Common were seen. A pleasant feature here was the presence of Rev. Dr. Calvin A. Staples, the town historian, and whose personal resemblance to Henry Ward Beecher was noted by many. Standing at the monument and facing the lotty flag pole on which was inscribed "The Birthplace of Liberty," he explained the many interesting places, and briefly recited the history of each. President Lang, on behalf of the Association, expressed thanks. Returning to the train the trip was continued to Concord, where conveyances took the entire party on a drive through the county. Among the places visited were the First Church; home of Ralph Waldo Emerson; "Wayside" home of Hawthorne; battle ground; The Old Manse; Sleepy Hollow Cemetery; Block House; home of Thoreau; and many others. The return to Boston was followed by a general reception in the evening in the Paul Revere Hall with music and dancing. The ladies receiving were: Mrs. W. B. Ferguson, Mrs. E. P. Shaw, Mrs. John Graham, Mrs. E. C. Foster, Mrs. Frank Woodman, Miss Elizabeth Staw, Mrs. Charles Richardson, Mrs. Fred. Hines. Refreshments were served in the banquet hall adjoining and the table was really a dream of the caterer's art. The festivities lasted until after midnight.

Wednesday morning the ladies were shown many of the local points of interest, and in the afternoon everybody went to Nantasket to the clam bake. Special care were provided to Rowe's Wharf, where the splendid steamer Myles Standish was tendered for the exclusive use of the street railway people. This steamer trip was tendered by the municipality of Boston as a compliment to the Association—an entirely new honor for the convention—and Mayor Quincy graced the occasion with his presence. At Nantasket the freedom of the place was extended, and while the little buttons worked charms our money would not go. Fully 1,200 made this trip and were given a shore dinner—something quite novel for many. Col. Heft, of the New Haven road, had a special train at the beach for a run to Braintree on the third-rail system, accompanying the party himself. The change in the weather on Wednesday afternoon from extremely hot to bracing cool, was a grateful one.

Thursday morning the ladies took tally-hos and enjoyed a parkway drive, going through Brookline and Jamaica Plain. In the afternoon everybody went to Plymouth on a special train, walked over the Plymouth Rock, visited the old cemetery, and other historic points, and returned with swords and other curios secured at the curiosity shops. In the evening occurred the annual banquet mentioned elsewhere.

Friday morning the ladies were conducted on a shopping trip and in the afternoon we all went out to Norumbega Park, taking special cars on the city line and changing to those of the Commonwealth Avenue Company. The distance was about 11 miles, and took the party along Beacon street, Commonwealth avenue and the Chestnut Hill reservoir. The scenery was most charming. At the park a performance was given and the return was made in time to dine and attend Keith's theatre, where the entire lower floor had been reserved for delegates. After those unfortunates who did not wear buttons had departed, the entire house and stage were inspected and a special illumination made to the great delight of the guests.

After all the delights of the week, many visitors were prevailed on to remain over Sunday, and were entertained at the homes of their friends. Altogether the pleasure features of this convention have never been equalled, for no other city has so many historic points to show; and the visitor might well say his experience was "one continued round of pleasure."

---

### THE BANQUET.

The annual banquet of the Association was given on Thursday evening at the Brunswick; about three hundred were present. The decorations, music and menu were pleasing and the toasts as follows:

The Commonwealth, His Excellency, Governor Roger Wolcott.

The City of Boston, His Honor, Mayor Josiah Quincy.

Rapid Transit in Boston, Hon. Geo. G. Crocker, Chairman Rapid Transit Commission.

The New England Bar, Hon. Samuel J. Elder.  
Orators and Oratory, Hon. P. A. Collins.  
The New England Press, Stephen O'Meara, Boston Journal.

Great disappointment was felt at missing the speech of the Governor, but he left early to welcome home what was left of the Ninth Massachusetts, which arrived about 10 o'clock that evening. The Governor, by the way, makes it a point to shake every returning soldier by the hand, and in these days soldiers deserve preference over banquets.

The toasts were good, and as the banquet room was opened promptly at 7:30 p. m., it was only midnight when the diners rose to sing "America."

## THE BUREAU OF INFORMATION.

Of all the thoughtful provisions made for the comfort of visitors, none was more valuable or better appreciated than the Bureau of Information. This was located in convention hall, in charge of Robert H. Derrah, chief executive clerk of the Boston Elevated Railway, and the management of the bureau could not possibly have been improved upon. The office was an especially built room, 15x25 ft., and both the building and decorating plans were Mr. Derrah's. Here one could find out anything and everything. A long distance telephone was installed, stenographers

MR. DERRAH'S HEADQUARTERS.

were at hand for dictation of letters or other matter, folders and time tables of all leading railroads and steamship lines in the country, and a bulletin board contained daily announcements of what was being done in the convention, and notices of the program of the day. The interior furnishings of the apartment were extremely harmonious and pleasing. Our view shows Mr. Derrah occupying the arm chair, and around him some of his assistants. As many more were on the staff, but were absent on assignments. It is certain there will never be another convention without its Bureau of Information.

Hugh H. Harrison, secretary of J. G. White & Co., 29 Broadway, N. Y., was at the Boston convention.

## CONVENTION NOTES.

The buttons provided by Secretary Penington bore a picture of Bunker Hill monument, and were backed by a small flag. These buttons were good for transportation of the wearer during convention week on every street railway in the State of Massachusetts. As an instance of the thoroughness with which everything was planned, it is interesting to note that every conductor in the city of Boston was required to receipt for a bulletin notice as to free transportation on the buttons. The result was, not a single instance occurred in which delegates were asked to pay fare. The freedom of the Boston lines is further emphasized in the fact that free transportation on the road is unknown. All the officers, from the president down, pay cash fares when riding; employes sent out on the lines to work are, of course, given trip passes.

We were all impressed with the uniform courtesy of the employees of the Boston Elevated, and the unusual fine character and neat appearance of the men. They appeared to take a lively interest in their work and anxious to keep their positions. On the other hand there was a marked politeness and regard for the individual rights of others on the part of the public not generally prevailing in many parts of our country.

Among the old timers present who used to attend early conventions were Mr. Payne, of Milwaukee; D. F. Longstreet, Providence; and Mr. Wharton, Philadelphia.

Col. D. B. Dyer, Augusta, Ga., was unable to attend and sent letters of regret.

A western manager remarked on the few exhibits of emergency apparatus. He would liked to have seen more of them.

A. E. Baker, London, connected with various tramway interests in England, was present with his brother, J. Paul Baker, of the Baltimore Car Wheel Company. Mr. Baker returns about Christmas.

The Massachusetts and nine cruisers, and the hospital ship Solace, lay in Boston harbor during the convention, and were open to visitors several hours each day. On the trip to Nantasket a fine view was had of the fleet.

There was the usual crop of souvenirs this year, some of which were quite expensive, and several original and unique.

The proximity of Trinity church, Museum of Fine Arts, and the Public Library to the headquarters hotel afforded many visits during half hours which would otherwise not have been as pleasantly occupied.

The Lynn & Boston is the only road, other than the Boston Elevated, whose cars use the subway.

C. S. Clark, chairman of exhibits, returned from Europe a few days prior to the convention, greatly improved in health.

Koran Sugahara, chief engineer of the Koku and the Buse Chuo Railway Companies, Tokyo, Japan, and T. Y. Dzushi, chief of finance and stores of the Imperial Japanese Government Railways, attended the convention and were given the freedom of the floor. Mr. Sugahara addressed the meeting.

## SWINDLER RICE KILLS HIMSELF.

Charles F. Rice, otherwise known as Lause, Kramer, Wright, Powers, Smith and Bidwell, whose career as a swindler of transportation and insurance companies was mentioned in our August issue, committed suicide by taking morphine while confined in the county jail at Saginaw, Mich., where he was held on the charge of assault and battery.

## THE ACCOUNTANTS' CONVENTION.

The Second Annual Meeting of the Street Railway Accountants' Association of America—Good Attendance—Exhaustive Report by the Committee on Standardization of Street Railway Accounts.

The Street Railway Accountants' Association of America held its second annual meeting under the same roof as the American, and at the same time. The attendance was good, about 40 being present, including one lady auditor.

The sessions were devoted to hard work, and lots of it; indeed, any one who looked in the first two days beheld a body of handsome young men who had shed coats and vests, for their room was on the sunny side.

President Wilson, of Boston, presided in a most acceptable manner, and Secretary Brockway had carefully prepared all the arrangements.

J. F. CALDERWOOD.  
President-Elect.

The principal feature was, of course, the report of the committee on standardization, of which C. N. Duffy, St. Louis, was chairman. It was a matter of universal regret that Mr. Duffy, who has worked so hard on this report, could not be present to share the honors of the report which was presented by Mr. Ham, of Brooklyn.

Mr. Seymour, of Connecticut, was present at the reading of the report on standardization, representing the Association of Railroad Commissioners, and addressed the convention, paying a very high tribute to the work of the committee, and expressing the good will his association entertained toward the Accountants' Association.

On Monday the Executive Committee met in annual session. Tuesday morning the convention opened with the president's address, secretary's report, and the reading of Mr. Hibb's paper by the secretary in the absence of the author. Wednesday the Committee on Nominations and Resolutions was appointed; the Executive Committee reported, and Mr. Ford's paper was read and discussed. Thursday and Friday were devoted to the standardization of accounts. The discussions during all the sessions were extremely interesting and valuable, and can only be obtained in full on application to the secretary of the Association, as publication has been reserved.

The new officers are as follows:

President, J. F. Calderwood, Minneapolis.

First Vice-President, E. R. Tighe, Brooklyn.

Second Vice-President, R. L. Williams, Richmond, Va.

Third Vice-President, F. E. Smith, Lynn.

Secretary and Treasurer, W. B. Brockway, Toledo, O.

Executive Committee, officers and H. L. Wilson, Boston; H. E. Babcock, Elmira, N. Y.; H. O. Mackay, Milwaukee, and J. D. Fraser, Ottawa, Can.

The meeting next year will be in Chicago; date not yet determined.

A permanent committee, of which F. E. Smith, of Lynn, is chairman, was appointed to take charge of the constantly increasing collection of forms and blanks. The exhibit this year was better than ever before and carefully studied by members.

### PRESIDENT'S ANNUAL ADDRESS.

Why this Association has continued to shower honors on my unworthy head is something I have been unable to understand. When I found it would be impossible for me to be present at the first annual convention of the Association at Niagara Falls last year, I naturally supposed that my career as presiding officer had come to an untimely end, and the only reason that has occurred to me since why this was not so, is that you all felt so sorry that it was necessary for me to forego the many instructive features as well as the many pleasures which you, who were present enjoyed on that occasion, that from pure sympathy you concluded to give me another opportunity to occupy the chair.

You have my assurance that whatever the reason may have been, your generosity was fully appreciated, and I thank you for the double honor you have conferred upon me.

The interests of all persons connected with the street railway business are, or should be the same, and it is a pleasure to note how much closer the accounting and operating departments are constantly coming together. Accounting is now looked upon as a much more important branch of the business than was the case a few years ago, and we must make it the aim of the Association to make it still more important each year. In order to accomplish this much desired end we must steadily look forward and use every endeavor to shorten, improve and perfect our methods in such a way that the results will give more complete information, in as concise a manner as possible, to all departments of the company.

That a good thing is good enough is a mistake we must not allow ourselves to fall into. How many of us today would be satisfied with what our grandfathers considered was good enough for them?

Most of you are thoroughly familiar with what this Association has already accomplished, and while some may possibly think that the improvement has been so rapid, that it may have been caused by the enthusiasm of youth and cannot continue in the same ratio, I for one think that we have only begun the good work and that it is bound to continue if only the same interest is shown in the future as has been shown in the past by all our members.

The committee appointed to further consider the question of a standard system for street railway accounting has been very active during the past year and three of the five members, namely, Mr. Duffy, Mr. Ham and Mr. Davies, have worked very hard in trying to perfect what the previous committee so ably accomplished, in the short time they had to devote to this subject previous to the last convention.

They have consulted with members of the Association of State Railroad Commissioners, with the Interstate Commerce Commis-

sion, and with members of the Association of Railway Accounting Officers and have asked for suggestions from all our own members, and have carefully considered all questions which have been submitted to them.

They held a meeting in New York a few weeks ago and met again at Cleveland only a few days since. They have rendered the Association much valuable service at no inconsiderable sacrifice to their time, and have refused to allow the Association to pay the personal expenses of their meetings, and they should receive our unbounded thanks for what they have accomplished. The report which they will submit is the most important matter we have to consider, and I trust that every one present will have some views on this subject, and will not hesitate to give us the benefit of their ideas.

The Association has continued to grow in a manner that is quite encouraging, and if it is not all that we might have hoped it would be at this time, it is at least quite gratifying that the membership has steadily increased, and that while its growth may have been somewhat slow it is still very healthy and the scope of the territory covered is constantly widening. Before the final adjournment I hope that our membership may be doubled, and we ought to feel that if we can induce any of the railway officials who are now in this city to join our Association we are doing them and their company a favor, as I feel assured they will consider themselves well repaid when they know the benefits to be derived from a membership in our Association.

During the year we have admitted another company from the Republic of Mexico, and one from the city of Honolulu, in the Hawaiian Islands. I do not know whether our having admitted this latter company to our Association was all that was necessary to influence Congress to annex these islands, but it is a fact that it was only a very short time afterward that they obtained the recognition they had so long sought.

It is with the deepest regret that I have to announce that the grim messenger of death has entered our ranks and taken from us three members: Morris W. Hall, of Camden, N. J.; James A. Stratton, of Birmingham, Ala.; and C. B. Reavis, of Atlanta, Ga. All of these gentlemen were deeply interested in everything pertaining to the welfare of our organization, and many of us feel a personal sorrow at the loss of our friends.

The American Street Railway Association clearly demonstrated by the recognition they accorded our Association at the last convention that they have a kindly interest in our well being, and we shall always consider that we owe them a deep debt of gratitude for all the delicate attentions they have shown us.

The two leading street railway publications have also shown us many favors, and have done all that lay in their power toward bringing our organization prominently before the railway fraternity of the country, and I take this opportunity to thank them in the name of the Association.

I shall not consider my duties completed without first calling your attention to what our secretary and treasurer has done, and is still doing, for us. To his tireless energy we owe to a large degree our present high standing and the tasks which he is constantly imposing upon himself would well tax the strength of a much stronger man.

### Report of the Secretary and Treasurer.

In reviewing the transactions of this office for the second year of the Association there is much to encourage us to continued effort in the extension of the interest in our aims and reasons for organizing. That the importance of the results we desire to reach and that our aim to be of more assistance to the street railway properties of America is being appreciated can best be shown by the following statement of our membership:

Total companies joining at Cleveland, O., March, 1897.....	25
Number joining between Cleveland and Niagara Falls meetings .....	12
Number joining at Niagara Falls, October, 1897.....	16
Number joining since Niagara Falls meeting.....	16
—	
Total .....	69

Less Cincinnati Street Railway Company, withdrawn.....	1
—	
Total membership September 2, 1898.....	68

The companies joining at and since the Niagara Falls meeting are:

Brooklyn City & Newtown Railroad Company, Brooklyn.	
Columbia Railway Company, Washington	
Wilmington City Railway Company, Wilmington, Del.	
Tonawanda Electric Railroad Company, North Tonawanda, N. Y.	
Milwaukee Electric Railway & Light Company, Milwaukee.	
Manchester Street Railway Company, Manchester, N. H.	
Memphis Street Railway Company, Memphis, Tenn.	
Hamilton Street Railway Company, Hamilton, Ont.	
Fitchburg & Leominster Street Railway Company, Fitchburg, Mass.	
Denver Consolidated Tramway Company, Denver, Col.	
Colorado Springs Rapid Transit Company, Colorado Springs.	
Columbus Central Railway Company, Columbus, O.	
Metropolitan Railroad Company, Washington.	
Union Depot Railroad Company, St. Louis	
West Chicago Street Railroad Company, Chicago.	
Cicero & Proviso Street Railway Company, Chicago.	
Capital Traction Company, Washington.	
Brockton Street Railway Company, Brockton, Mass.	
Detroit Citizens' Street Railway Company, Detroit.	
Atlanta Railway Company, Atlanta, Ga	
St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.	
United Traction Company, Pittsburg, Pa.	
Hartford Street Railway Company, Hartford, Conn.	
Salt Lake City Railroad Company, Salt Lake City, Utah.	
Aurora & Geneva Railway Company, Aurora, Ill.	
New Orleans & Carrollton Railroad Company, New Orleans.	
Hawaiian Tramway Company, Honolulu.	
Market Street Railway Company, San Francisco.	
Oakland Transit Company, Oakland, Cal.	
Federal District Railways of the City of Mexico, Mexico.	
Haverhill & Amesbury Street Railway Company, Amesbury, Mass	
Concord Street Railway Company, Concord, N. H.	

Thus our membership includes nearly all of the states in the Union, several cities in Canada, two in Mexico and one in the Hawaiian Islands. Inquiries have been received from Europe, Brazil and Sidney, N. S. W.

A circular explaining our aims, etc., was mailed December 1, 1897, to a large number of the presidents of non-member companies and from this can be traced the addition of several of the above companies. It seems proper to expect that when our position becomes better known our membership will be still more representative and our field of usefulness increased.

The finances to be reported are as follows:

Receipts from new members.....	\$320.00	
Receipts from interest on deposit.....	6.13	
Receipts from 1898 dues .....	460.00	
Balance on hand October 20, 1897.....	222.08	\$1,008.21
<hr/>		
Expended, services secretary 1897-1898.....	200.00	
Expenses of secretary's office and to New York..	181.17	
Printing and stationery .....	50.15	
Stenographer Niagara Falls meeting, Oct., 1897..	201.92	
Printing report of Niagara Falls meeting.....	198.15	
Expenses committee on Standardization of Accounts .....	106.45	
Printing committee on Standardization of Accounts .....	18.50	
Balance in Home Savings Bank, Toledo, O.....	51.84	\$1,008.21
<hr/>		
Dues for 1898 unpaid.....	\$60.00	
Amount in bank .....	51.84	
Total amount due and on hand.....	\$111.84	

Some of the expenses will not have to be duplicated the coming year, so a relatively better showing will be made

The sincere thanks of the Association are due to the members of the Permanent Committee on a Standard System of Accounts for their generosity in paying their own expenses to their meeting held at Manhattan Beach, N. Y., in July, of this year. It is by their action the treasurer is enabled to report a balance on hand.

Three times we have been called upon to feel the loss of one of our members: Morris W. Hall, secretary of the Camden & Suburban Railway Company, Camden, N. J.; James A. Stratton, secretary of the Birmingham Railway & Electric Company, Birmingham, Ala., and C. B. Reavis, secretary of the Augusta Railway & Electric Company, Augusta, Ga., have died. Mr. Hall was the chairman of the organization meeting and Mr. Reavis was the third vice-president for 1897. They were of our most helpful members.

The secretary is deeply under obligation and is pleased to acknowledge the valuable services and encouragement received from the officers of the American Street Railway Association, from H. H. Windsor, of the STREET RAILWAY REVIEW, and E. E. Higgins, of the "Street Railway Journal," from A. O. Kittredge, editor of "Accounties," for the presentation of a book for the Association Library and to the STREET RAILWAY REVIEW for the loan of type matter for use in the annual report. These and others have materially assisted in the handling of the duties of the office.

#### STATISTICS—THEIR USE AND ABUSE.

**E. D. Hibbs, Auditor North Jersey Street Railway Company, Jersey City, N. J.**

In discussing any phase of Accounts it is necessary to bear in mind that the duties of the railway auditor are to see that all moneys due to the company are promptly turned over to the officer appointed as custodian of the company's funds and that the source from whence this money is received should be plainly indicated; that the disbursements of the company's moneys, upon proper authority, be so charged upon the books of the company that each department of the company's service should bear its proper proportion of the expense; that the statements taken from the books of the company show to the stockholders and bondholders, through their board of directors, the financial condition of the company, the source from which its revenue is received and the manner in which it is expended; and that the manager or superintendent be furnished details of expense and revenue that will enable him to operate the road economically.

With these points borne in mind, it will be readily seen that the compilation and proper arrangement of figures, commonly termed statistics, so as to convey to the mind of the party interested information necessary for the proper management of the company's interests, must enter very largely into the Auditor's daily labor.

A bald statement of facts, such as are only too frequently the only information given out from the Accounting Department, if not supplemented by statistical information, will never reveal the weak points in a company's management. I have never known statistics to prove other than valuable information and frequently have been the means of starting investigations that have led to economies that have contributed largely to a company's financial success. It is not necessary, however, to incorporate into a report for the benefit of stockholders and others outside or the direct management of affairs a mass of statistical information that only tends to mystify those not initiated into the technical details of management and divert the mind from the actual financial and physical condition of the property which it is the purpose of the report to expose. But for the guidance and information of the superintendent and others directly in charge of operations, etc., and who are responsible for the result of the management or mismanagement of the company's various interests, statistical information cannot be given in too great detail.

Without opening the question of which is most desirable as a basis for comparison "per passenger carried" or "per car-mile

E. D. HIBBS.

Ellwood Doron Hibbs was born in Bristol, Pa., September 27, 1861. In July, 1879, he entered the employ of the Pennsylvania Railroad Company in the accounting department and remained with the company in various capacities until February, 1895. At that time Mr. Hibbs became auditor of the Consolidated Traction Company, of Jersey City, and at the organization of the North Jersey Street Railway Company he was chosen for the same position. The system of accounts in use by that company is very largely the result of his labor and has proven very satisfactory.

run," I cannot conceive how a superintendent in charge of a division can possibly be in possession of the necessary information to intelligently operate his lines without the knowledge conveyed to him by this means. In addition to this, the general superintendent or manager should have for his information in making comparisons with other lines as to cost of operating, the physical characteristics of the different lines comprising the system of which he is in charge, curves, grades, congestion of street through which they run, etc. The engineer in charge of power houses should know the number of pounds of coal necessary to convert a pound of water into steam, and so on through all the ramifications of the system.

No Accounting Department is fulfilling the purposes for which it was created that does not furnish information of this nature and it should be furnished in the shape of statistics that will enable each man interested to comprehend thoroughly the part he is bearing in the success of the company to which he is attached.

That the value of statistics may not be detracted from by indiscriminate distribution, care should be taken to place before each party in charge of a certain line of work the figures referring to that line of work only. Power house statistics would have no value when placed in the hands of a division superintendent whose duties have no connection with the operation of the power house, and platform or car house expenses convey no information when given to an engineer in charge of power houses. But on the other hand, wattmeter readings and expense statistics of one power station properly tabulated and compared with those of another station bring forcibly to the mind of the man in charge that one station is producing power at a higher cost than the other in some particular and he naturally seeks to remedy it to the manifest better interest of the company.

Statistical information enters largely into an intelligent understanding of the earnings of lines on which transfers are issued and received. Very few roads give credit to the line receiving a transfer issued by a connecting or intersecting line of the same company. To points where summer travel is very heavy, reached by a particular line of cars receiving transfers from feeder lines and on return trips passengers have the option of returning home from the transfer points by more than one line of cars, unless the line receiving the transfer is given a proportion of the original fare, entailing a more detailed audit of transfer business than is practical with most roads, a statistical report of the transfer business is absolutely necessary to explain the difference in earnings. I have in mind a line on which several summer resorts are located that is intersected by two belt lines, one of which carries most of the passengers to the point of intersection while in returning passengers almost invariably use the other belt line. The earnings of the belt line carrying the passengers to the intersection and receiving the original fare shows earnings of 35 cents per car-mile, while the belt line carrying passengers from the intersecting point and receiving the transfer shows earnings of 26 cents and 27 cents per car-mile. The adjustment of the transfers so as to give a part of the value to the accepting line is no doubt the most desirable way to cover the point, but a statement showing the number of transfers carried on each line by car and by trip and the percentage of total

passengers carried on transfers, would reveal the cause of discrepancy in earnings.

The opinion is frequently expressed by persons connected with large systems of street railways that the cost of placing statistical information in the hands of the parties to whom such information is of value, is greater than would be warranted by any benefit accruing to the company from their use. Steam roads have long ago recognized the fact that the compilation of statistics is a necessary expense connected with a well organized Accounting Department and while it bears all the odium attached to a non-revenue producing department, the discontinuance of such information is never contemplated. Street railway systems have the prejudices and traditions of years to combat. Horse railroads as a rule paid dividends to the stockholders and no questions are usually asked in such cases. But today, the capital invested in street railways is so greatly increased that the earning capacity of almost all systems have been taxed to their fullest extent to pay fixed charges, while dividends are not yet in sight. Any agency that contributes to the economical operation of a road is of great importance, and street railway systems must treat their Accounting Department with liberality to enable the parties in charge to aid in producing results for which all are laboring.

Let me say in conclusion that while statistics are not of sufficient value to occupy the first place in the mind of the Auditor, they are of such vast importance that much more attention could be very safely given them than is now generally the case.

### Report of Executive Committee.

To the President and Members of the Street Railway Accountants' Association of America.

The committee met once in Niagara Falls, immediately after the election of officers, and passed favorably upon 14 applications for membership. During the year they have taken three mail votes and have passed favorably upon the application of 15 members. We have also had one meeting at Boston, and passed favorably upon the application of five members, making a total increase in membership during the year of 34 members, there having been no withdrawals.

Considering the fact that the Association is still very young, this showing is particularly satisfactory, and if the members of the Association will show as much interest during the coming year as they have in the past, we believe that before we meet again our membership will exceed one hundred.

Your committee have audited the books of the secretary and treasurer and find them correct in every respect.

We desire to express the appreciation of this Association for the thoroughness and care with which Mr. Brockway conducts the duties of his office.

The meeting of the Association at this time of the month is particularly unfortunate, and the absence of many of our members is due to that fact. We should not be discouraged if our attendance at this meeting is not as large as we had hoped for, while some members may be unable to be present on account of the time of the month, we feel sure that we have their hearty good will, and that they would be present if it were possible.

### CAR MILEAGE—HOW ARRIVED AT, AND ITS USE.

By A. H. Ford, Secretary and Treasurer New Orleans Traction Company, New Orleans, La.

The subject assigned to me is somewhat limited in its scope, being statistical in its nature (as has probably been shown by Mr. Hibbs in his paper) and for that reason, interest in its discussion is limited to the Accounting Department, to whose lot generally falls the preparation of statistics, and the operating department, which makes use of the same in determining the actual status of affairs in its control, or in suggesting needed economies or improvements, which alone are demonstrated by this means.

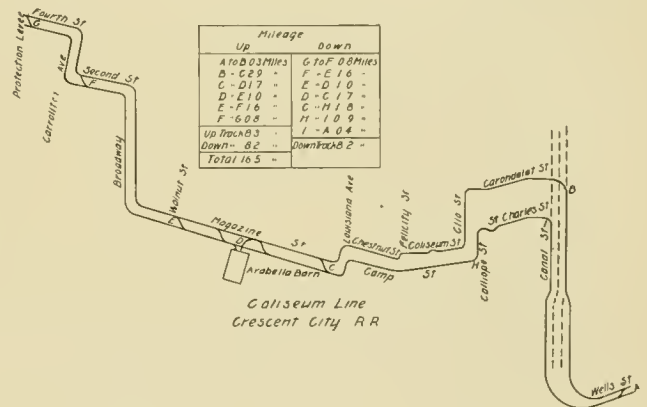

Executive officers and directors, as a rule, do not take the interest they should in the statistical information we place in their hands, daily, weekly, monthly and annually, at the ex-

A. H. Ford was born in New York City July 28, 1859, and received the first rudiments of education at Bridgehampton, Long Island. Very early in his career the family moved to Evansville, Ind., where his common school education was completed. At the early age of 17 he entered the railroad service, holding the positions of clerk to receiver and local ticket agent of the Lake Erie, Evansville & Southwestern Railroad. From 1880 to 1884 he was secretary of the Evansville & Eastern Railroad, assistant auditor of the Evansville, Rockport & Eastern Railroad and, when the two companies were consolidated, he became traveling auditor. From 1884 to 1892 he was successively auditor of the Kentucky & Indiana Bridge Company, treasurer and auditor of the Louisville & Southern Railroad and secretary and treasurer of the Southern Contract Company. Since February, 1893, Mr. Ford has been secretary of the New Orleans City & Lake and the Crescent City Railroads, and on January 1, 1897, he was appointed secretary and treasurer of the New Orleans Traction Company, which position he now holds.

A. H. FORD.

pense of careful forethought, great labor and comprehensive thoroughness. This information is worthy of careful study, which, if bestowed, would in many instances, locate the difficulties which are hindering the financial success of some of our systems. It is true these gentlemen have other and weightier matters to occupy their time and attention, and our statements therefore, in most cases, find slight appreciation and little study from them, but the general manager, or head of the transportation department, who carefully considers them, gets help, and

many suggestions which assist him in the discharge of his responsible duties.

The "Car Mile" with many roads has become the unit of calculation. This should be the case with all, as from the showing made from this unit, figures can be made which will unerringly determine many vexing questions of management.

**ITS USE.**

We probably make a more extended use of our mileage than most roads, and therefore, every effort is made to insure correctness.

A statement is made weekly and monthly for the general manager, showing, among other things, the earnings per car mile of each line in the system, and the average total, from which he can see at a glance what lines are not up to the standard, and changes in schedules, effecting headway and running time, are suggested, to overcome the loss. The Monthly Earnings and Statistics Statement shows the earnings and operating expenses (in detail) per car mile, comparison being made with previous year.

The monthly statement of mileage of cars prepared by station foremen, is used in making up the record showing the life of wheels which are contracted for under a guaranteed mileage, of trolley wheels, motors, motor bearings, gears and pinions and other parts of the equipment, which record is made the test of the efficiency and economy of the particular kind or design used.

Our power is rented, and the basis of compensation is a rate per car-mile.

Our advertising contract is upon a basis of per car-day of so many miles.

Copies of some of the forms mentioned are attached hereto, for the information of those wishing to examine them

## REPORT ON STANDARD SYSTEM OF STREET RAILWAY ACCOUNTING.

The Committee on a Standard System of Street Railway Accounting, appointed near the close of your convention held in Niagara Falls, New York, October 19-22, 1897, for the purpose of further prosecuting the work of the former committee, has prepared a report covering classification of construction, equipment and operating expense accounts, forms of monthly and annual reports, and an alphabetical list of items chargeable to operating expense accounts. The report has been printed, and copies have been handed to the members present at this meeting.

This report should be considered in connection with the report submitted to the last annual convention of the Association, printed on pages 90-119 of its proceedings. (See REVIEW, November, 1897, pp. 768-774). The classification and forms recommended by the former committee, as the committee stated, were hastily prepared and unfinished, and the work of this committee has been mainly one of revision and suggested improvements of the recommendations of that preliminary report, in the light of the extended discussion of it at the Niagara Falls meeting, and of the subsequent experience of the members of the committee and of other members of the Association as gathered by correspondence.

On January 15, 1898, after the verbatim report of the Niagara Falls meeting had been for almost two months in the hands of members, and after the beginning of the fiscal year of most of them, Secretary Brockway sent a postal card to each member of the Association for the purpose of ascertaining how many had adopted the recommendations of the convention. To this postal card 39 replies were received. Nineteen companies stated that they had adopted, substantially, the classifications of accounts and forms of report, and found them practicable; and most of the other members who replied found little to criticize, and highly commended the general plan, although for various reasons they had not put it into practical use. It is interesting to note that they have been adopted also by the Street Railway Company of New South Wales, Australia.

Your committee feel that the fact that so considerable a proportion of the membership of the Association is using the Association's classifications and forms, imperfect as the former committee and the convention felt the first draft of them to be, is sufficient of itself to justify the formation of the Accountants' Association, and its continued existence until such time as the system of accounting, satisfactory in its general form and in most of its details to a majority of the street railway companies of the country, has been adopted, tried under a great variety of conditions, and approved in its main features by all. They are encouraged, too, by statements of members that the adoption of the new classifications does not interfere with the making of reports on forms previously used when required by the management of their companies or by state boards of railroad commissioners.

Some of the members, in their replies to Mr. Brockway's postal card, were good enough to make criticism of the work of the convention, and their objections and suggestions have been carefully considered by your committee.

On May 28, 1898, your committee sent to the members of the Association a letter supplementary to Mr. Brockway's postal card, and in part a repetition of it, asking them to assist the committee by sending to it answers to the following questions, and to have their replies in the hands of the committee on or before June 10:

1. Has your company adopted the standard system of accounts?
2. Has your company found the standard system practical and satisfactory?
3. Has your company found objections to the standard system? If so, please state them in detail.
4. What suggestions can you offer, or what criticisms can you make, to perfect the standard system?
5. On what date did your company put the standard system into operation?

6. On what date does the fiscal year of your company close?
7. Do the state officials of your state exercise any supervision over the books and accounts of your company?

8. If your company has not adopted the standard system, has the matter been considered at all?

To this letter the committee received replies from 26 companies—more than one-third of the membership. Only five of the replies, aside from those of the members of the committee, contained any criticisms or suggestions.

While the members of the committee were disappointed at receiving so few replies, they did not believe that the failure to reply indicated, in any case, a lack of interest in their work; neither did they assume that the failure to answer was an indication that the work of the previous committee was entirely satisfactory to the members who did not reply.

On July 4 your committee mailed a circular letter to the members of the Association for the purpose of ascertaining the practice of the membership as to charging to capital or construction to expense, or directly to income the cost of extensive renewals of track or equipment, and with reference to debiting income account with any sum, at stated intervals or otherwise, on account of depreciation, and it enclosed with the letter printed query blanks, on which it invited members to submit to the committee questions as to the proper account to which to charge or credit any item of expenditure or income as to which they might be in doubt. The responses to this circular were not numerous. The committee believes that it has answered, in its classification of accounts, all the queries propounded.

Your committee endeavored, by correspondence, to obtain a list of the states which require street railway companies to file reports of earnings and expenses, and to obtain copies of the blank forms on which these reports are made, and such blanks as it obtained it has turned over to the committee appointed to arrange the exhibit of blanks at the Boston convention.

The committee is indebted to the secretary of the Interstate Commerce Commission for copies of its form of annual report of railroads for 1897, and of each of the following pamphlets:

"Classification of Construction Expenses"; "Classification of Operating Expenses"; Bulletins Nos. 1, 2 and 3, containing decisions upon questions raised under the classification of operating expenses prescribed by the Commission.

Through correspondence with the secretary of the Interstate Commerce Commission, your committee learned of an Association of State Railroad Commissioners: that that association, at its ninth annual convention, in St. Louis, in 1897, appointed a committee to formulate a classification of construction and operating expenses of electric railways; that, at its tenth annual convention, in Washington, D. C., in May, 1898, the chairman of that committee, William O. Seymour, of Richfield, Conn., made the following report:

"The full committee have met, in connection with the Association of Railway Accounting Officers, and have prepared a classification of the operating and construction expenses of electric railways, and desire more time to submit the work which they have done to a committee composed of those who represent the American Street Railway Association, in order that, when this report is presented, it may be a report substantially approved by those who are experts in electrical railroad construction as well as the Railway Accounting Association, which more distinctly represents steam railroad construction. Hence, our report is not now in condition to be presented at this session, and we ask further time. We shall have it in preparation, and complete for presentation at the next meeting of the convention."

On receipt of this information, your committee wrote to Mr. Seymour, explaining to him the organization of the Street Railway Accountants' Association, the work that had been accomplished at the two meetings of the Accountants' Association, the work still in contemplation, and especially the scope of the work of the committee on Standard System of Street Railway Accounting, and sent to him a copy of our constitution and by-laws, a copy of the STREET RAILWAY REVIEW for April, 1897, containing a full report of the Cleveland meeting, and a copy of the printed verbatim report of our Niagara convention. The committee stated to Mr. Seymour that, if it had known of the

existence of the Association of State Railroad Commissioners, it would, if it had been agreeable to the Association, have attended its annual meetings in St. Louis and Washington; and it invited him and the other members of his committee to attend a meeting of your committee, to be held shortly in Cleveland or in New York.

Mr. Seymour replied as follows:

"Ridgefield, Conn., June 16, 1898.

"MR. C. N. DUFFY, Sec. and Treas., etc

"DEAR SIR.—Your kind favor, with accompanying documents, received. You represent just the parties with whom we wish to confer, but heretofore knew not whom to communicate with. At the annual convention of the Railroad Commissioners, in St. Louis, in 1897, the following persons were appointed a committee to prepare a proper classification of the construction and operating expenses of the street railway companies, similar, so far as applicable, to the classification of the same accounts of steam railroads, viz.:

"Wm. O. Seymour, Railroad Commissioner of Connecticut, Ridgefield.

"Ashley W. Cole, Albany, N. Y.

"R. S. Kayler, Columbus, Ohio.

"H. M. Kochersperger, President Railway Accounting Association, New Haven, Conn.

"M. Riebenach, Assistant Comptroller Pennsylvania Railroad, Philadelphia.

"H. D. Bulkley, Comptroller Baltimore & Ohio Railroad, Baltimore, Md.

"N. H. Heft, Chief of Electrical Department of New York, New Haven & Hartford Railroad, New Haven, Conn.

"The committee met in New York and have a report partially prepared, but before looking it over finally wish to confer with some experts in the electrical accounting so as to submit something likely to meet the approbation of all parties interested, which will be probably universally adopted, and thus secure uniform reports from all companies valuable for comparison. The street railways are becoming such valuable properties that investors and the public generally demand some such information for guidance. In the preparation of our work, we have relied greatly upon the aid and advice of the members of the Railway Accounting Association, named above, who are very able men in their line. Before saying definitely whether this committee can meet you at the time you name, I am going to communicate with them personally and inform you by mail later. I can and would be glad to meet you in New York City, but to make our conference most valuable, we should surely have the presence and co-operation of the gentlemen above referred to. Expect to hear from me soon.

"Yours very truly.

"(Signed) WM. O. SEYMOUR."

The committee are indebted also to E. S. Doud, of Hazelton, Pa., and Elmer M. White, of Hartford, Conn., for blank forms, and to E. D. Hibbs, of Jersey City, for printed lists of items chargeable to the various expense accounts kept by the companies. These have been sent to the committee in charge of the exhibition of blanks at the Boston convention.

The committee and the Association are under obligations to the STREET RAILWAY REVIEW and the "Street Railway Journal" for giving circulation beyond the membership of the Association to the circular letters of the committee, for valuable hints in their editorial columns, and for many words of encouragement. Both have done much to keep alive an interest in the Association and its objects.

Your committee wishes especially to thank Mr. Brockway, the secretary of the Association, for most valuable assistance in the matter of conducting the committee's correspondence, and in attending its meeting in New York.

Having obtained what data it could by correspondence, a meeting of your committee was called at the Oriental Hotel, Manhattan Beach, New York, on Monday, July 18th. This meeting was attended by Messrs. Duffy, Ham and Davies, of the committee, by W. B. Brockway, secretary of the Association, and by A. O. Kittridge, editor of "Accounties" and associate editor of the "Street Railway Journal."

The committee invited the secretary of the Interstate Commerce Commission, the members of the committee on accounts of the Association of State Railroad Commissioners, and the secretaries of several state Boards of Railroad Commissioners to meet with it in New York on July 20, and a number of them promised to attend. Much to their regret, however, and much more to the regret of your committee, they were unable to come. Every effort was made by correspondence and by personal solicitation of members, to interest in the work of the committee, representatives of every state which exercises any control over the books or accounting of street railway companies.

After a six days' session at Manhattan Beach, your committee separated, each member to take up at home a particular branch of the work. Finding it impossible to complete their report without another meeting, the members of the committee who attended the New York meeting met again in Cleveland on August 26 and 27.

The committee resolved to make no changes in the former classifications or forms, except for good and sufficient reasons, and the principal purpose of this statement is to present to the Association in detail the changes which have been recommended, and the considerations which influenced the committee in recommending them.

There can be no doubt that a scientific system of accounting is an effective check on the efficiency or inefficiency of the management of the street railway company, especially when a comparative study can be made of reports of other companies kept under exactly the same rules. For this purpose uniformity in accounting is as essential as accuracy. The committee have tried to adopt a classification comprising as small a number of accounts as will give to the management, with as much detail as necessary, the fullest information as to the receipts and expenditures of the company.

In the revised classifications the committee have made the explanations of what should enter into the various accounts as brief, clear and comprehensive as they could, and has supplemented the explanation of operating expense accounts with lists of the more important items chargeable to the respective accounts.

As the construction and equipment of a road must necessarily precede its operation, the committee has placed the classification of construction and equipment accounts ahead of the classification of operating expense accounts. To prevent confusion, it has designated the construction and equipment accounts by letter, and the operating expense accounts by number; and it has taken pains to make those construction and equipment and operating expense accounts which pertain to way and structures and to equipment consistent with each other, listing similar items under corresponding accounts.

Referring first to the construction and equipment accounts, the alterations which have been recommended in the titles and in the analyses or explanations of what should be included in each account, are as follows:

The account entitled, "Right of Way"—formerly No. 3, now Account C—as defined by the committee last year, included all expenditures in connection with securing or paying for right of way. The account was meant to include the cost of land acquired for right of way, as well as other right of way expenses, but as land was not mentioned, some might have been led to charge its cost under Account No. 6, "Real Estate Used in Operation of Road." To prevent any possible misunderstanding on this point, your committee have thought best to explain the account to include "all expenditures in connection with securing or paying for right of way, including cost of real estate for right of way."

The explanation of the account entitled "Track and Roadway Construction"—formerly Account No. 4, now Account D—is, in substance, the same as in last year's classification, but the committee have defined a little more explicitly the class of material and labor chargeable to it, and have endeavored to make it cover materials used on underground trolley and surface contact roads.

Account No. 5, "Electrical Track Construction," has been changed to Account E, "Electric Line Construction." As the

items chargeable to this account are no part of the track proper, but pertain only to the construction of the electric line, this is a better and more appropriate title. The committee have tried to make the account applicable to underground trolley, third rail and surface contact roads, as well as to overhead trolley roads. The punching or drilling of rails for track wiring was not specially mentioned last year, but it is now expressly stated to be chargeable to this account.

Account F (formerly No. 6), has been defined to include all expenditures for real estate used in the operation of the road except right of way.

Accounts 7 and 8 have been transposed, "Buildings and Fixtures Used in Operation of Road," (G) now preceding "Investment Real Estate" (H). The word "Fixtures" has been substituted for "Improvements," as more properly descriptive of the structures whose cost is intended to be covered by this title; and the term "building and fixtures" has been more particularly defined.

"Investment Real Estate and Improvements" has been changed to "Investment Real Estate" (H), the term "real estate," in its legal meaning, including both land and improvements.

"Power Plant Equipment" (Account I), has been explicitly defined to include the cost not only of the steam and electric equipment of the main power plant, but of sub-stations, and of water power machinery.

Account K, "Cars," is expressly limited to those cars from the operation of which revenue is derived. This is what is meant in the classification of 1897, and is evident from the explanation of expenditures chargeable to Account No. 13 ("Miscellaneous Equipment"), but the explanation of what was to be debited to "Cars" if read alone, must have been understood to refer to all cars.

Account No. 12, "Electrical Car Equipment," has been changed to Account L, "Electrical Equipment of Cars," and has been more clearly defined.

Freight, mail and express cars have been taken from "Miscellaneous Equipment" (Account No. 13, now Account M), and placed in Account K ("Cars"), and "Miscellaneous Equipment" is explained to refer only to cars used exclusively for the company's convenience, and not to cars used for the carriage of passengers or the hauling of baggage, freight, mail, express or other material for the public.

Account No. 14, now Account N ("Interest and Discount"), remains as before, except that it is specifically stated to include discounts or premiums resulting from the sale of bonds or other securities negotiated for construction purposes.

No construction accounts have been added to the former list; none has been taken from it.

Coming now to the revision of operating expense accounts, these were classified last year under four principal headings or divisions, namely, "A, Maintenance of Way and Structures"; "B, Maintenance of Equipment"; "C, Conducting Transportation"; "D, General Expenses." Your committee have reduced these headings to three—"Maintenance" (including "Maintenance of Way and Structure" and "Maintenance of Equipment"), "Transportation" (including "Operation of Power Plant" and "Car Service"), and "General." This is not, in any sense, a radical change, the headings remaining as they were before, except that the two maintenance headings ("Way and Structures" and "Equipment") are placed in one division, "Maintenance." This change was suggested by W. G. Ross, of Montreal, and the members of the committee who attended the New York meeting were unanimous in the opinion that it should be made. Under this heading are included all expenses of keeping up road and equipment. In other words, all maintenance expenses are classed under one general heading, as, in the report of 1897, all transportation expenses, although subdivided into "Operation of Power Plant" and "Car Service," were included under the one general heading "Transportation," this plan receiving the endorsement of the convention at Niagara Falls.

The order in which the three general headings should be arranged was carefully considered and debated by your committee. It had been suggested to the committee, in some of the replies to their circular letters, that the order of general headings recommended and adopted at Niagara was a departure from

the arrangement generally in use; that as transportation expenses on most roads exceed in amount the expenses of either of the other two divisions, "Transportation" should occupy first place in the classification, and should be followed by "Maintenance." The committee, however, were unanimous in thinking that as transportation expenses are subordinate and subsequent to maintenance expenses, and as transportation is necessarily dependent upon proper maintenance, the cost of maintenance should, in any classification of accounts, precede the cost of transportation. In this opinion as to the proper order of these two headings, the committee are backed by other accountants who have written to it upon the subject.

It was suggested in one of the letters to the committee that "General" should be the first subdivision, "because general expense embodies the salaries of the highest officials of the company, whose time and ability is devoted to everything pertaining to the company's business, whether it be maintenance, transportation expense or construction." The committee thought, however, that as "General Expenses" include items, such as salaries, printing and stationery, miscellaneous office expenses, and other miscellaneous expenses which, under a stricter auditing of vouchers than is practiced by any company with whose accounting any member of the committee was acquainted, might be divided between "Maintenance" and "Transportation," and as "General Expenses" cannot possibly, in logical or chronological order, precede "Maintenance" and "Transportation," "General" should be the last of the three main headings.

It may not be out of place to remark here that, in the form for reports of steam railroad companies prescribed by the Interstate Commerce Commission, the highest official authority accounting, the order of arrangement is "Maintenance," "Transportation," "General."

The total number of expense accounts in the classification adopted in 1897 was 38; the number recommended by your present committee is 39. The difference occurs in this way: Items chargeable under Account No. 8 in the former classification ("Renewals of Horse and Vehicle Equipment") are now chargeable to "Maintenance of Miscellaneous Equipment" (Account No. 8) and "Stable Expenses" (Account No. 30). Former Account No. 8 is thus abolished. Account No. 34 in the classification of 1897 ("Legal Expenses") has been divided into "Legal Expenses in Connection with Damages" (Account No. 34) and "Other Legal Expenses" (Account No. 35), for reasons stated in the discussion of this account at the Niagara meeting, and a new expense account, to include taxes, cost of car licenses, etc., has been added.

In all titles in which, in the classification of 1897, the phrase "repairs and renewals" was used, the single word "maintenance" has been recommended. In all titles in which the word "electrical" was used, the word "electric" has been substituted.

It is difficult sometimes to get a short ledger title which, standing alone, expresses all that is to be included under it. There are two rather indefinite and unsatisfactory titles in the classification of operating expense accounts—"Wages of *Other* Car-Service Employees," and "*Other* Legal Expenses." They immediately follow, however, accounts to which they are subordinate, and it is believed that no confusion can result from their use.

Taking up now the 39 accounts in their numerical order, the committee will state briefly the changes recommended and the reasons for them.

The word "construction" has been omitted from Account No. 1, first, to shorten the title, and, secondly, because some companies use the word "construction" to mean original cost or investment, rather than operating expense. This account thus becomes "Maintenance of Track and Roadway," instead of "Repairs and Renewals of Track and Roadway Construction."

For the same reasons, the phrase "track construction" has been dropped from Account No. 2, the word "line" being substituted, and the account becomes "Maintenance of Electric Line," instead of "Repairs and Renewals of Electrical Track Construction."

The title of Account No. 3 has been changed from "Repairs and Renewals of Buildings and Improvements" to "Maintenance of Buildings and Fixtures," because the word "improvements"

in street railway accounting has another meaning distinct from the sense in which it was used in the classification of operating expenses of 1897, namely, betterments, chargeable usually to some capital account, and it might be confusing to use the word in two senses in the same classification. Besides, the term "fixtures" more properly describes the structures or appurtenances, the cost of whose maintenance is meant to be included under this title.

It will be noticed that these three accounts, as in the classification of 1897, are placed under the main heading "Way and Structures" and in the same numerical order.

Accounts 4, 5 and 6, except as before noted, remain as they were in the classification of 1897.

Account No. 7 has been changed from "Repairs and Renewals of Electrical Car Equipment" to "Maintenance of Electrical Equipment for Cars." This may seem an unimportant change, but the former title might have been understood to include cars as well as the electric equipment of cars, and the new title more clearly and properly expresses what should be classed in the account.

Horses and horse vehicles play so small a part in the operation of a modern electric railway, that it seemed to the committee inadvisable to keep a separate account for the cost of their renewal, and former Accounts No. 8 ("Renewals of Horse and Vehicle Equipment") and No. 9 ("Repairs and Renewals of Miscellaneous Equipment") have been consolidated in new Account No. 8 ("Maintenance or Miscellaneous Equipment"), except that depreciation of horses and the cost of renewals of horses are now included in Account No. 30 ("Stable Expenses"). The cost of repairs and renewal of harness and vehicle equipment has been taken from former Account No. 31 ("General Stable Expenses") and put in this new Account No. 8, because being a maintenance expense, it should be classed in a maintenance account.

Former Account No. 10 ("Repairs and Renewals of Shop Tools and Machinery") now becomes No. 9 ("Miscellaneous Shop Expenses"). The change is in the title merely; the same things are listed under the new account as were charged to the old one. The new title is shorter, more generally used, better understood and more accurately descriptive of what should be included in the account, viz., not only the cost of repairs and renewals of shop machinery (engines, boilers, etc., used in repair shops), appliances (such as cranes and hoists), and tools (lathes, planers, drill-presses, etc.), but the expense of operating them, as, for example, the cost of coal and water for the shop engine, coke for smithing purposes, etc. As stated in the definition of this account, the cost of repairing or renewing hand-tools should not be charged to this account, unless used for repairing shop tools or machinery, but to the account most affected by their use. For example, repairs and renewals of picks and shovels used in track repair work, spike-mauls, ratchet-drills for drilling rails, and similar small tools should be debited to Account No. 1; a screw-driver used in repairing car bodies to Account No. 6; and it might be desirable similarly to apportion the cost of keeping up fixed tools and machinery; but it is impracticable to divide the cost of maintaining such machines among the various accounts for which their work is done, as, for instance, the work of a drill-press, used for many purposes—for example, for drilling rails for the benefit of Account No. 7, and side bars and other parts of trucks for Account No. 6.

As in last year's classification, there are six accounts under the sub-heading "Operation of Power Plant."

"Power Plant Wages and Superintendence" has been shortened to "Power Plant Wages," the definition of the account showing that it is meant to include superintendence.

The committee considered the recommendation of the Niagara Falls convention that Account No. 13, now No. 12, be made to read, "Water for Steam Power," but thought the better title to be "Water for Power," the account to include both water for steam plant and water for water-power plant.

The accounts under "Car Service" (Nos. 16 to 24) are the same in number, arrangements and definitions as in last year's classification, but some slight changes have been made in several of the titles.

"Car and Motor Supplies" has been changed to "Car Service Supplies" (Account No. 21), this being a better and more logical and consistent name. If "Car and Motor Supplies" were a popular title for this account, then "Maintenance of Motors" would be a proper title for Account No. 7 ("Maintenance of Electric Equipment of Cars"). But Account No. 7 was meant to include not only motors but controllers, trolley bases and poles, trolley wheels and forks, etc., and the wiring of car bodies for the purpose of conveying current from the line: so that the word "motors" did not seem to be sufficiently comprehensive, and the title "Electric Equipment of Cars" was adopted. For the same reasons, the word "motors" seemed to the committee too restricted a term to describe all the supplies for the electric equipment of cars intended to be included in this account, and the title "Car Service Supplies" was substituted.

"Miscellaneous Transportation Expenses" has been changed to "Miscellaneous Car Service Expenses," for the reason that there are two sub-headings under the main title "Transportation" (namely, "Operation of Power Plant" and "Car Service"), and miscellaneous transportation expenses might be construed to include expenses both of power plant and of car service. Inasmuch as an account (No. 14) has been provided for the miscellaneous expenses of the power plant, and another account for the miscellaneous expenses incident to car service, they should have distinctive titles. One should not be given a title that might cover items chargeable to the other.

"Cleaning, Watering and Sanding Track" has been changed to "Cleaning and Sanding Track" (Account No. 23)—a shorter title and just as expressive of what is to be embraced in the account.

We come now to the third main division—"General"—and the 15 accounts listed under it. This general heading has no sub-headings. The question as to whether or not sub-headings, "Current," to embrace Accounts 25 to 35, inclusive, and "Fixed," to embrace Accounts 36 to 39, should be provided, was fully considered by the committee, and it was decided not to use them, because, principally, of the danger of misunderstanding or misapplying the term "fixed," which is generally applied to interest charges only.

The number of "General" accounts has been increased from 13 to 15, because of the division of former Account 34 ("Legal Expenses") into the present Accounts Nos. 34 and 35 ("Legal Expenses in Connection with Damages" and "Other Legal Expenses"), and the addition of Account 39 ("Taxes").

The titles of some of the "General" accounts have been changed. "General Stores Expenses" is now "Storeroom Expenses" (No. 29); "General Stable Expenses" is now "Stable Expenses" (No. 30); "Advertising and Expense of Park Properties" is now "Advertising and Attractions" (No. 31); "Injuries and Damages" is now "Damages" (No. 33); a division has been made of "Legal Expenses," following the recommendations of the Niagara Falls convention, into "Legal Expenses in Connection with Damages" (No. 34), and "Other Legal Expenses" (No. 35); "Track Rentals" is now "Rent of Tracks and Terminals" (No. 37), and "Rental of Land and Buildings" is now "Rent of Land and Buildings" (No. 36). The numerical order of the accounts is not changed, except as to Nos. 36 and 37, which have been transposed, it being the judgment of the committee that this order was preferable to the old order.

The title "General Stores Expenses" was changed to "Storeroom Expenses," and the title "General Stable Expenses" to "Stable Expenses," because all accounts under this main heading are general, and it is unnecessary to repeat the word in their titles.

"Advertising and Expenses of Park Properties" was changed to "Advertising and Attractions" because the latter title is shorter and more accurately descriptive of the expenses which should be debited to the account. All expenses incurred for the purpose of attracting and inducing travel, such as maintenance of parks, or donations or contributions to parks, theaters, circuses or other amusements, while not perhaps strictly advertising, are analogous to advertising, and may properly be included with advertising expenses in one account.

"Track Rentals" has been changed to "Rent of Tracks and

Terminals"—a broader title, and one that will better take care of the expenses chargeable to the account. Some companies, notably suburban companies connecting with city lines, are obliged to rent a piece of track, or possibly a piece of ground, for a terminal station or stopping place, and the expense of this should be charged to "Rent of Track and Terminals," as the rent of offices in an office building not owned by the company should be charged to Account No. 36. The word "terminals" in this account (No. 37) is not meant to refer to depots, car-houses or other buildings. This account should not be confounded with "Rentals of Leased Lines," which the committee consider not an operating account, but a deduction from income.

A new operating expense account (No. 39) to include taxes, cost of car licenses, etc., has been added, the committee being unanimously of the opinion that taxes, being incident to the ownership of property and the operation of the road, are an operating expense. In the report of the former committee, it was recommended that taxes should not be considered as an operating expense, but should be classed as a deduction from income, together with interest on funded and floating debt, and rentals of leased lines. The disposition of taxes was a subject of careful thought and deliberation by the former committee, and in reaching the decision that they did, they were largely influenced by the fact that nearly all Boards of Railroad Commissioners required that taxes be treated in this way. There seems to be no logical reason why taxes should *not* be treated as an operating expense. They are a necessary burden in the operation of every railroad. No company escapes them. They are analogous to insurance, rent of tracks and terminals, and rent of land and buildings. If a company rents the real estate it uses in the operation of its road, its rent of land and buildings account will be larger and its taxes account correspondingly smaller than they would be if it owned the real estate. If rentals, therefore, are to be treated as an operating expense, taxes should be treated in the same way.

In addition to the fact that taxes seem logically to be an operating expense, much confusion will be avoided by so classifying them. At the present time, although it has come to be the general practice to charge taxes in operating expenses, yet when a statement is made of the cost of operating a road, it is not certainly known whether taxes are included or not, some companies considering them as a fixed charge. Taxes being included in operating expenses, the stockholders of a company, when they are informed of the amount of the company's gross receipts and operating expenses, know what the difference, if any, is the amount applicable to interest on capital invested in the property, whether that capital be represented by bonds, bills or accounts payable, preferred stock, or common stock, or applicable, if the stockholders so elect, to the purchase or construction of extensions, additions, or betterments.

The committee considered a suggestion that interest should also be included in operating expenses, but in line with the substantially universal practice, concluded to leave it as a fixed charge to be deducted from income.

Rent of leased lines is also to be deducted from income, separately from expense, this charge being regarded by the committee as similar to interest and dividends, it being, under some leases, in the nature of a guaranteed dividend on the stock of the line leased. A distinction should be made between the leasing of a line of railroad under an agreement by which the lessee operates and the leased lines and the renting of a part of the track of another operating company, which is clearly chargeable to Operating Expenses.

A few words as to some changes that are recommended in the classification of items chargeable to "General" accounts may be appropriate.

The salary of general counsel or solicitor is to be charged to Accounts Nos. 34 and 35, and not to account No. 25. In this ruling the committee followed what seemed to be the consensus of opinion at the Niagara Falls meeting.

Account No. 27 ("Printing and Stationery") has been made to include coin-bags, money-wrappers and money-tags. These items are as properly printing and stationery as any items that can be so classed, and have been taken out of "Miscellaneous Office Expenses", where they were placed last year, the committee being

fully agreed that this was an error. In every other respect "Printing and Stationery" conforms to the recommendations of the Niagara convention. The committee have not failed to consider the items of printing or engraving of tickets or transfers, the printing of briefs and other legal papers, and of signs, posters, etc., but believe that these things were properly placed last year. These items are so clearly separable from general printing and stationery that no confusion can arise from this classification. Printed tickets are as clearly a part of transportation expenses as metal or celluloid tickets, which would hardly be charged by anyone to "Printing and Stationery." Of course some roads have such expenses. "Printing and Stationery" is generally understood to include printing and supplies intimately connected with accounting, corresponding, etc., although some printing and stationery, as, for example, time-books and pay envelopes, may be used in every department of the roads. Time-books, used to record the time of men working on the track, for instance, are a part of the "General Expense" of the company, because they pertain to accounting. Tickets are no part of accounting; but printed blanks for reports of conductors, being used for accounting should be charged to "Printing and Stationery."

Account No. 30 ("Stable Expenses") has been changed in this respect; that the ordinary repairs of harness and vehicle equipment formerly classified under the heading are now assigned to Account No. 8; and depreciation and renewal of horses, formerly chargeable to old Account No. 8, are now to be charged here. The committee carefully considered the suggestion of some of the members of the Association that this account ("Stable Expenses") should be divided and apportioned to the work that horses do; but it is the judgment of the committee that such a change should not be made—first, because of the labor and expense that would be involved in ascertaining the proper apportionment, and, secondly, because if this were done, the aggregate of "Stable Expenses" might be lost sight of. The committee suggests that any one desiring to do so may make such an apportionment or subdivision, if the value and importance of the information sought justifies it, and still carry all other stable expenses in Account No. 30. Of course if there are stable expenses in connection with construction work—extensions of track, or otherwise—construction accounts should be debited with the amount of them.

"Injuries and Damages" seemed a tautological title, and has been shortened to "Damages." This change was recommended by the last convention.

Under headings Nos. 34 and 35 the committee have attempted to define "legal expenses", and following the suggestions made at the Niagara convention, to distinguish between legal expenses connected with the investigation, adjustment and trial of damage claims and cases and other legal expenses.

Part of the work assigned to the Committee on a Standard System of Street Railway Accounting was the preparation of a form of annual report for street railway companies. The committee have included in their reports forms for both annual and monthly reports. They differ in several respects from the form of annual report submitted last year. In the first place, columns are not provided for comparison with previous corresponding periods; the forms are for the current month or year only. They can easily be made to cover two or more months or years, and comparisons are desirable wherever possible, but they are no necessary part of such an annual report as the committee was asked to suggest.

Instead of providing a single column for all figures, a column for the totals of the several subdivisions has been provided, to facilitate addition and subtraction.

"Track Rentals" has been changed to "Rent of Tracks and Terminals," and this source of income follows, instead of preceding, "Rent of Land and Buildings," to make the reports conform to the change made in the titles of Operating Expense Accounts Nos. 36 and 37.

Taxes have been omitted from deductions from income, because, for reasons before stated, they are now regarded as an operating expense.

Lines have been provided for the totals of Income from Other Sources, Deductions from Income, and Deductions from Net Income.

Provision has been made for showing interest on real estate mortgages separately from interest on funded and floating debt, and for showing miscellaneous deductions from income.

The surplus to be carried forward in the annual report is the surplus shown by the balance sheet at the close of the current fiscal year, and not necessarily on December 31, as indicated in the form presented last year. This change has been made because the fiscal year of some companies does not end with the calendar year.

There is an alphabetical list of items chargeable to operating expense accounts. This list, of course, is not, and probably never will be, complete; but it is believed that some who are charged with the duty of street railway accounting will find it useful.

Since coming to Boston the committee have met Mr. Wm. O. Seymour, chairman, and Mr. H. F. Billings, secretary, of the State Board of Railroad Commissions of Connecticut, and Col. N. H. Heft, chief of the electrical department of the N. Y., N. H. & H. R. R. Co.—all members of a committee on uniform system of electric railway accounting appointed by the National Association of Railroad Commissioners, and have invited them and any others whom they may wish to bring with them, to attend the sessions of the Street Railway Accountants' convention, and to participate in the discussion of this committee's report.

Every member of your committee knows that the task of standardizing the classifications of street railway accounts is far from finished, but this report is submitted as a step toward a standard system, and the committee hope for, and earnestly invite the freest criticism and fullest discussion possible in the short time assigned for its consideration. Respectfully

C. N. DUFFY,  
Wm. F. HAM,  
J. F. CALDERWOOD,  
H. L. WILSON,  
H. J. DAVIES.

## CLASSIFICATION OF CONSTRUCTION AND EQUIPMENT ACCOUNTS.

In the following classification "Labor" should be understood to mean not only the manual work of laborers, but also superintendence, supervision, clerical work, engineering and inspection, so far as they are chargeable to the account referred to.

"Material" should be understood to mean not only finished or unfinished products, appliances or parts, but such smaller articles as are usually termed "supplies."

"Tools" should be understood to mean hand-tools of mechanics, and other tools, used in the work chargeable to the account referred to.

"Expenses" should be understood to mean all expenses chargeable to the account referred to that are not labor, material or tools.

### CONSTRUCTION AND EQUIPMENT ACCOUNTS.

- A. Organization.
- B. Engineering and Superintendence.
- C. Right of Way.
- D. Track and Roadway Construction.
- E. Electric Line Construction.
- F. Real Estate Used in Operation of Road.
- G. Buildings and Fixtures Used in Operation of Road.
- H. Investment Real Estate.
- I. Power Plant Equipment.
- J. Shop Tools and Machinery.
- K. Cars.
- L. Electric Equipment of Cars.
- M. Miscellaneous Equipment.
- N. Interest and Discount.
- O. Miscellaneous.

#### A. ORGANIZATION.

Charge to this account all expenses incurred in effecting organization, including legal expenses.

#### B. ENGINEERING AND SUPERINTENDENCE.

Charge to this account all expenditures for services of engi-

neers, draftsmen and superintendents employed on preliminary and construction work, and all expenses incident to the work.

#### C. RIGHT OF WAY.

Charge to this account all expenditures in connection with securing or paying for right-of-way, including cost of real estate for right-of-way.

#### D. TRACK AND ROADWAY CONSTRUCTION.

Charge to this account all expenditures for track and roadway construction, including labor, material, tools, freight, hauling, distribution of material, and all other expenses incident to the work; cost of grading, excavating, track laying, ties, yokes, slot-rails, manhole frames and covers, rails, rail fastenings, welded joints, special work (such as crossings, cross-overs, curves, frogs, guard-rails, run-offs, switches, switch-mates, turn-outs), ballasting, paving, fences (right of way), bridges and culverts, trestles, subways and tunnels.

The cost of tracks in yards, terminals, car-houses or other buildings, should be charged to this account.

The cost of punching and drilling rails for track wiring should be charged to account E.

#### E. ELECTRIC LINE CONSTRUCTION.

Charge to this account all expenditures for overhead, underground, third-rail, or surface-contact electric line construction, including labor, material, tools, freight, hauling, distribution of material, and all other expenses incident to the work.

Cost of punching and drilling rails for track-wiring, rail-bonds, poles (iron or wood), labor and material for setting and painting poles; feed-wire, guard-wire, span-wire, strain-wire, supplementary-wire, trolley-wire, ground-feeders, underground-feeders, pole fixtures, hangers or suspensions, insulators (overhead), lightning arresters and appliances, signals and signaling apparatus, overhead crossings and switches, ground terminals, and all labor in connection with putting same in position; conduits and conduit appliances for underground trolley construction, including conductors, insulators, sewer connections, sewer traps and underground feeders; third rails, and insulators for third-rail construction; surface-contact appliances for surface-contact roads, including magnets, contact-boxes, manhole-frames and covers.

#### F. REAL ESTATE USED IN OPERATION OF ROAD.

Charge to this account all expenditures for real estate used in operation of road, except real estate used for right of way charged in account C.

#### G. BUILDINGS AND FIXTURES USED IN OPERATION OF ROAD.

Charge to this account all expenditures for buildings and fixtures used in operation of road, including labor, material, tools, freight, hauling of material, and all other expenses incident to the work.

The term "Buildings and Fixtures" includes power house, car houses, shops, office buildings (when owned by the company), waiting rooms, sheds, out-houses, coal bins, sand houses, stables, store houses, switch tenders' houses, fences (except park and right of way), docks, wharves, and all other buildings and enclosures, and their stationary fixtures, including pipes for gas, water, sewage and drainage, apparatus for heating, lighting and ventilating, sidewalks and paving in streets in front of and adjacent to the company's buildings (except in tracks), and inspection and repair pits in car houses, shops or other buildings.

The cost of tracks in yards, terminals, car-houses and other buildings should be charged to account D.

The cost of electric line in yards, terminals, car-houses and other buildings should be charged to account E.

#### H. INVESTMENT REAL ESTATE.

Charge to this account all expenditures for land and buildings not used in operation of road.

#### I. POWER PLANT EQUIPMENT.

Charge to this account all expenditures for steam and electric equipment of power plant, including foundations and installations.

The equipment of sub-stations (if used) should be charged to this account.

All expenditures for water-power machinery (if used) should be charged to this account.

The cost of buildings used for main power houses or sub-stations should be charged to account G.

**J. SHOP TOOLS AND MACHINERY.**

Charge to this account all expenditures for shop tools and machinery for general repair shops, car-houses, etc., including foundations and installation.

**K. CARS.**

Charge to this account all expenditures for passenger, baggage, express, freight, mail and other cars from the operation of which revenue is derived.

The term "Cars" includes car-bodies and trucks, and all fixtures or appliances inside of or attached to the car-body or truck (except the electric equipment of the car).

**L. ELECTRIC EQUIPMENT OF CARS.**

Charge to this account all expenditures for electric equipment and wiring of all cars, whether revenue cars or work cars, including labor, material, tools, freight, hauling of material, and all other expenses incident to the work.

**M. MISCELLANEOUS EQUIPMENT.**

Charge to this account all expenditures for water cars, sprinkling cars, sand cars, salt cars, supply cars, and other work cars; snow-plows, sweepers, scrapers, and miscellaneous snow equipment; horses, harness, wagons and vehicles; tools and appliances necessary in the use of work cars or snow equipment.

**N. INTEREST AND DISCOUNT.**

All interest paid or received in connection with funds for construction, and all discounts or premiums resulting from the negotiation of securities for construction, should be charged or credited to this account.

**O. MISCELLANEOUS.**

Charge to this account all expenditures for printing and stationery, office supplies and expenses, damage claims, wages of clerks, and all other expenses incident to construction not otherwise provided for.

### CLASSIFICATION OF OPERATING EXPENSE ACCOUNTS.

In the following classification, "Labor" should be understood to mean, not only the manual work of laborers, but also superintendence, supervision, clerical work, engineering and inspection, so far as they are chargeable to the account referred to.

"Material" should be understood to mean, not only finished or unfinished products, appliances or parts, but such smaller articles as are usually termed "supplies."

"Tools" should be understood to mean hand-tools of mechanics, and other tools used in the work chargeable to the account referred to. These tools should not be confounded with the tools used in shop, for which a separate account (No. 9) is provided.

"Expenses" should be understood to mean all expenses chargeable to the account referred to that are not labor, material or tools.

The cost of replacement, renewal or repair of property destroyed or injured by fire, worn out, or otherwise unfitted for use, should be charged to the appropriate maintenance account, which should be credited with the amount received for insurance or realized from the sale of the property so unfitted for use. But if the property substituted is of greater value than the original property, the excess should be charged to the capital or construction account to which the original property was charged, if of less value, the difference between the value of the property as repaired, renewed or replaced and its original cost or value should be credited to the capital or construction account to which the first cost was charged. So proceeds from the sale of scrap material should be credited to the account to which the cost of replacement of that material is charged, or, if not replaced, to the original cost account.

The cost of experiments should be charged in operating expenses to the account most affected.

In making up monthly reports charge to accounts Nos. 36, 37, 38 and 39, respectively, the month's proportion of the total annual charge for rent of land and buildings used in the operation of the road, rent of tracks and terminals, insurance and taxes, as nearly as the same can be ascertained, and not the amount which may have been actually paid in the month.

**Operating Expense Accounts.****MAINTENANCE.****WAY AND STRUCTURES.**

1. Maintenance of Track and Roadway.
2. Maintenance of Electric Line.
3. Maintenance of Buildings and Fixtures.

**EQUIPMENT.**

4. Maintenance of Steam Plant.
5. Maintenance of Electric Plant.
6. Maintenance of Cars.
7. Maintenance of Electric Equipment of Cars.
8. Maintenance of Miscellaneous Equipment.
9. Miscellaneous Shop Expenses.

**TRANSPORTATION.****OPERATION OF POWER PLANT.**

10. Power Plant Wages.
11. Fuel for Power.
12. Water for Power.
13. Lubricants and Waste for Power Plant.
14. Miscellaneous Supplies and Expenses of Power Plant.
15. Hired Power.

**CAR SERVICE.**

16. Superintendence of Transportation.
17. Wages of Conductors.
18. Wages of Motormen.
19. Wages of Other Car Service Employes.
20. Wages of Car House Employes.
21. Car Service Supplies.
22. Miscellaneous Car Service Expenses.
23. Cleaning and Sanding Track.
24. Removal of Snow and Ice.

**GENERAL.**

25. Salaries of General Officers.
26. Salaries of Clerks.
27. Printing and Stationery.
28. Miscellaneous Office Expenses.
29. Store-Room Expenses.
30. Stable Expenses.
31. Advertising and Attractions.
32. Miscellaneous General Expenses.
33. Damages.
34. Legal Expenses in Connection with Damages.
35. Other Legal Expenses.
36. Rent of Land and Buildings.
37. Rent of Tracks and Terminals.
38. Insurance.
39. Taxes.

**Maintenance.****WAY AND STRUCTURES****1. MAINTENANCE OF TRACK AND ROADWAY.**

Charge to this account all expenditures for repairs and renewals of track and roadway, of culverts and subways, of tracks in yards, terminals, car houses or other buildings, including labor, material, tools, fuel, light, water, ice, freight, hauling and distribution of material, and all other expenses incident to the work.

The cost of taking up track, whether new track is laid in its place or not, should be charged to this account.

The cost of punching and drilling rails for repairs or renewals of track-wiring, and of removing and relaying pavement, ballast, etc., when necessary for repairs or renewals of the electric line, should be charged to account No. 2.

The feed and keep of horses used in connection with this work should be charged to account No. 30.

The cost of repairs and renewals of harness and wagons used in connection with this work should be charged to account No. 8.

Following is a list of some of the items chargeable to this account:

Ballast.	Lumber.
Bolts.	Manhole covers for underground trolley.
Braces, rail.	Manhole frames for underground trolley.
Brick.	
Bridges.	

Cement.	Molds for welded joints.
Chairs for rails.	Nails.
Chinders for ballast.	Nuts.
Coal for welding joints.	Nut-locks.
Clamps for welded joints.	Paving materials.
Crossings.	Pig-iron for welded joints.
Cross-overs.	Pipes, drain.
Culverts.	Rails.
Curves.	Run-offs.
Drains.	Sand.
Fences, right-of-way.	Screws.
Fish-plates.	Slot-rails for underground trolley.
Freight.	Spikes.
Frogs.	Steel.
Fuel.	Stone.
Guard-rails.	Subways.
Gravel.	Switches.
Hauling.	Switch mates.
Ice for ice water.	Ties.
Iron.	Tie-plates.
Joints, welded.	Tie-rods.
Joints, not welded.	Tools.
Labor.	Trestles.
Light (lanterns and fixtures, oil, lamp-wick, torches, candles, incandescent lamps and fixtures, arc lights and fixtures, globes and carbons).	Turn-outs.
	Washers.
	Water.
	Yokes for underground trolley.

## 2. MAINTENANCE OF ELECTRIC LINE.

Charge to this account all expenditures for repairs and renewals of overhead, underground, third-rail, or surface-contact electric line, including labor, material and tools employed or used in taking up, resetting and painting or repainting poles, taking down trolley, feed, guard and supplementary wires and substituting new, repairing and renewing conduits for wires, repairing and renewing bond-wires, punching and drilling rails for track-wiring, removing and relaying pavement, ballast, etc., when necessary for repairs or renewals of the electric line, freight, hauling and distribution of material, fuel, light, water and ice, and all other expenses incident to the work.

The cost of repairs and renewals of electric line in yards, terminals, car houses or other buildings should be charged to this account.

The feed and keep of horses used in connection with this work should be charged to account No. 30.

The cost of repairs and renewals of harness and wagons used in connection with this work should be charged to account No. 8.

Following is a list of some of the items chargeable to this account:

Bolts.	Magnets for surface contact roads.
Boxes for lightning arresters.	Mandrel frames for surface contact roads.
Cement.	Nuts.
Charcoal.	Painting material for poles.
Clamps for poles.	Pins, iron, for cross-arms.
Conductors for underground trolley.	Pins, wood, for cross-arms.
Conduits.	Poles, iron.
Contacts for surface contact roads.	Poles, wood.
Contract boxes for surface contact roads.	Pole-tops for iron poles.
Cord.	Rail-bonds.
Cross-arms, iron.	Screws.
Cross-arms, wood.	Sewer connections for underground trolley.
Crossings.	Sewer traps for underground trolley.
Feeders, ground.	Signals and signaling apparatus.
Feeders, overhead.	Solder.
Feeders, underground.	Soldering salts.
Freight.	Steel.
Fuel.	Stone.
Gasoline.	Suspensions.
Hangers.	Sand.
Hauling.	Switches.
Ice for ice water.	Tape, insulating.
Insulators, overhead.	Terminals.
Insulators, underground.	Third rails.
Insulators, for third rail.	Tools.
Iron.	Washers.
Labor.	Water.
Light (lanterns and fixtures, oil, lamp-wick, torches, candles, incandescent lamps and fixtures, arc lights and fixtures, globes and carbons).	Wire, feed.
Lightning arresters and parts.	Wire, guard.
Mandrel covers for surface contact roads.	Wire, span.
	Wire, strain.
	Wire, supplementary.
	Wire, trolley.

## 3. MAINTENANCE OF BUILDINGS AND FIXTURES.

Charge to this account all expenditures for repairs and renew-

als of buildings and fixtures used in the operation of the road, including labor, material, tools, freight, hauling of material, and all other expenses incident to the work.

The term "Buildings and Fixtures" includes power houses, car houses, shops, office buildings (when owned by the company), waiting-rooms, sheds, out-houses, coal-bins, sand-houses, stables, store houses, switch-tenders' houses, fences (except park and right of way fences), docks, wharves and all other buildings and enclosures, and their stationary fixtures, including pipes for gas, water, sewage and drainage, apparatus for heating, lighting and ventilating, sidewalks and pavements in front of and adjacent to the company's buildings (except in tracks), and inspection and repair pits in car houses, shops or other buildings.

The cost of repairs and renewals of tracks in yards, terminals, car houses or other buildings should be charged to account No. 1.

The cost of repairs and renewals of electric line in yards, terminals, car houses or other buildings should be charged to account No. 2.

Following is a list of some of the items chargeable to this account:

Awnings.	Pipes, drain.
Bolts.	Pipes, gas.
Bolt ends.	Pipes, sewer.
Brick.	Pipes, water.
Builders' hardware.	Pits in car-houses and shops.
Building material.	Plumbing.
Building permits.	Rivets.
Cement.	Roofing material.
Cisterns.	Sand.
Drains.	Sash cord.
Excavations.	Sash weights.
Fences (except park and right-of-way).	Scales, platform.
Foundations.	Screws.
Freight.	Sewerling.
Grading.	Shelving and other fixtures.
Hauling.	Shingles.
Heating apparatus and fixtures.	Side-walks.
I-beams.	Slate.
Iron.	Spikes.
Labor.	Steel.
Laths.	Stone.
Lighting apparatus and fixtures.	Tools.
Lime.	Tile.
Lumber.	Turn-buckles.
Nails.	Ventilating apparatus and fixtures.
Nuts.	Washers.
Painting materials (oil, turpentine, varnish, lead, painters' supplies).	Water.
Paving in streets (except in connection with tracks).	Water connections.
Plaster.	Water meters.
	Wells.
	Wire.

## EQUIPMENT

### 4. MAINTENANCE OF STEAM PLANT.

Charge to this account all expenditures for labor, material, tools, freight, hauling of material and all other expenses incident to repairs and renewals of steam plant or water power plant, including engines and engine parts, appliances and fixtures, belts, belt tighteners and fixtures, receivers, lubricators and oiling devices; shafting, clutches, cranes, hoists and other engine-room appliances; boilers, boiler fittings and appliances; furnaces, economizers, stacks, mechanical-draft machinery, pumps, feedwater heaters, purifiers, tanks, condensers, coal and ash-conveying machinery, mechanical stokers and other boiler-room appliances; piping and steam fitting, including valves, separators, water and sewer connections and water meters.

Following is a list of some of the items chargeable to this account:

Ash-conveying machinery.	Hoists.
Belts.	Injectors.
Belt fixtures.	Iron.
Belt tighteners.	Labor.
Boilers.	Lubricators.
Boiler appliances.	Oiling devices.
Boiler fittings.	Piping.
Bolts.	Pipe covering.
Cement.	Pipe fittings.
Clutches.	Pulleys.
Coal-conveying machinery.	Pumps.
Condensers.	Purifiers.

Cranes.	Receivers.
Draft machinery.	Screws.
Economizers.	Separators.
Engines.	Sewer connections
Engine appliances	Shafting.
Engine fixtures.	Stacks.
Engine parts.	Steam fittings.
Fire brick.	Steel.
Fire clay	Stokers, mechanical.
Freight.	Tanks.
Furnaces.	Tools.
Grate bars.	Water connections.
Hauling.	Water meters.
Heaters, feedwater.	Water power machinery.

#### 5. MAINTENANCE OF ELECTRIC PLANT.

Charge to this account all expenditures for labor, material, tools, freight, hauling of material and all other expenses incident to repairs and renewals of electric plant, including generators and generator parts, switchboards, cables and feeder terminals and wiring in connection with same, storage batteries, transformers, boosters, rheostats, circuit-breakers, ammeters and other electric equipment.

Commutator-brushes for generators should be charged to account No. 14.

Following is a list of some of the items chargeable to this account:

Ammeters.	Labor
Boosters.	Lightning arresters and parts.
Cables.	Rheostats.
Circuit breakers.	Storage batteries.
Feeder terminals.	Switchboards.
Freight.	Switches.
Generators.	Tools.
Generator parts	Transformers.
Hauling.	

#### 6. MAINTENANCE OF CARS

Charge to this account all expenditures for repairs and renewals of passenger, baggage, express, freight, mail and other cars from the operation of which revenue is derived, including labor, material, tools, freight, hauling of material, and all other expenses incident to the work.

The term "cars" includes car-bodies and trucks and all fixtures or appliances inside of or attached to the car-body or truck, except the electric equipment of the car.

The cost of cars purchased to keep good the original number of cars should be charged to this account

Bell and register cord, trolley rope, incandescent lamps, commutator-brushes and other supplies for cars should be charged to account No. 21.

Following is a list of some of the items chargeable to this account:

Axles.	Labor.
Bells.	Life guards.
Bell cord fixtures.	Lumber.
Bolts.	Mirrors.
Brakes (hand or power).	Nails.
Brake appliances (hand or power).	Nuts.
Brake shoes.	Oil boxes.
Brasses.	Painting material.
Brass fixtures.	Pedestals.
Brass trimmings.	Pilots.
Bumpers.	Sand boxes, attached to cars.
Canvas.	Screws.
Cotters.	Seats.
Curtains.	Seat covering
Curtain fixtures.	Seat fixtures.
Dashes and parts.	Signs.
Draw bars.	Sign fixtures.
Electric heaters	Snow scrapers, attached to cars.
Electroliers.	Springs.
Fare registers.	Steel.
Fenders and parts.	Steps.
Floor mats.	Stoves
Freight.	Stove fixtures.
Gates.	Tools.
Glass.	Trucks.
Gongs.	Truck frames and parts.
Grab handles.	Washers.
Hauling.	Wood-work.
Headlights and parts.	Wheels.
Iron.	

#### 7. MAINTENANCE OF ELECTRIC EQUIPMENT OF CARS.

Charge to this account all expenditures for repairs and renewals of the electric equipment and wiring of cars, whether revenue

cars or work cars, including labor, material, tools, freight, hauling of material, and other expenses incident to the work.

The cost of shifting electric equipments from summer to winter cars, or vice versa, should be charged to this account.

The cost of equipments purchased to keep good the original number of equipments should be charged to this account.

The cost of commutator-brushes, incandescent lamps, oil and other supplies for the electric equipment of cars should be charged to account No. 21

Following is a list of some of the items chargeable to this account:

Armatures and parts.	Labor.
Bearings.	Light circuits.
Bolts.	Lighting arresters and parts.
Brasses—armature, axle, gear—case.	Motor frames.
Brush-holders and parts.	Nuts.
Canvas.	Pinions.
Circuits for heat, light, power.	Plows, for underground trolley cars.
Circuit breakers, automatic.	Power circuits.
Commutators and parts.	Rheostats.
Contact shoes for surface contact cars.	Screws.
Contact shoes for third-rail cars.	Shafts.
Controllers and parts.	Springs.
Cotters.	Steel.
Cut-out boxes and parts.	Storage batteries, for storage battery cars.
Fields and parts.	Tape.
Frames for motors.	Terminals.
Freight.	Tools.
Gears.	Trolley bases.
Gear cases and parts.	Trolley forks.
Hauling.	Trolley poles.
Heat circuits.	Trolley wheels and parts.
Insulating material.	Washers.
Iron.	Wiring.

#### 8. MAINTENANCE OF MISCELLANEOUS EQUIPMENT.

Charge to this account all expenditures for repairs and renewals of water-cars, sprinkling-cars, sand-cars, salt-cars, supply-cars, or other work cars, snow-plows, sweepers, scrapers, miscellaneous snow equipment, wagons and all other vehicles not operated for the purpose of revenue, including labor, material, tools, freight, hauling of material, and all other expenses incident to the work.

Repairs and renewals of all harness should be charged to this account.

Repairs and renewals of the electric equipment of all work-cars, snow-plows, sweepers, etc., should be charged to account No. 7.

Following is a list of some of the items chargeable to this account:

Axles.	Life guards.
Bolts.	Lumber.
Brakes, hand or power.	Nails.
Brake appliances, hand or power.	Nuts.
Brake shoes.	Oil boxes.
Brasses.	Painting material.
Brass fixtures.	Pedestals.
Bumpers.	Pilots.
Canvas.	Rattan for sweepers.
Cotters.	Sand boxes, attached to work cars.
Dashes and parts.	Screws.
Draw bars.	Snow scrapers, attached to work cars.
Electroliers.	Springs.
Fenders and parts.	Steel.
Freight.	Tools.
Glass.	Trucks.
Gongs.	Truck frames and parts.
Grab handles.	Washers.
Hauling.	Wheels.
Headlights and parts.	Wood-work.
Iron.	
Labor.	

#### 9. MISCELLANEOUS SHOP EXPENSES.

Charge to this account all expenditures for repairs and renewals of shop tools, machinery and appliances, such as engines, boilers, shafting, motors, etc., used in general repair work, including labor, tools, coal, coke, lubricants, waste and other material, freight, hauling of material, fuel, light, water and ice, wages of master mechanic, shop foreman, engineers, firemen and other employees engaged in operating shop engine, and all other expenses incident to the general repair shops.

Hand-tools of mechanics or laborers used exclusively in connection with work chargeable to accounts Nos. 1 to 8, 14, 21 and 22

should not be charged to this account, but to the account benefited by their use

Following is a list of some of the items chargeable to this account:

Belts and belt fixtures.	Light (lanterns and fixtures, oil, lampwick, torches, candles, incandescent lamps, arc light globes and carbons).
Boilers and boiler fittings.	Lubricants.
Bolts.	Lumber.
Brooms	Motors and parts (for shop use only).
Charcoal.	Nails.
Clutches.	Nuts.
Coal.	Piping.
Coke.	Pipe covering.
Cotters.	Pipe fittings.
Cranes.	Pulleys.
Draft machinery.	Pumps.
Engines and parts.	Screws.
Engine appliances and fixtures.	Shafting.
Fire brick.	Stacks.
Fire clay.	Steam fittings.
Forges.	Steel.
Freight.	Tools, machine.
Fuel.	Tools, hand.
Furnaces and parts.	Washers.
Hauling.	Waste.
Heaters, feed water.	Water.
Hoists.	Welding compounds.
Ice, for ice water.	
Iron.	
Labor.	

### Transportation.

#### OPERATION OF POWER PLANT.\*

##### 10. POWER PLANT WAGES.

Charge to this account all expenditures for operation of power plant, except labor employed in making repairs or renewals.

This includes the wages of the following employes:

Boiler cleaners.	Generator tenders.
Chief engineer.	Other labor (boiler room).
Engineers.	Other labor (engine room).
Firemen.	Switch board tenders.
Coal passers.	Water tenders.
Oilers.	

##### 11. FUEL FOR POWER.

Charge to this account all expenditures for coal, oil or gas used as fuel, or other fuel used at power plant, including freight and hauling.

##### 12. WATER FOR POWER.

Charge to this account all expenditures for water used to produce steam or to operate a water-power plant

##### 13. LUBRICANTS AND WASTE FOR POWER PLANT.

Charge to this account all expenditures for lubrication of power plant, including oil, grease, waste, rags, etc

##### 14. MISCELLANEOUS SUPPLIES AND EXPENSES OF POWER PLANT.

Charge to this account all expenditures for labor in the power plant not otherwise provided for.

Following is a list of some of the items chargeable to this account:

Boiler compound.	descent lamps, arc light globes and carbons).
Boiler inspection.	Matches.
Brooms.	Mops.
Brushes, flue.	Oil cans.
Brushes, for generators.	Packing.
Brushes, for scrubbing.	Polish.
Buckets.	Sand paper.
Chamois skins.	Soap.
Dusters.	Sponges.
Emery cloth.	Sprinkling cans.
Fire buckets.	Tools.
Fire extinguishers.	Water (except water charged in account No. 12).
Garnet paper.	Water gauge glasses.
Hose.	Waste cans.
Ice, for ice water.	
Light lanterns and fixtures, oil, lampwick, torches, candles, incan-	

##### 15. HIRED POWER.

Charge to this account all expenditures for power purchased from other companies or power plants.

\*Income from the sale of power, to the extent only of the cost of producing the power sold, should be credited to operation of power plant. Profit or loss resulting from the sale of power should be carried directly to Income Account, as "Income from other sources," or as a "Deduction from income."

### CAR SERVICE.

#### 16. SUPERINTENDENCE OF TRANSPORTATION.

Charge to this account wages of division superintendents, their assistants and aids, road officers, inspectors, and others employed in superintending transportation.

#### 17. WAGES OF CONDUCTORS.

Charge to this account wages of conductors engaged in operating revenue cars.

#### 18. WAGES OF MOTORMEN.

Charge to this account wages of motormen engaged in operating revenue cars.

#### 19. WAGES OF OTHER CAR SERVICE EMPLOYEES.

Charge to this account wages of starters, transfer agents, switch-tenders, trolley-men, trail-car-couplers and other car-service employes.

#### 20. WAGES OF CAR HOUSE EMPLOYEES.

Charge to this account wages of car house foremen, watchmen, car placers, car-shifters, car and motor-inspectors, car-cleaners, lamps and headlight-tenders, car-oilers, car-stove firemen, trolley-oilers and other car house employes not engaged in making repairs or renewals.

The cost of shifting cars for the purpose of repairs or renewals should be charged to account No. 6 or 7.

#### 21. CAR SERVICE SUPPLIES.

Charge to this account all expenditures for lubricants and waste for cars and electric equipment of cars, incandescent lamps, oil and other supplies for lighting cars, water and other supplies for cleaning cars, fuel for heating cars, bell and register-cord, trolley-rope, commutator-brushes, tools and other materials and supplies, except such as are used for repairs or renewals of cars or electric equipment of cars.

Following is a list of some of the items chargeable to this account:

Batteries, dry, for electric bells in cars.	Lamp wicks.
Bell cord.	Lubricants.
Brooms, for cars.	Matches.
Brushes, for car washing.	Mops.
Brushes, for motors.	Oil cans.
Buckets, for car washing.	Pokers.
Candles.	Polish.
Chamois skins.	Rags.
Chimneys for headlights.	Register cord.
Coal hods for cars.	Shakers.
Dusters.	Shovels.
Fuel for cars.	Soap.
Fuses.	Sponges.
Hose, for car washing.	Stove blacking.
Illuminating oil.	Tools.
Incandescent lamps.	Trolley rope.
Kindling.	Waste.
	Water, for car washing.

#### 22. MISCELLANEOUS CAR SERVICE EXPENSES.

Charge to this account all expenditures for secret inspection, transfers and tickets, conductors' books, punches, portable registers, tools for motormen, employes' badges and uniforms; cost of getting derailed cars on track and removing obstructions and wreckage; miscellaneous expenses of car houses, including fuel, light, water (except water used for car washing) and ice, and all other car service expenses not otherwise provided for.

Water used for car washing should be charged to account No. 21.

Following is a list of some of the items chargeable to this account:

Badges, for employes.	Incandescent lamps, arc light globes and carbons).
Buckets, for car houses.	Portable registers.
Brooms, for car houses.	Secret inspection expenses.
Conductors' books.	Sprinkling cans.
Conductors' fare boxes.	Tickets.
Conductors' punches.	Tools.
Fire buckets.	Tools for motormen.
Fuel for car houses.	Transfers.
Fire extinguishers.	Uniforms.
Hose for car houses.	Water (except water for car wash-
Ice for ice water.	ing).
Light (lanterns and fixtures, oil, lamp wicks, torches, candles, in-	Wrecking expenses.

#### 23. CLEANING AND SANDING TRACK.

Charge to this account all expenditures for cleaning, greasing, watering, sprinkling and removing dirt from track, sanding track, including wages of men engaged in the work, cost of sand and of

hanging, drying and distributing same, cost of track-brooms and other tools, curve-grease, water for sprinkling and watering track, and all other supplies and expenses incident to the work.

The feed and keep of horses used in connection with this work should be charged to account No. 30.

The cost of repairs and renewals of harness and wagons, water, sprinkling and sand-cars used in connection with this work should be charged to account No. 8.

This account should not include cost of sprinkling rendered necessary by repairs or construction of track or paving.

The cost of sprinkling street (except tracks) in front of or adjacent to company's property should be charged to account No. 32.

Following is a list of some of the items chargeable to this account:

Curve grease.	Shovels.
Fuel for sand dryer.	Track brooms.
Sand.	Track brushes.
Sand dryer and parts.	Water.

#### 24. REMOVAL OF SNOW AND ICE.

Charge to this account all expenditures for removal of snow and ice from tracks, whether done by the company or otherwise, including labor, material, tools and expenses, cost of salt and delivering same in ear-houses or bins, and the wages of men engaged in salting track and operating snow-plows, sweepers, scrapers, etc.

The feed and keep of horses used in connection with this work should be charged to account No. 30.

The cost of repairs and renewals of harness, wagons, salt-cars, snow-plows, sweepers, scrapers and miscellaneous snow equipment used in connection with this work should be charged to account No. 8.

#### General.

#### 25. SALARIES OF GENERAL OFFICERS.

Charge to this account salaries of President, Vice-President, Secretary, Treasurer, Auditor, General Manager, Assistant General Manager, Chief Engineer, General Superintendent, Purchasing Agent and all other officers whose jurisdiction extends over the entire system.

#### 26. SALARIES OF CLERKS.

Charge to this account the salaries of bookkeepers, cashiers, receivers, paymasters, stenographers, clerks employed in counting cash, tickets and transfers, and all other clerks employed in the general office or elsewhere.

#### 27. PRINTING AND STATIONERY.

Charge to this account all expenditures for printing, stationery and stationery supplies, except as hereinafter provided.

The cost of printing transfers and tickets should be charged to account No. 22.

The cost of printing briefs and other legal papers should be charged to account No. 34 or 35.

The cost of printing signs, posters and other advertising matter should be charged to account No. 31.

Following is a list of some of the items chargeable to this account:

Arm rests.	Paper cutters.
Binders.	Paper fasteners.
Blanks.	Paper files.
Blank books.	Paper weights.
Blotters.	Pencils.
Blotting paper.	Pencil erasers.
Carbon paper.	Pens.
Coin bags.	Pen holders.
Copy (impression) books.	Pen racks.
Copying brushes.	Pina.
Dating stamps.	Printing (except printing charged to accounts Nos. 22, 31, 34, 35).
Envelopes.	Rubber bands.
Eyelets.	Rubber stamps.
Eyelet punches.	Rulers.
Erasers.	Scrap books.
Hektographs.	Sealing wax.
Indexes.	Seals.
Ink.	Shears.
Ink stands.	Shipping tags.
Ink erasers.	Shipping tickets.
Letter presses.	Short hand books.
Mechanical calculators.	Sponges.
Mimeographs.	Sponge cups.
Money tags.	Tissue (impression) paper.
Money wrappers.	

Mucilage and brushes.  
Numbering stamps.  
Oil paper.  
Paper (all kinds).  
Paper baskets.  
Paper clips.

Type writer supplies.  
Twine.  
Type writers.  
Waste baskets.  
Wrapping paper.

#### 28. MISCELLANEOUS OFFICE EXPENSES.

Charge to this account the cost of office supplies, repairs and renewals of office furniture, wages of janitors, porters and messengers, and all other office expenses.

The cost of printing, stationery and stationery supplies should be charged to account No. 27, except as otherwise provided.

Following is a list of some of the items chargeable to this account:

Brooms.	Newspapers.
Brushes.	Periodicals.
Buckets.	Postage.
Chamois skins.	Soap.
Dusters.	Sponges.
Fuel.	Sprinkling cans.
Ice.	Towels.
Internal revenue stamps.	Towel service.
Light.	Water.
Mopa.	

#### 29. STORE ROOM EXPENSES.

Charge to this account all salaries and expenses in connection with store-rooms, including cost of sending material and supplies from general store-room to branch store-rooms, and the collecting of scrap material.

#### 30. STABLE EXPENSES.

Charge to this account the cost of feed, keep and shoeing of horses, replacing horses lost by death or worn out in service, depreciation in value of horses, and all other stable expenses.

This account should include the stable expenses of all horses regardless of where they are used.

Repairs and renewals of harness and vehicles should be charged to account No. 8.

Following is a list of some of the items chargeable to this account:

Bedding.	Horse shoeing supplies.
Blankets.	Horse shoeing (by contract).
Brooms.	Hose.
Brushes.	Hostlers, wages of.
Buckets.	Ice.
Chamois skins.	Light.
Curry combs.	Medicine.
Dusters.	Salt.
Feed.	Sponges.
Fire buckets.	Sprinkling cans.
Fire extinguishers.	Stablemen, wages of.
Fuel.	Veterinarian (salary or fees).
Horse shoers, wages of.	Water.

#### 31. ADVERTISING AND ATTRACTIONS.

Charge to this account the cost of advertising of every description, including printing hand-bills, dodgers, posters, folders, etc.; net expense of music, parks, park properties and resorts (after deducting all income from admittance fees, sale of privileges, etc.) and all donations made and other expenses incurred for the purpose of attracting travel.

#### 32. MISCELLANEOUS GENERAL EXPENSES.

Charge to this account the cost of public telephone service, maintaining and operating private telephone system, telegrams, subscriptions and donations (except those provided for in account No. 31), traveling expenses of general officers and others connected with general office, and contingent expenses connected with the general management not otherwise provided for.

#### 33. DAMAGES.

Charge to this account all expenditures on account of property damaged and persons killed or injured, salaries and expenses of claim agents, investigators, adjusters and others engaged in the investigation of accidents and adjustment of claims, salaries, fees and expenses of surgeons and doctors, nursing, hospital attendance, medical and surgical supplies, fees and expenses of coroners and undertakers, fees of witnesses and others, except lawyers' fees and court costs and expenses.

Following is a list of some of the items chargeable to this account:

Accident insurance premiums.	Doctors' fees or salaries.
Adjusters' expenses.	Funeral expenses.
Adjusters' salaries.	Hospital expenses.
Claim agents' expenses.	Investigators' expenses.

Claim agents' salaries.	Investigators' salaries.
Coroners' fees and expenses.	Medical supplies.
Damage claims for ejection from cars.	Nurses' expenses.
Damage claims for electrolysis.	Nurses' fees.
Damage claims for horses killed or injured.	Premiums for accident insurance.
Damage claims for persons killed or injured.	Surgeons' expenses.
Damage claims for property damaged.	Surgeons' fees.
Doctors' expenses.	Surgeons' salaries.
	Surgical supplies.
	Undertakers' expenses.
	Undertakers' fees.
	Witnesses' expenses.
	Witnesses' fees.

**34. LEGAL EXPENSES IN CONNECTION WITH DAMAGES.**

Charge to this account all legal expenses incurred in connection with the defense or settlement of damage claims.

The compensation of the general solicitor or counsel and other attorneys engaged partly in the defense and settlement of damage suits and partly in other legal work should be apportioned between this account and account No. 35.

The term "legal expenses" should be understood to include the salary of general solicitor or counsel, salaries, fees and expenses of attorneys, fees of court stenographers, unless included in court costs, cost of law-books, printing of briefs, court-records and other papers, court costs, expenses connected with taking depositions, and all other court expenses.

**35. OTHER LEGAL EXPENSES.**

Charge to this account all legal expenses except those incurred in connection with the defense or settlement of damage claims.

The compensation of the general solicitor or counsel and other attorneys engaged partly in the defense and settlement of damage suits and partly in other legal work should be apportioned between this account and account No. 34.

**36. RENT OF LAND AND BUILDINGS.**

Charge to this account all rents paid for land and buildings used in the operation of the road.

**37. RENT OF TRACKS AND TERMINALS.**

Charge to this account all rents paid for tracks and terminals, bridge rentals and tolls.

The word "terminals" is not meant to refer to depots, car houses or other buildings at the terminus of the road. Rents for these should be charged to account No. 36.

**38. INSURANCE.**

Charge to this account the cost of fire and boiler insurance.

**39. TAXES.**

Charge to this account taxes on real and personal property used in the operation of the road, track-taxes, franchise-taxes, taxes upon capital stock, taxes upon gross earnings, car-licenses, and other vehicle licenses.

Surplus at close of fiscal year, as per general balance sheet .....	.....

**REMARKS.**

If deficit be shown in monthly or annual report, substitute the word "Deficit" for "Surplus."

In monthly reports, the month's proportion of each item under "Income from Other Sources," "Deductions from Income," and "Deductions from Net Income" should be debited or credited, currently, each month. If the exact amount is not known, it should be estimated.

In monthly reports, charge to accounts Nos. 36, 37, 38 and 39, respectively, the month's proportion of the total annual charge for rent of land and buildings used in the operation of the road, rent of tracks and terminals, insurance and taxes, as nearly as the same can be ascertained, and not the amount which may have been actually paid in the month.

If a company conducts the business of selling or renting advertising space in its cars, instead of leasing the privilege so to do to someone else, the amount shown as "Income from Advertising" should be the net income from this source after deducting all expenses of conducting the business.

"Income from Rent of Land and Buildings" refer to rents received from real estate not used in the operation of the road, and the amount shown in the report should be the net amount received after deducting all taxes, insurance, water rents or rates,

cost of repairs, and other expenses connected with such real estate.

Under "Miscellaneous Income" should be shown the income from sale of power in excess of the actual cost of producing the power sold.

Income from the operation of parks, park-resorts, or similar property, should appear under "Miscellaneous Income," and the amount shown should be the net amount received after deducting all expenses connected with such operation.

If advertising results in a loss, if power is sold at less than the cost of producing it, or if the expenses in connection with real estate not used in the operation of the road exceed the income from that source, the loss or deficit should appear under "Miscellaneous Deductions from Income."

The following alphabetical list of items chargeable to operating expense accounts of electric railways shows the account, or accounts, to which each item is chargeable. The purpose of this list is that it may serve as a guide in the use of the classification of operating expense accounts recommended by the Street Railway Accountants' Association of America, and bring about a standard method of making charges. It is not a complete list of all items chargeable to the operating expense accounts of electric railway companies, but is an index of many, and perhaps most, of such items.

Blotting paper .....	27
Boilers, steam plant .....	4
Boilers, shop .....	9
Boiler appliances .....	4, 9
Boiler cleaners .....	9, 10
Boiler compounds .....	9, 14
Boiler fittings .....	4, 9
Boiler inspection (city or insurance companies) .....	9, 14
Boiler room employes (power plant) .....	10
Bolts .....	1, 2, 3, 4, 5, 6, 7, 8, 9
Bolt ends .....	1, 2, 3, 4, 5, 6, 7, 8, 9
Books (blank-books) .....	27
Book-keepers .....	26
Boosters (electric plant) .....	5
Boxes for lightning arresters .....	2
Braces, rail .....	1
Brakes (hand or power) .....	6, 8
Brake appliances (hand or power) .....	6, 8
Brake-shoes .....	6, 8
Brasses (car brasses) .....	6, 7, 8
Brass fixtures (cars) .....	6, 8
Brass trimmings (cars) .....	6
Brick .....	1, 3
Bridges .....	1
Bridge rentals .....	37
Bridge tolls .....	37
Briefs (printplug of law briefs) .....	34, 35
Brooms, corn .....	9, 14, 21, 22, 28, 29, 30
Brooms, stable .....	30
Brooms, track .....	23
Brushes for car washing .....	21
Brushes, flue .....	14
Brushes for generator .....	14
Brushes, horse .....	30
Brushes (cars or electric equipment of cars).....	21
Brushes, scrubbing .....	9, 14, 21, 22, 28, 29, 30
Brush-holders and parts (electric equipment of cars).....	7
Buckets .....	9, 14, 21, 22, 28, 29, 30
Buggies .....	8
Buggies (material or repair parts).....	8
Builders' hardware .....	3
Building material .....	3
Building permits .....	3
Bumpers (cars) .....	6, 8
C.	
Cables, switchboard .....	5
Calculators, mechanical .....	27
Candles (light) .....	1, 2, 9, 14, 21, 22, 28, 29, 30
Canvas or duck for cars .....	6, 7, 8
Carbons for arc lights (light).....	1, 2, 9, 14, 22, 28, 29, 30
Carbon paper .....	27
Carpenters (mechanics) .....	1, 2, 3, 4, 5, 6, 7, 8, 9
Cars, baggage .....	6
Cars, express .....	6
Cars, freight .....	6
Cars, mail .....	6
Cars, passenger .....	6
Cars, private .....	6
Cars, salt .....	8
Cars, sand .....	8
Cars, sprinkling .....	8
Cars, supply .....	8
Cars, water .....	8
Cars, work .....	8
Car cleaners .....	20
Car curtains .....	6
Car curtain fixtures .....	6
Car couplers .....	19
Car house employes .....	20
Car house foremen .....	20
Car inspectors .....	20
Car oilers .....	20
Car placers .....	20
Car seats .....	6
Car seat coverings .....	6
Car seat fixtures .....	6
Car service employes .....	19
Car shifters .....	20
Car signs .....	6
Car sign fixtures .....	6
Car springs .....	6
Car steps .....	6
Car stoves .....	6
Car stove firemen .....	20
Car stove fixtures .....	6
Car wiring .....	7
Carts .....	8
Carts (material or repair parts) .....	8
Cashiers .....	26
Cement .....	1, 2, 3, 4, 9
Chairs, for rails .....	1
Chamois skins .....	9, 14, 21, 22, 28, 29, 30
Charcoal .....	2, 9
Chief engineers, civil, electrical, mechanical.....	25
Chief engineers (of power plant) .....	10
Chimneys, for headlights .....	21
Cinders, for ballast .....	1
Circuits (heat, light, power), for cars.....	7
Circuit-breakers (electric plant or cars).....	5, 7
Cisterns .....	3
Claim agents' expenses and salaries.....	33
Clamps, for poles .....	2
Clamps, for welding rail joints.....	1
Clerks .....	1, 2, 3, 4, 5, 6, 7, 8, 9, 26, 29
Clutches (steam plant or shop) .....	4, 9
Coal, for heating .....	1, 2, 9, 21, 22, 23, 28, 29, 30
Coal, for power .....	11
Coal-conveying machinery (steam plant).....	4
Coal hods (for car stoves).....	21

Coal passers (steam plant).....	10
Coin bags .....	27
Coke for heating .....	1, 2, 9, 21, 22, 23, 28, 29, 30
Coke, for welded rail-joints .....	1
Commutators and parts (electric plant or cars).....	5, 7
Condensers (steam plant) .....	4
Conductors (of revenue cars).....	17
Conductors, for underground trolley.....	2
Conductors' books .....	22
Conductors' fare boxes .....	22
Conductors' punches .....	22
Conduits .....	2
Contacts (for surface-contact roads) .....	2
Contact boxes (for surface-contact roads).....	2
Contact shoes (for surface-contact cars).....	7
Contact shoes (for half-rail cars).....	7
Contingent expenses .....	32
Controllers and parts (cars).....	7
Copylag (impression) books .....	27
Copying brushes .....	27
Cord, bell .....	21
Cord, for electric line.....	2
Cord, register .....	21
Cord, trolley .....	21
Coroners' expenses and fees .....	33
Cotters .....	6, 7, 8, 9
Counsel .....	34, 35
Court costs .....	34, 35
Court records .....	34, 35
Court stenographers' fees .....	34, 35
Cranes (steam plant, shop, car houses) .....	4, 9
Crews operating snow plows.....	24
Crews (operating electric sweepers).....	24
Crews (operating work cars).....	23, 24, 29
Cross-arms, iron, for poles.....	2
Cross-arms, wood, for poles.....	2
Crossings, track (special work).....	1
Crossings, electric line .....	2
Cross-overs, track (special work).....	1
Culverts .....	1
Curry combs .....	30
Curves, track (special work).....	1
Curve grease .....	23
Cut-out boxes and parts (cars) .....	7

D.

Damage claims, ejection from cars.....	33
Damage claims, electrolysis .....	33
Damage claims, horses injured or killed.....	33
Damage claims, persons injured or killed.....	33
Damage claims, property damaged .....	33
Damage claims, vehicles damaged .....	33
Dashes and parts (cars).....	6, 8
Dating stamps (office) .....	27
Depreciation of horses .....	30
Deposition expenses .....	34, 35
Division superintendents .....	16
Division superintendents, assistant .....	16
Doctors' expenses, fees and salaries .....	33
Dodgers (printing) .....	31
Donations, to attractions .....	31
Donations, other than to attractions .....	32
Draft machinery .....	4, 9
Draftsmen .....	1, 2, 3, 4, 5, 6, 7, 8, 9
Drains .....	1, 3
Draw-bars for cars .....	6, 8
Duck or canvas for cars.....	6, 7, 8
Dusters, feather .....	9, 14, 21, 22, 28, 29, 30

E.

Economizers (steam plant) .....	4
Electric heaters, for cars .....	6
Electric sweepers .....	8
Electricians (mechanics) .....	2, 3, 5, 6, 7, 8, 9
Electroliers (cars).....	6, 8
Electrolysis .....	33
Emery cloth .....	1, 2, 3, 4, 5, 6, 7, 8, 9, 14
Employees (indexed by occupation).....	
Engineers (chief engineers, civil, electric, mechanical).....	25
Engineers, chief of power plant .....	10
Engineers (civil, electric, mechanical).....	1, 2, 3, 4, 5, 6, 7, 8, 9
Engineers in power plant or shop.....	9, 10
Engines (steam plant or shop).....	4, 9
Engine appliances .....	4, 9
Engine fixtures .....	4, 9
Engine parts .....	4, 9
Envelopes .....	27
Erasers .....	27
Excavations, for buildings .....	3
Expenses, contingent .....	32
Expenses, depositions .....	34, 35
Expenses, store-room .....	29
Eyelets (office) .....	27
Eyelet punches (office) .....	27

F.

Fare boxes (cars) .....	6
Fare boxes, conductors' .....	22
Fare registers .....	6
Feather dusters .....	9, 14, 21, 22, 28, 29, 30
Feed .....	30
Feeders, ground .....	2
Feeders, overhead .....	2
Feeder terminals (electric plant).....	5
Feeders, underground .....	2
Fields and parts .....	5, 7
Fences (buildings and enclosures) .....	3
Fences, park .....	31
Fences, right of way .....	1
Fenders and parts (cars) .....	6, 8
Fire brick (steam plant or shop).....	4, 9
Fire buckets .....	9, 14, 22, 28, 29, 30
Fire clay (steam plant or shop).....	4, 9
Fire extinguishers .....	9, 14, 22, 28, 29, 30
Firemen (power plant).....	10
Firemen (car stoves) .....	20
Fish-plates, track (rail fastenings) .....	1
Fixtures for buildings .....	3
Floor mats for cars .....	6
Folders .....	31
Forges (blacksmith shop) .....	9
Foremen, of car houses .....	20
Forms, blank .....	27
Foundations for buildings .....	3
Frames, motor .....	7
Freight .....	1, 2, 3, 4, 5, 6, 7, 8, 9
Frogs, track (special work).....	1
Fuel (coal, coke, kindling) .....	1, 2, 9, 21, 22, 23, 28, 29, 30
Fuel for power .....	11
Fuel for car stoves .....	21
Funeral expenses .....	33
Furnaces (boiler) .....	4, 9
Fuses (cars) .....	21

G.

Garret paper .....	1, 2, 3, 4, 5, 6, 7, 8, 9, 14
Gas for fuel for power .....	11
Gasoline, for electric line .....	2
Gates (cars) .....	6
Guard-rails, track (special work).....	1
Gears (electric equipment of cars).....	7
Gear cases and parts.....	7
General manager .....	25
General manager, assistant.....	25
General solicitor .....	34, 35
General superintendent .....	25
Generators and parts (electric plant).....	5
Generator tenders (power plant).....	10
Glass .....	3, 6, 8
Globes for arc lamps (light).....	1, 2, 9, 14, 22, 28, 29, 30
Glue for car repairs.....	6, 8
Gongs for cars.....	6, 8
Grab handles for cars.....	6, 8
Grading, for buildings.....	3
Grading, for track.....	1
Grate bars, for furnaces (steam plant or shop).....	4, 9
Gravel, for track .....	1
Grease for power plant.....	13
Grease for cars .....	21
Grease for tracks .....	23
Grease for wagons and other vehicles .....	30

H.

Hand-bills .....	31
Hangers for electric line .....	2
Hardware (buildings) .....	3
Harness (buggy, cart, wagon) .....	8
Harness (material or repair parts).....	8
Hauling of material.....	1, 2, 3, 4, 5, 6, 7, 8, 9
Hauling of salt .....	24
Headlights and parts (cars).....	6, 8
Headlight tenders .....	20
Heat circuit, for cars .....	7
Heaters, electric, for cars .....	6
Heaters, feedwater .....	4, 9
Heating apparatus for buildings.....	3
Heating fixtures for buildings.....	3
Hektographs .....	27
Hired power .....	15
Holsts (steam plant, shop or car house).....	4, 9
Horses, depreciation of .....	30
Horses, replacement of .....	30
Horse shoeing .....	30
Horse-shoeing supplies .....	30
Horse-shoers .....	30
Hoae.....	9, 14, 21, 22, 28, 29, 30
Hospital expenses (persons injured) .....	33
Hostlers .....	30

DEATH OF LIEUTENANT TIFFANY.

The pathetic death of Lieut. William Tiffany, more than any other one instance, called the attention of the country to the suffering and hardship endured by the volunteer soldiers returning from the Cuban campaign. It was stated by the attending physician that death was due to stravation while convalescing from fever.

WILLIAM TIFFANY.

Lient. Tiffany was the son of George Tiffany, of the great jewelry house, and the grand-nephew of Commodore Perry. After receiving a finished education and experiencing some years of western life, he settled down in business and became secretary and treasurer of the Sterling Supply & Manufacturing Company. When Colonel Roosevelt organized his regiment of rough riders, Lient. Tiffany enlisted as a private, but was soon promoted to be a corporal, and then a sergeant. His bravery on the battlefield before Santiago won for him his lieutenantcy. He contracted fever at Santiago and was brought to Montauk Point on the notorious Olivette, and later was taken to Boston. With the best of medical attention and tender nursing he was in a fair way to recover, but on August 25 a change for the worse came and he died peacefully with his mother, brother and fiancée about his bedside. He was buried with military honors, his grave being surrounded by his comrades in arms, Colonel Roosevelt, in whose praise his last breath was spent, attended the funeral ceremonies.

The Cincinnati Inclined Plane Railway, of which Brent Arnold has been receiver and general manager, has been sold and transferred to C. H. Kilgour.

STREET RAILWAY ACCOUNTANTS' ASSOCIATION AT BOSTON.

## THE EXHIBITS.

The conditions were never more favorable for a fine exhibition of street railway apparatus and supplies than this year, and the suppliers responded by giving us the best display ever found at an A. S. R. A. convention. The space was ample; everyone was assigned all that he applied for, and hence there was not that crowding which has detracted from the appearance of the hall at former conventions.

The light, both by day and by night, was all that could be desired. Everything was under one roof, and the large basement space available reduced the number of outdoor exhibits, all the heavy apparatus cars, trucks, snow plows, etc., being shown there instead of outside the hall. Power was easily obtained, as it was at Niagara Falls.

There were but few exhibits in place on the morning of the first day, because of the holiday, Labor Day, making it difficult to get workmen and trucks to remove apparatus from the freight houses. But the exhibitors went to work early Tuesday morning, and it was really marvelous to note the change they had wrought in the appearance of the hall by noon. Before the day was over everything was in its proper place and very attractive the result was.

During the daytime only the wearers of buttons were admitted, and thus the halls were not crowded when the street railway men were on hand to inspect the displays. In the evenings the general public was admitted and thousands packed the halls.

The suppliers generally expressed themselves as well pleased with the attention that their exhibits received from the managers present, and we are advised of a number of large orders that were placed during the convention.

The Bureau of Information was a great convenience for everyone and greatly appreciated.

Swift's illuminated reversible signs were exhibited by W. H. Swift, the patentee, and B. T. Loudon. This device sets the signs on all parts of the car at once, and a dial in the roof at the motorman's head shows at a glance how they are set.

The Taylor Electric Truck Company, of Troy, N. Y., exhibited seven trucks. One single truck embodying the latest improvements and one single truck with extension truss for long open cars, both having 7-ft. wheel bases, illustrated the standards for single cars. The extra heavy 8-ft. wheel base truck is the one recommended for heavy cars and severe service. For double track cars two sets of trucks were shown: one pair were the regular "Empire State" radial trucks, and the other pair, recently designed swing motion trucks. John Taylor, manager; Robert Kasson, foreman, and Aubrey Tupper, of the office staff, represented the company and were kept very busy with the numerous callers at the Taylor exhibit.

The Barney & Smith Car Company, of Dayton, Ohio, exhibited three trucks for street railway service. These were the well known "Class G" single truck of 6 ft. 6 in. wheel base; the "Class H" double truck of 5 ft. 10 in. wheel base with 33-in. double plate wheels, and the "Class C" maximum traction truck, which has been in service for the last two years on numerous roads. This "Class C" truck has a wheel base of 4 ft.; the wheels are 33-in. and 18-in. Henry Tesseyman, mechanical engineer, and H. M. Esterbrook, assistant superintendent, represented the company, and they report that many calls and inquiries were received at the convention. Everyone who has used Barney & Smith products had only good to say of them.

The New York Switch & Crossing Company, of Hoboken, N. J., had on exhibition one of its automatic electric switches, which, to judge by the crowds present about the exhibit, was inspected by every one at the convention. The switch exhibited is for the Boston Elevated. Aside from this switch some pieces of chrome steel special work were shown; these were all made to order and were en route to the purchaser. W. C. Wood, president; Louis

E. Robert, secretary and A. H. Baldwin, superintendent, represented the company. The electric switch exhibited was the well known "dividend saver," which has been in use on several large eastern roads for some years, and was shown in operation at Niagara Falls, last year.

The Pantasote Company had an extremely attractive exhibit, where it displayed its latest patterns in curtain materials. Sample curtains were shown fitted with Forsyth fixtures, being mounted in handsome frames. The exhibit space was decorated with palms. This company has demonstrated that pantasote is the logical curtain fabric, and this is borne out by the list of orders taken during the last six months, it having supplied practically all the curtain fabrics for the street cars built this year. The list includes 350 open and 200 closed cars for the Metropolitan, of New York; 120 open and 110 closed cars for the Brooklyn Heights; 60 open and 120 combination cars for the Nassau road, of Brooklyn; 75 closed and 75 combination cars for the Baltimore Consolidated; 100 cars for the Chicago City; 75 cars for the North Chicago, and many others, including cars for the Baltimore City Passenger, the Metropolitan of Kansas City, the Norfolk, and the Kings County Elevated roads. John M. High, general agent, of New York, and H. N. Grier, Chicago representative, were at the convention. The two cars in the Brill exhibit, the standard Metropolitan and the new Brill convertible car, were both fitted with pantasote curtains. A pamphlet entitled "Pantasote" and telling the story of what one man learned about the many uses of pantasote from "a chance acquaintance" was a very clever souvenir, which every one fortunate enough to get one read with interest.

The exhibit of the Cleveland Frog & Crossing Company did not reach Boston in time to be displayed, but the company was represented by F. A. Lapham, who devoted himself to his many acquaintances among the railway men present.

The Rochester Car Wheel Works were represented by F. D. Russell, vice-president; George C. Morse, general sales agent, and A. A. Strickland, superintendent at New York, and had an attractive exhibit.

J. R. McCardell, of McCardell, West & Co., Trenton, N. J., attended the convention and exhibited one of their celebrated Trenton trolley wagons, which was inspected by all the electrical men not already familiar with its merits. Mr. McCardell took several orders while at the convention. These are the only trolley wagons now built.

The Ridgway Dynamo & Engine Company, of Ridgway, Pa., had planned to exhibit a 75-k. w. direct connected unit, but because of a delay on the railroad the machinery did not reach Boston in time for the A. S. R. A. convention. The company was represented by James L. Kimball, New England agent, and distributed illustrated pamphlets showing the U. S. naval vessels as souvenirs.

W. H. Bailey exhibited the Tonkin internally-fired water-tube boiler which attracted many visitors. He was assisted by Percy Allingham.

The exhibit of the Taunton Locomotive Manufacturing Company was in charge of W. R. Billings, treasurer of the company, and Messrs. Wendell and MacDuffie, selling agents. The company showed the heavy nose, the standard nose, and the double track share snow plows, representing the three types of Taunton plows which have proved so popular and effective. Two of these plows were sold on Tuesday, the first day of the convention; the double track share went to the Portland (Me.) City Railroad Company, and the heavy nose plow to the Worcester & Clinton road. A second double track share plow was

sold to the Manchester (N. H.) road. One of the most pleasing features to Mr. Billings was the spontaneous enthusiasm with which the employes of the Boston road recognized the double share plow as being like the one that did such good work on their road last year.

The exhibit of the Bemis Car Box Company, of Springfield, Mass., comprised two of its trucks, the standard motor truck for single truck cars and the No. 37 pivotal motor truck for double truck cars. The exhibit was in charge of George M. Hoadley, general manager, and Edw. N. Richards, superintendent, who met their old friends and made many new ones. During the week many orders were taken for trucks. The souvenir was a box of safety matches enclosed in a handsome aluminum guard bearing the legend, "A match for any truck."

The McGuire Manufacturing Company, of Chicago, exhibited the latest style "Columbia" solid steel truck, the "New Columbia" heaters and positive lock ratchet brake handles

THE MCGUIRE EXHIBIT.

without springs, and outside of the hall showed one of the McGuire combination snow plow and sweepers. All of these goods are well known as standing in the first rank. The company was represented by W. J. Cooke, vice-president, and M. G. Hubbard, engineer.

The R. Bliss Manufacturing Company, Pawtucket, R. I., showed the only car gate exhibited at the convention. The Wood platform gate is a combination of grab handle, hand rail and gate, and is used in all parts of the United States, and in foreign countries as well; two steam roads entering Boston have over 5,000 each. This gate has been adopted by the Boston Elevated for all cars entering the subway. The company was represented by N. H. Colwell, general manager, and Charles O. Hood.

The exhibit of the John Stephenson Company in the convention hall was a model of the cars built for the Metropolitan, of New York. This model was an exact reproduction of the regular

cars one-fourth size; it was mounted on a Peckham truck, equipped with Providence fenders, Sterling wheel guards and fare registers. The car was opposite the entrance to the General Electric globe and attracted much attention. It was in charge of Messrs. Vanderhorst, Howells, Hodges and H. Wood, the maker of the model.

J. W. Meaker, president of the Meaker Manufacturing Company, Chicago, represented his company and showed something new in fare registers as well as the older Meaker standards. The new registers have letters instead of figures on one or more of the wheels of the totalizer, thus making a record that only those knowing the cipher can read intelligently, thus enabling the manager to put a check on the bookkeeping as well as on the conductor. George Bean, vice-president of the company, was also at the convention assisting Mr. Meaker. The exhibit proved to be very attractive to street railway men.

George F. Sumner, president of the Knitted Mattress Company, exhibited a line of padding for car upholstery, etc.

The Pennsylvania Steel Company made an exhibit of its street railway special work. Charles S. Clark and W. C. Cuntz, Boston agents; Stephen W. Baldwin, New York agent; C. W. Reinhold, general agent, and Mason D. Pratt, chief engineer, represented the company.

The Watson-Stillman Company, New York, showed a line of hydraulic tools and jacks for use in street railway work. The company was represented by George L. Gillon, treasurer. Leather pocket books were the souvenirs.

Sherburne & Co., makers of railroad supplies, showed a very interesting line of track tools, construction cars, drills, etc. F. O. Nourse and C. H. Sherburne represented the firm, which is eastern agent for many well known machines and devices, among them the Q. & C. rail saws and drills, the Buda drills, the Watson-Stillman Company's hydraulic tools.

The Sampson Cordage Works, of Boston, displayed a case of its goods. Their specialty is rope and cordage for street railway use. F. J. Coakley represented the company at the convention.

E. S. Netherent, engineer of the Paige Iron Works, of Chicago, had a desk in the convention hall and ably represented his company.

George A. Parmenter, maker of the Parmenter fenders and wheel guards, which have been adopted by the Metropolitan Railroad, the Capital Traction, and the Capital Railway companies, of Washington, D. C.; the Union Railroad, of Providence, and numerous other roads, was present in Boston. These devices have been illustrated in the REVIEW. The exhibit comprised a full-size model showing fender, wheel guards and track cleaner attached, and excited much interest among managers, especially those from cities where fender ordinances have been recently adopted.

Wm. Wharton, Jr. & Co. showed a number of frogs, switches and mates, and a general line of street railway manganese steel special work, the Wharton unbroken main line cross-over, the Pennsylvania Railroad three-rail crossing, etc. A new feature in the manufacture of special work is making frogs and mates entirely of manganese steel and to fit low T-rails; this manganese steel is so much harder that it will last years longer than any other material which has been used for this purpose up to the present time. The company was represented by Messrs. Wharton, Howe and Angerer and by Harrington, Robinson & Co., their New England agents; Mr. Robinson was in charge of the exhibit. During the convention over \$6,000 of orders were taken.

E. F. de Witt, of E. F. de Witt & Co., Lansingburgh, N. Y., exhibited the celebrated "common sense" sand boxes which are

used from Portland, Me., to Portland, Ore., and in foreign parts as well. Mr. de Witt has great numbers of the most flattering testimonials.

W. R. Evans, of Portland, Me., exhibited an improved car sign which attracted much attention.

Thayer & Co., Inc., exhibited some of the flanged steel headers and swinging man-hole plates which are features of the Cahall

boilers, for which they are agents. Aside from this the display consisted of photographs of some of the large installations of Cahall vertical and Cahall horizontal boilers, among which we noted those of the Lowell & Suburban Street Railway, the Carnegie Steel Company's Edgar Thomson Works, and the Lancaster Cotton Mills, of Clinton, Mass., all of which are very large and representative boiler plants. An interesting feature of the Carnegie plant is the use of a separate steel stack for each boiler, which makes the total cost of the stacks about equal to the in-

terest on the cost of single brick stack, and also gives uniform draft for all boilers. Winthrop Thayer, president, and George B. Clark represented Thayer & Co., Inc.

M. W. Greenwood, of Pittsburg, also represented the Cahall sales department.

The Heywood Brothers & Wakefield Company, of Boston, had a most attractive exhibit of the Henry car seats. Fred H. Henry was in charge of the exhibit, assisted by Clifford L. Lougee.

The Forsyth Brothers Company, of Chicago, exhibited car curtain materials, car curtains and curtain fixtures. It showed a revolving frame fitted with its well known curtains and roller-tip fixtures. A special feature which excited a great deal of favorable comment was a frame fitted with the company's new open street car fixture, which works on an entirely new principle from any heretofore used. The curtain does not depend on the frictionizing of a cable or tape, these being used simply to keep the curtain within the grooves; heavy springs force the solid ends of the guides into contact with the bottoms of the grooves, thus holding the curtains at any desired point. There is, therefore, no wearing, fraying or breaking of the cable or tape, it having no stress upon it, and the curtain is hence very durable. The company has increased the adjustability of its roller-tip curtain fixtures by a new mechanism so that they can now be applied to any variation in the different windows; leather or metal heads may be selected as desired. Geo. E. Pratt, the eastern representative, and W. H. Forsyth were present in the exhibit hall. Among other recent orders it reports the following: 102 cars for the Chicago City Railway Company, 80 cars for the Brooklyn Heights Railroad Company, 20 cars for the Cleveland City Railway Company, also the new cars for the Toledo Traction Company, Van Brunt & Erle Railroad Company, Ottawa Car Company.

The Pearson Jack Company was represented by A. H. Richardson, general manager, and T. Edward Tuttle who is in charge of the street railway department. The exhibit consisted principally of the company's latest improved device, the Pearson ratchet jack. The Pearson jacks are in successful operation on over 200 roads in the United States. A recent foreign order was for 64 jacks, which went to the road between Leghorn and Palermo; other foreign sales have been made in Moscow, Calro, Berlin, London, Calcutta and Mexico. The company will gladly send jacks on trial.

The Wagner Electric Manufacturing Company, of St. Louis, was represented by E. H. Abadie, manager of the sales department, and Henry M. Nay, New England sales agent. The exhibit comprised a number of instruments, transformers and switches, and a number of photographs.

One of the most attractive exhibits in the convention hall was that of the New Haven Fare Register Company. The exhibit comprised a full line of the New Haven single, double and triple registers, the company's new round register and the machine which has registered over 14,000,000 times without a break, which is fully equivalent to a century of hard service. Willis M. Anthony, president; F. C. Boyd, vice-president and general manager; John S. Bradley, secretary and treasurer, represented the company. The souvenirs of the New Haven company were combination paper cutters and letter scales which were much sought for, and like the paper cutters of last year will be found on many desks. In the evenings friends of the company were entertained at the Copley Square hotel where the handsomest suite in the house had been engaged.

The H. W. Johns Company exhibited three lines of street railway goods, the "vulcabeston" insulating parts for all standard motors and controllers, a line of the H. W. J. heaters and regulating switches, and several layouts of overhead line materials. The all-steel flexible trolley bracket, just put on the market attracted a great deal of attention from visiting managers. At the convention were A. Hall Berry, manager of the electrical de-

partment; J. E. and S. G. Meek; D. T. Dixon and J. W. Perry, of Philadelphia; E. B. Hatch and H. H. Luseomb, of Hartford, and H. C. Spaulding, of Boston, who has charge of the electrical department for New England.

The Ham Sand Box Company, Troy, N. Y., exhibited its No. 3 box which was shown last year, also the No. 4, the new type which was recently described in the REVIEW, both of which attracted a great deal of notice. A. M. Wight, secretary and treasurer, was in charge. Many orders were taken during the convention and numerous compliments received from those who had given the boxes trials. Mr. Moore, of the Chicago City Railway, did not hesitate to express his satisfaction with these boxes, which that road has adopted as standard. Great numbers of the motormen on the Boston roads who examined the exhibit, wished that their cars might be equipped thus instead of with the pails and shovels now provided.

Dr. J. M. Griffin, president of the Wheel Truing Brake Shoe Company, maker of composite wheel grinding shoes, Detroit, Mich., represented his company and showed samples of the shoes.

John E. Welsh, special agent of the Mason Safety Tread Company, 40 Water street, Boston, exhibited the unwearable, non-slipping treads for street car steps. The Mason tread is in general use in Boston, and Mr. Welsh had a unique experience in that he took a sample order from almost every railway manager who saw the exhibit. This is a remarkable record but justified by the goods.

A. O. Norton, of Boston, exhibited a full line of his well-known street car and track jacks.

C. D. Holman, represented the Methuen Electrical Company, of Methuen, Mass., and exhibited a water-proof, almost indestructible rubber sleeve for insulating motor connections, which does away with taping such joints, and is cheaper than the tape.

J. P. McMahon, treasurer of the Rochester Hose Bridge Company, exhibited one of the Rochester bridges, which all of our readers who were at Niagara Falls will remember having seen in service there.

The exhibit of the Du Quesne Forge Company, Pittsburg, Pa., was in charge of D. S. Bissell, president, assisted by J. N. Parsons and J. B. Van Wagener. These gears which were fully described in recent issues of the REVIEW, have proved very popular and in the last year have been put on 40 different roads throughout the country.

J. B. Van Wagener exhibited the Bryan bond now in general use in Pittsburg.

The Crosby Steam Gage & Valve Company exhibited a full line of gages, valves and indicators, which being artistically displayed, made his booth very handsome. The company was represented by Robert Pirlle, S. G. Reed and Charles M. Gibbs.

The Shawmut Fuse Wire Company showed a line of enclosed fuses and switches, which was in charge of H. P. Moore and B. S. Luther. These fuses will be remembered by many as having been a feature of the Niagara Falls convention; they have proved very popular for car heating work for which they are especially designed.

L. C. Chase & Co., selling agents for the Sanford Mills, of Sanford, Me., had a most attractive exhibit and displayed a very complete line of plush goods for all kinds of cars. The exhibit was in charge of George Goodall, of Sanford, assisted by Frank B. Hopewell, of L. C. Chase & Co. Goods for all purposes and qualities were displayed. This company will furnish the plush for the Boston Elevated cars.

The Christensen Engineering Company, of Milwaukee, had an extensive exhibit which comprised a No. 1 independent motor-compressor of a capacity of 11 cu. ft. of free air per minute, operating through a straight air engineer's valve, a 7-in. brake cylinder; one No. 2 independent motor-compressor of 20 cu. ft. capacity, operating, through a straight air engineer's valve, three 7-in. brake cylinders; one No. 4 independent motor-compressor

of 46.7 cu. ft. capacity, operating, through automatic engineer's valve, two 10-in. brake cylinders; all of these were controlled by automatic switch controllers. The company was represented by N. A. Christensen, Frank C. Randall, W. J. Davison and S. W. Watkins. For a souvenir it had a very artistic, illustrated, pamphlet showing the year's business; it included a number of the most flattering testimonials from roads using these brakes on

all types of locomotives and cars. The brakes were used on the special excursion trains at Nantasket Beach

The American Rail Joint Company was represented at Boston by W. E. Ludlow, general manager, and T. V. Church, of Julian L. Yale & Co., Chicago agents. This joint is meeting with a great deal of favor for an article so recently put on the market and the exhibit space was always crowded with visiting managers.

T. V. Church, of Julian L. Yale & Co. Chicago, represented the Allen & Morrison Brake Shoe Company with an exhibit of its composite brake shoes which have seen service. Very handsome memorandum books were distributed as souvenirs.

James N. Richards and Charles Earnshaw attended the convention in the interest of the P. & B. products of the Standard Paint Company, of 81 and 83 John street, New York. This company made no exhibit other than such of its products as were shown in other spaces, but, thanks to its representatives there, the P. & B. interests were well taken care of. One of the most useful souvenirs of the convention was the P. & B. bill book, a standard with the Standard Paint Company, and we venture to predict that they will prove to be just as good stayers as the commercial P. & B.

The Walker Company, of Cleveland, made an elaborate showing of street railway apparatus for surface, elevated and conduit railways. The details of construction of the new 25-h. p., 33-S type of motor were shown by an exhibit of parts of the motor in its various stages of development. The thorough protection of the conductors and the effective means for ventilating the armature received favorable comment. Two 75-h. p. motors were shown of the type adopted for the Brooklyn elevated. These motors from their extraordinary size and massive construction seem entirely capable of performing the arduous duties demanded of them. Their commutators were noteworthy for the number and depth of the segments. A line exhibit of the Love conduit railway was made on 60 ft. of track set up for inspection. A Peckham special Metropolitan railway truck upon which Walker motors were mounted ran upon Johnson rails. The plow and insulators of the Love conduit system, which is now under the control of the Walker Company, were also shown separately. The object of greatest interest was the solenoid blow-out controller which operated both practically and in an experimental model form. The celerity and effectiveness with which the arcs, usually so destructive to the contacts, were eliminated was a cause for amazement to those who had not seen it before. A large number of Walker low tension enclosed arc lamps and a railway switch-board, made up of one generator and two feeder panels, completed the exhibit. To J. S. Anthony, advertising agent of the company, was due the greater part of the credit for making the booth so attractive. H. L. Harding, manager of the sales department, C. N. Black, superintendent of the New Haven factory, M. D. Law, J. N. Dodd, T. Zweigber, C. A. Barton, of Cleveland, H. G. Issertel and F. W. Sawyer, of Boston, John D. Moore, of New York, R. A. Byrns, of Buffalo, H. B. Gay, of Baltimore, W. G. Bain, of Philadelphia, E. K. Noyes, H. W. Hobbs, G. D. Smmons, T. C. Hawks and H. Harding were representatives of the company.

A. G. Hathaway, of Cleveland, is responsible for that useful souvenir seen in so many hands at Boston: the pack of cards which included the program, a memorandum of the points of interest and the business cards of 12 prominent street railway supply houses of Cleveland. Mr. Hathaway himself was playing a 10 to 1 shot on Campbell & Zell boilers and Santiago bankers.

Parlor G at the Brunswick was occupied by the J. G. Brill Company where its handsome truck models were on exhibition, and where a royal welcome and entertainment were furnished.

The Garton-Daniels Electric Company, of Keokuk, Ia., was represented at the convention by J. V. E. Titus, secretary of the

company. The company had no exhibit of its own but Garton arrangers were to be seen in the exhibits of the Ohio Brass Company, Elmer P. Morris and Pettingell, Andrews & Co.

The American Brake Shoe Company was represented by F. W. Sargent and two of its lessees, the Sargent Company, of Chicago, and the Ramapo Iron Works, of Hillburn, N. J., who exhibited the "Diamond D" brake shoes in connection with Dilworth, Porter & Co., Pittsburg, makers of steel car axles, the Continuous Rail Joint Company, Newark, N. J., and J. H. Sternbergh & Son, Reading, Pa. William F. Ellis is the New England agent for these firms. The souvenirs of the Ramapo Iron Works were nail nippers.

The Consolidated Car-Heating Company, of Albany, N. Y., was represented by J. F. McElroy, consulting engineer, R. P. Seales, H. N. Ransom and W. P. Cosper. The exhibit included a set of six heaters (the number usually placed in a car) properly connected but with the heating coils replaced by incandescent lamps so as to make apparent to the eye the different intensities of heat obtained by manipulating the heater switch. A feature very interesting to managers was made by connecting two heaters which have been in use in street cars since 1893, in series with two of the latest make. Measuring instruments showed the old ones to be as efficient as ever, refuting the statement sometimes heard that the heating coils deteriorate with use. The new lock switches were also shown. The company to date has sold nearly 34,000 heaters; in June, 1893, there were but 360 in use.

J. Hinekey Williams, 34 Wrentham street, Ashmont, Boston, exhibited the Williams truss rail joint

John D. Reed, the inventor, and H. Gore & Co., agents, represented the John D. Reed all metal construction for railways, exhibited models and drawings.

The John F. Ohmer Register Company, of Dayton, exhibited its multiplicity fare register which keeps a separate record for each conductor and gives the company a printed classified statement of the various fares collected, the conductor having no reports to make. Mr. Ohmer and an assistant were in charge.

The Gold Street Car Heating Company was represented by Edward E. Gold, John E. Ward, Frederick Weston, E. H. Moss-grove and H. E. Beach, and exhibited its new style electric heaters, consisting of the Gold improved resisting coil and support.

N. C. Keeran, Chicago city passenger and ticket agent of the Wabash Line, "personally conducted" the Wabash special which carried 65 of the western street railway people to Boston. He remained throughout the convention and escorted another large party back on Friday night

Charles N. Wood had an extensive exhibit, being the sole New England agent for the R. D. Nuttall Company, the Van Wagner & Williams Hardware Company, the American Electrical Heating Corporation, the Frank Ridlon Company, Wilson, Thomas & Co. and the International Register Company. F. C. Waddell assisted Mr. Wood.

F. A. Estep, president and treasurer of the R. D. Nuttall Company, and George W. Provost, of the home office, were attendants at the convention and were to be found at the very handsome and complete exhibit of their gears, pinion, trolleys and bearings in the space of C. N. Wood.

The International Register Company, of Chicago, had a very complete and artistically arranged exhibit of its different types of registers at the space of C. N. Wood. A. H. Woodward, president of the company, and W. H. Brown were in charge.

The "Monarch" track cleaner, made by the Monarch Stove & Manufacturing Company, of Mansfield, O., which has met with such flattering success ever since its introduction to the trade, was exhibited by C. N. Wood.

A. C. Woodruff, general manager of the Consolidated Car Fender Company, of Providence, A. C. Woodruff, Jr., superintendent, and George H. Hale, general agent, represented that company and were to be found at the very attractive exhibit at space No. 246. The exhibit comprised a complete assortment of the different fender parts and a platform equipped with three Providence fenders, finished in different styles. These fenders are perhaps the best known of any there being over 6,000 in use in 70 cities and towns. For a souvenir there was the well with the old oaken bucket, which when drawn out proved to be filled with philosophical reflections, and reasons why car companies should use Providence fenders.

A. C. Vosburgh, secretary and treasurer of the New Process Raw Hide Company, of Syracuse, was at Boston representing that company and renewing his acquaintance with the street railway men. The souvenir of the company was a combined match box and cigar cutter. The raw hide pinions are now such well known specialties that an exhibit is a useless expense.

Elmer P. Morris, of 15 Cortlandt street, New York, made a dis-

globe from all points of view he failed to find one from which he could not see places where the plastic bonds were used. James Hollowood, superintendent, and Charles H. Wilson, New England agent, assisted Mr. Brown at the exhibit hall. One of his souvenirs was a bond of the Up-to-date Street Railway.

Albert B. Herrick exhibited one of his portable testing sets for ear inspection. At Niagara Falls last year Mr. Herrick had a testing switchboard which will be well remembered. The present set is portable and has been greatly improved. This system of inspection is being widely adopted, 26 roads having ordered them. The one shown at Boston was the second one ordered by the Union Traction Company, of Philadelphia.

F. H. Newcomb, 13 Astor place, New York, showed a full line of uniform caps. The exhibit was in charge of F. H. Newcomb and H. H. Boerum.

The Rooke Register Company, of Peoria, Ill., was represented by George F. Rooke, treasurer and manager, Albert W. Jamison and A. N. Loper. Probably none of the devices exhibited were examined with greater interest than this fare register which records the money before it passes into the possession of the conductor. Lead pencils were distributed for souvenirs.

W. T. Van Dorn, of Chicago, represented his company and ex-

VIEWS OF THE EXHIBIT OF ELMER P. MORRIS.

play occupying 1,100 sq. ft. of space in the main hall, and was ably assisted by C. T. Harrington. Mr. Morris exhibited the products of the following companies whose representatives were also at the convention: Keystone Electric Company, representative, J. T. Stevens; Ajax Metal Company, George Pratt; Railway Equipment Company, George Wick; Kosmic Filter Company, H. P. Hess; Pittsburg Steel Trolley Plate Company, Samuel Maver; Sterling Arc Lamp Company, Robert Randolph; Forest City Electric Works, John Dolph; Partridge Carbon Company, J. S. Speer; Harrington Rail Bond Company, S. H. Harrington; Garton-Daniels Electric Company, J. V. E. Titus; also the Wheeler Reflector Company, McGuire Manufacturing Company, Harrington Illuminated Sign Company, Point Marion Manufacturing Company, Forsyth Brothers Company, Hope Electric Appliance Company, and agent for the "Monarch" insulating paint. The X-ray booth, otherwise known as the "Morgue," attracted a great deal of attention and the many visitors each carried away a souvenir glass upon which was cut the trade mark of the Partridge Carbon Company. All the exhibits were sold before the convention closed.

Harold P. Brown, of 122 Liberty street, New York, occupied space immediately opposite the REVIEW headquarters, and exhibited the standard plastic rail bond, which is now so well known that little new can be said of it. Some interesting features were some joints which had been in service for several years. The hand power grinder used for cleaning the rails was also shown. Mr. Brown states that in examining the General Electric

hibited aluminum models of the Van Dorn couplers and a book of prints showing nine sizes and types of couplers.

The Falk Manufacturing Company, of Milwaukee, had at its space in the convention hall a collection of Falk cast-welded joints, which have been in service, and they proved to be one of the most interesting exhibits for the track men. Among these were two taken from the Clark street line of the Chicago City Railway, being relaid at this time to avoid interruptions in the future; in forwarding these joints the company expressed its entire satisfaction with the service; the joints were selected at random and are in perfect condition. E. A. Wurster, secretary and treasurer; Clement E. Smith, superintendent, and Henry L. Prather represented the company.

The Creaghead Engineering Company, of Cincinnati, made a very complete display of its well known "flexible brackets." These brackets have become standard for high speed roads throughout this country and abroad, and their universal popularity is attested by the many thousands in daily use. Great care has been given the manufacture of these brackets, the arms being made of a special steel constructed to withstand about double the strain of ordinary gas pipe, and all the fittings are made of high grade wrought and malleable iron, making a bracket that will withstand the most severe strains without damage. This exhibit also included a full line of overhead material, line insulators, curve pull-overs, insulated crossings, section insulators, strain insulators and a very complete exhibit of malleable iron

pole fittings, pole tops, collars, bands, cross arm clamps, cross arms, etc. The display was very nicely arranged and handsomely decorated, and was in charge of the superintendent, G. R. Scrugham. The company's souvenir was a neat steel pocket rule in a leather case and was much sought after.

The Ashton Valve Company, of Boston, New York, Chicago and London, exhibited a complete line of safety valves, relief valves and pressure and vacuum gages. The exhibit was in charge of Albert C. Ashton, secretary and treasurer, H. H. Ashton and C. W. Houghton.

The Corning Brake Shoe Company was represented by Francis Granger and H. T. Mereur, and exhibited a number of special brake shoes. Among them were two "maximum traction shoes," the large one for inside hung brakes and the small one interchangeable, doing away with rights and lefts. Extra long shoes with a high coefficient, special shoes with deep flanges, and the standard shoe of the Manhattan Elevated, New York, were also shown. The company states that its business has increased tenfold in the last year. The souvenirs of this company were callipers which were much sought after.

Adam Cook's Sons, of 313 West street, New York, were represented by M. V. Peavey, its New England agent, and showed the celebrated "Albany" grease and the "Albany" electric motor compound.

The exhibit of the Albert & J. M. Anderson Manufacturing Company, of Boston, comprised a line of insulators, lamps, special brass goods, etc., and was in charge of C. B. Pear. Switches constitute a specialty of this company but because of the works being so crowded with orders for switches, there was not time to prepare any for exhibition in the convention hall, the company feeling that those in use in the various power houses in Boston would suffice. Pocket memorandum books made very attractive souvenirs.

The Bibber-White Company was represented by C. E. Bibber, president; T. H. Bibber, David W. Dunn, E. L. Brown, and H. W. Smith, manager of the railway department. The line material made by this company was shown in black enameled iron, galvanized iron, bronze, and glass "agatized" material, last being entirely new. In addition to the line material, headlights and bracket arms, made by the company, the exhibit included New Haven fare registers and Hope Electric Appliance Company switches. The Bibber-White Company handles all kinds of railway merchandise, and will have built before the snow flies some 150 miles of track this season. The souvenirs were miniatures of the corrugated trolley poles recently placed on the market, designed to serve as pen holders. A phonograph was an attractive feature at this exhibit.

The Billings & Spencer Company was represented by H. E. Billings and W. B. Post. The exhibit comprised samples of commutator segments, some 200 in number, including the largest segment ever drop-forged, some drop-forgings for Lundell motors and line material. Key rings were distributed as souvenirs. The Billings & Spencer Company has just issued a new illustrated catalog showing two hundred or more commutator segments made by it for all types of stationary machines.

Walter N. Dole, manager, and A. E. Prince, assistant treasurer, represented the Boston Artificial Leather Company, which had a most attractive exhibit of "Moroccoline," its upholstering substitute for leather. This material is attractive in appearance, cleanly, cheap and durable. Moroccoline pocket books were distributed as souvenirs.

One of the most attractive and artistically arranged exhibits in the hall was that of the Charles Scott Spring Company, which was represented by H. C. Johnston and D. S. Roche. No attempt

was made to show a full line of the Scott springs because that would be impossible outside of a warehouse, but a few car springs, trolley springs, etc., were artistically displayed. The railing was in keeping with the times, being formed of red, white and blue trolley springs. The souvenirs distributed were those the company have found to be so popular at past conventions, leather covered memorandum books. Many of the company's friends called in response to the engraved cards which had been sent out, and all were handsomely entertained by Messrs. Johnston and Roche.

The Sterling Supply & Manufacturing Company, of New York, was represented by Frank A. Morrell, who represents the company in the east, and L. D. Nelson, who has the western territory. The exhibit, which was one of the most sought in the hall, included the No. 1 double register, just put upon the market, which registers the cash fares and transfers and totalizes each separately and yet is worked by only one rod or cord. Among the other materials shown were samples of overhead line material, drop-forged commutator segments, the "Sterling" sand box, the "Sterling" fenders adopted by the Metropolitan Street Railway, of New York, special brackets for registers, six different styles of registers, etc. Last year the Sterling Company had the best souvenir of the Niagara Falls convention, and this year its souvenir was a sterling silver lead pencil in the shape of a 13 in. gun which will hold the record for 1898. A souvenir equally as acceptable was the handsome new catalog given to each visitor. It is handsomely printed on fine paper with a flexible cloth back. The Sterling fare registers, safety brake, fender, sand box, suspensions, insulators, counters, wire measurer, winding machine and badges are all illustrated and described.

J. P. Sjöberg & Co., of New York, manufacturers of street car wood work, were represented by W. J. Walker, who exhibited a model of a car window at the space of the Sterling Supply & Manufacturing Company.

The Hipwood-Barrett Car & Vehicle Company exhibited its car fender and showed the working by models; the exhibit was in charge of George Hipwood and J. W. Barrett. During the convention these fenders were in use on the Newton & Boston road and tested at Newton.

The Standard Underground Cable Company, of Pittsburg, had an exhibit at the convention which was in charge of T. E. Hughes, manager of the Philadelphia office, and G. L. Wiley of the New York office. Frank A. Rinehart, treasurer of the company, with his wife also attended the convention. The exhibit included samples of every kind of electric light, power, street railway and telephone cables. The company has just completed the largest contract for cables ever let for street railway cables—\$950,000 worth for the Union Traction Company, of Philadelphia. Lead-covered telephone cables have also been a specialty. Sections of power cables of suitable size for paper weights were its convention souvenirs; copies of the "Electrician's Handbook of Useful Information" were also distributed and will be found to be all that the name implies. This company is running 24 hours per day and is behind with orders. Work now on hand includes three of the largest telephone plants now being erected, two at St. Louis and one at Indianapolis; they call, in the aggregate, for over \$250,000 worth of telephone cables.

The Baltimore Car Wheel Company showed both its single and double trucks, the exhibit being in charge of J. Paul Baker, secretary of the company, and A. E. Baker. Very handsome lithographs in several colors were distributed showing the famous "Lord Baltimore" single truck and the coat of arms of the early Maryland proprietor. The picture is on a heavy card, 11x16 in., with a red, white and blue ribbon for a suspension. It would be an ornament in any office. The trucks are constructed entirely of steel and are simple, durable and strong. The Lord Baltimore double center bearing truck has proven as successful in service as has the single truck, and is built upon the same lines.

The R. Woodman Manufacturing & Supply Company, which has over 3,000 of its ticket punches in use on the Boston Elevated lines, had a full line of punches, seals, speed indicators, punching and numbering machines, office stamps, buttons, badges, etc., on exhibition. R. Woodman and T. W. Wardley were at the convention representing the company.

W. H. Russell represented the Russell Manufacturing Company, Watertown, Mass., and exhibited its curve taking trolley harp, and its special overhead crossing.

The Massachusetts Mohair Plush Company, of Boston, had an interesting exhibit.

The Columbia Machine Works, Buchler & Platt, of New York, had an extensive exhibit of commutators, drop-forged copper bars, trolley wheels, bearings, fuse boxes, car trimmings, adjustable brake and controller handles, etc., which had many visitors. All the commutators shown were sold during the convention. The firm was represented by Mr. Buehler, James Grady, superintendent, and W. R. Kerschner.

R. S. Bishop, of the Bethlehem Foundry & Machine Company, attended the convention in the interest of the Moyer trolley base which was shown in the Columbia Machine Works exhibit.

The Coleman Farebox Company, of Tottenham, Ont., exhibited its boxes for collecting street railway fares. J. H. Coleman was in charge and took pleasure in explaining the working of the apparatus.

The Pottier & Stymus Company, maker of ear seats, was represented by F. C. McLewee. The Brill Company has purchased 1,050 of these seats within the last 30 days.

The Churchill rail joint, for all sizes and patterns of T and girder rails, which is made by the Diamond State Iron Company, Wilmington, Del., was shown in charge of H. T. Wallace, secretary of the company. Forty miles of Boston track are laid with these joints.

E. H. Morgan, successor to W. H. Kilbourn & Morgan, Greenfield, Mass., exhibited the Kilbourn sand feeder, which is recommended by the roads using it as reliable and always ready for use.

An exhibit which attracted considerable attention was that of the Incandescent Electric Light Manipulator & Cleaner Company, which makes tools for handling and cleaning lamps which are so placed as to be otherwise inaccessible save by using long ladders or heavy chairs. Joseph J. Dunn, manager, was in charge.

The Lyte Steel & Lead Woven Tread, of 3 Hamilton place, Boston, was represented by W. M. Evatt, who exhibited samples.

The Wm. H. Gallison Company, 36 Oliver street, Boston, engineers and contractors for steam piping, had an interesting exhibit.

The American Wheelock Engine Company exhibited a full size valve plug and valve, which was in charge of C. C. Hardy.

D. C. Sweet, of Springfield, Mass., had one of the well-known Sweet car-wheel grinding machines on exhibition in the basement.

Wadsworth, Howland & Co., Boston, had a most attractive display of paints, varnishes and painters' supplies. The exhibit was in charge of Frederic A. Gunnison and H. A. Putnam.

The Hampden Corundum Wheel Company, of Brightwood, Mass., had a very interesting exhibit, one of its improved car wheel grinders, which was in charge of Charles Nicholson, it attracted a great deal of attention. This grinder is a very complete machine, with all manner of devices for close adjustments; it is placed in the car pit and the wheels are trued without removing them from the car.

The Pennsylvania Car Wheel Company exhibited a number of its standard and special wheels for street railway service; among them the 33-in. and 30-in. motor car wheels and 28-in. and 24-in. trail car wheels. James D. Rhodes represented the company.

George Weston, manager of the construction department for Naugle, Holcomb & Co., the well-known firm of railway contractors, and dealers in ties, poles, etc., represented that firm at the convention. Mr. Weston was ubiquitous and distributed leather

covered memorandum books which contained the convention programs, list of officers, committees, etc., and other data which the delegates found quite useful.

The Cambria Iron Company, of Philadelphia and Johnstown, had headquarters in the convention hall and displayed a full line of sections of rails from 8 lbs. to 107 lbs. per yard, and of all types. W. A. Washburn, sales agent, 33 Wall street, New York, was in charge.

The Standard Air Brake Company made no exhibit in the hall but showed its brakes in service on the cars of the Commonwealth Avenue Street Railway Company, over whose lines the trip to Norumbega Park was made. During the ride to the Park, Friday afternoon, the writer heard a number of complimentary remarks as to the manner in which the cars were braked. At the Park representatives of the Standard Air Brake Company were in attendance to explain the mechanism in detail and were kept busy, as there were many managers present who contemplate adopting air brakes as soon as the financial condition of their companies will permit it, and they took this opportunity of seeing how the brakes worked in practice.

One of the most acceptable souvenirs of the convention was a booklet prepared by A. L. Reich and entitled "The General Electric Company at Boston." It is most artistic in make-up and is filled from cover to cover with handy information for the visitor at the "Hub" and profusely illustrated. The power houses of the Boston Elevated, the Lynn & Boston and the Lowell & Suburban, Nantasket Beach roads are all described, and a brief account is given of the Lynn factories of the company. The principal points of historic interest in and about Boston, location and means of getting to the pleasure resorts, theaters, ferries, steamboat lines, etc., are described in a terse and lucid manner.

The Joseph Dixon Crucible Company, Jersey City, N. J., was represented at the Boston convention by George E. Long, secretary, and John H. Baird, A. L. Haasis and E. A. St. John, salesmen. The exhibit in the hall was visited by everybody, and all who sampled the souvenir lubricants provided were in accord as to the excellence of the Dixon products. On exhibition were samples of the Dixon lubricants. "Graphited wood grease" is for gears; in a very short time after it is applied, it loses its original granular character and assumes a peculiar tough, spongy consistency, very adhesive and of excellent body. This body is due to the fibre of the wood, which is now in a very fine condition. The method of application is ordinarily to put enough inside the gear cases, so that one of the gears may drag through it. Employed in this way, the grease is exceedingly durable, and reduces the labor of application to a minimum. Flake graphite (No. 635) is a lubricant for raw hide pinions. The name of "graphited curve and track lubricant" explains itself. The best dressings, paints, etc., made by the company were also shown. Pencils were the company's souvenirs.

J. H. Van Dorn, of the Van Dorn & Dutton Company, Cleveland, was at Boston during the convention meeting his many friends and extending his acquaintance.

H. F. J. Porter represented the Bethlehem Iron Company, South Bethlehem, Pa., at the convention. Mr. Porter's headquarters were at the Hotel Brunswick in parlor 18, where he kept open house and entertained all his friends. He had an interesting collection of photographs showing some of the work turned out from that forge.

The Vacuum Oil Company was represented by E. A. Record and exhibited samples of oil and lubricants

The Lawton "Peerless" fender was shown by John C. Curtis, agent for the patentee. Mr. Curtis, whose office when at home is 1218 Masonic Temple, Chicago, was kept busy showing the exhibit. Col. Lawton, the inventor, was also at the convention.

"The "Auto-Motoneer," illustrated and described in another column, was delayed in transit and could not be placed on exhibition until Friday afternoon, much to the chagrin of G. W. Knox, the patentee, and C. E. Moore, who were among the delegates from the Chicago City Railway. When the apparatus did arrive, however, it attracted the keenest interest, and many favorable comments were made by the railway men who saw it.

John George, who is handling the apparatus, took it down to the New York State Association meeting the following week.

G. E. Stanley and J. E. Miles attended the convention and exhibited the Stanley & Miles emergency brake, which is stated to have great power, to be easily adapted to all cars, to be simple in construction, inexpensive and can be instantly applied.

The E. T. Burrowes Company, of Portland, Maine, had a very complete exhibit of the Burrowes patent car shades. The Burrowes Company is the pioneer coach curtain maker and the inventor of the spring actuated curtain holding device which is so universally used. The different styles of curtains were shown in a large revolving mahogany model and the display was most attractive and interesting. The curtains, as shown this year, embrace many radical improvements and desirable modifications, among the later designs of holding mechanisms being the No. 83, the "Royal" and the "Climax" styles. For the particular conditions for which these three mechanisms were devised, they show the highest attainment and greatest perfection to date in curtains. The "Climax" fixture is more easily operated and the wire will not bulge out of the groove (a sad objection to the old style), as children and even older people could not always resist the temptation to tamper and play with the wire thus exposed. This style of mechanism is, perhaps, not as popular as the spring or pinch

ears; the triple enshioned swing bolster double truck No. 14 A, for high speed interurban and elevated electric railway service; the extra strong No. 14 A for extra heavy service; the short wheel base swing bolster double truck No. 14 B, particularly adapted for short radius curves; the center bearing, swing bolster, maximum traction trucks, No. 14 D2, as constructed for G.-E. 1,000 motors, designed for high speed closed or open cars using only one motor; and the 14 D3 of the same style as the 14 D2, but made for extra heavy cars. These last two trucks were designed to overcome the objections existing in maximum traction trucks constructed with side bearings and do away with the necessity of applying a portion of the weight of the car body to the small wheels, to prevent their jumping the track. The center bearing swing bolster relieves all side strain; placing the motor outside the axle permits the bolster to be nearer the driving axle and increases the load available for traction by from 7 to 10 per cent, according to the weight of the motor; the segmental

EXHIBIT OF THE PECKHAM TRUCK COMPANY.

handle device, but it too has its friends and is used to a considerable extent. A picture showing the three large well appointed factories of the Burrowes Company, located at Portland, Me., indicating a prosperous business, together with a large line of curtain materials, made up the balance of the exhibit which attracted a great deal of attention. H. H. Russell and E. A. Baker represented the company.

The Peckham Truck Company occupied 1,500 sq. ft. in the convention hall and exhibited Peckham's system of single and double trucks, which includes trucks adapted to any and all conditions of electric service, from light, short to long, heavy closed and open cars, as well as extra strong trucks for freight, switching and locomotive service. The trucks shown in the Peckham exhibit were nine in number and comprised the 7 D "Excelsior" single truck for 16 to 20-ft. closed and 26 to 30-ft. open cars; the "Cincinnati special," extra strong "Excelsior" designed for extra heavy cars and severe service, it has M. C. B. journal boxes; the standard S A as constructed for 16, 18 and 20-ft. closed cars, and especially adapted for high speed and double-deck cars; the extra long "Broadway" standard No. 9 A, designed for 20 and 22-ft.

swivel plates used in this truck may be adjusted so as to give any desired swing to the truck.

In addition to these one of the Peckham trucks was shown in the exhibit of the Walker Company, and Peckham trucks were used under the car in the Safety Third Rail Company's exhibit and under the Stephenson model.

At the Hotel Brunswick Peckham headquarters were in Partor K, where Mr. Peckham's handsome models were to be seen and visitors entertained. Representing the company at Boston were E. Peckham, president; E. G. Long, vice-president; A. W. Field, eastern agent; J. A. Hanna and W. H. Gray, of the western office; and several representatives from the New York office. The Peckham souvenirs were beautiful gold-mounted white leather card cases with memorandum books for the ladies, and puzzle purses for men.

The Beverly Machine Works, Beverly, Mass., were represented by John S. Baker, proprietor, and W. E. Bailey, superintendent. The exhibit comprised the Beverly ratchet clutch brake handle and the Beverly ratchet clutch vertical brake wheel, both of which are well-known devices.

Gus. Suekow, manager of the Vose Spring Company, New York, attended the convention. He reported his company as being full of orders.

Charles Blizard, manager of the New York office of the Electric Storage Battery Company, Philadelphia, was at Boston during the convention. This company's specialty is the chloride accumulator.

Charles R. Brown represented the Pratt & Letchworth Company, of Buffalo

The exhibit of the Ohio Brass Company was opposite the entrance to the exhibit hall, and the first one to catch the eye on entering. The space was made very handsome and attractive by the artistic arrangement of the goods displayed, which included track-bending and overhead line materials, car supplies, commutators, bearings, bearing metals, etc. C. K. King, secretary, and A. L. Wilkinson, special representative, were in attendance.

Considerable attention was given by these interested to the electrical apparatus shown by the Johnson Company. The exhibit consisted of double equipments of 30 h. p. and 50 h. p. capacity mounted on trucks, and 35-h. p. motors on blocks with the pole pieces raised and lowered to show the access to the armature and field coils. Different types of controllers were also exhibited. The motors mounted on the trucks were connected up and were operated for the purpose of showing the working of the controllers which, on account of their simplicity, occasioned more than ordinary comment. From the number of interested visitors and the favorable criticisms expressed in general concerning this exhibit the Johnson Company representatives state they have every reason to be well pleased with the result of the Boston convention. H. C. Evans, F. S. Eient and J. A. Rutherford were present

P. G. Augher represented C. S. Schieren & Co., of New York.

Peter Leidenger and Joseph Leidenger, of the Dayton Manufacturing Company, Dayton, O., attended the convention.

A. B. Mendum, of Boston, was one of the several representatives of the Bihber-White Company

E. A. Chandler, of Detroit, represented the "Excelsior" self-oiling trolley harp

The Dearborn Drug & Chemical Works, of Chicago, were represented by R. C. Carr.

F. C. Brownell, of the Brownell Car Company, St. Louis, was at Boston in the interest of his company

President William Sutton and E. J. Lawless, eastern agent, represented the American Car Company, St. Louis

C. K. Knickerbocker attended in the interest of the Griffin Wheel Company, of Chicago.

The American Electrical Works, Providence R. I., were represented by Eugene F. Phillips, F. Rowland Phillips, Frank N. Phillips, C. H. Wagensele, W. H. Sawyer, W. J. Watson and F. E. Donohue, George H. Olney, 2nd; C. R. Remington, Jr., P. C. Ackerman.

Adam Cook and John G. Engel, of Newport, were present in the interest of Adam Cook's Sons

Theo. A. H. Weintz, New York, sole agent for the Warrenton Woolen Company, manufacturer of all kinds of uniform cloths for street car men, was present, interviewing his many friends. This cloth is now standard on the Chicago City Railway and many other large roads.

The Duplex Car Company was represented by John A. Lowell, president; W. B. Crittenden, of New York; O. W. Marshall and George Moore. The exhibit consisted of a "Duplex" car built by the Briggs Carriage Company. It was a handsome piece of work and was examined with the greatest interest by the railway men at the convention

The gigantic sign "The Name of Westinghouse is a Guarantee," drew the attention of every one in the exhibit hall. The metal letters were mounted on a thick plate of glass and formed one of the terminals of a high voltage circuit. The current being unable to penetrate the glass spread out over the surface and around the edges like forked lightning. The company made a fine exhibit of street railway apparatus. There were a No. 49 35-h. p. motor with armature, core, coils and commutator exposed, a 12 A motor and a No. 38 motor with side suspension irons. The three types of controllers exhibited were the K 10, K 11 and the B 4. There was a 25-k. w. rotary converter changing a 500-volt direct current to an alternating current of 380 volts or vice versa, together with a complete switchboard. A 50-k. w., 60,000-volt trans-

IN THE WESTINGHOUSE EXHIBIT.

former proved of interest. Among the smaller street railway appliances were, six station and six line lightning arresters and one choke coil, a 1,000-ampere tank arrester, a 2,000-ampere, two-way switch and a 2,000-ampere circuit breaker with pneumatic operating attachment, a canopy switch, and a 2½-h. p. air pump and motor. There were 12 alternating current and direct current fans that stirred up gentle breezes, much to the comfort of the visitors for the first two days. The Westinghouse Electric & Manufacturing Company had the following representatives: Frank H. Taylor, general sales manager, L. E. Finley, W. M. Alexander, U. W. Storer and H. D. Murdock, of Pittsburg; Maurice Coster, manager of the Chicago office; Charles A. Bragg, of Philadelphia; Calvert Townley, of Boston; R. S. Brown, H. M. Southgate, W. W. Ward and H. C. Farnsworth, of Sawyer-Mann, Boston; J. R. Gordon, of Atlanta; C. C. Frenyear, of Buffalo and Ahren & Soper, Ottawa, Canada.

The exhibit of J. G. Brill Company comprised a line of its standard products and a number of street railway novelties. The standard Metropolitan closed car, at the entrance of the building, was noteworthy for its great length, being 37 ft. 2 in. over all, and seating 38 passengers. The car was built with a truss plank on each side and had window trusses as well as the longitudinal tie rods, giving strength and durability, and was mounted on "Eureka" maximum traction trucks. The convertible car exhibited combined all the advantages of a box and summer car, as it can be easily converted from an open to a closed car by the conductor and motorman in from three to four minutes, or vice versa. Four of the company's trucks were shown, the "Perfect," or No. 27, the "Eureka" maximum traction, the "Ideal" No. 21-E, and the No. 27-G trucks. The "Perfect" truck is especially applicable to electric locomotives which are to carry car bodies. The "Eureka" truck, with its short wheel base, ample room for motors, variable braking pressure and great tractive power, is in use both for heavy city traffic and fast suburban service. It carries a car as low as a 4-wheeled truck and with a single motor gives high tractive power. The "Ideal" truck for 4-wheeled cars has proven very durable in service and on account of the peculiar arrangement of springs rides with an unusual degree of steadiness. The 27-G is a modification of the "Perfect" with the motors hung outside of the axles, giving a short

treadle and weighted hammer. The treadle, when not in use, can be locked down so that the gong cannot be rung by accident nor by the jolting of the car. The blow is delivered after the treadle has reached its lowest point and when the hammer is entirely clear from the treadle, so that the sound is always clear and distinct. The hammer does its work by inertia and drops back after striking the gong, producing a clear musical note. Track scrapers have been made of almost every conceivable form, but the Littell scraper, as shown at the Brill exhibit, is certainly the simplest. It is put in operation by a mere touch of the motorman's foot and it is said that more than once, in case of a person falling upon the track, it has been dropped so quickly as to prevent the body from going under the wheels. The company was represented by John A. Brill, Samuel M. Curwen, W. H. Heulings, Jr., George M. Haskell, G. S. Hastings and Walter S. Adams.

The most unique and conspicuous feature at the convention was the great globe of the General Electric Company, which served to exhibit in a graphical manner the world wide use of machines and instruments of its manufacture. It was 25 ft. 2 in. in diameter, with a scale of 312 miles to 1 ft. and was mounted on a pedestal 16 ft. in diameter. The globe was built up of papier mache upon a frame work of wood, and no less than 2,700 sq. yds.

CAR AND TRUCKS IN THE BRILL EXHIBIT.

wheel base of 4 ft. and also enabling the car body to be brought very low. Quarter size brass models of the "Eureka," "Perfect" and "Ideal" trucks were exhibited in parlor G. Hotel Brunswick, and were much admired by all visitors. Among other novelties round end seat-panels were shown. These are especially strong, as they are easily and accurately fitted and have become very popular with street railway men and car patrons. Dunning's draw bar is a simple mechanism which by means of a pocket at the rear and a latch controlled by a rod at the front end of the car, enables the draw head to be thrust back so as to have the whole front or buffer of the car clear without a projection beyond it. The Millen sign, an invention of Thomas Millen, general master mechanic of the Metropolitan Street Railway Company, New York, is both simple and ingenious. The idea is to provide simple means for operating box signs from the inside of the car or from beneath the hood. It consists of a pair of bevel wheels contained in a casing at the end of the sign. To one of the wheels the sign is connected; the wheel is, in fact, mounted on the axis of the sign. The axis of the other wheel projects downward through the hood and terminates in a hand wheel which is marked with letters indicating each one of the four sides of the box sign. By turning the wheel anyone of the signs can be brought so as to face outward. The signs on the side of the car can be moved from the center of the car inside, those on the hood can be moved without leaving the platform. The new Dedenda gong struck most street railway men who saw it as being both neat and efficient. The mechanism consists of a

of paper were used in its construction, which required two months. The continents and oceans were painted upon the surface of the globe by a scenic artist. A 100-c. p. incandescent lamp marked the north pole and small incandescent lamps of different colors indicated the location of cities in which the General Electric Company had installed some street railway, mill, mine or lighting machinery. For this purpose 400 lamps were placed, although if each installation instead of cities were so marked it would have required several thousand. As an instance, had each plant in New England been marked, the entire surface representing New England would have been covered with lamps 40 tiers high. The lamps were on the map of nearly every country in the world, indicating the world wide business of the company. A small national flag was placed within the boundaries of each country. The equator was marked by a small track, around which a miniature electric car traveled. This globe will be sent to Paris to be placed in the General Electric exhibit in the Exposition. There was an exhibit of street railway machines and instruments, but this was not as extensive as it might have been, for with few exceptions the generators, motors, controllers and switchboard instruments of the Boston companies are the product of the factories at Schenectady and Lynn. An illuminated sign gave the following figures of the street railway apparatus sold by the company up to September 1, 1898.

Two thousand two hundred and eighty-five railway generators, aggregating 423,101 h. p.; 52,841 railroad motors, aggregating 1,270,865 h. p., and 50,000 series parallel controllers. W. J.

Clark, general manager of the railway department, was assisted by C. B. Davis, F. M. Kimball, C. C. Pierce, C. D. Haskins, S. B. Paine, G. E. Steele, J. S. Butler, of the Boston office; H. R. Beach, T. Beran, J. J. Mahoney, T. A. Branion, T. Weare, W. G. Bushnell, New York office; Theo. P. Bailey, Chicago office; G. D. Rosenthal, St. Louis office; H. J. Crowley, Philadelphia office; A. D. Babson, Baltimore office; H. T. Heywood, Atlanta office. The supply department at Schenectady was represented by J. R. Lovejoy, general manager, H. C. Wirt, engineer and J. K. Aitken; the railway department by W. B. Potter, chief engineer, F. E. Case, E. D. Priest, L. C. Batchelder and C. A. Barry; the patent department by A. J. McDonald, Arthur Baldwin

The New York Electrical Works, of Brooklyn, were represented at the convention by J. H. Henderson

Richard Devens, engineer, represented the Weber Railway Joint Manufacturing Company, of New York, and exhibited the Weber joint.

Frank MacGovern, of Rosstiter, MacGovern & Co., 107 Liberty street, New York, dealers in electrical machinery, was at Boston during the convention.

Clift Wise, of Chicago, the well-known general contractor for electric railway, paving and underground conduit work, was in attendance at the convention

W. W. Whitcomb, president and general manager of the Composite Brake Shoe Company, Boston, had a very interesting exhibit of new and service-worn "Compo" shoes with cork insets.

Wendell & MacDuffie, of New York and Boston, dealers in electric and steam railway supplies, were represented in Boston during the convention by Jacob Wendell, Jr., R. L. MacDuffie and B. F. Ager

The Central Union Brass Company, of St. Louis, made no exhibit in the hall but T. C. White was in attendance at the convention and represented the company. He distributed watch charms, miniature trolley hangers, for souvenirs. The company makes a complete line of overhead material, trolleys, gears, pinions, etc. W. R. Garton Company is its Chicago agent.

Among others present at the convention we noted:

- H. B. Ham, New York, Babcock & Wilcox Company
- B. J. Jones, Chicago, Sargent & Lundy.
- Charles W. Jefferson, Mica Insulator Company
- Newton Jackson and D. H. B. Rockwell, Scranton, Pa., American Mutual Indemnity Company.
- E. W. Hodgkins, Chicago, Q & C Company
- George F. Porter and Romaine Mace, New York, Okonite Company.
- E. I. Robinson, St. Louis, Laclede Car Company
- E. G. Knapp, Sandusky, O., Partridge Carbon Company.
- C. S. Van Wagoner, Cleveland, Van Wagoner & Williams Hardware Company.
- J. A. Brett, Chicago, Electrical Installation Company.
- John Jackson, Pittsburg, Simonds Manufacturing Company.
- W. W. Wharton, Philadelphia, Electric Mutual Casualty Association.
- Henry B. Cutter, Philadelphia, Cutter Electrical & Manufacturing Company.
- L. A. Lockwood and A. F. Montgomery, Pawtucket, R. I., Crefeld Electrical Works.
- H. G. Brinkerhoff, Boston, Fuel Economizer Company.
- Henry Daily, Jersey City, Joseph Dixon Crucible Company.
- George C. Bailey, Chicago, John A. Roebling's Sons Company.
- Giles S. Allison, St. Louis, St. Louis Register Company.
- J. A. Granger, New York Car Wheel Works
- J. N. Parsons, Pittsburg, A. Mertes Manufacturing Company.
- Frederick A. Lex, Wilmington, Del., Lobdell Car Wheel Company

## WILSON TROLLEY POLE CATCHER.

One of the most practical car devices which has been introduced of late is the trolley pole catcher and reel made by Wilson, Thomson & Co., of Brooklyn, N. Y. Its object is to catch the pole instantly after the wheel has left the wire and hold it securely until released by the conductor, thus preventing damage to overhead wires. The illustration shows the catcher attached to the dash, but this is only one of several ways of applying it. The reel is regulated by a long clock spring, taking up the slack rope and feeding it out to the trolley pole according to the inequalities of the line. The device permits an increased pull upon the trolley pole spring, or the pull may be diminished to a much lower standard than is practical without such attachment, because it acts instantaneously either at high or low pressure of the trolley on the wire. When the wheel leaves the wire
