On 29 May, as soon as the convention had been fairly opened, Edmund Randolph presented the Virginia plan, which was probably largely drawn by Madison. It proposed a fundamental change in the government from a confederation to a federal union of States. It made provision for three distinct departments of government, a national legislature, executive, and judiciary. The legislature was to consist of two branches, the first branch (representative) to be elected directly by the people of the respective States, the second (senate) by the first branch out of candidates nominated by the State legislatures. Representation in both branches was to be apportioned among the States according to the quotas of contribution or the free inhabitants. In addition to the powers under the confederacy, the Congress should legislate in all cases in which State legislation would interrupt the harmony of the United States, should have a negative on State laws contravening the articles of union or its laws and treaties, and might coerce a delinquent State. The executive should be chosen by Congress for a limited term, and with a part of the judiciary should form a council of revision with a limited veto on legislation. An independent national judiciary was provided for. The remaining resolution related to the admission of new States, the guaranteeing to each State a republican form of government, the requirement of an oath to support the national Constitution from State officers, provision for amendment and the ratification of the new Constitution by conventions of the people. This plan was nationalistic in its tendency, although favoring the large States. It became the basis of the Constitution. On the same day Charles Pinckney, of South Carolina, presented a plan of government. The so-called "Pinckney Plan" first published in 1819 in the 'Journal of Congress,' has long been known to be a document of little authority. Recently attempts have been made to reconstruct this plan, and within the last few months a contemporary manuscript has been found giving what is believed to be the chief provisions of this plan. This would seem to indicate that the plan Pinckney actually presented suggested a considerable number of provisions that were incorporated into the completed Constitution, and entitle him to greater credit than he hitherto has been accorded by scholars. It is impossible here to present the details of this draft, but suffice it to say that it was national in character, made provision for the three departments of government, namely, a bicameral legislature,— the senate and house by name,— a single executive with the title of President, and a federal judiciary, and suggested several additional features in regard to the powers of the executive and legislative departments.

The debates in the convention naturally fall into three periods. During the first period from 30 May to 19 June, the proceedings took place chiefly in the committee of the whole. The Virginia plan was under discussion for several days, when on 13 June this plan, somewhat amended, but practically intact, was reported favorably to the convention in 19 resolutions. The chief changes made provided that a national government ought to be established, that the term of members of the lower house should be three years and of the upper seven years, and for the executive one term of seven years, and dropped the clauses for the coercing a State and for the council of revision, leaving to the executive a limited veto. During this discussion the antagonism between the large and small States had become evident, as the provision for proportional representation in both houses had been retained. This would give to the large States of Virginia, Massachusetts and Pennsylvania nearly a majority in both branches of the legislature. North Carolina, South Carolina and Georgia also voted for this provision probably in anticipation of future growth. This called forth a plan from the small States, which was presented on 15 June, by William Patterson of New Jersey, and is generally known as the New Jersey plan. This proposed no change in the basis of the government, which was still to be a confederacy. The existing Congress was to be preserved, but a plural executive chosen by Congress and a judiciary appointed by the executive department with well defined jurisdiction, were provided for. Congress was to be given additional powers to enable it to levy customs duties and internal taxes, and to regulate commerce and for enforcing the payment of requisitions. The acts of Congress and treaties were to be "the supreme law of the respective States," and the executive was authorized to enforce obedience to the same. Once more the Convention went into the committee of the whole to consider these two plans. The issue of a national government or a confederation was clearly presented and on 19 June the committee reported back the Virginia plan. It may be of interest to note that on the day before this, Hamilton, expressing his objection to both plans, sketched the outline of a system which was the embodiment of his views. He advocated a stronger and more centralized government, in which the States would have been reduced almost to administrative divisions of the central government. The Assembly was to be chosen by the people for three years, the senators to be chosen for good behavior by electors, and should represent property. The executive to be chosen for good behavior by a more complicated electoral system. He was to be vested with an absolute negative on congressional legislation. The governors of the States were to be appointed by the central government and were to be given an absolute negative on State legislation. As one of the delegates remarked, "Hamilton was praised by many but supported by none."

During the second period of its deliberations, which extended from 19 June to 26 July, the convention was occupied in the discussion of the 19 resolutions agreed to in committee. It was in this period that the great contest between the large and small States, or better, between the national and confederate parties took place. The nature and character of the new organization was at stake, and was involved particularly in the determination of the question of representation. The large States insisted upon proportional representation in both houses of Congress, the small States refused to enter the Union on any such terms. On 2 July a proposition for equal representation in the Senate was lost. The excitement was intense, the convention seemed on the point of dissolving. Sherman declared, "We are now at a full stop. Nobody, I suppose, means that we shall break up, without doing something"; and he suggested a committee as "likely to hit on some expedient." The matter thereupon was referred to a committee of one from each State. They reported 5 July, favorably to equal representation in the Senate and proportional in the House, and as a concession to the large States that the House should originate money bills. To the resolution as reported there was subsequently added the proviso that in the apportionment of representatives and direct taxes "three fifths of all other persons" (slaves) should be counted, which was the rule fixed upon for the apportionment of quotas in the revenue amendment of 1783, and which had been agreed to by the legislatures of 11 States and already had been incorporated in the report of the committee of the whole of 13 June. This proviso should not, therefore, be considered as an essential part of this compromise. This report agreeing to equal representation in the Senate at first excited a storm of protest, but the entire resolution was finally adopted 16 July, by a vote of five States to four, one State being divided and three unrepresented. Thus this compromise, involving the structure of Congress and the organic nature of the government was determined by a vote of less than a majority of the States present and by the representatives of less than one third of the people of the States. The effect of this compromise was most marked. The small States now gave up their opposition to the reorganization of the government and joined heartily in the work of providing an efficient organization and adequate powers for the new government. The other important modifications of the plan made during this period were substituting for the phrase "National Government" the "Government of the United States," shortening the term of representatives to two years and of senators to six years, and providing that the latter should retire by thirds, omitting the provision for the negative on State laws and inserting "the supreme law" clause first suggested in the New Jersey plan. Some of these changes show a departure from nationalism in the direction of federalism, and indicate that the spirit of compromise was at work. On 24 July a "Committee of Detail" was appointed to prepare the draft of a Constitution conformable to the resolutions adopted by the convention. Two days later the 23 resolutions already agreed to, together with the Pinckney and New Jersey plans were referred to this committee. Then the convention adjourned until 6 August to await the committee's report. On that date they reported the draft of a Constitution in which the main features of the completed Constitution already appear.

We now approach the third period of the work of the convention, extending from 6 August to 17 September. During these six weeks the debate over the details of the draft progressed, and while great diversity of opinion was exhibited, it proceeded in the main without undue excitement, although the difference in the interests of the northern and southern States over commerce and slavery aroused for a time considerable excitement. Already during the preceding period it had become evident, as Madison records, "that the real difference of interest lay not between the large and small States, but between the northern and southern States. The institution of slavery and its consequences formed the line of discrimination." But these yielded, as in the case of so many other issues, to compromise. In regard to commerce it was agreed that Congress might regulate foreign and interstate trade but should not have power to lay any export tax. This was a compromise between the commercial States of the north and the agricultural States of the south. Again the northern States desired that Congress should have power to pass navigation acts, but the three extreme southern States objected, and refused at first to sanction the power except by a two thirds vote of Congress for fear that the slave trade might be interdicted. The situation became critical, and again a committee of one from each State was resorted to. On 24 August they reported a compromise which as amended provided that Congress should not prohibit the slave trade prior to 1808, but might impose a tax not to exceed ten dollars per head on such importations. This was carried by the votes of New England and those of the Carolinas and Georgia. By a similar combination of votes the clause requiring a two thirds vote to pass navigation acts was defeated. It is noteworthy that the Virginia delegates earnestly opposed this compromise. Subsequently the provision in regard to the rendition of fugitive slaves was agreed to. This probably formed a part of the above mentioned compromise. These compromises were severely condemned by later generations who forgot that slavery at that day hardly was regarded as a great moral issue. It is altogether probable, also, that these compromises generally have been over-emphasized and that others, perhaps of equal importance, have been overlooked. Certainly it is true, as has been well said, that "the Constitution is a series of compromises." No question gave the framers of the Constitution so much trouble as the choice of the executive. The convention vacillated between several plans and showed a strange fluctuation of sentiment. Several times it voted in favor of election by Congress; once it agreed to a choice by electors chosen by the State legislatures — a plan subsequently twice rejected. After repeated reconsideration the special committees in their report of 4 September, recommended the electoral system very nearly as it was finally adopted on 6 September. This was regarded as a compromise between the large and the small States, as by many it was expected that the ultimate election would usually devolve upon the House, voting by States. Thus it was said that the large

States would nominate while the small States would elect. Over the organization of the executive, also, there was great difference of opinion between those who desired a strong executive, vested in one man, and those who feared an approach to monarchy. These conflicting ideas were compromised by conferring upon the President great powers, but giving to the Senate or both branches of Congress certain checks and limitations upon the exercise of those powers.

It is impossible to enter further into the details of the convention. Suffice it to add that on 8 September, when the members approached substantial agreement on the chief provisions of the Constitution, a committee of five on "style and arrangement" was appointed. This committee made its report, largely drawn by Gouverneur Morris, on 12 September. It was arranged in seven articles with the various sections as in the present Constitution. Discussion upon this report continued until the 15th, when the Constitution as amended was agreed to. On Monday, 17 September the draft of the Constitution was signed by 39 of the delegates and the convention adjourned *sine die*. Three delegates present, Gerry, Mason and Randolph, refused to sign, owing to the strong national features of the document, and to the rejection of the proposal to hold a second convention to consider amendments that might be recommended by the State conventions. There is evidence that only four of the 13 delegates who had been in attendance, but were absent at the time of adjournment, were opposed to the Constitution; certainly the majority approved of it.

It has been truly said that "if Americans possess political genius to any degree, it is for adapting old institutions to new needs." The work of the framers of the Federal Constitution strikingly illustrates the force of this statement, and the institutional development of our fundamental law. The framers drew largely upon their experience both during the colonial times and under the State governments, and the chief features of the Constitution are but a selection and adaptation of the provisions of the contemporary State constitutions. The Constitution made provision for the establishment of a government which was neither wholly national nor wholly federal, but partaking of the features of both. It provided for a mixed system. As Madison remarked, "In some respects it is a government of a federal nature, in others, it is of a consolidated nature." Thus in the legislature, consisting of two bodies, the Senate is based upon the federal, the House upon the national principle. In the new organization of the government the legislative department was improved, the executive and judiciary were substantially created. All were modeled in large measure after the similar departments in the State governments. The powers of the general government were greatly increased, while those of the State governments were correspondingly decreased. Certain express limitations were laid upon the latter and certain other powers were denied both to the State and to the Federal governments. The convention by a tie vote refused to add a bill of rights, as the opinion prevailed that such a guarantee of individual rights was unnecessary as the Federal government was one of delegated powers only. By providing that the ratification of nine States should be sufficient to establish the new government the work of the convention was revolutionary.

In accordance with its resolves the Constitution was transmitted to Congress and after some attempts to amend, that body finally agreed unanimously 28 September, in accordance with the desire of the convention, to transmit the Constitution to the legislatures of the several States to be submitted to State conventions. At once there sprang up a great pamphlet and newspaper contest over the merits of the proposed frame of government. The most famous of these was a series of letters in advocacy of the Constitution written by Hamilton with the aid of Madison and Jay, subsequently collected under the title of 'The Federalist.' These exerted a profound influence throughout the country. 'The Letters of the Federal Farmer' by Richard Henry Lee, one of the foremost opponents of ratification, had the widest circulation and were the most effective of the pamphlets on the other side. The country was shortly divided into the Federalists and the Anti-Federalists. The former comprised chiefly the professional and commercial classes, who favored the new government because it would promote national credit and commercial intercourse. The Anti-Federalists were mainly the agricultural classes, who were the advocates of paper money, stay and tender laws and who opposed increased taxation. Geographically the strength of the Federalists was near the seacoast and in the few important valleys which were the highways of commerce inland, while that of the Anti-Federalists was in the interior and agricultural sections.

Hardly a provision of the Constitution escaped criticism, but the absence of a bill of rights was the most common and weighty objection raised. The fear that the strong general government provided for would encroach upon the sovereignty of the States and the liberty and rights of the individual was the chief obstacle to be overcome. The first State to ratify was Delaware (7 Dec. 1787), followed in the course of a month by Pennsylvania, New Jersey, Georgia and Connecticut. In three of the States the vote was unanimous, and in Pennsylvania, and Connecticut ratification was carried without difficulty, although in the former State there was a vigorous but small opposition. The first close struggle occurred in Massachusetts. The convention was very evenly divided and ratification was only secured (7 Feb. 1788) by a narrow margin, through the Federalists agreeing to the recommendation of a series of amendments. This plan was followed by all the subsequent conventions save Maryland, which ratified in April, to be followed by South Carolina in May. Eight States had now taken favorable action, but it seemed very doubtful if any one of the five remaining States could be brought to accept the Constitution unconditionally. The Virginia convention was the first of these to assemble, but the discussions were so prolonged that New Hampshire ratified before it, on 21 June, by a majority of 11, making the ninth State, and thus insuring the inauguration of the new system. Virginia followed on 25 June, by a majority of 10 votes in favor, out of 186, under the impression that it was the ninth State to take action.

The effect of these two ratifications upon the New York convention was fortunate. At first the opponents to unconditioned ratification had been in the majority. Finally a few of the opposition yielded sufficiently to permit of ratification by a majority of four, but this action was secured only by the Federalists consenting to a call for a second general constitutional convention to consider amendments. Happily this convention was never held. It has been impossible to refer to the important influence of certain men in the State conventions, but at least passing note should be made of the astuteness of the Federal leaders in the Massachusetts convention, of the heroic services of Hamilton and Madison, and the strenuous opposition of Patrick Henry and Lansing in their respective State conventions. Favorable action had finally been secured in the doubtful States, owing to the realization that the alternative of "the Constitution or disunion" was before them to choose from. John Quincy Adams truly said, "The Constitution was extorted by grinding necessity from a reluctant people." Of the two remaining States, the North Carolina convention on 2 August refused to ratify without a bill of rights and the Rhode Island legislature repeatedly refused to call a convention. Finally, after the new government had been inaugurated, and Congress, in response to the general demand for a bill of rights had submitted a series of amendments to the States, North Carolina ratified 21 Nov. 1789, but Rhode Island's adherence was not secured until 27 May 1790, by a majority of two votes, and only then as a result of threatened hostile commercial legislation by Congress. Thus the 13 original States were finally reunited under the new Constitution. For *Bibliography* see article UNITED STATES — PEOPLING OF THE. See CONGRESS, CONTINENTAL.

HERMAN V. AMES,
Prof. of History, University of Pennsylvania.

11. United States — Beginnings of Party Organization in the (and Growth of the Party System and Party Machinery). Political parties so-called have existed in the United States from the beginning of its independent national life. Even earlier, while the colonies owed allegiance to the governments of Europe, there were traces of political divisions and groupings among the colonists according to their inclinations to sympathize with one or another of the political groups contending for power in the old home, or according to their differing views upon colonial and local affairs. But party organization there was none until near the end of the 18th century. Federalists and Anti-Federalists were the parties of the great discussion upon the adoption of the Constitution, but they were unorganized groups of the leaders of opinion and their supporters, divided by their opposing views upon the sole question in debate. After that contest had been ended by the triumph of the Federalists the party names persisted for a time, and the divisions were upon questions of constitutional interpretation. No organs were developed for perpetuating these early parties or for enlarging their political functions. The beginnings of a form of organization which did permanently affect the development of the oldest of our true American parties appear during the first administration of Washington in the Democratic clubs that sprang up and spread rapidly through the country. These were in some cases organized in a manner remotely comparable to the organization of a modern party and did effective service in strengthening the group which supported the views of Jefferson. They were, however, discredited by the turn of events and their development was checked.

Party organization arose out of the search for methods of political action which would secure in a representative democracy the choice of men as servants of the people who would be truly acceptable to the people. To this end and in order that the electoral forces might not be scattered and lost, it was found necessary to make use of some form of nomination of candidates previous to an election. After the adoption of the Constitution the irregular and varying local methods previously in use (the secret caucus, the open public meeting, the local unorganized convention, assisted by systems of correspondence and consultation) were rapidly extended and made more effective, while more central agencies of nomination for State and national officials were developed. The difficulties and expense of travel led to the rise of the legislative caucus system for the nomination of State officers as early as the year 1790. The opposing parties were both represented in the State Assemblies by prominent members and it seemed but a natural expansion of their regular duties that they should choose suitable candidates for the State offices. Their recommendations were made known by proclamations signed by members of the caucus. Against constant and severe criticism the legislative caucus continued in most of the States to exercise the power which had almost by accident fallen into its hands down to the year 1824, and even later in a few States; then, under the pressure of popular demand, it gradually gave way to the growing convention system. In many instances during the period of its prevalence the legislative caucus of the States assumed the privilege of nominating presidential candidates.

The last years of the 18th century were marked by the rise of a distinct party organ for the nomination of national elective officers. This was the Congressional caucus which was of an origin similar to that of the legislative caucus of the States and grew out of the practice of the Federalist members of Congress of meeting, with more or less formality and official sanction, for the discussion of party policy. It was easy to carry over into the field of nomination the party power in their hands. Hamilton is credited with suggesting the first formal action of the Congressional caucus of the Federalists in favor of a candidate for the presidency in 1800, and so of originating the party organ. Evidences of such use of the Republican party caucus are to be found, however, in the history of the previous campaign. Both parties did so nominate candidates for the election of the year 1800. The efficiency, convenience and economy of the new agency, together with a natural human reluctance to surrender power once grasped, led to its continued use against constant and growing popular opposition. It was seen to have become fully established as a party organ when, in 1808, the Republican caucus was called by the Senator who had presided over that of 1804, "in pursuance of the powers vested

in him." By the Jeffersonian Republican party it was made so able and efficient a party engine as to render the acceptance of its decisions a practical test of party loyalty, not only in the official circle but throughout the rank and file of party membership in the country. Party discipline was firmly enforced and the Republican representatives in Congress saw that the behests of the caucus were respected in all the States. The nominating agencies in the States were manipulated in a manner to strengthen the national party organ, and the minority became almost helpless before it.

No method for choosing presidential electors was prescribed by the Constitution, that matter being left to each State to determine for itself. Three systems were employed in the early elections. In some of the States the legislatures chose the electors. In others candidates were nominated in large assemblies of prominent citizens, including members of the legislature, which foreshadowed the State conventions of later days. Names so chosen were placed upon the general ticket of the party. Other States elected the electors by congressional districts. The general ticket system gained ground over the others until by the year 1860 it was practically universal. The supremacy of the Congressional caucus, supplemented as it was by the power of the legislative caucus in the States, transferred the political authority of a free, democratic people to the hands of a few powerful leaders. The effects of the popular dissatisfaction with this form of party organization were apparent first in the yielding of the caucus in some of the States. The districts where the party was in a minority complained that they were unrepresented in the legislative caucus, and in concession to their demands a modified form of the caucus began to be used (first in Rhode Island) about 1807. This was known as the "mixed caucus," and was composed of the party members of the legislature together with delegates elected by the party in the districts in which the party sent no representatives to the legislature. Some 10 years later still further concession was made to public sentiment (first in Pennsylvania), by substituting a "mixed convention" for the mixed caucus. This also was made up of delegates popularly elected in the counties, along with members of the legislature, but the members of the legislature were permitted to sit in the convention only when they represented counties from which no special delegates had been chosen.

From 1817 to the final overthrow of the legislative caucus, which for nearly all of the States was completed in 1832, the mixed convention was preparing the way for the advent of a truly representative nominating machinery, the State convention. Pennsylvania was again the first State to take the advance step. In like manner the Congressional caucus gave way slowly before the popular distrust, but its ultimate destruction became certain when, in 1816, it manifested a determination to force upon the Republican party an unacceptable candidate for the Presidency. It was called again in 1820, but, in the face of the manifest temper of the people, decided to take no action. In 1824 it did once more and for the last time put forth candidates, but only a minority of the party members of Congress participated and it commanded no respect.

The Federalist party received a mortal blow in the election of 1800 and was slowly dying throughout the period of the dominance of the caucus. It held no more national caucuses, but in a variety of ways announced its candidates. In 1812 the Federalists held what has been called, though improperly, the first national convention. It was composed of delegates from 11 States, who met as a peace party to oppose the war with England. They adopted the candidates already nominated by the Peace Republicans, who had "bolted" the regular party ticket. During the unsettled period between the Congressional caucus and the national convention, State and local party agencies of diverse forms acted as nominating bodies. The legislative caucus was still active in some States; the assemblies themselves, as such, sometimes chose candidates; mass conventions, county conventions, district conventions, and popular mass meetings, all nominated presidential candidates, and some of those gatherings took pains to declare that they would not be bound by the proceedings of any congressional caucus. All available means were made use of to render clear the final condemnation by the people of the objectionable party organ. Having been tried and found wanting, it was swept aside, to give place to an agency more in consonance with the national spirit. Though a congressional party caucus is at the present day an acceptable part of the national party organization, it does not exercise the nominating function.

Nomination by conference or by preliminary meetings of party supporters, which might be called conventions, had always been practised in the States and local areas, and the use of a convention for nominating the chief executive officers of the nation was the application of a principle already familiar to the people. The first of the long series of modern national nominating conventions was that of the ephemeral Anti-Masonic party, which met in Baltimore, 8 Sept. 1831, having representatives from 13 States. A long "Address to the People of the United States" set forth the principles of the party somewhat after the manner of the platforms of later years, and presidential candidates were nominated. The political importance of this convention is not great, and it is significant only as standing first on the list. The two leading parties quickly adopted the convention method in national politics. In December 1831 the National Republicans — successors to the Federalists and predecessors of the Whigs — met in pursuance of a call by a legislative caucus in Maryland. All opposed to the existing administration to Andrew Jackson were invited to send delegates. Eighteen States and the District of Columbia responded, and the convention laid plans for rendering the new organ a permanent part of party machinery. The first Democratic national convention, which met in May 1832, was called by New Hampshire politicians and was composed of delegates from all the States except Missouri. The National Republicans were now giving place to the Whigs, and in the unsettled state of political affairs that party held no national convention in 1836, but legislatures and legislative caucuses put forth candidates. A Democratic convention was held, and that party has thenceforth convened with uninterrupted irregularity in national convention to

nominate party candidates for Federal elective office. By the year 1840 the Whigs also were equipped with adequate machinery, and held their nominating conventions with regularity thereafter.

The national convention cannot be said to have become a permanent part of the party organization until it had provided for its own perpetuation. This was accomplished first by the Democrats when, in 1848, a national central committee, consisting of one member from each State, was appointed by the convention, one of its duties to be the calling of the next succeeding national convention. Similar action by the Whigs in 1852 completed the organization of that party. Previous to that year Whig conventions had been called by a Congressional caucus or by a legislative caucus of some one of the States. Tributary to the national convention, which is, in theory, the gathering up of the myriad expressions of political opinion throughout the whole country, is a long series of State conventions, district conventions, county conventions, city conventions, until the unit of party organization is reached in the ward or township primary, or caucus, made up of individual voters. All this complex machinery is kept in condition for effective action by means of committees appointed in the various election areas. Details of the system vary widely in the several States, but each State has its State central committee with a general supervision of the subordinate party agencies of the State. The national committee consists of one member from each State and Territory. It has general charge of the national interests of the party. Next in rank is the national congressional committee, first appointed in 1866 by a Republican congressional caucus. A few years later the congressional caucus of the Democratic party took similar action. The Republican congressional committee consists of one member of Congress from each State or Territory represented by a party member. In the Democratic congressional committee a State or Territory having no party member of Congress is represented by an outside member of the party. It is the duty of the congressional committee to supplement the action of the State and national committees and more especially to take charge of the elections of members of the lower House which occur midway between two presidential elections. In this matter the committee co-operates with local committees in the congressional districts of the various States. The party committees hold a most important and responsible position in the organization. They are the permanent party officials who formulate the party rules, administer the enormous party funds, and have general control over party business.

Since about the year 1880 the convention system has undergone considerable modification in the direction of legislative control of nominations. Under the fully developed system direct nomination is confined to the local officers in precinct, ward or township where the primaries are held. Here the individual members of the party by their direct votes nominate the party candidates for local office. Candidates for the larger areas of city, county, judicial district, congressional district and State are nominated indirectly by delegates chosen at the primaries. Two methods of procedure are in use at the primaries. The older is that of the mass meeting of party voters, most commonly called the caucus. It is organized by electing a chairman and a secretary, and the voting for local candidates or for delegates may be by ballot, or by any method prescribed by party rules, or by vote of the members present. The newer method is that of the primary election, which substitutes for the mass meeting a regular election held under the control of party or State officers, where qualified members of the party cast their votes one by one, for candidates for office or for delegates to nominating conventions.

The adoption of the primary election system does not necessarily do away with the nominating convention. Direct nomination may still be limited to local officials; but the primary election method admits of being indefinitely expanded, as the mass convention or caucus system does not. It may be so extended as to perform all the functions of the various conventions within the State, and this it is which makes the introduction of direct election in the local areas of special significance. Instead of calling upon the primaries of a county to choose delegates to attend a county convention for the purpose of placing in nomination candidates for county offices, the county committee may notify the party electors to proceed, at a certain time and place, to vote directly for candidates of their own choice. In such a case the primary elections held in the several precincts of the county supplant the county convention and exercise its functions. In like manner a congressional district composed of several counties may provide for choosing the party candidates for the House of Representatives by direct vote at the local primaries of the district, thus doing away with the need of a congressional nominating convention. In the same direct way candidates for judicial and State offices may be nominated, and the convention within the State be wholly displaced.

The discontinuance of the convention involves radical changes in party organization. The permanent committees, the platforms, the rules for the control of party conduct, have all been the product of party conventions. When the convention disappears all party functions devolve upon the primaries and the officers chosen by them.

It has not been seriously proposed to abolish the national nominating convention and transfer to the primaries the additional duties of nominating candidates for the presidency by direct vote, formulating quadrennially the national party platform and choosing the national committee. But there is a natural distinction between national and State politics. Issues arise within the States which have no direct relation to national affairs, and which furnish a natural line of cleavage for the parties. For the formulation of party issues and the development of party policies the convention is found to be a more convenient agent than the primary. Some of the States in which direct nomination is extensively practiced still retain the State convention for nominating State officers and promulgating the State party platform. Where the State convention has yielded to the movement for direct nomination, party issues are formulated by party officeholders, by party candidates and party com-

mittees, or by direct vote at the primary election.

The primary election system has been most widely introduced in those southern States in which one political party has control and a nomination is equivalent to an election. Here the real contest is within the ranks of the dominant party at the primary. The party members there vote directly for the various candidates, the votes are canvassed, and it is made a point of honor to abide by the decision so rendered. So important is the primary election that more votes are cast at it than at the legal election which follows. Some of the States — Mississippi, for example — have passed laws for the regulation and control of the primary election. In other States, as Georgia, the dominant party holds a similar election under rules formulated by the party organization.

But the development of the primary election system is by no means confined to the South; it extends to all sections of the country. Its object is to give to the unofficial members of the party greater power of control. The development of the system has coincided with the introduction of the Australian ballot legislation. These new laws require the State to print and distribute the ballots. This had formerly been an important party duty. Before the State officer can print the ballots he must have official information as to the names of candidates; the laws therefore prescribe a formal process of nomination by petition; but the real nominations are made by the political parties, and since the laws require some sort of official recognition of the nominating process, the State legislatures have been the more ready to yield to the already existing demand for legislation on the subject of primary elections. The result is that in many States the ordinary party machinery is becoming subject to State regulation and control. In 1901 the State of Minnesota passed a law providing for the holding of a primary election for the nomination of candidates to be voted for at the general election. The Minnesota primary election under State supervision is for all parties, who must all vote at the same place and on the same day. This provision makes it easier to confine the vote of each party to its own members. Under this law the candidates for State offices are not subject to nomination at the primary. The object of this exception was to preserve the State convention and render it convenient for party leaders to meet in conference and make declarations of party principles. A bill introduced a year later in the legislature of Wisconsin requires all important nominations of all parties to be made at the one primary election legally provided for. If such a bill should become law the State nominating convention would be displaced.

State control of party nomination leads to legal definition of party membership. Only members of the party have a right to vote at the primary. In Massachusetts, participation in a primary election of a given party disqualifies a man for voting at the primary of any other party for the ensuing 12 months without a formal legal notice of a change of party choice. Direct nomination at a primary election creates a demand for preliminary nomination of candidates, more or less formal, within the party itself. Party caucuses and conferences are utilized for this purpose. See DEMOCRATIC PARTY; REPUBLICAN PARTY; WHIGS.

12. United States — The Colonial and Territorial Systems of the. Under the generally well-known name of "territorial government," the United States has developed one of the best systems of colonial government that has ever existed. When, acting under the suggestions of Maryland, several of the colonies between 1780 and 1784 surrendered to the federal authority their claims to lands west of the Alleghanies, some provision had to be made for the government of them. This was done by the Ordinance of 1784, which provided for (1) the division into States; (2) the establishment of temporary governments; (3) the establishment of permanent governments and the admission of the prospective States into the Union as full States when a certain number of population had been reached; (4) the maintenance of a republican form of government in the States; (5) and the subjection of each new State to the Articles of Confederation. Grayson's Land Ordinance of 1785 made provision for (1) the survey of the lands; (2) its division by north and south, and east and west lines into townships six miles square; (3) and finally its sale in lots to purchasers. By 1787 all of the land north of the Ohio River, known as the Northwest Territory (q.v.), had come under the jurisdiction of Congress. Meantime an emigration company, called the Ohio Company (q.v.) had been formed in Massachusetts for the purpose of exploiting and settling these western lands. It had failed of success partly because settlers were unwilling to go to a land where so little guarantee was made for personal rights as in the Ordinance of 1784. The head men of the company therefore petitioned Congress for legislation which would give the guarantees desired. The result of this petition was the passage of the Ordinance of 1787. This contained the personal rights asked for, such as trial by jury, habeas corpus, etc., made arrangements for the treatment of the territory as one, or later as two, districts, and made provisions for two successive forms of territorial government. At first a governor and three judges appointed by Congress were to act as a legislature, as well as fulfil their own special functions as executive and judiciary. When there were 5,000 free male inhabitants of full age in the district, they were to receive authority to elect a general assembly or lower house of a legislature, but the upper house or legislative council of five members was to be appointed by Congress from a list of 10 names submitted by the lower house. The two houses meeting jointly were to choose a delegate to Congress who was to have a seat and the right of debating but not of voting. The governor, judges, and administrative officers were still appointed by Congress. The keystone of this ordinance, and that which placed the American colonial system above all other systems, was the provision which allowed the division of the territory into three to five parts, and when any one had 60,000 inhabitants it was to be admitted to the Union on an equality with the other States.

The Northwest Ordinance has formed the basis for all later territorial governments in

the United States. As strong doubt was expressed as to the right of Congress of the Confederation to pass such a law, the first Congress under the Constitution confirmed the ordinance by the Confirmatory Act of 1789, and gave to the new President all the powers therein exercised by the old Congress. This it was enabled to do under the clause of the Constitution which reads that Congress shall have power "to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States." In 1796 Congress passed, for the territory south of the Ohio River, an ordinance which was almost the same as the Northwest Ordinance.

With the great additions of territory (see TERRITORIAL EXPANSION) to the United States by the Louisiana and Florida purchases and subsequent wars and treaties came the necessity of providing territorial governments. All of these were very similar to that outlined in the Ordinance of 1787. As all of the land now comprised within the United States, with the exception of the original 13 States, Vermont, Kentucky, West Virginia, Texas, and California was at one time or another under territorial government, it is easily realized how important a good colonial or territorial system of government has been to the United States. In all its vast area there are at present only three territories left: Oklahoma, New Mexico, and Arizona. The territorial governments, on account of their common basis, have been very similar, even though entirely dependent on the will of Congress. At the head of each territorial government stands the governor. He, with any administrative officers he may need, is appointed by the President for a term of four years, and is removable by him with the consent of the Senate. In earlier times the governor was usually sent out from the East, but recently some man prominent within the territory has been chosen. The President also appoints judges for the territories for terms of four years. The male inhabitants of the territory, of full age, are allowed to elect a legislature of two houses, a council and a house of representatives. The legislature may pass laws on a large variety of subjects and arrange for local and municipal governments. The governor, however, has a veto on any laws, but they may be passed over his veto. Congress may at any time override statutes passed by a territorial legislature. This, however, is not often done. The territory has the privilege of sending a delegate to Washington, to sit in the House of Representatives. He has the salary and all the rights and privileges of a regular member of that house, except the right to vote. Congress may, of course, withdraw a territorial government at any time, but this has seldom been done. When the territory has reached a certain population (the number has varied much), Congress may admit it as a State by ratifying and accepting a constitution already drawn up by the people, or it may pass an Enabling Act. Under this the voters elect a convention to draft a constitution. If this is accepted the territory forthwith becomes a State on an equality with other States of the Union. Congress has at times imposed certain conditions in the Enabling Act. Whether these conditions are binding on the State if it afterward disregards them is a mooted point.

Besides the territories organized as above, among which the Hawaiian Islands, acquired in 1898, may be included, there are certain lands under the jurisdiction of the United States, which may be called unorganized territories. These are Indian Territory and Alaska. In both of these the population is largely Indian, and that accounts for their different treatment. Indian Territory has a government with a legislature, but it sends no delegate to Congress like the other territories, has no organized government like theirs, and in reality is only a form of local government which Congress permits to exist for the time being and which it may abolish at pleasure without feeling that it is violating any of the rights or privileges which in the organized territories are looked upon by the inhabitants as guaranteed to them by a compact with Congress. Alaska has not even as complete a government as Indian Territory. By an act of 1884 Congress provided for a governor and a district court. Owing to the influx of white people at the time of the discovery of gold in the Klondike, Congress had to pass acts in 1899 and 1900 making more careful regulations for the government.

The United States had to confront new problems in the government of colonies or territories when Porto Rico and the Philippines were acquired in 1898. These islands could not be treated like the older territories of the United States. There were those, however, who held that they were the same and that all laws passed for the United States were applicable to these outlying domains in the same way as they were to New Mexico or Arizona. Still others maintained that such was not the case and that laws passed for the United States did not apply to Porto Rico and the Philippines. The latter view was upheld by the Supreme Court in the Insular Cases decision in 1901. This made possible a new colonial system of government for the United States and brought about the abandonment of the principles of the Ordinance of 1787, so far as these island possessions were concerned. A special kind of government has accordingly been worked out for Porto Rico and another one for the Philippines. Porto Rico has a governor and other administrative officials appointed by the President, a legislature of two houses, the upper one largely appointive, and the lower one elective. The old courts of the Spanish regime, including the municipal courts, are retained, but the island is now organized as a new judicial district of the United States. The district judge, district attorney and marshal are appointed by the President. The qualified voters of the island every two years choose a resident commissioner to the United States who is recognized as such by the departments at Washington and receives a salary of $5,000. For the Philippines a still more exceptional form of colonial government has been established. The inhabitants are allowed to participate in the municipal government, but are not allowed to have a representative legislature. The executive power is in the hands of a commission of five members appointed by the President. No provision has been made for the eventual admission of either Porto Rico or the Philippines to statehood.

With the addition of these outlying dependencies to the jurisdiction of the United States the

high ideal of colonial and territorial government set by the Ordinance of 1787 has not been followed. The United States has found that it has to handle these outlying domains in much the same way as England, France and Germany handle their colonies, and with little regard to those principles which were so vigorously upheld in the Declaration of Independence. In addition to the territories, organized and unorganized, and to the dependencies, the United States now provides for the government of the District of Columbia, national forts and sites, and Indian reservations. The regulations for these, however, scarcely form a part of the colonial or territorial system of government. The same is true of the virtual protectorates which the United States exercises over Cuba and Panama.

13. United States — Beginnings of Executive Departments of the. Prior to 1789 there was no independent executive, the departments of Foreign Affairs, War, and Finance being but the agents of the old Congress, and providing governmental machinery both feeble and inefficient. The new Congress met in 1789, established three departments, State, War, and Treasury, continued the General Post-office and created the office of Attorney-General. Here was the beginning of the executive machinery; its development into the enormous civil establishment of to-day has been irregular; new functions have been assumed by the government; the scope of old ones has been enlarged and constantly the work to be performed has increased in bulk.

The Department of State.— An act of July 1789 established a Department of Foreign Affairs, the sole duty of which was to conduct our relations with foreign countries. There were other duties, however, which it was thought that this department could perform advantageously, such as issuing commissions to presidential appointees, preserving and promulgating acts of Congress and executive orders and proclamations, and being custodian of the Great Seal, so in September the designation of the department was changed to Department of State, and it was entrusted with the performance of the duties just enumerated. From time to time other duties were added to it, such as issuing and recording patents, the supervision of the census, issuing warrants for pardons, corresponding with territorial officers, etc.; but these duties were performed by it only for a time, and have one by one been transferred to other departments, until at present the State Department retains only its original functions. The clerical force of this department has always been much smaller, and its organization much simpler, than those of the other departments; but as the relations of the United States with other countries have been extended, the force employed in the offices of the department has slowly increased. In 1792, an old civil list, or 'Blue Book,' shows that this government had six representatives abroad and that the secretary of state employed eight persons in his office; in 1821 there were 10 diplomatic agents and 83 consular officers, while the office force, exclusive of the three persons employed in issuing patents, had increased to 12. In another decade it had increased to 16, while there were nine more in the diplomatic service and 51 more in the consular service. At present there are 109 chiefs of divisions, clerks, and other employees in the State Department, and over 1,200 persons in the diplomatic and consular services. The organization of the department has developed slowly; at first certain clerks would be given certain kinds of work to do, probably because of a special aptness displayed; by 1833 we find a Diplomatic Bureau with three clerks, a Consular Bureau with two, a Home Bureau, and a Bureau of Archives, Laws, and Commissions of two each, while one clerk took care of the library and performed the clerical work connected with issuing pardons and copyrights, another had charge of disbursements, while a third, in addition to translating, performed such odd jobs as fell to none of the others. The organization of the department has continued, with some changes, along the line thus indicated; the bureaus which at first were organized by the secretary having since been established by Congress and chiefs provided for them. In 1853 an assistant secretary was appointed; and since that date the offices of second and third assistant secretaries have been established.

Department of the Treasury.— The act of 1789, establishing a treasury department, provided for a secretary, an assistant secretary, a comptroller, an auditor, a register, and a treasurer. In 1792 those offices employed 100 persons; in 1903 the 18 main offices, with their 65 subdivisions, into which the department is organized, employed over 3,000 persons. In 1792 about 500 officers collected the customs revenue, which in that year amounted to $3,400,000, while in 1902 nearly 7,000 officers and other employees were engaged in collecting the $254,400,000 accruing from the customs tariff. In 1802, 400 officers collected $621,800 as internal revenue, while a century later 4,000 persons collected an internal revenue amounting to $271,800,000. The gross receipts of the government in 1791 amounted to $4,770,000, while the expenditures were $3,790,000; in 1902 the former were $651,730,000, and the latter $559,240,000. The above statements serve to illustrate the growth of the fiscal operations of the government and the corresponding enlargement of the machinery for administering them. The Treasury Department has been the department to which offices for the performance of new governmental functions, when they did not clearly belong in one of the other departments, have been attached. Thus the General Land Office, the Bureau of Navigation, the Coast and Geodetic Survey, the Light-house Establishment, the Bureau of Immigration, and other offices, have been at one time or another a part of this department. The organization of the department has undergone many changes; the present accounting system, for example, is much modified from its original form. The comptroller and auditor as at first established were soon found unable to audit all the accounts of disbursing and receiving officers; in 1817 four more auditors were appointed as well as a sec-

ond comptroller, and in 1836 a sixth auditor was added. At this time a double audit of all accounts was performed, the comptroller revising the work of the auditors, but in 1894 a system of single auditing was introduced; the office of second comptroller was abolished and the comptroller became an officer of appeals from the decisions of the auditors. The duties of these latter were redistributed so that the accounts of any one department would go to the office of but one auditor. The seven offices engaged in auditing and accounting employ at present about 1,300 persons, in place of the 35 employed in the two offices in 1792. But besides enlarging and modifying old offices, new ones have been established. At first the internal revenue that was laid appears to have been collected under the supervision of the officer in charge of the customs revenue system. In 1862 the office of commissioner of internal revenue was created and has been continued to the present time. In 1792 the office of director of the mint was established, but did not become a regular bureau of the Treasury Department until 1873. In 1798 an act was passed providing for the establishment of a fund for the relief of sick and disabled seamen and shortly thereafter marine hospitals were established; in 1870 the Marine Hospital Service was reorganized, with a supervising surgeon-general at its head, and became a regular establishment of the Treasury Department. In 1862 the government took over the work of printing its own notes and securities, and in 1874 the Bureau of Printing and Engraving was established. In 1878 the Life-Saving Service was definitely organized in the Treasury Department, although as early as 1874 it had had its beginnings under the Revenue Marine Service. Finally, with the development of a system of national banks, issuing notes secured by bond deposits, the office of comptroller of the currency was created in 1863. The other offices of the department, those of treasurer and register, have remained as they were established, except for the increase in their forces, and certain changes in their duties; the register's office having become merely the place where the machinery connected with the public debt is located; its other functions have for the most part been absorbed by the secretary's office.

Department of War.—The growth of the War Department from two offices employing 18 clerks to an establishment of 18 offices employing about 1,700 persons in Washington, and over 18,000 at large, is readily understood when the expansion of the army, particularly of the engineer department, is taken into consideration. This growth can best be considered under the following heads: (1) The command and discipline of the army. The adjutant-general's department in practically its present form was established in 1821, as was also that of the inspector-general. Prior to that time they were merged under an officer with the title adjutant and inspector-general. The inspector-general, however, appears to have had no office force at the department for some time, while that of the adjutant-general was a permanent bureau from 1821, being a continuation of the office under the adjutant and inspector-general. (2) The pay of the army. As early as 1792 there was a pay-office in the department, it being one of the two offices then in existence, but the pay department by that name was not established until 1816. (3) The supply of the army. The purchase of supplies for the army was first performed by the Treasury Department, the office of purveyor of public supplies having been established in that department in 1794. In 1812, however, the ordnance and quartermaster-general's departments were established by law, and in 1821 the office of commissary-general of subsistence was created, which, in 1835, became the subsistence department. The medical department, under a surgeon-general, was permanently established in 1818, but an act of 1813 had created the office of physician and surgeon-general, and in reality marked the beginning of the organized department. (4) The engineer department. As early as 1821 there was an office in the War Department under the chief of engineers, and this has continued to the present time. In 1818 a Topographical Bureau was established in the War Department, but in 1863 it was merged in the chief engineer's office. The engineer department employs at present over 10,000 persons in its work on rivers and harbors, boundaries, fortifications, etc. (5) Military justice. The office of judge-advocate of the army was permanently established in 1849; in 1862 its title was changed to that of judge-advocate-general; in 1864 the Bureau of Military Justice was created in the War Department and the judge-advocate-general placed at its head, but in 1884 the title was changed to Judge-Advocate-General's Department. Other bureaus have been temporarily established; thus the Bureau of Refugees, Freedmen, and Abandoned Lands carried on the work of military reconstruction in the South between 1865 and 1873; the Provost Marshal General's Bureau existed from 1863 to 1866, and in 1898, when it devolved upon the War Department to establish civil government in the new island possessions, the Bureau of Insular Affairs was created.

The Navy Department.—In 1789 there was no navy; to-day we have a naval establishment, including the Marine Corps, of 300 vessels of all kinds, 25 navy-yards and stations, 2,700 officers, 35,000 enlisted men, and 19,000 civilian employees; the task of administering the affairs of the organization that guarantees our position as a world power has grown from work so slight that it could be performed by the secretary of war in addition to his other duties, to proportions that demand the energies of a great department. We had no naval affairs until 1794, when the depredations of the Barbary powers caused Congress to authorize the building of six ships, an establishment which, as the attitude of France became a growing menace to our merchant marine, was so rapidly enlarged that in 1798 a separate Navy Department was created. The new department was small at first; in 1802 the secretary and four clerks managed its business, while an accountant's office employing 11 persons conducted its financial operations and audited its accounts; this latter office was, however, transferred to the Treasury Department in 1817. Our foreign relations continued such that the naval establishment was rapidly increased, and by 1815 the administrative work had become too great for the simple organization of the department, under which nearly every matter received the secretary's personal

attention. Accordingly in that year a board of three navy commissioners was created, for the supervision of the construction, repair, equipment, and supply of vessels, and the superintendence of navy-yards. The department now consisted of two offices: the secretary's and navy commissioners', each employing four clerks; while the establishment was composed of 118 vessels, 6 navy yards, and 1,000 officers, including midshipmen. This organization lasted until 1842, when the force of each office had increased to eight. In that year the board of commissioners was abolished, and five bureaus, each with a naval officer at its head, were created, while the clerical force of the department was increased from 16 to 30. It was about this time that the scientific work of the department, which has expanded into the Naval Observatory, Hydrographic Office, and Office of the Nautical Almanac, was definitely inaugurated. In 1859 the department force had increased to 56. In 1862 three more bureaus were added, one of them being that of steam engineering, thus marking the change in motive power; in 1865 a law officer, the judge-advocate-general, was appointed, and by 1867 the department force had increased to 100. With the creation of the new navy the increase has been more marked; there being now 240 civilian employees in the department proper, exclusive of the 150 in the scientific offices.

The Post-Office Department.— The extension of the postal service, both from point of business done and of increased usefulness, is one of the most striking phases of the development of governmental activity. In 1789 there was already a postal system, but only in a small way; there were 75 post-offices and about 2,000 miles of post-roads. The increase in number of offices was very rapid from the first; in 1800 there were 803; in 1850, 18,417; and in 1902, 75,924, while the post-roads have stretched to cover 509,540 miles. During the same period the gross revenue of the service has increased from $40,000 to $122,000,000, and the expenditures from $32,000 to $124,000,000. Meanwhile the service has been greatly extended; in 1825 the Dead Letter Office was established, and the first provisions made for foreign correspondence. In 1835 mails began to be carried on steam railroads and in 1862 the railway post-office was introduced. In 1855 the registration system was introduced; which cared for 600,000 pieces of mail the first year, and over 22,000,000 in 1902. In 1864 the money order system was put into operation, which transferred $1,360,000 during its first year; in 1867 international money orders were introduced, and in 1902 the total amount transferred by the system was over $336,000,000. Finally, in 1863, free delivery in cities was provided, and in 1897 was extended to the country. The 63 city offices, with their 685 carriers, have increased to 933 with 17,785 carriers, while the 44 rural routes established in 1897 had reached 11,199 in 1902. With this growth the department force has kept pace; in 1802 it consisted of a postmaster-general, an assistant postmaster-general, eight clerks, and one messenger; at present it is organized in over 20 divisions which employ more than 1,200 persons.

Department of the Interior.— The Department of the Interior was established in 1849, and to it were transferred the most important duties relating to home affairs. It is composed of a number of wholly unrelated offices, the most important of which are described separately below. (*a*) The General Land Office is the medium through which the public domain of the United States is administered, surveyed, and disposed of. In 1789 the public domain, composed of cessions by the various States, was 270,000 square miles in extent; with the accessions of Louisiana, the Floridas, California, New Mexico, and Alaska, this area has been enormously increased, and through the operations of the Land Office much of it has been disposed of. The business connected with the public lands was first transacted by the secretary of the treasury, who in 1800 established four land offices, each with a register and a receiver. In 1812 the General Land Office, with a commissioner at its head, was established in the Treasury Department. Four years after its establishment it employed 14 persons, while the local land offices employed 47. During the next 20 years with the westward movement the business of the office increased to a considerable extent, and the office was reorganized in 1836. The next year the office force numbered 92, the force in the field 171. In 1849 the General Land Office was transferred to the Interior Department; its present number of employees is nearly 1,800, of which 450 are in the office proper. (*b*) Office of Indian Affairs From 1789 to 1849 Indian affairs were administered by the War Department, and, during the first part of that period under the direct supervision of the secretary of war. The supply and trade of the Indians received most attention at first; by 1802 an Indian department had been organized in the War Department, consisting of 19 persons who performed the duties of agents, factors, and interpreters, and who lived among the Indians; by 1816 another office, that of superintendent of Indian trade, employing five clerks, was created, and for a time this office and the Indian department existed separately. In 1823, however, they had been united; a superintendent of Indian affairs lived at St. Louis, and 67 agents and interpreters constituted the field force. In 1832 the Office of Indian Affairs was established and a commissioner appointed as its head; with this reorganization the work of the office was enlarged; the office force numbered five at first, while 174 persons in the field performed the duties of agents, interpreters, clerks, smiths, millers, and farmers; in a few years teachers were added to the list. In this way the Indian service was extended from mere supervision of trade and supply, to the establishment of communities among the Indians, each with its medical, educational, and industrial corps. The service at present employs nearly 5,000 persons, of whom 140 are in the office in Washington. (*c*) The Patent Office. The history of the Patent Office records the change from an agricultural to a manufacturing basis in this country. The first patent law was passed in 1790 and provided for the granting of patents by a board composed of the secretaries of war and state and the attorney-general; in 1793 they were granted by the secretary of state alone. During these first years the chief clerk of the State Department performed, in addition to his regular duties, the work connected with issuing patents, of which, by 1793, there had been only 57. Before

long a patent office was established in the State Department; at first this employed a force of three persons, but in 1836 it was reorganized, a commissioner was appointed as its head and the force had increased to 25. In 1849 the office was transferred to the Interior Department; its present force numbers about 750. Meanwhile the business transacted has increased with great rapidity. To 1793 57 patents had been issued, to 1836, 9,957; the increase has been most marked since 1848; in that year 584 patents were issued; in 1849, 988; while in 1900 the number was 24,660, making a total for the first 110 years of the government of over 674,000. (*d*) The Pension Office. Before 1789 pensions were granted and paid by the respective States, but in that year the Federal government assumed the obligation. The Pension Office was established in the War Department in 1833, the work having been performed under the direct supervision of the secretary of war prior to that time. During the first year of its existence the office employed 22 clerks; in 1902 it employed 1,741 in Washington and 432 in the field. This growth has come about with the great expansion of the pension system; in 1792 there were 1,472 pensioners; in 1902 there were 999,446, and the amount paid was $137,504,267. (*e*) Other offices. The Geological Survey, established in 1879, was the outcome of surveys made under specific appropriations since 1834; while the Bureau of Education was created in 1867.

Other Departments and Offices.— The origin of the Department of Agriculture can be traced to 1839 when the commissioner of patents was directed to submit an annual report on agricultural progress. In 1862 a Department of Agriculture with a commissioner at its head was established, which, in 1889, was made an executive department. Among its bureaus should be mentioned the Weather Bureau, established in 1890, but originating in the office of the chief signal officer of the army in 1870. The Department of Justice was established in 1870 and grew out of the Attorney-General's Office. The latest executive department, that of Commerce and Labor, was established in 1903, taking over from other departments such offices as the Bureau of Statistics, which originated in the Treasury Department in 1820; the Light-House Board, created in the Treasury Department in 1852; the Coast and Geodetic Survey, which originated with the coast survey made under the treasury in 1807; the Bureau of Immigration, established in 1891, and others. The establishment of the Department of Labor (now in the Department of Commerce and Labor) in 1884, together with the creation of the Bureau of Corporations (also in that department) prompted by the growing agitation in regard to trusts, as well as the creation in 1887 of the independent Interstate Commerce Commission, all mark a tendency on the part of the government to inquire into and regulate conditions of labor and trade. Finally should be mentioned the Civil Service Commission, established in 1883, and necessitated by that growth of the governmental machinery which has been described above.

W. G. Leland,
Carnegie Institution, Washington.

14. United States — The Cabinet of the. The Cabinet, as the name is used in American affairs, is the President's council. It is composed of the heads of the nine great executive departments. Four of these are older than the government under the Constitution, for the Old Congress had found it necessary to establish a Department of Foreign Affairs, of the Treasury, and of War. The Postoffice Department was established by the Continental Congress before the Declaration of Independence. The framers of the Constitution assumed that such departments would continue to be necessary. They perceived also that the heads of these should be at the service of the chief executive. Hence the provision that he — "the President — may require the opinion in writing of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices." The first Congress under the Constitution re-established the executive departments already existing. To the Foreign Office it added certain internal affairs, and changed the name to the Department of State. The office of Attorney General was also established in 1789, being provided for by the great act that established the Federal Courts. In 1870, 22 June, the Attorney-General was made the head of a Department of Justice. Four additional departments have been created as the expansion and progress of the country have demanded. The Department of the Navy was established in 1798, 30 April; the Home Department, popularly called the Department of the Interior, in 1849, 3 March; the Department of Agriculture, in 1889, 9 Feb.; and the Department of Commerce and Labor, in 1903, 14 Feb. Although the Constitution of the United States refers in two places to the heads of departments, it does not imply that they are to form a council to advise the President on questions outside of their respective departments. The distinction between the two functions is illustrated by the following episode. During the interval, 21 Feb.–28 May 1868, Secretary Stanton was on duty at the War Office, while Lorenzo Thomas, who had failed to get possession of the office, was attending the Cabinet sessions. Left without a council by the Constitution, Washington sought one for himself. At first he turned to the Senate. He had Constitutional authority for advising with this body on the two subjects of appointments and treaties. But his visits to the Senate chamber were coldly received. At the same time he singled out certain men whom he consulted as individuals. On 27 Aug. 1790, he formally requested written opinions, on a question of general policy, of Hamilton, Jefferson, Knox, Randolph, Jay, and Adams. These men were respectively the Secretary of the Treasury, Secretary of State, Secretary of War, Attorney-General, Chief Justice and Vice-President. On 4 April 1791, the President addressed a letter to the three Secretaries which brought about the first cabinet councils to which there is any reference. The occasion was his own absence from the seat of government. He herein expressed the wish that if any important cases arose during his absence, the Secretaries of the Departments of State, Treasury and War may hold consultations thereon to determine whether they are of such a nature as to demand his personal attendance at the seat of government. If the Vice-President is at the seat of government, the President wishes that he also be consulted. One or more consultations were held agreeably to this

suggestion. Besides the officers specified, the Attorney General was present. During the year 1792, the three Secretaries and the Attorney-General occasionally met the President at his house for consultation. But it was in 1793 that frequent consultations gave the council a definite place. The circumstance of this was the conduct of Minister Genet. In August of this year, Jefferson referred in his diary to the President's council as «our cabinet.» In the administration of John Adams the word was quite commonly used. It has never been introduced into the laws; but it can be found in the debates of Congress and in the President's messages. The rule that Washington followed in the choice of his counsellors was to summon those officers who filled sufficiently high places in the government, and who held office at his pleasure. Under Jefferson the whole executive body was for the first time at harmony with itself. The cabinet now had five members. For a period of seven administrations it maintained the status of an advisory body which expected to be called for consultation on all important questions, and at the same time had no power to enforce its views upon the chief executive. This was interrupted only by the disorders that resulted from weakness in the War and Navy Departments during the War of 1812. All the Presidents of this period succeeded to that office after being Secretary of State. Moreover, Madison, Monroe, and John Quincy Adams retained in their cabinets a number of their colleagues of the preceding administration. This stability was favorable to the cabinet prestige. Jackson reduced the Cabinet to a more humble status. However, the popular idea of the «Kitchen Cabinet» is a mistake. During the period 1829–31 strained personal relations growing out of a scandal in the family of the Secretary of War made it almost impossible for the six heads of departments to meet together. The Postmaster-General was now included with the others. But it does not appear that the President was at this period guided by the counsels of the editors who had helped to elect and had received positions under the government. He was on most cordial relations with the Secretary of State and the Secretary of War. After the reconstruction of the cabinet, councils were held regularly or at least frequently. In the matter of the removal of the deposits from the Bank of the United States, he acted contrary to the cabinet opinion, and found his chief adviser in Amos Kendall, who is the most remarkable figure in the commonly accepted «Kitchen Cabinet.» It might be expected that a great war would give to the Cabinet an increased importance. This was not the case in the War of 1812 or the Spanish War of 1898. The cabinets of Madison and McKinley did not meet the extraordinary demand upon them with notable strength. But those of Polk and Lincoln profited by their opportunity. The period from Jackson to Polk was one of cabinet debasement. That from Fillmore to Lincoln was one of cabinet ascendency. The executive council now had seven members. It had also begun to meet at regular times. Pierce has been the only President who made no change among the heads of departments during four years. This has been pointed to by Southern writers as proof of great power to control men. But Pierce was led by his council. The Cabinet ascendency culminated under Buchanan. During the last months of his administration, the President was under the dictation of Black and Stanton, the Secretaries of State and War. The high position occupied by the Cabinet during the Civil War was not at the expense of the presidential prerogatives. If Seward and Chase and Stanton were exercising extraordinary powers, Lincoln was doing the same. Indeed he consulted his advisers in the matter of the Emancipation Proclamation only after the document was already composed. The most momentous episode in Cabinet history is Johnson's attempt to remove Secretary Stanton from the War Department contrary to the Tenure of Office Act. This led to the impeachment of the President. Congress repealed the act early in the next administration, thereby acknowledging that it was an encroachment upon the President's rights. Since the reconstruction of the government, the status of the Cabinet has been on the whole as it was before the administration of Jackson. In Cleveland's first administration, the eighth member was added; and under Roosevelt, the ninth. The President's council bears the name of the great executive organ of the British government. But its functions are much inferior. The ministers who compose the British cabinet are members of Parliament. They digest the great bills that are to be introduced, and direct their course in the House of Commons and the House of Lords. Their functions thus combine those of the standing committees of Congress with the direction of executive affairs. Under the American system, the executive officers are rigorously excluded from the floors of Congress. The chief avenue through which the heads of departments can influence legislation is the standing committees. The question of admitting cabinet members to the floors of Congress for the purpose of giving information and of allowing them to participate in the debate of questions pertaining to their respective departments has been before Congress several times. See CABINET; KITCHEN CABINET; UNITED STATES — CABINET OFFICERS, ETC., OF THE.

An account of the way a President transacts business with his cabinet officers is given by President Harrison in 'This Country of Ours' (1901). For remarks by President Hayes concerning the attitude of a President towards the advice of his cabinet, consult Stevens' 'Sources of the Constitution of the United States,' (1894).

MARY L. HINSDALE,
Ann Arbor, Mich.

15. **United States — The Interpretation of the Constitution of the.** The interpretation of the Constitution began even before its adoption. As it came from the hands of the convention it contained no bill of rights. This was made a ground for fierce attack in many of the ratifying conventions. Said Patrick Henry in the Virginia convention: «The necessity of a bill of rights appears to me to be greater in this government than ever it was in any government before. . . . I repeat that all nations have adopted the construction that all rights not expressly or unequivocally reserved to the people are impliedly and incidentally relinquished to rulers as necessarily inseparable from the delegated powers.»

The friends of the Constitution, on the con-

trary, maintained that a bill of rights was neither necessary nor desirable. Said Hamilton in the 'Federalist': "I go further and affirm that bills of rights in the sense and to the extent in which they are contended for are not only unnecessary in the proposed Constitution, but would even be dangerous. They would contain various exceptions to powers not granted, and on this very account would afford a colorable pretext to claim more than were granted."

This argument, however, did not satisfy. Seven of the States at the time of ratifying the Constitution asked for 124 amendments, counting duplicates. Congress paid no attention to these but offered instead to the States 12 amendments for adoption. All but the first two, which were unimportant, were adopted and constitute the first 10 amendments, or Bill of Rights. Theoretically, Hamilton's position is correct, but in view of the wide extent of powers assumed by Congress under the elastic clause of the Constitution, there is no doubt that the adoption of these amendments was a wise act. They at least set limits beyond which Congress may not go. These amendments are limitations upon Congress and not upon the States.

With the adoption of the Constitution began at once discussion as to the character of the government it created. It was known to be a federal government, one wherein certain powers were granted to the general government and all powers not granted were reserved to the States. But the extent of the powers granted and the character of the powers reserved; in a word, the true relationship existing between the states and the general government was not known. Discussion over this question took the form of three great controversies, the subjects of which were: (1) The nature of the implied powers of Congress. (2) The right of a State to nullify and secede. (3) The status of the seceding States after the Civil War.

The question of the nature of the implied power of Congress arose over the attempt of Hamilton to have a national bank incorporated by Congress. Jefferson, then Secretary of State, led the opposition. He argued that Congress had only such powers as were expressly granted or necessarily implied. The necessity, moreover, must be an absolute one. Only such means were granted according to Jefferson "without which the grant of the power would be nugatory." Hamilton, on the contrary, maintained that Congress had three kinds of powers: (1) Those expressly granted. (2) Those implied. (3) Resulting powers; that is, those "arising from the whole mass of the power of the government." Those powers were implied, according to Hamilton, which were "fairly applicable." They need not be absolutely necessary but merely "appropriate and proper." Washington, after reading the arguments of both men, accepted that of Hamilton and signed the bill.

Later in the case of McCullough *v.* Md., the Supreme Court was called upon to decide the constitutionality of the bank. Marshall, in his opinion followed very closely the reasoning of Hamilton. He said: "Let the end be legitimate, let it be within the scope of the Constitution and all means which are appropriate, which are plainly adopted to that end, which are not prohibited but consist with the letter and spirit of the Constitution are constitutional." This question has arisen many times in our history. In 1803 Louisiana was purchased. The Republican party under Jefferson were responsible for the act. Jefferson himself was consistent in that he did not believe that Congress had any power to annex new territory. He therefore asked Congress to propose an amendment granting this power. This not being done, he favored the dangerous doctrine of "shutting up" the Constitution until the annexation should be accomplished. Strange to say the Federalist, or broad construction party, now reversed its position and denied the right of Congress under the Constitution to annex new territory. This is but one of the many examples which testify to the fact that the position of parties as well as of individuals has in our history been often determined by expediency rather than principle.

The Federalists also opposed the embargo acts of Jefferson's administration as being unconstitutional. They distinguished them from their own embargo on the ground that their acts were but temporary and so a regulation of commerce, while the acts complained of were permanent and so not a regulation but a destruction of commerce. One of the chief occasions of this controversy was over the question of internal improvements. This question first seriously arose in Madison's administration when the President, doubting the power of Congress to appropriate money for internal improvements vetoed the "Bonus Bill." Monroe for the same reason vetoed the Cumberland Road Bill, and Jackson the Maysville Road Bill. Jefferson, Madison, Monroe, Jackson and Polk all in messages to Congress asked that an amendment be proposed granting this power. The Whig party all along maintained the constitutionality of such appropriations and such has for a long time been accepted as the true interpretation. The last great occasion for the discussion of the subject was in regard to the issue of legal tender notes by Congress during and after the war. In Hepburn *v.* Griswold the court declared that Congress had no power to make such an issue, but in the Legal Tender Cases this decision was overruled and in Juilliard *v.* Greenman the issue of such notes in time of peace as well as war was upheld. In these last cases the doctrine of implied powers received a broader meaning than had ever before been given to it.

The question of broad or strict construction of the Constitution has been the only permanent dividing line between the great political parties. Other issues have at times arisen and brought into being parties, but they have been but temporary. The reason is simple. Broad or strict construction is the result of a deeper difference; one that exists in human nature. Some men by nature believe in government, in order and system. Such men are nationalists and favor a broad construction of the Constitution. Other men by nature believe in the individual, even at the expense of good government. Such men are particularists and favor a strict construction.

Nullification and Secession.— The Alien and Sedition Laws (q.v.) were passed in June and July 1798, respectively. In protest were passed in November and December 1798 the Kentucky and Virginia Resolutions (qq.v.) which contained at least "the first germ of the doctrine of nullification." The Virginia Resolutions declared:

That this assembly doth emphatically and peremptorily declare that it views the powers of the federal government as resulting from the compact to which the States are parties, as limited by the plain sense and intention of the instrument creating that compact, as no further valid than they are authorized by the grants enumerated in that compact; and that in case of a deliberate, palpable, and dangerous exercise of other powers, not granted by the said compact, the states which are parties thereto, have the right and are in duty bound to interpose, for the purpose of arresting the progress of evil and for maintaining within their respective limits the authorities, rights, and liberties appertaining to them.

The Kentucky Resolutions declared:

That to this compact each State acceded as a State and as an integral party; that this government, created by this compact was not made the exclusive or final judge of the extent of the powers delegated to itself, since that would make its discretion and not the constitution the measure of its powers, but that, as in all other cases of compact among parties having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress.

Delaware, Rhode Island, Massachusetts, New York, Connecticut, New Hampshire and Vermont responded to these resolutions, all opposing the doctrines laid down. In response Kentucky passed the Resolution of 1799 which said: "That the several States have the unquestioned right to judge of the infraction; and that a nullification by those sovereignties of all unauthorized acts done under color of that instrument is the rightful remedy."

Later it was claimed that these resolutions were authority for the nullification doctrine of Hayne and Calhoun. This is a mistake. Madison in 1831 denied that nullification by a single State was meant. It is true the Kentucky resolutions, and especially those of 1799, are stronger in their language, but though the word "nullify" does occur in these last resolutions, it is not to be done by a single State but by "those sovereignties." The difference between nullification as used by Hayne and Calhoun and as used by Kentucky and Virginia in their resolutions, is that in the former case the right of a single State to nullify subject to the revokal of a three-fourths vote of the States was meant, while in the latter case only the constitutional right of three fourths of the States to act in convention was meant.

Between 1798 and 1832 when South Carolina declared null and void the tariffs of 1828 and 1832, the right of a State to resist the exercise of undelegated power by the Federal government was often asserted. In 1809 the State of Pennsylvania ordered out its militia to resist the enforcement of an order of a Federal court. In 1809–10 the cities and legislatures of New England were a unit in denouncing the Embargo and Force Acts as unconstitutional and in threatening State interposition. In 1814 the Hartford Convention was called to consider what action should be taken to resist the continuance of the war with England. Delegates were present from the States of Massachusetts, Rhode Island, Connecticut, New Hampshire, and Vermont. The convention in its resolutions declared that "it is as much the duty of the State authorities to watch over the rights reserved as of the United States to exercise the powers granted." In words almost identical with those used in the Virginia resolutions it declared that "it is not only the right but the duty of such a State to interpose its authority for their protection." In 1820 occurred the contest between the United States bank and the State of Ohio. The State had levied a tax of $50,000 on each of the branch banks within its jurisdiction, and had by force taken the money from their vaults. The bank sued the officers and won their suit. Ohio in turn protested and "approved the resolutions of Kentucky and Virginia." In 1824 was passed the tariff called the "Woolens Bill." Virginia, North Carolina, South Carolina, Georgia, Alabama, and Mississippi adopted resolutions of protest, laying down again the doctrine that the Constitution is a compact and that there is no common judge. In 1825–6 Georgia successfully nullified the decision of the Federal Supreme Court in regard to her right to exercise jurisdiction over the lands of the Indian tribes within her borders. It was not, however, until South Carolina adopted the South Carolina Exposition written by Calhoun in 1828, that we have an official assertion of the constitutional right of a single State to nullify an act of Congress.

The position taken by Calhoun briefly stated was:

1. The Constitution is a compact to which each State is a party. The General Government is not a party to the compact but an agent thereof.

2. The Constitution gives to the General Government certain sovereign powers, but the exercise of sovereign powers and sovereignty itself are two different things. The States alone are sovereign.

3. When the General Government, or agent, exceeds the powers granted to it, any one of the principals (States) has the right to declare such act void as to itself.

4. The General Government, or agent, may appeal in such case to all the principals. If three fourths of the States, who are the principals, decide that the power in question belongs to the General Government, the nullifying State must yield.

Calhoun denied that the Federal Supreme Court was constituted a tribunal to decide such controversies, because

1. There are many questions which may be matters of dispute, that could not come before the Supreme Court at all, being political in nature.

2. The Federal Supreme Court had already shown its prejudice.

3. The Federal Supreme Court is but a part of the General Government, and to allow it to be the final judge would be to allow the General Government, or agent, to determine the extent of its own powers, and that says Calhoun "would be monstrous and has never heretofore been claimed in similar cases." Calhoun also laid great stress on the argument that in case a State nullified an act of Congress the General Government could not successfully enforce such nullified act by the processes of the courts. In a contest of this kind Calhoun was certain the State must win.

Secession.—The doctrine of nullification and that of secession are not to be confounded. One does not necessarily go with the other. While more destructive than that of nullification, the doctrine of secession is nevertheless more logical and consistent. It follows directly from the compact theory of the Constitution. It is one thing to say that a sovereign State which is a party to a compact may, when it sees fit, with-

draw from the compact. It is another thing to say that such State may remain in such compact, receive the benefit of it and yet refuse to be bound by it. There were, therefore, many who believed in the right of secession, who denied the right of nullification. Said Jefferson Davis in his farewell speech in the Senate: "I hope none who have heard me will confound this expression of mine with the advocacy of the right of a State to remain in the Union and to disregard its constitutional obligation by the nullification of the law. Such is not my theory. Nullification and secession, so often confounded, are indeed, antagonistic principles."

The Civil War settled forever the question of nullification and secession. Said the Supreme Court in Texas *v.* White in 1868: "The Constitution in all its provisions looks to an indestructible Union composed of indestructible States. When, therefore, Texas became one of the United States she entered into an indissoluble relation. . . There was no place for reconsideration or revocation except through revolution or the consent of the States." The Civil War, however, did not settle the question of the true relations between the States and the Federal Government. At the conclusion of the war the North was in an anomalous position. It had denied the right of a State to secede. It had denied the validity of acts of secession. The South, being beaten, accepted for its own purposes this reasoning, and demanded that the seceding States be given all the rights of States, such as representation in Congress and the right to exercise all the power reserved to the States. This the North was unwilling to do, but insisted rather that though States they be denied the rights of States until reconstructed. There were five theories advanced as to the status of the seceding States after the war.

1. The Southern theory which claimed, as stated above, that the seceding States were entitled to all the rights of States.

2. The Presidential theory which claimed that the States were the same as always. The only offense committed was by disloyal individuals within the States. It was therefore a question for the President to settle through the exercise of his pardoning power.

3. Conquered Territory theory, which held that the war had temporarily broken all the bonds between the United States and the seceding States and that they were as conquered foreign territory.

4. State Suicide theory, which was that the States had by seceding committed suicide and were again territories, under the plenary power of Congress.

5. Congressional theory, which was that the acts of secession were void and unavailing to take the State or people out of the Union. Nevertheless the States had by such act forfeited their rights under the Constitution and lost their status as "States." They remained, according to this theory, in this condition until Congress in its discretion, acting under its power to guarantee to the States a republican form of government, should admit them again to the full status of "States."

This was the theory under which Congress acted in its Reconstruction policy. The constitutionality of the Reconstruction Acts was never directly passed upon by the Supreme Court. A case was before it once involving this question, but before a decision was reached the jurisdiction of the court in the case was taken away. In Texas *v.* White and White *v.* Hart, however, the court, though specifically refusing to pass upon the constitutionality of the various Reconstruction Acts, did practically declare sound the Congressional theory, when it said: "These new relations imposed new duties upon the United States. The first was that of suppressing the rebellion, the next was that of re-establishing the broken relations of the State with the Union. The authority for the performance of the first had been found in the power to suppress insurrection and carry on war; for the performance of the second, authority was derived from the obligation of the United States to guarantee to every State in the Union a republican form of government."

The nature of the government created by the Constitution is then a settled question. The Civil War not only destroyed the doctrine of State sovereignty, but made unpopular any assertion of the doctrine of State Rights. The doctrine of implied powers, as laid down by Hamilton, is now accepted without dispute. The danger is that in this emphasis of the powers of the General Government, the powers of the States will be forgotten and overridden. This is the great question of interpretation for the future. See also CONSTITUTION OF THE UNITED STATES.

ALONZO HUBERT TUTTLE,
Professor of History, University of Ohio.

16. United States — The Alien and Sedition Laws of the. Alien and Sedition Laws, in the political history of the United States, were four laws passed by the Federalist party in Congress, June and July 1798, during President Adams' administration. These laws gave rise to the first nullification proceedings in the South, namely, the Kentucky Resolutions (q.v), passed in November 1798, and the Virginia Resolutions (q.v.), passed in December 1798, and resulted in the final defeat of the Federalist party. The Federalists, who had controlled the government from its very inception, resented all hostile criticism of their conduct of national affairs and spurned the charge made by the Republicans that the Federalists were strongly inclined toward England and were trying to embroil the American nation in a war with France. Especially obnoxious to them were the embittered exiles who had been flocking to the shores of America from 1790. These exiles, who were French sympathizers, and, therefore, affiliated with the Republican party, attempted to create sentiment in favor of France, thus blocking the way of the Federalists, who desired to punish France for her outrageous attacks on American commerce and for her hostile attitude to the United States after the conclusion of the Jay Treaty. Moreover, by obtaining control of journals here and there throughout the country, or by establishing sheets of their own, they would publish scurrilous and offensive attacks upon the ruling party of Federalists, which the latter felt very keenly.

In 1797, the Federalists had a majority in the Senate, but the House was Republican. Therefore, the measures for defense against French aggression, which the Federalists at-

tempted to pass, were all defeated by the Republican majority in the House. But the timely publication of the "X. Y. Z." correspondence (q.v.) showing the scandalous conduct of Talleyrand and the French directory produced such an outburst of popular indignation against France throughout the entire country that the defenders of France were completely silenced, and even the moderates, who had sided with the Republicans, went immediately over to the support of the Federalists. The popular demonstration appeared to furnish a complete vindication of the course of the Federalists, who gained control of both houses and now were supreme. No sooner had they secured entire control of the reins of government than they began to carry out their party programme of suppressing all hostile criticism of the Federal administration, even at the risk of stifling liberty and freedom of speech.

Accordingly, in 1798, the Federalists enacted three laws concerning aliens: (1) The new naturalization act, passed 18 June; (2) the alien acts, passed 25 June; (3) the sedition act, passed 6 July. The new naturalization act prolonged the requisite term of residence before naturalization from 5 to 14 years, and the term after declaration of intentions from 3 to 5 years; denied alien enemies naturalization, and required all white aliens to be registered on arrival, under penalty, and such registry to be the only proof admitted on application for naturalization. The alien act authorized the President, for the next two years, to order out of the country any aliens whom he thought dangerous or engaged in conspiracy. Any alien thus notified who should be found at large without the President's license might be imprisoned for three years, and could never thereafter be admitted to citizenship. The sedition act empowered the President to arrest or deport all resident aliens when war was declared against the United States. As finally approved by the President, the first section of the sedition act made it a high misdemeanor, punishable by a fine of $5,000 and five years' imprisonment, for persons unlawfully to combine and conspire to oppose any measures of the government directed by proper authority, or to interfere with the operation of any law of the United States, or to intimidate any person from accepting or holding Federal office, or to commit, advise or attempt any insurrection, riot, or unlawful assembly. The second section prescribed that the writing, printing, or publishing of any false, scandalous and malicious writings against the government of the United States, or either house of Congress, or the President, with the intent to defame or bring any of them into contempt or disrepute, or to arouse against any of them the hatred of the good people of the United States, or to stir up sedition within the United States, or to excite any unlawful combination for opposing or resisting any law or lawful executive act, should be punished, on conviction before the United States court having jurisdiction, by a fine not exceeding $2,000 and imprisonment not exceeding two years. The third section provided that the truth of the matter contained in the publication might be given in evidence as a good defense, the law and fact under the court's direction to be determined by the jury. A clause added by Bayard of Delaware limited the term of operation to 4 March 1801, so that it should expire with the Federalists if they should lose in the succeeding presidential election and the Republicans should not have the credit of repealing it.

These acts were denounced by the Republicans as being in opposition to the Constitutional rights of the States to permit such immigration as they chose up to the year 1808 (specifically applicable to slaves), as assuming national powers over persons under the jurisdiction of their States and as violating the general right of trial by jury. On these points the laws were attacked by the Kentucky and the Virginia resolutions, which Jefferson and Madison drew up, and which suggested nullification as the proper remedy.

The alien and sedition laws were obnoxious to the Republicans, not so much on the ground that they were inimical to civil liberty, but rather because they were regarded by that party as an encroachment upon the principle of States' right. It is this aspect of the laws that gives them their chief interest and importance. The alien law, it is to be observed, was not enforced, nor would it have produced much disturbance among the Republicans if it had been strictly enforced. But the sedition act, which cut very near the root of civil liberty and was contrary to the underlying principle of American institutions, was enforced, since at least six prosecutions took place under it and Judge Chase invoked its authority for his scandalous partisan decisions. Upon the accession of the Republicans to power, these odious laws either expired by limitation or were repealed.

EDWIN W. BOWEN,
Department of Latin, Randolph-Macon College.

17. United States — Judiciary of the. In the colonies the courts consisted of judges appointed, save in Connecticut, by the crown or by its representative, the governor of the colony. In the beginning, in some of the colonies, appeal lay from these courts to the General Assembly. In many of the colonies the governor's council, which was the upper legislative body, was also the highest court, and in all of the colonies appeal could be had to the King in Council. Acts of the Colonial Legislature which were repugnant to the laws of England or to the charter were void. Winthrop *v.* Lechemere is one of the very few cases where a colonial statute was declared void by the Privy Council as being contrary to the laws of England. Under the Confederation there were three courts that were, in a way, Federal. (1) Congress by an "especial process" was given power by the Articles to determine disputes between States as to "boundary, jurisdiction, or any cause whatever." Congress was called upon to exercise this power but three times,—the most important one being the dispute between Connecticut and Pennsylvania in regard to the "Wyoming" territory. (2) Congress could appoint "courts for the trial of piracies and felonies committed on the high seas." State courts were used for this purpose. (3) Courts of Appeals in Cases of Capture.—This was the only permanent Federal court and is important, since it was the "predecessor" of the Supreme Court. Some 118 cases were tried before this court, among them being the famous

Olmstead case. "It could hardly be," says Prof. Jameson, "that so many cases should be brought by appeal from State courts to a Federal tribunal, without familiarizing the public mind with the idea of a superior judicature in Federal matters, exercised by Federal courts. The court of appeals in cases of capture may therefore be justly regarded not simply as a predecessor but as one of the origins of the Supreme Court of the United States." This statement is thought by some to be too strong, especially in view of the fact that not once was this court referred to in the Federal convention.

The need of a Federal judiciary was recognized as a paramount one by every member of the Constitutional Convention. It was a part of every plan introduced. On 14 June the convention agreed *nem. con.* to the first clause of the ninth resolution of the Virginia plan, which read "that a national judiciary be established." In regard to the details there was great difference of opinion as to three points. (1) Should inferior courts be provided for. (2) How should the judges be appointed. (3) What should be the jurisdiction of courts created.

At first, the convention decided that the "Federal judiciary should consist of one supreme tribunal and one or more inferior tribunals." Almost immediately "one or more" was struck out. Rutledge, among others, objected to the creation of inferior courts, holding that the State courts should be used instead. Madison and Wilson argued strongly for the necessity of inferior Federal courts. A compromise was reached by providing that Congress might create them if necessity occasioned. This clause was probably the ground of the most bitter attack made on the Constitution in the ratifying conventions called by the States. They saw in it the complete destruction of the power of the State judiciary.

In regard to the appointment of the judges the greatest discussion took place. At first it was decided that the national legislature should appoint, then it was changed to the Senate, and finally, at the very end of the convention, the report of the "Committee on Unfinished Portions," putting the appointment in the hands of the President, by and with the advice and consent of the Senate, was adopted.

The question of jurisdiction was one full of difficulty and it is doubtful if, when they were through, the convention fully realized the great power they had given to the federal judiciary. At one time it was decided that the jurisdiction of the national judiciary should extend "to the trial of impeachment of officers of the United States," but this was later omitted. It was not until late in the convention, 27 Aug., that on motion of Dr. Johnson the jurisdiction was extended to cases arising under the constitution and on motion of Rutledge to cases arising under treaties.

As finally adopted the constitution provides for two kinds of jurisdiction for the Supreme Court: original and appellate. It has original jurisdiction in all cases affecting "ambassadors, other public ministers and consuls, and those in which a State shall be a party." Its appellate jurisdiction is within the control of Congress and was largely fixed by the Judiciary Act of 1780.

In the beginning the Supreme Court was weak and gave little promise of its present power. When appointed a second time as chief justice, Jay declined because he was "perfectly convinced that . . . it (the Supreme Court) would not obtain the energy, weight and dignity which was essential to its affording due support to the National Government; nor acquire public confidence and respect, which as the last resort of the justice of the nation it should possess." To-day the Supreme Court is without question the most august tribunal in the world. Its great power has come from the fact that it has maintained the right to declare void as unconstitutional Federal and State statutes. The origin of this power is a matter of controversy. It is claimed by some to be expressly granted by the constitution, and to have been so intended by the "Framers." There is no doubt that some members of the convention were of the opinion that the constitution as adopted did confer this power. Gerry, Gouverneur Morris, Sherman, Wilson, Mason and Luther Martin expressed themselves in the convention to this effect. It is doubtful, however, if very many members believed, or at least realized, that such was the case. No one protested when Mercer and Dickinson declared that no such power should belong to the courts. Madison himself insisted that Congress be given the power to negative acts of the State legislature, on the ground that otherwise there would be no check upon the power of the States to pass laws contrary to the Federal constitution. Another view is that this great power, though not expressly granted, is implied from the fact that the constitution is the supreme law of the land and the courts must apply the law. When therefore there are two laws like the constitution and a Federal or State statute contradicting one another, both applicable to a given set of facts, the court cannot apply both, but must reject the statute and apply the constitution, for this is the supreme law. There are a number of cases where the State courts asserted this right before the adoption of the constitution. In 1780 the court of New Jersey is said to have declared its right to pronounce unconstitutional acts void. In 1782 in Commonwealth *v.* Caton, Justice Wythe of the Virginia court in strongest language declared that "if the whole legislature should attempt to overleap the bounds prescribed to them by the people, I, in administering the public justice of the country, will meet the united powers at my seat in this tribunal, and pointing to the constitution will say to them, here is the limit of your authority and hither shall you go but no further." In Bayard *v.* Singleton, decided in North Carolina in 1787, an unconstitutional act was declared void, and about this time according to a letter written to Jefferson by J. B. Cutting, the Massachusetts Supreme Court pronounced void a statute in that State. Rutgers *v.* Waddington decided in 1794 by the Mayor's Court in New York and Trevett *v.* Weeden, decided in 1786 by the Supreme Court of Rhode Island, are often cited as instances of the same kind, but upon examination will be found to have involved different considerations. The principle therefore was not entirely new when the Federal Supreme Court began its work, but it was by no means a generally accepted principle. In 1800 in Cooper *v.* Telfair, the Supreme Court itself expressed its doubt upon the matter. It was not until 1803 when

Marshall read the opinion of the court in Marbury *v.* Madison that the question was definitely settled. Congress had conferred upon the Federal Supreme Court original jurisdiction in regard to writs of mandamus. Acting under this law, Marbury petitioned the court to grant a writ commanding Madison, the Secretary of State, to deliver to him his commission of office, he being one of Adams' midnight appointees. The court refused to issue the writ. It conceded that Madison, though Secretary of State, might be compelled to perform such a ministerial duty, but it denied that it had any original jurisdiction in the matter. The constitution having defined the original jurisdiction of the court, such definition was exclusive and any act of Congress adding thereto was contrary to the constitution and therefore void. This decision became at once the accepted rule and has been followed almost without question ever since. The reasoning of Marshall in this case is luminous and justly famous, but possibly it has been given greater praise than is due. The dissenting opinion of Justice Gibson of the Pennsylvania Supreme Court in Eakin *v.* Raub (12 S. and R. 330) in which opinion he denies the right of the State Supreme Court to declare void, as unconstitutional, a State statute, is considered by Prof. Thayer to be an abler argument on the subject than that of Marshall.

The history of the Supreme Court naturally falls into four periods: (1) Prior to John Marshall's appointment. (2) Marshall as Chief Justice. (3) Taney as Chief Justice. (4) From Taney to the present time. During the first period which extends from 1789 to 1801 Jay and Ellsworth served as Chief Justice. Rutledge and Cushing were appointed during this time to this position but the former failed of confirmation and the latter refused to accept. Jay also refused a second appointment. During this period six constitutional cases were decided, the most important being the case of Chisholm *v.* Georgia, wherein the court declared its right to entertain a suit against a State. The States took great offense at this decision and as a result the 11th amendment was adopted. Though the volume of business done was small, this period was not unimportant, for at this early day the court gave to the constitution that nationalistic interpretation which prepared the way for Marshall. "The real importance," says Judge Cooley, of the Supreme Court, "was never greater than at first."

In the period of Marshall's chief justiceship the court was lifted to its present strong position. Though not so learned in the law as either Story or Taney he was superior to both in his matchless power of analysis and logic. During his 34 years of service as Chief Justice 1,116 decisions were handed down. Of these Marshall wrote 519, the remainder being divided among the 15 associate justices who sat on the bench during that time. Marshall was a strong Federalist and, carrying his court with him, gave to the constitution that broad national interpretation that has made possible the later development of the nation. During this period four great principles were established. (1) The right of the Federal Supreme Court to declare void a Federal statute. (2) The right of the same court to hear cases on error from a State Supreme Court. (3) The principle of the implied power of Congress. (4) The right of the Federal Supreme court to declare void a State statute. The first principle was established in 1803 in Marbury *v.* Madison. The second was established in 1816 in Martin *v.* Hunter's Lessee and again in 1821 in Cohen *v.* Virginia. The doctrine that Congress has not merely the powers expressly granted and those implied by absolute necessity but as well all other powers not forbidden by the spirit or the letter of the constitution, which are appropriate and plainly adapted to the carrying out of the express powers, was laid down in 1819 in McCulloch *v.* Maryland and again in 1824 in Osborn et al *v.* the Bank of the United States.

The right of the Federal Courts to declare void a State statute, as contravening the Federal constitution was determined in 1810 in Fletcher *v.* Peck, in 1819 in the Dartmouth College case, in 1824 in Gibbons *v.* Odgen, in 1850 in Craig *v.* Missouri, and in many other cases since.

The period of Taney is the period of reaction. Five judges were appointed in the last ten years of Marshall's term. Four of these had little sympathy with the nationalistic theories of Marshall. Toward the end, the court several times refused to hand down a decision, without a rehearing, owing to division among the judges. In 1845–6 three new vacancies were filled by Democratic appointees and by 1861 the court was solidly Democratic. The tendency during this time was toward a stricter construction of the constitution and an extension of the powers of the States. The change in the character of the court was evidenced soon after Taney's appointment in the decision in Briscoe *v.* Bank of Kentucky, handed down in 1837, wherein the court, departing from the former decision of Marshall, declared that bank notes issued by a State bank of which the State was the sole stockholder were not bills of credit within the meaning of the Federal Constitution. The leading case during this time is the Dred Scott case (q.v.), wherein the court went outside the case to declare unconstitutional the Missouri Compromise. The reputation of Taney has suffered much from this decision, and doubtless had he not been so old and infirm he would never have been persuaded into committing this error. Taney was, however, honest in this opinion and as a Chief Justice in ability and influence he ranks second only to Marshall.

Since Taney's death there have been three chief justices: Chase (1864), Waite (1874), and Fuller (1888). Under Republican administrations the character of the court has again been changed and has come again to the position of Marshall. Immediately after the Civil War Congress was afraid of the court and so took away its appellate jurisdiction in certain cases then pending before it, so as to prevent its passing upon the constitutionality of the Reconstruction Acts. They had no reason for their fear, however, for the court in Texas *v.* White accepted in full the right of Congress to "reconstruct." After the court in 1870 had declared in Hepburn *v.* Griswold that the issue of legal tender notes by Congress was unconstitutional, the court was reorganized. One member resigned, the court was increased in size by one, so two judges, Bradley and Strong were appointed by President Grant. It was charged and generally believed that the court was "packed" to bring about a reversal of the Legal Tender de-

cision, but much effort has been made by some, notably Senator Hoar, whose brother was Attorney General at the time, to prove that this was not so. Many of the important decisions of the court during this period have been concerning the interpretation of the 14th amendment. In interpreting the clause which provides that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States," the court in the Civil Rights cases put a salutary check upon the rapidly increasing power of the Federal Government by deciding that the General Government has no power to protect the individual in his civil rights, this being still a function of the States. The clause which forbids a State to " deprive any person of life, liberty or property without due process of law" has been most prolific of litigation and will doubtless continue to be so for a long time to come. The court as constituted in 1904 consisted of the following judges: Fuller, Chief Justice, (1888); Harlan (1877); Brewer (1889); Brown (1890); White (1894); Peckham (1895); McKenna (1898); Holmes (1903); Day (1903). See SUPREME COURT.

Professor of History, University of Ohio.

18. United States — Diplomacy of the. No complete history of the diplomacy of this country has ever been written. Much of its diplomatic effort has been spent upon private claims and national affairs of a commercial rather than a political character. A history of these would be dull reading indeed. Moreover it must be confessed that, for long periods in our national life, our country played but an inconspicuous part in the world's politics, and upon such periods the historian must touch but lightly. To sketch the diplomacy of a century and a quarter, observing a proper sense of proportion; to trace the growth of policies, which have marched with the nation's growth; to characterize treaties which are the crystallized results of diplomacy; yet withal to keep within the narrow limits of a review such as this; such is the aim of this article. The treatment of the subject chosen is partly by periods and partly by topics, the latter where it is desirable to show the continuous growth of a policy or the history of a negotiation running over many years.

The French Alliance, 1778.—How to get military supplies and aid; how to win a standing among nations; these were the problems which the men of the Revolution had to face. The difficulties were tremendous. No foreign state was in political sympathy with the colonies. Recognition of their independence meant war with Great Britain. The only string to play upon was hostility to Great Britain. The only states likely to feel such hostility were Spain — on account of Gibraltar — and France, driven out of Canada by the English only 15 years before. Secret aid had been sent by France in 1776 and 1777 to keep the struggle alive, but open aid was dangerous, unless the colonies showed ability to hold their own. Thus the diplomatic situation waited upon the military one. The success at Saratoga was the turning point. Not in itself but in its consequences it was one of the great battles of the world. For after that the Comte de Vergennes threw off the mask, made treaties of commerce and alliance, thus recognizing the infant state, sent money and aid openly, and accepted the consequence — war with England. In all this Franklin was the influential factor. His fellow commissioners, Deane and Lee, were inferior men. Their instructions from Congress were impossible, to seek recognition, commercial privileges and aid, without reciprocal military engagements. By departing from these, they secured a liberal commercial treaty and a military alliance, binding until the independence of the colonies was secured, peace to be made jointly with the common enemy. These treaties did very much to accomplish American independence. Spain, though in nominal alliance with France, actually gave but trifling help.

The Treaty of Peace, 1782.—There had been overtures and negotiations looking toward peace in 1778 and 1779, but not on the basis of a prior recognition of American independence which the colonies deemed essential. In 1781 various agents to foreign states were united as commissioners, with full power to treat with Great Britain. These were Franklin, Adams, H. Laurens and Jay. Of these Franklin alone had faith in the sincerity of the French government. A change in the British ministry in the spring of 1782, Lord North going out, made negotiation easier. The chief points at issue were: (1) the boundaries; (2) the northern fisheries; (3) the confiscated estates of loyalists. Spain intrigued with France against the Mississippi as our western boundary, desiring to confine the new state to the region east of the Alleghanies. But by the westward migration into the Ohio which was already in motion, this was made impossible. In the northeast the Penobscot and Saint John rivers had been urged as boundaries, and a compromise, the Saint Croix, adopted. New England regarded the enjoyment of the fisheries of the Gulf and Banks as essential to her prosperity. Against the covert opposition of France and the indifference of the South, she stoutly held out for large fishing liberties and got them. Full restoration of confiscated estates by the new government was a financial impossibility, was physically difficult, was negatived by the fortune of war. The utmost that Great Britain could wring from the Americans was a treaty provision that Congress should recommend to the States restitution and compensation to the purchaser for value. This was, and probably was intended to be, a nullity. But it was coupled with the welcome proviso that debts should be collectible and further confiscations stopped. This treaty was provisional, and made without Vergennes' knowledge (which was a violation of instructions), so great was the distrust of France by Adams and Jay. It was put into definitive shape the next year, 1783, with French consent and in compliance with Article VIII of the treaty alliance of 1778. This treaty of peace was a diplomatic triumph for the United States.

Attempts to Secure Recognition From Other Powers.—Although Spain was in alliance with France, the ally of the colonies, she added little weight to the coalition, was unfriendly and tricky, feared the result of American independence upon her own possessions, and made no treaty with the United States until 1795. Tuscany and Austria also refused a treaty on the plan voted by Congress and accepted

by France, as did Prussia, whose timid king, without a navy, saw no chance of maintaining intercourse should it be established. Congress was ready to accede to the principles of the armed neutrality of 1780, but was not permitted by Russia, its originator. The Netherlands joined this neutral league in spite of British threats. This, with the exposure of an incipient negotiation with the colonies, led England to declare war against her in 1780.

The Establishing of Commercial Relations.— This was of the first importance to the new state. Its foreign trade was then relatively more important than now. The French treaty was the only commercial treaty existing until the very close of the Revolution. Decentralization, under the Articles of Confederation, was a serious handicap in negotiating, for it weakened the trade privileges to be offered. After sturdy persistence, John Adams had secured a treaty in 1782, from The Netherlands, much on the lines of the treaty with France. Both of these treaties, in the freedom of neutral trade, in the regulation of search, in the definition of contraband and the opposition to privateering, were liberal, and show the influence of Franklin. He also shared in the negotiation of two other treaties of amity and commerce, with Sweden in 1783 and Prussia in 1785, both containing much the same features as the earlier ones, and displaying the same enlightened characteristics. Spain came into line in 1795, her treaty restating our southern boundary also, and in 1799 the expired treaty with Prussia was revived with some changes, due to war time. Jay's Treaty with Great Britain in 1794, was very much more than a treaty of commerce. How it dodged and how it settled many outstanding difficulties will be seen presently. But as a commercial agreement, its unlikeness to the others enumerated must be recognized. For in it, England, the foremost maritime state, did *not* grant that free ships made free goods, did not like Prussia allow pre-emption of all contraband articles except provisions, but permitted trade without discrimination, admitted consuls, and inserted the earliest of our extradition agreements. Upon the basis of these commercial treaties this country's foreign trade was built up, and much of its prosperity was founded. This is too apt to be overlooked.

Treaties With the Barbary Powers, 1787–1805.—This is a curious chapter in American diplomacy, but must necessarily be brief. Like every state trading along the Mediterranean, our own country was forced to pay tribute, to avoid the seizure of its ships and the enslavement of its citizens by the African corsairs. The alternative was to convoy our vessels, to put them under foreign protection, or to establish immunity by successful war. The treaties with France 1778 (Art. VIII.), and with The Netherlands 1782 (Art. XXIII), promised us the diplomatic aid of those countries against the Barbary powers, while both Portugal and Spain on occasion helped our crews. In 1784, Congress authorized direct negotiation, the commissioners being Adams, Franklin, and Jefferson. Of these Jefferson preferred war, while Adams thought tribute the less expensive way. They tried to bring about concerted action with other states but failed. Then through an agent they dealt directly with Morocco in 1787. This treaty regulated commerce, forbade enslavement of prisoners, and allowed partial consular jurisdiction. It promised no tribute but seems to have needed occasional liberal "presents" to be operative. In the next decade treaties were made with Algiers, 1795, carrying 12,000 sequins annually; Tripoli, 1796, with a lump sum of tribute agreed to (Art. X.); Tunis, 1797, $107,000; the three costing us for their execution some $2,000,000. They contained some curious and some very modern provisions, but were alike in forbidding the enslavement of Americans. There were disputes, armed clashes, but nevertheless tribute, until Decatur wiped out the system and the shame in 1815.

Neutrality and Its Difficulties, 1793–1812.— Except for the Civil War, this was perhaps the most critical period in the history of the republic. Gratitude to France, the surviving bitterness toward England, many grievances left by the war and still unsettled, all these inclined the United States towards the French side in the Wars of the Directory. Such aid upon the sea might well be of vital importance. To secure it Genet was sent by France as minister. But he found Washington resolved upon neutrality as the only safe course. Maritime war with England would have destroyed our commerce and thrown our affairs into fatal confusion. Neutrality meant a breathing spell. Angered by this, Genet tried to compromise our performance of neutral duties in every way until withdrawn at the close of 1793. (See INTERNATIONAL LAW.) Opposition to Washington's course, shared by Jefferson and his followers, gradually built up political parties. Besides old grievances against Great Britain, there were newer ones, which the war with France led to, impressment of seamen from our ships, for instance (see IMPRESSMENT), and the ruin of our trade with the continent in breadstuffs, by an order making them contraband. A commercial treaty was also badly needed. In 1794, John Jay made the treaty which settled all these points, but only by leaving some of them out. It contained our first extradition agreement. It admitted us to the East and West Indian trade under conditions. It framed a list of contraband. But in it Great Britain did not renounce impressment. Jay's treaty was ratified in spite of a storm of abuse and opposition, and helped American trade immensely in the years to come. Our relations with England and France were like buckets in a well. As friendship with one grew, with the other it waned. So now France began to seize vessels and property, under any or no pretext. When Pinckney went to Paris to remonstrate in 1796, he was rebuffed. Humiliating negotiation went on nevertheless, in 1797, three commissioners being sent instead of one. A national loan and individual bribes were demanded by Talleyrand as a condition of negotiation. It was then that the curious episode of the X. Y. Z. Correspondence (q.v.) occurred. Thus this mission was as fruitless as the other had been. Yet a third one was sent, by Adams, to the dismay of the Federalists, and was lucky enough to profit by the revolution of 18 Brumaire 1799, which made Napoleon first consul. For now France contemplated a commercial league against England, and was ready to negotiate. The treaty of 1800 was the result. This did not pay for French

spoliations (that was arranged in 1803), but relieved the United States of the various embarrassments of the 1778 treaties, while restating many of their provisions. This treaty was another valuable step forward. But after an interval of calm, impressment became again active, and various outrages were committed by British ships of war off our own coast. All this was dwarfed, however, by the extensive and illegal paper blockades (see INTERNATIONAL LAW) with which the combatants fought to the injury of the neutral. Our reply was an embargo (see EMBARGO), and useless negotiations with both countries. England's obstinacy and Napoleon's duplicity, coupled with the ardor of our own South, forced us into the ill-judged War of 1812. In spite of all the hampering restrictions of this period, our foreign trade increased largely. Neutrality as established by Washington meant national salvation.

Boundaries and Territorial Growth.—The diplomatic processes which have built up our present limits, out of a country bounded west by the Mississippi and void of Florida, are lengthy and important. But the barest outline can be given here. They consist of (1) boundary adjustment; (2) territorial acquisition; the two often mingled. The first stretch of line, the Saint Croix River, was in dispute as early as 1783, but definitely identified in 1798. The next piece was to run north to certain "highlands," which we placed near the Saint Lawrence, but Great Britain laid down across the heart of Maine. Much disturbance arose in this vast wild region, the scene in 1839 of what is known as the Aroostook War. In 1842 it was divided by the Ashburton Compromise, on the line of the Saint John River, the Saint Francis and a range of hills. From the source of the Connecticut to the Lake of the Woods, the differences have not been serious. West of the Lake of the Woods, after the Louisiana Purchase, the line ran along the 49°, but halted at the Stony Mountains until 1846, when it was carried forward to the Gulf of Georgia, studded with islands. There are two ship channels through this archipelago, one of which (the Canal de Haro) after more long years of controversy was designated as the treaty channel, by the Emperor of Germany, arbitrator, in 1873. Meanwhile Alaska had been purchased from Russia in 1867, and here, too, were disputed boundaries. The Canadians desired a harbor on that coast, and interpreted the treaty so as to draw the line 10 leagues back from the coast, crossing some fjords, not going around their heads. But this was denied by the commission which decided the boundary in 1903. (See ALASKAN BOUNDARY COMMISSION.) The Mexican boundary is partly an artificial, partly a riverine one. The Rio Grande is a shifting stream and the Arizona boundary marks have a way of disappearing, so that to this day occasional diplomatic adjustments of the line are necessary. The chief acquisitions of territory prior to 1899, have been by the purchase of Louisiana, 1803; of Florida, 1819; of Alaska, 1867, and by the annexation of that vast region southwest of Louisiana which the Mexican War brought. Each of these events should be studied under its own title. Of their diplomatic aspects but the slightest review can be given here. A long controversy with Spain over the free navigation of the Mississippi to the Gulf, with the right to transship, made it perfectly clear that our West would insist upon these privileges. French ownership of Louisiana, 1800, was far more dangerous than Spain's could be. The sale of Louisiana, 1803, though earnestly desired by the United States, was effected by Napoleon's naval and financial weakness and change of plans. (See LOUISIANA PURCHASE.) Louisiana was a terribly ill-defined region and naturally capable of being stretched. In the far Northwest this process was aided by Gray's discovery of the Columbia, 1793; Lewis and Clark's exploration in 1804–5; Astor's trading-post at its mouth, 1810, and by the Spanish cession of rights on the Pacific (Art. III., Treaty of 1819). But the rights so derived were vague at best; the title to the Oregon country was left by treaty for many years in abeyance, and that splendid region finally won by the influx of settlers. Spain, in Florida, for years kept the inevitable at bay with the sole weapon of delay. Finally, in 1819, upon the assumption of our citizens' claims against Spain, up to $5,000,000, the cession of Florida was agreed to. (See FLORIDA.) The territory gained by the Mexican War was partly seized, partly paid for. That war was necessitated by the annexation of Texas, to which Mexico still laid claim and with which she was still at war. (See MEXICAN WAR.) The Gadsden Treaty of 1853, by purchase, enlarged this territory.

The Monroe Doctrine and Its Development.—This policy was based on the right of self-defense. It has never given the United States rights not otherwise existent. With much of truth it has joined much of indefiniteness; to the genuine principle of self-defense it has joined this paradox, that the stronger the nation grew and the less it had to fear, so much the broader grew the doctrine in its application. Throughout the diplomacy of the past 80 years, this doctrine runs like a thread. Towards Cuba and Hawaii, as well as towards South and Central America, it was the determining factor in the national attitude. No native politician can live without accepting it; our foreign neighbors, at one time or another, have for the most part grudgingly submitted to it. Originally it announced three things: that no colonization on this continent by a foreign power would be suffered; that the United States would take no part in European politics; that European intervention, to control the form of government of an American state against its will, would not be tolerated, because it was dangerous to our peace and safety. The first principle was aimed at Russia; the last at the Holy Alliance. This Monroe Doctrine was enforced on its original lines as late as 1865, against French intervention in Mexico. (See MEXICO.) In and out of Congress it was deemed applicable in a broader way, to limit French control of De Lesseps's Panama Canal, in the period subsequent to 1880. With a scope still further enlarged, it was used by President Cleveland in 1895, to curb Great Britain in her boundary dispute with Venezuela. And now it is within bounds to say that the old policy tends to become a new one, "America for Americans," the freedom of this continent from European sovereignty and control. See MONROE DOCTRINE.

Relations With Spanish-American States.— Our diplomacy in this direction has been concerned mainly with such matters as (1) protection from foreign aggression, as of Venezuela from her creditors, in 1903; (2) pressing private claims; (3) exercising an indefinite kind of police power to keep order; (4) rarely trying to bring about unity of feeling and action in various directions, as in the two Pan-American and earlier congresses. The various factors which complicate the situation are: chronic revolutions, lack of security to the persons and property of foreigners resulting, defaulted national debts, redress claimed by other powers, jealousy of the United States, lack of consideration and of understanding on the part of the United States, a theoretical but not very active republican tie of sympathy. The natural desire of foreign powers is to collect debts or secure redress by force, and if this is prevented by the United States, to make this country responsible. Our problem is to exercise the control which our position on the continent demands, with no assumption of responsibility for the acts of our neighbors. Somewhere between these positions there must be a line drawn; to find it requires a nice diplomacy.

The Slave Trade and the Right of Search.— For nearly 70 years the right of search was a burning question with England in one form or another. The key to the difficulty was the painful recollection of British impressment practice. That was an attempt to enforce a municipal law on a foreign ship on the high seas, that is, within another state's jurisdiction. It was not formally surrendered; it was disused. Early in the 19th century began the anti-slave trade agitation in England, perhaps a unique example of national altruism. To be made effective, this movement needed a universal right of search on suspicion of slave trading, to be exercised by the war ships of one or more states. By treaty with several powers, Great Britain gained this right, but in the case of the United States the memory of impressment made this later exercise of search too unpalatable. Hence, of course, slavers would try to screen themselves by a false use of our flag. To meet this Great Britain set up two new theories. One was, 1810, that since American statutes forbade our citizens to trade in slaves, English ships and courts might enforce this prohibition — an absurdity. The other, about 1840, claimed a right of visit (of a foreign ship at sea in time of peace) as distinct from a right of search, which was denied by Mr. Webster and surrendered by Lord Aberdeen in 1859, after years of exasperating cntroversy. (See INTERNATIONAL LAW.) In 1842, by treaty, the two powers agreed to maintain separate squadrons for slave trade prevention, acting in concert when feasible; in 1862, the reciprocal right of search was at last conceded to ships specially authorized. To stamp out the slave trade on land and on sea, as relates to Africa, many states, the United States amongst them, united in the act of 1892, but here too a reciprocal right of search existed only when otherwise granted by treaty.

Fisheries and Sealing.— Here we touch the question of a state's jurisdiction over the high seas and its coast sea. The treatment of the Northern fisheries was a problem in the peace of 1783: it is a problem to-day. In 1783, the high sea fishery was admitted to be open to the new state, while an extensive grant of coast fishing privileges off Newfoundland, Labrador, Nova Scotia, and the Magdalen Islands, was added. As a grant, this privilege was terminated by the War of 1812, according to British contention. By consenting in 1818 to the revival of but a portion of the coast fishery formerly enjoyed, the United States accepted this theory. The grant of 1818 was in terms perpetual. Between this treaty and the next, in 1854, much had happened in fishery matters to disturb the peace of the two countries; adverse provincial legislation, the broadening of forbidden waters by the headland theory; exclusion from the large bays under penalty of capture; and on the other side, smuggling and aggression by our own smacks. In 1854 came in the principle of reciprocity, which really meant free fishing to us, free entry of fish to the Canadians, which they strongly desired. (See RECIPROCITY.) In 1871, this reciprocity, which had terminated, was revived for a term of years, coupled with an arbitration plan for striking a balance of values. Under this the Halifax Commission, 1877, decided $5,500,000 to be due Great Britain. Now we are back on the 1818 basis again, but we still need the Gulf fishing and the Canadians need our market. But as these are, the one of fluctuating the other of great and certain value, it seems false reciprocity to try any longer to balance them. In the Prihilof seal herd, acquired by the Alaska purchase, the United States had a valuable asset. These seals spend part of their year at sea, but returning to their isles to breed are exposed to pelagic attack. The United States has tried to prevent this wasteful method of gathering skins by claiming exclusive jurisdiction over the Eastern Bering Sea, and by claiming ownership in the seals while at sea. When these claims were tested by arbitration at Paris in 1893, they both broke down (see BERING SEA CONTROVERSY), but it had been agreed whatever their respective rights might prove to be, that sealing regulations should be enforced by the two powers for the preservation of the seal herd. Such were framed, but have proven ineffective. The best way of treating the question from the first would have been by international union, to include Russia and Japan. Mr. Bayard tried this, but Canada's influence prevented, and later Mr. Blaine tried the other, mistaken, tack. In 1897, our own country, Japan and Russia, agreed to prohibit pelagic sealing, so long as experts deemed essential.

As to Interoceanic Canals.—The diplomacy of the United States has been long and often concerned with the attempt to secure a favorable canal concession across some portion of Central America, and to define such canal's status. It has been seriously handicapped, however, by two things: (1) In constant uncertainty as to what route was physically best, it has had to negotiate, so to speak, in the dark, with several states, any one of which might be the sovereign of the route decided upon. (2) Our policy has alternated between the neutralization of a canal by the commercial powers, as in the case of Suez, 1888, and single-handed control and protection by the United States, the latter predominating. The victory of the latter

policy was made clear by the defeat of the first Hay-Pauncefote treaty in the Senate. The convincing argument for it was the desire for an exclusive war right in the canal, for naval mobilization. This was rendered possible by the abrogation in 1901 of the Clayton-Bulwer treaty (q.v.) of 1850 with Great Britain. The revolution in Panama and its recognition as an independent state in 1903, followed by a canal treaty with the new state, by which the United States guarantees Panama's continued independent existence, are the final steps in this long process of negotiation and definition. See PANAMA CANAL.

The United States and the Declaration of Paris.—Why has the United States, always standing up for neutral rights, never joined in the neutral bill of rights of 1856, called the Declaration of Paris (q.v.)? It was the abolition of privateering which was Mr. Marcy's stumbling block in 1856, because he deemed the retention of this right necessary to supplement our small navy. But, he said, if you will yield the right to capture enemy's innocent private property at sea as well, our accession will be gladly made. Spain and Mexico likewise refused. Yet when Spain and the United States were at war in 1899, neither side employed privateers. It can be shown that the other rules of the Declaration are in the interest of the United States and accepted by it; also that privateering is not of much practical value to-day, particularly to a naval power. The conclusion should be drawn that in this respect our diplomacy has been a mistake, that we should gain much and lose little by accepting the Declaration of Paris in its entirety.

The Diplomacy of the Civil War.—This was mainly concerned with three classes of questions: (1) those relating to the recognition of Southern belligerency; (2) those relating to the blockade; (3) those connected with the equipment and reception of Confederate ships of war in foreign, mostly British, waters. In the first particular Mr. Seward pursued a wrong-headed policy, claiming the rights of a belligerent to blockade and search, for example, which implied a legal war, but denying nevertheless the existence of a war and of a body of neutral powers. This mistake complicated much of the early diplomacy of the war, and made the attitude of the North most difficult. When states find their relations closely affected by a civil war, their commerce hampered by the rules of blockade, contraband and search, a new flag seeking entrance to their ports, a new government *de facto* applying belligerent rights on the sea, they are warranted by international law and by their own commercial interests, in recognizing the new belligerent and declaring their own neutrality. In our Civil War, Spain, The Netherlands, Great Britain, and France did this, and Mr. Seward complained of it. The blockade of southern ports was a gigantic task, slowly made effective, with some irregularities, but in the main conducted on legal lines. Great Britain, the power whose trade was most affected by it, respected it and was even considerate in declining to press remonstrance in view of lapses in the blockade of certain ports, and in cases where the declaration of blockade for a long period was not substantiated in fact. It was in the partiality with which England's neutrality laws were administered at her colonial ports, and particularly in the violation of those laws in home waters, that she erred. Two Confederate cruisers were built, equipped, armed, and in some degree manned by British agencies. They helped to sweep Northern commerce from the seas. Mr. Adams and the watchful consuls resident in England left no stone unturned to stop them. Never was there a more difficult position than that of C. F. Adams, nor one more gallantly filled. Sympathy for the South pervaded the ruling class. The gradual change of sentiment as the war progressed, the consciousness of a dangerous precedent set, the diplomatic pressure applied after the war by a reunited United States, these led Great Britain on to the settlement of the so-called Alabama claims at Washington in 1871. This was a diplomatic triumph, because it laid down a strict standard of neutral behavior, by which England consented that a court of arbitration should judge her conduct, though denying that it had been theretofore applicable. See ALABAMA CLAIMS.

Naturalization Questions.—The allegiance of individuals is transferred by emigration followed by naturalization. But if the laws of two countries prescribing the conditions of these processes are not identical, since the new allegiance involves protection, upon the return of the individual to his country of origin a legal conflict as to his allegiance may occur. So, too, if his emigration has been unpermitted, or has evaded military service. Owing to the copious immigration which has sought the United States, our diplomacy has been largely concerned with just such cases. Our diplomatic remedy was to seek as a favor for the individual, relief from the obligation or service still due which the naturalized German-American, for instance, visiting his mother country, was held liable for. Some such had served in the Civil War, some had emigrated as mere boys. The law was clear, for a state may lay down its own conditions of emigration. Between 1865 and 1870 the situation became acute, and a remedy was eagerly sought. Another class of difficulties arose where our laws naturalized emigrants of states like England, which held the allegiance of their subjects to be indelible. Here both countries had claims to the service of the same person. By the negotiation of treaties with the North German Union, 1868; Belgium, 1868; Hesse, Bavaria, Baden and Würtemberg, 1868–9; Mexico, 1868; Sweden and Norway, 1869; Austria and Great Britain, 1870; Denmark, in 1872, these difficulties were cured. By these treaties, the right of expatriation was allowed, and our five years' residence requirement was recognized. (See NATURALIZATION.) The provisions of these treaties were reciprocal. Two withheld their privileges from youths who ran away when actually drawn for military service. The others made no such distinction. The subsequent working of these treaties has not been altogether without friction. It may be noted that the modern tendency is towards a uniform five years' residence rule for naturalization, as under the new Cuban Constitution. These naturalization treaties were a very considerable diplomatic achievement, due largely to our minister resident at Berlin, George Bancroft.

The Diplomacy of the United States in the Orient.—This has reflected commercial rather

than political demands. Owing to the radical differences in law, in usage, in racial feeling, European intercourse with the East has insisted for its protection upon a fixed treaty tariff upon imports, and upon that exemption from the local law and jurisdiction which we call exterritoriality. This was a limitation upon the sovereignty of Oriental states. On the other hand, only certain ports in China and Japan were opened to foreign trade. These various features appear in our treaties with China, 1844, 1858, and with Japan, 1854, 1857, 1858. Between 1860 and 1880 both countries began to absorb the new civilization, Japan eagerly and China, vaster and not so centralized, without enthusiasm. Here was the parting of the ways. China thereafter allowed religious freedom, submitted to our drastic immigration restrictions, 1880 and 1894, but otherwise dealt with the United States on the old conservative basis. Japan meanwhile abolished feudalism in 1871; set up a representative parliament, 1881, 1890; adopted a code of law framed on an European model, and made rapid progress in the new ways. Her victory over China in 1895 gave her a position which compelled the powers to surrender their special privileges. In this our own country had prior to the war taken the initiative. And in China we have played no sinister part, though open to criticism for allowing our anti-Chinese legislation to anticipate for a time treaty provisions. A considerable influx of Chinese work people, intense local prejudice against them in the West, some deadly riots in which they have suffered, and on the other hand outrages to missionaries and the Boxer attack on the legations in Pekin have proved some mutual ill-will, while in the main the respective governments have been on friendly terms. With Japan as a power of the first rank, and with China soon to be opened to freer trade, our future relations are likely to be closer and more important. See JAPAN; CHINA; SIAM.

Cuba and the Spanish War.—The relations of the United States with Cuba have been impressed with a sense of the latter's geographical importance, jealousy of its control by any other state than Spain, and a desire for undisturbed trade and settled government. To Cuba, Monroe's declaration of policy has applied with peculiar force. The slave interest before 1860, at one time dreaded a free Cuba, at another desired its annexation. Purchase was several times offered, as in 1847, and in 1854 under the foolish threat of the Ostend manifesto (see OSTEND MANIFESTO), but Spain declined. During the Civil War, Spain showed some sympathy for the South, although it was Southern influence that had coveted the island. The liberal revolution of 1868 in Spain was reflected in Cuba, but there cruelly put down. There ensued a disturbed decade when our neutrality was enforced in spite of aroused sympathy, some filibusterings, and an offer of mediation, 1869. Cuban belligerency was not recognized, though Grant came within an ace of such action. In 1878 the rebellion collapsed, in 1894 it broke out again. In the interval had come illusory reforms, better trade under reciprocity with the United States, and steady misgovernment. We were nearly affected by the new insurrection, in damage to trade and the burden of preventing filibustering. Yet what remedy was there? Recognition of Cuban independence was out of the question, since independence as a fact did not exist. Recognition of Cuban belligerency was inconsistent with our usage and would have hurt our trade still more, while releasing Spain from all further responsibility for losses in Cuba. There remained inaction or intervention. The hand of the administration was forced early in 1898 by the destruction of the war ship Maine in Havana harbor, attributed by many to Spanish agencies, though a court of inquiry fixed no responsibility. War resulted. The chief points at issue before the peace commissioners at Paris were, the assumption of the Cuban debt by Spain, and the disposition of the Philippines. After a struggle and the payment of a solatium, Cuba was set free without being saddled with the costs of her ravaging, and the Philippines were ceded to the United States. So strong was the opposition to this last, as an act of domestic policy, that the Senate barely ratified the treaty.

Modern Diplomacy and General Characteristics.—Other topics with which our diplomacy has had to do might be detailed. Extradition, copyrights and trademarks, free navigation of rivers, Samoan affairs, tariff by treaty, and so on; but these are more conveniently discussed elsewhere. American diplomacy to-day still shrinks from an active part in European politics. This was explicitly stated to the Hague Conference in 1899. With this in mind it is a question if the United States can properly be called a world power. But in point of fact, our interests and our diplomacy have been more impressed by those of Europe than we may think. Our share in international legislation relating to the care of the wounded, industrial property, the slave trade, submarine cables, exchange of official documents, are examples, and particularly since the Spanish War has this been true. One detects in our recent diplomacy a more confident tone, a readier initiative, even the air of leadership, coupled with ingenuity of resource and that simplicity and directness of aim which have long been its characteristics. But yet its defects and handicaps must not be lost sight of,— lack of continuity from frequent change in administration and in party, lack of certainty because of the Senate's control of treaties made by the Executive, lack of a trained diplomatic service. In reviewing the diplomacy of the United States as a whole, one is impressed by its blunt straightforwardness (sometimes amounting to crudity or ill manners), by its usual freedom from intrigue, lastly by its rather surprising successes, owing surely to the soundness of its aims. "Observe good faith and justice toward all nations," wrote Washington in his farewell address, "cultivate peace and harmony with all." Could any diplomacy have had a nobler rule laid down for it? 19. United States – The War With France. The outbreak of war in 1793 between Great Britain and the French Republic placed the United States in a most embarrassing position. President Washington determined to adopt a policy of neutrality, but for two reasons he found it very difficult to do so. In the first place were the treaties concluded with France in 1778. The treaty of alliance guaranteed forever the integrity of the French possessions in America, and the treaty of commerce provided that French privateers and their prizes should have shelter in United States ports, a favor which was denied to the enemies of France. The question of the privateers gave most trouble. If the United States had adhered strictly to the obligations of the treaty they could not have preserved neutrality. Fortunately, at a critical time, the President's position was strengthened by the intemperate conduct of the French minister, Citizen Genet (q.v.). The encroachments of the belligerents upon our trade rights constituted a second obstacle to the maintenance of a neutral policy. The British and French appeared to vie with each other in their zeal for seizing and confiscating American merchantmen and their cargoes. Many of these outrages could not be justified even under their own extravagant interpretation of the principles of international law. The partial compromise of the troubles with Great Britain in 1794 served to increase the hostility of France.

In March 1797, just after the inauguration of President Adams, news was received that the French Directory had refused to accept Charles Cotesworth Pinckney, who had been sent to supersede Monroe as minister. Desiring to bring about a peaceful settlement if possible, Adams sent Elbridge Gerry and John Marshall to join Pinckney in a special mission. Shortly after their arrival in Paris they were approached by some agents of Talleyrand, who informed them that the Directors were much annoyed at certain remarks made by President Adams in a recent speech, but that a *douceur* of 1,200,000 livres would probably mollify their wrath. Negotiations went on for several weeks, but as the commissioners refused to submit to blackmail, nothing was accomplished. On 5 March 1798 the President informed Congress that certain dispatches had been received from France, which he would lay before them as soon as they could be deciphered and translated. A second message dated a fortnight later stated that the peace mission had been a failure and urged Congress to prepare for war. The Federalists were jubilant and the Republicans very much disconcerted. The publication of the dispatches, however, aroused such strong popular feeling against France that the moderate Republicans gave up their opposition. These documents became known as the X. Y. Z. Correspondence (q.v.), because the government used those letters in referring to Talleyrand's representatives. Both houses of Congress agreed by large majorities to support the President's policy. An act was passed establishing the navy department, and Benjamin Stoddert of Maryland was appointed as the first secretary. Previous to this time naval affairs had been in charge of the war department. Money was appropriated to equip the navy, to strengthen the coast defenses, and to buy arms and ammunition. An act of 14 July 1798 levied a tax on houses, land, and slaves, the first national direct tax ever imposed in the United States. Of more doubtful wisdom were the Naturalization, Alien, and Sedition acts, which were directed against French sympathizers.

The President's course was approved with as much enthusiasm by the public as it was by Congress. "Millions for defense, but not one cent for tribute," became the popular cry. Scores of patriotic war songs were written, among them being "Adams and Liberty" and "Hail, Columbia." Monster mass meetings were held throughout the country, militia companies were organized, and liberal contributions were made for the support of the infant navy. The President continued his preparations for war, then, with every assurance that the nation would support him. Washington was called from retirement to assume the duties of lieutenant-general and commander-in-chief of the army. Naturally much was left to his discretion in the choice of subordinates. Hamilton, Knox, and Charles Cotesworth Pinckney were, at his suggestion, commissioned as major-generals. An unfortunate controversy at once arose in regard to the question of seniority. Adams favored Knox, and gave an order that his commission should be made out before the other two. This plan was so strongly disapproved by Washington that the President finally yielded, and Hamilton was made second in command. Four brigadiers were appointed, and steps were taken to increase the army to a war footing. These elaborate preparations for the strengthening of the land forces seem somewhat premature. It was not at all likely that France would attempt an invasion, and, unless Spain should be drawn into the conflict, there was no territory in America which we could attack. As a matter of fact, hostilities were confined to a few minor naval engagements. Early in July 1798 Stephen Decatur, the elder, in command of the sloop of war Delaware seized a French privateer mounting 20 guns. The prize was refitted, named the Retaliation, and placed under the command of Captain Bainbridge. The most serious battle of the war was fought off the island of Saint Kitts in February 1799. After a chase of three hours and a fight of an hour and a quarter, Commodore Truxtun's flagship, the Constellation, forced the French frigate L'Insurgente to lower its colors. La Vengeance, another French frigate, attacked by Truxtun in February 1800, escaped only as the result of an accident. Just as the victory was almost won the foremast of the Constellation fell over the side, drowning a young midshipman and several of the crew, and making it impossible to continue the pursuit of the enemy.

In spite of these successes the President manifested very little zeal for the prosecution of the war. This was doubtless due in part to jealousy of Hamilton, but it was mainly the result of his intense conservatism. John Adams was not the man to sympathize with the hair-brained schemes of Hamilton for the conquest of the Floridas, and he was certainly not the man to continue a war when there was no longer good cause for it, merely because public opinion seemed to favor it. Hearing that the French government would receive a minister from the United States and would treat him with courtesy and respect, he nominated William Vans Murray

to that position. The members of his own party were taken completely by surprise, and the leaders of the war faction made an attempt to defeat Murray's confirmation in the Senate. Adams checkmated their plans by withdrawing Murray's name and substituting three commissioners, Murray, Chief Justice Ellsworth, and Patrick Henry (25 Feb. 1799). Henry refused to accept, and William Davie of North Carolina was selected in his stead. Much to the chagrin of Hamilton, the Senate confirmed the nominations. The Hamilton partisans in the Cabinet now made a final attempt to delay the departure of the commissioners, but their success was of short duration. The President asserted his authority, and the commissioners set sail in October 1799. The Federalists throughout the country were at first surprised, not to say disgusted, at the peace policy of the chief executive. Hamilton's intrigues to checkmate his plans, moreover, resulted in a revulsion of feeling, and it may safely be said that the commissioners sailed with the approval of the vast majority of the American people.

The mission was successful. A treaty of peace was concluded with the First Consul, 30 Sept. 1800. Provision was made for the restoration of captured ships and goods which had not yet been condemned. For protection in the future the rule was adopted that "free ships make free goods," except in the case of contraband of war. The terms blockade and contraband were defined, and certain regulations were made in regard to prizes and privateers. The most serious problem arose from the desire of the United States to be released from the obligations of the treaties of 1778 and the desire of France to avoid paying indemnities for the American vessels and cargoes which had been confiscated. Article two of the new convention provided for the postponement of both questions until a future settlement, with the understanding that in the meantime the treaties of 1778 should not be in force. Strong opposition was made in the Senate to this article on the ground that it sacrificed the claims of American merchants. It was finally struck out and a clause was inserted limiting the convention to eight years. In this amended form the treaty was returned to France. Napoleon ratified it with the proviso that each country made the concession which the other demanded. The Senate passed the final vote of ratification with this understanding. It was this bargain which gave rise to some of the French spoliation claims. The obligations of France were, of course, not to the United States government, but to American citizens who were engaged in foreign trade. Consequently when our government released France from those obligations, it tacitly assumed them itself. This treaty of 1800, like the Jay Treaty with England, was really only a temporary settlement. The troubles with both countries continued until the close of the great European conflict on the battlefield of Waterloo. See TREATIES; UNITED STATES — DIPLOMACY OF THE.

20. United States — The Louisiana Purchase. The vast province of Louisiana was ceded by France to the United States 30 April, 1803, the purchase price being $15,000,000. Originally belonging to France, Louisiana was ceded to Spain by the treaty of Paris in 1763, and was retro-ceded to France for the purpose of colonization 1 Oct., 1800, with the understanding that if it was ever again ceded away, it should revert to Spain. It was shortly after President Jefferson's installation that information concerning the retrocession of Louisiana to France reached America. Though the act was believed to be hostile to the interests of the United States, yet Jefferson hoped to maintain the friendly relations with the French government so recently restored by the so-called treaty of Morfontaine. But when the Spanish intendant, Don Juan Ventura Morales, closed the port of New Orleans to American trade, Jefferson began to see the purpose of the first Consul in securing the retrocession of Louisiana and to experience a foretaste of Bonaparte's aggressive policy. Morales' act in closing the right of *entrepôt* at New Orleans, as the right of deposit was called, was regarded throughout the United States with feelings of strong disapproval. Excitement ran high, especially in Tennessee and in Kentucky, in which states the people were eager for war. The Western settlers looked upon the summary closing of the port as the initial step in Bonaparte's aggressive policy, which contemplated not only the arrest of American trade development, but also of any farther expansion toward the Mississippi. The Western traders had chafed greatly under Spanish authority along the banks of the Mississippi. Spain blocked the way to farther expansion on the west and held control of all the waterways leading to the Gulf of Mexico, since the entire seaboard along that gulf was under Spanish dominion. Moreover, the whole valley of the Ohio as far as Pittsburg was dependent upon the permission of the king of Spain for an outlet to the Gulf for its rapidly increasing trade with the outside world. This permission the king granted, and by the treaty of 1795, which Godoy executed by way of offsetting Jay's treaty, Spain gave the United States special privileges along the Mississippi, as the right of deposit at New Orleans with only a nominal charge. Still the Western traders were subjected to much annoyance under Spanish rule, and a growing desire manifested itself to expel Spain from that region and to annex her rich territory to the United States.

After Charles IV. ceded Louisiana to France and Spain retired from the Mississippi, conditions were not improved, but rather aggravated, since the Western States feared Napoleon's grasping ambition quite as much as they had despised King Charles' authority. When, therefore, the port of New Orleans was summarily closed, preparatory to the transfer of that region to France, there was such an outburst of popular feeling throughout the United States that President Jefferson was constrained, despite his strong desire for peace, to open negotiations

United States of America, 1900.

immediately for the purchase of West Florida and New Orleans, as affording an outlet to the sea. Accordingly, he instructed his ambassadors at Madrid and Paris, if possible, to obtain from their respective governments the cession of West Florida and New Orleans. Congress was fully alive to the demands of the people, and on 12 Jan. 1803 appropriated $2,000,000 with a view to purchasing the desired territory. Jefferson appointed James Monroe as minister extraordinary to France to aid Chancellor Livingston, United States ambassador at Paris, to effect the purchase of New Orleans and West Florida. When Monroe set sail for France, on 8 March, 1803, Jefferson was not at all confident that Monroe's mission would be successful. He admitted that he sent him largely to conciliate the people and to restore political quiet throughout the country, then much worked up over the situation.

In treating for the purchase of West Florida and New Orleans Monroe's instructions included three contingencies: Monroe and Livingston were to buy the desired territory if it could be bought for any sum not exceeding $10,000,000. They were to offer, besides the purchase price, commercial privileges for 10 years in the ceded ports, the incorporation of the inhabitants on an equal footing with the citizens of the United States, and, if demanded, even a guaranty of the west bank of the Mississippi. As a second contingency, in case France refused to sell the territory in question, the ambassadors were instructed to sue for the right of deposit, together with such privileges as France would grant. In the event France acceded to neither of these propositions, then the ambassadors were to be given special instructions by Congress adapted to the case. This last contingency might mean war, or it might mean further procrastination. In a communication to the first Consul, delivered through Pichon, Jefferson had already hinted at a probable alliance with England in case France declined to accept any terms whatsoever and positively refused relief to the United States from the severe conditions of trade along the Mississippi. When Livingston and Monroe first opened negotiations through Talleyrand for the purchase of New Orleans and West Florida, the French minister of foreign affairs held out but little hope. The American ambassadors used every argument, but to no purpose, apparently. However, the aspect of affairs soon changed. The first Consul was growing weary of the drain on his resources which Santo Domingo entailed. He reflected, too, that he would soon need all the men and money he could command for the execution of his plans in Europe. When, therefore, he received intelligence of the death of Leclerc in Santo Domingo and the annihilation of his army and the general uprising of the negroes of that province, he realized that the offer of the United States furnished him a suitable occasion for abandoning his costly schemes of French colonization in America, under cover of a new enterprise, and he gladly closed with the American ambassadors to cede to the United States the whole of Louisiana for the largest sum he could obtain. He needed money to replenish his exchequer for his contemplated war with England and Germany, and he did not hesitate to break his word with Spain in ceding away Louisiana, which act, perhaps, he intended as a punishment for Spain for Godoy's treaty with the United States. The American ambassadors, astonished at the offer to sell the whole or no part of Louisiana, though not authorized to purchase the entire province, wisely closed with Talleyrand and Marbois and agreed to buy the whole of Louisiana. After some haggling over the price, Livingston and Monroe agreed to pay France $16,000,000. The documents were signed early in May and antedated to 30 April 1803, and thus the United States, beyond the expectation of all, acquired possession of the vast province of Louisiana.

The treaty for the cession of Louisiana is notable in that it contains no definition of the boundaries of the property transferred. When the American commissioners insisted that the boundaries of Louisiana be defined, they were merely informed that the boundaries were the same as they were in the hands of France, according to Berthier's original treaty of retrocession. However, it was definitely understood on both sides that the Floridas were not included in the transfer, since that territory did not belong to France. Article III. of the treaty provided that "the inhabitants of the ceded territory shall be incorporated in the Union of the United States, and admitted as soon as possible, according to the principles of the Federal Constitution, to the enjoyment of all the rights, advantages and immunities of citizens of the United States." In addition to the sum of $11,250,000, which the United States promised to pay France, the United States agreed to assume the spoliation claims of American citizens against the French government, amounting to $3,750,000, thus making the price in all $15,000,000. The ratification of the treaty by the Senate of the United States gave rise to a perplexing constitutional question as to the right of Louisiana to be admitted into the Union and the process to be adopted. President Jefferson recommended, since there was no authority in the Constitution to buy foreign territory, that a constitutional amendment be adopted as the most convenient solution of the problem. However, the treaty was at length ratified without recourse to a constitutional amendment, and the President acquiesced even at the risk of making blank paper by construction of the Constitution. Spain protested vigorously against the cession of Louisiana to the United States, alleging that the first Consul had violated the treaty of retrocession and claiming that the province could be ceded to herself only. But when the Spanish government realized that both the United States and France were resolved to make good the transfer, even by a resort to arms, if need be, Charles IV. yielded and accepted the cession as inevitable. Thus, for $15,000,000, the United States added to her territory a vast region extending from the Mississippi to the Rocky Mountains, and from Mexico to the Lake of the Woods. The annexation of Louisiana not only increased the territory of the United States by an immense area, but it also put a new complexion upon the politics of the nation and marked a new epoch in the national life.

In 1901 the total population of the 14 States and territories occupying the area originally in the Louisiana Purchase was 14,706,563. Their industries are shown in the following tables:

VALUE OF FARM PROPERTY.

Arkansas	$181,416,001
Colorado	161,045,101
Indian Territory	92,181,615
Iowa	1,834,345,546
Kansas	864,100,286
Louisiana	198,536,906
Minnesota	788,684,642
Missouri	1,033,121,897
Montana	117,859,823
Nebraska	747,950,057
North Dakota	255,266,751
Oklahoma	185,343,818
South Dakota	297,525,302
Wyoming	67,477,407
Total	$6,724,855,132

or a permanent value in farm property alone of over 448 times what we paid for the entire property.

MANUFACTURES.

	Capitalization
Arkansas	$35,960,640
Colorado	62,825,472

21. United States — Causes of the War of 1812. The latter years of the 18th and the earlier years of the 19th centuries witnessed a phenomenal growth of American commerce due to incessant wars in Europe. Naturalization was easy in the United States and the wages of seamen were high. Great numbers of English sailors availed themselves of these advantages. England became jealous of American trade. She had never granted to her subjects the right of expatriation, though she gladly recruited seamen wherever they could be found. In 1793 the right of searching neutral, especially American, vessels was claimed and put into practice. This so-called right meant that wherever an English warship met American merchantmen or war vessels they were required to stop, order their men on deck and permit as many sailors to be seized and forced into the English service as were unable to prove their nationality. It was maintained that only deserters from the English navy were wanted; but in the period of 1796 to 1802, 1,042 American seamen were pressed into the English naval service on the plea that they were deserters.

When the war between Great Britain and Napoleon broke out afresh in 1803, American trade received another impetus. French, Spanish, and even English traders raised the American flag in order to get the advantages of neutrals. An arrangement between England and the United States permitted American vessels to take in cargoes in her colonies provided these commodities were consigned to United States ports. The cargoes were afterward reshipped to Europe. This arrangement gave rise to great abuse. Ship-owners learned to touch at American ports, unload their cargoes, pay the required tax in the form of a bond, reload and, at the same time receiving their bonds back again, set sail for foreign markets. Thus it appeared that England's commerce would fall into the hands of her rivals. To break up this almost illicit trade and at the same time to bring the impressment policy more strictly to bear upon the Americans, British war vessels were stationed just outside the more important ports of the United States. In the rigor of this surveillance American citizens were seized and American vessels confiscated in larger numbers than ever before. English cruisers virtually blockaded the Atlantic coast from Maine to Georgia. On 27 June the British war vessel, Leopard, under orders from the British admiral at Halifax, signaled the Chesapeake to stop as she was leaving Norfolk harbor. An officer was sent aboard the Chesapeake to search for deserters. Commodore Barron of the Chesapeake refused to muster his men. Thereupon the Leopard opened fire and, taking the Chesapeake by surprise, speedily disabled her; three men were killed and eighteen wounded. When the search was completed only one Englishman was found. Nevertheless three American sailors were taken away, one being a negro. The «Chesapeake affair» excited the people of the United States almost beyond precedent. Indignation meetings were held in most of the towns. Prominent men presided over these gatherings; thousands of petitions calling loudly for reparation were sent to the President. War soon became the cry. President Jefferson did not believe in war, but he felt keenly the force of the insult and, after forbidding American harbors to English war vessels, he sent an agent to England to demand disavowal of and reparation for the attack on the Chesapeake. England paid no attention to the President's representations.

While English-American relations were thus assuming a threatening attitude neutral trade was suffering still further restrictions in Europe. In May 1806, provoked by Napoleon's closing the ports of Hamburg and Bremen, England declared, through her Orders in Council, the coasts of Belgium, Holland and Germany to the mouth of the Elbe in a state of blockade. On 21 Nov. 1806 the French emperor replied by the Berlin decree which declared a similar blockade of all the ports of England. Neither the orders

nor the decrees could be enforced, but they made trade with England, France, and Germany unlawful. Yet during the year 1807 still other Orders in Council were issued. These closed to neutral commerce all the ports of European states friendly to France, and authorized the seizure of any neutral vessel *en route* to any closed port unless its captain first entered an English harbor, subjected its cargo to taxation and obtained a license to trade. Napoleon's reply was the Milan decree, which ordered the confiscation of every neutral vessel that permitted itself to be searched or in any wise recognized the British Orders in Council.

The British orders and the French decrees, the so-called right of search and finally the actual attacking of American war vessels seemed to leave the United States government no peaceful way out of her situation. President Jefferson, however, suggested in 1807 that an embargo be laid on all American shipping. Congress had already prepared the way for such a policy at its previous session in the non-importation law which had not been put into force until a few weeks before. Congress assembled in November 1807, and immediately fell in with the President's idea of starving Europe into a recognition of the rights of neutral trade. The embargo went into effect in December 1807, and remained in force until 4 March 1809. This law solved none of the difficulties it was intended to solve. Opposition to the measure became so great that an Enforcement Act was passed. This gave the President despotic powers; yet the commercial sections of the country resisted the law and smuggling became so general in New England that local officers of the United States declined to make any effort to stop it. The South suffered much hardship, too: tobacco and wheat, the principal commodities of export, shrank to one half their former value. The Union itself seemed about to go to pieces just before the close of Jefferson's administration.

In place of the embargo a second Non-intercourse Act was substituted, which, though it practically prohibited trade with the great warring powers of Europe, gave some promise of improving the condition of commerce. With this change of policy Madison became President, 4 March 1809. England now sent a new minister, David Erskine, who speedily negotiated a treaty which promised the withdrawal of the Orders in Council. Madison suspended the Non-intercourse against Great Britain on 10 June 1809 by proclamation. The merchants and ship owners who had respected the Non-importation hastened their goods and ships to sea. On 10 June 600 vessels sailed from American ports to take chances with their enemies in Europe. In July the news that Erskine's treaty had been disavowed by the London cabinet and that Erskine himself had been recalled came as a painful surprise to the American people. Madison issued at once a second proclamation which recalled the first and replaced the former restrictions on English trade. The British cabinet now sent F. J. Jackson as minister to the United States. Jackson completed the alienation of the American government. He insulted the President and ruined his own cause by insisting that Madison had duped Erskine into signing the recent treaty. The new minister was summarily dismissed. Rose, another British representative, appeared next year in Washington, but his efforts availed nothing so long as his government forbade him to yield the great point in question — the repeal of the Orders in Council.

The year 1809 proved the Non-intercourse ineffective, more injurious to Americans than to England and France, for now both powers had a chance to enrich themselves by enforcing the laws of the United States against her own commerce. Napoleon proposed in his Rambouillet decree (March 1810) to sieze every vessel within his reach, that is, in the French harbors, on the ground that such vessels had, perhaps, recognized England's Orders in Council and were thus subject to his Milan decree; or if not, then they had violated the laws of their own country in offering to trade at all with either France or England. In a few months $10,000,000 worth of property was thus seized and finally confiscated. Before Napoleon issued his Rambouillet decree the American Congress had resolved to repeal the Non-importation Act. In place of it a new law was passed which held out a sort of bribe to England and France: in case either nation should cease to violate the commerce of the United States then non-importation should be revived against the other and maintained until neutral trade ceased to be violated. Napoleon again turned an American law to his own advantage: he announced that his decrees would be suspended as against the United States after 1 Nov. 1810, if by that time England had suspended her orders or if the United States "caused her flag to be respected." However, he continued to sequester American cargoes. President Madison considered this a sufficient concession. He gave England warning that non-intercourse would be enforced against her if the Orders were not rescinded by 2 Feb. 1811. When the time expired, no action having been taken by England, Congress renewed the former law and prohibited all importation of English goods. This caused some alarm in England, but there was no abatement of impressments. A new minister was sent to Washington. His instructions, however, still permitted no promises of any change in British policy.

While the ire of America was constantly rising there came the news in May 1811, only three months before most of the congressional elections were to take place, that the United States frigate, President, had encountered the British sloop, Little Belt, after a hot chase of several hours, and practically annihilated her. Never was news more welcome to American ears. The "Chesapeake affair" had been avenged. Minister Foster wrote his government that the Americans no longer pressed for reparation on that score. Public meetings were again held and the newspapers, especially in the South, were filled with exaggerated accounts of what had happened. Other events occurred during the summer and autumn of 1811 which tended to hasten the breach with England. The Indians on the western frontier from Fort Dearborn to northern Georgia formed a confederation against the United States. Tecumseh, the famous Shawnee chief, was the soul of the movement. It came to a battle at Tippecanoe, in western Indiana, on 7 Nov. 1811. The Americans, under General William Henry Harrison, gained a complete victory. Tecumseh joined the English soon

after and the general belief that England instigated the Indian attacks was confirmed. Harrison's victory was the second good omen of the year.

Notwithstanding all these causes for war it is quite probable that the government would not have declared hostilities the next year but for the revolution which took place in the Republican party — the controlling party since 1801. This party had come into power as an uncompromising opponent of English influence in the country. It had, however, for its leader and founder a man who opposed war from principle — Jefferson. The old Republicans, co-workers with Jefferson, had become so opposed to war that they permitted themselves to be isolated. The events of 1811 taught the people a bolder policy. The antipathy for England which pervaded the ranks of the party had outgrown peaceful embargoes and non-importation laws; men thought again of the Revolution. They elected new representatives to Congress. The new Congress had a membership of one hundred and forty; on its assembling more than seventy were found to be young and untried politicians. The most important of these new men were Henry Clay of Kentucky and John C. Calhoun of South Carolina. When Congress met the younger element evinced a war-like feeling quite unusual in that body. Clay was at once elected speaker of the House, and with the aid of his friends he organized that branch of the legislature for the purpose of war. These young leaders were vigorous nationalists; they thought of the Union as a great state; they looked to the future and had confidence in the Republic; they were imperialists who not only hoped to compel Europe to respect their flag but who aimed to conquer and annex Canada. They counted on using their strength to the utmost advantage against England because of the impending struggle with Napoleon. In this President Madison joined them. From November 1811 to the end of the session the new party exercised all its ability and ingenuity in persuading Congress and the country to prepare for hostilities. After long and weary debates and after many a compromise on army and naval matters, war was at last declared 18 June. The invasion of Canada had already begun. 22. United States — The War of 1812. The War of 1812 began officially on 18 June. The army of the United States numbered at that time 6,744 regulars. It was poorly equipped, poorly drilled and its morale was extremely low. But Congress had authorized its increase to 25,000 and provided, at least by law, for a second volunteer army of 50,000 men; besides, the militia of the several States was called on to co-operate with the regulars and the volunteers. The result of these acts was very unsatisfactory. The regular army never during the war reached 10,000, the volunteers appeared only in small numbers and the militia offered to serve only for short terms and then preferably in their own States. The governments of the New England States prohibited their militia from going beyond their State boundaries and various obstacles were put in the way of enlisting. The South was too remote from the theatre of action to feel the need of sending the militia to the front. Tennessee, Kentucky and the old Northwest furnished the main body of soldiers, regular and irregular, who fought in this war. The American navy apparently promised still less at the beginning of the conflict. It consisted of seven frigates and nine smaller craft. And as to the sinews of war, the treasury was in a precarious condition as a result of the numerous trade regulation acts of Jefferson's and Madison's administrations. Congress was inveterately opposed to laying new taxes in any form. Loans had to be resorted to at the beginning. But the bulk of the capital in the country was in New England and New England was bitterly opposed to the war. Hardly half the money asked for was subscribed. On the other hand, England was contending in Europe with her great enemy, Napoleon. The British troops in Canada numbered barely 7,000; their line of defense was 1,000 miles long. The English navy was, however, the undisputed mistress of all the seas; the North Atlantic squadron counted three battle ships, 20 cruisers and 50 smaller ships.

The conquest of Canada was made the first object of attainment. An army of 1,850 men, under command of General William Hull, crossed the Detroit River in the latter part of July 1812. Hull threatened the British stronghold, Malden, for a few days; but hearing that the English and their Indian allies had seized Mackinaw, a fort at the head of Lake Huron, he retreated across the American border to Detroit. From this point Hull hastened off two regiments to oppose the advance of the enemy from the west. At this juncture the British Major-General Brock crossed the river and demanded the surrender of the Americans. Hull's supplies were already becoming scarce, his basis of operations was 200 miles south, and his communications were most difficult to maintain. He surrendered the fort and all the troops under his command, without a fight, on 14 Aug. 1812. Some 2,500 men, 33 guns and the whole of Michigan were thus lost at the beginning of the contest. The principal cause of this was the failure of General Dearborn to march into Canada from the eastern end of Lake Erie, according to the plan of the campaign, and thus cut off all supplies from Brock and finally force him to surrender. But while Hull made his way through dense forests to Detroit, Dearborn was in Boston attending to the political side of the war. Not until October, nearly two months after the disaster at Detroit, did Dearborn cross the Niagara; and then it was with only a small part of his army under the command of Van Renssellaer, a New York militia commander. Van Rensselaer attacked Queenstown (13 Oct. 1812), and was repulsed by General Brock, who had hastened from the scenes of his recent triumph to check this second movement. He was successful, though he was killed in the engagement. The campaign closed with the enemy in possession of the western forts and the territory of Michigan to the Maumee River. In the east the border remained the same.

But while things had thus gone ill on land, the navy had in a measure restored American

confidence. The frigate Constitution, Captain Isaac Hull in charge, met the British Guerrière about 800 miles northeast of Boston on 19 Aug. 1812 and captured her after a fight of 30 minutes. Hull reduced his enemy's ship to a complete wreck, killed or wounded one third of their crew and received the remainder as prisoners of war. On 18 October, the American sloop, Wasp, met the British sloop, Frolic, and completely demolished her and on the 25th the United States, a frigate of 44 guns, fought the British frigate, Macedonia, 38 guns, and gained as signal a victory as that of Hull over the Guerrière. This telling work of the navy took the world by surprise. England forbade her seacaptains to fight American ships of superior tonnage. American privateers swarmed the Atlantic. They did effective work. It became dangerous for an English merchantman to cross the English channel. They captured 500 vessels during the fall and winter of 1812–13. Marine insurance for the Irish Sea rose to 13 per cent.

The campaign of 1813 centred about Lake Erie. General William Henry Harrison had led an army of militia, volunteers and regulars from Kentucky during the preceding summer with the object of reconquering Detroit. The winter and spring of 1812–13 were practically wasted; but news reached him, while still in upper Ohio, 12 Sept. 1813, that Commodore Perry had annihilated the enemy's ships on Lake Erie, and he began to move forward more rapidly. Perry had devoted the spring and summer to the construction of a fleet which he thought would break the power of the British on the lake. On 10 September, Perry came up with the enemy's vessels under command of Captain Barclay. After a serious mishap to his flagship Perry took command of the Niagara, came within close range and after two and a half hours of heroic fighting, completely defeated him. Thenceforth the lake remained in American hands. Harrison was now on the offensive. With the aid of R. M. Johnson's regiment of cavalry he forced Proctor, the English commander, across the Detroit. Proctor remained a few days at Malden, but, very much to the chagrin of his Indian allies, he continued his retreat northward. On 5 October, on the north side of the river Thames, he gave battle to his pursuers. Proctor lost his entire army; the Americans lost 15 killed and 30 wounded. Upper Canada fell into American control. At the eastern end of the lake and looking to the gaining of Lake Huron, General Dearborn made several half-hearted moves. On 27 April 1813, the town of York (now Toronto) was attacked. A sharp battle ensued. The Americans were successful and in the disorder which followed the victory the government house was burned. A month later Commodore Chauncey compelled the English to evacuate Fort George on the Niagara, while the English made an unsuccessful attempt on Sackett's Harbor. An expedition to Montreal under the command of General Wilkinson proved a signal failure. The year closed with Lake Ontario still in English hands. At sea the Americans were unable to hold their own. On 1 June the frigate Chesapeake, commanded by Captain Lawrence was defeated and destroyed by the British frigate, Shannon. The enemy now blockaded the whole Atlantic seaboard.

The year 1814 brought Napoleon's overthrow and consequently peace in Europe. Veteran troops were sent to Canada and to the South. But the Americans were becoming inured to war; there was a more general support of the administration. After some feeble movements in the spring a third invasion of Canada was begun. The Americans numbered 4,700; the enemy was equally strong. At Chippewa an attempt was made to check the invasion but without success. On 25 July Lundy's Lane, the bloodiest battle of the war, was waged. The British were 3,000 strong; the Americans, 2,600. The greatest valor was manifested on both sides; the losses amounted to about one third of the forces engaged. Both sides claimed the victory; but the invaders held their ground until autumn when they withdrew to the Niagara. In September an invasion of New York was attempted from the Canadian side. The line of Lake Champlain and the Hudson River was selected; but Commodore McDonough foiled the plan in the famous battle of Plattsburg on Lake Champlain on 11 Sept. 1814. The campaign closed with no serious advantage gained on either side. To divert attention from Canada the British cabinet had sent an army of 3,500 men under General Ross to threaten Washington. Finding the capital so poorly defended, Ross landed his force, marched directly on the city, and, though meeting with some feeble resistance at Bladensburg, drove the government into the woods and set fire to the public buildings — in retaliation for the destruction of the public building at York a year before. Ross now turned his attention to the city of Baltimore. Here he met with some resistance, the general himself being killed in the attack.

New Orleans was the next object. There was chance here of Indian support from northwestern Georgia. An army of 6,000 British regulars sailed for the Mississippi under command of General Packenham. It appeared a few miles southwest of New Orleans (q.v.) on 23 Dec. 1814. The Americans were commanded by General Andrew Jackson. Before the decisive engagement occurred both armies had been augmented to about 8,000 men each. Jackson fortified himself a few miles below the city and awaited the approach of Packenham; on 8 January at early dawn the battle began. Seeing his men waver, Packenham undertook to rally them. He was instantly killed; repeated efforts were made to carry the American works, but without avail. The English withdrew, having lost 2,036 men killed or wounded. Jackson's loss was 71.

On 24 Dec. 1814 the treaty of peace had been signed in Ghent. No mention was made in the treaty of impressment of sailors, of the right of search, or of the status of neutral trade. The fall of Napoleon had made these questions obsolete. As to boundaries neither party gained anything. The cost of the war had been $100,000,000, 1,400 ships of all kinds, 21,000 sailors, and about 30,000 soldiers killed or injured. Its benefits were the rise of a truly national spirit, the weakening of the State supremacy of former days and the consequent overthrow of the half-treasonable opposition of New England. Consult: Adams, 'History of the Administrations of Jefferson and Madison'; Schouler; McMaster; Hunt, 'Life of Madison.'

Professor of History, Randolph-Macon College.

23. United States — Finances of the (1789–1816). The finances of the government of the United States in 1789 were in a most unfavorable condition. Not only had the Revolutionary War left a legacy of national indebtedness, amounting in 1784 to $39,000,000 exclusive of the continental bills of credit, but owing to the defective revenue system prescribed by the Articles of Confederation, no adequate provision could be made either to pay the principal or to meet the annual interest charges. When the new Federal government under the Constitution was established, the debt had swelled to $54,000,000; of this $11,700,000 was owed abroad. In addition to the above obligations, there was an unknown amount of State indebtedness, approximating $20,000,000. The total debt was a heavy burden for a population of less than 4,000,000, and for a country as yet undeveloped in its material resources.

In 1790 Congress enacted an elaborate funding scheme providing for three loans. The first of $12,000,000 to take up the foreign indebtedness; a second, to the full amount of the domestic debt, accepting at face value all obligations previously authorized, excepting bills of credit which were rated at 100 to 1; and a third of $21,500,000, to cover such State indebtedness as had been incurred for war purposes. The act was a complicated measure with ingenious contrivances, not only to make the loans acceptable to holders of old obligations, but also, by varying rates of interest and deferred interest on a portion of the debt, to afford the new government time to recover from its financial misfortunes. On two points there was bitter opposition to the passage of the act: (1) from those who objected to the acceptance of old certificates of indebtedness at their face value, inasmuch as these had passed current at depreciated value, and had fallen into the hands of speculators; (2) from the Southern States which had paid off a larger share of their indebtedness, and consequently were unwilling to be burdened with the debts of States which had been less self-sacrificing. The first objection was met by the firm contention that national credit could not tolerate discrimination; the second was removed by a shrewd bargain which established the new capital in southern territory on the boundaries of Maryland and Virginia. In 1795 after the funding operations were over, the total debt amounted to $80,700,000, bearing an annual interest charge of about $3,000,000.

The revenue system established in 1789 was of simple character. A tariff act with low rates was passed; specific duties were placed on about 30 articles; ad valorem rates of from 7½ to 15 per cent on a few specified commodities, and a 5 per cent ad valorem rate on unenumerated articles. Tonnage duties were included, and the principle of discrimination against goods imported in foreign vessels and foreign shipping was adopted. Although the rates imposed in this tariff were low, the debate on the measure, as well as the preamble of the act, shows that the principle of protection of home industry was recognized.

In the law establishing a treasury department, provision was made for a secretary of the treasury, a cabinet position; for a comptroller to pass on the legality of bills presented against the government; for an auditor responsible for the accuracy of the accounts; for a register to preserve the accounts; and for a treasurer to receive and pay out money on presentation of proper warrants. The framework of this system has continued until the present time and has proved highly effective in safeguarding the government against illegal expenditures. Alexander Hamilton (q.v.) was chosen secretary of the treasury, and by his constructive genius, exhibited in a remarkable series of reports on public credit, a mint, national bank, and manufactures, encouraged Congress to establish its credit on a broad and generous basis. Through his influence the Bank of the United States was established which granted temporary loans to the government, furnished a sound note circulation, and took care of the government funds. In 1791 it was found that additional revenue was needed, and under the advice of Hamilton internal revenue duties were imposed upon the distillation of spirits. This provoked opposition, especially in the agricultural section of the Middle and Southern States. Here it was claimed that the interior was sacrificed to the commercial interests of the Northern seaboard. In 1794 there was open defiance in Pennsylvania, and the federal troops were called out to put down the so-called Whiskey Insurrection (q.v.). It was contended that the collection of the taxes was inconsistent with the principle of individual liberty, that it injured morals by inducing false swearing, was burdensome, and interfered unduly with the business of distilling. Although the opposition failed in its efforts, the tax was not fruitful, amounting in 1793 to only $422,000 from which about one quarter was deducted for cost of collection and returns for drawbacks. In 1794 excise duties were extended to carriages, sales of liquors, manufacture of snuff, refining of sugar and auction sales. The constitutionality of the carriage tax was assailed on the ground that it was a direct tax and should be levied by apportionment according to population. The Supreme Court, however, in the case of U. S. *v.* Hylton (1796) decided that under the Constitution there were practically but two direct taxes, the poll tax and the tax on land, that the carriage tax was an indirect tax and consequently constitutional. Expenditures continued to exceed the earlier estimates; the Indian war of 1790 was followed by the Whiskey Insurrection, and in 1797 new military and naval expenditures were demanded on account of the strained relations with France. In 1798 a direct tax of $2,000,000 was laid upon dwelling houses, lands and slaves. In 1800 the total receipts from all sources was about $10,848,000, of which $9,081,000 was derived from customs and $1,543,000 from internal revenue and the direct tax.

Hamilton resigned from office in 1794 and was succeeded by Oliver Wolcott who maintained the Federalist policy of his predecessor. The administration of each was subjected to severe and bitter criticism by the Republican party under the leadership of Albert Gallatin. Charges were made that the accounts were juggled, that adequate information of the condition of the treasury was not given to Congress, and that appropriations were not made for specific objects but in lump sums, giving undue and arbitrary power to the treasury department. In 1801 the Republicans came into power with Albert Gallatin as secretary of the treasury.

Economy and abolition of what were regarded as inquisitorial taxes were immediately entered upon. Appropriations for the army, navy and diplomatic service were reduced and the excise duties were repealed. The latter step, however, was taken contrary to the opinion of Gallatin, who wished to husband the resources of the treasury in order to pay off the national debt as rapidly as possible. The commercial prosperity of the country at this period was at a high level; our neutral commerce took advantage of the European wars; exports and imports were large, and customs revenues for several years continued to increase by more than $1,000,000 annually. Notwithstanding the loss of the internal revenue duties and the issue of a new loan of $11,250,000 required by the purchase of Louisiana, the position of the treasury steadily improved, so that the debt was reduced from $86,000,000 in 1804 to $45,000,000 in 1812. The success of this operation was largely due to Gallatin's insistence that $8,000,000 should be annually appropriated to the extinction of the debt regardless of all other demands. Gallatin also introduced the practice of rendering annually to Congress a statement of the finances, and during his administration the policy of making appropriations specific was established.

In order to meet the expenditures of the war with Tripoli a special revenue was created in 1804 by the imposition of additional duties of 2½ per cent on all imported articles paying ad valorem duties; this was known as the Mediterranean Fund. In 1806 the import duty on salt was removed. In 1809 there was a temporary check to the good fortune of the treasury owing to the Embargo Act, but upon its repeal there was prompt recovery. Irritation between England and the United States was deep-seated, and in 1812 the treasury faced a situation for which it was ill prepared. War with England made a heavy loss in customs revenue, for a large part of the commerce of the United States was with that country; there was no internal revenue system to fall back upon; and the estrangement of the wealthy merchants of New England who opposed the war, made it difficult to borrow money in that section. The failure to renew the charter of the United States Bank in 1811 also deprived the government of a substantial agency either for making temporary loans or selling securities. Moreover, there were intrigues in the Republican party directed against Gallatin; his influence was so far weakened that in May 1813, he retired from the treasury.

The extraordinary demands occasioned by war were at first met by loans in which short time treasury notes played an important part. Between 1812 and 1816, $84,400,000 of government stock was sold, of which $17,700,000 was redeemed during the period, making a net increase of $66,700,000; $36,600,000 treasury notes were issued of which about one half were redeemed, leaving $18,400,000 outstanding at the close of the war. Funds were borrowed under disadvantageous terms, a large part of the stock being sold at a discount; of $41,000,000 borrowed up to the end of 1812, New England contributed less than $3,000,000. The financial distress was also aggravated in 1814 by the suspension of specie payments by local banks in all sections of the country except New England; thus the receipts of the government, both for taxes and loans, were in depreciated currency. It is estimated that for loans of over $80,000,000 the treasury received but $34,000,000, as measured in specie. Treasury notes were issued under five different acts; the earlier ones were in denominations of less than $100 and were not designed for circulation; before the close of the war, however, provision was made for the issue of notes as low as $3.00. With the exception of the last issue all notes were redeemable in one year; and again with the exception of the small notes, all bore interest; none of the notes was legal tender.

Congress too tardily endeavored to enlarge the sources of fiscal supply by increased taxes. The customs duties were doubled at the outset, but this gave little strength, since commerce was almost at a standstill. In 1813 a direct tax of $3,000,000 was levied and internal revenue duties were revived. It takes time, however, to establish the machinery of a new tax system, and no receipts from either of the above sources appear on the books of the treasury accounts until 1814. As a consequence of this feeble financiering, deficit followed deficit, amounting in the years 1812–15 to $68,600,000. Gallatin was succeeded in the treasury by William Jones and George W. Campbell, neither of whom was able to cope with the situation, and in October 1814, Alexander J. Dallas, a conservative Republican and friend of Gallatin, was made secretary. The mischief, however, had already been accomplished, and Dallas was unable while the war lasted to extricate the treasury from the embarrassments occasioned by inadequate taxes and depreciated currency. See UNITED STATES — FINANCES OF THE (1816–61).

Massachusetts Institute of Technology.

24. United States Westward Movement. The curtain which veiled far Cathay and the mystic East was raised during the Crusades, but the trade of Europe was blocked by the intrusion of the Ottoman Turks. Adventurous captains, barred by the scimeter in the East, by the cold of the North and the heat of the South, sailed boldly into the West, and consequently brought civilization to the Americas on the eastern rather than the western coast. The American people took up the extension of this triumphal course, and, following the same direction, carried civilization directly across the continent of North America from the Atlantic to the Pacific. In less than three centuries, they traversed the 3,000 miles of continental interior, conquered nature, dispossessed the savages, evicted European rivals, and set up a high form of civilization and government, where formerly were only wilderness and barbarians. This achievement is commonly known as "the westward movement."

Speculation is exhausted in conjecturing the probable result had civilization been cast on the Pacific instead of the Atlantic coast, and been compelled to make its way across the continent from west to east. Recalling the many chance discoveries along the Atlantic because captains mistook indentations, one may imagine the numerous accidents which must have resulted along the almost solid Pacific coast, and the hindrance to the spread of the people because all must come through a few ports. The narrow Pacific coast plain cannot be compared in size with the great Atlantic plain as a place for recruiting strength before commencing the overland jour-

ney. Passing eastward, the inhospitable desert between the Sierra Nevada and Rocky Mountains would have met the emigrants instead of the fertile lands of Tennessee, Kentucky, and Ohio. An eastern movement must have been delayed for generations by the impenetrable Rockies and the arid region at their base, just as the western movement stands to-day blocked while developing a national irrigation scheme. If there be a national destiny shaping our end, it was surely in evidence when directing Columbus to the eastern instead of the western coast.

In 1619, the first successful attempt at colonization within the confines of the British dominions of North America was made at Jamestown, Va. In 1775, the first representative body of men gathered at Boonesborough from four incipient settlements in the present State of Kentucky. It had taken 165 years for the English speech to cover the Atlantic plain, cross the Alleghany Mountains, and set up free government within the Mississippi basin. In 1820, Missouri was admitted, the first State beyond the Mississippi River. Louisiana is not considered because her population was sufficiently complete for admission when she was purchased. It had thus required only 45 years to go from the Alleghanies to the trans-Mississippi region. In 1850, California, the first Pacific State, was admitted. Thirty years only had been required for the people to traverse the remaining half of the continent. The rapid increase in the rate of speed may be attributed to the growth of the protective efficiency of the central government, to the increasing number of people, and especially to improved means of transportation.

The Atlantic Coast Plain, upon which the present United States was born, is a long, narrow strip of comparatively level land, trending from northeast to southwest, and lying, generally speaking, between the Appalachian mountain system and the Atlantic Ocean. Its width varies from 50 to 200 miles, depending on the approach of the various flexions of the coast to the mountains. Within this long stretch, the battles of the Revolution were fought with a few small exceptions. It was essentially a coast war, the troops being frequently conveyed by transports from one point to another, and a French fleet co-operating with the army during the last general campaign. During the war, the Continental Congress sat at Philadelphia, Baltimore, York, Princeton, Annapolis, Trenton, and New York, never more than 150 miles from the coast. It is said that during one of the many dark hours of the contest, Washington expressed his determination, in case of ultimate defeat, to retire with his remaining comrades to the fastnesses beyond the Alleghanies and there continue the unequal contest. Evidence is not wanting to show that many of Washington's fellow officers and comrades contemplated future residences in the "back lands," as the region beyond the mountains was called. They were "back" lands in the sense that they did not drain through the Atlantic or "front" way. Although claimed by the king *ex officio*, as "crown lands," these lands as far west as Britain ruled were demanded by some of the colonies because their charters covered them. Others thought that the Indians owned the lands beyond the mountains, and endeavored to purchase them from the aborigines. The king still insisted that the limits of the 13 colonies terminated on the watershed of the mountains. He did not except even Pennsylvania from this rule in his proclamation of 1763. But the political rebellion arose so soon that the proclamation was virtually null and void, if the Americans should succeed in securing Independence.

Several attempts to penetrate the western country were made about the time of the outbreak of hostilities between the colonies and those in authority. The country-dwellers in the uplands of Virginia and North Carolina were restless, fearless and self-reliant. They needed only a rifle, powder and ball for equipment. In this and similar respects, they were the antipodes of their urban-dwelling brethren of the north Atlantic plain. A glance at a map will show that in western North Carolina, the watershed has leaped over to the most easterly of the mountain ridges, leaving a large space of the "back lands" within the limits of this State and Virginia. The Yadkin approaches the water shed upon the eastern side very closely, while the western slope is drained by the Watauga, the French Broad and other headwaters of the noble Tennessee River. Here was probably the earliest carrying place of any magnitude between the Atlantic plain and the Mississippi basin. Over it passed Daniel Boone, Robertson, and other adventurous spirits to form the Watauga Association in the back country in 1772. The map will also show that other streams tributary to the head of the Tennessee take their rise in long parallel valleys in southwestern Virginia. Among them are the Clinch, the French Broad, and the Holston. They are almost touched by the headwaters of the James and the south branch of the Potomac. Over the many short portages between the two systems came such hardy men as John Sevier and Richard Henderson to meet the North Carolinians in northeastern Tennessee.

These scattered Watauga settlements, largely in what is now Carter County, Tenn., not only set up the rudiments of government, but also furnished a supply for two great streams of emigrants to the West. One branch passed directly down the Tennessee River, founded Knoxville, and planted innumerable villages and homes throughout eastern Tennessee. John Sevier attempted to collect them into his state of "Frankland" or "Franklin," as it was later called. The other branch of people turned directly west across the Clinch and Powell Mountain, passed through the Cumberland Gap, and found its way into the limestone valley of the Elkhorn, the "blue grass" region of Kentucky. Watauga hunters encamped there heard the news of 19 April 1775, and named their camp "Lexington," a name the city bears at this time. When independence was announced, there were several thousand people maintaining their stand against the hostile savages and the British in the present States of Tennessee and Kentucky. Uncertainty of ownership left them almost entirely unprotected. As a defensive measure, George Rogers Clark headed a number of them, together with some Virginia recruits, and marched to destroy Kaskaskia and other former French posts now held by the British. Virginia in this way doubly confirmed her claim to the land north of the Ohio. It is

worthy of note that it was a Virginia-Kentucky enterprise, and formed no part of the claims put forward in the treaty of peace for American ownership of the "back lands."

The Watauga route, although the first to be used in popular migration, was outranked in age by the Potomac-Monongahela portage path. it was the one which young Washington chose across the mountains when warning the French from the "back lands"; along it Braddock led his ill-fated expedition; and over it Washington brought back the survivors of that disastrous excursion into the Western country. It required the shortest carrying over the Allegheny watershed and evidently awaited only the pacification of the Indians north of the Ohio to become the great thoroughfare to the West. The conduct of the Revolutionary War had made the Lake Champlain route to Canada familiar. At Albany, the Mohawk invited travelers to the west to follow its charming valley to Lake Oneida, and thence by the Oswego River to Lake Ontario. Washington, Lafayette, Madison, and Hamilton made short trips in this direction after the war. But it was a long and perilous way to the Western lands, involving passing through the undependable Iroquois, a canoe trip on two great lakes, and a long portage about Niagara Falls. This route, destined to become eventually the most popular, was very tardily developed. A fourth route would be opened in time about the southern end of the mountains, but not until the Creeks and the Cherokees could be removed from the way or pacified.

These were the four great ways from the Atlantic to the interior. Pioneers on foot and in "dug-outs" pushed their way across prairie, through forests, and along the streams. The northern portage is now used by the New York Central and West Shore railways and by the Erie Canal; the Pittsburg route by the Pennsylvania and Baltimore and Ohio railways; the "Wilderness Route" by the Chesapeake and Ohio, the Norfolk and Western and the Southern railway lines; and the extreme southern route by the many east and west systems centring in Birmingham, Ala. In the many changes from "dug-out" to palace car, the people have never abandoned the line of least resistance for travel.

Among the many inducements held out in recruiting for the Revolutionary service was the promise of "a good farm." Led by visions of this bounty land, officers and men, at the close of the war, banded themselves together for the purpose of migrating to the "back lands," which had been won by their valor. This they would do not only for bettering their condition, but also for protecting the frontier against the Indians, the Spanish in the Floridas, and the British in Canada. Efforts to satisfy these ambitions brought about the cession of the western lands by the States to the national government, the creation of the Northwest Territory (q.v.), the sale of 1,000,000 acres to the Ohio Land Associators, and the first settlement north of the Ohio made at Marietta, 1788. However, occupation of the land north of the river progressed but slowly until the victory of Wayne over the Indians and the resulting treaty of Greenville in 1795.

The year 1790 marked an important stage in the history of the westward movement. The Constitutional government under President Washington had been established the year before. One of its duties was to make a numbering of the people so that an equal representation in Congress might be had. The first census taken in 1790, enabled us to know the number of people in each county and town and hence the distribution of population. It showed that little "islands" of people had run far ahead of the main body and established themselves, as already described, in Tennessee, Kentucky and Ohio. Not more than 5 per cent of the 3,929,214 total population lived west of the Allegheny watershed. The front wave of people extended almost uniformly along the eastern slope of the mountains, throwing out long arms along the four routes to the West. The average distance of the people from the ocean was not more than 250 miles. The Americans were still coast dwellers. The West was as yet unknown. The most thickly settled portions lay in an irregular line from Portsmouth, N. H., to Baltimore, Md. Here dwelt more than 60 people to the square mile.

The westward advance, as suggested heretofore, was hindered constantly by the hostility of the savages. Perforce the national government was gradually given control of them by the States. It recognized them as foreigners so far as making treaties with them for the possession of their land was concerned. Scores of these treaties were made, establishing lines beyond which the whites solemnly promised not to migrate and east of which the Indian agreed not to molest the white. But it was impossible for the government to restrain the land-hunger of the citizen when confronted by a savage. On the frontier, treaties were secondary to force. These broken and obsolete Indian treaty lines, from which the savages were driven back, bear a striking resemblance to the positions occupied at different decades by the foremost line of the pioneers. In order to provide for the unstayable advance of population, increased constantly in numbers by immigration from Europe, the national government was convinced that something like a general policy of treating with the Indians must be formulated. The whites sometimes surrounded the Indian lands, threatening to annihilate the savages, if they did not move on. Thus in 1820, the advance line of pioneers extended from Kentucky in a strong belt down through Tennessee and western Alabama to Louisiana; but between these people and their brethren in South Carolina and Georgia lay hundreds of miles occupied only by the savage Creeks and Cherokees. Toward the north, civilization had spread up from the Ohio River about to the latitude of Vincennes and Saint Louis, but further advance was barred by the Pottawatomies. With difficulty the whites were kept from annihilating whole tribes. Peace and preservation for the Indian as well as for the white could be secured only by keeping the former well in advance of civilization, assigning them to some remote portion of the country which they could hold *en bloc*. Here they could dwell perpetually. See TREATIES, INDIAN.

Many presidential messages, beginning with those of Jefferson, advocated such a disposition of the Indian. In 1839, a revision of the laws regulating trade with the Indians was made.

One provision set aside all the land lying to the west of the Mississippi River except the States of Louisiana and Missouri and the Territory of Arkansas to be an "Indian country." Within a few years it received the Creeks, the Seminoles, the Cherokees, Chickasaws, Choctaws and other warlike tribes from east of the Mississippi. Some came willingly, others by compulsion. Incidental to their removal occurred the Seminole War and the Supreme Court case of Worcester *v.* Georgia. Gradually the "Indian country" has been scaled down to the present Indian Territory. Released from the barrier of savages, population moved forward more evenly and brought portion after portion of the new lands to statehood. The admission of new States to the Union was made possible by the western movement. So early as Revolutionary days, the number of people pouring across the mountains showed that some provision must be made for governing the land beyond the undisputed limits of the 13 States. It might be held as a tributary province, it might be left to protect itself, or it might be nourished by the parent until it reached a stated point and then be admitted to equal rights in free government. In 1780, Congress, wishing to persuade the States having claims on the "back lands" to yield them, promised that it would not hold land entrusted to it as subject territory, but would erect it into states of moderate size as rapidly as population should warrant. This promise had the desired effect and has been redeemed 32 times by the national government. With the exception of Maine, created from a Massachusetts Bay province; Vermont, claimed by several adjacent States, and Florida, purchased from Spain, the new States have been created uniformly on the western side of the old 13 and have been due entirely to the western migration across the continent. New accessions of territory brought land for these new States. The additions of Louisiana, the Floridas, Texas, California, and Oregon have come from the movement and demand of the people. The invariable condition of these acquisitions has been that trade allures the American into a neighboring foreign possession. He becomes involved with the authorities, or friction ensues in some other way, and he then demands that his flag shall follow and protect him. Trade never follows the flag, but trade demands that the flag shall follow and protect it. By means of these additions the people have spread over a territory ten times that of the original 13 States.

It is evident that the front line of people will always be at right angles to the direction of movement, representing, as it does, the foremost wave of advance. This is the "frontier." Technically it is the long, narrow advanced strip which contains more than two people and less than six people to the square mile. The latest aspect of the frontier is associated with the Great Plains and cowboys; but the frontier in past times has occupied successive positions from the Alleghanies westward at each succeeding census. Its various positions remind one of the old sea beaches on a geological map. When young Andrew Jackson migrated to Tennessee and lodged in the "lean-to" of Mrs. Donelson, built against her log cabin, he was on the frontier of that day. When Abraham Lincoln's mother died 18 miles from a physician in a southern Indiana cabin, it marked the hardships of the frontier. When "border ruffians" contested with "Thayerites" for the possession of eastern Kansas, the frontier had reached that point.

Manifestly, if the start had been equal all along the line and the rate of progress equal, the frontier line would have been almost a straight line. But the topography of the land and the hostility of the Indians prevented such a regular advance. Long arms of people ran up the streams, islands of people were formed far in advance, and deep indentations frequently resulted from some hindrance. The frontier of 1830, for example, extended in a great convex westwardly curve from Detroit, Mich., to New Orleans. It threw out so many projections along the Wabash, the Illinois, the Mississippi, the Missouri, Arkansas and Red rivers that it was 5,300 miles long. Ten years later it had filled out these inequalities so much that although it extended from Green Bay, Wis., to Corpus Christi, Tex., it was only 3,300 miles in length.

No prediction could be safely made as to direction or rate of motion. A rush or "boom" would make a fully populated region out of what was yesterday an untenanted wilderness. The census of 1830 showed a barren sweep about the head of Lake Michigan with less than two white men to the square mile except in the lead mines in northern Illinois and a group about Kalamazoo, in southern Michigan. Ten years later the lake was skirted from north of Milwaukee far down into Indiana by from 6 to 18 people to the square mile. Within the decade, it had leaped through the intermediary stage of the frontier. In 1830, Mississippi was settled only in a narrow strip across the southern part. Ten years later the entire state, except a spot near the Gulf, was covered with a population in many places of 20 people to the square mile.

The frontier in 1860 lay almost due north and south just west of Iowa and Missouri. It was the line-up for the final dash across the Great Plains, the best known and most picturesque of all the positions of the frontier. In 1890, it had assumed its highest achievement and was in its proudest position. Beginning at the Canadian border near longitude 100° it came down through the Dakotas and suddenly turned westwardly, encompassing the larger part of Colorado, and rounding down into Texas on the south. But ten years later, population had so shrunken in the "dry farming" districts of Nebraska, Kansas, and Colorado, that the line had fallen back, almost coincident with the meridian of 101° north latitude from the Canadian boundary to the Rio Grande. For the first time in its history, the American frontier had retreated. Nature, driven back step by step through the conquering will and forces of man, seemed to have taken her stand in the arid regions and to defy further encroachments upon her realm. National irrigation under the form of internal improvement may be the weapon with which she will again be defeated.

The movement of population, which conquered the continent and unified the American people, was not only a westward movement but a due west movement. Men follow parallels of

latitude because of similarity of climate, occupation, products, foods, and dress. The constant tendency to migrate due west is shown in a study of Americans living in one state who were born in another. New York, to illustrate, has contributed more citizens to New Jersey than to any other State; then to Michigan, Pennsylvania, and Illinois in decreasing order, but all to the westward. Georgia has sent more of her citizens to Alabama than to any other State; then to Texas, Florida, Tennessee, Arkansas, and Mississippi, in decreasing ratio. Arkansas and Iowa are about equally distant from the Atlantic, the place of setting out. But in the onward march, 26 New Yorkers found their way to Iowa for every one to Arkansas. On the other hand 57 South Carolinians have chosen to live in Arkansas for every one who chose to remove to Iowa. The State of Washington has drawn most largely upon Illinois and Texas most heavily upon Tennessee. All this had a most important bearing on northern and southern sectionalism.

The due west movement has been accompanied thus far by a very slight return movement, except beyond the Rocky Mountains, where the entire migration is the reverse of that to the east of the continental divide. Thus Virginia has given to Missouri 35 citizens for one received in return. But with the exhaustion of the western public lands, the growth of cities, and increased means of communication, the westward movement will gradually wane. As evidence of this, it may be noted than in 1880, Illinois had given to Iowa six persons for one received, but in 1900 the ratio had fallen to three to one. During the same period, the ratio of exchange between New York and Colorado had fallen from 75 to 1 to 22 to 1.

This return movement will be increased by the improved methods of applying steam and electricity to means of transportation. Mention has been made of the increased rate of motion owing to these and similar improvements. The waterways were the ready-made highways for the pioneers. Supplemented by carrying or portage paths from stream to stream or across watersheds, they formed a network of routes of travel, not only in a drainage basin, but from basin to basin. No small amount of the proverbial American "initiative," the capacity for doing things, must be attributed to the manner in which obstacles were overcome in this primitive travel and transportation.

The American frontier has passed forever. Fully equipped civilization stands at the edge of the arid region. It is met in the mining cities of the Rockies. The American pioneer lives only in the gratitude of the people. The influence which the frontier and frontiersman have wrought on American life have been suggested frequently in preceding pages of this article. A supplemental summary finds that the frontier has produced (1) a constant renascence of the principles of free government upon which the republic was founded. Western State constitutions have been notedly more liberal than those of the Eastern States. Eastern statesmen have been rejuvenated by contact with the crude sons of the West. A jealousy of their republican institutions, amounting almost to a madness, permeates the western people, sometimes making them liable to harbor political and economic vagaries. (2) The frontier has helped keep alive the principles of democracy in America, notwithstanding the enormous accumulations of riches which tend naturally toward begetting social distinctions. Among the frontiersmen personal strength and personal merit outweigh descent and social rank. (3) The needs of the people in the remote regions, met by Congress under the general name of "public improvements," have tended constantly to widen the scope of the national government. The scruples of "strict construction" must give way before the clamor of the people, as Clay easily demonstrated. (4) The public domain, by the easy arrangement of purchase, has furnished farms and homes for millions of immigrants, who would otherwise have crowded into the cities to become consumers of food, but who, as agriculturalists, have become producers of food. (5) The missionary spirit has been kept alive by the needs of both savage and civilized man along the border. Frequently colonies were transplanted to the wilds, carrying churches, schools, and even colleges with them. Galesburg, Ill., and Granville, Ohio, are examples. (6) The vacant land in the West has offered an asylum for theorists and philanthropists. The Mormons, the Icarians, the Harmonists and the community at Greeley, Col., are instances of this kind. (7) Guarding the frontier has furnished a *raison d' être* for maintaining a small force of national troops until such time as the growth of cities furnishes a new task. The deeds of daring performed by both rangers and regulars along the border will be handed down among American traditions. (8) Free education has been fostered through the provision for granting a certain portion of the public lands for public schools and for colleges. (9) The tillable land of the West has made us independent of other nations and has largely turned their dependence for food supply on America. In a similar manner, the western mountains have furnished a mineral supply for the manufacturing demands of the older portion. Cities and villages have cut down materially the food-producing area in the older States, but the West is still unhampered. Excluding Alaska and the other outlying possessions, the centre of area of the United States is in northern Kansas, but the centre of population is in central Indiana, more than 700 miles behind.

"The West" has always been a purely relative term and so remains. To the New Englander, it means New York or Ohio. To the people of those States it means the trans-Mississippi region. In Utah, it means California. In 1832, Chicago was in the far West. About that date, a man conceived the idea of killing hogs, packing them in barrels with salt, and shipping the pork by lake to Detroit and Buffalo, instead of driving the animals on foot or shipping them by boat, as was the practice. By the end of the century, Chicago was "packing" 2,000,000 cattle annually and 7,000,000 hogs, sending the meat in refrigerator cars to supply the hungry Eastern States and Europe. As early as 1830, a long, thin projection of people ran up the Missouri River to the mouth of the Kansas, following the route of Lewis and Clark a few years before. It was prophetic of the future collecting and distributing point of Kan-

sas City, 1,500 miles from the starting points along the Atlantic.

So long as wagon trains toiled over prairie trails, or pony expresses handled light packages and the mails, or the overland coach carried a limited number of travelers, the resources and capacities of the great West remained untried. But, in 1862, two companies accepted the offer made by the national government of land and loans to construct a continuous railway from the Missouri to the Pacific. Precedent for this assistance of the government was found in the custom of granting certain portions of the domain for constructing means of access, thereby rendering the remaining land more valuable. In 1869 the line was opened and it sounded the death knell of an isolated West. When the road was begun, there were only 14,916 miles of railway beyond the Mississippi. When it was completed, there were 22,863 miles in operation in that remote region.

The Great American Desert, as our fathers mistakenly called the Great Plains, is now fretted over with railway lines. In its midst lies Kansas, Nebraska, and the Dakotas, among the largest corn and wheat producing States. West of the Mississippi lie Texas, Montana, Oregon, and New Mexico, containing more sheep than the remaining States combined. West of the Mississippi lie California, Idaho, and Colorado, producing more precious metals than all the remaining States. Seven-ninths of the manufacturing is still carried on east of the Mississippi. Nearly three-fourths of the people dwell on the eastern side. But the river, running north and south, is no longer a menace to the perpetuation of the republic as it once was. Migration and trade run east and west, and the great Father of Waters is spanned by more than a score of railway bridges, linking the people together along modern lines of transportation. These trunk lines bind together the East and the West, the old and the new, sire and sons, manufactures and raw products, storehouses and grain fields. Home ties are no longer sundered by migration; sectionalism is no longer begotten of distance; but the people move freely to and fro over soil which their forebears wrested from nature in order that the experiment of a confederated republic might be tried on the largest scale yet attempted.

Professor of History, University of Chicago.

25. United States — Monroe Doctrine. The Monroe Doctrine is so called because it was first officially announced by President James Monroe, in a message to Congress 2 Dec. 1823. The immediate cause of the declaration of this doctrine was a double danger to America from the aggressions of European nations. Russia, it was feared, was likely to extend her colonies southward from Alaska until California would be in danger, while Spain, it was expected, would make a great effort to recover her revolted American colonies, which had thrown off her authority and had established governments of their own. After consulting with his friends, and powerfully urged by his secretary of state, John Quincy Adams, President Monroe sent his famous message to Congress in which he declared "that the American continents by the free and independent condition which they have assumed and maintained are henceforth not to be considered as subjects for future colonization by any European powers." He further declared that "with the governments who have declared their independence and have maintained it and whose independence we have . . . acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any manner their destiny, by any European power in any light than as a manifestation of an unfriendly disposition toward the United States." This position in regard to the relation between European nations and the nations of America the United States has consistently maintained from the days of Monroe to our own time. See MONROE DOCTRINE.

W. H. MACE,
Professor of History, Syracuse University.

26. United States — The New Democracy and the Spoils System. Up to 1828, the spoils system was unknown in national politics. Jefferson had in 1801–1803 removed many opponents, but he had not made political service an important qualification for office. From that time until 1828, all Presidents were of one political party, there were few removals, and the management of the civil service was conservative, honest, and fairly efficient. Very different was the condition in many of the States. In Pennsylvania in 1799, in New York in 1801, Republican victories had been followed by the wholesale removal of Federalists. The swiftly succeeding party changes brought retaliation, and both parties were soon committed to the practice. Popular approbation confirmed it, and popular apathy allowed appointments to be made more and more exclusively for political reasons; changes were so numerous that merit could not be investigated. The New York constitution of 1820 embodied an attempt at reform. It abolished the Council of Appointment, which consisted of four senators annually elected by the House of Representatives, and which had entirely controlled appointments since 1801, and concentrated the power and responsibility in the hands of the Governor and Senate. The number of appointive offices was greatly decreased by giving to the people the election of militia officers and justices of the peace. The spoils system was, however, too firmly intrenched to yield, and the Albany Regency, a combination of politicians skilful in making use of appointive offices for political purposes, and in controlling the minor elective offices by means of caucuses, became the dominant power in the State. The advantages of the spoils system in building up and holding together a political organization did not escape the attention of politicians of other States. Proscriptions were carried out in Rhode Island in 1810, in Massachusetts in 1813, and, while they were unpopular and did not lead to a permanent introduction of the spoils system there, they indicate that in these States, and probably in others, there existed a class anxious to see the public offices turned over to the politicians. Debarred from using the State service for their purposes, such men naturally looked to the national salaries; nor in this were they alone. The more fortunate politicians of New York and Pennsylvania had already a little tinged with politics the national service in their States, but they would not rest satisfied until they could elect to the Presidency a man who approved their principles and would make the spoils system national. The existing state of affairs was

displeasing not to the politicians only, but to the people, particularly those of the frontier States. The wholesome distrust of life-tenure in executive and legislative office, which had been so keen during the Revolutionary period, had extended to administrative office; the reasons for regulation had been forgotten and limitation had come to be considered as an end in itself. State constitutions and laws began to substitute a fixed term for tenure during "pleasure" or "good behavior," and in 1820 Congress limited to four years the tenure of the majority of United States officials. Such legislative action did not immediately lead, and was not intended to lead to, actual change; it was to give the people the power to make such change, if necessary. In 1828 there was a popular feeling that the time had come. The long tenure, and in some cases too eminent respectability, the book learning, of the existing servants of the people, had made them for some time feared and distrusted. In this situation, the charge of "bargain and corruption" against Adams and Clay seemed proof positive: the case against the civil service was complete. Joined to this distrust of those in authority, was a superb confidence in the honesty and capacity of the people. Jackson said in his first annual message: "The duties of all public offices are, or at least admit of being made, so plain and simple that men of intelligence may readily qualify themselves for their performance; and I can not but believe that more is lost by the long continuance of men in office than is generally to be gained by their experience."

Jackson Introduces the Spoils System.—The election of Jackson was brought about by the combination of these two elements. Van Buren had brought the support of the organized Democracy of the North and East, of the politicians and the people that they represented. Jackson himself stood for the frontier democracy, with its confidence in itself and distrust of those it did not understand. The enormous crowd of office-seekers at Washington on 4 March 1829 left no doubt as to what course the government was expected to pursue. It is useless to discuss the personal responsibility of Jackson and Van Buren for the subsequent course of the administration. They were but carrying out a policy in which they believed and which the people had elected them to put into effect.

Of 610 officers of the presidential class, that is, those appointed by the President with the advice and consent of the Senate, 252 were removed during Jackson's administration. This number is not large, but there are facts which make this proscription the most noteworthy in our history. The majority of the removals were made in the spring and summer of 1829, and so attracted more attention than those of Jefferson, which were scattered through several years. Among those changed, moreover, were included nearly all the important officers, many of whom controlled large numbers of subordinates and carried on proscriptions of their own. In addition, the removals were to some extent localized, for few were made in the old South. In the North and West, then, by far the greater proportion of the salaries and influence of the national service changed hands. The specially distinguishing feature of this proscription, however, was the nature of the qualifications for office demanded. Up to this time, ability to perform the duties of the office, geographical fitness, good local standing, and political opinions in sympathy with the appointing power, had been required with varying emphasis. Service to the party was sometimes rewarded, but incidentally, at no time being actually essential. Under Jackson, ability became incidental, and party service the main requirement, not only past service but future usefulness as well. Newspapers were then not generally self-supporting and many editors received offices to enable them to pay their debts and improve their papers. Nor was loyalty to party alone sufficient. Unless one were a friend of Jackson or could obtain his ear, it was decidedly advantageous to belong to the Calhoun faction, and have his friend, General Duff Green, editor of the 'United States Telegraph,' press one's suit; or to advocate the succession of Van Buren and receive the aid of the powerful interests he represented. By 1831, the salaries of office-holders were occasionally assessed for party purposes, and, by the close of the administration, this practice was well recognized. The spoils system had been introduced into the national service: the question of its continuance remained.

The Whigs Establish the Spoils System.—The opponents of Jackson seized upon his administration of the civil service with avidity. They could not conceive that the people would indorse a practice that appeared so impolitic and wasteful. The Senate did not reject many of his nominations, but in 1831 several resolutions were introduced to show its disapproval and in 1835 an elaborate plan to regulate the control of the patronage was formulated. Webster, Clay, White, and Calhoun delivered able speeches filled with high ideals of public service. When examined, however, the plan proposed is found to be purely an attempt to limit the power of the executive. The President was to present to the Senate the reasons for removals. Jackson refused to yield. His friends defeated the Senate's proposal, those whose nominations were rejected received compensation in other ways, and on 10 Feb. 1835 he peremptorily refused to send the Senate any information concerning the removal of Gideon Fitz, asserting that that body had no right whatsoever to investigate removals. While no tangible results were obtained by this senatorial opposition, the patronage was to play a prominent part in the campaign of 1840. The crisis of 1837 struck a staggering blow at the civil service. Public servants who had speculated with government funds were caught without property to pay their loans: of 67 land officers, 64 were said to have been at one time in default. This condition was partly due to downright dishonesty, as in the case of a Samuel Swartwort, collector at New York; more, and especially in the West, to lack of business education. A treasury agent wrote of "a certain looseness in the code of morality, which here does not move in so limited a circle as it does with us at home." Some such experience was inevitable in so great a crisis. Its extent was due to the carelessness with which appointments had been made, and the Van Buren administration suffered as if alone responsible for the spoils system and the breakdown in the civil service. Reform became one of the most popular issues of the campaign, and the method

of dealing with the situation proposed by the Whigs, the limiting of the power of the executive, was one that appealed strongly to their Southern States rights supporters. To nothing did the election of Harrison so strongly commit his party as to the abolition of the spoils system. Having come into power, they failed to enact their legislation planned in 1835, although in full control of Congress, and although the subject was brought up. To remove many of the incumbent officers was necessary to their reform, but in filling the vacancies thus created they were pledged to return to the pre-Jacksonian qualifications for office. Instead, while insisting upon ability somewhat more than Jackson had done, they continued to make party service the chief essential. The man appointed collector at New York was described to Peter B. Porter by Thurlow Weed as follows: "Although not personally popular, [he] is represented as possessing an extraordinary share of tact or stratagem, and as being able, by his skill in planning and combining, and his untiring industry in executing, to produce the most astonishing political results. That, with the office of collector [which Weed considered as second only in importance to that of Postmaster General] he could on all important occasions, command the vote of the City of New York, and, per consequence, of the State." In 1841, then, the spoils system had been recognized by both parties and might be considered established.

The Significance of the Spoils System.—The continuous progress of the spoils system from a few States to the nation, from the nation into other States, from one party to the other, until it became a thoroughly national institution, indicates that it possessed some principle of vitality. The reasons thus far offered are insufficient to explain its growth. No practice could become so firmly fixed unless it served some fundamental lasting use. The spoils system was in fact a concomitant and probably a necessary one, of the democratic revolution which made Jackson President in 1829 and established the rule of the people in the United States. The people cannot govern unless organized. They may overthrow old leaders in a revolution, they may elect new leaders by a plebiscite, they may even determine the policy of the government in moments of great national enthusiasm, but they cannot exert a steady control of the details of administration unless their lagging interest is kept up and their views given a means of expression by organization. Organization, however, requires leaders, not only leaders of ten thousands who receive a reward of glory, but humble leaders of tens, ward-heelers, who enjoy little honor. Public interest attracts some to perform this function, but a sensitive democracy requires that these men shall be of the "people," not men of wealth; it would not have politics a business of class, as it largely is in England. Now, however public-spirited a poor man is, he has to earn a living. Such motives, moreover, would not attract a sufficient number. Material inducements are necessary, and some substantial means of supporting party organization must be found. To supply this is the function of the spoils system. The civil list becomes the pay roll of the party, and the recipients of public salaries are expected to serve the nation in the double capacity of working officials and party organizers. The rise o the spoils system was, then, inextricably joined with the rise of party organization and of democratic government, and this connection has continued to the present day (1904). That such connection is permanently necessary does not follow, but, if it is to be done away with, a substitute must be provided, for it fulfills a necessary and useful function. Politics may become a recognized profession with legitimate rewards, the people may become less suspicious of men of wealth, party organization may be simplified and fewer workers required — in some way the cause must be removed; direct attack can never succeed.

The Struggle for the Patronage.— It follows from this inter-relation of the spoils system and party organization that the control of the patronage would often mean control of the party. Hence the struggle to secure this control became very bitter, and raged not merely between the two parties but also between the different branches of the government. The Constitution gives the House of Representatives no share whatsoever in the appointing power. In 1826, however, it was proposed that the delegations select the newspapers to be given the printing of the laws. In 1862 each member was allowed the appointment of two cadets at Annapolis, and in 1899 General Grosvenor proposed that all government offices be divided equally among the congressional districts and that the recommendations of the congressmen be requisite for appointment. The Senate, on the other hand, possesses rights under the Constitution and has always fought to have them respected. In 1789 Congress decided that the Senate had no power over removals. This interpretation was continually attacked, but for a long time unsuccessfully. The House of Representatives did not sympathize and a two thirds majority would be necessary to override the almost inevitable veto of the President. Under Johnson, however, circumstances were favorable. The executive power had grown abnormal during the war; the patronage had become so extensive that it was feared even before the death of Lincoln; the actual President was hated, and his opponents had a two thirds majority. In 1867, the Tenure of Office Act was passed, providing that Presidential officers could be removed only with the advice and consent of the Senate. The friends of President Grant procured the modification of this act in 1869, but, in spite of protests and with little to say in its defense, the Senate maintained the law until 1887, when finally it was repealed and the interpretation of 1789 restored.

The Machinery of the Spoils System.—While legally the President has maintained his power except for this short period, in actual practice he has long been greatly restricted. It is of course impossible for him to be personally cognizant of the conditions and the qualifications of candidates for all the positions scattered over the country. Assistance has always been necessary and it has been natural to consult the members of Congress best acquainted with the locality. This was done from the foundation of the government, but, with the development of the spoils system, the requests for advice became more a matter of routine and the obligation to accept it became more binding; the discretion of the central government became a smaller

factor. All representatives in sympathy with the party in power began to expect as a matter of course to control the appointment of minor officers, as rural postmasters, within their districts. Lincoln's correspondence shows that in 1840 he considered this a well-established rule, and as President he abided by it. Often courtesy extends this privilege to congressmen of an opposing party, notably to those from the South, and in cases where a fixed number of new offices is created for every congressional district, as in the census appointments for 1900. With regard to all local offices of the Presidential class, the Senators from the State in question expect to be consulted. In the early history of the spoils system, the delegations composed of all members of Congress from the Several States settled such questions; under Pierce, they dictated nearly all important appointments. Lincoln wrote that the two Rhode Island Senators, the two old representatives, and one of the new ones, combined in favor of one candidate, and added: "While under peculiar circumstances a single member or two may be overruled, I believe as strong a combination as the present never has been." After the passage of the Tenure of Office Act, the Senators waxed in power at the expense of the Representatives, their assumption reaching its height when Conkling and Platt in 1881 retired from the Senate because they were not allowed to control the New York appointments. The repeal of this law, however, has not restored the delegation to its former position. General and foreign appointments are oftentimes divided pro rata among the States and assigned in the same way as the local offices. This was understood in 1849, was a fixed rule under Pierce, and has been the general practice ever since. The extension of the influence of members of Congress curtailed that of the secretaries of departments, and the limits of their respective powers have always been a source of difficulty. Under Pierce, it seems to have been the practice to allow the secretary at least a nominal veto on all nominations to offices within his department. Lincoln was inclined at first to overlook this, and had much difficulty with Secretary Chase in regard to it. The personality of the secretary has much to do with his influence, but few of them exert very much at present, except as advisers of the President. The latter dispenses comparatively little patronage directly, but as the final arbiter in disputes between Senators and Representatives, holding in his hands the whole situation and adjusting the various interests, he has a power which makes even a weak man powerful and a strong man, party dictator. The boss exerts his influence through some of these agencies: as the friend of the President, as a member of Congress, or as the political mentor of Congressmen. The whole is now highly systematized; the Treasury Department can tell in a moment by its card catalogue how many men every Congressman has recommended, how many have been appointed, and what Congressman recommended every appointive officer.

The Spoils System and Administration.—The spoils system does not necessarily mean bad administration. Its uncertainties deter men of conservative tendencies from entering government employ; but the opportunities of sudden and distinguished advancement attract men of adventurous character, and undoubtedly so far in our history this latter class has contained the greater part of the ability of the nation. It is not to be supposed, moreover, that the whole service has ever been changed at any single proscription. William Hunter entered the State Department in 1829 and served until 1886, preserving the continuity of tradition and becoming a power in the State by reason of his experience. He is a type of a large class of permanent officials, who have on their shoulders the weight of routine business. Often it is easy to distinguish between two distinct classes of officers, the one working at government duties and the other attending to politics. Of course this double system is expensive, because of the unnecessary number employed and the fact that the class of men attracted while able are not always honest; but it need not be inefficient.

Rotation in Office.— While the rise of the spoils system is so closely connected with the rise of the new democracy, and its organization was soon completed, there are several significant episodes in its later history. The system had been justified before the public largely by the democratical phrase "rotation in office." For a long time, however, actual rotation was practised only when the incoming President belonged to a different party from his predecessor. Buchanan was the first President to expel men of his own party. It was then held that the public offices were prizes, and that democracy demanded that they be shared round as often as possible, that no one should hold longer than four years. Consistency required that a President who was re-elected, decapitate his own appointees, and this policy was urged on Lincoln in 1865. He firmly set his face against the suggestion, and it has never been carried out. Buchanan's example, however, has been followed with the single exception of when Roosevelt succeeded McKinley.

The Spoils System and the South.—The seaboard South was for a long time comparatively free from the spoils system. Jefferson stated, not quite truly, that he had no requests for removals from that region. The dislike for the New York machine did much to promote the formation of the Whig party there, and Calhoun was not more emphatic in his support of slavery than in his demand for reform in politics. This immunity was largely due to the political conditions, the fact that politics was the business of the wealthy, and that the public offices were not needed to support party organization. The Civil War and Reconstruction brought a total change. The attempt to build up a stable Republican organization composed of moneyless negroes and money-seeking white men from the North, involved necessarily the use of public offices, both State and national, as spoils. After the overthrow of the negro domination, this organization was still maintained by the use of the national spoils, because of the votes it could cast in national nominating conventions. In the Democratic party, the wealthier class gradually lost its control, and the rise of a real democracy has been again marked by the adoption of the spoils system, which may be said now to embrace the whole country.

The Spoils System and Civil Service Reform.—At the very time that the spoils system was being extended into the South, it received a

vigorous attack in the development of civil service reform. It was natural that such a movement should come when the Civil War had so greatly distended the civil service. The method of reform proposed was the substitution of a mechanical for a personal method of appointment. It was claimed by the supporters of the *status quo* that no mechanical system could be devised which could properly take into account a man's ability to perform the functions of his office. The reformers claimed that such a system was possible, that offices must be withdrawn from politics, and that this could be done only by eliminating the personal element. In 1883, after an earnest crusade, Congress voted that the experiment should be made. It has received the support of every President since that time, and has been extended until about half the offices in the national civil service have been withdrawn from politics, while many States and cities have followed the example of the national government. But the end of the spoils system is not yet. It has been seen that party organization has never demanded all the offices; and one half being taken away, it lives now on the other half. With the extension of protection to department after department, the pressure on those remaining has become greater. Partly as a result of competition and partly because of the improved tone of business in the country at large, ability and honesty have been more demanded them formerly in the open departments and their administration much improved. With this improvement the efforts of the reformers have slackened. Party organizers, on the other hand, have rallied to save what is left to them, and much further progress for the examination system seems improbable unless some substitute can be found for the offices as the payroll of party organization. Finally, it should be noted that the reform system rests very greatly on the President, and that, should he become hostile, it might be so thoroughly emasculated as to open everything to the spoilsman.

Professor of History, University of Wisconsin.

27. United States — Annexation of Texas to the. The Louisiana Purchase in 1803 gave the United States a shadowy claim to Texas. This claim was maintained and strengthened by each succeeding administration until 1819, when all rights beyond the river Sabine were given up as a consideration to Spain for the cession of the Floridas. Between 1820 and 1830 great numbers of Americans settled in central Texas; most of these were from the Southern States, and they had carried their slaves with them. An arbitrary union in 1824 of this semi-Anglo-Saxon region to the Spanish state of Coahuila gave rise to much dissatisfaction; the abolition of slavery throughout the newly established Mexican republic in 1829 increased the discontent of the thrifty Texan slave-holders; but when, in 1830, the Mexican government forbade citizens of the United States to settle within the discontented region and placed the country under military control, the Texans demanded (1833) complete separation from Coahuila and an independent existence in the Mexican confederation. This was refused and a still closer surveillance was established by Santa Anna in 1834. Two years later the Texans issued their declaration of independence and set up a government of their own. The fact that only two of the leaders of this movement were not American settlers is proof enough as to one cause of the conflict. Santa Anna attempted to put down the revolt; he failed disastrously. At San Jacinto, in northeastern Texas, April 1836, the insurgents defeated the Mexicans and either killed or captured their entire army. A constitution was now agreed upon and the republic of Texas firmly established. It is significant that the constitution provided expressly for the re-establishment of slavery, which had been maintained contrary to law since 1829. The boundaries of the new state were declared to be the Rio Grande on the southwest and the Sabine, Red and Arkansas rivers — the line of 1819 — on the north and northeast. These boundaries gave Texas a total area of 270,000 square miles — a territory equivalent to five of the larger States of the American Union. Gen. Sam Houston, the hero of San Jacinto, became the first President of the Texan republic. The government thus founded was in its essential features a copy of that of the United States. Texas was recognized at once by the United States as an independent nation, and the powers of Europe followed suit in a few years.

Texas made application for admission into the American Union in August 1837. President Van Buren opposed the proposition and eight States made formal protest against annexation. But as early as May 1836, one month after the battle of San Jacinto, John C. Calhoun had declared from his seat in the Senate that an independent power between the United States and Mexico was inadmissible; he favored immediate annexation, and, as he openly declared, on the ground of the extension of slavery. Calhoun represented the South, and the South since 1830 had become more firmly anchored in slavery than ever. The States of Virginia, Maryland and the Carolinas exported not less than 50,000 slaves a year to the Far South and Southwest. An active propaganda favoring annexation immediately began; legislatures of most of the slave-holding States passed resolutions calling for annexation. Even the great influence of ex-President Jackson was given to the cause. But the Whig party won the election of 1840, and the Whigs, more a Northern than a Southern party, opposed annexation. In order to "carry" the important State of Virginia, which was already States-rights and pro-annexation in political complexion, John Tyler had been placed on the ticket with Harrison. Tyler, a Whig because of Jackson's high-handed methods rather than from principle, was a States-rights devotee, a slave-holder and a determined annexationist; he became President on the decease of Harrison in April 1841. In 1842 the Texans again knocked at the door of the Union. It would have been opened to them but for the opposition of Webster, the secretary of state. Next year Webster resigned and Abel P. Upshur of Virginia was appointed to fill the vacancy. The new secretary belonged to the extreme States-rights school of politicans. The cabinet, which had been re-formed in 1842, was now in accord with the executive. Annexation became at once the main business of the administration. In October 1843 Upshur informed the Texan representative in Washington that a re-

newal of overtures for annexation would be welcome. Van Zandt asked for the requisite powers, but meanwhile the influence of the abolitionists had reached Texas and a sharp contest was waging there about the question of slavery. The pro-slavery party, both in Texas and the United States, suspected English intrigue. A speech of Lord Aberdeen's in Parliament gave some color to this suspicion. The administration inquired of the English cabinet the cause of the rumors circulating in Texas and the South and received a complete disavowal of any aim or intention on the part of the English government to interfere in any way with the affairs of the new republic. Still other influences had come into play: Texas had learned to stand alone; an armistice had been arranged with Mexico; a definite peace seemed more than probable. Houston and the other leaders of Texas had lost their former enthusiasm for annexation. The wooing was now to come from the other side. The slave States of the United States became uneasy; the vast and fertile area of Texas seemed about to be lost to their cause; failure to act promptly had been the fatal cause, and now fear of war with Mexico gave the final motive to Texas for remaining out of the Union. The outlook was not quite so dismal as it seemed; the Texans inquired of Upshur, in January 1844, whether the United States would protect them against Mexico while the proposed negotiations were pending, for it was known to all that much difficulty and delay would be put in the way of annexation by the Whig party in the United States Senate. The secretary of state did not answer this question, but his agents in Texas let it be known that protection would be guaranteed. The way was again open and negotiations now began in earnest. Upshur was killed, on 28 Feb. 1844, by the explosion of a gun on board the warship Princeton. Tyler called John C. Calhoun, the first great mover of the annexation scheme, to the office thus made vacant. Calhoun accepted the State portfolio with the single purpose of finishing the work he had begun eight years before. The treaty was speedily concluded and ratified by the representatives of both countries. On 22 April 1844 it was sent to the Senate. The issue was now clearly drawn and the country immediately divided: Calhoun, sustained by the unanimous voice of the Southern States, asked for immediate annexation; the Whigs, except its Southern wing, followed by the great majority of the North, denied the request.

Meanwhile, another issue had been preparing. For many years the vast Oregon region had been held jointly by Great Britain and the United States. This territory extended from northern Texas to the 54th parallel of north latitude. Both England and the United States had claims on Oregon, and these claims had been mutually recognized, but the people of the West, always ready for growth and expansion and not given to quibbling over constitutional limitations, were rapidly coming to demand the whole of Oregon. Calhoun saw the importance of the Oregon question; he recommended that the Democratic party couple it with the Texas question, though he did not favor the extreme demands of the Westerners. The Southern Democrats seized the opportunity, and co-operating with the expansionists of the West, they began a campaign for the control of the Democratic national convention, which was to meet in Baltimore. The editor of the Richmond *Enquirer* was a typical leader of this movement. A letter of ex-President Jackson, written a year before, was now published in the *Enquirer*, bearing date of 1844. The Nestor of the party urged annexation. When the convention met it set aside at once Jackson's favorite, and the ablest Northern candidate, Van Buren, and nominated James K. Polk, an avowed "Texas man." The platform demanded the immediate "re-annexation of Texas and the re-occupation of Oregon." "Fifty-four or fight" became the party cry of the West, while the leaders of the South boldly threatened secession in case Texas was not annexed. Meanwhile, the Senate rejected the Texas treaty by a majority of 35 to 16, and the leaders of the Whig party, aided by the dissatisfied followers of Van Buren, exerted their influence to the utmost to get the country to sustain the Senate majority. They failed by a narrow margin and Polk became the next President. Tyler and Calhoun, falling back on a popular Democratic doctrine, considered themselves and Congress "instructed" by the country to proceed with their work. Since the Senate held out stubbornly against them they resorted to the plan of accepting Texas by joint resolution, a method hardly justified by the Constitution. This required a majority only of both Houses, while the passage of a treaty in regular form required two-thirds. The joint resolution passed, and on 3 March 1845 annexation was complete, so far as the United States was concerned. Texas approved the treaty without questioning its legality in June 1845, and in July of the same year the people of the Lone Star State, in convention assembled, ratified the work of their representatives by an almost unanimous consent.

Texas came into the Union with a quarrel on its hands: Both the Mexican and Texas governments claimed the country lying between the Nueces and the Rio Grande. This and all other subjects of dispute between these governments seemed about to be amicably arranged in the early months of 1845, on condition, however, that Texas should not permit annexation to the United States. Mexico had repeatedly declared that annexation would be regarded as a declaration of war. When the joint resolution passed Congress the Mexican minister in Washington asked for his passports and the American representative in Mexico was unceremoniously dismissed. The United States had already sent troops into the disputed country; a year later they advanced under General Taylor to the Rio Grande and trained their guns on the Mexican town of Matamoras. War followed. Texas had been obtained at the behest of a Southern party and for the purpose of a make-weight against the expansion of the free States toward the Northwest. The leaders of Texas had come into the Union to safeguard slavery against the free labor and abolitionist sentiment of the great outside world. This had not been done without the promise of the "re-occupation" of Oregon, which gained the votes of the West and North. But the able, aggressive and uncompromising policy of Calhoun and his section had aroused the North; the abolitionists became politically important, and the issue which followed ter-

minated in civil war. Consult MacMaster's and Schouler's Histories; also Von Holst, 'Life of Calhoun,' and McLaughlin, 'Life of Cass.' See also TEXAS; MEXICAN WAR.

WILLIAM E. DODD,
Professor of History, Randolph-Macon College.

28. United States — The Abolition and Free Soil Movements in the. The first important and concerted movement in America for giving freedom to the slave began with the Quakers (q.v.). Their persistent opposition to human slavery arose from the nature of their doctrines. Even before the American Revolution, individual Quakers like John Woolman of Philadelphia, raised their voices in favor of emancipation. The emphasis placed upon the rights of man, in the Revolutionary struggle, also strengthened the sentiment in favor of emancipation in all the colonies. As this period drew to a close, no stronger condemnation of slavery was uttered than by Thomas Jefferson, himself a slaveholder, in his famous book called 'Notes on Virginia.' A similar arraignment of the institution was made by George Mason of Virginia, in the Constitutional Convention of 1787. About this time the Northern States were taking steps which ultimately freed them from slavery. New England and Pennsylvania led the way in this movement. The first anti-slavery society in America was formed in Philadelphia in 1780. Benjamin Franklin became one of its members. But this form of opposition was not confined to the Northern States, for both Maryland and Virginia organized anti-slavery societies. The movement in the South, however, did not reach the point of emancipation by State action. The institution of slavery had become firmly riveted on the South, because of climatic and industrial conditions, and the problem of emancipation, therefore, was vastly more difficult than at the North.

In Washington's administration a new and powerful factor was introduced into the problem by the invention of the cotton gin (q.v.). This machine so cheapened the preparation of cotton for the market that the raising of cotton became the dominant industry of the lower South. The North profited from this new era of cotton development by building cotton factories and in competing with England for the raw cotton of the slaveholding States. Both an American and European demand were placed upon the South for the extension of cotton production. The price of slaves also rose, and the domestic slave trade so increased that the supply seemed to be abundant, although, when the African slave trade was abolished in 1808, many persons had hoped that the result would be the gradual decay of slavery. But they were mistaken. The new industrial and commercial foothold obtained by the institution gave it more favor than before in the eyes of both the North and South. Only the Quakers kept up any serious attack upon it during the first 25 years under the Constitution.

Opposition to slavery had been based, thus far, on all sorts of grounds, and had been carried on in a very moderate and decorous fashion. The Quakers, although attacking the system on moral grounds, did so in a manner comporting with their reputation for moderation. The prolonged and exciting struggle over the admission of Missouri (1819–21), however, turned attention upon the slavery question in a more intense way than ever before. Benjamin Lundy, a Quaker, who had already been working to encourage slaveholders to emancipate their slaves, now founded the first important anti-slavery paper, the 'Genius of Universal Emancipation' (1821). He published editions of his paper in Ohio, Tennessee, and Maryland. In 1829 Lundy called to his aid young William Lloyd Garrison who became the most fiery and radical of all the early abolitionists. His hard-hitting blows fell upon a New England slave dealer for carrying a cargo of slaves from Baltimore to New Orleans. Garrison was soon in jail, from which he was released by a stranger paying his fine. He now returned to New England and founded in Boston (1831) the most famous of all abolition papers, 'The Liberator.' With the aid of a few friends he founded the New England Anti-slavery Society in 1832 with the avowed object of endeavoring "by all means sanctioned by law, humanity, and religion to effect the abolition of slavery in the United States." Similar organizations sprang up in other northern States, and another anti-slavery paper, the 'Emancipator,' was launched in New York city, under the patronage of Arthur Tappan, a philanthropist. These were small beginnings. Only a few men in any community were courageous enough to stem the tide of public disapproval. In 1833 a little group of men and women gathered from ten States, met in Philadelphia to establish the American Anti-slavery Society. Among them were Garrison, Samuel J. May, John G. Whittier, William Goodell, Lewis Tappan, and Lucretia Mott. In that city not a man was found willing to serve as chairman. For safety they met behind locked and guarded doors and labored at their task throughout the day without venturing to hold an evening session or to be seen on the streets in search of a mid-day lunch. A declaration of principles was issued which showed the unalterable determination of the abolitionists to carry on the agitation against slavery until every slave in America was liberated. Public sentiment was to be aroused by public speakers traveling about the country, by sermons from the pulpit, by appeals from the press wherever possible, and by a wider circulation of antislavery tracts and periodicals. Headquarters of the new society were set up in New York with Arthur Tappan as president, and with the 'Emancipator,' Goodell editor, as their organ. Immediate emancipation was their cry and uncompromising hostilities to slavery their creed. In a few years hundreds of anti-slavery societies had sprung up and more than 500,000 anti-slavery documents been distributed.

The rapid growth of the abolitionists introduced discord and faction. In a short time leaders arose who demanded that abolitionists participate in politics, as a means of forwarding the cause. Some of the old leaders, of whom Garrison was chief, strongly opposed political action, but declared in favor of woman's participation in the work of the anti-slavery societies. The differences between the two parties were augmented by the strong opposition of some northern clergymen to women taking part in public discussion. The dissensions grew till State and national organizations were disrupted, resulting in two sets of anti-slavery societies and two sets of anti-slavery publications. In 1840

a number of abolition leaders who believed the time for political action had come, met at Albany and formed the Liberty party (q.v.). Among the founders of this national party were Myron Holley, Gerrit Smith, and James G. Birney. The latter was nominated for the presidency, and renominated in 1844. In the famous campaign of 1840, he polled about 7,000 votes and in 1844, 62,000. Neither of these votes represented the total strength of the abolitionists and certainly not the strength of the anti-slavery sentiment of the country. The rapid rise of the anti-slavery societies which followed the formation of a national organization, greatly accelerated the work, begun by Garrison and the 'Liberator,' of sending abolition documents into the South. The result was a storm of indignant protests from the slaveholders who resented what they termed an interference with their own domestic institutions. They declared that the abolition literature sent among them was incendiary and intended to excite servile insurrection, the most dreaded, because the most horrible, of events. Nat Turner's rebellion (q.v.) in Virginia (1831) was then still fresh in mind. In their excitement the slaveholders made certain demands upon the people of the North. They called for the suppression of the abolitionists and their work by public opinion and by State action. Rewards were even offered for the arrest and transportation to the South of Garrison and Arthur Tappan.

Public feeling in the North was already so bitter against the abolitionists that it hardly needed the added impulse of the South's demands. On 4 July 1834, the anti-slavery celebration in New York city was broken up and the leaders compelled to escape for their lives. For nearly a week the excitement continued. All the important daily papers, except one, encouraged the populace to suppress the abolitionists. Their business places and even their houses were attacked by the infuriated mob, and the quarters occupied by the negroes were invaded and property destroyed. In nearly every Northern State the work of putting down the abolitionists went on. The rougher element was encouraged by resolutions passed by meetings of the respectable portion of the community. Fifteen hundred influential names signed a call for an anti-abolition meeting in Faneuil Hall. The great orators of Boston addressed an excited multitude. In a few days gallows were found standing in front of Garrison's home. A few weeks later at a woman's anti-slavery meeting a mob filled the streets, broke into the house to which Garrison had fled and dragged him out with a rope. He was rescued with great difficulty and was compelled to leave the city for safety. Danger threatened abolitionists in Brooklyn. Lydia Maria Child (q.v.) wrote: "I have not ventured into the city, nor does one of us dare to go to church to-day, so great is the excitement. Mr. Wright was yesterday barricading his doors and windows with strong bars and planks an inch thick." A mob led by respectable citizens of Cincinnati destroyed the printing press of 'The Philanthropist,' and attacked the houses occupied by negroes. In 1837 an Alton, Ill., mob shot down the Rev. Elijah P. Lovejoy (q.v.), the editor of an abolition paper, while he was endeavoring to protect his press. This event, and other extreme measures against the abolitionists, overshot the mark, and public opinion became more sympathetic toward the hated and hunted disciples of the abolition creed. The great majority of them — women as well as men — showed the true martyr spirit, in the era of their persecution. But the rush of events was already drawing public attention away from the abolitionists, and turning it toward other phases of the anti-slavery conflict.

The Quakers had begun in Washington's administration to petition Congress against the slave-trade. Later their petition struck at slavery in the District of Columbia. The abolitionists joined in the work of petitioning against slavery in the District. As early as 1831 John Quincy Adams, then a congressman, presented 15 such petitions, but declared that he did not approve of their object. From year to year these petitions had been received and referred to the committee on the District of Columbia, and nothing more came of them. But in 1835 Hammond of South Carolina moved that an anti-slavery petition be not received. To some, this motion seemed necessary to check the rising tide of abolition petitions, but to others, the remedy seemed worse than the disease, for it attacked the ancient right of petition. An exciting debate arose running throughout an entire day. Adams now came forward as the champion of the right of the petition and Slade of Vermont made a fiery speech declaring war upon the institution of slavery. This speech greatly angered the slaveholders and their supporters. In 1836, the debate over abolition petitions was renewed and continued for four months during which many thousands of persons put their names to petitions. The result was a resolution of the House to lay all papers relating to slavery on the table and to take no further action on them. This was the germ of the famous "gag" rule. But this action only stirred anti-slavery people and by 1838 petitions to Congress against slavery had increased tenfold. Early in 1840 the House made answer to these by establishing the following standing rule: "That no petition . . . or other paper, praying the abolition of slavery in the District of Columbia, or any State or Territory, or the slave-trade between the States or Territories of the United States in which it now exists, shall be received by this House or entertained in any way whatever." Similar, though more temperate debates were going on in the Senate and similar results followed.

The attempts to suppress the abolitionists' agitation both in and out of Congress by attacking ancient popular rights very naturally produced a reaction in their favor and against the cause of slavery. The battle for the right of petition was waged, therefore, with untiring energy by John Quincy Adams, Joshua R. Giddings and others. The threats made to expel them from Congress and the denunciation heaped upon them only aided them in the end by bringing to their aid an increasing number of congressmen, and in 1844 victory crowned their efforts; the gag rule was repealed.

Additional meaning was given to the questions of freedom of the press and the right of petition by the demands of the slaveholders that all anti-slavery documents be excluded from the United States mails. Some of the inhabitants of Charleston, S. C., broke into the post-office (1835) seized a quantity of abolition literature and burned it in the presence of spectators. The

postmaster-general gave it as his opinion that although such documents could not lawfully be excluded from the mails, the postmasters owed a higher duty to their communities than to the laws. President Jackson, in a message to Congress, severely criticised the work of the abolitionists and recommended that Congress prohibit under severe penalties, the circulation of such documents through the mails. Congress not only did not accept the President's recommendation, but instead passed a law providing for fining and imprisoning postmasters for withholding mail from the persons to whom it was addressed. On none of the points of contention had the opponents of the abolitionists been able to score a permanent victory. On the contrary the permanent results were against slavery. Among them may be enumerated the rapid increase of anti-slavery, if not abolition, sentiment, and the formation of a political party. Another result was the feeling of many northern men, who had little or no sympathy with the agitators that the friends of slavery were demanding too great a sacrifice of cherished principles for its protection. One of the most deplorable results of 10 years of bitter agitation was the ill will engendered between the radical elements of the two sections. Neither could do right in the eyes of the other. The danger lay in the fact that other events might cause the spread of this sentiment to the steady minded classes of the two sections. Such events were already on the horizon.

The South came to feel that safety to slavery, and to the social and industrial fabric based upon it, lay in preserving the equilibrium between the sections in the Senate. That equilibrium had been hopelessly lost in the House of Representatives, and to preserve it in the Senate required the addition of new territory to the United States. To accomplish this end, the annexation of Texas quickly followed the Texan revolution, and the cession of California and New Mexico came as a consequence of war with Mexico. But it was far more difficult to determine slavery's relation to the new territory than it had been to win the territory by war. The South gave an indication of its coming attitude by defeating Van Buren for renomination in 1844, because he had opposed the immediate annexation of Texas. Northern anti-slavery men followed by defeating Henry Clay in New York by voting for a candidate of their own, because Clay, after opposing immediate annexation, had written a letter trying to explain the matter to the satisfaction of Southern Whigs. In 1846, President Polk asked Congress to vote a sum of money to assist him in making peace with Mexico. David Wilmot, a Pennsylvania Democrat, offered an amendment to the appropriation bill, providing that in any territory obtained from Mexico, slavery should never exist. This amendment is the famous Wilmot Proviso (q.v.). Twice it passed the House, but each time failed to get through the Senate. Southern leaders were stirred to combat more vigorously the idea that Congress could exclude slavery from the Territories. Northern men affirmed more vehemently the right of Congress in this matter, because, to admit the South's contention would invalidate the anti-slavery features of the Ordinance of 1787 and the Compromise of 1820. The debates in Congress and the discussions by pulpit and press began to shake men's allegiance to the old parties. Therefore, the Whig party, the majority of whose votes was generally in the North, nominated for President (1848) General Zachary Taylor, a Louisiana slaveholder, but refused to commit itself on the slavery question. The Democratic party, whose main strength lay in the South, nominated Lewis Cass of Michigan, and likewise uttered no decisive word on the vital question. This noncommittal attitude of the leaders of the old parties angered anti-slavery men of all parties who promptly coalesced and launched the Free Soil party at Buffalo, N. Y. (1848). The platform contained 19 resolutions mainly relating to slavery, and declaring in favor of "Free Soil, Free Speech, Free Labor, and Free Men." It also declared that Congress had, and ought to exercise, the power to exclude slavery from the Territories, but that it possessed no authority to interfere with slavery in the States where it already existed. Although this platform did not satisfy the extreme abolitionists, it offered a line of defense, on constitutional grounds, which appealed to moderate reformers who could not sympathize with the Anti-Union sentiment of Garrison and his radical followers. The slaveholders were right in believing that the underlying cause and the logical consequences of the Free Soilers and the abolitionists were not greatly different. The Free Soilers nominated Martin Van Buren for President and Charles Francis Adams for vice-president. The Van Buren Democrats in New York, nicknamed the "Barnburners," supported the new party. The result was a nominal Free Soil vote of over 290,000, the loss of New York by Cass, and the triumph of General Taylor. The Van Buren supporters were avenged by the defeat of Cass, and most of them returned to this allegiance.

During the next four years the Free Soil idea gained at the North, but the party made but little progress. The Compromise of 1850, and the consequent effort to discourage all agitation as dangerous to the perpetuity of the Union, discouraged any great gain by the party. Both the old parties in their nominating conventions (1854) pledged themselves to stand by the Compromise, and Hale, the Free Soil candidate only polled 156,000. The passage of the Kansas-Nebraska Bill (q.v.) (1854), suddenly precipitated the anti-slavery conflict in a more virulent form than ever before. The result was the break-up of the Whig party. Thousands of its Southern supporters joined the Democratic party (q.v.), while the majority of its Northern voters cooperated with other anti-slavery elements in forming a new party, the Republican. Although the organization of the Free Soil party was thus disbanded, its principle became the rallying cry of the Republican party (q.v.). See also SLAVERY.

29. United States — Mexican War. Owing to its close association with the slavery controversy the Mexican war has been the subject of almost endless dispute. Many people believed at the time, and many others still believe, that it was forced on by a Democratic administration in order to secure more territory in the southwest for the extension of slavery. It would be difficult either to prove or to disprove this view conclusively. The immediate cause of the war was the

annexation of Texas. The Democratic platform of 1844 favored annexation, but at the same time it was equally explicit in asserting the American claim to Oregon, a territory which could not by any possibility be opened to slavery. To the party leaders this connection of the two questions may have been only a shrewd bit of politics, but President Polk's determination to fight for 54° 40′ showed that it meant much more than that to him. The success of the ticket also indicated that it meant more to the American people. The constant cry of a slaveholders' conspiracy would not blind them to the advantages of acquiring so much valuable territory. At the time of the annexation, Texas (q.v.) had been an independent republic for nine years, recognized as such by the leading nations of the world. Although the Mexican government had made no serious attempt during that interval to reassert its rights, it now notified the United States that anexation would be regarded as a *casus belli*. The passage of the joint resolution of 1 March 1845, was, in consequence, followed by the recall of the Mexican minister at Washington, and the formal suspension of diplomatic relations.

In addition to the Texan question there was a long-standing controversy in regard to the claims of American citizens against the Mexican government. During the numerous revolutions which had occurred since Mexico gained her independence Americans had often suffered imprisonment and loss of property. A claims convention of 1839 provided for a board of commissioners to pass upon these cases. There was some delay, however, in making the payments, and a second convention was concluded in 1843, in which Mexico agreed to pay all claims within five years in quarterly installments. A few payments were made, but in 1845 they had again fallen very much in arrears.

In October 1845, President Polk informed the Mexican secretary of state that he wished to settle the questions in dispute amicably, and that he was ready to send an envoy with full power to act. The secretary made an evasive reply in regard to the subjects to be discussed, but expressed a willingness to receive our representative. The president at once commissioned John Slidell, of Louisiana, as envoy, and he set out for his new post in November. The war fever was so strong in Mexico when Slidell arrived that President Herrera was forced to refuse him an audience. A revolution, which occurred a few days later, resulted in bringing General Paredes, the head of the war party, into power. Being again refused recognition, Slidell returned to the United States in March, 1846.

If annexation and the spoliation claims had been the only questions involved, the war might still have been averted. But a controversy arose in regard to the western boundary of Texas. The congress of Texas in 1836 asserted that the boundaries of the republic extended to the Rio Grande. Historically the claim to the territory between the Nueces and the Rio Grande was of doubtful legality, but owing to internal difficulties the Mexican government had taken no steps to assert their authority. Texas was admitted into the union with "the territory properly included within and rightfully belonging" to it, but subject to the adjustment by the United States government of all questions of boundary that might arise with other governments. If the Mexican authorities had received Slidell this question might properly have come up for discussion. Their refusal left but one course open to the president, namely to treat the Nueces–Rio Grande tract as American territory. The revenue laws were extended to it, and Corpus Christi, a town west of the Nueces, was made a port of entry. The Mexican authorities resented this intrusion, and a large force of men under General Ampudia were stationed on the south bank of the Rio Grande, preparatory to an invasion of the disputed territory. To oppose him, General Zacharary Taylor with about 2,000 men was ordered to advance to the north bank of the river, opposite Matamoros. On 12 April, Ampudia warned Taylor to withdraw beyond the Nueces within twenty-four hours or take the consequences. The warning being disregarded, General Arista, Ampudia's successor, sent notice on the 24th that hostilities were commenced. On the same day a considerable force of Mexicans crossed the river a few miles above Matamoros and defeated a detachment of United States dragoons.

The news of this engagement reached Washington early in May, and on the 11th President Polk sent a special war message to congress. After speaking of the failure of the Slidell mission and explaining the movements of General Taylor, he went on to say that war already existed, that it existed by the act of Mexico itself, and, consequently that it was the duty of the American people to vindicate the honor, the rights, and the interests of their country (see MEXICAN WAR). The whole question hinged upon the ownership of the Nueces–Rio Grande strip. According to the president this district belonged to the United States, and the war was therefore defensive in its origin. On the other hand, if the Mexican claims to the strip were valid, Polk exceeded his constitutional powers in beginning an offensive war without the consent of congress. However, the president's position was safe enough because congress had already recognized the country beyond the Nueces as American territory, by including it within the revenue system, and the senate had ratified the appointment of a revenue officer. Two days after the message was received an act was passed providing for the vigorous prosecution of the war.

Whether or not the war was defensive in origin, it was certainly not long conducted on that basis. After his successes at Palo Alto, 8 May, and at Resaca de la Palma, 9 May, Taylor crossed the Rio Grande and captured Matamoros on the 18th, before he could possibly have heard of the congressional act of the 13th. The president's military orders showed clearly his intention to seize Mexican territory. General Kearney was authorized to occupy New Mexico, Commodore Sloat to take possession of Upper California, and Taylor to prosecute the war in Mexico. These orders were faithfully executed. Kearney captured Santa Fé and brought all of New Mexico under subjection. Frémont and Commodore Stockton, who had succeeded Sloat, were equally successful in California. Taylor made his way slowly into the interior. In September, after defeating an army under Ampudia, he captured Monterey.

The anti-slavery Whigs in congress pointed to these facts as evidence that the war was not being waged to protect the honor of the United States, but purely in order to seize the territory of a weaker power. Among the discontented was Abraham Lincoln, who was elected to congress in 1846. Jefferson Davis approved of the war and resigned his seat in congress to lead a Mississippi regiment. In general the conflict was popular in the South and unpopular in the North, the strongest opposition being in New England. Lowell's keen satires in the 'Biglow Papers' represent well the sentiment of that section of the country. See LOWELL, JAMES RUSSELL.

In spite of adverse criticisms, President Polk never once swerved from his original line of action. Early in 1847 a second army was sent out under General Winfield Scott to land at Vera Cruz, and to attack the capital from the east. The series of Mexican disasters at the beginning of the war had resulted in another revolution which restored Santa Anna to power. His plan was to meet Taylor first, defeat him, and then return to the city of Mexico in time to defend it against Scott. The battle of Buena Vista was fought 23 February 1847. Taylor's force of 5,000 men won a victory over an army four times as large. Immediately after the battle Santa Anna hurried south to meet General Scott. The two armies first came into conflict at the mountain pass of Cerro Gordo, and the Americans were again successful. This was followed by the victories of Contreras, San Antonio, and Cherubusco. The way was now open to the City of Mexico, but the arrival of a peace commissioner from the United States led to the conclusion of an armistice. See MEXICAN WAR.

The scene now shifts to Washington. President Polk had been confident of success from the very beginning of the war. As early as 8 August 1846 he asked Congress for $2,000,000 to be used in negotiating a peace. This was far more than enough to meet the ordinary expenses of peace commissioners. The object of the President, however, was perfectly clear; in fact, he made no attempt to conceal it. Mexico was to be called upon to cede New Mexico and California. A bill was introduced into the House of Representatives to appropriate the amount required. David Wilmot, a Pennsylvania Democrat, moved the insertion of a proviso to the effect that neither slavery nor involuntary servitude should exist in any territory to be acquired by the war. (See WILMOT PROVISO.) It was passed by the House in 1846 and again in 1847, but was defeated by the Senate on both occasions. The House finally yielded, and the appropriation, increased to $3,000,000, was made without the proviso.

Nicholas P. Trist, of Virginia, was at once sent to Mexico as a peace commissioner. He was authorized to demand the cession of New Mexico and Upper California and the recognition of the Rio Grande boundary. This was the minimum to be accepted. In order to obtain these terms, he was to begin with an additional demand for Lower California and for the right of way across the Isthmus of Tehuantepec. At the proper moment he might surrender these points and also offer a money consideration. The Mexican authorities refused the terms, negotiations were broken off, and General Scott renewed his campaign. On 13 September he stormed the heights of Chapultepec, and on the following day entered the City of Mexico. The enemy were now compelled to accept whatever terms were offered to them. Negotiations were reopened with Trist, and the treaty of Guadalupe Hidalgo was signed 2 Feb. 1848. It was sent to the Senate 23 February, ratified by them with amendments 10 March, and the final ratifications were exchanged 30 May. In return for $15,000,000 and the assumption by the United States of the spoliation claims of their citizens, estimated at $3,250,000 more, Mexico ceded California and New Mexico, and recognized the Rio Grande frontier. Mexicans living in the ceded territory were to be free to continue to reside there or to remove to Mexico, without any prejudice to their property. Those who remained could either retain the title and rights of Mexican citizens or become citizens of the United States.

The immediate result of the war, then, was the acquisition of the vast territory comprising the present States and Territories of California, Nevada, Utah, Arizona north of the Gila, and parts of Wyoming, Colorado, and New Mexico. More than half a million square miles of valuable land were transferred from a non-progressive nation to a nation that was able to develop its resources. The enormous mineral deposits of that region were just beginning to be developed. And even now, over half a century after the peace, the agricultural industry, owing to the tardy extension of irrigation facilities, is still in its infancy. Many of the best people in the country in 1848 were so blinded by the slavery issue that they could not realize the value of their conquest. Fortunately for our history, such men as Cass and Douglas had sufficient influence partially to allay the prejudices of their section and thus to secure the ratification of the treaty.

But, although the anti-slavery sentiment was not strong enough to embarrass the government in the conduct of the war or to endanger the treaty of peace, still it could not entirely be kept in the background. That was shown, for example, in the struggle over the Wilmot Proviso. As soon as peace was concluded and it was no longer necessary to keep up the appearance of unanimity before the enemy, the controversy was renewed. Three questions came up for solution: Should California be admitted as a free State? Should the remainder of the territory acquired from Mexico be organized in accordance with the Wilmot Proviso? What should be the boundary between Texas and New Mexico? These questions and others connected with slavery were nominally settled by the compromise of 1850, but the controversy was soon renewed in a more violent form, and culminated in secession, civil war, and emancipation. See MEXICAN WAR, THE; TEXAS.

30. United States — Slavery in. When the English colonies were first established in America, chattel slavery of white people had nearly died out in Christian Europe, although serfdom to the owner of the estate to which one was attached still prevailed in Russia, Germany, and many other parts of Europe. In England, the only recognized chattels were the rare negroes or Asiatics owned as a matter of pride by a few wealthy men. In the new world, however, the English colonists adopted the Spanish habit of enslaving such of the native Indians as they could possess themselves of; but the tribesmen were sullen, insubordinate, and short lived. Though as late as 1692 an Indian woman, Tituba, was the first of the Salem witches, the slavery of that race was never of any economic importance.

Nevertheless part of the white population in all the English colonies was in a condition not far different from serfdom: until some time after the American Revolution, there was a distinct class of so-called "indented" or "indentured" white servants, both men and women, who served their masters for a term of years, sometimes for life, and were almost completely subject to his will.

One element of this class was convicts. The early planters begged for "offenders condemned to die out of common gaols." By 1650 grew up a regular practice of "transporting" some criminals instead of hanging them, and it is estimated that first and last 50,000 convicts came over. For instance, a Scotchman was sold as a slave for life to America for the heinous offense of burning the Bible; and in 1736 Mr. Henry Justice of the Middle Temple stole books and in consequence was transported to America, "there to remain seven years, and to be put to death if he returned, etc.," and one Sarah Wilson, servant to a maid-of-honor to the Queen, was landed in Maryland, put up for sale and purchased. Another fruitful source of indented servants was the political prisoners. After the battle of Worcester in 1650, about 1,000 Scotchmen were ordered sent to the colonies. In 1716 a lot of Jacobites were sent over. By far the larger and more important class of white serfs was that of the "redemptioners," who agreed with some shipmaster to carry them over and in America to sell their services for a term of years to any purchaser for a sum sufficient to pay their passage money. Thus, in 1774, John Harrower, whose diary has been preserved, "was obliged to engage to go to Virginia for four years as a schoolmaster for bed, board, washing, and five pounds during the whole time." He was duly sold to a Virginia gentleman, and lived a respectable and honest life. Many such servants on expiration of their time, set up for themselves and founded families. Many of them ran away from their masters and were advertised, pursued, arrested, whipped, and branded exactly like slaves.

By far the most important phase of American servitude was the slavery of the African negroes; it was directly related to the centuries of war between the Mohammedans and the Christians in Europe, which engendered a deep seated belief that Christianity forbade the slavery of Christians, but allowed the enslavement of infidels. In 1517 Las Casas, a benevolent Spanish divine, suggested that negroes be imported into the West Indies from Africa, to save the remnants of the unhappy Indians. The African slave trade at once sprang up to the Spanish and Portuguese possessions, and by 1670 the English adventurers, especially Sir John Hawkins, began to engage in this profitable business. The first English continental colony to buy negro slaves was Virginia, where, in 1619 a Dutch ship of war sold some in exchange for provisions; but it was in the English West Indies, especially the sugar growing islands of Barbadoes, Tobago and Jamaica that slavery first found a profitable field. To these islands were sent most of the white convict slaves, and the continent received for its supply of slaves only those already seasoned in the West Indies.

Though so early established, negro slavery was of very little importance on the continent during the 17th century. The total number of negroes in all the colonies in 1700 probably not being more than a tenth of the whole population. The 18th century saw, however, a lively slave trade, and widely distributed slaves. For supplying these laborers, there grew up a direct traffic from Africa to the North American colonies, in colonial vessels, chiefly owned in New England and in New York. Newport and Bristol, R. I., were noted centres of the trade.

The result was that negroes were distributed more or less throughout all the colonies, although their condition, employment, and treatment was very different from community to community. Excepting on Narragansett Bay and the Hudson River, where there were plantations with large numbers of slaves, the negro in the northern colonies was chiefly a house servant, and the institution was here at the best; the old North Church in Boston still contains a slave gallery for such people. Negroes probably were no worse treated than indentured servants or apprentices of the time, and were often much valued and respected by their masters. Well-to-do free negroes had a vote, though nearly two-thirds of the white men were deprived of the suffrage.

Proceeding southward, in Pennsylvania the number of negroes was large, and in Maryland, Virginia, the Carolinas, and Georgia, it was an established part of the social and economic system. The cruelties of the institution were most manifest in the scattered plantations of the Carolinas, in which the slaves considerably outnumbered the white people. There about 1780 Saint-John Crèvecœur found a negro servant exposed in a cage, left there to be devoured alive by insects and by birds, which had already destroyed his eyes; his unpardonable offense was killing a white man.

The steady growth of slavery is remarkable because it was actually prohibited by two of the New England colonies. Massachusetts in the Body of Liberties in 1641, drawn up by Rev. John Cotton declared that, "There shall never be any bond slaverie, villinage or captivitie amongst up unles it be lawfull captives taken in just warres, and such strangers as willingly sell themselves or are sold to us." And Rhode Island in 1652 "ordered that no black mankind, or white . . . serve any man or his assigns longer than ten years." These acts were a dead letter; slaves were born, grew up, died, and left the taint to their posterity in every Northern community, as well as in the South.

Indeed, there was in every community a body of positive legislation on terms of transfer of slave property, and on special offences of slaves and of white people toward slaves, so that the institution of slave property was as firmly rooted and as widely disseminated as that of private property in land. This is the more striking, because in England even the enslaving of blackamoors was thought inconsistent with human rights. In the celebrated case of James Somersett, in 1772, Lord Mansfield gave a decision that slavery was "so odious that nothing could be suffered to support it but positive law"; there being no such law in England, he therefore refused to compel Somersett, whom his master had brought to England, to remain in the custody of that master.

Long before slavery had acquired such a firm and important status, it had been attacked by philanthropic men. In 1624, John Usselinx objected to slavery in the proposed Swedish colonies. Georgia was founded in 1732, as an anti-slavery colony, but the restriction was given up in 1749. The first Englishman to protest against colonial slavery was Roger Williams in 1637, and John Eliot in 1675 declared that "to sell soules for mony seemeth to me a dangerous merchandize." Richard Baxter, favorite English Puritan author of devotional books, said in 1673, "To go as Pirates and catch up poor Negros or people of another Land, that never forfeited Life or Liberty, and to make them slaves, and sell them, is one of the worst kinds of Thievery in the World." Samuel Sewall, in his tract 'The Selling of Joseph,' says: "Originally and Naturally, there is no such thing as Slavery, because all Men, as they are the sons of Adam, are Coheirs; and have equal Right unto Liberty, and all other outward Comforts of Life."

The most efficient agency against colonial slavery was the disapproval of the Quakers, both north and south. The German Quakers of Germantown in 1688 adopted a minute against the traffic in negro slaves, to the effect that though they were black, there was still no more liberty to have them as slaves than there was to have white ones. The organization of the Quakers in local meetings gave them an opportunity to develop an opposition to human slavery which was inherent in their attempt to embody the Golden Rule in their own lives; hence there sprang up Quaker agitators, of whom Anthony Benezet and John Woolman were the most famous. John Woolman has left a delightful journal, edited by Whittier, full of the quaint records of his laborious journeys to testify against the evils of human slavery. Furthermore many Quaker meetings passed minutes disapproving of slavery, and eventually disfellowshipping members who insisted on holding them. They did much to raise the standard of treatment of slaves and caused the liberation of very considerable numbers.

By the time of the Revolution then, both slavery and anti-slavery were firmly established in the English colonies. The slave trade continued steadily; and outside the Quakers and a few other reformers, there was little protest against it on moral grounds. Yet efforts were made to restrict it in some of the colonies; in the Northern, because they wished to raise a revenue from it; in South Carolina because they feared slave insurrections. Whatever the reason, all such colonial acts were regularly vetoed by the governor, or disallowed by the home government, on the ground that a trade so profitable to British merchants must not be diminished.

The main objection to slavery before the American Revolution was that it was contrary to Christianity; indeed for many years the planters objected to the efforts to evangelize their slaves, on the ground that a baptized slave might claim freedom as a Christian. Yet planters had their slaves, kept them, worked them, if they felt like it killed them with overwork, and ignored the philanthropists.

The Revolution added a second argument of immense weight, namely, the rights of man. It is perfectly true that the framers of the Declaration of Independence, when they said that "all men are created equal" had in mind men who were sharers in the government; but some negroes had the requisite property qualifications and were voters in states both North and South. Still when the Revolutionary patriots so vehemently declared that they never would be slaves they could hardly have forgotten that about one sixth of the community were actual slaves. The progress of the Revolution emphasized this contradiction, for large numbers of negroes were enlisted in the Continental Army, especially in the Northern states, where they seem sometimes to have served in regiments indiscriminately with white men. Rhode Island was obliged to promise freedom to slaves who joined the army, and to liberate their families; and a dangerous rift was thus made in the system of slavery.

This rift was widened by the action of several states during and immediately after the Revolution. In 1775, an abolition society was formed in Pennsylvania under the presidency of Benjamin Franklin, and similar societies followed in the New England States. These organizations at once began to petition legislatures to secure better treatment for slaves, and even to prohibit slavery altogether. The movement rapidly gained headway in the Northern communities where slaves were few and vested property interests were small.

In 1777, the people of Vermont drew up a state constitution containing clauses "that all men are born free and independent," and that hence slaves should be set free at the age of majority. The next community to act was Pennsylvania, where under strong pressure from the abolitionists, 1 March 1780, an act was passed declaring that all persons thenceforward born within the state should be set free at 28, thus putting slavery in process of extinction. Still more effective was the action of Massachusetts which, in 1780, adopted a new constitution, drafted by John Adams, the opponent of slavery; the bill of rights included the declaration "that all men are born free and equal, and have certain natural, essential, and inalienable rights, among which may be reckoned the right of enjoying and defending their lives." In 1783, in a test case, the Supreme Judicial Court held that under this clause there was no such thing as slavery in Massachusetts. The precedent thus set was followed by New Hampshire in 1783, in a constitution similar to that of Massachusetts; and by gradual emancipation acts in Rhode Island and Connecticut in 1784. For a time the tide was stayed till in 1799, New York,

and in 1804, New Jersey, passed gradual emancipation acts. Thus, of the sixteen communities admitted to the Union before 1800, eight became free.

Meantime the national government had also taken important and far-reaching steps in regard to slavery. The First Continental Congress, to damage English trade, drew up the Association of 1774, in which the colonists agreed not to import slaves; and this prohibition was maintained throughout the Revolution. Most of the states passed laws prohibiting the slave trade, so that when the Revolution was over, there appear to have been no importations.

The opposition of the Northern States to slavery was quickly reflected in Congress, where from 1775 to 1777 there were hot disputes on the question of assessing federal taxes; the Northern States insisting that slaves ought to be counted either as a part of the population, or a part of the wealth of the South; the South insisting that slaves were not as productive as free men and that they ought not to be reckoned at their full number. Upon the more serious question of territorial slavery the Confederation Congress took radical ground, for it became necessary to provide a government for the immense areas added to the United States both north and south of the Ohio River. In 1784 Jefferson reported an ordinance which included a clause that in all the new territories, "after the year 1800 of the Christian æra there shall be neither slavery nor involuntary servitude." For lack of one vote in one State this clause was rejected; but in 1787, in the Northwest Ordinance, Congress applied to the Northwest Territory the prohibition which had failed three years before. Hence, when the Constitutional Convention of 1787 adjourned, slavery was prohibited in the whole section of the country north of Maryland (except New York and New Jersey), by action of the States; and from the Pennsylvania line westward to the Mississippi, by Congress.

When the Federal Convention assembled at Philadelphia in May 1787 it speedily became evident that slavery, or rather the division of the Union into a free and a slaveholding section, was an obstacle to the work. Following the suggestion of Mr. Madison, that it was "wrong to admit in the Constitution the idea of property in men," the Convention scrupulously avoided using the words slave and slavery in the final document, but five clauses in the final draft distinctly refer to that institution.

1. The apportionment of direct taxes "shall be determined by adding to the whole number of free persons . . . three fifths of all other persons." This clause was the result of a long and bitter controversy; as Gerry of Massachusetts put it, "why should blacks who are property in the South, be in the rule of representation more than cattle and horses in the North?"; while Pinckney of South Carolina thought that in apportionment "the blacks ought to stand on an equality with the whites."

2. "The migration or importation of such persons as any States now existing shall think proper to admit, shall not be prohibited by the Congress," prior to 1808. This clause of course relates to the slave trade, complete control over which was for a time withheld from Congress; and the concession to the Northern States was part of a bargain by which they retained the right to pass navigation acts.

3. A clause relating to fugitives provided for the return of any person "held to service or labor in one State, under the laws thereof, escaping into another."

4. "The citizens of each State shall be entitled to the privileges and immunities of the citizens in the several States,"—a clause afterward applied to, or claimed for, negroes.

5. "Congress shall have power to dispose of and make all needful rules and regulations respecting territory or other property belonging to the United States." This was the power under which the Northwest Ordinance of 1787 had prohibited slavery.

The experiment was now fairly under way of carrying on a federal government with three different principles as regarded human slavery,—freedom in the northern colonies; slavery in the southern; and a discretionary power over territorial slavery in the Federal Government. The difficulties of this situation were clearly shown when, in 1790, the abolition societies petitioned Congress to regulate the slave trade; and the House of Representatives passed resolutions in which they expressly disavowed any power to regulate slavery within the States. Three years later Congress exercised its power over fugitive slaves by passing an act which provided that under the authority of the United States and on the certificate of any magistrate, a master or his agent might personally apprehend a slave escaped into a free State.

In 1789 Congress exercised its power to deal with slavery in the territories by re-enacting the ordinance of 1787; but in 1798, on the organization of Mississippi Territory, the anti-slavery clause was omitted, and slavery was allowed to continue there. In 1801 the United States took over the District of Columbia and reaffirmed the pre-existing laws of Maryland, including harsh slave codes. In 1827 the opponents of slavery in the District of Columbia memorialized Congress to prohibit slavery in the District.

A long-continued agitation in England against the slave trade resulted in an act against it in 1806. This example was helpful in the United States which by the act of 7 March 1807, laid an absolute prohibition on the foreign slave trade.

In 1821, on the final admission of Missouri, Congress insisted that a clause in the State Constitution prohibiting the incoming of free negroes should be withdrawn, because contrary to the citizenship clause.

In the forty years from 1790 to 1830 the conditions of slavery radically changed. In 1790 the census showed 700,000 slaves; in 1830 there were 2,000,000, in each case about one third of the total population of the slave-holding communities; but slavery in 1790 was dying out from want of profitable employment. When Eli Whitney invented the cotton gin for separating the seed from the fibre (1794) a profitable crop was opened up. The product of cotton in 1800 was 210,526 bales, in 1830 1,038,847 bales. It is a crop requiring cultivation during a considerable part of the year and adapted to rude labor in large gangs; it thus made slave labor profitable along the Gulf, and furnished a market for the surplus slave population of the border slave States; hence all sections of the South had an economic interest in its continuance.

Looking at slavery from the side of the slave, the conditions varied extremely; in general the work was lighter and the relations with the master more humane in the border slave States where cotton was little grown, and farming was more diversified. The great cotton, rice, and sugar plantations of the far south made heavier demands upon the slave; and the plantations were often managed by hired overseers. The condition varied also according to the character, intelligence, and temper of the masters; easy-going, kind-hearted, genuinely religious masters and mistresses often felt a strong personal responsibility for their slaves; but it was part of the system of slavery that passionate, coarse, and overbearing men and women might own slaves and frequently treated them with harshness, severity, or extreme cruelty.

The condition of the slave varied also according to his employment. Most of them were field hands, engaged in the rudest and most toilsome labor; but some were employed as roustabouts on the river steamers, as longshoremen, and some as carpenters, blacksmiths, masons, plasterers, and the like. The number of slaves thus used in small gangs was not significant; and a much greater number were busy as household servants, there being practically no other domestic service obtainable in the South; people, therefore, who needed such services and had no slave, hired one.

Almost always the handsomest, most intelligent, and most promising slaves were used for household service, and it was a highly prized privilege, bringing better food, abundance of cast-off clothing, and personal relations with the white people.

The field slaves worked long hours, commonly from sunrise to sunset, and were kept up to their work by white overseers, and on large plantations also by negro slave drivers armed with the whip. Men and women, and half-grown boys and girls were engaged in this field labor. Their houses were cabins in the negro quarters, usually small, dark, and dirty, but often as good as the ordinary house of the poor white. The clothing of the field hand was rough, coarse, and scanty. Thrifty planters estimated that it cost about $15 a year, on an average, to feed and clothe a slave.

Most adult slaves were married, but family relations were so disturbed by sale and a feeling of irresponsibility, that such relations were very changeable. The slaves usually had Sunday free and a few days of jollification at Christmas; in many places they also had their own churches with a rude and boisterous worship, conducted by slave preachers.

One of the incidents or accompaniments of slavery much in the minds of people at that time, was sale. Negroes who, in the colonial days, could be bought as low as $50, by 1830 were worth $500; and by 1860 prime cotton hands were quoted as high as $1,500. The South, in 1860, valued its slave property at about $2,000,000,000. Of course this high value depended upon the opportunity to market surplus slaves and to buy hands as needed; hence, a lively system of picking up slaves at private sale, gathering them up into coffles or gangs and shipping them south by land or river, there to be sold out again. Though the slave trader was universally despised by the white people, the kindest master might get into debt and have to sell his slaves, or his death might cause his property to be divided. Auction sales were very frequent and abounded in most pathetic incidents of the division of families.

Another frequent incident was escape. Slaves were always running away and taking refuge in swamps or forests; many of them returned, took their flogging, and went to work again; many others became fugitives, and made their way northward; and thousands of them remained there or passed on farther north to Canada. These fugitives were commonly the most determined and ablest of their race, and by stealing themselves they depreciated slave property, especially in the border States.

A third incident was manumission,— from early Colonial days slaves were set free by indulgent masters during their life or by their wills; and the free negroes in the South in 1860 were about one sixteenth of the whole number. The process of setting slaves free was commonly hedged about by two restrictions: (1) The master must give bonds that the freedman should not become a public charge; (2) in some States he was obliged to remove him from the commonwealth in which he was set free.

A fourth incident was insurrection. Beside several risings in Colonial days, of which the New York Slave Plot of 1741 is the best known, there were three insurrections or attempted insurrections in the 19th century: the Gabriel insurrection in Virginia (1800); the Denmark-Vesey in Charleston (1822); and the Nat Turner rising in Virginia in 1831, in which 70 white people were massacred. This was the last of such movements; even during the Civil War there was no slave rising in the South, but the fear of it was a constant motive in the minds of the Southern people.

Looking at the institution of slavery from the point of view of the master, the southern community was divided into three strata of white people: (1) The large slave holders. In 1850 about 2,000 families owned as many as 100 slaves each; the largest number under one management was about 2,500. These 2,000 families made up the social and political aristocracy of the South, furnished a great number of the professional men, and almost all the holders of high political offices, State or national, in the South. (2) The small slave-holders, about 350,000 families: of these, in 1850, about 60,000 held only one slave. Such people commonly had a poor living, in rough houses with unsavory food, and few opportunities for their children; with them were associated a considerable body of non-slaveholding farmers.

(3) At the bottom of society was the great class of poor whites, including the mountaineers; they held no slaves, but owned their own land and lived upon it in a miserable fashion. They were a naturally intelligent people, but extremely ignorant and made up about three fourths of the white population. They implicitly followed the political leadership of the great planters, and were perfectly persuaded that the cause of slavery was their own, although they were looked down upon by well-to-do white men, and were sometimes despised by slaves.

The system of slavery was maintained by a rigorous code of special laws. Property and mortgage rights in slaves were protected by

law. The masters were assured the physical control of slaves by laws and customs which gave them authority to compel obedience and force labor; and to resist any real or supposed belligerency of the negro by force, which commonly took the form of whipping. The laws held a master responsible for killing a negro, unless in defence of his life; but negro testimony could not be received against a white man, and the law of a State which absolved the master in case a slave was so inconsiderate as to die under a "moderate" chastisement, sufficiently indicates public sentiment on the necessity of giving discretion to the master in all doubtful cases.

Assemblages of slaves, and any sort of riotous behavior were dealt with by special acts. In many States, special tribunals of the slaveholders in the neighborhood took testimony in a summary fashion, and executed punishment, even to the taking of life. There were also special laws against the consorting of whites with negroes, or their purchase of property from slaves. Runaways were stopped by a system of patrols, a kind of voluntary mounted police, who scoured the roads and picked up suspected characters.

Such was the system of slavery, a system of brute force, supported by a powerfully welded public opinion and backed up by a body of positive law. On many plantations the life of a slave was easy enough, labor was light and he was looked on as a reasoning being; on other plantations he was treated worse than the beast of the field, because he could talk and was held to the responsibility of men. Slave labor was notoriously inefficient and wasteful; and small planters made very little out of their slaves. The larger planters, by working out a kind of machine system, had better results; but it was at the expense and the degradation of their white neighbors as well as of the slaves.

The opposition to slavery which had been widespread in 1787, grew less and less, as the years went on, though till 1830 there was a national anti-slavery organization, which held a convention about once in two years, usually in a border state city. The system of slavery grew more and more deeply rooted, and when the Northern abolitionists began, in 1831, an active crusade against it, the Southern societies disappeared and only a handful of Southern men could be found who would so much as make a public argument against the desirability of slavery.

From being an "evil" which must be destroyed, by 1820 the South as a community were thinking of it as an evil which could not be removed without destroying the country; by 1830 they grew to advocate it as something which, whether evil or not, must neither be attacked nor discussed; thence it was an easy step to advocate it as desirable in itself, as Calhoun put it, "a good, a positive good"; and in the last stage of the contest, just before the Civil War, Southern leaders like Jefferson Davis insisted that slavery must be extended in some degree to the Northern States.

The abolition movement is elsewhere discussed,— our object at this point is to show how slavery, so strongly buttressed in the interests and the pride of the South, yet quickly came to an end. As has already been shown, when the two sections had clearly adopted opposing systems of labor, many questions of choice between the two systems came before the federal government. It was in vain to urge that slavery was a State institution existing only under State laws, in the face of the fact that Congress, by its regulation of the slave trade in the District of Columbia, of international relations, of fugitives, and of the Territories, had a power to increase or to diminish the slave power. In fact, the national government furnished the arena in which the question must finally be fought out.

The first great step came about 1835, when the abolitionists, in part encouraged by the English acts abolishing slavery in the West Indies (1830-5), sent petitions to Congress asking for the prohibition of slavery in the District of Columbia. The South was able to influence enough Northern votes to secure a succession of gag resolutions, intended to prevent discussion in Congress; but the question sprang up in many unexpected ways. The apparently innocent power of carrying mails by the federal government brought to light the objections to the delivery of abolition mail at the Southern post-offices. The Southern leaders attempted to stop the rising tide of discussion of slavery in Congress; but John Quincy Adams arose as the champion of free speech, and he was speedily aided by other men like Joshua R. Giddings of Ohio, who would not be silenced.

By 1842 it was plain that slavery might be discussed throughout the North and in Washington; soon it had to be discussed, because of new questions of territorial slavery. The principle of dividing the Union by a geographical line had been continued by the compromise of 1820, which prohibited slavery north of 36° 30′ (excepting in Missouri). In 1845 Texas was brought into the Union with the express purpose of furnishing material for a body of slave-holding States; yet again Congress prohibited slavery in Texas, north of 36° 30′.

Then followed, in 1848, the annexation of New Mexico and California, with the plain expectation that the 36° 30′ line would be produced to the Pacific. The North, however, was aroused and the people of California refused either to divide their commonwealth or to admit slavery within its borders. By the compromise of 1850, California was acknowledged free, and New Mexico and Utah were practically left as fighting ground for slave power; yet Congress, in 1848, passed a fourth act prohibiting territorial slavery, this time in Oregon. In the same compromise of 1850, Congress passed a new fugitive slave law and prohibited slavery in the District of Columbia.

The contest was raised again by the Kansas-Nebraska Act of 1854, which repealed the Missouri Compromise and, by implication, the three other acts prohibiting slavery in the territories; and left Kansas to be controlled by the first set of people who might get on the ground. Contrary to expectation, the first set were from the North, and the determination of the Southern settlers in Missouri and of the South generally, to take possession of Kansas in spite of the will of the majority of the settlers, occasioned a civil war in Kansas, six years before the greater national Civil War.

By this time it became evident that slavery

was a political question which divided the nation; and in 1856 the first large and widespread anti-slavery party was formed. The Dred Scott Decision of 1857 was an attempt to suppress the controversy, and to take it out of politics, by denying the right of Congress to prohibit slavery in a territory, though that right had four times been exercised, with little opposition. From this time the drift was steadily and irresistibly toward Civil War,—and the crisis was reached in 1860, when the Southern Democracy demanded, as a condition of remaining in the Union, their right to share in all territory thereafter annexed, and to have an end of abolition agitation in the North.

Although in a resolution of 22 July 1861, the House of Representatives declared that slavery was not the cause of the war nor the freeing of the slaves its purpose, from the beginning it was plain that slavery was the great question which divided the two sections, and that consequently its future was inextricably woven into that struggle. Hence, the war had hardly begun before there came a series of special enactments and executive proclamations. (1) On 26 April 1862 an act of Congress freed the slaves in the District of Columbia, with a compensation of about $300 a head. (2) On 19 June 1862 an act, in flat defiance of the Dred Scott Decision, prohibited slavery in every Territory. (3) On 2 July 1862 an act was passed providing that slaves of persons engaged in rebellion against the United States thereby gained their freedom. President Lincoln was all the while turning over in his mind a larger scheme, and on 22 Sept. 1862 he issued a preliminary proclamation, followed on 1 Jan. 1863 by a final proclamation, of emancipation, by which all slaves within the Federal lines were declared free, excepting in the State of Tennessee.

To the national prohibitions of slavery in the Territories, the District of Columbia, and the seceded slave States were added the actions of three slave-holding communities; West Virginia, by its Constitution (21 March 1862), Missouri by a vote in convention, 1 July 1863, and Maryland by constitution (13 Oct. 1864), declared for absolute or gradual emancipation. They thus joined the cohort of freedom, so that at the end of the war, the only regions within the boundaries of the United States in which slavery remained legal were Delaware, Kentucky, and Tennessee, the last of which States declared for freedom by a new Constitution in 1865.

But although slavery was practically at an end, under the then accepted theory of the Constitution, both Congress and the States might legally re-establish it; and to prevent that contingency and wipe out the last vestige of the system, the Thirteenth Amendment was introduced into Congress, received the necessary two thirds vote (22 Feb. 1865) and 18 Dec. 1865 it was announced that the necessary three fourths of the States had ratified it, and that to the text of the Constitution had been added the significant words, "Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction."

As Lincoln said a few days before his death, "We have finished the job." Beginning in 1775 with a United States in which slavery was the normal condition of every community and every square mile of vacant territory, the struggle of 90 years ended with a condition in which by the firmest of constitutional enactments, the normal status was everywhere that of freedom. The amendment even reached out into the future, and covers all annexations made or that can ever be made; so that chattel slavery of human beings, no matter what their color, is now absolutely unknown to the law of the United States or of any State, Territory, or dependency.

ALBERT BUSHNELL HART,
Professor of History, Harvard University.

31. United States — Finances of the (1816–1861). In 1816, at the close of the war with England, the chief problem before the government was the restoration of the currency to a specie basis. Dallas, upon assuming the office of secretary of the treasury in 1814, vigorously endeavored to secure a charter for a second United States Bank through which pressure might be exercised upon the local banks to resume specie payments. The Republican party as a whole had long opposed a bank founded upon a federal charter; and notwithstanding Dallas' support, promptly advanced constitutional objections. The discussion ran through two years in which several plans were proposed; the principal points of difference were, first, whether the capital of the bank should be based upon treasury notes or upon government stock; second, whether the bank should be forced to loan money to the government; and third, whether the bank should be given power to suspend specie payments. The bank was chartered in March 1816. Its capital was based in large part upon government stock; the government in addition subscribed to the stock and had representation in its management. The bank was obliged to transfer the public funds free of charge, and was made the depository of government moneys. As a return for the exclusive privilege of a national charter, the bank paid to the government a bonus of $1,500,000. The establishment of this institution was quickly followed by a congressional resolve that after 20 Feb. 1817, all dues to the government should be paid only in specie, treasury notes, notes of the Bank of the United States, or in notes of local banks which were payable on demand in the foregoing currency. This decisive action forced the State institutions to adopt sounder methods, and on the date named there was general resumption.

In 1816 the revenue system was reorganized, not for lack of revenue, but because the enormous volume of imports rushing into the country upon the return of peace, endangered domestic manufactures which had been abnormally stimulated during the war. The value of imports in 1816 was estimated at $116,000,000 as compared with $13,000,000 in 1814. Customs duties amounted to $36,000,000, far surpassing the previous estimate of Dallas of $13,000,000. Even President Madison affirmed the necessity of protection. A new tariff bill was consequently enacted 27 April 1816; in particular the cotton industry received protection. In December 1817, the internal revenue duties were repealed; and in the following year supplementary customs duties were placed upon iron commodities, thus establishing the policy of protection. In these measures the South cordially joined, and Calhoun, who afterward bitterly op-

posed the high tariff policy, at this time supported higher duties.

During 1816 and 1817 the treasury was in a most favorable condition; revenue exceeded all expectation, yielding surpluses amounting in two years to nearly $30,000,000. Good fortune, however, did not continue; the new United States Bank was mismanaged and the currency was once more thrown into disorder. This, together with an extraordinary commercial and manufacturing expansion, led to a crisis in 1819. The revenues were severely affected and customs duties which yielded $26,000,000 in 1817 fell back to $13,000,000 in 1821. In 1820 and 1821 the treasury budget showed a deficit. Expenditures for the navy and pensions were reduced; and a change in the management of the bank, with a contraction in its circulation and loans, led to a revival of business and improving revenues. Beginning with 1822 the treasury annually enjoyed a surplus (except in 1824 when a large payment was made on account of Spanish claims) which was applied to the reduction of the debt. In 1820 an attempt was made to increase tariff duties, partly to help the revenues at that time embarrassed, and partly in behalf of protection. The bill passed the House but failed in the Senate by one vote. Clay and John Quincy Adams championed protection and liberal expenditures for internal improvements, cardinal points in the "American System." The effort was renewed in 1824 and protection was sought in particular for iron, wool, hemp, glass and lead, industries of the middle west. The contest now assumed a sectional division; the Middle, Western and Southwestern States being arrayed against New England and the South. New England's chief interest at this time was in commerce, and her leading representative, Webster, made an exhaustive argument in behalf of freedom of trade. The measure became law by a vote of 107 to 92; in the South there was but one vote in favor to 47 against. During the next 10 years the tariff question occupied a large place in congressional debate and legislation. The tariff of 1824 fell short of the demand of woolen manufacturers, and agitation for a revision with still higher rates resulted in the tariff of 1828. New England was turning more and more to protection, and Webster under instructions made a speech declaring that through the encouragement of the Act of 1824 capital had been invested which needed further protection. The woolen tariff, or Tariff of Abominations as the measure was frequently termed, aroused the fiercest controversy, which finally led to nullification and the compromise tariff of 1833. By this latter act a horizontal reduction of duties, spreading over a number of years, was made and for a while the tariff question yielded in importance to other political issues.

A persistent attack upon the United States Bank, resulting in its downfall as a federal institution, began in 1829. President Jackson in his first annual message in 1829 raised the question of constitutionality, and doubted the value of the Bank in establishing a sound currency. In its place he suggested an institution more directly under the management of the treasury department with power to receive both public and private deposits, but with no right to make loans. Jackson undoubtedly voiced the conviction of western democracy, that the affairs of the government should be divorced from private corporate undertakings. The suggestion had little immediate influence, for both branches of Congress made reports in favor of the Bank. In 1831 Senator Benton took up the fight against the Bank, resting his argument upon the evils of all kinds of bank notes, and in particular attacked the issue of branch drafts. In 1832 the Bank petitioned for a new charter and was successful in carrying its bill through Congress. Jackson interposed a veto, laying stress upon the evil of a money monopoly. He did not stop here but next determined on the removal of the government funds from the custody of the Bank; in this he was encouraged by his re-election in 1832 which he interpreted as a popular endorsement of his opposition to the Bank. There were doubts, however, as to the legality of removal of the public moneys without the sanction of Congress. W. J. Duane who was appointed secretary of the treasury in June 1833, refused to take the responsibility, and although Taney the attorney-general supported Jackson's contention, Duane remained obstinate. He was forced from office and was succeeded by Taney who on 26 September, issued an order directing the deposit of public moneys henceforth in certain local banks. These institutions, popularly known as Jackson's "pets," were chosen with care, and by the Act of 23 June 1836, the regulation of public funds was strictly prescribed so as to safeguard the interests of the government in every possible way.

In 1835 the public debt was paid off; customs receipts had steadily increased; and beginning with 1830 there was an enormous expansion in revenue from sales of public land. In 1834 and 1835 the annual receipts from this source alone were nearly $15,000,000 and in 1836, $25,000,000. A new fiscal problem of dealing with a surplus was thus created; many schemes were projected, chief among which was Clay's proposition that revenue from lands be distributed among the several States. Any plan to prevent a surplus by lowering customs was negatived on the ground that the tariff question has been, for the time being at least, settled by the Act of 1833 and ought not to be reopened. On the other hand, there was objection to the distribution of the proceeds of land sales on the ground that public lands had been ceded for paying off the Revolutionary debt; that this national income could not in fairness be given to States which had not originally shared in the gift, and that the Constitution required all revenues to be appropriated for specific objects. Others desired to make large expenditures for internal improvements, fortifications, or education. It was impossible to pass a distribution bill, but the same end was reached by the Act of 23 June 1836, providing for the deposit of certain surplus funds in the treasury, amounting to $37,000,000, with the several States in proportion to their respective representation in Congress. In law this was a deposit which could be recalled, but it was practically regarded as a gift to the States. The deposits were to be made in four quarterly installments during the year 1837. Before the deposit was completed, the country was involved in a commercial panic which made it impossible for the government to pay the fourth installment.

On 1 July 1836, the treasury department issued an order known as the Specie Circular, requiring all land agents to accept only specie in

payment for public lands; as local bank notes had been previously received, and specie was scarce in the West where sales were made, speculative operations based upon land were sharply checked. Eastern banking institutions with western connections were obliged to contract their loans, and this, coupled with a heavy transfer of funds, in accordance with the deposit act, proved a severer strain than many banks could stand. The evils were aggravated by commercial failures in Europe, decreasing crops, and southern speculation in cotton. In May 1837, the banks throughout the country suspended specie payments, and as the treasury had parted with its funds, it shared in the distress and was also forced to suspend. During the next few years treasury notes were issued amounting to $47,000,000 of which one third were reissues; and between 1841 and 1843 there were three long-term loans. With the exception of 1839, there was a series of annual deficits until 1844.

The failure of the banks to protect the funds of the government led President Van Buren to recommend the establishment of an independent treasury system by which the government might take care of its own funds. A prolonged dispute within the party over the details of this plan, as well as the opposition of Whigs who wished to establish another United States Bank, deferred the passage of the independent treasury act until 1840. In 1841 the Whigs gained the election and used their power by repealing the treasury law. Owing to the vacillating opposition of Tyler who succeeded President Harrison, it proved impossible to pass constructive legislation, and for lack of other agencies, the public funds were once more placed with local banks; this practice continued until 1846. Whig success also led to a revision of the tariff in the Act of 1842 along protectionist lines. Additional reason for higher duties was found in the embarassment of the treasury and the need of increased revenue. In 1846 the Democrats regained the presidency and at once re-established the independent treasury system and enacted a new tariff. The treasury act of 1846 provided for the custody of public funds at mints, custom houses, and at sub-treasuries in a few of the larger cities. It also provided that all public dues should be made either in specie or treasury notes, thus excluding bank notes. The system in its main features has remained unchanged to the present time, and it has been successful in safeguarding the funds of the government.

The tariff of 1846 was a free trade tariff; specific duties were abolished; and the duties were so rated as to yield the largest amount of revenue. Commercial enterprise was again at a high level; railroad construction and foreign immigration contributed to new industrial development; and in spite of the temporary interruption occasioned by the war with Mexico, the treasury entered upon another long period of prosperity. Customs receipts were large; the sales from public lands again proved fruitful; and repeated surpluses made it possible to reduce the debt, until in 1857 it stood at $28,800,000. In 1857 another reduction in tariff rates was made to which all sections of the country gave generous support. Railroad construction, however, had been carried too far and capital for the moment was unprofitably tied up in unproductive investment. Bank note circulation was unduly expanded, and a panic occurred in August 1857. The treasury with weakened resources fell into embarrassment and was obliged to issue treasury notes to meet its obligations. In the years 1858–60, the deficits amounted to $50,000,000.

During the period 1816–61, the United States became a commercial nation, necessitating new methods of customs administration. The regulations affecting the appraisement of goods were made more strict. Credits to importers were abolished, and in its place a system of warehousing was established. Among the later secretaries of the treasury, Walker and Guthrie stand out pre-eminent, the first for his notable report in which he recommended the tariff of 1846, and the second for his development of administrative details. 32. United States — Efforts to Settle the Slavery Question in the. In all cooperative efforts of the North and South to settle disputes over slavery the preservation of both slavery and the Union were objects of primary consideration. The roots of such efforts are found in the compromises of the Constitutional Convention of 1787. The most important agreements then made, provided that (1) three fifths of the slaves should be counted in determining the number of congressmen a State should have and the amount of direct taxes it should pay and that (2) the African slave trade should continue for 20 years. These compromises are significant partly because the "more perfect union" could probably not have been formed without them and partly because the "Fathers" thus gave the stamp of approval to compromising disputes over slavery, for the sake of the Union. By the aid of the three fifths advantage the South, in 1790, had but three less congressmen than the North. But each succeeding census showed a constantly growing majority in the North's favor so that by 1820, this majority amounted to 43. But the South had already begun to look for the protection of her interests in the preservation of an equilibrium in the United States Senate, where population is not so directly represented.

Of the original 13 States seven were northern and six southern. During the administrations of Washington and Adams, Vermont, Kentucky, and Tennessee were admitted and established an equilibrium between the two sections in the Senate. The admission of Ohio (1802) and Louisiana (1812) preserved this situation. The addition of Indiana (1816), Mississippi (1817), Illinois (1818), and Alabama (1819) still kept up the balance. But the application of Missouri for permission to form a State Constitution in 1819 threatened to break the plan of alternate admissions. Besides, slavery seemed to be making a flank movement into territory which might be looked upon as geographically belonging to the North, since nearly the entire eastern line of Missouri faced the free State of Illinois. The South's need of Missouri was indeed great, for but two more possible slave States remained to be carved out of Territories. Congressman Talmadge of New York introduced an amendment to the bill permitting Missouri to form a constitution, which precipitated the first great quarrel over slavery between the two sections,

and which threatened the existence of the Union. This amendment called the "Missouri Limitation," provided that no more slaves should be taken into Missouri and that slave children born within the State should be free at 25 years of age. The House of Representatives passed the amended bill, after warm debates, but the Senate struck out the amendment and then passed the bill. The House refused to accept the change and the measure was lost for the time being. In the next session the contest was renewed, but was given a new turn by the Senate linking the bill for the admission of Maine, which the House had already passed, to the bill authorizing the people of Missouri to form a State Constitution. The Senate passed this bill with the proviso that slavery should be prohibited in the territory north of 36° 30′, but twice the House rejected the bill in this form. A committee of both houses, however, agreed upon the following compromise: (1) The separation and passage of the Maine and Missouri bills; (2) The prohibition of slavery in the remainder of the territory of the Louisiana Purchase north of 36° 30′. Both houses accepted the compromise and President Monroe signed the bill (1820).

But the quarrel which the people hoped had been settled was suddenly renewed in a more violent way than before. The constitution presented by Missouri to Congress looked toward the exclusion of both mulattoes and free negroes from the State. The fiery debates, the resolutions from State legislatures on both sides of the question which had already been presented to Congress, and the widespread discussion in the newspapers, led patriotic men to fear a dissolution of the Union. Therefore, Henry Clay at once took the lead in trying to settle the new dispute. Although the House rejected the report of the committee of 13, Clay did not give up, but by his persuasive eloquence, and by personal appeals to members, he finally induced the House to pass a bill to admit Missouri as a State on the condition that her legislature give a pledge that the State would never pass a law excluding the citizens of any other State. Missouri gave the pledge and was admitted (1821). Three important consequences followed from the Missouri contest: (1) The conviction that danger to the Union could force a compromise; (2) That Congress accepted the South's contention against placing unusual restrictions upon a State as it enters the Union; (3) That Congress had the power to prohibit slavery in the Territories. The remote effect of thus devoting the northern part of the Louisiana Purchase to free labor was far reaching.

The second conflict over slavery which seriously menaced the Union had reference to territory obtained by the Mexican War (q.v.). Anti-slavery men sought to exclude slavery from such territory by the Wilmot Proviso (q.v.) while pro-slavery men attempted to secure their interests by an extension of the Missouri Compromise line to the Pacific. Both of these efforts failed, but the discussions in and out of Congress deepened sectional feeling. Excitement was further increased by events in California. The discovery of gold on the Sacramento (1848) drew a large, hardy, but reckless population from all quarters. The disorder which resulted, made organized government an immediate necessity, but a bill to establish territorial government for that region failed. California did not wait long on Congress, but called a Constitutional Convention whose delegates voted unanimously for a constitution prohibiting slavery. The people of California ratified the constitution by an overwhelming majority. Thus circumstances, beyond the control of either party to the contest, placed California beyond the reach of slavery. In the meantime the State of Texas seemed to be preparing to enforce her claims to a large portion of what is now New Mexico. Anti-slavery men opposed the demand of Texas because it was expected that New Mexico would follow the example of California. President Taylor recommended Congress to admit California immediately as a State and expressed the opinion that the people of New Mexico would soon follow the example of California (1849). The radical pro-slavery men were grievously disappointed over this attitude of President Taylor and strongly favored first putting California and New Mexico through the experience of territorial government. Such a plan would have given slave holders time to move into those territories. Slavery had not yet learned that in the race for population it could not compete with freedom. The irritation of the two sections was now so great that men again feared for the safety of the Union. Although Henry Clay had retired from public life to spend his few declining years, the legislature of Kentucky without a dissenting vote re-elected him to his old place in the Senate hoping that the spell of his presence and the power of his eloquence might once more restore harmony between the sections. In January 1850, Clay introduced his most famous compromise bill. The following were its main features: (1) That California be admitted as a free State; (2) That the Territories of New Mexico and Utah be organized and that the question of slavery be left for their people to settle; (3) That Texas be paid $10,000,000 to satisfy her claims against New Mexico; (4) That the slave trade be abolished in the District of Columbia; (5) That a more efficient fugitive slave law be passed. The debates over these measures continued into September, and brought out the most splendid array of oratorical talent ever seen in the Senate. Stimulated by his last great effort for the Union, Clay seemed to gather new vigor, was unremitting in his labors, and frequently spoke with his old time power. When he rose to make his great speech, a vast concourse which filled even the avenues to the Senate, greeted him with tremendous enthusiasm, and hung in breathless silence upon his words. When he had finished, women crowded to imprint on his wan cheek the kiss of admiration and approval. His effort kindled afresh the fire of patriotism.

The hand of death was also upon the mighty Calhoun. He was only able to sit in his place and listen to another read his last speech. The burden of his address may be summed up in three propositions: (1) The restoration of the equilibrium between the North and the South by an equal division of the territory and by an amendment to the Constitution in order to guarantee the equilibrium; (2) A new law for the return of fugitive slaves, and the cessation of anti-slavery agitation; (3) The peaceful secession of the slave States from the Union, if the above propositions are rejected. Calhoun was asking for an impossible Union and an

impossible secession. The other member of the great trio, Daniel Webster, had been silent thus far, and no man, probably, knew what he would say, least of all his New England supporters. On 7 March Webster addressed the Senate in a speech "For the Constitution and the Union." He made an appeal for conciliation, and condemned agitation whether by Northern or Southern men. But he seemed to lay the greater blame for the distracted state of public opinion upon anti-slavery men. For this unexpected position they roundly denounced Webster, and his popularity in the North began to wane. Clay and Webster were of the past and had spoken for the past. But the men of the future were in the Senate also: Seward, Chase, Douglas, and Davis. There was less of compromise in these men. Seward, in particular, aroused criticism by declaring in favor of a "higher law" than the Constitution, in dealing with the slavery question. Davis demanded the extension of the compromise line of 1820 to the Pacific. In spite of the efforts of Clay and his supporters, Congress refused to accept the bill as a whole. But after Taylor's death, President Fillmore gave his influence in favor of the various parts of the bill, for, although no majority could be found for the measures as one bill, Congress gave majorities to the separate parts.

The people of the country seemed ready to accept the main features of the agreement and special efforts were made to impress upon the people the necessity and fairness of the result. Union meetings were held at which Whigs and Democrats vied with each other in praising the compromise as a final and fair adjustment of the slavery question. Although these efforts seemed somewhat artificial, the result was a lull in agitation. The two old parties in 1852, in national conventions pledged themselves to stand by the Compromise. Pierce was overwhelmingly elected President and was known to be a warm supporter of the Compromise. With these happy omens, politicians began to speak of a "second era of good feeling." One feature of the Compromise, however, threatened to disturb the promised peace. The provisions of the law for the rendition of the fugitive slaves were exasperatingly severe. The fugitive was denied the right to testify in his own behalf and was refused the use of the writ of habeas corpus. Any citizen could be summoned to aid in capturing and returning the fugitive and could be fined and imprisoned for aiding him to escape. Slaveholders, who had lost many slaves through the operation of the Underground Railroad (q.v.), put the new law into vigorous operation. One result was a number of "rescue mobs." The most famous were the rescue of the slave Shadrach in Boston by a crowd of his own color, and the rescue of the slave Jerry in Syracuse, by citizens led by Gerrit Smith and Samuel J. May. If the execution of the fugitive slave law failed to renew the controversy with its old time bitterness the introduction of the Kansas-Nebraska Bill (q.v.) (1854) by Stephen A. Douglas, senator from Illinois, more than accomplished this result. This measure was intended to settle the slavery question by turning it over to the people of the Territories of Kansas and Nebraska to determine for themselves whether they would have slavery or not. This bill involved the repeal of the Missouri Compromise and was amended so as to specify that fact. The reason given was that the compromise of 1820 was not in harmony with that part of the Compromise of 1850 which left the question of slavery to the people of New Mexico and Utah. A flame of resentment spread over the North. Since the South had not demanded the measure, it appeared that Douglas was gratuitously presenting to slavery what had heretofore been regarded as free soil, and that, too, by the repeal of a compromise venerated on account of its age. In spite of intense opposition in Congress and the fierce denunciations heaped upon the measure by pulpit and press, it became a law and compromise was at an end. Douglas lost in popularity at the North. He was burned in effigy in many places, and was even howled down in his own city of Chicago while trying to justify his conduct. The race for Kansas began before the bill became a law, and soon free State settlers and slave State settlers were struggling for its control. (See KANSAS.) Two territorial governments, two delegates to Congress, two constitutions, and armed collisions followed in rapid succession. It was necessary to call in Federal troops to preserve order in Kansas. The doctrine of popular sovereignty had failed in application. The Whig party was dead and in its stead a powerful anti-slavery party, the Republican, had arisen. Even the Democrats who remained loyal to the party were divided on the question whether a fair test of popular sovereignty had been made or not. Douglas and his followers in the North declared that the pro-slavery constitution of Kansas had not been fairly ratified by the people of Kansas. President Buchanan and his supporters asserted that the test was fair and that Kansas should be admitted as a slave State.

While the contest over Kansas was raging and threatening to involve the country in war, an entirely new method of solving the problem was tried. It was planned to take slavery completely out of politics by means of a Supreme Court decision. The case of Dred Scott (q.v.) offered the opportunity. Dred Scott had sued for his freedom on the ground that having resided in a free State he could not be held in slavery on return to a slave State. The decision contained two points of historical importance. The first denied that the negro was entitled to the natural rights enumerated in the Declaration of Independence and the second asserted that neither Congress nor the Territorial legislature could prohibit slavery in the Territories. The South rejoiced over the decision, but public sentiment at the North refused to accept its conclusion because it not only refused to the negro his natural rights as a man, but in effect asserted that Douglas' doctrine of Popular Sovereignty and the Republican free soil principles were opposed to the Constitution. Instead of taking slavery out of politics, this decision drove the question in so deep that the country was hastened rapidly toward the crisis.

The Lincoln-Douglas joint debates (1858) so widened the breach between northern and southern Democrats that the national convention of the party in Charleston in 1860 witnessed its complete disruption. The southern delegates utterly repudiated Douglas and popular sovereignty, the only man and the only principle on which the northern wing of the party could

conduct a campaign with any show of success. Four parties were in the field and the Republicans with Lincoln, won. During the fall and winter following, seven Southern States seceded from the Union. They had done what had been threatened for several years. The North had not believed the threats and was alarmed at the result. The Union of the Fathers was in danger of annihilation. "What could be done to save it?" was a question asked by thousands of persons. Nothing decisive could be done. An old administration and a timid President were passing out. The new President and an untried administration had not yet assumed responsibility. In such a period how naturally men turned to compromises in order to insure the return of the seceded States and to prevent others from withdrawing.

President Buchanan in his message to Congress declared that concessions to the South were the only means of saving the Union. Both houses entered on the work of conciliation by carefully appointing committees. The Senate's committee of 13 was made up of six Republicans and six Democrats. A seventh member was the venerable John J. Crittenden of Kentucky, a non-partisan. The House committee of 33 was made up in the same careful way. The Senate committee soon fell into hopeless disagreement and accomplished nothing. The House committee worked under great disadvantages. Two southern members refused to serve, and after the events at Fort Sumter others left the committee. More than 40 propositions and plans were submitted. Some were wise and some were foolish. Some proposed that no changes be made in either the laws or in the Constitution respecting slavery. Others proposed changes which involved the reconstruction of the very foundations of the government. The report of the committee, however, recommended a number of far-reaching concessions: (1) The repeal of all Personal Liberty Bills by which States had hindered the execution of the fugitive slave law; (2) An amendment to the Constitution prohibiting future amendments, interfering with slavery, which were not proposed by slave States; (3) Immediate admission of New Mexico as a slave State; (4) The trial of fugitive slaves in the States from which they escaped. No less than seven minority reports from members of the committee were presented to the House. The report was finally adopted, after fruitless discussion, but too late to check the tide of secession. It probably convinced the Border Slave States that they were safe within the Union. The impression made by the southern members on the Border State men was not so favorable, particularly because they refused to accept the simple statement "that peaceful acquiescence in the election of a President, constitutionally accomplished, was the paramount duty of every good citizen." The House modified and passed the amendment so that no future amendment might be made granting Congress power to interfere with the domestic institutions of any State. The Senate accepted the amendment by the requisite two thirds vote. Eight Republican senators voted in its favor. But two States ratified it, Ohio and Maryland, one free State and one slave State. The most famous advocate of compromise was the venerable Senator John J. Crittenden of Kentucky, the successor of Henry Clay. Although the Committee of Thirteen accomplished but little, Crittenden presented to the Senate a series of six amendments to the Constitution: (1) That in all the Territories north of 36° 30′ slavery should be prohibited, in those south of that line slavery should be protected; (2) That Congress shall have no power to abolish slavery in places where Congress has jurisdiction; (3) That Congress shall have no power to abolish slavery in the District of Columbia or prevent Federal officers from taking their slaves into the District; (5) That the United States shall indemnify slaveholders for loss of slaves through failure of officers caused by violence or intimidation; (6) That no future amendment shall destroy the preceding amendments or give Congress power to interfere with slavery in any State whose laws permit slavery. Petitions from all parts of the North prayed for the acceptation of the Crittenden Compromise. Although petitions came in from the South, and although the compromise was almost entirely in the interest of slavery, it was defeated by six southern senators refusing to vote. Three days after this defeat, the legislature of Virginia invited the other States to send commissioners to Washington to "adjust the present unhappy controversies . . . so as to afford to the people of the slaveholding States adequate guarantees for the security of their rights." All the States sent commissioners except five free and eight slave States. Ex-President John Tyler was elected chairman. From 4 to 27 February the "Peace Convention" as it was called, discussed propositions for conciliation. It finally recommended to Congress the amendment of the Constitution very much after the plan of Senator Crittenden. But the Confederacy was already organized. Federal forts had been seized, and Lincoln's administration was about to enter upon its duties. The situation had moved beyond the point of Compromise. Men were no longer willing to follow in the footsteps of the "Fathers," and Congress gave little or no heed to the work of the Peace Congress. See UNITED STATES — SLAVERY IN THE.

Professor of History, Syracuse University.

33. United States — Causes of the Civil War in the. The Civil War was the culmination of the development of conflicting interests and feelings between the slave and the free States. Slavery in colonial days, aided by favoring physical conditions, obtained a deeper hold in the South than it did in the North. The invention of the cotton gin increased that hold in many ways, and hastened the growth of industrial and social differences between the two sets of States. The North, with its free labor, was able to respond to the industrial revolution which found its origin in certain great mechanical inventions, including the application of steam as a motive power, the manufacture of iron, and the use of coal as fuel. Northern industry became rapidly diversified and northern population grew with great rapidity and built up great centres of production. The South, with its slave labor, did not, or could not, take advantage of the new industrial forces, but pursued the older, and quieter ways of plantation life. Her occupations did not increase greatly in number or change in character and her population remained, as formerly, largely agricul-

tural. The meaning of two such contrasting industrial and social conditions was not clearly seen at first. It took the tariff policy from 1816 to 1828 to show that these contrasting interests were becoming conflicting interests. The adoption of a distinctly protective policy caused commercial New England to enter upon an era of manufacturing, although her capital had been largely in the carrying trade. This same policy, after 8 or 10 years, convinced Southern leaders that their hopes of the South's profiting by the tariff were doomed to disappointment. Hence, in defense of their section and the interests built upon its system of slave labor, these leaders generally united in opposition to the tariff. But how could the South successfully oppose protection while in a minority in the House of Representatives and while not able to carry Kentucky, Louisiana, and possibly other slave States against the tariff?

Southern leaders soon began to pronounce the tariff unconstitutional, but as neither Congress nor the Supreme Court had so held, this sort of opposition was not very successful. But John C. Calhoun of South Carolina went further and declared that according to the Kentucky and Virginia Resolutions, the final appeal of the slave States should be to the right of nullification by which, according to his view, any sovereign State might refuse to obey any law of Congress which the State deemed unconstitutional. The principles of the Kentucky and the Virginia Resolutions (q.v.) had been again and again asserted by the New England States during the War of 1812. James Madison, the author of the Virginia Resolutions, denied Calhoun's interpretation of them, and the other slave States refused to follow South Carolina into nullification in 1833. They did, however, accept more and more the States Rights view of the Constitution, as a means of shielding their peculiar interests. Every additional conflict between the two sections only intensified the South's view of this political doctrine, and in the end stood to the seceding States as the constitutional justification of secession. With little exception, during this same period, the North was moving just as certainly further and further from the views of the Hartford Convention and more and more toward the nationalistic view of the Constitution. The doctrines asserted by Webster and Hayne in the great debate were typical of the position of the two sections. The two sections, therefore, were not only developing interests more or less antagonistic, but were developing views of the Constitution best suited to the defense of their respective interests.

During Andrew Jackson's administration the consciousness of hostile sectional interests was deepened by other events besides the tariff controversy. Again and again in the 'South Carolina Exposition,' and in other papers intended to prepare the way for nullification, Calhoun set forth the idea of permanent industrial and social differences between the two sections. The attack by the abolitionists upon slavery as morally wrong, and the reply of the slaveholders in demanding the suppression of anti-slavery agitation, by denying the right of petition on the question of slavery, greatly strengthened the idea that the two sections possessed contrasting and conflicting interests. The natural consequence was the rise of antagonistic feeling between the slave and free States. The growth of hostile feeling went rapidly forward during the contests over the annexation of Texas and over the Mexican War. Southern leaders declared that the acquisition of new territory for slavery was necessary to preserve the balance of power in the Senate and give fresh soil and a wider area for slavery. The anti-slavery men declared that, for these very reasons, no such territory should be acquired. Both parties began to threaten the Union. In 1844 the Legislature of Massachusetts passed a resolution, introduced by Charles Francis Adams, which referred to the Constitution as a "compact" and asserted that annexation was an undelegated power to which Massachusetts would not submit. Southern declarations of dissolving the Union, if slavery should be excluded from the Territories, were even more emphatic.

The year 1844 witnessed another event which revealed the widening difference between the two sections. After an exciting contest over slavery the Methodist Episcopal Church split into a northern and southern branch. This division made it easier for both parties to obtain both religious sanction and religious condemnation for their work. This situation added greatly to the bitterness of the strife. The feeling between the pro-slavery and the anti-slavery elements became so pronounced in the next few years that both Whigs and Democrats in the Presidential campaign of 1848, refused to make any definite statement on the slavery question. The anti-slavery Whigs resented this noncommittal position of their party and many of them joined in the formation of the Free Soil party which pledged itself to oppose the extension of slavery to the Territories. At the same time the new party declared that Congress was powerless over slavery in the States where it existed. The election of 1848 revealed a further tendency toward sectionalization among the voters of the two old parties. Because General Taylor, the Whig candidate, was a Southern slaveholder he received a much larger vote in the South, where the great strength of the Democrats usually lay; while Cass, the Northern Democrat, received somewhat similar support in the North, though not so striking on account of the Van Buren defection. For the next two years the gulf of sectionalization greatly widened.

The specific cause of contention was the question of slavery or no slavery in the territory obtained by the war with Mexico. The South felt that slavery must go into the new lands, not only because that section needed the new region to add to her weight in the councils of the nation, but, also, because the region was acquired largely through her own efforts. The North was becoming more and more outspoken in opposition to the extension of slavery into the new region obtained from Mexico. Nearly every northern legislature resolved in favor of the power and duty of Congress to prohibit slavery in the Territories. The legislature of Virginia resolved that if this principle be carried out the people of Virginia must either submit to "aggression and outrage" or resist "at all hazards and to the last extremity." Public meetings in several Southern cities approved the strong words of Virginia. Although the number in favor of dissolving the Union rapidly increased in the South and grew bolder in asserting their views, the great mass of people were yet true to the Union.

When, therefore, Henry Clay, by the unanimous vote of the legislature of Kentucky, was called from retirement and sent back to the Senate to restore harmony and to strengthen the weakening bonds of union his efforts met with sympathy and support on the part of the masses of the two sections. By the compromise of 1850, the admission of California as a free State and the abolition of the slave trade in the District of Columbia were balanced by the payment of $10,000,000 to Texas and by a new Fugitive Slave Law. "Union" meetings were held in various places to bring public opinion into hearty accord with the compromise. Nevertheless there were men in both sections who had little or no faith in the measure as a means of allaying the hostile sectional feeling. The greatest argument of the South in support of the compromise was the greatest argument of the North against the compromise — the Fugitive Slave Law (q.v.).

The drastic provisions of this law and the new zeal for its enforcement caused a wider development of the "Underground Railroad" (q.v.). But to hinder further the return of the fugitive to his master, some of the northern States began to pass Personal Liberty Laws. The Kansas-Nebraska Bill (q.v.), and the consequent contest for Kansas, led the majority of northern States to nullify, as far as possible, the execution of the Fugitive Slave Law by means of some such legislation as the Personal Liberty Laws. This legislation was cited by more than one seceding State, in 1860 and 1861, in justification of secession. Immediately, however, the South became more and more irritated because, on account of the opposition of Northern men, so few fugitives were returned, while the North became more and more irritated because, by the aid of Northern men, so many fugitives were returned. It is instructive to note that the people of the extreme Southern States, who lost few or no slaves, and the people of the extreme Northern States, who knew least about slavery, were the loudest in talk and most radical in action.

The growth of political association and interest which bound parties together had done much to strengthen the Union. But the excitement aroused by the passage of the Kansas-Nebraska Bill and the bitter conflict for the possession of Kansas destroyed the Whig party, and dealt the Democratic party a severe blow. Southern Whigs went over to the Democrats, while Northern Whigs joined with anti-slavery Democrats and Free Soil men in forming a new anti-slavery party, the Republican, a purely sectional party. The break-up of the Whig party left an inheritance of suspicion and ill-will that boded nothing but evil.

The election of 1856 resulted in a victory for the Democrats, but the Republicans carried all the Northern States but four. The falling off in the Northern Democratic vote was as ominous as the disappearance of the Whig party. Would, therefore, the oldest party in our history also break in two along sectional lines, and former political friends be turned into enemies? Such an event, many believed, would indeed hasten the disintegration of the Union.

It was probably clear to the great leaders of the Democratic party that if the struggle in Kansas should go on much longer, nothing could prevent the Northern and Southern wings from taking opposite sides. Hence, the decision in the Dred Scott case (q.v.) was hailed as the means of settling the dispute over Kansas by taking the question out of politics entirely. Chief Justice Taney, in rendering this decision, declared that, according to the Constitution, neither Congress nor the legislature of a Territory could exclude slavery from the Territory. The decision, in effect, placed the doctrine of Popular Sovereignty and the Republican party under the ban of being opposed to the Constitution. The question was not taken out of politics, for while the South applauded, the North denounced, the decision. Even Northern Democrats wavered in its support; for of what use was Popular Sovereignty, the doctrine of their favorite, Senator Douglas? The clearer this question became, the more uncertain became the question: Can the Democratic party be held together in support of the slaveholders' view? The Lincoln-Douglas joint debates, in 1858, settled that question in the negative. Lincoln forced Douglas to admit that he believed that a Territory could exclude slavery from the limits in spite of the Dred Scott decision. Douglas took this stand in order to keep faith with the Democrats of Illinois and of the North. But Southern leaders watched the debate with deep interest, and were mortally offended at this position of Douglas. They immediately began to take steps to "read him out of the party." But Douglas went into the national Democratic Convention at Charleston in 1860 with a majority of delegates in his favor. They stood faithfully by him and voted down the platform of the southern wing of the party. Southern delegations, one after another, withdrew from the convention, and the party of Jefferson and Jackson was broken in two. Later, in convention at Baltimore, no compromise could be reached, and both factions nominated presidential candidates. With the Republican party, there were thus three sectional parties in the field. How completely the people were imbued with sectional feelings may be seen from the fact that the one party — the Constitutional Union — which professed to be a national party and urged the putting away of sectional questions received only 80,000 votes in the North. Douglas obtained about 1,300,000 votes, but only 163,000 from the slave States. Lincoln received but 26,000 of his 1,800,000 votes from the South. The strong ties of political association were breaking under the strain of sectional hostility, and it seemed that the only thing wanting was some overt and formal act to certify to the division in sentiment which already existed. When, however, South Carolina took the leap, after Lincoln's election, and six other States followed her example, and when it became apparent that secession meant a conflict of arms, then those deeper and more fundamental interests than party politics began to assert themselves. The conservative forces born of the history of the past and of the hopes of the future began to call out for concession and compromise. During the winter of 1860–1861 Congress, under pressure of the conservative interests and patriotic feelings made vigorous efforts to allay the demon of sectionalism. The Peace Convention (q.v.) which met in Washington in February 1861, also endeavored to aid in restoring harmony. But the movement of events was too rapid. Lincoln was in the Presidency but a few weeks before Sumter fell, and the two sec-

tions were at war. It is of little consequence which of the parties struck the first blow, for there seemed nowhere any power or influence strong enough to long prevent sectional animosity from bursting into flame.

The causes of the war, or rather of secession, as viewed by the South Carolina Secession Convention are here briefly epitomized: (1) The American Revolution established the right of a State to govern itself and the right of a people to abolish a government, and that each colony became a free, sovereign, and independent State. (2) That the Constitution is a compact and was agreed to by sovereign States. Since the obligation established by a compact is mutual, its violation by a single party to the contract releases the others. (3) We assert that 14 States have refused for years to fulfill their constitutional obligations by hindering the return of fugitive slaves. (4) "These States have assumed the right of deciding upon the propriety of our domestic institutions" and have denounced as sinful the institution of slavery. (5) They have permitted societies to disturb the peace and incite servile insurrection. (6) They have elected a man President who is hostile to slavery and who has declared that the government cannot endure permanently half slave and half free. This analysis of the causes as stated by the first State to secede shows that the irritating and real cause was the question of slavery and that the doctrine of State sovereignty was used as a justification of the act of secession.

Finally it may be said that another cause which hastened the sectionalization of opinion and interests was the very great ignorance of the two sections of each other. The main lines of migration, travel, and commerce were east and west instead of north and south. This situation promoted ignorance, and ignorance promoted suspicion and hate. The result was that the people of the extreme North and of the extreme South had the most exaggerated notions of the characters, manners, and views of the other. From these portions of each section came the bitterest partisans in the conflict. There was little toleration in their views. But the people who neighbored across "Mason and Dixon's Line" were very different in their attitude. Their position was born of personal experience. They knew each other and knew that men on opposite banks of the Ohio River were really more alike than different. Whatever of moderation there was in the conflict was largely due to the people of the border States. Does not this justify the conclusion that if the two sections had really known each other the contest would have lost much of its bitterness and might have taken another form, and the controversy have ended short of war? Certainly the nation paid a dear price for its partisanship and sectional bitterness.

W. H. Mace,
Professor of History, Syracuse University.

34. **United States — Secession.** The secession of 11 Southern States of the American Union during the winter and spring of 1860–1 is the most significant fact in American history after the adoption of the Federal Constitution. It was the one great attempt to make of the United States two republics instead of one, and the struggle which it precipitated decided that this could not be and that the Federation of 1787–9 had become a nation.

Whether secession was a reserved right of the original members of the Union is the first inquiry that arises. From the reasoning of the founders of the national Constitution during the decades of fierce political controversy which followed the inauguration of the government one is compelled to believe that such right was considered as still residing with the States, though Madison gives strong grounds for the contrary opinion in the writings of his early as well as his later life. As to whether this right was reserved it should be said that there is today a marked difference of opinion among historical scholars. That the States conferred whatever authority the Federal government had and that this central authority was strictly and specifically limited are propositions no longer seriously disputed.

The threat of Virginia and Kentucky in 1798 to prevent the enforcement of the alien and sedition laws (q.v.) within their boundaries; the public declaration on the floor of Congress by leaders of New England public opinion in 1807 to 1811 that the commercial States would be justified in seceding from the Union; and the actual meeting of the Hartford convention in 1814 to consider ways and means of resisting the national authority would all seem to establish the point that the right of secession was claimed by each of the two great sections of the Union. These incidents are of further importance because they occurred within the lifetime of many of the framers of the Constitution and because many of these "framers" publicly espoused the views thus enunciated.

The Supreme Court of the United States, however, began about 1810 to expound the Constitution in a spirit of healthy nationalism. Chief Justice Marshall repeatedly affirmed the doctrine that the central government was that of a nation and that the rights of the States must be subordinated to the requirements of an enlightened national policy. This attitude of the court was vigorously and solemnly opposed by the Supreme Court of Virginia in 1815. In the celebrated lawsuit of Martin *v.* Hunter's lessee appeal had been taken to the United States courts by means of a writ of error. Judge Marshall, with the unanimous agreement of his colleagues on the bench, reversed the decision of the Virginia court and issued a mandamus on the latter to execute the decree of the former. The judges of the Virginia court now entered into a painstaking examination of the case and not only declined to honor the mandamus but declared in published opinions that the United States Supreme Court was usurping powers not granted and thereby encroaching on the rights of the States. The policy of the Supreme Court was repudiated and the authority of the State courts even in cases involving the interpretation of treaties with foreign powers was asserted and incidentally the sovereignty of the States was maintained as staunchly as in 1798 — the right of a State to judge of infractions of the constitutions being emphatically re-asserted. The right of secession was not advocated in terms, but any one could see that this was only a step further in the process.

During the years 1815 to 1822 the leading

men of Virginia, including ex-President Jefferson, constantly excited public opinion against what they declared to be the dangerous teaching of the national courts. Virginia took the position she had occupied in 1798–9. Madison, however, protested against this later Virginia view, but rather on the grounds of expediency than otherwise. Other States followed the example of Virginia. Clearly then it was not a settled question in 1820 and the aggrieved party, whether North or South, claimed rights which, in the last analysis, were equivalent to a withdrawal from the general compact.

What caused the matter to be more difficult of settlement was the fact that there was no final authority, no judge between the two parties. An infraction of the general constitution, that is, a violation of the contract between the Union on the one side and the States on the other, was a matter that could not be satisfactorily determined since there was no outside tribunal whose judgment could be accepted as disinterested. Jefferson thought, on the whole that the States should be the final judges; Madison inclined with the exception of a few years of his life to the opposite view, while both Washington and Hamilton had held that the national government was to be its own judge in such cases.

In 1832 South Carolina formally annulled the tariff laws of the Union and the State of Georgia had steadily refused to recognize the authority of the United States courts within her boundaries during a period of several years beginning with 1825. After the passage of the fugitive slave law of 1850 and especially after the Dred Scott decision of 1857, many Northern States refused to obey the national authority and in various instances passed laws to prevent enforcement of the laws of the Union.

Further still actual secession was not unfamiliar to Americans. The counties of Western North Carolina (now Tennessee), just prior to the formation of the national government, had formally declared their independence and then proceeded to establish a separate and independent government. This new sovereignty, called the State of Franklin, was successfully maintained for four years, 1784–1788. Western Pennsylvania and Northwestern Virginia made a similar attempt to secede both from their mother States and from the Federal Union in 1794; in 1805 to 1807 there was danger that Kentucky, Tennessee and parts of the Louisiana cession would withdraw their allegiance from a government which was thought not to be sufficiently jealous of Western interests. The principle of local autonomy and local sufficiency was so universally accepted in the various sections of the United States that such threats and outbreaks were not surprising; they were not thought to be positively unlawful. Yet public opinion supported the Executive in putting down the Whiskey "insurrection" as it was called and President Jefferson did not sacrifice his popularity by taking vigorous measures to prevent what appeared to be a dangerous movement led by Aaron Burr in 1806. In 1814 the strongest organs of public opinion in Virginia recommended the use of force against New England in case of secession and the terms of "traitor" and "treason" were frequently applied to leading opponents of the war with Great Britain. The vigorous and prompt proclamation against the proposed plan of South Carolina by President Jackson was a prominent cause of that leader's lasting popularity South as well as North. However, it was not quite decided then that a State could not withdraw from the Union, in which case, of course, no national law would have force within its jurisdiction. Calhoun, the author of nullification, did not at that time advocate secession. He relied on the Jeffersonian teaching of 1798, that the State was the proper judge of the validity of a national law in so far as that State was concerned. The debate between Webster and Hayne brought to light the fact that a genuine national spirit had arisen in the North and that the conservative particularism of the earlier years had entrenched itself in the Southern States. Meanwhile economic forces had begun to crystallize in such a way that disunion seemed to offer advantages to the South.

When the fierce struggle over Missouri was waging certain strong and far-seeing Southern leaders who regarded negro slavery as essential to the Southern economic and social structure declared that the James River and the Kentucky-Tennessee boundary was a natural line of cleavage between two civilizations which were growing up within the bounds of the United States. John Randolph and Nathaniel Macon held this view and there were a few others who agreed with them. The Missouri Compromise was considered by them a great blunder, notwithstanding its Southern origin. They declared it a violation of the national compact. From this time forward the development of the cotton plantation as the typical Southern institution of everyday life caused negro slavery in the lower South to appear to be an absolute necessity. Climate, soil and social habit combined to raise the institution from the position of a necessary evil to that of a benevolent system working alike for the up-building of the slave and his master. The price of cotton regulated the price of the negro; and the demands of the world's commerce grew faster than the supply of cotton. The economic life of this section was centred in this industry, and the profits were so great that with a small capital the younger sons of the older families of the South-Atlantic seaboard could become independent planters in a few years and in a decade or two they became masters of vast estates with hundreds of slaves. Three factors entered into the makeup of these fortunes: cheap lands, negro slaves, and a demand for cotton. The supply of cheap lands seemed inexhaustible, the demand for cotton as already noted continued to increase, negroes alone were limited in supply and they died very rapidly in the cotton belt. Maryland, Virginia, and the Carolinas began early to send their surplus slaves south; as the price mounted from $300 in 1820 to $1,000 in 1850 the stimulus to raising negroes increased and the immorality of the business appeared less evident. This is the development which brought unity of economic interest to all the Southern States from Virginia, at least, to Louisiana.

It was but a natural step after 1833 to combine the inherent Anglo-Saxon idea of local autonomy with the economic interest of this group of States. And the almost universal resort to agricultural pursuits caused the operation of the national tariff to appear sectional, favoring the manufacturers of other sections at the expense of the cotton growers, who, having no competitors in the world's markets, could not ask for protection as did the industrialists of the North and East. The tariff became the object of the Southerner's most determined opposition. In Virginia college students formed anti-tariff clubs, taking vows not to wear tariff-favored clothing. And it required but little invention to combine these ideas with those older ideas of State supremacy which had been so prevalent immediately after the Revolution. Nullification became secession and all the more rapidly since the great nullifier, John C. Calhoun, soon gave up the former for the latter constitutional doctrine.

All these forces tended to build up a peculiar civilization, a peculiar social system south of the famous Mason and Dixon's line. Heads of families became patriarchs with numberless dependents looking up to them for their daily bread, and these chiefs naturally assumed the leading roles in State and local government. Government itself became a social affair and office-holding remained the badge of honor. These masters at home undertook quite as naturally the representation of their States in the national congresses and cabinet. And since 3 negroes out of every 5 were counted in the apportionment of representation in Congress, the owner of 500 slaves was equal in political power to 301 voters in the North. This had secured to the South a preponderance of influence in national legislation until about 1830, when the West and Northwest began to loom large on the horizon of the future.

Texas, embracing an area of 270,000 square miles, declared her independence in 1836. Mexico was unable to suppress the revolution. The great majority of Texans were from the Southern States; they were also slave-holders. A new State — Texas — entered the family of nations. It applied, however, for admission into the United States in 1837. This meant an expansion of the territory of the South. It might serve as a check-mate to the West should it fail, as was clearly evident, to co-operate with the South in party policy. But admission of the new State was opposed by the Northern representatives. After a struggle of several years the new State was finally admitted in 1845. This controversy embittered the sections of the country and threats of secession had been freely and boldly made in the South during the campaign of 1844 in case the new territory should not be admitted.

Admission of Texas meant a declaration of war on the part of Mexico and war with that feeble and rather decrepit nation exposed a vast region of country stretching from Santa Fé to San Francisco to American conquest. In the war that ensued every thing that could be desired was won. But not being content simply to despoil a weak neighbor the United States offered by way of conscience salving, to pay for the territory so ruthlessly seized. When the bill authorizing the payment of a portion of the money came up in the House of Representatives David Wilmot of Pennsylvania offered his famous proviso (see Wilmot Proviso), prohibiting the introduction of slavery into the country to be acquired. This aroused the ire of the Southern leaders, as was to have been expected. From 1847 to 1850, the date of the second series of compromises on slavery, the South was agitated as never before and in every State strong secession parties arose.

The South was ripening for a revolution. William L. Yancey (q.v.) of Alabama, had recognized this; he had given up his seat in the national House of Representatives in 1846 and from that time forth appealed to the people of his State to yield nothing whatsoever to Northern sentiment concerning slavery. He demanded that all territory to be acquired from Mexico should be kept open to slave settlement, and a failure to protect slave-holders in their rights he declared to be a violation of the national compact. Yancey was a fiery orator not inferior in the control of popular passion to Wendell Phillips; he was in fact the Southern counterpart of Phillips. In 1848 he prevailed on the Alabama State Democratic convention to adopt his ideas which soon became known to the country as the "Alabama Platform." At the National Democratic convention of that year Yancey presented resolutions embodying the Alabama platform; they were rejected, and Yancey withdrew from the convention. Lewis Cass was nominated for the Presidency on an evasive platform. Yancey canvassed Alabama urging rejection of Cass. Gen. Zachary Taylor, the Whig candidate, was elected President. In 1850 when the agitation came to an issue in Congress on the question of the admission of California, Yancey advocated the secession of all slave-holding States.

In February 1849, the Virginia legislature declared almost unanimously that the Wilmot proviso, if passed, would meet with "resistance at all hazards and to the last extremity" in that State. South Carolina followed with a recommendation for a convention of the Southern States; 3 Oct. 1849, Mississippi held a Southern rights convention which embodied the principles of the Virginia resolutions in an address to the people. As a result of this agitation Southern rights associations and committees of correspondence were organized in every section of the South. Throughout the North public opinion was crystallizing against the South on the subject of slavery; leading men were opposed to what was termed a "further surrender to Southern demands."

When Congress met, all the subjects in dispute were summed up in the proposed "compromise of 1850" (q.v.). The South was thoroughly aroused. The Mississippi delegates in Congress unanimously asked their State legislature for instructions how to vote on the compromise measures. The reply was a condemnation of the proposed compromise and the election of delegates to the Nashville Convention to be held on the first Monday in July 1850. South Carolina followed suit. The other

Southern States in irregular manner chose delegates to the Nashville Convention. But when the representatives came together they proved to be conservative. Formal protests against the principal items of the compromise bill still pending were voted; but no threats were offered and the body adjourned to meet on the call of the President, who was a Whig and supposedly not unfavorable to Henry Clay's last great scheme. The convention never met again. This meeting had been intended on the part of South Carolina and, perhaps, Mississippi, as the first great step toward concerted action on the question of secession. It failed. The secessionists were still in a minority in all the Southern States except South Carolina and possibly Mississippi and Texas. Congress after much angry debate passed the "compromises." The abolitionists of the North declared that the cause of humanity and good morals had been betrayed. Their speakers were applauded when disunion was threatened or when it was asserted that the fugitive slave law, one of the items of the compromise, could not be enforced. Nearly all senators from the Southern States signed a formal protest against the compromise and had it published in the record.

Co-operation among Southern States having failed, separate State action was now recommended, and South Carolina led off with a State convention in 1851, but failing to get a two thirds majority in that body the secession party failed again. The agitation was continued. In Georgia, Alabama, and Mississippi, States Rights conventions were held and resolutions still looking to secession were adopted. In the elections which ensued in all the cotton States the extremists were so badly beaten by a combination of Whigs and conservative Democrats that the movement was given up and the compromises were acquiesced in. Even Robert Barnwell Rhett (q.v.), the arch-secessionist of South Carolina, gave up the fight, resigned his seat in the United States Senate and retired to his plantation.

Notwithstanding the opposition in the North to the fugitive slave law, and the persistent discontent and agitation of such men as Yancey in the South against the so-called unequal opportunity of slave-holders in the Territories, the sober element of the country accepted the compromises of 1850. The election of 1852 confirmed this view. The Democrats, who had come to be the conservative party of the nation and who emphasized the importance of quieting both the abolitionist and pro-slavery agitation, elected their candidates almost without opposition. The President, Franklin Pierce, chose his cabinet from both North and South; he without any doubt meant to "let sleeping dogs lie."

However, the country was at heart divided, and when the administration paid $10,000,000 to quiet the claims of Mexico to lands on our Southwestern frontier it was taken by serious and conservative people as a sign that the South was really in the saddle and that the slave-expansionists meant to make use of their position; but later when the bill for the erection of the portion of the Louisiana Purchase territory now known as Kansas and Nebraska into a territory came up it was impossible to prevent the representatives of our two civilizations from renewing the struggle for supremacy. Senator Douglas thought to solve the whole problem by enacting a law giving both sections of the country equal chances to win possession of new States, that is, the new-comers, whether pro- or anti-slavery in sentiment and practice, were to be protected by national law until the population of the new Territory had grown large enough to be admitted as a State into the Union. In the formation of a State constitution the question of slavery was to be settled according to the interests and wishes of the majority. This was local or "squatter sovereignty" (q.v.), as it was called. The advocates of this scheme thought it would please the North because that section would feel certain that her teeming population of free emigrants would secure to her the control of the new States. The South would have all cause of complaint removed because she would at least have the opportunity to plant her standards in all the common territory without official interference and under the guarantee of national protection.

But this meant the repeal of the Missouri Compromise (q.v.), by this time a sort of fetich in the eyes of the majority of people in the Northern States. It also meant the undoing of the now accepted legislation of 1850. But a strong party arose declaring that the Missouri Compromise was itself unconstitutional — the idea advanced by John Randolph and a few of his friends in 1820. The press of the South almost without exception joined in the demand for the open and formal repeal of the compromise legislation and for the adoption of the popular sovereignty plan. The cabinet approved the new and radical departure and during the spring of 1854 Congress debated and passed the Douglas bill by large majorities and the President made it a law on 30 May, 1854.

Immediately Kansas and Nebraska (q.v.) became the battle-ground of the two parties and in every State the war of words was waged hotter than ever. During the summer of 1854 "anti-Nebraska men," as they were called, met together in their various States and formed local organizations. They were able to secure the election of 103 members of the national House of Representatives and 15 senators. The new party, made up of remnants of all the older parties and embracing not a few abolitionists, took the name of Republican and declared unceasing warfare on the further spread of slavery. The next year it polled 114 electoral votes as against 174 for the Democratic candidate.

The Democratic party from 1852 to 1860 accepted either positively or negatively the chief tenets of the Southern constitutional theory: (1) States rights, (2) low tariff, (3) non-interference with the expansion of the slave power. The party was in the main dominated by Southern men. During the Pierce administration, in addition to negotiating the Gadsden Purchase (q.v.), and repealing the Missouri Compromise, the leaders of the Democratic party committed the country to the annexation of Cuba even by force if necessary and the administration failed

to punish Southern filibustering expeditions directed against Mexico and Central America. President Buchanan in 1857 publicly endorsed the aggressive Democratic policy. He called to his council board such pronounced pro-slavery men as Howell Cobb, Jacob Thompson, and John B. Floyd, and he relied too much upon these men for advice in every crisis, which was but natural, since so few Northern States had cast their electoral votes for him.

In the South during these years the aggressive sectionalists continued to urge the people on to secession as the only guarantee of their safety. Commercial conventions which discussed politics met each year in one of the larger Southern cities. These bodies recommended the boycotting of Northern manufactures, the encouragement of direct trade with Europe, the reopening, even, of the African slave trade. The Southern press took up the programme and kept the agitation of sectional issues at the highest pitch of excitement. Parents were criticised for sending their sons to Princeton and Yale to be educated; States legislatures were urged to establish and generously support military schools. Secession was often and in all sections of the South threatened in the event that the Republican party should succeed in electing a President.

In 1857 the Supreme Court added fuel to the fire by going out of the way to declare that Congress could not lawfully interfere with slavery in any Territory of the United States and that any slave-holder must be protected in his rights in all sections of the country. (See Dred Scott Decision.) The result in the North was the immediate supremacy of the Republican party, whose one idea was that slavery should not be permitted to expand, but should be limited to the States in which it had prevailed for years. Lincoln expressed the view of the advanced thought of the North when he said this nation can not long endure "half slave and half free"; it must become all one or all the other. His programme was that steps should be taken to fix the bounds of the institution and to assure the nation that slavery was under process of final extinction. He was nominated as the Republican candidate for the Presidency in Chicago in May 1860, and elected the following November.

The Democratic party still insisting on its conservative, free trade, pro-slavery programme, met in Charleston, South Carolina, in April 1860. After some attempt on the part of some Eastern men to nominate Jefferson Davis on a Douglas platform and on the failure of Yancey to get his famous "Alabama platform" adopted the convention split asunder, the Southern extremists following Yancey out of the convention hall in dramatic fashion, the Douglas men adjourning to meet again in Baltimore in June. Attempts were made during the succeeding months, especially after the nomination of Lincoln, to reconcile the two wings of the convention and thus unite on a candidate, but to no avail. The two branches of the Democratic party met in Baltimore and nominated separate tickets: the Northern men naming Douglas and Johnson, of Georgia, and the South putting forth Breckenridge and Lane on an aggressive pro-slavery platform.

An exciting campaign was waged throughout the country. In the South Yancey was the principal orator. He had finally brought his section to accept the programme which he had written for the Democrats of Alabama 12 years before; his powers of speech, the evident sincerity of motive which animated him and the universal interest in the campaign gave him vast audiences everywhere. Every Southern State but three voted as he asked and in the States which did not support him, his party strength was very great. Douglas canvassed the North manfully, but he received the vote of but two States, New Jersey and Missouri. Lincoln received the majority of the electoral vote.

It was generally understood among Southern politicians that South Carolina would promptly secede in the event of a Republican victory. The Gulf States were expected to follow suit. The South Carolina plan was the same that Barnwell Rhett had urged in 1850–51 and Rhett, having been some years now the editor of the Charleston 'Mercury,' had come forward again the leader of a State completely converted to his way of thinking. The Palmetto State seceded by unanimous vote of a convention of her ablest men on 20 Dec. 1860. By 6 Feb. 1861, the tier of Southern States from South Carolina to Texas withdrew their allegiance from the Union and reassumed the sovereign powers which had been surrendered to the national government.

The agricultural life of the South had developed slavery as a fundamental factor in her economic life; on this basis had been erected a feudalism of a high order, a social system unique in modern times. To protect this system from the hostile encroachments of an unsympathetic outside world, the leaders of this section had since 1820 entrenched themselves behind the popular doctrine of States rights. Accepting this dogma without question the State of South Carolina made a single-handed fight in 1833 against the national tariff system as based on false interpretation of the national compact. The nation gradually adopted the Southern view and steadily lowered the tariff duties until in 1857 the country was placed practically on a free trade basis. Constantly threatened by representatives of Northern and Eastern States with the declaration that "slavery must go," the champions of this new feudalism had accepted the issue with the aggressive North on the slavery question in the hope of winning again. Failing in this secession was resorted to as the only alternative.

South Carolina sent commissioners to Washington to negotiate with the President concerning the delivery of Fort Sumter and other property of the United States within the bounds of the seceded State. President Buchanan declined to receive them, but indicated a strong desire to avert hostilities. South Carolina demanded the surrender of the forts she claimed as her own. Meanwhile the State of Virginia had procured the assembly of a Peace Convention (q.v.) with the aim of bringing about a compromise. This failed to get consideration in Congress which had met in

regular session. Then Senator Crittenden of Kentucky proposed his scheme (q.v.) of pacification; this failed to satisfy either the extreme republicans or the determined secessionists, and events were left to shape themselves until the incoming President should be installed.

A convention of Southern delegates met at Montgomery on 4 Feb. 1861 to draw up a provisional constitution. This work was done in a few days and Jefferson Davis of Mississippi, recently a distinguished senator in Congress, was elected President, with Alexander Stephens of Georgia, for Vice-President. The new Constitution was in most points quite like that of the old Union, the changes, with a few exceptions, being improvements on the old. This government went into operation at once, the United States forts and arsenals within the bounds of the confederation being promptly seized and strengthened for the benefit of the new Union of States. Secession was a *fait accompli*.

But from December 1860, to April 1861, the Northern people were anxiously debating the question whether there was a nation and whether this nation could coerce a seceded State or group of States. The firing on Fort Sumter on 12 April 1861, by the Confederate and South Carolina authorities decided these questions in the affirmative. President Lincoln called for troops to suppress what he called a revolt. This call forced Virginia, North Carolina, Tennessee, Arkansas, Kentucky and Missouri to decide on which side they would cast their lots; the two last named States determined to remain neutral; Virginia, North Carolina, Tennessee, and Arkansas all before the middle of June joined the Confederacy. The capital was removed to Richmond; armies were rapidly enlisted; diplomatic agents were sent abroad; a regular government succeeded the provisional without serious friction. But the people of the Northern States had decided that a breaking up of the Union was unthinkable, criminal, treasonable, and as such must be suppressed. The war began in earnest, and four years later all parties agreed to a peace which denied forever the right of secession, which yielded to the Union the constitutional right to lay such tariffs as were deemed necessary by Congress and which abolished African slavery forever and destroyed the social system which had been erected upon it. Professor of History, Randolph-Macon College.

35. United States — Military Events of the Civil War. The flag of the United States was first fired upon during the Civil War by some batteries erected against Fort Sumter in Charleston harbor. The occasion was the appearance of the Star of the West on 9 Jan. 1861, off the harbor, bringing supplies of provisions from New York for Fort Sumter. This fort, under command of Major Anderson, was forced to surrender to Gen. Beauregard 14 April 1861. Thereupon President Lincoln issued a proclamation calling for 75,000 volunteers. In the spring of 1861, after some skirmishes between Union forces and Confederate troops dispatched to western Virginia to hold that section within the Confederate lines, West Virginia seceded from Virginia and passed permanently into the Union lines. In July the army in front of Washington, under Gen. McDowell, prepared to advance against the main Confederate army, under Gen. Beauregard; and the encounter took place on the 21st at Manassas, where, on the arrival of the last brigade of Johnston's army, Beauregard's attack upon the Union flank turned McDowell's advance into a disorderly retreat, the army fleeing back to Washington. This signal defeat of the Union arms produced great mortification and consternation at the North. But the South was correspondingly elated and regarded this brilliant victory as an augury of the ultimate success of the Confederate cause. Both sides now proceeded to make more vigorous preparations.

Gen. McClellan was summoned from West Virginia and given command of the Department of the Potomac, and forthwith he set about organizing the troops rushing in from all parts of the North. On 20 August he took command of the Army of the Potomac, now first organized under that title, and 1 November he was appointed commander-in-chief of the armies of the United States, superseding Gen. Winfield Scott, who was retired, at his own instance, because of failing health. After the battle of Bull Run but little hard fighting occurred during the remainder of 1861. Both sides contented themselves with establishing their respective lines. On 15 August President Davis ordered all Northern men to leave the South within the next 40 days. President Lincoln thereupon proclaimed the seceded States in rebellion and prohibited all intercourse.

Early in 1862 the Confederate line through Kentucky was broken by separate attacks under Gen. Thomas and Gen. Garfield. On 6 February Admiral Foote's fleet, with the aid of Gen. Grant's forces, captured Fort Henry on the Tennessee, and Grant then moved on Fort Donelson and forced it to surrender, 16 February, with 15,000 men. On 7 April Gen. Pope captured Island No. 10. About the same time Gen. A. Sidney Johnston, with headquarters established at Corinth, attacked Grant awaiting Buell, at Shiloh Church, near Pittsburg Landing. Johnston was killed, and Beauregard in command of the Confederates was driven back by Grant and Buell, who had meanwhile joined him. Defeated, Beauregard returned to Corinth. The Federals now began an advance on Corinth. The Confederates ordered Price and Van Dorn from west of the Mississippi to defend the city; but on Halleck's drawing near Corinth, it was learned that the Confederates had already evacuated it. Gen. Bragg, who had succeeded Beauregard, proceeded to Chattanooga by way of Mobile, forcing Buell meanwhile to withdraw to the Ohio to protect his department. At the same time Gen. E. Kirby Smith invaded Kentucky, and defeating the Federals at Richmond on 30 August, he threatened Cincinnati. Thereupon Buell advanced from Louisville against Bragg, who, as a result of the battle of Perryville on 8 October, was compelled to abandon Kentucky,

In September Price and Van Dorn advanced against Grant and Rosecrans, near Corinth, and were both defeated. After this campaign Rosecrans was sent to relieve Buell in command of the Army of the Cumberland, 30 October. On assuming command Rosecrans concentrated his army at Nashville. On 26 December he moved toward Murfreesboro to attack Bragg, and there ensued a three days' battle ending 2 Jan. 1863. Rosecrans occupied Murfreesboro, and Bragg retreated to Shelbyville, Tullahoma and Wartrace. Both armies then went into winter quarters. On 8 March 1862 the Union fleet in Hampton Roads was attacked by the Confederate ironclad Merrimac, which inflicted heavy loss. However, on the following day the Merrimac was met by the Monitor and, after a severe engagement, retired to Norfolk, where she was blown up at the evacuation of that city by the Confederates, 9 May. The western rivers, too, were the scene of some active naval engagements. Farragut's fleet did effective work on the Mississippi, taking New Orleans 1 May, and a little later Baton Rouge and Natchez. The Confederate flotilla under Commodore Montgomery was destroyed by Commodore Foote's fleet, in a desperate fight before Memphis, 6 June; and Memphis surrendered to the victorious fleet. At Galveston, however, the Confederates under Magruder, with the aid of an ordinary river fleet, won a brilliant victory; and the Alabama (which was sunk by the Kearsage off Cherbourg in 1864) captured the gunboat Hatteras.

In March McClellan, who had been lying inactive so long, began his noted Peninsula campaign which terminated in utter failure. His advance was opposed by Gen. J. E. Johnston, who gradually fell back toward Richmond till he reached Seven Pines, or Fair Oaks. Here the armies met on 31 May. The timely arrival of Sumner's corps from the other side of the Chickahominy saved McClellan from serious disaster. Johnston being badly wounded, Gen. G. W. Smith succeeded to the command temporarily. On 2 June Gen. R. E. Lee was assigned to the command of the Army of Northern Virginia, which he retained till the close of the war. Gen. "Stonewall" Jackson (q.v.), by a brilliant campaign in the valley, in which he defeated Banks at Winchester, forcing him across the Potomac, Frémont at Cross Keys, and Shields at Fort Republic, held most of McDowell's corps around Fredericksburg, thus preventing them from joining McClellan, and himself suddenly appeared, 25 June, at Ashland, on the flank of McClellan's army in front of Richmond. Thereupon followed the Seven Days' battles, beginning with Mechanicsville 26 June, and including Gaines' Mill and Malvern Hill, after which McClellan withdrew to Harrison's Landing on the James. The campaign proved a disastrous failure; and McClellan, having been relieved, 11 March, of the general command of the armies, now retained that of the Army of the Potomac and saw Halleck assigned to the chief command, 23 July.

After the withdrawal of the Army of the Potomac to the James, McClellan, against his protest, was recalled from the Peninsula to the vicinity of Washington. General Pope was now ordered to organize the corps of McDowell, Banks and Fremont into the Army of Virginia, to cover this movement and to protect Washington. With this army Pope advanced against the Confederate forces near Gordonsville, where, confronted by Lee and Longstreet, he retired behind the Rappahannock and was defeated at the second battle of Bull Run, 30 August. He then withdrew to Centreville, where he was reinforced by the corps of Sumner and Franklin from McClellan's army. His flank was attacked by Jackson at Chantilly. On 2 September Pope was recalled with his army to Washington and was relieved of his command, his forces being added to the Army of the Potomac under McClellan.

In September Lee set out for his invasion of the North, crossing the Potomac near Leesburg and moving toward Frederick. He captured Harper's Ferry and advanced to Hagerstown, thence retiring to Sharpsburg, where he was met by Hooker's corps of McClellan's army. A desperate fight ensued, 17 September, in which the losses were greater for one day's fighting than in any other battle of the war. Lee then withdrew across the Potomac, McClellan's army following him into Virginia, and resumed his position beyond the Rappahannock. Near Warrenton McClellan was superseded, 7 November, by Gen. Ambrose E. Burnside. Burnside took his position opposite Lee's army near Fredericksburg, and on 13 December attempted to cross the Rappahannock and assault Marye's Heights, only to be repulsed with terrific slaughter. The following month he undertook to cross the river above Fredericksburg and turn Lee's left, but the attempt proved a dismal failure, being known as the great Mud March. Thereupon Burnside was relieved of his command and was succeeded by Hooker, 26 Jan. 1863.

The winter of 1863 was spent in laborious, though fruitless efforts to capture Vicksburg, which, because of its strategic importance, the Confederates held strongly fortified. Grant and Sherman both failed. At length, in April, Grant began his second move upon the city from the south and east. Admiral Porter's fleet convoying the transports ran the batteries on the night of 16 April, and the advance of the army crossed the river, 30 April. On 1 May Port Gibson was captured and Grant had forced his way to the rear of Vicksburg. Preventing a junction of Pemberton's and Johnston's forces, Grant defeated the former at Champion's Hill, and again at Big Black Ridge, 18 May, pursuing him into Vicksburg. After two unsuccessful assaults upon the fortifications, Grant undertook the siege of the city, which surrendered, 4 July 1863. This event was a turning point in the war in the West, hardly less important than Gettysburg in the East. Hooker opened the campaign of 1863 in the Army of the Potomac by crossing the Rappahannock at Fredericksburg and advancing to the Rapidan. At Chancellorsville the Union right was disastrously routed by Jackson's corps, 2 May. In the night, while reconnoitering before his pickets, Jackson was mortally wounded by his own men, who mistook him for the enemy. On the following day Hooker was forced back, with heavy loss, and recrossed the river, 5 May. Hooker being utterly defeated, Lee set out from Fredericksburg, on 3 June, for a second invasion of the North. The advance under Ewell, after some minor engagements in the valley, crossed the Potomac at Williamsport,

1. U. S. Grant. 2. Robert E. Lee. 3. William T. Sherman.
4. Thomas J. (Stonewall) Jackson. 5. Philip H. Sheridan.

15–16 June, and moved on to Chambersburg and the vicinity of Harrisburg and Columbia, capturing York on 28 June. Ewell was then ordered to fall back to Gettysburg, where Lee was concentrating his army. The Army of the Potomac under Hooker had advanced meanwhile to Frederick, where Hooker requested to be relieved; and Meade was assigned to the command. The two armies encountered each other at Gettysburg and after a three days' battle, 1–3 July, Lee retreated and recrossed the Potomac, without a battle. After a month's rest in the Shenandoah, Lee resumed his former position below the Rappahannock, Meade following him thither.

The campaign of 1863 in the Army of the Cumberland had as its objective the recovery of middle Tennessee. Rosecrans forced Bragg from his lines along the Duck River; and Bragg retreating over the Cumberland crossed the Tennessee and arrived in the vicinity of Chattanooga. The Union line being advanced to the western base of the Cumberland, a campaign against Chattanooga was begun. Grant, now assuming general command of the military division of the Mississippi, arrived 23 October; and with the Army of the Cumberland under Thomas and with a force from Vicksburg under Sherman and one from the Army of the Potomac under Hooker, Grant fought and won the battles of Lookout Mountain and Missionary Ridge, 24–25 November, and forced a general retreat of the Confederates, thus securing Chattanooga to the Federals. Knoxville, held by Burnside, was besieged by Longstreet, who, when Sherman approached, retreated to Virginia. In the meantime Charleston harbor was the scene of formidable attack and brilliant defense, and on 16 November the city was bombarded.

On 12 March 1864 Grant, now commissioned lieutenant-general, was placed in command of all the Union armies. He planned a combined movement of the armies: Gilmore from South Carolina to join Butler at Fort Monroe for a move up the James to capture City Point, threatening Petersburg and Richmond; Burnside with an army from Annapolis to join Meade in command of the Army of the Potomac and advance against Lee's right to Richmond; Sherman, with the Army of the Cumberland under Thomas and the Army of the Tennessee under McPherson and the Army of the Ohio under Schofield, to move against Johnston's army at Dalton; and Banks, leaving the Red River country to Steele and the navy, with his army to move against Mobile. Grant operating with the Army of the Potomac under Meade, 119,000 strong, crossed the Rapidan 4 May 1864 and met Lee with 62,000 men in the Wilderness, and a great battle followed, 5–6 May. At Spottsylvania Court House both armies entrenched and from 8–20 May there was terrific fighting. Grant then moved toward the North Anna. Meanwhile, Sheridan, commanding Grant's cavalry, made a raid around Lee's army and met and defeated J. E. B. Stuart at Yellow Tavern, where Stuart was killed, 11 May. Grant's advance was opposed by Lee and desperate fighting occurred at North Anna and Bethesda Church. At Cold Harbor Grant attempted an assault along his entire line, only to be repulsed with a sickening slaughter, 3 June, and so failed to interpose between Lee and Richmond. But Sheridan, who had been sent against Fitzhugh Lee's and Hampton's cavalry, in the meantime defeated both at Trevilian's Station. Grant now moved toward the James, crossing at City Point and Bermuda Hundred now occupied by Butler.

Grant established his lines before Petersburg and notwithstanding his heavy fighting till 1 November (the mine explosion and battle of the Crater occurred 30 July), Lee's lines remained unbroken. Sigel's campaign in the Shenandoah ended in defeat at New Market, 15 June, and he was superseded by Hunter, whose movement against Lynchburg was repelled by Early. Early then invaded Maryland, threatening Baltimore and Washington, 11 July, after which he was compelled to retire across the Potomac. Again he advanced into Pennsylvania and burned Chambersburg, whence Sheridan drove him back into Virginia beyond Staunton and devastated the valley. Sherman moved against Johnston at Dalton early in May, and Johnston, stubbornly resisting, fell back to Atlanta. Johnston was succeeded by Hood, who, after several unsuccessful battles, evacuated Atlanta and invaded Tennessee, only to be thoroughly defeated by Thomas at Nashville, 15–16 December. Sherman occupied Atlanta 2 September, and after Farragut's brilliant naval victory in Mobile harbor, made his famous march through Georgia to the sea, occupying Savannah 21 December.

Early in 1865 the closing campaigns of the war opened. Terry, co-operating with Admiral Porter, captured Fort Fisher 15 January. On 1 February Sherman started north from Savannah, captured Columbia, after which event Charleston was evacuated, and on 19 March met Johnston whom he defeated after a sharp battle. In Alabama, Wilson, operating under Thomas, captured Selma with its immense war supplies, 2 April, and defeated Forrest's cavalry. The Army of the Potomac, the last to move in 1865, began a general movement to the left, 29 March; and there followed the battles of Dinwiddie Court House and Five Forks, 31 March and 1 April. On 2 April the Confederate entrenchments were carried and Petersburg was evacuated; Lee, abandoning his lines held so long against such heavy odds, began a retreat to Amelia Court House. After the fall of Richmond on 3 April, Grant, with his entire army under Meade and Sheridan, pursued Lee and forced him to surrender at Appomattox, 9 April. The number paroled was 28,231, all told, the worn-out remnant of Lee's brave and noble Army of Northern Virginia. In North Carolina Sherman and Schofield moved against Johnston, who occupied Raleigh, and compelled him to surrender on 26 April 1865. This was the end of the war. See CIVIL WAR; also accounts of various battles and engagements under their respective titles.

36. United States — The Confederacy. When the election of Mr. Lincoln by the practically unanimous vote of the free States was announced in the autumn of 1860, the slave States of the lower South made preparations to exercise what they regarded as their constitutional right of seceding from the Union. The Republican party had triumphed on a platform which de-

clared the Dred Scott decision of the Supreme Court to be a dangerous political heresy and which announced a determination to exclude slavery from the territories. This platform was regarded by the South as the culmination of a long line of grievances; its triumph seemed to justify secession. It is true that the Republicans were still in the minority in both houses of Congress and on the Supreme bench; but the election showed the increasing power of that party and pointed to its ultimate success. It is now evident that it was folly for the South to suppose that secession would be successful, but if it was to be attempted, the South showed great political sagacity and foresight in not waiting longer. The anti-slavery sentiment had been growing apace in the North, and to the writer the autumn and winter of 1860–1 seems to have been precisely the time to strike for a separation. The South, weak though it was, was stronger than it could have been at any subsequent period. This point should not be obscured by the disastrous consequences of secession. However this may be, it now seems clear that the slavery question, in its various phases, was the principal, if not the only, cause of secession, and, in its turn, secession was the cause of the war. This was the view taken by Vice-President Alexander Stephens after the war had begun — a view not inconsistent with his declaration before the war (21 March 1861) that "slavery was the corner-stone of the new Confederacy." This latter statement, it may be added, is often quoted by those who forget that 25 years before in the case of Johnson *v.* Tompkins, Judge Baldwin of the Supreme Court, said: "Thus you see that the foundations of the [Federal] government are laid and rest on the right of property in slaves. The whole structure must fall by disturbing the corner-stone." The struggle on the Northern side, therefore, was primarily to resist secession and to preserve the Union. Subsequently the destruction of slavery was included in the programme. On the Southern side, while the opposition of the Republicans to the extension of slavery in the territories, the "personal liberty laws," and the reproaches of the North touching the iniquity of the institution, carried all but the border States into secession, the active force in the war that followed this rash act was not so much the preservation of slavery as it was the determination to resist invasion and to maintain the right of secession or the right of revolution. The motive that led to secession was replaced by the motive of resistance to coercion. Thus can be explained the heroism and sacrifices of the four fifths of the Southern people who owned no slaves.

On 4 Feb. 1861, a congress of delegates from all the States that had seceded met in Montgomery, Ala. At this date only six States had left the Union: South Carolina, 20 Dec. 1860; Mississippi, 9 Jan. 1861; Florida, 10 January; Alabama, 11 January; Georgia, 18 January; Louisiana, 26 January. In Texas the ordinance of secession was not passed until 5 February, and it had still to be submitted to the people. The Texan delegates, however, arrived in Montgomery before this final ratification. All the delegates were elected by the same conventions that had passed the ordinances of secession.

The Montgomery Congress immediately proceeded to form a provisional government. On 8 February it adopted a provisional constitution, differing in some important particulars from the Constitution of the United States. Under this constitution, which, being provisional, was not submitted to the States, the delegates elected a president and a vice-president of the Confederate States of America, each State being allowed one vote. By the unanimous vote of the six States present, Jefferson Davis of Mississippi was elected president, and Alexander H. Stephens of Georgia, vice-president. On the 18th, some three weeks before Mr. Lincoln was sworn in, these officers were duly inaugurated. The constitution of this provisional government resembled so closely the permanent Constitution to be described later, that its provisions need not be given. It was to continue in force for one year, unless altered by a two thirds vote of Congress or superseded by a permanent government. A committee of two from each State represented in Congress having drawn up a permanent constitution, this instrument of government was promptly adopted by the Congress 11 March, and being submitted to the seceded States was with almost equal promptness adopted by them. This was accomplished by action of the same conventions that had passed the ordinances of secession. Where these conventions had adjourned, they were reassembled for the purpose. In no case does there seem to have been any demand for the calling of new conventions to ratify the constitution. It was thought important to organize the government as soon as possible.

In the meantime Congress had passed acts to raise provisional forces for the Confederate States, to authorize the president to borrow $15,000,000 at 8 per cent interest for the support of the government, to levy an export duty on each pound of cotton exported after 1 August, and to organize the post-office department. Courts were rapidly organized in the different States, but, as we shall see, the Confederate States never possessed a Supreme Court. The president was then authorized to receive from the various States such forts, arsenals, and other public establishments with their contents as they had taken possession of within their respective limits. The request of the president to this effect met with prompt compliance on the part of the States. With the hope of obtaining recognition from foreign governments, commissioners were sent to European countries, but they were unsuccessful in their missions. England, France, and other countries in the summer of 1861 acknowledged the belligerency of the Confederate States, but beyond this action they refused to go. A recognition of the independence of the new Confederacy would have been regarded by the United States as an act of hostility. In November 1861 J. M. Mason and John Slidell were sent as special commissioners to England and France respectively. After leaving Havana the English vessel in which they had taken passage was overhauled by the San Jacinto of the American navy, and these commissioners were forcibly removed. England demanded their restoration. The United States government at first hesitated, raising a hope in the Confederacy that war might ensue between the two countries. Finally, however, Lincoln said: "We fought England about this matter in 1812; we must give

up these men." Accordingly the commissioners were placed on board an English vessel and allowed to continue their voyage. On the 8th of August the Confederate Congress, to please foreign powers, had adopted all the provisions of the famous Declaration of Paris, except as to the use of privateers.

The provisional government of the Confederacy had hardly been in force two months before it came into conflict with the United States government. The occasion of this conflict was the demand of the Confederate authorities that Fort Sumter in Charleston harbor should be surrendered by the Union force that occupied it. Senator Douglas, though opposed to secession, had argued in the United States Senate that South Carolina was entitled to the possession of Fort Sumter; General Scott had advised its evacuation; and Secretary Seward had practically promised that it should be given up. The South, therefore, thought that a peaceable solution was in sight. But President Lincoln, after a period of indecision, decided to provision the fort, and on 8 April 1861 so informed the governor of South Carolina. The South had not desired hostilities; but the Confederate government thought it necessary to capture the fort and opened fire on it 12 April. This act precipitated war. The Confederate States, therefore, have generally been made to bear the odium of beginning hostilities. The question is debatable; for as Hallam says: "The aggressor in a war is not the first who uses force, but the first who renders force necessary." We are thus thrown back upon the question raised by Senator Douglas, which cannot be discussed here. The bombardment of Sumter stirred the North as by an electric shock. When on 15 April Lincoln called for 75,000 volunteers "to suppress combinations obstructing the execution of laws in seven of the Southern States," the free States rallied to his support. His determination, however, to coerce the Confederate States persuaded four of the border States, which had hitherto held aloof, to join the Confederacy. Arkansas seceded 6 May; North Carolina 20 May; Virginia 23 May, and Tennessee 18 June. Kentucky, Missouri, Maryland and Delaware having refused to secede, no more accessions were to come to the South. West Virginia, moreover, with a population of 250,000, detached itself from Virginia and remained loyal to the Union. The population of the Confederacy was about nine millions, of whom three and a half millions were slaves; while that of the Union States was approximately 22,000,000, an immense disparity of numbers. "Yet," said J. F. Rhodes, "had the North known that the people of the cotton States were practically unanimous, it might have refused to undertake the seemingly unachievable task; for while hardly a man in the North assented to the constitutional right of secession, all acknowledged the right of revolution. . . . Many would have objected to combating that right." The provisional Congress, being called together 29 April in Montgomery to consider the new condition of affairs, made provision for the prosecution of the war by adopting financial and military measures. On 6 May it passed an act, declaring that negotiations with the United States for a peaceable solution of difficulties had failed, and as Mr. Lincoln had called for 75,000 men to capture forts within the jurisdiction of and belonging to the Confederate States of America, and had issued another proclamation announcing his intention to set on foot a blockade of the Confederate ports; and "whereas by the acts and means aforesaid war exists between the Confederate States and the government of the United States, and the States and territories thereof, excepting the States of Maryland, North Carolina, Tennessee, Kentucky, Arkansas, Missouri, and Delaware, and the territories of Arizona, New Mexico, and the Indian Territory, south of Kansas; therefore the president is authorized to use the whole land and naval force of the Confederate States to meet the war thus commenced and to issue letters of marque under the seal of the Confederate States against the vessels of the United States." It was further provided in accordance with the Declaration of Paris (q.v.) that property of the enemy (except contraband of war) on board a neutral vessel should not be subject to seizure. In response to this declaration of existing war, a hundred applications for letters of marque were received from privateers, and troops crowded to the support of the new government with the same alacrity as in the North. On 21 May Congress adjourned to meet 20 July in Richmond, Virginia, now chosen as the permanent capital of the Confederate States. On 6 November an election was held under the permanent constitution for president and vice-president. As there was no opposition to Davis and Stephens, they were unanimously elected president and vice-president respectively by the electoral votes of the 11 Confederate States. They were to enter upon their offices 22 Feb. 1862, and to hold office for six years. Under the provisional government the president had appointed as members of his cabinet Robert Toombs of Georgia, secretary of state; C. G. Memminger of South Carolina, secretary of the treasury; L. P. Walker of Alabama, secretary of war; John H. Reagan of Texas, postmaster-general, and J. P. Benjamin of Louisiana, attorney-general. At the close of 1861 J. P. Benjamin had become secretary of war; S. R. Mallory of Florida, secretary of the navy; ex-Governor Thomas Bragg of North Carolina, attorney-general, and R. M. T. Hunter of Virginia had been appointed secretary of state, vice Toombs resigned. As the war went on, changes were made in the cabinet as follows: On the resignation of Mr. Hunter, Mr. Benjamin in 1862 held for a time the portfolios of state and of war, until Geo. W. Randolph of Virginia was made secretary of war. In the same year Mr. Randolph resigned and was succeeded by James A. Seddon of Virginia. Mr. Seddon resigned in the early part of 1865 and was succeeded by Major-General John C. Breckenridge of Kentucky. In 1864 Mr. G. A. Trenholm succeeded Mr. Memminger as secretary of the treasury. Attorney-General Bragg was succeeded by Thos. H. Watts and subsequently by George Davis of North Carolina.

The provisional Congress, which was unicameral, expired 15 Feb. 1862, and the Senate and House of Representatives elected under the permanent Constitution, met in Richmond 18 Feb. 1862. The members of this Congress were chosen from the most distinguished men of the South. "Of the 26 Senators, fourteen had been formerly members of the United States Congress, and in the lower house, out of 106, thirty-

three had also represented the South at Washington." Subsequently in the course of the war, the character of the Confederate Congress in general ability declined, many of the best men joining the army. One very necessary department of the new government it was found difficult to organize. This was the post-office. The position of postmaster-general was offered by President Davis to Mr. Ellet of Mississippi, and later to Mr. Wirt Adams of the same State; but both declined. Then J. H. Reagan of Texas, after twice refusing, was persuaded to accept the office. His reluctance was due to the fact that he knew the labor of organization would be heavy, and that if the mail facilities were inferior to those formerly furnished by the Federal government, there would be great dissatisfaction. But Mr. Reagan was thoroughly competent. He sent letters to Washington before the war began, and invited a number of clerks in the post-office department to take positions in the Confederate post-office. All but two accepted. With their help organization proceeded rapidly, and on 13 May Mr. Reagan announced that on the first of June the Federal service would cease and the Confederate service would begin. All postmasters were required by that date to render their final accounts to the United States government, and were invited to continue their duties under the Confederate government. The postmaster-general of the United States suspended the Federal service to take effect the same day. The permanent Constitution of the Confederate States required that the post-office should be self-sustaining after 1 March 1863. In 1859–60 the United States had conducted the post-office department in the States that were to form the Southern Confederacy at a loss of $1,941,425. Hence a radical change of management was necessary to meet the new requirement. Accordingly Postmaster Reagan persuaded the railroads to carry the mails at one half the former rate and to accept the bonds of the Confederacy in payment. He raised the rate on packages, newspapers, and letters, the postage on the last being fixed at five cents per half ounce for a distance of less than five hundred miles and ten cents for a greater distance. The franking privilege was abolished, and mail routes considered unnecessary were reduced in number or discontinued. As a result of these and other radical changes, the reports of the postmaster-general show that by the latter part of 1862 a surplus was obtained and from that time on there was a net annual increase of receipts over expenditures.

The various States of the Confederacy made no changes in the organization of their judiciary system, but the provisional constitution of the Confederacy provided that each State should be erected into a distinct judicial district, the judge having all the powers hitherto vested in the judges of the district and circuit courts; and that the several district judges together should compose the supreme bench, a majority of them constituting a quorum. During the year 1861 these district courts were organized, and they were continued under the permanent constitution. Congress, however, passed an act 31 July 1861, providing that the Supreme Court should be organized only under the permanent Constitution. Accordingly in the Congress that met in 1862, the establishment of a Supreme Court was discussed, but nothing was done until the following year. In January 1863, Senator Hill in the Senate said: "I think it high time the judicial department of the government be thoroughly organized; for it has been a limping concern long enough." Finally, on 18 March 1863, the Senate passed a bill to organize the Supreme Court. This bill was intended to carry out the provisions for a Supreme Court as found in the permanent Constitution; provisions that were practically identical with those of the Constitution of the United States. The bill provided for a Supreme Court of the Confederate States to consist of a chief justice and four associate justices, any three of whom should constitute a quorum. The court was to hold annually at the seat of government two sessions, and its appellate jurisdiction was limited to appeals from the Confederate district courts in the several States. Under a law passed by the provisional Congress (16 March 1861) it had been provided that the Supreme Court should, also, have jurisdiction in appeals from the State courts, "where was drawn in question the validity of a treaty or statute of, or an authority exercised under, the Confederate States; or where was drawn in question the validity of a statute of, or an authority exercised under any State, on the ground of their being repugnant to the Constitution, treaties, or laws of the Confederate States; or where was drawn in question the construction of any clause of the Constitution, or of a treaty, or statute, or commission held under the Confederate States." This law of the provisional Congress was significantly repealed in the Senate bill above mentioned. Whereupon the Richmond 'Examiner' declared that a Supreme Court, without the circuit feature of the Supreme Court of the United States, and acting simply as a court of appeals from the inferior tribunals of the Confederation, could do no mischief and might do much good. "But had the original law been allowed to stand, prophetic inspiration was not necessary to foresee that the career of the Southern Confederacy would have been but a pursuit of the catastrophe which overwhelmed the late Union." The Supreme Court as thus constituted, however, never saw the light of day after all. The Senate bill, after having been twice read in the lower house, was referred (20 March 1863) to the Committee on Judiciary, and no further mention of it is to be found. There has been much discussion as to the reason why the Confederacy failed to establish a Supreme Court. It seems clear that the reason was twofold. The experience of the South with the Supreme Court of the United States had, in the opinion of many, been disastrous to States rights. Moreover, at this time the military exigencies were much greater than the judicial; hence it seemed wise to defer the establishment of such a tribunal to a more peaceable season. The absence of a Supreme Court, however, had its natural result. The Federal district courts and even the State supreme courts interpreted the Confederate Constitution and in some instances, declared the acts of Congress unconstitutional. When a Confederate court in South Carolina decided that Congress had no right to tax State bonds, the war tax on bonds was not collected in that State. The existence of a court of final resort might have aroused antagonism among the sovereign States; but it seems to have been necessary.

The permanent Constitution of the Confederate States, while providing in almost the same words for the same division of powers, differed from that of the United States in some important details. If a good case of infringement of copyright could be made out against the South, it is to be remembered that that section could claim a large share in the framing and wording of the original instrument. Nor did the South desire to draw up a new constitution. The intention was rather to make explicit certain states-rights principles that were held to be implicit in the old constitution, and to make some additions which it was believed the experience of seventy years had shown to be necessary. Only the more important of the changes can be given here. In the preamble, instead of the ambiguous "we the people of the United States," is found "we the people of the Confederate States, each State acting in its sovereign and independent character in order to form a permanent Federal government." As an additional qualification of electors, it is declared that "no person of foreign birth, not a citizen of the Confederate States, shall be allowed to vote in State or Federal elections" (a restriction upon the previous powers of the States). Further changes were that any judicial or other Federal officer, resident and acting solely within the limits of any State, may be impeached by a vote of two thirds of both branches of the legislature thereof. Congress may by law grant to the principal officer in each of the executive departments a seat upon the floor of either house, with the privilege of discussing any measure appertaining to his department (an excellent arrangement which, though practised under the provisional government, was never put into force by the Congress). The president may approve any appropriation and disapprove any other appropriation in the same bill. All taxes or importations shall be for revenue only; not to foster any branch of industry. The "general welfare" phrase of the Federal Constitution is omitted: taxes are to be laid for "the common defence and to carry on the government." The power of Congress to provide for internal improvements is limited. Congress is denied the right to emit bills of credit (legal tender). No bankrupt law must be retroactive. The African slave trade is forbidden. Taxes may be laid on exports by a two thirds vote of both houses. Except in certain specified cases Congress can appropriate no money from the treasury without a vote of two thirds of both houses. A State may lay a duty on the tonnage of sea-going vessels for the improvement of its rivers and harbors. When a river divides two or more States, they may enter into compacts with each other to improve the navigation thereof. The president and the vice-president are to hold their offices for six years, but the president is not to be re-eligible. The president may at his pleasure remove the principal officer in each of the executive departments. All other civil officers of the executive department may be removed by the president or other appointing power when their services, etc., are unnecessary, or for incapacity, dishonesty, etc., and the removal with the reasons therefor shall be reported to the Senate. Citizens of any State shall have the right of transit and sojourn in any State of the Confederacy with their slaves or other property, and the right of property in said slaves shall not be thereby impaired. The Confederate States may acquire new territory (a clause much desired by Jefferson in the original Constitution), and in all such territory the institution of negro slavery, as it now exists in the Confederate States, shall be recognized and protected by Congress and by the territorial government. Amendments to the Constitution are not to be made through the initiation of Congress as in the old Constitution; but upon the demand of any three States, legally assembled in their several conventions, the Congress shall summon a convention of all the States to consider such amendments as may be proposed by the States. If these amendments are agreed on by the convention and are ratified by two thirds of the States acting through their legislatures or conventions, they shall form a part of the Constitution. Finally the ratification of five States shall be sufficient for the establishment of this Constitution between the States so ratifying the same. Southern writers have very generally maintained that every point which differentiated this Constitution from its predecessor was an improvement on the latter. As to the correctness of this claim jurists will differ accordingly as they approve or disapprove of loose confederacies. Under this Constitution the Confederate government levied taxes, negotiated loans, raised armies, and for several years carried on a terrible conflict. The test of the worth of a constitution, however, is its working in times of peace as well as in times of war. If this Constitution had been tested in times of peace, it is likely that it would have shown the fatal tendency of all confederacies to disintegrate when no external pressure holds them together. Nor will it be maintained that in time of war the Constitution proved itself a very efficient instrument. The States, endowed with fresh "sovereignty," were jealous of their rights and sometimes nullified the Constitutional acts of the government. For such cases the Constitution spoke no word of coercion. On the other hand, while the government was clearly a Confederacy, the exigencies of war compelled a concentration of power into the hands of the president and his cabinet which grew into a military despotism. Congress protested, but grew feebler as the conflict became more desperate. There was friction between the legislature and the executive, and between both and the States. Among the acts of the government that caused particular dissatisfaction may be mentioned the repeated suspension of the writ of *habeas corpus* down to 1 Aug. 1864; though Dr. Schwab has shown that this suspension was carried out with less stringency in the South than in the North. Other grievances were the severe conscription acts, the impressment of supplies for the army at fixed prices, the constant interference with interstate commerce, and the issue of vast quantities of irredeemable paper money. This currency was never formally made legal tender as was done in the North, but it was practically forced upon those who sold supplies to the government. All these measures which may easily be paralleled in history, and which seem to have been rendered necessary by the dire necessities of the war, caused distress and met with opposition in some of the States.

The blockade of the Southern ports by the navy of the United States was so strict that the

wealth of the South, its cotton and other crops, could not be sent abroad, save at fatal risk, in exchange for the munitions of war. In the early stage of the conflict there had been no desire to export the cotton. The strange delusion that "cotton is king" was so widespread that it was thought possible to compel England to recognize the Confederacy by withholding from her the great staple. When, however, the fallacy of this embargo was as clearly seen as once before in our history, both the Confederate government and some of the State governments utilized the blockade runners to send cotton abroad to exchange for the thousand and one things which the South, from lack of industrial development, was unable to supply for the support of the army. But the help thus obtained was infinitesimal in comparison with the needs, and the government had to fall back upon the sacrifices of devoted men and women. "The Southerners' sacrifices," says Dr. Schwab, "far exceeded those of the Revolutionary patriots. The Southern cause evoked as much devoted loyalty as has been called forth by any cause in history; and that cause was supported at a cost greater than in any similar conflict." Yet, in 1865, after four years of terrible struggles, it was seen that the Confederacy was tottering to its fall. It is generally held that the most potent factor in its ruin was the effective blockade of its ports, cutting it off from the only markets in which its products were available. Doubtless this is true. The Confederacy, with a debt of $1,400,000,000, was now hopelessly bankrupt. But it must also be remembered that the crop of men was beginning to fail. While the North was able to increase its active army each year, and even draw from its foreign population 720,000 men, the South in 1865 was reduced to the desperate resource of passing a law to draft the slaves into military service. "The total military population of the South," says Dr. Woodrow Wilson, "was 1,065,000, of which 900,000 went into the army for at least three years' service. The losses were about 300,000. At the end, 175,000 surrendered to armies of 980,000." It is idle, therefore, to attribute the downfall to the errors of the president and his cabinet or the deficiencies of the constitution. In accumulated wealth, in industrial development, in ships, and in men, the South, in a prolonged struggle, was no match for its powerful adversary. The logic of facts pointed to a united country. See CONFEDERATE STATES OF AMERICA; U. S.— CAUSES OF THE CIVIL WAR.

JOHN R. FICKLEN,
Professor of History, Tulane University.

37. United States — The Political Events of the Civil War. The Civil War in America began by the Confederate attack on Fort Sumter, 12 April 1861. The Secession movement had begun upon Lincoln's election; war had become inevitable at the time of his inauguration. Two authorities — two sovereignties — were claiming independent jurisdiction over the same area, and, after that, it was only a question of time when these would meet in armed conflict. All effort at further compromise had failed. The time for saving the Union by conciliation and concession had passed. The United States government had now to decide either to recognize the Southern Confederacy as an independent power in its own limits, or to vindicate the national authority by force of arms. There was no longer any middle ground.

The issue upon which Lincoln had been elected was the restriction of slavery to the area of the Slave States. The first purpose of the new President upon coming into power was to restrict the area not of slavery but of secession. There were still thousands of Union men, especially in the border States and among Mr. Lincoln's party opponents in the North, to whom "coercion" was odious; who thought that military force as a means of holding the States together was not only useless but pernicious; who believed, or professed to believe, that the national authority could never be successfully asserted by the bayonet and the sword against such a formidable revolution as that represented by the confederated slave States; that compromise and conciliation were still the only hope of holding the border States; that the Union, now destroyed because of abolition fanaticism and folly, could be restored only by dividing public opinion in the South, and by waiting until Southern men could be induced to accept Federal appointments and until the civil machinery of the Federal government could again be put in motion in the Southern States. Lincoln recognized this body of conservative Union opinion, and whatever of genuine loyalty to the national cause there was in it he wished not to antagonize. He would bring every possible man, every ounce of opinion, to oppose secession. He would, if possible, unite the North, divide the South, and save the border States. For this reason Mr. Lincoln's inaugural address was quite conciliatory in its attitude towards slavery and the South. The platform of his party committed him both to "the preservation of the Union and the maintenance of the right of each State to order and control its own domestic institutions according to its own judgment exclusively." In his inaugural address Lincoln reiterated this sentiment of his party platform, and, quoting one of his former speeches, he declared, "I have no purpose, directly or indirectly, to interfere with the institution of slavery in the States where it exists. I believe I have no lawful right to do so, and I have no inclination to do so."

In this address Lincoln took no positive anti-slavery stand. He spoke in favor of the return of the fugitive slave, and he in no way urged the cause — the non-extension of slavery — for which he had been elected. In this Lincoln merely recognized, as any statesman should have done, that the paramount issue confronting the nation had changed since his election in November. Then it had been the extension of slavery; now it was the preservation of the Union, the unity and integrity of the nation itself. Therefore, on 4 March 1861, Lincoln stood ready for the sake of avoiding war and disunion, to subordinate, so far as it was morally possible, his own and his party's anti-slavery purposes. He would not surrender the principle for which he had been called into power and his party into being. But he declared his willingness to accept an irrevocable amendment to the Constitution prohibiting the national government from ever interfering with slavery in the slave States; and he assured the people of the South that they would not be assailed, and that they could have no conflict unless they themselves became the aggressors. But the

President declared that, despite the ordinances of secession, he regarded the Union as unbroken, and that, as the Constitution and his oath of office bound him to do, he would faithfully "execute the laws of the Union in all the States"; and this he would continue to do unless, and until, his "rightful masters, the American people, shall withhold the requisite means or in some authoritative manner direct the contrary." "The power confided to me," he said, "will be used to hold, occupy and possess the property and places belonging to the government, and to collect the duties and imposts; but beyond what may be necessary for these objects, there will be no invasion, no using of force against or among the people anywhere."

Here was clearly drawn the political issue of the Civil War — national unity and the enforcement of the national authority against disunion and the right of secession. It was not possible for the national authority to recognize this issue — its own right to exist — as within the field of negotiation, and the attempt of the Confederate government to secure recognition by opening diplomatic relations at Washington was repelled.

If the national government intended to maintain its authority and to "execute the law in all the States," there was nothing for the South to do but to yield or fight. The South's answer was the defiant attack on the national authority at Sumter. The call for 75,000 three-months' volunteers and the uprising of the national spirit followed. Party issues were forgotten, and the great body of the Democratic voters in the North, following their leader, Mr. Douglas, rallied patriotically to the support of the government, as did also many Breckenridge Democrats. (See DOUGLAS; BRECKENRIDGE, J. C.) In the proclamation calling for volunteers Lincoln commanded the insurgents to disperse within 20 days, called Congress into extraordinary session for 4 July 1861, and announced that the object of the military force was to repossess the forts and places seized from the Union. The time limit of three months for the troops was made necessary by the Act of 1795, as this law authorized the use of the militia "until the expiration of three months after the commencement of the then next session of Congress."

Virginia's secession followed immediately (17 April) upon Lincoln's call for troops, upon the plea of resisting "coercion" and "invasion." Tennessee and Arkansas soon afterward followed Virginia and joined the Confederacy, but the attempt to carry Missouri and Kentucky into the secession movement was foiled by the co-operation of the national government with the Union forces in those States. After the bombardment of Sumter and before the meeting of Congress (12 April–4 July 1861), President Lincoln assumed extraordinary war powers. (See UNITED STATES — THE PRESIDENT'S OFFICE.) He proclaimed a blockade of Confederate ports (19 and 27 April); he increased the forces of the regular army and navy (3 May) by his mere executive order, and he authorized his military subordinates in several places to suspend the writ of habeas corpus. (See HABEAS CORPUS.) The orders of blockade had been evoked by the purpose of the Confederate government, indicated by Mr. Davis' letters of marque and reprisal (17 April), to use its ports for fitting out privateers to prey upon the commerce of the United States. The other measures of the President were held to be justified by the emergency. (See PRIVATEERING; BLOCKADE; BELLIGERENT.) Upon the assembling of Congress these executive acts were approved, and, as far as indorsement and congressional resolution could do so they were legalized; and Congress proceeded to make military and financial provision for a vigorous conduct of the war.

Slavery had been the primary cause of secession and war. But slavery was not the issue on which the men of either side were called upon to fight. The cause for which the North rallied to arms was union and nationality; the cause of the South was independence and the rights of the States. Both disclaimed slavery as the cause of arms. But slavery, as it was the everlasting cause of strife before the war, was the chief cause of political difference during the war; and the relation of the war to slavery is the most important point of view from which the political events of the war are to be studied. To what extent should the war be distinctly an anti-slavery war and be made an instrument of emancipation? To what extent should the war be conducted solely to preserve the Union, and to restore national authority without disturbing in any way the "domestic institutions" of the States? On these questions Mr. Lincoln was constantly subject to pressure in opposite directions. The conservatism in his nature, and the conservative wing of his party required that he should not assume a more radical and aggressive anti-slavery attitude than the public sentiment of the country would support; while his party opponents were vigilant and quick to denounce and oppose him for converting and degrading the war from a noble effort for the Union into a mere abolition war for the "nigger." On the other hand the radical anti-slavery forces were constantly urging him to strike at the real strength of the rebellion by striking at its cause. This wing of the Union forces held with Sumner that the "rebellion was but slavery in arms."

Congress attempted to define the purpose of the War and its relation to slavery in the famous Crittenden resolution of 22 July 1861, which was passed in both Houses by an almost unanimous vote. It was declared that the War was forced upon the country by the disunionists of the South; that "the War is not waged upon our part for any purpose of conquest or subjugation, nor for the purpose of overthrowing or interfering with the rights or established institutions of those States; but to defend and maintain the supremacy of the Constitution and to preserve the Union with all the dignity, equality, and rights of the several States unimpaired; that as soon as these objects are accomplished the War ought to cease." See CRITTENDEN COMPROMISE.

This is the platform upon which the conservative Democracy of the North insisted that the War should be conducted, and for any departure from this policy they were ready to denounce the administration and displace it from power. In saving the Union by war the administration must not be allowed to violate the Constitution in any way nor in any way interfere with the rights of the States or the legal status of the slaves. The political and party

struggles of the Civil War focus themselves largely about this issue. On the one side were those of a conservative, purely Union-saving purpose, who were disposed to demand that the war be conducted strictly according to the forms and canons of the Constitution. Among these were probably many who cared more to save slavery and the rights of the States than to save the Union. On the other hand were the radical anti-slavery men who were determined that, while the war should be for the Union, it should not cease until emancipation should be secured. Among these were many who cared more to destroy slavery than to save the Union. Lincoln, as we shall see, occupied middle ground between these opposing extremes.

In the gradual but constant progress of the Administration toward an anti-slavery policy—in its movements from an attempt to save slavery and the Union together to the policy of emancipation and the reconstruction of a New Union wholly free, there are certain notable features and landmarks. Among these we may notice first, the attitude of the Administration toward military emancipation.

As early as 25 May 1861, Gen. Benjamin F. Butler in command of the Union forces about Fortress Monroe, gave the first indication of a military method of emancipation. He refused to return to their masters slaves coming within his lines, on the ground that they had been used in aid of the rebellion, in the erection of batteries and other works; that if slaves were property, as the South had always contended, they were therefore properly "contraband of war"; that this slave property, useful for military purposes, might as well be used in aid of the United States as against it; that masters in arms against the Constitution were barred from claiming the enforcement of their constitutional rights by their belligerent opponents, and that only slaves of loyal owners should be returned. Butler put this "contraband property" to work for his own military purposes. Public sentiment of the North applauded Butler's course although he was not promptly and heartily sustained by the administration.

The Confiscation Act (6 Aug. 1861), passed within a fortnight of the Crittenden resolution, indicated the beginning of a change of policy toward slavery on the part of Congress. This is to be regarded as a military measure. It pronounced forfeiture of all slave property used in aid of insurrection and thus it substantially, under another form, endorsed Butler's contraband order. Mr. Lincoln was not pleased with the confiscation act, as he feared it would alienate the border States which he was diligently trying to conciliate. He wished Congress not to meddle with the slavery question, but to leave that problem to the military authorities. On 8 August 1861, two days after the passage of the Confiscation Act, Mr. Lincoln's Secretary of War, Mr. Cameron, wrote to Butler, who was pressing for further instructions: "It is the desire of the President that all existing rights in all the States be fully respected and maintained; in cases of fugitives from the loyal slave States the enforcement of the Fugitive Slave Law by the ordinary forms of judicial proceedings must be respected by the military authorities; in the disloyal States the Confiscation Act of Congress must be your guide." The slave rights of loyal masters in disloyal States were to be safeguarded as far as possible. This policy indicates Lincoln's conservatism at the beginning of the war, and his regard for vested rights whenever the slavery question appeared. In pursuance of this line of policy Lincoln tacitly endorsed Halleck's order returning fugitives and protecting slave property, while he did not hesitate to overrule and set aside General Frémont's order (30 Aug. 1861) in Missouri emancipating the slaves of all persons who had taken up arms against the United States. On 11 September 1861 Lincoln overruled Frémont and on 19 May 1862 he revoked and repudiated a similar order of General Hunter for the Department of the South. Lincoln declared that "no commanding officer shall do such a thing upon my responsibility without consulting me." Chase and other anti-slavery supporters of the Administration urged Lincoln to let Hunter's order stand, but the President was afraid it might alienate support from his policy of compensated emancipation which he was then urgently pressing upon the representatives from the border States. In his annual message of December 1861, Lincoln had expressed his purpose still "to keep the integrity of the Union prominent as the primary object of the contest." By this time Congress, aroused by the sad losses of the War and the formidable power of the rebellion, refused to reaffirm the Crittenden resolution of the previous July. This refusal seemed to indicate that other objects of the war were in view besides the suppression of the insurrection.

By the spring of 1862 Lincoln's policy on slavery may be said to involve gradual emancipation by the consent and co-operation of slave-holding States; national aid for the compensation to owners, and the colonization of the negroes made free by this policy and by the operation of the confiscation act of Congress. Up to the time of the rejection by the border slave States of Lincoln's policy of compensated emancipation and its failure in consequence, anti-slavery sentiment and purpose may be said to have been more radical and outspoken in Congress and the country than in administration councils. But after he dismissed his plan of compensated emancipation Lincoln determined upon emancipation in another way. This was emancipation as a war measure, by military power. He made known this purpose to his Cabinet, as early as 22 July 1862. It was determined in the Cabinet council not to make public announcement of this policy until a more favorable military situation could be secured. Lincoln's pro-slavery orders, and his policy that seemed so much like timid conservatism, led the radical Republicans and anti-slavery men to continue their pressure and hostile criticism. The effort to induce Lincoln to take a more decided stand against slavery brought out the celebrated Greeley-Lincoln correspondence. Greeley sent to Lincoln and published in his *Tribune* (20 Aug. 1862) his "Prayer of Twenty Millions." This letter created a distinct impression upon the country and is a document of historical importance. "All who supported your election," said Greeley, "and desire the suppression of the rebellion are sorely disappointed by the policy you seem to be pursuing with regard to the slaves of rebels." The editor urged Lincoln to execute the laws especially the confiscation act, and he censured the President as disastrously remiss with regard to the emancipation provision of that

act. "You are unduly influenced by the counsels, the representations, the menaces of certain fossil politicians hailing from the border slave States; timid counsels in such a crisis are calculated to prove perilous and probably disastrous. We complain that the Union has suffered, and is now suffering, immensely from your mistaken deference to rebel slavery."

Lincoln's famous reply to Greeley contains in the most succinct form a statement of his war policy and his political attitude toward slavery. "I would save the Union." This Lincoln announced as his constant end and aim.

> If there be those who would not save the Union unless they could at the same time save slavery, I do not agree with them. If there be those who would not save the Union unless they could at the same time destroy slavery, I do not agree with them. My paramount objection in this struggle is to save the Union, and is not either to save or to destroy slavery. If I could save the Union without freeing any slave, I would do it, and if I could save it by freeing all the slaves, I would do it; and if I could save it by freeing some and leaving others alone, I would also do that. What I do about slaves and the colored race, I do because I believe it helps to save the Union; and what I forbear, I forbear because I do not believe it would help to save the Union. I shall do less whenever I shall believe what I am doing hurts the cause, and I shall do more whenever I shall believe doing more will help the cause. I shall try to correct errors when shown to be errors, and I shall adopt new views so fast as they shall appear to be true views. Such is my purpose according to my view of official duty. I intend no modification of my oft-repeated personal wish that all men everywhere might be free.

In September 1862 Lincoln publicly announced his policy of emancipation. (See EMANCIPATION.) Notwithstanding this forward step, momentous in its ultimate, if not in its immediate, results, dissatisfaction with Lincoln among anti-slavery men continued and a concerted movement arose within the Republican party to supersede Lincoln in the leadership. The dissatisfied Republicans sought to secure the nomination of Chase or some other more radical anti-slavery man for the Presidency. When this fell through, the more radical spirits secured an independent convention and the nomination of Frémont against Lincoln in 1864, and this indicated a serious division within the Union-Republican party. On the other hand conservative men in the Administration, like the Blairs, and others sincerely in favor of the war for the Union, opposed the Emancipation Proclamation on the ground that it would lose the fall elections, alienate support from the war and endanger its success; while the Democratic opposition in the North were seizing upon all the anti-slavery measures of Congress and the President as material for a political campaign against the Administration, on the ground that the war for the Union was being turned into a war for abolition.

The anti-slavery purposes of the war were making headway. The Democratic opposition to the war policy of Mr. Lincoln arraigned the Administration on various indictments. The refusal of Congress to re-affirm the Crittenden Resolution; the abolition of slavery in the District of Columbia (April 1862); the abolition of slavery in the Territories (June 1862); the second Confiscation Act of 17 July 1862, providing for the emancipation of the slaves of rebels and their abettors, and for the employment of such freedmen in the suppression of the rebellion as the President might direct; the military annulment of the Fugitive Slave Act by the contraband policy and by the act (13 March 1862) forbidding military officers from arresting and returning fugitive slaves; the scheme for compensated emancipation, because of its enormous expense; the emancipation proclamation, as tending to incite slave insurrection; he military organization of the blacks (July 1862), as tending to equalize the white soldiery with the negro; the recognition of Liberia and Haiti; the enlargement of legal privileges for the negroes where they were under national jurisdiction — all these measures were denounced by the opponents of the Administration and were used to prove the aholition and unconstitutional character of the war.

On account of these anti-slavery measures all those were arrayed in the political opposition whose race prejudices against the negro were pronounced; who hated the New England abolitionists as much, or more, than they did the "fire-eating" secessionists; who believed in slavery, or were indifferent to its evils; who thought that in the conduct of the war the wrongs of the negro should not be taken into account and that the interests of the white race alone should be considered.

Another noticeable factor in this opposition were the constitutional legalists, who were insistent upon holding the conduct of the war strictly to the forms of the law and the constitution. These made the preservation of civil liberty and the rights of the individual their special cause and chief concern. They were more strenuous to preserve these individual rights than they were to preserve the Union, and they contended that the Union could not be preserved, or need not be, if the Constitution and the law were violated and disregarded. That which claimed their obedience and loyalty, they asserted, was not a person invested with office, nor an idea of public necessity, nor an imaginary national life apart from the life of the Constitution. "What the Constitution ordains or authorizes, *that* is the public necessity, *that* is the national life, *that* is the supreme civil obligation." This was the position taken by able and conservative lawyers and leaders like George Ticknor Curtis and Horatio Seymour, who opposed the conduct of the war because of what they considered the high-handed usurpations of power by the war authorities. They felt that loyalty required them to be loyal to the reserved rights of the States as the supreme law of the land as well as to the powers vested in the general government; that loyalty bound them to safeguard the rights of persons and property guaranteed by the Constitution to every citizen, as well as to support a war to crush insurrection. With these feelings and principles they opposed the Administration on account of the suspension of the writ of habeas corpus, on account of arbitrary arrests, and the suspension of free assembly, free speech and free press. Certain newspapers had been suppressed (the New York *News*, the New York *Journal of Commerce*, Chicago *Times*, Brooklyn *Eagle*, and others) on the ground that they were encouraging the rebels to persevere in their resistance, by expressing sympathy with them, by urging the duty of acceding to their demands, and by expressing dissatisfaction with the policy of employing force to overcome them. These papers were constantly denouncing as "an unholy war" the war "in defence of our country, its institutions and most sacred rights, and carried on solely for the restoration of the authority of the government." This kind

of party opposition to the war was what Lincoln called "the fire in the rear." See HABEAS CORPUS; MILLIGAN DECISION.

Some of these opponents of the war were disloyal factionists who at heart were in sympathy with the South, and who preferred disunion to the political and military success of the Administration. These were the "Copperheads" of the North. Clement L. Vallandigham, of Ohio, was one of the most distinguished and extreme representatives of this group. He was arrested at Mount Vernon, Ohio, in May 1863, upon a charge of "publicly expressing sympathy for those in arms against the government of the United States, and declaring disloyal sentiments and opinions with the object and purpose of weakening the powers of the government in its efforts to suppress an unlawful rebellion." He was found guilty by a military tribunal and sentenced to close confinement—a sentence which President Lincoln commuted to banishment to the enemy's lines. The Democrats of Ohio officially protested against these proceedings and Lincoln informed them that Vallandigham had been arrested because "he was laboring with some effect to prevent the raising of troops, to encourage desertions from the army, and to leave the rebellion without any adequate military force to suppress it." While in exile Vallandigham was nominated by the Democrats for the Governorship of Ohio and was defeated by the unprecedented majority of 100,000 votes.

Elsewhere in the North Democratic leadership, while its purposes and principles were in most respects the same as those of Vallandigham, was more moderate and restrained, and, under the direction of men whose loyalty to the Union was undoubted, the Democratic successes in the elections of 1862 and 1863 were very pronounced. The military losses and disasters, the newness of the emancipation policy, the unexpected extension of the war, the unfriendly attitude of foreign powers, the growing belief that the Union could not be restored by war, the vigor of the Democratic attack in the rear—all these were factors in causing the loss of the fall elections in 1862. This was interpreted as a vote of want of confidence in the Administration, and it is probable that if Lincoln had been a candidate for re-election in 1862 he would have been defeated.

Another cause of opposition is to be taken into account after the summer of 1863. This was the Conscription Act and the effect of the draft. Although what seems now like decisive military successes had come to the national arms in July of that year (Gettysburg, Vicksburg) a successful end of the war seemed distant; and the people were becoming very weary of waste, bloodshed, and battle. They were sighing for peace. But the burdens of the war were to be still further increased. On 3 March 1863 Congress passed a Conscription Act authorizing a draft of 300,000 men. Certain provisions of the act led to disagreements as to quotas between Federal and State authorities, and a clash seemed imminent. A $300 clause allowed a man who could pay that sum to be released, while one who could not must go into the ranks. With this discrimination in favor of the rich and against the poor, a great deal of popular prejudice and opposition were aroused by the party opponents of the administration against the draft; and the draft riots in New York, in July 1863, resulted in serious loss of life and property. Governor Seymour, of New York, requested President Lincoln to suspend the enforcement of the draft in that State, and it was intimated to Secretary Stanton that this act could be enforced only by the co-operation and consent of the State authorities. Stanton held that the issue of the Civil War was the enforcement of the national authority by its own power without dependence upon the consent of the State.

Added to the excitement and opposition aroused by the draft came the President's Proclamation of 15 Sept. 1863, suspending the privilege of the writ of habeas corpus throughout the United States in all cases where persons were held by the civil, military, or naval authorities under the orders of the President, as "aiders or abettors of the enemy." This proclamation followed the grant of power conferred by the act of 3 March 1863, by which Congress, as it had previously legalized previous suspensions of the writ, authorized the President to suspend this guarantee of personal liberty during a period of Civil War throughout the whole United States. Under this act military arrests, without civil warrants, and trials by military commissions continued in various parts of the North. The critics of the administration held that the purpose of this policy was to consider all political opponents of the administration as "aiders and abettors of the enemy," and they feared that all political discussion and criticism were to be suppressed by a military absolutism. (See HABEAS CORPUS; MILLIGAN DECISION.) Freedom of the mails had also been denied to hostile matter, or such as might instigate others to co-operate with the enemy. (See Report of the Judiciary Committee of the House, 20 Jan. 1863.)

Thus, with divisions within the ranks of the Union-Republican party, with the country longing for peace, with many factors and elements arousing and uniting the opposition, there was danger that the Union-Republican party would be defeated by the party calling itself the "Conservative-Union Party." This party had nominated Gen. George B. McClellan, one of Lincoln's deposed generals, on a peace platform, demanding peace after "four years of failure to restore the Union by war." Their policy was to restore the Union by stopping the war, by armistice, negotiation, convention,—by some diplomatic agreement to which both parties might agree, and that fighting should cease until an arrangement could be adjusted. They would substitute negotiation for subjugation. Presumably, in the mind of this party, if negotiation failed disunion was preferable to a continuance of the war. Their great political error was in their failure to perceive that it was forever too late, on account of the state of public sentiment both North and South, to secure a restoration of the old Union under the old Constitution. While there was any hope left to them in the field the South would never consent to a restoration of the Union; and when their military defeat, after Atlanta, Nashville, and Sherman's march to the sea, became a foregone conclusion, then the terms of settlement and reunion were to be determined only by the national will. But it was in the

face of the situation before these military victories in the latter part of '63 and the early part of '64, with the cry for peace seemingly almost irresistible, that Andrew, Sumner and other radical anti-slavery men, felt that the most important thing to do was to rescue Lincoln from the peace influences that seemed to surround him; from those who were tempting or pushing him to an unworthy or disgraceful offer of compromise with the leaders of the rebellion. These radical spirits wished to prevent Lincoln from offering the South peace merely on the basis of a restored Union without emancipation.

There were other political phases of the war on which the opposition joined issue with the administration. The conduct of foreign affairs was made the subject of severe animadversion. In the settlement of the Trent Affair it was charged that Seward had been subservient to Great Britain and had sacrificed the national honor. In his tolerance of the French intervention in Mexico he had sacrificed the traditional policy of the Monroe Doctrine (q.v.). In domestic affairs the financial and revenue policy of the government were brought into adverse review; while the creation and the admission of West Virginia were denounced as an unconstitutional act of spoliation and dismemberment of the "Old Dominion."

In the long session of 1861–2 Congress passed a number of measures which, even in this brief review, should not go unmentioned. It authorized the President to take possession of the railroad and the telegraph when the public safety required it; passed a Homestead act; established a Department of Agriculture; passed the act to donate public lands to States and Territories for the purpose of founding agricultural colleges; authorized the construction of a railroad to the Pacific Ocean, aiding the road in land and government bonds; and, finally, created the comprehensive scheme of internal taxation. The famous revenue act of 1 July 1862, developed the excise tax in a manner unheard of in this country before. Writers have frequently applied to this system of internal revenue Sydney Smith's humorous account of British taxation in 1820: "Taxes upon every article which enters into the mouth, or covers the back, or is placed under the foot; taxes upon everything which it is pleasant to see, hear, feel, taste, or smell; taxes upon warmth, light and locomotion; taxes on everything on earth and the waters under the earth." Every visible commodity or transaction was taxed. Licenses were required of all distillers and brewers, manufacturers, wholesale and retail dealers, of men in all kinds of business,— proprietors of theatres, of jugglers and circuses, of lawyers, physicians, surgeons, and dentists. The act imposed 20 cents per gallon on spirits, $1 per gallon on malt liquors, a heavy tax on tobacco and cigars, carriages, yachts, billiard tables, and plate; on slaughtered hogs, cattle and sheep; on passports, legacies, and receipts from railroads, steamboats, and toll-bridges; on dividends from banks and trust companies; and 3 per cent was assessed on incomes less than $10,000 and 5 per cent on incomes over $10,000, with an exemption of $600. Stamp duties on all kinds of paper were imposed. The income tax was regarded as a form of excise, not a direct tax. (See Income Tax.) This Revenue Act and Legal Tender Acts under which $450,000,000 of legal tender notes, commonly called greenbacks, were issued, were the most important pieces of fiscal legislation during the war. See Legal Tender.

After the military successes of the Union arms in the fall of 1864 and after the re-election of Lincoln, all hope of an independent Confederacy passed away. It was then only a question of endurance, of "fighting to the last ditch." The peace conferences had come to naught, and the demands for an armistice were no longer a menace to the complete triumph of the national arms. (See Hampton Roads Conference.) Already, in 1864, the 13th Amendment and the various plans of Reconstruction had begun to receive the attention of Congress, and it is to these subjects after the fall of 1864, that the student of the political history of the war should give his attention.

38. United States — Finances of the (1861-1903). In the winter of 1860–1 the finances of the federal government were most discouraging. Secession was already under way; national credit was depressed; and executive efficiency was slowly disintegrating. There was little confidence that the Republican party which had carried the election in November 1860, would be able to weather the approaching storm. Some strength was shown at the close of the session by the passage of a new tariff law known as the Morrill Tariff, in which rates were slightly advanced. Lincoln took office 4 March 1861, and appointed Salmon P. Chase secretary of the treasury. On 15 April the troops were called out to put down the rebellion, and the country entered upon a four years' war which tried the financial system to the utmost, necessitated radical methods of financiering, burdened the country with an enormous debt, and raised taxes to a permanently high level. In brief, during the fiscal years, 1862–5, expenditures were $3,348,000,000; taxes $667,000,000, and loans $2,622,000,000. Loans were nearly four times as large as taxes. In the spring of

1861 it was not supposed that the war would last long, and consequently the legislation of July and August was not designed to increase taxes in any considerable degree. A loan of $250,000,000 was authorized, some increase was made in the tariff schedules, and an income tax was levied. Under the authority of the loan act the treasury department endeavored with the assistance of local banks to borrow $150,000,000 by the issue of three year treasury notes, bearing 7.3 per cent interest, since known as the seven-thirties. The banks responded with energy, but owing to the restrictions of the independent treasury law requiring all payments to the government to be made in specie, they could not carry the burden, and in December suspended specie payments. The treasury department was forced to follow their example. By the act of 25 Feb. 1862, a comprehensive loan act was passed, and authority given for the issue of $150,000,000 non-interest legal tender treasury notes. There was much opposition to making the notes legal tender, but the issue was justified in the debates on the ground of necessity,—"necessity to meet the immediate obligations of the government; necessity to give currency to treasury notes; necessity to provide money which would in turn purchase bonds." Two further issues, each of $150,000,000, were made by the acts of 11 July 1862, and 17 Jan. 1863. In addition to these non-interest notes, the legal tender quality was attached to some of the other short-term treasury notes. Other forms of treasury indebtedness were demand notes, certificates of indebtedness, temporary loans and fractional currency. Of the total amount borrowed, $1,045,000,000 was in the form of long-term loans; $890,000,000 in interest bearing notes; $458,000,000 in non-interest bearing notes, and $208,000,000 in temporary loans.

In selling long-term bonds Chase kept four objects in view: (1) moderate interest; (2) general distribution; (3) future controllability; and (4) incidental utility. Chase objected to selling bonds at a discount, or to offering more than six per cent interest. After the suspension of specie payments the legal treasury tender notes, or greenbacks, depreciated greatly in value; as they were, however, receivable in the purchase of bonds and as the bonds bore interest in gold, the return to the purchasers, as measured in gold, was far greater than the nominal rate of interest would indicate. Under the conditions, therefore, the market for bonds constantly broadened. To secure a wider distribution in the investment of government securities, an agent, Jay Cooke (q.v.), was employed with an extensive system of sub-agents to place the bonds in every section of the country. Chase was also opposed to making long loans and consequently reserved the right to the government of redeeming bonds after five or ten years. This gave rise to securities known as five-twenties and ten-forties, running for 20 or 40 years, but redeemable at the option of the government at the shorter period. In order to make a wider market for bonds, as well as to reform the currency system on a national basis, the national banking system was organized in which circulation is based upon the deposit of bonds.

In July 1862, a more vigorous policy of taxation was adopted; internal revenue taxes were imposed upon fermented liquors and tobacco; upon occupations, auction sales, carriages, yachts, billiard tables and plate; upon slaughtered cattle, transportation agencies, banking and insurance companies, advertising, incomes, and legacies. At the same time tariff duties were increased to compensate domestic industry for the internal revenue duties. Internal revenue receipts did not meet expectations, and in 1864 a second expansion of the revenue policy was made. The internal revenue system was well-nigh universal in its application. "Nothing was omitted from the raw product to the finished commodity; often an article received a half dozen additions ere it reached the consumer. And not only were all the constituent elements which entered into an article taxed, as the bolts, rivets, castings, trimmings and the like of an engine, but the engine when completed was subjected to an additional ad valorem duty upon its value." Customs duties were again advanced because of the increased duties upon manufactures. The act of 1864, however, went further in the direction of protection and brought rates up to a level which established a new standard of protectionism. The average rate on dutiable articles was increased to 47 per cent. The income tax of the war period was highly productive; at its maximum, incomes between $600 and $5,000 were taxed 5 per cent; and incomes above $5,000, 10 per cent. The total receipts from this source, 1863–73, amounted to $347,000,000.

When the legal tender notes were first issued they were convertible into bonds,—securities which had a definite gold value, as interest was payable in gold. The quality of convertibility was taken away by the act of 3 March 1863 and this, together with the increased issues and the waning hope that the government would be able within any short period of time to settle its obligations on a gold basis led to a marked depreciation in the value of greenbacks. In July and August 1864, the average value of the gold dollar in currency was but 39 cents. As gold was daily needed by importers to pay customs duties and to settle balances abroad, a brisk and often speculative market in bullion resulted. Moreover, the repeated fluctuations in the value of gold measured in currency, occasioned by alternating hopes and fears as to the outcome of the war, affected all business. Prices were abnormally high, and it was estimated that the cost of the war to the treasury alone was increased by the inflated issues about $600,000,000.

When peace was restored in 1865, there were three enormous tasks before the government: funding the debt into more convenient form, revision of the tariff system, and the restoration of a standard of value by the resumption of specie payment. On 1 Sept. 1865, the public debt was $2,846,000,000; less than one half of this was funded; loans bore interest at five different rates; they matured at 19 different periods; and some were convertible or redeemable at the option of the government. At first there was apparently general agreement that the volume of legal tender notes should be reduced, for on 18 Dec. 1865, the House of Representatives passed a resolution in favor of a contraction of the currency with a view to as early a resumption of specie payments as the various interests of the country would permit. The funding act of 12 April 1866, authorized the conversion of temporary short-time interest bearing securities into long-term bonds, but provided

only a slight contraction of legal tender notes. It gave authority to retire $10,000,000 within six months and not more than $4,000,000 in any one month thereafter. Even this reduction was not long continued. It was not easy for the country to readjust itself to peace conditions. Discontent was especially strong in agricultural sections where indebtedness had been incurred by farmers on long-term credits. The return of hundreds of thousands of soldiers to industry led to many ill-advised ventures and failures. Prices naturally fell with the withdrawal of the excessive demands made by war, and for this fall producers were disposed to place the blame upon the contraction in currency. On 4 Feb. 1868, after $44,000,000 in greenbacks had been retired, further contraction was suspended. In 1869 the Supreme Court in the case of Hepburn *v.* Griswold decided, four to three, that the legal tender notes were unconstitutional. In 1871 the decision was reversed on the ground that the government had the right to employ freely every means, not prohibited, which was necessary for its promotion. In 1884 the Court decided in favor of the constitutionality of issues in times of peace.

National credit was also assailed by the proposition that federal securities should be subject to local taxation and by the demand that bonds should be redeemed in currency instead of in coin. In some sections bitter attacks were made upon the rich, who were represented as owners of idle wealth which they had gained through the possession of government securities at the expense not only of the laborer who had toiled under low wages and high prices, but also of the soldier who had taken his life in his hands and had received his pay in greenbacks. In 1870 a refunding act was passed authorizing the isssue of $500,000,000 bonds at 5 per cent, redeemable after 10 years; $300,000,000 at 4½ per cent, redeemable after 15 years, and $100,000,000 at 4 per cent, redeemable after 30 years, all to be paid in coin, and exempt from national, as well as local, taxation. This act with supplementary legislation fixed the character of the debt for the next 25 years.

In 1873 a commercial panic occurred resulting in prolonged industrial depression. The treasury endeavored to relieve the situation by reissuing $26,000,000 of legal tender notes, and Congress passed a bill for a permanent increase to $400,000,000. This inflation bill was vetoed by President Grant in a notable state paper, 22 April 1874. The Republican party, then spurred on by the repeated victories of the Democrats, by Grant's firm stand and the insistence of Secretary Bristow, finally determined to make resumption effective. In the Act of 14 Jan. 1875, it was provided that resumption of specie payments should be entered upon 1 Jan. 1879, and authority was given to the secretary of the treasury to sell bonds in order to acquire the necessary amount of gold. In 1877 John Sherman (q.v.) was appointed secretary of the treasury and vigorously undertook a policy of gold accumulation; $138,000,000 in gold was regarded as sufficient to win confidence in the ability of the government to redeem all notes presented, and for this Sherman sold $95,500,000 of bonds. Resumption was accomplished on the date set.

In the meantime a new financial question had arisen. In 1873 silver was demonetized by Congress; a variety of causes led to a fall in the bullion value of silver, among which were its demonetization by Germany in 1871; the limitation of coinage in the Latin Union in 1873; and the discovery of new supplies of silver in the United States. The depression following the panic of 1873 started a new clamor for an increased supply of currency, and it was bitterly asserted that the United States had joined in a conspiracy to disown silver, and limit the volume of legal tender money, in the interest of the creditor class. A struggle ensued to secure the free and unlimited coinage of silver; and in 1878 the Bland-Allison Act was passed over the veto of President Hayes, providing for the monthly purchase of not less than $2,000,000 and not more than $4,000,000 of silver bullion at the market price. The Bland-Allison Act of 1878 continued in operation until 1890. Under its provisions 378,000,000 silver dollars were coined, at a purchase value of only $308,000,000, thus yielding a seigniorage of about $70,000,000. As the country had become accustomed to paper money, it was difficult to put the new coins in circulation; authority was consequently given for the issue of silver certificates in denominations as low as $1.00 for the deposit of coin. There was a more serious objection to continuing coinage in the fear that it would be impossible to maintain a gold standard. Secretary McCulloch in 1884 and Secretary Manning in 1885 endeavored to arouse Congress to a repeal of the act. The demand, however, for an enlarged currency, represented both by the greenback movement of the period, and by those who advocated still freer coinage of silver, made it impossible to secure this legislation.

After the Civil War sweeping changes were made in internal revenue taxes. In 1870 there were left only those on distilled spirits, fermented liquors, tobacco, banks and bankers, adhesive stamps and certain manufactured articles, and the income tax; the latter was repealed in 1872. There was less readiness to change tariff duties; protectionism had gained in strength through the growth of manufactures, and the Republican party from its origin had been committed to the principle. Slight reductions were made, but the system as a whole was maintained with little change. The country recuperated from the crisis of 1873, and beginning with 1880 large surpluses were turned into the treasury. The refunding act of 1870 hampered the government in the redeeming of bonds, except at a premium; and in 1883 Congress was forced to overhaul the tax system. All internal revenue duties were repealed except those on spirits, fermented liquors and tobacco. Rates on tobacco were reduced one half. A tariff commission recommended a substantial reduction in customs, but Congress paid little heed and enacted a protective tariff in which a harmonious framework was sacrificed to the pressure of conflicting interests. The Democrats repeatedly endeavored, particularly during President Cleveland's administration, 1885–9, to enact tariff measures, but protectionist sympathies within the party defeated every attempt. In 1889 the Republicans regained control and in 1890 enacted a measure, the McKinley bill, in which protectionism was developed to a point hitherto unknown. Increased duties were laid upon a great number of articles and in some cases the rates practically prohibited importation. The act also introduced two new princi-

ples,—a bounty on the domestic production of sugar and commercial reciprocity under executive proclamation.

In 1890 silver sentiment affecting both parties was so strong that further concessions had to be made in order to prevent unlimited coinage. An act was passed known as the Sherman silver purchase act, providing for the purchase of 4,000,000 ounces of silver bullion monthly, and the issue in payment thereof of treasury notes of full legal tender. This increased the monthly purchases of silver and authorized treasury notes of full legal tender in place of silver certificates which were of only partial legal tender quality. Treasury notes were redeemable either in gold or silver coin at the discretion of the secretary.

Under the McKinley tariff customs duties declined, and this, coupled with commercial disturbances involving the United States, resulted in the exportation of gold. Large amounts of gold were obtained from the treasury by the presentation of legal tender notes and treasury notes of 1890. The gold reserve which since 1879 had been maintained at $100,000,000, or more, began to slip away until there was fear that the treasury would be forced on to a silver basis. On 30 June 1890 the reserve stood at $190,000,000; three years later it had fallen to $95,000,000. The significance of the underlying forces which were weakening government credit were not, however, clearly seen and appropriations continued to be made with a liberal hand. In 1890 there was a surplus of $105,000,000; in 1893 it was but $2,000,000, and in 1894 there was a deficit of $70,000,000.

The Democrats won in the elections of 1892 and Cleveland again became President. In June 1893 the mints in India were closed to the coinage of silver; this led to a still further fall in the price of silver bullion and occasioned immediate apprehension that the treasury would soon be unable to redeem its obligations in gold. Within a few weeks the country was in a state of panic. President Cleveland called a special session of Congress and after most urgent pressure secured the repeal of the silver purchase act of 1890. The country did not easily recover from the panic; withdrawals of gold from the treasury continued and the administration was forced to make four issues of bonds in order to keep an adequate supply of gold on hand to meet the requirements of the "endless chain." The embarrassment of the treasury was also aggravated by an insufficient supply of revenue. The Democrats in 1894 enacted a new tariff measure which included an income tax; as introduced in the House under the leadership of Wilson, this bill was in the interest of free trade, but protective sentiment within the Democratic party radically modified the measure in the Senate, so that in its final form it made little change in existing policy. The income tax was promptly attacked on the ground of unconstitutionality. In a decision of 8 April 1895, the Supreme Court decided that a tax on income from land was a direct tax and therefore unconstitutional unless apportioned; and in a decision 20 May, income derived from other sources was also brought within the same interpretation.

The presidential campaign in 1896 was fought out on the basis of free silver. The Democrats in their platform declared in favor of the free and unlimited coinage of both gold and silver at the ratio of 16 to 1 without waiting for the aid or consent of any other nation; the Republicans, on the other hand demanded international agreement. The Republicans won and made good the victory for the gold standard in the currency act of 1900. This declared gold as the standard of value and authority was given the secretary of the treasury to maintain it by the temporary locking up of treasury notes and the sale of bonds, whenever the reserve fell below $100,000,000. The act also provided for the refunding of the debt at a lower rate of interest, and gave national banks opportunity to take out a larger amount of circulation.

Upon their return to power in 1897, the Republicans enacted the Dingley tariff; on some commodities the duties of 1890 were restored, on others compromises between the rates of 1890 and 1894 were accepted, and in a few instances the lower rates of the Wilson tariff were allowed to stand. The principle of reciprocity, dropped in the Wilson tariff, was again incorporated into the tariff system to be brought into operation, however, by treaties executed by the Senate. In 1898 war with Spain necessitated the issue of $200,000,000 of bonds and the levying of new internal revenue duties. This proved amply sufficient to meet the increased expenditures for the army and navy, and in 1901 many of the new duties were repealed.

The growth of treasury receipts and expenditures since the Civil War is shown in the following table (in millions of dollars):

	Customs	Internal revenue	Total Receipts	Expenditures
1870	195	185	396	294
1880	187	124	334	265
1890	230	143	403	298
1903	284	231	560	506

Since 1861 there have been 18 secretaries of the treasury; the most distinguished among these are as follows: Chase, notwithstanding his lack of experience with fiscal affairs, displayed political shrewdness, devotion and integrity at a time when ordinary methods of finance had to be laid aside; Fessenden, his successor, during the closing months of the war inspired confidence; McCulloch earnestly contended for an early resumption of specie payments and the retirement of the greenbacks; Boutwell in Grant's first administration carried through the refunding of the debt; Bristow in Grant's second administration, attacked corruption in the internal revenue service and placed new insistence upon resumption; Sherman left a brilliant record in making resumption successful notwithstanding the opposing forces of inflation; Manning in Cleveland's first term strongly urged a moderation of the tariff and the repeal of the Bland act; Carlisle in Cleveland's second administration upheld the credit of the government in the issue of bonds; Gage executed the provisions of the currency act of 1900; and Shaw has successfully handled the surplus and reorganized the details of the customs administration. As a whole, the treasury administration has been free from scandal. See also BANKS AND BANKING; FINANCE; MONEY, PAPER.

39. United States — Reconstruction in the. With the surrender of the Southern armies and the collapse of the Confederate government all organized resistance to the authority of the United States was at an end, but a problem second only to that of suppressing the insurrection now confronted the nation. This was the question of the restoration of the late insurrectionary states to their normal relations in the union and the determination of the political status of both those who had borne arms against the United States and those who had been made free by the results of the war. It was a great political and social problem, involving, on the one hand, the political reorganization or "reconstruction" of the southern State governments which had carried on the war against the Union and, on the other, "the investment of the freedmen with the rights and privileges of citizenship and the protection of them in the enjoyment of those rights and privileges." The ideas and traditions of constitutional liberty in the United States made the problem especially difficult. In Europe indefinite military occupation would have been the solution of the problem so far as it related to political reconstruction, but that was repugnant to American ideas and was, therefore, not to be thought of.

Theories of Reconstruction.—It was admitted on all hands that the collapse of the Confederacy left the Southern States in an anomalous condition so far as their political status was concerned, but opinions varied widely as to the exact nature of that status. The framers of the Federal Constitution apparently did not foresee the possibility of civil war and consequently inserted no provisions in the fundamental law relative to the status of a State which having once seceded should be reconquered and brought again under the authority of the United States. As soon as the eventual defeat of the Confederate armies was foreseen discussion of the status of the Southern States, preliminary to the work of political reorganization, became active both in and out of Congress and several well defined theories were enunciated. One of these was the view held by President Lincoln and his supporters that the act of rebellion in each State was the act of combinations of disloyal persons who had unlawfully subverted the State governments. The existence of the States themselves, he held, was not affected by the disloyal acts of their inhabitants although he admitted that as a result of rebellion the States were out of their "proper practical relations" with the Union. In his opinion, the problem of reconstruction consisted simply in placing the loyal element of each State in control of the government after which its normal relations with the Union could be resumed. By means of the executive pardon those who had engaged in rebellion could, upon promise of future loyalty, be restored to their rights and allowed to join with the loyal element in the re-establishment of the State government. This process would perhaps require the use of the military arm of the government but the intervention of Congress would not be necessary. Opposed to this lenient view was that of the more extreme radicals like Sumner and Stevens. According to their view the Southern States by act of rebellion had destroyed their corporate existence as self governing commonwealths, and should be held as conquered provinces or governed indefinitely as territorial dependencies under the plenary power of Congress. A third and somewhat intermediate view was that finally adopted by Congress, namely, that the Southern States as a result of rebellion had "deprived themselves of all civil government" and had forfeited their rights of self government. They continued to exist, but rather as disorganized communities, subject to the paramount authority of Congress to restore them to their rights as states under such conditions as it might prescribe. Other views of the status of the Southern States were but modifications of these three. It is to be noted that according to Lincoln's view the whole task of reconstruction was an executive problem, while according to the view finally reached by Congress it was a legislative problem, being derived from the Constitutional provision which makes it the duty of the United States to guarantee to each State a republican form of government — a duty which had been interpreted by the Supreme Court as devolving upon the legislative branch. This difference of view led to important consequences and greatly complicated the whole process of reconstruction.

Executive Reconstruction.— As early as 1862 large portions of Arkansas, Louisiana and Tennessee having been occupied by the military forces of the United States, President Lincoln proceeded to administer these districts through officers called "military governors," who were vested with rather vague and undefined powers. After the fall of Gettysburg and Vicksburg the President, foreseeing the ultimate defeat of the Confederate armies, gave his attention to the working out of a more definite and systematic plan of reconstruction which could be applied to all the Southern States. Accordingly in his annual message to Congress in December, 1863, he announced his plan which included an offer of amnesty to all persons who had served the Confederacy, except certain classes of men who had held high military or civil offices under the Confederate regime or who had resigned offices under the United States to engage in the Confederate service. Whenever a number of voters equal to one tenth of the voters in 1860 had taken the amnesty oath to support the Constitution of the United States, and the proclamations of the President made during the war and had re-established a State government, republican in form, such government should receive the recognition of the executive, but whether its representatives in Congress should be allowed their seats was a question to be decided by each house. "Ten per cent" governments so called were accordingly established in Louisiana and Arkansas early in 1864 and representatives in Congress were duly elected but were refused admission to their seats in December, 1864. Early in 1865 Tennessee was "reconstructed" according to the President's plan and representatives were chosen, but they likewise were refused their seats in the National House. In the meantime Congress was manifesting its disapproval of the executive method in a very substantial way. In July, 1864, it passed the Wade-Davis bill for the reconstruction of the Southern States along lines radically different from those followed by the President. Mr. Lincoln refused to sign this bill before the expiration of the session and thus defeated it. In February

1865, Congress aimed another blow at the executive method by the passage of a joint resolution which prohibited the counting of the electoral vote of any State that had passed an ordinance of secession. A breach between the President and Congress now seemed inevitable but had Mr. Lincoln lived it is highly probable that owing to his tact and influence with Congress, the difficulties would have been settled in a manner satisfactory to Congress and to the great advantage of the Southern States. After the assassination of Mr. Lincoln, the Vice-President, Andrew Johnson, a man of far more aggressive and obstinate disposition, took up his policy without material change and carried it through only to have it all rejected by Congress. On 29 May 1865, President Johnson issued a proclamation of amnesty designed for the benefit of all who had not taken advantage of Mr. Lincoln's offer of 1863. It resembled Mr. Lincoln's proclamation in all essential particulars except that it excluded a large number of persons from the privileges of amnesty, among them, all owners of $20,000 worth of property who had voluntarily enlisted in the Confederate service. Those who belonged to the excepted classes were allowed to make special application to the President, who agreed to extend such clemency as appeared to be consistent with the facts of the case and the peace and dignity of the United States. By subsequent proclamations President Johnson appointed "provisional governors" for North Carolina, Georgia, Mississippi, Alabama, South Carolina and Florida, the reconstruction of the other Southern States being regarded as already complete. These officials were directed to call conventions in their respective States for the purpose of amending their old constitutions so as to adapt them to the new conditions created by the results of the war, after which they were to be restored to their normal relations with the Union. Before the end of the year conventions had been held in all these States except Texas, and they had adopted constitutional amendments either "repealing" the ordinances of secession or pronouncing them null and void. Likewise they had all abolished slavery, most of them had repudiated all debts incurred in aid of the rebellion and all but Mississippi and Florida had ratified the thirteenth amendment to the Federal Constitution. Moreover they had held elections, chosen State officers and representatives in Congress and the legislatures had elected United States senators. When, therefore, Congress met in December, 1865, for the first time since the close of the war, the President took great satisfaction in informing that body that all the late insurrectionary States except Texas, whose convention was not to meet until March of the following year, had been reconstructed and were ready to resume their constitutional places in the Union. Congress, however, ignored the whole scheme of reconstruction which Lincoln and Johnson had carried out, refused to admit the senators and representatives from the Southern States to seats in Congress and appointed a joint committee of 15 members to inquire into the condition of these States and report whether any of them were entitled to representation in Congress. One of the chief reasons which led Congress to veto the executive policy was the drastic character of the police legislation which some of these States had enacted in the summer and autumn of 1865 for the purpose, it was alleged, of keeping the negroes in a condition of involuntary servitude if not of actual slavery. The offense of vagrancy was so defined that few freedmen could escape punishment. Those who were unable to pay the fines imposed upon them were to be "sold out," their former masters being given the preference as lessees. A harsh and unnecessary apprentice system for binding out colored minors was adopted. In Mississippi negroes were prohibited from renting or leasing land in incorporated towns and in most of the Southern States they were denied the right to give testimony in the courts except in cases in which negroes were parties. The demoralization of the negro race in 1865 was undoubtedly such as required stringent police measures to prevent crime and pauperism; but in singling out the black race for especial punishment the Southern legislatures greatly offended the sentiment of the North. In April, 1866, Texas having complied with the requirements of the executive scheme of reconstruction the President issued a proclamation officially declaring the rebellion at an end. In June the Reconstruction Committee made its report declaring that the Southern State governments established under the executive auspices were illegal (although they had been regarded as good enough to ratify the Thirteenth Amendment), that Congress alone had authority to reconstruct these governments, and that guarantees of future security should be required as a condition of restoration to the Union. The committee recommended the denial of representation to these States until sufficient guarantees for the protection of the civil rights of the negro were forthcoming and that a portion of those guilty of having taken part in the rebellion be disfranchised from voting and disqualified from holding office.

Congressional Reconstruction.— When Congress met in December 1866 an effort was made to impeach the President (see UNITED STATES — IMPEACHMENTS IN), the Tenure of Office Act was passed to limit his power of removal. His power, also, as commander-in-chief of the army and his power of clemency were abridged and a law was passed requiring the new Congress to meet on 4 March following. In February Congress passed in spite of the President's veto the first of the Reconstruction Acts for the more efficient government of the late insurrectionary States. This act grouped the said States into five military districts each of which was to be placed under the command of an army officer who was charged with the maintenance of order and the protection of property. The State governments were left intact but were declared to be provisional only and subject to the paramount authority of the United States. By a supplementary act of 19 March, likewise passed over the President's veto, the military commanders were directed to cause to be made a registration of the qualified voters without regard to race or color and to call a convention, if the majority of the voters were in favor of one, for the purpose of adopting a new constitution. When the constitution should be approved by Congress the State should be readmitted to representation in both Houses of the National legislature. Military commanders were promptly appointed for the different districts and with adequate forces they took posses-

sion and proceeded to govern the inhabitants according to the forms of military law. Arbitrary arrests were common, trial by jury was superseded by trial by military commission and various orders having the force of law were issued for the regulation of the conduct of the citizens. The new colored voters were registered, many of the old white voters were excluded for participation in the rebellion, conventions were chosen in all the Southern States by the new electorates and by May 1868 these conventions had all adopted constitutions establishing negro suffrage and disqualifying large numbers of white persons. In all the States except Mississippi, Texas and Virginia these constitutions were promptly ratified by the new electorates and in June they were readmitted to representation in Congress. In Mississippi, where a constitution containing several provisions of a proscriptive character had been framed the whites after a determined campaign succeeded in defeating it at the polls. In Texas and Virginia, where likewise obnoxious provisions had been inserted in the constitutions the reconstructionists were induced to delay indefinitely submission to the people. These three States, therefore, continued under military rule. In the meantime the legislature of Georgia having excluded the negro members-elect from their seats, the United States Senate refused to admit the senators from that State to seats in Congress. Consequently at the time of the accession of President Grant four of the Southern States were still unrestored to their constitutional positions in the Union. He was induced to recommend to Congress the resubmission of the constitutions of Mississippi and Virginia to the voters in such a way as to enable them to vote separately upon the obnoxious provisions. Congress so directed; the constitutions were resubmitted, and were ratified without the objectionable provisions. By the same act Congress directed the submission of the Texas constitution to the people and it was duly ratified. These three States were punished for their tardiness by the imposition of an additional condition precedent to restoration, namely, the ratification of the 15th Amendment. Early in 1870, having complied with this additional requirement they were readmitted to representation in Congress and restored to their full positions in the Union. Finally after having been twice reconstructed Georgia complied with the new conditions imposed by Congress and in June was likewise restored to her place under the constitution. The military governments now gave way to the State governments, Federal interference was withdrawn, and reconstruction technically at least was completed.

Civil and Political Rights for Freedmen.— Slavery having been abolished by the 13th Amendment, adopted in 1865, the investment of the negro with civil rights followed as a necessary incident of his new status. Some of the Southern legislatures in 1865 passed laws denying the freedmen the right to own real estate in some cases and to give testimony in the courts and having otherwise abridged their civil rights, Congress in April 1866 passed over the President's veto the noted Civil Rights Act which conferred upon all persons of color the status of citizenship and placed them upon an equality with white citizens in the making and enforcing of contracts, in suing and giving testimony in the courts, in acquiring, holding, and conveying real as well as personal property, and in the enjoyment of equal protection of the laws for the security of person and property. The United States courts were given jurisdiction of cases arising under the act, and the President was empowered to use the army and navy to enforce it. Foreseeing the possible return to power of those opposed to civil rights for the negro and the consequent repeal of the act, Congress immediately proposed the 14th Amendment, embodying the principles of the Civil Rights Act. To incorporate it in the Constitution would have the effect of placing the civil rights of the negro beyond the reach of any hostile Congress. Ratification of this amendment by the Southern States was made a condition precedent to their restoration to the Union. Finally, in July 1868, Congress declared that the amendment had been ratified by the requisite number of States and was therefore proclaimed a part of the Constitution. The amendment declared that all persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States and of the State in which they reside; provided for a reduction of the representation in Congress of any State that should deny the suffrage to any of its adult male citizens; disqualified many of the prominent ex-Confederates from holding Federal office; invalidated all debts and other obligations incurred in aid of the rebellion; and prohibited the States from abridging the privileges of citizens or denying to any person the equal protection of the laws. By the threat of reducing their representation in Congress the nation offered an inducement to the Southern States to give the negro the right of suffrage, but it was soon discovered to be insufficient, and in February 1869 a new amendment (the 15th) was proposed which declared that the right to vote should not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude. Ratification of this amendment was imposed as a condition precedent to the re-admission of the four States of Mississippi, Texas, Virginia, and Georgia, which still remained under military government and without representation in Congress. By March 1870 the requisite number of States had ratified the amendment and it was proclaimed a part of the fundamental law. Although this important amendment did not directly confer the suffrage upon the negro it did confer upon him an exemption from discrimination upon the part of any State in fixing the qualifications for voting. Having secured full civil and political rights for colored citizens, the Republican leaders now undertook, by an act of March 1875, to secure social equality for all colored persons in hotels, public conveyances, theatres, and other places of public amusement, but the Supreme Court held the act void as beyond the power of Congress.

The Freedmen's Bureau.— One of the agencies through which the process of reconstruction was worked out was the Freedmen's Bureau, first established in March 1865 and placed under the supervision of the War Department. In general, its purpose was to aid and advise the large number of freedmen who were demoralized and made helpless as a result of sudden liberation. During the last years of the War thou-

sands of blacks left the plantations and gathered about the camps or followed in the wake of the Federal armies. To provide for their support was a difficult problem which every commander in the South had to meet. At first, appeals were made to philanthropic persons of the North for funds with which to support this class, and generous responses followed, but as the end of the War approached the number of negro "contrabands" increased until it was found impossible to rely wholly upon the support of charitable relief. Being released from the restraints of slavery, many freedmen made good use of their liberty to quit work and wander about the country only to find themselves, after a brief season, in a state of destitution. Others who continued to labor on the farms of their former masters were sometimes taken advantage of in regard to labor contracts, and were denied the rights of free men which the results of the War had brought them. The Bureau undertook to provide hospitals and medical relief for the sick and infirm; it distributed large quantities of food to the destitute; it undertook to prevent the infringement of the civil rights of freedmen; it provided special courts for the trial of accused freedmen in all cases in which the State excluded the testimony of colored witnesses; it examined and approved their labor contracts; it circulated the emancipation proclamation among the blacks of the remote districts; it instructed them as to their new duties and responsibilities; it urged them to labor and impressed upon them the sacredness of the marriage contract; it established schools and supplied teachers to such communities as wished them; and in various other ways undertook to aid the unfortunate blacks whom emancipation had left to shift for themselves. The officials of the bureau also used their influence with the credulous blacks to induce them to enter into labor contracts with planters and thus performed a service not without value to the white race.

The organization of the bureau was quite elaborate. Its head was a commissioner, this office being held by General O. O. Howard (q.v.); there was an assistant commissioner for each State, and a number of sub-commissioners, each in charge of a particular district of the State. In every locality was stationed an agent who acquainted the freedmen with the orders of the bureau, distributed the rations, and performed various other duties. The law as passed in 1865 made no appropriation for the support of the bureau, but its income from the sale of certain confiscated property and the rent of abandoned lands was sufficient to meet expenses. In July 1866 a new act was passed and the operations of the bureau largely extended. It was not finally withdrawn from all the Southern States until 1872. Although the bureau accomplished some good it did not promote the harmonious relations between the two races which it was expected to do. The agents of the bureau were mostly subordinate military officers and a considerable number of them turned out to be inefficient and unscrupulous. Too often able-bodied freedmen were encouraged in their idle habits by the distribution of government rations, while in not a few cases they were led to believe that the lands were to be distributed among them. Likewise it frequently happened that the zeal of the bureau officials for the enforcement of exaggerated rights led to violent conflicts between white citizens and the military forces which were at the disposal of the bureau.

The "Carpet-Bag" Regime.—The reconstruction acts by enfranchising the negroes and disqualifying large numbers of the more influential whites made it possible for the blacks to get possession of the governments in most of the Southern States and to rule them in a most ignorant and extravagant manner. They were made use of by unprincipled adventurers from the North who flocked to the South in considerable numbers after the close of the War, some to engage in the profitable industry of cotton planting, others to fill the offices from which the more prominent Southern whites were excluded. These Northern immigrants came to be called "carpet-baggers" by the native whites, in allusion to the popular assertion that all their worldly effects were carried in a carpet-bag. By no means all of the Northern men who came to the South at this time were unscrupulous adventurers bent upon plunder, but they all allied themselves on the side of the negro in political matters, thus increasing the bitterness of race antagonism. A few native Southerners—"scalawags," they were called—also allied themselves politically with the northern men and negroes for the purpose of sharing in the offices. Both these classes of whites were bitterly hated by the native Southern element who saw themselves excluded from power by strangers and others who had little substantial interest in the State. The influence of the carpet-bag class over the negroes was at first very great. They organized the freedmen into political clubs, instructed them in the art of voting, and made use of them to further their own political ambitions. The carpet-baggers secured the nominations to the more important offices and were easily elected by large black majorities. But the colored voters were not content to see all the offices held by their white allies, and their ambition was frequently too great to be ignored. Consequently many of the important offices came to be held by ignorant blacks who but a few years previous were field-hands on the plantations. In several States negroes filled the offices of lieutenant-governor, secretary of state, superintendent of education, and other important offices. In some instances they even sat upon the benches of the higher courts, while they filled many minor judicial positions. They occupied seats in the legislatures of all the Southern States, that of Mississippi in 1871 having as many as 55 colored members. A considerable portion of these were ignorant, some of whom were unable to read or write, and all of whom were the pliant dupes of unscrupulous northern men. With the State and local governments controlled by ignorant negroes and designing white men, an era of extravagance, misrule, and corruption set in which in some instances amounted to outright robbery and plunder. Long and frequent sessions of the legislature were held for service in which the members voted themselves large per diem allowances. Old laws were ruthlessly repealed and replaced by bulky statutes, many of which bore the car marks of animosity and oppression. Counties were rechristened with names full of offense to Southern whites. Laws favoring social equality were passed. Public school systems on an extravagant scale for the

children of both races were established and taught by Northern teachers. Offices were greatly multiplied — many of them mere sinecures — for the benefit of good Republicans. Gigantic schemes of public improvement were undertaken, most of which were marked by frauds and extravagance. The rate of taxation was increased out of all proportion to the ability of the people to pay in their then impoverished condition resulting from four years of destructive war. In Mississippi this rate was increased from one mill on the dollar in 1868 to 14 mills in 1871, and the inability of the people to pay resulted in the confiscation of one fifth of the land of the State. Large debts were incurred for projected improvements, especially in Louisiana and South Carolina, where a wholesale system of plunder was carried out by the reconstruction governments. In the latter State the public debt was increased from $5,000,000 in 1868 to nearly $20,000,000 in 1874. The tax levy was increased four-fold, although the value of taxable property had declined 100 per cent. Large gratuities were voted State officials, the State capitol was furnished after the manner of a European palace, and vast sums were squandered in reckless schemes for public improvement.

Under these conditions the tax payers grew restless and disorders began to occur here and there. They naturally chafed under the rule of their former slaves who were controlled by strangers possessing no permanent interest in the South. Wherever the negroes were in the majority they carried the elections and controlled the government. The extravagance and corruption of their rule aroused the whites to adopt concerted measures for counteracting the political power of the negroes by terrifying them and keeping them away from the polls at election times. This was effectively accomplished by the organization of secret bands, the best-known of which was the so-called Ku-Klux Klan, said to have originated in Giles County, Tenn., in 1866. At first it was intended to serve as a disciplinary organization for scaring the superstitious blacks into good behavior, but with the ascendency of the negro to political power with its resulting imbecility and corruption the purposes of the Ku-Klux Klan were changed to meet the new situation. Its jurisdiction was styled the "Invisible Empire"; the chief functionary was the Grand Wizard; each State was a realm ruled over by a Grand Dragon. Then there were Dominions, Provinces, and Dens presided over by Grand Titans, Grand Cyclopses, Ghouls, etc. The organization was elaborate and mysterious; there was a constitution and a solemn ritual, and a gruesome mode of initiation, all of which appealed to the curious and at the same time excited the fear of the superstitious blacks. The members of the Klan when in service wore hideous disguises, the sight of which terrified the negroes and sent them running to their cabins. Prominent negro politicians, obnoxious carpet-baggers, and scalawags, Northern teachers of negro schools, were the most common victims of the Ku-Klux activities. Usually the Klan made known its orders by a warning couched in mysterious language, but always intelligible enough to convey its meaning. After the withdrawal from the South of the military governments between 1868 and 1870 Ku-Klux outrages threatened the peace and security of the South. Republican legislatures passed anti-Ku-Klux acts, and Republican governors offered large rewards for persons guilty of going in disguise to commit crime, but public sentiment was too much in favor of Ku-Klux methods to make either effective. Besides, it was next to impossible to convict anyone if caught and put on trial. Upon the recommendation of President Grant Congress appointed a joint committee to make a thorough investigation of conditions in the South, and the voluminous testimony which it took showed conclusively that hundreds of murders had been committed in the Southern States by Ku-Klux bands, besides many outrages of a less flagrant character. To meet the situation Congress passed, in 1870, the so-called Enforcement Act giving the federal courts jurisdiction over certain offenses committed with the intent of depriving colored persons of their rights as citizens of the United States. In April of the following year Congress passed another Enforcement Act which further extended the jurisdiction of the United States courts and authorized the President to employ the army and navy and to suspend the writ of habeas corpus if necessary to put an end to Ku-Klux outrages. It also empowered Federal judges to exclude from juries persons believed to be in sympathy with the Klan. In pursuance of this act the Federal attorneys in the Southern States made special exertions to secure the indictment of those engaged in the Ku-Klux outrages, and hundreds of indictments were found, but few convictions followed, owing to the sympathy of the juries for the accused. Acts were also passed for the supervision of Federal elections in the hope of securing to colored voters the unobstructed enjoyment of the right of suffrage which the 15th amendment had conferred upon them. But all the efforts of Congress to secure the political rights of the freedmen failed because it involved negro domination, and this had proved intolerable to the whites. See Ku-Klux Klan.

The Undoing of Reconstruction.— For a time the reconstructionists in the South were able, with the aid of Federal troops to maintain their power, but as the extravagance and corruption of their rule increased the discontent of the native whites, who were the chief sufferers, became more general. Organized intimidation and ballot box frauds were openly committed for the purpose of defeating the Republicans in the elections. Race collisions and election riots were of frequent occurrence, and in all of them the blacks were the chief sufferers. In several States rival governments were set up and civil war threatened. Negro militia companies were organized, but they were ineffective and served only to inflame the passions of the whites and increase their determination to overthrow the Republican governments by violence. The government at Washington showed less readiness to call out troops to interfere at the elections and a growing disposition to leave the Southern State governments to take care of themselves. Under these as early as 1870 the Democrats had regained control of North Carolina, Tennessee, Texas, Georgia, and Virginia. Meantime the progress of the Southern movement was aided by the wholesale removal by Congress of the political disabilities of the Southern whites and the division of the Southern Republicans into

radical and conservative wings, the latter of which joined with the Democratic organizations. In 1874 Alabama and Arkansas were carried by the Democrats and the carpet-bag governments in those States came to an end. In the following year, after a remarkable campaign, characterized by violence, riots, and wholesale intimidation, Mississippi was carried by the Democrats, who speedily got rid of three of the State officers, including the governor, by means of impeachment. In the following year the "Mississippi plan" was employed with success in the three remaining Southern States which were still "unreclaimed," namely, Louisiana, Texas, and Florida. Solid Democratic delegations were now sent to Washington, most of the carpet-baggers returned to the North, and the Southern whites were left in control. The subsequent disfranchisement of the negro race in Mississippi, Louisiana, South Carolina, Alabama, North Carolina, and Virginia, and the judicial approval by the Supreme Court of these disfranchising constitutions insured the permanent rule of the white race, and thus marked the final and complete undoing of reconstruction so far as its political effects were concerned.

40. United States — Last Three Amendments to the Constitution of the. The last three amendments to the Constitution are popularly known as the War Amendments. This designation is not without justification in their origin. The difficulties involved in amending the Constitution are so great that but for the conflict with which in the popular mind these amendments are associated, it is doubtful if the principles which they embody could ever have been incorporated into it. These amending articles primarily concerned the negro race, and their adoption marked the transition of these people from slavery to citizenship. They meant that within a period of five years more had been accomplished than had been by half a century of polemical discussion. They embodied the results of such a revolution of public sentiment as only war could have effected. The emancipation of the American negro was never a more remote probability than at the outbreak of the Civil War. Almost the entire time of the last session of the 36th Congress, 3 Dec. 1860 to 2 March 1861, was devoted to the consideration of various measures calculated to compromise sectional differences. Every plan proposed had as its basis an effort more specifically to guarantee against outside interference the institution of slavery in the States wherein it then existed. On 11 Feb. 1861, without a dissenting vote the House agreed to a resolution of Mr. Sherman of Ohio which indicated the spirit of that body. It declared that neither Congress nor the people of the non-slave-holding States had any right to interfere with the institution in any State in which it was established. A few days later the House went much further than this, and by a vote of 133 to 65 passed the Corwin resolution, proposing an amendment to the Constitution. This provided that the Constitution should never be so amended as to empower Congress in any way to interfere with slavery in the States. It is significant of the sentiment which then pervaded the country that this resolution secured the support of such men as Charles Francis Adams, Schuyler Colfax, Henry Winter Davis, Justin S. Morrill, and John Sherman. On the last day of the session, 2 March, it received the constitutional majority in the Senate, and was duly proposed to the country as the Thirteenth Amendment. Few more striking contrasts are presented in the history of the development of the Constitution than that between the amendment with which Congress would thus have commemorated the opening of the great conflict, and the one which marked its close. This resolution was ratified by Ohio, Maryland and Illinois, but its fate possesses scant interest now, if indeed it did even at that time. Men soon realized that the hour of compromise had passed,— that the great issues which had so long disturbed the repose of the country had been removed from the halls of Congress and submitted to the arbitrament of the sword.

Mr. Lincoln's attitude at this time was thoroughly in accord with that of Congress. In his inaugural address he declared that he had no purpose, inclination or right to interfere with slavery in the States. To emphasize his position he quoted from the platform on which he had been elected, and also declared that as in his opinion the proposed Corwin amendment was already "implied constitutional law" he had "no objection to its being made express and irrevocable." There can be no question that in these declarations Mr. Lincoln gave expression to his most earnest convictions. The fact that within two years after he uttered them he felt compelled, "upon military necessity," to issue the Emancipation Proclamation affords some idea of the significance and magnitude of the events which made for the first of the war amendments. When, on 1 Jan. 1863, Mr. Lincoln followed his provisional proclamation of the preceding September by one unconditional in its terms, no one knew better than he that it was literally no more than it purported to be on its face,— a war measure, pure and simple. The Emancipation Proclamation designated certain States and parts of States within the field of military operations as "in rebellion," and declared free all slaves within such districts. It advised the slaves so emancipated to labor for wages and to refrain from acts of violence, and announced that they would be received into the armed service of the government. Such a proclamation was mere *brutum fulmen* without military force behind it. It meant no more to the slaves in territory not actually occupied by the Union army, so far as their status at that time was concerned, than a piece of blank paper. Its immediate effectiveness anywhere was dependent upon the force of arms, the perpetuity of its declarations upon the ultimate outcome of war. The very limitations which its own terms placed upon its geographic application carried with them the necessity of a constitutional ratification in order to render the principle enunciated both

general and permanent. From the date of that document another amendment to the Constitution became an event contingent only upon the triumph of Union arms.

The Thirteenth Amendment.— It is one of the singular turns of the history of anti-slavery agitation that although New England had been so long identified with the abolition movement, it should fall to the lot of a man from a western slave State to formulate and introduce the amendment which was to write into the Constitution the fulfillment of the highest hopes of Garrison and Phillips. It was Mr. Henderson of Missouri, who on 11 Jan. 1864 introduced in the Senate the joint resolution which became the 13th Amendment. This resolution, somewhat amended by the Judiciary Committee, passed the Senate on 8 April by a vote of 38 to 6. Abolition sentiment had not gained ground rapidly in Congress. That body had put itself on record many times as carrying on the war for the sole purpose of preserving the Union. As late as 22 and 25 July 1861, after the battle of Bull Run, the Crittenden resolutions declared that the war was not waged "for the purpose of overthrowing or interfering with the rights or established institutions" of the Southern States. These resolutions had been agreed to in the House with but two negative votes, and in the Senate but five were recorded against them. There were also many members who realized that slavery was doomed, but were unwilling formally to put themselves on record as cooperating in its destruction. It was not surprising then that the Henderson resolution was rejected when it came up in the House on 15 June. But 95 votes were cast in its favor. The election of 1864 determined beyond all question that the country indorsed Mr. Lincoln's administration. This meant more than mere approval of his course in conducting the war. The Emancipation Proclamation, and an amendment to give it effect upon the restoration of peace, were just as truly issues of that election as was any other feature of the administration. From the first the President had been a champion of the Henderson resolution, and he was quick to take advantage of the result of the election in urging upon the House the necessity of its passage. This he did in his annual message of 6 Dec. 1864. He called the attention of the House to the result of the recent contest, and told them that it meant the passage of the measure by the next Congress, if it failed in this. He declared the election to be "the voice of the people now, for the first time heard upon the question" at issue. We need not consider which most influenced their action, Mr. Lincoln's message or the determination to accept an accomplished fact. On 31 Jan. 1865, by a vote of 121 to 24, the House finally passed the resolution as it came from the Senate: Section 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction. Section 2. Congress shall have power to enforce this article by appropriate legislation. On 18 Dec. 1865, the 13th Amendment was declared a part of the Constitution.

The Fourteenth Amendment.— On the first day of the memorable 30th Congress, 4 Dec. 1865, Mr. Stevens submitted a resolution providing for a joint committee of 15 to inquire into the affairs of "the so-called Confederate States." The resolution created what became known as the Reconstruction Committee. To this committee was referred every bill, resolution or petition bearing upon any phase of the relations between the Southern States and the general government, or involving consideration of the future status of the negro. The only result of their labors in which we are interested was submitted to both Houses on 30 April 1866, as their plan for the reconstruction of the Southern States. This consisted of three features, embraced in a joint resolution, proposing a constitutional amendment, and two bills. The three combined did not differ greatly from the 14th Amendment as finally adopted. The first section of the joint resolution did not contain a definition of national citizenship. In other respects it was the same as that adopted. Its second section, reducing representation for suffrage abridgment, was adopted substantially as reported. Section 3 deprived of the right to vote for electors or representatives until 4 July 1870, all those in any way identified with the "late insurrection." One of the bills reported as part of this plan provided for rendering ineligible to office certain proscribed classes of men in the Southern States. This bill formed the basis of the third section of the amendment as adopted, in lieu of the one reported by the committee. The fourth section was similar to the fourth section of the amendment, except that it did not contain the provision as to the validity of the public debt. The first of the bills reported provided that when the amendment proposed therein should have become part of the Constitution, and been ratified by "any State lately in insurrection," the senators and representatives from such State "might" ["may"] be admitted into Congress as such." This bill did not pass either House, nor did Congress commit itself in any way to the policy suggested by it,— that of admitting the Southern States upon their ratification of the proposed amendment. The House passed this joint resolution just as it came from the committee, the Senate making the amendments outlined above. These modifications brought the resolution to the shape in which it now stands as the 14th Amendment. The Senate passed it 8 June 1866 by a vote of 33 to 11. On 13 June the House agreed to the Senate amendments by a vote of 138 to 36. A study in detail of the ratification of this amendment would take us further afield than we can go, for here the history of the amendments and that of Reconstruction so blend as to become difficult of separate treatment. Thus would be opened up the whole question of the rejection of the amendment by the Southern States, save Tennessee, and of the effect of such rejection upon the subsequent action of Congress toward those States in the matter of negro suffrage and the last amendment. In the process of Reconstruction ratification became, in specific terms, a condition precedent to the readmission of the Southern States, and was declared accomplished in Seward's proclamations of 20 and 28 July 1868.

THE FOURTEENTH AMENDMENT.

Section 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of

citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

Section 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice President of the United States, representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male inhabitants of such State, being 21 years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion, or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens 21 years of age in such State.

Section 3. No person shall be a senator or representative in Congress, or elector of President and Vice President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a two-thirds vote of each House, remove such disability.

Section 4. The validity of the public debt of the United States, authorized by law, including debts incurred for pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

Section 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

The Fifteenth Amendment.— Propositions having negro suffrage as an end were almost as numerous during this period as were similar efforts toward an emancipation measure prior to 1865. Indeed, one of the most frequently suggested means of enforcing the 13th Amendment was by conferring suffrage upon the freedmen. Limitations of space render it impossible to trace here the evolution of the 15th Amendment through these numerous bills and resolutions. It has been noticed above that the author of the 13th Amendment was a Senator from a Western slave State,— Mr. Henderson of Missouri. It is even more singular that the same man should also have introduced the resolution which became the 15th. Early in the first session of the 40th Congress, 7 March 1867, Mr. Henderson introduced a resolution proposing an amendment to the Constitution which would prohibit a State from abridging the right "to vote or hold office on account of race, color, or previous condition." The 40th Congress had three sessions, and the Henderson resolution slept in the Judiciary Committee until well along toward the close of the third. It was reported by Senator Stewart, on 15 Jan. 1869, amended to read as follows:

"The right of citizens of the United States to vote and hold office shall not be denied or abridged by the United States, or any State, on account of race, color, or previous condition of servitude."

The Senate passed this resolution on 17 February. The House amended it by striking out the words "by the United States," which would have left Congress with absolute control over negro suffrage. It also added to the grounds upon which suffrage abridgment was denied the States those of nativity, property, and creed. The House had just refused to accept from the Senate such an amendment to a resolution of its own. Its action now, in tacking this on to the Senate measure, showed an utter absence of anything like agreement between the two bodies as to the precise form of the amendment. The situation finally yielded to considerations of party expediency, and the House acceded to the Senate's request for a conference. This resulted in a recommendation that the House recede from its amendments and agree to the Senate resolution. The latter, however, was to be amended by striking out the words "and hold office." Here was another important compromise to be engrafted on the Constitution, whereby was secured the 15th Amendment as we have it to-day:

Section 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.

Section 2. The Congress shall have power to enforce this article by appropriate legislation.

Under the operation of the previous question the House was able to secure an agreement to this report as soon as submitted, 25 February. In the Senate, however, serious opposition developed among the friends of the measure. It was claimed that too great a sacrifice to expediency had been made in striking out the words "and hold office," and thus reducing the scope of the amendment to the matter of suffrage alone. On this account Mr. Edmunds, one of the managers at the conference, had refused to sign the report, and now opposed the amended measure on the floor of the Senate. The session was drawing to a close, and perhaps there was something in the taunt of the minority that the dominant party dare not trust the fate of the measure to the succeeding Congress. Though markedly earnest, the debate was not protracted. The Senate passed the resolution on 26 February. On 3 March Congress adjourned. In the unusual form of a special message from the President, communicating its promulgation by the Secretary of State, the last of the War Amendments was declared adopted on 30 March 1870.

Validity and Enforcement.— The charge of "irregularity," of a departure from established constitutional methods, was made by the minority against all the legislation enacted by Congress during the eventful years covering the period of Congressional Reconstruction. It was urged with greater force against the validity of the action by which the passage and adoption of these amendments were secured. Against the 13th was brought the charge that West Virginia, whose ratification was declared necessary, had been created a State in disregard of the letter and spirit of the Constitution. The question of the right of a State to rescind a ratification once given was raised in the case of the 14th and 15th, as also the constitutionality of the entire plan of Congressional Reconstruction. It was not long, however, before the minority realized the necessity and wisdom of accepting the amendments as a matter of public policy. By February 1872 both parties in the House had gone on record as formally recognizing their validity, and the question ceased to possess more

than a mere academic interest. The energy and earnestness of the Reconstruction statesmen were not exhausted with the adoption of the amendments. Immediately following the ratification of each one they set to work to enforce its provisions with the same determination which had characterized their efforts to secure its incorporation into the organic law. Various acts, some directed against peonage in New Mexico, others against the kidnapping of negro children, were passed to render impossible the placing or retaining of anyone in a state of involuntary servitude. The principal act for enforcing the 13th Amendment clearly anticipated important provisions of the succeeding amendment. This was the Civil Rights Bill of 9 April 1866. The emancipating amendment left the late slaves in an anomalous position, and to meet the difficulties of their situation was the prime object of this elaborate measure. It declared all persons born in the United States, not subject to a foreign power, except Indians not taxed, citizens of the United States. Here we have a near approach to the definition of national citizenship contained in the first section of the 14th Amendment. It gave to every citizen so defined the same rights of property, and the same protection of person and property, enjoyed by the white citizen. It provided extraordinary means, judicial and executive, for its own enforcement, and for guaranteeing protection to all persons in their "constitutional rights of equality before the law." This act was passed over Johnson's veto more than two years before the adoption of the 14th Amendment, yet it served the purpose of an enforcing act for that amendment long after its ratification. Indeed, it answered that purpose, without even being amended, until after the ratification of the 15th Amendment. These enforcing acts themselves illustrate the process of development through which the negro passed in his transition from slavery to citizenship. They reflect the views of their framers as to the significance of each step taken in that movement. Thus it appears that an act merely to enforce the emancipating amendment was considered broad enough to cover the first section of the Fourteenth also. Extreme views were entertained as to the power of Congress in regard to the matters covered by the amendments. The last two were not proposed by Congress because that body doubted its constitutional right to accomplish the same ends by legislation, but simply to remove those matters beyond the reach of a possible hostile majority. The next enforcing act was that of 31 May 1870. This was "to enforce the right of citizens of the United States to vote," but it also re-enacted, with some additional provisions, the Civil Rights Bill of 1866. Means were provided for preventing suffrage discriminations on account of color under almost any contingency that could rise. The act also provided for enforcing the third section of the 14th Amendment, prohibiting certain classes in the Southern States from holding office. This act was amended 28 Feb. 1871, by one which provided still more elaborate machinery for enforcing the right to vote. Among other features it required judges of United States circuit courts to appoint supervisors of Congressional elections, upon petition of two citizens. This, however, applied only to cities of at least 20,000 inhabitants. The act of 20 April 1871, was the first specifically directed to the enforcement of the 14th Amendment. This was known as the Ku-klux Act, and of all the enforcing laws it was the most drastic. The others conferred upon the federal courts jurisdiction for acts in violation of their provisions, and for their enforcement placed at the call of even petty officials the military and naval branches of the government. This authorized the President in certain contingencies to suspend the privileges of the writ of habeas corpus. It was directed primarily against alleged conspiracies in the Southern States to render inoperative the first section of the 14th Amendment. The second and last act to enforce the first section was the Civil Rights Act of 1 March 1875. The first two sections of the act attempted to do for the newly declared citizens, in the sphere of what may be called social privileges, what the Civil Rights Bill of 1866 had done in the field of property rights. They declared all persons within the jurisdiction of the United States "entitled to the full and equal enjoyment of the accommodations, advantages, facilities, and privileges of inns, public conveyances on land or water, theatres, and other places of public amusement." Infractions of this act gave rise to the Civil Rights Cases, which furnished the occasion for one of the most important interpretations of the 14th Amendment ever announced by the Supreme Court. The one section of the 14th Amendment which has never been enforced is the second,— which provides for reducing the representation of States as a penalty for abridgments of the suffrage. Some of the men most prominent in Reconstruction legislation have announced the opinion that this section was rendered nugatory by the adoption of the 15th Amendment. This question, however, has not been passed upon, in the absence of enforcing legislation. Such legislation was attempted in the first apportionment act after the new amendment, that under the census of 1870. It was at once discovered that the question was one involving numerous practical difficulties,— difficulties probably unforeseen by the framers of the section, certainly entirely unprovided for by them. The advocates of changing the basis of representation in accordance with the new provision had finally to content themselves with merely restating in the apportionment act the penalty provided in the amendment itself.

Interpretation.— The 14th Amendment has overshadowed the other two, alike in the number and the importance of the cases involving its interpretation by the Supreme Court. A consideration of the three amendments shows this to have been inevitably incident to the nature of the 14th. The 13th and 15th were simple and direct in terms, each covering a single question. Article IV of the Constitution declared the citizens of each State entitled to all the privileges and immunities of citizens in the several States. Article V of the amendments declared that no person should be deprived of life, liberty or property without due process of law. But Article V was operative upon the general government, not upon the States. The 14th Amendment for the first time defined national citizenship, and endowed it with the privileges and immunities hitherto the attributes of citizens of the States. It then went further,

and prohibited the States from abridging these privileges and immunities in their new and broadened application. It borrowed and brought forward from the 5th Amendment the guaranty of due process of law, and decreed that henceforth the denial thereof should also be beyond the province of the State. In their new relation, the questions, What are the privileges and immunities of citizens? What is due process of law? and What the equal protection of the laws? are capable of being raised under an almost infinite variety of circumstances. They assume a new significance, and issues of consequence and moment are involved in their determination.

The amendment of which this first section is the most important part, was formulated by a Congress which convened almost before the din of war had died away. It was written of it, by the Speaker of its House, that "Its key-note of policy was protection to the down-trodden." Some members of that body may have been gifted with the prescience to see beyond the strife and partisanship of the hour,—but these were few. Such as they may have realized the true import of the measure thus wrought out in the heat and bitterness of debate. One or two did indeed predict its future. But of the many whose voices gave it the sanctity of constitutional law with truth it may be said that only the freedman was in their view. The first case which involved the interpretation of this amendment by the Supreme Court disclosed this view of restricted application. This was in the famous Slaughter House Cases, decided 14 April 1873. In behalf of the majority of the court, Mr. Justice Miller expressed this opinion: "We doubt very much whether any action of a State not directed by way of discrimination against the negroes as a class, or on account of their race, will ever be held to come within the purview of this provision. It is so clearly a provision for that race and that emergency, that a strong case would be necessary for its application to any other." But the Constitution was "made to march" during the succeeding quarter-century. In 1898, in Holden *v.* Hardy, we find the court declaring that "A majority of the cases which have since arisen have turned not upon a denial to the colored race of rights therein secured to them, but upon alleged discriminations in matters entirely outside of the political relations of the parties aggrieved." Doubtless it would be a pleasing reflection that the later and larger interpretation of this Amendment was the one contemplated by its framers. But this would not be warranted by the facts. The decisions nearest the amendment in point of time are nearest also to the intent of most of those who gave it life. The measure would scarcely have appealed to men from the Pacific coast had they foreseen the construction to be placed upon their work in the cases of Yick Wo *v.* Hopkins and the United States *v.* Wong Kim Ark. In the case of Yick Wo, Chinese, as "persons," were held to be entitled to "due process of law." In Wong Kim Ark it was held that children born in the United States of Chinese parents having their domicile here, are citizens of the United States. The effect of the former of these decisions was to give to the word "person" the broadest possible significance, as meaning every natural person within the jurisdiction of a State. But there was another class of persons to claim the protection of the amendment. Corporations came forward with the sound argument that they were mere associations of persons, each of whom was guaranteed due process of law and the equal protection of the laws, and that in their corporate capacity, as artificial persons, they were entitled to the same protection. Not until the lapse of 18 years after the adoption of the amendment were these artificial persons clearly held to be within the purview of its first section. This was in 1886, in Santa Clara County *v.* Southern Pacific Railroad. Since that time, of the cases involving the construction of this amendment, those in which corporations are interested probably outnumber all others combined. The courts have quite clearly distinguished, however, one important difference between these artificial persons and citizens. Privileges and immunities are held to belong only to the latter. Corporations must rely for their protection under the 14th Amendment upon their character as persons.

The Civil Rights Cases furnish the most striking instance of the difference between the interpretation placed upon the 14th Amendment by those who framed it, and that of the court whose province it is to construe its meaning and determine its powers and limitations. These cases, which were decided in 1883, arose through certain alleged violations of the first and second sections of the Civil Rights Act of 1875. It will be recalled that this act declared all persons entitled to the equal accommodations of hotels, theatres and public conveyances. It also provided certain penalties for the denial of these privileges "to any citizens, except for reasons by law applicable to citizens of any race and color." The court held that these two sections of the act were unconstitutional and void. They were held to be "direct and primary, as distinguished from corrective, legislation," and as such constituted an invasion of the domain of State control of its purely domestic affairs. The court placed upon the amendment the important and far reaching construction that it operated as an inhibition upon the States alone, and not upon their citizens. In the words of Mr. Justice Bradley: "Civil rights, such as are guaranteed by the Constitution against State aggression, cannot be impaired by the wrongful acts of individuals unsupported by State authority." Two other important interpretations of the 14th Amendment are that "equal" does not necessarily mean "identical," as applied to rights and privileges, and that the amendment created no new "privileges or immunities." Under the former have been upheld State laws which provided separate schools for the two races, and also those requiring railroads to provide "separate but equal" accommodations. Under the latter of these interpretations the court has held that women, as citizens of the United States, have no privileges to which citizens were not entitled before the amendment. Hence a State statute prohibiting women from voting or practising law was not an abridgment of the privileges of citizens within the purview of the amendment. If considered from the narrow viewpoint of a mere attempt to endow one race with privileges and immunities enjoyed by another, the interpretation of the 14th Amendment

has fallen short of the hopes and expectations of many of its advocates. The first section is now all of real significance that remains of the amendment. Held within its proper bounds, and wisely interpreted as it has been, this wears no longer the aspect of an instrument in derogation of the dignity of the States. As an effort to render more secure to all persons life, liberty and property, it stands forth in some measure worthy of rank with the ten great amendments which constitute the American Bill of Rights.

Of the 15th Amendment it may be said, as Mr. Justice Miller said of the 13th: "Its two short sections seem hardly to admit of construction." Of itself it confers suffrage upon no one. Save upon the grounds of race, color and previous condition of servitude, it does not diminish the right of the State to regulate the suffrage of its citizens. The power to impose any other qualification remains as it was before 1870. This has been held clearly enough in the few cases involving the right of suffrage abridgment thus far presented to the court. For one section of the country at least, harassed by problems peculiar to itself, it is well that this is so. See CONSTITUTION OF THE UNITED STATES; also UNITED STATES — INTERPRETATION OF THE CONSTITUTION.

ALFRED HOLT STONE,
Washington, D. C.

41. United States — State Constitutions of (1789-1904). The American Union is composed of 45 States or commonwealths, each of which has a body of fundamental law known as a constitution. The sphere of governmental activity which may be covered by the State, has been negatively defined in the Constitution of the United States (Article X. of the amendments): "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively or to the people." Among these powers which thus inhere in the people of the several States are those of determining the form which their own government shall take, with the sole provision that it must be republican in form, and of drafting their own fundamental law, subject to limitations imposed by the Federal Constitution.

Within the limits of the power thus defined, the State is supreme and in no way subordinate to the national government. The vast scope and sovereign character of this State activity seemed to substantiate the doctrine of State sovereignty. But the Civil War definitely and finally decided that the State is not sovereign, although it exercises many of the powers usually regarded as sovereign. The accepted interpretation of the relation of State and Federal governments under the Constitution is, that neither is sovereign. The people of the United States are alone sovereign. They have made both the Federal Government and the States their agents for certain specified purposes, and for those purposes each is supreme and uncontrollable by the other. The organs of the State are concerned solely with those powers reserved to the States, and do not possess and cannot have imposed upon them by the Federal Government, duties which are given by the Constitution of the United States to that government. The Constitution of the United States places upon the State a few, but very few, duties in connection with the conduct of the Federal Government. The most important of these are those of electing the United States senators; of conducting the election of presidential electors, and of members of the House of Representatives; and of providing a militia for federal use in certain contingencies. Disregarding, for the purpose in hand, these limitations and exceptions, we may treat the State Constitutions as if they operated within the several States to the exclusion of all other authority.

The closing years of the colonial period saw the 13 colonies in the possession of constitutions, either written or unwritten, which were in most respects essentially similar and which were, on the whole, well adapted to the needs of the inhabitants. The severance of the political ties which had bound the colonies to Great Britain made necessary the adoption of bodies of fundamental law for the new States. With the exception of Rhode Island and Connecticut, all of the original States had adopted new constitutions when the present Federal Constitution went into effect. In Massachusetts, a convention (1780) draughted a constitution and submitted it to the people for ratification. New Hampshire adopted her first constitution (1776) without popular ratification, but submitted a second constitution, drawn up by a convention, to the people, by whom it was adopted in 1784. Rhode Island and Connecticut, whose colonial charters granted in 1662 and 1663, needed few changes to adapt them to the needs of statehood, did little more than to substitute the name of the people for that of the king and continued these documents as their constitutional law until 1842 and 1818 respectively. In the remaining nine States the constitutions were in every case adopted by conventions, without submission to popular vote, although in only one State, Delaware, had the convention received a formal mandate for so doing. In each of these States, except Delaware, the convention exercised the powers of a legislature as well as those of a constitutional convention. These revolutionary constitutions were very short and most of them hastily constructed. They contained little besides a bill of rights and an outline of the frame of government. Their chief purpose was to define the fundamental principles of civil liberty and "to distribute all, rather than to withhold any, of the powers of government."

The history of the colonial period had taught the people that the legislature was the protector of their rights and liberties and that the other two departments were to be feared and guarded against as the representatives of the English crown; hence, in framing their new constitutions they gave predominent weight to the legislature, and defended the rights of the people against executive and judicial encroachment by provisions in their declarations of rights and further by subordinating both, and especially the former, to the legislature. In eight of the original States, the governor was appointed by the legislature and in Massachusetts alone did he receive the veto power. The highest judges were in no case elected by the people. In nine States they were chosen by the legislatures, in three by the executive and council and in one by the executive council alone. The possession of a freehold or the payment of a tax were qualifications required of all voters, with a few minor exceptions, as in Rhode Island, where the eldest

son of a voter who qualified by the possession of property of the value of $2,000 or of $100 a year, could vote, or in Pennsylvania, where the sons of a tax-paying voter were likewise privileged to vote. South Carolina alone imposed a religious qualification: belief in God. In the five States where the governor was elected by the people, a higher property qualification was demanded for the electoral franchise in voting for governor than for members of the legislature. Nearly all of the States required additional qualifications for office holding. In six States, property qualifications, ranging from a freehold to $50,000, were demanded of the governor and six prescribed a religious qualification for the same office. New Hampshire, Maryland and North Carolina permitted none but Protestants to occupy the governor's chair; Massachusetts none but Christians, while Delaware made belief in the Trinity, and Pennsylvania and North Carolina belief in God and in the divine authority of the Bible, necessary qualifications.

Three well defined periods can be traced in the development of American State constitutions since the Revolution: (1) From the Revolution to the War of 1812; (2) From the War of 1812 to the Civil War; (3) From the Civil War to the present time. The first period may be characterized as that in which the legislature was supreme. The legislature, historically the guardian of popular rights against the British government, continued to be regarded as the best and safest repository of power. The strong colonial executive was replaced by a governor having very slight administrative duties and even less discretionary power. He was elected by the legislature in most of the States, had the veto power only in Massachusetts and was unable to adjourn, prorogue or dissolve the legislature. The constitutions were based upon a belief that the people had nothing to fear from the legislature, but that they should be safe-guarded against the executive and judiciary. The second period experienced most far-reaching political and social changes in the United States. Democracy was everywhere triumphant and American political institutions, including State constitutions, were very thoroughly democratized. The earlier period placed marked limitations upon the privilege of voting, while the second nearly everywhere granted manhood suffrage to whites. State governors and judges were generally elected and the judicial term was shortened. The governor began to acquire the veto power. The confidence reposed in the legislature had been, in a sense, misplaced. In the early part of the second period there was much reckless management of the finances, money was squandered on the most chimerical schemes for internal improvements, charters were granted for banking institutions that had little or no capital, special legislation of the worst sort was passed, monopolies were created, appointments controlled, unmerited exemption from taxation was voted, and laws were even passed for the purpose of affecting cases pending in the law courts. The day of reckoning came in 1837 and since that time there has been a constant tendency to check and limit the powers of the legislature. The revolutionary practice of adopting constitutions in State constitutional conventions, without ratification by popular vote, gave place to the direct reference of constitutions and their amendments to the people at the polls. The desire to narrow the field of legislative competence was further evidenced by the adoption of amendments limiting its authority over specified fields. Few important changes in the principles of State constitutional law took place before the Civil War. The chief improvements were of an administrative character. The Civil War, which marks the beginning of the third period, brought about a radical readjustment of economic and industrial conditions throughout the United States, and, in addition, effected a complete change in political conditions in the Southern States. The predominant characteristic of this period has been a continued and increasing distrust of the State legislatures, which has resulted in very marked limitations of their powers. These have been effected chiefly in two ways. First, the field of legislative activities has been decreased by prohibiting the passage of certain laws or classes of laws; by direct legislation by means of constitutional amendments in matters formerly controlled by the legislature; and by requiring popular approval, at the polls, of certain legislative measures, before they can be enacted as laws. Second, the powers of the governor and judges have largely increased. The governor's term which was, at first, annual in all but three States, has been greatly lengthened and is now annual in two only, while nearly half the States have a four-year term. His power has been further enhanced at the expense of the legislature by an almost universal grant of the veto, only three States withholding this power and 26 granting, in addition, the power to veto items of an appropriation bill. The State of Washington even allows the executive to veto items of any bill and the governor of Pennsylvania can approve such portion of an item of an appropriation bill as he sees fit. In 1901, he vetoed 47 and cut down or partly vetoed 132 other items of appropriation measures. The executive appointing power has been materially augmented and the power to pardon and reprieve has been nearly everywhere granted. These changes are indicative of a growth in the conconfidence placed by the people in the governor, which is the most important source of his increased power. This confidence has been engendered by the fact that responsibility can be fixed upon the single executive, as it cannot be upon the legislature, which is, under our American system, without responsible leadership. The judicial office, although based in a large majority of cases upon popular election, has had its term materially increased in this period.

Another evidence of the increasing lack of confidence in the legislature is the limitation of the time during which the legislature can sit. This has been accomplished by decreasing the frequency and by limiting the duration of the sessions. Public opinion has traveled far from that of the revolutionary period, which was expressed in the so-called axiom of political science: "Where annual sessions end tyranny begins." Six States only, and all of them of the original 13, retain annual sessions. Alabama, in her recent constitution, has prescribed a quadrennial session. Twenty-nine States limit the duration of the session to from 40 to 90 days. This attitude of the people is further shown by numerous constitutional provisions adopted for the purpose of preventing the railroading and

fraudulent passage of bills, especially during the closing days of the session. For example, in New York, no bill may be passed or become a law unless it is printed and lies, in its final form, for at least three calendar legislative days upon the desks of the members, unless the governor certifies to the need of its immediate passage; and no amendment is allowed on the last reading of a bill. Other provisions attempt to prevent or punish bribery and make impossible the appointment of a legislator to any civil office during the term for which he is elected.

The rapid growth of State debts during the half century preceding 1870 was another cause of great dissatisfaction with the legislatures. The total State indebtedness in 1825 was $12,790,728, in 1870, it had risen to the portentous sum of $352,866,898. Drastic measures were taken by a large number of States to prevent further squandering of the people's money by their representatives, with such success that the total of State indebtedness has been reduced to about $172,000,000 (1904). Most States forbid the legislature to contract debt for more than a maximum amount fixed by the constitution. (For example, $50,000 in Oregon; $1,000,000 in Pennsylvania.) New York State allows the legislature to issue deficiency bonds, not to exceed $1,000,000, and to contract debt for the purpose of repelling invasion or of suppressing insurrection, but for all other purposes the approval of the voters is necessary before a loan can be contracted. Moreover, nearly every State requires that a sinking fund be established for every bonded loan issued.

This distrust of the legislature is traceable to several causes. State legislation has been frequently hasty and ill-advised. In New York from 1895 to 1904 the courts pronounced 41 laws, passed by the legislature, unconstitutional. Special legislation has engrossed the attention of the legislators and has often been so obviously opposed to the general welfare that public opinion has imputed the worst of motives to the members. The people are convinced that the party "boss" controls the legislature, the members of which merely register his will; and that he orders measures passed for partisan or corrupt purposes. The second of these reasons is unquestionably the most influential. A vast majority of the laws passed in the average legislature concern local or special interests. Eight typical States, in 1901, passed a total of 7,032 statutes, of which 5,876 were of local or special import. The objections to this class of legislation are two-fold. First: the time and interest of the members are so largely occupied with the work of obtaining legislative favors for political and personal friends that insufficient time and attention are give to bills of a general character whose effect upon the private or political fortunes of the legislators may not be so intimate. Second: special legislation, particularly for corporate interests, gives ample opportunity for bribery and corruption, which, although doubtless not so great as is often charged, is commonly believed by public opinion to be associated with the passage of such measures. Perhaps an even greater evil is the constant changing and amending of city charters and other local government laws in the interests of the "boss" or party which controls the legislature, or of influential public service corporations. Sometimes an entire city government has been legislated out of office, as in the Pennsylvania "Ripper" Act of 1902. To check this abuse, 36 States have adopted constitutional provisions forbidding special or local legislation. These provisions vary greatly. Some of them are very sweeping and stringent and others have not been carefully enough draughted to prevent the continuance of the practices they were intended to abolish. The most common of these provisions require incorporation under a general law; prescribe legislative auditing of private claims; prohibit exemption from taxation, except under general laws; forbid the passage of acts, except as general laws for the chartering and government of cities and towns and, in the realm of purely private law, interdict legislative divorce and legislative admission to the bar.

The result of the presence, in the constitution, of this great mass of matter, either directly or indirectly restrictive of the powers of the legislature, has been to abolish the distinction in character which formerly existed between constitutional and statue law, and to incorporate in the body of supposedly fundamental law details that more properly belong in a statute or even in an administrative ordinance and thus enormously to increase the size of the constitution. It must be remembered that the State legislature is not, like Congress, a body exercising only delegated powers. Any power within the competence of the State it can legislate upon, unless forbidden by the constitution; hence any limitation of its power must be expressly stated in the constitution. This is the reason why distrust of the legislature has caused such an increase in the size of our State constitutions.

The frequent and lengthy additions to our State constitutions are themselves a fruitful source of further amendment, for the more elaborated the fundamental law is in a growing civilization, the more frequent will the changes be. Dealing, as they do, often in minute detail, with a large range of subjects, constant revision is necessary to remedy defects and to meet the needs imposed by changing conditions. The New Hampshire constitution of 1776, excluding the preamble, contained 600 words; the present constitution of Missouri or South Dakota contain over 50 times as many.

Constitution making has been most active in the West and South. Economic and social changes have been the chief causes in the West, while in the South, the Civil War and the successive attempts at a settlement of political problems have occasioned the frequent adoption of entirely new constitutions. Massachusetts has lived, since the Revolution, under the constitution of 1780; but several of the Southern States have adopted five and six entirely new constitutions in addition to numerous amendments. Nine new constitutions were adopted, and two were rejected, during the period from 1890 to 1903, and in the shorter period from 1895 to 1903, 284 amendments were proposed and 168 adopted. Practically every State has made some change in its constitution within the last ten years.

The method of amendment varies in the different States. The practice of submitting fundamental law to the voters for adoption had been almost universally in vogue, except in the Con-

federate States, for about three quarters of a century before 1890, but while the North and West still make this method obligatory, six Southern States, largely influenced by the negro problem, have recently promulgated new constitutions by act of the constitutional convention without popular ratification. In all but 12 of the States, constitutional provision is made for calling conventions for the purpose of general revision of the constitutions. The legislatures in most of these States, if their action is supported by the voters at the polls, can call conventions. Several make obligatory the submission to the people, at stated intervals (N. Y., Md., Va., O., 20, Mich., 16, Ia., 10, and N. H., 7, years) of the question whether a convention is desired or not. Every State, save New Hampshire, makes provision for ordinary amendment by legislative initiative and in all of these, except Delaware, by submission to the voters for ratification. In Delaware only, is the legislature, acting by two thirds majorities for two successive legislatives, competent to adopt a constitutional amendment without popular vote. South Carolina and Mississippi have the unique method of requiring an amendment, which has been proposed by two thirds of each house of the legislature and approved at the polls, to be further ratified by a majority of each house at the next legislature. Twenty-eight States allow one legislature, generally by a two thirds vote of each house, to propose amendments. In 12, two successive legislatures must each adopt the proposed amendment before submission to the people. A majority of votes cast is sufficient for adoption in all but three States. Rhode Island requires a majority of three fifths of the votes cast, while Missouri and Wyoming prescribe a majority of all the voters of the State.

After the grant of the franchise to the negro during reconstruction, the ideal of manhood suffrage was very nearly attained. Recent years, however, have shown a tendency to restrict the franchise. Seven of the Southern States have adopted restrictions (six of them constitutional), which were primarily designed to deprive the negro of the right to vote and which have, in spirit at least, annulled the 15th amendment. Even when the race problem is not involved, there is a tendency to place a higher value on the elective franchise. An increasing number of States are restricting the privilege to citizens of the United States (only about one fourth now permit aliens to vote), and a number of recent constitutions have imposed the qualification of ability to read and write English. In all, 13 States have an educational qualification, in several alternative with a property qualification.

The typical State Constitution contains: (1) A definition of boundaries, except in the older States; (2) A bill of rights; (3) A frame of government; (4) A great mass of miscellaneous provisions, arranged with slight regard for logical classification, "relating to administration and law, including articles treating of education, of the militia, of taxation and revenue, of the public debts, of local government, of State prisons and hospitals, of agriculture, of labor, of impeachment and of the method of amending the constitution, besides other matters still less political in their character"; (6) The schedule, which contains temporary provisions about putting the constitution into effect.

A bill or declaration of rights, historically the most important part of the document, is found in every State Constitution, except Michigan's, where there is no separate bill of rights. It contains those fundamental guarantees of personal liberty, the most prized heritage of our race, which are most familiar through incorporation in the Federal Constitution, and in addition, many provisions, widely dissimilar in the several constitutions, defining supposedly inherent rights of the individual. The bill of rights of the Federal Constitution restricts the Federal Government alone; hence the necessity for the incorporation of a bill of rights in the State Constitution. Mention will be made of one only of the rights thus secured to the citizen. Religious liberty, in its fullest sense, was not a possession of all people in the American States during the early years of national independence. Connecticut did not abolish her established church until 1818 and that of Massachusetts was not fully disestablished until 1833. At the present time all States have constitutional guarantees of freedom of conscience, of expression of religious opinion, of worship or of non-worship and of equality of all religious denominations in the eyes of the law; although the Christian religion is by the common law recognized as the prevailing religion of the country, as is witnessed by the laws of blasphemy and of observance of the Christian Sabbath.

The frame of State government is strikingly similar throughout the Union. Each provides for an executive department consisting of a governor, a lieutenant-governor in most States, and heads of the important departments of administration (Secretary of State, treasurer, comptroller, attorney-general, etc.), elected in nearly all of the States and constituting, with the governor, what is in reality an executive in commission. While in the Federal Government the President is *the* executive, the State governor is merely a part of the executive; a number of the most important heads of departments being nearly or quite independent of the governor, although in some States subject to removal from office for cause shown. They are practically colleagues, not subordinates, of the governor. Executive decentralization is the rule; a rule still further enforced by the creation of large numbers of administrative boards and commissions, all of which are created by law and have their duties prescribed by the legislature and, whether appointed by the governor or not, are in practice very little under his control. A number of State governors have, in recent years, called attention to the defects of such excessive decentralization and have asked the legislatures to devise remedies for what they deem a growing evil. The governor's power of appointment is in most States small and his actual control of administration is even less. His greatest power and responsibility are derived from the possession of the veto and the marked increase in recent years in the influence of the gubernatorial office has been due to the governor's share in legislative power and hardly at all to his executive and administrative functions.

The legislature is everywhere bicameral. Two houses exist because the American people believe that the bicameral system embodies a sound principle of political science and not because special classes, or elements of the body politic,

can thereby obtain a share in government; for everywhere, except in Rhode Island and Connecticut, representation in both houses is based upon population, the only difference being that the senatorial district is the larger. The town is the basis of representation in the senate of Rhode Island and in the House of Representatives of Connecticut. Although over one half of the States give the initiation of money bills to the lower house, there is no sufficient reason for such discrimination. The practice is a survival of colonial custom or is a meaningless copy of Federal or English precedent. In other matters the powers of the two houses are in general identical, except in the process of impeachment and in some States the senate has the power of confirming executive appointments. The committee system, modeled closely after that of Congress, is everywhere in use and rules and procedure are practically the same as the Congressional. The governor and heads of departments never occupy seats in the legislature and the English system of government through a premier, who is subject to a parliamentary majority, has never found lodgment in the United States.

The organization of the judicial department varies somewhat in the several States, although the difference is rather in the degree of development than in the principle of organization. Most States have at the head of their system a single court of appellate jurisdiction, called, generally, the supreme court, sometimes the court of appeals; and a superior or circuit court of highest original jurisdiction. Lower courts consist of county and local courts of inferior jurisdiction. In New York, whose judiciary may be taken as an example of more highly organized systems, which obtain in some of the larger States, the State courts consist of a court of appeals, four appellate divisions of the supreme court, with justices assigned from the supreme court, and the supreme court of 76 judges, county courts, except in New York County, and courts of the justice of the peace. The cities of the State have special municipal courts. In counties having a population of 40,000 or over there is a surrogate's court for probate jurisdiction. Separate chancery courts, which were found in nearly all of the original States, were regarded as inconsistent with the democratic spirit of the age and now exist in a few only of the older commonwealths. Equity jurisdiction is, however, administered in all of the other States by the regular judges of the law.

Georgia was the only revolutionary State to vest the election of judges with the people. Six gave the choice to the legislature and in the remaining six, the governor, with the consent of the council (in Delaware of the legislature), made the appointment. The strong democratic wave which swept over this country in the early part of the 19th century, affected the judicial office by very generally transferring the election to the people and by adopting a short term in place of the life tenure of the early period. There are now 34 States which vest the election of the higher judges in the people, while minor judges are even more generally elected. The governor appoints in six States, subject to the approval of the council or senate. In Connecticut, the governor nominates and the legislature elects. In Rhode Island, Vermont, Virginia and South Carolina the legislature both nominates and elects the judges. Massachusetts, Rhode Island and New Hampshire (until 70 years of age), alone retain life tenure. The term in Pennsylvania is 21 years, in Maryland, 15, and in New York, 14. Vermont has the shortest term, two years, while the average is from six to eight years. Judicial salaries have been considerably increased of late, but in many States are still altogether too low to command the best or even thoroughly qualified men. They range from $2,000, in Vermont to $17,500 for supreme court judges in New York city, which is the highest judicial salary paid in America. The average for supreme court judges is about $5,000. In some States judges are removable by impeachment and in others by an address of both houses of the legislature, a two thirds vote generally being necessary.

The local government divisions of the State are the creation of the legislature, which, unless expressly restrained by the constitution, can make and change them as it pleases. Legally they are political divisions erected by the legislature for the purpose of assisting in the government of the State. Historically the principle of local self government lies deeply embedded in our political life and this fact has been recognized in several recent constitutional enactments, which limit the hitherto unrestricted control of local government by the legislature, notably in California where cities have the right to frame their own charters.

Two among the numerous miscellaneous provisions of the modern State Constitution deserve especial mention: those dealing with education and with the control of corporations. Formerly education was a purely local concern, but the increasing recognition of the political importance of education in a democracy has led the State to grant extensive aid and to assume a large degree of control. Practically all of the States now have a State superintendent or commissioner, generally elected and nearly always a constitutional officer, and State boards of education. All but a few of the older States, in addition to financial assistance to primary and secondary schools, maintain State universities. So vital is the subject considered that the people embody the most important regulations in the constitution. Even the revenues for the support of the universities are secured beyond the chance of hostile legislation by a constitutionally fixed rate of taxation.

The growth of great transportation and industrial corporations in recent years has been the cause of a vast amount of restrictive and regulative legislation. Popular fear of the railroad combination and of the industrial trust, and distrust of the legislature as an efficient and incorruptible agent for dealing with capitalistic monopolies, have led the voters in 19 States to incorporate provisions in their constitutions forbidding the combination of competing railroad and telegraph lines, while anti-combination laws have been passed by 16 of the remaining States. The lack of power to regulate interstate commerce has made most of these efforts at control of transportation ineffective and a demand for more effective congressional legislation has consequently arisen. Anti-trust agitation has been so wide-spread that 30 States have now passed laws against trusts, and of this number,

about one half have anti-trust clauses in their constitutions. Nearly 40 States have provisions against monopolies, either in constitution or statute, and every State of the Union has found the regulation of corporations necessary. The subject of corporation control has aroused more interest than any other question that has been before the American people since the era of reconstruction. Even in the recently adopted southern constitutions, the control of corporations was second only to the disenfranchisement of the negro as an object of popular desire. See CONSTITUTION OF THE UNITED STATES; GOVERNMENT.

MARSHALL S. BROWN,
Professor of History, New York University.

42. United States — The War with Spain. The Spanish-American War of 1898 was the outcome of conditions set up in Cuba by the political discontent in the island during nearly the whole of the 19th century, varied in the latter half by long continued revolts. The United States government, controlled as it was in the earlier half of the century by the slave interests of the South, had desired and made overtures at intervals to annex the island. But this wish disappeared with the changed conditions brought by the Civil War. There was no longer a reason through desire to extend slave territory, and the annexation of a large alien population, much of which was colored, was repellant. The ten years' war in Cuba, which began in 1868 through the refusal of Spain to accede to plainly necessary reforms, had been ended by promises from Spain which were not kept. Revolt thenceforward was passive rather than active, but sure in time to break into activity, which it did in 1895. The commercial and social conditions begotten by chronic strife through so many years wrought not only upon the sympathies of the United States, but generated ill feeling which must always come when trade interests are deeply injured. Large property interests in the island itself were held by Americans, many of whom suffered most severely. By the end of 1897 the island had been brought to the verge of ruin. The insurgents, always strong in the east, had raided the west, burning canefields and destroying plantation buildings in the attempt to create a desolation which would make Cuba valueless to Spain. The Peninsular Government with more than 200,000 men in the island was making no headway against the insurgents. It had become clear, as Consul-General Lee reported to his government, that Spain was powerless to suppress the revolt, and the insurgents equally powerless against the Spanish occupation. A large proportion of the rural population had been brought within the Spanish lines by a decree of Governor-General Weyler, issued early in 1897. But the Spanish authorities could feed neither them nor their own troops. Destitution, starvation, and death to an appalling degree was the result; cultivation outside the Spanish lines practically ceased; the commonest necessaries of life had to be imported. Spain looked upon the situation as due largely to American sympathies and aid. No doubt the dogged persistence of the insurgents was due in a considerable degree to hopes of American intervention, but the fact is that the American government loyally did its duty in suppressing unlawful attempts to send aid from its territory. It could not suppress the general sentiment of the country for a much suffering population. The American government thus felt called upon to insist upon reforms which would restore something like the normal conditions of human society, and this pressure, united with the action of the Spanish liberals, caused to be enacted the law signed by the Queen Regent, November 1897, establishing a system of Cuban autonomy. General Blanco was sent in the beginning of 1898 as governor-general with the avowed object of pacification upon such lines. But the Spaniards and their friends in Cuba were opposed to the scheme as granting too much; the insurgents, as granting too little. Nor were the latter willing to continue the dominancy of Spain at any price. Nothing short of independence would be listened to. The attempt was thus doomed to failure. January 1898 was marked by serious military riots in Havana due to the opposition of the Spanish party to Blanco. In consequence of the supposed danger from these disturbances to American citizens, the Maine, which had been for some time at Key West and vicinity, engaged in looking after filibustering attempts, was sent to Havana. Her arrival gave fast offense. She dominated the city from her anchorage, and her coming was thus looked upon as a threat. Her destruction, 15 February, naturally laid by the American public at the door of the Spaniards, brought a state of excitement which, combined with the previous feeling, made war dangerously near. The Court of Inquiry of which Admiral (then Captain) Sampson was president, after sitting more than a month, rendered a finding that her destruction was due to an exterior mine. This finding was chiefly based upon the extraordinary manner in which the keel was forced up at the centre of the explosive effort, 34 feet above its normal position. As the ship settled but from four to six feet before touching bottom, it would seem impossible that any launching forward of the after body could have produced such an effect. Two other considerations add weight to the board's finding; the first, that the only ship of the American navy ever so destroyed had to wait to arrive in an unfriendly port before the catastrophe should be accomplished; the second, the wholly different effects of the explosion of the forward magazine of the Oquendo after the Santiago action. The finding of the board in no way implicated the Spanish government, and the writer, as a member of the board, can state explicitly that no member of the board held

such a view. It should be added that the very cursory and untrustworthy examination by the Spanish divers is shown by their report that the keel appeared to be intact.

Events thenceforward marched rapidly. Congress and the people of the United States both became very hostile in sentiment to Spain. As early as January the government had taken steps to cover eventualities, as far as the navy was concerned, by ordering that the time expired men should be retained, and after the Maine disaster, ships were concentrated; the North Atlantic squadron at Key West, the Asiatic squadron at Hongkong (ordered 25 February). Congress 9 March voted $50,000,000 for national defense; merchant vessels and yachts were purchased and armed; colliers and two hospital ships equipped; the four large ships of the American line taken over for service, and the two cruisers built at Elswick for Brazil, purchased and renamed the New Orleans and Albany; the latter, however, was not far enough advanced to be used during the war. An American merchant ship which had been converted into a cruiser by Brazil was also bought, as also the Diogenes of 1,800 tons, built for Peru and never delivered, renamed Topeka; a small torpedo boat purchased in Germany and named the Somers, which did not reach the United States until after the war. The treasury department turned over to the navy 15 revenue cutters and four lighthouse tenders, all of which did good service. Coal in quantities was forwarded to Key West, which rapidly assumed the prominence of an important naval base, the command of which was assigned to Commodore Remey. A squadron was formed at Hampton Roads of the Brooklyn (flag), and battleships Massachusetts and Texas, denominated the flying squadron with Commodore W. S. Schley in command.

The two navies stood as follows:

	United States		Spain	
	Nominal	Effective	Nominal	Effective
Battleships	5*	5	1	0
Armored Cruisers	2	2	6	4
Monitors	6	6	2†	
Protected Cruisers	13	8	5	4
Unprotected cruisers and gunboats	21	20	9	5
Torpedo gun vessels	1	1	11	10
Torpedo boat destroyers	0	0	6	6
Torpedo boats	6	6	12	3
Small gunboats	0	0	84‡	?

* One second class.
† Old iron-clads done over — non-effective.
‡ All but 20 of these last under 200 tons.

The war was necessarily to be mainly naval. Whoever should control the sea would win. Spain could only hold Cuba by being able to send thither troops and supplies. As Mahan well says: "A million of the best soldiers would have been powerless in face of hostile control of the sea." The United States could not invade Cuba unless the navy was strong enough to control the neighboring waters and make transport to and fro perfectly safe. Spain had, in the squadron under Rear Admiral Cervera, four fine armored ships of 20 knot speed and good armament, with which in speed and armament the United States had but two to cope, the New York and Brooklyn. So long as this squadron existed, Spain had a powerful military asset which would aid the war's continuance. The Carlos V. of like character was also counted, even by the Spanish Minister of Marine, as available, as also the Pelayo, a second-class battleship, overhauling at La Seyne (near Toulon) where she had been built. In the East were two squadrons, facing one another, but neither was of a character to play a decisive part in such a war; neither could face a squadron of armored ships without expecting destruction. The disquieting element to the United States was thus Cervera's squadron which it was expected at the time would be increased by at least the two other armored ships mentioned; and it was a reasonable disquiet. It was very possible for this squadron to have appeared upon the United States coast, causing much apprehension and some damage and to have taken refuge in Havana, to emerge again under the guns of what became, as time went on, powerful batteries. But as we know from Admiral Cervera's reports, the inefficiency of his ships made such action hopeless. Spain had started a small torpedo flotilla to Cuba in early March, but the sea was too rough for the smaller boats and all took refuge at the Cape Verdes, returning later, except the three torpedo boat destroyers, to Spain. The Vizcaya had been sent to New York in February as an offset to the visit of the Maine to Havana, whither she shortly went. She was joined there by her sister ship, the Oquendo, the arrival of the two adding greatly to the enthusiasm of the Spanish party. But this action was ill considered. Neither ship had been docked for many months, and when they left 1 April to go to the rendezvous east of Porto Rico to meet the expected torpedo flotilla and, failing the rendezvous, had to go to the Cape Verdes to join Cervera, they had crossed the Atlantic twice, had severely tried their engines and boilers, and had had no chance for a much needed overhauling of their machinery. They thus started on a third transatlantic journey, bottoms foul, machinery in bad condition and ill equipped in almost every respect except in gallant spirit, to meet a foe who was in the highest state of preparation. The advice and prophesies of Cervera were unheeded. When war had declared itself a large number of officers high in the navy met at Madrid 24 April and decided that his squadron should at once proceed to San Juan, Porto Rico, its later movements being left to his discretion. The decision revealed an utter lack of preconceived plan and ignorance of the conditions of the problem. The ultimatum signed by President McKinley 20 April 1898, demanding the withdrawal of Spain from Cuba was practically a declaration of war and the Spanish government sent the American minister his passport the next day without awaiting the presentation by him of the fateful resolution.

In the early morning of 22 April, Captain Sampson, then rear-admiral by the authority vested in the President in time of war, sailed with such of the ships as could be made ready to leave, with orders to blockade the Cuban ports. The ships at or near Key West which could be drawn upon for this first move were (armored) New York, Indiana, Iowa; (monitors) Puritan, Terror, Amphitrite; (cruisers)

Cincinnati, Marblehead, Detroit; (cruisers gunboats) Wilmington, Machias, Castine, Nashville, Newport, Helena, Dolphin, and auxiliary Mayflower; (torpedo boats) Dupont, Porter, Foote, Winslow, Cushing, and Ericsson; (armed tugs) Nezinscot, Samoset, the armed lighthouse tender Mangrove and supply steamer Fern. By the afternoon of 23 May, 20 of these were on the blockade, which was established from Cardenas, 85 miles east of Havana to Bahia Honda, 55 miles west. It had been Sampson's wish to attack Havana at once and the order of battle was prepared, but the navy department refused consent, holding that the heavy ships should not be risked against batteries until the Spanish squadron should be met. This was undoubtedly correct in principle, but Sampson's knowledge of the conditions was more complete than that of the officials in Washington and the writer is of the opinion now as then, that had Sampson had his way he would have taken Havana at once, without loss or serious injury to his fleet. It was his intention to go within 800 yards of the batteries, the water being extremely deep to the shore itself; it would have been impossible for the men in the batteries, exposed as they were, to stand to their guns under the fire of the multitude of small guns carried by the small ships. Sampson yielded to the department's views with great reluctance. Commodore Dewey, who had relieved Rear Admiral McNair in command of the Asiatic Station had concentrated, by order of the department of 25 February, all the ships of his squadron at Hongkong.

His squadron was composed of the

	Tons	Speed	Main Armament	
Olympia	5,870	21.6	4–8″; 6–6″	10–5″
Baltimore	4,413	20.		
Raleigh	3,183	19.	1–6″; 2–8″; 6–6″	10–5″
Boston	3,000	15.5		
Concord	1,710	17.3		
Petrel	892	13.7	4–6″	

The ships carried also 36 6- and 3-pounders, 40 smaller guns and 19 torpedo tubes; the crews numbered 1,743 men. The revenue cutter McCulloch, lately arrived, had been joined to the squadron, but, lightly armed, could not be considered as adding to his fighting force. At Manila, under Rear Admiral Montojo, were available for aetion the

	Tons	Speed	Main Armament	
Reina Cristina	3,090	16.0	6–6.2″	
Castilla	3,342	0.	4–5.9″	2–4.7″
Don Antonio de Ulloa	1,152	14.	2–4.7″ *	
Don Juan de Austria	1,152	14.	4–4.7″	
Isla de Cuba	1,040	15.9	6–4.7″	
Isla de Luzon	1,040	15.9	6–4.7″	
Marques del Duero	500	10.	2–4.7″	

* This ship's machinery was under repair and the other two guns of her main battery were mounted, one at El Fraile, the other at Saugley Point.

Two 2.9″, two 2.7″, 27 6- and 3-pounders, 19 smaller guns and 17 torpedo tubes, with crews amounting to 1,695 men, were carried by the ships just mentioned. Besides there were the Velasco of 1,139 tons with two of her four guns at El Fraile and two gunboats, the Correo and General Lezo of 525 tons and three 4.7″ guns each. All these were under repairs and took no part in the coming action, the crew of the Velasco manning the hastily built batteries at the entrance of the bay 25 miles from Manila. The Castilla, a wooden ship, built in 1881, had to be towed, as she could not use her engines. It must be admitted that the Spanish outlook was a sorry one and fully as hopeless as the report of Admiral Montojo indicates it to have been in his own mind.

The Baltimore had arrived at Hongkong 22 April, and was allowed by the Hongkong authorties to be docked. On the 25 the British governor requested Dewey to leave, and the squadron went to Mirs Bay, 30 miles distant on the China coast, where it awaited the arrival of O. F. Williams, the American consul to Manila, whose local knowledge was regarded valuable. He came 27 April and that afternoon the squadron left in accordance with the navy department's telegram, sent 24 April, announcing that war had begun and directing Dewey to "commence operations at once, particularly against the Spanish fleet. You must capture vessels or destroy." The telegram ended "Use utmost endeavors," words which might have been spared. On the same day that the American squadron went to Mirs Bay, Montojo left with the Reina Cristina, Castilla, Don Juan de Austria, Isla de Cuba, Isla de Luzon and the Marques del Duero for Subig Bay, an excellent defensive point 50 miles distant from Manila, and one where batteries had been begun by Spanish army engineers. The bay was the site of a proposed new Spanish naval arsenal, some buildings for which had already been erected. Montojo towed the Castilla. Three vessels had been sunk in the eastern entrance to Subig Bay and it had been hoped to hold the western with the batteries and ships. But the batteries were not ready. The failure of the admiral to have this knowledge beforehand was in itself a startling instance of the inefficiency of Spanish administration. Receiving a telegram 28 April that Dewey had left for Manila, Montojo held a council and returned, mooring in a general east and west line in Cañacao Bay, just north of the spit on which was the small naval arsenal and village of Cavite and abreast the small batteries mounting, on the sea front 4.7″ B. L.; on Sangley Point two-5″ .87 B. L.; at Cavite three-6″.2 muzzle loading rifles. The Spanish squadron was as well off there as anywhere. These guns were much better placed to aid it than would have been the guns at Manila had he chosen to lie near the town. At and near Manila were 36 guns; none of these were of great range and most were ineffective. There were, however, four 9″.45 breech loaders and eight of 4″.2 and 5″.87 converted to breech loaders, but his squadron would have had to lie so far from shore that their range would have been insufficient to protect it against the high power guns of the Americans.

Dewey arrived off Subig the afternoon of 30 April, reconnoitred Subig with three of his ships, and informed his captains assembled in consultation of his intention (the Spanish ships not being found in Subig) to stand on slowly and arrive at Manila at daybreak. He stood for the Boca Grande. The mouth of the bay, which is half way between Subig and Manila, is 10 nautical miles broad and divided by the island

Corregidor two miles from the mainland on the north, which thus forms the Boca Chica (narrow mouth). On the north side of this entrance were two batteries, one (Punta Gorda) mounted 7″ muzzle loading rifles, the lower, two 6″.2 B. L. Hontoria rifles. On Corregidor itself were three 7″ muzzle loaders looking north. Two miles southeast of Corregidor is Caballo island on which were three 5.″87 B. L. Armstrong rifles. Three and a half miles from Caballo is El Fraile, on which was a battery of three naval 4.″7 guns taken, two from the General Lexo, one from the Don Antonio de Ulloa. All these batteries were built and manned by the navy. There were no torpedoes, the channel being too broad and deep for mining. The squadron naturally selected the broad passage between El Fraile and Caballo, which was reached at midnight. Signals from Corregidor showed that they were discovered and two shots were fired from El Fraile which were answered by three of the ships, and the squadron headed at slow speed for Manila, 25 miles distant. At 5.15 it was fired at from the Manila and Cavite batteries as it approached; the Spanish ships being sighted to the southward, the American squadron turned south and opened fire at 5.41. The ships moved in column three times west and two east, about parallel to the Spanish line and at ranges varying from 5,000 to 2,000 yards. At 7 the Spanish flagship made a futile effort to leave the line and attack, and at 7.35, it being erroneously reported that but 15 rounds per gun remained for the 5″ battery, the American squadron hauled off and the commanding officers called aboard the flagship for consultation. The crews were given breakfast. Nothing was known at the moment of the effect of the attack, but somewhat later this was evident when the two largest Spanish ships were seen to be afire. Being assured as to the ammunition supply, the attack was renewed at 11.16 and continued until 12.40 when the American squadron returned and anchored off Manila. The Reina Cristina, Castilla and Don Antonio de Ulloa had sunk; all the others were burned by a party sent in from the Petrel after resistance had ceased and the ships been abandoned. The Spanish loss was 167 killed and 214 wounded; there were of the Americans 7 slightly wounded. While the American squadron was much more powerful, the difference in character of ships and numbers of types of guns cannot account for this immunity from loss on the American side. All the ships were vulnerable to all but the very lightest of the Spanish guns. The only reasonable supposition is that the Spanish by want of practice and through temperamental excitability, could not shoot with any accuracy whatever. There was courage in abundance, but no training.

Dewey made no effort to capture the city of Manila, as he had no troops to hold it. No further firing took place. Cavite arsenal was taken possession of and a blockade of Manila established. He lifted and cut the telegraph cable, but the Hongkong office of the cable company refused to take his messages as vitiating its contract with the Spanish government. It was thus necessary to send a ship to Hongkong to cable thence. The McCulloch coaled and left 5 May, and arrived at Hongkong the 7th with the official information of the victory. There was a period of quiet waiting for the troops and ships, varied with rumors of the despatch a fleet from Spain and by the arrival of Aguinaldo and the organization of a Filipino army which was later to give much trouble. The first American troops, 2,500 in number, reached Luzon 30 June accompanied by the cruiser Charleston, which took over the surrender of Guam en route; the second expedition of 3,500 arrived 16 July. Dewey in the meantime was rendered anxious by the departure from Cadiz 16 June of the Spanish squadron under Admiral Camara. This consisted of the second-class battleship Pelayo, the armored cruiser Carlos V., three destroyers, three armed liners (two of which had been purchased from the Hamburg line) and four transports. The expedition was in reality as ill advised as any other act of the Spanish ministry of marine. There were but two ships of any power and one of these slow; the rest, excepting the destroyers, were powerless for offense or defense. The battle of Santiago, which left Spain's coast open to the attack of the squadron which was formed to go through the Mediterranean, settled the question of their return, which was ordered from Spain 7 July. An expenditure of $320,000 for the benefit of the canal company was the main result of the expedition. In any case the arrival of the Monterey 4 August and the Monadnock 16 August, very effective ships in smooth water, removed any anxiety on the part of the American commander. While much was to come in the Philippines, the battle of 1 May practically determined that they were lost to Spain unless she should succeed in destroying the American fleet in the Atlantic; should she do this the question of final command in Asian waters could easily wait. The loss of the Philippines could have no determining effect (valuable as the result was in prestige and in setting to rest any question of a European concert of intervention) so long as Spain could keep open her communications with Cuba, relinquishment of Spanish authority in which had been announced in the Congressional resolution of 20 April as the object of American action. In the Atlantic was her only battle squadron; so long as this was in being, so long would the war continue.

Cervera left the Cape Verdes with his four armored cruisers and three destroyers 29 April. This was known at the navy department the same day and the news at once transmitted to Sampson. The latter determined to go eastward with the main part of the battle portion of his fleet. He obtained the consent of the department, coaled his ships and 4 May left with the New York, Iowa and Indiana, the monitors Amphitrite and Terror, the cruisers Montgomery and Detroit, torpedo boat Porter, tug Wompatuck and collier Niagara. He had calculated to reach San Juan by the 8th, judging that by this date the Spanish squadron would be in that longitude and premising with his usual excellent judgment that San Juan was their objective, as was the case. Should he not find them at San Juan it was his intention to at once return to Havana, after making an effort to occupy San Juan and leaving the monitors there in occupancy, to hold it against the Spanish squadron should it appear later. Continuous breakdowns of the monitors, which had to be towed a great part of the way, and of the Indiana, so delayed the squadron that it was not off San Juan until

the early morning of 12 May. No Spanish ships were there. The fortifications were, however, assailed by the squadron in an active bombardment of three hours, in which, on the American side, one man was killed and four wounded. On the Spanish side eight were killed and 20 wounded. There is little doubt, as is known from Spanish officers present, that the place would have been yielded had the attack been a little longer continued, not through actual damage but through pressure from a population frantic with fear. Sampson, however, yielded to the arguments regarding the necessity of holding the fighting ships intact to meet the Spanish fleet, and started westward.

The day previous to that of the action at San Juan, occurred, as far as loss of life was concerned, two of the most serious fights of the war; one in connection with the cable cutting at Cienfuegos; the other at Cardenas; both were most gallant deeds. The four launches (including two steamers) of the Marblehead and Nashville, under the immediate charge of Lieutenant Winslow, were employed in the former operation, which was carried on in the early morning within a few yards of the beach under a covering fire from the ships in a rough sea and under a severe rifle fire from shore. Three hours were spent in lifting the cables, two of which were cut; a third was lifted but as it was thought to be a small cable connecting the destroyed cables with Cienfuegos and thus useless, it was left uncut, it being thought advisable not to delay for the purpose under the heavy and increasing fire. Lieutenant Cameron McR. Winslow and 12 men were wounded, two of the men mortally. At Cardenas, which was blockaded by the Machias, Wilmington, the revenue cutter Hudson and the torpedo boat Winslow, it was determined to attack the three Spanish gunboats in the port, which is extremely shallow and difficult of access to larger vessels. The Winslow, leading, had approached the town within a mile when fire was opened by the Spanish battery and gunboats. Though supported by the other ships, the Winslow armed only with three one-pounder guns could not make much return. The Spanish fire was concentrated upon her, her steering gear and one engine injured and a shell exploded in one of her boilers. She became helpless and drifted shoreward. The Hudson, the lightest of the three other vessels, gallantly went to her aid and towed her into safety, but not before the Winslow's commander, Lieutenant Bernadou, had been wounded, and a little later, Ensign Bagley and two seamen killed and two others mortally wounded by a shell which exploded on the deck. Her use for such a purpose was, of course, not justified, and the same might be said of much of the employment of these frail crafts during the war, the paucity of vessels and the necessities of the service making such misapplication unavoidable.

Sampson, standing westward with his slow squadron, received the firt news of Cervera's arrival in the Caribbean at 3.30 A.M. 15 May while off Porto Plata, San Domingo. He then learned that Cervera was on the 14th off Curacao, and that the destroyer Terror was at Martinique. The telegram announcing this directed him to proceed with all possible dispatch to Key West, whither Commodore Schley's squadron was also ordered from Hampton Roads. Cervera's slowness of movement had been a surprise to all concerned on the American side at least. The two large liners Harvard and Saint Louis had been despatched, on his departure from the Cape Verdes, to cruise on a line 73 miles north and south about 100 miles east of Martinique, until noon of 10 May. Had the orders read until 11 May, they would in all probability have sighted the Spanish squadron at sea. As it was the Harvard reached Saint Pierre, Martinique, at 9 A.M. of the 11th and the destroyer Furor, Fort de France, the capital of the island, at 5 P.M. The news reached the navy department early 12 May by telegram from Captain Cotton of the Harvard. The broken-down destroyer Terror came into Fort de France next morning and remained there until 25 May when she went to San Juan, where she will be later heard from. The presence of Sampson at San Juan changed Cervera's course. Had the American squadron been slower by two or three days in reaching San Juan, Sampson's surmise would have proved correct. He would have found and destroyed the Spanish ships there, where they were ordered to go, instead of at Santiago. Cervera's information regarding Sampson's movements caused him to shape his course from Curaçao, 290 miles away, in hope of obtaining much needed coal, and picking up the vagrant colliers Roath, Twickenham and Restormel, which had been chartered by Spain. These, however, failed him, but the Curacao authorities allowed him 500 tons for the Teresa and Vizcaya, and he was enabled to obtain fresh provisions. At 5.15 P.M. 15 May he left for Santiago de Cuba. The Saint Louis which had joined Sampson the morning of 15 May, was ordered with the armed tug Wompatuck to Santiago to cut cables, and left the squadron for that port almost at the same hour as Cervera. Captain Goodrich, commanding the expedition, succeeded 18 May in cutting one cable in over 500 fathoms of water, engaging the batteries at the same time. Having succeeded, as he supposed (mistakenly), in destroying the Santiago-Jamaica connection, he left for Guantanamo for the purpose of destroying the French cable leading from there, but an engagement of 40 minutes with the Spanish gunboat Sandoval compelled him to desist, the very vulnerable character of his own ship, wholly unfitted for fighting, rendering this necessary. At this time, 8 A.M., 19 May, Cervera was entering Santiago Harbor only 40 miles away, having taken three and a half days to traverse the 600 miles from Curaçao. Sampson reached Key West at 4 P.M. of the 18th and found Commodore Schley's squadron, which had arrived at midnight. All but the smallest vessel off Cienfuegos were ordered by the navy department to be withdrawn. The telegrams received showed that the Washington authorities were convinced by information received that the Spanish squadron was supposed to carry munitions of war essential to the defense of Havana, and that it must reach this port or one connected by rail with it, notably Cienfuegos. The flying squadron was thus, with such additional armored and other vessels as Sampson should judge suitable, to proceed to Cienfuegos, Havana being covered by the remainder of the fleet. Sampson was to have choice of command off Cienfuegos or Havana; Schley, however, to keep the flying squadron. He generously gave the opportunity to Schley, who having coaled, sailed

on the forenoon of the 19th with the Brooklyn, Massachusetts, Texas and Scorpion with orders to establish a blockade at Cienfuegos with the least possible delay. Shortly after leaving Key West he passed the Marblehead and Eagle returning from Cienfuegos, Commander McCalla of the Marblehead having withdrawn the whole force on his own responsibility. McCalla communicated the situation there by sending the Eagle to speak the Scorpion. Much was made of his failure to mention an arrangement of signals he had made with the considerable Cuban force west of the harbor in case these latter wished to communicate, but as will be seen later this was of no consequence. The Iowa, the collier Merrimac, the Castine and the torpedo boat Dupont left on the forenoon of the 20th to join Commodore Schley, thus making a force much more than able to meet the Spanish squadron. A telegram was received from the navy department at 12.30 A.M. of this day saying, "The report of the Spanish fleet at Santiago de Cuba might very well be correct; so the department strongly advises that you send immediately by the Iowa to Schley to proceed off Santiago with his whole command, leaving one small vessel off Cienfuegos . . ." The peculiar phraseology of the telegram, taken in connection with the Navy Department's insistence upon the necessity of Cervera's coming within reach of Havana, caused doubt in Sampson's mind, and he thus determined to hold the *status quo* until further information should be obtained. He thus wrote Commodore Schley to that effect, sending the despatch by the Iowa and a duplicate by the Dupont, which vessels also carried copies of a memorandum prepared by Commander McCalla regarding the Cuban forces west of Cienfuegos which showed that he had communicated with them, and mentioning a convenient landing place some 13 miles from the port. Events were, however, moving rapidly. Lieutenant Staunton, Assistant Chief of Staff, while in Key West in the forenoon of this day was told by Captain Allen, the signal officer in charge of the Key West telegraph office, that he had received the night before (19th), after 6 P.M., through an employee in the Havana office, a dispatch stating that Cervera had entered Santiago that morning with his squadron. This reached Washington as qualified by the word "probably" which no doubt caused the phraseology mentioned in the dispatch to Sampson. Captain Allen stated that his correspondent would thus send dispatches nightly after 6, and Staunton arranged to go back that evening (20th) for corroboration. This coming, a dispatch was prepared, as soon as Staunton returned with the information, to go by the Marblehead, supposed ready to leave for Cienfuegos, saying, "Spanish squadron probably at Santiago de Cuba —4 ships and 3 torpedo boat destroyers. If you are satisfied that they are not at Cienfuegos, proceed with all despatch, but cautiously, to Santiago de Cuba, and if the enemy is there, blockade him in port. . . ." As it appeared during the night that the Marblehead might be delayed, Sampson upon arrival off Havana in the afternoon (21 May) sent the Hawk as the fastest of the squadron with a copy of the despatch, and an additional memorandum, the tenor of which urged the utmost despatch as did also the verbal instructions which Lieutenant Hood of the Hawk, was ordered to communicate. Sampson moved with the available force on the north side of Cuba to Nicolas Channel, in order to have an advanced position in case Cervera should move toward Havana from the east. Hood arrived off Cienfuegos at 7.30 A.M. 23 May, delivered his dispatches and repeated the verbal instructions. He returned the same day, reaching Havana 25 May with dispatches from Schley which reached Sampson at 9.30 P.M. of the 26th by the Dolphin, whose failure to pick up the squadron earlier was a startling instance of the difficulty of finding even a large force at sea. Schley wrote that he was by no means satisfied that the Spanish squadron was not at Cienfuegos, giving a number of reasons for his belief, one of which was his having heard guns the afternoon of 21 May (when about 40 miles from Cienfuegos), which he took to be a welcome to the Spanish fleet. Lights, which turned out to be signals by the Cubans as arranged with Commander McCalla, had been seen to the westward of the harbor, but this arrangement, not having been communicated to Commodore Schley, was not acted upon, though the fact of the presence of Cuban troops in that vicinity was known from the memorandum previously mentioned. The report of Captain Dayton of 20 July when blockading Cienfuegos would seem to show that it was not necessary to apply to the Cubans for knowledge regarding ships in the harbor. Dayton says (p. 219 Appendix to Report of Chief of Bureau of Navigation 1898) "During the afternoon I made as close an inspection [of Cienfuegos Harbor] as practicable. From aloft could detect in the inner harbor four large steamers flying Spanish colors, one with four masts and one smoke stack, one with three masts and one smoke stack, and two with two masts and one smoke stack; also two fair-sized gunboats, the larger being apparently of the Esmeralda class. . . . The four-masted steamer was surrounded by lighters and appeared to be discharging cargo."

The arrival of Commander McCalla, however (with the Marblehead, 24 May), who at once found the Cubans at the point which had been designated in his memorandum settled the fact that Cervera was not at Cienfuegos. Commodore Schley thus left that evening with his squadron, making, however, such slow progress that he was not off Santiago, 315 miles from Cienfuegos, until the afternoon of 26 May. The Yale, Saint Paul and Minneapolis were at the moment off Santiago by orders of the Navy Department to watch the port, and on the morning of 25 May the Saint Paul had captured the British collier Restormel with 2,400 tons of coal which had already touched at Porto Rico and Curaçao from which latter place she had been ordered to Santiago. The Harvard which had also been there had gone to Saint Nicolas Mole to send a dispatch received by the Scorpion 24 May from Commodore Schley. The three other ships, sighting the smoke of a number of ships to the south, had steamed in that direction, thus leaving the port without any observing ship, a fact which as will appear later might have had most serious consequences. It was found that Commodore Schley had determined to return to Key West and at 7.45 P.M., signal being made to that effect, the squadron headed westward with the collier Merrimac in tow of the Yale. The frequent breaking of the towline caused little prog-

ress to be made. The Harvard on the morning of 27 May reached the squadron and delivered a telegram received from the Navy Department at Saint Nicolas Mole the preceding morning (26 May), the more important part of which was that directing him to proceed at once and inform Schley and also the senior officer present off Santiago de Cuba as follows: "All Department's information indicates the Spanish division is still at Santiago de Cuba. The Department looks to you to ascertain fact and that the enemy, if therein, does not leave without a decisive action. . . ." This was answered (sending the Harvard to Kingston for this purpose and for coal) in a telegram, the main parts of which are as follows. ". . . . Merrimac's engine is disabled and she is helpless; am obliged to have her towed to Key West. Have been absolutely unable to coal the Texas, Marblehead, Vixen and Brooklyn from collier owing to very rough seas and boisterous weather since leaving Key West. Brooklyn is the only one in squadron having more than sufficient coal to reach Key West. Impossible to remain off Santiago in present state of coal account of squadron. . . . It is to be regretted that the Department's orders cannot be obeyed, earnestly as we have all striven to that end. I am forced to return to Key West via Yucatan passage for coal. Can ascertain nothing certain concerning enemy. . . ." This was a very unhappy telegram in view of the facts that the Iowa, Massachusetts, Castine and Dupont had coaled from the collier at various times and that the Texas and Marblehead took coal the evening of the day the despatch was sent; that while it was but 790 miles to Key West, the Massachusetts had sufficient coal to steam at 10 knots, 2,371 miles; the Iowa, 2,028; the Texas, 1,459. The Brooklyn had enough to have blockaded 32 days, the Massachusetts, 24; the Iowa, 18; the Texas, 14, and the Marblehead about 6 days and still have enough to go to Gonaives Bay in Hayti (Testimony Schley Court of Inquiry, p. 535). There was, moreover, the splendid and commodious harbor of Guantanamo but 40 miles east of Santiago, to be had, so to speak, for the asking. Had the squadron gone to Key West, it would still have had to coal at an anchorage in the open sea. Nor was any real endeavor made to get information as to the presence of the Spanish squadron. Most fortunately the next day, 28 May, Commodore Schley now 38 miles west of Santiago, decided to return and go off the port. He arrived there the same evening and the question of the presence of the Spanish squadron was fixed by discovering the Colon moored near the harbor entrance; and another man-of-war and two destroyers near her. Cervera had been twice on the point of leaving Santiago for San Juan, Porto Rico, and steam was actually got up on the evening of 26 May, and every preparation made to leave, when his heart failed him at the report that the swell was sufficient to cause danger of the Colon's striking a rock off Point Morillo on which there was but 2½ feet of water more than the Colon drew. With the American squadron so far (20 miles at 8 P.M.) to the south and with the intended departure so near nightfall, it is very probable the Spanish squadron would have got away unnoticed. There is no need to dwell upon the sensation such an escape would have made.

Schley's telegram of 27 May produced consternation at Washington. Sampson on the north side of Cuba had occupied Nicolas Channel 25 May. The force in the beginning was a very meagre one, the New York and Indiana being the only armored ships; with these were the gunboats, Newport, Vicksburg, Mayflower, Machias, and the torpedo boats Rodgers and Foote. If the Spanish squadron should be met it was expected that the gunboats should be sacrificed in the general attack. In the afternoon of the same day, however, the fast and excellently armed cruiser New Orleans joined, and by the 25th were added the Montgomery (with the broad pennant of Commodore Watson), the Cincinnati, Detroit, Miantonomoh, Puritan, Terror, Amphitrite, Wilmington, Wasp and Vesuvius; a powerful force if the Spanish squadron would only wait an attack, but amounting to little if it should use its speed to escape. This heterogeneous collection of ships was fitly called by the men the "Bargain Counter" squadron. The despatches brought by the Dolphin in the night of 26 May, announcing that Commodore Schley had not moved from Cienfuegos, caused the Wasp to be despatched to him with an order to proceed "with all possible dispatch to Santiago to blockade that port. If on arrival there you receive positive information of the Spanish ships having left, you will follow them in pursuit." This, of course, was not delivered, the Wasp having found that Commodore Schley had already gone. Sampson supposed this might be the case, as appears in his telegram of 27 May to Washington, and his supposition was confirmed by a telegram sent by the torpedo boat Dupont 24 May by Commodore Schley to Key West for transmission to Washington, in which he mentioned that he would "move eastward tomorrow" (25th), though in fact he left that night. The mention of this delay, however, decided Sampson to go himself to Santiago. The New Orleans was ordered there with the collier Stirling, and her commander, Captain Folger, was ordered to communicate with Schley "and direct him to remain on the blockade of Santiago at all hazards, assuming that the Spanish vessels are in that port." He also carried directions to use the Merrimac to block the harbor entrance, a suggestion for doing so also coming from the Navy Department. Though somewhat criticised, this was wise from the point of view at the time. The telegram of the secretary of the navy of 5 May directed Sampson not to so risk his ships against fortifications "as to prevent from soon afterward successfully fighting the Spanish fleet composed of the Pelayo, Colon, Teresa and four torpedo boat destroyers if they should appear on this side." Spanish reinforcements were thus regarded possible; there were two destroyers in Santiago and the danger to ships on blockade of being torpedoed would be constant; to hermetically seal a powerful squadron in the port, the entrance channel to which was less in breadth than the length of a ship of moderate size, thus leaving our own force free for other operations, was sound policy and so held by every one consulted.

Sampson arrived at Key West at 2 A.M. 28 May and found the Oregon, which had completed her brilliant voyage of 16,000 miles, 26 May. She was reported ready for any service and left during the day for the squadron in Nicolas

Channel. At 8 Sampson received the telegram announcing the intention to send 10,000 troops to Santiago and that he was expected to convoy the transports, going in person; but about midnight the Department's telegram arrived, reporting Schley's intention, expressed in his telegram of the 27th, to return to Key West, and asking Sampson how soon he could reach Santiago with the New York, Oregon, Indiana and some lighter vessels, and how long he could blockade there, sending his ships singly to a coaling point. Sampson answered this at 3 A.M. (29th), that he could reach Santiago in three days and could blockade indefinitely; that he thought he could occupy Guantanamo; and that he "would like to start at once with the New York and Oregon, arriving in two days. Do not quite understand as to the necessity of awaiting the arrival of Schley but would propose meeting and turning back the principal part of the force under his command if he has left. Try to hold him by telegraph. Watson will be in charge of everything afloat. Does the Department approve proposed action?" About noon, no reply having been received, Sampson sent another telegram urging immediate reply. A little later came one from Commodore Schley direct and also the substance of the same repeated from the Navy Department, showing that he had arrived off Santiago and that he would remain "until coal supply of larger vessels has given out . . . "; and also announcing the capture of the collier Restormel by the Saint Paul. Sampson replied to this "Congratulate you on success. Maintain close blockade at all hazards, especially at night; very little to fear from torpedo boat destroyers. Coal in open sea whenever conditions permit. Send a ship to Guantanamo with view to occupying it as base, coaling one heavy ship at a time. Appraise captured coal, use if desired and afterward send ship in as prize."

In the afternoon the desired permission to go to Santiago was received, and at 11 P.M. the New York, having finished coaling, left for Nicolas Channel, reaching the squadron at 7 A.M. Commodore Watson was conferred with and at 9.07, signal being made to the Oregon, Mayflower and torpedo boat Porter to form column on the New York, Sampson stood eastward at 13 knots. The squadron arrived off Santiago at 6 A.M. 1 June (in less than two days) having met in the Bahama Channel the Yale and Saint Paul. From Captain Sigsbee of the latter, the admiral received copies of several telegrams from Commodore Schley taken by the Saint Paul to Nicolas Mole, which showed that the enemy's ships had been seen in port, and that the situation would be held. As the squadron arrived, the Colon and one of the Vizcaya class were seen about seven eighths of a mile within the entrance, but they moved out of sight almost at once, which, in the case of the Colon, could be done without unmooring, by veering the hawsers attached to the shore and heaving in on her chain, the distance to go to take her out of view being very slight (her log mentions leaving her moorings at this point at 10.35 A.M.). The day previous (21 May) Commodore Schley had gone aboard the Massachusetts and with the Iowa and New Orleans had fired upon the Colon and the batteries at the entrance. The ships passed the entrance twice at a speed of 10 knots and the ranges, as stated in the Iowa's log, at first 8,500 yards, increasing to 11,000. The total time of firing stated by the Massachusetts was 7 minutes 35 seconds. One shell, reported in the Colon's log as exploding near the stern, did some slight damage, but a battle between ships at the ranges reported in the log of the Iowa, 8,500 to 11,000 yards (from nearly 5 to over 6 miles), or even at 7,000 (4 miles), the range first proposed, and lasting the time reported by the Massachusetts, could not be effective.

Sampson at once made preparations for sinking the Merrimac, Naval Constructor Hobson being put in charge, as he had been previously directed, as an expert, to study the question of the best steps to be taken to sink her quickly. Hobson was finally allowed to take the ship in. Many were as eager to go as he, the officers and men volunteering by the hundreds, but Sampson was moved to let it fall to Hobson from a sense of fairness, in that he had done the whole work of preparation. It was breaking day when the ship finally started and it became so light that she was recalled and sent in the night following; but her steering gear being shot away, she drifted, before sinking, too far up the channel to block it in any degree. Had her bow taken the east side of the channel at the point proposed, her stern would have swung with the tide (running flood) in such a way that the channel would have been closed almost as a caisson closes a dry dock. It was fortunate, of course, in the light of events that it was otherwise. Hobson in his graphic and most excellent account says that he would more certainly have succeeded had he not been recalled on his first start. The writer is now inclined to agree with him and rather the more as an amend for his share in causing his recall. But the fame of an heroic act is Hobson's all the same, and the failure made the third of July victory possible.

Sampson on arrival had found the Flying Squadron moving in column east and west in face of the port. He changed this, placing the ships with their heads toward the harbor entrance on a six-mile radius, which made a semicircle of about 9 miles. (This was later reduced to 4 during the day and 3 at night, with much less for certain ships.) An order of battle was issued 2 June dividing the fleet into two squadrons, one (to the east) under the personal command of the commander-in-chief, the other (to the west) under Commodore Schley. This order enjoined: "If the enemy tries to escape, the ships must close and engage as soon as possible and endeavor to sink his vessels or force them to run ashore in the channel. It is not considered that the shore batteries are of sufficient power to do any material injury to battleships." On 6 June the batteries were actively bombarded. The next day Guantanamo Bay was occupied by the Marblehead and Yankee and thenceforward was Sampson's base; the fort at the head of the deep water bay was destroyed 15 June by the Texas, Marblehead, and Suwanee, the two former coming in contact each with a heavy gun cotton mine, but, in the pious language of Captain Philip, in his report, "owing to Divine care neither of them exploded." While every combatant is ready to suppose Providence on his side, some credit ought to be given to the barnacles which had grown so actively that the mine machinery could not operate. On the 10th, the marine battalion arrived in the Panther and at once

went into camp, where from 11 May to the 14th it underwent a severe fire from the enemy, occupying a commanding position, in which some lives were lost. On the 14th, however, a force of two companies of marines and 50 Cubans, under Captain Elliott, attacked some 500 of the Spanish and destroyed their only water supply from which time the bay and vicinity remained undisturbed, though there was a force of over 7,000 Spanish at and near Guantanamo town, 12 miles from the bay head.

On 7 June a memorandum for night duty was issued ordering three picket launches to be placed 1 mile from the Morro, the Vixen, Suwanee and Dolphin on a 2-mile radius from the Morro, the larger ships to come within a 4-mile radius. The memorandum continued: "I again call attention to the absolute necessity of a close blockade of this port, especially at night and in bad weather. In the daytime, if clear, the distance shall not be greater than 6 miles; at night, or in thick weather, not more than 4 miles. The end to be attained justifies the risk of torpedo attack, and that risk must be taken. The escape of the Spanish vessels at this juncture would be a serious blow to our prestige and to a speedy end of the war. . . ." Memorandum No. 14, issued the next day (8 June), had a most important bearing upon the final successful result. It directed the battleships to take turns of 2 hours each, beginning at dark, in illuminating the harbor entrance with a search light. Later a second battleship was kept close to the illuminating ship so that the former could do any firing necessary without disturbing the illumination. The ship using the search light was kept not beyond two miles from the Morro and was frequently nearer. The effect was a complete lighting up of the harbor entrance, making it impossible for the smallest craft to appear without being seen. It was the main element, as Admiral Cervera mentions, in preventing any attempt to leave at night. Memorandum 20 of 15 June directed that the distance of 4 miles from the entrance during daytime should under no circumstances, even when coaling, be exceeded. The next day the batteries were again bombarded. It was clear to the admiral's mind that in themselves they were not to be taken as a serious obstruction to the fleet. The Vesuvius had arrived 13 June and from this time forward for many nights shook the vicinity with the explosions of her shells. While it cannot be said that they produced much actual damage, as there was so little to sustain damage, the batteries being but small objects for such practice, they certainly had a very marked moral effect upon those in the vicinity of their fall, the Pluton, by Spanish accounts, being so violently lifted once that every one was thrown off his feet. The New Orleans and Texas had each by order of the Admiral engaged singly the batteries and it was clear that they alone were not an obstruction to the fleet; but the mines had to be reckoned with and Sampson urged the sending of the army, telegraphing that with 10,000 men the city and squadron could be captured in 48 hours. His only view of the case, and the correct one, was to land in the vicinity of the entrance, capture the batteries and occupy the adjacent positions, so that the fleet could at leisure lift or destroy the mines and enter the harbor.

When the war came the regular army of the United States had but 2,116 officers and 25,706 enlisted men. There were 25 regiments of infantry, 10 of cavalry and 5 of artillery. The bill approved 22 April declared all able-bodied male citizens from 18 to 45 liable to military duty; that the President might call upon each State and Territory for troops in proportion to its population; that the regimental and company officers should be named by the governors of the States, the general and staff officers by the President. On 23 April a call was made for 25,000 men. On 26 April additional enlistments in the regular army were authorized temporarily to a total of 62,597 men. In May the enrollments amounted to 124,776 men. A second call 25 May for 75,000 caused the volunteer army to reach in August its highest number, 216,256. Immediate steps were taken by the War Department towards concentration, chiefly at Chickamauga, Tenn., Camp Alger, Va., and at Tampa, Fla.; the last being selected as the point of departure of the invading force for Cuba, though many, including its General-in-Chief advocated strongly making no move to invade the island until October on account of its supposed deadly summer climate. Historical precedents were brought to bear showing the fearful losses of expeditions of earlier centuries; with as much reason might one have deprecated living in London because it once suffered from the plague. It was, as we came to know from the experience of the marines at Guantanamo, a question of care; but this care could not be given without experience on the part of officers and men, and the officers of the regular force were too few to count as against the rawness and ignorance of the vastly greater number of volunteer officers who had never known anything of the care of troops. The zeal and spirit of the army of volunteers, composed, as much of it was, of the best blood and intelligence of the country, were far from being an offset to their inexperience in the field. The army corps numbered eight, but the sixth was never organized. The fifth, under Major-General Shafter, at Tampa, numbering about 15,000 men; and a part of the eighth, Major-General Merritt (some 11,000 out of a total of 16,000 at San Francisco) were those actively employed before hostilities ceased. Shafter received orders 9 May "to move his command under protection of the navy and seize and hold Mariel on the north coast of Cuba, where territory is ample to land and deploy army," troops to be fully equipped, abundance of ammunition and food for men and animals for 60 days. Such orders indeed point a moral in the circumstances, and in themselves stand an all sufficient reason for the general staff now in being. An expedition under Colonel R. H. Hall had landed some arms and supplies for the insurgents and this was followed 11 May with one under Captain Dorst with 100 men of the 1st infantry who attempted a landing 40 miles west of Havana but were repulsed. The failure was due partially to newspaper publicity, partially to the use of the Gussie, a very conspicuous and rather ridiculous looking side wheel steamer, as well known along the Cuban shore as Morro Castle. Sampson received a telegram 28 May announcing the intention to send 10,000 troops to Santiago which he was expected to convoy in person, and the War Department had at once begun to collect transports at Tampa. General

Shafter telegraphed 1 June that he was progressing rapidly with loading transports and that he expected to be ready to start Saturday morning (4 June). The gunboats Annapolis, Helena, Castine, and Hornet were at Tampa; when all should be ready the fleet to rendezvous to westward of Dry Tortugas, where it was to be met by the battleship Indiana, the Detroit, Bancroft, Manning, Wasp, armed tugs Wompatuck and Osceola; the whole naval force to be under the command of the senior officer, Captain Taylor of the Indiana. On 9 June, however, Sampson received a despatch from Key West via Nicolas Mole that the armed yacht Eagle had on the night of 7 June, when 15 miles north one-half east of Bahia de Cadiz light, sighted to the north northwest an armored ship, a protected cruiser, and two destroyers in fleet formation, and that the Eagle had scouted abreast "until character of Spanish vessels was ascertained. . . One deep sea torpedo vessel chased Eagle for a short time. . . . Resolute confirms it." The next day Sampson received a telegram from the Navy Department that the army expedition was stopped temporarily on account of the report Eagle and Resolute; that the convoy was distributed to scour the straits and re-enforce the blockade, and he was directed to send two of his fastest armored ships to search through Nicolas Channel, and then reenforce the convoy. The telegram asked "Are you sure all four Spanish armored cruisers are at Santiago?" The only action taken by Sampson was to telegraph that he had no confidence in the report and that he considered it very unwise to suspend operations on this account, "but even if it is found correct there is sufficient force to furnish convoy. Armored vessel was probably Talbot which was sighted Thursday at 9 A.M. by the Scorpion standing east; am confident no large ship escaped from here. . . ." His view was correct, the armored ship as is now known was the English cruiser Talbot which left Havana that evening and was sighted by the Eagle at the same time with the Armeria and Supply under convoy of the Scorpion. Sampson sent for the log of the Scorpion, determined her position at the time and so telegraphed the Navy Department. To set the matter completely at rest Lieutenant Blue, who volunteered for the service, was landed 11 June at Aserradero, 15 miles west of Santiago, whence he went inland with guides furnished by General Rabi to a hill overlooking Santiago Bay. He reported aboard his ship, the Suwanee, again the morning of the 13th, after a journey of 70 miles (the same officer made a similar journey 25 June to locate each ship). Sampson's telegram and Blue's report fixed the question of starting the army expedition and on the 14th the force, 819 officers and 15,058 men, was under way. There is no need to dwell upon the shortcomings of transport or organization for the movement of so large a body of men over sea; such difficulties are the natural outcome of the want of organization which existed for so many years. Almost the worst feature of the whole was the clothing worn; the men landed in the tropics in that in which they came from our coldest climates. The expedition arrived off Santiago the morning of 20 June, stopping by arrangement 20 miles south of the port. Captain Chadwick, Chief of Staff, was sent by Admiral Sampson in the Gloucester to see General Shafter, and took with him a chart of the harbor to explain to Shafter Sampson's views with regard to his proposed assault and capture of the harbor entrance in order that the fleet might enter. General Shafter at the time entirely agreed with this view, as indeed his orders of 31 May from the War Department suggested. His ship, the Segurança, then steamed up to the squadron; Sampson and his assistant Chief of Staff, Staunton, came aboard and a visit was paid to Garcia's camp near Aserradero. General Shafter apparently dropped the scheme of assaulting the batteries and determined to land at Daiquiri, 17 miles east of Santiago, used as a port for the shipment of ore by an American mining company. There were, however, no conveniences for landing, beyond a very small wooden wharf; the place was a mere indentation in the coast line giving some protection from the usual southeast swell. Captain Goodrich of the Saint Louis was put in charge of the landing beginning 22 June, a task which was executed with great success. In all 29 boats, of which 12 were steam launches, were furnished from the fleet besides the 23 of the Saint Louis. A feint was made by the fleet and 10 of the transports of disembarking at Cabañas Bay, two miles west of the harbor. General Rabi with 500 Cubans was also to make a demonstration near by. The New Orleans, Detroit, Castine and Wasp were stationed off Daiquiri, the Helena, Bancroft and Hornet at Siboney (7 miles nearer Santiago than Daiquiri), the Gloucester and Eagle at Aguadores (3 miles east of the port) and the Texas, Vixen and Scorpion at Cabañas; the extent of coast line covered was 32 miles. Great difficulty was experienced through the wretched conduct of many of the transport captains who were under no proper control and wandered over the sea at will. Hours were spent in finding some of them, and when found they would insist upon lying miles from a shore which they could have approached with safety within a ship's length. By sunset 6,000 men were ashore with the loss of two drowned by the capsizing of a boat. The immediate desertion by the Spaniards, under the fire of the fleet, of all the points about Daiquiri and Siboney, but 10 miles from Santiago, caused the transfer to the latter point of landing operations, and this was thenceforward the army base. Wheeler, the senior officer ashore (Shafter remaining aboard until the 29th), ordered Young to make a forward movement on the 23d, which brought about the skirmish of Las Guasimas, in which the 1st and 10th cavalry and the Rough Riders, all of course unmounted, were engaged. The American loss out of the 964 in the fight was 16 killed and 52 wounded. The Spaniards retreated leaving 11 dead. On 24 June the last of the troops had been landed and two days later the field batteries were ashore. Shafter sent a telegram to the War Department gracefully acknowledging the services of the navy: "Without them I could not have landed in 10 days and perhaps not at all, as I believe I should have lost many boats in the surf." More difficult, however, was the question of getting supplies ashore, as the fleet's boats with their crews had to return to their ships; and the army had a hand to mouth existence for days which must have been a serious element, through ill nourishment, in the development of

the sickness later. On the 25th and 26th Garcia's force of 2,978 was transported from Aserradero; on the 27th the 33d and part of the 34th Michigan arrived under Brigadier-General Duffield from Camp Alger and went into camp at Siboney. By 30 June the American force was in face of the Spanish positions to the east and northeast of Santiago and in the afternoon a council was called in which plans were made for the battle of next day, 1 July; Lawton's division to assault El Caney at daybreak, Wheeler's and Kent's the lines to the east of and near Santiago. It is impossible in the space to deal with the details of these actions, which reflected the greatest credit upon both victor and vanquished. The American force was greatly superior in numbers, the force under Generals Lawton, Chaffee, Ludlow, and Colonel Miles (commanding a brigade) attacking El Caney, numbering 6,654, against about 500 Spanish, who, occupying a strong defensive position, maintained themselves most heroically, losing 300 killed and wounded, and 150 captured. Among the killed were General Vara del Rey and his two sons. The American losses at this point were 88 killed and 355 wounded. The attack upon the main Spanish lines east of and near the city, along the crest of San Juan hill was made by the dismounted cavalry division under General Wheeler and the 1st infantry division under General Kent, the whole force numbering 8,336 men. Lieutenant Miley, of Shafter's staff, gives the numbers of the Spanish as 750 in the most advanced position on San Juan Hill and 3,500 immediately in the rear. There were about 1,000 men ashore from the Spanish squadron under Cervera's Chief of Staff, Captain Bustamente, who was mortally wounded. San Juan Hill was occupied by the Americans after a most courageous and bloody struggle with the loss of 144 killed and 951 wounded. The casualties of the day were thus over 10 per cent of the force engaged. It may confidently be said that few armies would have won success under the immense disadvantages to which the Americans were subjected. Suddenly transported to a tropical climate, with clothing of a character in itself to madden a man into illness, with the scantiest of rations for days, subjected daily to torrential rains, fighting through the thickest of jungle, opposed by an entrenched foe with smokeless powder, it required to win men such as composed this force, the finest in the writer's opinion, through its practical experience and training, ever put into the field. Nor must the disabilities of the Spanish be overlooked. They were ill fed, had long undergone the depressing effects of the tropics, and were in no condition to meet a determined foe. They showed the obstinate courage always shown by their race when on the defensive, and sustained to the full its honor.

Admiral Sampson, at the request of General Shafter, had supported, on the 1st, a demonstration at Aguadores by a force commanded by General Duffield; the few Spanish seen having disappeared, the New York and Oregon fired a number of 8-inch shell over the hills in the direction of Santiago and the ships in the bay. The evening of this day Colonel Escario with 3,500 men entered Santiago from Manzanillo, a reinforcement which in the existing destitution but added to the difficulties of the Spanish. Sampson at Shafter's request bombarded again the batteries at the entrance 2 July. Shortly after, Shafter sent a message urging Sampson to force an entrance, to which reply was made that this was impossible until entrance was cleared of mines; a work of some time after the forts should be taken. Shafter stated it was impossible to say when he could take these and if as difficult as what he had been pitted against, it would require time and great loss of life. "I am at a loss to see why the navy cannot work under a destructive fire as well as the army. My loss yesterday was over 500 men. By all means keep up fire on everything in sight until demolished. I expect, however, in time and with sufficient men, to capture the forts along the bay." Sampson at once replied that the forts could not prevent his entrance but that it was a question of mines, to attempt to go over which would certainly result in the sinking of one or more ships, thus preventing further progress by the fleet. He said: "It was my hope that an attack on your part on the shore batteries from the rear would leave us at liberty to drag the channel for torpedoes. If it is your earnest desire that we should force our entrance I will at once prepare to undertake it. I think, however, our position and yours would be made more difficult if, as is possible, we fail in the attempt." The Resolute, carrying 40 mines, was at once ordered from Guantanamo and Sampson purposed as soon as the arrangements could be made for countermining, to bring up the battalion of marines, with which and with those of the squadron, about 1,000 in all, he proposed to assault the western side of the entrance, the army to take the eastern. His Chief of Staff went to Siboney to arrange for a consultation respecting this combined action between the two commanders-in-chief. This consultation was set for the next morning, Sunday, 3 July. During the night there were several large fires on the distant hill tops, evidently the burning of block houses. The Massachusetts, as soon as her searchlight duty had ended at 4 A.M. (3 July), left for Guantanamo for coal. The ships present were in order from east, the Gloucester, Indiana, New York, Oregon, Iowa, Texas, Brooklyn, Vixen; the armed yacht Hist; the torpedo boat Ericsson and the transport Resolute carrying the mines, which had been brought the day previous from Guantanamo. At 8.50 A.M. the New York had begun to turn towards Siboney, but seven miles from her position, to carry Sampson to the meeting with General Shafter. She had been fairly on her course from 30 to 35 minutes when, attracted by the sound of a gun from the Socapa battery, the Spanish ships were reported leaving the harbor. The flagship, then seven and a half miles east of the harbor entrance, at once turned, hoisting the signal "Close in toward harbor entrance and attack vessels." On account of the position of the sun, behind the signal, it is not probable that this signal was read by either the Gloucester or the Indiana, both of which were nearer to the New York (the former less than half the distance at the time of the latter's turning) than to the Brooklyn. The Teresa and Colon, the one flying the Admiral's flag, the other unmistakable because of her peculiar features, were named by the signal quartermaster as they came out. After the fourth (the Oquendo) there was a very appreciable interval before the destroyers

appeared, the last emerging about 10 o'clock. Several of the ships hoisted almost at the same time the signal "Enemy's ships escaping" though the Iowa seems to have been the first, as from her position she had the best view into the harbor. All the ships at once closed in and began firing upon the escaping Spaniards who stood west close in shore. The American ships naturally converged to the north, taking up a more westerly course as the Spanish ships moved westerly. The Brooklyn, however, made at this juncture a turn with the port helm, endangering the Texas, which backed her engines to avoid collision. One after the other the Teresa and Oquendo were seen to turn inshore afire and they were beached, the Teresa 5½, the Oquendo 6 miles west of the harbor entrance. The destroyers Pluton and Furor were fired upon by the Indiana and Iowa, but were destroyed in the small bight 4 miles west of Santiago largely by the fire of the Gloucester which engaged them with the utmost intrepidity. They were also fired at by the New York. The Vizcaya and Colon were still steaming west but the former hauled down her colors and turned in to the beach at Aserradero, 15 miles from the harbor, crossing the bows of the New York within a few hundred yards. The flagship signalled the Indiana to return off the port. The Iowa remained near the Vizcaya with the Ericsson and Hist to rescue the Vizcaya's crew. The Gloucester rendered the same service to the Teresa and Oquendo, assisted later by the Indiana, Iowa and Hist, a duty which was rendered under great difficulties and danger. The chase of the Colon continued, the ships in pursuit the Brooklyn, Oregon, Vixen, Texas and New York (taken in order from seaward). The Oregon began firing her 13 inch guns at 10,000 yards range and the shot went over; her 8 inch guns were also tried but fell short as did the Brooklyn's. The Oregon reduced the range to 9,500, to 8,500, then 9,000, when at 1.20 the Colon hauled down her colors, turned inshore and ran her bows on the steep beach where empties the little river Turquino under the mountain of the same name, the highest in Cuba (8,400 feet). The nearest ships had still over five miles to run to reach this point and on arriving near, Captain Cook of the Brooklyn boarded the Colon and received her surrender. He stopped on his return and reported aboard the New York which was the third ship to arrive, having passed the Texas and Vixen.

Note:— The log of the Texas is inaccurate in stating that the New York and Vixen came up about 3.00; the writer has a photograph taken from the Texas showing the New York passing the Vixen and from a direction which shows the New York must have passed the Texas. The time is marked by the signal flying from the New York which the Brooklyn's log gives as received at 1.50.

The Oregon was ordered to take charge of the Colon. The ship, however, was clearly sinking. All her sea valves had been opened and though every effort was made to save her, and when the rising tide had floated her during the evening she was pushed hard ashore by the New York, she turned over on her side as she sunk and there remains. The Resolute, ordered by the Commander-in-Chief to report at Guantanamo the exit of the Spanish squadron, had met off Daiquiri an Austrian man-of-war whose flag is so similar to that of Spain that a warning memorandum had been issued in expectancy of a visit from the Maria Theresa, which this ship turned out to be. The Resolute taking the ship for Spanish turned westward warned the Harvard at Siboney, which also sighting the stranger stood west with the same news. The Resolute arrived at Rio Tarquino with the news, the Brooklyn was ordered to investigate the report, and proceeding to the eastward met the Austrian vessel and after some delay ascertained her character. The distance from the Santiago entrance to the point where the Colon was beached is 52 nautical miles. Taking the ships successively from the east to west positions, the New York was 59½ miles, the Oregon 53, the Texas 50¾, the Brooklyn 49½ miles from this point when the Spanish ships came out. Allowing 5 minutes to get headway and 2 miles for changes of direction of the Brooklyn, the speeds of the Oregon and Brooklyn to 1.20 P.M., when the Colon surrendered and these ships as established by the Oregon's gun ranges were 4 miles east of the Colon's turning in point, were for the Oregon 13.37 knots and for the Brooklyn 12.06; for the New York to the time of stopping at 2 P.M. at the point of beaching (allowing 5 minutes to turn) 13.73; the Texas to the same point, and allowing 1 mile lost in backing and her time of arrival as 2.05, 11.72 knots.

Admiral Cervera and a large number of his officers and men were received on board the Iowa, but all these as well as those on board the Resolute from the Colon were transferred to the Harvard and Saint Louis later; 1,615 men were taken to Portsmouth, New Hampshire, and interned; the larger number of officers were cared for at Annapolis. The total Spanish loss was 353 killed or drowned and 151 wounded. The American loss was one man killed aboard the Brooklyn. There was the same disparity of damage as at Manila, in no wise to be accounted for by disparity of force. The Spanish were greatly outmatched in heavy guns, having but 6 11-inch against the 14 12- and 13-inch and 38 8-inch of the Americans; but in rapid fire of lesser calibre, which should have done some damage against unarmored parts, they were practically equal, having 10 6-inch, 30 5-inch and 6 4.7-inch against the American 14 6-inch, 12 5-inch, and 18 4-inch.

The next evening, 4 July, at midnight the searchlights showed a large ship in the entrance to Santiago harbor. This, as known later, was the cruiser Reina Mercedes, sent down to block the channel. She was sunk by the gunfire of the Texas and Massachusetts and later raised and sent to the United States. The destruction of this squadron was virtually the end of the war.

The firing on shore had been renewed the morning of the 3d, but at 8.30 A.M. General Shafter sent a letter to the Spanish commander saying that unless he should surrender he would be obliged to shell the city and allowing until 10 next morning for women and children to leave. At 6.30 P.M. a letter was received declining surrender, but Shafter on request of the various consuls delayed further action until the 5th. On 6 July Sampson's Chief of Staff visited General Shafter with reference to further action, and the result of the conference was that a second letter was sent the Spanish commander giving the facts of the destruction of the Spanish ships and the ability of the squadron to shell

his position with 8- and 13-inch shell; it urged surrender suggesting a reference of the situation to his government, in the meantime the cessation of hostilities to continue. On 8 July the Spanish general offered to leave Santiago with arms and baggage provided he should not be molested before reaching Holguin. This was referred to Washington and was declined. At 4 P.M. 10 July the truce was ended, and firing began on both sides, the heavy shells of the navy during this and the next day falling in the town and destroying 57 houses. At 2 P.M. the 11th the firing ceased and was not renewed. General Toral was informed of the heavy American reinforcements, and surrender was again demanded, the government of the United States offering to transport the entire Spanish command to Spain. A surrender was agreed upon 14 July, this to include not only the troops in Santiago but all those of the Department, a total of about 24,000. The city was delivered to the Americans 17 July. The result was fortunate for the American force in view of the sickness which had rapidly developed through the constant rains, bad shelter and insufficient food in the earlier days of the investment. The situation became such that the general officers united in advising the removal of the army from Cuba. On the other hand the marines at Guantanamo, under the excellent conditions of shelter and food and water supply which they had been able to keep up, were remarkably healthy, the sick list not rising above that which was usual at home ports; the same can be said of the fleet, which kept its normal health. General Miles had arrived off Santiago 11 July in the Yale with 1,500 troops. As soon as the surrender of Santiago was determined an expedition to Porto Rico under his command was organized, which sailed 21 July with 2,000 additional men. The battleship Massachusetts and 13 other naval vessels were detailed for service with the expedition.

There were in Porto Rico 8,223 regular Spanish troops and 9,107 volunteers. The destroyer Terror and small cruiser Isabel II. were at San Juan, the former badly injured in an action with the Saint Paul 22 June. She had been struck by two 5-inch shells, had 3 men killed and her machinery so damaged that she returned to port with difficulty. The Gloucester seized Port Guanica 25 July and Ponce surrendered to the Dixie 28 July, in each case without appreciable resistance. Both places were occupied by American troops. Reinforcements were rapidly arriving, there being available by the end of July a force of 9,461 officers and men (rising by the end of August to 16,973). Advance was made from Guanica, Ponce and Arroyo. Several skirmishes ensued, in which 3 enlisted men were killed, and 4 officers and 36 men wounded. The cessation of hostilities 12 August prevented the more serious work which would probably have been met in carrying the Spanish entrenched positions in the advance to San Juan.

General Merritt in command of the expeditionary force to the Philippines had arrived 25 July. Accompanying him was a force of 4,847 officers and men, part of which did not arrive until 21 July. He had been preceded by the expedition under General Anderson with a force of 2,501, arriving at Cavite 30 June, and by that under General F. V. Greene of 3,586, July 17.

The situation at the time of General Merritt's arrival was quiescent, but was seriously complicated by the presence of a Filipino army of probably 12,000 well-armed men under Aguinaldo, who had proclaimed an independent government. The investment, however, proceeded without reference to this force and under the strain of considerable firing from the Spanish lines at night. A joint demand on the part of the military and naval commanders-in-chief for surrender was made 7 August. The Governor General declined but offered to refer to his government. This was declined by the American commanders and the city was taken by assault, with but a show of resistance, 13 August. The total army casualties during the investment and assault were 17 enlisted men killed, and 10 officers and 96 men wounded. Commodore Watson, relieved in the second command of the blockade on the north coast of Cuba by Commodore Howell, had been assigned 7 July to the command of the squadron to join Admiral Dewey in the Philippines. This was to proceed, until their separation in the eastern part of the Mediterranean, in company with the whole available armored force under Admiral Sampson. The protocol suspending hostilities, signed 12 August, of course ended the expedition and Sampson with the battleships and armored cruisers of his fleet arrived at New York 20 August, meeting an improvised reception which in spontaneity, magnitude and picturesqueness, combined as they were with the sentiment attaching to a victorious fleet, has never been equaled in our country. The total losses had been in the army 279 killed, 1,465 wounded; in the navy 16 killed, 68 wounded.

The Spanish war, short and comparatively bloodless as it was, lifted the United States to a new plane. They became at once one of the dominant factors in world politics. Whatever the divergence of views, ethical or financial, in regard to the territorial acquisitions, there can be none as to the vastness of the change, considered politically. The primary cause of the war, the freeing of Cuba, has become a secondary event in face of the great changes wrought in our relation to the Caribbean and more particularly to the momentous question of dominancy in the Pacific. The ownership of Hawaii and the Philippines (the former a direct outcome of the war also) are elements in this natural destiny of the highest importance. From this point of view, and there is nothing facing the world of greater import than the future of Eastern Asia, the war did much to put the United States in a position to meet the coming emergency. It also gave us a navy, an adequate army, and the necessary bases for action, if action be forced upon us. F. E. CHADWICK,

Rear-Admiral, United States Navy.

Note:— 1,682 officers and men under Gen. E. S. Otis arrived 21 August; three other detachments left San Francisco successively 19, 23 and 29 July, making a total of 641 officers and 15,058 enlisted men.

43. **United States — Territorial Expansion of the.** The territorial expansion of the United States dates from the peace treaty of 1783, the very treaty by which their independence was recognized and their boundaries named. There had been much uncertainty about the boundaries of the colonies for a considerable period prior to the War of the Revolution, and especially so

in years immediately preceding the Declaration of Independence. The early grants to the colonies were made "to the South Sea," by which was meant the Pacific Ocean, though it was not then supposed that the continent was more than a few hundred miles wide. Gradually, however, the French moved up the Saint Lawrence and down the Mississippi Valley, establishing their claim to the great central area, and the Spanish gradually extended their claims northward at the extreme west, so that the claims of the colonies that their territory extended to the Pacific gradually dwindled, in view of the fact that the mother country made no attempt to prevent these encroachments on the west. The increasing claims of the French in the Mississippi Valley and finally their claims to the Ohio Valley led to hostilities between the English and the French colonists and they were supported by their respective governments. In 1753, the French having begun the establishment of a military post at the present site of Pittsburg, George Washington was sent by the governor of Virginia to warn them that the territory was claimed by the English colonies and must not be occupied by the French. Their reply was that they also claimed the territory by exploration and settlement and would hold it. This led to an attack by the English in the following year, in which they were repulsed by the French, and this precipitated the war between the French and English, which resulted in the expulsion of the French from the continent. The treaty between the French and English governments, by which the French withdrew from continental America, was made in 1763, and fixed the Mississippi River as the western boundary of British territory. It subsequently developed that France had a few months before secretly ceded her claims west of the Mississippi to Spain. The acceptance of the terms of this treaty of 1763 by the British government terminated the claims of the colonies that their boundaries extended to the Pacific. By this same treaty of 1763, made between England, France, and Spain, Florida passed to the control of England, and as it was deemed advisable to divide it into two provinces or colonies, the British government concluded to add to the western section a narrow strip from the southwestern part of the great colony of Georgia. Accordingly a strip west of the Appalachicola River, which had been formerly a part of Georgia, was attached to West Florida, against the protest of Georgia. The war between Great Britain and France regarding the territorial area in America had also resulted in the transfer of the French colony of Quebec to British control, and in 1774 the British government attached all of the territory north of the Ohio River and west to the Mississippi to the province of Quebec, making it, for purposes of government, a part of that province. This gave great dissatisfaction to the people of Massachusetts, Connecticut, New York and Virginia, since each of these claimed that a part of the section north of the Ohio was within its original grant and should not be taken from them. And this was one of the many causes of dissatisfaction which finally culminated in the War of the Revolution.

Thus when the Revolutionary War closed there were several territorial questions to be settled, in making the peace treaty: first and most important, whether the country north of the Ohio was to remain a part of Quebec, or be recognized as still a part of the former colonies; second, whether the section which had been taken from Georgia at the southwest and added to Florida should be restored as a part of the territory of the United States, in view of the fact that Great Britain had meantime receded Florida to Spain; and, third, what should be the boundary at the extreme northwest. Virginia had held that her original charter gave her the territory north of the Ohio to the Mississippi River, including that lying west of the lakes, and besides that was the important fact that it had been occupied, in some degree at least, by the colonial forces during the War of the Revolution.

The result of these uncertainties as to boundary was that the commissioners sent to Paris to negotiate a treaty of peace with Great Britain were instructed to claim all of the territories in question, but to be guided by the French government in their work. These commissioners, Benjamin Franklin, John Adams, John Jay, and Henry Laurens, soon after their meeting, found a disposition on the part of the French government to advise that the British retain the country north of the Ohio, and even that the country south of the Ohio, between the Cumberland Mountains and the Mississippi, be declared neutral territory for the use of the Indians. As a result, the United States commissioners broke off their relations with the French and negotiated the treaty according to their own views. By the boundary lines finally determined they obtained the recession to the United States of the small strip at the southwest corner of Georgia, now the southern part of Alabama and Mississippi, also the entire country north of the Ohio to the Great Lakes and that section west of the Great Lakes to the Mississippi and as far north as the present boundary line. These may be properly said to be the first additions to the territory of the United States, since all of the area in question was more or less in dispute under the latest acts of the British government prior to the War of the Revolution and the organization of the 13 Colonies as the "United States of America."

The next addition to the territorial area of the United States, and that which is usually spoken of as the first addition to the territory of the United States, was the Louisiana Purchase. France had included the city of New Orleans and a small tract of country on the eastern bank of the Mississippi near its mouth in the territory ceded to Spain when she abandoned the continent of North America in 1763. This gave the control of the mouth of the Mississippi to the nation controlling this territory. Following the close of the War of the Revolution, the area west of the Alleghanies had rapidly increased in population, and it was essential that this population should have an opportunity to reach the sea by the Mississippi River. An agreement was made with the Spanish government in 1795 by which citizens of the United States should have the privilege of depositing their goods in New Orleans for transshipment abroad, without payment of duties, and that incoming goods should have similar privileges. In 1802, however, it became known that Spain had ceded the Louisiana coun-

try to France, by a secret treaty made in 1800, and this fact caused great alarm among the people of the United States, lest their privilege of reaching the ocean through the Mississippi should be lost. A resolution was introduced in Congress authorizing the President to seize the city of New Orleans, but a substitute was adopted authorizing the President to send a commission to France and offer $2,000,000 for the city of New Orleans. James Monroe was sent as the Special Commissioner and authorized to co-operate with our minister to France, Mr. Livingston. Napoleon, who was about entering upon war with the English, saw that his great possessions in America would be a source of weakness to him in such a war, and offered to sell the entire Louisiana territory to the commissioners. While they were not authorized to make such an agreement, they determined to assume the responsibility of doing so, and after some negotiation an agreement was made by which the entire territory was to be ceded to the United States for the sum of $15,000,000, of which $11,250,000 was to be in bonds of the United States, the remainder to be paid to citizens of the United States having claims against France. The treaty reached the United States in July 1803, a special session of Congress was called in the following October, and after two days of discussion the treaty was ratified, and in December the city of New Orleans and the vast territory thus acquired was turned over to the United States. The population at that time was about 100,000, of which about one half were whites, 10,000 mulattoes, and 40,000 negroes. See UNITED STATES — THE LOUISIANA PURCHASE.

The next addition to the territory occurred in 1810–12, in the form of a small section of territory which had been a part of west Florida during the time that Great Britain controlled Florida. After the recession of Florida to Spain by Great Britain, the English citizens of the western part of west Florida became dissatisfied, and especially so in view of the reports that Spain had sold west Florida to France. They held a convention in 1810, declaring themselves a free and independent State. A communication was sent to the President of the United States, who instead of recognizing the new republic, directed the governor of New Orleans Territory to take possession of the territory, basing this action upon a claim that the territory had been sold to France and should have been included with the cession of Louisiana Territory by France. The annexation does not seem to have been seriously objected to by the people of the area in question, but was met with protests on the part of both Spain and Great Britain. No further action was taken, however, and in 1812 the control of the United States was extended to another small section lying east of that occupied in 1810, this action being based upon claims similar to those upon which the occupation of 1810 was made. These two additions gave to the United States the small section by which Alabama and Mississippi now have a frontage upon the Gulf of Mexico.

The next addition to the territory of the United States, and that which is usually known as the second, was the purchase of Florida from Spain, in 1819. Florida had been continuously in control of Spain from the discovery to 1763, when Spain ceded it to Great Britain in exchange for a part of Cuba, which Great Britain had seized during the war with France, because of the aid which Spain gave to France in that war. In 1783 England receded Florida to Spain, and in 1785 Spain sold west Florida to France, and it was upon this fact of the ownership of that territory by France that the United States claimed that it was included in the cession of the Louisiana territory in 1803, and upon this claim was based the occupancy in 1810 and 1812 above described. Florida was greatly desired as a part of the United States, both for the purpose of extension of the slave area and because of the fact that the presence of this foreign territory alongside of that in which slavery existed resulted in constant friction between the people of the two sections. The escaping slaves from the adjacent territory of the United States found Florida a safe retreat and there was also much bitterness over the fact that Florida had been made the headquarters of a British force during the war of 1812–14. Repeated offers were made to the Spanish government for its purchase but without avail, but finally, in 1819, the Spanish ambassador at Washington signed a treaty by which Florida was to pass to the United States on payment of $5,000,000 in full extinction of the claims of certain American citizens against the Spanish government. The treaty was ratified in 1821 and the territory taken possession of by the United States, which in 1822 established the "Territory of Florida." See FLORIDA.

The next addition to the territory of the Union was that of Texas. It was desired as a part of the Union, especially by those interested in the extension of slave area and slave States. It was formerly a part of the Spanish colony of Mexico. In 1810 the people of Mexico revolted against Spanish rule, and in 1822 were successful, and in 1824 the Republic of Mexico was established. The two provinces, formerly known as "Texas" and "Coahuila," were made a single state of the new republic of Mexico, under the name of Texas. The desire of the people of the United States for this territory led to an offer of $1,000,000 to the Mexican government for its purchase in 1827 and another of $5,000,000 in 1829, but each was rejected. Meantime a large number of persons from the southern part of the United States settled in Texas, and in 1833 Texas attempted to obtain a peaceable separation from Mexico and independence, but without success. In 1836 Texas seceded from Mexico and established itself as a republic. In the election for president which followed, an almost unanimous vote was cast for annexation to the United States, but the application for admission, made by its minister at Washington, was not favorably received by Congress. In 1844 another treaty of annexation was made but rejected by the Senate. The presidential election in the United States which soon followed hinged largely on this question, and the sentiment was apparently in favor of annexation, and in January 1845, Congress passed a resolution giving "consent that the territory properly included within the Republic of Texas may be erected into a new State to be called the State of Texas." This was accepted by the congress of Texas and by popular vote in that Republic, and in December 1845, a joint resolution was passed in the Congress of the United States admitting Texas as a State. Thus, Texas passed from the position of an

independent republic to that of a State of the United States, without a treaty or without passing through the territorial stage which usually preceded the formation of States of the Union. See UNITED STATES — ANNEXATION OF TEXAS.

The next great step in the development of the territory of the United States was the favorable settlement of the pending question between the United States and Great Britain regarding the control of the Oregon Territory. This territory had been claimed by Spain, Great Britain and the United States on grounds of exploration, and been jointly occupied by Great Britain and the United States after 1818, pending a settlement of their respective claims. Meantime the treaty of the United States with Spain, made in the purchase of Florida, had resulted in the abandonment by Spain of her Oregon claim and the fixing of the boundary line between the Oregon country and Spanish territory which then included all of what is now know as California, New Mexico and Utah. This strengthened the claim of the United States to the Oregon country, and by 1846 the demand of the people of the United States for a settlement of the boundary line became so great that there was serious talk of war with Great Britain to determine the question. Finally, in the year 1846, a proposition was made by the British government fixing the boundary line on the 49th parallel and the Straits of Fuca. This was accepted and the Oregon country south of that line became an undisputed part of the territory of the United States. See NORTHWEST BOUNDARY.

The next addition to the national territory was what is known as the Mexican cession. A quarrel had arisen between Mexico and the United States, shortly after the annexation of Texas, regarding the boundary line between that area and Mexico, the Mexican Government holding that the Nueces River was the southern boundary line of Texas, while the United States held that the Rio Grande was the boundary. The result was the war with Mexico, in which the United States was successful in every engagement, and it was followed by the cession by Mexico of the great area which includes the present States of California, Utah, part of Colorado, a small part of Wyoming, and the territory of Arizona and a part of New Mexico. The eastern part of New Mexico was jointly claimed by Texas and by the United States as a part of the Mexican cession, and this claim and the control of about 125,000 square miles of Texas was settled by payment to Texas by the United States of $10,000,000. The area thus purchased from Texas now forms part of New Mexico, Oklahoma, Kansas, Colorado and Wyoming. The sum paid to Mexico for the magnificent area which was ceded to the United States at the close of the war was $15,000,000 in cash and a settlement of claims of citizens of the United States to the extent of $3,200,000.

The last addition to the contiguous territory of the United States was what is known as the Gadsden Purchase (q.v.). It is a comparatively small and unimportant strip of territory lying between the Mexican cession and Mexico, south of what is now New Mexico and Arizona. It was claimed by both Mexico and the United States, and the dispute was settled by a payment of $10,000,000 by the United States for the territory. The purchase was negotiated by the United States minister to Texas at that time, James Gadsden, hence the title, "Gadsden Purchase." The transfer occurred in 1853.

The first addition of non-contiguous territory occurred in 1867, by the purchase of Alaska (q.v.). The territory had been acquired by Russia, by discovery in 1741 and settlement in 1784, and a considerable industry in furs and shipbuilding developed. After the discovery of gold in California the Russians in Alaska traded with the people of California, especially prior to the development of transportation systems between California and the eastern coast, and in this manner the people of San Francisco became aware of the value of the fur business, and probably of the existence of the precious metals. The California members of Congress urged its purchase, bills to that effect were introduced in Congress, negotiations were opened with Russia through its minister in Washington, and after considerable delay the agreement was made and the purchase consummated in 1867, the purchase price being $7,200,000. The Russian government was moved to this sale of its territory in part by its disputes with Great Britain regarding boundary lines between Alaska and British-North America, and chiefly by the great distance at which the territory lay from its possessions in Europe and Asia.

The territory of Hawaii (q.v.) was the first island territory annexed by the United States. Negotiations for the annexation of these islands began in 1854, when a treaty of annexation was framed under President Pierce's administration, but the sudden death of the king of the islands before its completion terminated the negotiation. In 1876 a reciprocity treaty was made with the islands by which the products of the islands were admitted free of duty into the United States and those of the United States admitted free into the islands, and this developed commercial and other relations of the two communities very greatly. In 1893 a revolution occurred in the islands and application was made to the United States for annexation and a treaty framed and laid before Congress. It had not been acted on, however, at the close of the term of President Harrison and his successor, President Cleveland, withdrew it. On the inauguration of President McKinley the application for annexation was renewed, and after some delay Congress passed a joint resolution annexing the islands, and they were subsequently given a territorial form of government and made a customs district of the United States, so that all merchandise passes between them and the United States free of duty, just as it does between the various States of the Union.

Porto Rico (q.v.), Guam (q.v.) and the Philippine Islands (q.v.) were seized by the United States during the war with Spain, inaugurated in 1898 for the purpose of compelling that government to terminate her oppression of the people of Cuba. At the close of that war, in which the United States was successful, the islands were transferred to the United States by Spain, on the payment of $20,000,000 by the United States. While the treaty did not specify the precise purpose of the payment of the $20,000,000, it was understood that Porto Rico and Guam were retained by the United States under the rules of war, and that the payment of the sum named was with reference to the Philip-

pines. Porto Rico has been made a customs district of the United States and the commerce between that island and the United States is not subject to any customs duties. It has grown from about $4,000,000 per annum, before the transfer, to about $22,000,000 in 1903. The duty on commerce from the Philippines coming into the United States has been reduced 25 per cent, and bills for a further reduction are pending in Congress. Porto Rico is governed by officers appointed by the President and a legislature elected by the people. The Philippines are governed by a commission appointed by the President of the United States, the commission being made up in part from citizens of the islands and a part from citizens of the United States.

The island of Tutuila, one of the Samoan group in the south Pacific, passed under the control of the United States in 1899. The group had been for many years under a joint protectorate of the United States, Great Britain and Germany, but in that year the joint protectorate terminated, and the island of Tutuila, whose people had long ago expressed a desire for annexation to the United States, was annexed. The island is small, its chief importance being the possession of a fine harbor, the best in the south Pacific. See SAMOAN ISLANDS.

EXPANSION OF THE TERRITORY OF THE UNITED STATES FROM 1800 TO 1901:

	Year	Area	Cost
Louisiana Purchase	1803	875,025	$15,000,000
Florida	1819	70,107	*a*6,489,768
Texas	1845	389,795	.....
Oregon Ter.	1846	288,689	.....
Mexican cession.	1848	523,802	*b*18,250,000
Purchase from Texas	1850	(*c*)	10,000,000
Gadsden Purchase	1853	36,211	10,000,000
Alaska	1867	599,446	7,200,000
Hawaiian Is.	1897	6,740	.....
Porto Rico	1898	3,600	.....
Guam	1898	175	.....
Philippine Is.	1899	143,000	20,000,000
Samoan Is.	1899	73	.....
Addl. Philippines	1901	68	100,000
Total area added		2,936,731	$87,039,768

(*a*) Includes interest payment.
(*b*) Of which $3,250,000 was in payment of claims of American citizens against Mexico.
(*c*) Area purchased from Texas, amounting to 123,784 square miles, is not included in the column of area added, because it became a part of the United States with the admission of Texas.

44. United States — Immigration to the (1789–1904). The causes which operated before the Revolution to bring a small stream of European emigrants to the United States continued to operate after the establishment of the Federal government. Though no trustworthy records were kept in the early history of the republic, it is estimated that from 1783 onward the number of immigrants to this country was about 4,000 a year till 1794, when, as a result of the French-English war, the number was increased to 10,000. After that date it dropped to about 6,000 a year till 1806, when, as a natural result of the British and French continental blockades and of the American Embargo, it was reduced practically to nothing for the next 10 years. Then, beginning with 1816, the passenger arrivals, including returned Americans, reached about 8,000; and in the following year the number bounded up to 22,240. The large number of immigrants flocking to the country about this time produced considerable hardship incident to overcrowding. At this juncture the first legislation concerning immigrants was enacted by Congress, which simply provided that a record should be kept of the number of passengers in each customs district, registering the sex, age, occupation and country of birth. Since the government encouraged immigration as increasing the wealth and developing the resources of the country, this act of March 1819 was not in the nature of a restriction, but was intended merely as a record of the arriving aliens. Accordingly from 1 Oct. 1819 an account has been kept at all the customs ports of the number, sources, and conditions of all immigrants to the United States. The record will be found in the table below:

IMMIGRATION TO THE UNITED STATES BY YEARS.

Year ending 30 Sept.		Year ending 30 June	
1820	8,385	1860	133,143
1821	9,127	1861	142,877
1822	6,911	1862	72,183
1823	6,354	1863	132,925
1824	7,912	1864	191,114
1825	10,199	1865	180,339
1826	10,837	1866	332,577
1827	18,875	1867	303,104
1828	27,382	1868	282,189
1829	22,520	1869	352,783
1830	23,322	1870	387,260
1831	22,633	1871	321,350
1832 (to 31 Dec.)	60,482	1872	404,806
1833 (Jan. to Dec.)	58,640	1873	459,803
1834	65,365	1874	313,339
1835	45,374	1875	227,498
1836	76,242	1876	169,986
1837	79,340	1877	141,857
1838	38,914	1878	138,460
1839	68,069	1879	177,826
1840	84,066	1880	457,257
1841	80,289	1881	669,431
1842	104,565	1882	788,992
1843	52,496	1883	603,322
1844	78,615	1884	518,592
1845	114,371	1885	395,346
1846	154,416	1886	334,203
1847	234,968	1887	490,109
1848	226,527	1888	546,889
1849	297,024	1889	444,427
1850	310,004	1890	455,302
1850 (1 Oct. to 1 Dec.)	59,976	1891	560,319
1851 (Jan. to Dec.)	379,466	1892	479,663
1852	371,603	1893	439,730
1853	368,645	1894	285,631
1854	427,833	1895	258,536
1855	200,877	1896	343,267
1856	195,857	1897	230,832
1857 (to 30 June)	112,123	1898	229,299
		1899	311,715
Year ending 30 June		1900	448,572
1858	191,942	1901	487,918
1859	129,571	1902	648,743
		1903	857,046

It is to be noted: first, that up to 1856 the record includes all "alien passengers arrived," and does not distinguish immigrants from passengers, so that a reduction must be made from the total; second, that the immigration overland from Canada and Mexico is not included in these figures. For example, in the census of 1900 Canada is given as the birthplace of 1,183,255 persons, and Mexico as 103,445. An examination of the table reveals the fact that

the record shows several well-defined periods, with notable fluctuations. The first period extends from the beginning to 1826 inclusive, when the maximum seems to have been about 10,000 (reached in 1794, 1825, and 1826). The second period extends from 1827 to 1831, when the maximum is 27,382, the average being more than double that of the first period. This increase is perhaps explained by the enormous influx of Europeans to this country as the natural result of the wretched industrial conditions in Europe during the time of the Holy Alliance. The third period includes the decade from 1832 to 1842, when the tide of immigration is trebled or quadrupled, save a considerable ebb in 1838 due to the panic of the preceding year. After this period, when steamboat navigation and railroads began to render the fertile plains of the West accessible, such abnormal conditions as the Irish famine and the California gold discoveries sent immigration up by leaps and bounds till 1854. The flood of immigration that swept over the country during these years, demoralizing politics, trade and industries of all sorts, gave rise to the anti-foreign agitation; and this combined with the business depression of 1857 and the Civil War, which followed soon after, to reduce the number of immigrants greatly. However, after the war when the country entered upon a new era of industrial enterprise offering an almost boundless field for laborers, the tide of immigration again rose rapidly till 1873, when, under the influence of the panic and the hard times that followed, it once more receded. But, with the revival of business in 1880, foreigners again flocked to our shores in larger numbers than ever before, and immigration reached a high-water mark (669,431) in 1881. Since that year there has been a steady stream pouring into the country, save during the period of business depression from 1894 to 1898. In 1903 immigration reached the unprecedented figures of 857,046.

Most of the early immigrants came from Great Britain, a fair number from Germany, but very few from other European countries. In 1850 Great Britain furnished about 60 per cent of the immigrants and Germany 584,000, or 36 per cent. Thus 96 per cent of the immigrants in 1850 were of Teutonic blood, with the Anglo-Saxon element predominating. The proportion was very much the same in 1860. But in 1870, while the totals were much larger, the British percentage was falling and that of the other foreign elements was increasing. In 1880 the British contingent, including the Canadian, though larger in the grand total than before, had dropped to 47.5 per cent, the German to 30, but a considerable new element had arrived of Bohemians, Poles, Scandinavians, Italians, and Russians. In 1890 the British contingent had fallen to 29 per cent, or 2,700,000; the German increased to 33 per cent, or 3,000,000; while the number of Poles, Russians and Bohemians in the country amounted to 450,000, the Italians to 182,500 and the Scandinavians to 933,000. In 1900 the Slav element had reached 1,000,000, or nearly 10 per cent of the foreign-born population of the country, the Scandinavian over 1,000,000, the French including French-Canadian 500,000, the Italian nearly 500,000, the Mexican over 100,000, while the British had sunk to 19.4 and the German to 14 per cent. Within the last three years (1901–3) the Teutonic element, even including the Scandinavian, has greatly diminished. But from the countries of southern and eastern Europe have come nearly as many immigrants during these three years as came during the entire preceding decade.

In 1864 Congress passed the first immigration act, which was designed to promote, not to restrict, immigration; but this act was repealed in 1868. In 1882, the year after immigration reached its high-water mark, Congress passed the first restrictive act barring out criminals, insane, paupers, and other undesirable classes. In 1885 a more drastic act was passed. This act did not operate as successfully as was expected, for while it was aimed at strike-breakers and persons of the baser sort, it has also militated against the better classes of immigrants, such as artists, architects, musicians, and even clergymen. It was therefore later modified and in 1891 was extended to all "assisted" immigrants and to other classes. The act of 3 March 1903 is more drastic and requires a preliminary inspection at the point of departure and gives the government the right to deport, within two years after arrival, any immigrant landed in violation of the act.

45. United States — Suffrage in the. Suffrage means participation in government by voting. There are two theories in regard to suffrage: (1) That it is a privilege granted by the State to individuals; (2) that it is a natural, inherent right belonging to every man. The former is the usually accepted theory; the latter, the outcome of the revolutionary movements of the 18th century, is to-day generally discredited. Suffrage in the English colonies in America was restricted as in England. Virginia began in 1619 with manhood suffrage, but in 1655 and 1670 restricted the suffrage to "free-holders and householders." Similar restrictions existed in the other Southern colonies and in the middle colonies. New England, notably Masachusetts and New Haven, had strict religious tests. Only "freemen" could vote and only members in good standing of some Congregational church could be "freemen." Consequently the majority of the male inhabitants were excluded, the entire list of "freemen" in Massachusetts between 1630 and 1691 numbering only about 2,000. When England secured better control over the New England colonies the suffrage was given to owners of estates valued at £40 or freeholds worth 40*s.* a year. During the 18th century the freehold test became general. Roman Catholics, Jews, and in New England, Quakers, were generally disfranchised. There was also a moral qualification in New England — a voter must be "a person of civil conservation and quiet and peaceable behavior," not "an opposer of the good and wholesome laws of the Colony." In the South, no convict could vote. Each colony had its own naturalization laws until Parliament passed a uniform law (1746) requiring the Protestant faith and seven years of residence. The suffrage was extended very slowly, and when the Union was formed, in 1787, in each State it was very limited. The qualification was usually a freehold of 40*s.* to £3, or an estate worth £20 to £60, or ownership of a certain number of acres. It has been estimated that in 1787 there were in America

150,000 electors from a population of 5,000,000 which a hundred years later would have furnished 700,000 to 1,000,000 voters. The religious restriction soon disappeared,— last in South Carolina in 1797. Under the Constitution each State regulated its own citizenship. The influence of revolutionary theories upon politics had much to do with broadening the suffrage. In New England, where most men were white, the "rights of man" were believed in; in the Middle and Southern States, where blacks were numerous, the rights of white men alone were recognized. The new Western States offered citizenship on easy terms, thus stimulating the advance of democracy in the older States. Rival political parties wanted more votes, and all white men were gradually enfranchised. The last property test disappeared in Louisiana in 1845. The abolition agitation hastened enfranchisement of all whites by asserting the "rights of man." Before the Civil War only Connecticut and Massachusetts restricted white suffrage. Alarmed at the rapid increase of foreigners they enacted in 1854 and 1856 educational qualifications for voters.

Negro Suffrage.— The extension of suffrage to negroes was a result of the Civil War. Prior to the Revolution, though there were no laws against it, it is not known that any negro ever voted in the New England or Middle colonies, but a few free negroes voted in Maryland, South Carolina, and probably in North Carolina. Between the Revolution and the Civil War free negroes voted in several States. They were disfranchised in New Jersey, 1807; Maryland, 1810; Tennessee, 1834; North Carolina, 1835, and Pennsylvania, 1838. The elections of two Tennessee congressmen, John Bell and Cave Johnson, were decided by the ballots of free negroes. The agitation of abolition societies was the principal cause of the disfranchisement of free blacks. Vermont, Massachusetts, New Hampshire and New York alone before 1861 did not disfranchise them. The 13th Amendment (1865) to the United States Constitution merged the negroes into the political population for purposes of representation. A movement in the South (1867) to give the negro a limited suffrage was stopped by the Reconstruction Acts (1867) which gave the ballot to the negroes in the South, though as late as 1868 most of the Northern States gave them no political privileges. The 14th Amendment (1868) while disfranchising the prominent whites of the South, put a premium on the enfranchisement of the blacks by the State governments by offering increased representation in Congress. The 15th Amendment (1870) provided against discrimination on account of race or color and practically resulted in universal manhood suffrage. The amendments apply to the whole United States. Political corruption and misgovernment followed the enfranchisement of the negro, and from 1868 to 1876 the Southern whites were engaged in overturning the governments ruled by the negroes, thus beginning a thorough-going reaction against negro suffrage. From 1876 to 1890, the whites devoted themselves to destroying in the South the Republican party organization which controlled the negro vote. During this period the negro vote was restricted by centralization of the administration in Louisiana and North Carolina; by requiring the payment of taxes in Virginia, Arkansas, Georgia, Florida, Mississippi and Tennessee; and by complexity of election laws — Australian ballot system, registration, etc.— in Alabama, Arkansas, Virginia, Tennessee and Mississippi, amounting practically to an educational qualification. About 1890 began a movement to disfranchise negroes by changes in the State Constitutions. Upon readmission to the Union (1868–70) a fundamental condition imposed was that their constitutions should never be revised so as to deprive any one of the right of suffrage. This condition was ignored by the Southern States and the amendments were evaded. The suffrage clauses in these new Southern constitutions are alternative: (1) the "understanding" clause requires the voter to be able to read or understand when read to him any section of the Constitution; (2) the "grandfather" or "old soldier" clause excuses from other tests those who have served in any war and their descendants, or those who were voters before 1 Jan. 1867, and their descendants; (3) a clause requiring a taxpaying and property qualification from those disqualified under other clauses; (4) the "good character" clause requiring the voter to be of good moral character. Mississippi (1890) invented the "understanding clause," giving it to South Carolina, Alabama, and Virginia; Louisiana the "grandfather" or "old soldier" clause (1898) giving it to North Carolina, Alabama, and Virginia. Alabama (1901) discovered the "good character" qualification, passing it on to Virginia. Practically all the Southern States have a property and tax paying qualification for voters, which, with the educational test, will by 1905 become the sole qualifications. The evasive provisions are temporary, intended only to disfranchise the negroes, while including the whites. The effect of these restrictions is remarkable, disfranchising in each State that has restricted the suffrage from 30,000 to 60,000 whites and practically all the blacks. The tax paying requirement is the most effective in excluding both whites and blacks. Regarding the conflict of these provisions with the United States Constitution and laws, the Supreme Court decided that the fundamental restriction imposed upon readmission is unconstitutional, and that it is the duty of Congress to enforce the 14th and 15th amendments, which probably will not be done. The evil results from negro suffrage during Reconstruction caused Congress to hesitate before again interfering in affairs of the Southern States.

Suffrage in the Territories.— In the Territories suffrage is regulated by Congress, which may delegate its authority to the territorial legislature. In the District of Columbia, white tax payers voted from 1802 to 1855, when the suffrage was extended to all white men, and in 1867 to white and black males excepting Confederates and Confederate sympathizers. Misgovernment and corruption followed and in 1878 all voters in the District were disfranchised by Congress, local government now being carried on by a board of commissioners. Alternate educational or property qualifications exist in Connecticut (1854); Massachusetts (1856); Wyoming (1889); Maine (1891), and Delaware (1897). The United States confers citizenship upon the alien by naturalization; the State confers the right to vote. In many States aliens

are allowed to vote after they have declared their intention to become citizens. Indians must become naturalized before voting. California allows no Chinese to vote.

Woman Suffrage.— Women voted in New Jersey in 1776–1807. The renewed agitation (1830–67) in regard to "natural rights" caused a demand that women be allowed to vote. In 1848, the first woman's suffrage convention demanded the ballot, basing their claims on the principles of the Declaration of Independence. In 1866, the first petition for woman suffrage was sent to Congress. In 1868, the New England Woman's Suffrage Association was formed, and in many States the political parties favored the movement. In 1869, Wyoming Territory enfranchised women, Utah in 1870, Colorado in 1876, Washington in 1883, and Idaho in 1896. In 1882 women in Utah Territory were disfranchised by the Edmunds law, but in 1890 the State of Utah again gave them the ballot. At present they enjoy equal suffrage with men in four States, Wyoming, Colorado, Utah, and Idaho, and in 18 States of the North and West women vote in school elections. In two States, Montana and Iowa, women taxpayers may vote upon issuing municipal bonds. In Louisiana women taxpayers may vote upon questions relating to public expenditure. It is said that women usually vote the Republican ticket. WALTER L. FLEMING,
Professor of History, University of West Virginia.

46. United States — History of the Tariff. Almost from the organization of the government of the United States, duties upon articles imported into the country have been a part of the fiscal system. These duties have nearly always carried with them more or less of a protective influence, although at times not imposed for that reason, and at other times enacted by administrations avowedly opposed to the protection principle. Before 1816, and between 1846 and 1860, were the nearest approaches to a free trade basis for foreign commerce, especially in the earlier period. At no time, however, has such foreign trade really approximated a genuine free trade basis, and the term as used in connection with American commerce is more or less misleading.

At such times as the so-called free traders have come into political power they have failed to enact laws which carried into full effect radical free trade theories. Beginning with the tariff for revenue, and without much thought of protective influence, the system soon developed into a combination of revenue and protection. The revenue feature has been given the most prominence when the free trade party has come into power, and the protection feature has been brought to the front in turn whenever its adherents have secured control of the legislative machinery.

Whereas in the past there have been sharp dividing lines between political parties representing the free trade and protection idea, this is no longer true. Free trade is no longer an issue in American politics. The question, so far as the tariff is concerned, being rather one of high or low duties, the former being for the avowed purpose of protection, and the latter carrying what is termed incidental protection. If it is possible at this time to define the tariff position of the two great political parties of the United States it must be along these lines. The need for money, occasioned by the expense of war, has generally been met not only by an increase in internal taxation, but by an increase in import duties. This was particularly notable after the War of 1814, and the Civil War of 1861. Duties imposed by reason of war necessities have seldom been reduced subsequently to previous levels, hence temporary needs have aided materially in building up the high level of protection now generally accepted as the fiscal policy of the United States.

From 1789 to the present day there have been nearly 200 acts and joint resolutions of Congress affecting import duties. A large majority of these have been of minor importance, or merely amendatory to laws which were retained almost intact. The necessity for providing national revenue was the first consideration with the American Congress. That body met 6 April 1789, and two days later the House of Representatives resolved itself into a committee of the whole on the state of the union. Within 70 hours of the opening of the organization, James Madison introduced the subject of the tariff as one which appeared to him to be of the greatest magnitude, and one requiring the first attention of the legislative body. He said: "The deficiency in our treasury has been too notorious to make it necessary for me to animadvert upon that subject. Let us content ourselves with endeavoring to remedy the evil. To do this a national revenue must be obtained, but the system must be such a one that, while it secures the object of revenue, it shall not be oppressive to our constituents. Happy it is for us that such a system is within our power, for I apprehend that both these objects may be obtained from an impost on articles imported into the United States."

On closing his speech Mr. Madison offered a resolution, declaring it to be the sense of the committee that specific duties should be levied on spirituous liquors, molasses, wines, teas, sugars, pepper, cocoa and spices, and an ad valorem duty on all other articles; and also a tonnage duty on American vessels in which merchandise was imported, and a higher rate on foreign vessels. The following day the subject was again taken up, and continued to be the all absorbing topic of debate from the date Mr. Madison introduced his resolution until 17 May following, when the House agreed upon a bill and ordered it sent to the Senate. The Senate took up the bill on the 18th, and it was under consideration until June 11, when it was concurred in with sundry amendments. The House refused to concur and asked for a conference. The conference committee effected a compromise, which resulted in a lowering of some of the proposed duties.

The bill thus agreed to by both houses of Congress became a law by the approval of the President 4 July 1789, and thus was completed the first act in the building up of the present tariff system of the United States. The system

as it stands to-day, in the duties imposed and in the machinery of its application, is the outgrowth of a century of experiment and experience, and the advent into power of the most extreme low tariff party would do little more than lower some of the rates without disturbing to any great extent the complex organization provided for the administration of the customs houses. The tariff systems of nearly all protection countries are now modeled after that of the United States, and the effect of the policy of the latter country upon international commerce has been so powerful as to practically establish all existing channels of trade of any great importance.

Germany became a protection country by virtue of following the example of the United States at a time when German industrial affairs were faced with a crisis. The only great nation in the world which in 1904 still stood for an ostensibly free trade basis in its foreign commerce was the United Kingdom, and that country, struggling in the grasp of severe industrial depression, began to doubt the wisdom of its fiscal policy. This doubt obtained such strong hold upon the minds of the British people that a movement for the protection of British producers gained sufficient headway to warrant the prediction that within a reasonable time the example of the United States will also be followed by the United Kingdom to the extent of adopting a system of moderate import duties.

The tariff legislation of the American Congress may be grouped in a general way into a number of epochs. The first may be said to extend from 1789 to 1816; the second, from 1816 to 1832; the third, from 1832 to 1846; the fourth, from 1846 to 1860; and the last, from 1860 to the present time (1904). Opinions may differ as to whether there was any element of protection intended in the law of 1789. Whether there was or not, the operations of that law resulted in the passage of a tariff law in 1816, in which is embodied a distinctly protective policy. The duties imposed by the law of 1816 are lower than those which would now be considered as purely of a revenue character. The highest rate imposed by that law was 20 per cent. This was an increase over the rates established by previous acts, and was brought about more by the need for money to pay the interest charged on the war debt than by a popular demand for more protection. The law carried with it, however, sufficient protection to illustrate the principle and demonstrate its possible benefits to struggling industries. Popular sentiment became aroused in protection directions, and here may be said to have begun the first general movement in favor of a protection policy not only for revenue purposes but to secure immunity for home industry and labor against foreign competition.

The tariff law of 1824 was the outcome of a protection campaign, and in 1827 the duties were still further increased on woolens, around which class of manufactures most of the agitation for protection had arisen. A still stronger element of protection was contained in the law of 1832 and protection may be said to have prevailed in that and previous acts for a period of about 20 years. The duties imposed during that period, however, would not be regarded, in most instances, as high compared with the duties now collected on certain schedules. Between 1832 and 1860 protection and free trade alternately made their influence felt upon public opinion, and consequently in legislation. The record of Congressional action shows considerable vacillation, though at no time was the protection principle in danger of being abandoned. It had apparently become accepted as a basis for the fiscal system of the new country.

Low tariffs were succeeded by high tariffs, which in turn yielded to the agitation of the moment and were followed by lower rates. It was during this period that the great territorial development of the United States took place. The discovery of gold in California, the settlement of vast areas of western lands, and the coming of nearly all the new wealth of the country from the soil, obscured to a greater or less degree the real effects of any changes which were made in the tariff policy of the country. The law of 1832 was distinctly a protective measure, carrying high duties on cotton, woolen and iron imports, the principal articles concerned in any tariff legislation.

What is known as the compromise act was passed in 1832, this being an agreement between Clay and Calhoun, the leaders of the protection and low tariff parties, respectively. That law, while retaining a large element of protection, provided for a gradual reduction of duties upon a sliding scale. In 1842 a tariff law was passed by the Whigs as a party measure. This law carried high duties and was avowedly protective in its purpose. It remained in force but four years and was followed by the tariff law of 1846 enacted by the Democrats and based upon the Treasury report made by Secretary Walker in 1845. Secretary Walker was allegedly in favor of free trade, and his bill was referred to as a free trade measure. Notwithstanding this, some of the import duties were placed as high as 100 per cent and 30 per cent duty was retained upon nearly all of the principal articles of trade which had been in controversy for the 50 years preceding.

The act of 1846 remained in effect for 11 years, and in 1857 a still further reduction of duties was made. This law was passed without perceptible opposition owing to the fact that the revenue of the country was very large, and the treasury enjoyed a surplus of funds evidently calling for a reduction in national income. The average duty on the articles which were protected was reduced from 30 to 24 per cent, but the reduction was not so large as appeared upon the face of the law, for cotton manufactures, which in the act of 1846 were included in a schedule which only paid 25 per cent, were transferred to the schedule which had previously paid 30 per cent; hence a reduction of only one per cent was made in the import duty paid by this important class of competitive goods.

The law of 1857 only remained in force four years, for in 1861 came a revolution in the affairs of the country brought about by the Civil War. In the 30 years preceding, therefore, the country had conducted its fiscal affairs upon a varying basis. Beginning with a comparatively high protection policy in 1832, duties were gradually reduced until 1842 when, for a very brief period, the country approached closely to a free trade basis. From 1842 to 1846 protection again prevailed. In 1846 free trade, as it was called, controlled the situation, though it would be fairer to call it moderate protection, as the import duties exacted were not inconsiderable. In

1857 the protection given to domestic products was still further moderated and this law remained in force until the tariff legislation of 1861. In that year was enacted what was then and for some years afterward referred to as the "war tariff," though it was long ago accepted as expressing the permanent policy of the United States so long as the protection or Republican party should control the legislation of the country.

Before the Civil War a system of duties had been imposed which were very moderate compared to those the American people are now accustomed to. For a number of years immediately preceding the war the tariff was arranged upon a basis as closely approaching free trade as the economics of the country seemed to warrant. The Democrats, however, did not follow free trade principles in the framing of these laws, for many non-protective articles, such as tea and coffee, which might have been used to produce revenue were admitted free of duty. Iron and manufactures of iron, cotton goods, wool and manufactures of wool, carried an import duty of 30 per cent, and duties were also levied against steel, copper, lead and other articles of more or less competitive nature. In the law of 1857 the highest protective duty was 24 per cent. Nearly all raw materials were admitted free, and the duties on all manufactured articles were established at the lowest level which had prevailed since the beginning of the century.

The great change in the policy of the country in the matter of import duties came in 1860. It was in the winter of that and the preceding year the House of Representatives passed what is known as the Morrill Tariff Act of 1861. It was not until the next session, that of 1860–1, that this act received the assent of the Senate and became a law. This tariff legislation originated in the House of Representatives before a time when it could be charged with being a war measure. In fact, its promoters declared it to be their intention merely to restore the rate of duties which had prevailed in 1846. The most important change made in this bill was the substitution in many instances of specific for ad valorem duties, a change which generally results in a higher rate of impost. The iron and wool manufacturers benefited greatly by the passage of this law for it carried with it notable increase of protection for their output. This measure had hardly become a law when the Civil War began, and immediately the attention of Congress was centred upon the raising of additional revenue.

For the four years following no extra or regular session of Congress was held without many increases being made in the duties upon imports. The tariff act of 11 July 1862 increased the duties all along the line, for the avowed purpose of outsetting the internal taxation upon industry made necessary by war expenses. The protection idea, however, controlled largely in raising the schedules as set forth in this measure, and American manufacturers then received the highest degree of protection yet afforded them. In 1864 the import duties were again increased. This was done primarily, as before, to increase the revenue of the government, but as the men who framed and managed the bill were high protectionists, the law as enacted reflects their intention to give American industry the fullest measure of protection which Congress would allow. The average rate of duty under the law of 1862 had been 37.2 per cent, and under the law of 1864 the average rate was raised to 47.8 per cent. When the Morrill acts were passed, it was not believed that they represented a policy of high protection which was to be permanent. They were then regarded merely as necessary revenue producing measures so constructed as to afford protection to American industries while furnishing this revenue.

Immediately following the war, all branches of the fiscal policy received immediate attention except that dealing with the import duties. The schedules established during the war remained in force until the next general revision of the tariff in 1883, and by that time they had ceased to be regarded as war measures by the people, and had been adopted as a recognized part of the fiscal system of the United States when in its normal condition. The financial stress of the Civil War may, therefore, be said to have resulted in the present high protection policy of the United States. The tremendous growth of manufactures and the generally favorable operations of the law of 1864 produced an impression throughout the country that high protection was beneficial, and the people accepted it willingly. In fact, in a number of instances import duties have since been raised above those imposed by what is known as the "war tariff." This is particularly notable in the case of the wool schedule, one of the most complicated in the tariff system. These increases were made in the Tariff Act of 1867, and the main features of this bill were retained in the acts of 1883 and 1890, and after the brief period of lower tariff brought about by the Democratic measure of 1894 were readopted in the measure of 1897, the one now in force (1904). In 1882, a commission was created to consider a revision of the tariff, and the bill of the following year was based upon the report of this commission. The wool and iron schedules, around which all tariff agitation has gathered since the beginning, received the most benefit from this law. There were some slight reductions on raw materials.

No consistent policy was evident in the framing of the law of 1883, it apparently having been a measure controlled by the high protectionists, who were then animated by a desire to meet in some degree the wishes of those favoring a more moderate tariff. It was not until seven years later, or 1890, that another general revision of the tariff was undertaken. A number of measures were proposed in the meantime, but did not receive much encouragement. It was in this period that Mr. Morrison of Illinois, originated his "horizontal" reduction bills, all of which met with defeat, being opposed by the members of his own, the Democratic, party, as well as by the Republicans. The tariff question came to the front again with the Congressional session of 1887–8. President Cleveland's message in the fall of 1887 was devoted almost entirely to the tariff, and he took a decided stand in favor of general reduction and in favor of free raw materials.

The so-called Mills bill, expressing the ideas of President Cleveland and his followers, was passed by a Democratic House, but failed to become a law through the Senate being Republican. A bill originating in the Senate proposed

still further increases of protective duties and the campaign of 1888 was conducted on the tariff issue. The Republicans were triumphant and interpreted the result at the polls to be a verdict in favor of protection. This election resulted in the final enactment in October 1890, of what has been popularly known as the McKinley Bill. (See McKinley Act.) As usual the controversy raged fiercest over the woolen schedules, and no tariff has been more fully debated, or to such wearisome length, as this bill which finally became a law.

Immediately after the passage of the McKinley Bill, the Democrats were successful at the polls. In the fall of 1890 Democratic majorities were returned in the Congressional elections, and in 1892 President Cleveland was again elected, after making a compaign in which little was talked of except the tariff. In the period immediately following, the tariff question was obscured, however, by the sudden appearance of a currency issue, and in 1893 severe financial depression throughout the country centred public attention almost exclusively upon the currency issue. The Democrats had a very small majority in the Senate, and many Democratic senators hailed from States which benefited materially by protection. A Democratic measure lowering the tariff schedules was reported to the House in December 1893. This measure is popularly known as the Wilson Bill. Owing to the narrow majority possessed in the Senate by the party in power, and the conflicting interests affected by the measure, it was radically amended before it stood any chance of enactment. The House was forced to accept the Senate amendments and the bill as thus shaped became a tariff law of 1894. It went into effect 28 August, and President Cleveland expressed his displeasure and disapproval by permitting the bill to become a law without his signature.

The Wilson Bill was a radical change in the long existing tariff policy of the United States. Free wool was its most important feature and was looked upon as a test of the wisdom of free raw material. There were also marked reductions in the schedule imposed on manufactures of wool. The iron and steel industries also suffered a marked reduction in the duties on competitive products. By the time the Wilson Bill went into effect the country was in most desperate financial straits; crops were bad, and the mining industry of the west was at a low ebb. Disaster was general throughout the western States, many causes serving to emphasize it. Owing to this combination, it is difficult to justly estimate the economic effects of the changes in the tariff, but the general impression created upon the country was unfavorable to the measure, and reflected severely upon the economic theories advanced by the Democrats.

The presidential campaign of 1896 was fought upon the currency issue purely and simply, for the free coinage of silver was advanced as the only question before the people, and advocated as a remedy for all the ills under which the country was then laboring. Discussion of the tariff was thus practically eliminated from the controversy, and the Republican party, standing as it did for the gold standard, won an overwhelming victory on that issue alone and came back into power. The people accepted the argument of the high protectionists to the effect that the black years of 1893–4–5–6 were due almost entirely to the enactment of a low tariff bill by the Democrats in 1894, and the Republican party met with every encouragement to reassert the protection principles of the McKinley Act and raise the import duties once more to rates approximating at least those which had prevailed before the panic. President McKinley called Congress together in extra session in 1897 for the sole expressed purpose of treating of tariff and revenue. The campaign of 1896 had been carried on with the currency as the sole issue, but the first act of the new Congress was one affecting the tariff.

A bill had been prepared unofficially before the House was organized, and the third day after the session began witnessed the introduction of a measure known as the Dingley Bill, which stands without material modification as the law of 1904. The bill was passed within two weeks and without very much consideration by the House as a whole, the committee plan being accepted entire. Its passage was effected by strictly party vote, and under the severe rulings of Speaker Reed. In the Senate, as usual, there was more delay. After remaining in the committee for a month it was reported with some amendments. As the bill finally passed the Senate it contained nearly 900 amendments, but followed the report of the House committee rather than that of the committee of the Senate. An agreement was reached in conference and the bill enacted into law 24 July 1897.

Under this act the duties on wool were restored to an even higher level than ever before. The duty on hides was re-imposed, cotton manufactures did not receive quite as high a degree of protection as in the McKinley Bill, but silks and linens secured the maximum of protection. Some attention was paid to the agricultural interests in a duty on flax and lower duties were imposed on imported goods consumed in the pursuit of agriculture than were common to the law of 1890. The duties on the iron and steel schedules were not increased in proportion, for these industries had remained prosperous under lower tariffs, and popular sentiment was already forming in opposition to high protection for articles controlled by industrial combinations. In the Dingley Law were revived the provisions of the McKinley Law providing for reciprocity in foreign trade, but a time limit of two years was placed upon the operation of this clause, and owing to the opposition of the Senate to such reciprocity treaties as were subsequently negotiated by the State Department no results were achieved thereby.

The enactment of the tariff law of 1897 was the result of a well-defined determination on the part of the people as expressed at the polls to maintain the system of protection which had so long been in force and under which the industries of the country had apparently benefited most materially. That the American people were satisfied with the action of Congress in re-establishing protection at a high mark is shown by the return of the subsequent national election in 1900, when the Republican Party was again decisively triumphant in its appeal to the voters. It is true that the money question was again to the front in 1900, but with far less virulence than in 1896. General conditions throughout the country in 1900 were most excellent, with every prospect for a continuation

of the same. The contrast of these years of plenty to the lean years when the Wilson Bill was in force could not fail to appeal not only to the imagination, but to the pockets of the electorate, and whether the deductions as to causes were correct or not, it is not to be wondered that the average voter accepted apparent results without questioning too closely the reasons why.

Since the enactment of the tariff law of 1897 the United States has come into possession of important areas of new territory, which while not held to be integral portions of the United States are considered by the people as entitled to the full benefits of American protection and free intercourse with the government country. Industrial interests which would be seriously affected by suddenly applied free trade with large tropical areas, and other interests favoring a narrower economic policy have prevented the enactment of laws giving unrestricted trade privileges to the Philippines.

Considerable progress has been made along these lines, however, as commerce is now entirely unrestricted between the United States and Porto Rico, and material reductions have been made in the duties assessed against Philippine products. No tariff legislation of importance has been enacted by Congress since the law of 1897 with the exception of these concessions made to American territory, and the ratification of a treaty with Cuba, which provides for a reduction of duties on Cuban products entering the United States, this reduction being given in consideration for reductions of equal value allowed by Cuba upon goods imported from the United States. This legislation in favor of Cuba can not be regarded as an expression upon the tariff question, for it was dictated more by the peculiar relations between the two countries and the understood pledge made by the United States in 1898 to the effect that when Cuba should have secured her independence, the United States would extend a helping hand to rehabilitate the distressed industries of that island.

A large number of reciprocity treaties have been negotiated with foreign countries by the State Department since 1898, but all of these have failed of ratification by the Senate, the coordinate treaty-making power. The question as to the right of the treaty-making power to bring about any increase or reduction in the national income by changing the rate of import duty is moot. A number of the best constitutional lawyers in the legislative branch of the government hold that without direct authority from Congress this can not be done. The reciprocity clause of the Dingley Law having had a two years' limitation placed upon it, the position is taken that no authority exists to-day for any reciprocity agreement unless such agreement shall be enacted into law by Congress as a whole.

In the matter of Cuba, deference was paid to this belief and upon the ratification of the treaty it was passed upon by Congress and followed the usual and ordinary course of any other legislative measure. The industrial growth of the United States since the enactment of the McKinley Law is one of the wonders of the world. Economists differ as to the causes of this growth, and attach varying degrees of importance to the fiscal policy under which it has appeared. High protectionists ascribe the increase of national wealth to a protection policy. Others, while admitting that protection has built up many industries, assert that the development of the great natural resources of the United States is solely responsible for the aggregation of wealth presented through the operations of industry in the past 15 years. In fact those who oppose high protection attribute many evils incident to industrial control and monopoly to the immunity from foreign competition afforded by prohibitive tariffs.

There was in the year 1904 a general sentiment throughout the United States in favor of a more or less radical revision of the tariff. Another tariff campaign is not expected, however, for some years, and then many believe that it will come through a wise moderation of its own protective policy by the Republican party. The industrial and commercial interests of the country dread the uncertainty and confusion incident to a tariff revision, ofttimes preferring to labor under an unscientific system of import duties rather than to risk the disturbance of a change and the evils which are possible in a new measure dictated more or less by political rather than by industrial considerations.

One of the great difficulties confronting the framers of a tariff measure for the United States is found in the vast size of the territory involved and the conflict of localized industries. The shoemakers of Massachusetts want hides placed upon the free list, but the Texas cattle man, Democrat as he may be, is in favor of protection for one of his chief products. Hence it is that party lines are not now sharply drawn upon the tariff issue. There are few if any free trade members of Congress. The Democrats as a body are nothing more or less than moderate protectionists, and in their beliefs are not far removed from many of their Republican fellow members, who are almost equally opposed to the extreme high protection ideas which controlled the Republican party in the campaign of 1888. There is no immediate prospect of a radical change in the tariff policy of the United States. Schedules may be lowered or readjusted to meet changing conditions, and some provision may be made in the near future for reciprocity in foreign trade. The principle of protection is too well established in the national policy to be uprooted. See Duty; Free Trade; Imports and Exports, American; Protection; Revenue; Tariff.

James Davenport Whelpley,
Economist.

47. United States — Reciprocity. The term reciprocity, in its economic sense, is not easy to define. The word itself seems simple enough; but it now embraces many things not wholly consistent with its derivation. It has applications in Europe which are unknown in the United States, and it is now used to describe governmental operations to which it was entirely foreign a few years ago. This will account for the inaccuracy and incompleteness of many of the definitions found in the well-known dictionaries and encyclopedias. The writer has examined a number of these attempted definitions, and in nearly all of them it is assumed that a reciprocal trade arrangement involves the grant of identical rights to the citizens of the countries entering into the arrangement; that is to say, that the articles covered by the agreement, and import duties laid under it, must be

the same on both sides. This notion is radically wrong. Reciprocity, as now understood, does not require that the articles named in behalf of one country shall be the same in whole or in part with the articles named in behalf of the other, and it follows, that it does not require that the duties prescribed shall be identical. While in the case of a direct treaty, the thought of equivalency of concession or privilege is not absent, it is a matter of judgment rather than mathematics. For instance, an agreement between the United States and Germany providing that the former should admit to its ports structural iron of German production, upon the payment of an import duty of $5 per ton, and that the latter should admit to its ports wheat produced here upon the payment of an import duty of five cents per bushel, would be reciprocity between the two countries without reference to the value of the bargain to the one or the other.

Some of these definitions are imperfect in another respect. They imply that reciprocity must be embodied in an agreement or arrangement made by treaty between two nations, and which concerns no other countries. This view ignores the well established plan of effecting reciprocity through general legislation or regulation. For instance, the reciprocal relation can as well be created by the means of conditional or maximum and minimum tariffs, as by trade treaties, and Europe affords many illustrations of the use of this plan at the present time.

To three familiar definitions a more particular reference may not be uninstructive. In Lalor's 'Encyclopedia of Political Science,' Vol. III., page 537, the author of the article defines the word as follows:

"Reciprocity is a relation between two independent powers such that the citizens of each are guaranteed certain commercial privileges at the hands of the other."

This definition is much too broad. Reciprocity from the modern standpoint is limited to arrangements respecting tariffs, and much confusion will result if we think of it as including all commercial privileges which may be mutually granted by two sovereignties. Taking the word alone for our guide, it may be fairly correct, for substantially all international agreements have elements of reciprocity, but they are not so denominated, and by common consent reciprocity has become a matter of tariffs.

Another well known encyclopedia ('Chambers,' Vol. III., page 598) defines the word thus:

"A term for an arrangement between two countries having a protective tariff against other countries, to admit each into the other's territories certain specified taxable articles of commerce duty free or with exceptionally light duties. The classes of articles are arranged to balance one another on one side and the other. Such mutual arrangements are sometimes called *fair trade* as opposed to *free trade* and thoroughgoing protection."

This definition is even more inaccurate and misleading than the other. It does not at all follow that articles passing between countries operating under a reciprocal arrangement shall be admitted "duty free" or with "exceptionally light duties," and it is obvious that there may be a reciprocal adjustment in absolute harmony with "thoroughgoing protection." To illustrate: Suppose that the United States imposed a high prohibitive import duty upon foreign glass, and France imposed a high prohibitive duty upon American wheat. A treaty that would admit French glass into the United States so that it could enter our markets upon even terms with our own product, and admit American wheat into the markets of France upon even terms with our competitors there, would embody the policy of reciprocity as now accepted, and yet be absolutely consistent with the strictest theory of protection.

In Harper's 'Encyclopedia of United States History,' Vol. VII., page 383, it is said of reciprocity: "In commercial relations a mutual agreement between nations to secure reciprocal trade, and involving a modification of regular tariff rates." The fault of this description is not only that it implies a specific arrangement and excludes conditional or maximum and minimum tariffs; but that it does not include those cases in which the abolition of discriminating tariffs is a part or the whole of the concession of the one country or the other. It may be, indeed has been, true, that the privilege of enjoying the regular tariff rates constitutes the reciprocal relation existing between two countries.

Without at this time giving attention to the various phases of the word in other countries, its meaning in our own country at the present time may be fairly expressed thus: A direct agreement between two independent countries prescribing the duties which the products, or some of the products, of the one, shall pay upon entering the markets of the other; or, general legislation or executive regulation which makes the duties imposed by one country dependent upon the duties levied in the other. It is important that there should be a careful understanding of the meaning which has gradually been attached to the word, with all its limitations and expansions; otherwise much of the current discussion upon the subject will become unintelligible.

Historical.— Unquestionably the term reciprocity, in its governmental application, was originally used to describe the exchange of privileges in shipping and navigation. But this use long ago became obsolete, and I do not enter upon the development of that part of its history. Confining this article to the United States, except as incidentally there may be mentioned the operation of the doctrine in other countries, it may be remarked that here we have talked and written much about it, but have done very little. To fully appreciate the relation which reciprocity has borne to our tariff laws, it is essential to hold in mind the general attitude of our political parties toward two distinct policies which have, broadly speaking, dominated these laws from the early days of the republic. One party has always stood, with varying degrees of firmness, for the doctrine of protection, which means the levy of import duties upon competitive products sufficient to enable home producers to reach home markets upon at least even terms with their foreign competitors, and the admission of noncompetitive products free, or at most with the lightest practicable revenue duty. Another party has stood, theoretically at least, for a system of duties that would admit competitive products free, or with a light revenue duty, and that would impose on noncompetitive products whatever duty was necessary to provide

the remaining part of the expenses of government which was to be raised through imports. These conflicting economic declarations are in some measure abstract. What has been stated respecting them is a composite of our political platforms, running over many years. In the actual work of the two parties in Congress, marked and constant departures from platform utterances are observable. The party of protection has, especially since 1861, established many duties upon competitive products much higher than necessary to afford protection, and has not always adhered to the principle of admitting noncompetitive products practically free. On the other hand, what may be called the revenue duty party, when in opposition, has spent its time in mere criticism of particular duties, and when in power, has contented itself with formulating tariff schedules which neither answered the demands of its platforms nor afforded adequate protection. It is preferable, however, to judge these parties by their repeated declarations upon policies which they insist should prevail, rather than by congressional enactments or debates. It is obvious that the doctrine of protection presents abundant opportunity for reciprocity in competitive products and but little opportunity for reciprocity in noncompetitive products, unless duties be imposed upon noncompetitive things in violation of the protection theory simply for the purpose of reducing them through reciprocity. It is equally obvious that the doctrine of the revenue duty party presents no opportunity for reciprocity, either in competitive or noncompetitive products; none in competitive products because there is no duty imposed upon them except that which is laid for revenue, and none in noncompetitive products because it would be the climax of folly to impose upon them a single farthing of duties in excess of the requirements of the government. When, therefore, in the 'Congressional Record' it appears that a revenue duty member advocates reciprocity, it will he understood that he is proposing to attach it in some form or other to tariff schedules formed upon the protection plan.

Some of the early general treaties entered into by this country, notably those with France in 1778, with Prussia in 1828, and with Austria in 1829, contained what is known as the "most favored nation" clause, and exemplify the first forms of reciprocity known to our laws; but it is not within the scope of this article to consider their operation. The first substantial effort in this country, looking to practical reciprocity, occurred in 1844 when the President negotiated a treaty with the German Zollverein. It was not ratified by the Senate, its defeat being placed nominally on the ground that the executive had exceeded his authority in negotiating a treaty which infringed upon the rights of the House of Representatives, to which is given, by the Constitution, the exclusive privilege of initiating revenue measures. It is probable, however, that the ostensible objection was not the real one. From the current discussion of the time it is reasonably clear that it failed because many influential senators believed that our duties should be laid by general enactment and should not be created by special agreement with any power. In other words, the opposition was to the whole scheme of reciprocity. Our next venture was more successful. In 1854 we entered into a reciprocal treaty with Canada, which continued in operation until 17 March 1866, when it terminated under a notice authorized by Congress on 16 Jan. 1865. Many controversies had arisen under the treaty and its immediate advantage to the United States was doubtful. Before its abrogation, however, it was made clear that a modified treaty could be secured that would have been of great benefit to our people, both directly and indirectly, but so violent was the spirit exhibited in Congress against its continuance and against any negotiations looking to its modification, that we peremptorily declined to consider the matter with the Canadian authorities. The favorite ground, in speech, for the opposition to the treaty was the fact that during the 11 years, from 1854 to 1865, the balance of trade between the United States and Canada was against us. Viewed, however, in the calmer light of nearly a half century later, and understanding that the value of a treaty with any particular country does not depend upon the balance of trade, it may be assumed at this time with a reasonable degree of certainty, that the real reason for abrogating the treaty and refusing to even consider propositions for its modification and enlargement, was the hostile feeling that the War of 1861–5 had engendered against England and her dependencies, and especially against Canada. We had been sorely tried by the unfriendliness of the British people in an hour of peril, and we were in no fit mind to consider either the commercial or political advantages which might ensue from close business relations with our northern neighbor. Late in 1859 a reciprocal treaty was negotiated with Mexico, but it came into the Senate in the days when the approaching war absorbed the attention of that body to the exclusion of every other thing, and it failed of ratification. A feeble effort toward reciprocity was begun with Hawaii in 1855, but came to nothing. It was revived in 1867, and a reciprocal treaty was negotiated, but it was rejected by the Senate. The subject, however, continued under discussion and a new reciprocal treaty was agreed upon in 1875, which was at once ratified by the Senate and passed into operation. It was renewed with modifications in 1887, and continued until it expired by its terms. In 1883 General Grant and Mr. Trescott, acting for the United States, negotiated with the Republic of Mexico a most important reciprocal treaty. It was transmitted to the Senate by President Arthur with his recommendation. In 1885 the time of ratification was extended one year, and in 1886 again extended for a similar period. This treaty is worthy of especial study, because it initiated what may be termed the modern discussion as to the relation between reciprocity and protection, and is exceedingly significant upon a controversy now widespread — whether reciprocity in competitive things is consistent with the true theory of protection. The Mexican treaty so negotiated by General Grant and Mr. Trescott, if it had been ratified, would have established substantial free trade between the United States and Mexico; and concerning it Mr. Blaine, six years later, wrote thus in a letter to Senator Frye, during the pendency of the McKinley Bill.

"Six years ago the prime minister of Spain, in his anxiety to secure free admission to our markets of the sugar of Cuba and Porto Rico,

agreed to a very extensive treaty of reciprocity with General Foster, then our minister at Madrid. A year before — in 1883 — a very admirable treaty of reciprocity was negotiated by General Grant and Mr. Trescott, as United States Commissioners, with the Republic of Mexico — a treaty well considered in all its parts and all its details — and its results would have proved highly advantageous to both countries. Both these treaties of reciprocity failed to secure the approval of Congress, and failed for the express reason that both provided for the free admission of sugar. Congress would not then allow a single pound of sugar to come in free of duty under any circumstances." While General Grant was negotiating this treaty with Mexico, General Foster, our minister to Spain, was negotiating a treaty with that power covering our business with Cuba and Porto Rico. It also embraced competitive products. It was sent to the Senate by President Arthur near the close of his term, but was withdrawn by President Cleveland, and was not afterward submitted. Contemporaneously with the Mexican and Spanish treaties a somewhat similar one was negotiated with Santo Domingo. Neither of these treaties was ratified for the reason, first, they encountered the opposition of President Cleveland and some of his party, who proposed that all the tariff schedules should be revised in order to bring them to a revenue basis; second, many members of the Republican party stood against them because they interfered to some extent with some of the beneficiaries of the protection policy. The general issue thus drawn at a time when the tariff had again become the paramount question before the American people has continued to this day, and every suggestion toward reciprocity which has since been made has become involved in the division of opinion observed in the discussion of the Mexican and Spanish treaties.

Out of the debates to which reference has already been made there came an act of Congress, providing for a commission for looking into the relations between the United States and the countries of Central and South America, to the end that there might be established more intimacy in a commercial way. This commission visited some of the Central and South American countries, and its reports were transmitted to Congress by President Arthur in 1885. Among other things recommended by the commission was a Pan-American Conference. It was expected that this conference would take into consideration not only the modification of tariffs through reciprocal arrangements, but every other question which related to the development of business between them. Congress authorized the calling of the conference in 1888, and President Cleveland, although hostile to the measure, invited the Central and South American states, together with Mexico, Haiti, and Santo Domingo, to send representatives. The place of meeting was fixed at Washington, and the time, the year 1889. So much President Cleveland did under the imperative command of Congress, but he relaxed nothing of his hostility to the doctrine of reciprocity, which was to be the chief subject of discussion in the conference. In 1889 President Cleveland passed out of office, and President Harrison came in, and Blaine, the keenest-sighted statesman of his age, the ardent friend of protection, but an enthusiastic believer in the efficiency of reciprocity, became secretary of state. It was under his fostering influence that the Pan-American Conference came together, and he was its presiding officer. Its proceedings cannot be followed at this time nor is it possible to point to any specific result of the meeting. It had one consequence, however, which must not be overlooked. It gave great impetus to the investigation of the value of our foreign trade, and to the methods that should be employed for its expansion, but above all, the conference prepared Blaine for the struggle in which he was shortly to engage over the terms of the new tariff law which it was sure the Republican party would shortly undertake to pass. When Congress met in December 1889, the Republicans were in a majority in both branches; and William McKinley, afterward President of the United States, became the chairman of the House committee on ways and means. In April 1890 he reported a tariff bill, which, generally speaking, increased the duties over those of any prior law, and greatly restricted the free list. It was silent with respect to reciprocity in any form, and upon it Blaine fought his campaign for reciprocity. He not only appeared before the committees, but wrote and published letters and made speeches throughout the country, and created, for the first time in the history of the American people, a real interest in the subject. He was measurably successful in the House, continued the struggle before the Senate and with the conference committee, until what is now known as the McKinley Bill became the McKinley Act (q.v.). No attempt will be made to follow this bill in its various stages through the houses of Congress, but it will be interesting to note some incidents which accompanied its passage. In a speech which Mr. Blaine made in his own State, he said, among other things: "I wish to declare the opinion that the United States has reached a point where one of its highest duties is to enlarge the area of its foreign trade. . . . I mean the expansion of trade with countries where we can find profitable exchanges. . . . I think we would be unwisely content if we did not seek to engage in what the younger Pitt so well termed 'annexation of trade.'" . . . In a direct communication to Congress he recommended: "An amendment to the pending tariff bill, authorizing the President to declare the ports of the United States free to all the products of any nation of the American hemisphere upon which no export duties are imposed, whenever and so long as such nation shall admit to its ports, free of all national, provincial, municipal, and other taxes, our flour, corn meal, and other breadstuffs, preserved meats, fish, vegetables, and fruits, cotton-seed oil, rice, and other provisions, including all articles of food, lumber, furniture, and other articles of wood, agricultural implements, machinery, mining, and mechanical machinery, structural steel and iron, steel rails, locomotives, railway cars, or supplies, street cars, and refined petroleum." In a letter written to an influential newspaper shortly after the passage of the bill through the Senate he also said: "Finally, there is one fact that should have great weight, especially with protectionists. Every free trader in the Senate voted against the reciprocity provision. The free-trade papers throughout the country are showing determined hostility. . . . They know and feel that with a system of reciprocity established and growing their policy of free trade

receives a most severe blow. The protectionist who opposes reciprocity in the form in which it is now submitted knocks away one of the strongest supports of the system. The enactment of reciprocity is the safeguard of protection. The defeat of reciprocity is the opportunity of free trade." Shortly after the bill appeared in the Senate, Senator Hale, a prominent Republican, introduced an amendment to it which embodied in terms the recommendation that Mr. Blaine had made, and which has already been quoted. About the same time, Senator Sherman, a long-time leader of the party of protection, offered an amendment which provided, first: a reciprocal arrangement with Canada for the free admission of coal into both countries; and, second: for a joint commission to negotiate a full reciprocity treaty with Canada. Both these amendments failed, but they are important in that they mark the division in the ranks of the Republican party concerning reciprocity — a division which was then somewhat vague, but which has now become sharp and clear, and which involves the fate of reciprocity as an efficient economic doctrine in the United States.

The McKinley Bill as it finally passed contained an effective provision for reciprocity in both competitive and noncompetitive things, namely: Under the act generally sugar, molasses, coffee, tea, and hides were admitted free of duty. The President was authorized to put them upon a dutiable list if any country sending them here failed to treat our exports fairly. It is therefore clear that whatever Congress may have thought of the practicability of a treaty of reciprocity with Canada or with the countries of Europe in competitive things, it firmly established the doctrine that it was wise in some instances and with some countries, to enlarge our foreign trade by making agreements that would admit competitive products into our markets. Mr. Blaine, who firmly believed in the great advantages that might be acquired for his country, at once went energetically forward, with the result that in the course of a little more than a year we entered into reciprocal treaties with Brazil, with Spain for Cuba and Porto Rico, with England on behalf of Jamaica, Trinidad, Barbados, Guiana, and the Leeward and Windward Islands, with Santo Domingo, Guatemala, Salvador, Costa Rica, Honduras, and Nicaragua in the American continent, and with Germany and Austria-Hungary in Europe.

In 1892 the Democratic party was again successful, and on 4 March 1893 President Cleveland again became President. When Congress met in December, 1893, both branches were Democratic, and under the leadership of William L. Wilson, chairman of the House committee on ways and means, work was immediately begun upon a tariff bill which would embody, it was hoped, the Democratic revenue duty view. The presence of Democratic protectionists in the Senate prevented the passage of the measure as it came from the House, and as finally passed it was a conglomerate of protection and free trade; but without any provision looking toward reciprocal arrangements with other countries; not only so, but it abrogated every treaty that had been entered into under the McKinley Act. We were thus left, in 1894, with not a single reciprocity treaty in existence, unless an exception be made of the rather uncertain relations that then existed between this country and Hawaii, and from that time until 1897 there was no effort made to establish reciprocal relations with any country in the world. In 1896 political supremacy again shifted, and William McKinley was elected President of the United States, and with him came in a Republican Congress. A special session was immediately called, and Nelson Dingley, chairman of the ways and means committee of the House, within a few days after the session opened, presented a tariff measure, formed along protection lines. The chief discussion of the bill, both in the House and Senate, related to reciprocity. This discussion developed the usual difference in the dominant party. As adopted, the Dingley Act conferred upon the President the absolute right to enter into reciprocal arrangements with any country permitting free importation, in consideration of satisfactory concessions to us, of the following articles: argols or crude tartar or wine lees, crude brandies or other spirits manufactured or distilled from grain or other materials, champagne and all other sparkling wines, still wines and vermuth, paintings and statuary. It will be observed that these are all competitive products, but they are not of the first importance in the commerce of the country. It further gave the President power to suspend the free importation of coffee, tea, tonquin, tonqua, or tonka beans, and vanilla beans from any country that imposed duties upon our agricultural or manufactured products which, in the opinion of the President, were reciprocally unequal and unreasonable. It further gave to the President, for the purpose of securing reciprocal trade with foreign countries, power to enter into treaties, by and with the advice and consent of the Senate, and the approval of Congress, covering all products, for a period not exceeding five years, and to attain that end permitted the reduction of duties imposed by the Dingley Act to the extent of not more than 20 per cent. Whatever else may be said of the Dingley Act, it must be admitted that it contains a full and complete recognition of the advantages of reciprocal treaties embracing all products, competitive as well as noncompetitive. It has often been said that many of the duties were fixed at a high point in order to give room for reduction through reciprocity. It is not, and cannot be, known certainly whether this be true or false, but theoretically it must be assumed that the duties were fixed at the protection point, and that the latitude of 20 per cent was intended to admit some things into our markets that would come into competition with our own products. The difference between approving any particular treaty and establishing a policy must not be forgotten. It is to be presumed that the executive would not negotiate nor Congress approve a treaty that upon the whole would injuriously affect the general welfare of the people of this country, but upon the controversy respecting the scope of reciprocity as a political or economic doctrine the Dingley Act is conclusive. It may very well be that some of the members of Congress believed that they were keeping the promise to the ear and breaking it to the hope and that they anticipated the refusal of both the Senate and the House to even consider treaties that might be negotiated under the act to which they gave their support. If this be true,

it merely proves double dealing and insincerity, but it does not impeach the general conclusion.

President McKinley, proceeding upon the hypothesis that the Dingley Act meant what it said, immediately appointed John A. Kasson, a distinguished statesman and diplomat, to conduct negotiations for the state department, looking to reciprocal treaties which would carry out the purposes of the act, and in the years 1899 and 1900, he, on behalf of the United States, signed treaties with France; with Great Britain for Jamaica, Turks, and Caicos Islands, Barbados, Bermuda, and British Guiana; with Denmark for the Danish West Indies, including the Dominican Republic, with Nicaragua, Ecuador, and Argentina. These treaties were all transmitted to the Senate by President McKinley, with his recommendation for their ratification, and there they have ever since remained without action either favorable or unfavorable. In 1903 we entered into a reciprocal treaty with the Republic of Cuba. It was not brought about, however, so much by commercial considerations as by a desire to satisfy obligations of honor created at the time Cuba accepted certain amendments to her constitution proposed by the United States. Attended even by these circumstances, it required all the influence that the executive could bring to bear upon Congress to secure a ratification of the arrangement. This treaty provided, among other things, for the introduction of Cuban sugar at a reduced duty, and sugar being a sharply competitive product, the old dispute was renewed. In 1898, under the concurrent action of the United States and Canada, a Joint High Commission was created for the purpose of reviving, if possible, reciprocity between these countries. The commission held many and long continued conferences, but no agreement was reached. It is still nominally in existence; but there seems to be no disposition on either side to resume its labors.

The foregoing is a bare outline of the history of reciprocity in the United States. After all that has been said and done, the only evidence of progress toward the expansion of our foreign trade through reciprocity that we have preserved is the treaty with Cuba. Our exports are large, but they have grown to their present immense proportions without the aid of the government, and indeed in spite of its influence.

Conclusion.— Whether reciprocity will become an active factor in our industrial life depends upon two contingencies. If the revenue duty party now known as the Democratic party secures and retains control of the government, reciprocity is eliminated as an economic force in our affairs, for even though in revising the tariff it does not embody the theories of its platform utterances, it will adhere to its legislative view of a general, unconditional, inflexible reduction of duties. If the protection party, now known as the Republican party, maintains its supremacy, and that element in it which insists upon the absolute exclusion at all times and under all circumstances of all competitive imports from our markets, shall prevail, reciprocity falls into a mere abstraction. If, however, that element in it which has adopted the opinions of Garfield, of Blaine, of Sherman, and of McKinley, in his later years, shall prevail, then our foreign trade, which must always be small as compared with our domestic trade, but which nevertheless is essential to our steady progress and permanent prosperity, will receive its due share of the care and solicitude of our statesmen and law makers. See FREE TRADE; PROTECTION.

ALBERT B. CUMMINS,
Governor of Iowa.

48. United States — Development of the America Idea or Democratic Spirit in the. The United States is spoken of rightly by all writers as the living exponent of the democratic idea in government. Carlyle in a celebrated epigram spoke of democracy as starting from Bunker Hill to make its journey round the world. And while the leading writers of the civilized world recognize this statement as condensing the true history of the progress of the democratic idea, the existing constitutions and governments of the United States itself present themselves as the physical creations of a Democracy. It is, therefore, interesting to remember that among all the settlers of English or French blood who founded the Thirteen United States of 1775, no man had any forelook to a government of pure democracy. That is to say, the idea of universal suffrage as a controlling power in the state, did not suggest itself to any one of the founders of America. What is more, very little discussion of universal suffrage will be found even in the best writers from time to time. When Topsy said of herself, "I 'spects I growed," she announced without knowing it the law of existence of universal suffrage in America. There are illustrations even humorous in the early history which show the surprise which existed among the first founders when the equality of men began to assert itself. Thus in the Massachusetts annals we find Winthrop, the first governor, thought he was to be attended by four men with halberds. When the Court of Assistants would not vote him the halberds, Winthrop made four of his own servants carry them. But Winthrop very soon found that he was servant and not master. The halberds were relegated to the museums,— one might say in half an hour. What does this mean? It means that so soon as they were building log cabins, one man who could swing an axe was in as much demand as another. If the churl could lift one end of the log as well as his master who was at the other, the sentiment of equality was at once implied. In Knickerbocker's 'History of New York' you find a similar instance as funny as this, which we owe partly to Irving's wit and partly to the real annals of the infant town. Writers on the subject like to refer this opinion of equality to the customs of the German forests. It is probable that in fact like causes produced like effects. In the German forests or in the forests of Massachusetts Bay, or on the Blue Ridge or in the Valley of the Mohawk, the new settler found that he was the essential part. Land as land proved to be worth nothing. Land proved to be valuable only in proportion to the number of men who lived on it or wanted it. This discovery that land as such is worth no more than water as such, that an acre of land is as worthless as an acre of salt water in the Atlantic, was the first discovery of the new settlers.

In most of the modern colonies of the world the results of this discovery were slightly affected by the arrival, with the settlers, of governors who brought with them feudal notions

and commissions and exercised as such feudal powers. But the efforts for such English domination here were ludicrously small. The Colony of Massachusetts at the beginning, took care to have no relations whatever with the crown. From the beginning till Charles I. fell, there will not be found a document of the slightest importance addressed by the independent states of Massachusetts Bay to any secretary of the king or the Parliament. On the other hand, it proved very early in their affairs, that they would not display the flag of England on their fort when they were asked to do so by an officer in King Charles' navy. When they found themselves threatened by that navy, they considered first the means of fortifying Boston that they might keep out the invasion of their own "sovereign"; and, second, they discussed the best methods of removing to the Valley of the Mohawk, into a sealed wilderness where no Stuart should dare to come. Something similar to this could be said of Virginia. It may be doubted whether an ounce of powder or lead from the royal stores was ever furnished for that colony. Nothing is more certain than that William Penn, in the colony which established Pennsylvania, received no help from the crown. "Nourished by your care?" — these are the words ascribed to James Otis — "It was your oppression that drove us to America. Our fathers plunged into the ocean, with the charter of freedom in their teeth, and left the faggot and the sword behind them."

It was true that under the several charters, some broken-winded soldier or some penniless courtier was sent over from time to time to be what was called "Governor of Virginia," "Governor of New York," "Governor of New England." But how did the poor creatures govern? How did they get the daily bread for their wives and little ones, or the butter for the bread? It was they who were dependent on the colonies, not the colonies who were dependent on them! Poor Lord Bellomont, governor of all New England and New York under Queen Anne, was walking home one day from the Puritan Thursday Lecture in Boston. The poor man had to hear it once a week, lest he should offend the General Court of the Province of Massachusetts, who voted him his annual salary. As the governor's cortége passed an apothecary's shop in the Main Street, his excellency said to the shop-keeper, who was lounging at the door, "You have lost a precious sermon, doctor." "I would have heard it," said the impudent apothecary, "if I had been paid for it as well as your lordship was." That is the way in which, under such auspices, an apothecary speaks to the representative of Queen Anne. And the governor cannot help himself, because what the apothecary says is founded on the truth. The crown is dependent on the colony. The colony is independent of the crown. Earlier than this, in the reign of Charles II., the combination of all the savages of New England had threatened the four colonies there with extermination. One in eleven of all their men was killed in war. More than that number carried the wounds of battle to their graves. Nearly half their towns were raided by the savages. It was a question, close to every man's thought, whether they should not be all swept into the sea. So near was the exigency to one which should leave the colony of New England to be marked only by such traces as we find to-day of the Norse colony on the coast of Greenland. When it was all over, and peace re-established, their friends in England asked them why they had not sent for help. In fact, they had not sent for soldiers, for lead, or for powder. The answer was very simple. They had no concern with Charles II., beyond sending him now and then a complimentary present of a barrel of cranberries to flavor his Christmas dinner; or perhaps a cargo of spars, to show him what they could sell him for his navy. As for the savages, that is our affair — it is none of his. We coin our own money. We fight our own enemies. "We are and of right ought to be independent states."

It will be found, however, in the gradual growth of the thirteen original colonies that this equality of the citizens presupposed, almost without the asking of a question, the citizen's ownership in land. The suffrage up to the Revolution was almost entirely a suffrage of landed proprietors. The precise solution of difficulties which always occur now to Girondists and other theorists, had asserted itself already. Let the man own land so that he shall have some stock in the commonwealth. As a matter of theory the custom prevailed in many of the colonies that no person was admitted to the suffrage except by the vote of those who had it already. Practically this came out in the presentation every year at the annual election of a list of tax payers. These tax payers were, as a matter of course, voted in as freemen. The one great exception always mentioned by American writers on the subject is that made by the Puritan States of New England, who for a generation refused to admit as voters any men who were not members of their Congregational Church. But this distinction also gave way under pressure of an intimation from Charles II., made in his letter to the colony of 28 June 1661. "Since the principle and foundation of the Massachusetts Charter was and is the freedom and liberty of conscience, we do hereby charge and require you that that freedom and liberty be duly admitted and allowed. . . and that all persons of good and honest lives and conversation be admitted to the sacrament of the Lord's Supper . . . we assuring ourselves and obliging and commanding all persons concerned that in the election of the governor or assistants, there be only consideration of the wisdom and integrity of the persons to be chosen, and not of any faction with reference to their opinion or profession, and that all the freeholders of competent estates not vicious in conversation, orthodox in religion, though of different persuasion concerning church government, may have their vote in the election of all officers, civil or military."

One may say in a parenthesis that King Charles would have found it hard to make himself a voter under these conditions. The reader will observe, however, that in this enlargement of the suffrage of Massachusetts, it was only the freeholders for whom the privilege of the ballot is required.

As late as 1789, in Franklin's discussion of the Constitution of Pennsylvania it appears

that the proposal had been made that an "Upper House" should be chosen by freemen possessing in land and house £1,000. The "Lower" body was to be chosen by such as had resided four years in the country and paid taxes. Franklin protests against this because it gives "the rich predominancy in government, a choice peculiar to themselves in one half the legislature, to be proudly called the 'Upper House,' and the other branch, chosen by the majority of the people, degraded by the denomination of the 'Lower'; and giving to this Upper House the permanency of four years and but two to the Lower." Against this Franklin protests, but at that time he probably thought that a freeman who paid taxes would be a landholder, as he probably was 99 cases out of a hundred. However this may be, it is certain historically, that with the creation of an army in which every man was obliged to serve, every such man would in the end be permitted to vote. The State of Massachusetts, for instance, in 1777 swept every boy and man in the Valley of the Connecticut between the ages of 15 and 55 into its militia and sent that militia to fight against Burgoyne. The crops of the Connecticut Valley that year were harvested by women. Now it was very hard to tell those men when they came back that unless they held land or property they would not be permitted to have a share in the government. The first concession apparent which was made to the great demand for universal suffrage was that the property on which taxes were to be paid was eventually not necessary in land. Thus the Constitution of Massachusetts, adopted in 1780, required that a voter should have an estate of the value of £60. This was removed by the amendment introduced in 1820. It is with reference to some such provision as this in Pennsylvania that Franklin made his suggestion regarding the death of an ass. He supposed a voter who owned an ass which earned for him £3 a year, riding to the voting place on this ass. The ass falls and dies on the way to the election, and the voter loses his vote. Franklin asks with his pitiless humor whether in that case it is the ass who votes or the man.

In the establishment of the western States of the Valley of the Mississippi there appeared very soon the wish on the part of those who in any State made its constitution to recommend the new-born State to emigrants, whether from the Atlantic sea-board or from Europe. This wish dictated the widest extension of the suffrage which could be granted. Now the Constitution of the United States gives to each State the power to choose the members of the National House of Representatives who are to be elected by the same constituency which chooses the popular branch of the State legislature. Any State, therefore, by its terms of suffrage for its own house of representatives, virtually gives suffrage in the National Legislature. This results in universal suffrage.

Universal suffrage was not proclaimed, as theorists would suppose, by any sudden revelation of sentiment or of authority. It came about almost without man's knowledge. In fact, at this hour, in most of the northern States where property is much subdivided, it would prove that there are as many persons who pay taxes on property in the State as there are voters at the average election. They are not precisely the same people. Women may be tax payers who do not vote, or unnaturalized aliens may be tax payers who do not vote. But the small margin of such people is really unimportant. In practice it would be fair to say that the suffrage is universal suffrage for men.

It is easy then to see that the result of elections in the long run will be the choosing of men or of laws which are acceptable to the average of the people. If by whatever processes, call them human or call them divine as one will, the average of the people prefer right to wrong, good to evil, law to license, universal suffrage will give them what they want. Universal suffrage does not profess to obtain the elegant niceties of the theorists, but it is apt to prefer sense to nonsense, government to anarchy, national honor to national dishonor. The result hoped for and thus far attained in the American democracies will depend, as our people are always saying, upon education. If more than half your people want to have a good road rather than a bad road, an upright court rather than a corrupt court, if they prefer good schools to bad schools, universal suffrage will give such privileges to them in the long run. For this, what is called the higher education of the majority of the people is well nigh necessary. You do not make an intelligent voter by teaching him to write his name, to read his Bible, or by teaching him that 9 times 9 is 81. But when you extend your public education from bald instruction in facts so that it shall involve some knowledge of history, some outlook into the larger range of government and some reverence for law, the decision of universal suffrage may be safely relied upon. At the beginning of the Civil War Abraham Lincoln said boldly in his first message: "There are many single regiments (in the army) whose members one and another, possess full practical knowledge of all the arts, sciences, professions, and whatever else, whether useful or elegant, is known in the world and there is scarcely one from which there could not be selected a President, a Cabinet, a Congress, and perhaps a court, competent to administer the government itself. Nor do I say this is not true also in the army of our late friends, now adversaries in this contest."

What he said was true. And wherever that can be said, the country in which it is said need not be afraid of the decisions of its democracy. It will be observed, however, that in order to preserve such success, the higher education of the country,— what the French call oddly enough its secondary education, must be kept at that level which shall enable us to say that the decisions of the average of the people may be sufficient for the administration of law.

EDWARD EVERETT HALE,
Author of 'The Man Without a Country.'

49. United States — Civil and Religious Liberty in the. The euphony and familiarity of this title must be broken so as to read, "Religious and Civil Liberty in America," if we are to study the subject in its logical as well as its chronological order, for civil liberty follows and is the product of religious liberty. A hierarchy implies an aristocracy; an aristocracy a monarchy. The student can do no better than to group his studies around the names of Roger Williams (q.v.) and Thomas Jefferson

(q.v.). The birth of the one preceded that of the other by 136 years. The pivotal date of the first is the founding of the Providence Plantation by the exiled Roger Williams, 1636; and the pivotal date of the other is the signing of the Declaration of Independence in 1776. These two events are separated by a period of 140 years. The story of these two men is told elsewhere in these volumes, but the story of civil and religious liberty in America cannot be separated from their lives; still less can its purchase price be understood or appreciated apart from their story. Says John Fiske:

> Within five years from the settlement of Massachusetts this young preacher — the learned, quick-witted, pugnacious Welshman, Roger Williams, had announced the true principles of religious liberty with a clearness of insight quite remarkable in that age.

There is good history back of the pleasantry that the Puritans sought the western shore in order that they might enjoy the privilege of worshiping God according to the dictates of their own conscience and the further privilege of making all others worship in the same way. Governor Winthrop, one of the most liberal of the Boston Colony, wrote:

> We believe it to be important that the members of a Christian commonwealth should all hold the same opinions regarding essentials; and of course it is for us to determine what is essential. If people who have come here with us hold different views, they have made a great mistake and had better go back to England. But if, holding different views, they still wish to remain in America, let them leave us in peace and, going elsewhere, found communities according to their conscience of what is best. We do not wish to quarrel with them, but we will tell them plainly that they cannot stay here.

This is literally the program carried out in the case of Roger Williams. From the beginning he denied the power of civil magistrates to punish for violations of "the first tablet of the law," the table of piety, dealing with man's relations to his God. He declined the call to enter upon his chosen work with the settlement on Massachusetts Bay because they were not "separated," as the Pilgrims were who settled at Plymouth; they were simply non-conforming members of the Episcopal Church, and as such they claimed the right to discipline for spiritual as well as civic misdemeanors. A few months later he accepted the opportunity to work with and for the Pilgrim Fathers of Plymouth Here he worked for two years, supporting himself by manual toil during the week and teaching on Sunday. But his ecclesiastical independence and his persistent teaching of the principles of soul-liberty filled Elder Brewster with anxiety, and when a call was given the young radical from the Salem church, the good Elder advised the Plymouth church to demit him. In the latter controversy, John Cotton, the belligerent ecclesiastic of Boston, remembered that "Elder Brewster warned the whole church of the danger of his spirit."

When in 1633 the young minister ventured again within the jurisdiction of the Bay and took up the work of a religious teacher at Salem, the Boston ministers protested and objected to his coming among them at the ministers' meetings held from house to house. Two years later he was summoned to Boston to answer charges before the General Court. He was accused of teaching that magistrates ought not to punish a breach of the "first table" except when it was also a disturbance of the civil peace; that the church had no right to impose an oath on an unbeliever, and that prayer at the sacrament or after meat must not be enforced by the magistrates. Williams' defence was that "none of his teachings led to a breach of holy or civil peace, of which I have desired to be unfeignedly tender." Governor Winthrop, of whom Williams wrote years afterwards, "Though he was carried with the stream for my punishment, he tenderly loved me to his last breath," recorded in his diary:

> Rev. Mr. Hooker, who was chosen to dispute with him, could not reduce him from any of his errors, so the next morning the Court sentenced him to depart out of our jurisdiction within six weeks, all the ministers save one approving the sentence.

The sentence itself in part runs as follows:

> It is therefore ordered that the said Mister Williams shall depart out of this jurisdiction within six weeks now next ensuing, which, if he neglects to perform, it shall be lawful for the Governor and two of the magistrates to send him to some place out of this jurisdiction, not to return any more without license from the Court.

But soon this six weeks' leniency caused the magistrates anxiety; they were afraid he would be able to carry out his expressed purpose of "establishing an independent community where all men may work as their conscience persuades them, everyone in the name of God." A captain of a sloop was therefore sent with orders to apprehend Williams and carry him on board his ship about to sail for England. The captain found the wife and children, but the minister had departed three days before. Thus in midwinter, January 1636, this earliest apostle of religious liberty in America, and, up to this date, one of the very few such apostles in the history of the world, secretly departed from Salem, leaving wife and children behind him. He sailed away, according to the advice of Governor Winthrop who, apparently ashamed of the precipitancy and narrowness of his clerical colleague, had advised Mr. Williams to retire promptly to the Indians on Narragansett Bay, where he would be beyond English claims and patents. His own account of this momentous exodus in America runs in part as follows:

> I steered my course from Salem — though in winter snow, which I feel yet — unto these parts wherein I may say *Peniel*, that is, I have seen the face of God. I first pitched, and then began to build and plant at Seekonk, now Rehoboth; but when I received a letter from my ancient friend, Mr. Winslow, then governor of Plymouth, professing his own and others' love and respect to me, yet lovingly advising me, since I was fallen into the edge of their bounds, and they were loth to displease the Bay, to remove but to the other side of the water; and then he said I had the country free before me, and might be as free as themselves, and we should be loving neighbors together. These were the joint understandings of these two wise and eminently Christian governors, and others, in their day, together with their counsel and advice as to the freedom and vacancy of this place, which in this respect and many other providences of the Most Holy and Wise One, I called Providence.

Following the voyage came the desperate exposures on land,—"fourteen weeks of bitter winter season without knowing what bread or bed did mean," in his own phrase. His only succor was received at the hands of the Indians, whose language he had mastered during his Plymouth ministry for a purpose higher than he could then have dreamed of. When the final place of settlement was reached on Rhode Island, he said: "In gratitude to God's merciful providence to me in my distress, I gave to the place the name of Providence."

Henceforth the story of Roger Williams is the story of the planting of what is probably

the first commonwealth in history into whose fundamental constitution was incorporated an unequivocal guarantee of religious liberty. From Constantine to Williams, the Christian church, always and everywhere in Christendom, dominated the State. Indeed, in all religions and in all ages, up to this time, priests have more or less directly claimed to be the arbiters of the civic and physical interests as well as of the spiritual destinies of men. The quality and quantity of the work accomplished by Roger Williams cannot be appreciated until the spirit of the Puritans, of whom he was one and with whom he contended, is more closely studied and understood. Popular traditions have lumped the various settlements of New England under one estimate, as one movement. The Puritans have been studied too much in bulk, as though they represented a coherent and consistent body, moving forward with one spirit and for one end: that spirit the spirit of freedom, and the one end religious and civil liberty. But the banishment of Roger Williams is but one of a series, albeit the first of such acts. The noble Henry Vane arrived in Boston three months before Williams had to flee. Though a young man of only 24 years, he was of such brilliant powers that he was made governor of Massachusetts. But the spirit of the people was too intolerant, the air too dogmatic for him to stay, and in less than three years he went back to England to his larger career and to a tragic death for freedom's sake. In 1636 came Anne Hutchinson, the brilliant woman who preached transcendentalism before the Transcendentalists: a woman who was gladly heard in the pulpit at that early date; she gathered around her a growing following,—but she must not stay. With her band of followers she had to go. They turned their faces toward the land of greater freedom, the hospitable Rhode Island, where for a while she tarried on her way to death from an Indian's tomahawk, in the neighborhood of what was to be New York.

The persecuted Quakers were naturally drawn to the boasted freedom of the New World, but when Anne Austin and Mary Fisher, representatives of this fellowship, landed at Boston from Barbados in 1656, they were promptly locked in jail lest they might proclaim their heresies to the curious crowd that gathered around them. A council pronounced their doctrines blasphemous; their books were burned, and they themselves confined under hard circumstances for five months, until the ship they had come in was ready to return them to Barbados. Later these Quaker missionaries found a more cordial welcome at the hands of the Mohammedans in Turkey than they did at the hands of the Christian Puritans in Massachusetts. However, the contention of John Fiske, that the Puritans had more at stake than the Mohammedans, deserves to be considered in this connection. Following these two women came eight Quakers from London, who were promptly arrested and special laws were passed that they might be disposed of. The penalties affixed in these anti-Quaker laws were cumulative, passing on up from flogging, through imprisonment at hard labor, cutting off one or both ears, boring the tongue with a hot iron, until finally capital punishment was reached in 1659, when two were hanged on Boston Commons. This was going farther than Quaker persecution had ever reached in old England; and next year a Quaker woman was hanged at the same place. The last victim suffered in 1661, for the sole crime of holding to and practicing the precepts of George Fox, as represented by the fellowship of the Friends.

There is no finer test of a man's sincerity than that which demands that he take his own medicine. Roger Williams was called upon to apply his own doctrines in the case of the Quakers. From their teachings he dissented most heartily; he never came so near the intolerant spirit as in the book entitled 'George Fox Digg'd out of his Burrowes,' and George Fox never came so near dealing in venom as in his reply, entitled 'A New England Fire-Brand Quenched.' And still the communities of Rhode Island not only refused to join with the New England confederacy in a movement to keep out the Quakers, but welcomed them in spite of their views. When George Fox visited this country he did not dare go farther north than Newport, R. I., where he was sheltered in spite of his teaching. Hither Williams went, thirty miles in an open boat, he himself working the oars, not to suppress, but to hold high debate with the great disciple of soul-liberty, who had stood the test in England even as Roger Williams had in America, and who, in his doctrine of the "inner light" and the noncombatant requirement of religion had found a more ample foundation for religious liberty than the probably less heterodox opinions of Williams.

As with the followers of Anne Hutchinson and George Fox, so with the Jews. Williams pleaded their cause with the powers of England, and the hunted children of Israel found shelter and welcome at Newport, where the lonely graves of the exiled community moved Longfellow two centuries later to sing the pathetic song of toleration entitled "The Jewish Cemetery at Newport."

Twice, at least, Roger Williams returned to England in the interest of the new community, each time for the sake of strengthening the safeguards of religious liberty in his charter rights. The first time he was obliged to sail from Manhattan, for he was an exile from Boston. Once his stay was prolonged for three years, during which time he was deep in the politics of the Protectorate, an active helper of Cromwell, and an intimate associate of Cromwell's foreign secretary, "Mister Milton," to whom he taught Dutch. Scant justice has as yet been done to the benignant and ameliorating element introduced into the history of the United States, particularly of the New England States, by Roger Williams. He came to reform the reformers, of whom Hawthorne facetiously said:

> Let us thank God for having given us such ancestors; and let each successive generation thank Him not less fervently for being one step further from them in the march of ages.

Williams necessarily had much fighting to do. The titles of his books suggest controversy. "The Bloudy Tenantt of Persecution for Cause of Conscience; A Dialogue Between Truth and Peace," is his most noted work. This a Puritan House of Commons caused to be burned in England. To this John Cotton wrote the reply entitled, "Bloudy Tenantt Washed and Made White in the Bloud of the Lamb." In due time

came the rejoinder from Williams, "The Bloudy Tenantt Yet More Bloudy by Mr. Cotton's Attempt to Wash it White in the Bloud of the Lamb." But notwithstanding this belligerency, Williams vindicated the liberty he espoused, and demonstrated in his own life that liberty and the love of liberty breed tenderness and not violence. "We have taxed your patience often, but never exhausted it," wrote Governor Winthrop. And his latest biographer, Oscar S. Straus, says: "In no act of his life is a spirit of selfishness disclosed"; and again, "His patriotism was never dimmed by a shadow of suspicion of self-interest"; and again, "He held his colony with a firm hand and a wise head." He ever preferred to be the power behind the throne rather than to be the power on the throne. When the Indians were at last nagged into the violence that led to the invasion of Rhode Island, Roger Williams, unarmed save with his staff, went out to meet them. He failed to turn them back, but they said, "We will not hurt you, Brother Williams." This accomplished linguist, the master of seven languages, spent his 70 years and more in unceasing toil, much of the time earning his bread by manual labor. He alludes to a sacrifice of his own interests by refusing to kiss the Bible when taking an oath in England, but furnishes no particulars. Everywhere and always he kindled the spirit of liberty, and was never known to light the fires of persecution.

The first compact of the little band of exiles on the hill he named "Providence" carried the signatures of 13 men, five of whom made their mark. It was of such humble material that he laid the foundations of the first State ever unequivocally committed to religious liberty. His first-born son is supposed to have been the first white child in Rhode Island. The last charter he obtained from Charles II. was so wisely drawn, and liberty in it was so securely vouchsafed, that it served the commonwealth of Rhode Island for one hundred and eighty years; it was not changed until 1843, and it would still serve as a model for a new State.

Thus the movement for religious liberty in America unfolded naturally into a passion for democracy, a demand for civil liberty, and our study lands us at the feet of Thomas Jefferson, who was the father of civil liberty in America, so far as movements whose beginnings are always hid in the obscurity of still more primitive beginnings can be said to have a father.

"*Author of the Declaration of Independence, of the statute of Virginia for religious freedom, and Father of the University of Virginia,*" was the inscription which Thomas Jefferson left among his papers as one suitable for his own tomb. In another catalogue of things accomplished, drawn up by his own hand, we find the following: "Separated the church and state in Virginia; put an end to entails; prohibited the importation of slaves, and drafted the Declaration of Independence."

Mr. Jefferson was the widest read, the most accomplished of the presidents, the intellectual giant of them all; the first, if not the greatest, thorough-going democrat in American politics. Jefferson, Jackson and Lincoln are the three presidents who, in practice as well as in theory, by nature as well as by conviction, believed so profoundly in popular government and the simplicity and freedom involved therein that it became to them a religion, a source of unfailing enthusiasm. These three belonged to the people, and found their highest inspiration in the purpose to serve them. The opinions of no other president ever received such prompt respect at home and abroad as those of Thomas Jefferson, and his official utterances occupy a place in literature as well as in the history of statesmanship unparalleled by the deliverances of any other president of the United States, save Lincoln.

Jefferson's devotion to civil liberty led to, or sprang from, his freedom in religious thought, in which he was notoriously unorthodox. He was deeply versed in the writings of French philosophers and the events that led up to the Revolution, and was sufficiently grounded in the philosophy of liberty to be able to give at short range the true estimate of that atmosphere-clearing storm which all clear thinkers at longer range are able to give it. He was a confidant and friend of Thomas Paine, and the principles laid down in "The Rights of Man" and "Common Sense" were not only familiar but congenial to him and probably had a direct influence upon his work. These documents, together with the life of the much-maligned and cruelly misunderstood author, should be closely studied in connection with the subject at hand.

At the first Congress, systematically convened in Philadelphia in 1774, Thomas Jefferson was chairman of the committee appointed to draft the Declaration of Independence, which in due time was offered in his own handwriting, essentially as it now stands; a clause censuring slave trade was suppressed. He regretted the first draft of the Constitution as adopted because he feared the liberties of the citizens were not sufficiently safeguarded; it contained no precaution against monopolies and standing armies; the freedom of conscience and of religion were not sufficiently guaranteed; the rights of habeas corpus were not adequately secured, and no limitation was set to the time one person could occupy the presidency, which, unguarded, as he feared, might grow into an absolutism more or less complete; in short, because it had no "Bill of Rights." Says one of his later biographers:

> In his day, Mr. Jefferson combated a greater number of laws which were oppressive, customs which were stale, tendencies which were undemocratic, and fixed opinions which were popular than any other man in public life. He attacked systems and creeds where they were most sensitive. He aroused vested interests which were the most powerful, and which, when alarmed, were the most vindictive. Yet never once in all his long life did he falter, surrender, or apostatize.
>
> He took the unpopular side of slavery, and held to it. He defied the religious bigotry of his times, and continued to defy it. He challenged the organized power of land monopoly and class rule in his own State and overthrew it.

The first session of Congress after the adoption of the Constitution in 1789 adopted 12 amendments, most of them looking towards the relieving of the above anxieties expressed by Mr. Jefferson; the first amendment providing for the religious freedom of all the citizens, and the unequivocal separation of church and state. The constitution of nearly every state in the Union now has its "Bill of Rights." Most of these bills incorporate the exact phraseology of the Declaration of Independence concerning the "inalienable rights to life and liberty, and the pursuit of happiness." This guarantee of re-

ligious liberty is somewhat modified by the following States:

Maryland declares a person incompetent as a witness or juror who does not believe

in the existence of God, and that under His dispensation such person will be held morally accountable for his acts, and be rewarded or punished therefor in this world or the world to come.

The law of Maryland provides that "a belief in the existence of God" is a necessary qualification "for any office of profit or trust in this State." And also:

That every gift, sale or devise of land to any minister, public teacher, or preacher of the gospel, as such, or to any religious sect, order or denomination, or to or for the support, use, or benefit of, or in trust for, any minister, public teacher, or preacher of the gospel, as such, or any religious sect, order, or denomination; and every gift or sale of goods, or chattels, to go in succession, or to take place after the death of the seller or donor, to or for such support, use or benefit; and also every devise of goods or chattels to or for the support, use or benefit of any minister, public teacher or preacher of the gospel, as such, or any religious sect, order or denomination, without the prior or subsequent sanction of the Legislature, shall be void; except always, any sale, gift, lease or devise of any quantity of land, not exceeding five acres, for a church, meeting house, or other house of worship, a parsonage, or burying ground, which shall be improved, enjoyed, or used only for such purpose; or such sale, gift, lease, or devise shall be void.

Mississippi provides that "The Holy Bible shall not be excluded from use in any public school of this State"; and makes a six months' residence a sufficient qualification for voting to a minister of the gospel, while two years' residence is required for a layman.

New Hampshire provides that:

The people of this State have a right to empower, and do hereby fully empower the Legislature to authorize, from time to time, the religious societies within this State to make adequate provision at their own expense, for the support and maintenance of public Protestant preachers of piety, religion, and morality; provided, notwithstanding, that the several towns, parishes, bodies corporate, or several religious societies shall at all times have the exclusive right of electing their own public teachers, and of contracting with them for their support and maintenance.

Vermont, after providing freedom of conscience for all and the free exercise of religious worship in sweeping phrase, adds in Article III.:

Nevertheless, every sect or denomination of Christians ought to observe the Sabbath or Lord's Day, to keep up some sort of religious worship which to them shall seem most agreeable to the revered will of God.

Virginia, though perhaps the first State after Rhode Island to provide for absolute separation of church and state, introduces a curious inconsistency, evidently quite unconsciously, in this wise:

It is the mutual duty of all to practice *Christian* forbearance, love, and charity toward each other.*

"Tell the committee to be on the alert," were the last audible words that Jefferson spoke. His lips seemed to dictate to the fingers that still imagined a pen between them. This suggests the "eternal vigilance" that is the "price of liberty."

* (The above study of the State Constitutions is based on the study of the text found in the Convention Manual for the Sixth New York State Constitutional Convention, published in 1894. Doubtless further amendments have been enacted since then, and our attention has been called by Judge E. O. Brown of the circuit court of Illinois, to certain omissions in the New Hampshire Constitution as published in this work, bearing on the question in hand.)

Ever since the signing of the Declaration of Independence there have been those in the United States who would dispose of its fundamental contention as a "glittering generality," or limit its application to their own sect or race; but, spite of sneers, past or present, evasions and contemptuous appeals to technicalities, it still survives as the matchless document that not only liberated the United States from foreign thrall, but by its logic is destined to enfranchise the children of the world. Side by side, Jefferson's Declaration of Independence and Lincoln's Emancipation Proclamation stand in the world's library, unmatched and undimmed, to rebuke, to instruct, and to inspire unborn generations. They were and still are prophetic documents. The Civil War which Jefferson foresaw, came, and he who would study the story of civil and religious liberty in America must take note of such events as the martyrdom of Elijah Lovejoy (q.v.), and the destruction of his abolitionist press at Alton, Ill. (1837); the appearance of Harriet Beecher Stowe's 'Uncle Tom's Cabin' (1852); the execution of John Brown (q.v.) at Harper's Ferry (1859); the firing upon the flag at Fort Sumter (1861); the Emancipation Proclamation of Abraham Lincoln (1863); the surrender of Robert E. Lee at Appomattox (1865).

In studying civil and religious liberty we find that, though they may be distinguishable in their sources, they are one in their culmination. Not more clearly did the passion for religious liberty make of Roger Williams an advocate of political liberty than did Thomas Jefferson's zeal for political liberty make of him an apostle of religious liberty. The government has recently ordered published a little manuscript book of Thomas Jefferson's, entitled 'The Life and Morals of Jesus of Nazareth, Extracted Textually from the Gospels, together with a Comparison of His Doctrines with Those of Others.' In this book the author compiled the ethical and spiritual portions of the Gospel, eliminating the miraculous and theological passages. Of the compilation he himself wrote:

A more beautiful or precious morsel of ethics I have never seen. It is a document in proof that I am a REAL CHRISTIAN; that is to say, a disciple of the doctrines of Jesus, very different from the Platonists who call ME infidel and THEMSELVES Christians and preachers of the Gospel; while they draw all their characteristic dogmas from what its author never said nor saw.

The conviction indicated in this book may be right or wrong. I refer to it because it illustrates the liberty vouchsafed by the fundamental laws of the United States, which not only guarantee freedom of utterance, but lead to a respect for sincere opinions, however they may differ from prevailing opinions.

Any sketch of the history of civil and religious liberty in America would be incomplete without reference to the interesting contributions of Lord Baltimore in Maryland, of William Penn in Pennsylvania, and the Utopian schemes of John Locke and Lord Shaftesbury in the Carolinas. It is one of the interesting paradoxes of history that the Catholic Calverts, who held the most sweeping charter ever brought to the New World, should establish a standard of hospitality in religion and liberality in politics exceeding that of any other colony.

Lord Baltimore came to establish a "Palatinate," a palace county. He was made absolute

lord of a vast territory with powers to declare war, collect taxes, create legislatures, and appoint judges. But knowing from experience the heavy hand of religious bigotry, his autocracy was a benign one. It offered hospitality to the persecuted in all lands, and established many precedents precious to liberty.

The Quaker spirit represented by William Penn and his associates and successors was and is a pervasive influence, making for toleration, peace and co-operation. While the dreams which the free-thinking philosophers above mentioned tried to realize in South Carolina may be taken as forerunners of many sociological ventures on communistic or ideal lines that have followed, perhaps the most suggestive and creative of which was the work of Robert Owen at New Harmony, Ind. At any rate, from New Harmony to Altruria, the story is an attractive one to the social philosopher and a potent one in the interest of civil and religious liberty.

The law of the land demands toleration, but spiritual freedom goes further and demands appreciation and fellowship in the things about which men honestly differ. He who would study closely the development of religious liberty in America must note the discussions and agitations that gathered about the following epoch-marking addresses: Channing's Baltimore address (1818); Emerson's Divinity School address, which, to use his own words, "caused such a tempest in the Unitarian washbowl," and in consequence of which Harvard for 30 years practically exiled its most illustrious alumnus from the platform of the freest university in America (1838); Theodore Parker's discourse on 'The Transient and the Permanent in Christianity' (1841); William C. Gannett's address on 'The Faith of Ethics' (1887).

The growth of the spirit of religious liberty may be further traced by a close study of the most noted religious controversies in our history, among which were the discussion concerning the teachings of Horace Bushnell (1839–54) by the Congregationalists of New England; the withdrawal of Henry Ward Beecher (1882) from the local Congregational Association to which he belonged; the trial of David Swing (1874) by the Presbyterians of Chicago, and of Hiram W. Thomas (1881) by the Methodists of Chicago. Significant also in the history of religious liberty is the organization of the Free Religious Association in Boston (1867), and the holding of the Parliament of Religions in Chicago (1893). This was the most significant religious conclave ever held, perhaps the noblest corporate event in the history of religion. This was followed the next year (1894) by the organization of the Congress of Religion in Chicago and the subsequent organization of the New York Conference of Religion, a similar organization within State limits. Significant indications of the growth of this spirit of co-operation, which springs out of the spirit of religious liberty, are found in the numerous interdenominational organizations for practical work, such as the Young Men's and Young Women's Christian Associations, The Christian Endeavor movement, the Woman's Christian Temperance Union, the Chautauqua movement, and the various combinations for missionary work at home and abroad.

The development of civil and religious liberty is still incomplete; it still behooves "the committee to be on the alert." But the great advancement made in this direction is a magnificent guarantee of greater progress yet to be made. The high achievements already realized will inspire a continued zeal to evoke the new wisdom and fresh courage which the future of America will demand.

JENKIN LLOYD JONES, D.D.,
Editor of 'Unity.'

.50. United States — Disputed Elections in On four occasions the electoral colleges have failed to accomplish the task of choosing a President and Vice-President. In 1801, after the counting of the electoral vote, the question was left to settle which of the two men, Jefferson or Burr, should be President, and which Vice-President. In 1825, it remained to choose a President from among the three candidates, Andrew Jackson, John Quincy Adams and William H. Crawford. In 1837, it was left to determine whether Richard M. Johnson or Francis Granger should be Vice-President. In all these cases the difficulty was merely that the electors had so distributed their votes that the choice was incomplete. And the Constitution of the United States pointed out the procedure by which to complete it. The fourth case arose in 1877. The task was now thrust upon the government of deciding between rival electoral colleges in four States. This would determine whether Samuel J. Tilden and Thomas A. Hendricks, the candidates of the Democrat party, or Rutherford B. Hayes and William A. Wheeler, who were the Republican candidates, should become President and Vice-President respectively. There was no agency provided by the Constitution or laws to decide such a question.

The dispute of 1801 was a natural result of the rule laid down in the Constitution for the procedure of the electors. Each elector should vote for two persons. The person found to have the greatest number of votes should be the President, provided such number was a majority of the whole number of electors. The person having the next greatest number should be the Vice-President. But since a majority of the electors might be only one more than a quarter of the votes, and each elector cast two, it was possible for two persons to receive an equal majority vote. The constitutional provision for this contingency was that the House of Representatives should immediately choose by ballot one of the two persons for President. This vote must be taken by States, and the representation from each State should have one vote. A majority of the States was necessary to a choice. The official count of the electoral votes was made before the two Houses of Congress as prescribed by the Constitution. This was done on Wednesday 12 Feb., Jefferson himself presiding. There were 138 electors and 276 votes. The vote was distributed as follows: Thomas Jefferson, 73; Aaron Burr, 73; John Adams, 65; Charles Cotesworth Pinckney, 64; John Jay, 1. It had been anticipated that the electoral vote would not be decisive. Two days before the count the House of Representatives had adopted rules of order for the expected election. The Representatives should be grouped by States, in order to determine for whom the vote of each State was to be cast. If the preliminary vote of any State resulted in a tie, that delegation could only cast a ballot marked "divided." Each State should appoint one teller. Two ballot boxes should be

used, and each delegation should cast its ballot in duplicate. The tellers should be divided into two groups, one to examine the votes in each ballot box. The Senate was to be admitted. The House should not adjourn until the election was complete. Immediately after the count, the House of Representatives began to vote for a choice between Jefferson and Burr. By midnight 19 ballots had been taken. The sitting continued until 11 o'clock the next day, nine ballots being taken on 12 Feb. The rule against adjournment was now evaded by taking a recess. One ballot was taken 13 Feb., four on the 14th, one on the 16th, and two on the 17th. From the beginning eight States cast their ballots for Jefferson. These were New York, New Jersey, Pennsylvania, Virginia, North Carolina, Georgia, Kentucky and Tennessee. Six voted for Burr. These were New Hampshire, Massachusetts, Rhode Island, Connecticut, Delaware, and South Carolina. The remaining two, Vermont and Maryland were divided. Nine States were necessary to a choice. The House was Federalist, while both of the candidates belonged to the other party. The chief issue was the commercial policy of the next administration. As Jefferson came from Virginia and Burr from New York, New England stood by the latter. Burr did not receive the vote of his own State. This was due to Hamilton's influence. Prior to the thirty-sixth ballot, which was taken 17 Feb., some assurance was given on the question of the commercial policy. Vermont and Maryland now voted for Jefferson. At the same time South Carolina and Delaware cast blank ballots. Jefferson was thus chosen President by the vote of ten States. Burr became Vice-President. Before the next presidential election, the Constitution was amended to prevent the recurrence of such a dispute. The new amendment declares that the electors shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President.

By the official count of 9 Feb. 1826, the electoral vote for President was found to stand as follows: Andrew Jackson, 99; John Quincy Adams, 84; William H. Crawford, 41; and Henry Clay, 37. The number of electoral votes necessary to a choice was 131. The ballot for Vice-President had been decisive; for John C. Calhoun had received 182 votes. The Constitution limited the House of Representatives in its choice of a President to the three highest candidates. The first ballot gave Adams the vote of 13 States; Jackson that of 7 States; and Crawford that of 4 States. There was great popular indignation. For Jackson had received 15 more electoral votes than Adams. And besides this the Jackson electors had received a great majority of the popular vote. A rumor became current that there had been a "corrupt bargain" among the Adams and the Clay men. This seemed to be confirmed as soon as President Adams took his seat by the nomination of Mr. Clay for Secretary of State. However, it was sufficiently shown later that this story rested upon no evidence.

It was discovered by the official count of 8 Feb. 1837, that the electoral vote for Vice-President had been indecisive. The constitutional rule in such a case is that the Senate shall choose the Vice-President from the two highest numbers on the list. These were Richard M. Johnson and Francis Granger. Upon the motion of one of the members, the Senate proceeded to a viva voce vote. The result was 33 to 16 in favor of Mr. Johnson.

After the elections of 7 Nov. 1876, the first indications were that the Democratic party had chosen a majority of the electors. But the Republican party managers immediately began to claim three Southern States whose votes were likely to decide the issue. These were Florida, Louisiana and South Carolina. When the day arrived for the meeting of the electoral colleges, two sets of electors voted in each of these States and in Oregon as well. Thus four States transmitted double returns to the President of the Senate. Evidently a quarrel was before the country which might set up rival executives in the National Government, or leave the nation without an executive. Whether it is agreeable to the Constitution for Congress to regulate by law the counting of the electoral vote, we will not here discuss. The only power relating to this subject, that is expressly granted, is to determine the time of choosing the electors and the time when the electors shall meet. Laws had been enacted concerning the accepting and rejecting of electoral votes prior to 1877. The most discreet men in the government felt that Congress should devise some expedient for dealing with an unprecedented situation. The Electoral Commission law was enacted. This passed the Senate 25 Jan., the House of Representatives 23 Jan., and was approved 29 Jan. Its title was "An act to provide for and regulate the counting of votes for President and Vice-President, and the decision of questions arising thereon, for the term commencing 4 March 1877." It provided in detail for the official count as prescribed by the Constitution. It ordered that this should begin on the first Thursday in February, which was the first day of the month, and that the returns should be acted upon in the alphabetical order of the States. After the reading of each certificate, the President of the Senate should call for objections. In cases which did not involve conflicting returns, the two Houses should pass upon the objections. They should separate for this purpose. No electoral vote should be rejected except by the affirmative vote of both Houses. Section 11., the most remarkable part of the law, provided for the Electoral Commission, which was created to pass upon cases where there were double returns from a State. The Senate should choose five of its members by viva voce vote, on the Tuesday before the count began, to serve on the Commission. The House of Representatives should likewise choose five members. Five Associate Justices of the Supreme Court were also to serve. The law designated four of these under the numbers of their respective circuits, the first, third, eighth, and ninth. These were to select the fifth. When any case of double returns was reached in the official count, the certificates and papers relating thereto, together with all the objections filed in the joint meeting of the two Houses, were to be referred to the Commission. This body should decide by a majority vote the questions; whether any and what votes returned from a State are the votes provided for by the Constitution of the United States, and how many and what persons were duly appointed electors in such State. The decisions were to be final unless they were set aside by the

vote of both Houses of Congress. The members of the Commission were chosen on Tuesday, 30 Jan. The Senate was Republican at the time, while the House of Representatives was Democratic. Three of the Senators selected were Republicans and two were Democrats. The former were George F. Edmunds, Vermont; Oliver P. Morton, Indiana; and Frederick T. Frelinghuysen, New Jersey. The latter were Thomas F. Bayard, Delaware, and Allen G. Thurman, Ohio. In the House this proportion was reversed. The three Democratic members were Henry B. Payne, Ohio; Eppa Hunton, Virginia, and Josiah Abbott, Massachusetts. The two Republicans were James A. Garfield, Ohio, and George F. Hoar, Massachusetts. Of the four Justices designated by the law, Nathan Clifford and Stephen J. Field of the first and ninth circuits respectively were Democrats. William Strong and Samuel F. Miller, of the third and eighth circuits, were Republicans. Thus far the Commission was equally divided. Moreover the arguments were likely to be so strong on both sides of the different questions that the decisions would inevitably follow party lines. While the law seemed to shift the burden of decision upon 15 men, it so operated that it was really imposed upon one man. It had been expected that the four Associate Justices would select Justice David Davis to be the 15th member of the Commission. Mr. Davis was independent in politics. But he had accepted an election to the United States Senate, which was thought to make it unsuitable for him to serve. Justice Joseph P. Bradley of the fifth circuit was chosen. This made the Commission consist of eight Republicans and seven Democrats. At the final sitting Senator Thurman was unable to serve on account of illness, and Francis Kernan, New York, a Democrat, was substituted. The two most important United States laws pertaining to presidential elections were enacted 1 March 1792, and 23 Jan. 1845, respectively. The act of 1792 provides that the executive authority of each State shall cause lists of the names of the electors of such State to be certified and delivered to the electors, and that the electors shall annex one of the said lists to each list of votes. The law of 1845 declares that each State may by law provide for the filling of any vacancy or vacancies which may occur in its college of electors, when such college meets to give its electoral vote. Numerous cases came up in the count of 1877, to which these provisions were applicable. The Electoral Commission held four sittings. The first one began 2 Feb., when the returns from Florida were reached. It took a week to come to a decision in this case. The returns of the Hayes electors were certified by the Governor in office on the day when the electors met. But it was believed that the State returning board, which had declared for a Republican victory, had in canvassing the votes of the State rejected the returns from certain polling places. On the other hand, the returns of the Tilden electors were certified by the Attorney General. And there was a duplicate of the same returns certified by a new Democratic Governor. An additional cause of dispute in the case of Florida grew out of the charge that one of the Hayes electors held an office under the United States government at the time when he was elected, and was therefore ineligible. This objection was based upon the Constitutional provision that no person holding an office of trust or profit under the United States shall be appointed an elector. The decision of the Commission was based upon the ground that the returns of the Hayes electors were certified according to the law of the United States, and that the returning board had operated under the laws of Florida. To set these returns aside would be to go behind the action of the State officers. This the Commission was incompetent to do. And it would be impossible to investigate the charges of fraud. As for the one elector who was objected to on the charge that he held an office under the United States, it was concluded after hearing evidence on both sides that he had properly resigned the office. The Commission therefore held by a vote of eight to seven that the four Hayes electors were the lawful ones. This decision was reported 9 Feb. The Electoral Commission was next in session 12–16 Feb., as the official count had now reached Louisiana. This State presented the spectacle of rival governments. The Republican officers claimed authority under the canvass of the State returning board. The Democratic ones claimed that under the popular vote as cast they had been elected. The returns of the Tilden and the Hayes electors were certified by rival executives. The Commission maintained that the Republican government held office by the operation of the laws of the State. In this case, as in that of Florida, there were charges of fraud and ineligibility. But the Commission could not go back of the certificate of the State authority. Accordingly the eight Hayes electors were held to be the rightful ones. The Commission was again in session 21–23 Feb., to pass upon the returns from Oregon. The Republican party had carried the election but the Governor, who was a Democrat, had certified to the election of only two of the Hayes electors. The third certificate was issued to the highest Tilden elector on the ground that the third Hayes elector was a postmaster. As the two Republican electors refused to meet with the Democratic one, both sides preceded to fill the vacancies in the electoral college. The Republican electors appointed the man from whom the Governor had withheld the certificate. The one Tilden elector appointed two other Democrats. The Governor certified to the returns of the Tilden electors. Those of the other college were certified to by the Secretary of State. The reasoning by which the disputes about Florida and Louisiana were decided operated in this case in favor of the Tilden electors. But the Commission made a distinction. In those cases it had inquired whether the executive authority had carried out the laws of the State, and had found that it had done so. Thus it was incompetent for the Commission to inquire further. But in the case of Oregon it found that the Governor had not carried out the laws. Accordingly the Commission was competent to make him do so. Thus the three Hayes electors were recognized. On 26 Feb., the returns from South Carolina were submitted to the Commission. The votes of the Hayes electors were duly certified by the Governor. But fraud on the part of the returning board and intimidation at the polls were charged. On the second day the Commission decided that the returns of the

seven Hayes electors should be accepted. The decision in favor of the Hayes electors was made in every case by a party vote of eight to seven. Moreover the Senate voted on each occasion to accept the decision and the House of Representatives to reject it. As the count proceeded, six cases of disputed votes came up which were not referred to the Electoral Commission, as they did not involve conflicting returns. In the electoral colleges of Michigan, Nevada, Pennsylvania, Rhode Island, Vermont, and Wisconsin, respectively, vacancies had been cused by ineligibility, and the other electors had proceeded to fill the places. Some of the votes were objected to on this account. The two Houses concurred in accepting some of these, and differed with respect to others. There was no concurrent vote to reject. It was in the early morning of 2 March, only two days before the date set by the Constitution for the existing administration to come to an end, that the result of the official count was announced. The vote as accepted stood Tilden and Hendricks 184, Hayes and Wheeler 185. Thus if the decision of the Electoral Commission had been different in the case of a single elector, the contest would have been decided in favor of the other party.

After this contest was settled there were numerous movements in Congress to amend the Constitution so as to provide for disputed elections. But none of them came to anything. Several laws on the subject were also introduced. It was ten years afterward that a law disposing of such cases was enacted, the date being 3 Feb. 1887. This act is a lengthy one, and provides in detail for the certification of electors and the counting of electoral votes. Its great provision is that the States shall provide under their own laws by judicial or other methods of procedure to settle disputes as to the choice of electors. The decision arrived at within the State must be accepted. The only case that could arise for the National Government to settle would be that of rival tribunals within a State sustaining rival electors. The rule in such a case is that no vote can be rejected except by the affirmative vote of both Houses of Congress acting separately. See BALLOT; ELECTIONS.

Ann Arbor, Mich.

51. United States — Impeachment in. Impeachment in the American national government is the formal act by which the House of Representatives makes accusations, before the Senate, against the President, the Vice-president or any "civil officers" (executive and judicial officers, except those of the army and navy) of the United States government. It is analogous to an indictment by a grand jury, though it is not confined to indictable offenses. Impeachment developed in English history before the establishment of the modern cabinet system, as a power by which the representatives of the people could control the agents of the irresponsible king, who, according to theory, could do no wrong. After the establishment of the Parliament's supremacy, and the present method of conducting the government, the custom gradually fell into disuse. One of the most noted cases was that of Warren Hastings whose trial for misgovernment in India lasted from February 1788 to April 1795, when he was acquitted. The latest case was that of Lord Melbourne in 1806.

The American colonial assemblies adopted the custom in a modified form as a means by which to check the executive and the judiciary. Though the right to remove officials was given to the general assembly by the Fundamental Orders of Connecticut in 1638, by the charter of Connecticut in 1662, and by the charter of Rhode Island in 1663, the word impeachment first appears in 1683 in the Pennsylvania frame of government, which provided that the general assembly should bring the impeachment, and that the council should try the case and pronounce judgment.

The new State Constitutions after 1775 contain provisions on the subject: Virginia (1776); New Jersey (1776); Delaware (1776); Pennsylvania (1776); North Carolina (1776); Georgia (1777); New York (1777); Vermont (1777); Massachusetts (1778); South Carolina (1778); Massachusetts (1780); New Hampshire (1784), and Vermont (1786). The New Jersey constitution of 1776 provided that the lower house should bring the impeachment and that the upper house should try it. The New York constitution of 1777 provided that the assembly should bring the impeachment and that it should be tried before a court consisting of the president, the senators, the chancellor, and the judges of the supreme court. Judgment was to extend no farther than removal from office and disqualification from holding office under the State. The methods of trying the impeachment varied, but the tendency was to have judgment pronounced by the council or senate. The Constitutional Convention of 1787 incorporated the same principle into the Constitution for application in cases of treason, bribery, "or other high crimes and misdemeanors," all of which can be punished in the ordinary courts. The House first passes a resolution to impeach and then appoints a committee to present the charges at the bar of the Senate which sits as a high court to try the case. The House also appoints a committee of managers to act for it in the trial before the Senate. At the close of the trial, after the evidence has been introduced and the arguments of the managers and of the defendant's counsel have been heard, each senator is required to vote "guilty" or "not guilty" on each of the articles of impeachment. A two thirds majority of those present is necessary to convict. The object is not to punish wrong. The penalty can be only removal from office and disqualification from further public service, but the person convicted is still liable to punishment by the ordinary courts, and he cannot receive a reprieve or pardon from the President.

In our national history this constitutional process has been invoked in seven cases; four times against federal judges, once against a senator, once against a cabinet officer, and once against a President. Only in two cases has it resulted in removal from office: Judge John Pickering in 1803 for drunkenness, profanity and violence on the bench, and Judge W. H. Humphreys in 1862 for adhering to the Confederacy. Both were district judges of the United States; Pickering for the District of New Hampshire, and Humphreys for Tennessee. In the articles against Pickering it was charged that he made decisions contrary to law in a suit involving the

seizure of a ship and that he appeared upon the bench "in a state of intoxication, produced by the free and intemperate use of inebriating liquors, and did then and there frequently in a most profane and indecent manner invoke the name of the Supreme Being." Judge Pickering did not attend the trial, but his son entered a plea of insanity and consequent irresponsibility, stating that his father for over two years had been altogether incapable of transacting any kind of business which required the exercise of the judgment or the faculties of the reason; and therefore incapable of corruption of judgment, and therefore that he was "not amenable to any tribunal for his actions." The House managers held that the insanity was the result of habitual drunkenness. On 12 March 1803 he was convicted and removed by a party vote, the Federalists voting in the negative, but the further disqualification to hold office was not inflicted.

Judge Humphreys at the beginning of the Civil War had engaged actively in the secession movement, but had not resigned his position as judge of the Federal District Court for Tennessee. In May 1862, the House preferred against him seven articles of impeachment, based on a secession speech made by him at Nashville, 29 Dec. 1860, on his acceptance of office under the Confederacy, and on his action in the arrest and imprisonment of W. G. Brownlow, a citizen of the United States in violation of his rights. Judge Humphreys made no defense and on 26 June 1862, he was convicted by unanimous vote of the Senate. The proceeding was merely a formal means of declaring his office vacant.

Justice Samuel Chase of the Supreme Court, appointed by President Washington in 1796, an able but partisan judge who frequently indulged in political harangues in his jury charges, and who had incensed the Jeffersonian Republicans of the House by his conduct in certain trials under the Sedition law, was impeached before the Senate in December 1804 on eight charges relating to arbitrary and unjust conduct, and to highly indecent and extra-judicial reflections upon the government of the United States before the Maryland grand jury. He was found not guilty, probably because it was believed that "his conduct had been rather a violation of the principles of politeness than of the principles of law; rather the want of decorum than the commission of high crime and misdemeanor."

Judge J. A. Peck of the Federal District Court for Missouri was impeached in 1830 on the charge of unduly punishing, for contempt of court, an attorney who had published a criticism of a decision of the judge in a land case (1827). He was acquitted by a vote of 24 against 21.

The case of William Blount, senator from Tennessee, seems to have settled that senators and representatives are not impeachable, on the ground that they are not civil officers. On 7 July 1797, the House, having evidence that Senator Blount was conspiring to transfer New Orleans and adjacent territory from Spain to Great Britain, by means of a hostile military expedition from the territory of the United States, decided to impeach him. Two days later, he was expelled from the Senate, and soon thereafter he was elected to the Tennessee Senate. In December 1798, the House managers presented the case before the Senate of the United States for trial. Blount did not appear, but his counsel (Jared Ingersoll and A. J. Dallas) entered a plea that the Senate had no jurisdiction, since a senator is not a "civil officer" of the United States. The Senate sustained this plea and Blount was discharged for want of jurisdiction. The defense also made the plea that Blount, having been expelled, was no longer a senator, and could not be punished after he was out of office for acts done while he was in office.

It is still an open question whether an officer can escape impeachment and trial before the Senate by resignation or dismissal from office. This subject was discussed in the case of William W. Belknap, who was impeached in 1876 for using his position as Secretary of War as a means of securing bribes from an Indian agent whom he had appointed at Fort Sill. A few hours before his impeachment, he resigned his office and his resignation was accepted by the President. Belknap's counsel made the plea that the House had no power to impeach anyone who by resignation or otherwise had ceased to be "a civil officer of the United States." By a vote of 37 to 29 the Senate decided that Belknap was amenable to trial by impeachment. On most of the articles 36 senators voted "guilty" and 25 voted "not guilty," and thus Belknap was acquitted. More than one third of the Senate refused to vote for conviction, on the ground of lack of jurisdiction over an officer who had resigned. This precedent may not be regarded in future cases, however.

The most prominent case of impeachment in our history was that of President Andrew Johnson. It was the result of the violent controversies concerning policies of reconstruction, and was inspired largely by party motives. The President vetoed some of the most important measures of Congress and belligerently condemned its policy of reconstruction. Congress passed all important measures over his veto, and sought to reduce his power and influence in other ways, especially by the Tenure of Office Act of March 1867. Johnson denounced Congress in very intemperate language, and by demanding the resignation of Edwin M. Stanton, Secretary of War, attempted to ignore the Tenure of Office Act which had stripped from him the power to remove executive officials. The House was thoroughly aroused, and on 3 March 1868, brought articles of impeachment against him, on 11 charges, principally of a political nature and based chiefly on his alleged violation of the Tenure of Office Act. The event was considered so momentous that the Senate in accord with the conviction of the Chief Justice who presided, drew up and adopted its own formal rules of procedure.

On 23 March, the court of impeachment convened and the reply of the President was read by his counsel. He denied any intention of violating the Constitution, or of attempting to bring Congress into disgrace or to ridicule it. Testimony was taken and then the arguments of the attorneys were filed. Party excitement and passion ran high, and on 16 and 26 May, after a long trial, the Senate by a vote of 35 to 19 decided that he was guilty of the principal charges. This lacked one vote of the two thirds majority necessary for conviction. (The court then adjourned *sine die* by a vote of 34 to 16.) The necessary two thirds was not obtained, largely because some of the leaders in the Senate feared

that conviction might result in the permanent subordination of the executive to Congress. Seven Republican senators voted against conviction. The failure to convict was a public advantage, but the President did not win with dignity — for even while the trial was in progress he traveled about, making passionate speeches against Congress.

In the States, officers are removable either by a two thirds vote of the legislature, or by impeachment by the lower house and trial in the senate. Though there have been over 40 attempts to remove, there have been very few cases of actual removal from office by impeachment. One governor and a few judges have been removed, and there have been several cases of resignation while under impeachment in order to avoid conviction.

52. **United States — The President's Office.** The theoretical model for the new executive officer of the "more perfect Union" was the king of England. Practically the framers were guided by such models as the colonial governors and the official heads of the recently formed States. Having determined upon a single executive, such details as the tenure, powers, and method of choice of this officer were matters for careful adaptation and of mutual compromise. The result formed a sufficiently important part of the new frame of government to cause its opponents to style it "a monarchical constitution," and to concentrate their attack upon the proposed executive. Still popular confidence in Washington as the unanimous choice for this position caused even this opposition to fail.

The ultimate position of the American president was not determined till the end of Jackson's administration. Washington established the office upon a broad national basis, but even he could not render it strictly non-partisan. Jefferson first exemplified the method of conduct by a brilliant and successful party leader. Under his weaker successors the congressional caucus nearly destroyed the independence of the executive, and it was the great work of Jackson to restore the office to a co-ordinate position with Congress and the Judiciary. He was aided in this work by the rise of the national convention, which destroyed the power of the congressional caucus, and by the development of party machinery, based upon executive patronage and a subsidized press. The convention and party machine, however, rendered the selection of a second-rate party man a greater future possibility. Polk showed the influence of a successful war upon the executive power, but it was under Lincoln that the war powers of the President reached their highest development. His successor, Johnson, was unable to maintain this high level and narrowly escaped impeachment in his attempt to resist the encroachments of Congress. Many important assertions of executive authority occurred during Cleveland's administration, but the most important development of recent times occurred under McKinley in connection with the colonial problems growing out of the Spanish-American War.

The Choice of the President.— In the convention of 1787 the method of selecting the new executive presented a most perplexing question. The natural methods of choice — by the legislative assembly or by the people at large — were both rejected. After passing over propositions to elect the President by the suffrages of the State governors and by electors chosen by districts, the convention, as a result of one of its most important compromises, adopted the expedient, suggested by Maryland's experience, of giving to each State a number of presidential electors equal to its senators and representatives. These electors, who supposedly would represent the intelligent people of the States, were to vote for persons for president and a majority of all electors was necessary for a choice. By 1800 the chief defect of this plan was revealed in the tie vote for Jefferson and Burr, and this led to a speedy adoption of the Twelfth Amendment to permit electors to signify their choice for President and Vice-President, and to make possible a definite party selection. By this article of the Constitution the legislatures of the various States are to determine the method of choosing the electors; and in the first election five of these chose them without reference to the people at large. In 1832 Delaware and South Carolina alone retained this method, which the latter continued till 1860. Since that date, Colorado selected its delegates by its legislature, in the election of 1876. Election by districts was employed by Massachusetts in 1788, and by four States in 1808. Maryland, with the temporary exception of Michigan, in 1892, was the last to give up this system. After 1836, the practice of a popular choice of electors, upon a general State ticket, was in universal use outside of South Carolina. In 1845 Congress prescribed for the whole Union the present general election day.

Technically, the President is not chosen until the counting of the electoral votes, in February, before the assembled Senate and House of Representatives. An unsuccessful attempt was made in 1800, to determine to what extent each house should participate in this ceremony, especially in the case of a contested vote. In 1865, owing to a question about the returns from the "reconstructed" States of Tennessee and Louisiana, Congress hastily adopted the "Twenty second Joint Rule," which provided for a separate vote by each house upon disputed election returns. This joint rule was suspended, in 1877, by the famous "Electoral Commission," consisting of five members of the Supreme Court and five from each house. This commission passed upon the returns of each State, and by a party vote seated Mr. Hayes. In order to avoid the recurrence of such a dispute, the 49th Congress, in 1877, passed the law providing that Congress should not go behind the returns issued by regu-

larly accredited State officers, and thus left to each State the determination of its own electoral vote.

The Presidential Succession.— The natural successor of the President, in case of his disability or removal, is the Vice-President, who is chosen in the same manner as the President. Five of the twenty-six Presidents have reached the higher office through the vice-presidency. The law of 1792, the first to regulate the succession, provided for the accession, after the Vice-President, for the purpose of ordering a new election, of the president *pro tempore* of the Senate, and after him, of the speaker of the house. This plan was open to the objection that during the intermission between two congresses, neither of these officials was in existence. Accordingly it was superseded by the act of 1886, which provides, that in case of the death of both President and Vice-President, the secretary of state shall succeed, and after him, in order of seniority, the other members of the cabinet.

Powers, Obligations, and Privileges of the Presidency.—Since 1871 the annual compensation of the President has been $50,000, with special appropriations for the care of the executive mansion. In general the life of a President is characterized by a simple dignity. The first two presidents attempted a series of stately public ceremonials, which their successors wisely abandoned. The President endeavors to keep in touch with public sentiment, particularly through his official advisers — the members of the cabinet. It was at first proposed that this body should exercise a definite check upon the President, but it was clearly perceived that the power of the Senate over treaties and appointments was sufficient for this purpose. The Act of 1789 creating the office of secretary of state permitted the President to remove a secretary without previously consulting the Senate. This power has been used on two occasions only. As head of the army and navy the President exercises an extensive appointing power in peace, and actual command in war. He also has the direct appointment of some 5,000 civil officials of higher rank, and indirectly influences the appointment of all others. A few of the President's appointments are made upon his own responsibility; all others with the advice and consent of the Senate. The latter body before making an appointment has occasionally requested additional information, which Jackson and Cleveland uniformly refused to furnish. The accompanying power of removal, which does not extend to judges or army and naval officers, has generally been construed as a necessary adjunct to the President's duty to see that the laws are faithfully executed. This power, sparingly used by the early presidents, was definitely employed by Jackson in building up a personal party machine. It formed an important factor in succeeding elections, and was extensively used by Lincoln; but it has been greatly curtailed since 1883 by the extension of the civil service system. The power of removal has rested almost exclusively with the President, the only exception occurring in 1867, when Congress passed the Tenure of Office Act to curb Johnson; but in 1869 the most important portion of it was repealed, and the remainder in 1885.

The President exercises a potent influence upon legislation, often due to his position as a great party leader, to his communications to Congress, his veto power and enormous patronage. The veto power was copied almost verbatim from the Massachusetts constitution of 1780. In theory, by means of it, the President wields a power equivalent to one sixth the whole number of senators and representatives, but practically he is far more potent. The first six presidents made rare use of the veto. Jackson found it useful in reasserting the co-ordinate power of the presidency. Hayes made use of it to prevent the addition of "riders" to appropriation bills; Cleveland, more extensively than any other President, to defeat special pension legislation. The first two presidents opened each Congress in person by a speech; their successors have preferred to make written communications to that body, and these have often proved influential in initiating legislation or in forcing a party issue to the front. Moreover, it is upon the presidency that the judiciary depends for the enforcement of its decrees. This dependence and the check upon legislation serve to maintain the presidency in its co-ordinate position.

ISAAC JOSLIN COX,
Department of History, University of Pennsylvania.

53. United States — The Vice Presidency. By provision of the Federal Constitution, a Vice President of the United States is elected at the same time, for the same term, and in like manner as the President:— by electors chosen in each of the States. A majority of the votes cast in the several electoral colleges is necessary to an election. The Vice President is the president of the Senate, and in the event of an equal division in that body, he gives the deciding vote. Under no other contingency has he a vote. The powers and duties of the office of President devolve upon the Vice President in case of the death, resignation or removal from office, of the President. The Vice President is included in the category of public officers liable to removal from office on impeachment and conviction for treason, bribery or other high crimes and misdemeanors. By the twelfth amendment to the Constitution no person constitutionally ineligible to the office of President shall be elected to that of Vice President. In the event of a vacancy occurring in the office of Vice President, the Senate is presided over by a member of that body. In such contingency the death of the President would, under existing law, devolve the office of President upon the Secretary of State. Twenty-five persons have held the office of Vice President; their names and the dates of their respective elections are as follows, viz: John Adams of Massachusetts, elected in 1788, re elected in 1792; Thomas Jefferson of Virginia in 1796; Aaron Burr of New York in 1800; George Clinton of New York in 1804, re-elected in 1808; Elbridge Gerry of Massachusetts in 1812; Daniel D. Tompkins of New York in 1816, re-elected in 1820; John C. Calhoun of South Carolina in 1824, re-elected in 1828; Martin Van Buren of New York in 1832; Richard M. Johnson of Kentucky in 1836; John Tyler of Virginia in 1840; George M. Dallas of Pennsylvania in 1844; Millard Fillmore of New York in 1848; William R. King of Alabama in 1852; John C. Breckenridge of Kentucky in 1856; Hannibal Hamlin of Maine in 1860; Andrew

Johnson of Tennessee in 1864; Schuyler Colfax of Indiana in 1868; Henry Wilson of Massachusetts in 1872; William A. Wheeler of New York in 1876; Chester A. Arthur of New York in 1880; Thomas A. Hendricks of Indiana in 1884; Levi P. Morton of New York in 1888; Adlai E. Stevenson of Illinois in 1892; Garrett A. Hobart of New Jersey in 1896; Theodore Roosevelt of New York in 1900.

Three Vice Presidents were subsequently elected President, viz: John Adams in 1796; Thomas Jefferson in 1800 and 1804; and Martin Van Buren in 1836. The dates given have reference to the election by popular vote of the electors in the several States, by whom the President and Vice President were subsequently chosen. Six Vice Presidents died in office, viz: Clinton, Gerry, King, Wilson, Hendricks and Hobart. In the Presidential contest of 1836 Martin Van Buren received a majority of the electoral votes for President, but no candidate received a majority for Vice President. By constitutional requirement the duty of electing a Vice President then devolved upon the Senate; the candidates from whom such choice was to be made being restricted to the two who had received the highest number of electoral votes. One of these, Richard M. Johnson of Kentucky, was duly elected by the Senate. The only Vice President who resigned the office was John C. Calhoun. This occurred in 1832, and Mr. Calhoun soon thereafter took his seat in the Senate, to which body he had been elected by the Legislature of South Carolina.

Five Vice Presidents have, upon the death of the President, succeeded to the Presidency. The first President to die during his incumbency of the great office was William Henry Harrison; his death occurred 4 April 1841, just one month after his inauguration. The Vice President, John Tyler, then at his country home in Virginia, was officially notified of the event, and upon reaching the seat of government at once took the oath of office as President. There was much discussion for a time in and out of Congress as to his proper title, whether "Vice President of the United States acting as President" or "President." The language of the Constitution, however, is clear, and it is no longer controverted that upon the death of the President the Vice President becomes in name as in fact — President. Upon the death of President Zachary Taylor, 9 July 1850, Vice President Millard Fillmore succeeded to the Presidency, and was at a later date an unsuccessful candidate for election to that office. The third Vice President who reached the Presidency by succession was Andrew Johnson; this occurred 15 April 1865, the day following the assassination of President Lincoln. President Garfield was shot 2 July 1881 and died in September of that year, when he was succeeded by Vice President Chester A. Arthur. Vice President Roosevelt was the successor of President McKinley, who died by the hand of an assassin in September 1901.

Two attempts have been made to secure the impeachment of the President; — the incumbent in each instance having been elected Vice President, and succeeded to the higher office upon the death of the President. A resolution looking to the impeachment of President Tyler was introduced into the House of Representatives in January 1843, but being defeated no further steps were taken. Articles of impeachment for "high crimes and misdemeanors" were presented by the House of Representatives, against President Johnson in 1868. By constitutional provision the trial was by the Senate, the Chief Justice of the United States presiding. Less than two-thirds of the Senators voting for conviction, he was acquitted.

No constitutional provision existed until the adoption of the 12th amendment for separate votes in the electoral colleges for President and Vice President; the candidate receiving the highest number of votes (if a majority of all) became President, and the one receiving the second highest, Vice President. In 1801 Jefferson and Burr each received 73 electoral votes, and by constitutional requirement the election at once devolved upon the House of Representatives, voting by States. Upon the 36th ballot, a majority of the states voting for Jefferson, he became President, and Burr Vice President. The constitutional amendment above indicated — by which separate ballots were required in the electoral colleges for the two offices — was the result of the intense excitement throughout the country engendered by this contest. The earnest opposition of Alexander Hamilton to Aaron Burr in the above mentioned contest, was the prime cause of the duel by which Hamilton lost his life at the hands of Burr, in 1804.

George Clinton, the fourth Vice President, had as a member of the Continental Congress voted for the Declaration of Independence, and held the rank of Brigadier General during the war of the Revolution. The fifth Vice President, Elbridge Gerry, had been a prominent member of the Constitutional Convention of 1787. William R. King, elected in 1852, by reason of ill health, never entered upon the discharge of the duties of his office. By special act of Congress, the oath of office was administered to him in Cuba and his death occurred soon thereafter. Of the 25 Vice Presidents thus far elected, nine have been taken from the State of New York. Adams and Jefferson, the first and second Vice Presidents, rendered valuable service to the young Republic at foreign courts, each by election was elevated to the Presidency, and their deaths occurred upon the same historic 4 July — just 50 years from the day they had signed the Declaration of Independence. A marble bust of each of the Vice Presidents has been placed in the gallery of the Senate chamber. The office of Vice President is one of great dignity. He is the presiding officer of the most august legislative assembly known to men. In the event of an equal division in the Senate he gives the deciding vote. This vote, many times in our history, has been one of deep significance. It will readily be seen that the contingency may often occur when the Vice President becomes an important factor in matters of legislation. See also UNITED STATES — PRESIDENTS AND VICE PRESIDENTS OF.

ADLAI E. STEVENSON,
Ex-Vice President of the United States.

54. United States — Speaker of the House of Representatives. The constitution of the United States provides that: "The House of Representatives shall choose a speaker and other

officers, and shall have the sole power of impeachment." Even if the power to choose a Speaker had not been expressly conferred by the Constitution, the House, as a legislative body, would have possessed the inherent authority to elect or appoint a presiding officer and such other officials as might be necessary to enable it to transact its business in an orderly and regular manner, and to make and preserve a record of its proceedings. As the Constitution does not prescribe the manner in which the Speaker shall be chosen, the House itself must determine the mode of election, and, therefore, may order a vote to be taken in any way that will ascertain the choice of a majority, or the choice of a plurality, in case it shall have previously been determined that a plurality may elect. Although no rule has been adopted upon this subject, it is customary to choose a Speaker by calling the names of the members present who have filed regular credentials with the clerk, and by recording their votes in the journal. Pending the election, the clerk of the last preceding House of Representatives (q.v.) presides, and it is his duty to preserve order and decorum and to decide all questions of order, subject, however, to appeal by any member. The Speaker is nominally elected to preside during the Congress then existing, but there is no constitutional or statutory provision, nor any rule of the House fixing the term of office, and, as he is merely an officer of the House, it would seem that he might be lawfully deposed at any time by the election of another to take his place. By statute, in England, it is provided that, in case of a dissolution of Parliament, the then Speaker of the House of Commons shall continue in office until one shall be chosen by the new Parliament, and that, in case of his death, disability, or absence from the realm during any dissolution or prorogation, three of the commissioners of the House of Commons shall act for him in regard to the offices of the House. In this country, the office becomes vacant immediately upon the adjournment of Congress (see CONGRESS OF THE UNITED STATES), and there is no one authorized to act until a new Speaker is elected by the next House, but, as already stated, the clerk presides over the new House until a Speaker is chosen. During the sitting of Congress, the Speaker may designate a member to discharge the duties of the office in his stead, but this substitution cannot extend beyond an adjournment. In case of his illness, however, he may, with the approval of the House, make such appointment for a period not exceeding ten days; but, if he is absent and has omitted to make an appointment, the House elects a Speaker pro tempore.

The Speaker is nominated and elected by the members of the party with which he is affiliated, and the office is one of great political importance. His powers and duties differ in many respects from those appertaining to the office of Speaker of the House of Commons, and he exercises much greater influence in directing the course of legislation and in political matters generally than the presiding officer of any other legislative body in the world. He not only presides over the deliberations of the House and preserves order and decorum, but he appoints all standing committees and all select and conference committees ordered by the House, and, inasmuch as the member first named on the committee becomes its chairman, the Speaker determines who shall occupy all those important positions. In constituting the important standing committees, chairmanships are always given to members of the Speaker's political party, and this is also generally the case in the appointment of select and conference committees. This power to appoint the standing and select committees is generally exercised by the presiding officers of legislative bodies in the United States, but it is not vested in the Speaker of the English House of Commons or in the Speaker of the House of Commons of the Dominion of Canada. Originally, the House of Representatives appointed all the important committees by ballot, and the Speaker appointed only such as consisted of not more than three members, an arrangement which confined his power to control legislation, otherwise than by the exercise of his personal and official influence, within very narrow limits as compared with the present system.

The Speaker is chairman of the Committee on Rules, consisting of himself and four other members, who are appointed by him. All proposed action relating to the rules, joint rules, and order of business must be referred to this committee for consideration and report, and it, therefore, practically decides what legislative measures shall be taken up for consideration in the House, when they shall be considered, what time shall be allowed for debate, and what amendments, if any, shall be offered and voted on. While it is true that its reports, in order to become binding upon the House, must be agreed to by that body, yet, the committee itself is so constituted that it represents the views of the majority of the House, especially when political questions are involved, and the adoption of its recommendation is generally little more than a mere form.

The Speaker must rise from the chair to put a question to the House, but he may state it sitting. There are four different methods of taking the sense of the House on a pending proposition: First, by the voices, the members who vote in the affirmative saying "Aye," and those voting in the negative saying "No." If the Speaker doubts, or if a division is called for, he directs those in the affirmative to rise from their seats and be counted, and after he has made the count and announced the number, those voting in the negative rise and are counted. If he still doubts, or if tellers are demanded by one fifth of a quorum, the Speaker designates two members, one from the affirmative side and one from the negative side, to count the votes for and against the measure and report the result to him. Even after all these methods are resorted to, if the yeas and nays are demanded by one fifth of the members present, the Speaker directs the clerk to call the roll, and the names of those voting are entered on the journal. It is frequently the case that the votes are taken in all these different ways upon the same question before the result is finally ascertained and announced.

When the House resolves itself into a committee on the whole, the Speaker leaves his

place and designates a member to preside as chairman. In case of disorder in the committee, the regular practice is for the committee to rise by vote and report the fact to the House, but there have been occasions when the Speaker, having knowledge of the disorder, has summarily resumed the chair and restored order without the formality of a vote by the committee to rise and report.

It is the duty of the Speaker to sign all acts, addresses, joint resolutions, writs, warrants, and subpœnas ordered by the House, and to decide all questions of order as they arise, subject to appeal by any member. Being a representative himself, he has the right to vote on all questions in the House and in committees of the whole, but, under the rules, he is not required to vote in ordinary legislative proceedings, except in case when his vote would be decisive or when the House is voting by ballot. When there is an even, or tie, vote, the question is lost, and the Speaker, therefore, does not vote unless he is in favor of the measure. According to the general parliamentary law, the Speaker has no right to speak except on questions of order, but, in the House of Representatives, he has several times participated in the debates without asking the consent of the House; and it is not unusual for him to speak and vote in committees of the whole.

He is required to take the chair on every legislative day at the time to which the House shall have adjourned at its last sitting, and, on the appearance of a quorum, it is his duty to cause the journal of the last day's proceedings to be read, having first examined and approved it. Generally, however, the reading of the journal is dispensed with by unanimous consent of the House. If no quorum attends at the hour of meeting, or if it appears at any time during the sitting that no quorum is present, he has no power to adjourn the House on his motion, as is the case in the English House of Commons. Under the Constitution, a majority of the House constitutes a quorum to do business, but it is provided that a smaller number may adjourn from day to day and may be authorized to compel the attendance of absent members, in such manner and under such penalties as it may prescribe. Accordingly, it is provided by rule that 15 members, including the Speaker, shall be authorized to compel the attendance of absent members, and, consequently, the House is not disabled and forced to adjourn because there is no quorum present.

The Speaker has the power to appoint and remove for cause the official reporters of debates for the House, and he prescribes regulations for the admission of the representatives of the press to the reporters' gallery. He has also control over the hall of records and the unappropriated rooms in that part of the Capitol assigned to the use of the House. Under the statutes of the United States he appoints from the membership of the House three visitors to the Military Academy (q.v.), three to the Naval Academy (q.v.), a consulting trustee of the Reform School of the District of Columbia, two directors of the Columbia Hospital for Women, three regents of the Smithsonian Institution (q.v.), and two members of the Memorial Association of the District of Columbia.

Since the organization of the government under the Constitution, on 30 April 1789, there have been 58 Congresses, but owing to the fact that in many cases the same person was several times re-elected to the office, there have been only 33 permanent Speakers of the House. Of the 33, 4 were Representatives from Massachusetts, 4 from Virginia, 4 from Kentucky, 3 from Pennsylvania, 3 from Indiana, 2 from New Jersey, 2 from South Carolina, 2 from Georgia, 2 from Maine, and 1 from each of the States of Connecticut, North Carolina, New York, Tennessee, Ohio, Iowa, and Illinois. The Speaker who held the position longer than any other was Henry Clay, of Kentucky, who was elected six times; but he did not serve six full terms, having resigned from the office twice before the expiration of the Congresses for which he had been chosen.

Under the Constitution, Congress may provide by law for the case of removal, death, resignation, or inability, both of the President and Vice-President, designating what officer shall then act as President, and, by a statute passed 1 March 1792, it was enacted that in such a case the President of the Senate, or, if there should be none, the Speaker of the House, for the time being, should act as President until the disability should be removed or a President should be elected. This statute remained in force until 19 Jan. 1886, when Congress passed another act providing that in case of the removal, death, resignation or inability of both the President and Vice-President, the secretary of state, or, if there should be none, or, in case of his removal, death, resignation, or disability, the secretary of the treasury, shall act as President, and that the right of succession shall pass next to the secretary of war, then to the attorney-general, postmaster-general, secretary of the navy, and secretary of the interior. The Department of Agriculture and the Department of Commerce and Labor had not then been created, and, consequently, the secretaries of these departments are not included in the act, and they are not in the line of succession. Although the act of 1792 remained in force nearly 95 years, the contingency provided for never occurred. This was fortunate for the country, because there were grave doubts as to its constitutionality, and, if the offices of both President and Vice-President had at any time become vacant, the succession of the President of the Senate or the Speaker of the House might have been seriously contested. The questions which would have arisen are: (1) Whether the word "officer" used in the Constitution did not mean an officer of the United States; and, if so (2) whether the President of the Senate and the Speaker of the House are such officers, or are only representatives of the States or the people, chosen by the two branches of Congress to preside over their deliberations.

JOHN G. CARLISLE,
Ex-Speaker of the House of Representatives.

55. United States — History of Arbitrations. International arbitration is a voluntary submission of certain definite points in an international dispute to the decision of a third party. (The decision of the arbitrator or court of arbi-

tration is binding except when the award is outside of the points submitted, equivocal, impossible, influenced by fraud or corruption, or a denial of justice.) It is largely the outgrowth of the complex international relations of the 19th century which have resulted in a growth in the recognition of international duties and liabilities. From 1800 to 1900 there were 136 important international arbitrations and many minor commissions.

The United States has taken the lead in several very important adjustments. She began her national existence with many unsettled questions, and as she settled them there arose many new problems demanding solution. With a desire to substitute reason for force in settling disputes, she has accepted international arbitration as a prominent feature of her policy. Her arbitrations have embraced many kinds of international controversy, and many important questions of law, both public and private, some of which might have resulted in expensive wars.

With Great Britain.—Arbitrations with Great Britain have been the most important. The first cases arose under the Jay Treaty of 1894, articles 5, 6, and 7 of which provided for three mixed commissions: (1) To settle the identity of the Saint Croix River, which was specified in the treaty of 1783. The commission in 1798 decided upon the Schoodiac. (2) To decide what compensation, if any, was due British subjects who had been unable to collect debts in some of the States where the terms of the treaty of 1783 had been disregarded. The board of five arbitrators met at Philadelphia in 1797, quarrelled, and adjourned in 1798. The matter was finally settled by the treaty of 1802 which awarded Great Britain £600,000. (3) To settle questions regarding contraband, rights of neutrals, and prize court decisions. This commission met at London. There were several interruptions (and the disagreement of the Philadelphia commission caused a suspension from July 1799 to February 1802), but it completed its work in 1804. Its work was very important in determining subsequent international law (q.v.).

After the cases wisely provided under the Jay treaty, there followed a period in which the effects of European wars rendered arbitration practically impossible, and produced an extraordinary train of circumstances which finally precipitated the Anglo-American War of 1812. Since that war every vexatious question which has arisen with Great Britain has been settled by arbitration in case direct negotiation failed. Articles 4, 5, 6, and 7 of the Treaty of Ghent of 1814 provided for three commissions or boards of arbitration: (1) To determine the title to certain islands in Passamaquoddy Bay. At New York in 1817, the board made its award, substantiating in the main the British claims. (2) To determine the northeast boundary of the United States, from the source of Saint Croix to the Saint Lawrence. The board met at Saint Andrews in 1816, and held its last meeting at New York in 1822, but reached no agreement. By a convention of 1827 the points of difference were referred to the King of the Netherlands, who, in 1831, proposed a compromise line which neither party was willing to accept. The matter was finally settled by the Webster-Ashburton treaty of 1842. (3) To determine the boundary through the middle of the lakes to the upper end of Lake Huron and then to the Lake of the Woods. The commission agreed upon the first part in 1822 and finally adjourned in 1827 leaving the boundary westward from Lake Huron through Lake Superior to the Lake of the Woods unsettled till the Webster-Ashburton treaty of 1842.

By the treaty of 1818 the question in dispute as to the obligation of Great Britain to return the slaves which she had in her possession at the time of the signature of the Treaty of Ghent was referred to the Emperor of Russia who in 1822 decided that Great Britain had not complied with the Treaty of Ghent, and that she should pay to the United States an indemnity. The mixed commission which was selected to fix the amount of compensation finally agreed, on most points, but adjourned in 1827, its functions having been ended by the ratification of a convention concluded at London in 1826 by which the United States received $1,204,906.

A convention at London in 1853 provided for a claims commission which ended its sessions in 1855, after giving important decisions regarding fishery rights, and rendering awards in the famous McLeod and Creole cases. The reciprocity treaty of 1854 provided a commission to adjust disputes regarding fishermen which might arise under the treaty, but no resort was made to the stipulation. In 1855, a commission was organized to determine the reciprocal reserved fisheries rights, under the reciprocity treaty, which had renewed the privileges renounced by the United States in the convention of 1818 as to in-shore places. The work was concluded in 1866.

In 1857 commissioners were appointed to determine the boundary under the treaty of 1846, there having been a disagreement in regard to the San Juan water boundary — as to the middle of the channel separating Vancouvers Island from the continent. They held six informal meetings in 1857 and finally disagreed. Discussion of the boundary continued until the Civil War, and was resumed in 1866. The Senate failed to vote upon the convention of 1869 for the submission of the question to the arbitration of the President of the Swiss Confederation. Under the treaty of 1863 commissioners were appointed to settle the claims of the Hudson's Bay Company (q.v.) and the Puget Sound Agricultural Company arising under the Oregon treaty of 1846. In 1869 they awarded $450,000 and $200,000, respectively, to the companies, which in turn executed deeds relinquishing all claims.

The greatest arbitration treaty was that of Washington (1871) which provided for four distinct arbitrations: (1) The question of the San Juan water boundary was referred to the Emperor of Germany who in 1872 rendered an award in favor of the American claim to the Haro channel. (The boundary was fixed by protocol in 1873.) (2) The American claims for losses from Confederate cruisers of British origin (Alabama claims, q.v.) were referred to the Geneva tribunal, which in 1872 awarded $15,500,000 to the United States. (3) The claims and counter-claims growing out of the Civil War (outside of the cruiser claims) was referred to a mixed commission which in 1873 awarded Great Britain $1,929,819. (4) The

claims for American use of the northeastern fisheries (of Nova Scotia) were referred to a commission of three persons which met at Halifax in 1877 and awarded $5,500,000 to Great Britain.

Under a treaty of 1892, a commission was created to settle the Bering Sea controversy (q.v.) as to sealing. It met at Paris in 1893 and decided that the United States can claim no exclusive rights in sealing in Bering Sea except within three miles of the coast of her territory, though it favored the American plea for the necessity of regulating pelagic sealing. Under the decision of this commission, there was created a new commission (1896) which awarded $471,151 to the Canadian sealers whose vessels had been seized. In 1897 the question of the boundary between Alaska and the British possessions was submitted to a board of arbitration. After considerable delay, the arbitrators met at London (1903) and decided the main points in favor of the American contentions.

There have been two important Anglo-American cases in which a third party was involved: (1) Under a convention of 1889 between the United States, Great Britain and Germany, to settle conflicting interests in the Samoan Islands (q.v.), the nomination of the chief justice of the Islands was to be referred to the King of Sweden in case the three powers could not agree. In 1899, a joint high commission, which was sent to investigate the complications which had arisen, decided that a partition of the Islands between the United States and Germany was the best solution of the problem. An agreement for partition was signed at Washington in December of the following year. (2) In 1890 the United States, Great Britain and Portugal agreed to submit to three eminent jurists, to be selected by the President of Switzerland, the settlement of a dispute caused by the seizure and the annulment of the charter (by Portugal) of the Delagoa Bay Railway, which had been constructed under a concession to an American.

Among the more important arbitrations with other nations are the following:

With Spain: A commission, under article 21 of the treaty of 1795 with Spain provided for a commission which met at Philadelphia in 1797–9 and awarded $325,440 to the United States for depredations on American commerce before 1794. To settle spoilation claims arising after 1795 a commission was appointed in 1802, but the provision governing it were rejected by the United States. Diplomatic relations which were suspended in 1805 were resumed at the close of the Napoleonic wars and resulted in the Treaty of Florida, in 1819, by which all claims were adjusted. In 1870, on the suggestion of Secretary Fish, the case of the Colonel Lloyd Aspinwall, an American vessel seized near Cuba by the Spanish authorities, was submitted to a board of arbitration which met at New York in the same year and awarded $19,702 to the United States. By an agreement of 1871 a mixed commission was created to adjust claims resulting from the Cuban insurrection. It met at Washington and concluded its labors by February 1883. In 1885 the question of damages for wrongful seizure and detention of the American bark Masonic was referred to Baron Blanc, the Italian minister at Madrid.

With France: The United States and France have not succeeded well in settling their disputes by arbitration. In 1800 they agreed upon a convention for settling disputed claims for depredations after 1788. France did not carry out faithfully her part of the agreement, but in 1803 she concluded another convention providing a commission and the payment of claims. Subsequent depredations produced new claims which France delayed to pay. In 1831 these claims and French counter-claims were adjusted by a commission which awarded the United States an indemnity of $5,558,108. The delay of France in paying led to a rupture of diplomatic relations, but through the mediation of Great Britain in 1836 the claims were paid. In 1880 a board was created to adjust the claims growing out of the Mexican troubles of 1862–7, the American Civil War and the Franco-German war (q.v.). It completed its work in 1884, and awarded $612,000 to France.

With Mexico: By the treaty of 1839 with Mexico, the adjustment of miscellaneous claims was submitted to a mixed commission, composed of two Mexican commissioners and an umpire (a citizen of Prussia). In the treaty of 1848 the United States and Mexico agreed to submit all disputes to arbitration, and in 1868 they provided for the settlement of all claims after 1848 by a joint commission which held its first meeting in 1869 and finally completed its work in 1876. The award was in favor of the United States ($4,125,622 in favor of citizens of the United States and $150,498 in favor of citizens of Mexico), but Mexico delayed final settlement, claiming that the award was unjust. Under the convention of 1889 (and in harmony with the arbitral boundary stipulations of the treaties of 1828, 1853 and 1882) a permanent board, called the International Boundary Commission, was established to determine questions arising from changes in the course of Rio Grande and the Colorado rivers along the boundary between the United States and Mexico.

With Venezuela: In 1866 a mixed commission was created to settle American claims against Venezuela. In 1868, it awarded $1,253,310 to the United States. Fraud being charged, the claims were finally (1885) submitted to a second commission which in 1890 awarded $980,572 to the United States. Another claims case with Venezuela was that of the Venezuela Steam Navigation Company in 1892.

Among other cases that have been arbitrated are the following: Claims for the brig General Armstrong in 1851 (with Portugal); Panama riot claims, in 1857–62 (with New Granada); claims for the brig Macedonia, 1858–63 (with Chili); claims for the United States and Paraguay Navigation Company, 1859 (with Paraguay); claims against Costa Rica, in 1860; claims against Ecuador, in 1862; Columbian claims of 1861 and of 1864; Peruvian claims, 1863 and 1868–9; claims for the steamer Montijo 1874 (with Columbia); Pelletier and Lazare claims, 1884 (with Hayti); Bokkelen claims, 1888 (with Hayti); the Carlos Butterfield claims, 1888 (with Denmark); Chilean claims, 1892–4; the Santos claims, 1893–6 (with Ecuador).

In addition to submitting its own cases to arbitration, the United States through its officials (the President and diplomatic representatives) has acted as arbitrator in several cases. She has acted as mediator in numerous cases, the

most important being to secure an armistice between Spain and the several trans-Andean South American countries in 1871, and in adjusting a long standing boundary dispute between Chili and the Argentine Republic in 1881. Her government has often created tribunals, under the own statutes, to execute conventional obligations and to settle questions of international relations.

There have been many memorials and petitions presented to Congress on the subject of international arbitration. In 1874 a resolution in favor of general arbitration was passed by the House. In 1888 the President and Congress received a communication signed by 233 members of the British Parliament urging the negotiation of an arbitration treaty. In 1883 Switzerland proposed to the United States the inauguration of international treaties providing for arbitration. The President of the United States assented to the proposal. In 1890, the Senate (the House concurring) adopted a resolution in favor of arbitration. Negotiation between the United States and Great Britain for a general and permanent treaty of arbitration soon followed, and in 1897 a treaty was concluded and sent to the Senate by President Cleveland. President McKinley also urged its ratification, but it failed to get the necessary two thirds vote. The United States is a party to the Hague convention adopted at the Hague Peace Conference, 29 July 1899. See also ARBITRATION; INTERNATIONAL LAW; DIPLOMACY; TREATIES.

Professor of History, West Virginia University.

56. United States — Growth and Development of Law in the. The history of law, or of the relations of the members of society to each other and of all to the state, is a history of organic growth. Upon it the various phases of political, social and economic activities of a people have left indelible traces. The history of American law is from the beginning somewhat complex, but it represents the development of legal principles in the feeble and scattered colonies of the 17th century into the diversified yet systematic body of law in force to-day in a nation whose inhabitants differ in their various needs as widely as they are distributed geographically. The heterogeneous character of administration in the various colonies, the organic change from British colonies to independent states, the welding of the separate states into a national union, the taking-over of certain legal powers and duties by the Federal government under the Constitution and the consequent growth of a federal jurisprudence, partly opposed and partly complemental to that of the states, the addition of new territories by conquest and purchase, each in turn becoming states under the Constitution,—all these have been factors in producing the differentiated body known as American jurisprudence. In order to understand the development of American law, its history may be divided roughly into four periods: (1) The period of settlement, extending through the 17th century; (2) The period of organization, covering the 18th century to the Revolution; (3) The period of extension, from the Revolution to about 1850; and (4) The period of modern law and procedure from about 1850 to the present time.

The Period of Settlement. (1607–1700).— The year of the settlement at Jamestown, Va., was also the year of Calvin's case (7 Coke's Reports, 17), which upon a state of facts quite disconnected with colonial matters laid down the theory of the English courts as to the position of dependencies. This was that English statutes did not bind dependencies, as parcels of the realm in tenure, unless they were specially named. At a later time in the cases of Blankard vs. Galdy (2 Salk. 411) and Campbell vs. Hall (1 Cowper 204) this principle was more elaborately developed, and Blackstone lent to it the weight of his authority. That English subjects going to a new and uninhabited country carried with them, as their birthright, the laws of England existing at the time of colonization, was a supplemental corollary of the former principle. While such was the theory accepted by English courts, it does not follow that during the colonial period it was adopted in its entirety by the colonists themselves.

The English settlements in America varied so much in their origin and spirit that at first no general legal principles were consciously adopted. The early London Company which exploited Virginia had few purposes in common with the Puritans who aimed at a theocratic form of government in Massachusetts. Their different aims were apparent in the laws adopted for the regulation of the colonies. Nowhere were trained lawyers to be found among the early settlers, and the profession of law was not only held in no esteem, but the lawyer was for a long time denied the privilege of practising for hire. This distrust of the legal profession was under the circumstances not unnatural. The common law of England in the early 17th century had become harsh in its methods, rigorous in its procedure and technical in its practice. It was founded upon precedents which grew out of old social and religious conditions with which the emigrants not only had little sympathy but from which they had also sought to escape. The settlement of hitherto unoccupied territories made necessary a new order of things in which were erected new institutions fitted for a scattered population, a rude society and a simple economic system. All of the colonists had, however, as a part of their English birthright and inheritance, certain deeply-rooted traditions which included a knowledge of and reverence for the great principles of the English common law, which assured the fundamental rights of person and property. Familiar with representative government, they brought with them belief in the adequacy of statutes as a means of bringing law into conformity with the needs of society. Moreover, some notion of the orderly arrangement of statutes into codes was not wanting to the settlers. At the beginning, therefore, dependence was placed upon statute law to the exclusion of judge-made law. Such dependence is to be explained by the new conditions in which the colonists were placed, their distance from the mother-country and the absence of trained lawyers.

The radical differences in the character of the colonists were reflected in their statutory enactments. The theocracy of Massachusetts found expression in the Body of Liberties (1636) in which the Mosaic code was adopted. The Connecticut code (1643) was similar. The early code of Virginia (1612) was exceedingly severe and it was modified soon after the colony had its own legislative assembly. The commercial spirit of the colony's promoters asserted itself in the laws which aimed at the economic regulation of the colony. While the criminal codes, judged by the standards of the present, seem harsh, yet in comparison with the criminal law of England, they were mild, for while the laws of Connecticut specified 12 crimes for which the death penalty was provided, there were 200 offenses punishable by death under the English law. No other colony introduced a system of codes so all-embracing and modern in spirit as did Pennsylvania, which by its frame of government and fundamental laws embodied the opinions of the most enlightened statesmen of the time with the modifications which experience had found necessary. In Maryland, owing to the continued disagreement between the proprietors and the people, no formal code of laws was in force. The colonists accordingly claimed that they were governed by the common law of England in so far as it was applicable to the local conditions existing. The proprietor opposed this claim as in derogation of his rights and the controversy was not settled until well into the 18th century.

The almost universal adoption of codes which restated legal principles remained to be put in force by the colonial courts. The constitution of these courts was as various as was that of the colonies. Everywhere the trial courts were presided over by men untrained in the law; the procedure was of the most informal kind. Whether, as in Virginia, the county court consisted of eight or ten gentlemen holding commissions from the governor, or as in Rhode Island, where the judges were elected annually by the people, there was little chance for a systematic declaration of the law based upon precedent. It is the universally accepted theory of American jurisprudence that the colonists brought with them such parts of the unwritten common law of England as was suited *mutatis mutandis* to the conditions of colonial life. Where the colonial codes were silent, however, the early colonial judges did not consciously draw upon English precedents for their decisions. Knowing little and caring less for the technicalities of the law and having no lawbooks, they decided cases not covered by the codes according to the rules of substantial justice as between man and man, taking as in Massachusetts (1646) "the words of eternal righteousness and truth as the rule by which all kingdoms and jurisdictions must render account," or, as in Virginia (1631) "doing equal right to poor and to rich after their cunning, wit and power and after the laws and customs of the colony and as near as may be after the laws of England." While the systems of grand and petit juries were everywhere to be found, their powers differed from their English originals; the respective provinces of the court and petit jury were not clearly defined. Contrary to the English practice, evidence was frequently submitted in writing; pleading was according to no rule, and while the terminology of the common law was used, the precise meanings of legal phrases were overlooked. Peculiarly English provisions were modified or abrogated. The theory of feudal tenures was abolished save in those colonies, as in Maryland, where the proprietary system prevailed. Primogeniture had no existence in Massachusetts, Connecticut or Delaware and the eldest son was given a double portion in lieu thereof. Appellate procedure was as informal as was that of the trial courts. Usually the method was by appeal to the governor and council or assembly, not upon reserved questions of law, but by a review of the whole case upon its merits. Appeals beyond the highest authority in the colony to the King in Council were generally and successfully denied by the colonial governments.

In the founding of separate colonies, distinct in character one from another, by resourceful and self-reliant Englishmen were the beginnings of American jurisprudence. The "wise and salutary neglect" of the mother-country did much to make early American law peculiar to itself.

Period of Organization (1700–1776).—During the 18th century and prior to the Revolution, law and procedure tended toward a common type in all the colonies. The causes of such a change from the variant beginnings of the century previous were not only political, but social and economic. Increase of population by immigration, mostly from England, and by natural increase, added wealth, growth of towns and better facilities of inter-communication rendered the crude administration of the earlier period insufficient for colonial needs. The revocation of colonial characters and the organization of crown colonies led the way to greater uniformity of administration. Common grievances started a national feeling. All of these forces aided in creating a common public sentiment which found its expression in law either directly through legislation or indirectly from the bench. During this period were laid the foundations of a later constitutional law. Every inhabitant of a charter colony was interested in the legal proceedings in England concerning the charters, in which were involved definite and fundamental principles of public law. Furthermore, sentiment in these colonies agreed that if a colonial legislature enacted laws not in accordance with the powers granted by charter, the act was void. Familiarity with colonial charters bred a belief in the wisdom of written constitutions; and the practice of declaring void all legislative enactments in conflict with charter powers assisted in building up the later theory of constitutional legislation, state and federal.

As a part of the political education of the period was the growing conviction, long held in Maryland, that the common law of England, modified in certain matters by parliamentary enactments, was the supreme law; that it was one and the same for each colony and that by means of it every one was guaranteed in his rights as an Englishman. Appeals to England, which at an earlier time had been discouraged, were now a matter of right, so that if a colonial court failed to declare the law in accordance with the common

law, an English court of appeal had jurisdiction to remedy the error. As the judges in the crown colonies were appointed during good behavior and tended therefore to hold to prerogative, their decisions in matters of public right were apt to be unpopular.

The appearance of trained lawyers and the removal of the ban placed upon the legal profession had much to do with the change in procedure. Local prejudices and slip-shod methods of practice gave way before a regulated system based upon the common law. Not until the second half of the 18th century, however, was the American lawyer a person of great public influence. The generation which stood for political independence and furnished men of affairs was one of lawyers. English lawbooks and reports were imported. Procedure was copied from that obtaining in the English courts. Pleading according to the rules of the common law as introduced with all the old technicalities.

Holding by commission from the crown, the colonial governor assumed to a greater or less extent the functions of a chancellor and gave relief in equity. As the governor derived his chancery powers from the king, recourse to him was never popular. While in England equity had become an independent system under the chancellorship of Lord Hardwicke (1736–56), in the American colonies the chancery courts remained in a rudimentary state. In every colony, however, there was a court having a semblance of chancery powers. Pennsylvania adopted in her early codes a system unique in the history of jurisprudence, in that in the courts of the colony, having both law and equity powers, equitable rights were administered under common law forms.

The period may be characterized as one in which courts were organized as far as possible like those of England, rendering decisions according to the common law, introduced by lawyers and welcomed by the people as a part of their liberties. The uniform character of the common law superseded local custom as far as practicable, while the earlier colonial codes covering many matters of criminal law and necessarily local economic regulations remained in force.

The Period of Extension (1776–1850).— The legal changes entailed by the War of Independence were largely of a constitutional character, a discussion of which is beyond the scope of the present article. The ideas of which the Revolution was the outgrowth, contributed vastly to the development of an American jurisprudence sufficiently distinct from that of England and of the later colonial period as to be a separate system. Speculative writers like Montesquieu exerted an influence which was apparent not only in matters of constitutional organization but also in the habits of thought of the American bar. Of the 56 signers of the Declaration of Independence 35 were lawyers. The American nation began not so much with the promulgation of a revolutionary manifesto as by a declaration of principles of law, the fruit of American legal minds. It is of no little significance that more copies of Blackstone's 'Commentaries,' the first systematic exposition of English law, were sold during the 18th century in America than in England.

Independence brought about a change in the fundamental organization of every state. Each adopted a written constitution or (as in Rhode Island and Connecticut) continued in force its colonial charter as a sufficient declaration of constitutional matters, and in each it was necessary to construe them. Experience and theory left such construction to the courts and the supreme rule which guided was that of the common law. In every state varying written constitutions construed according to the principles of the common law tended to the formation of fairly uniform ideas of constitutional law. The Federal Constitution provided what the Articles of Confederation had almost completely lacked. The courts authorized by the Constitution acquired jurisdiction not only of constitutional questions, disputes between states and admiralty matters, but also, within certain limitations, of cases wherein citizens of different states were parties. Both the Articles of Confederation and the Constitution provided that full faith and credit should be given to the proceedings of a state court by the courts of every other state and an essentially national character was impressed upon American jurisprudence. Thus, while the federal courts had exclusive jurisdiction in certain cases (a power which the decisions of Chief Justice Marshall greatly increased), the division was not as between matters of purely public and those of private law. All the courts, state and national, became necessary and component parts of one symmetrical system, in which there was one approximately uniform mode of procedure, that of the common law of England, consciously adapted to American needs. Judges appointed by popularly elected governors or elected directly by the people, decided questions of law and equity presented by lawyers who had none of the class traditions of the English barrister. The American lawyer was from the first amenable to democratic influences. The requisites for admission to the bar were determined by state laws and not by slavish adherence to the traditions of the Inns of Court. The lawyer knowing no distinction between barrister and attorney, as obtained in England, gave advice to clients and tried their cases himself; he was not a member of a caste but of a more or less democratic society. The position which he assumed was one in which activity in politics was expected as well as accessibility to clients in matters more particularly concerning his profession. The influence of the American bench and bar has generally been to assist in making law to conform to social needs, or, in other words, in the democratization of law.

When the American colonies became independent, each was governed by (1) the common law of England, in so far as each had tacitly or expressly adopted it as suited to local needs; (2) those English statutes which were amendatory of the first; (3) the colonial statutes and (4) such customs as were peculiar to American conditions and incorporated in judicial decisions. In order to give authority to these earlier laws, nearly all of the original thirteen states formally adopted them either by a constitutional provision, as in Delaware (1776) and New York (1777), or by legislative enactment as in Pennsylvania (1777). The method of adopting English statutes was by no means uniform

Vermont recognized the statute laws of England as existing prior to 1760, in so far as they were not repugnant to the constitution and laws of the state. The beginning of the American Revolution (19 April 1775) was the date set in New York, and English statutes locally applicable and enacted prior to that time were declared in force. In Pennsylvania only those English statutes which were admittedly valid during the colonial period were continued. The Virginia convention of 1776 adopted the common law and English statutes of a general nature which had been enacted prior to 1607. This action was taken as a precedent in the first extension of law over territory belonging to the federal government. The United States adopted the language of Virginia and extended the common law under the same limitations to the Northwest Territory. The Ordinance of 1787 was the foundation of the jurisprudence of the states carved out of federal territory. In Michigan, while the English statutes were afterward expressly repealed, the substance of them was re-enacted and to prevent any confusion as to what system of law existed, the old *Coutume de Paris,* once in force when Michigan was a French possession, was declared abrogated. In Louisiana a different policy was followed. The Territory of Orleans, afterward the State of Louisiana, formed the most populous portion of the Louisiana Purchase. French in spirit and tradition, its institutions had been developed according to French ideas modified somewhat by Spanish influence. The civil law of France and Spain was continued in force. Thanks largely to the influence of the code prepared by Edward Livingston, who had in turn been influenced by Bentham, Louisiana is the only state of the Union whose jurisprudence is not based upon the common law. In the other states of the old Louisiana Purchase, the common law was adopted, as was proper according to the theory of the extension of law over territories hitherto uninhabited. In all the western states, formed out of territory originally Mexican, the practice was the same and in all of them the common law is presumed to exist. While common law powers were given to the courts in their entirety, in no State was there created an equity court having the full and complete jurisdiction which such a court had in England. Chancery courts, when created by legislative enactment, have had their powers conditioned and circumscribed by the law creating them.

The Period of Modern Law and Procedure (1850 to the present).— The theory of American government is that the state and the people are one. In nothing has this theory produced more definite results than in law. This is true not only in positive legislative enactments made by the people's representative but in the indirect legislation of the bench, formulated by judges, the servants of the people. While it is the function of a judge to declare and not to make law, he may be a potent factor in bending old law to new needs. The irresistible tendency toward universal suffrage and the enormous increase in population which characterized the middle of the 19th century, at once left marks upon law and procedure. The states of the middle west, which drew a large share of their inhabitants from Europe, entered upon an era of constitution-making. In these new expressions of fundamental rights, the middle states put aside traditions, according to which their first constitutions had been framed, and built upon a democratic basis. The statutes, which up to that time were of comparatively small bulk, were revised and put into codes. Some states (for example, Ohio, Indiana, and Iowa) abolished all common law offenses and rebuilt their systems of criminal law upon a statutory basis. Impatience was felt at the technical methods which the courts had used and the adoption of the Reformed Procedure was the expression of this dislike.

In 1848 David Dudley Field, an eminent lawyer of New York, succeeded in having the legislature of that State adopt a code of civil procedure which effectually broke away from all tradition and aimed at the simplifying of civil pleading and practice by the abolition of all distinctions between actions at law and in equity. According to the reformed theory, there is but one form of action, based upon a complaint containing a simple statement of the facts constituting the grievance for which redress is asked in a judgment settling the rights, whether legal or equitable, of all the parties to the action. This theory was well calculated to appeal to the imagination of democratic commonwealths; one after another state adopted the New York plan as a whole or in part, and the Reformed Procedure is now in force in all but a few of the states. This system was, so far as pleading was concerned, an entirely new idea; it was neither a modification of the common-law method nor an adaptation of the various forms of equity pleadings. The code furnished its own rules for the construction of pleadings upon its own peculiar principles. Whether or not the Reformed Procedure as in force in many states has resulted in simplicity is a question for legitimate difference of opinion. In some jurisdictions the constant tinkering with the laws of practice and procedure by the legislature has rendered that branch of the law so uncertain that probably more than one half of the questions of law presented to courts of appeal are upon questions of trial or appellate procedure.

The second half of the 19th century was marked by stupendous development in industrial enterprise. Steam and electricity revolutionized the forces of production and distribution, and necessitated the employment of vast combinations of capital. Substantive law, as expressed in statute and decision, has tried to follow as closely as possible this industrial and commercial evolution. Contracts, once a small part of the body of law, now occupy a position once undreamt of. Insistence upon the form of a contract has given way to reasonable interpretation of its matter, viewed according to the changing conditions of commerce and trade. Corporations, once created only by the express favor of a sovereign, were given a new character such as modern society and its industrial enterprises demanded. But two hundred private corporations were organized in the United States prior to 1800, and of these a dozen only were designed to engage in manufacturing. Capitalistic production with its consequences created anew the purpose and idea of a private corporation. Individuals, none of whom had at command sufficient capital to

float a large enterprise, joined their funds and in their associated capacity received as a matter of right a charter from the state. The charter, the powers of which were limited by the law of its authorization, at first special and afterward general, gave the corporation a personality having certain rights. As a consideration for these rights, the corporation assumed certain statutory burdens and regulations. Unless by the express or implied authority of its charter, a corporation cannot engage in business outside of the jurisdiction creating it. In other states it is a foreign corporation. As such, the other states may stipulate the conditions under which it may enter to do business. Here the Federal Constitution steps in. Under it Congress has the power to prescribe rules for the regulation of inter-state commerce. The organization of railway systems extending through several states and the increase in production of large manufacturing corporations, selling their output in many states, have given opportunities for national legislation. The diverse citizenship of corporations and the large interests represented by them have brought a constantly increasing number of cases into the federal courts. Thus the American law of corporations, a compound of national and state legislation and of federal and local decisions, is of increasing bulk and variety and no subject of the law has grown into greater importance, save perhaps the division of purely constitutional law, affecting personal rights.

For nearly two centuries and a half after the English colonies were planted in America, American jurisprudence changed gradually, keeping in harmony with the political and social conditions of the colonies and states. Then with a great wave of immigration and far-reaching industrial changes and the occpuation of a continent from ocean to ocean, American jurisprudence set itself to meet the needs of a modern and complex society. The result has been an enormous product of legislation and a much bulkier output of decisions from the federal and state courts. A system of law, to be sound, must have an orderly development; it must be progressive and not revolutionary. Many of the changes which have taken place in America have likewise been adopted in England and for the same reason as in this country. Since 1875 the English procedure has been similar to the American. Both the English and American systems of jurisprudence are, therefore, parts of one great system, based upon the common law of England and built to satisfy the requirements of a modern commercial and industrial society, wherein personal freedom has the greatest possible play. Its idea of personal right is its heritage from the common law. See also various articles under Law.

57. United States — Intellectual Development of. If we search through history for the original forces from which all modern intellectual development seems to have proceeded, we undoubtedly trace these influences to Greece and Rome; but we find that there was, from the first, one essential difference between the two nations. Cicero, the greatest of Romans, points out that poets came late to Rome, but orators early. This is equally true of the United States of America as compared with European states, for Americans surprised older nations by developing statesmanship and oratory before a literature, in any proper sense, was born. There had been, here and there, in this country, detached fragments which might pass for literature, single sayings, fine passages, brief descriptions; but scarcely any purely original literary work had been done in any systematic way, at least none now much sought by the reader. Samuel Sewall wrote private diaries which were unconsciously amusing; Madam Sarah Knight wrote narratives of travel which are to this day readable, and were meant to be such. Mather wrote with great quaintness and sometimes with rhythmical beauty in his 'Magnalia.' Freneau wrote poetry, Jonathan Edwards wrote theology, but none of these is now extensively read, not even 'Edwards on the Will'; they are scarcely reprinted. Yet from the very first, the Revolutionary War brought forth an exhibition of statesmanship, in the documents sent forth by Jay, Lee, and Dickinson, which won the respect of the best European critics. Lord Chatham said in the House of Lords on 20 Jan. 1775, "I must declare and avow, that in all my reading and observation — and it has been my favorite study — I have read Thucydides, and have studied and admired the master-states of the world — that for solidity of reasoning, force of sagacity, and wisdom of conclusion, under such a complication of difficult circumstances, no nation or body of men can stand in preference to the general Congress at Philadelphia." Meanwhile, Horace Walpole, the most brilliant English writer of his time, foresaw that the War of Independence had also remoter results to bring with it and had predicted to his friend Mason, two years before the Declaration of Independence, that there would one day be a Thucydides in Boston and an Xenophon in New York.

It must be remembered that the American Revolution took place when English literature as well as American was experiencing an ebb tide. For more than a century, the mother country had produced nothing in any high, imaginative direction; nothing, that is, between the death of Milton in 1674 and the publication of Burns' poems in 1786, and of Coleridge's and Wordsworth's 'Lyrical Ballads,' in 1798. The men of that period in England — as even Johnson, Pope, Addison, DeFoe, Goldsmith, Gibbon, Sterne,— however highly esteemed in their day, were wanting on the ideal side; and the readers of a higher standard were glad to turn away from them all to collections of wayside poetry like

Percy's 'Reliques' and Scott's 'Border Minstrelsy.' Accordingly when Fisher Ames, being laid on the shelf as a statesman, wrote the first really important essay on American literature — an essay first published in 1899, after his death — he treated literature itself as merely one of the ornaments of despotism. He wrote of it, "The time seems to be near, and, perhaps, is already arrived, when poetry, at least poetry of transcendent merit, will be considered among the lost arts. It is a long time since England has produced a first-rate poet. If America has not to boast at all what our parent country boasts no longer, it will not be thought a proof of the deficiency of our genius." Believing as he did, that human freedom could never last long in a democracy, he thought that perhaps when liberty had given place to an emperor, this monarch might desire to see splendor in his court and to occupy his subjects with the cultivation of the sciences. At any rate, he maintained "After some ages we shall have many poor and a few rich, many grossly ignorant, a considerable number learned, and a few eminently learned. Nature, never prodigal of her gifts, will produce some men of genius, who will be admired and imitated." The first part of his prophecy failed, but the latter part fulfilled itself in a manner quite unexpected.

The point which was ignored by Fisher Ames and by the whole Federalist party of his day was that there was already created on this side of the ocean, not merely a new nation but a new temperament. How far this temperament was to arise from a change of climate, and how far from a new political organization, no one could then foresee, nor is its origin yet fully analyzed; but the fact itself is now coming to be more and more recognized. "As I take it, Nature said, some years since,—'Thus far the English is my best race; but we have had Englishmen enough; now for another turning of the globe, and a further novelty. We need something with a little more buoyancy than the Englishman; let us lighten the structure even at some peril in the process. Put in one drop more of nervous fluid and make the American.' With that drop, a new range of promise opened on the human race, and a lighter, finer, more highly organized type of mankind was born." This remark by an American called down the wrath of Matthew Arnold who called it "tall talk" or a species of brag, overlooking the fact that it was written as a physiological caution addressed to this nervous race against overworking its children in school. In reality, it is a point of the greatest importance. If Americans are to be merely duplicate Englishmen the experiment is not so very interesting, but if they are to represent a new human type, the sooner we know it, the better. No one finally did more to recognize this new type than when Matthew Arnold himself wrote afterward ('Nineteenth Century' for September 1887) "Our countrymen [namely, the English,] with a thousand good qualities, are really, perhaps, a good deal wanting in lucidity and flexibility," and again in the same essay, "The whole American nation may be called 'intelligent,' that is, quick." This would seem to yield the whole point between himself and the American writer whom he had criticised.

One of the best indications of this very difference is the way in which American journalists and magazinists are received in England and their English compeers among ourselves. An American author connected with the 'Saint Nicholas Magazine' was told by a London publisher that the plan of the periodical was essentially wrong. "These pages of riddles at the end, for instance," he said, "no child would ever guess them"; and though the American assured him that they were guessed regularly every month in 20,000 families or more, the publisher still shook his head. In the same way, they tell you many stories in London about Englishmen who have called on Mr. Choate or Mr. Depew to express their somewhat tardy appreciation of something very facetious said by them at some dinner-party the night before, but with which the auditor did not fairly grapple at the time. In the same way, Professor Tyndall used to say that whereas in his London lectures he made it a practice to explain each experiment three times,— once before he began to perform it, secondly, while the experiment was going on, and thirdly, after it was all over,— he soon found that in America, he could omit one at least of these elucidations, and when he grew more accustomed to the fact could get on with only one out of the original three. He used, furthermore, to quote the leader of a company of Ethiopian minstrels with whom he took the voyage home from America and who had been accustomed to have his joke begin with the man in the middle of his semi-circle of performers, then to have it continued by one of the end-men, and finally brought to a climax by the other; but who, to his disgust, found every American audience laughing at his joke long before its full announcement was officially made. This quality in Americans, though commonly noticed most in matters of humor, is in reality temperamental in all directions and makes Americans not only better jokers, but better orators, better inventors, and even better business men than their English compeers. In all these different walks the quality is accompanied by possible drawbacks; quickness may end in too much haste, while slowness may imply deliberation and mature conviction. One notices in Parliament in what a hesitating and even bungling way the debaters often begin their remarks, while an average American would slide in far more easily. On the other hand, Americans doubtless find it harder to leave off and may well envy the pungent closing remark with which the Englishman often sits down. As to the element of humor in itself, it used to be the claim of a brilliant New York talker that he dined through three English counties on the strength of the old jokes which he found in the corners of an American 'Farmer's Almanac' which he had happened to put into his trunk.

It is to be doubted how thoroughly the English mind recognized this lighter intellectual element, either in Franklin or in Irving, though both were favorites in that country. But no one can help observing how much more promptly it was appreciated, if vaguely, on the part of Frenchmen. From Brissot and Volney, Chastellux and Crèvecoeur, down to Ampère and De Tocqueville there was an appreciation of this lighter quality which was denied to the English and this certainly seems to indicate that the change in temperament had already begun to show itself. Ampère especially notices what he

calls "*Une veine Européenne*" among the educated classes. Many years after, when Mrs. Frances Anne Kemble, writing in reference to the dramatic stage, pointed out that the theatrical instinct of Americans created in them an affinity for the French in which the English, hating exhibitions of emotion and self display, did not share, she recognized in our nation this tinge of the French temperament, while perhaps, giving an inadequate explanation of it.

It is a curious fact that this lighter element in the American, though visible even under the veil of Puritanism — as, for instance, where Samuel Sewall dwells so dotingly upon his long series of successive courtships — and still more apparent in the early southern writers, as in William Byrd, yet seemed to disappear during the period of the Revolution. Franklin, Adams, and Fisher Ames alone showed it among the grave orators of the Revolution, and so strong an impression was left by this that the kindly French observer, Philarète Chasles, made it a definite assertion in his *Etudes sur la Littérature et les Mœurs des Anglo-Americans* (Paris 1851) that all America did not even then possess a humorist ("Toute l'Amérique ne possède pas un humoriste," p. 339). He did not even recognize humor in Washington Irving, but regarded him only as a literary follower of Pope and Addison, while finding much charm in him and calling him the Wouvermans of American Literature. Beyond this, he could find no humorist, although already there was a boy of 16 on a Mississippi steamboat who was to take the lead among the humorists of the world, under the name of Mark Twain.

The literary development in the United States of America followed very closely on the organization of its government and its first headquarters lay for that reason in Philadelphia. The First Continental Congress met there, the Declaration of Independence went forth thence in 1776, and the Federal Constitution was put in shape there in 1787. All these were successive steps in the intellectual development of America, but construing the phrase more strictly, we also find that Philadelphia produced the first monthly magazine, the first daily newspaper, the first religious magazine, the first religious weekly, the first penny paper or illustrated comic paper or juvenile magazine or mathematical journal ever published in the United States. We also notice that the city produced or, at least, adopted and reared the first American writer of international reputation in Benjamin Franklin, and the first imaginative writer, or indeed, professional writer of any kind, in Charles Brockden Brown, the novelist. Franklin's personal history and also his innate humor were all identified with the nation's records; while Charles Brockden Brown's novels, although they were read and quoted in England and indeed perceptibly influenced the Godwin and Shelley group of writers, are now universally pronounced to be hard to read and, though reprinted, are treated rather as historic monuments than as sources of pleasure. Still another remarkable memorial was Dennie's 'Portfolio,' a magazine whose editor, like Franklin, had migrated from Boston, although he was unlike Franklin a Harvard graduate. Dennie kept his magazine singularly in touch with the advanced literary training just taking place in England, quoted early poems by Coleridge, Wordsworth, and Leigh Hunt, and although he derided the new German literature, it was in the Kotzebue period, a period when there was hardly anything better to quote. His paper was in these respects the high-water mark of the Philadelphia culture of that day, while the low-water mark in that society must be judged from the fact that new books could there, as in the rest of the new commonwealths, be published only by subscription and scarcely ever as now, at the risk of book sellers; and also by the fact that the Loganian Library, the pioneer of all American libraries, was then opened only in the afternoon, when it became a sort of fashionable lounge.

The new government, ere long, removed itself to New York, where the American Republic was finally organized in 1789 and the first strictly original school of authors took the name of Knickerbocker School, and was organized or at least drawn together by Washington Irving and his friends. Diedrich Knickerbocker was the first imaginative creation in the history of our country and furnished very distinctly the opening of a notable career, soon temporarily transferred to the other hemisphere. Irving's later books were of a higher grade and, although he spent a large part of his life in Europe, he was essentially an American at heart. He worked in many fields and was only slightly and incidentally tempted into fiction. This field was first preoccupied in America by two or three women, such as Mrs. Foster and Mrs. Rowson, whose highly wrought and quite tragic books such as the 'Coquette' and 'Charlotte Temple' went through many editions and were translated into various languages. Cooper then came upon the field and surpassed all others in the popularity of his works into which he introduced, for the first time, certain really American types, such as Leatherstocking, the woodsman; Long Tom Coffin, the sailor; and Chingachgook, the Indian. He had obvious faults which he shared with his contemporary English rival, Sir Walter Scott, faults including unreasonably long first chapters and very loose-jointed plots. But he won without effort a wider international audience than has yet been secured by any other American writer, except Longfellow and Mrs. Stowe, each of these three reaching the limit of 30 or thereabouts in the variety of languages into which their books have been translated. No one can look over the catalogues of foreign book stores without seeing how remarkably this popularity has held its own, in the case of Cooper. Bryant, who is claimed with New York authors, belongs rather to Massachusetts where he was born and bred and where he drew from classic rural influences, even in his early youth, that high and delicate vein which seemed curiously inconsistent with his life as a hard-working journalist.

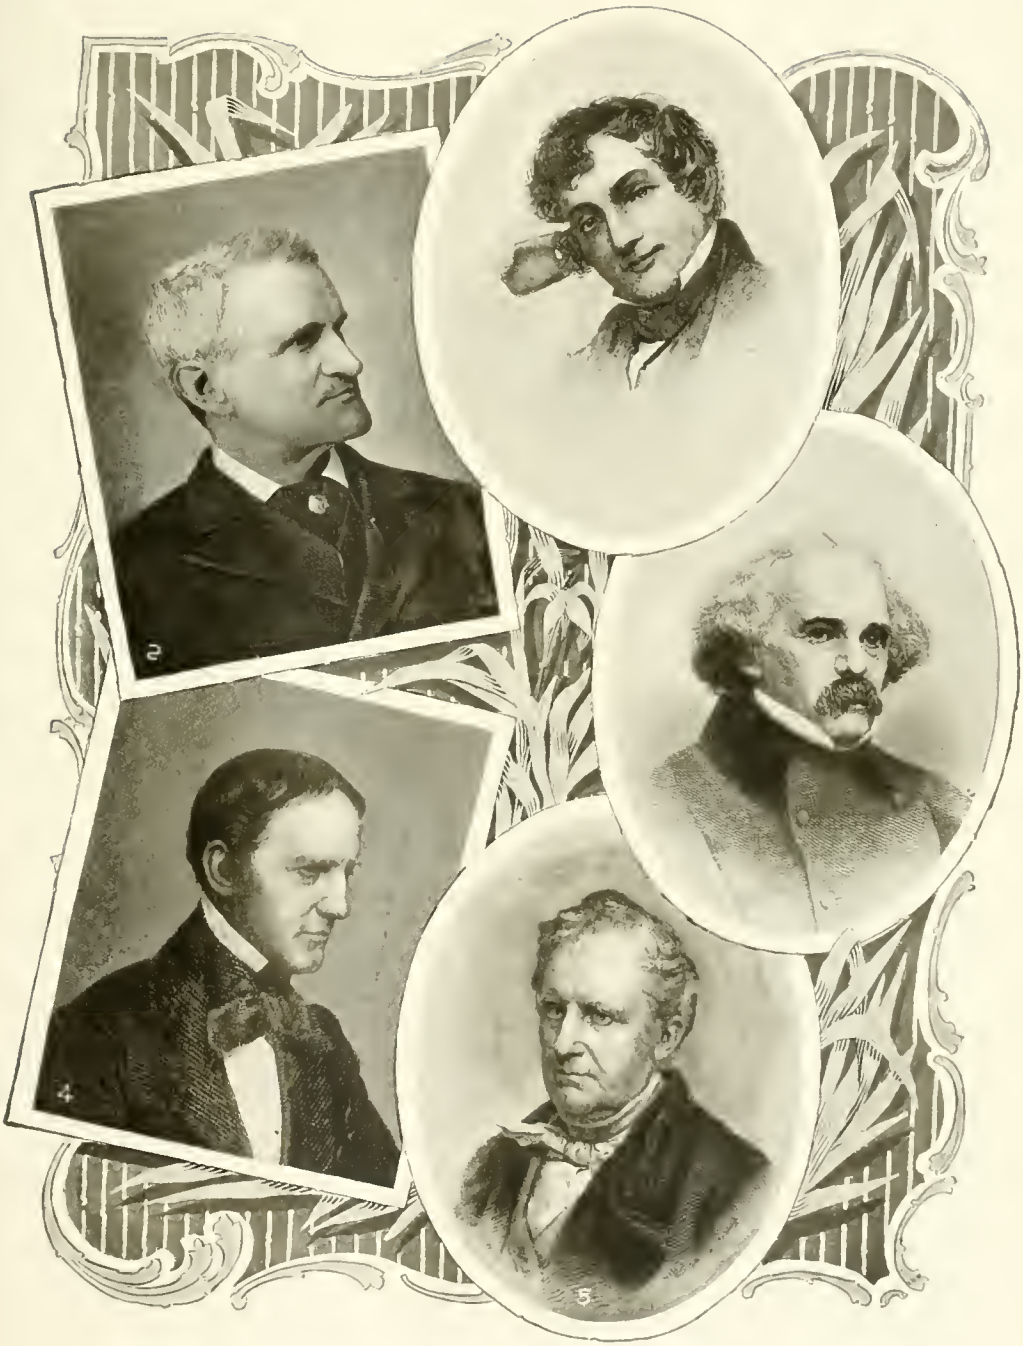
After the Philadelphia and New York periods, there came a marked outburst of intellectual activity which made Boston, instead of New York or Philadelphia, the temporary centre of American literary life. Such a group of authors as Channing, Emerson, Holmes, Longfellow, Lowell, Whittier, Thoreau, Parkman, and others had never before met in America. With these was developed a lecture system which spread itself all over the country, though the leading lecturers in almost all cases were, at first, from

the Atlantic shore. Most of these men found in the lecture field a temporary fame to which no permanent literary fame responded and the names of even the leading lecturers such as Gough, Chapin, Curtis, Whipple, Holland, and lesser men are now beginning to fade into oblivion. To them was to be added the strong force of Abolitionists, headed by Wendell Phillips and Frederick Douglass, whose remarkable powers drew to their audiences many who did not agree with them. Women like Lucretia Mott, Anna Dickinson, and Lucy Stone also joined the force. These lectures were a source of popular education; they were subject, however, to the limitation of being more suggestive than instructive, because they always came in a detached way and so did not favor coherent thinking. The much larger influence now exerted by courses of lectures in the leading cities does more to strengthen the habit of consecutive thought, and such courses, joined with the great improvement in public schools, are assisting much in the progress of public education. The leader who most distinguished himself in this last direction was, doubtless, Horace Mann. The influence of American colleges which are, in the older States, steadily maturing into universities, has made itself more and more obvious, especially as they have with startling suddenness and comprehensiveness extended themselves to women also, whether in the form of co-education or of institutions for women only. For many years, the higher training of Americans was obtained almost entirely by periods of study in Europe, especially in Germany. Men, of whom Everett, Ticknor, Cogswell, and Bancroft, were among the pioneers, beginning in 1818 or thereabouts, discovered that Germany and not England must be made our national model in this higher training; and this discovery was strengthened by the number of German refugees, highly educated men, who sought this country for political safety. The influence of German literature on the American mind was undoubtedly at its highest point half a century ago, and the passing away of the great group of German authors then visible was even more striking than have been the corresponding changes in England and America; but the leadership of Germany in scientific thought and invention has kept on increasing so that the mental tie between that nation and our own was perhaps never stronger than now.

In respect to literature, the great tendency to fiction everywhere visible has nowhere been more marked than in America. Since the days of Cooper and Mrs. Stowe, the recognized leader in this department has been Howells; that is, if we base leadership on higher standards than that of merely numerical comparison. The actual sale of copies in this department of literature has been greater in certain cases than the world has before seen, but it has rarely occurred that books thus copiously multiplied have taken very high stand in more deliberate criticism. In some cases, as in those of Bret Harte, an author has won fame in early life by the creation of a few remarkable characters, and has then gone on reproducing them without visible progress; and this is especially apt to be the case wherever British criticism comes in, this being naturally more impressed by a few interesting novelties than by anything deeper in the way of local coloring or the delineation, however profound, of what goes on daily in the world. In the case of Howells, the work has ultimately suffered, not from any outward conditions, but from the tendency of certain temperaments, like certain eyes, toward demanding more microscopic work as they grow older, so that they end in laboriously analyzing and painting the little, instead of grasping the large. Both the public taste and the more fastidious criticism seem to unite in preferring this author's earlier fiction to his later productions, although he has not gone so far in waywardness as his earlier champion, Mr. James; and it is to be noticed also that both these authors retain the power of disarming criticism, from time to time, by remarkable single efforts.

Meanwhile Mr. Crawford, without residing in America, keeps up his work, laying the scene in Italian life; and we have at home authors like Hamlin Garland, H. B. Fuller, Owen Wister, Winston Churchill, who may at any moment surprise us by doing something better than their very best. The same remark might yet more emphatically be made of Frank Norris and Stephen Crane, had not their period of work on earth prematurely ended. In calling over the names of these later American writers, it is quite worth noticing that leadership has not come to those who had been the greatest wanderers over the earth, but to those who led their lives, formed their style, and established their standards at home. The most cosmopolitan American writers of the last generation were probably Willis and Bayard Taylor, but their fame has proved, or is proving, insecure. On the other hand, the American names which one sees oftenest mentioned in European books — Emerson, Thoreau, Poe, Whitman — are those of authors who never visited Europe or under such circumstances as to mold but a trivial part of their career. We must always remember, moreover, what is true especially in works of fiction, that not only individual books, but whole schools of them emerge and disappear, like the flash of a revolving light; you must make the most of it while you have it. "The highways of literature are spread over," said Holmes, "with the shells of dead novels, each of which has been swallowed at a mouthful by the public, and is done with."

It was once wisely said that there never yet was a great migration which did not result in a new form of national genius. When, as in the case of America, the transplantation of a race brought men and women into a new atmosphere beneath a new sky, this result was necessarily more apparent. He who lands from Europe on our shores perceives a difference in the sky above his head, the height seems greater, the zenith father off, the horizon wall steeper. With this result on the one side, and the vast and constant mixture of races, on the other, there must inevitably be a change. No portion of our immigrant body desires to retain its national language; all races wish their children to learn the English language as soon as possible, yet no imported race wishes its children to take the British race, as such, for models. Our new-comers unconsciously say with that keen thinker, David Wasson, "The Englishman is undoubtedly a wholesome figure to the mental eye; but will not 20,000,000 copies of him do, for the present?" The Englishman's strong point is his vigorous insularity; that of the



1. Washington Irving. 2. Francis Parkman. 3. Nathaniel Hawthorne.
4. William H. Prescott. 5. J. Fenimore Cooper.

American his power of adaptation. Each of these attitudes has its perils. The Englishman stands firmly on his feet, but he who merely does that never advances. The American's disposition is to step forward even at the risk of a fall. Washington Irving, who, as we have seen, seemed at first to an acute French observer a mere reproduction of Pope and Addison, wrote to John Lothrop Motley two years before his own death, "You are properly sensible of the high calling of the American press — that rising tribunal before which the whole world is to be summoned, its history to be revised and rewritten, and the judgment of past ages to be cancelled or confirmed." For one who can look back 60 years to a time when the best literary periodical in America was called 'The Albion,' it is difficult to realize how the intellectual conditions of the two nations are changed. In many things which require thorough workmanship, England still remains the more thoroughly organized, as, for instance, in its roads and in its postal system, while in all that concerns the future conditions of a great continent, American enterprise is taking the lead. M. D. Conway once pointed out that the English magazines, such as the 'Contemporary Review' and the 'Fortnightly,' were simply circular letters addressed by a few cultivated gentlemen to the fellow members of their respective clubs. Where there is an American periodical, the most striking contribution may proceed from a previously unknown author and may turn out to have been addressed practically to all the world.

So far as the intellectual life of a nation exhibits itself in literature, England may always have one advantage over us — if advantage it be — that of possessing in London a recognized publishing centre, where authors, editors, and publishers are all brought together. In America, the conditions of our early political activity, have supplied us with a series of such centres, in a smaller way, beginning namely with Philadelphia, then changing to New York, then to Boston, and then reverting, in some degree, to New York again. I say "in some degree" because Washington has long been the political centre of the nation and tends more and more to occupy the same central position in respect to science, at least; while western cities, notably Chicago and San Francisco, tend steadily to become centres for the wide regions they represent. Meanwhile the vast activities of journalism; the readiness of communication everywhere; the detached position of colleges and many other influences decentralize literature more and more. Emerson used to say that Europe stretched to the Alleghanies, but this, at least, has been corrected and the national spirit is coming to claim the whole continent for its own. Mr. Howells, whatever his limitations, has at least contributed toward this great change and it has been said of him that his best scenes imply a dialogue between the Atlantic and Pacific slopes.

If there is, at present, in America a tendency to transfer its allegiance to science rather than literature, it is to be remembered that this phenomenon is not local, but general and extends also to all European nations. It was predicted in a manner by that curious atrophy of one side of the mind which took place in the great leader of modern science, Charles Darwin, who took in his youth intense delight in poetry, and read Shakespeare with supreme enjoyment, a kind of enjoyment which also extended to music and to plastic art. At the age of 67, however, he tells us with "great regret" that for many years he cannot endure to read a line of poetry, that Shakespeare nauseates him, and that he has lost almost all taste for pictures and music. There may be no need for this transformation, and it is probably only a swing of the pendulum; but its temporary influx has nowhere been better defined or characterized than by the late Clarence King, formerly director of the United States Geological Survey, who wrote thus a little before his death: "With all its novel modern powers and practical sense, I am forced to admit that the purely scientific brain is miserably mechanical; it seems to have become a splendid sort of self-directed machine, an incredible automaton, grinding on with its analyses or constructions. But for pure sentiment, for all that spontaneous, joyous Greek waywardness of fancy, for the temperature of passion and the subtler thrill of ideality, you might as well look to a wrought-iron derrick."

Whatever charges can be brought against the American people, no one has yet attributed to them any want of self-confidence or self-esteem, and though this trait may be sometimes unattractive, yet the philosophers agree that it is the only path to greatness. "The only nations which ever come to be called historic," says Tolstoi in his 'Anna Karénina,' "are those which recognize the importance and worth of their own institutions." Emerson, putting the thing more tersely, as is his wont, says that "No man can do anything well who does not think that what he does is the centre of the visible universe." The history of the American republic was really the most interesting in the universe from the outset, were it only from the mere fact that however small its scale, it yet showed a self governing people in a sense never before witnessed on the globe; and to this is now added the vaster contemplation of it as a nation of 70,000,000, rapidly growing. If there is no interest in the spectacle of such a nation, laboring with all its might to build up an advanced civilization, then there is nothing interesting on earth. The time will come, when all men will wonder not that Americans attached so much importance to their national development, but that they appreciated it so little. Canon Zincke has computed that in 1980, the English-speaking population of the globe will number, at the present rate of progress, 1,000,000,000, and that of this number 800,000,000 will dwell in the United States. No plans can be too far-seeing, no toils and sacrifices too great in establishing this vast future civilization. Take, for instance, the immense endowments of Mr. Carnegie which fulfill the generalization of the acute author of a late Scotch novel, 'The House with the Green Shutters,' who says that while the Scotchman has all the great essentials for commercial success, "his combinations are rarely Napoleonic until he becomes an American."

When one looks at the apparently uncertain, but really tentative steps taken by the trustees of the Carnegie Institution at Washington, one sees how much must yet lie before us in our provisions for intellectual progress. The growth of our common schools and universities is per-

haps as rapid as is healthy and the number of merely scientific societies is large, but the provision for the publication of works of research and literature is still far too small. The endowment of the Smithsonian Institution now extends most comprehensively over all the vast historical work, now so widely undertaken, and the Carnegie Institute bids fair to provide freely for purely scientific work and the publication of its results. But the far more difficult work of providing for pure literature is as yet hardly attempted. Our boasted magazines tend more and more to become mere picture books and our really creative authors are geographically scattered and, for the most part, poor. Professor Newcomb has just boldly pointed out that we have intellectually grown as a nation "from the high school of our Revolutionary ancestors to the college; from the college stage we have grown to the university stage. Now we have grown to a point where we need something beyond the university." He further suggests the need of an institution at Washington which will not merely encourage scientific research, but plan and organize it in advance. Yet what he aims to do for science is more needed in the walks of pure literature and is there incomparably more difficult, since it has to deal with that more subtle and higher form of mental action which culminates in Shakespeare instead of Newton. This high effort, which the French Academy alone even attempts, however it may fail in accomplishing the enterprise, may at least be kept before us as an ultimate aim in America. See AMERICAN LITERATURE; PERIODICAL LITERATURE.

THOMAS WENTWORTH HIGGINSON,
Author of 'History of the United States.'

58. United States — Economic Development of the. During the colonial period the population of the country was confined to a narrow strip of territory along the Atlantic coast. By the middle of the 18th century the river valleys had been settled, the pioneers had reached the barriers of the Appalachian mountains, and the region beyond this barrier had been penetrated only by a few hardy explorers. After 150 years of settlement the population had increased to 2,500,000 in 1770, of whom the vast majority were engaged in agricultural pursuits. The division of labor between different sections of the country was but slightly developed, and in large measure each family produced on its own land the chief articles of its consumption. Indian corn, an indigenous product, had proved itself the most valuable crop because of the quick returns from newly cleared land and its utility as food for man and feed for cattle. Another indigenous product, tobacco, formed the basis of the earliest export trade, and with rice and indigo and laid the foundation of the economic growth of the Southern Seaboard States. The surplus products of the Northern States as population and production increased, found their chief market in the West Indies, flour and provisions from the Middle States and fish and naval stores from New England. These exports formed the means of payment for the imports of manufactured goods which were drawn chiefly from England. Certain manufactures were carried on at home, but these were almost without exception the cruder forms, furnishing such goods as could not have been imported in any case. Very little change took place in the quarter century following the achievement of independence. Population grew rapidly till it reached over 5,000,000 in 1800, and production increased correspondingly, but it was production along the old lines with little advance in the direction of the new industrial development which was already of importance in England. In the South the cultivation of tobacco, indigo and rice still flourished, but was beginning to give way before the expanding cotton culture which was destined to fix the economic and social character of that region. Slavery had been introduced at an early date, and owed its growth to the economic need for a large labor class, and the adaptability of slave labor to the cultivation of the peculiar products of southern soil. The invention of the cotton gin in 1793 was destined to make cotton the southern staple, and the consequent greatly increased demand for labor was bound to establish slavery on a firm basis for years to come. Cotton cultivation under a system of slave labor could best be carried out on large estates, and the character of the southern gentry also aided to establish the great plantation system of land holding which so markedly distinguished the South from the rest of the country.

In the North small holdings with diversity of agriculture prevailed. Food products were grown both for the home market and for export. The West Indian market still continued to be the most important. The greatest commercial activity was found in New England, where the fishing industry provided an immediate source of export trade, and where the shipping industry and carrying trade were especially stimulated by the opportunities afforded to neutrals during the period of the European wars. Domestic manufactures were in a flourishing condition, but little advance had been made in the introduction of mechanical processes, while the factory system was nearly unknown. There was little to encourage capital to compete with the powerful industries of England, especially while the opportunities for its employment in agriculture and shipping were so attractive. In the meantime, the movement toward the settlement of the West, which was to be a controlling factor in the economic development of the country, had begun. By 1800, about one tenth of the population had moved west of the mountains into western New York and western Virginia, but especially into Kentucky and Tennessee, a movement which began the settlement of the Ohio valley. For the time being, however, this population was practically shut off from close commercial connection with the older settlements. The movement, however, continued rapidly year by year. The situation, then, during the first 20 years after the adoption of the constitution, was that of considerable widespread comfort, leading to rapid increase in population (about 35 per cent to the decade), but with no very marked changes in the line of progress in methods or a more complicated organization of industry.

The War of 1812 marks the beginning of an important change. From this time on, changes of a more radical nature took place, leading to a much greater diversification of industry and a more complicated territorial division of labor.

The causes of this change were the rise of manufactures, the great improvements in transportation methods, and the extension of agriculture in the Middle West and of cotton culture in the new southwestern States. At the same time a national economic policy took shape which aimed to stimulate all of these factors. The practical cessation of foreign trade in the years 1808 and 1809, and again at the time of the war, forced the nation into a more rapid industrial development, which led to the adoption of the factory system and production on a larger scale. The development was so marked that at the close of the war in 1815 the industrial situation was completely changed. Many new industries had been established and a large amount of capital had been invested. The new industries were brought at once into competition with the older industries of Great Britain, and the natural result was a demand for tariff protection. The principle of protection had already been firmly established, but the act of 1816, providing especially for the protection of the new textile industries, marks the beginning of a new and more energetic policy in this direction.

In the meantime the settlement of the Ohio valley continued. Soon after the close of the war the population west of the mountains had reached a total of 2,000,000, the settled area including, besides Kentucky and Tennessee, a large part of Ohio, and the southern parts of Indiana and Illinois. This population was confined largely to the territories immediately adjacent to the important rivers, but constituted, on the whole, a wedge of settlement extending from Lake Erie to the Tennessee on the east, and following roughly the valley of the Ohio westward to its junction with the Mississippi. The extraordinary foreign demand for cotton greatly stimulated the settlement of the Southern States. The total production of cotton in the United States in 1790 was only 1,500,000 pounds. By 1810, however, this was increased to 85,000,000 pounds. Down to this time production had been confined practically to the Atlantic States. In the next decade the cultivation of cotton was rapidly extended, and with it of course the slave system with which it was bound up, until by 1820 the river valleys of Alabama, Louisiana and Mississippi were already well settled. The agricultural states of the West were, however, at this time almost completely separated, for commercial purposes, from the Eastern States, which were rapidly increasing along industrial lines. The traders from the Eastern States were able to carry goods across the mountains and down the valleys, but it was practically impossible for the agricultural products of the West to find a market in the East, because of the tremendous difficulties of transportation. The further development of the West would have been seriously hindered had it not been for the division of labor between the two sections. For the Southwest the all-important product was cotton, and this fact made these States dependent to a large extent on the States of the Ohio valley for corn and provisions, and this furnished a good outlet for the superfluous products which were shut out from the East by the impassibility of the mountains.

The problem of transportation was at this time the most critical economic problem. Except for a few turnpikes in the most thickly settled regions, the roads were in most wretched condition, and from an early date agitation had arisen in favor of public improvement of highways and the establishment of a network of canals to supplement them. The immediate need was to secure such a system as would unite the traffic of the eastern river districts, connect eastern rivers with those west of the mountains, and bring the agricultural regions of the Western States into closer connection with their own natural waterways. For the time being, the chief hope of further material expansion seemed to lie in the rapid development of such a system of canals, and enterprises of considerable moment were undertaken during these years. Such enterprises demanded a far larger capital than could be secured in the home markets and extensive borrowing in England became necessary, which was only possible by the issue of State bonds in support of these internal improvements; and the contributions of the State governments were, in view of the resources of the time, not only large, but, as the result proved, frequently reckless. The most important of the canal undertakings was the construction of the Erie Canal (see CANALS), connecting Lake Erie with the Hudson River, and opened the eastern markets to northern Ohio. But the great body of settlers were still too far south to make connection with this route practicable. Of more importance for these sections was the introduction of steam navigation on the Ohio. The first attempt in this direction was in 1811, but it was not until several years later that steam navigation on the western rivers became commercially important. This great improvement in transportation, combined with the opening of the southwestern market to western products, greatly stimulated the development of this section. Towns along the Ohio and Mississippi flourished as never before. Pittsburg became the distributing centre for merchandise to the west, and New Orleans the great receiving port for western provisions whether for home consumption or export.

Despite the great prosperity of the country as a whole, the different sections could, however, not be bound together into a strong national unit until the three sections, the Southern, the Western, and the North Atlantic States, could be united by closer commercial interests than had hitherto been the case. The most important factor in bringing about these closer relations was the introduction of the railroad. It is not necessary to enlarge upon the great importance of the commercial revolution brought about everywhere in the world by this invention. Several specially important results for the United States, however, are noteworthy. The great extent of territory already settled compared with the total population and capital facilities made further development hang almost entirely upon improvements in transportation. Furthermore, the railroad first made it possible to utilize to the full extent the fertile territory and was a most important influence in causing the settlement of regions lying between and away from the great water-courses. It also solved the problem of the commercial separation of the East and West, and united these two sections of the

country in a way which could never have been possible under a system of canals. From the time that railroads were fully extended into the west to the present, the chief routes of commerce have been east and west rather than north and south. Finally, the railroad in this country has been the chief means of further expansion of the population and the development of commerce in unsettled regions. In the West the rails have frequently been laid first through vast unsettled tracts and the settlers been enabled to enter only because of these new facilities. It is this fact which made possible the development of the trans-Mississippi region. The first railroad to be opened was the Baltimore and Ohio, the first rail of which was laid in 1828. The idea of the road was to unite the sea coast with the Ohio River, but it was not until 1853 that the Ohio was finally reached. In the first 20 years, railroad development was confined chiefly to the Atlantic States, and as formerly in the case of canals, so now extraordinary advances were made by the State governments for the extension of this new form of internal improvements. Some beginnings were made in the forties toward the extension of railroads in the Western States, and this movement became increasingly important down to 1860. In 1850 the total mileage was 9,021 miles and in 1860 30,626.

The period from 1840 to 1860 is the period of the settlement of the Mississippi valley above the corn belt, as the two decades before had been especially marked by the settlement of the southwestern cotton States, and the first two decades of the century by the settlement of the Ohio valley. From 1840 to 1860 the population of Illinois and Indiana more than doubled, and the population of Michigan and Wisconsin increased from 333,000 to 1,500,000, while the west bank of the Mississippi was settled from North to South. Among the important causes tending to this expansion, besides the improved methods of transportation, were, in the first place, improvements in methods of agricultural production, especially the application of a reaper of an improved pattern to farming on a large scale. Important improvements have been made since this period in such machinery, but all the main inventions had been made before 1860 and the reaper had come into general use. The second factor in increasing the rapidity of settlement was the policy of the government regarding the public lands. The early theory regarding government domain was that it should be used as a vast property for fiscal purposes, and the change to a more liberal policy was largely due to the popular demand for land, and showed the growing influence of the West. As early as 1820 the minimum unit of purchase had been reduced to 80 acres, and the price to $1.25 per acre. By 1841 a permanent pre-emption act was passed and the principle firmly established that public lands were to be opened freely to the agricultural settlers, on the ground that the strength of the State would be much more increased by the rapid expansion of a prosperous population than by the utilization of so important a government asset primarily as a source of revenue. This policy was carried to a conclusion by the adoption of the Homestead Act in 1863. The area of improved farm land increased by 50 per cent between 1850 and 1860, and the value of farm property by one hundred per cent. The increase of an industrial population in the Eastern States afforded a constantly expanding market for the new products, while in 1846 the markets of England were thrown open by the repeal of the Corn Laws. This was the beginning of a steady foreign market for American food, but down to the Civil War the exports, save in exceptional years, were not great, and with the exception of cotton and tobacco Europe took, in normal years, a smaller quantity of American products than the non-European countries. At the same time the demand for cotton continued to increase until the cotton belt, by 1860, had spread so far west that Texas already had a population of 600,000, and the production of cotton had increased by that year to 2,200,000,000 pounds, nearly three times the production of 1840. Of this great production 75 per cent still continued to be exported. This continued expansion of cotton culture was the chief cause of the firm establishment of the slave system, and despite its great effects on material prosperity, was the fundamental cause in bringing about the strained situation which seemed likely to cause a political disruption. In the meantime, however, the movement in the West had begun, which was to be of great importance in bringing the West and East together. Gold was discovered in California in 1849, and within ten years the rush of settlers had given a population to that State of 350,000. Had it not been for this settlement, due to the eager search for gold, the region beyond the arable lands would probably have remained an unsettled frontier for a much longer period than was actually the case. The development of a large community on the Pacific slope led to the building of the transcontinental railroads and the elimination of an unsettled area in a surprisingly short time.

The period of the Civil War naturally caused a severe interruption to this continued material progress, and retarded the development of the Southern States immeasurably. On the whole, however, the Northern States came through that struggle with surprisingly slight economic loss, and throughout the struggle increased their population, their area of settlement, and their total production. The period after the Civil War is marked by important changes. In fact, the Civil War was almost as much of a turning point in the economic life of the country as in its political life. The question of national unity, which had been settled as a political theory, was to be settled even more effectively by an economic development which was to bring all sections of the country into much closer commercial relations.

The two most striking features of the development for 30 years after the war were the rise of the United States to a position of chief source of food products for Europe on the one hand, and on the other, its growing independence of Europe in the matter of manufactures, due to the extraordinary development of home industries. The most important factor in this development lay in the unparalleled command of natural resources. The area of the United States at the close of the Civil War was 3,025,000 square miles. Stretching across the con-

tinent, it commands access to two great oceans. Its eastern coast line, indented with frequent harbors, stretches south until it meets the great southern Gulf, which then extends beyond the mouth of the Mississippi to the cotton fields of Texas. To the north, the Great Lakes, connected with the Atlantic seaboard by the St. Lawrence and the Erie Canal, reach the wheat fields and iron supplies of the West. One third of the way across the continent, and in the very middle of its most fertile region, the great Mississippi flows from the Canadian border to the Gulf, and into this river flow vast tributaries from both east and west, forming a single valley which extends for 1,800 miles at its widest part, and includes more than half the arable land of the country. Within the area thus situated is to be found a marvelous variety of climate, soil, and mineral resources. From the arid plains to the Alleghany Mountains stretch three great belts of arable land, distinguished by their chief crops into the spring wheat belt in the north, the central belt of winter wheat and corn, and the southern cotton belt. Beyond this fertile territory lie the plains which are the seats of vast cattle and sheep ranches, while the mountain States are rich in valuable ores, gold, silver and copper. Beyond these lie the fertile States of the Pacific, with their lumber, wheat and fruits. Coal and iron, the most important minerals for industrial development, are widely distributed within the great belts of arable territory already described, throughout the Alleghany region, and even further east. In the period after the war all these regions were rapidly connected by an extensive network of railroads. At the close of the war the railroad mileage of the country was 35,000 miles. Within four years from the close of the war the first great transcontinental line was completed, and the Atlantic and Pacific at last united. In the meantime, rapid building continued in all sections of the country, and by 1870 the mileage had increased to 52,000 miles, by 1880 to 93,000, and by 1890 to 166,000. This continuous expansion of transportation facilities brought new areas into cultivation, opened up new supplies of raw materials, and built up a market in the West for the products of the East.

Between 1860 and 1870 the population of the grain States increased by more than 42 per cent and the next decade by nearly 34 per cent, a total addition in 20 years of over 8,000,000 inhabitants. The production of cereals and the accompanying production of provisions increased correspondingly. The wheat crop, which in 1870 had amounted to 235,000,000 bushels, had doubled in 1890, and since then has twice exceeded 600,000,000 bushels, and once 700,000,000 bushels. The corn crop has increased from an average of about 1,000,000,000 bushels in 1875, to an average of over 2,000,000,000 bushels in recent years. The value of the meat packing industries, dependent upon this great corn crop, increased from $75,000,000 in 1870 to $561,000,000 in 1890. Exports increased in even greater proportion than production. The annual average export of wheat, including flour, from 1867 to 1872 was 35,500,000 bushels; from 1873 to 1878 it was 73,400,000 bushels; from 1879 to 1883, 157,000,000 bushels. Such an increase could not continue indefinitely, especially in view of the increasing home demand, and in the next decade exports fell off slightly, but in recent years they have increased to a higher figure than ever. The export of corn is of relatively less importance. It is primarily the feed crop for the home market, and eighty per cent of the total crop, which in bushels is three or four times that of wheat, is consumed in the county where grown. In recent years, however, the exports have increased enormously, and now in bushels are as great as the export of wheat. In the matter of provisions, the exports increased from 1870 to 1890, for fresh beef, from 20,000,000 pounds to 200,000,000; for bacon and hams from $6,000,000 to $60,000,000; for lard from $6,000 to $42,000,000.

Despite this growth of exports, an important cause for the agricultural development was the continually expanding home market in the industrial States. The primary cause for this industrial expansion may also be said to lie in the natural advantages noted above. The people possessed of these advantages have, however, shown themselves peculiarly fitted for their utilization; the energetic and practical character of the American fits him for success in any economic field, but his peculiar aptitude for invention and the use of machinery guarantees especial success in the line of manufactures. Inventions have been stimulated by an admirable system of patents, and the number of new inventions annually patented in this country is far in excess of that in any other country in the world. Added to these natural advantages of resources and character was the special stimulus given to the expansion of manufactures by the system of high protection adopted at the time of the war, and consistently maintained ever since. Whatever may be the ultimate effects of such a policy, it cannot be doubted but that the rise of manufactures has been in many if not all lines more rapid than it would have been without such a national policy. The present protective tariff really originated in the high duties imposed for revenue purposes at the time of the Civil War, and which were maintained in time of peace because of the stimulus which they had already given to manufacturers, who successfully urged the necessity of maintaining these high rates to prevent a decay of industry from competition with manufacturers producing with cheaper costs of production abroad. A further aid to the development of manufactures was the large stream of immigration (see IMMIGRATION TO THE U. S.) which began about 1845 and increased after the Civil War. All told, over 20,000,000 immigrants have come into the country since 1845, and in 1900 the ratio of foreign born to the whole population was 13.7 per cent, in actual number 10,460,085, while all those born of foreign parents constituted 34.3 per cent of the total, or about 26,000,000. It has been a popular idea that this large immigration was primarily due to the possibility of taking up free land in the West, but statistics show that the progress of settlement has been primarily a native movement while the immigrants have filled the positions in mines, factories and construction undertakings. To be sure, certain farming sections have been settled by special nationalities, but even of the Germans only

25 per cent have taken to the land, and of the Irish only 12 per cent. The chief incentive to immigration has been the opportunity for employment afforded by the great industrial development in the last forty years, and the extension of our railroads, the exploitation of our coal fields and the rise of our factories have all been made more rapid by this influx of cheap labor. Immigration, however, has brought some serious evils in its train. So far as the foreign elements were distributed among the native population or where they took to the land they have become assimilated to the native stock and have formed a sober and industrious element of the population. Where, however, they have been concentrated in manufacturing and mining centres they have frequently remained unaffected by the national ideal of democratic equality based on an enlightened obedience to law. The situation is made even worse by the fact that the character of the immigration has changed in recent years. Formerly the immigrants were chiefly of the sturdy races of northern and western Europe, while to-day a large majority come from the less advanced races of the south and east. However, it is not immigration alone which has introduced problems into our society which are inconsistent with the earlier democratic theories. The great rise of industrialism has been possible only through the extension of production on a colossal scale and the consequently increased dominance of a capitalistic class. The earlier artisan had always an escape to the land, which tended to strengthen his position socially and economically. To-day a great and permanent wage-earning class is the characteristic feature of industrial society.

It is impossible here to enter into a discussion of the problems involved in the changed conditions of "labor and capital." It is well, however, not to forget that these problems are the natural results of an economic growth which has increased enormously the production of wealth and raised the United States to the first rank among industrial and commercial nations. Thirty years after the Civil War the United States had come to a position where they were able both to furnish enormous supplies of food products and raw materials to Europe and at the same time supply most of the home demand for manufactured goods from their own factories. From 1860 to 1890 the capital invested in manufactures increased from $1,000,000,000 to nearly $10,000,000,000; the output of products increased from less than $2,000,000,000 to over $13,000,000,000, and the wage-earners from 1,311,000 to 5,315,000.

The extraordinary economic position of the United States can be seen best, however, from still later statistics, for the seven years from 1897 to 1904 mark the beginning of a new departure. The great prosperity since the end of the depression which followed on the panic of 1893 has been sufficient to establish both the agricultural and industrial supremacy of this country among all nations, and at the same time has raised it to be a leading factor in the export markets for manufactures. Before the Civil War it was the general opinion that this country must of necessity be primarily an agricultural country and that our foreign trade would consist of an exchange of food and raw material for manufactured products. The industrial development in the 30 years after the war made us less and less dependent on foreign manufacturers, and made possible an internal trade of greater importance, compared with the foreign trade, than that of any other country of the first rank. The new era ushered in by the recent period of prosperity promises to be one in which the United States will become more and more an importer of raw materials and food and an exporter of manufactures. In the matter of manufactured exports our trade increased three-fold in a decade. In the three years from 1890 to 1892 the exports of manufactures were $470,000,000, and in the three years 1900–1902, $1,250,000,000. The exports of iron and steel rose from $27,000,000 in 1892 to $120,000,000 in 1901. The proportion of manufactured exports to total exports rose from 17.87 per cent in 1890 to 31.65 per cent in 1900. See Exports and Imports, American.

Turning to the side of imports it appears that at present scarcely more than 25 per cent of the total imports consist of manufactured goods ready for consumption. The former heavy imports of woolens, silks, and iron and steel products have greatly decreased, and of the chief articles of such imports during recent decades cotton goods alone seem to hold their own. In the case of iron and steel we have imported less than $20,000,000 on an average in the five years, 1899 to 1904, while average exports have been over $100,000,000. On the other hand, the imports of food products and materials for manufacture have greatly increased. The most important items of import are now coffee, sugar, india-rubber and gutta-percha, hides and skins, raw silk, and the like. The actual proportions in 1901 were as follows: Food products and animals, 27.02 per cent; raw materials, 32.79 per cent; partially manufactured, 9.61 per cent; ready for consumption, 30.58 per cent.

Such figures are significant of an important change in the character of our trade. Agricultural exports, however, still hold their pre-eminence. Despite the increased consumption at home, the exports of breadstuffs, provisions and cotton have steadily grown. We still export two thirds of our cotton crop, in 1901 over 3,500,000,000 pounds, about 80 per cent of the world's supply. Out of a crop of 748,000,000 bushels of wheat, 290,000,000 were exported. In values the exports of cotton were $300,000,000, of breadstuffs $276,000,000 and of provisions $207,000,000, making a total of $783,000,000 for these three items alone. More important than the foreign market, however, is the home market, with the exception of cotton, of which the exports are two thirds of the total crop. The exports of wheat are one third, but of corn the exports are only 10 per cent and the great feed crops, corn, oats and hay, are more important to farmers as a whole than wheat. The money value of the dairy products annually produced in this country is greater than that of the wheat crop, and the value of the poultry and eggs greater than that of the gold, silver and copper combined. The home market is still more pre-eminent in the case of manufactures. The consumption of cotton by American mills is already greater than by the English mills; the manufacture of silks has increased to over

$100,000,000 in value of the annual product. The production of pig-iron has increased 90 per cent since 1897 and reached 17,000,000 tons in 1901, while steel was produced to the amount of 15,000,000 tons, the product in both cases being greater than the combined output of Great Britain and Germany. All these great lines of manufacture find their chief market at home.

The above facts show the extraordinary economic independence of the United States, due to our combination of vast and varied resources and skilful and intelligent labor. In the matter of raw materials the country has ample supplies of food products for its own consumption and a great surplus for export; it has an ample supply of cotton and in a less measure of wool for its clothing; of coal, iron, copper and lumber for building and manufactures. It imports less than 5 per cent of its consumption of iron and steel, less than 10 per cent of its cottons and woolens, and less than 20 per cent of its silks. Its chief dependence for outside supplies for single important commodities is on the non-European countries for its coffee, tea and sugar, its hides and furs, its silk, fibres and rubber, its tin, and, to some extent, its wool. Though many of these are important for our manufactures, none of them are absolute necessities of life. No other great civilized race is able to produce so completely within their own borders the goods which they need. See POPULATION; U. S.— THE PEOPLING OF THE.

Bibliography.— The above article is based on a chapter by the author on the Economic Development of the United States, contributed to the 'Cambridge Modern History,' Vol. VII., 'The United States' ch. 22), which may be consulted for a more complete bibliography. Much valuable material will also be found in the general histories, especially those of Henry Adams, MacMaster and Rhodes. Other general works are: Bolles, A. S., 'Industrial History of the United States,' 1878; Depew, C. (editor), 'One Hundred Years of American Commerce,' 2 vols., 1896; Gannett, H., 'Building of a Nation,' 1895; Shaler, N. S. (editor), 'The United States of America,' 2 vols., 1894; Wells, D. A., 'Recent Economic Changes,' 1889; Woolsey, T. D. (editor), 'First Century of the Republic,' 1876; Report of the Industrial Commission, 1900–1902, 19 vols. The reports of the various departments of the government contain a vast amount of material, but are too numerous to be cited at length. For statistics of commerce and industry see especially the United States Census, taken each decade, the Statistical Abstract, Bureau of Statistics, annual, and the Monthly Summary of Commerce and Finance. Professor of Political Economy, Yale University.

59. United States — Commercial Development of. The commerce of the American colonies during the 17th and 18th centuries was chiefly with the mother country and the West Indies, the former being promoted by the intermittently enforced Navigation Acts (1651, 1660, 1663); the latter in a measure in spite of them. Three-fourths of the trade with England was carried on, principally in English ships, with the southern colonies, who received manufactured and forwarded goods — clothing, implements, wines and spices — in exchange for rice, indigo, tobacco, corn, naval stores and some cotton. The central and northern colonies sent to the mother country only a limited amount of products, but these covered a wide range;— lumber, masts, hides, and furs, ships, grains, fish, pot and pearl ashes, and some flour, cattle, butter and cheese. The chief trade of the New England and central colonies was with the West Indies, three-fourths of the shipping engaged belonging to New England; flour, lumber, fish, animals and dairy products being traded for the products, chiefly molasses, of the islands. An important field of trade was offered by the "Triangular Route," New England ships trading rum on the African coast for negroes, which were in turn traded in the southern colonies and the islands for molasses, this raw material being carried to New England and converted into more rum for further trade. There was a small trade with the Continent, fish, lumber and fur hats, for instance, being sent to Spain and Portugal in exchange for wines, brandy, tea, coffee and spices. At the outbreak of the Revolution the imports of the colonies amounted to approximately $20,000,000, and the exports to $11,000,000.

1790–1814.—With union and political strength came commercial strength. The first 25 years of union constitute a period of commercial advancement, characterized by great fluctuations, and by the predominant influence each upon the other of international politics and commerce. Other influences, more fundamental though less conspicuous, were present. The settled area doubled to nearly 500,000 square miles; population increased from less than 4,000,000 to over 9,000,000; the density of population on that area from 16.4 to about 18 per square mile. The most noteworthy extensions of production were of cotton and tobacco in the South and wheat in the Ohio Valley. But during this period commerce did not increase proportionately with settlement and production, the facilities for transportation,

little improved, being so poor as to hinder the movement of surpluses. A few canals were dug, and a flatboat trade was developed on the Ohio and Mississippi, but goods could be carried only at high rates; the freight rate from Louisville to New Orleans in 1812 was over $60 per ton. This period, characterized by the influence on commerce of international politics, may be divided into two periods distinguished from each other by the opposite effects of opposite political conditions. During the European wars and until the Embargo of 1807, the United States remained neutral and profited greatly. Not only was she called upon to supply goods, but the carrying trade of the world fell into her hands, and re-exports came to make up half of her exports. In 1789 the tonnage of American vessels in foreign trade was 123,893; in 1807, 848,306 tons. The total foreign trade reached for the years 1805, 1806, and 1807 an average of $231,000,000, the effects of the Orders in Council and the Berlin and Milan Decrees not being immediately felt. Their destructive effects, the Embargo of 1808 and the War of 1812 gave character to the second of the minor periods: American ships were seized and condemned, foreign freight fell off, the cotton, tobacco and wheat crops remained unsold, and the commerce of the United States decreased to $20,000,000 in 1814. During the more favorable part of this period, to the former trade with Great Britain and the West Indies was added a direct trade with the Mediterranean countries, with Germany, Sweden, and Russia, and with China and the East Indies. Clothing and implements remained the important articles of import from the Continent; sugar, silk, tea, and spices from the Orient. The exports continued to be predominantly agricultural, varying little from 80 per cent of the increasing total. Manufactures represented from 7 per cent to 9 per cent, forest products 7 per cent, fishery products 3 per cent to 4 per cent. Cotton had changed from an insignificant to an important item of trade, the production having increased from 3,000 bales in 1790 to 177,000 bales in 1819, and increasing amounts of flour were sent to feed the armies in the Peninsular and other wars. Manufactures were represented in foreign trade by such articles as candles, pot and pearl ashes, gun powder, spirits, flax and hemp, boots and shoes, tobacco, furniture and other manufactures of wood, and some pig and bar iron and nails.

1815–1865.— During the half-century following the Treaty of Ghent (see GHENT, TREATY OF) commerce trebled, imports increasing from an average of $113,000,000 for the five years 1815–1819 to an average of $321,000,000 for the five years preceding the Civil War, and the exports from an average of $77,000,000 to an average of $296,000,000. Fluctuations caused by wars, depressions, panics and tariffs are conspicuous and noteworthy, but the fundamental force to which may be attributed this remarkable development was the expansion of the settled area with its increasing density, the increased production in old and the opening up of new resources, and the establishment of communication between formerly isolated regions and the coast by the building of railroads and canals. The settled area extended westward into the great plains and increased by 1865 to over 1,000,000 square miles; the population reached over 30,000,000 and its density on the settled area over 26 per square mile. The rich cereal soils from western New York to the Mississippi, the cotton soils from Virginia to Texas, the animal resources of the Ohio and Mississippi valleys, the white pine regions from Maine to Minnesota, the hard wood regions to the south and the mines of the Pacific coast began to yield surpluses for export, increasing at the same time the power to command the commodities of other lands. By 1860 the production of wheat was 173,000,000 bushels, corn 867,000,000 bushels, cotton 4,000,000 bales and of gold $50,000,000, while the exports of wheat and flour reached nearly 35,000,000 bushels, and of cotton over 3,000,000 bales. Those exports with agriculture as their source continued to predominate, their proportion of the total still varying little from 80 per cent. Although the development of mineral resources was well under way, their products were absorbed in the domestic market, and their contribution to exports was small, while the exports of forestry and fishery industries decreased to 3.2 per cent and 1.3 per cent respectively. The value of manufactures produced in 1860 was nearly $2,000,000,000 and the proportion of exports from that source increased from 6.16 per cent in 1815 to 12.59 per cent in 1860. To the articles enumerated of manufacture for the preceding period the most important articles added were manufactures of bricks, cement, cars, carriages, copper, brass, rubber goods, leather goods, paper, soap and wearing apparel, while the contributions of tobacco, iron and steel and cotton manufactures increased to $3,383,428, $5,870,114, and $19,934,796 respectively. The exploitation of new resources, and especially their influence upon commerce, would not have been so marked had it not been for the great development of means of communication, highways, railroads, and canals. The Erie Canal, opened in 1825, gave an outlet to the east for the grain of the middle west, and soon freight rates between Ohio and New York were lowered 90 per cent. The shipments of wheat from Chicago increased from 78 bushels in 1838 to over 9,000,000 bushels in 1856 and nearly 16,000,000 bushels in 1860. By 1830 railroad building was under way, the mileage increasing from 23 in that year to over 35,000 in 1865, the Erie Canal being paralleled at the end of the period by railroads connecting the Mississippi Valley with New York and Boston. This made possible a segregation of traffic; by 1860, while 96 per cent of the grain from Chicago was sent by water, 65 per cent of the flour was sent by rail. In 1838 regular lines of steamers began shipments across the Atlantic, but their part in facilitating commerce did not become important until the end of the period. The direct influence of tariff (see U. S.—TARIFF IN THE) policy on commerce was slight; its significant influences were the indirect ones, to appear in the next period, when the policy bore its fruit in an increase of the volume and range of manufactures. On the whole, the tariffs of 1816, 1824, 1828, and 1842 decreased imports, which reacted slightly on exports, and affected unfavorably the rate of increase of international trade, while the tariffs of 1832 and 1846, lowering the preceding tariffs, had an opposite effect. Important commercial treaties with Great Britain (1818, 1830, 1854), France (1822, 1831), and most of the other continental countries; with

Mexico and the Central and South American countries; and with Siam (1833), China (1844, 1858), and Japan (1854) removed obstacles to trade. It was also increased by the European wars and famines, and diminished by the panics of 1837 and 1857. The Civil War stopped industry in the South, and with it the commerce of that section of the country; on the other hand, although it deranged business in the North, before its close it had, both directly and indirectly through high tariffs, stimulated agriculture and manufacturing, and the commerce of that section suffered comparatively slight diminution. The change between 1860 and 1865, for the entire United States, is indicated as follows: Imports $362,166,254 to $258,555,652; exports, $490,122,296 to $355,857,344. While American shipping ceased to enjoy in international trade the abnormally favorable conditions of the preceding period and suffered from the War of 1812 and the re-establishment of European shipping, it experienced an absolute increase, and the tonnage of American vessels registered in foreign trade increased from 984,269 tons in 1810 to 2,642,628 tons in 1861. The proportion, however, of imports and exports carried in American bottoms declined, the former from 94.2 per cent in 1830 to 60 per cent in 1860, and the latter from 86.5 per cent to 70 per cent. This proportional decrease was due to normal competition, to the advantages possessed by Great Britain as iron was substituted for wood in ship construction, and to the injury done American shipping by the Civil War. The decrease in tonnage carried in American vessels during the war was from 66.5 per cent in 1860 to 28 per cent in 1865. The number of treaties established during the period suggests an expansion of trade along many courses. In every direction there was an absolute increase both of imports and exports, although in some courses there were relative declines, as indicated by the following table:

INCREASE OF IMPORTS AND EXPORTS, 1830 TO 1860.

		Imports.	Per cent of total	Exports	Per cent of total
Europe	1830	$ 40,841,420	57.63	$ 48,175,248	65.24
	1860	216,831,353	59.87	310,272,818	77.54
North America	1830	17,548,892	24.76	18,886,434	25.57
	1860	75,082,583	20.73	53,325,037	13.33
South America	1830	6,239,176	8.80	4,587,391	6.21
	1860	35,992,719	9.94	16,742,100	4.18
Asia	1830	5,531,737	7.80	1,845,224	2.50
	1860	26,201,603	2.24	11,067,921	2.77
Oceanica	1830	384,887	.54	93,668	.13
	1860	3,495,226	.96	5,373,497	1.34
Africa	1830	308,797	.44	233,601	.31
	1860	3,798,518	1.05	3,227,760	.81

1865-1904.— The forces at the basis of the commercial development of the United States have been cumulative in their effects, and these effects were therefore most conspicuous during the four decades after the Civil War. As was true of the preceding periods, the increase in international trade was due to the tremendous industrial development of the country and not to any fixed policy looking toward its encouragement. The population of 76,303,387 in 1900 occupied the entire area of over 3,000,000 square miles, stretching from ocean to ocean, and had for some years been filling up formerly neglected areas left undeveloped in its westward march. The density over the entire area had increased from 10.8 in 1860 to 25.66 in 1900. The country had become unified by a railroad system which had increased from 30,626 miles in 1860 to over 200,000 miles, or more than all Europe, in 1902. The total bank clearings had more than doubled, passing $116,000,000,000 in 1902. By the end of the century the United States had taken the first rank in the production and exportation of agricultural products, and in the production of minerals and of manufactured goods. In 40 years the acreage of cultivated lands had trebled, while the value of farm property had increased from $7,980,493,060 to $20,514,001,838, and the value of farm products from $1,958,030,927 in 1870 to $3,764,177,706 in 1900. In 1902 the United States produced approximately two-thirds the world's corn, three-fourths the world's cotton and one-fifth the world's wheat (2,523,648, 312 bushels, 10,680,680 bales and 670,063,008 bushels respectively). In 1901 the production of coal was 261,873,675 tons, of petroleum 2,914,346,148 gallons, pig iron 15,878,354 tons, gold $78,666,700, silver $71,387,800, the entire production of minerals reaching a value of $1,086,529,521. The value of lumber products in 1900 was $566,832,984, and of fisheries about $40,000,000. It is in manufacturing that the most significant advances, both in production and in exports, were made. The increased production was due to the opening up of abundant resources of raw materials of manufacture; to the exploitation of the world's greatest resources of power, both steam and water; to an application of that power through labor-saving machinery that had resulted in the greatest net return per unit of cost; to a highly developed genius for organization and management; and to the stimulus of government assistance through a high protective tariff, which reserved for domestic manufactures the largest home market in the world, with the greatest purchasing power per capita. Exports increased not only as a natural result of this increased productive power, but, during the last decade of the century, the productive power of the United States in certain industries had so nearly reached the limits of the demand of the home market, that, in order to keep invested capital employed at the point of most economical production by finding a market for all it could produce, these manufacturers were compelled for the first time to give serious attention to international trade. Between 1895 and 1903 the imports and exports of merchandise increased one and one half times, from $1,530,508,130 to $2,417,050,530. The value of manufactured products increased from $1,885,861,676 in 1860 to $13,039,279,566 in 1900.

The following table indicates the increase in foreign trade:

MERCHANDISE AND SPECIE IN MILLIONS OF DOLLARS.

Average	Total imports	Total exports	Excess imports * Excess exports †
1865–1869	$ 384.16	$ 368.58	$ 15.57*
1870–1879	535.93	611.13	75.20†
1880–1889	734.28	810.78	76.50†
1890–1899	834.80	1078.62	243.82†
1900–1902	946.32	1528.23	581.91†

Important characteristics of the industrial development of the United States are reflected in the changes in the proportions of the various classes of articles entering into international trade. Between 1870 and 1902 the imports of food and live animals decreased from 32.65 per cent to 22.25 per cent of the total; articles manufactured wholly or partly for use as materials in mechanic arts from 12.59 per cent to 10.09 per cent; of articles manufactured ready for consumption from 27.98 per cent to 16.67 per cent. On the other hand, the imports of crude articles for domestic industries increased from 15.69 per cent to 36.27 per cent. This was due to the increased demand of industries which, like silk, cocoa and rubber manufacture, are dependent on other countries for raw material, and which like those using wool, leather and sugar, find their domestic supply of raw materials inadequate. The increase in the imports of articles for voluntary use, luxuries, etc., was from 11.09 per cent to 14.72 per cent.

Of the exports, agricultural goods retained their preeminence and experienced a marked absolute increase ($68,279,764 in 1870 to $403,641,401 in 1902), but suffered a relative decline from 79.35 per cent of the total to 62.83 per cent. Cotton and wheat continued to lead, the exports in 1902 being $290,651,819 and $112,875,222 respectively. The exports of crude articles whose origin is in mining increased from 1.10 per cent to 2.90 per cent, while the per cent of forest products increased slightly (3.27 per cent to 3.55 per cent) and of fisheries decreased (.62 per cent to .57 per cent). The exports of manufactured goods doubled during the period, increasing from 15 per cent in 1870 to 29.77 per cent in 1902. The above table, in presenting the changes which took place in the exports of important articles of manufacture, indicates also the most important lines along which manufacturing developed.

THOUSANDS OF DOLLARS.

Average.	1871–1880.	1881–1890.	1891–1900.	1902
Agricultural implements	$ 2274.6	$ 2989.8	$ 6167.0	$16286.7
Books, maps, etc	594.2	1353.8	2352.9	3907.9

Wool, manufactures	257.9	503.1	795.6	1512.4

The exports of certain other articles in 1902 were (in thousands of dollars) Canned salmon $3991.4, canned fruits $1289.9, furs and fur skins $5030.2, glue and soap stock $2895.3, naval stores $11733.5, oil cake and oil cake meal $19943.1, vegetable oils $15308.6, meat and dairy products $190,861.3.

The changes in the direction of trade are indicated by the following table, the figures representing millions of dollars and per cent of total:

	IMPORTS.		
	1870	1800	1902
Europe	$249.5 (53.98)	$449.9 (57.14)	$475.1 (52.60)
North America	126.5 (27.42)	148.3 (18.84)	151.0 (16.72)
South America	43.5 (9.41)	90.0 (11.43)	119.7 (13.26)
Asia	31.4 (6.78)	67.5 (8.57)	129.6 (14.36)
Oceania	1.4 (.31)	28.3 (3.60)	14.1 (1.57)
Africa	9.8 (2.10)	3.3 (.42)	13.4 (1.49)
	EXPORTS.		
Europe	420.1 (79.35)	683.7 (70.74)	1008.0 (72.96)
North America	68.9 (13.03)	94.1 (10.98)	203.9 (14.76)
South America	21.6 (4.09)	38.7 (4.52)	38.0 (2.75)
Asia	10.9 (2.07)	19.6 (2.30)	63.9 (4.63)
Oceania	4.3 (.82)	16.4 (1.92)	*34.2 (2.48)
Africa	†3.4 (.64)	4.6 (.54)	33.4 (2.42)

* Hawaiian Islands not included. † Includes "All other countries."

Half of our import trade and two-thirds of our export trade is with Europe, the trade with the United Kingdom being about one-third of our total foreign trade. Exports to the United Kingdom are increasing rapidly ($548,548,977 in 1902), while imports are decreasing ($165,746,560). Foodstuffs and cotton continue to be the predominant articles, although manufactured goods, especially machinery and other iron and steel products are becoming more important. Germany is next in importance among European countries (exports in 1902, $173,148,280; imports, $101,997,523), tariff obstacles having been modified by reciprocity arrangements. Trade with France ranks third (exports, $71,512,984; imports $82,880,036 in 1902). Trade with other European countries is relatively small; there is not the same dependence on the United States for food stuffs, and high tariffs, especially in Russia and Austria-Hungary, tend to keep out American products. The geographical advantages of trade with British North America, in which forest and farm products could be exchanged for American manufactured goods, has been neutralized in part by tariff friction. The total trade increased, however, from $86,814,859 in 1893 to $160,445,848 in 1902. Trade with American countries south of the United States has increased slowly because the United States is self-sufficient in many of the southern temperate zone products, while Europe could take those products and send manufactured goods in exchange. The United States, however, takes wool and hides and leather, and tropical and semi-tropical products like rubber, dyewoods, mahogany, fruits, sugar and coffee, and exchanges for them commodities like petroleum, lard, hardware and cotton goods. The total trade of the most important of these countries with the United States in 1902 was: Brazil, $89,569,167; Mexico, $80,256,202; Cuba, $61,318,184; Argentina, $20,922,525; Chile, $11,455,281. The increasing trade with Asia is of significance, inasmuch as the greatest increase is of the export of manufactured goods to that continent. A policy of exclusion shuts out American goods from territory under Russian influence; in other countries the trade in 1902 was: China, exports, $24,722,906, imports, $21,055,830; Japan, exports, $21,485,883, imports, $37,552,778. In 1893 the exports to China and Japan were only $3,900,457 and $3,195,494 respectively. In the trade with India and the East Indies imports are in great preponderance. The exports to British Africa in 1902 were $28,780,105, and the imports $979,361; the exports having increased from $3,688,099 in 1893. The exports to British Australasia increased from $7,921,228 in 1893 to $28,375,199 in 1902, while imports decreased from $7,266,808 to $5,386,509. During the same ten years the imports from the Philippines decreased from $9,159,857 to $5,258,470, while exports increased from $154,378 to $5,258,470.

The high war tariff is still the basis of the commercial policy of the United States, although, since the United States has become relatively self-sufficient in manufactured as well as other products, there have been indications of a change of policy, and it seems likely to be modified more and more by reciprocity agreements. The direct influence of the tariff has been to discourage foreign trade; such advances in that trade as have been pointed out have been in spite of it, because of sheer physical strength. It may perhaps be said to have indirectly encouraged international trade by constructing a basis for it in the strong home industries which it has built up. But that basis once constructed, international trade is likely to become less and less patient of tariff barriers. In most instances where applied, foreign trade seems to have been promoted by the policy of reciprocity treaties. The most important of these treaties have been with Canada (1855–1866), Hawaii (1876–1900); with Guatemala, Honduras, Nicaragua, Salvador, British West Indies, Santo Domingo, Cuba, Porto Rico, Brazil, British Guiana, Austria-Hungary and Germany (under the Act of 1890; terminated by the Act of 1894); and with Germany, France, Italy, Portugal and Switzerland (under the Act of 1897). In 1903 a reciprocity treaty was concluded with Cuba. The treaties with Germany, France, Italy, Portugal, the Azores and the Madeira Islands, and with Cuba are still in force. The establishment of sound currency and banking systems has contributed to the development of international trade during the period. On the other hand, the panics of 1873 and 1893 and the years of depression following each, were periods of temporary decline. Accompanying this marked increase in foreign trade has appeared a serious decline in the shipping of the United States engaged in it. This decline is presented in the following table:

	Am. vessels engaged in foreign trade	Per cent imports in Am. vessels	Per cent exports in Am. vessels
1860	2,546,237 tons	63	70
1870	1,516,800 "	33.1	37.7
1880	1,352,810 "	22.9	13.1
1890	946,695 "	16.7	9.4
1900	826,694 "	12.9	7.1
1902	884,555 "	12.1	6.6

The beginning of this decline is a reflection of the changed conditions of ship construction at the middle of the century, when construction of iron and steel, in which England at that time had an advantage, was substituted for construction of wood, in which the United States had an advantage. Its continuance, however, is rather a reflection of the commercial policy of the period. High duties on the materials for the construction of iron and steel vessels, the restrictions of the Navigation Laws, high local taxation, tonnage dues and restrictions as to the hiring of seamen have all contributed. The tariff policy in general has discouraged shipping by tending to oppose a natural exchange of commodities and a more even-balancing of cargoes. The decline has been due also to the general industrial situation, in which attention has been concentrated on the building up of home markets and not on the development of foreign trade. Until recent years the trade of the United States may be said to have been due more to the necessity of the foreigner to buy than to the necessity of the United States to sell and the locus of the necessity has been the locus of the attention to shipping. The change of attitude from that of an almost passive willingness to supply foreign demands for necessities to an active desire to dispose of surpluses of manufactured goods in competive markets should have a profound effect not only on foreign trade, but also on the re-establishment of American shipping in that trade.

Domestic Commerce.— The value of the internal trade of the United States has been estimated to be some 28 times as great as the ex-

ternal trade (about $28,000,000,000) and the volume about 25 times as great. Practically all articles that enter into foreign commerce enter also into domestic commerce, and in addition there is the movement of that great volume of commodities produced within the country and in continual flow from one part to another. The ton-miles of freight carried by railroads increased from 39,202,209,249 in 1882 to 156,624,166,024 in 1902. The conditions of industry in the United States have made inevitable an internal trade of so great volume. No other industrially developed country possesses so vast an area practically physically, politically and socially homogeneous. Neither of the two mountain systems is a comparatively serious obstacle to commerce, and the river and lake systems are its instruments. The separate states may not interfere with commerce in a way to destroy the freedom of intercourse of one region with another. The population, both of native and of foreign stock, has developed a uniformly high degree of energy in industrial activity. Accompanying these aspects of homogeneity is a great variety of resources and activities. The climatic range is represented by a difference of 40° in mean annual temperature: by cotton, sugar and semi-tropical fruits in the south and white pine and cereals in the north. Differences in climate, soils and geological formation are represented by coal and iron in the Appalachian and Superior regions, gold and silver in the Cordilleran system, copper around Lake Superior and in Montana, agriculture in the Mississippi basin, and grazing on the western plains. The northern States east of the Mississippi constitute a relatively dense manufacturing region. In many items of resources, among them the basic materials of industry, the United States assumes a leading position. Because in the production of wheat, corn, cotton, animal products, lumber, coal, iron ore, copper, and in the value of manufactures, the United States leads the world, and is in the front rank in the production of precious metals, the internal movement of goods is necessarily great. These conditions of size; of physical, political and social homogeneity; of abundant and diverse resources; of great industrial energy; and of the possession of adequate instruments of communication explain the volume and value of domestic commerce. The increase of internal trade, and of the area concerned in it, has accompanied the extension of settlement and the exploitation of new resources suggested in the preceding section: it has been a condition precedent to the increase of foreign trade. During the first decades of the last century, the flow of commodities was along the Atlantic coast and along the Mississippi, the Hudson and the Delaware, while cotton was moved on the rivers of the south. The water routes, especially the Mississippi and its tributaries and the Erie Canal, remained most important until near the middle of the century. With the construction of railroads, the centre of gravity rapidly shifted. In 1861 the Erie Canal carried 2,070,251 tons of flour, meal and grain; in 1899 only 562,740 tons. The construction of railroads began in 1830; in 1840 there were 2,755 miles, confined to the Atlantic States. By 1850 the railroads had extended into western New York, western Pennsylvania and Maryland, and construction was under way in the Mississippi Valley and the Lake States. By 1860 there were 28,919 miles; construction had begun in the South, had increased in the Mississippi Valley and the middle West, and the latter region had been connected with the North Atlantic seaboard by rail as well as by canal. After 1870 the extension was chiefly west of the Mississippi and in the South. In 1902 there were 203,132 miles of railroads, which with the water routes still of importance, presented the following channels of transportation: Trunk lines (1) connecting the Mississippi Valley with the North Atlantic ports; (2) connecting the Mississippi Valley with the South Atlantic ports; (3) connecting the Mississippi Valley with the Gulf ports; (4) connecting the Mississippi Valley with the Pacific States; (5) coastwise routes of the Great Lakes; (6) the Mississippi River; (7) the coastwise routes of the Atlantic, the Gulf, and the Pacific (including Porto Rico, Hawaii, and likely to include the Philippines); (8) minor water routes like the Erie Canal, the Hudson River, and the Kentucky River. The direction of the flow of domestic trade is determined by the relation to one another of regions of important products, routes of rail and water transportation and the denser areas of population. Most of the imports are received at New York, which becomes thereby the great primary distributing centre of such commodities. The value of the imports received at various ports was, in 1902: New York, $559,930,849; Boston, $71,921,436; Philadelphia, $47,750,342; San Francisco, $35,183,755; New Orleans, $23,763,480; Baltimore, $22,825,281. The relative rank of the cities as ports of entry has varied but slightly. As points of concentration for export, these cities ranked in 1902 as follows: New York, $490,361,695; New Orleans, $134,486,863; Boston, $102,409,304; Baltimore, $80,532,512; Philadelphia, $80,383,403; San Francisco, $38,183,175. New York early took the lead because of its excellent harbor, its situation relative to European markets, and because it became the terminus of the first trunk rail and water route from the Middle West. Although the lead has been retained, relatively other of the cities named have advanced more rapidly. Philadelphia and Baltimore have become the termini of important trunk lines, which have favored these cities by differential rates. New Orleans has enjoyed the advantage of proximity to the cotton fields and become the terminus of important north and south trunk lines. The movement of goods destined for export has not been confined to these points; Portland, Maine, for instance, has become the terminus of a trunk line reaching back into the cereal and animal husbandry regions, while cities like Newport News, Norfolk, Charleston, Savannah, Pensacola, Mobile and Galveston have become important cotton shipping points.

Only in its broadest outlines can the movement of goods within the interior of the country be presented, and that only with respect to leading articles. The cotton of the South flows from the local market towns toward the larger distributing centres like Houston and Galveston, Texas; Shreveport and New Orleans, La.; St. Louis, Mo.; Vicksburg and Columbus, Miss.; Nashville, Tenn.; Montgomery and Mobile, Ala.; Augusta, Macon, Columbus and Savanna, Ga.; Port Royal and Charleston, S. C.; Wilmington, N. C.; Norfolk and Newport News, Va.; Baltimore, Md.; and even Philadelphia and New

York. Anthracite coal of eastern Pennsylvania finds its chief receiving and distributing centres at Philadelphia, New York, and Buffalo, while the bituminous coal is carried in all directions from a large area of production in the centre of the country. The Monongahela and Ohio rivers are important coal routes. The fruits and garden products of the coast and the dairy and garden products of New England and New York converge upon the congested manufacturing regions. The manufactures and imports of the East and the imported and domestic fruits of the South flow west and north respectively into the receiving and distributing centres of the Middle West. The wool of the western and middle western States moves toward the textile centres of the East, while the cattle of the range States converge upon the corn fields of the middle Mississippi, whence, after fattening, they move to the slaughtering and packing centres, Chicago, Kansas City, South Omaha, Saint Joseph, Indianapolis, and Saint Louis. From these distributing points the slaughtering and packing products flow toward the markets and ports of the East. Of the cereals, corn converges upon Chicago, Saint Louis and the cities of the region between these markets; while wheat, the centre of the production of which is farther to the north, moves chiefly toward Minneapolis, Duluth, Superior, and Chicago. Most of the flour finds its way to the eastern markets and ports by rail, while the remainder and practically all the bulk grain move as far as Buffalo by water. The ores of the Lake Superior region are carried almost entirely by water to the Lake ports, Chicago, Buffalo, Cleveland, and other Erie ports, and, by an additional short rail haul, to the iron and steel manufacturing region within the quadrant defined by Cleveland, Youngstown, Pittsburg and Wheeling. The lumber of the South is carried northward and that of Maine southward by coasting vessels; while there is a large movement by rail from the interior. The lumber of the North Central States finds its way into commerce through the lakes, the Mississippi and the Erie Canal and the Hudson, as well as by through railroad connection at the southern lake ports. The lumber and grain of the Pacific States move toward the ports of San Francisco, Willamette, Tacoma, Seattle, and Portland, while the fruits are carried across the mountains and plains to the markets of the east by fast transcontinental freight trains.

While the foreign commerce of the United States is carried chiefly in foreign bottoms (see preceding section), the coastwise trade, from which foreign bottoms are excluded by the Navigation Laws is carried in shipping belonging to the United States. The increase of that shipping in total tons employed has been: (1860) 2,644,867; (1870) 2,638,247; (1880) 2,637,686; (1890) 3,409,435; (1900) 4,286,516; (1903) 5,141,037. Its distribution in 1903 is indicated in the following table of tons employed:

	Sail	Steam	Canal	Barges.	Total
Atlantic and Gulf	1,260,372	1,382,708	.....	475,975	3,149,711
Porto Rico	5,528	2,134	.....	.....	7,662
Pacific	357,856	378,958	.....	39,045	775,859
Hawaii	26,073	9,347	30,656	.....	36,320
Northern lakes	315,195	1,467,902	47,750	71,761	1,902,698
Western rivers	.....	166,949	.....	48,146	215,095

HARLOW S. PERSON,
Professor of History, Dartmouth College.

60. United States Presidents and Vice-Presidents. From 30 April 1789 to 30 April 1904 there have been 34 presidents and 29 vice-presidents of the United States. The names of these executive officers with the names of the States from which they were elected together with their tenure of office follows:

PRESIDENTS AND VICE-PRESIDENTS.

PRESIDENTS	VICE-PRESIDENTS	DATE
George Washington, of Va.	John Adams, of Mass.	April 30, 1789, to March 3, 1793.
George Washington, of Va.	John Adams, of Mass.	March 4, 1793, to March 3, 1797.
John Adams, of Mass.	Thomas Jefferson, of Va.	March 4, 1797, to March 3, 1801.
Thomas Jefferson, of Va.	Aaron Burr, of N. Y.	March 4, 1801, to March 3, 1805.
Thomas Jefferson, of Va.	George Clinton, of N. Y.	March 4, 1805, to March 3, 1809.
James Madison, of Va.	* George Clinton, of N. Y.	March 4, 1809, to March 3, 1813.
James Madison, of Va.	† Elbridge Gerry, of Mass.	March 4, 1813, to March 3, 1817.
James Monroe, of Va.	Daniel D. Tompkins, of N. Y.	March 4, 1817, to March 3, 1821.
James Monroe, of Va.	Daniel D. Tompkins, of N. Y.	March 5, 1821, to March 3, 1825.
John Quincy Adams, of Mass.	John C. Calhoun, of S. C.	March 4, 1825, to March 3, 1829.
Andrew Jackson, of Tenn.	‡ John C. Calhoun, of S. C.	March 4, 1829, to March 3, 1833.
Andrew Jackson, of Tenn.	Martin Van Buren, of N. Y.	March 4, 1833, to March 3, 1837.
Martin Van Buren, of N. Y.	Richard M. Johnson, of Ky.	March 4, 1837, to March 3, 1841.
§ William Henry Harrison, of Ohio.	John Tyler, of Va.	March 4, 1841, to April 4, 1841.
John Tyler, of Va.		April 6, 1841, to March 3, 1845.
James K. Polk, of Tenn.	George M. Dallas, of Pa.	March 4, 1845, to March 3, 1849.
‖ Zachary Taylor, of La.	Millard Fillmore, of N. Y.	March 5, 1849, to July 9, 1850.
Millard Fillmore, of N. Y.		July 10, 1850, to March 3, 1853.
Franklin Pierce, of N. H.	° William R. King, of Ala.	March 4, 1853, to March 3, 1857.
James Buchanan, of Pa.	John C. Breckinridge, of Ky.	March 4, 1857, to March 3, 1861.
Abraham Lincoln, of Illinois.	Hannibal Hamlin, of Me.	March 4, 1861, to March 3, 1865.
** Abraham Lincoln, of Ill.	Andrew Johnson, of Tenn.	March 4, 1865, to April 15, 1865.
Andrew Johnson, of Tenn.		April 15, 1865, to March 3, 1869.
Ulysses S. Grant, of Illinois.	Schuyler Colfax, of Ind.	March 4, 1869, to March 3, 1873.
Ulysses S. Grant, of Ill.	†† Henry Wilson, of Mass.	March 4, 1873, to March 3, 1877.
Rutherford B. Hayes, of Ohio.	William A. Wheeler, of N. Y.	March 5, 1877, to March 3, 1881.

§§ Died Nov. 25, 1885. ‖‖ Died Nov. 21, 1899. ¶¶ Died Sept. 14, 1901.

Election of President and Vice-President.— Under Article II. of the Constitution of the United States each State is authorized to appoint, in such manner as the legislature thereof may direct, a number of electors equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative, or person holding an office of trust or profit under the United States, shall be appointed an elector.

(Article XII. of amendments, proclaimed 25 Sept. 1804.) The Electors shall meet in their respective states, and vote by ballot for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same state with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate;— the President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted;— The person having the greatest number of votes for President, shall be the President, if such number be a majority of the whole number of Electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President, shall be the Vice-President, if such number be a majority of the whole number of electors appointed, and if no person have a majority, then from the two highest numbers on the list, the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

The first four elections were held under the 2d Article of the Constitution, which made no provision for the separation of the President from the Vice-President in the voting. In the fourth election, it was found that Jefferson and Burr had each received a majority and an equal number of the electoral votes, and the resulting contest in the House of Representatives demonstrated the need of the 12th Amendment to the Constitution.

Presidential Succession.—The Act of 1 March 1792, provided that in case of the removal, death, resignation, or inability both of the President and Vice-President, the President of the Senate *pro tempore*, and in case there shall be no President of the Senate, then the Speaker of the House of Representatives, for the time being shall act as President until the disability be removed or a President shall be elected. This arrangement continued in force until 19 Jan. 1886, when an act was approved which provided for the performance of the duties of the President, in case of removal, death, resignation, or inability of both the President and Vice-President, by the following officers in order, namely: The Secretary of State, Secretary of the Treasury, Secretary of War, Attorney-General, Postmaster-General, Secretary of the Navy, and Secretary of the Interior.

Electoral Votes for President and Vice-President of the United States of America.

ELECTION FOR THE FIRST TERM, COMMENCING 4 MARCH 1789, AND TERMINATING 3 MARCH 1793.

ROBERT BRENT MOSHER,
Chief of the Bureau of Appointments, Department of State.

62. United States — The Great Seal of the. On 4 July 1776, when the Declaration of Independence had been finally acted upon, John Hancock, president of the Continental Congress, arose and said, "We now are a nation, and I appoint Benjamin Franklin, John Adams and Thomas Jefferson a committee to prepare a device for a Great Seal of the United States of America." The committee immediately proceeded to perform its assigned duty and after six weeks of labor, during which time many designs were submitted and considered, it was agreed that the conjoint design of Jefferson be reported to Congress on 10 Aug. 1776. His device for a Great Seal was very elaborate, containing on a shield something emblematic of the several nations from which America was peopled. Jefferson's report read as follows: "The committee to whom was referred on the Fourth day of July last, the duty of preparing a device for a Great Seal of the United States of America, in Congress assembled, beg leave to report the following description:

"The Great Seal should on one side have the arms of the United States of America, which arms should be as follows: The shield has six quarters, parti, one, coupé, two. The first or, an enamelled rose, gules, and argent, for England; the second argent, a thistle proper, for Scotland; the third vert, a harp, for Ireland; the fourth azure, a fleur-de-lis, for France; the fifth or, the imperial eagle, sable, for Germany; and the sixth or, the Belgic crowned lion gules, for Holland; pointing out the countries from which the States have been peopled. The shield within a border gules, entwined of 13 escutcheons, argent, linked together by a chain or, each charged with initial sable letters, as follows: (1) N. H., (New Hampshire); (2) Mass., (Massachusetts); (3) R. I., (Rhode Island); (4) Conn., (Connecticut); (5) N. Y., (New York); (6) N. J., (New Jersey); (7) Penn., (Pennsylvania); (8) Del., (Delaware); (9) Md., (Maryland); (10) Va., (Virginia); (11) N. C., (North Carolina); (12) S. C., (South Carolina); (13) Ga., (Georgia); for each of the 13 independent States of America.

"Supporters, dexter, the Goddess of Liberty, in a corslet of armor, in allusion to the then state of war, and holding in her right hand the spear and cap, and with her left supporting the shield of the States; sinister, the Goddess of Justice, bearing a sword in her right hand, and in her left a balance.

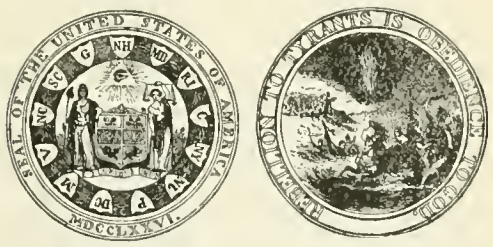
"Crest, the eye of Providence in a radiant triangle, whose glory extends over the shield and beyond the figures; motto, 'E Pluribus Unum.'

"Legend round the whole achievement, 'Seal of the United States of America, MDCCLXXVI.'

"On the other side of the said Great Seal should be the following device:

"Pharaoh sitting in an open chariot, a crown on his head, and a sword in his right hand, passing through the divided waters of the Red Sea, in pursuit of the Israelites. Rays from a pillar of fire in the cloud, expressive of the divine presence and command, beaming on Moses, who stands on the shore, and extending his hand over the sea, causes it to overthrow Pharaoh.

"Motto, 'Rebellion to Tyrants is Obedience to God.'"



Conjoint Devices — Reported by Jefferson.

Without any additional remarks, after having finished reading, Jefferson quietly took his seat. Congress referred the report back to the committee, asking for an early supplemental report. It may be interesting to learn how Jefferson came to make the report and also learn what Franklin and Adams contributed to the committee's report. A Frenchman, Du Simetière by name, had been requested to attend the committee meeting, he being the most expert pen-and-pencil artist in Philadelphia. He took great interest in the American cause; and his attention was early called to the fact that in America, artists were in demand; and, in consequence he began painting profiles in black, of distinguished Americans and caricatures of prominent Englishmen engaged in the war. His paintings and miniatures had attracted general attention, which led the committee to engage him to sketch devices for a Seal. Du Simetière proposed a Norman shield divided into six quarterings.

First Quartering symbolized the English inhabitants of this country and placed first upon the shield to indicate that they were a primary factor in the new confederacy. English civilization was planted among the forests of America as early as 1607, in the colony of Virginia.

Second Quartering was intended for Scotland, a thistle in its proper color or an argent field, representing Scotch people as included in our national fold.

Third Quartering, green, with a harp of gold, was to be the respected symbol of Ireland, and was placed upon the shield as a token to the Irish patriots who took an active part in the war for independence.

Fourth Quartering was supposed to do honor to the French people.

Fifth Quartering, in honor of the German settlers was a golden field and upon it the imperial black eagle.

The Sixth Quartering represented the Dutch and a lion in gules was the emblem.

The dexter supporter of the shield was the Goddess of Liberty, with a Phrygian cap on a staff. The sinister supporter was to typify a continental soldier in uniform, holding in right hand a hatchet, in the left a gun. As a motto or "war cry" the Latin words, "*Bello vel Pace.*" Above the shield an eye of Providence. The border contained the words: "The Great Seal of the United States of America."

Franklin proposed for a Seal, Moses lifting his wand and dividing the Red Sea, and Pharaoh and his chariot overwhelmed with the

Du Simetière's Design of Seal.

Franklin's Suggestion.

waters. For a motto well befitting the existing circumstances and one that would be a cherished "war cry" for future generations he suggested: "Rebellion to Tyrants is Obedience to God." Franklin's aim was to depict that Providence favored slaves and bondsmen, and destroyed tyrants and usurpers; and for his illustration he chose the war between the Israelites and Egyptians. In modern times the legend on his design began to be used about 1645, and was then used as a "war cry" by Cromwell's party; it was intended to refer to Charles I. The reinvention has been attributed by some, to Oliver Cromwell, but later research would indicate that John Bradshaw, president of the court of judges who tried Charles I., is the person who gave voice to this expressive motto. Thomas Jefferson later adopted this motto as his sentiment on his personal seal. But Jefferson suggested to the committee that the Seal contain an obverse and a reverse side: on the former the Children of Israel, led by a "cloud" by day and a "pillar of fire" by night; on the latter Hengist and Horsa the "Saxon Chiefs, from whom we claim the honor of being descended, and whose political principles and form of government we are now about to assume."

John Adams' proposal was of a different character; he recommended — so the report tells, "The choice of Hercules, as engraved by Gribelin in this edition of Lord Shafteshury. You notice the hero resting on a club; Virtue pointing to her rugged mountain on one hand, and persuading to ascend; and Vice glancing at her flowery paths of pleasure, wantonly reclining on the ground, displaying the charms both of her eloquence and person, to seduce him into vice." Hercules, as the central figure, was to symbolize the young nation; indicating strength, valor, perseverance, and immortality. The Goddess of Pleasure, on the sinister side, was to depict all forms of corruption, and would thoroughly represent a lack of dignity and respect, or the seven vices — pride, wrath, envy, lust, gluttony, avarice and sloth. The Goddess of Virtue, on the dexter side, was to be the guide of the young government and as such would enforce her "seven cardinal excellences," namely, Faith; Hope; Charity; Prudence; Justice; Fortitude, and Temperance.

These few designs were then carefully considered by the committee and finally Franklin suggested that the draughts be placed in Jefferson's hand and that he select the meritorious features in all and combine them into a conjoint device. This is how it came about that Jefferson reported to Congress the composite device for a Great Seal. In this conjoint design by Jefferson, we see several new ideas — namely, a goddess of Justice, and the 13 shields in the border, representing the colonies, bound together by 13 links of a chain. He also added the motto, "E Pluribus Unum," and his drawing dated the Seal MDCCLXXVI.

In the spring of 1779, Congress was overjoyed at the evacuation of Philadelphia and anon returned to the patriotic city to continue its important work, and again the Continental Congress began to arrange for a Committee on Great Seal. On the afternoon of Wednesday 24 March 1779, James Lovell of Massachusetts addressed the Continental Congress on the "Grand Future of the United States," referring in the course of his speech to the grand triumph of Gates over the British at Saratoga. John Jay was the presiding officer, and he appointed Mr. Lovell of Massachusetts, with Scott of Virginia, and Houston of Georgia, as a committee, requesting that they report within a fortnight. The committee immediately set to work, but the bulk of the labor fell to the hands of Chairman

Adams' Design.

Lovell, who applied for artistic assistance to Du Simetière, who had done justice to the devices suggested by the former committee. After a lapse of some 10 days Lovell showed his device to his coadjutors, who highly approved of the same, and on the 10 May following the committee reported that —

The Seal shall be four inches in diameter; on one side the arms of the United States as follows:

The Shield charged in the field with thirteen diagonal strips, alternately red and white.

Supporters: Dexter, warrior holding a sword; sinister, a figure representing Peace, bearing an olive branch.

The Crest, a radiant constellation of thirteen stars.

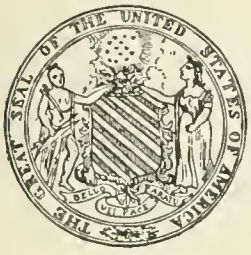
The Motto: "Bello vel Pace."

The Legend round the achievement, "Seal of the United States."

On the Reverse: The Figure of Liberty, seated on a chair, holding the staff and cap.

Motto: "Semper"; underneath, "MDCCLXXVI."

The report made a favorable impression on the members. On account of important matters demanding immediate attention, further consideration of the Seal was postponed until 17 May, when after a lengthy and heated discus-



Lovell's Design (Obverse). Lovell's Design (Reverse).

sion, the report was ordered to be recommitted. The committee to whom was recommitted the re-devising of the proposed Seal, made their report on Wednesday, 17 May 1780, just one year to the day, when they gave their first report. The chairman, Mr. Lovell, rose in Congress and read:

The Committee, to whom was referred, on the 17th of March last (1779), the report of a former Committee on the devices of a Great Seal of the United States in Congress assembled, beg leave to report the following description:

The Seal to be three inches in diameter, on one side the Arms of the United States as follows: The Shield charged in field azure, with thirteen diagonal stripes, alternate rouge and argent.

Supporters: Dexter, a Warrior holding in hand a bow and arrow. Sinister, a figure representing Peace, bearing the olive branch.

The Motto: "Bello vel Pace Paratus."

The Legend around the achievement: "The Great Seal of the United States."

On the Reverse: The figure of Liberty seated on a chair holding a staff and cap.

The Motto: "Virtute Perennis." Underneath, MDCCLXXX.

Much to the surprise of the committee, and especially Mr. Lovell, the Continental Congress was hard to please, and contrary to what they had expected, their report was rejected; and once more the matter of a Seal rested till months and even years rolled by. Early in April 1782, John Hanson, then president of the Confederation Congress, briefly addressed that body on the necessity of a National Seal, and appointed Henry Middleton, Elias Boudinot, and Edward Rutledge as a committee to prepare a suitable device. The committee, after a diligent search for something appropriate, finally agreed that they report substantially as the committee of 1780, and so on 9 May 1782, Chairman Middleton submitted the former designs. In consequence of Congressional dissatisfaction the entire previously submitted devices were, on 13 June 1782 referred to Charles Thomson, secretary of the Confederation Congress. On 13 June 1782, immediately after his appointment, he, in the company of Dr. Arthur Lee and Elias Boudinot, set out soliciting designs for the Seal. They had called on several prominent men of Philadelphia, requesting, they should devise designs, and among those called upon was one, a young and talented graduate, Will Barton, A.M., brother of the patriotic Dr. Benjamin Barton. Young Barton unhesitatingly told Thomson, that he would diligently comply with the request, and the three missionaries left, feeling sure that an appropriate device would ripen ere the next morn. Barton at once began rummaging through his few books on heraldry, and after remaining up nearly all that night, retired believing that the question of an ideal Seal was solved. Some few days after Barton submitted the following:

Arms.—Paleways of thirteen pieces, argent and gules; a chief azure; the escutcheon placed on the breast of an American eagle (the bald-headed), displayed proper; holding in his beak a scroll, inscribed with the motto, viz.:

"E Pluribus Unum,"

and in his dexter talon, a palm or an olive branch; in the other a bundle of thirteen arrows; all proper.

For the Crest.— Over the head of the eagle, which appears above the escutcheon, a glory, or breaking through a cloud, proper, and surrounding thirteen stars, forming a constellation, argent on an azure field.

In the exergue of the Great Seal,

Jul IV., MDCCLXXVI."

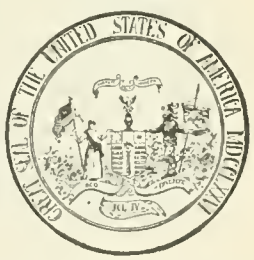
In the margin of the same,

"Sigil. Mag. Reipub. Confœd. Americ."

Remarks.—The escutcheon is composed of the chief and pale, the two most honorable ordinaries; the latter represents the several States, all joined in one solid compact entire, supporting a chief, which unites the whole and represents Congress. The motto alludes to the Union. The colors or tinctures of the pales are those used in the flag of the United States. White signifies purity, innocence; red, hardiness and valor. The chief denotes Congress. Blue is the ground of the American uniform, and this color signifies vigilance, perseverance, and justice.

The meaning of the crest is obvious, as is likewise that of the olive branch and arrows.

Mr. Thomson was highly pleased with Barton's device, but intimated that the design if anything was too plain, whereupon Barton of-



Barton's First Design. Barton's Second Design.

fered to complete another. On 15 June Barton again called at Thomson's residence where he found the secretary, Dr. Arthur Lee and Elias Boudinot awaiting his arrival. After a few moments of verbal exchange he handed them a large drawing with the following description:

A device for an armorial achievement for the Great Seal of the United States of America, in Congress assembled, agreeable to the rules of Heraldry, proposed by William Barton, A.M.

Arms.—Barry of thirteen pieces, argent and gules, on a canton azure, and many stars disposed in a circle of the first; a pale or, surmounted of another, of the third, charged in chief, with an eye surrounded with a glory proper; and in the fess-point an eagle displayed on the summit of a Doric column, which rests on the base of the escutcheon, both as the stars.

Crest.—Or an helmet of burnished gold damasked, grated with six bars, and surmounted with a cap of dignity, gules, turned up ermine, a cock armed with gaffs proper.

Supporters.—In the dexter side: the genius of America (represented by a maiden with loose auburn tresses),

having on her head a radiated crown of gold encircled with a sky blue fillet, spangled with silver stars, and clothed in a long loose white garment bordered with green. From her right shoulder to her left side a scarf, semee of stars, the tinctures thereof the same as in the canton; and round her waist a purple girdle, fringed or embroidered, argent, with the word "Virtue," resting her interior hand on the escutcheon, and holding in the other the proper standard of the United States, having a dove argent perched on the top of it.

On the sinister side; a man in complete armor, his sword-belt azure fringed with gold, his helmet encircled with six bars, and surmounted by a red cap of dignity, two blue plumes; supporting with his dexter hand the escutcheon, and holding in the interior a lance, with the point sanguinated, and upon it a banner displayed, vert; in the fess-point a harp strung with silver, between a star in chief, two fleurs-de-lis in fess, a pair of swords in saltier, in basses, all argent. The tenants of the escutcheon stand on a scroll, on which is the following motto:

"Deo Favente,"

which alludes to the eye in the arms, meant for the eye of Providence.

Over the crest, in a scroll, this motto:

"Virtus Sola Invicta."

After thoroughly discussing the matter they agreed, that Barton had done exceedingly well, but they believed the device entirely too elaborate and complex; and also that he had failed

Barton's Third Design (Obverse).

Barton's Fourth Design (Reverse of third design).

to present them with a design of the reverse side of his proposed seal. Mr. Barton, however, satisfied them that he would abridge the obverse, and furnish a reverse by the next meeting, which they agreed should be the following night. As per appointment he called 16 June and presented his new sketches, the description of which is as follows:

OBVERSE SIDE.

Arms: An escutcheon consisting of a blue border, spangled with thirteen white stars, and divided in the centre, perpendicularly by a gold bar; on each side of this division, within the blue border; thirteen bars or stripes, alternately white and red, like the American flag, adopted 14 June 1777. Within the Doric column a gold bar bearing a displayed eagle on its summit.

Crest: A helmet of burnished gold, and engrated with six bars, and surmounted by a red cap of dignity such as dukes wear, with an ermine lining; supporting a displayed cock armed with gaffs, in the sinister talon he held the new ensign of the Confederacy, the stars and stripes—and in the dexter talon a sword, on the point of which was suspended a wreath of laurels. Above the crest this motto:

"In Vindiciam Libertatis."

Supporters: On the dexter side, the genius of America (represented by a maiden with loose, auburn tresses), having on her head a radiated crown of gold, encircled with a sky-blue fillet, and clothed in a long loose white garment, bordered with green. From her right shoulder to her left side a scarf, semee of stars, the tinctures thereof the same as in the shield-border, and around her waist a blue girdle, fringed or embroidered with silver; her sinister hand rested on and supported the shield, and upon her dexter hand was perched a dove argent.

The sinister supporter was an ideal or typical American soldier dressed in a uniform peculiar to an American, with a naked sword in the hilt, on his head a felt hat, distinguishing him as an officer, with his dexter hand resting on the escutcheon, and in his sinister a wrapped roll of paper (evidently the Declaration of Independence). The tenants of the escutcheon stand on a scroll on which is the following motto: "Virtus Sola Invicta."

The entire is designated as "Great Seal of the American Confederacy." He proposed as the reverse, the following:

An unfinished pyramid, consisting of ten layers of stone. [He undoubtedly intended that there should be thirteen.] In the zenith, the eye of Providence, surrounded with a glory. Over or about the eye the Latin phrase "Deo Favente"—with God's favor. At the base of the pyramid the word "Perennis"; the former motto is the same as on his second design and the latter is taken from the device of the second committee on the Seal.

Secretary Thomson decided he would report the first design of Mr. Barton as the obverse and his fourth design as the reverse, as follows:

The Secretary of the United States, in Congress assembled, to whom were referred the several reports of committees on the device of a Great Seal to take order reports:

That the device for an armorial achievement and reverse of a Great Seal for the United States in Congress assembled, is as follows:

Arms: Paleways of thirteen pieces, argent and gules, a chief azure. The escutcheon on the breast of the American bald eagle, displayed proper, holding in his dexter talon an olive branch and in his sinister, a bundle of thirteen arrows, all proper, and in his beak a scroll, inscribed with this motto:

"E Pluribus Unum."

For the Crest: Over the head of the eagle, which appears above the escutcheon, a glory, or breaking through a cloud proper, and surrounding thirteen stars, forming a constellation, argent on an azure field.

Reverse: A pyramid unfinished. In the zenith an eye in a triangle, surrounded with a glory proper. Over the eye these words:

"Annuit Coeptis."

On the base of the pyramid the numerical letters MDCCLXXVI., and underneath the following motto:

"Novus Ordo Seclorum."

Thomson's report was adopted on 20 June 1782, and Congress instructed him to have the design executed in metal. Accompanying the sketch was the following definition of the Seal; this is the authentic meaning of our emblem:

Adopted Seal (Reverse).

Adopted Seal (Obverse).

Remarks and Explanations: The escutcheon is composed of the chief and pale, the two most honorable ordinaries. The pieces paly, represent the several states all joined in one solid compact entire, supporting a chief which unites the whole and represents Congress. The motto alludes to this Union. The pales in the Arms are kept closely united by the chief, and the chief depends upon that union, and the strength resulting from it for its support to denote the Confederacy of the United States of America, and the preservation of the Union through Congress.

The colors of the pale are those used in the flag of the United States of America; white signifies purity and innocence; red, hardiness and valor; and blue, the color of the chief, signifies vigilance, perseverance, and justice. The olive-branch and arrows denote the power of Peace and War, which is exclusively vested in Congress. The constellation denotes a new State taking its place and rank among sovereign powers. The escutcheon is borne on the breast of the American eagle, without any other support, to denote that the United States of America ought to rely on their own virtues.

Reverse: The pyramid signifies strength and duration. The eye over it and the motto, allude to the many and signal interpositions of Providence in favor of the American cause. The date underneath is that of the Declaration of Independence; and the words under it signify the beginning of the new American era which commences from that date.

It has been claimed of late years, that we owe the design for our nation's mark, to Sir John Prestwick of England. That this statement has been made through carelessness and lack of thorough research on the part of our historical writers, can easily be proven; and inasmuch as we have definite authority to establish this proof let us as Americans closely stand by our American patriot, Will Barton, and give him this honor due and preserve his name among the other great benefactors of the Union. The following letter Secretary Thomson wrote Will Barton a few days after the adoption of the Great Seal, and in it there is all the evidence possible to refute the claims of the Royalists. It is as follows:

Philadelphia, Penn.

MR. WILL BARTON, *Sir:*

I am much obliged for the perusal of the 'Elements of Heraldry' which I now return. I have just dipped into it so far as to be satisfied that it may afford a fund of entertainment, and may be applied by a State to useful purposes. I am much obliged for your very valuable present of 'Fortescue de Laudibus Legum Angliæ,' and shall be happy to have it in my power to make a suitable return.

I enclose you a copy of the device by which you have displayed your skill in beraldic science, and which meets with general approbation.

I am, sir, Your obedient, humble servant,
(Signed) CHARLES THOMSON.
June 24, 1782.

In reference to the above letter Mr. Barton in after years wrote the following note, which goes to corroborate the statement, that he designed the present Great Seal of the United States:

Lancaster, Penn.

In June 1782, when Congress was about to form an armorial device for a Great Seal for the United States, Charles Thomson, Esq., then secretary, with the Hon. Arthur Lee and Elias Boudinot, members of Congress, called on me and consulted me on the occasion. The Great Seal, for which I furnished those gentlemen with devices (as certified by Charles Thomson, Esq.), was adopted by Congress on the 20th of June 1782. Mr. Thomson informed me four days after the design met with general approbation.

(Signed) W. BARTON.

Charles Thomson had the obverse side of the seal cut in brass — the reverse side was never cut or used. Strictly speaking the national documents are not sealed as the enactment calls. The first time the Great Seal was used it was found on a commission dated 16 Sept. 1782, granting full power and authority to Gen. George Washington for arranging with the British for exchange of prisoners of war. This commission is signed by John Hanson, president of the Confederation Congress, and countersigned by Charles Thomson, secretary of the same body; the seal on this document being impressed upon the parchment, over a white wafer, fastened by red wax in the upper left hand corner, instead of the lower left hand corner as is now the custom. This document is in the possession of the State Department and few papers are more carefully stored or more highly cherished. The seals of many of our States contain emblems borrowed from the "Great Seal." This is also true of many of the seals of government departments. The historic and much admired china set of the White House has the Great Seal blazoned upon every piece — the seal being in heraldic tinctures. The Great Seal of the United States being used very frequently, its wear of necessity is great, and several secretaries of state had it retouched and corrected. Officially the Great Seal has been changed in Webster's term, in Frelinghuysen's term, and in John Hay's term.

In 1841, during the administration of President Tyler, it was found by Webster, then secretary of state, that the Seal was badly worn and beyond the engraver's power of redemption. The President then ordered that Webster see that a new Seal be engraved. The engraver, it seems, found it difficult to engrave the bundle of 13 arrows, and with Webster's advice and consent agreed that six arrows would suffice.

Second Great Seal — 1841 (Webster's).

Present Great Seal.

In 1885, during the administration of Chester A. Arthur, Mr. Frelinghuysen, the secretary of state, found that the Great Seal was badly worn and beyond restoration. The secretary consulted Mr. Arthur, who ordered that a new Seal be executed. This Seal also lacks the true heraldic significants. In 1903 Secretary John Hay's attention was called to the lapses in the execution of the Seal and President Roosevelt ordered that a new one be made. The present Seal is a beautiful emblem and is considered the most artistic "hand mark" of the nations. See SEAL.

United States Christian Commission, a unique and almost unparalleled association in its origin and operation, which came into existence during the Civil War, for the purpose of promoting the spiritual welfare of the Federal soldiers, sailors, marines, etc., while alleviating, comforting, and humanizing their temporal needs. It originated at a convention of the Young Men's Christian Associations of the Northern States, called for the purpose 16 Nov. 1861, in the city of New York, and while the war lasted was in full operation. Its activities became familiar to nearly everyone throughout the entire community and the civilized world, and it received liberal and generous support in voluntary services, money, supplies, and literature. The appointed members of the commission were George H. Stuart, Philadelphia; Rev. Rollin H. Neale, D.D., Boston; John P. Crozer, Philadelphia; Bishop E. S. Janes, New York; Rev. M. L. R. P. Thompson, D.D., Cincinnati; Hon. B. F. Manierre, New York; Col. Clinton B. Fiske, Saint Louis; Rev. Benjamin C. Cutler, D.D., Brooklyn; John V. Farwell, Chicago; Mitchell H. Miller, Washington; and John D. Hill, M.D., Buffalo. The commission met at Washington, D. C., and organized by appointing George H. Stuart as chairman; Hon. B. F. Maniere, treasurer; Rev. A. M. Morrison, secretary; while the executive committee was composed of George H. Stuart, Bishop Janes, Dr. Cutler, Charles Demond, and the Hon. B. F. Manierre. The commission was located at first in New York. During the first year changes in the commission were filled by Jay Cooke, Philadelphia, and Rev. James Eels, D.D., Brooklyn. The Rev. W. E. Boardman replaced the Rev. A. M. Morrison as secretary; Joseph Patterson the Hon. B. F. Manierre as treasurer; and for convenience the commission removed to Philadelphia. While the central office of the commission was in Philadelphia, important auxiliary branches were organized in all the large cities and towns, whose officials and members were especially active in promoting this great mission of mercy.

As the operations of the committee involved large expenditures, it was necessary to make proper provision to meet them. From the commencement the finances were carefully managed. The committee resolved to incur no responsibilities which could not be promptly met, and to this rule they steadily adhered. The policy inspired public confidence, and contributed not a little to the prosperity and efficiency of the commission. The usual mode of awakening and continuing an interest in its behalf was by spreading information before the people through the religious and secular press, by public meetings, by special appeals and by enlisting the clergy to bring the subject before their congregations. This latter method was productive of large results. Lotteries, raffles, and other doubtful means of raising funds, then much in vogue, sensational or clap-trap appeals, were studiously avoided. To select, commission, and send forth persons to act as delegates was a most important and delicate duty. These persons represented, on the one hand, the commission and the Christian and patriotic sentiment of the people; and on the other, had to accommodate themselves to the rules of the military and naval service, commend themselves and their work to the officers in charge, and minister acceptably to the physical, mental, and religious wants of the men. To the appeal of the commission for helpers there was a whole-hearted response, and the difficulty arose to make a proper selection from among those who offered their services; 4,859 delegates were commissioned during the war. From its origin to its close the commission had the warm approval of the general government, and received every possible facility for carrying out its operations; transportation and telegraph companies assisted, and the American Bible and Tract Societies donated for distribution thousands of their publications. The cash receipts of the commission during the four years of the war amounted to $2,524,512; the value of the stores donated was $2,839,445; the value of the publications donated was $300,000. Chapels for religious worship and temporary libraries were established in the camps; 136,152 sermons were preached and prayer meetings held, and, among other work, the delegates wrote 92,321 letters and gave the dead Christian burial, also suitably marking the graves of the known dead. Consult: 'United States Christian Commission — Facts, Principles, and Progress' (1863); 'Memorial Record of the New York Branch of the United States Christian Commission' (1866).

United States Daughters of 1812, National Society of. This society is an organization founded for the purpose of memorializing historical events from the close of the war of the American Revolution to the formation of the United States (as such) and till the close of the second war with Great Britain in 1815, to collect all historical, genealogical and biographical data, to search for and bring to light any valuable documents pertaining to that period and to carefully classify and preserve the same. It is preparing a home where the descendants of the patriots of that time can be sheltered as old age, loss of friends and money leaves them uncared for. It takes up all patriotic work called forth by current circumstances such as that of the Spanish-American war, when it sent nurses and books and necessities to the army and cared for the families which were left in need at home. It has placed tablets in historical places — one in the Post Chapel at West Point in honor of the army of that period, one on Columbia College to mark the "Chain of Defenses" in 1818–1815, and is now preparing one for Lundy's Lane. The monument is being completed on the Field of Chalmette (Battle of New Orleans) and one put up in Detroit in honor of Gen. Alexander Macomb, and in Plattsburg, N. Y., in honor of the victory there. Efforts are being made to save the frigate Constitution, the sloop Polly (in commission from Maine in 1814), to raise Perry's flag-ship — the Niagara — and to hold in patriotic remembrance the Constellation, the oldest naval vessel now in existence. It sends remembrances to Hiram Kronk, the only survivor of that war, now 104 years of age, and commemorates the birth of the United States Navy (by the naval

memorial exercises of casting flowers upon the water in honor of those lost in action, and by furnishing rooms in the buildings built for the navy in Brooklyn and in California); honors the framing and adoption of the Constitution of the United States, and their formation, and rejoices that the 'Star Spangled Banner' was so loyally brought forth by Francis Scott Key under the influence of the action at Fort McHenry. The Western States are marking the spots of protection during that pitiless border warfare which succeeded the Revolution.

This present society is the outcome of the "General Society United States Daughters 1812," founded by Flora Adams Darling in 1892, on the anniversary of the Battle of New Orleans, 8 January. Its work begins where that of the revolutionary commemorative societies leaves off, namely, when the Treaty of Peace was ratified by the Congress in session on 14 Jan. 1784. The qualifications for membership are: Any woman over 18 years of age, of good character, and a lineal descendant of an ancestor who rendered civil, military, or naval service during the War of 1812, or the period of the causes which led to that war (subsequent to the War of the Revolution), 14 Jan. 1784 to 2 Nov. 1815, may be eligible to membership, provided, the applicant be acceptable to the society. Girls under 18 and over 10 years of age can join this society, and shall be called "Juniors." This comprises women whose lineal ancestors took part in the framing of the Constitution of the United States, members of any of the congresses during the administration of Presidents Washington, Adams, Jefferson, Madison, and the first two years of President Monroe, were in the Wyoming Disturbances in Pennsylvania, Shay's Rebellion in Massachusetts, Wars with the Miamies, Wyandotts, Delawares, Pottawatamies, Shawnees, Chippewas and Ottawas, during the Whiskey Rebellion in Pennsylvania, War with France, War with Tripoli, Burr Conspiracy, Sabine Expedition in Louisiana, the Naval affair on the Chesapeake, the Embargo Troubles on Lake Champlain, War with the Northwest Indians, Florida Seminole War, Peoria Indian War, Creek Indian War, the Louisiana Purchase Commissioners and the Second War with Great Britain up to the time when Commodore Decatur's treaty with the Algerians was ratified by the United States Congress on 2 Nov. 1815.

The name "United States Daughters" covers the period from 1784 to 1812. "Daughters of 1812" the period from 1812 to 1815, and the two names are connected without a repetition of the word "Daughters." The form of organization is as near that of the United States Government as is possible. The entire society is the people. The associate council of delegates is the Congress. The executive board is the cabinet, while each organized State is perfectly independent as is each of the United States.

The five years from 1892 to 1897 ended in the organization of the following States: New York, Mrs. William Gerry Slade, president; Louisiana, Mrs. John B. Richardson, president; Michigan, Mrs. Alfred Russell, president. In 1901 the society received a federal incorporation by act of the Congress of the United States, its charter being one of the last — if not the last — bill signed by President McKinley, on 25 February, is as follows, and contains its purposes:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That Mrs. Flora Adams Darling, of New York; Mrs. William Gerry Slade, of New York; Mrs. Louis W. Hall, of Pennsylvania; Mrs. Edward Roby, of Illinois; Mrs. M. A. Ludin, of New York; Mrs. Le Roy Sunderland Smith, of New York; Miss Helen G. Bailey, of New Hampshire; Mrs. Alfred Russell, of Michigan; Mrs. William Lee, of Massachusetts; Mrs. William Tod Helmuth, of New York; Mrs. Nelson V. Titus, of Massachusetts, their associates and successors, are hereby created a body corporate and politic in the District of Columbia, by the name of the National Society of United States Daughters of Eighteen Hundred and Twelve, for patriotic, historical, educational and benevolent purposes, the objects of which are as follows: To perpetuate the memory and spirit of the men and women who were identified with the war of eighteen hundred and twelve by publication of memoirs of famous women of the United States during that period, and the investigation, preservation, and publication of authentic records of men in the military, naval and civil service of the United States during the said period; by making the society one of the factors of educational and patriotic progress, and by the promotion and erection of a house or home where the descendants of the zealous and brave patriots who achieved American independence who have need of such a home may be sheltered from the storms of life.

That the said society is authorized to hold real and personal estate in the United States, so far only as may be necessary to its lawful ends, to an amount not exceeding two hundred thousand dollars, and may adopt a constitution and make by-laws not inconsistent with law, and may adopt a seal.

At this time the following States had been added: 1897, Pennsylvania, Mrs. Louis W. Hall; 1897, Massachusetts, Mrs. Nelson V. Titus; 1900, Maine, Mrs. Charles A. Dyer; 1900, Ohio, Mrs. T. L. A. Greve; 1900, Maryland, Mrs. Robert C. Barry; 1901, Wisconsin, Mrs. Charles Catlin. Since then, and up to 1904, the additional organized States are: Vermont, 1901, president, Mrs. Clarence F. R. Jenne; Georgia, 1901, president, Miss Nina Hornady; Missouri, 1901, president, Mrs. Western Bascome; New Jersey, 1901, president, Miss M. Louise Edge; Colorado, 1902, president, Mrs. William T. Gauss; Delaware, 1902, president, Mrs. Millard F. Corkran; Illinois, 1903, president, Mrs. Robert Hall Wiles; Texas, 1903, president, Mrs. Z. T. Fulmore; District of Columbia, 1903, president, Mrs. Frank Wheaton; Mississippi, 1903, president, Mrs. William R. Wright.

Organizing presidents have been appointed in Alabama, Miss E. J. Hansell; Washington, Mrs. Esther Allen Jobes; Iowa, Miss Mary C. Key; New Hampshire, Miss Elizabeth Flather; Arkansas, Mrs. Charles Henry Wilmans; Kentucky, Mrs. George H. Wilson.

There have been but two national presidents, Mrs. Flora Adams Darling (till 1897) and Mrs. William Gerry Slade of New York city.

The national vice-presidents have been: Mrs. Stephen Adams, Webster, Ohio; Miss Georgina Campbell, Ohio; Mrs. Celestra Waldron, Ohio; Mrs. William Gerry Slade, New York; Mrs. Louis W. Hall, Pennsylvania; Mrs. George A. Ludin, New York; Mrs. William H. Brearley, New York; Mrs. Charles A. Dyer, Maine; Mrs. Alfred Russell, Michigan; Mrs. Nelson V. Titus, Massachusetts; Mrs. Western Bascome, Missouri; Mrs. Sullivan Johnson, Pennsylvania.

The 18 honorary vice-presidents national in honor of the 18 States in the Union at the time of the War of 1812 are as follows: Mrs. Louis J. Allen, Mrs. A. M. Bailey, Mrs. Braxton Bragg, Mrs. William H. Brearley, Mrs. Jefferson Davis, Mrs. J. C. Fremont (deceased), Miss Elizabeth Benton Fremont, Mrs. James A. Garfield, Mrs. Ulysses S. Grant (deceased), Miss

Mary Grace Hall, Mrs. J. D. Iglehart, Mrs. Sullivan Johnson, Mrs. William Lee, Mrs. William A. McKinley, Mrs. Edward Roby, Mrs. Russell Sage, Mrs. Nellie Grant Sartoris, Mrs. Letitia Tyler Semple, Mrs. William Gerry Slade, Mrs. Leroy Sunderland Smith.

MRS. WILLIAM GERRY SLADE,
National President and New York State President.

United States, Decorative Art in. See DECORATIVE ART IN THE UNITED STATES.

United States Indian Training and Industrial School, at Carlisle, Pa. It was established on the present site in 1879; but its real beginning was in 1875, when 74 Indians were brought as prisoners of war to Fort Marion, Saint Augustine, Fla. When put to work at the fort they proved intelligent and trustworthy, and their skill as workmen aroused the interest of some of the women of Saint Augustine, who established a school for them and taught them English. In 1878, when their term of confinement was over, 22 asked to stay in the East to attend school, 17 of whom were placed at Hampton Institute; Capt. R. H. Pratt of the United States army was then authorized to bring 50 more Indians from the Dakota reservation to Hampton. He soon found that a separate school for the Indians was desirable, and the abandoned army post at Carlisle was assigned for the uses of a school in 1879. In October of that year he brought the first Indian pupils to Carlisle. The aim of the school has always been to prepare the Indians to take part in the life of a civilized community as citizens on an equality with other citizens, and thus to free them from especial and separate supervision. The courses offered are of elementary and secondary grade, and are grouped about four central subjects, the English language, history and literature, science, and form and number (including geometry and algebra). There are also excellent music and art departments. A normal department was organized in 1894 and provides instruction in psychology (elementary), pedagogics, history of education, and methods of teaching sloyd, with practice work. The industrial work is a prominent feature, half the school day being devoted to some productive industry. Instruction and practice is given in carpentry, blacksmithing, painting, harness-making, tinsmithing, shoe-making, laundry work, hospital and nurse work, sewing, household and domestic economy (including special course in bread-making), farming and dairying. Another important part of the work is the systematic physical training, gymnastic classes being arranged for boys and girls in all grades; athletic sports are also encouraged, and the football team has a national reputation for excellent playing. The most distinctive feature of the school is the "outing system," by which the school requires all its students to spend at least one year in some white family under the supervision of the school. During the winter they attend the public school in their neighborhood, and when not in school receive regular wages for work on the farm or in the home; a portion of these wages is placed in the school bank and draws interest. This system, which has been in force since the beginning of the schools, has proved eminently successful; the Indians have been pleasantly welcomed in the homes to which they go, and have proved themselves, as a rule, helpful and congenial members of the family. Over 800 pupils are sent out every summer, and about half that number remain out every winter. The aim of this system is to enable the Indians to gain direct, personal experience in self-support by honest work, and an insight into the responsibilities and amenities of civilized family and institutional life in its best and most attractive forms. The united earnings of the students who were working outside, in 1902–3, amounted to $31,393. A weekly paper, 'The Red Man and Helper,' is printed in the school shop by Indians. The school is under the control of the Indian Office of the United States government, and is supported by government appropriation. The students in 1904 numbered 1,069; the total enrolment since the beginning was 5,135.

United States Military Academy. See MILITARY ACADEMY, UNITED STATES.

United States National Museum, a national depository for scientific and historical collections under the administration of the Smithsonian Institute (q.v.), located at Washington, D. C. The beginning of the museum was Smithson's cabinet of minerals, and other collections gathered by exploring expeditions, which had been placed under the charge of the Smithsonian Institute by the act establishing it in 1846. The name of United States National Museum was not adopted until 1876, when the Smithsonian Institute added to the collections already made the exhibits prepared to illustrate the resources and ethnology of the United States at the Centennial Exhibition, together with a large amount of material presented by 34 foreign nations. In 1879 Congress appropriated $250,000 for a museum building; but this has for some time been inadequate for the proper housing of the collections, and a new building was provided for in 1903 by the appropriation of $3,500,000. The chief means of adding to the collection are by the specimens gathered by government explorations and surveys, by exchanges, by gift, and by limited purchases provided for in the Congressional appropriation. The museum is under the general direction of the secretary of the Smithsonian Institute, and under the special charge of an assistant secretary and curators, appointed by the secretary; and receives an annual appropriation from the government. Its collections are naturally best for matters relating to North America; the material illustrating the arts and occupations of the American Indians and the fisheries of the United States is particularly valuable; and the historical collections containing personal relics of famous Americans are interesting. The Museum publishes 'Proceedings' and an 'Annual Report,' containing scientific articles describing or illustrating the collections; aid is also given to students in using the collections for purposes of scientific research.

United States, Painters of. We must look upon Benjamin West (1738–1820) as the first of the American painters. Of course art on the American continent in his days was an exotic, and most of West's life was spent in London; yet he was born in Pennsylvania and early brought up under American influences and did not go to London until he was 25 years of age. He painted history and portraits, and his influence on the English school of painting was certainly of transatlantic origin, for he taught them to abandon such conventionalities as the use of classic costume in the treatment of heroic subjects of modern time like the 'Death of Nelson' and the 'Death of General Wolfe'. It must, however, be said that his compositions were over-studied and not natural; the action conventional and melodramatic; the draperies, though learned, heavy and untrue; his color deficient in freshness and variety. His figures are often vapid and without character; yet he preserved a certain dignity and consistency in the treatment of his subjects which almost raised his mediocrity to excellence. Perhaps his best works are his life-sized portraits and family groups, and his greatest misfortune was that he left the new world for the old and submitted himself to the conventionalities of London instead of working out a new field in the life of his native land. One of his best and most natural pictures, 'Penn's Treaty with the Indians,' was sold in 1851 for $2,200. To be classed with West as one of the early painters of the United States is Gilbert Stuart (1755–1828) (q.v.), of whom West was an early patron. Stuart made himself immortal by his masterly portraits of George Washington, the first President of the United States. In the many likenesses which he executed of this great personage he has shown himself an illustrious member of that English school which includes the names of Gainsborough, Reynolds, and Lawrence. An American painter of the same period was John Trumbull (1756–1843), who painted the 'Battle of Bunker Hill,' and whose pictures are familiar to all visitors of the Capitol at Washington.

Washington Allston (q.v.) (1779–1843) was born in South Carolina and was, like American artists of that period, a painter of scriptural and heroic subjects. From his use of color and light he has been styled "The American Titian." He was intimate with Thorwaldsen and Coleridge, and the latter said of him, that he was surpassed by no man of his age in artistic and poetic genius. It must, however, be said of him that his grandeur of conception was often superior to his power of execution.

John Singleton Copley (1737–1815) must be considered as belonging to the same group of American painters, although he left the United States in middle life. He was encouraged in London by the generous benevolence of West, who never overlooked a fellow countryman. He was made a member of the London Royal Academy in 1779, and although he had been almost self-taught his work was much superior to that of many academicians. His principal pictures representing historic events and containing many portraits will always be valuable, and his 'Death of Major Pearson' was bought for the National Gallery in 1864 for the sum of $8,000.

American Landscape.—As soon as American painting cast itself free from the traditions of Europe there was developed a great school of landscape painting. The glories of American scenery immediately claimed the attention of the pencil and the brush.

Thomas Cole (1801–48) was the founder of what is known as the Hudson River school. Although born in England he removed to the United States in his 18th year and all his best landscapes were those chosen from American scenery. Among his contemporaries and successors were Frederick Edwin Church, Albert Bierstadt and Bradford, who were especially remarkable for their representations of abnormal landscape effects such as they discovered in Arctic scenery, in the mountains of South America and the bizarre glories of the Yellowstone Park. Their pictures produced a profound sensation both in Europe and America, though many of them were more conspicuous for the strange and startling features of the natural scenery which they portrayed than for the originality of treatment or imaginative power which they displayed. The freshest and most original painter whose earliest work shows the influence of Cole and of the Hudson River school, was Georges Inness, who proved himself capable of producing work which did not rely for its success upon mere panoramic size or grandeur of distance. Inness, to judge from his 'Berkshire Hills,' 'Sunshine and Clouds,' was profoundly influenced in his work by the genius of the Barbizon school. He was of a religious temperament, and in many of his paintings we are struck by a deep thoughtfulness, a half melancholy feeling after the supernatural, such as are conspicuous features in the works of Corot. Although his 'Midsummer' is elaborated with the most profound knowledge of tonality and a remarkable power of atmospheric lucidity it is almost impressionistic in freshness and offhandedness. Yet Inness is credited with the remark, "While pre-Raphaelism is like a measure worm trying to compass the infinite circumference, impressionism is the sloth enveloped in its own eternal dullness."

There are three names which should be grouped together as representative of the genuine American spirit of independence and discovery in modern painting. George Inness was a member of this group, and by his side stood Whistler and John La Farge. La Farge is indeed one of the most striking personalities in the history of American painting. Even though his daughtsmanship sometimes emphasizes expression at the expense of academic correctness, he has something of that versatility which we associate with the artists of the Renaissance. He is a writer and a thinker. He has the artificer's love of effect as represented in glass and metal. While he can rise on the wings of poetry and devotion to the conception and execution of great religious paintings, he revels in the sparkling combinations of tinted crystals and brass work, and as an art theorist had the happy power of thinking out, expressing in words and thoroughly trusting his own sensations — a power of isolation and independence rarely to be found excepting in artists of the first genius. The same faculty belongs to the life of James A. McNeill Whistler. He was a pathfinder and a discoverer. He was for instance, among those who found out and ex-

pounded the significance of Velasquez and Rembrandt as sources of inspiration in modern art, and who by practical example taught English and American artists to recognize reality in the art of China and Japan. His 'Portrait of My Mother' must be looked upon as embodying not only his intensity of conception, his brilliant simplicity of execution, but also his sweetness and devotional tenderness of mind. His landscape studies, or symphonies as he chose to call them, testify to his craving for abstract expression in art. His etchings approach in their suggestiveness and freedom of touch to that perfection which before him had been monopolized by the Dutch school, and it is not too much to say that in daring originality and simplicity, earnestness and absolute grandeur Whistler stands alone among the artists of his century.

The works of John Singer Sargent were very happily represented to the eyes of the American public by the exhibition of his works which was given in Copley Hall, Boston, in 1899. He was then about 40 years of age, and in his 125 portraits and sketches appeared what was worthy to be reckoned the production of a lifetime. A second exhibition held at the same city, 1904, contained later works of still more extraordinary value. We see in his pictures more perhaps than in those of any of his contemporaries that a genuine American school of painting does actually exist. His virtuosity, the tricks of his technique, may be French, but the pose, the handling, the unconventional arrangement are distinctly American. The assurance and certainty with which he treats the most hackneyed subjects are inspired by the fresh breezes of the West, and the mark which he has made in art circles on both sides of the Atlantic is due to his great faculty of combining in a portrait the individualism of the sitter in posture and expression with the suggestiveness of harmonious accessories. His most permanent claim to artistic glory will ultimately rest upon his mural paintings in the Boston Public Library, some of which are unsurpassed for power, dignity and decorative effect by any work of the kind executed in the 19th or 20th century.

A great number of American painters have passed over into the European school and have quickly assimilated the style and technique of French and German masters. The crowd of American gentlemen who paint with ease has thus been multiplied. The American Gérôme and the American Piloty have appeared over and over again, and Breton fisher girls and German historic pictures signed by artists from New York, Boston or Philadelphia have become monotonously tedious. It is therefore refreshing to come upon work like that of Winslow Homer, who appears in this country as among the forceful and individual men who refuse to be hampered by a foreign convention. No one can refuse this artist the title of American painter. As a boy at Cambridge, Mass., he led the out-of-door life which made him acquainted with nature in sky, in land and animated life. In early manhood he represented 'Harper's Magazine' as a war artist. As a landscape painter he spent for many years the life of a recluse on the coast of Maine. Some of his most powerful, most original pictures are inspired by the scenery with which he was surrounded in his lonely hermitage at Scarboro. His 'West Wind' and 'The Maine Coast' are among the most genuine and suggestive of American landscapes, although in dimensions, distance and panoramic comprehensiveness they are mere vignettes, snap-shots which the modest eye of the painter has taken in and transferred without dramatic grouping or artistic comment to his imperishable canvas. It is somewhat difficult to classify Edwin A. Abbey among contemporary American artists. Probably he will be taken and placed in a niche among the immortals as a supremely successful illustrator. There are some artists whose strength lies in presenting the ideal in concrete form. They take up some figure of religion or mythology and embody by their pencil the 'Immaculate Conception' or the 'Muses on Helicon.' There are others who conceive their own story and tell it as Millais in his 'Order of Release' or his 'Autumn Leaves.' There is a third class of painters who choose some of the most salient incidents of poetic or historic literature and represent it in line and color. To this last class of painters belongs Edwin A. Abbey. We do not realize until we see his pictures what an immense field for imagination is to be found in this sphere of artist activity. Indeed, we are made to feel in seeing the marvellous creations of Abbey that he has added something to the beauty and dignity of every episode which he has illustrated. His interpretations of Shakespeare and Goldsmith, of Sir Thomas Malory and Robert Herrick prove that he veritably shares and enlarges the romantic mood of the author whose words and music he has transformed into vivid pictures of life. His decorations of the Boston Public Libary constitute a monument of American art in which are blended all the religious sentiment, the chivalric enthusiasm and the archæological learning which have been presented to the world by the intellectual activity and serious energy of the 19th century, but as wall paintings they are patchy and lack continuity and harmoniousness of general effect.

A most curious and interesting figure in American art history is that of George Fuller, born at Deerfield, Mass., in 1822. His life on a farm familiarized him with the features of external nature and probably this experience prompted his declaration in which self-reliance is blended with artistic sincerity. "I have concluded to see nature for myself, through the eyes of no one else, and put my trust in God, awaiting the result." This clear and simple mood of mind well fitted him for the work which he has done in American art. His life including his 15 years' work on a farm, during which period his pictures were unseen by the public, reads like a romance. His bankruptcy as a tobacco grower forced him in 1875 to come out as a painter, when he made a reputation and a living as a producer of beautiful and suggestive pictures. His 'By the Way Side,' 'Turkey Pasture in Kentucky,' 'The Quadroon,' and his nude 'Arethusa' exhibit the wide extent of his capacity and the remarkable skill and learning of this genuine artist.

Among American landscapists must be mentioned Homer D. Martin, whose work rises far above that of all others of the Hudson River

school. He paints in two moods, one of which is impressionistic, the other thoughtful and interpretative. The first is seen in his naturalistic picture 'Westchester Hills,' the second in his somewhat fanciful painting 'The Sun Worshipers,' in which the trees on a ridge of hills are bending under a western breeze before the rising sun. What is most lovable in Martin's pictures is the infinite and tender expanse of his skies. These skies tremble and quiver with light. His clouds are moving fleets of luminous vapor. To the picture lover Homer D. Martin stands on the highest pinnacle of American poetic painters.

George D. Forrest Brush is one of the students of Gérôme who has perhaps more than any other American artist reflected the particular genius of his master. His creations are characterized by singular novelty and imaginative force. Take, for instance, 'His Silence Broken.' Here we see a glimpse of river — dense forests on either side — an Indian in a canoe turning up his face startled by the cry of a wild goose bursting from the covert and passing by overhead. The genuineness, the cleverness, the directness of this representation would be enough to establish an artist's reputation in any age.

Among American landscape painters — of men, that is, who paint external nature in such a way as to produce a composition — Alexander H. Wyant will always hold a prominent place. The School of Poussin and Claude Lorraine has left a host of imitators, and perhaps the Hudson River school were too much under the influence of these European masters who sought in a landscape the symmetry and perspective of an architectural structure or a dramatic group of figures. In Wyant we find a certain remarkable combination of the grandeur of Salvator Rosa and the realism of the camera. A good example of his work is 'The Mohawk Valley,' and of his more subtile and imaginative mood we may find represented in his remarkable 'Moonlight and Frost.' He must be looked upon as the most triumphant impressionist of the American school. Among those who share his honors in this particular may be mentioned Julian Alden Weir.

Dwight W. Tryon is a New Englander by birth, and his work seems to suggest the possession of those qualities which are generally credited to the New England character. What is the most remarkable in all recent American art is the absence of anything like definite exposition; the artist seems to take the spectator by the hand and to say help me to interpret this. He portrays the mysterious light and shade, the masses and outlines of the landscape with the most faithful, the most passionate devotion. But he will not interpret it excepting so far as his unconscious mood leads him to do so. Of such painters Tryon is a brilliant example. The American temperament is here typically represented; his works have largeness and boldness combined with the utmost subtility and refinement of detail.

Horatio Walker must be classed as one of the leading American painters of this period. In some respects he resembles Moreland, although quite superior to the slovenliness and quite equal to the truthfulness and sympathetic treatment of that great artist. His 'Milking' is quite characteristic of his style. Here we find a stable interior, with dull brown walls. A woman dressed in blue is milking a black and white cow, while the calf is standing by. The light enters by a window on the right and seems to sift through the dust of the stable.

In writing a history of American Art we have thus briefly alluded to some of its masters. For the account of Vanderlyn, Twachtman, Smedley, Edward Simmons, E. H. Blashfield, Will H. Low, Elihu Vedder, Chas. Y. Turner, Chas. Sprague Pierce, and others who have made American painting illustrious, we refer to the biographies given elsewhere.

Revised by RUSSELL STURGIS.

United States Presidential Candidates. Since the establishment of the government of the United States there have been several important changes in the method of electing the candidates for the offices of President and Vice-President. Prior to 1804, for example, each elector voted for two candidates for the Presidency. The one who received the largest number of votes was then declared elected, while the candidate receiving the second largest electoral vote filled the office of Vice-President. Thus as the electoral vote at the first election showed 69 ballots for George Washington and 34 for John Adams, General Washington became the first President of the new republic, while the defeated Adams was declared its Vice-President.

During the first quarter of a century of its national existence practically no "direct" vote was cast for the election of the two chief executives of the United States. Instead of selecting the electors by a "direct" vote — as is the case at the present day — in nearly all States, the electors were "appointed" by the Legislature, a fact which makes it extremely difficult, if not absolutely impossible, to obtain any accurate figures which might indicate the strength of popular opinion at any of the national elections prior to 1824, by which time the choice of electors by the "direct" vote of the people had become general throughout the Union.

It was not until 1804 that electors cast their vote for both a President and a Vice-President instead of for the two candidates for the Presidency, for it was during Thomas Jefferson's first term that this matter was so widely agitated that a necessary Constitutional amendment was adopted providing for the methods of election which now prevail in all parts of the country.

Although, from an official point of view, there is no such thing as a popular vote for the election of President and Vice-President the ballots cast in the various States for the several electors is always regarded as the "direct" expression of popular opinion, and as the number of such electors are apportioned among the several States upon a basis in keeping with the growth of population it is not strange that the popular vote and the electoral vote should not always agree in their results. In 1824, for example, as in 1888, the candidate who was defeated by the electoral college was the one who had received the largest "direct" vote. So, too, in 1876, when the dispute over the electoral vote of several of the Southern States was referred to the Congressional electoral committee, the choice of Hayes defeated Tilden, a man who had received almost 300,000 more votes from the people.

UNITED STATES PRESIDENTIAL CANDIDATES

PRESIDENTIAL CANDIDATES OF THE UNITED STATES, 1789–1904.

(1) Prior to 1804 each elector voted for two candidates for President. The person receiving the largest number of votes was elected, while the person receiving the next largest number of votes was declared Vice President. Then John Adams, of Massachusetts, was elected Vice President in 1789 and 1792; Thomas Jefferson, of Virginia, in 1796, and Aaron Burr, of New York, in 1800. In 1804, the Constitution of the United States having been amended, the electors voted for the Vice President as well as for President.

United States, Presidents of the. In the following tables the important facts concerning the various Presidents of the United States have been condensed for convenient reference. The first table gives the place of birth of each President, and, if a college man, the name of the college which graduated him. The second table gives the vocations of the Presidents and the length of service of each, and the third table gives the cause of death and the place of their burial. See also UNITED STATES — PRESIDENTS AND VICE-PRESIDENTS; UNITED STATES PRESIDENTIAL CANDIDATES; and the biography of each President in this encyclopedia.

NO. 1. BIRTH AND EDUCATION.

President	Place of Birth	Year	College
Washington ..	Virginia.	1752	None.
J. Adams	Quincy, Mass.	1735	Harvard.
Jefferson	Shadwell, Va.	1743	Wm. and Mary.
Madison	Port Conway, Va.	1751	Princeton.
Monroe	Virginia.	1758	Wm. and Mary.
J. Q. Adams.	Quincy, Mass.	1767	Harvard.
Jackson	North Carolina.*	1767	None.
Van Buren ..	Kinderhook, N. Y.	1782	None.
Harrison	Berkeley, Va.	1773	Hampden.
Tyler	Greenway, Va.	1790	Wm. and Mary.
Polk	North Carolina.	1795	U. of N. C.
Taylor	Virginia.	1784	None.
Fillmore	Summerhill, N. Y.	1800	None.
Pierce	Hillsbo', N. H.	1804	Bowdoin.
Buchanan ...	Cove Gap, Pa.	1791	Dickinson.
Lincoln	Kentucky.	1809	None.
Johnson	Raleigh, N. C.	1808	None.
Grant	Pt. Pleasant, O.	1822	West Point.
Hayes.....	Delaware, O.	1822	Kenyon.
Garfield	Orange, O.	1831	Williams.
Arthur	Fairfield, Vt.	1830	Union.
Cleveland ...	North Bend, O.	1837	None.
Harrison	Caldwell, N. J.	1833	Miami Univ.
McKinley ...	Niles, O.	1843	None.
Roosevelt	New York, N. Y.	1858	Harvard.

* It has generally been stated that President Jackson was a native of South Carolina, but the most authentic evidence that could be collected by Parton, the historian, and Kendall, his biographer, shows that he was born in Union County, N. C., about a quarter of a mile from the South Carolina line.

NO. 2. VOCATION AND SERVICE.

President	Vocation	Inaugurated	Service—Years
Washington ..	Planter.	1789	7 y. 10 m. 4 d.
J. Adams....	Lawyer.	1797	4
Jefferson	Lawyer.	1801	8
Madison	Lawyer.	1809	8
Monroe	Statesman.	1817	8
J. Q. Adams.	Lawyer.	1825	4
Jackson	Lawyer.	1829	8
Van Buren ..	Lawyer.	1837	4
Harrison	Farmer.	1841	1 m.
Tyler	Lawyer.	1841	3 y. 11 m.
Polk	Lawyer.	1845	4
Taylor	Soldier.	1849	1 y. 4 m. 5 d.
Fillmore	Lawyer.	1850	2 y. 7 m. 26 d.
Pierce	Lawyer.	1853	4

United States Sanitary Commission, The. An organization appointed by the United States government during the Civil War, and co-operating with it in promoting the health, comfort, and efficiency of the armies. It also gave aid to the navy. The war prevailed from 12 April 1861 to 9 April 1865. On 15 April 1861 President Lincoln called for 75,000 volunteers, believing they would be required for only a few months. But in July of the same year 800,000 more were called for, later 300,000, and in 1864, 500,000. Of this army of over 1,000,000 men (with 15,000 regulars) 350,000 died during the war, thousands were crippled by wounds and ailments. About 190,000 of the deaths were from sickness, mainly scurvy, dysentery, diarrhœa, erysipelas, and general debility, the result of insufficient sleep, clothing and food, exposure, hard marches, and poor drinking water. In the early part of the war, before drafting was resorted to, one eighth of the volunteers were in their 19th year, and three fourths were under 30 years of age. At the outbreak of the war, the Quartermaster, Commissary and Medical Departments of the regular army were inexperienced in caring for large bodies of men, in active service, the last war (Mexican) being in 1846–8. The medical staff could not properly initiate or execute sanitary work, as by custom hospital construction and the transportation of sick and wounded belong to the quartermaster department, and the regulation of diet to the commissary. Inspection and the means for giving aid were imperfect. The government had not learned the lesson of the Crimean war, that "the cause of humanity was identified with the strength of armies." In May and June 1861 many of the volunteers arrived in Washington, in miserable physical condition, in overcrowded cars, suffering from poor food, insufficient clothing and drinking-water. The people of the North were aroused as to the importance of adequate preventive and relief measures. The same day that the President called for 75,000 soldiers, the women and men of Bridgeport and Charleston, and on 19 April in Cleveland, and later in the month in New York, established soldiers' aid societies. During the war there were more than 7,000 such societies scattered throughout the North, tributary to the commission. Some of them, at first, proposed not only

to furnish nurses, clothing and comforts, but also delicacies, and to bring disabled soldiers home, to keep complete records of the sick and wounded, etc.

Realizing that some of these aims were impracticable, that to do the most good there must be co-operation in a definite plan, under the auspices of the government, Rev. Dr. Bellows and Dr. Elisha Harris called a public meeting at Cooper Institute. At this meeting it was decided "to collect and disseminate information upon the actual and prospective wants of the army, to establish recognized relations with the medical staff and act as auxiliary to it, to maintain a central depot of stores and open a bureau for the examination and registration of nurses." In this way, it was believed, results could be accomplished, similar to those effected by Miss Nightingale and the English Government Sanitary Commission in the Crimean war.

Drs. Van Beuren and Harsen, representing two prominent New York medical associations, suggested to General Scott that diseased men and mere boys should be discharged from the army. Comparatively few were discharged. The surgeon-general was asked to reorganize the medical staff and if possible have its sanitary powers increased. This was not done. In May 1861, the government was appealed to, to appoint a commission of civilians, medical men and army officers, to cooperate with the Medical Bureau (or to act independently of it) in an investigation as to preventable diseases of hospitals and camps. To this there was much opposition, even the President believing that such a commission would be "the fifth wheel to the coach." But on 9 June 1861 the government appointed "a commission of inquiry and advice in respect of the sanitary condition of the United States forces," consisting of Rev. Dr. Bellows, Prof. Bache, Drs. Wyman, Gibbs, Van Beuren, and Howe, from civil life, and Drs. Wood, Cullum, and Shivers, U. S. A., with power to add to their number. Dr. Wyman resigned, and Drs. Harris, Agnew and Newberry and Mr. Geo. T. Strong were added. The commission was to serve without pay, but had a furnished room allotted it in Washington, and was "to ascertain the sanitary condition of volunteers, to suggest means to preserve and restore health, and to insure the general comfort and efficiency of troops, such as proper cooks, nurses, hospitals, etc., and to correspond freely with the War Department and the Medical Bureau."

The United States Sanitary Commission organized 12 June 1861, with Rev. Dr. Bellows as president. Relief was to be subordinate to prevention and advice, the conclusions of the commission must "be approved by the Medical Bureau, ordered by the War Department and carried out by officers and men." Mr. Olmsted was appointed resident secretary and general manager at Washington. He had general oversight of the work of the commission, was in the confidence of the government, and ready at all times to supplement government deficiencies. Resigning his herculean task in 1863 he was succeeded by Dr. Jenkins and Mr. Blatchford. The six inspectors of camps appointed, found inefficient drains and police duty, overcrowded tents, offensive sinks, personal uncleanliness, poor and filthy clothing, badly cooked food and a scarcity of green vegetables. By persistent efforts of the commission, these deficiencies were gradually remedied to a large extent. But it was difficult at first to raise sufficient money for preventive measures, though life insurance companies responded nobly. Later, when the work broadened, railroad, telegraph and express companies gave their services and with the people at large contributed abundantly. Cash receipts to 1 May 1866, were $4,962,014.26, and of branch treasuries nearly two millions more. Over one fifth of this amount came from the Pacific coast — $100,000 received from California in one sum in 1862, saved the commission at a critical time. So great was the popular enthusiasm, that a sack of flour, first sold in Nevada to the highest bidder for $5,000, finally yielded in the western country, $40,000. Supplies were needed as the operations of the armies extended. Depots were established in New York, Boston, Philadelphia, Washington, and other cities, and calls were made upon the aid societies. Supplies furnished during the war were valued at $15,000,000. The women's convention at Washington in November '62, resolved to send supplies, "abundantly, persistently and methodically." Frequently the government asked the commission for blankets, green vegetables, etc.

After the battle of Murfreesboro and at Vicksburg and other points, scurvy broke out among the troops. The government could not obtain potatoes, but the commission, through its "potato and onion circulars" to farmers, forwarded to the armies an immense quantity of potatoes and green vegetables, and saved many lives. It established vegetable gardens at Nashville, Knoxville, Newbern and Chattanooga, worked by contrabands and convalescents. Potatoes, lettuce, radishes, onions, beans, spinach, cucumbers, squashes, okra, cabbages, corn, melons, pumpkins, etc., were raised. The money value of truck raised at Chattanooga from 15 April to 14 Nov. 1864, was $66,375.14. Ice was frequently furnished. When yellow fever prevailed at Newbern, in the town and garrison, the commission aided materially in the cleaning up.

Before the war there was no general hospital, only tent hospitals, the largest containing 40 beds. In July 1861 the commission suggested well equipped general hospitals in pavilion form, and that these should be built under the direction of the Medical Department, which should also arrange for the transportation of the sick and wounded and attend to their diet. These suggestions were carried out when Dr. Hammond became surgeon-general in April 1862. After the battle of Fort Donelson in February 1862, the government could not transport the sick and wounded to hospitals on the Ohio River. The commission did, in transports fitted up for that purpose. The same was true in the Peninsula campaign. It also operated during the war more than 30 ambulance cars, carrying to the hospitals in the East about 100,000 men, to the West, 125,000, the railroads conveying the cars free. The Camden & Amboy donated a car. The relief system was divided into general and special relief, the first attending to the wants of the inmates of general, field and regimental hospitals, and of men in camp and on the march, the second cared for the sick and needy at military depots, discharged men, paroled prisoners and irregulars. The various agents of the commission were paid a moderate salary, it being found best not to rely upon

volunteer agents. With each army was a medical inspector, relief agents, wagons and horses, transports if necessary and a supply depot at the base. The battle of Antietam was the first great battle when the organization of the commission told. There were 10,000 of our wounded, besides many of the enemy. Chloroform, opiates, and medical stores were supplied. Within a week there were distributed "28,768 shirts, towels, bed ticks, etc., 30,000 pounds of bandages and lint; 3,188 pounds of farina, 2,620 pounds of condensed milk, 5,000 pounds of beef stock and canned meats, 3,000 bottles of wines and cordials, and several tons of lemons, fruit, crackers, tea, sugar, rubber cloth, tin cups and hospital conveniences."

The special relief service, organized by F. W. Knapp, cared for men on their way to and from the front, in 40 "Homes," "Rests" and "Lodges" at various points; acted as attorneys in obtaining back pay and pensions, kept the inmates under surveillance that no danger might befall them; paid their way home when necessary, established feeding stations, where hot soup and coffee were always ready, and cared for discharged prisoners at parole camps, and the motley crowd of substitutes, stragglers, deserters, etc., at convalescent camps, affording comforts, information and opportunities to communicate with their families. The Auxiliary Relief Corps, organized by F. B. Fay in 1864, cared for the wounded and sick sent to the depot field hospitals in the rear of large armies, and also for those left behind by an army in its onward march. It furnished food, stimulants, underclothing and reading matter, communicated with the soldiers' friends, obtained express packages, and provided in many instances Christian burial. After the battle of the Wilderness, it followed the base of the army to Port Royal, White House and City Point, established special diet kitchens and attended to the sick and wounded. Other work was accomplished by the commission. Medical tracts, on subjects relating to army life, prepared by experts, were distributed to army surgeons. A Hospital Directory (main office in Washington, branches in other cities) was established, recording entrances, transfers and dismissals. In 1863, a "free pension and war claim agency" was founded. Over $2,500,000 of back pay and pensions amounting to $7,500,000 were obtained for discharged soldiers, at a saving to the beneficiaries of thousands of dollars.

Valuable statistics were published in pamphlet form, embracing the effects on soldiers of marches, the rate of recruiting required for the losses of war, measurements of soldiers, the number of sick in various regiments and the causes of sickness, etc. Nurses and physicians were supplied in emergencies. The success of the commission was due to the influence of popular ideas, American civilization and thorough organization. It had much to contend with, governmental red tape and deficiencies and the bad will of State agencies.

JEROME WALKER, M.D.,
Formerly Relief Agent, U. S. Sanitary Commission.

United States, Sculptors of. In studying the history of American sculptors it is necessary to distinguish between three periods. The initial stage of the art was from 1750 to 1850; this was succeeded by a period ending in 1876, from which time we may date our contemporary sculpture. The first period was of course a time of struggle against influences of various kinds, counting among them puritanic repugnance to anything like representation of the nude form. The second period included the stormy years of the Civil War, which was largely a time of commercial activity. And yet there were men toiling at that time whose genius and industry made possible the achievements of later years.

It is impossible in this present article to do more than mention the names of the artists who have made the American School of Sculpture what it is. The first sculptor of importance in America was a woman, Mrs. Patience Wright (1725–85) of Bordentown, N. J., who, according to common reputation, excelled in wax figures. A contemporary critic said of her, "her likenesses of the King, Queen, Lords Chatham and Temple, Messrs. Barre, Wilkes and others attracted universal admiration. Her natural abilities are surpassing, and had a liberal and extensive education been added to her innate qualities, she would have been a prodigy." Her likeness of Lord Chatham was a full length portrait in wax, which stood for many years protected by a glass case in Westminster Abbey.

The real commencement of American sculpture may be dated from the visit in 1785 of Jean Antoine Houdon, whose business was to make a portait statue of Washington, which work was cut in marble in France and sent to America in 1788. The commission was from the State of Virginia, and the statue is now in the state house at Richmond. There is also in Richmond a bust of Lafayette by Houdon; for this artist, the friend of the French Revolutionary patriots, was eagerly accepted by the people of the United States. There were also busts of Washington and other American statesmen by Giuseppe Cerracchi.

William Rush (1756–1833) of Philadelphia, was occupied as a carver of figure-heads for ships and developed a marked sculpturesque power. It appears that his work was limited to wood-carving, but his statues wrought in that material were often of life size and larger, and those that have been preserved, such as the one in Independence Hall, Philadelphia, have much merit.

The curious record of Hezekiah Augur's life is quoted by Mr. Taft (see his book in bibliography) from French's 'Arts and Artists of Connecticut'; and the two figures in marble preserved in the Yale Art School are the sole records of this career of disappointment and suppressed ability. John Frazee (1790–1852) was a native American who, as it seems, never left the United States. He took his mission as a sculptor very seriously, and was the pride of his contemporaries as the maker of the first marble portrait busts executed in America. These portrait busts were his most important work and they have unquestioned merit.

The first American deliberately to choose sculpture for a profession and to go abroad for the purpose of studying it was Horatio Greenough. He was born in 1805 and early exhibited a taste for art. He began modeling in clay under Solomon Willard of Boston, and took lessons in carving marble from Alpheus Cary.

In 1825 he went to Rome, where he began his art career by modeling a statue of Abel. Returning to America he executed portrait busts of President John Quincy Adams and Chief Justice Marshall. In the Boston Museum is his bust of Napoleon. His most notable work, however, is his half nude figure of Washington, over which he toiled for eight years. This important seated statue stands on the eastern side of the Capitol at Washington. It is treated as were treated the half mythological figures of Roman emperors, such as are to be seen in the galleries of the Vatican at Rome. Those statues put on somewhat the air of the deified emperor; and in like manner it has been alleged that the classically treated figure of the first President holding a Roman sword in the left hand, pointing with the right hand to heaven, and seated upon a marble chair of Roman design, is in a way a Zeus or Jupiter, as much as a portrait statue.

Hiram Powers was born in the same year with Greenough and began his artistic life as a modeler in wax for a museum. He afterward moved to Washington, where he was very successful in portrait busts. He subsequently (1837) sailed for Italy, where he continued to live until his death in 1873. His greatest work is 'The Greek Slave,' in which is represented a woman as if taken by the Turks from one of the Islands of the Archipelago, standing stripped and manacled in the market-place. Many copies of this statue were executed by the artist, but only one is now accessible to the public, and that stands in the Corcoran Gallery at Washington. None of the nudes of Powers can be ranked as first-class sculpture, but his execution is smooth and careful. His figures are tolerably well modeled, but there is little life, spirit nor meaning in them. But Powers, like Greenough, was a real and sincere pioneer in American art; and from this mediocrity was to spring eventually the fresh originality of a maturer day.

The most important sculptor of the early time was Thomas Crawford (1813–67) who, dying young, left behind him much work of unquestioned importance. His most significant work of sculpture is the pediment of the southern wing of the Capitol at Washington, in which, although the space is not sufficiently filled and the figures are too small, slender and light for the architectural framing, there is yet real significance in a kind of emblematic history of American development. The colossal 'Freedom' which crowns the dome is the best known of his works and it just misses sublimity. Probably his most valuable work is to be found in the bronze doors of the Capitol which, though in a way they have been surpassed by the Rogers doors mentioned below, are still vigorous compositions. Probably the best known of his works is the bronze statue of Beethoven in Boston.

The statue of Henry Clay at Richmond is the work of Joel T. Hart of Kentucky, and was completed in 1859, after engaging the labor of the sculptor for 13 years. Shobal Vail Clevenger, another early sculptor, died at the age of 31 in 1843. He is known for his excellent bust of Henry Clay in the Metropolitan Museum of New York. His portrait busts are remarkable for their exactitude and truthfulness and he certainly exhibits a grasp of mind and a comprehensiveness of knowledge hitherto unprecedented in American art. Joseph Mozier was born in Vermont 1812. He sailed for Europe in 1845 and worked at Rome until his death in 1870. His 'Rizpah,' now in the Metropolitan Museum, was executed in 1869 and is perhaps the most inane of all the works in that collection. His most important work is 'The Prodigal Son,' the treatment of which, however, is extremely hard and conventional. Ball Hughes, of English birth, settled in New England where he died in 1868. He was known for the marble portrait statue of Alexander Hamilton in New York, destroyed afterward in the great fire of 1835. Chauncey B. Ives (1812) left behind him several statues and groups of some interest — popular in their character but not without a certain easy merit.

American sculpture saw its first great advance in the work of Henry Kirke Brown, whose statue of Washington in Union Square in New York must be looked upon as a first-rate production. However American art may be developed, the time will never come when this excellent equestrian statue will be considered anything but good sculpture. This is much the most important of Brown's works in sculpture, but there is also by him an admirable statue of the Revolutionary Gen. Greene in the collection of the Capitol at Washington, in which collection there are also three other portrait statues by him; and the Winfield Scott, an equestrian statue in the Scott Circle at Washington, is of singularly good taste and severity of treatment, the horse standing on all four feet as if using all his strength to support the colossal figure of the late lieutenant-general after Washington. In this respect the two equestrian statues by Brown contrast most favorably with the childish treatment of the Jackson monument by Clark Mills. This statue, also in Washington, caused great excitement at the time of its erection because the heavy casting is balanced upon the hind feet, a trick utilized also in one of the statues of Peter the Great in Russia. The statue has little merit, even of technical skill in modeling.

With the works of Erastus D. Palmer and Thomas Ball, American sculpture made great advances. Palmer's 'White Captive' in the Metropolitan Museum is a charming creation, a figure of virginal grace and softness, while Ball's equestrian statue of Washington in Boston is certainly, for life, action and dignity, one of the first of its kind in the country.

William Henry Rinehart (1825–74) attracted little attention during his life, but his posthumous reputation is great; and a peculiar honor has been done him in the organization of a collection of his works at the Peabody Institute in Baltimore. There are also works of his in other American museums. The best of these works lack general interest; and it is doubtful if they will ever receive as much study as they deserve except from those few sculptors who are concerned with the past history of their own art.

The earliest American sculptor to win a European reputation was William Wetmore Story, born in Massachusetts 1819. His 'Cleopatra,' now in the Metropolitan Museum, New York, was exhibited in London 1862. It has been a much discussed work of art, eulogized by Hawthorne and condemned by cooler critics.

Like all the works of this sculptor it shows fancy and skill of invention, but has nothing in it that can properly be classed as genius. His exceptional repute came of his long residence in Rome and his literary gifts. Randolph Rogers was born in 1825. He studied sculpture at Rome under Bartolini and was a prolific worker. His productions, however, are without poetry and almost without marked expression. His statue of Seward in Madison Square in New York is on the whole a good piece of work, though marred by the curious error which makes it seem the statue of a very tall man; his Lincoln in Philadelphia has no such deterrent quality. The most notable productions of Randolph Rogers are the eastern doors of the Capitol at Washington, with reliefs of the life of Columbus. Another sculptor of the period is John Rogers, known for his small groups.

Among woman sculptors are Harriet Hosmer, the classicist, whose dignified 'Zenobia' is in the Metropolitan Museum. Equally memorable were Emma Stebbins, Margaret Foley, Edmonia Lewis, Vinnie Rean, Blanche Nevin, Elizabeth Ney, and especially Anne Whitney, the author of some meritorious portrait statues.

During the 15 years following the Civil War there came into existence a new school of sculpture in the United States, earliest among whom was John Quincy Adams Ward, a pupil of H. K. Brown. His bronze 'Indian Hunter' is one of the finest statues in Central Park, New York; while his statue of Henry Ward Beecher in Brooklyn and his remarkable 'Pilgrim' in Central Park are notable and epoch-making productions. Still more remarkable are the attendant figures grouped about the pedestal of the Beecher statue. Portrait statues, sometimes partly idealized, have been, however, the most often successful in American sculpture, and Ward's work has been no exception to this rule. His 'Washington' on the steps of the Sub-Treasury in Wall Street, New York, his most interesting 'Lafayette' in the university grounds at Burlington Vt., and the remarkable seated statue of Horace Greeley in front of the *Tribune* office, are artistical successes of a high order. It is rare that portrait sculpture is made so truly sculpturesque. The equestrian statue of Gen. George Henry Thomas at Washington, D. C., is one of the most successful works of the sort, the horse standing quiet except as his attention is called by tumults as of passing soldiery, and the pose of the man perfectly understood. The celebrated naval arch erected in New York after the war with Spain was crowned by a remarkable work by Ward, a group made up of the principal figure studied rather closely from the magnificent 'Victory of Samothrace,' and sea-horses supposed to be drawing her chariot. It was most unfortunate that this could not be preserved in its place or in a similar situation. The crowning glory of Ward's career will be the great pediment of the Stock Exchange building in New York, which now (June 1904) is approaching completion and which has been known for a year or more in the model.

As the Civil War gave a great impetus to the building of public memorials and the erection of statues, so the period of its close was marked by the appearance of such artists as Thompson, Meade, Bissell, Simmons and Milmore. Launt Thompson's 'Napoleon' in the Metropolitan Museum is a fine specimen of dignified monumental art. Larkin G. Meade was a pupil of Henry Kirke Brown, and one of his greatest works is the statue of Lincoln and that of Ethan Allen at Washington. George Bissell has made his mark in New York by his 'Lycurgus' on the Appellate Court Building and his 'President Arthur' in Madison Square. Franklin Simmons is the author of the 'Roger Williams' in the Capitol, Providence, R. I., and the monument of General Logan at Washington.

The influence of the French school in modern American sculpture is seen most strikingly in the work of Augustus Saint-Gaudens, one of the greatest figures in modern sculpture on this side of the water. For originality, freshness, vigor and imaginative energy there is nothing among American sculpture that can excel the 'Shaw Memorial' in Boston Common or the equestrian statue of General T. W. Sherman in New York. Daniel Chester French was born in 1850 and his equestrian statues of General Grant (1899), Washington (1900), and General Joseph Hooker (1903) are all good sculpture, whose workmanship satisfies the artist while it appeals to the popular taste. Mr. French's most remarkable achievements are, however, in the way of a singularly profound and delicate sentiment rendered in sculpture of high technical merit; thus the Milmore tomb at Mt. Auburn Cemetery, Massachusetts, has the alto-relief, death stopping the sculptor's hand; the group of Gallaudet teaching a deaf and dumb scholar is full of pathos; the monument in the Boston Fenway to the memory of John Boyle O'Reilly consists of three symbolical statues admirably grouped on a granite monument of ancient Irish decoration. Frederick MacMonnies is one of the boldest, the most dashing and brilliantly successful of modern sculptors. His 'Nathan Hale' in City Hall Park and his 'Bacchante' in the Metropolitan Museum show the great range of this sculptor's genius. Another brilliant sculptor of the day is George Grey Barnard whose 'Two Natures' is one of the most original productions of the modern chisel.

Paul Wayland Bartlett (1865) has won fame by his 'Columbus' at Washington and still more by the magnificent 'Michelangelo'; both of these being in the rotunda of the Library of Congress, as Charles Niehaus has by his 'Garfield' at Cincinnati, and the figure of the 'Driller.'

The modern school of American sculptors includes Boyle, Elwell, Comper, Tribel, Ruckstuhl, Moynihan, Doyle, MacNeil, Lukeman, Conti, Proctor and Potter. These are all original and characteristic workers whose productions are of high promise for American art. One of the most interesting developments has been in the field of pure architectural sculpture, in such work as that of John Evans in the porch of Trinity Church in Boston. The very latest great achievement is also of architectural character: for the new front of St. Bartholomew's Church in New York, finished in 1903, includes important bronze doors and marble reliefs by Herbert Adams of Brooklyn, Philip Martiny, and Andrew O'Conner, who worked in aid of D. C. French on the middle doorway.

United States Steel Corporation. See Steel and Steel Manufacturing.

United States, The Wars of the. As generally regarded, the United States is rated as one of the most peaceable nations in the world, the idea being that during the 130 years of its existence it has participated in but five wars, in all of which, parenthetically, it has been victorious. Notwithstanding the general credence given to this statement, it is far from being in accord with history, for, as a matter of fact, scarcely a year has passed in which either the army or the navy has not been called upon to do battle for the country. Of late, it is true, the unpleasantness in the Philippines has been the only discordant element, but, prior to that, there were the labor disturbances; the Indian wars and massacres, and a dozen other factors that kept the United States forces almost constantly engaged in warfare of a more or less consequential character. At times, of course, some of the disturbances were little more than riots, but there were other events which seem to have been quite as thoroughly forgotten by the ordinary reader of history, but which in every respect deserve a place in the catalogue of wars. In fact the War of the Revolution had scarcely commenced when the colonists were compelled to meet the attacks of the Indians who, inspired by the English, instituted an incessant border warfare against the whites; a warfare of brutality which culminated in the bloody massacres in Wyoming Valley, Pa., and Clinton, N. Y.

The Shays Rebellion.—The first armed and organized rebellion against the conduct of political affairs in the United States, however, occurred in Massachusetts in 1786, when Daniel Shays organized the dissatisfied faction in the community into an armed and determined force of malcontents. The cause of this early trouble was largely a financial one. Solid money was still scarce, with paper money practically worthless, and yet affairs were at such a state that debts contracted upon a paper basis were pressed for payment in solid money. As this was a period when men were imprisoned for debt, such conditions were held to be almost usurious in their effect, and the orderly meetings of protest which were at first held soon developed into violent assemblages. In August the tide of dissatisfaction had become so strong that uprisings occurred in many parts of the State; courthouses were seized and courts were prevented from sitting; the governor announced his determination to put down the rebellion, and there were several engagements between the insurgents and the volunteer forces of the State. At last, in February 1787, General Lincoln surprised the rebels at Petersham, where, after a decisive engagement, they were dispersed.

The Whiskey Rebellion.—The announcement that the Federal Government had assumed the right to levy an excise tax was the cause of the insurrection in Pennsylvania which is now commonly referred to as the "Whiskey Rebellion." The act, which was passed in May 1792, was strenuously opposed on political grounds, the argument against it being that it was dangerous to the doctrine of individual liberty. In the four western counties of Pennsylvania whiskey was a staple product, and, aside from its political aspect, the people felt that such a tax was an unjust discrimination against that region. The attempts to enforce the law were resisted with violence, therefore, and all citizens who advocated conformity to the law, or who quietly conformed to it were subjected to various kinds of ill-treatment by their neighbors. To further inflame the spirit of opposition incendiary posters, all signed "Tom the Tinker," were displayed in all directions, and there was rioting and bloodshed in many places. In this emergency President Adams assumed control of the situation, and sent 13,000 troops upon Parkinson's Ferry in time to receive the peace overtures of the rebels. They were not accepted, however, and many arrests were made.

War with France.—One of the first troubles with which President Adams had to contend was the French question, for it had then become plain to all that America would have to take some decided steps if she was to maintain her honor against the arrogance of France. The President's policy of neutrality, following on Jay's treaty with England, had greatly exasperated France, and when the American envoys were ordered out of that country it became apparent that war could not be far off. In fact French and American vessels did meet on the ocean, but in the encounters that followed, thanks to Captain Truxton and his frigate Constellation, the United States did not make a discreditable appearance. In the battle with the French frigate L'Insurgente, off the island of Nevis in the fall of 1799, as well as in her encounter with the frigate La Vengeance, off Guadaloupe, in February 1800, the Constellation was victorious. Realizing that war was already under way upon the water, the United States government began to prepare her land forces. General Washington was again summoned from his retirement at Mount Vernon to assume command of the army, but as the formal declaration of war was deferred, Napoleon's seizure of the governmental power in France gave a new aspect to the situation, and a treaty of amity was soon concluded between the two countries. See UNITED STATES—THE WAR WITH FRANCE.

The Fries Rebellion.—What is known in the history of Pennsylvania as "Fries' Rebellion," or the "Window Tax War," was the result of an act of Congress, which, in July 1798, levied a direct tax of $2,000,000, of which the sum of $237,000 was apportioned as Pennsylvania's quota. In this State the tax was appraised upon houses and land, the amount assessed against each house being determined by the size and number of its windows. In some portions of the State the tax was accepted practically without protest, but the German residents of Montgomery, Lehigh, Bucks, and Berks counties organized opposition to it under the leadership of John Fries. It was not long before there was open conflict between the rebels and the United States authorities, one of the acts of the insurgents being an attack upon the marshal at Bethlehem, where that official was compelled by force of arms to liberate 30 persons whom he had arrested for their opposition to the window tax. Under the circumstances an appeal was made to President Adams, and the militia was ordered to suppress the rebellion, which ended with the capture of Fries and a number of his adherents. Taken to Philadelphia, Fries was twice tried for treason, and, being convicted, was sentenced to death. In 1800 he was pardoned by the President.

The Barbary War.—It was not long after the signing of the treaty of peace with England that the Barbary powers commenced to annoy Amer-

ican commerce. In 1784 the Betsey was captured; in 1785 the Maria of Boston and the Dauphin of Philadelphia were seized and their crews held as captives with threats of ultimate slavery if the ransom, amounting to some $60,000, was not paid. As ransom was regarded as cheaper than force, various large sums were contributed at the command of the Dey of Algiers. To Thomas Jefferson, however, such abject submission to a barbarous ruler was particularly loathsome, and he decided to put an end to such outrages. Commodore Dale was, therefore, ordered to the Mediterranean, where one of his vessels, the Experiment, soon captured a Tripolitan cruiser of 14 guns, and, by 1803, war was on in earnest, culminating, on 27 April, in the bombardment of Tripoli.

Slave Insurrection, Louisiana.— In January 1811 there was an uprising of slaves which extended throughout the entire parish of Saint John, La. The whites armed themselves and there were several serious battles between the two forces, more than 60 of the negroes having been killed before the slaves could be forced to surrender.

War of 1812.—The bloodless Burr conspiracy; the Sabine expedition; the unwarranted attack upon the Chesapeake by the Leopard, a British two-decker; and the troubles resulting from the Lake Champlain embargo, all of which kept the United States forces engaged in more or less active service, were soon forgotten in the more important declaration of war with Great Britain (see UNITED STATES — WAR OF 1812), and this conflict had scarcely commenced before the troubles with the Indians began once more with the Seminole War in Florida. The growth of the country; the expansion of its territory; the explorations of venturesome spirits who were continually opening up new lands for settlement, all had a tendency to arouse sentiments of dissatisfaction in the minds of the red men. They saw that encroachments were constantly being made upon them; the fields of the white man interfered with their hunting and fishing; the industry and other features of civilization were distasteful to them, and, as original occupants of the land, one by one the various tribes began to enter their vigorous protests, protests which finally assumed warlike proportions. From the beginning of the War of 1812, therefore, almost up to the beginning of the 20th century, the soldiers of the United States have been engaged in battles with the Indians, and as these almost continuous disturbances and massacres have occurred first in one part of the country and then in another the present-day submission of the red man has not been obtained without the expenditure of much money and the cost of many lives. At about the same time, throughout the Southern States, a spirit of dissatisfaction was also being engendered; the dishonesty of the blacks, and the danger of slave insurrections making rights in property insecure. Of these insurrections there were several, but the only one that attained any great degree of importance was the Turner Rebellion which broke out in Virginia, in 1831.

Nat Turner's Rebellion.—Among the blacks in Virginia there was one who exerted a great influence over the slaves. His name was Nat Turner, and he firmly believed that he had been called of God to lead his people to freedom. He had heard voices calling to him from the air; he had seen strange signs in the sky, and all the portents which he could interpret gave additional proof of his divine commission. Forming an alliance with three other blacks and three ignorant white men, he began his crusade by killing several families. Wherever he went there was bloodshed, while everywhere he pressed the slaves into his service until he was accompanied by a force of more than 200 persons. Unable to suppress the insurrection, an appeal to the government was made, and both Virginia and North Carolina sent troops to the scene of the outrages. As the result, all the insurgents were either killed or captured; Turner and 16 of the leading spirits were hanged, and scores were punished, some most inhumanely and without trial, their bodies being decapitated and their heads impaled along the highways as a warning.

Troubles Under Jackson's Administration.— The political contest which shook the Union to its very centre in 1832, culminated, in all its violence, in the South Carolina doctrine of State Rights and Nullification. The origin of the trouble was the tariff: first, the tariff passed during the Adams administration, which was extremely distasteful to the South, and, second, the tariff of 1832, which was even more so, and as, at this time, there was a powerful party in South Carolina which contended that Congress had no power to impose taxes for the protection of home industries or manufactures, and who held that each State had the right to judge if Congress had exceeded its powers, and, if so, to disobey it, it was not long before the new act was declared unconstitutional. It was resolved, therefore, to prevent its enforcement in the port of Charleston, even by armed resistance, or by withdrawal from the Union. In fact, so strong was the feeling upon this subject that the nation was threatened with dissolution. President Jackson, however, refused to listen to the arguments of the nullifiers, the leaders among whom were Hayne and Calhoun, the latter having resigned the vice-presidency to accept a seat in the Senate in order that he might speak upon this question, and he at once ordered troops to Charleston. The presence of the soldiers had a quieting effect upon the belligerents, who postponed their threatened action, and the difficulty was finally settled by the Clay compromise bill. More trouble with the Indians and the "Toledo War," a dispute over the southern boundary between Ohio and Michigan, which followed the admission of the latter State to the Union, were among the factors that disturbed the Jackson administration, but none of these events were as important as the Mormon disturbances, and the "Patriot War," which occurred soon after Van Buren's succession to the Presidency.

Mormon Disturbances.—During the peregrinations of the Mormons, prior to their ultimate settlement in Utah, they attempted to locate in several places, but as their presence was not relished by other citizens, who charged them with such crimes as robbery, arson and secret assassination, they had frequent conflicts with mobs and were driven from spot to spot until they made their final stand in Missouri, at the town of Far West, in Caldwell County. Here they were joined, in 1838, by Joseph Smith and Sidney Rigdon, who, after the failure of the Mormon Bank at Kirtland, Ohio, had fled from

that State to avoid arrest for fraud. To the troubles arising from the hatred and distrust of the people of Missouri there were soon added those of internal dissensions. On 24 Oct. 1838 Thomas B. March, president of the 12 apostles, and Orson Hyde, one of the apostles, made affidavit that Smith and Rigdon placed the teachings of the Book of Mormon and the regulations of the Church above the laws of the land, and that there also existed among the Mormons a band known as the "Danites," organized to execute the will of the head of the Church, whether it were legally right or wrong. Under such conditions the feeling against the Mormons grew so strong that it was determined to drive them from the State. Smith and Rigdon had already been arrested on charges of treason, murder and forgery, but their adherents fortified their settlement and resisted both the popular will and the law so strenuously that it became necessary to call out the militia to expel them. They at once turned their steps towards Illinois, where they founded the city of Nauvoo, but the authorities were to have still more trouble with them, the most serious disturbances being those of 1844, when they were driven out of Illinois, and those which followed the Mountain Meadow Massacre, in 1857, when an army of 2,500 men, under Col. Albert Sidney Johnston, was sent to Utah to put down Mormon resistance to United States' authority.

Alton Riots, Illinois.— The Alton, Ill., riots resulted from a popular uprising against the Saint Louis 'Observer' and its owner, Rev. Elijah P. Lovejoy. Compelled to leave Saint Louis by reason of his anti-slavery proclivities, Mr. Lovejoy took his paper to Alton, Ill. There, too, he provoked enmity, however, and several riots occurred, his newspaper plant being destroyed no less than three times. On the occasion of the last riot, 7 Nov. 1837, Mr. Lovejoy was killed.

Patriot War.—Friendly relations with Great Britain were again endangered in 1837, when the so-called "Patriot War" broke out on the Canadian frontier. Sympathizing with the movement, the people of the United States did much to aid the insurgents, some New Yorkers even going so far as to seize an island in the Niagara River. These acts, however, received such prompt recognition from the government, which not only issued a neutrality proclamation, but sent Gen. Wool to the Niagara frontier to preserve the peace, that no ill effects resulted. Equally successful was Gen. Scott, who was sent to the northeast frontier to quiet the disturbances which had resulted from a dispute over the boundary line between Maine and New Brunswick.

Dorr Rebellion.—Although friendly relations were maintained with all foreign powers during Tyler's administration, several internal disturbances occurred which called for quick action upon the part of the authorities. In Rhode Island, for example, the Dorr Rebellion required the presence of the United States troops, while the militia was called upon in New York to suppress the anti-rent rioters. According to the judgment of later days Thomas W. Dorr, the political reformer who led Rhode Island into its only insurrection, was a man whose chief offense was that he was in advance of his time, for since his death every reform for which he argued and for which he was ready to fight has been freely adopted by the people of the State. According to the charter which had been granted to Rhode Island by Charles II., in 1663, no person was permitted to vote for town or State officials unless he was possessed of a certain amount of real estate. Under a subsequent statute of the legislature no person could be admitted a free man of any town, with such political privileges, unless he owned a freehold estate to the value of $134, or was the eldest son of such a freeman, qualifications which barred fully two thirds of all the citizens of the State from becoming legal voters. It was to these provisions that Dorr and his adherents objected, and when they found that they could not accomplish their purpose in any peaceable way, recourse was had to arms. The insurgent forces, however, were defeated and dispersed upon each occasion. Dorr, who was convicted of high treason, was subsequently pardoned.

Anti-Rent Rebellion.—During this time the New York authorities were engaged in trying to suppress the anti-rent rebellion. According to the statement of Willard, the historian: Under the early Dutch governors of New York certain settlers received patents of considerable tracts of land, that of Van Rensselaer being the most extensive, comprising, as it did, the greater portions of Rensselaer and Albany counties. These lands were divided into farms of from 100 to 160 acres, and leased in perpetuity on condition that the tenant pay annually, to the landlord or "patroon," a quantity of wheat from 22½ bushels to 10, in addition to four fat fowls, and a day's service with wagon and horse. If the tenant sold his lease, the landlord was entitled to one quarter of the purchase money. The summer of 1844 witnessed the most violent disturbances by the anti-rent party in the eastern towns of Rensselaer, and the Livingston Manor, in Columbia County. The anti-renters formed themselves into associations to resist the law, and armed and trained bands, disguised as Indians, scoured the country, crying "Down with the rent!" and in various ways intimidating those who favored the execution of the law. In 1846, Silas Wright was chosen governor of the State, and, by his wisdom and firmness, public order was restored. By proclamation, he declared the locality in which these disorders prevailed to be in a state of insurrection; resolute men were made sheriffs, military forces were brought into requisition, and the leading anti-renters were not only brought to trial but were convicted.

The Revolt in New Mexico.— The revolt against the authority of the United States government which broke out at Taos in 1847, was quickly suppressed by the Federal forces under the command of Col. Sterling Price. Montoya, the leader of the insurrection, who had assumed the role of governor, was captured, tried by court martial, and shot, 7 Feb. 1847.

Kansas Border Warfare.—Following the Mexican War (q.v.) the government was engaged in almost continuous conflicts with the Indians, while the "Know Nothing" disturbances, which followed the organization of the American party, and resulted in anti-foreign and anti-Catholic riots in various parts of the country, caused no little trouble. As the years passed, however, the anti-slavery question had pushed itself further and further to the front and it required no inspired prophet to predict

that a few such disgraceful incidents as those which accompanied the rendition of Anthony Burns in Boston would make the issue the vital one for the nation. In the meantime the Kansas border troubles, troubles which practically resulted in civil war, held the attention of the people. This sectional excitement arose from the introduction of a bill into Congress by Senator Douglas of Illinois, which provided for the organization of that vast tract lying west of Missouri, Iowa and Minnesota, into two territories, Kansas and Nebraska, each of which, being exempt from the operations of the Missouri Compromise, should come in as free or slave States according to the vote of the people at the time of their admission. Although this bill was fiercely fought in Congress, it was passed in 1854, upon which there began a terrible struggle for the possession of Kansas. From the Northwest and the East the anti-slavery men flocked into the territory, while the slavery partisans, with their slaves, rushed in from the South, each party being determined to people the new land with settlers in sympathy with their respective views. To make matters worse the Missourians — or so it was charged — crossed the borders by the hundreds, and, wherever it was possible, controlled the elections. As the result of the disruption two sets of territorial officers were elected, and civil war with all its attendant evils followed. During the summer of 1856 the territory was in constant war. Men were murdered and towns were sacked, and while both sides were guilty of violence, the free-state party was much the less so, being confessedly in the majority. For two years Kansas suffered, but at last the opponents of slavery gained the upper hand, and, in 1861, Kansas was admitted as a free State. Among the many anti-slavery leaders in Kansas none had been more prominent than John Brown (q.v.), a man of great courage, who believed that the liberation of the slaves could be easily accomplished if they should be given an opportunity to rise. With 21 men, therefore, Brown went to Virginia to carry out his purpose. They succeeded in seizing the United States arsenal at Harper's Ferry, but as neither the negroes nor the anti-slavery whites gave them the support for which they had hoped, they were soon overpowered by a force of marines. With the exception of two, who escaped, all the participants in the revolutionary movement were either killed during the engagement or hanged afterward, the latter being the fate of John Brown.

Fenian Troubles.— Shortly after the close of the Civil War (q.v.) in the United States, leaders in the long continued struggle for the emancipation of Ireland undertook to make this country the base of operations against England by the invasion of her Canadian possessions. There was an organization of formidable numerical strength, largely composed of a military body known as the "Fenian Brotherhood." During the excitement large sums of money were raised, bodies of soldiers were organized and drilled, and war material was gathered together at convenient points. The first actual attempt at invasion was made in April 1866, when an iron steamship was purchased in New York and manned to carry arms and munitions of war to Eastport, Maine, from whence a descent was to be made upon the island of Campobello, belonging to New Brunswick, and the breakwater between Eastport harbor and the Bay of Fundy. Pending the arrival of the steamer some 500 Fenians had gathered at Eastport, but the boat did not sail, the order for her departure having been countermanded by the leaders of the movement in New York. The intending invaders, however, remained at Eastport, to which point a schooner was despatched with 750 stand of arms sent from Portland, but on representations made by the British consul these were seized by the United States authorities, and while the Canadian troops were sent to the frontier from Saint John and a British warship was stationed outside the island of Campobello, there was also an American force on hand under command of Capt. Meade. Later, in May of the same year, the Fenians made a more pretentious demonstration, under the direction of Gen. Sweeney, but before anything was accomplished in the way of getting upon Canadian soil the United States authorities seized 1,000 stand of arms at Rouse's Point, N. Y. Several other seizures afterward occurred, and, in the meantime, the entire volunteer force of Canada was ordered out. On 1 June between 1,200 and 1,500 Fenians crossed the Niagara River at Buffalo in canal boats. They were under command of Capt. O'Neil, a graduate of West Point. A skirmish took place the following day, when it was reported that nine Canadians had been killed and a number wounded. At this time Gen. U. S. Grant was in command of the United States troops sent to the frontier and he not only prevented any reinforcement of the invaders, but arrested the entire Fenian army upon its return, placing all members of the party under parole to keep the international peace. On 7 June another expedition entered Canada, going from Saint Albans, Vt., and Malone, N. Y. This force numbered nearly 2,000 men. It advanced upon Saint Armand, which the Canadians had evacuated, but, on the 9th, the Canadian force returning, the Fenians were driven back, with a loss of 15 prisoners.

Walker's Expeditions.— The violation of the neutrality laws was always the excuse for the United States' interference with William Walker's various filibustering expeditions. In 1853 this famous American adventurer invaded Lower California, where, his plans failing, he surrendered to the United States authorities at San Diego. Having escaped conviction, two years later he invaded Nicaragua, where, for a time, he was successful. In 1857 he fell, however, and on 1 May he surrendered to Commodore Charles H. Davis of the United States sloop-of-war Mary. Taken to New Orleans, he not only escaped trial, but, evading the government authorities who were watching him, he organized another expedition and landed at Greytown on 14 Nov. 1857. Shortly after landing, however, he was again compelled to surrender to Commodore Paulding of the United States frigate Wabash. Although the United States authorities had no further trouble with Walker, his next expedition was a fatal one, for, having invaded and captured a part of Honduras, he was himself captured by the commander of the British man-of-war Icarus, by whom he was delivered to the Honduran officials, and was shot, 12 Oct. 1860.

The Draft Riots.— The necessity of reinforcing the Union army by means of conscription resulted in the development of a strong spirit of opposition to the Government, a senti-

ment which, in New York and Boston, culminated in uprisings that were suppressed with great difficulty. In New York city the outbreak occurred on 13 July 1863; in Boston, a day later, but while the Boston riot was suppressed by the militia within 24 hours and at the cost of only one life, in New York order was not restored until the 16th. During this period of disturbance property to the value of more than $2,000,000 was destroyed, and it was estimated that fully 1,000 of the rioters fell in the various battles between the troops and the people.

Tin Horn War.— The Ku-Klux (q.v.) disturbances in the South; the later and still fruitless Fenian demonstration on the Manitoba frontier; the insurrection against Gov. Kellogg in Louisiana; the race riots and massacres in several of the Southern States; the troubles arising from the opening of Oklahoma and the Cherokee Strip, and the Chinese labor riots in the West, were events which, like several of the labor uprisings of later days, have required the attention of United States troops or State militias for their suppression. Of more consequence, however, was the "Tin Horn War," the last affair of importance with which the United States had to deal prior to the War with Spain and the later insurrection of the Philippine Islanders. The "Tin Horn War" was in reality a series of outbreaks against the Mexican government, beginning in the autumn of 1891, and continuing intermittently into the early part of 1894. In each of these outbreaks the insurgents operated along the Rio Grande, and evidently relied upon the contiguity of the United States for safety in case of defeat. Catarino Garza, who had conducted a number of periodicals opposed to the administration of President Diaz, inaugurated the first of this series of troubles in September 1891. He was at that time living on his cattle ranch in Texas, near Palito Blanco, at which place he collected his band of revolutionists. Issuing a manifesto, in which he proclaimed the overthrow of Diaz, he crossed the Rio Grande with less than 100 men, who were reinforced from time to time by sympathizers in the movement. There were many brushes with the Mexican troops, and, little by little, the insurrectionary spirit extended. The fact that the insurgents took refuge on American soil when worsted made it necessary for the United States authorities to act, and two companies of infantry, with two of cavalry, did effective work in preventing the violation of American neutrality. The Mexican government sent a strong force to the scene of trouble and the fighting degenerated into guerrilla warfare. During the latter part of 1892 there was another gathering of insurgents, under leaders named Pacheco and Perez, the scene of operation being several hundred miles above that of Garza's war. The rebels captured Ascension and Corralitos, driving out the American settlers who crossed the Rio Grande into New Mexico. The Indians along the Yaqui River joined in this uprising, while another band of rebels, under the leadership of a man named Amalla, added to the complications. During this period Gen. McCook had maintained a force on the American side of the Rio Grande and it was largely through his efforts that, in 1893, the insurgents were dispersed. The last outbreak occurred in January 1894, when two filibusters named Ochoa and Lugan attempted to revive the insurrection. They were unsuccessful, however, being dispersed after two somewhat sharp engagements.

The Colorado War.— Disturbances resembling in intensity and bitterness the Pullman Car Company strike and the mining troubles at Cœur d'Alène, Idaho, occurred during the winter and spring of 1903–4 in the Cripple Creek mining district, Colorado. In the summer of 1903 a strike was ordered and several thousand miners went out. Three weeks after the inauguration of the strike, an assault on two miners resulted in the ordering of State militia to the region. The presence of the soldiers was resented and rioting followed. Martial law was declared, "bull pens" established, and the leaders of the strikers arrested on various charges. Later on, prominent strikers were deported by order of the military. A state of almost civil war existed, which increased as the spring advanced. In June a crowded station was blown up by dynamite and 12 men killed. More rioting followed, and several battles occurred between strike sympathizers and the militia.

The following is a practically complete list of the wars and minor engagements, or disturbances, in which the United States has participated since 1775:

1775–1783	War of the Revolution, 19 April 1775 to 11 April 1783.
1782–1787	Wyoming Valley Massacres, Pennsylvania.
1786–1787	Shays Rebellion, Massachusetts.
1790–1795	War with Northwest Indians.
1792–1794	Whiskey Insurrection, Pennsylvania.
1798–1800	War with France.
1799	Fries' Insurrection, Pennsylvania.
1801–1803	War with Tripoli.
1806	Burr Conspiracy.
	Sabine Expedition, Louisiana.
1807	Chesapeake Bay naval battle.
1808–1809	Lake Champlain embargo.
1811–1813	War with Northwest Indians.
1811	Slave Insurrection, Louisiana.
1812–1815	War with Great Britain.
1812	Seminole War, Florida.
1813	Peoria Indian War, Illinois.
1813–1814	Creek Indian War, Alabama.
1817–1818	Seminole War, Florida.
1819	Yellowstone Expedition.
1823	Upper Missouri River campaign against Blackfeet and other Indian tribes.
1827	La Fevre Indian War, Wisconsin.
1831	Turner's Rebellion, Virginia.
	Sac and Fox troubles, Illinois.
1832	Black Hawk War.
1832–1833	Nullification disturbances, South Carolina.
1833–1839	Cherokee disturbances.
1834	Pawnee Expedition, Indian Territory.
1835–1836	Toledo War, between Michigan and Ohio.
1835–1842	Seminole War, Florida.
1836–1837	Sabine disturbances, Southwestern frontier
	Creek disturbances, Alabama.
1837	Osage Indian troubles, Missouri.
	Alton, Ill., Riots.
1838	Heatherly Indian disturbances, Missouri and Iowa.
	Mormon disturbances, Missouri.
	Maine boundary trouble.
1838–1839	Patriot War, Canadian frontier disturbances.
1840–1842	Dorr War, Rhode Island.
1841–1846	Anti-Rent riots, New York.
1846–1847	Doniphan's expedition from New Mexico to Mexico.
1846–1848	Mexican War.
	New Mexico Revolt.
1848	Cayuse War, Oregon.
1849–1861	Navajo troubles, New Mexico.
1849	Astor Place Riot, New York.
	Continuous disturbances with Indians, Texas.
1850	Pitt River expedition, California.
1850–1860	Know-Nothing disturbances.
1851–1852	Yuma expedition, California.
1851–1853	Utah Indian troubles.
1851–1856	Indian wars in Oregon and Washington.
1855	Rendition of Anthony Burns, Massachusetts.
	Yakima Indian expedition, Washington Territory.
	Winnas expedition against Snake Indians, Oregon.
1856	Attack on Canton forts, China.

1855–1856	Cheyenne and Arapaho troubles.
	Seminole War, Florida.
1855–1860	Walker's expedition.
1856–1858	Kansas border troubles.
1857	Gila expedition, New Mexico.
	Sioux Indian troubles, Minnesota and Iowa.
	Mountain Meadow massacre, Utah.
1857–1858	Utah expedition.
1858	Puget Sound expedition, Washington Territory.
	Expedition against Northern Indians, Washington Territory.
	Navajo expedition, New Mexico.
	Spokane and other Indian troubles, Washington Territory.
1858–1859	Wichita Indian troubles, Indian Territory.
1859	Colorado River expedition, California.
	Pecos expedition, Texas.
	Antelope Hill expedition, Texas.
	Bear River expedition, Utah.
	San Juan trouble, Washington Territory.
	John Brown raid, Virginia.
1859–1860	Cortina troubles, Texas and Mexican border.
1860	Piute expedition, California.
	Kiowa and Comanche expedition, Indian Territory.
	Carson Valley expedition, Utah.
	Bannock Indian massacre, Snake River, Idaho.
1860–1861	Navajo Indian expedition.
1861–1890	Apache Indian wars and troubles, New Mexico and Arizona.
1861–1866	Civil War.
1862	New Ulm Indian massacres, Minnesota.
1862–1867	Sioux Indian wars, Minnesota and Dakota.
1863–1869	War against the Indians in Kansas, Nebraska, Colorado, and Indian Territory.
1863	The Draft Riots.
1865–1868	Indian wars in Oregon, Idaho, California, and Nevada.
1865–1866	Fenian raid, Canadian border.
1866–1870	Ku-Klux disturbances, Southern States.
1867–1881	Campaign against Lipan, Kiowa, Kickapoo, and Comanche Indians.
1868–1869	Canadian River Expedition, New Mexico.
1871	Yellowstone expedition.
	Fenian disturbances on the Manitoba frontier.
1872	Yellowstone expedition, Dakota.
1872–1873	Modoc campaign.
1873	Yellowstone expedition, Dakota.
1874–1875	Campaign in Indian Territory.
	Insurrection against Governor R. D. Kellogg, Louisiana.
1874	Sioux Indian expedition, Wyoming and Nebraska.
	Black Hills expedition, Dakota.
	Big Horn expedition, Wyoming.
	Race riots at Austin, Miss., and Trenton, Tenn.
1875	Eastern Nevada expedition.
1876	Sioux expedition, Dakota (Custer massacre).
	Powder River expedition, Wyoming.
	Massacre of negro militiamen by whites, Hamburg, S. C.
1876–1877	Big Horn and Yellowstone expeditions, Montana and Wyoming.
1876–1879	War against Northern Cheyenne and Sioux Indians.
1877	Nez Perce campaign.
1878	Bannock and Piute campaign.
	Ute expedition, Colorado.
1879	Sheep-eater Indian troubles, Idaho.
1879–1894	"Oklahoma Boomers" and Cherokee Strip disturbances.
1879–1880	Ute Indian campaign, Colorado and Utah.
1885	Chinese miner disturbances, Wyoming.
1890–1891	Sioux Indian disturbances, South Dakota.
1891–1893	The "Tin Horn War," Texas and Mexican border.
1892–1896	Trouble with renegade Apaches, Arizona and Mexican border.
1894	Coxey's Commonweal and other industrial army disturbances.
1898–1899	War with Spain.
1898	Chippewa Indian disturbances, Leech Lake, Minn.
1899–1902	Insurrection in Philippine Islands.
1903–1904	The Colorado mine disturbances.

United Workmen, Ancient Order of, a beneficial organization founded in 1868. In 1902 it had 44 grand lodges, 5,500 subordinate lodges, and over 500,000 members. In the same year it paid $8,895,952 in benefits.

Units of Measurement. When any physical quantity is to be measured, it is necessary to select a unit, in terms of which the magnitude of the quantity is to be expressed. We may, if we choose, select an entirely arbitrary unit for each different kind of quantity to be measured; or we may select certain arbitrary fundamental units as a basis, and construct upon these a consistent system of derived units. The first method is employed in English-speaking countries, and the second in those countries which employ the metric system. In scientific measurements, the second, or "logical" system is also employed, in practically all civilized countries at the present time.

In any system of units of measurement, it is necessary to select at least three units that are entirely arbitrary. It is customary (though not at all essential) to select, as the three fundamental units, the units for measuring length, mass, and time. In the English system, the fundamental unit of length is the yard. It is said that the yard was originally defined, by royal decree, as the length of the arm of King Henry I. It is doubtful if this is true; but at all events, the standard yard, at the present time, is defined as the distance, at 62° Fahr., between two marks upon a certain bar of bronze in the possession of the United States government. The foot is then defined as the third part of a yard, and the inch as the twelfth part of a foot. In the British system, the unit of mass is the avoirdupois pound, which is defined as the mass of a certain cylinder of platinum in the possession of the British government, which is marked "P. S. 1844"; the letters "P. S." signifying "Parliamentary standard." In the United States, the unit of mass is, theoretically, the "pound" of Queen Elizabeth; but in recent years, the British pound, as defined above, has been taken as the standard. The difference between the two probably does not much exceed two grains. In all civilized countries the fundamental unit of time is the second; the second being defined as the 86,400th part of a mean solar day, or the 86,400th part of the average interval between two successive passages of the sun across the meridian of any given place. In the metric system the fundamental unit of length is the metre; the metre being defined as the distance, at 0° C., between two marks on a certain bar of platin-iridium in the possession of the International Bureau of Weights and Measures, at Sèvres, France. The fundamental unit of mass, in the metric system, is the kilogram, which is defined as the mass of a certain piece of platin-iridium in the possession of the International Bureau of Weights and Measures. The kilogram was intended to be (and is, very nearly,) equal to the mass of a cubic decimetre of water, at the temperature (about 4° C.) at which water has its greatest density.

Secondary Units.—The various units that

are employed in measurement, in addition to the fundamental units described above, are defined, for the sake of precision, in terms of those fundamental units. The legal gallon in the United States, for example, is defined as the volume occupied by 8.3389 avoirdupois pounds of water, when the water is at the temperature at which its density is greatest, and when the weighing is performed in air while the barometer stands at 30 inches, and the atmospheric temperature is 62° F. Many of the secondary units that are used in English-speaking countries are as arbitrary as the gallon; but others are derived from the fundamental units in a perfectly definite way. The unit of work and of energy, for example, in English and American engineering practice, is the foot-pound; the foot-pound being defined as the work that must be done in order to overcome, through a distance of one foot, a force equal to the attraction that the earth exerts upon a pound of matter. (See FORCE and MECHANICS.) The attractive force that the earth exerts upon a pound of matter is often called a "pound." This is incorrect, however, for the pound (like the gram or the kilogram) is a unit of mass, and not of force. The "poundal" is the logical unit of force in the system of units in common use in English-speaking countries; the poundal being defined as the force which, when acting for one second upon a body whose mass is one pound, will communicate to that mass a velocity of one foot per second. The poundal is not in very general use, however, because in scientific work, where precision of statement and a high degree of numerical accuracy are of paramount importance, the "centimetre-gram-second" system of units is now almost universally employed.

The Centimetre-Gram-Second System.— The centimetre-gram-second system of units is so called because it is based upon the centimetre as the unit of length, the gram as the unit of mass, and the second as the unit of time. The name of the system is commonly abbreviated to "C.G.S." In the C.G.S. system, the unit of force is the "dyne"; a dyne being defined as the force which, when allowed to act for one second upon a body whose mass is one gram, will communicate to that body a velocity of one centimetre per second. The unit of work in the C.G.S. system is the "erg," this being defined as the quantity of work that is done when a force of one dyne is overcome through a distance of one centimetre. The unit of energy is also the erg, because energy is measured by the quantity of work that it can perform. The dyne is a very small unit in comparison with the forces that we commonly have to deal with in the physical world, it being only about 2 per cent greater than the attraction that the earth exerts upon a milligram of matter. To avoid the use of inconveniently large numbers in expressing forces, a unit called the "megadyne" is therefore used to some considerable extent, a "megadyne" being defined as equal to 1,000,000 dynes. This convention of prefixing "mega-" to indicate a unit of 1,000,000 times as great as the unit whose name follows the prefix is quite common. A quantity of work equal to 1,000,000 ergs, for example, is called a "megaerg," or more commonly a "megerg," or a "megalerg". The prefix "kilo-" is similarly used to signify a unit that is one thousand times as great as the unit to whose name it is prefixed; this being familiarly illustrated in the "kilogram" and the "kilometre." The prefix "micro-" is also employed to a considerable extent, to signify that the unit to which it relates is one one-millionth as great as the unit whose name follows the prefix. A "microfarad," for example, is a unit whose magnitude is the millionth part of a farad. (See below.)

The most arbitrary unit in the C.G.S. system is the "absolute atmosphere," which is defined as the pressure of a megadyne per square centimetre. This unit, however, has the advantage of being perfectly definite. Moreover, it is not greatly different from the ordinary pressure of the atmosphere. At sea-level in the latitude of Paris, for example, a column of mercury 76 centimetres high, and at a temperature of 0° C., exerts a pressure of 1.0136 megadynes per square centimetre; that is, a pressure of 1.0136 "absolute atmospheres."

All of the electrical and magnetic units that are now in common use are based upon the centimetre-gram-second system; and they illustrate, admirably, the convenience of that system.

Electrical and Magnetic Units.—A unit magnetic pole, in the C.G.S. system, is a magnetic pole of such strength that it will repel an equal pole, at a distance of one centimetre, with a force of one dyne. The intensity of a magnetic field, in this system, is numerically equal to the number of dynes of force that the field will exert upon a unit pole that is placed in it. The "moment" of a magnet is the product of the distance between its poles (expressed in centimetres) by the strength of one of these poles; and the intensity of magnetization of a magnet is numerically equal to the moment of the magnet, divided by the volume of the magnet in cubic centimetres.

In electrical measurements, two distinct sets of units are employed, these being known, respectively, as the "electrostatic units" and the "electromagnetic units," because one is commonly employed in calculations concerning static electricity, while the other is employed in work that relates to dynamic (or "current") electricity. Both sets are based upon the C.G.S. system, and it is likely that in the not very distant future a single set of units will be employed for electrical measurements of all kinds. At present, however, this is not feasible, on account of our temporary ignorance with respect to certain points which must be cleared up before the ideal single set of electrical units can be realized. Consult Lodge, 'Modern Views of Electricity'; Maxwell, 'Electricity and Magnetism.'

Electrostatic Units.—The absolute (or C.G.S) units for the measurement of static electricity are derived as follows: The C.G.S. unit of "quantity of electricity" is that quantity which would repel an equal quantity, situated at a distance of one centimetre, with a force of one dyne. The C.G.S. unit of electromotive force (or difference of potential) is that difference of potential through which a unit quantity of electricity must be raised, in order that the work done shall be one erg. The capacity of a conductor, in C.G.S. measure, is the quotient obtained by dividing the quantity of electricity upon the conductor by the potential which this quantity of electricity produces in the conductor. (The capacity of an isolated sphere is numerically equal to the radius of the sphere, as

expressed in centimetres.) The unit of current is the current which conveys one unit of electricity in one second of time.

Electromagnetic Units.—The units that are employed in the measurement of dynamic (or current) electricity are derived as follows: The unit of current is the current which, when flowing along a circular arc one centimetre in length and one centimetre in radius, produces, at the centre of the arc, a magnetic field of unit intensity. The unit of "quantity of electricity" is the quantity of electricity that a unit current conveys in one second. The unit of electromotive force (or of difference of potential) is a difference of potential of such magnitude that to cause the flow of a unit quantity of electricity against it requires the expenditure of one erg of work. The unit of resistance is the resistance through which a unit current would be produced, by one unit of electromotive force. The unit of capacity is the capacity of a conductor whose potential is increased by unity, by the addition to the conductor of one unit of electricity. The absolute electrical units, in the electrostatic and electromagnetic systems, have not (in general) received definite names; it being sufficient, in calculations in which these units are employed, to speak of a certain number of "C.G.S. units of electricity," or "C.G.S. units of resistance," etc. For the practical measurement of dynamic electricity in the laboratory and the power house, the absolute (or C.G.S.) units are not of convenient size; and for them it is therefore customary to substitute certain more convenient multiples and submultiples of the electromagnetic units, as they are defined above. The modified units are known as the "ohm," "ampere," "volt," etc., and are considered in the following paragraph.

Practical Electrical Units.—The unit of resistance that is employed almost universally in practical electrical work is the "ohm," which was named for G. S. Ohm, the distinguished physicist and discoverer of Ohm's law. This is defined as equal to 1,000,000,000 (or 10^9) C.G.S. electromagnetic units of resistance; the ideal standard having precisely this resistance being called, for the sake of distinct identification, the "true ohm." Many physicists have investigated the value of the ohm, as here defined, and have constructed material standards for practical work, having a resistance of one ohm, as nearly as possible. A committee appointed by the British Association for the purpose of investigating the value of the true ohm, prepared a coil of German silver wire, which, at a certain definite temperature, was supposed to have a resistance of practically one ohm; and this coil, from the time of its acceptance by the British Association in 1864 down to the year 1884, was the standard ohm of the world, being known, for definiteness, as the "British Association ohm," or, more briefly, as the "B.A. ohm." It is now customary to define the practical ohm in terms of the resistance of a column of mercury of stated dimensions and temperature, as it is found that the resistance of a solid conductor depends not only upon the material of which the conductor is made, but also upon the physical state of that material with respect to internal stresses and other circumstances. The B.A. ohm of 1864 has a resistance equal to that of a column of pure mercury having a constant cross section of one square millimetre, and a length of 104.83 centimetres; the temperature of the mercury being 0° C. This standard was subsequently found to be materially smaller than the true ohm, and the International Congress of Electricians at Paris, in 1884, adopted, as the equivalent of the ohm, a column of mercury having a constant cross section of one square millimetre, and a length of 106 centimetres; the temperature of the mercury being 0° C., as before. This standard is known as the "legal" or "congress" ohm. Several of the physicists present at that congress were of the opinion that the length of the column should be 106.2 or 106.25 centimetres; but the decimal being admittedly uncertain, it was finally agreed to disregard it entirely, until further experimental evidence could be had. In August 1893 an International Congress of Electricians was held at Chicago; England, France, Germany, Italy, Austria, Switzerland, Sweden, Mexico, Canada, and the United States being represented. This congress adopted another and (presumably) better value of the ohm, the new standard being designated as the "International ohm." The International ohm, which has since been adopted by the nations represented at the conference, was defined as "the resistance offered to an unvarying electrical current by a column of mercury (at the temperature of melting ice) 14.4521 grams in mass, of a constant cross-sectional area, and of the length of 106.3 centimetres." The conference preferred, it will be seen, to fix the sectional area by giving the mass of the column, rather than by stating the sectional area directly. The intention was, however, that the sectional area shall be sensibly one millimetre; for a column of mercury 106.3 centimetres long and having a mass of 14.4521 grams, would have a sectional area, at 0° C., of between 1 and 1.00003 square millimetres. The ohm thus defined by the Chicago congress is probably very near to the true ohm.

The practical unit of current is the "ampere," named for the French physicist, A. M. Ampere. It is defined as equal to one tenth of a C.G.S. electromagnetic unit of current. The Chicago International Congress of 1893, after considering the available experimental evidence, concluded that the ampere can be defined, for practical purposes, as equal in magnitude to the unvarying current which will deposit 0.001118 gram of metallic silver every second from a solution of nitrate of silver in water. This particular estimate of the value of the true ampere is called for definiteness, the "International ampere." The practical unit of electromotive force the "volt," which was named for the Italian physicist, Alessandro Volta, and which is defined as equal to 100,000,000 (or 10^8) C.G.S. electromagnetic units of difference of potential or as the electromotive force which is required in order to maintain a current of one ampere through a resistance of one ohm.

Of the remaining practical electrical units, the coulomb, farad, joule, watt, and henry call for special mention. The coulomb is the practical unit of electrical quantity. It may be defined either as one tenth of the C.G.S. electromagnetic unit of "quantity of electricity," or as the quantity of electricity conveyed by an ampere in one second. The farad (named for Faraday) is the practical unit of capacity, and may be defined either as the 1,000,000,000th part

of a C.G.S. electromagnetic unit of capacity, or as the capacity of a condenser which holds one coulomb of electricity, when charged to a potential of one volt. The farad is much too large for convenience, and although it is called the "practical" unit of capacity, it is replaced, in practice, by the "microfarad," which is equal to the millionth part of a farad. The condensers which are in ordinary use are commonly made to have capacities of a microfarad, or of some decimal subdivision of a microfarad. The "joule" is the practical unit of work (or energy) in the electrical system of units, a joule being defined as 10,000,000 (or 10^7) ergs; and its practical convenience depends upon the fact that it is equal to the quantity of energy that is expended in one second by a current of one ampere acting through a resistance of one ohm. The watt is the corresponding unit of power, and is defined either as the expenditure of 10,000,000 ergs per second, or as the rate at which energy is expended when a current of one ampere flows through a resistance of one ohm. In dealing with the large currents that occur in modern electrical power-houses, the watt is an inconveniently small unit, and the kilowatt is almost invariably used in its place; a kilowatt being equal to 1,000 watts. A horsepower is equal to 746 watts, or to 0.746 of a kilowatt. The henry (named for Joseph Henry) is the practical unit of inductance, and it is defined as the induction in a circuit, when an electromotive force of one volt is induced in this circuit while the inducing current varies at the rate of one ampere per second.

Dimensions.— A surface is said to have extension in two dimensions, and a solid is similarly said to have extension in three dimensions. The volume of a cube, for example, is found by multiplying together the length, width, and height of the cube; and hence we may say that the volume in question is of three "dimensions" in terms of L, the unit of length employed. This mode of expression has been extended to other units besides units of length, and the idea has proved itself quite useful in numerous ways. For example, a velocity is found by dividing a length by a time; so that if L represents a length and T a time, we may write $V = LT^{-1}$; and we say that velocity is of dimension $+1$ in length, and -1 in time. Similarly, force is measured by the change of momentum that it produces, in a given mass, per unit of time. That is, it is found by multiplying a mass (which we may represent by M) by a velocity, and dividing the product by a time. That is, $F = MV/T$. But we have already found that $V = LT^{-1}$, and hence the equation becomes $F = MLT^{-2}$, and we say that force is of dimensions $+1$ in mass and in length, and of -2 in time. The equations here given are called "dimensional equations," since in writing them we pay no attention to the actual numerical magnitudes of the quantities involved, but only to the "dimensions" of those quantities. As a further illustration of the "dimensions" of a physical quantity, let us consider the case of work. This is defined as the product of a force by a distance, and hence we have $W = FL = MLT^{-2}\ L = ML^2T^{-2}$, and we say that work is of dimensions $+1$ in mass, $+2$ in length, and -2 in time. Kinetic energy is found by taking half the product of a mass and the square of a velocity. Omitting the numerical factor $\frac{1}{2}$ (since it does not affect the dimensions of the energy in any way), we have $E = MV^2 = M(LT^{-1})^2 = ML^2T^{-2}$, so that kinetic energy is of dimensions $+1$ in mass, $+2$ in length, and -2 in time That is, it is of the same dimensions in all respects as work; which is evidently correct, since work and kinetic energy are mutually convertible. As an illustration of the determination of the dimensions of a quantity when those dimensions are much less obvious, consider the dimensions of a "quantity of electricity," as expressed in electrostatic units. Let Q denote a charge of electricity, as expressed in electrostatic units. Then if a similar charge were brought near to the first one, the repulsion between the two would be found by dividing the product of the two charges by the square of the distance between them. Hence the dimensions of the repulsion between the two charges would be Q^2L^{-2}. But this repulsion, being a force, must be of the dimensions $F = MLT^{-2}$; and hence we have $Q^2L^{-2} = MLT^{-2}$; whence $Q = M^{\frac{1}{2}}L^{\frac{1}{2}}T^{-1}$. That is "quantity of electricity," as expressed in the electrostatic system, is of the dimensions $\frac{1}{2}$ in mass, $\frac{3}{2}$ in length, and -1 in time. For the dimensions of other electrical magnitudes, and for the interesting facts that are known relatively to the ratios of the dimensions of the various electrical units, special works on these subjects must be consulted. Maxwell pointed out that in any equation that expresses a fact in nature, the several terms that are added together, or equated to one another, must be all of the same dimensions; a fact of which use has been made above, in determining the dimensions of "quantity of electricity."

As an illustration of the kind of information that can sometimes be had from dimensional equations, in constructing a formula of which we know the general but not the precise form, let us consider the case of the pendulum. Let us suppose that we know that the time of oscillation of a pendulum, through a small arc, varies as some power of the length of the pendulum, multiplied by some power of the intensity of gravity at the place where the experiment is made, and let us seek to find what these unknown powers are. Representing the intensity of gravity by g, and the unknown exponents by x and y, respectively, the foregoing assumption with respect to the general form of the dependence of the period upon the length of the pendulum and the intensity of gravity gives us an expression of the form g^xL^y, for the time of oscillation of the pendulum. Now g, being an acceleration, is of the dimensions LT^{-2}; so that the foregoing expression is of the dimensions $(LT^{-2})^xL^y$; but this, being the expression for the time of oscillation of the pendulum, must itself be of the dimensions T. Hence we have $(LT^{-2})^xL^y = T$, or $L^{x+y}T^{-2x} = T$. This being an identity, we have, by equating the exponents of T, $-2x = 1$, or $x = -\frac{1}{2}$. And since we also have $x + y = 0$, we see that $y = +\frac{1}{2}$. Hence the time of vibration of the pendulum varies directly as the square root of the length of the pendulum, and inversely as the square root of the intensity of gravity. Universal German Working Men's Association. See SOCIALISM.

Universal Language, or World Language, a language that may serve as a means of communication among all the peoples of the earth, or at least all cultured peoples. The project of a universal language has engaged the attention of scholars ever since the days of Leibnitz, and actually existing languages, as English or French, or a dead language, as Latin, or an artificial language, as Volapük and Esperanto (qq.v.), have been proposed, each in turn, as meeting all the requirements. National jealousies, were there no other objections, present an insurmountable obstacle to the adoption of any living language as the universal medium of communication, as the same feeling has prevented the universal adoption of a prime meridian. Nor would the opposition to any living language, English, for example, be simply Chauvinistic: the adoption of English would give to the English-speaking nations an immense advantage over all others in commerce: English books would be read everywhere, and the thought and civilization of the world at large would be transformed — Anglicized. The adoption of Latin is practically out of the question for one reason, because it is entirely too difficult to learn. If living languages must be ruled out, the proposed world language must be an artificial construction. The essential conditions with which such an artificial language must comply, as defined by the International Congress of Philosophy, which was held at Paris in 1900, are: (1) That the new language shall serve the needs of daily life and business as well as the requirements of science and learning; and, (2) that it shall be so simple that a person possessing an average common school education can acquire it readily. That the artificial language Esperanto to a considerable extent fulfils these conditions appears from the fact that at the International Geological Congress held in Vienna 1903, three of the delegates, a Norwegian, a Rumanian, and a Belgian, none of them understanding the national speech of the others, found in Esperanto a sufficient means of communication on all scientific subjects. In 1879 was published the scheme of a world speech, called Volapük, a word made up from world and speak or speech. Volapük was invented by Johann Martin Schleyer, a Catholic priest of Baden; its elements are derived from the West-European languages Teutonic and Latinish. Its alphabet comprises 27 letters, namely the vowels *a, e, i, o, u, ä, ö, ü,* and these 17 consonants, *b, p, h, y, g, k, l, r, m, n, s, j, c, x, z.* The vowels are pronounced as in German, the consonants as in English, except that *g* is always hard, *s* is always sharp, *c* is like *j*, and *z* is equal to *ts.* There are 10 other consonant signs for sounds peculiar to various languages: there are no silent letters and no diphthongs. About 40 per cent of the root words of Volapük, which usually are nouns, are from English, the rest are chiefly from German, French, and Latin. In choosing root words the desiderata were brevity, clearness and ease of utterance: every root word consists of one syllable, a vowel between two consonant sounds: man is *man, dom* is house (Lat. *domus*), *tim* is time; and root words are formed from ordinary words either (1) by substituting a consonant for a final vowel: Eng. pay becomes *pel,* Fr. mer (sea) becomes *mel;* or (2) consonants and vowels are dropped: Lat. pons (bridge) becomes *pon,* Eng. state becomes *tat;* or (3) the most important syllable alone is retained: Lat. sapientia (wisdom) becomes *sap.* Here are some examples of root words from different languages: From Eng. gift, *giv,* lady, *läd,* woman, *vom;* from Lat. finis (end) comes *fin,* flumen (river) *flum,* tensio (stretching) *ten.* From these root words, which are nearly all nouns, are formed the other parts of speech — verbs, adjectives, adverbs — by proper prefixes and suffixes. Nouns have four cases, namely, nominative, genitive, dative and accusative. The nominative is the unmodified root, for example, *val,* world, is in the nominative case. The genitive adds *a, vola,* of the world; *vola pük,* world's speech. The dative and accusative respectively add *e* and *i* to the root; *vole,* to the world, *voli,* the world (objective case). The pronouns I, thou, he, she, it, are *ob, al, om, of* and *os,* and they are declined like nouns: *oba,* of me, *obe,* to me; *ala,* of thee, *ale* to thee; and so on. The tenses of verbs, except the present, are formed by prefixing the vowels *ä, e, i, o,* and *u* to the root; thus *löfob* (*löf,* love, *ob,* I) is I love, *älöfob,* I loved, *elöfob,* I have loved, *ilöfob,* I had loved, *olöfob,* I shall love, *ulöfob,* I shall have loved: by putting *al,* thou, *om,* he, *of,* she, in the place of *ob,* I, we get the forms for thou hast loved, he will love, she had loved, etc. By similar devices the various moods are indicated, for example, the ending *ös* added to the present indicative *löfom,* he loves, makes it optative, may he love, *löfomös.* The passive voice is formed by prefixing *p* or *pa.* Thus, *palöfon,* to be loved, *palöfob,* I am loved, *pälöfob,* I was loved, *pelöfob,* I have been loved, *polöfob,* I shall be loved, *pulöfob,* I shall have been loved. The adjective is the noun with *ik* suffixed: *gud,* goodness, *gudik,* good; *yun,* youth, *yunik,* young. The adverb is formed from the adjective by adding *o: gudik,* good, *gudiko,* well. In pronunciation every syllable is long and the accent is always laid on the last syllable of the word. Volapük was received with great favor immediately after the scheme was published. The first "Congress of Volapükians," held in Switzerland in 1886, had 300 delegates: a few years later the students of Volapük numbered 250,000.

Universal Prime Meridian. See LATITUDE; LONGITUDE.

Universal Time. See TIME.

Universalism, the belief in the final triumph of good over evil in the Universe. As applied to the human economy it is the belief that God is pledged by his goodness and omnipotence to overcome and destroy sin and save ultimately the "whole family of mankind." Universalists claim that they can find this tenet in the teachings of primitive Christianity, and it was held among other notable writers of the early Church, by Clement of Alexandria, and Origen. From the inception of the Protestant Reformation to the close of the 18th century, both on the Continent of Europe,— in Holland, Switzerland, France,— and in England, there rose from time to time eminent theologians who ventured to proclaim the

doctrine. Sometimes great schools of thought, like the Mystics and the Anabaptists, were tinctured by it.

It is only in North America, however, that it has served as the basis of an organized Christian denomination. The Universalists of America trace the beginning of their order directly to John Murray, who came to this country from England and landed on the New Jersey coast at a place called Good Luck about 20 Sept. 1770. There he met one Thomas Potter, who had erected a church which he said was waiting for the minister whom God would send to preach in it. As soon as Mr. Potter saw Murray, he declared that he was the minister for whom he was waiting. Much against his will, and after resisting the solicitations of Mr. Potter for more than a week, under circumstances which seem to some almost miraculous, and which are certainly highly romantic, Mr. Murray at length yielded. Thus began his remarkable career as the preacher of what was then a new doctrine in America and the founder of a sect of considerable importance to-day.

Mr. Murray had never intended the ministry as a profession. He had been brought up as a strict Calvinist, but from very early life had associated with the Methodists, having been made a class leader by John Wesley when he was scarcely more than a youth. Later he became a communicant in Whitfield's Tabernacle in London. He was a very diligent reader of the Scriptures, very devout and thoughtful. By accident, he was brought in contact with the Rev. James Relly, an independent preacher of Universalism. The task was given him to bring back into the fold of the Tabernacle a young woman who had become a convert to Mr. Relly. The task was not so easy as he imagined it would be; for instead of confounding her by his questions she confounded him by her answers. His curiosity was thus piqued and he began to investigate. First he read Relly's 'Union,' a book in which the preacher had set forth his peculiar views; then he became an attendant on Relly's preaching, and finally he announced himself a complete convert. About this time his young wife, to whom he was devotedly attached, died. He was thrown into the deepest despondency, and being unable to rally from his grief, he sought to find oblivion and rest in the wilderness of America. His strange meeting with Thomas Potter changed the trend and purpose of his life. For a period of three or four years he continued to make his home with his new-found friend. But his fame gradually spread abroad, invitations began to pour in upon him from far and near. In responding to these his message was carried along the Atlantic seaboard from New Jersey to New Hampshire. He made many warm friends in Rhode Island, among them Cols. Greene, Lincoln, and Varnum, at whose instance, on the breaking out of the Revolutionary War, he was made chaplain of the Rhode Island Brigade.

On one of his northerly visits he was invited to Gloucester, where he found a company of people who had seen and read a copy of Relly's 'Union' and been powerfully influenced in favor of its teachings. These formed the nucleus of a congregation; and at their earnest solicitation he decided to take up his residence among them and become their pastor. The "Independent Christian Church,' of Gloucester, enjoys the distinction of being the first organized Universalist Church in America. But it did not long remain alone. By the end of the century, or in less than a generation from the landing of Murray, a considerable number of congregations had been gathered. There was at least one such congregation in most of the leading towns of New England, and churches were also to be found as far south as Philadelphia. These were ministered to, for the most part, by a body of remarkable men, some of whom, like Elhanan Winchester, George Richards, Edward Turner, Walter Ferris, and Hosea Ballou, are still famous. In April 1785, an organization of churches, in the eastern part of Massachusetts mainly, was effected under the name of Universalists. This organization constantly enlarged its membership, and may be regarded as the forerunner of what is now known as the Universalist General Convention.

In this constantly widening extension of the doctrine, of course, the first impulse was given by Murray. Many doubtless owed their first conception and conviction directly to him. As was natural, however, almost from the start there was not a little variety of opinion. Men of such eminence as many of the clergy of that period were likely to work out the problems for themselves. The doctrine, as reasoned by Relly and proclaimed by Murray, was crude and fanciful. It was scarcely more than an ill-conditioned graft upon the Calvinistic tree. Taking the Scriptural affirmation that Christ died for all men and the assertion of Calvinism that all for whom Christ died will be saved, Relly reached the conclusion of universal salvation. Both Relly and Murray made a distinction between redemption and salvation, arguing that Christ had paid the price, purchased or redeemed the whole human race. This redemption was appropriated by each individual through faith. Mr. Murray was not, however, always consistent in maintaining this distinction.

On 25 May 1790 a convention was held in Philadelphia for the purpose of drawing up articles of faith and a form of church government. In this convention, of which Mr. Murray was a member, there were representatives from churches in Massachusetts, Virginia, New Jersey, and Pennsylvania. The articles of faith adopted were five in number and related to (1) the Holy Scriptures, (2) the Supreme Being, (3) the Mediator, (4) the Holy Ghost, (5) Good Works. These declarations, while cast in the common mold of the prevailing theology of the time, are yet broad and elastic in their scope. How far these articles were accepted by the Universalist churches in general it is impossible now to determine. In 1803, however, at a meeting of the Universalist General Convention in Winchester, N. H., a Profession of Belief was adopted which has since been the basis of fellowship and faith in the Universalist denomination. That profession is as follows:

ARTICLE I. We believe that the Holy Scriptures of the Old and New Testaments contain a revelation of the character of God and of the duty, interest and final destination of mankind.

ARTICLE II. We believe that there is one God, whose nature is Love, revealed in one Lord Jesus Christ, by one Holy Spirit of Grace, who will finally restore the whole family of mankind to holiness and happiness.

ARTICLE III. We believe that holiness and true happiness are inseparably connected, and that believers ought to be careful to maintain order and practice good works; for these things are good and profitable unto men.

In the convention at Winchester and taking part in the discussions was a young man, Hosea Ballou, then 32 years of age, who had already made publicly a declaration of principles widely different from those advocated by either John Murray or Elhanan Winchester. He was about to publish (in 1805) a work entitled, 'A Treatise on Atonement,' in which he had worked out a new and original system of theology. Starting with the premise of the universal fatherhood and infinite love of God, he carved out for himself a new path in theological belief, and really settled the essential principles of what is now known as the ethical theology. A contemporary writer said:

> In the 'Treatise on Atonement,' he had treated the subject at length, maintaining the subordination of the Son to the Father, the eternal and infinite love of God to all creatures, and holding forth the death of Christ not as a cause, but as the effect of this eternal principle of the divine nature.

The treatise is remarkable in view of the fact that Mr. Ballou, as he himself says, "never read anything on the doctrine of universal salvation before I believed it, the Bible excepted; nor did I know, that I can now recollect, that there was anything published in its vindication in the world." Again, "when . . . I wrote my 'Notes' and 'Treatise' I had never seen any work in defence of the doctrine of the Divine Unity, and the dependency of the Son upon the Father."

The points argued in the work are, first, sin, its nature, origin, and consequence, showing that it is a voluntary transgression of the law, that it is not an inherited condition, neither the work of a personal devil, and that its consequences are experienced in the unhappiness and degradation of the soul; secondly, the human will, that it is free, and yet, that its freedom will not be permitted to the extent of defeating the purposes of God; thirdly, the atonement, that, in opposition to current theories of a substituted punishment designed to affect the mind and disposition of God toward the sinner, it was a voluntary sacrifice on the part of Christ, the whole object of which was to draw men away from sin and reconcile them to God; fourthly, the person of the Mediator, that he is a created being subordinate to and dependent upon the Father, whose supremacy he acknowledged in the act of prayer, and yet a being to whom the Father gave all power in heaven and on earth to the end that he might reconcile all things unto himself; and finally, the consequences of atonement, that they would be complete in the reconciliation of every soul to God.

Almost immediately the greater part by far of the Universalists of that day accepted this new statement of their belief. A preponderating majority of the Universalist clergy accepted almost without question the new leadership. A considerable number, however, especially of the older men did not go to the full length of Mr. Ballou's reasoning. Mr. Murray of course remained steadfast in his old opinions. Others hesitated and doubted the soundness of Mr. Ballou's conclusions. Gradually a breach was created, more especially with reference to the doctrine of a general judgment and future retribution for sin. The assertion of Mr. Ballou that "the effects of sin, as sin, are not endless, but are limited to the state in which it is committed," together with the declaration that the Scriptures are silent as to any consequences of sin beyond the grave caused many to halt. Accordingly, in 1831, Paul Dean, Charles Hudson, Adin, Ballou, David Pickering, and a number of other clergy only less distinguished, withdrew from the fellowship of the Universalists and sought to form a new denomination under the title of Restorationists. Their effort, however, was abortive, and most of these gentlemen soon found fellowship among the Unitarians.

Since that time the Universalist denomination has continued without signs of disruption. The teachings of Hosea Ballou have constituted the foundations on which the doctrines of the Universalist churches are based. These doctrines have undergone important modifications in conformity with the constantly widening area of human knowledge, the profounder and more accurate as well as the more rational interpretation of Scripture and the growing liberality of the age. For a considerable period there was a widespread dissatisfaction with the phraseology of the second article of the Winchester Profession. For a period of 20 years an effort was made in successive sessions of the Universalist General Convention to secure some modification of this phraseology. The discussion was brought to a conclusion at the session held in Boston, in 1899, by the adoption of the following declaration:

> The conditions of fellowship shall be as follows:
> 1. The acceptance of the essential principles of the Universalist Faith, to wit: 1. The Universal Fatherhood of God; 2. The Spiritual authority and leadership of His Son, Jesus Christ; 3. The trustworthiness of the Bible as containing a revelation from God; 4. The certainty of just retribution for sin; 5. The final harmony of all souls with God.
>
> The Winchester Profession is commended as containing these principles, but neither this nor any other precise form of words is required as a condition of fellowship, provided always that the principles above stated be professed.
>
> 2. The acknowledgment of the authority of the General Convention and assent to its laws.

In the latter part of September 1870, the 100th anniversary of the landing of John Murray in America was celebrated by the holding of the session of the General Convention in Gloucester, Mass. The occasion drew together many thousands of people from all parts of the country. As the number in attendance was greater than the power of public and private hospitality combined could care for, tents were erected in a large vacant plot of ground overlooking the sea, one mammoth tent being erected in the midst of them for the public gatherings. In this tent, Dr. T. J. Sawyer, Dr. A. A. Miner, Dr. E. H. Chapin, Horace Greeley, and other eminent men, both clerical and lay, of the period were

heard to the abundant satisfaction of the people. The celebration was made the occasion of raising a fund of $100,000 to be known as the Murray Centenary Fund, the income to be devoted to missions, church extension, and the education of candidates for the ministry. At this session also a complete reorganization of the General Convention was effected. With slight modifications, the organization remains unchanged.

The Universalist General Convention, having jurisdiction over the ecclesiastical organizations of the Universalist Church in the United States and Canadian provinces, meets biennially, on the Wednesday preceding the fourth Sunday in October. The Convention is composed of the Presidents, the Vice-Presidents, and the Secretaries of the State Conventions, and of clerical and lay delegates from the State Conventions, each State being entitled to two clerical and four lay delegates and to an additional number of each class of delegates in proportion to the aggregate of its parishes and clergymen. At least four parishes must be organized and established in a State before a State Convention can be formed, but a less number of parishes may unite to choose two delegates, clerical or lay, to represent them in the General Convention; and if there be one parish so situated, it is entitled to two delegates. In all such States or Territories the General Convention has original jurisdiction.

All laws relating to fellowship, ordination, and discipline originate in the General Convention, and it is the final court of appeal in all cases of dispute or difficulty between State Conventions. It is an incorporated body, empowered to hold real and personal estate to the value of $500,000, «to be devoted exclusively to the diffusion of Christian knowledge, by means of missionaries, publications, and other agencies.» In the interim of sessions the interests of the Convention are watched over and managed by a board of trustees. The funds of the Convention, as reported in 1902, aggregate $364,319.25. There are now (1904) 43 State Conventions; 982 parishes, containing 54,619 families; 877 church organizations with a membership of 54,102 persons; 778 Sunday schools with a membership of 55,625; 790 church edifices of a total valuation of $10,255,460; there are nearly 750 clergymen in fellowship.

The last 50 years of denominational history has been particularly marked by activity in the founding and development of educational institutions. There are now under the nominal patronage and control of Universalists four of collegiate rank, namely, Tufts College in Massachusetts, Saint Lawrence University in New York, Buchtel College in Ohio, and Lombard College in Illinois, and three Academies, namely, Dean Academy, in Massachusetts, Goddard Seminary in Vermont, and Weetbrook Seminary in Maine. Tufts College, the oldest and most important of the colleges, is an institution of university rank. It has 186 teachers, nearly 1,000 students and embraces, besides the usual college of letters, the following departments: A divinity school, an engineering department, a medical school, and a dental school. All the educational institutions under denominational control give instruction to 2,200 pupils and have a combined endowment of over $4,000,000.

Thus it will be seen that the Universalist Church is thoroughly organized for the work of a living Christian denomination. It is true that the ethical principle which is central in its theology has been accepted by nearly every body of Protestant Christians throughout the world. Its peculiar ideas of eschatology have also spread very widely in all the more progressive organisms of Christendom. Still the adherents of this church lift up their banner with confidence and look with faith to the future, holding steadfastly to the traditions of their great founders.

ELMER HEWITT CAPEN, D.D.,
Late President of Tufts College.

Universe. In the article STARS will be found a description in detail of those wonderful bodies which stud the sky. In the present article we consider these bodies as forming a connected whole, which we call the universe, and which comprehends creation in its widest extent. Many questions connected with the universe are not yet answered; but our ideas of its structure are surely though slowly advancing. The object of the present article is to set forth what can be said on the subject at the present time.

The first question to arise is the oldest. Is the collection of heavenly bodies — stars and nebulæ,— which we see with our telescopes, a bounded whole of any kind; or do such bodies extend through infinite space, so that those we see are distinguished from the others only by their proximity to our system? The general trend of modern science is toward the former alternative. While it is quite true that no limit can be set to the possible extent of creation, the evidence is very strong that that portion of creation which can be studied by man forms a bounded whole, having certain common characteristics which run through its whole extent. It seems almost certain that there is a limit in every direction beyond which the stars become comparatively few and scattered, if they exist at all. The most simple and conclusive proof of this is the fact that, if the stars extended out without limit, their infinite number would fill the whole sky with a blaze of light equal to that of the noon-day sun. Instead of this we have a night-sky so faint that a circle of it half a degree in diameter is almost or quite invisible to the eye. Another idea of the subject may be based on the principle that in a universe of stars, extending out indefinitely, there would be nearly four times as many stars of each order of magnitude as of the order next brighter. This is true in the case of the stars visible to the naked eye. But, when counts are made of the telescopic stars, it is found that although the number of each successive order increases, the ratio of increase continually diminishes, thus showing that a limit must finally be reached.

Another indication bearing on the same ques-

tion is afforded by the Milky Way. This vast girdle, which consists of agglomerations of stars, has a unity of structure throughout its whole extent which justifies us in considering it as, in a certain sense, a single object. The stars which comprise it are probably more distant than the others and may, therefore, be considered as forming a band including the universe within it.

Another conception of the universe is gained by considering the thickness with which the stars are scattered through space; in other words, how many stars a given volume of the celestial spaces, in the general average, may contain. Measures of parallax, and studies of proper motion, lead to the conclusion that the thickness of the stars, as thus defined, is a fairly definite quantity. To measure the volume of space we require a unit. The most convenient unit for our purpose is the volume of a sphere whose centre is in the solar system, and whose surface is at a distance represented by a parallax of half a second. This distance is, in round numbers, 400,000 times that of the sun from the earth, a space through which light would travel in about seven years. The volumes of spheres being as the cubes of their radii, it follows that a sphere whose surface is at twice the distance of the unit sphere, or 400,000 times the distance of the sun, will have a volume represented by the number 8, while 100 times the radius will have a volume of 1,000,000 units. Now, the indications are that the stars are strewn through space with such thickness that, in the general average, each unit of space contains one or two of these bodies. The law according to which the stars thin out, and investigations into the statistics of the stars generally, lead to the conclusion that the parallax of the most distant of these bodies is about 0″001. This distance is 500 times that which we have chosen as the radius of our unit sphere; the volume of space included within it is, by the law of cubes, 125 millions and, were the stars scattered with equal thickness throughout the whole space, the number contained would be between 125 and 250 millions.

Although, in the general average, it is probable that the thickness of the stars in space does not vary greatly within the limits we have indicated, there are exceptions in special cases. The most notable exception is that of the Milky Way, where the stars are undoubtedly much more thickly strewed in space than they are in the central regions of the system. We also find in many regions of space collections of hundreds or even thousands of stars evidently in close proximity to each other. But outside of these collections the scattering is probably nearly uniform as far out as the limit we have mentioned.

Altogether, we may say with some confidence, that if we could fly through space to a distance over which light would require 4,000 years to travel, we should find ourselves approaching the boundary of the stellar system, if we were not actually outside of it.

Notwithstanding the darkness of the sky, it seems probable that we receive more light from it than could be supplied by all the stars, seen and unseen, which make up the known part of the universe. This conclusion is based on the fact that the amount of light received from a circle 1° in diameter on the darkest night-sky is about equal to that of a star of the 5th magnitude, while, when we carry out the progression in the light of the stars of diminishing orders of magnitude, we find that the total of their light could not well amount to so great a quantity as this. The source of this excess of light is yet to be investigated. Whether it is atmospheric, whether it is reflected from innumerable opaque bodies, or whether it is emitted by a nebulous mass of almost inconceivable tenuity, has not yet been determined.

A remarkable feature of our relation to the universe is that our solar system seems to be very near its centre. That we are near the central plane of the Milky Way is shown by the fact that the latter is nearly a great circle on the celestial sphere. It is true that the most exact determination yet made shows a slight displacement of our system, since the central line of the Milky Way is about 1° from that of the great circle which would pass nearest to it. Another basis for the same conclusion is that the stars seem about equally numerous in the direction of the two opposite poles of the Milky Way. If there is any deviation from equality, it seems likely that the faint telescopic stars are fewer in number toward the south pole than toward the north pole of the Milky Way. This view is not yet proved, and cannot be until we have more exact counts of the stars of each order of magnitude in the two hemispheres. The question whether our system is situated with equal exactness in the centre of the great girdle does not admit of settlement. All we can say is, that, up to the present time, there is no positive evidence on which to base a statement that we are any nearer one point of the girdle than another. It is indeed true that, in the constellations Aquila and Sagittarius, which are visible in the south on autumn evenings, the Milky Way shows numerous rifts and vacant spaces which are not shown on its opposite side. This might seem to indicate that we are nearer to it in this region. But further researches are required before a definite conclusion can be reached.

It should be remarked that, even if we are at present centrally situated, the position cannot be permanently held. The motion of the solar system through space, by which we are carried forward on a journey of which we can see neither the beginning nor the end, at the rate of ten or twelve miles a second, must eventually carry our posterity away from the centre of the universe, even if we are now situated near that point. But this motion will have to be continued hundreds of thousands, even millions, of years before the displacement would be appreciable when compared with the dimensions of the universe.

S. Newcomb.

University, an institution for the promotion of higher education by teaching and investigation, and having the right to confer degrees in several faculties. Though there were Greek and Roman institutions of learning analogous to universities, the university as above defined did not originate till the 12th century. The name university is still later, not being found in any application at all like the modern one till the 13th century. Such phrases as *universitas magistrorum et auditorum* (or *scholarium*), meaning the whole body of teachers and

scholars, are met with at the very beginning of the 12th century; but it was not till the next century that the term *universitas* acquired a technical sense, and came to be used by itself pretty much as we use it. The three oldest universities, those of Bologna, Paris, and Oxford, grew out of schools that had previously attained a more or less widespread fame as seats of learning.

In the early part of the 12th century Bologna acquired great celebrity as a school of law; later in the same century the lectures of Abelard on philosophy and theology attracted to Paris hearers from all parts of Europe; and by the middle of the 11th century there were undoubtedly schools at Oxford. Earlier by a century than the oldest of these schools there existed a famous school of medicine at Salerno, in lower Italy, but it was long before it obtained the rank of a university. The practice of granting degrees probably originated in Paris in the second half of the 12th century. If this is the case, the University of Paris is in this sense entitled to be regarded as the oldest. (See PARIS, *University*.) At first the universities were free and self-governing corporations, in no way dependent on either Church or state. But gradually this freedom of organization was modified, owing to the increasing influence of the Church. The pope granted bulls of confirmation to the universities already in existence, and till the Reformation no new universities were erected throughout Christendom without the papal sanction. The popes also claimed the right of protecting and superintending the universities. After the Reformation the claims of the popes were, of course, no longer recognized in countries that had become Protestant. The University of Paris was a corporation of teachers, that of Bologna a corporation of students; the universities of southern Europe generally resembled Bologna in this respect, those of northern Europe resembled Paris. At first the students and teachers were organized on the basis of nationality, in groups called "nations"; and these groups were, for about a century, the only divisions in the university. A division into faculties did not arise till the 13th century. The distinction of faculties was aided by the fact that Honorius III., who feared that the general interest in legal studies would extinguish theology at Paris, forbade, in 1219, priests and regulars to read civil law. Thus the faculties of theology, arts, law, and medicine became gradually differentiated. In the 13th and following centuries endowed colleges were established at Paris and the English universities for the reception of poor scholars, some of whom received also pecuniary assistance from the foundation. Both in Paris and in England it became customary for all the students of the university to reside in colleges, and gradually also the colleges almost entirely superseded the universities in the work of teaching. Students who had degrees conferred upon them were thereby entitled to teach; bachelors, or *baccalaurei*, under the supervision of a fully-qualified teacher, and masters, or doctors (*magistri, doctores*), independently.

Numerous universities have been established in the different nations of Europe since the 12th century, a list of which will be found in the following table from the United States Education Report:

FOREIGN UNIVERSITIES ARRANGED ACCORDING TO AGE.

Date of foundation	Locality
	Tenth century
988	Cairo, Egypt.
	Twelfth century
1119	Bologna, Italy.
1181	Montpellier, France.
1200	Paris, France.
1200	Oxford, England.
	Thirteenth century
1209	Valencia, Spain.
1222	Padua, Italy.
1224	Naples, Italy.
1233	Toulouse, France.
1243	Salamanca, Spain.
1257	Cambridge, England.
1266	Perugia, Italy.
1288	Coimbra, Portugal.
	Fourteenth century
1303	Rome, Italy.
1339	Grenoble, France.
1343	Pisa, Italy.
1346	Valladolid, Spain.
1348	Prague, Bohemia, Austria.
1349	Florence, Italy.
1361	Pavia, Italy.
1364	Krakow, Galicia, Austria.
1365	Vienna, Austria.
1367	Fünfkirchen, Hungary.
1386	Heidelberg, Baden, Germany.
1391	Ferrara, Italy.
	Fifteenth century
1402	Würzburg, Bavaria, Germany.
1409	Leipsic, Saxony, Germany.
1409	Aix, France.
1411	St. Andrews, Scotland.
1412	Turin, Italy.
1419	Rostock, Mecklenburg, Germany.
1422	Parma, Italy.
1422	Besançon, France.
1426	Louvain, Belgium.
1431	Poitiers, France.
1437	Caen, France.
1441	Bordeaux, France.
1444	Catania, Sicily, Italy.
1450	Barcelona, Spain.
1451	Glasgow, Scotland.
1456	Greifswald, Prussia, Germany.
1457	Freiburg, Baden, Germany.
1460	Basel, Switzerland.
1463	Nantes, France.
1465	Budapest, Hungary.
1472	Munich, Bavaria, Germany.
1474	Saragossa, Spain.
1477	Upsala, Sweden.
1477	Tübingen, Würtemberg, Germany.
1478	Copenhagen, Denmark.
1494	Aberdeen, Scotland.
	Sixteenth century
1501	Valencia, Spain.
1502	Halle-Wittenberg, Prussia, Germany.
1502	Seville, Spain.
1504	Santiago, Spain.
1506	Breslau, Prussia, Germany (1702).
1508	Madrid, Spain.
1527	Marburg, Prussia, Germany.
1531	Granada, Spain.
1531	Sarospatak, Hungary.
1537	Lausanne, Switzerland.
1540	Macerata, Italy.
1544	Königsberg, Prussia, Germany.
1548	Messina, Sicily, Italy.
1549	Debreczin, Hungary, Theological College.
1556	Sassari, Italy.
1558	Jena, Thuringia, Germany.
1559	Geneva, Switzerland.
1566	Olmütz, Moravia, Austria.
1567	Strasburg, Alsace, Germany.
1568	Braunsberg, Prussia, Germany.
1572	Nancy, France.
1575	Leyden, Netherlands.
1580	Oviedo, Spain.
1582	Rome, Italy (Pontif.).
1583	Edinburgh, Scotland.
1586	Gratz, Styria, Austria.
1591	Dublin, Ireland.
1596	Cagliari, Italy.
	Seventeenth century
1605	Manila, Philippine Islands.
1607	Giessen, Hesse, Germany.

Date of foundation	Locality
1614	Groningen, Netherlands.
1632	Salzburg, Austria.
1632	Amsterdam, Netherlands.
1632	Dorpat, Russia.
1636	Utrecht, Netherlands.
1640	Helsingfors, Finland, Russia.
1647	Bamberg, Bavaria, Germany.
1657	Kaschau, Hungary.
1665	Kiel, Prussia, Germany.
1666	Lund, Sweden.
1671	Urbino, Italy.
1673	Innspruck, Tyrol, Austria.
1676	Eperies, Hungary.
1683	Modena, Italy.
	Eighteenth century
1710	Barbados (Codrington College), West Indies.
1721	Habana, Cuba.
1722	Dijon, France.
1727	Camerino, Italy.
1737	Ratisbon, Germany, Theological Lyceum.
1737	Göttingen, Prussia, Germany.
1740	Erlau, Hungary.
1743	Erlangen, Bavaria, Germany.
1743	Santiago, Chile.
1748	Cadiz, Spain.
1755	Moscow, Russia.
1771	Münster, Prussia, Germany.
1777	Siena, Italy.
1779	Palermo, Sicily, Italy.
1784	Lemberg, Galicia, Austria.
1785	Pressburg, Hungary.
1788	Grosswardein, Hungary.
1798	Kazan, Russia, Theological College.
	Nineteenth century
1800	Edinburgh, Scotland, Medical College.
1804	Kazan, Russia.
1804	Kbarov, Russia.
1805	Yaroslavl, Russia.
1808	Clermont, France.
1808	Lille, France.
1808	Lyon, France.
1808	Rennes, France.
1809	Berlin, Prussia, Germany.
1811	Christiania, Norway.
1812	Genoa, Italy.
1815	Moscow, Russia.
1816	Ghent, Belgium.
1816	Warsaw, Poland, Russia.
1817	Liège (Lüttich), Belgium.
1818	Bonn, Prussia, Germany.
1819	St. Petersburg, Russia.
1820	Nezin, Russia, Philological School.
1821	Halifax, Canada.
1821	Montreal, Canada.
1826	London (University College), England.
1827	Toronto, Canada.
1827	Sheffield Medical College, England.
1828	Lampeter (St. David's College), Wales.
1832	Durham, England.
1832	Zurich, Switzerland.
1832	Kiev, Russia.
1834	Freising, Germany, Theological Lyceum.
1834	Brussels, Belgium.
1834	Bern, Switzerland.
1836	London (University), England.
1837	Athens, Greece.
1838	Messina, Italy.
1840	Kingston, Canada.
1843	Eichstätt, Germany, Theological Lyceum.
1845	Cork, Ireland.
1845	Belfast, Ireland.
1845	Galway, Ireland.
1849	Algiers, Algeria.
1850	Sydney, Australia.
1851	Manchester (Victoria University), England.
1851	Newcastle, England.
1853	Melbourne, Victoria, Australia.
1857	Calcutta, India.
1857	Madras, India.
1857	Bombay, India.
1858	Lisbon, Portugal.
1860	Jassy, Rumania.
1862	Kecskemet, Hungary.
1864	Bucharest, Rumania.
1865	Odessa, Russia.
1866	Neuchâtel, Switzerland.
1868	Tokyo, Japan.
1870	New Zealand, New Zealand.
1872	Aberystwith, Wales.
1872	Adelaide, Australia.
1872	Klausenburg, Hungary.
1873	Cape Town, South Africa.
1874	Agram, Croatia, Hungary.
1875	Angers, France.
1875	Lille (Faculté Libre), France.
1875	Lyon (Faculté Libre), France.
1875	Czernowitz, Bukowina, Austria.
1875	Birmingham, England.
1876	Bristol, England.
1876	Montevideo, Uruguay.
1876	Montreal, Canada, Université Laval de Quebec.
1877	Leeds, England.
1877	Liverpool, England.
1878	Stockholm, Sweden.
1879	Sheffield (Firth College), England.
1880	Amsterdam, Netherlands, Free University.
1880	Dublin, University of Ireland.
1880	Dundee, Scotland.
1880	Nottingham, England.
1882	Prague (Bohemian University), Austria.
1882	Lahore, India.
1883	Cardiff, Wales.
1884	Bangor, Wales.
1885	Odessa, Russia.
1887	Allahabad, India.
1888	Tomsk, Siberia, Russia.
1888	Sophia, Bulgaria.
1889	Freiburg, Switzerland.
1891	Gottenborg, Sweden.
1892	Bello Horisonte, Brazil.
1897	Kyoto, Japan.
1901	Cologne, Prussia, Germany.
1901	Frankfort, Prussia, Germany.
	Date not known
	Belgrade, Servia.
	Limoges, France.
	Marseilles, France.
	Montauban, France.
	Cordoba, Argentina.
	Buenos Ayres, Argentina.

The usual university organization includes the four faculties, of philosophy (or arts), law, medicine, and theology; with the development of scientific study, a number of universities have also added scientific schools or faculties. The leading universities of Austria are Czernowitz, Gratz, Innspruck, Krakow, Lemberg, Olmütz, Prague (Bohemian), Prague (German), Salzburg, and Vienna; of these Czernovitz and Lemberg have no medical faculties and Olmütz and Salzburg have only theological faculties.

In France the leading universities are those of Aix, Algiers, Angers, Besançon, Bordeaux, Caen, Clermont, Dijon, Grenoble, Lille, Limoges, Lyon, Marseilles, Montauban, Montpellier, Nancy, Nantes, Paris, Poitiers, Rennes, Toulouse, and four separate medical schools; of these Aix has neither medical nor theological faculties; Algiers, Bordeaux, Montauban, Montpellier, and Toulouse have a scientific, but no theological faculty; Angers and Lyon a scientific, but no medical faculty; Besançon has a scientific but no theological or law faculty; Caen, Dijon, Grenoble, Poitiers, and Rennes have a scientific but no medical or theological faculty; Clermont has scientific and philosophical faculties only; Lille has a scientific faculty in addition to the other four; Limoges is a medical school; Marseilles has a scientific, but neither philosophical nor theological faculty; Nancy has a scientific faculty and pharmaceutical school, but no theological faculty; Paris in addition to the four usual faculties, has a scientific faculty, and schools of engineering and pharmacy. These universities are federated more closely than in other nations in an institution known as the University of France, having a general control of the educational system of the nation. (See also FRANCE, *Education.*)

In Germany the universities of importance include those of Bamberg, Berlin, Bonn, Braunsberg, Breslau, Cologne, Dillingen, Eichstätt, Erlangen, Frankfort, Freiburg, Freising, Giessen, Göttingen, Greifswald, Halle, Heidelberg, Jena, Kiel, Königsberg, Leipsic, Marburg, Munich, Münster, Ratisbon, Rostock, Strasburg, Tübingen, Würzburg; of these Bamberg, Braunsberg, Eichstätt, Freising, and Münster have only theological and philosophical faculties; Berlin has, in addition to the four regular faculties, a seminary of Oriental languages, and other seminaries; Cologne is a commercial university; Freiburg has no medical faculty; Heidelberg, Marburg, Strasburg, and Tübingen have scientific faculties in addition to the four regular faculties.

In Russia the leading universities are those of Kharkov, Dorpat, Helsingfors, Yaroslavl, Kazan, Kiev, Moscow, Nezin, Odessa, Saint Petersburg, Warsaw; of these Kharkov, Kazan, Moscow, and Warsaw have a scientific, but no theological faculty; Kiev has no theological faculty; Odessa, a scientific faculty, but no medical or theological faculty; Saint Petersburg, scientific faculty and a faculty of Oriental languages, but neither medical nor theological faculty.

The leading universities of Italy are those of Bologna, Cagliari, Camerino, Catania, Ferrara, Florence, Genoa, Macerata, Messina, Modena, Naples, Padua, Palermo, Parma, Pavia, Perugia, Pisa, Rome, Sassari, Siena, Turin, and Urbino; of these none have theological faculties, the majority have the three other faculties; also, Bologna has scientific and pharmaceutical faculties, and veterinary and engineering schools; Cagliari, Ferrara, and Sassari have a scientific, but no philosophical faculty; Camerino has a pharmaceutical faculty and veterinary school, but no philosophical faculty; Catania, a scientific faculty; Florence has scientific and pharmaceutical faculties, but no law faculty; Genoa and Rome have scientific faculties and schools of engineering and pharmacy; Messina, scientific and pharmaceutical faculties; Modena, scientific and pharmaceutical faculties, but no philosophical faculty; Naples, mathematical and scientific faculties and a school of pharmacy; Padua and Palermo have a scientific faculty and schools of engineering and pharmacy; Parma has a scientific faculty, and veterinary and pharmaceutical schools, but no philosophical faculty; Pavia and Turin have scientific faculties and pharmaceutical schools; Perugia has pharmaceutical and veterinary schools, but no philosophical faculty; Pisa, a scientific faculty, and engineering, pharmaceutical, veterinary, and agricultural schools; Siena, a pharmaceutical school but no philosophical faculty; Urbino, a mathematical faculty and pharmaceutical and surgical schools, but neither medical nor philosophical faculties.

The universities of Great Britain are those of Birmingham, Bristol, Cambridge, Durham, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham, Oxford, Sheffield, in England; Belfast, Cork, Dublin, and Galway, in Ireland; Aberdeen, Saint Andrews, Dundee, Edinburgh, and Glasgow, in Scotland. Of these Birmingham has faculties of arts and sciences, of medicine, and of commerce; Bristol, faculties of arts and sciences and of medicine; Cambridge has schools of philology, of music, of moral science, of history, of the various sciences, and of medicine, law, and theology; London has a scientific faculty in one of the colleges included in its organization; Nottingham has philology, law, and scientific faculties, and a school of engineering; Oxford, a scientific faculty in addition to the usual faculties; Sheffield, a medical school in addition to the University College.

Scotch universities are four in number, St. Andrews, Glasgow, Edinburgh, and Aberdeen. They were decidedly mediæval in character until 1858, when they were reorganized by statute. In organization and administration they resemble the Continental, rather than the English, universities.

In Ireland the chief university is Dublin, commonly known as Trinity College, Dublin. The Royal University, which is largely an examining body, similar to the University of London, comprises likewise the Queen's Colleges of Belfast, Cork, and Galway. The Catholic University is at Dublin.

The Spanish universities, nine in number, are at Barcelona, Granada, Madrid, Santiago, Saragossa, Seville, Valladolid, and Valencia. There is a medical faculty at Cadiz and a law faculty at Oviedo. The most important is Madrid. It cannot be said that most of them are in a flourishing condition.

Portugal has one university, located at Coimbra. It has faculty of law, mathematics, medicine, philosophy, and theology, and a school of design.

After the Greek war for independence, King Otho established the University of Athens, in 1837. It was planned closely after the universities of Germany. The king, with whom resided appointive power, also selected chiefly Germans to compose the faculty. Since 1882 the power of appointment has been vested in the faculties. The universities has the four faculties of law, medicine, philosophy, and theology customary in German universities.

The Dutch universities are those of Amsterdam, Groningen, Leyden, and Utrecht, all directed by the state. The general organization and *modus operandi* of these institutions are largely similar to those of the German universities. Their organization is wholly uniform throughout, and there are, therefore, no such distinctive features, peculiar to individual institutions, such as may be found in Germany. Originally these institutions were intended as training-schools for the clergy, subsequent to the Reformation.

In Belgium are four universities. That at Brussels is a free institution; those at Ghent and Louvain are directed by the state, largely in the Dutch manner; and that of Louvain is under Roman Catholic control.

The universities of Sweden and Norway are as follows: In Sweden, Lund and Upsala; in Norway, Christiania. There are, further, a medical faculty at Stockholm, and philosophical faculties (private) at Göteborg and Stockholm. They are designed after the familiar German pattern, are closely united with the national Church, and are decidedly Lutheran in tone. There is a Danish university at Copenhagen.

There are Australian universities at Adelaide, Melbourne, and Sidney, the last named being connected with the University of London.

At Belfast is a school of mines connected with with the University of Melbourne.

The Canadian universities are at Montreal and Toronto. There further exist in Canada 24 institutions entitled to give degrees, these being, in the main, of a denominational character.

For the organization and history of the American universities, see AMERICAN UNIVERSITY, THE. For other institutions of higher learning, not properly universities, see COLLEGES; COLLEGE, THE AMERICAN; TECHNOLOGY, SCHOOLS OF; MEDICAL EDUCATION; etc.

University, American. See AMERICAN UNIVERSITY.

University, National. See NATIONAL UNIVERSITY, THE.

University of Chicago, located at Chicago, Ill. A Baptist institution known as the University of Chicago was founded in 1857, and was compelled to close its work in 1886. Shortly after the closing of that institution, a movement for the founding of a larger university was begun by the American Baptist Education Society at the suggestion of John D. Rockefeller (q.v.). The present university was chartered in 1890, and opened to students in 1892; Mr. Rockefeller contributed the larger part of the original endowment fund to which he has since added gifts amounting to over $10,500,000. The university was organized under the leadership of William R. Harper (q.v.), who has since been its president, and has largely directed and controlled its administrative and educational policy. In accordance with the charter, the president and two thirds of the trustees must be members of a Baptist Church, but there is no denominational control.

The university includes the following departments: (1) the Schools, Colleges, and Academies; (2) the University Extension Division; (3) the University Libraries, Laboratories, and Museums; (4) the University Press; (5) the University Affiliated Schools. The Schools, Colleges, and Academies include: (1) the Schools, which are the Divinity School, the Ogden (Graduate) School of Science, the School of Education, the Law School, and the Medical School (partly organized); the School of Technology, the School of Fine Arts, and the School of Music are yet to be established; (2) the Colleges, the College of Arts, the College of Literature, the College of Science, the College of Commerce and Administration, and the University College; (3) the Academies, including the Morgan Park Academy for Boys and the University High School, directly under University control, and numerous other secondary schools affiliated with the University. The University Affiliated Schools include both academies and colleges which have been affiliated with the University, their students and graduates having special privileges at the University. Each College is divided into a Junior College and a Senior College, the former including the first half of the curriculum, corresponding to the work of the usual college Freshmen and Sophomore years, the latter the work of the Junior and Senior years. The academic year for all departments is divided into four quarters of twelve weeks, and each quarter into two terms of six weeks each; the courses are arranged with the work of twelve weeks or six weeks as a unit, and students may enter upon their work at the beginning of any quarter, and may be absent from the university during any quarter they desire. The summer quarter has a large attendance of teachers, and others outside the regular student body, but an increasing number of regular students continue their work in the summer. Instructors from other universities are added to the staff for this quarter. The courses are classified as majors and minors, a major course requiring four to five hours of class room work for twelve weeks, a minor four to five hours class room work for six weeks; the regular work of a student during each term of a quarter is three minors or the equivalent. The Colleges of Arts, Literature and Science confer the degree of A.B., Ph.B., and S.B. for the completion of the full work of the Junior and Senior Colleges; the College of Commerce confers the degree of Ph.B. The work of the Junior Colleges is largely prescribed for each degree; the work of the Senior Colleges of Arts, Literature and Science is elective, with the limitation that the student may not elect more than half his work from any one department; the electives are further limited by the degree to be received. The work of the Senior College of the College of Commerce and Administration is divided into four groups: (1) Banking; (2) Transportation; (3) Trade and Industry; (4) Journalism, one of which must be elected. The University College is conducted by the university in the centre of the city, and is designed chiefly for the benefit of teachers. It confers the degrees of A.B., Ph.B., and S.B., on the fulfilment of the requirements for the degrees in the other colleges. The Divinity School includes: (1) the Graduate Divinity School, for college graduates; (2) the English Theological Seminary; (3) the Dano-Norwegian Theological Seminary; (4) the Swedish Theological Seminary. The Graduate Divinity School offers courses leading to the degrees of B.D., A.M., and Ph.D.; certain studies are prescribed for all courses; the others are elective, depending upon the degree to be obtained. The English Theological Seminary offers resident courses in the summer quarter, and non-resident courses during the other quarters; the course covers four years' work. The Graduate School of Arts and Literature and the Ogden School of Science confer the degrees of A.M., M.S., Ph.M., and Ph.D. The Law School was organized in 1902; it requires for admission the equivalent of three years of college work, and confers the bachelor's degree (A.B., Ph.B., or S.B.) after one year's work in the Law School; the degree of Doctor of Laws (J.D.) is conferred on the completion of the full course (three years); special students who maintain a high standing are granted the degree of LL.B. The Medical School offers the courses of the first two years of the medical curriculum only; Rush Medical College (q.v.) is affiliated with the university and provides a full medical course. The School of Education offers courses for the training of teachers which lead to the degrees of A.B., Ph.B., S.B., or Ed.B. (Bachelor of Education). The University Extension Division offers university extension lecture courses and corresponding courses, which entitle the student completing them to university credit; for fuller description of these courses see the article on

University Extension. This department also sends out libraries to supplement the work of the lectures and courses; and carries on work for the promotion of better library facilities in general. The University Library comprises the general library, departmental libraries, the branch libraries, and the traveling libraries of the University Extension Division. The Yerkes Observatory, founded in 1892, is located on Lake Geneva, Wis., near the town of Williams Bay; it contains a refracting telescope of 40 inches aperture, and offers special facilities for advanced work in astronomy.

Women are admitted to all departments of the university, but those who enter the Divinity School are not expected nor encouraged to take up the work of public preaching. The students maintain a Men's Club, a Woman's Union, Greek letter fraternities, a Dramatic Club, a Glee Club, an Athletic Association, and numerous smaller societies and clubs. Some of the students, nearly one third, live in the university dormitories on the campus; a few live in their fraternity houses; but the greater part live in the city and its suburbs. All students are required to wear the academic cap and gown on formal occasions. The university campus lies between Washington and Jackson Parks, facing the Midway Plaisance on the south. The buildings, of which there are 20, are built of Indiana limestone, all in the same general style of architecture, an English Gothic; they are grouped in accordance with a fixed plan, which is not yet worked out to completion, but allows for numerous additions. The library in 1904 contained 367,442 volumes; the students (on the basis of nine months' attendance) numbered 2,938; the whole number, including those who received instruction for any period, numbered 4,463; and the faculty 347.

Though the University of Chicago is the youngest of the large universities of the United States, it has taken a leading position. Its standards of scholarship are the highest, and it carries out the true university ideal, offering the best of opportunities for graduate and research work, and emphasizing that part of its work. Its policy is in many ways unique, notably in the establishment of the summer term, in its system of affiliated institutions, and in the important place given to university extension. Two other characteristics of the university are the quarter system, which permits a student to take his work when it is most convenient for him and saves him from losing a year because of some enforced absence for a few weeks, and the maintenance of a large enough force of instructors to keep the classes small, thus insuring students individual attention. Through these affiliations it has exerted a wide influence on the educational institutions of the Middle West, particularly; and through its University Extension Department it has come into close touch with the general public and the work of "popular education."

William Rainey Harper,
Late President University of Chicago.

University of Cincinnati. See Cincinnati, University of.

University Club, The, an organization of New York, incorporated in 1865. Members are required to hold a university or college degree representing a course of not less than three years of study; or an honorary degree, in the case of distinguished personages. Graduates of the United States military and naval academies are also eligible. In 1903 the membership was 3,278, the limit being 3,500 — 2,000 resident and 1,500 non-resident and of the army or navy.

University College, the specific title of an institution attached to various British universities. (1) University College, Oxford, the oldest in the university, founded through the munificence of a bequest of William, archdeacon of Durham after 1249, the exact date being unknown, consists at the present time of a master, nine ordinary fellows, one civil law fellow, 15 scholars, and 14 exhibitioners. The fellowships are held for seven years, but may be extended under certain conditions. The scholarships ($400 per annum) are open to all who have not exceeded 19 years of age. There are seven church livings in the gift of this college. The earliest statutes of the college date from 1280. (2) University College, London, founded 1828, is closely connected with London University. (3) The name is given especially to three of the four colleges which form a Welsh University, namely, the University College of Wales at Aberystwith, University College of South Wales at Cardiff, and the University College of North Wales at Bangor. The students of these colleges, proceeding to degrees, have to go through a course at either London, Dublin, Edinburgh, or Glasgow. (4) University College, Dundee, Scotland, founded in 1882, is affiliated with Saint Andrews University.

University Costume, the cap and gown worn by graduates and undergraduates of colleges and universities, indicating their academic rank. The custom of wearing special academic costume originated in the Middle Ages, when doctors and bachelors of divinity and all graduates of the universities above the rank of bachelor in other departments wore long, flowing gowns with capes or hoods; those having the highest rank also wore round caps, with a point in front. Later, undergraduates were also entitled to wear the gown; distinctions in gowns of different ranks and faculties did not become common until the 15th century; then the bachelors' gowns were made shorter than the masters'; hoods for bachelors of arts were usually bordered with white, and numerous differences in form and color distinguished graduates of higher rank. The types of caps and gowns now in use at the University of Oxford have been worn by both graduates and undergraduates since the beginning of the 17th century, and the universities of Great Britain have largely followed the customs of Oxford. The gowns of Oxford are of two types: (1) those worn by all graduates in divinity and arts and by all members on the foundation of any college, with loose sleeves, without collars, and gathered in small plaits at the back; (2) those worn by the graduates in law and other faculties, and by undergraduates not on the foundation of any college, the gowns not so full, with falling collars and closer sleeves. The Cambridge types are about the same as Oxford for graduates; the undergraduates have a slightly different type of gown for each college. In the United States the wearing of academic costumes was at first looked upon with disfavor, but recently the custom of wearing caps and gowns has been

adopted by the leading universities and by many smaller institutions. The movement for the adoption of this costume originated in most cases with the students, but has met with encouragement from the university faculties and authorities, and in some instances has been required by them independently of student initiative, as by the University of Chicago since its opening. The wearing of the costume has been urged on the ground that it gives to university functions a more impressive and artistic appearance, and that it is essentially democratic, concealing all differences in dress and enabling the poor students to make as good a public appearance as the rich. In some institutions the cap and gown are worn by all undergraduates, the graduates and the faculty; in others by no undergraduates except the senior class; and in still others by only the graduates and faculty on specified occasions. Where undergraduates wear costume it is usually required only at special university functions; the students, however, often adopt the custom of wearing cap and gown throughout the year. As the custom of wearing caps and gowns became fixed in American colleges and universities, the desirability of some uniformity in type and colors became evident, and, on the initiative of Princeton, an intercollegiate committee was appointed, which decided upon certain rules for gowns and hoods that have been generally adopted. In accordance with these rules all gowns are to be black, the bachelor and undergraduate gowns to be made of woolen stuff, the masters' and doctors' gowns of silk. The gowns may be of different types, in accordance with the choice of the different institutions; they are, in general, loose gowns with a yoke; they may be open or closed in front, and may differ in the amount of fulness in the back and shirring below the yoke. The bachelors' gowns have long, pointed sleeves; the masters' gowns, long closed sleeves with slit for the arm to pass through near the top; the doctors' gowns, round, open sleeves. Trimmings of velvet either in black or in colors to match the hood are allowed on the doctors' gowns, only. The shape of the hoods are the same as in the University of Oxford; the bachelors' hoods are three feet in length, the masters' one foot longer, and the doctors' hoods are made with a panel. The department from which the degree is received is indicated by the color of the trimming of the hood, a band not more than six inches wide around the outer edge; the colors are as follows:

Arts and letters	white	Science	gold yellow
Theology	scarlet	Fine arts	brown
Law	purple	Music	pink
Philosophy	blue	Medicine	green

The institution from which the degree is received is indicated by the colors of the lining of the hood; where two institutions have the same colors they are distinguished by difference in color arrangement. Undergraduates wear no hoods. The cap for all ranks is the Oxford cap, with skull cap foundation and square mortar board top; the cap for the doctor's degree may be of velvet and the tassel partly or entirely of gold.

University Extension, an educational movement designed to bring the advantages of higher education within reach of all the people. As the name indicates the centre of this work is usually a university, though in some instances libraries or educational associations have taken up university extension teaching. University extension work is carried on by the following agencies: (1) Courses of lectures on some one subject delivered by university professors or others approved by the extension centre; these courses usually consist of six or twelve lectures each, given every week or every two weeks; (2) syllabi, or outline of lectures, including references for outside reading and suggestions for study, distributed to all who attend the lectures; (3) classes for discussion and question conducted by the lecturer before or after each lecture; (4) home reading and preparation of papers on subjects, suggested in the syllabi by those attending the lectures; (5) local examinations conducted by the extension centre; where a university is the centre, credit is often given for complete and satisfactory work in extension courses; (6) traveling libraries consisting of books relating to subjects of lectures sent out by the centre to communities where suitable literature could not otherwise be obtained. The best extension centres make use of all these agencies; some of the smaller centres confine themselves mostly to furnishing lectures and the syllabi. Also, a large number of people in each community who take an interest in attending the lectures, do not take part in the classes, home study, or examinations. It is the rule in extension work to charge a small fee for admission to the lectures; any community within reach of a centre may have the benefit of a course by making the necessary local arrangements and providing for the sale of tickets for the lectures. The customary method of beginning extension work in a community is for those interested to establish a simple form of local organization or local "committee," communicate with the centre with which they are most naturally allied, and select from the centre's list the course which is desired. This committee then has charge of selling tickets, providing the hall for the lectures, and arousing public interest as widely as possible. The initiative in starting a university extension course very often comes from a study club, a library, or the teachers in the community. Large cities as well as towns and villages take advantage of university extension courses. The subjects which are most popular for extension lectures are in history, literature, political economy, art, and natural science; in view of the number of teachers taking extension work, courses in pedagogy are also often given. Many communities adopt a series of related courses extending over several years; and such consecutive work is encouraged by the centres.

History.—The university extension movement is of English origin; as early as 1850 the University of Oxford entered upon the work of general education by establishing local examinations for those not its regular students; the University of Cambridge soon followed Oxford's example; and in 1873 supplemented the examinations by establishing a course of lectures, thus beginning real extension teaching. Oxford, in turn, established lecture courses in 1878, but did not do continuous work in that line until 1885, when full extension work was organized. Durham University, Victoria University, and the University of London (through its extension board) have also taken up the work

of university extension. Certificates are awarded at the end of each full course to those passing the examinations. In Oxford and Cambridge centres which provide a suitable course of instruction covering a period of several years are connected with the university as affiliated centres; students taking these courses are granted "higher" certificates, that give them credit toward the university degree. An outgrowth of the extension teaching in England is the establishment of study clubs in connection with the extension courses, and reading circles for the guidance of the student's reading between lectures. In the United States university extension work was first taken up in 1887, when the subject was publicly presented before the American Library Association; and in the same year the librarian of the Buffalo Public Library organized a course of 12 lectures on economics, with printed syllabi, classes, and a special reference library arranged in a room of the library building. This plan was afterward adopted by the librarians of Saint Louis, Chicago, and other southern and western cities, university graduates and local institutions co-operating with the libraries in extending the work. At about the same time (1887–8) individual professors at Johns Hopkins University gave lectures and conducted classes in the city of Baltimore, but this work did not come under the supervision of the University as such. In 1888 Melvil Dewey first presented the subject of the university extension before the regents of the University of the State of New York, and in 1890 a committee representing several colleges and universities urged the regents to establish a system of university extension; in 1891 the State appropriated $10,000 for the organization of university extension. The law stipulated that this grant should be used to defray the costs of organization, supervision, and printing, not for the payment of lecturers, the expenses of the lectures to be met by the local constituencies. This work of university extension in New York State has remained under the charge of the Home Education Department of the University of the State of New York, and has been successfully carried on in connection with the work of other divisions of that department (see HOME EDUCATION), though the tendency has been to pay more attention to library organization and traveling libraries. The extension centre at Albany registers as lecturers, university professors, teachers, and others qualified, arranges courses, prints syllabi, and corresponds with local committees and associations, aiding them in establishing extension courses. Traveling libraries are sent out to local centres by the traveling library division of the Home Education Department, and examinations conducted by the regents of the university are open to those taking extension courses. In 1890 the American Society for the Extension of University Teaching was organized in Philadelphia under the leadership of Dr. Pepper, provost of the University of Pennsylvania. This Society has ever since been one of the strongest influences in the spread of university extension work; it has organized courses of six lectures each; engaged competent lecturers; has co-operated in establishing extension courses with existing local institutions, libraries, clubs, etc., and has sent its lecturers to towns at considerable distances from Philadelphia in Pennsylvania and adjoining States. At the close of 1900 the society reported an average attendance of 18,000 a year at its lectures for the 10 years of its existence. In 1892 the University of Chicago was opened, and shortly after university extension was made one of the regular departments of the university. Chicago sends out traveling libraries and awards certificates for satisfactory completion of its courses; the work has met with the heartiest co-operation, especially from teachers, women's clubs, and public libraries. These three original centres are the most successful and most important centres of university extension in the United States. The State universities of the South and West have taken up the work for their States with varying degrees of completeness and success. Prominent among these is the University of Wisconsin, which in 1892 established a Department of University Extension; it has organized a complete system of extension work, conducting examinations, and awarding certificates giving certain university credit. Single lectures are provided where a full course is not practicable. Other universities, as for example the Iowa State University, do not organize full extension work, leading to university credit, but provide for courses of lectures to be given before schools and other local institutions and associations.

Other Factors in Popular Education: Correspondence Schools.—The name of university extension has been, in common usage, applied to the lecture courses above described; the real work of university extension is, however, carried on by a number of other agencies, which in the United States have proved even more successful than the work of university extension proper. Such agencies include summer schools (q.v.), public libraries (see LIBRARIES), traveling libraries (q.v.), study clubs, and correspondence schools. Correspondence schools have been organized by stock companies on a commercial basis, offering a large variety of courses in general and technical subjects; the largest and best of these schools do thorough and efficient work under the guidance of competent men, though of many of the smaller schools this cannot be said. Their charges, however, are comparatively high, few courses being offered under $30, and many costing as high as $100; these schools establish branch offices, and adopt the methods of any business house in advertising for students. This commercial side tends to separate them somewhat from the educational movement led by colleges and universities. More closely allied to the work of university extension is the correspondence work of Chautauqua (q.v.), begun in 1884, and leading in some cases to a degree, and the correspondence work which has been undertaken by a few colleges and universities. The leader in this line is Chicago, which has made its correspondence courses a part of the work of its university extension department. The unit or major course represents the amount of work done by a student in residence in 12 weeks, a half or minor course the work of six weeks; these correspondence courses cover exactly the same ground as the residence courses, and 12 of the 36 courses required for the bachelor's degree may be taken by correspondence. The regular or formal courses are conducted on the basis of printed instruction sheets and recitation papers written

by the student in answers to questions on these sheets; advanced (or informal) courses are arranged between instructor and student to suit the latter's needs. A fee is charged for each course. The Pennsylvania State College gives correspondence courses in agriculture free of charge. Baylor University at Waco, Texas, has conducted formal and informal correspondence courses since 1897, as does the State Normal Training School at Willimantic, Conn.

University of California. See CALIFORNIA, UNIVERSITY OF.

University of North Carolina. See NORTH CAROLINA, UNIVERSITY OF.

University of the Pacific, located at San José, Cal. It was founded at Santa Clara in 1851 under the auspices and control of the Methodist Episcopal Church; in 1871 it was moved to San José; about 40 years after its incorporation Napa College was consolidated with it, and the name of the University of the Pacific adopted. It is open to both men and women. The organization of the university includes the College of Liberal Arts, the Academy, the Department of Elocution and Oratory, the Commercial College, the Art Department, and the Conservatory of Music. The College of Liberal Arts offers four courses, the classical, the philosophical, the scientific, and the literary, for completion of which the degrees of A.B., B.Ph., B.S., and B.L. are conferred. The work of the last two years in each course is elective, a limited amount of work in certain departments being required according to the degree conferred. Four corresponding courses are given in the Academy. The Commercial College offers a commercial course, a shorthand course, and an advanced course, the last named including electives in the College of Liberal Arts, and leading to the degree of expert accountant. The Department of Elocution offers a course covering two years; the Art Department a course of three years. One tenth of the work of the B.L. course may be taken in the Art Department. The full course in the Conservatory of Music extends over four years, and leads to the degree of bachelor of music. The university is situated in the Santa Clara valley, within easy reach of both San José and Santa Clara; and occupied five buildings (1904). The library in 1904 contained 2,000 volumes; the income amounted to $23,000; the students numbered 272, and the faculty 16.

University of Rochester, located at Rochester, N. Y. The university was established by the Baptists of New York State with the aid of Rochester citizens; it was opened to students in 1850, and received its permanent charter in 1851. In 1900 it was opened to women on equal terms with men. Though it was incorporated as a university, it has never sought to do university work, but aims to give its students a thorough, liberal college course of the best type. It offers three courses, classical, philosophical, and scientific, and confers the three degrees of A.B., B.Ph., and B.S. Each course has certain prescribed studies and elective studies, the elective work beginning in the Sophomore year. In the scientific course arrangements have been made by which students taking certain electives and some technical work in the Mechanics' Institute of Rochester may enter the third year of the best technical schools. There is also a teachers' training department and a manual training normal course; graduate work is provided leading to the master's degrees. Saturday classes are arranged for the benefit of teachers. There are 118 scholarships, of which 40 are for students for the Baptist ministry, 24 for graduates of the Rochester High School, and 12 for women. The university campus comprises 24 acres situated in one of the most beautiful parts of the city; the buildings include Anderson Hall, Sibley Hall, Reynolds Memorial Laboratory (chemistry), and the Alumni Gymnasium (for the use of men students); there are no dormitories; many students live in the chapter-houses of the Greek letter fraternities. The library in 1903–4 contained 40,492 volumes; the students numbered 264, of whom 72 were women.

University Settlements. See SOCIAL AND UNIVERSITY SETTLEMENTS.

University of the South, located at Sewanee, Tenn. It was chartered in 1857 by the Southern dioceses of the Protestant Episcopal Church; the site and endowment were obtained, and the central building begun, when the Civil War stopped further operations and rendered the endowment worthless. In 1867 more funds were obtained largely through the efforts of Bishop Quintard of Tennessee, and the Grammar School (secondary grade) and Academic Department (collegiate grade) opened to students in 1868. The university now includes the Grammar School, the Academic Department, the Theological Department organized in 1878, the Medical Department established in 1892, and the Law Department established in 1893, the School of Pharmacy established in 1904, and a Training School for Nurses, connected with the Medical and Pharmaceutical departments. The Academic Department offers five groups of studies leading to the degree of A.B., and one course in civil engineering leading to the degree of C.E. The degree of A.M. is conferred for graduate work. In the Theological Department the degree of Graduate in Divinity is conferred on all who complete the regular three years' course (including Greek and Hebrew); post-graduate work and a thesis entitles those who have the A.B. degree to the degree of B.D. The Law Department has a course of two years, for completion of which the degree of LL.B. is conferred. The Medical Department offers a four years' course leading to the degree of M.D. The course in both the School of Pharmacy and the Training School for Nurses is two years in length. Six scholarships are available for students in the Theological Department, and about 20 for students in the Academic Department. Full provision is made for physical training, and there is a general interest in athletic sports which are under the control of the Students' Athletic Association. Seven Greek letter fraternities are represented at the university, and the students also maintain two literary societies, musical clubs, and a

dramatic club. The university controls a domain of nearly 10,000 acres in the midst of the beautiful scenery of the Cumberland Plateau; a reservation of 1,000 acres surrounds the central buildings, from which building lots are leased for long terms. The chief buildings are Saint Luke's Memorial Hall (Theological Department), Walsh Memorial Hall, the Library with a tower modeled upon that of Magdalen College Chapel, Oxford, in which are a clock and peal of bells, Thompson Hall (Medical Department), Hodgson Memorial Infirmary, Hoffman Memorial Hall (dormitory), Quintard Memorial Hall (Grammar School), the Chapel, and Forensic Hall; a new gymnasium was in process of erection in 1904. The library in 1904 contained 23,330 volumes; the students in all departments numbered 467, and the faculty 45.

University of Southern California, The, located at Los Angeles. It was established in 1879 under the auspices of the Methodist Episcopal Church, and first opened to students in 1880. Men and women are admitted on equal terms. The university organization includes the College of Liberal Arts, the College of Medicine, the College of Law, the College of Dentistry, the College of Music, the College of Art, the Preparatory School, and the Commercial Department. The College of Liberal Arts offers three courses, the classical, the philosophical, and the scientific, leading to the three degrees of A.B., B.Ph., and B.S. Each course includes some required studies, and some electives, among which must be a major subject in one department; the electives are first offered in the Sophomore year. Bible study is a part of the curriculum, but is entirely elective. The degrees of A.M. and M.S. are conferred for graduate work. The College of Medicine offers a course of four years, leading to the degree of M.D.; and the College of Dentistry also a four years' course, leading to the degree of D.D.S. The College of Law was established in 1897 as the Los Angeles College of Law, and was later affiliated with the university; it has a course of two years, and confers the LL.B. degree; in 1903 new courses were added and lectures on special topics provided, such as mining law, patents, banking customs, etc. The College of Music has three general departments, preparatory, normal, and collegiate; special attention is given to the study of the pipe organ. The Commercial Department offers a commercial course, a shorthand course, a penmanship course, and a course in use of the typewriter. The university campus comprises 10 acres, three miles and a half from the main part of the city; the buildings include the main building and the buildings of the College of Music, and the Preparatory School, the colleges of Medicine, Dentistry, and Law have more central locations within the city; the College of Fine Arts has a building and grounds of its own at Gavanza, one of the suburbs of Los Angeles. The library contains 2,500 volumes; the Los Angeles County Law Library is also open to the students of the College of Law. The students in 1904 numbered 636, the faculty 110.

University of the State of New York. For an account of the history and work of the university, see NEW YORK STATE UNIVERSITY. A reorganization of the New York State educational system was effected in March 1904, in accordance with which the board of regents consists of 11 members, elected by the legislature, as far as possible one from each judicial district. The members of the board first elected under the new law were chosen from the former board of regents for a term of one, two, three, four, five, six, seven, eight, nine, ten, and eleven years respectively; their successors will be elected for the full term of 11 years. The office of secretary of the board of regents is abolished, and the duties of the office conferred upon a new officer, the commissioner of education, who also performs the duties of the former superintendent of public instruction; the commissioner of education first elected is chosen by the legislature for a term of six years; his successor is to be appointed by the board of regents and to serve during the pleasure of the board. The supervision of elementary and secondary schools, including all schools except colleges, technical, and professional schools, is devolved upon the commissioner. Thus the regents of the university lose their direct control over secondary schools, but gain the power of appointing the commissioner who has supervision of all schools, while his appointments in all departments are also subject to their approval; they also have power to establish such regulations as are necessary to carry out State laws relating to education. All their other powers are the same as formerly. The purpose of the law is to unify the educational system, control of which was formerly divided between the regents and the superintendent of public instruction. The commissioner of education has established the following departments: law; examinations; inspections; accounts; printing and publications; statistics and apportionments; normal schools, training classes and institutes; libraries; scientific work and museums. In these departments the work of the regents and the former Department of Public Instruction is united; the new libraries department associates school libraries, home education, and the Library School with the State Library.

University of Wooster, located at Wooster, Ohio. It was founded under the auspices of the Presbyterian Church, was chartered in 1866, and first opened to students in 1870. In 1899 the charter was revised, and the power of electing the members of the board of trustees delegated to the Presbyterian Synod of Ohio. Previously the board was self-perpetuating. The organization of the university now consists of the Collegiate Department, the Preparatory Department (organized 1872), the Conservatory of Music (established 1882), the School of Art (established 1895), the Bible and Missionary Training School (established 1903), and the Summer School (organized in 1876, reorganized in 1895). All departments are open to women. The Collegiate Department offers three courses, the classical, the philosophical, and the scientific, leading to the degrees of A.B., Ph.B., and B.S.; the elective system prevails in the Junior and Senior years of all courses; in the scientific course three electives must be in science. Some of the electives may be taken in the Music and Art departments. Students in the Music and Art departments may also elect courses in French, German, or English in the Collegiate Department. The Bible and Missionary Training School offers two courses, a three years' course, the central feature of which

is Bible study, and a one year's course especially for training in practical religious and philanthropic work. The school is designed for the training of missionaries, pastor's assistants, Sunday school teachers, etc. Those who have the A.B. degree may obtain the degree of A.M. in connection with the work of this school. The Summer School offers about 100 courses, including teachers' training courses, courses in music, art, bookkeeping, and the subjects of the general college curriculum; it is largely attended by teachers. The university has a campus of 32 acres, on a hill overlooking the city; the buildings include Kauke Hall (the main building), Severance Hall (departments of chemistry and physics), Scovel Hall (departments of geology and biology), Taylor Hall (preparatory department), the Library, the Chapel, Hoover Cottage (the women's dormitory), the Kauke Conservatory of Music, the Observatory, and the Gymnasium. The library in 1904 contained 26,000 volumes; the students including the Summer School numbered 882, of whom 257 were in the Collegiate Department, 208 in the Preparatory Department, and 446 in the Summer School. The spirit of the university is strongly religious, over 40 per cent of the men graduates being ministers or missionaries.

Unleavened Bread, bread made without leaven or ferment, and prescribed in the Jewish law (Ex. xii. 15, 17) to be used at the Passover festival; it is required in the Latin Church as one of the two eucharistic elements. The Authorized Version of Ex. xii. has "And ye shall observe *the feast of unleavened bread*," and from this it has been inferred that this feast is not identical with the Passover; but the words in italics are confessedly interpolated by the translators, and they appear to be the only ground for the inference: the Septuagint version has no such interpolation, but neither has it the term (*azyma*) for unleavened bread; it renders the passage, "And ye shall observe this command." In the Eucharist the Oriental Churches, as the Greek Orthodox, the Nestorian, and the rest, including the Oriental Churches in communion with Rome except the Maronites and the United Armenians, use leavened bread for the Eucharist: in churches of Latin rite unleavened bread alone is permitted. The Council of Florence (1439), in the Decree of Union, defined that consecration either in leavened or unleavened bread is valid. The usage of the Protestant churches conforms with that of the Oriental Church.

Unterwalden, oon'tĕr-väl-dĕn, Switzerland, one of the smaller cantons, in the centre of Switzerland, bounded on the north by the Vierwaldstätter Lake, on the east by mountains which separate it from Uri, on the south by Bern, and on the west by Lucerne. The pasturage of cattle is the chief support of the inhabitants, and there is a considerable trade in agricultural produce and in wood. The surface is mountainous; the most remarkable summits are those of Pilatus and of Titlis. The canton is divided into two valleys, Upper and Lower (Obwalden and Nidwalden), by a forest called Kernwald, which crosses it from north to south. Each of these valleys forms an independent state, but is represented by only one member in the council of the Swiss states, instead of two, as all the whole cantons are. The chief town of Obwalden is Sarnen, and of Nidwalden, Stanz. Area of Obwalden, 183 square miles; pop. (1900) 15,280; area of Nidwalden, 112 square miles; pop. (1900) 13,088.

Un'thank, James Bryant, American college president: b. Williamsburg, Ind., 1849. He was graduated from Earlham College, Richmond Ind., in 1874, was professor of history and logic 1874–81, and has been president of Wilmington College, Ohio, from 1881.

Un'win, William Cawthorn, English civil engineer: b. Coggeshall, Essex, 12 Dec. 1838. He was educated at the City of London School, and was instructor at the Royal School of Naval Architecture and Marine Engineering, Kensington, 1868–72. Since 1885 he has been professor of engineering at the Central Technical College of the Guilds of London, Kensington. He has published 'Wrought Iron Bridges and Roofs' (1869); 'Machine Design' (1877); 'The Testing of Materials of Construction' (1888); 'The Life of Hirn' (1896); etc.

Unyoro, oo-nyō'rō, British East Africa, a former native state bordering on the Albert Nyanza, and now included in Uganda. Pop. estimated at 1,500,000.

Up From Slavery, an autobiography by Booker T. Washington (q.v.), published in 1901. Its author was a slave until freed by the Emancipation Proclamation. The story of his career is told with much grace and simplicity as well as extreme modesty.

Upanishads, oo-pă-nĭ-shădz', a series of speculative treatises belonging to the Vedic literature. They are 108 in number and contain the mystical doctrine of the Hindus regarding the human soul, the nature of deity, and the process of creation. They constitute part of the Brahmanas or commentaries belonging to the Veda and present the Vedic doctrine in a comprehensive form. Though not supposed by Hindus to have been revealed in the same manner as the Vedic hymns, the Upanishads are not assigned to human authorship, but are deemed inspired writings. (See SANSKRIT.) There is an English translation of the Upanishads by Max Müller, 2 vols.

U'pas Tree, a Javanese tree (*Antiaris toxicaria*), celebrated for its poisonous qualities, which, however, have been very much exaggerated. It was long believed in Europe that this tree was a solitary one situated in a valley in Java, that the pestilential qualities of it were so great that neither herb nor animal could live within many miles of it, and that criminals alone were sent to gather poison from it, few of whom ever returned. The Javanese themselves dread this tree, and will not rest beneath it, or even pass to leeward of it. The upas tree belongs to the *Urticaceæ*, and the stem rises for about 60 feet before the first branch puts out. The wood itself is harmless, being used for furniture, but the bark, which is whitish, and nearly an inch thick, when wounded, exudes a viscid, milky yellowish sap, which becomes brown upon exposure and hardening into gum. From this sap, when mixed with the seeds of capsicum and other substances, a deadly arrow-poison is made, which is at first purgative and emetic in its effects, and then narcotic, finally killing the victim by tetanic convulsions. It is called upas-antiar. When the tree is felled or

the bark is much injured, the tree gives out noxious exhalations which will cause cutaneous eruptions, and if the upas tree be burned the smoke from it will produce the same result. A variety of *Antiaris* is the sack tree, formerly known as *A. innoxia.* It has a bark, pieces of which, when soaked and beaten, can be turned inside out without tearing, and, a section of the wood having been left for a bottom, can be used as a sack. It is said that a kind of coarse cloth is made from the fibrous inner bark of the upas tree, and is worn by poor people, but that if wetted it excites an intolerable itching of the wearer's skin.

Up'church, John Jorden, American mechanic: b. Franklin County, N. C., 26 March 1822; d. Steelville, Mo., 18 Jan. 1887. He gained a wide knowledge of mechanics and engineering through practical experience, engaged in constructing large saw and flour mills, was master mechanic on the Main Hill and Schuylkill Haven Railroad in 1841–54 and in 1868 entered the machine shops of the Great Western railroad at Meadville, Pa. On 27 Oct. 1868 he founded there the first lodge, consisting of 14 members, of the Ancient Order of United Workmen, a fraternal organization which has since extended into every State and Territory of the United States. He removed to Missouri in 1873, where he was engaged as master mechanic of the car-shops of the Saint Louis, Salem, and Little Rock railroad and also superintendent of the building of the shops and the purchase and erection of machinery.

Up'degraff, Milton, American astronomer: b. Decorah, Iowa, 20 Feb. 1861. He was graduated from the University of Wisconsin in 1884, was assistant astronomer at the Washburn Observatory 1884–7, and from the last named year until 1890 he held an astronomical post at the National Observatory at Cordoba, Argentine Republic. Since 1899 he has been professor of mathematics of the United States navy.

Upham, up'am, Warren, American geologist: b. Amherst, N. H., 8 March 1850. He was graduated at Dartmouth in 1871; served on the geological survey of New Hampshire 1875–8; on the geological survey of Minnesota in 1879–85; and on the United States Geological Survey in 1885–95. Since the last named date he has been secretary and librarian of the Minnesota Historical Society in Saint Paul. He has published 'The Glacial Lake Agassiz'; 'Greenland Icefields and Life in the North Atlantic, with a New Discussion of the Causes of the Ice Age' (with G. F. Wright); etc.

Up'john, Richard, American architect: b. Shaftesbury, England, 22 Jan. 1802; d. Garrisons, N. Y., 16 Aug. 1878. He emigrated to the United States in 1829 and took up his residence in New Bedford, Mass. On being appointed to direct the alterations in Trinity Church, New York, he left Boston, where he had been engaged on the designs for the Court House of that city, and settled in New York, where he drew the plans for the Trinity Church of to-day, completed in 1846 and then considered the handsomest church in the United States. He also built the Church of the Ascension, the Church of the Holy Communion, Trinity Chapel, St. Thomas' Church, and others in New York, St. Paul's Church, Buffalo, and the Church of the Pilgrims and Grace Church in Brooklyn. His civic architecture was chiefly that of Italian Renaissance, while his domestic buildings were of various styles.

Upjohn, Richard Mitchell, American architect, son of the preceding: b. Shaftesbury, England, 7 March 1828; d. Brooklyn, N. Y., 1903. He came to this country from England with his parents in his infancy and became a partner with his father when 20 years old. Among the many buildings erected with his co-operation are the Madison Square Church, the old Mechanics' Bank in Wall Street, St. Peter's Church, Albany; the Central Congregational Church, Boston; Park Church, Hartford, Conn.; St. Paul's Protestant Episcopal Church, Brooklyn, and Trinity Parish School, New York. His chief work was the State Capitol in Hartford, Conn., and he had frequently been employed as an expert on civic, State, and national commissions. He was a member of the American Institute of Architects since its foundation and was president of the New York Chapter for two years. He was also a member of the Architectural League, an officer of the Architectural Department of the Brooklyn Institute of Arts and Sciences, and a life member of the Metropolitan Museum of Art. As an architect he was possessed of rare versatility. While he exhibits in his State Capitol at Hartford a knowledge of what is meant by architectural magnificence, in other moods he has produced ecclesiastical, collegiate, and domestic structures of a sober dignity, and austerity of design which are not unworthy of the best ages of architecture.

Upland Plover, a sportsman's name for the Bartramian sandpiper. See SANDPIPERS.

Upolu (oo-pō-loo') Island. See SAMOAN ISLANDS.

Upper Alton, Ill., city, Madison County; on the Chicago, B. & Q. and the Chicago & A. R.R.'s; two miles northwest of Alton. It is in an agricultural region. There are roof-tile works, a machine shop, grist mill, and other manufactories connected with the shipping of farm products. The educational institutions are the Shurtleff College (Baptist), opened in 1827 and chartered in 1835; a high school, opened in 1885, and public elementary schools. The Shurtleff College had, in 1903, 13 professors and instructors, and 168 students. The library contained 10,000 volumes, the productive funds amounted to $143,436, and the total income to $13,864. Pop. (1890) 1,803; (1900) 2,373.

Upper Canada. See ONTARIO.

Upper Helderberg Group, a discarded term in geologic chronology, applied to the lower members of the Mid Devonic formations — the Schoharie Grit, and the Onondaga or corniferous limestone. The term was derived from the Helderberg Mountains where these rocks form the highest limestone members, while other limestones termed the Lower Helderberg group formed the basal limestone strata. To these latter, now classed as Lower Devonic, with the exception of the Manlius limestone, the name Helderbergian is now restricted. See DEVONIAN; OLD RED SANDSTONE.

Upper Iowa University, located at Fayette, Iowa. It was established as Fayette Seminary in 1857, and the name was changed to Upper Iowa University in 1858. It is supported and controlled by the Upper Iowa Conference of the

Methodist Episcopal Church. It has been open to men and women on equal terms from the first, and a third of the graduates have been women. The organization includes the College of Liberal Arts, the Academy, the Normal School, the Conservatory of Music, a school of art, the School of Oratory, the Business College, the School of Physical Culture, and the Summer School. The College of Liberal Arts offers a classical, a philosophical, and a scientific course, and confers the three degrees of A.B., B.Ph., and B.S. The courses of instruction are arranged in four groups: (1) the philosophy and history group; (2) the language group; (3) the scientific group; (4) mathematics. Certain studies are required in all courses; the rest of the work is elective, each student being required to elect a major and a minor subject, in different groups, the degree received depending upon the major subject. The full course in the Normal School is four years in length, and prepares for the State diploma; the first two years of this course prepares for a county certificate, and the first three years for a State certificate. The Business School offers a commercial course, and a course in shorthand and typewriting, each six months in length; the two may be combined in one course occupying eight months. A certain amount of work in the music, art, and oratorical departments may be elected by students in the College of Liberal Arts. The Summer School was organized in 1902 for normal work only; in 1903 general college courses were added. The university maintains one dormitory for young women, but students mostly board in private homes in the city. Much interest is manifested in athletics; inter-collegiate football has been (1904) temporarily discontinued; but match basketball and baseball games are played; the control of athletic sports is vested in a board of four representatives of the faculty, one representative from each college class, and a resident alumnus. The campus consists of 12 acres; the buildings include the Main Building, South Hall (women's dormitory), North Hall, Chapel, Gymnasium, Observatory, and the David B. Henderson Library, built by Andrew Carnegie. In 1904 the library contained over 8,000 volumes; the students numbered 527, of whom 129 were in the College of Liberal Arts, 150 in the Business College, and 144 in the Conservatory of Music.

Upper Sandus'ky, Ohio, village, county-seat of Wyandot County; on the Sandusky River, and on the Pennsylvania and the Columbus, H. V. & T. R.R.'s; about 60 miles north by west of Columbus and 57 miles south by east of Toledo. It is in an agricultural and stock-raising region. The chief manufacturing establishments are machine shops, wagon and carriage works, foundries, flour mills, and furniture works. The educational institutions are a high school, established in 1872, public and parish schools, and a public library. The two banks have a capital of $155,000, and deposits amounting to $512,000. Pop. (1890) 3,572; (1900) 3,355.

Upsala, oop-sä'lä, Sweden, a town situated on the Fyris River near the head of a navigable branch of Lake Mälar, 35 miles northwest of Stockholm. The most prominent building is the Gothic cathedral built in 1260–1435, and restored in 1886–93. It contains the tombs of several Swedish kings. The main building of the university is a fine Renaissance structure built in 1879–87. The university was founded in 1477. It has about 1,400 students, a library of 300,000 volumes and 12,500 manuscripts, large collections of coins and paintings, a botanical garden and museum, with a statue of Linnæus, and observatory, and other scientific institutions. The industries are unimportant, but there is a large annual fair. Pop. (1901) 23,802.

Upsetting Thermometer. See THERMOMETER.

Upshur, ŭp'shẽr, **Abel Parker,** American statesman: b. Northampton County, Va., 17 June 1790; d. Potomac River, near Washington, D. C., 28 Feb. 1844. He was admitted to the bar in 1810, practised law at Richmond, Va., in 1810–24, and in 1825 served in the Virginia legislature. He was appointed judge of the general court in 1826, was a member of the convention to revise the State constitution in 1829, and then resumed his office as judge, serving until 1841, when he accepted the appointment as secretary of the navy under President Tyler. On the resignation of Daniel Webster in 1843 he became secretary of state, in which capacity he favored the pro-slavery party and also supported President Tyler's policy of annexing Texas. On 28 Feb. 1844, in company with the President and his party, he visited the war steamer Princeton on the Potomac River to witness the testing of a large gun. It exploded in the experiments and Secretary Upshur, together with several others of the party, was killed.

Upshur, John Henry, American naval officer: b. Northampton County, Va., 5 Dec. 1823. He was educated at William and Mary College, entered the navy in 1841, served in the Mexican War, and participated in the capture of Vera Cruz. He was graduated from the Naval Academy at Annapolis, Md., in 1848, accompanied the Perry expedition to Japan in 1854, and in 1857–9 was flag-lieutenant on the African squadron. He was an instructor at the Naval Academy at the beginning of the Civil War and was assigned to the South Atlantic squadron with which he remained until 1862. He was then transferred to the North Atlantic squadron, was present at the engagements of Forts Royal and Hatteras and participated in the capture of Fort Fisher in 1865. He received promotion to commander in 1866, captain in 1872, commodore in 1880, was in command of the New York Navy Yard in 1882–4, and in the latter year was made rear-admiral in command of the naval forces of the Pacific. He was retired in 1885 at his own request.

Up'son, Anson Judd, American educator: b. Philadelphia, Pa., 7 Nov. 1823; d. Glens Falls, N. Y., 15 June 1902. He was graduated from Hamilton College, Clinton, N. Y., in 1843, and taught there until 1870, occupying the chair of logic and rhetoric in 1853–70. He was ordained in the Presbyterian ministry in 1868, and in 1870–80 was pastor of the Second Presbyterian Church at Troy, N. Y. In 1880 he was appointed to the chair of sacred rhetoric at Auburn Theological Seminary, in which office he remained until 1887, became vice-chancellor of the University of the State of New York in 1890, and from 1892 until his death was chancellor. He published: 'Inquiry into the Nature and Character of our Federal Government' (1840).

Upton, Emory, American soldier: b. Batavia, N. Y., 27 Aug. 1839; d. San Francisco, Cal., 14 March 1881. He was graduated at West Point in 1861, and was commissioned second lieutenant in the 4th artillery; and a few days later was promoted first lieutenant of the 5th artillery. While serving on the staff of Gen. Tyler he participated in the first battle of Bull Run, where he was wounded, and in the Peninsula and Maryland campaigns of 1862 (qq.v.). In October 1862 he was commissioned colonel of the 121st New York volunteers. He fought at Fredericksburg, and from Gettysburg to the Wilderness commanded a brigade of the Sixth corps, distinguishing himself at the battle of Rappahannock Station (q.v.), and especially at Spottsylvania Court House (q.v.), where he was wounded. For gallantry in the last-named action he was promoted brigadier-general of volunteers and brevetted lieutenant-colonel in the regular army. He participated in the Shenandoah campaign, was wounded at the battle of the Opequon (q.v.), and was brevetted major-general of volunteers. Later he served in Georgia and Alabama in command of the 4th cavalry division under Gen. J. H. Wilson, and for his services at Selma was brevetted brigadier-general in the regular army. From 1868 to 1880 he served as lieutenant-colonel of the 25th infantry, and in the latter year was made colonel of the 4th artillery. He originated a system of military tactics which was adopted by the government in 1867, and was commandant of cadets at West Point 1870–5. Soon after attaining his colonelcy in the regular army he was attacked by mental disease and committed suicide. His publications include: 'A New System of Infantry Tactics' (1867); 'Tactics for Non-Military Bodies' (1870); 'The Armies of Asia and Europe' (1878); and 'The Military Policy of the United States.' Consult Michie, 'Life and Letters of Major-General Emory Upton' (1885).

Upton, George Putnam, American musical critic: b. Boston 25 Oct. 1834. He was graduated from Brown University in 1854, and entered journalism in Chicago a year later. He was musical critic and editorial writer on the Chicago *Tribune* for 25 years. He has published 'Letters of Peregrine Pickle' (1870); 'Lives of Haydn, Beethoven, Wagner and Liszt'; 'Standard Operas' (1890); 'Standard Oratorios' (1891); 'Standard Symphonies' (1892); etc.

Upton, Winslow, American astronomer: b. Salem, Mass., 12 Oct. 1853. He was graduated from Brown University in 1875, studied astronomy at the University of Cincinnati and in 1877–9 was assistant astronomer at the Harvard Observatory. He was engaged in the United States Lake survey as assistant engineer in 1879–80, was computer and assistant professor in the United States signal service in 1881–3, and has since been professor of astronomy at Brown University, where he was also dean in 1900–1. He served on the United States eclipse expeditions of 1878 and 1883 and was a member of private expeditions in 1887, 1889, and 1900. In 1896–7 he was absent on leave from Brown while making observations at the Southern station of Harvard Observatory at Arequipa, Peru. He has published: 'Star Atlas' (1896).

Upton, William W., American jurist: b. Victor, N. Y., 17 July 1817; d. Washington, D. C., 23 Jan. 1896. In 1838 he went to Michigan where he studied law and held various offices, being a member of the legislature which located the capital at Lansing. He went to California in 1852 and was a member of the California legislature in 1856. He was prosecuting attorney of Sacramento County, 1861–64. He moved to Portland, Oregon, in 1865, whence he was almost immediately elected to the legislature. In 1867 he became a Justice of the Supreme Court and became Chief Justice in 1872. In the presidential election of 1876 the Republicans based their claim to the Oregon vote upon a telegram of Judge Upton in which he called attention to the fact that the governor of Oregon could not exercise judicial powers in passing upon the eligibility of an elector. The Electoral Commission sustained this contention, and Hayes became president. In 1877 Judge Upton was appointed Second Comptroller of the U. S. Treasury, which position he held until his resignation in 1885, during which time he passed finally upon nearly 160,000 accounts, involving about $160,000,000. In 1885 the government published his "Digest of Decisions of the Second Comptroller of the Treasury, 1869 to 1884."

R. R. Upton.

Upton, Mass., town in Worcester County; on the Grafton & Upton Railroad; about 35 miles southwest of Boston. The town contains the villages of Upton Centre and West Upton. The chief industries are connected with farm products and the manufacture of straw hats. Pop. (1890) 1,878; (1900) 1,937.

Urabá, oo-rä-bä', Gulf of. See Darien, Gulf of.

Uræ'mia, a toxic condition caused by the presence in the blood of urinary constituents which normally should be secreted by the kidneys. The nervous system is especially affected by the poisonous blood, as shown by mental disturbances, convulsions, headache, nausea, dyspnœa, disordered vision, and coma. What the toxic material really is has not been determined. It has been proved not to be urea alone, as was formerly believed. Some contend that the poison is a mixed product of uneliminated nitrogenous excrementitions substances; others, that it is a newly formed albuminous substance not related to ordinary waste material, or is due to a disturbance of an internal venal secretion brought about by changed metabolic processes. Uræmia is usually associated with acute or chronic nephritis, or may result from suppression or deficient secretion of urine from any cause.

The symptoms of uræmia depend upon whether the condition is acute or chronic. Acute uræmia may begin with a violent headache or persistent vomiting, with dyspnœa, convulsions, mania, or coma. There may be only one of these symptoms present, or two or more may appear. The headache is usually occipital, and may be associated with deafness. The vomiting may be accompanied by diarrhœa, both being efforts to excrete the toxic material. The dyspnœa is frequently continuous and severe; the patient cannot lie down or sleep in any position with comfort; there is much restlessness and tossing about; the legs, if resting on the floor, readily

swell from œdema. There is always a probability of pulmonary œdema and cyanosis of the face and extremities. Whenever sudden uncontrollable vomiting occurs without a known cause, or a severe and more or less continuous headache appears, uræmia should be suspected and the urine examined. The temperature in acute uræmia may be but little increased, or may rise 5° to 6° F. just before a paroxysm. The pulse varies, depending upon the condition of the heart and arteries; it may be full and throbbing, or small and hard and not especially rapid. The convulsions resemble those of epilepsy, but are not attended by a cry. They may come without warning or be preceded for a few days by twitching of the muscles of the face and hands; and may occur frequently and persistently until coma ensues. Amaurosis may follow these convulsions for a few days, or hemiplegia or monoplegia may follow or precede them. The delirium of acute uræmia may be mild, muttering, or it may be maniacal. Coma is generally present when there are general convulsions, and may appear without them, sometimes preceded by headache and dulness. The breathing is stertorous and the breath foul. The patient may recover from the stupor or may remain in it for weeks.

In chronic uræmia the patient complains of severe occipital or frontal headache, more or less continuous. There is dyspnœa not dependent on exertion. There may be nausea, vomiting, diarrhœa, and stomatitis. The breath is foul, the tongue coated with a brown offensive fur. The urine is usually increased in amount, is clear, acid, has a specific gravity of 1006 to 1010, contains albumen at variable periods, also a few hyaline or granular casts, and sometimes red blood-corpuscles and leucocytes. The urea is often diminished.

The symptoms of chronic uræmia may last for months, but acute exacerbations with convulsions and coma may appear at any time, and such cases are susceptible to inflammation of the pericardium, pleura, meninges, and endocardium. Melancholia and delusional insanity may occur. The skin frequently becomes dry and itches, and muscular cramps are common.

Uræmia must be distinguished from typhoid fever, alcoholism with coma, and from some forms of diabetes and meningitis. The prognosis of uræmia is not good, especially in albuminuria patients, and those having advanced heart disease or arteriosclerosis; but patients may recover when apparently hopelessly sick.

Treatment.— Keep the patient in bed and between blankets, especially in acute attacks; prevent him at all times from being chilled; induce free action of the skin by the hot pack, the hot air or steam bath, or the hot tub bath; and keep the bowels free by saline purges. Diuretics, such as water (considered by many as the best diuretic), lemonade with cream of tartar, the liquor ammoniæ acetatis, and the citrate of potassium, cannot be dispensed with. Cupping and poulticing of the loins (if the urine is scanty), venesection, and hot saline injections are advocated. Sometimes heart stimulants such as camphor, strychnine, digitalis, and strophanthus are necessary. During convalescence tonics may be given and careful outdoor exercise resorted to, the patient being comfortably clad. In most cases the use of alcohol and tobacco should be interdicted. The diet is of prime importance. In acute uræmia it should be solely of milk, with seltzer, vichy, or kumiss. In the chronic form this should be the chief mode of administering food. As improvement sets in the patient may have meat broths, gruels, egg-albumen, custards, toast, baked potatoes, cereals, soft-boiled eggs, fresh fish, etc. Most authorities believe that red meats should not be given until the amount of urea found in the urine is about normal.

Uraga, oo-rä'gä, Japan, a seaport town of Hondo, in the Sagami province, 16 miles southeast of Yokohama. Perry Park opened in 1900 at Kurihama, a suburb, commemorates the advent of Commodore Perry's fleet at Uraga in 1853, and the negotiations which led to the opening up of Japan again to foreign commercial and political relations. Pop. 13,000.

Ural (oo'ral or ū'ral) **Mountains,** Russia, a long mountain range forming the conventional boundary between Europe and Asia, and extending in a nearly north and south direction from the Arctic Ocean to the Aral Sea, a distance of about 16,000 miles. The average height of its crest is 1,000 to 1,500 feet, but several peaks are over 5,000 feet high, the highest, Telpòs, in the northern part of the chain, having an altitude of 5,433 feet. In the north the range forms a comparatively narrow ridge, destitute of trees. Further south it becomes covered with forests, and spreads out to a width of nearly 200 miles, finally dividing on the southern boundary of Orenburg into a western and a southern outrunner, the latter known as the Mugadzhar Mountains, reaching to the Aral Sea. The principal rivers fed by the Ural chain are the Petchora, and numerous affluents of the Obi, belonging to the Arctic Ocean; and the Kama and Ural, belonging to the Caspian. The geological structure consists of an axis of granite and porphry, covered on the slopes with palæozoic strata. The mineral wealth is very great, especially in the central portion. The range is one of the principal sources of platinum, and gold is also found in great quantities, besides silver, lead, copper, iron, rock salt, and diamonds and precious stones.

Ural River, Russia, a river which rises in the Ural Mountains in the northern part of the government of Orenburg, flows first south, then west, past Orenburg so far as Uralsk, then again south through the Uralsk district, emptying into the Caspian Sea through several mouths. It is 1,485 miles long, and navigable to Orenburg for vessels of considerable size. Its sturgeon fisheries are important.

U'ral-Alta''ic Languages, a family of languages of which two grand divisions are recognized by Max Müller, the Northern and the Southern. In the northern division are comprised the Tungusic, the Mongolic, the Turkic, the Finnic, and the Samoyedic. The Tungusic dialects, lowest of all these in organization, extend northward and westward from China. Of a grade a little higher are the Mongolic dialects of China: in these the different parts of speech are hardly distinguished. On the other hand, the Turkic dialects, chief among them the Osmanli of Constantinople, are rich in grammatical forms; Turkic speech is spoken from the Polar Sea to the Adriatic. The Finnic division com-

prises the speech of the Baltic coasts and the Hungarian or Magyar. (See FINNS; HUNGARY.) Among the languages of the southern division are the Tamulic or Dravidian dialects of southern India (see TAMIL); the Tibetan, the Taic or the dialects of Siam, and the Malaic or Malayan and Polynesian dialects. The Ural-Altaic languages all possess one characteristic feature; in them the radical or root is never obscured; the determining or modifying syllables are usually placed at the end; the vowels in a word may be changed and modulated to harmonize with the keynote struck by its chief vowel. In the Turkish, for example, if a verb contains a sharp vowel in its radical portion, the vowels of the terminations are all sharp; but the same terminations when they follow a root with a flat vowel, modulate their vowels into a flat key; thus *mek* or *mak* being the infinitive termination of verbs, *sev-mek* is the infinitive verb to love, but *bak-mak* is the infinitive verb to regard. The Ural-Altaic languages are sometimes called Turanian, also Finno-Tartar.

Uralite, a mineral which is a variety of amphibole and is produced by the alteration of pyroxene. Found very abundantly in various rocks.

Uralsk, oo-rälsk', Russian Central Asia, the capital of the district of Uralsk, situated on the Ural River, at the foot of the mountains, 160 miles southwest of Orenburg, and 280 miles north of the Caspian Sea, on the railroad between Orenburg and Saratov. It has numerous churches, two high schools, a library, a museum, and a theatre, steam mills, brick kilns, and a brewery. Pop. (1897) 36,597.

Urania, ū-rā'nĭ-a, the "heavenly one," sometimes a title of Aphrodite, as the goddess of noble love, but more commonly the name of the muse of astronomy, a daughter of Zeus and Mnemosyne. She is generally represented with a crown of stars, in a garment spotted with stars, and holding in her left hand a celestial globe or a lyre. By Apollo she was mother of Hymenæus and Linus. See MUSES.

Urani'idæ, a family of moths. See MOTH.

Uraninite, Uranin, or Pitchblende, a dark-green to black mineral belonging to the isometric or cubical system. Usually occurs in a massive condition. Brittle, hardness 5.5; specific gravity, 6.4 to 9.7; lustre, submetallic and greasy or pitch-like; streak, brownish-black to dark olive green; fracture, conchoidal; composition: an oxide of uranium that may be considered a uranate of uranyl. It also contains some lead and very small amounts of other elements, among which are radium (q.v.) and the rare gaseous elements helium. Pitchblende is the chief commercial source of uranium and radium. It is mined in considerable quantity at Joachimsthal in Bohemia. Found also in many other places as Cornwall, Saxony, Hungary, Turkey and in the United States in Connecticut, North Carolina, etc.

Ura'nium, a metallic chemical element, symbol U, atomic weight 238.5, specific gravity 18.6. It was discovered by Klaproth (1789) in the mineral pitchblende and named by him in honor of Herschel's discovery of the planet Uranus. The body discovered by Klaproth was really the oxide of uranium, the free metal being first isolated by Peligot (1842). It is one of the rarer elements and occurs in nature only in combination with other elements. The principal minerals containing it in any considerable quantity are *uraninite* or pitchblende (75 to 85% U_3O_8), a greenish mineral coming chiefly from Joachimsthal in Bohemia, though found in other places; *gummite,* a hydrated calcium lead uranium silicate; *uranosphærite,* a hydrated bismuth uranite; *torbernite,* a hydrated copper uranium phosphate from Saxony and Cornwall; and *autunite,* a hydrated calcium uranium phosphate from the same regions. The metal is prepared by heating a mixture of uranium chloride, sodium chloride, and carbon or of uranium chloride, sodium chloride and metallic sodium. It is a malleable white metal looking like nickel. It oxidizes very slowly in the air at ordinary temperatures, but rapidly burns to U_3O_8 when heated above 400° F. Is soluble in mineral acids. It acts both as an acid and a basic element. We have *uranous* salts such as UCl_4, *uranyl* salts in which the group UO_2 acts as a basic radical, example uranyl chloride $(UO_2)Cl_2$ and *uranates* which are formed by the combination of the oxide UO_3 with strong bases. Sodium uranate, or uranium yellow, is used in glass and china painting and in the manufacture of beautiful fluorescent uranium glass. Metallic uranium and minerals containing its compounds possess marked radioactivity. See RADIUM.

Uranus, ū'ra-nŭs, in Greek mythology, the son of Gæa, the earth, and by her the father of the Titans, Cyclopes, etc. He hated his children, and confined them in Tartarus, but on the instigation of Gæa, Kronos, the youngest of the Titans, overthrew and dethroned him.

Uranus, in astronomy, one of the primary planets, and the seventh from the sun, discovered by Sir William Herschel in 1781. To the naked eye it appears like a star of the sixth magnitude. Its mean distance from the sun is about 1,754 millions of miles, and the length of the year 30,686.82 days, or about 84 of our years. Its mean diameter is estimated at about 33,000 miles. Its volume exceeds the earth's about 74 times, but as its mean density is only 0.17 (the earth's being 1) its mass is only about 12½ times more. The length of its day is supposed to be between 9 and 10 hours.

Urates, or Lithates. Uric acid is sometimes called lithic acid and the salts of uric acid are therefore spoken of sometimes as *urates* or *lithates.*

Urban, ėr'ban, the name of eight popes, as follows:

Urban I., Saint. He was the son of a Roman noble, Pontianus, and succeeded Calixtus I., in 222. He suffered martyrdom in 230.

Urban II. (ODO OF LAGNY): b. Chatillon sur-Marne, France, about 1042; d. Rome 29 July 1099. He was a canon of Rheims, and a monk of Cluny where Gregory VII. met him and invited him to Rome. He was soon after appointed cardinal and bishop of Ostia, and in 1088 he succeeded Victor III. The anti-pope Clement III. was then in possession of Rome, but was obliged to flee in 1089. He returned in 1091 only to be again driven out in 1093 when Urban resumed possession of the city. At the council of Clement, in 1095, Urban preached the first crusade, and at the council of Bari in

1098 he attempted to bring about a union of the Greek and Latin churches. He maintained the validity of papal elections independently of the consent of Roman emperors, zealously enforced the law of priestly celibacy and forbade the clergy to accept ecclesiastical offices from laymen.

Urban III. (Umberto Crivelli, oom-bĕr'tō krĕ-vĕl'lē): b. Milan; d. Ferrara 20 Oct. 1187. He was archbishop of Milan and succeeded Lucius III. in the papal chair in 1185. He endeavored to send assistance to the Christians in the East, who were being sorely pressed by Saladin, and after a struggle with Frederick Barbarossa was about to excommunicate that monarch when his own death intervened.

Urban IV. (Jacques Pantaléon, zhäk pän-tä-lā-ôń): d. Orvieto, Italy, 2 Oct. 1264. He was of French birth, the son of a shoemaker, and became successively canon of Liège, bishop of Verdun, and patriarch of Jerusalem. He succeeded Alexander IV. in 1261. He excommunicated Manfred, king of Naples, and offered the crown to Charles, Count of Provence and Anjou, and brother to Louis IX. of France, which led to the subsequent wars of the Anjous for the possession of Sicily and Naples. He established the feast of Corpus Christi, first celebrated at Orvieto, 19 June 1264.

Urban V. (Guillaume de Grimoard, gē-yōm dē grē-mō-ār): b. diocese of Mende, France; d. Avignon, France, 16 Dec. 1370. He was a Benedictine monk who became renowned as a professor of canon law and Scripture and was raised to the dignity of abbot of St. Victor at Marseilles and papal legate. He succeeded Innocent VI. in 1362. He restored the papal seat from Avignon to Rome in 1367, founded many churches, and was a profound student and the patron of scholars. He was the first pope to bless a golden rose for princes.

Urban VI. (Bartolommeo Prignano, bär-tō-lōm-mā'ō prēn-yä'nō): b. Naples: d. Rome 15 Oct. 1389. He was archbishop of Bari and chosen to succeed Gregory XI. in 1378. The French cardinals dissatisfied with Urban withdrew to Anagni and there elected Robert of Geneva, who took the name of Clement VII., and took up his residence in Avignon. Thus was originated the famous "Western Schism," which endured for nearly 50 years. Urban has been characterized as of harsh and violent temper, but an impartial survey of history will rather credit him with being severe and rigorous in disposition, which his enemies interpreted for their own purposes.

Urban VII. (John Baptist Castagna, käs-tän'yä): d. 28 Sept. 1590. He was archbishop of Rossano, cardinal and papal legate to Spain, and succeeded Sixtus V. in 1590, but died 13 days after his election.

Urban VIII. (Maffeo Barberini, mäf-fā'ō bär-bā-rē'nē): b. Florence 1568; d. Rome 29 July 1644. Under Gregory XIV. he was governor of Fano, under Clement VIII. papal prothonotary, and in 1604 became archbishop of Nazareth (*in partibus infidelium*) and ambassador to Paris. He became cardinal presbyter the next year and archbishop of Spoleto in 1688. He was elected successor to Gregory XV. 6 Aug. 1623. He condemned the Jansenist tenets which then flourished in France, built the Collegium Urbanum or College of the Propaganda, established the Vatican Seminary, and issued the bull 'In Cœna Domini' in its present form. He also gave the cardinals the title of Eminence, regulated the number of feasts of obligation, put forth a revised breviary, and was the author of some Latin and Italian poems. Consult: Ward, 'Copernicanism and Pope Paul V.' (Dublin 'Review' 1871); H. de l'Epinois, 'Les pièces du procès de Galileo' (1877).

Urbana, ėr-băn'a, Ill., city, county-seat of Champaign County; on the Illinois Central, the Wabash, the Cleveland, C., C. & St. L. R.R.'s; about 78 miles northeast of Springfield, and 128 miles south by west of Chicago. It is in an agricultural region, and in the vicinity are valuable deposits of fire-clay. It was settled in 1824, incorporated 6 May 1833, and chartered as a city in 1860. The chief industrial establishments are the "Big Four" railroad shops, with 700 employees; brick works, 300 employees; and lawn mower and machine works, 50 employees. The principal public buildings are the county court-house, municipal buildings, Y. M. C. A. building, the churches, and schools. The educational institutions are the State University (q.v.), the Thornburn High School, public elementary schools, and two libraries. The three banks have a combined capital of $500,000, and the average annual business amounts to $5,000,000. The government is administered under a charter granted by the Legislature, which provides for a mayor and a council of 10 members, who are elected annually. Pop. (1890) 3,511; (1900) 5,728.

J. K. Groom,
Editor 'Courier.'

Urbana, Ohio, city, county-seat of Champaign County; on the Erie, the Pittsburg, C., C. & St. L., and the Cleveland, C., C. & St. L. R.R.'s; about 95 miles north of Cincinnati and 45 miles west of Columbus. It is in an agricultural region. The chief industrial establishments are the U. S. Rolling Stock Company works, carriage and wagon factories, stove works, machine shops, agricultural-implement works, shoe factories, broom and furniture factories, woolen mills, straw-board works, water-wheel works, a tannery, and a flour mill. The principal public buildings are the county court-house, municipal buildings, churches, and schools. The educational institutions are Urbana University (Swedenborgian), founded in 1850, a high school (building cost $125,000), public and parish elementary schools, public library, and the library of the university. The three banks have a combined capital of $300,000 and deposits amounting to $992,030. Pop. (1890) 6,510; (1900) 6,808.

Urbino, oor-bē'nō, Italy, a town in the province of Pesaro e Urbino, on an isolated hill in the midst of bleak and desolate mountains, 21 miles west by south of Pesaro. It is the see of an archbishop, and the seat of a university with two faculties — jurisprudence, and mathematics and natural science. Among the buildings deserving of notice are the ducal palace, one of the finest edifices of the kind in Italy, and the cathedral. Urbino is the birthplace of the painter Raphael. His house is still shown, and a statue of him was erected in 1897. From 1474 to 1626 Urbino was the capital of a duchy. Pop. (1901) of commune, 18,307.

Urd. See Norns.

Urdaneta, oor-dä-nā'tä, **Andres,** Spanish navigator: b. Villafranca, Spain, 1498; d. Mexico, 3 Nov. 1568. He was appointed by Philip II., chief pilot of the expedition under Miguel Lopez de Legazpe (q.v.) for the conquest of the Philippine Islands. He sailed with the expedition from La Navidad, Mexico, 21 Nov. 1564, and after the capture of Cebu and Mindoro he returned to Mexico, where he died.

Urdaneta, Philippines, pueblo, province of Pangasinán, Luzon, on the Macálang River, 20 miles east of Lingayén. It is on the highway from Villasis to Santa Barbara. Pop. 16,588.

Urdu, oor'doo, a dialect of the Hindi: it is in English usually called Hindustani: the native name, now given to it by philologists, means "camp language," from the Turkish *urdu,* meaning camp. It is really the Hindi, a language of the Aryan family, with a multitude of Persian, Arabic and Turkish words introduced into it. These intrusions, however, have in no wise altered or influenced the language itself, which, as regards its inflectional and phonetic elements, remains a pure Aryan dialect. The area over which the Urdu is spoken in North India is coextensive with that of the Hindi, estimated at 250,000 square miles, extending from the Gandak River in the east to the Sutlej in the west, and from the Himalaya in the north to the Vindhiya Mountains in the south. Moreover, it is the *lingua franca* of most parts of India. It has a considerable literature, chiefly historic, commencing with Akbar (1556–1605). See Sanskrit.

Ure, ūr, **Andrew,** Scottish chemist: b. Glasgow 1 May 1778; d. London 2 Jan. 1857. He was educated at the universities of Glasgow and Edinburgh, was graduated in medicine from the former in 1801, and in 1804 was appointed professor of chemistry and natural philosophy at the Andersonian Institution in Glasgow. He was one of the founders of the Glasgow Observatory, and in 1809 was appointed its first director, but removed to London in 1830, where, in 1834, he became analytical chemist to the board of customs. He published: 'A New Systematic Table of the Materia Medica' (1813); 'Dictionary of Chemistry' (1821); 'New System of Geology' (1829); 'The Cotton Manufacture of Great Britain' (1836); 'Dictionary of Arts, Manufactures, and Mines' (1837); etc.

U'rea is the principal waste product in the urine of mammals, and it occurs in small amounts in that of birds, especially when they are fed on meat. In the urine of man it is present to the amount of 2.5 to 3.2 per cent, and also occurs in the blood in the proportion of 0.025 per cent, and may be obtained from the liver, the perspiration, and the lymph. Under the influence of bacteria it undergoes alkaline fermentation, and carbonate of ammonia is formed. Urea is the final product of the decomposition of proteids in the body, the proteids of food, of the tissues, and of the blood and lymph. It is the form in which the nitrogen of the body is given off, and is believed to be formed in the liver out of leucin, tyrosin, and other products, and to be separated by the kidneys from the blood when that fluid reaches them. When the liver is diseased there is likely to be a diminished amount of urea excreted. It is increased in proportion to the amount of nitrogenous food, such as meat, which is absorbed, and probably also by muscular exercise. In the conversion of proteids into urea the change is not immediate; there are formed intermediate substances — leucin tyrosin, creatin, etc.

"In disease, urea is retained in the system in all cases where there is decreased diuresis, disease of the kidneys or diminished arterial pressure. Excessive perspiration, diarrhœa, and transudation of water into the serous cavities of the body, or into the connective tissue, by lessening the fluids excreted by the kidneys, also diminish the quantity of urea secreted. Urea is increased in acute febrile diseases until the acme of the fever is reached. It then later becomes subnormal, and during convalescence gradually approaches the normal."

Uredina'ceæ, the family of minute parasitic plants called rusts. See Fungi.

Ure'ter, the excretory duct of the kidney, which serves to convey the urine from the latter organs to the urinary bladder. In man each ureter averages from 16 to 18 inches in length, and is of the average diameter of a goose-quill. It consists of three coats, an outer or fibrous, a middle or muscular, and an inner or mucous coat. The ureter on leaving its kidney passes behind the peritoneum or lining membrane of the abdomen, at the back of the latter cavity. It runs downward and inward from the lower part of the pelvis of the kidney, and enters the cavity of the bony pelvis (q.v.), passing downward and forward to open into the base of the bladder. The ureters open into the bladder each by a constricted orifice, and each in its course lies upon the psoas muscle. They derive their nerves from the inferior mesenteric, spermatic, and hypogastric plexuses; and their blood-vessels form the renal, spermatic, and other arterial trunks. See Kidneys.

Ure'thra, the canal leading from the bladder to the external urinary opening, and serving for the excretion of the urine. In the male the urethra traverses the penis, and its length varies from 8 to 9 inches. In the female it is a narrow membranous canal attaining a length of about 1½ inches, with a normal diameter of about ¼ inch. It is thus a much more complicated structure in the male than in the female, and its anatomy and relations have to be carefully studied by the surgeon in view of the diseases to which it is subject, and also in connection with the important operations of lithotomy and lithotrity (qq.v.). The urethra in man consists of three coats: a mucous, a muscular, and an erectile coat. In the female the urethra is capable of great distention, so much so that it may be artificially dilated so as to permit the removal of calculi from the bladder without further operation.

Urga, oor'gä, or **Bogdo-Kuren,** Central Asia, a town in Northern Mongolia, on the Tola, at an elevation of 4,370 feet above sea-level. It contains several large Buddhist monasteries, occupied by about 10,000 monks, and is a sacred city of the Buddhists, the seat of a high priest or lama. With the exception of the monasteries and temples the town is dirty and ill-built. It is the seat of the Chinese administration of Northern Mongolia, and there is a separate Chinese quarter. It is also a considerable trad-

ing centre, lying as it does at the junction of highways between Kiakhta and Peking. Estimated pop. 30,000 to 40,000, part of whom are nomadic.

Uri, oo'rĭ, Switzerland, a canton in the central part of the country, bounded by the Schwyz, Glarus, Grisons, Ticino, Valais, Bern, and Unterwalden, and extending from the south-eastern shores of the Lake of Lucerne almost to the Italian frontier. Area 415 square miles. Capital, Altdorf. The canton is traversed lengthwise by the narrow valley of the Reuss, which empties into the Lake of Lucerne, and which is hemmed in by lofty, glacier-covered mountains belonging chiefly to the Glarner and Urner Alps. Large numbers of cattle, sheep, and goats are raised, and excellent cheese produced. The principal mechanical industry is the manufacture of explosives and ammunition. The canton is traversed by the Gotthard railroad, and the tourist traffic is important. The inhabitants are chiefly Germans and Roman Catholics. Pop. (1900) 19,759.

U'rial, a wild sheep. See Oorial.

Uric Acid, a crystallizable acid formerly called lithic acid, is a waste product found in small amount in normal human urine (q.v.) — 6.17 to 12.34 grains in 24 hours — usually combined with sodium, ammonium, potassium, calcium, and magnesium to form urates; but when the urine is very acid it appears in the form of crystals, lozenge- or whetstone-shaped, and of a yellowish-red color. It has been detected in the spleen, heart, liver, brain, and blood, especially the blood of gouty persons. It is abundant in the urine of birds and reptiles, and in guano. Urinary calculi and gravel consist frequently of uric acid or the salts formed from it. The concretions improperly called chalk-stones, which form in the joints of persons suffering from gout are composed of uric acid. This acid is increased by an animal diet, in febrile conditions and in gout, and by muscular fatigue. It is decreased by a diet containing but little nitrogen, by starvation, certain drugs, etc. Uric acid may be considered as one of the final products of oxidation, as is the case with urea, and, according to recent experiments, as one of the products of nuclein metabolism, formed from the nuclein of leucocytes and tissue-cells. This oxidation probably takes place everywhere in the body, but most actively where cells are most numerous. The view that uric acid results from the incomplete oxidation of proteids in the liver is no longer held, but the acid seems sometimes to be formed in the kidneys. When the spleen is enlarged the quantity eliminated is increased. Scientists no longer assign to uric acid the poisonous properties once believed to belong to it.

Uriel, ū'rĭ-ĕl, one of the archangels of the Hebrew Midrash and apocryphal Scriptures. The name means "the Light of God." Uriel is described as standing on the left hand of the throne of God, where he ministers light and forgiveness of sins to the children of Israel. He is introduced by Milton into 'Paradise Lost,' and also appears in Longfellow's 'Golden Legend.'

U'rim and Thum'mim, in Hebrew ritual, two appurtenances of the breastplate worn by the high priest. The two words, both plural, signify literally "lights" and "perfections"; in the Septuagint they are translated *delosis* (manifestation) and *alethcia* (truth), and in the Latin Vulgate *doctrina* (teaching or learning) and *veritas* (truth). In the Hebrew Scriptures the two words are inseparable save in 1 Sam. xxviii. 6, where Urim alone occurs. The firt mention of Urim and Thummim is in Ex. xxviii. 30; the other passages in which they occur are: Lev. viii. 8; Num. xxvii. 21; Deut. xxxiii. 8; Ezra ii. 63; Nehem. vii. 65. They appear to have served as an oracle through which the Divine Will might be ascertained. Jonathan Edwards writes that the High Priest's breastplate was called the breastplate of judgment because "in matters of judgment that were too hard for the judges they were to come to the Priest, who was to inquire of God by Urim and Thummim, in the breastplate, for a determination." The Jewish historian Josephus and some modern commentators teach that the Urim and Thummim are simply the twelve precious stones of the breastplate. Both Josephus and the ancient Rabbins held that those precious stones indicated the Divine Will by a preternatural luminousness. Renan, interpreting the existing Hebrew texts with the aid of the Septuagint, regards the instrument of the Urim and Thummim either as a sort of chessboard or as a whirligig or rotating winged globe ('Hist. Peup. d'Isr.,' I., 275).

Urinary Analysis, that branch of chemical and microscopical analysis which has to do with the detection or quantitative estimation of the constituents of urine. In practice, it is mostly concerned with the examination of the urine for such constituents as may have a known clinical significance. The average quantity of urine passed by an adult is probably about 50 fluid ounces (1,500 cubic centimetres) per day, though this may vary widely within the limits of health. The quantity is increased by drinking large amounts of water, and, temporarily, by the administration of diuretics; and it is decreased by unusual activity of the skin, as well as by several other causes. In general, the quantity of water taken into the system through the mouth must be equal, in the long run, to that which is eliminated through the kidneys, skin, bowels, lungs, and nose. The specific gravity of the urine also varies to a considerable extent, the normal specific gravity, when the quantity passed is 50 ounces per day, being about 1.020. Any cause which tends to increase the quantity of urine secreted will, in general, decrease the specific gravity, and *vice versa;* the total quantity of solid matter that the urine contains in solution being normally much less variable than the quantity of the urine itself. The specific gravity has a marked significance in itself only when it is high without the urine being scanty, or low without the urine being copious. The ideal way to obtain a sample for analysis is to save what is passed throughout the 24 hours, mix it, and take the sample from the result. Urine thus obtained is technically called "mixed urine." It is often inconvenient to go to this trouble, especially in hot weather, when special care must be taken to prevent the mixed product from spoiling before the sample can be prepared and transmitted to the analyst; and it is therefore customary to take the sample from what is passed in the morning, experience

indicating that a specimen taken at this time will correspond fairly well with mixed urine. Mixed urine should always show a slightly acid reaction, and the same is true of samples taken at any time during the day, except after a meal, when the reaction may be neutral, or even alkaline. Urine often contains slight clouds of mucus or other substances, which become visible after the specimen has been allowed to stand for a short time. These are usually of no clinical importance, merely indicating some slight irritation along the urinary passages, or some recent indiscretion in diet. After urine has been passed (and more quickly in hot weather than in cold) the urea that it contains soon begins to ferment, passing into the form of ammonium carbonate; and when the quantity of ammonium carbonate present is sufficient to make the reaction distinctly alkaline, the urine becomes semi-opaque from the deposition of a white cloud of phosphates, urates, and other substances.

In the examination of a specimen of urine, the analyst cannot undertake to test it for every constituent that might conceivably be present as a pathological symptom. He will be guided by the general nature of the patient's illness, and will seek for those elements which may be of special significance. In the examination of presumably healthy candidates for life insurance, it is customary to look for nothing but albumin and sugar, unless the specific gravity, when considered in connection with the quantity of urine passed, is high enough to indicate the presence of an abnormal amount of some other constituent. In general practice, however, it is often necessary to examine, not only for sugar and albumin, but also for pus, biliary coloring matters, blood-corpuscles, and "casts" from the little uriniferous tubes of the kidneys. It is frequently important, too, to make a more or less accurate quantitative determination of the urea that is passed, and sometimes of the chlorides also.

A "cast" may be formed in the kidney in any one of several ways, the simplest being by the direct exudation, into a little tubule of the kidney, of some coagulable constituent of the blood. After this becomes solidified, it may eventually become discharged from the tubule with the urine, and pass into the bladder in the form of a microscopic plug of approximately cylindrical shape. To detect the presence of casts and of blood-corpuscles and other undissolved constituents, the urine is allowed to stand for some time in a conical glass vessel, whose sides slope down to an acute point at the bottom. After a couple of hours, or when it is judged that the solid constituents that may be present have settled to the bottom or risen to the top, or taken such other positions as may correspond to their specific gravities, a few drops are drawn off by means of a pipette from the surface, and from the very apex of the glass at the bottom, and also from such other levels as may appear to contain floating matters; and every sample so taken away is separately and carefully examined under the microscope. The correct identification of the different objects that such an examination reveals calls for a considerable amount of practical experience with the microscope. Much assistance may be derived, however, from Beale's 'One Hundred Urinary Deposits,' which gives engravings of all the ordinary deposits that the analyst will be likely to meet, including such extraneous things as fibres of wool and cotton and bits of feather, which often find their way into the specimen to be examined.

Albumin is not a normal constituent of urine, and when it is present continuously and in any considerable quantity it constitutes a grave symptom. When present, it is in solution, and hence is not at all evident to the eye until it has been coagulated by the action of heat or some other agent. In testing a sample by heat, a test tube is half filled with perfectly clear urine, and heat is applied to the upper part of the liquid, until boiling occurs. If the boiled urine becomes turbid in the least degree, the turbidity is due either to the presence of coagulated albumin, or to the precipitation of the phosphates of lime and magnesia that are normally present in all urine. The earthy phosphates promptly re-dissolve upon the addition of a few drops of nitric or acetic acid; but if the turbidity is really due to albumin, it does not pass away upon this treatment. The object of heating only the top part of the test tube holding the urine is to facilitate the recognition of a precipitate, a comparison of the upper and lower parts of the test tube, in a good light, rendering the slightest loss of transparency quite visible. If no precipitate is obtained, a drop or two of nitric acid should be added, and the boiling repeated. A number of trials of this sort should be made, the nitric acid being added, a few drops at a time, until a considerable quantity of it is present. The consistent absence of a precipitate in all these tests indicates that albumin is not present. Physicians often make the serious error of adding too much nitric acid to the urine at the start. This is dangerous, because if any considerable quantity of nitric acid is added at the outset, it not infrequently happens that albumin will not be thrown down at all, even when much albumin is really present. The directions given above should therefore be followed implicitly, the urine being first boiled without any acid at all, and then again after successive additions of a drop or two have been made, until as many as 15 or 20 drops have been added.

"Heller's test" for albumin depends upon the fact that strong nitric acid throws down albumin from its solution, in the cold. In applying this test, a convenient quantity of strong, pure, colorless nitric acid is first placed in the bottom of a small test tube, and an equal bulk of perfectly clear urine is allowed to flow down upon it gently, the test tube being inclined so that the urine may float upon the surface of the acid, and not mix with it. If albumin is present, a sharp white zone appears at the surface of separation of the acid and the urine, the thickness of this zone varying with the quantity of albumin present. When normal urine is treated in this manner, a brown ring is formed at the surface of separation. In cases of fever, or when there is an excessive amount of coloring matter of any kind present, the albumin in Heller's test may be tinted, so as to appear brownish, reddish, violet, or greenish. Urates, when present in excess, also give a zone marked by a precipitate; but the precipitated urates differ from albumin in being soluble when the urine is cautiously warmed without being allowed to mingle with the acid to any great extent.

In testing urine for the presence of sugar, the test is ordinarily made to depend upon the

fact that diabetic sugar will throw down a yellowish or reddish precipitate of oxide of copper from an alkaline solution of copper sulphate and sodium (or potassium) tartrate. The test solutions that are ordinarily employed for this purpose are known, respectively, as "Fehling's solution" and "Pavy's solution" (qq.v.). In making a test, about one cubic centimetre of the test solution is placed in a test tube, diluted with about four times its own bulk of water, and then boiled for a few seconds. If a precipitate is thrown down by this treatment, the test solution has spoiled, and should be replaced by a freshly prepared one. If no precipitate is thrown down by boiling the test solution alone, the suspected urine should be immediately added, drop by drop. If any considerable quantity of sugar is present, a precipitate will be obtained almost immediately. In the absence of a precipitate, however, the urine should be added, a few drops at a time, with occasional heating, until the quantity added is about equal to that of the original, diluted test fluid. If no precipitate is obtained, sugar, clinically speaking, is absent. It should be observed that the formation of an actual precipitate must be observed in this test; the mere decolorization of the blue test solution being no criterion of the presence of sugar. Other methods are known for the detection and estimation of sugar in urine, but the copper test, as described above, is the one upon which physicians rely almost exclusively.

The nitrogen waste of the body passes away mainly through the urine, in the form of urea, CON_2H_4, and of compounds of uric acid ($C_5H_4N_4O_3$) with the alkalies and the alkaline earths. The approximate estimation of urea and uric acid is therefore often of considerable importance. The determination of urea by the well-known "hypobromite process" is based upon the fact that sodium hypobromite, NaBrO, decomposes urea quickly and completely in accordance with the equation $CON_2H_4 + 3NaBrO = 3NaBr + CO_2 + 2H_2O + 2N$. The sodium bromide (NaBr) that is formed remains in solution, and the carbon dioxid (CO_2) that is liberated is absorbed by the test solution, which is made to contain a large excess of sodium hydrate. The only visible product of the decomposition is the nitrogen gas, which is collected and measured, and which serves to indicate the quantity of urea decomposed. The hydrobromite solution is made from water, caustic soda, and bromine. Various proportions are used, but Tyson recommends dissolving 100 grams of caustic soda in 250 cubic centimetres of water, and adding 25 cubic centimetres of bromine to the solution so formed. In practice, the reaction is carried out in a special form of apparatus, which has a vertical graduated tube to collect and measure the nitrogen. The apparatus is first filled with the test solution, and one cubic centimetre of urine is then introduced into it by means of a pipette. The decomposition of the urea begins at once, a copious stream of nitrogen bubbles passing up into the vertical collecting tube. In 20 minutes or less the reaction is complete, and the number of cubic centimetres of free nitrogen is read from the graduated collection tube. For great refinement, the volume of this gas must be corrected to standard conditions of temperature and pressure; but for ordinary clinical purposes this is not necessary, and it is sufficient to read the number of cubic centimetres of gas directly from the apparatus. Multiplying this number by 0.00282, we obtain the number of grams of urea that the given cubic centimetre of urine contained; and upon multiplying this product again by the total number of cubic centimetres passed by the patient, we obtain the total number of grams of urea passed. The total amount of urea passed by a healthy adult may range from 20 to 40 grams per 24 hours.

In health, practically all of the uric acid in the urine occurs in combination with potassium, ammonium, sodium, calcium, and magnesium, in the form of salts known as "urates." Uric acid itself is highly insoluble, 14,000 parts of cold water dissolving only one part of the acid. To estimate the quantity that is present, 200 cubic centimetres of urine are acidulated by the addition of 20 cubic centimetres of nitric acid, and set aside in a cellar or other cool place for 24 hours. The nitric acid gradually replaces the uric acid in its combinations, and the freed uric acid, owing to its insolubility, is deposited upon the sides and bottom of the beaker in the form of yellowish-red crystals. These may be collected, washed with cold distilled water, and then dried and weighed; the weight so obtained giving the quantity of uric acid present in 200 cubic centimetres of the urine. In health, the quantity of uric acid passed by the kidneys in 24 hours may range from 0.4 to 0.8 gram. The heavy "brick-dust" deposit that is often observed in urine that has stood for a time, and which is frequently referred to in the advertisements of proprietary "kidney cures," for the purpose of terrifying the uninformed public into buying these "cures," consists mainly of urates, which are soluble at the temperature of the body, but relatively insoluble at the ordinary temperature of a sleeping-room, and hence are apt to be thrown down. This sediment is found most commonly in urine that is somewhat more acid than usual. It also occurs in connection with defective assimilation of the food, and is not to be regarded as of importance, unless it is markedly abundant or persistent; and even in these cases it points to an imperfect digestion, rather than to trouble with the kidney.

Editorial Staff, 'Encyclopedia Americana.'

Urinary Bladder. See Bladder.

Urinary Calculus. See Calculus.

Urinary Organs, the organs concerned in the secretion and discharge of urine; namely, the kidneys, which secrete the urine; the ureters which convey it to the bladder; the bladder or hollow organ in which it is stored; and the urethra, by which it is passed out of the body. All of these organs are lined with a continuous mucous membrane. See Bladder; Kidneys; Ureter; Urethra; Urine.

Urine, the fluid secreted by the kidneys, stored in the bladder and discharged by the urethra. It is an excrementitious fluid, ejecting from the system substances which if retained would impair health and destroy life (retention and suppression of urine). Healthy urine consists of water, urea, uric acid, hippuric acid, creatinin, phosphates, chlorides, and sulphates, mucus and other ingredients. The abnormal matters found in the urine in various

conditions include acetone, albumin, albumose, bile, blood, cystin, glucose, hemoglobin, fat, pus, spermatozoa, epithelial cells, casts, etc. (See URINARY ANALYSIS.) Normal urine is a transparent aqueous fluid, of an amber color, acid reaction, a peculiar odor, and with a specific gravity of about 1020 when passed in the average quantity of 50 ounces in the 24 hours. But each one of these characteristics is liable to some variations within the limits of health, as well as in disease.

As to transparency, it is quite constant, but cannot be considered an essential of normal urine, and on the other hand, because a given specimen of urine is transparent it is not necessarily normal. Urine transparent when passed frequently shows a faint cloudiness in some portion when standing, due to mucus, the slimy secretion from the mucous surface of the urinary organs. This cloudiness is most pronounced in the urine of females. Mucus can be filtered out, leaving the urine clear. Normal slightly acid urine may be somewhat turbid when passed from the presence of the earthy phosphates of calcium and magnesium, which after a time subside in the vessel, becoming a sediment. This sediment will disappear on the addition of a few drops of any acid, as nitric, but is increased by heat applied. Sometimes normal urine, on standing for a short time in a cold room, deposits a white or pink light sediment, the mixed urates of sodium, potassium, calcium, and magnesium. This is believed to be due to the lowering of the temperature of the urine. Normal urine may also be somewhat turbid from the presence of alkaline carbonates. Pathologically, urine may be more or less opaque from abnormal degrees of the above conditions, or from the presence of pus, bacteria, or fat, as in chylous urine, so called. As the result of disease the normal aqueous urine may become viscid or glutinous from the presence of mucus, or mucus and pus, etc. As to the color of normal urine, it is subject to considerable variation in health. As color is due to coloring matters in solution, it is deeper or paler according to the proportion of water present. For example, after much beer or water drinking the discharge of urine is large and the color very pale. When the skin is active, excreting much water in perspiration, the amount of urine is diminished and the color darker than usual; but in winter, when the skin is less active, the urine is increased in amount and is of lighter color. As the result of disease, there may be almost an entire absence of color, as in the copious urines of diabetes, hysteria, and convulsions. Or it may be high colored in fevers and febrile states, due to a diminution in the amount of water and the addition of abnormal coloring matters such as blood, or blood-coloring matters or bile pigments. Certain vegetable matters, such as santonin, also color the urine.

The reaction of normal mixed urine or the urine of the entire 24 hours is always acid. Freshly passed urine at different times of the day shows usually a varying amount of acidity; but urine examined three or four hours after a meal may be neutral or even alkaline. The cause of this change is still doubtful. Urine allowed to stand for a short time, especially at a moderate temperature, sometimes increases in acidity. The cause is not definitely settled. Neutral and even acid urines standing for some time, especially in hot weather, becomes alkaline, have an ammoniacal odor, and are turbid, and sometimes an iridescent pellicle forms on the surface. The turbidity and sedimentary deposits are caused by the precipitation of the crystalline triple phosphate of ammonium and magnesium, the amorphous phosphate of lime, the urate of ammonium, and to bacteria.

The peculiar and characteristic odor of normal urine becomes a "strong odor" in highly concentrated urines, a "putrescent" one when mucus and other organic matters are decomposed, an "ammoniacal" one when the ammonium carbonate has formed from the urea, or a sweetish one from the presence of sugar in the urine.

Certain substances ingested also give distinctive odors to urine, as turpentine producing the odor of violets, and the odors of cubebs, copaiba and sandal-wood oil.

The specific gravity, though normally about 1020, for 50 ounces of urine per 24 hours, when the skin is not acting freely and after copious use of water and diuretics, may descend to 1010 or lower and yet be within the limits of health. Or when the urine becomes concentrated by the drain of water through the skin or some other channel the specific gravity may rise to 1030 or higher. The normal range may be said to be from 1005 to 1030, but to be reliable, observation should be made on the entire quantity of urine passed in 24 hours. The specific gravity in diabetes mellitus sometimes reaches 1050, and, according to Tyson, if in a copious urine the specific gravity is over 1028 there is a suspicion of diabetes, and even if it is 1010 or lower it is not safe to infer from this circumstance alone the absence of sugar. Specific gravity is also increased in the first stage of acute fevers, and of acute Bright's disease. It is lowered in hysterical complaints and in all forms of nephritis except the acute.

The quantity of urine is increased in diabetes mellitus and insipidus, in hysterical and convulsive conditions, in cardiac hypertrophy and all conditions which cause increased blood pressure, by the peripheral action of cold, etc. It is diminished in most forms of Bright's disease and in the early history of acute fevers and inflammatory conditions. Morbid conditions of the urine include glycosuria or glucosuria, oxaluria, albuminuria, and phosphaturia.

Urinom'eter, an instrument for ascertaining the specific gravity of urine (q.v.). It is constructed on the principle of the hydrometer, and variations in the density of urine as detected by it are of great importance in the treatment of disease.

Ur'my, Clarence (Thomas), American poet and musician: b. San Francisco, Cal., 10 July 1858. He is an organist and choirmaster, and his songs and other verses deal with California themes. He has published 'A Rosary of Rhyme' (1884); 'A Vintage of Verse' (1897).

Urn, Cinerary. See URNBURIAL.

Urnburial, either the deposition of human ashes in a cinerary urn after cremation, or the enclosing of a dead body in two large urns placed mouth to mouth and sealed; both meth-

ods were employed in Grecian antiquity. The Grecian *pithos*, or wine jar, had a wide mouth, and in size and shape was like the large oil-jars of southern Europe. It was used as an urn to contain human ashes; and two such jars sometimes served as a rude coffin. Such coffins are found in ancient burying places in the Troad. See CREMATION.

Urochor'da. See TUNICATA.

Urode'la, or Gradientia, a division of amphibians (see AMPHIBIA) comprising those in which the tail persists in adult life. The skin is naked and soft, and an exoskelcton is rarely present. The body is elongated, and most of them have the four limbs well developed, but in some the posterior limbs are wanting. The order is conveniently divided into:

(1) *Perennibranchiata*, which retain the gills throughout life: including the American *Necturus*, the blind *Proteus* of the underground caves of Varniola in Dalmatia, and the eel-like *Siren* of North America.

(2) *Derotremata*, in which the gills are lost in the adult, but there is usually a persistent gill-cleft: including the newt-like *Cryptobranchus* and the eel-like *Amphiuma* from North America, and the giant salamander, *Megalobatrachus*, of China and Japan.

(3) *Myctodera*, the salamanders and newts, in which the gills are lost and the gill-clefts closed in the adult: including the common newts or efts (*Molge*), the spotted and black salamanders (*Salamandra*) of the European Continent, and the American *Amblystoma*, the sexually mature larva of which is the well-known axolotl.

Urquhart, ėr'ıı'art, **David,** Scottish political economist: b. Brackbanwell, Scotland, 1805; d. Naples, Italy, 16 May 1877. He was educated at Oxford, entered the diplomatic service and later traveled extensively in the East. He was secretary of the British legation at Constantinople in 1835-6, but resigned that position because of his opposition to the policy of Lord Palmerston, which he considered as subservient to the ambitions of Russia. He was member of parliament for Stafford in 1847–52 and maintained a vigorous opposition to Palmerston, his parliamentary attacks supplementing his writings for the press, and succeeding in instilling into the public mind a distrust of Russia's eastern policy. His works include: 'England, France, Russia and Turkey' (1835); 'The Spirit of the East' (2 vols., 1838); 'Progress of Russia in the West, North and South' (1853); 'Recent Events in the East' (1854), etc.

Urquiza, oor-kē'thä, **Justo José de,** Argentine soldier and politician: b. near Concepcion del Uruguay (now in Entre Rios, Argentina), 19 March 1800; d. there 11 April 1870. He was of mixed Spanish and Indian blood and during the war in La Plata in 1835–42 gradually rose in influence until he became a general of division under Rosas, dictator of Buenos Ayres. In 1844 he commanded the army sent against Uruguay, and in 1845, at the battle of India Muerte, he defeated Ribera. He was elected governor of Entre Rios in 1846, as leader of the federalist party. His administration of affairs was directed rather to his own glory and gain than to any benefit for the people, but he contrived to maintain a peaceful and prosperous condition of the country while strengthening his power, meanwhile acquiring great wealth. In 1851 he turned against Rosas, allied his forces with Brazil and Montevideo, and marched into Uruguay. He forced the capitulation of Oribe 8 Oct. 1851, then invaded Buenos Ayres, and on 3 Feb. 1852 defeated Rosas at Monte-Caseros. Urquiza was proclaimed provisional dictator and after the adoption of a federal constitution by the provinces (excepting Buenos Ayres) he was in 1853 elected president for a term of six years. In 1859 he forced Buenos Ayres to join the confederation, and after the expiration of his term of office took command of the army and endeavored to quell the revolt which had arisen in that country. He was defeated by Mitre at Pavon, 17 Sept. 1861, the result being the abandonment of the federalist constitution for the one since in force. He retired to Entre Rios, where he acted as governor, exercising semi-dictatorial powers, though nominally under the authority of the central government. In 1870 a formidable revolt arose, headed by his son-in-law, Gen. Lopez Jordan, and Urquiza was attacked in his palace and killed.

Ursa Major, ėr'sa mā'jor, or **Great Bear,** a northern constellation whose seven brightest stars are well known as Charles' Wain, as the Plow, the Dipper, and sometimes as the Butcher's Cleaver. Two of these seven stars are called the pointers, because they and the pole-star lie nearly in a right line, and these stars direct an observer to the pole-star. Ursa Minor, or Little Bear, a smaller constellation of the same configuration as Ursa Major, lies near the north pole.

Ur'sidæ, the family of the bears (q.v.).

Ursinus (ėr-sī'nŭs) **College,** located at Collegeville, Pa. It was incorporated in 1869, and was first opened to students in 1870; Freeland Seminary, whose property was purchased for the college, was incorporated into the college as its preparatory department; in 1871 a theological department was organized. The college is non-sectarian in its control, the board of directors being self-perpetuating; it is, however, affiliated with the Reformed Church in the United States, and the theological professors are ministers of that church. The organization of the college includes the College Department, the Academy, the School of Theology and the Summer Session. The School of Theology has been located in Philadelphia since 1898. The College Department offers six groups of studies, leading to the degree of A.B.; the groups are the classical, the Latin-mathematical, the mathematical-physical, the chemical-biological, the historical-political, and the modern language. The degree of A.M. is conferred for graduate work. In the School of Theology the regular course occupies three years; the curriculum, in addition to the ordinary theological curriculum, includes a lecture course in Sunday-school work, a complete course in the English Bible, a special course in the history of the Reformed Church, and a course in sociology; graduate courses are offered leading to the degree of B.D. The Summer Session offers courses of secondary and collegiate grade, work in the latter counting toward a degree. Women are admitted to all departments except the theological. The students in all departments in 1903–4 numbered 208, of whom 76 were in

the College Department and 36 in the Summer School.

Ursua, oor-soo'ä, or **Orsua, Pedro de,** Spanish soldier: b. Ursua, Navarre, about 1510; d. Machiparo, on the Upper Amazon, 1 Jan. 1561. He accompanied a Spanish expedition to New Granada, was governor of that country in 1545–6, and later led two expeditions from Bogotá in search of El Dorado. He commanded a force against the Cimarrones (fugitive slaves) on the Isthmus of Panama in 1555–7 and reduced them to subjection. In 1559 he was given command by the viceroy of Peru of an expedition to conquer the "kingdom" of the Omaguas, near the head of the Amazon. The purpose of the viceroy was really to rid himself of the unruly soldiers attracted to Peru by the civil wars. The ruse succeeded. Ursua adopted the title of "governor of Omagua and El Dorado" and set forth with several hundred of the turbulent soldiers in his train. He reached the Upper Amazon by way of the Moyobamba and the Ucuyali, but at Machiparo a conspiracy was formed among his followers, led by Lope de Aguirre, and he was murdered.

Ursula, ėr-sū'lą, **Saint,** virgin martyr, according to the legend, a daughter of a prince in Britain. She was put to death at Cologne by a horde of Huns, some say in 384, others in 453, together with 11,000 virgins who accompanied her. According to another reading the number of her companions was only eleven. The Roman martyrology mentions the saint and her virgin companions without stating their number. Some bones, said to be those of herself and her companions, are still shown to visitors. The day dedicated to her honor is the 21st of October. Saint Ursula was the patroness of the Sorbonne. Consult: Baring-Gould, 'Popular Myths of the Middle Ages'; Stein, 'Die heilige Ursula' (1879). See URSULINES.

Ursuline (ėr'sū-līn) **Convent and Academy of Saint Louis** (Mo.). Founded in 1848 by four sisters from Oedenburg, Austria, incorporated under the laws of the State of Missouri in 1884. It is one of the oldest houses of the order in the United States. They opened the school 2 Nov. 1848, in a small house on Fifth Street. In 1849 they were reinforced by six sisters from Landshut, Bavaria, and also received considerable pecuniary assistance from the Bavarian king, Louis I. Early in 1850 the city block bounded by 11th and 12th Streets and Russell and Ann Avenues, was purchased for them by Archbishop Kenrick, and extensive buildings — Convent, Academy, Day School — mark this their present location, whence band after band has since gone forth to found houses in other localities. In 1855 a colony of 12 set out for New York and established a house of the order at East Morrisania, N. Y. In 1859, in answer to an appeal from Bishop Juncker, seven sisters left the mother house to open a school at Alton, Ill. In 1877 another band went forth to plant the standard of education in the beautiful valley of Arcadia, Mo. Here they established an academy that bids fair to equal the one in Saint Louis in course of time. The Saint Louis community now numbers 160 members, and besides the flourishing academy and day-school connected with the mother house, the community supplies 16 parochial schools with teachers. These schools aggregate about 1,500 pupils — thus bearing out the motto of the institute: "*Mores Scientiaque.*"

Ursuline Sisters. See ORDERS, RELIGIOUS.

Urtica'ceæ, or Nettleworts. See NETTLE.

Urtica'ria, an inflammatory eruptive affection of the skin, also called hives and nettle-rash, the latter name referring to the resemblance of the wheals of urticaria to those caused by the sting of a nettle. The wheals are either rounded or elongated, appearing white at first, and afterward changing to red, the altered hue being more quickly assumed in consequence of rubbing or scratching to which the intense itching usually leads. Frequently urticaria follows upon gastric disturbance caused by eating certain fruits, shell-fish, or various other kinds of food. It may also be due to disorders of menstruation, to various functional irregularities, or to local irritations. Some of the balsamic drugs likewise give rise to it. The eruption appears and disappears suddenly in successive crops of wheals. In treatment it is necessary to evacuate the bowels and regulate the diet so as to restore the normal digestive condition, and cold-cream, glycerine, dilute acids, bichloride of mercury, etc., are useful locally. Salt-water baths are recommended for relief of the itching. For internal remedies salicylates and alkalies are administered, and by this means the severity of an attack may often be abated and its duration much lessened.

Uruguay, oo-roo-gwī' (REPÚBLICA ORIENTAL DEL URUGUAY), smallest of the independent countries of South America, is bounded on the north and northeast by Brazil, on the east by the Atlantic Ocean, on the southeast and south by the Atlantic Ocean and the estuary of the Rio de la Plata, and on the west by the Argentine Republic. Its territory extends from lat. 30° S. nearly to lat. 35° S., and the location of its principal city (or, more precisely, of the cathedral at Montevideo) is given as lat. 34° 54′ 33″ S., and lon. 58° 32′ 32″ W. Total area of the republic, 72,172 square miles.

Political Divisions.— The departments (with the population of each on 31 Dec. 1901, as shown by the official Boletín Estadístico Mensual for March 1902) are as follows: Artigas, 27,001; Canelones, 86,735; Cerro Largo, 37,236; Colonia, 51,563; Durazno, 38,111; Flores, 16,180; Florida, 45,248; Maldonado, 27,035; Minas, 37,152; Montevideo, 273,665; Paysandú, 44,411; Rio Negro, 23,127; Rivera, 25,349; Rocha, 30,428; Salto, 45,754; San José, 42,181; Soriano, 38,851; Tacuarembó, 38,789; Treinta y Tres, 25,800. See also sub-title "*Population.*"

Topography and Physical Geography.— The most elevated point in the republic is somewhat less than 2,000 feet above sea-level; the so-called mountains are, therefore, to be regarded rather as hills, which sometimes form chains — such as the Cuchilla Grande, which extends across the country, the Santa Ana range, between Brazil and Uruguay, the Cuchilla de Belén, and Cuchilla de Haedo,— but elsewhere give to the region, especially the northern districts, an irregular rolling or undulating surface. Forests or groves cover the hills in the north and generally extend along the banks of the numerous small streams (*arroyos*) and the larger water courses. The soil in the southwest is of uncommon fertility, being composed,

it is said, of detritus of great depth and rich alluvial deposits: the southeast and south have grassy slopes and good pasture lands, the hills here forming a bold line along the shore of the Rio de la Plata, but not extending to the Atlantic coast. For the dearth of good natural harbors, see La Plata, Rio de, and for a brief notice of the chief port, Montevideo. The small islands near the southern coast will be mentioned in a later paragraph. Important rivers, beside the great southern estuary, are: the Uruguay, which rises in the Brazilian state of Santa Catharina, and has a course of about 1,000 miles; and the Rio Negro, which also rises in Brazil, and empties into the Uruguay after flowing toward the southwest for about 350 miles. The latter passes through the centre of the republic; the former marks the boundary with Argentina; both are navigable for vessels of light draught (Rio Negro 55 miles, Uruguay 200 miles), and even large steamships navigate the Uruguay up to Paysandú. There are several shallow lakes, or *lagunas,* near the coast.

Mineral Resources.— It is impossible at the present time to offer a complete statement on this head. The production of gold in 1902 was 2,419 fine ounces, valued at $50,000. The hills and highlands are believed to be rich in minerals, and among the metals which have been found are mentioned (beside gold) silver, copper, iron, tin, and cinnabar. In the department of Minas, diamonds and topazes have been discovered; amethysts and agates have been exported to Europe. Deposits of coal are said to exist, but the quality remains to be ascertained. It is stated that the "silver ores yield 87 per cent of metal; copper ores, 56 per cent, and magnetic ores 72 per cent."

Flora and Fauna.— Hard and durable woods are: the ñandubay (which, instead of decaying when buried in the earth, becomes petrified), urunday, lapacho, coronilla, espinello, quebracho, arazá, algarroba, and lignum vitæ. Among the softer woods are the willow and acacia. Palms abound, and the poplar, pine, cypress, oak, eucalyptus, cedar, magnolia, and mulberry have been successfully acclimated. Yerba maté is indigenous, and 430 species of medicinal plants have been classified. As for animal life, the most interesting item is that relating to the seals, large numbers of which live and breed on the islands near the coast, especially Lobos and the Castillos group. More than three fifths of the seals at these rookeries are believed to be of the fur-bearing variety, and the islands are "strictly preserved," it is said, "no one being allowed to land upon them except the sealers — experienced men — during the killing month"; nevertheless 21,245 skins and 49,070 litres of oil were "produced" on Lobos and the Castillos group during the year 1901. The mainland fauna includes the deer, otter, wild hog, carpincho, fox, ounce, wildcat, ant-eater, etc. There are over 500 species of avifauna, including the crane, stork, swan, and wild turkey.

Agriculture and Stock Raising.— A marked increase is reported in the chief crops, with a single exception. Thus, in the fiscal year 1901–2, the production of wheat was 206,936,668 kilos, as compared with 99,719,771 kilos in 1900–1; of oats, 115,333 kilos, as compared with 68,334 kilos in the previous year; of barley, 1,016,441 kilos, whereas in 1900–1 only 438,263 kilos were produced; of flax, 8,757,245 kilos, or about three and one half times as much as in 1900–1; of corn, 128,539,335 kilos, as compared with 141,647,916 in the previous year. The cultivation of sugar-beets has begun, and refineries have been established. The largest sugar factory has been built by Belgian capitalists in the department of Maldonado. Statistics of 1902 show 24,266 farmers and tenants engaged in agricultural pursuits, nearly 2,000 being employed in the cultivation of vineyards. Statistics of 1901 to 1903, with reference to stock-raising, may be summarized as follows: live stock in the country, about 26,000,000 head, principally sheep and cattle. The relative importance of this industry will be indicated in the next paragraph.

Commerce.— The volume of foreign trade during recent years is shown in the following table:

Year	Value of imports	Value of exports
1893	$19,671,610	$27,681,373
1894	23,800,370	33,479,511
1895	25,386,106	32,543,644
1896	25,530,185	30,403,084
1897	19,512,216	29,319,753
1898	24,784,360	30,276,916
1899	25,652,788	36,574,164
1900	23,978,206	29,410,862
1901	23,691,932	27,731,126
1902	23,517,347	33,602,518

The foregoing figures are based upon customs valuations which, it is said, "average at least 30 per cent above real value" for imports; and the caution is added that "the same is true, though not to such an extent, of the exports" (Bulletin International Bureau American Republics, June 1903). The value of stock products and live stock exported was $25,992,817 in 1901, approximately $29,000,000 in 1902, and nearly $24,000,000 during the first six months of 1903. See also Exports and Imports of Latin-America.

Railways.— See South America.

Shipping, Roads, Telegraph, etc.— Vessels owned in Uruguay which are engaged in freight and passenger service number about 90. The activity of the chief port, harbor improvements, etc., are mentioned under Montevideo. The total length of the national and departmental roads is given as 5,340 miles; of telegraph lines, 4,604 miles; of telephone wires, 10,250 miles; of street railways, 103 miles. The total postal movement in 1902 was nearly 73,000,000 pieces. English, German, and French capital, which controls the large importing houses, has also nearly complete control of railways, telephones, and tramways.

Weights, Measures, and Money.— The *libra* = 1.0143 pounds; *arroba* = 25.35 pounds; *cuadra* = 2 acres (nearly); *suerte* = 2,700 *cuadras*; *fanega* = 3.888 bushels; double *fanega* = 7.776 bushels. The metric system has been officially adopted. Gold is the monetary standard; the unit is the *peso*, which has the value of $1.034 in United States currency. Practically, the medium of exchange consists of foreign gold coins and the silver peso and its divisions.

Government.— The legislative branch is composed of the Senate and Chamber of Deputies, the former having one member for each department (that is, 19 members), and the latter one for each 3,000 voters. The term of a senator

is six years, and that of a deputy is three. In most respects the powers of this Congress or General Assembly are similar to those of the Congress of the United States, but they extend much farther in certain directions, namely, to the granting of pardons and amnesties in extraordinary cases and electing the president of the republic (see below). The judicial power is exercised in several courts of first instance (distributed as civil, criminal, for cases affecting the treasury, for commercial cases, police, and departmental), courts of appeal, and the High Court of Justice. The executive power is vested in a president, who is chosen for a term of four years by a majority of the members of the legislature in joint session of its two chambers. The president is ineligible for re-election during two successive terms; he is aided by a cabinet of five, who are chiefs of the ministries of government, *Fomento* (Promotion of the Public Welfare), Finance, Foreign Affairs, and War and Navy. As in the United States, the vice-president is *ex officio* president of the Senate, Congress meets annually, etc. Each department has an administrative council whose members are chosen by popular vote, and a governor appointed by the national executive.

Finances.— The customs revenue for the year 1 July 1902 to 30 June 1903 was $9,928,935. In the budget for the fiscal year 1903–4, the principal sources of the government's income were scheduled as: customs revenue, $9,800,000; property tax, $2,000,307; business licenses, $1,040,000, etc. The sum (estimated) of the receipts was $16,371,516, exactly balancing expenditures. The debt of the republic, according to the '*Oficina de Crédito Público*,' was $123,843,694.95 on 30 June 1902.

Army and Navy.— On a peace footing the army formerly contained about 3,200 private soldiers and 232 officers; the national guard little more than 20,000. But these numbers were greatly increased in 1903–4, owing to the revolutionary movement (see below: *History*). The navy consists of three gunboats and a few auxiliary vessels.

Population.— The distribution of inhabitants in the several departments is shown above. The total population, including 9,961 transients, was 964,577 on 31 Dec. 1901: increase in that year 28,457.

Education and Religion.— In addition to the establishments for higher education at Montevideo (q.v.), there are in the republic about 600 elementary free schools, with about 55,000 pupils and 1,160 teachers; 332 private schools, with about 880 teachers; also many religious seminaries. The religion established by the constitution is the Apostolic Roman Catholic, but all other forms are tolerated, and the financial aid given by the government to the Church is small.

History.— On 8 Oct. 1515 Juan Diaz de Solis sailed from Spain; he explored the estuary of the Rio de la Plata, and was slain, with some of his companions, by natives of the Charrua tribe. On 2 Feb. 1520 Magellan sailed from the Rio de la Plata, after having explored the Paraná and Uruguay rivers in his search for a waterway across Terra Firma. On 1 April 1526 Sebastian Cabot set out from Seville; he ascended the Paraná to the great falls and the Paraguay to the mouth of the Bermejo. In 1527 Cabot ordered the construction of a fort in the country east of the Uruguay River. The opposition of the natives to the Spanish settlements was fierce and, during a century, successful: in 1603 a veteran Spanish force was routed in a pitched battle by the Charruas. In 1624 the oldest of the towns which now exist in Uruguay was founded on Rio Negro. The so-called "Banda Oriental" (that is to say, the region east of the Uruguay River) was the subject of contention between Portugal and Spain. In 1680 the Portuguese colonists of Brazil founded Sacramento (now Colonia), thus confronting the Spaniards at Buenos Ayres. In 1723 the Portuguese fortified the Bay of Montevideo, but surrendered to the Spaniards in the following year, and families from Buenos Ayres established themselves at Montevideo in 1726. In 1735–7 Colonia was besieged by the Spaniards. In 1761 it capitulated, but was restored to Portugal by the Treaty of Paris, 1763. This did not put an end to Spanish colonization there; on the contrary, immigration from the north of Spain and from Spanish settlements across the river continued throughout the 18th century. For the capture and abandonment of Montevideo by English forces, see La Plata, Rio de, and Montevideo. On 26 April and 28 May 1811 José Artigas, leader of the revolutionary party in the Banda Oriental, routed the Spanish forces; a confederation of the settlements east of the great river was formed, with Artigas as "Protector." But the Portuguese captured Montevideo and Maldonado, and in 1822 the region in dispute was organized as the Cisplatine Province of Brazil. Artigas took refuge in Paraguay, where he died. Other refugees, however, who had gone to Buenos Ayres, returned to start a rebellion in the Cisplatine Province, and on 23 Aug. 1825 issued a declaration of independence. On 24 September and 12 October in the same year the Brazilians were defeated. Then the Argentine government intervened. On 9 February and 30 July 1826 Admiral Brown, commanding the Argentine squadron, failed in his attempts upon the Brazilian fleet; but in February 1827 succeeded in destroying the expedition sent by the Brazilian admiral Lobo into the Uruguay River, and on the 20th of that month the Marquis of Barbaceno, commanding Brazilian forces, was defeated at Ituzaingo. On 27 Aug. 1828 the Treaty of Montevideo was signed, and the *República Oriental del Uruguay* was created, both Brazil and Argentina renouncing their claims to the country thenceforth to be known as the Eastern Republic of the Uruguay, or simply Uruguay. On 18 July 1830 the constitution was adopted, and a new declaration of independence issued — this time guaranteed by both of the strong neighboring states. But, unfortunately, from that day to this the political parties — the "Colorados," or Reds, and "Blancos," or Whites — have kept alive the traditions of home-bred strife. Thus, in 1842, a political chief secured Argentine support, and laid siege to Montevideo; in 1862 ex-President Flores, "Colorado" leader, made use of Brazilian troops to take Paysandú. On 25 Feb. 1865 Flores with his Brazilian allies took forcible possession of the capital and of the government; quite naturally, therefore, Uruguay was drawn into the

coalition formed to resist the dictator of Paraguay, Francisco Lopez (see PARAGUAY and DICTATORSHIPS IN LATIN-AMERICA). On 17 Aug. 1865 Flores defeated a division of Paraguayans at Yatay; three years later he was assassinated during a "Blanco" rebellion at Montevideo; and ex-President Berro, "who, though not one of the assassins, was arrested in the street with arms in his hands," was executed, with other rioters. The revolution of 1870–3 ended in a "Colorado" triumph. Of the long series of disturbances which have followed, marking the efforts of "Blancos" to regain power, only the last need be mentioned at present — the serious revolution which broke out in March 1903, and continued in 1904, despite the increased military force of the government.

Consult: Burmeister, 'Reise durch die La Plata-Staaten'; 'Códigos y Leyes Usuales de la República Oriental del Uruguay' (2 vols., Montevideo 1894); 'Handbook of Uruguay,' and other Bulletins of the Bureau of American Republics.

MARRION WILCOX,
Authority on Latin-America.

Uruguay, a river of South America, rising on the coast range of southern Brazil, flowing first west on the boundary between the states of Santa Catharina and Rio Grande do Sul, then southwest between the latter state and Argentina, and finally south between Argentina and the republic of Uruguay, emptying into the head of the estuary of La Plata. Its main head stream in Brazil is called the Pelotas. It is over 1,000 miles long, and an important avenue of commerce, passing the towns of Salto, Paysandú, and Concepción. It is navigable for the large steamers to Paysandú, and for smaller vessels to the rapids above Salto, above which it can again be navigated for several hundred miles.

Urumchi, oo-room'chē, Central Asia, a city of Chinese Sungaria, in the province Sin-kiang, on the northern side of the Tyan-Shan Mountains. It consists of an old and a new town, the former being situated on the slope of a mountain which attains a height of 14,000 feet above sea-level. It was formerly of great commercial importance in the trade between Russia, Turkestan, and India. Urumchi is of strategic importance and is now the administrative and military capital of the province of Sin-kiang. Pop. estimated at 15,000.

Urumia, oo-roo-mē'ä, **Urumiah,** or **Urumiyah,** Persia, (1) A town in the west of the province of Azerbijan, situated on an extensive plain about 10 miles west of Lake Urumia and 65 miles southwest of Tabriz. It claims to be the birthplace of Zoroaster, and in the vicinity are several mounds, supposed to have been made use of in the ceremonies of the ancient fire-worshippers. The surrounding district is of great fertility, covered with groves, orchards, vineyards, gardens, rice-grounds, and villages. Pop. about 30,000. (2) The lake, situated 4,300 feet above sea-level, is about 80 miles long from north to south, by 20 miles broad and has no apparent outlet. It is very shallow throughout. Numerous islands are scattered over its surface. Its waters are so salt that neither fish nor mollusca can live in it. Salt of a good commercial quality is obtained from shore deposits, the result of natural evaporation.

U'rus, a kind of large ox which ran wild in Gaul at the period of the Roman invasion, as described by Cæsar. See OX; WHITE CATTLE.

Usage, in law. See COMMON LAW.

Usambara, oo-zäm-bä'rä, German East Africa, a mountainous district in the northeastern part of the colony, bordering on the coast to the northwest of Zanzibar. It is extremely fertile, and one of the most important parts of the colony.

Usbegs, or **Usbecks.** See TUAREGS.

Use, in English law, the benefit or profit of lands and tenements that are in the possession of a person who simply holds them for another person, the real beneficiary. He to whose *use* or benefit the trust is intended, enjoys the profits, and is called *cestui que use.* All modern conveyances are directly or indirectly founded on the doctrine of *uses* and *trusts,* which has been deemed the most intricate part of the property law of England.

Use and Disuse, one of the doctrines in that view of organic evolution promulgated by Lamarck (q.v.) which holds that variations in structure are brought about by the use, in the one case, or by the disuse, in another, of organs. Conceding that physical changes due to such a cause may be brought about in the individual, the important question remains — are they inheritable? Hence, a correlated part of the theory must be disposed of under the name "Use-inheritance." Followers of Lamarck are believers in the efficacy of use and disuse and use-inheritance as factors in evolution. Consult the writings of Lamarck, Packard, Cope, Hyatt, Weismann, etc. See EVOLUTION; HEREDITY; LAMARCKISM.

Usedom, oo'zĕ dŏm, Prussia, one of the two islands which separate the Stettiner Haff from the Baltic Sea, six miles southeast of Rügen. It is of irregular shape, 34 miles long, and ¼ to 15 miles wide. Agriculture, cattle-raising and fishing are the chief occupations. The chief town is Swinemünde. Pop. about 30,000.

U"serte'sen, or **Userten** (known to the Greeks as SESORTOSIS), the name of several Egyptian kings of the ancient royal house of Thebes. They belonged to the 12th dynasty, and reigned between 2130 and 1930 B.C. Usertesen I. erected at Thebes the earliest and loftiest of the obelisks, which measured about a hundred feet from apex to base. His colossal statue in red granite has been discovered near Tunis. Usertesen II. and III. completed the subjugation of Lower Nubia.

Ushant, ŭsh'ant (French, OUESSANT, wĕs-sŏñ), France, an island 15 miles off the west coast of the department of Finistère, to which it belongs; area, six square miles. It is almost entirely composed of granite, with a bold and rocky coast, which is accessible only at some points. Fishing and the rearing of sheep are the principal occupations of the inhabitants. St. Michel is the chief village. Ushant, with the surrounding islets, forms a commune having a pop. of 2,377. Near the island in 1759 Sir Edward Hawke defeated Admiral Conflans and in 1778 Admiral Keppel and Count D'Orvilliers fought an indecisive battle.

Ush'er, Hezekiah, American bookseller: b. England about 1615; d. Boston, Mass., 14 March 1676. Thomas ('History of Printing' 1810) calls him "the first bookseller in English America of whom I can find any account." He was in Cambridge as early as 1639, but in 1646 set up business in Boston. As agent of the Society for the Propagation of the Gospel, he purchased the types and paper for the printing of Eliot's 'Indian Bible' (see ELIOT, JOHN), and directed all the transactions in connection therewith. This was the first Bible printed in the colonies. Usher was a founder of the Old South Church of Boston (1669).

Usher, or Ussher, James, Irish prelate, Archbishop of Armagh: b. Dublin 1581; d. Reigate, Surrey, 1656. He took orders in 1601, and in 1607 was appointed professor of divinity at Trinity College, Dublin, and chancellor of St. Patrick's cathedral; in 1620, bishop of Meath; in 1623, Irish privy-councillor, and primate of Ireland in 1624 as archbishop of Armagh. His notions of church government verging toward Presbyterianism, his enemies took advantage of this to attempt to destroy his credit with James I.; but he enjoyed to the last the esteem of that king. He attended Strafford in prison and at his execution. During the civil war he was a stanch adherent of Charles I., and witnessed the execution of the king. After that event he experienced civility and flattering promises from Cromwell, who finally ordered that he should be buried in Westminster Abbey. Archbishop Usher carried on an extensive correspondence with the learned in various parts of Europe, and was a man of great erudition. He wrote a number of works, the principal of which are the 'Annals of the Old and New Testament,' which forms the basis of the biblical chronology in King James' version of the Bible; 'Britannicarum Ecclesiarum Antiquitates.' Consult: Aikin, 'Lives of Selden and Usher' (1812).

Usher, John, American colonial executive: b. Boston, Mass., 27 April 1648; d. Medford, Mass., 1 Sept. 1726. He was son of Hezekiah (q.v). As a bookseller he was the first in the colonies to obtain a copyright for printing, the work being a revised edition of the laws of Massachusetts. He was colonel of militia, treasurer of Massachusetts, and agent in London for the Massachusetts colony for the purchase from Sir Ferdinand of Gorges or the title for the district of Maine (1677). In 1692–7 he was lieutenant-governor of New Hampshire, and again from 1702 till his death.

Uskup, oos'kŭp, Skopia, or Skoplie, European Turkey, the capital of a sanjak in the vilayet of Kosovo, situated on the river Vardar, 120 miles northwest of Saloniki, on the railroad from Saloniki to Belgrade and the branch line to Mitrovitza. It has a handsome mosque, a castle, a Byzantine aqueduct, and a recently established trade-school. The chief manufactures are leather, metal ware and cloth, and the town is an important trade centre for grain, wool and fruit. Pop. 20,000.

Us'nea, a genus of fruticose lichens, attached only in one place, with a shrub-like appearance. They are often pendulous, as is the old man's beard (*U. barbata*) which hangs in long tassels and festoons from the bark of trees or their branches, is gray-hued, and resembles somewhat in habit the *Tillandsia. Usnea* is also known as necklace-moss, or hanging moss.

Uspallata (oos-päl-yä'tä) Pass, Chile, a pass over the Andes between Chile and Argentina, 90 miles east of Valparaiso, and at the southern base of Mount Aconcagua. Its highest point is about 12,800 feet above the sea, and the Trans-Andine Railroad passes over it.

Ustica, oos'tē-kä, Italy, a small island in the Tyrrhenian Sea, 40 miles north of Palermo, Sicily. It is three miles long and two miles broad, and has a fortified harbor with a lighthouse. Pop. (1901) 1,992.

Us"tilagin'aceæ, the family of minute fungous plants called smuts. See FUNGI.

Usufruct, the most important of personal servitudes, servitude being the term for the right to use the property of another, whether real or personal. It may be established in any property which is capable of being used so far as is compatible with the substance of the thing not being destroyed or injured. This right may either be exercised directly, or may be leased or sold. The one possessing it is termed the usufructuary. The usufructuary is bound not to impair the property, and must furnish security for the restoration of it. A *quasi-usufruct* is recognized in the case of certain perishable things, or "consumptibles." In such case the equivalent in kind and quantity, or in value, is held to represent the things destroyed or impaired by use. There are works on the subject by Genty (1859) and Hanausek (1879).

Usumacinta (oo-soo-mä-sēn'tä) River, Central America, formed by the junction of three head streams, the Chixoy, Pasion, and Lacantum, rising in Guatemala, for some distance in its middle course constitutes the frontier line between Guatemala and Mexico. It flows northwestward through the states of Chiapas and Tabasco, Mexico, and joins the Tabasco near its mouth, after a course of about 400 miles. A navigable branch also flows eastward into the Laguna Terminos, opening into the Gulf of Campeachy.

Usury. If the term "usury" is to be defined, as in the strictly legal sense, as the illegal profit required by a lender for the loan of money or other property, it will be found that this offense against society is almost as old as society itself. Even in the earliest of Biblical days, for example, usury was practised so generally that the Lord uttered his warning against the custom: "Thou shalt not lend upon usury to thy brother, usury of money, usury of victuals, usury of anything that is lent upon usury; but unto thy brother thou shalt not lend upon usury, that the Lord thy God may bless thee" (Deut. xxiii. 19, 20.) And yet, while in this sentence, every kind of interest is blended together and the natural principles of economics are merged inseparably with the moral and religious law, the fact remains that until comparatively recent times the word "usury" had many definitions and was used to embrace several essentially different social phenomena. In the Old English application it denoted any sort of interest upon money loaned rather than in the more modern signification which has made it applicable only to the unlawful contract exacting that the loan of money be repaid with exorbitant interest for its use. In fact, if one were to

trace the history of the word back through the centuries that have passed since the Mosaic days it would be found that it had as often been applied to the strictly moral and legal methods of procuring just interest for capital invested as to those concerning which a moral if not a legal taint might be attached.

History.—The earliest interpreters of the laws of Moses certainly condemned the illegal practice of usury, and yet they did not forbid the taking of interest in payment for the loan of money, but expressly stipulated that such interest should be charged to strangers. It must be admitted, however, that this reading of the law was largely the result of the social conditions which existed in Israel at this time. In the first place the Israelites were neither a rich nor a commercial people, and the laws and regulations under which they lived were apparently not framed with the purpose of enabling them to become so. Their object, therefore, was to maintain their entity as a nation and to preserve the family inheritances which enabled them to continue happily their frugal mode of life. If the Israelites borrowed, therefore, it was not with a view to profit or to enable them to improve their condition, but simply from poverty and to secure to them some absolute necessity of life. To exact from such persons more than was lent, therefore, would have been both sinful and unjust. The result is denoted by the fact that among the ancient Israelites loans were made merely in cases in which there were poor persons who required assistance to tide them over present difficulties, and never for the purpose of enabling an avaricious man to increase his wealth at the cost of the sufferings of his poorer neighbor. This restriction, however, did not apply in the case of the stranger who was in need of financial help, and the extortion of usury was one of the several means resorted to by the Israelites to ruin the Canaanites and the other stranger-people who remained in the land.

As time passed the public attitude toward usury underwent a decided change, and society, which had branded all lending as immoral and all interest as "usury," because the lending had so generally resulted in cruelty and hardship to the borrower, finally began to feel that all lending was moral and honest, and it was under these conditions that the term "usury" was first applied to every method of receiving interest upon capital invested, an attitude that remained unchanged for many centuries.

One of the most interesting and instructive features in the study of the economic progress of society is that which enables one to follow the various changes that have occurred in the methods of money lending. It has already been shown that the ancient Israelites borrowed only from necessity and not from the possibility of furthering any commercial interests, and this condition, according to Grote, not only prevailed in Greece, but applied to nearly all parts of Europe during the early Middle Ages. In the third volume of his 'History of Greece,' he says:

"It is worthy of remark that the first borrowers must have been for the most part men driven to this necessity by the pressure of want and contracting debt as a desperate resource, without any fair prospect of ability to pay; debt and famine run together in the mind of the poet Hesiod. The borrower is in this unhappy state rather a distressed man soliciting aid, than a solvent man capable of making and fulfilling a contract; and if he cannot find a friend to make a free gift to him in the former character he would not, under the latter character, obtain a loan from a stranger, except by the promise of exorbitant interest and by the fullest eventual power over his person which he is in a position to grant."

In its inception the economic theory of the loaning of money did not contemplate the possibility that anyone might desire to raise a loan for the purpose of investment or to secure capital with which to carry one's business interests to a more successful outcome. In these early ages the commercial sense had not been widely developed and such business interests as those represented by the modern banker and broker were unknown, a condition that was not unfavorable to the extension of the practice of usury whenever and wherever there were laws permitting it. These ancient laws relating to loans read strangely to the modern student and can scarcely be comprehended if they are not considered in connection with the conditions of the times. If the Mosaic laws are taken as an example, the reader must place himself in a position to appreciate the Biblical point of view before he can hope to approximate fairly their justice to both borrower and lender. It must be remembered that the land (that is, the world) belonging originally to its creator, had been given by God to the descendants of Abraham, and liberality to the poor had been one of the conditions under which this gift had been made. Naturally, therefore, the needy Israelite felt that obtaining loans was a right which belonged to him, while the more wealthy people of Israel, feeling that all their property was a loan direct from the hand of God, did not, in the beginning at least, object to giving a small portion of their plenty for the relief of the destitute. Under such conditions it may clearly be seen that the execution of this law of lending was supported by all the force that the recommendation of the constitution itself could bring to bear upon it, and it was not until the selfishness of man commenced to exert a baneful influence that definite laws were promulgated, laws that made the duty of lending the express command of God. While the justice of such legislative enactments may be questioned, especially when viewed from the position of present-day society, their benignity is no longer a matter of doubt when the principle of the divine origin of property is accepted as the basis of ownership, and as this was the polity upon which the entire Mosaic commonwealth was constructed, the laws adopted for the government of the borrower and the lender assume a more just and reasonable position in the estimation of modern thought. In substance these laws provided that the destitute Israelite might borrow what he required for his necessities without interest, either in money or produce; at the end of each seven years there was a remission of debts when every creditor was supposed to remit such money or produce as he had lent, and a prospective borrower was not to be refused such necessities as he might require even when the year of the remission was at hand. While the Mosaic law strictly forbade the charging of interest, it did not prevent the

acceptance of pledges, yet even these pledges were legally protected in such manner as to prevent the possibility of any hardship falling upon the borrower. For instance, the lender was forbidden to accept a mill or the upper millstone in pledge, it being held that they were too much a necessity of life; if raiment should be taken it was required that it must be returned before sunset, lest it be needed during the night, while in the case of a widow's raiment, its acceptance was forbidden under all circumstances. Under the Mosaic law a creditor was forbidden to enter a house for the purpose of reclaiming a pledge, although he might stand without until the borrower should come to him and return it, and while the statutes did not prohibit temporary bondage in the case of insolvent debtors, they provided that the Hebrew bondsman should not be held longer than the year of jubilee, or the 7th year at the most.

If these were the laws that governed the financial relations of Israelites among themselves, however, the same leniency did not apply to the Israelite's treatment of the stranger. For example: interest might be taken from a foreigner, and, at the end of the 7th year, the principal as well as the interest might be exacted. Less restrictions were placed upon pledges taken from foreigners, and the foreign debtor held in bondage was not entitled to exact his release at the coming of the jubilee, and yet, even these laws were humane in comparison to those of Rome which not only provided for the enslavement of the debtor, but even permitted the creditor to put him to death, an extremity, however, to which, according to the best authorities, the Romans were never known to have resorted.

The provision of the Hebrew law which permitted the lender to collect both principal and interest from a stranger and which placed the stranger at the mercy of the creditor until such loans were repaid was the beginning of the practice of usury among this people, but many centuries elapsed, as is shown by reference to Proverbs, or to the Psalms, before the exaction of usury from another Hebrew was regarded otherwise than as a discreditable act. By the time of the birth of Christ, however, the original spirit of the law seems to have been forgotten, for the borrowing and lending of money then prevailed without regard to any race limitations.

The practice of mortgaging land and of paying exorbitant interest for money obtained upon such surety was a Jewish custom which grew up during the days of the Captivity. Although condemned by Nehemiah as being in direct violation of the law, and denounced by Jesus Christ, whose new law of love required the righteous man to give to all who asked of him, and to lend to his enemies, "asking for nothing again," the mortgaging of property has continued throughout the East. In the beginning, and for a long period, 12 per cent was generally the interest charged, but later, under Turkish rule, and despite the warnings of the Koran, which also forbids usury, from 40 to 50 per cent was exacted.

In ancient Greece the practice of usury prevailed to such an extent that in Athens, about 595 B.C., the bulk of the population were bound in practical slavery. Originally free, and small proprietors, they had continued to borrow from the rich until the majority of them had placed themselves completely at the mercy of the aristocracy, and even those who nominally owned their land were not only unable to pay the money they owed but were compelled to erect on their land huge stone pillars, monuments to advertise their debts, which bore the name of the plutocrat to whom they were so seriously indebted. At last Solon appeared and with him the reform legislation that made Athens once more a free city, for the radical remedy which he applied to the financial abuses formally put an end to the law of bankruptcy resting upon slavery, and practically overcame the evil effects of the entire system of usury. Realizing that such a serious condition required a firm hand, Solon first proclaimed a general *seisachtheia,* which provided that all debts made upon the person of the debtor or upon the surety of his land should become void. At the same time his legislation stipulated that bodily security should never again be accepted and that surety in land should rest only within a portion of the property. These reforms, which were certainly distinctly modern in their character, were so effective that the evils which had once threatened the security of Athens were no longer experienced, and although the rate of interest charged upon loans was still sometimes exorbitant — a condition which must exist whenever the rate is left to be determined by free contract — the restriction of the right of attachment was the means of preventing many abuses.

The conditions which existed in Rome during the early days of the nation were similar to those which prevailed in Greece, although in Rome there was no Solon to legislate reform measures that could really reform. As the result more than five centuries passed before the Roman debtor was accorded the relief that had saved Athens, and, by that time, it was too late for any legislation to preserve the identity of the middle class. In the beginning Rome resembled Athens in that the mass of its people were farmers living on their own small estates, and, as in Athens, these yeomen soon became overwhelmed by the debts that war and taxes had forced upon them. A protest was made and, in 500 B.C. the Twelve Tables were adopted as a remedy, the theory being that the stipulation of a maximum rate of interest would be all that was necessary to overcome the prevailing evil. So far from accomplishing this purpose the attempt to regulate the rate of interest failed utterly and as no alterations had been made in the laws which actually governed debt, it was less than three centuries before practically all the free farmers had become enslaved. It was not until the dictatorship of Julius Cæsar, in fact, more than five centuries after Solon, that the Athenian remedy was adopted and the law of debt really abolished. It has been stated that, at this time, while the rate of interest upon first-class properties in the city of Rome was only about 4 per cent, in the provinces the rate was increased to 25 and often 50 per cent. After pronouncing the accumulation of arrears illegal, Justinian established a rate of 6 per cent for all loans except those of a mercantile character, in which case 8 per cent was allowed, and public sentiment, at last aroused to the influence of usury upon the social and economic fabric of the nation, stamped it as such a pernicious crime that when Cato was asked what he thought of

the practice (usury) he made no other answer to his questioner than to ask him what he thought of murder.

Forbidden by legal enactment and condemned by the moralists it was but natural that the practice of usury should be just as severely censured by the Fathers of the early Church. They not only held the custom up to detestation, but they passed regulations prohibiting a usurer from obtaining ordination, while the Council of Nice, one of the many councils which took action upon the subject, carried its decree to such an extent as to stipulate:

"Forasmuch as many clerks, following covetousness and filthy lucre, and forgetting the Holy Scriptures which speaks of the righteous man as one that hath not given his money upon usury, have let forth their money upon usury, and taken the usual monthly increase, it seemed good to this great and holy synod that if anyone, after this decree, shall be found to take usury, or demand the principal with half the increase of the whole, or shall invent any such methods for filthy lucre's sake, he shall be degraded from his order and have his name struck out of the roll of the Church."

During these times usury was described as of various kinds. If it was called *centesimo*, it meant that a hundredth part of the principal was required to be paid every month; a practice permitted by law but forbidden by the Church. If called *sescuplum*, it implied the whole and half as much more, which was condemned both by the Church and by a law of Justinian. The only forms of usury permitted both by law and the Church were those which called for less than one half of the centesimal interest, while the importance of ecclesiastical disapprobation in such matters is shown by the fact that all the decrees of the Apostolic Canons; the Council of Eliberis; the first and second councils of Arles; the first and third councils of Carthage; the Council of Nice, and the Council of Laodicea and of Trullo, had great effect in discouraging the practice of usury among the Christian races.

The natural consequence of this general condemnation of usury by the highest tribunals of the Church was the excuse for the adoption of the usurious methods by the Jews. In their case the laws prohibiting extortionate interest had so far become a dead letter that the race question was never considered when the matter of the loaning of money was under discussion. Had the Jews still adhered to the ancient Mosaic law, however, its provisions which permitted them to charge interest to the stranger and to collect both principal and interest from him under the most extreme penalties for failure to meet such obligations, would have been sufficient authority for them to have become the money lenders of Europe. Moreover since the beginning of the Christian era the term "usury" had also been applied in the sense of receiving a reasonable rate of interest for the use of money loaned and as this had long been regarded as an allowable practice, one which was no more contrary to the Hebrew law of love than the ordinary acts of buying or selling merchandise for gain, they felt themselves at perfect liberty to enter this field of commerce which had so conveniently been deserted by the Christians. That they often abused their privileges and conducted their business in a manner that was far from consistent with the Hebrew principles of equity even when applied to the stranger, is, of course, beyond question; but these were the abuses of a system which time had made necessary and it was such abuses that have been responsible for much of the Jewish persecution which has darkened so many of the pages of history, for it was undoubtedly largely on account of their practice of money-lending and the determination shown by them in the collection of the last penny of both principal and interest that made the race so heartily detested and liable to such gross ill-treatment at the hands of the people. An interesting illustration of this popular animosity was exhibited at the time when Henry III. granted the charters to Newcastle and Derby, for by these documents Jews were forbidden to live in either place, and, as late as 1290 they were expelled in a body from the kingdom and were not permitted to return until the days of Cromwell, in spite of the fact that, long before their banishment, Christians had already commenced to accept interest upon money loaned and that the business of money lending had ceased to be exclusively a right of the Jews.

The history of usury in England begins during the reign of Edward the Confessor, for it was at this time that the exaction of exorbitant interest was first prohibited. By 1126 that law had so far become obsolete that the practice of usury was forbidden only to the clergy. In 1199, Richard I. decreed that the rate of interest should be restricted to 10 per cent and this remained the legal rate until 1624, when it was reduced to 8 per cent. In 1651 a still further reduction to 6 per cent was made, and, in 1714, the rate was established at 5 per cent, remaining unchanged until 1833, when, during the reign of William IV., bills not having more than three months to run were exempted from the operation of the laws against usury. Under Victoria this exemption was extended to bills payable in 12 months, and, later, it was enacted that bills of exchange and forbearances of money above ten pounds should not be affected by the usury laws. At present the legal rate of interest in Great Britain is 5 per cent, unless it can be shown that a different rate was agreed upon between the contracting parties.

Usury in the United States.— Usury was one of the subjects which received early attention at the hands of the legislatures of the various States. In most instances the crime is defined as "the illegal profit required and received by the lender of a sum of money from the borrower for its use. To constitute a usurious contract it is required that there be a loan under an agreement that the money shall be returned to the lender, together with interest greater than that fixed by law." Of course, the laws in relation to usury vary under the statutes of the different States, but, in almost every case, by the addition of a bonus to the interest in which the sum is greater than the legal interest, the contract is held to be usurious, and, in the absence of any statute regarding such usury, relief may be obtained through courts of equity. In every State, however, care has been taken to distinguish between usury, applying the word in the modern sense of "unjust exaction," and interest on capital, for the progress of society has been in such a direction that the position of borrower and

lender has now assumed an entirely different aspect. To-day the borrowing for commercial purposes represents transactions of overwhelming importance to the financial world, whereas the act of borrowing for purposes of necessity has become comparatively unimportant. As the result circumstances have so changed that the old laws would be useless in dealing with any present day usury evil, and the statutes enacted by the various States are of the character which seems best fitted to cope with the conditions of the times.

These laws, briefly summarized for tabulation, are as follows:

THE USURY LAWS OF THE UNITED STATES.

States	Legal rate of interest Per cent	Interest allowed by contract Per cent	Penalties for usury
Alabama	8	8	Forfeiture of interest.
Alaska	8	10	Forfeiture of double amount of interest.
Arizona	6	Any rate	No provision.
Arkansas	6	10	Forfeiture both principal and interest.
California ...	7	Any rate	No provision.
Colorado	8	Any rate	No provision.
Connecticut ..	6	Any rate	No provision.
Delaware	6	6	Forfeiture of principal and interest.
D. of Colum..	6	10	Forfeiture of interest.
Florida	8	10	Forfeiture of interest.
Georgia	7	8	Forfeiture of excess interest.
Hawaii	6	12	Forfeiture of interest.
Idaho	7	12	Forfeiture of interest and 10 per cent of principal.*
Illinois	5	7	Forfeiture of interest.
Indiana	6	8	Forfeiture of excess interest.
Indian Ter...	6	8	Forfeiture of interest.
Iowa	6	8	Forfeiture of interest.
Kansas	6	10	Forfeiture of double the amount of usurious interest.
Kentucky	6	6	Forfeiture of excess interest.
Louisiana	5	8	Forfeiture of interest.
Maine	6	Any rate	No provision.
Maryland ...	6	6	Forfeiture of interest.
Massachusetts	6	Any rate†	No provision.
Michigan	5	7	Forfeiture of interest.
Minnesota ...	6	10	Forfeiture of principal and interest.
Mississippi ...	6	10	Forfeiture of interest.
Missouri	6	8	Forfeiture of lien.
Montana	8	Any rate	No provision.
Nebraska	7	10	Forfeiture of interest.
Nevada	7	Any rate	No provision.
N. Hampshire	6	6	Forfeiture of three times the amount of excess interest.
New Jersey .	6	6	Forfeiture of interest and costs.
New Mexico..	6	12	Forfeiture of twice the amount of excess interest.
New York ...	6	6‡	Forfeiture of principal and interest.
No. Carolina.	6	6	Forfeiture of interest.
North Dakota	6	8	Forfeiture of excess interest.
Ohio	6	8	Forfeiture of all interest over 6 per cent.
Oklahoma ...	7	12	Forfeiture of interest.
Oregon	6	10	Forfeiture of principal and interest.
Pennsylvania	6	6	Forfeiture of excess interest.
Rhode Island.	6	Any rate	No provision.
So. Carolina..	7	8	Forfeiture of interest and liability.§
South Dakota.	7	12	Forfeiture of interest.‖
Tennessee ...	6	6	Forfeiture of excess interest.
Texas	6	10	Forfeiture of interest.
Utah	8	Any rate	No provision.
Vermont.....	6	6	Forfeiture of excess interest.
Virginia	6	6	Forfeiture of interest.
Washington	6	12	Forfeiture double the accrued interest and costs.
West Virginia...	6	6	Forfeiture of excess interest.
Wisconsin.....	6	10	Forfeiture treble the amount of usurious interest.
Wyoming	8	12	Forfeiture of interest

* Which sum reverts to the school fund; † not more than 18 per cent can be collected on loans of less than $1,000; ‡ on call loans of $5,000 or upward any rate of interest may be charged; § embraces liability to separate action to the extent of double the amount of usury; ‖ in this State usury is regarded as a misdemeanor.

JOHN R. MEADER,
Editor 'American Year-Book.'

Utah, ū'ta or ū'tâ, a State named after the Ute tribe of Indians, whose habitat was here, lies between lat. 37° 42′ N. and lon. 109° 114′ W., comprising an area of about 84,000 square miles. The country is crossed, mostly from north to south, by mountain ranges; the principal one is the Wasatch Range, which might be termed the backbone of the State. East of this natural wall is the region drained by Green and Grand rivers, affluents of the Colorado, while to the west is the Great Salt Lake (q.v.), otherwise known as the "Dead Sea of America," and its contiguous desert. This lake, extending north and south for 80 miles, with a width of over 30 miles, and an extreme depth of 60 to 75 feet, lies in the very heart of the vast arid intermountain plateau named the "Great Basin" (q.v.), whose eastern rim is the Wasatch Mountains, and its western limit, the Sierra Nevada Range. The lowest point of altitude in Salt Lake Valley is 4,210 feet above sea-level. Utah Lake (q.v.), a smaller body of fresh water, 40 miles southward, is connected with the Salt Lake by Jordan River, a circumstance which, with the general lay of the country, induces a comparison between Utah and the land of Palestine. Broken mountain chains in central, eastern, and southern Utah alternate with valleys and plateaus, while few and far between are fresh lakes and rivers, owing their existence mainly to the melted snows flowing in crystal torrents from the rugged gorges of the towering snow-capped hills. A dearth of moisture, and a consequent scarcity of timber and verdure, have been the country's serious drawbacks from the beginning. The rainfall in 1903 — reported as an average year — was about 10½ inches, less than half of which came between April and October. During much of that period the ground is parched and burning. The climate is healthy and delightful, the atmospheric rarity counteracting to a great extent the heat, which at times is almost tropical. Particularly is this the case with the Santa Clara region in the southwest. Much of the soil is strongly impregnated with salt and alkali, and though toil and irrigation have done much to redeem it, many parts are still pure desert, hopelessly barren. The naturally fertile spots are mostly the alluvial, sage-covered strips

lying along the bases of the hills. The mountains are Nature's treasure vaults, and though primarily an agricultural State, with manufacture and stock-raising as strong subsidiary features, Utah has in late years forged to the fore and taken a rightful place among the great mining commonwealths of the nation.

Mining.— Utah's mining history virtually begins with the advent of the railroad, prior to which time, although mines had been discovered and opened, and a few mills and smelters erected, little headway had been made, owing to the lack of facilities for transportation. The honor of pioneering this industry is given to General Conner, the commander at Fort Douglas, who, in the latter part of 1863, prospected in Bingham cañon, and located the Jordan mine. He afterward wrote mining laws, organized with others the West Mountain Mining District, and having established a paper, the 'Union Vedette,' heralded through its columns the opening of the Utah mines. The existence of valuable ore bodies, gold, silver, lead, iron, etc., had been known to the earlier settlers, but their leaders had not encouraged mining. "We cannot eat gold and silver," said Brigham Young; "neither do we want to bring into our peaceful settlements a rough frontier population to vitiate the morals of our youth, overwhelm us by numbers, and drive us again from our hard-earned homes." For this reason he discouraged mining, advising the people to turn their attention to agriculture, stock-raising, manufacture, and kindred pursuits. Most of the Mormons followed his advice, but some joined with the non-Mormons in exploiting the mines. After his death, in August 1877, conditions having greatly changed, leading churchmen engaged in the industry. Utah's principal mines at the present day are the Ontario, Silver King and Daly-West, at Park City; the Bullion-Beck, Centennial-Eureka and Grand Central, in the Tintic District; the Horn Silver, at Frisco; and the Consolidated, at Mercur. The Daly-West and Silver King, both silver and lead mines, are the heaviest producers, the former paying $117,000, and the latter $100,000 monthly, in dividends.

Agriculture, Manufacture, etc.— Utah is fundamentally agricultural, producing vast quantities of cereals, with all varieties of fruits and vegetables common to the north temperate zone. Sheep, cattle, and horse raising is also a prominent feature of her industrial life. Among many thriving industries may be mentioned the Provo Woolen Mills, the beet-sugar factories at Lehi, Ogden, Logan and Garland, the Inland Crystal Salt Works, the Germania and Highland Boy smelters, and the electric power plants at Ogden, Salt Lake, and Provo. From the granite quarries of the Wasatch came the material for the construction of the magnificent Temple at Salt Lake City, and in the Tabernacle adjoining the Temple may be seen and heard one of the greatest choirs and one of the most perfect pipe-organs in the world. The mountains of Utah abound in game — bear, deer, elk, antelope, grouse, prairie chickens, etc.; the fresh lakes and streams are well stocked with fish in numerous varieties, and lake and river margins are the haunts of wild geese and ducks in abundance. Fish cannot live in the Salt Lake, owing to the intense salinity of its waters, which are wonderfully buoyant and invigorating. Probably the largest and most splendid bathing pavilion in existence is Saltair, on the eastern shore, within 30 minutes' ride by rail from Salt Lake City.

History.— The region of the Great Salt Lake was originally settled by emigration from the East; the vanguard a small band of pioneers led by Brigham Young (q.v.) from the Missouri River, then the frontier of the nation. This man was the leader of a religious organization, the Church of Jesus Christ of Latter-day Saints, commonly called "Mormons" (q.v.), who, expelled from Illinois in February, in 1846, had begun their exodus into the all but untrodden West. Brigham Young, the founder of Utah, like his predecessor, Joseph Smith, the founder and leader of the Latter-day Church, who had been killed by a mob in Illinois, was a native of Vermont and of Revolutionary ancestry. Leaving the main body of his followers living in tents, wagons, and log huts upon and near the Indian lands in Western Iowa, President Young conducted his pioneer company, which included 143 men, 3 women and 2 children, across the great plains and mountains, the journey beginning at Winter Quarters (now Florence, Neb.) early in April, and ending on the shores of the famous "Inland Sea," in the latter part of July 1847. This pioneer trip would have been undertaken a year earlier, but for a call made upon the migrating people by the Federal government for a battalion of 500 men, to assist in the war against Mexico; a requisition promptly filled. The pioneers were well armed and equipped, and carried with them, in wagons drawn by ox and mule teams, plows and other implements, a surveying apparatus, seed grain, a year's supply of provisions, and the usual camp accessories.

The Great West, now divided into prosperous States and Territories, teeming with populous cities and thriving villages, connected by railroads and telegraphs, was then a wilderness, an almost unknown country, not only to the people of the East, who had heard of it merely through the media of romantic tales or the imperfect reports of early explorers, but also to the straggling mountaineers who roamed over its immense solitudes, trapping the wild animals that shared with savage tribes the occupancy of the land, and consorting with these degraded beings, who subsisted in part upon the reptiles and insects infesting the barren waste. Every school boy familiar with the map of North America was acquainted to that extent with the "Great American Desert," and every reader of Congressional reports in the early "forties" had thrilled under the graphic eloquence of the great Webster, who, denouncing a proposition to establish a mail route from the Missouri frontier to the Pacific Coast, stigmatized this region as "a vast worthless area." Colonel "Jim" Bridger, living in a lonely log fort near the head waters of Green River, met President Young and the pioneers just as they had passed the Rocky Mountains, and remarked pessimistically that he would give $1,000 if he knew an ear of corn could ripen in Salt Lake Valley. Nothing daunted, the hardy empire builders pursued their way, and having penetrated to the heart of the great desert "Basin," on the wave-washed, alkaline shores of "America's Dead Sea," they laid out Salt Lake City, the parent of hundreds of

other cities, towns, and hamlets that have risen from the waste as Utah's gift to civilization.

The founders of this commonwealth were not the first settlers of the West, but to them, more than to any other people, owing to their unity, communal spirit, and systematic methods, is due the redemption of arid America. They were the Anglo-Saxon pioneers of irrigation; their settlements formed a nucleus for civilization in the inter-mountain country; and the founding of Utah made possible, or at all events greatly facilitated, the development of the whole surrounding region. As early as 1841 a thin stream of emigration had been crossing the continent, most of it going to Oregon, some to California, and all, shunning the desolate Valley by the Lake, hurrying on to the green and fertile slopes of the Pacific. Such might have been the course pursued by the Utah pioneers, had not their sagacious leader foreseen the very probable result — a repetition of the troubles that had compelled them to flee from hostile religious and political sentiment in Ohio, Missouri, and Illinois. Hence his refusal to be influenced by a prominent co-religionist, Elder Samuel Brannan, who, after piloting a ship's company of Latter-day Saints from New York around Cape Horn to the Bay of San Francisco, and leaving them to plow, sow, build, and set up a newspaper in the San Joaquin Valley, came overland to meet the pioneers, and induce them, if possible, to forego their half formed design of settling Salt Lake Valley, and instead to join the Brannan colony on the Californian coast. "No," said President Young, "this is the place." Here, accordingly, they settled, upon alien soil, in what was then the Mexican province of California, which, with another province, New Mexico, comprised the present States of California, Nevada, Utah, the Territory of Arizona, and parts of Wyoming, Colorado, and New Mexico. The acquisition of these provinces by the United States was one of the immediate results of the war with Mexico, in which the Mormon battalion took part.

The pioneers of Utah, having partly explored Salt Lake Valley, planted here their first crops, breaking their plowshares at first in the hard, sun-baked soil, afterward softened and made arable by turning upon it the waters of the mountain streams. They also constructed a log and mud fort to protect themselves from hostile Indians, prowling wolves, and other wild beasts. This done, many of them, including most of the leaders, returned to the Missouri River for their families. Those who remained in the mountains were reinforced in the fall of 1847 by several large trains of immigrants, who had followed immediately in their wake from the frontier. The aforementioned, with a small company from Mississippi, who joined the pioneers at Fort Laramie, and the returned members of the Battalion, were the colonists who struck the first blows in the building of the inter-mountain empire.

February 1848 witnessed the signing of the treaty of Guadalupe Hidalgo, by which the provinces of California and New Mexico were ceded to the United States. In March 1849 was organized at Salt Lake City the provisional government of Deseret, pending Congressional action on a petition for a State government. Congress denied this petition, but organized, with greatly reduced boundaries from those of the proposed commonwealth, the Territory of Utah, destined also to be diminished in size by the formation of subsequent States and Territories The date of the organic act was 9 Sept. 1850, but the news did not reach Utah until late in January 1851. Early in February the Territorial government was formed. One of the first counties was named Millard, and its principal town Fillmore, in honor of the nation's head, by whom Brigham Young had been appointed governor.

The first 10 years of occupancy and colonization passed in comparative peace. There were wars with the red men, in which the settlers were uniformly victorious, not more by the prowess of their volunteers than by the wise diplomacy of their leaders, whose favorite motto was, "Feed the Indians, don't fight them." The savage tribes were gradually placated, and permanent friendly relations established between white and red. There were also seasons of drought and years of famine, before irrigation prevailed over aridity, and the swarming pests of crickets and grasshoppers, which devoured the early crops, ceased their terrible visitations. The work of colonizing was vigorously pushed, settlements being formed in all parts, wherever a spring of water, bubbling up from some oasis, or the most attenuated mountain torrent held out the least hope of agricultural success. Immigration was encouraged, and systematically carried on, particularly by the "Perpetual Emigrating Fund Company," which sent annually to the frontier 500 wagons to bring the poor to Utah. Many of these immigrants, men, women, and children, walked the entire distance from the Missouri River to Salt Lake Valley, a three months' journey, pulling handcarts through frost and snow and wintry storms, in which hundreds perished. All classes of people, professionals, tradesmen, peasantry, etc., mostly Mormon converts from the States, Great Britain, Scandinavia, and other parts of the world, were to be found in these migrating trains. The newcomers, wherever possible, practised their professions or trades, but all, irrespective of former vocation, were encouraged to take up land and build homes. Small farms were the rule. There was neither land nor water for speculation.

"If the Gentiles will let us alone for 10 years, I'll ask no odds of them." Such was Brigham Young's declaration on entering Salt Lake Valley 24 July 1847; and 10 years later to the day, while he and his fellow citizens were celebrating the advent of the pioneers, came, like a thunderclap from a sunny sky, the startling news that a United States army was marching to Utah, to put down a Mormon uprising against the government. The alleged rebellion had no existence, the excitement and agitation over it being due to false reports circulated by Federal office-holders and others who had left the Territory. Pending an investigation, which he knew would prove to the government the falsity of the statements by which it had been misled, and to prevent a possible repetition of the bloody scenes of Missouri and Illinois, Brigham Young, as governor, proclaimed Utah under martial law, calling out the militia to repel the invasion. As a result the Federal army wintered east of the Wasatch mountains, and the next spring brought peace commissioners from Washington and an amicable settlement of the difficulty. Governor Al-

THE MORMON TEMPLE, SALT LAKE CITY.

fred Cumming, the non-Mormon successor to Governor Young (whose second term now closed) was welcomed to Salt Lake City, and the troops, under General A. S. Johnston, augmenting materially the limited number of "Gentiles" then in these parts, founded Camp Floyd, 40 miles southward, where they were stationed until the outbreak of the Civil War, when the post was abandoned.

An event of great importance to Utah was the coming of the Overland Telegraph Line, completed to Salt Lake City a few months after the beginning of the Civil War. The first message over the eastern wire was dated 18 Oct. 1861. It said: "Utah has not seceded, but is firm for the Constitution and laws of our once happy country, and is warmly interested in such useful enterprises as the one so far completed." This message was signed by Brigham Young, who, though no longer governor, continued to be the first citizen of the commonwealth. It was addressed to President J. H. Wade, the telegraph magnate, at Cleveland, Ohio. A similar message was sent to President Lincoln by the non-Mormon executive, Acting-Governor Frank Fuller. Subsequently there was a despatch from President Young to the chief magistrate, offering to the Nation the free service of a picked band of scouts to guard the mail route and telegraph line from Indian or other depredations during the prevailing troubles. This offer was gratefully accepted. Such was the general prejudice, however, that Colonel P. E. Conner and the California and Nevada volunteers, who had enlisted for service in the East, were assigned, much to their disappointment, to needless vedette duty in Utah, where in October 1862, they founded Fort Douglas on the foot-hills east of Salt Lake City. These troops made themselves otherwise useful by subduing hostile Indians in Southern Idaho, for which Colonel Conner was given a brigadier-generalship.

For many years the construction of a transcontinental railroad had agitated the minds of the people of the West, and the citizens, through their legislatures and their representatives and delegates in Congress, had repeatedly memorialized the government in the interest of the mighty enterprise. Utah was weary of her isolation, and now that the telegraph had done its part to annihilate time and distance, a more than ordinary yearning for the railroad was felt. The dwellers in these mountain-girt valleys were a thousand miles from civilization, and the stage-coach, succeeding the pony express, was the fastest means of conveyance over the wide and desolate plains. What wonder they should welcome the "iron horse," as they had previously welcomed the electric wire! Brigham Young himself was a large contractor on the construction of the great highway. The meeting of the Union Pacific and Central Pacific roads at Promontory, on the northern shore of the lake, 10 May 1869, was an occasion of much rejoicing. Soon the point of junction was moved to Ogden, about 40 miles north of Salt Lake City, and between these towns was built, by home capital, in 1869–70, the Utah Central railroad, the pioneer local line, Brigham Young, president. This was immediately followed by a similar line south of the capital city. These roads, with others subsequently constructed, were absorbed by the Union Pacific, which held a virtual monopoly of railroads in Utah until the advent of the Denver & Rio Grande Western in March 1883.

Utah's earliest merchants were Mormons and non-Mormons. Originally goods were freighted in ox and mule trains from Saint Louis and other eastern points, and from Southern California. During the early days of money scarcity, exchange and barter was the rule — the dry goods and groceries of the merchant for the products of farm, orchard, mill, and workshop; the latter utilized at home, or turned into cash in distant markets. The first settlers coined imported California gold dust, and also made and used paper money, until the National coins and currency became sufficiently plentiful. The greatest mercantile movement that Utah has seen was the establishment of Zion's Co-operative Mercantile Institution, organized in October 1868, to unify Mormon commercial interests in the face of the fierce competition and other changes foreseen to be imminent from the coming of the railroad. This great house still exists, though no longer exclusively a Mormon institution, and has an annual trade of over $4,000,000.

The changes anticipated were realized. Population and capital poured into Utah; the mines, hitherto unprofitable, were made productive; railroads and telegraphs were extended, manufactures established, and an impetus given to trade and industrialism in general. The pioneer journal, the *Deseret Evening News*, established in June 1850, as a weekly paper, with Willard Richards, a Mormon leader, as editor, now had two great rivals, the *Salt Lake Daily Herald* and *Salt Lake Daily Tribune*, the former independent, the latter strongly anti-Mormon. The *Tribune* was the mouthpiece of the Liberal party, between which and the People's party a long and bitter fight was waged — a period of friction between Mormon and Gentile, reminiscent of the historic feuds of Guelf and Ghibeline. Non-Mormon churches and schools also multiplied, as an offset to the dominant church and its institutions of learning; and all these, with the State University, founded in February 1850, and the old district schools, now merged in a splendid free school system established early in the "nineties," have placed Utah in advance, educationally, of most of the States of the Union.

Congressional legislation against polygamy, or the Mormon plural wife system, began in 1862, but the law remained a dead letter; Mormons with many non-Mormons believing it unconstitutional, trenching upon a principle of religion. It was declared constitutional by the Supreme Court of the United States in January 1879. In March 1882 was enacted the Edmunds law, defining polygamy (the marrying of plural wives) and unlawful cohabitation (the living with such wives) and making the offenses punishable by fine and imprisonment. Under this law, administered in great severity by the Federal courts, a crusade was instituted, and rigorously carried on wherever the Mormons had settlements. Though the number of polygamists was relatively small, being only about 3 per cent of the membership of the Church, which was less than 300,000 throughout the world, the results, owing to the prominence of the persons affected, were far-reaching, and for five years Utah was filled with sorrow and gloom. Day and night, men, women, and children were relentlessly

hunted down, haled before magistrates and grand juries, and consigned to prison. Most of the church leaders were driven into exile. A veritable reign of terror prevailed. The object was to compel the abandonment of polygamy, and the fearful pressure finally had the effect desired; not, however, before most of the Mormon church property, amounting to nearly $1,000,000, had been confiscated under the provisions of the Edmunds-Tucker law of March 1887.

With the issuance, in September 1890, by President Wilford Woodruff, then at the head of the Church, of the famous "Manifesto," doing away with polygamy, came an era of good feeling, which has continued practically to the present time. Mormons and Gentiles affiliated socially, politically and in business as never before. Local party lines were obliterated, and national politics came to the front. Presidents Harrison and Cleveland, in successive proclamations, pardoned all polygamists; the confiscated church property was returned, and everything done that a great and generous government could devise to cause the unpleasant past to be forgotten.

Under an Enabling Act, signed by President Cleveland, 16 July 1894, a constitutional convention met at Salt Lake City in the following March, and framed the fundamental law upon which Utah, on 4 January 1896, was admitted into the Union as a State. Her first elected governor was Heber M. Wells, the present incumbent, now serving a second term. He is Utah-born, a Republican, and the second Mormon among the 15 governors who have served the commonwealth. The first chief justice after statehood was Charles S. Zane, who, as a chief justice during the territorial regime, had been the local head and front of the anti-polygamy crusade. The other public offices, as in the first instance when all were Federal appointments, were equally divided between Mormons and non-Mormons. Utah's present population is about 300,000, the Mormon element still greatly predominating.

Consult: Bancroft, 'History of the Pacific States'; Tullidge, 'History of Salt Lake City'; Whitney, 'History of Utah'; Nichols, 'Mineral Resources of Utah'; Government Reports on Agriculture and Mining.

ORSON F. WHITNEY,
Historian.

Utah, a lake in the State of Utah, in Utah County, about 30 miles southeast of Great Salt Lake. It is about 25 miles long from north to south and from 3 to 13 miles wide; area, 150 square miles; altitude, 4,500 feet. It is the largest body of fresh water in the State. It is in a valley formed by the uplift of mountain ranges; on the east the Wasatch and on the west the Lake, Oquirrh and Tintic. The streams which enter the lake come mostly from the Wasatch Range. The outlet of Utah Lake is Jordan River, which flows into Great Salt Lake.

Utah, Agricultural College of, the State agricultural and mechanical college, founded in accordance with the land grant act of 1862; located at Logan, Utah. The college is a part of the public school system, and is open to both men and women. It was chartered in 1888, and opened to students in 1890; in 1901, the curriculum was considerably enlarged, and an extra year's work required for entrance to the collegiate courses leading to a degree. In 1903 the college organization was made more complete and effective by the establishment of five schools — the School of Agriculture, the School of Domestic Science and Arts, the School of Engineering and Mechanic Arts, the School of Commerce, and the School of General Science; in 1904 a Department of Music was added offering courses in vocal music, pianoforte, violin, and theory of music. The courses offered by the various schools of the college are as follows: (1) four years' courses in agriculture, domestic science, commerce, civil and mechanical engineering, and general science, leading to the degree of B.S. in agriculture, etc.; (2) three years' courses of high school grade in agriculture, domestic science, and commerce; (3), manual training courses in domestic arts (three years), and in mechanic arts (four years); (4) a college preparatory course; (5) a sub-preparatory course. The work of the last two years of the collegiate courses in agriculture, domestic science, and commerce is partially elective; the last three years of the general science course are wholly elective, except that students in the latter course are required to take two years' work in one language, and a certain amount of work in English biology, and history and civics. There are also short winter courses in agriculture (four weeks), in domestic arts (12 weeks) and mechanic arts (12 weeks). The State experiment station is connected with the college, and offers opportunity for advanced work. The students maintain an athletic association, two general literary clubs, and four special organizations open to the members of certain departments of instruction. The college buildings include the main building, mechanic arts building, the conservatory, the experiment station, the veterinary laboratory, the poultry building and four barns. The library in 1904 contained 11,500 volumes; the students number 545.

Utah, University of, the State university located at Salt Lake City. It was incorporated as the University of the State of Deseret in 1850, and opened to students in that year. But as it failed to secure patronage or adequate financial support, it was closed after one session until 1867. The governing board of regents, however, maintained their organization during this time, and had general supervision of the public school system. When first reopened in 1867 it was largely a commercial college, but in 1869 was reorganized with normal and classical departments. In 1894 a new charter was obtained, the name was changed to University of Utah, and a 60-acre tract of land on the Fort Douglas Reservation was granted to the university by the Federal Government. In the same year the Salt Lake Literary and Scientific Association gave $60,000 for the endowment of the chair of geology. In 1899 the legislature provided for the erection of new buildings and the removal of the university to the new site, which was first occupied in 1900. The board of regents consists of the president of the university, member *ex officio*, and eight members appointed by the governor for four years. The university is open to both sexes on equal terms. The organization includes the School of Arts and Sciences, the State School of Mines, the State Normal School, and the Preparatory School. The School of

Arts and Sciences offers two courses leading to the degrees of A.B. and B.S., respectively; these courses are both largely elective, the electives to be chosen from depending on the degree to be conferred. The School of Mines offers courses in mining and electrical engineering, leading to the degree of B.S. The courses in the State Normal School are: (1) Advanced Normal Course, four years, including electives in the School of Arts and Sciences, and leading to a degree and normal diploma; (2) a four years' normal course, graduates receiving the State certificate; (3) a four years' kindergarten course; (4) a five years' kindergarten-normal course. Instruction for teachers of manual training is included in the curriculum. There is a summer school, courses being provided in the usual subjects of the college curriculum and in pedagogy; work in the summer school may be counted toward a degree. The campus is situated at the base of the Wasatch Mountains, overlooking the valley, Great Salt Lake, and Salt Lake City; the buildings in 1904 include the library and administration building, the normal building, the engineering and physical science building, the museum, and the shops building. The library is the largest in the State, containing in 1904 21,500 volumes. The property and productive funds in 1904 amounted to $350,000; the students numbered 744 and the faculty 44.

U'tahlite, a name given to the nodules of compact, green variscite from near Lewiston, Utah. They have been sliced and polished, and make charming specimens. Wardite is a frequent associate. See VARISCITE.

Utakamand, oo-ta-ka-mŭnd', or **Ootacamund**, India, a southern sanitary station, the summer quarters of the Madras government, in the Nilghiri Hills, 70 miles south of Mysore. It is 7,228 feet above sea-level, in an amphitheatre surrounded by noble hills, overlooking an artificial lake. Mean temperature about 58° F. Pop. about 15,000.

Ute, ūt. See SHOSHONEAN INDIANS.

Uterus. See WOMB.

Utica, ū'tĭ-ka, N. Y., city, county-seat of Oneida County; on the Mohawk River and the Erie Canal, and on the New York Central and Hudson River main line and the leased lines, Rome, Watertown and Ogdensburg, the Black River, the Mohawk and Malone, the Adirondack and Saint Lawrence, and the West Shore, the Delaware, Lackawanna and Western, and the Ontario and Western railroads; about 95 miles west of Albany and 55 miles east of Syracuse. Electric lines extend to villages and towns 20 miles east of the city, 15 miles west, and 10 miles south. The railroads extending north cross the Adirondack region, extend to the Thousand Islands, and connect with the steamers on the Saint Lawrence and with the trunk lines of Canada. The railroads to the south connect with the Erie and some of the lines in Pennsylvania. The large number of passengers who transfer at Utica, "the gateway to the Adirondacks and the Thousand Islands," make it one of the most important stations between New York and Buffalo.

Manufacturing.— The chief manufactures are hot-air furnaces, hosiery and print goods, men's clothing, machine-shop products, steam fitting and heating apparatus, lumber products, beer, marble products, paving material, foundry products, and tobacco products. In 1900 (government census) the city had 733 manufacturing establishments, with a total capital invested of $19,289,502, and with an average number of wage-earners, 10,759, to whom was paid annually the sum of $4,148,415. The cost of material used in the manufactories was $9,405,370, and the value of the annual products was $19,550,850. Men's clothing (factory products) brought annually $2,585,927; hosiery and knit goods, $2,514,073, and steam fittings and apparatus, $1,204,693. The city is famous for the excellence of its woolen, cotton and knit goods and its hot-air furnaces.

Commerce.— The advantages which the city has for the transportation of its manufactures are great inducements to the manufacturer. Goods may be freighted on the Erie Canal or sent by means of railroads to any part of the country. The city ships large quantities of its own manufactured goods, farm products, fruit, dairy products, and live stock. It is a distributing centre for an extensive region extending north and south. Utica is an important cheese market, and large quantities of flowers, especially roses, are shipped to the larger cities.

Buildings and Municipal Improvements.— The principal public buildings are the Government building, State Armory, City Hall, Y. M. C. A. and Y. W. C. A. buildings, public library, churches, schools, and business blocks. The altitude of the city is about 505 feet, and the slope is sufficient to make a surface drainage. The sewer system is excellent. The water plant is owned by a private corporation which has a paid-up capital of $500,000. The reservoir has a daily capacity of about 4,010,000 gallons. There are a number of small squares and several parks. The streets are wide, paved, and kept clean. Utica claims to have more miles of asphalt pavement than any other city of its size in the United States.

Churches and Charities.— There are about 51 churches, divided as follows: eight Roman Catholic, seven Protestant Episcopal, seven Methodist, six Presbyterian, five Baptist, two English Lutheran, four German Lutheran, four (different denominations) Welsh, one each of Reformed, Congregational, Universalist, and Christian Science, and three Jewish synagogues. The charitable institutions are the Utica State Hospital, the Masonic Home of New York State, Saint Elizabeth's Hospital and Home, Saint Luke's Homœopathic, Faxton, and City hospitals; Home for the Homeless (for aged women), Home for Aged Men and Couples, Saint John's Orphan Asylum, Saint Joseph's Infant Home, Utica Orphan Asylum, and the City Orphan Asylum. The Woman's Christian Association and other organizations do noble work for the relief of the needy.

Education.— The educational institutions are three high schools, the public school academy, founded in 1843, the Balliol School (Utica Female Academy), the Utica Catholic Academy, 22 ward schools, a teachers' training school, several parish schools, a public free library, libraries connected with each of the three high schools, and libraries connected with some of the literary societies. Hamilton College (q.v.), at Clinton, is only nine miles distant from Utica, and is reached by steam and electric cars.

Banks.— There are eight banks and one trust and deposit company. The combined capital of six of the banks is $3,700,000; the deposits of the Savings Bank of Utica (1903) amounted to $10,101,280; the combined deposits of the four national banks, one of the private banks, and the Utica Trust and Deposit Company amounted to $10,493,460. The bank clearings, weekly average, is $2,000,000.

Government.— The government is vested in a mayor and a council of 15 members, who hold office two years. The administrative officials are appointed by the mayor, subject to the approval of the council, or are elected by the council.

History.— The original settlement was called Old Fort Schuyler, from a fort which had been erected here during the French and Indian War. It was named in honor of Col. Peter Schuyler. The territory on which Old Fort Schuyler was located formed part of a tract of 22,000 acres, granted 2 Jan. 1734 by George II., king of England, nominally to several persons, but in reality to enure to the benefit of William Cosby, colonial governor of New York and New Jersey. In 1786 a survey of the manor of Cosby, together with a map of the same, was made by John R. Bleecker. It appears therefrom that two houses were located near the fort on what is now the east side of Genesee Street, and one house on land on the west side. Improvements had been made a little farther westward, somewhere between the present lines of Broadway and State streets, and other improvements in the eastern part of the city. Outside of these evidences of civilization was a vast unbroken forest. The occupant of the house nearest the river, on the western side of the road, was John Cunningham, and his nearest neighbor, on the same side, was George Damuth. The resident on the opposite side was Jacob Christman. The settler toward the west was a man named McNamee, and the clearings on the eastern border were designated as those of McNamee and Abraham Boom. It is not known which one of these men came first. Before that time Old Fort Schuyler was an advantageous place of trade between the outlying settlements and the Indians, as there was here a fording place across the Mohawk River and the old Indian path from Oneida Castle here intercepted the path along the river side leading to the portage of Fort Stanwix (now Rome). In 1798 the village was incorporated under the name of Utica, and in 1832 was chartered as a city.

Population.— The population of Utica by the last local census, made in May 1903, was about 64,000. The last Federal census, in 1900, gave it as 56,383. The city's growth since 1900 has been remarkable. Allowing the city to have a population of 64,000, there are as many more within a radius of 20 miles, for which Utica is the commercial and industrial centre.

GEORGE E. DUNHAM,
Editor 'Utica Press.'

Utica, North Africa, an ancient city 27 miles northwest of Carthage; originally founded as a Phœnician colony in 1101 B.C. During the third Punic war Utica submitted to Rome, and became the capital of the province of Africa. Afterward it was the see of a bishop, till its destruction by the Arabs. Its ruins include an amphitheatre, an aqueduct, and the remains of quays, formerly connected with the sea, now nearly 10 miles distant, by the ancient river Bagradas, the course of which has since diverted to the east.

Utica Slate. A black more or less carbonaceous, and silicious clay slate (*Carbonaceous argillutyte*) prominently developed in the Mohawk Valley of New York State, and deriving its name from the outcrops in the vicinity of Utica, N. Y. It is also recognized in the Champlain Valley, and in the northern Appalachian region, but beyond these localities their beds are represented by more calcareous or silicious shales and arenytes. These shales rest upon the Trenton limestone and are succeeded by the more arenaceous Lorraine beds. The chief fossils of the Utica slates are the trilobite *Triarthus beckii*, and graptolites of the genus Diplograptus. See ORDOVICIAN.

Utilitarianism is a term that was first employed by John Stuart Mill in a philosophical sense, to denominate a theory of morals that had already been formulated by the Greeks, but which reached its fullest development in England during the latter part of the 18th and the beginning of the 19th centuries. Mill tells us that he adopted the word from a passing expression in Mr. Galt's 'Annals of the Parish.' His definition of the term is as follows: "The creed which accepts as the foundation of morals utility or the Greatest Happiness Principle, holds that actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness. By happiness is intended pleasure, and the absence of pain; by unhappiness, pain and the privation of pleasure. To give a clear idea of the moral theory, much more requires to be said: in particular, what things it includes in the ideas of pain and pleasure; and to what extent this is left an open question. But these supplementary explanations do not affect the theory of life on which this theory of morality is grounded — namely, that pleasure and freedom from pain are the only things desirable as ends; and that all desirable things (which are as numerous in the utilitarian as in any other scheme) are desirable either for the pleasure inherent in themselves, or as means to the promotion of pleasure and the prevention of pain."

Utilitarianism in England was not merely a philosophical doctrine during the first third of the 19th century. This theory of morals furnished the basis for a political and social propaganda. Of this movement Jeremy Bentham, James Mill, and his son, John Stuart Mill, were successively leaders, and its objects were distinctly radical and reformatory. The Westminster Review was founded in 1824 as the organ of the new radicalism, and proved of great influence in exposing abuses in the Constitution, in existing legislation and in the administration of justice. Bentham's most important work was in the field of legislative reform, while the Mills, father and son, who were better instructed in philosophical principles and possessed broader interests, upheld the cause of freedom and progress as well in social, economic, and religious matters. The best account of this movement, which had very important practical results, is found in Leslie Stephen's 'The English Utilitarians' (1900).

It is with utilitarianism as a theory of morals, however, that we are here most directly

concerned. The doctrine that pleasure is the end of life, which is at present usually denominated hedonism (q.v.), was first formulated by the Cyreniacs, and in a somewhat more developed form by Epicurus. In modern times this doctrine is found in Hobbes, who assumes that mankind is essentially egoistic, each individual seeking naturally what is of advantage to him. Although most of the English ethical writers of the 18th century refuse to accept the conclusions of Hobbes, they generally find difficulty in explaining why the happiness of other men should be sought by the agent, since they assume with Hobbes that it is a natural psychological principle that each seeks his own happiness. The tendency and obligation to seek "the greatest happiness of the greatest number" (an expression first employed by Cumberland) is either explained as a result of the psychological principle of association, or by taking refuge in a refined egoism through a demonstration that it pays to have regard to the happiness of others. That mankind is moved by genuinely altruistic impulses, that it is as natural to promote the good of our neighbor as to seek our own advantage, was perhaps first clearly stated by Butler in his 'Sermons on Human Nature.' Neither Bentham nor Mill, however, provides any adequate way of passing from the psychological principle, "each man naturally seeks his own pleasure," to the ethical doctrine that "the happiness of all should be sought by each individual." This latter principle, nevertheless, is that which the Utilitarians assume as the basis of their moral theory. Among the more important English Utilitarians are Cumberland, Hume, Gay, Paley, Bentham, James Mill, John Stuart Mill, and Herbert Spencer, who unites Utilitarianism with evolutionary theories.

The end of life, according to the Utilitarians, is, as we have seen, happiness. The theory thus insists that the moral quality of an act is determined by its consequences — an act being good that promotes happiness or prevents unhappiness, and wrong when it operates in the reverse direction. It is accordingly directly opposed to Intuitionism (q.v.), which declares that there is some natural quality in acts which constitutes them good or bad in themselves, and that this moral quality can be directly known without any reference to consequences. Thus an Intuitionist would say that lying is bad in itself and is directly perceived to be such, while the Utilitarian would find that its moral quality is determined by its results to the individual and to society. As we have seen, happiness means pleasure, and the avoidance of pain. The question arises whether anything more than the quantity of pleasure is to be considered in judging the morality of an action. Bentham and the older Utilitarians maintained that everything depends upon the amount of pleasure resulting from an act: "the quantity of pleasure being equal, push-pin is as good as poetry." John Stuart Mill, on the other hand, introduced the concept of qualitative differences in pleasures. "It is quite compatible with the principle of utility," he says, "to recognize the fact that some kinds of pleasure are more desirable and more valuable than others. . . . Of two pleasures if there be one to which all or almost all who have experience of both give a decided preference, irrespective of any feeling of moral obligation to prefer it, that is the more desirable pleasure. If one of the two is, by those who are completely acquainted with both, placed so far above the other that they prefer it even though knowing it to be attended with a greater amount of discontent, and would not resign it for any quantity of the other pleasure which their nature is capable of, we are justified in ascribing to the preferred enjoyment a superiority in quality, so far outweighing quantity as to render it, in comparison, of small account." This doctrine of a qualitative difference in pleasures doubtless is borne out by experience, and consequently is a practical advantage to the older Utilitarianism. But the objection has frequently been raised that to rank pleasures as higher or lower, irrespective of their quantity, is logically to abandon the utilitarian position. For it appears that it is only by introducing some other standard than pleasure itself that this gradation is possible. The Epicureans and the older Utilitarians had showed that pleasures of the mind, for example, were preferable to pleasures of the body by using the quantitative standard — that is, by showing that on account of their constancy, permanence, and the fact that they entailed no subsequent pain, they really exceeded the latter in quantity.

Utilization of Power. See Power, Utilization of.

Uto'pia, a political romance by Sir Thomas More, written in Latin in 1615. The original title was 'De Optimo Republicæ Statu, deque Nova Insula Utopia.' It was translated by Ralph Robinson in 1551 and by Bishop Burnet in 1683. The work is the source from which have been taken many of the socialistic ideas which are to-day occupying modern thinkers. At the time it was written, the author, fearing to acknowledge these ideas as his own, attributed them to a mythical person, Raphael Hythloday, lately returned from America, whither he had gone with Amerigo Vespucci. In describing a country which he had visited, called Utopia (meaning in Greek "no place"), he calls attention to abuses then prevalent in England. Many reforms which More suggested are no longer considered Utopian, among them, entire freedom in matters of religion.

U'traquists. See Calixtines.

Utrecht, ū'trĕkt (Dutch, ü'trĕHt), Netherlands, the capital of the province of Utrecht, situated on the Old Rhine, where the Vecht branches off from it, 22 miles southeast of Amsterdam. It is a pleasant town with fine shaded promenades, and intersected with canals. The old fortifications are laid out in boulevards, but a double line of new forts surrounds the city. There are several very old churches, including the Gothic Cathedral, built in the 13th century. Other notable buildings are those of the university, recently extended, the government building, the court house, and the archives, formerly the palace of King Louis Napoleon. The university has a library of 200,000 volumes and a

botanical garden. The industrial establishments include pigment factories, saw-mills, breweries, two organ factories, a number of cigar factories, an iron foundry, etc. The town is also one of the most important railroad centres in the kingdom. Utrecht is the oldest of the Batavian cities, and was called by the Romans *Traiectum ad Rhenum*. In 1579 the act of confederation of the Dutch provinces declaring their independence of Spain was signed here, and here the peace of Utrecht was concluded in 1713 between the powers in the war of the Spanish succession. Pop. (1901) 106,800.

Utrecht, Peace of, the peace secured in 1713 through several separate treaties signed by France as one party and by Great Britain, Holland, Portugal, Prussia and Savoy on the other, later acceded to by Spain, supplemented in 1714 by the treaty of Radstadt, between Germany and France, and by the Barrier treaty of 1715, between Austria, Great Britain and the Netherlands. Its provisions terminated the war of the Spanish Succession and recognized Philip V. of Bourbon as king of Spain, he to renounce all claim to the throne of France; Savoy received Sicily from Spain; Prussia was acknowledged as a kingdom, renounced her claim to Orange and was granted Neuchâtel and a portion of Gelderland; Austria received the Spanish Netherlands, Sardinia, the Milanese and Naples; the protection of Holland was secured by possession of certain fortified towns under the Barrier treaty; and France recognized the Protestant succession in England, relinquished to her all claims to Newfoundland, Nova Scotia, Hudson Bay and Straits, and Saint Christopher, W. I., reserving fishery rights on the shores of Newfoundland, and also confirmed England in the occupation of Gibraltar and Minorca, together with the privilege of supplying African slaves to America.

Utricula'ria. See BLADDERWORT.

Uvalde, ū-văl'dē, Texas, town, county-seat of Uvalde County; on the Southern Pacific railroad; about 95 miles west by south of San Antonio. It is in an agricultural and stock-raising region, and in the vicinity are asphaltum mines. The chief industrial establishments are lumber mills, a flour mill, and a machine shop. There are seven churches, separate public schools for white and colored pupils. The two banks have a combined capital of $83,000, and the national bank has deposits amounting to $100,000. Pop. (1890) 1,265; (1900) 1,889.

Uvar'ovite, a rare and beautiful emerald-green variety of garnet (q.v.), distinguished by its containing chromium. It has a hardness of 7.5 and a specific gravity varying from 3.41 to 3.52. It is usually found in limestone or associated with chromite. Its most celebrated localities are the Ural Mountains and Orford, Quebec, where it occurs in groups of small dodecahedral crystals.

U'vula. See PALATE.

Uxbridge, ŭks'brĭj, Canada, a town of West Ontario County, Ontario, on the Black River, and on the Toronto and Northern Railway, 43 miles northeast of Toronto. It has lumber and flour mills, and manufactures iron ware, mill machinery, engines, agricultural implements, woolens, etc. Pop. (1901) 1,657.

Uxbridge, Mass., town in Worcester County; on the Blackstone River, and on the New York, New Haven and Hartford railroad, about 19 miles southeast of Worcester. Uxbridge was formerly a part of the town of Mendon; in 1727 it was separated and incorporated under its present name. In 1772 the northern part of the town was set off and incorporated as Northbridge. The town includes the villages of Calumet, Hecla, Rivulet, Scott's, Wheelock's, Uxbridge, North Uxbridge, and Uxbridge Centre. The chief industrial establishments are cotton and woolen mills, machine shops, a furniture factory, and creameries. There are five churches, a high school, 17 district schools, a free public library. The national bank has a capital of $100,000, and the national and savings banks have combined deposits amounting to $640,860. Pop. (1890) 3,408; (1900) 3,599.

Uxmal, ooz'mäl, Mexico, an ancient Maya city now in ruins, in the northwest of Yucatan, about 60 miles southwest of Merida. It has vast remains of ancient grandeur, temples, cyclopean terraces, etc., extending over a large area. The principal ruins are the 'Casa del Gobernador' and the 'Casa de las Monjas.' The temples are said to have been used by the Indians as late as the 17th century.

Uz, Syria, a historical region mentioned in the Old Testament as the scene of the story of Job, and lying to the east or southeast of Palestine, probably in Hauran, the exact position not having been identified.

Uzanne, ü-zän, **Louis Octave,** French writer on bibliography and miscellaneous subjects: b. Auxerre 14 Sept. 1852. He founded (1880) 'Le Livre,' succeeded (1890) by 'Le Livre Moderne.' In 1889 he founded the Société des Bibliophiles Contemporains. Among his works are 'The Caprices of a Book-Lover' (1877); 'Her Highness, Woman' (1884); 'Our Friends, Books: Talks on Curious Literature' (1886); 'Modern Bindings'; 'Physiology of the Quays of Paris' (1890); 'The Bachelor's Prayer-Book' (1890).

Uzziah, ŭ-zī'a, king of Judah (792–740 B.C.). He is described in the Book of Kings as being a successful warrior and wise ruler, but was stricken with leprosy because he persisted against the high priest in offering incense in the Temple. Consult Smith, 'Prophets of Israel.'
