## VEGETABLE ROOTS

### ASPARAGUS ROOTS and SEEDS

**CULTURE:** Dig or plow out a trench 18 to 24 inches deep, put in plenty of well-rotted manure, covering it with a few inches of soil, then set the roots 1½ to 2 feet apart and cover with 4 inches of soil. In the fall, cut off and burn the top growth, plow or throw down the earth and give a good application of stable manure. Early in the spring fork this in and apply ground bone meal. If white asparagus is wanted draw earth around the stalks as they grow. Do not continue cutting too long as this exhausts the plants. 100 roots plant about 15x50 feet; 5,000 to 7,000 will plant an acre.

**Washington Rust-Resistant** 12 roots 85c; 25 for \$1.50; 50 for \$2.50; 100 for \$4.00, postpaid. Not prepaid, 12 roots 65c; 100 to 999 @ .03 each; \$22.00 per 1,000.

### 30 Topcrop

Top crop is a result of crossing Full Measure and Refuge No. 5 by Dr. Zaumeyer of the U.S.D.A., producing the outstanding characteristics of earliness and productiveness. Hardy and widely adapted. Plants are mosaic resistant, producing very round, tender, meaty, 5½ to 6 inch long pods, which are stringless and fiberless. In a recent Experimental Station Test Topcrop averaged 262.2 bu. per acre compared with 197.8 bu. per acre for Tendergreen; although Tendergreen holds up in marketing better than Topcrop. Fine for canning and freezing. 50 days. Pkt. 15c; ½ lb. 45c; lb. 75c; 2 lbs. \$1.30; 3 to 9 lbs. @ 55c lb.; 10 to 24 lbs. 47c lb., postpaid.

**CULTURE:** Plant in the spring after danger of frost and the soil is warm, occasional earlier plantings may be made. For a continuous supply plant every 2 to 3 weeks until late August. Select any well drained soil of loose texture with a pH of 5.5 to 6.5. Fertilize with 800 lbs. of 6-12-6 per acre (3 quarts per 100 ft. row). Snap beans are susceptible to fertilizer injury, mix fertilizer well with soil or apply in bands on each side and below seed. Make rows 2½ to 3 feet apart and plant seed 1½ inches deep and 2 to 3 inches apart. Cultivate shallow. Do not cultivate or pick beans when vines are wet. Sidedress at time of bloom with 15 pounds nitrogen per acre (½ cup of Nitrate of Soda, or equivalent, per 100 ft. of row). Fifty pounds of seed to plant one acre; one lb. per 200 feet of row.

**CULTURE:** Celery is a cool season crop and should be seeded in a protected bed 10 to 14 weeks before field setting. It will stand light spring frosts, and should be set in the field slightly before the last frost in the spring. Premature seeding will result from too long exposures to cold. Delayed planting will result in poor quality due to the effects of hot weather. A good, loamy soil, high in organic matter with a pH of 6.0 to 6.5 is desirable. Mix thoroughly with the soil 1,500 lbs. of 5-10-10 fertilizer per acre (6 qts. per 100 ft. of row). Transplant to field when plants are 5-6 inches high. Plant in rows 18-30 inches apart with plants 6 to 8 inches apart in the row. Sidedress with 15 lbs. of nitrogen three times at 2 week intervals, beginning 3-4 weeks after transplanting to field. ## Wyatt's Western Grown CUCUMBERS

Make first planting after last frost in spring and a second planting 3 to 4 weeks later. Fertilize with 800 lbs. of 8-8-8 per acre (3 qts. per 100 ft. of row) 7-10 days before planting. Plant in rows 5 feet apart and drill seed so that a final stand of one plant every 12-14 inches is obtained. Cultivate shallow and early to keep weeds down. Sidedress with 15 lbs. of nitrogen (½ cup of Nitrate of Soda, or equivalent, per 100 ft. row) when plants are 6 inches tall.

Two pounds of seed will plant one acre; ½ oz. per 100 ft. of row. To reduce disease, seeds should be wet treated with mercuric chloride. Do not plant after other vine crops like watermelons, squash, cucumbers or cantaloupes.

**251 Ideal or Large Adams** Not a sugar corn but grown very extensively in all states. It is similar to Extra Early Adams but about two weeks later. Ears are 8 inches long. 65 days. Pkt. 15c; ½ lb. 35c; lb. 60c; 2 lbs. 95c; 3 to 9 lbs. @ 38c lb.; 10 to 24 lbs. @ 30c lb., postpaid.

**CULTURE:** Sweet corn, a warm season annual, is increasing rapidly in importance in the South. Improved methods of refrigeration and handling which reduce the rate of loss of sugar, have made it possible to produce sweet corn commercially. It is a standard crop in home gardens. After harvest, sweet corn should be immediately placed in temperature conditions of 35-40 degree F to prevent the loss of sugar and a lowering of quality. It can be grown on a great variety of soils. A well drained sandy loam with adequate humus supply and moisture is desirable. Fertilize with 500 lbs. of 8-8-8 per acre (2 qts. per 100 ft. of row) prior to planting the seed. Sweet corn responds to nitrogen sidedressing. Apply about 80 lbs. of nitrogen in split applications, 40 lbs. (1½ cups of Nitrate of Soda, or equivalent, per 100 ft. of row) when plants are about knee high and 40 lbs. when tassels begin to show. Plant seed in hills one foot apart, or drill seed and thin. One or two plants per foot is recommended. Rows should be spaced 3 feet apart. Two ounces of seed to plant 100 ft. of row; 10 lbs. seed per acre.

Seed may also be drilled in the row in late winter. A fertile, well drained soil, fairly high in organic matter with a pH of 6.0-6.5 is best suited for onions. Apply fertilizer in the rows at the rate of 700-1,000 lbs. of 5-10-10 per acre (2½-4 qts. per 100 ft. of row) about one week before seeding or transplanting. Sidedress with 30 lbs. of nitrogen per acre (1 cup Nitrate of Soda, or equivalent, per 100 ft. of row). For the transplant crop, apply nitrogen about February, and for crop seeded direct in the rows apply when plants are about 6 inches high. Plant in rows 1½-3 feet apart and space, or thin, plants to 4 inches apart in the row. # TOMATOES

## Plant Successively, Grow a Surplus to Can

**CULTURE:** The tomato is a warm season crop and requires a relatively long season. It is tender and will not withstand a hard freeze. The general practice for a spring crop is to sow the seed in a warm protected bed in late January or early February. The seedlings may be transplanted to a cold frame prior to transplanting to the field, or they may be thinned and transplanted direct from the original bed. In either case, the plants should be hardened sufficiently to stand the field conditions. They should not be set to the field before the danger of freezes is past. The tomato is grown on all types of soil from sands to heavy clays. A sandy loam, moderately high in organic matter and nitrogen, with a pH between 5.5 to 6.5 is most desirable. Fertilize with 800 to 1,200 pounds of 5-10-10 per acre (3-5 qts. per 100 ft. of row). After about 3 weeks in the field, apply 30 pounds of nitrogen in 15 lb. applications (½ cup of Nitrate of Soda, or equivalent, per 100 ft. of row) at 2 week intervals. Space plants 2 to 3 feet apart in rows 4 to 5 feet apart. One-fourth pound of seed will produce enough plants for one acre.

# Vegetable Planting Calendar

Many otherwise successful gardeners lose months of valuable production because of a failure to realize the cold hardness of a number of the most popular and productive vegetables.

By successive plantings beet, broccoli, cabbage, carrot, chard, kale, mustard, onion, parsley, radish, spinach and turnip (salad or root) can be kept in production, out-of-doors and without protection winter or summer, every day in the year in this isothermal zone.

The planting information shown in the chart on this page is the result of careful preparation and years of actual gardening experience. Planting dates shown for tender varieties are

based on the average U. S. Weather Bureau records of the last killing frost in the spring and the first killing frost in the fall in this zone, for the past 50 years.

Throughout our catalog we have endeavored to give the approximate number of days to maturity for all varieties. This information should be helpful, especially in determining the latest safe date to plant tender varieties in the summer or fall, in order to make a crop before frost.

Soil conditions permitting, we recommend planting on or immediately after the average date of the last frost in the spring, otherwise spring rains may delay planting days or weeks.

## "TESTED SEEDS"

The term "tested seeds" as used in this catalog, and in all of our advertising means that every bag or package of seeds purchased at Wyatt's is supplied from a lot that has been carefully tested by the North Carolina Seed Testing Laboratory and the seeds are known to grow. Every lot of seeds reaching our warehouse is sampled and tested before the seeds are moved into our store for packaging or for sale in bulk. This accounts for the fact that "Wyatt's Tested Seeds" are more and more in demand in North Carolina and in the South.

Plant Wyatt's Tested Seeds and be sure of success.

Water and fertilizer penetrate deeply, feeding the roots as needed.

Remember, your garden can be no better than your soil. Get Premier Peat Moss, with the certified seal.

## Ten Steps in Lawn Building

- 1—Break or plow deeply with subsoil or similar plow to prevent burying top soil—then level or grade as needed.
- 2—Apply the equivalent of 3 heavy green cover crops or 3 inches weed free manure or both if available.
- 3—Apply lime as needed up to 50 lbs. per 1,000 sq. ft. and fertilizer 50 lbs. per 1,000 sq. ft.
- 4—Pulverize and smooth surface.
- 5—Seed 6 lbs. Carolina, Sunny South or Shady Nook mixture per 1,000 sq. ft., between September 1 and March 15.
- 6—Soak thoroughly but slowly to avoid moving seeds. Keep moist until grass is up. Soak occasionally during dry periods.
- 7—Mow Bermuda and rye grasses close and often; Blue grasses and fescues no closer than 2 inches nor more often than necessary, particularly during hot, dry seasons.
- 8—Compost clippings with liberal amount of sand and return to lawn in light applications as mulching during summer.
- 9—Feed at 8 weeks intervals, year 'round, with 20 to 40 lbs. per 1,000 sq. ft., high grade fertilizer or 50 to 100 lbs. per 1,000 sq. ft. sheep manure, or both. Always sprinkle after feeding.

**1913 Glamour** A.A.S. 1942. Truly one of the loveliest Petunias we have ever grown. The flowers range from 4 to 5 inches across; they are artistically waved and ruffled, and the color is a beautiful salmon rose with golden veining on the white throat. Pkt. 25c; 3 pkts. 65c.

**1914 Theodosia** Large bright rose-pink flowers with a golden throat. Pkt. 25c; 3 pkts. 65c.

**1928 Comanche** The reddest red petunia ever offered. No fading. Pkt. 50c.

Sow the small seeds in a warm, sunny, open place outdoors, thinning to 15 inches apart, or in frames for transplanting. Scatter seeds thinly, barely cover and firm soil over them; water seedlings with a fine spray to prevent drying out. The weakest looking seedlings usually produce the finest flowers, so save the weak plants for transplanting. Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

Since, however, its own color is so showy in itself, it is well worth growing as an accent or specimen group. Pkt. 25c; 4 pkts. 75c.

**1912 Snow Storm Improved** The flowers are the purest white with yellow shaded throat. The uniformity of the dwarf compact growth is marvelous. Pkt. 25c; 3 pkts. 65c.

# CLOVER SEEDS

F97 Alfalfa

F94 Lespedeza, Rowan

## F89 Ladino Clover—More Popular Every Year

A perennial clover of exceptional merit for pastures, especially on moist, fertile land. Recovers rapidly from grazing or clipping and is leafy and succulent. Its growing season is as long as that of any other legume. Like all clovers, Ladino succeeds best on well limed and fertilized land. Sow 5 to 6 pound per acre alone or 1 to 3 pounds in mixtures. Prices: Calif. Blue Tag Certified lb. \$1.30; 2 to 9 lbs. \$1.10 per lb.; 10 to 49 lbs. @ 97c lb., postpaid. Not prepaid 10 to 49 lbs. @ 90c lb.; 50 lbs. or more @ 85c lb.

## ALFALFAS

**CULTURE:** Alfalfa is a relatively expensive crop, but the first cutting usually returns about double the cost of seeds, lime, fertilizer and planting. A good method is to lime the land and plant an annual legume crop that can be thoroughly disked, not turned, in preparing the alfalfa seed bed. Use 20 to 35 pounds (not more) borax per acre and drill August 20 to October 1, or February 15 to March 25, 25 to 40 pounds of thoroughly inoculated seeds per acre. Roll or cultipack after seeding. At seeding time use 1,200 pounds 2-12-12 and 8-10 tons barnyard manure if available and not weed infested. Apply 400 pounds 0-12-12 annually thereafter. Cut before  $\frac{1}{4}$  flowers open. Always leave the alfalfa stand 6 inches tall or more for winter since any closer cutting invariably results in severe damage. If your stand of alfalfa becomes thin or weak sow 3 to 5 lbs. Orchard grass per acre to help control weeds and increase production.

**F97 Alfalfa (Oklahoma)** We handle only quality, noxious weed free Alfalfa seeds. Prices: lb. 95c; 2 to 9 lbs. 75c per lb.; 10 to 59 lbs. 62c per lb., postpaid. Not prepaid, 10 to 59 lbs. @ 55c; 60 lbs. or more @ 50c lb.

**F95 Atlantic Alfalfa** N. C. Experiment Station reports up to a fifth more production with Atlantic than with other adapted strains, following good practices. We offer premium quality seeds of the highest purity. Prices: lb. \$1.10; 2 to 9 lbs. 91c per lb.; 10 to 59 lbs. @ 78c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 71c; 60 lbs. or more @ 66c lb.

**F96 Buffalo Alfalfa** Buffalo Alfalfa, slightly more winter hardy and adapted anywhere Kansas Common is grown, was developed at the Kansas Agricultural Experiment Station from an old strain of bacterial resistant Kansas Common Alfalfa which had been under observation since 1922. It is the most resistant to wilt of all alfalfas for this area. Yields the first 2 or 3 years after planting are about the same as Common. After this period Buffalo maintains a good productive stand while the common strains drop off sharply to  $\frac{1}{3}$  or  $\frac{1}{4}$  stand. We offer only the purest seeds from the original selection. Prices: lb. \$1.05; 2 to 9 lbs. 85c per lb.; 10 to 59 lbs. @ 72c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 65c; 60 lbs. or more @ 60c lb.

**F98 Alfalfa (Kansas)** Recommended because of its cold resistance. We consider our Oklahoma seeds equal to it in every respect and usually a few cents per pound cheaper. Prices: lb. 95c; 2 to 9 lbs. 77c per lb.; 10 to 59 lbs. @ 64c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 57c; 60 lbs. or more @ 52c lb.

**F83 Crimson Clover** Should be sown from August to October, 25 to 30 pounds per acre; with grain or vetches, 15 pounds. Prices: lb. 70c; 2 to 9 lbs. @ 50c lb.; 10 to 59 lbs. @ 37c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 30c lb.; 60 lbs. or more @ 25c lb.

**F87 White Blossom Sweet Clover** Adapted to most soils; is used for pasture, forage, ensilage, bees, soil improvement and inoculant, and grazing. Especially good as a manure crop and to inoculate the soil in preparation for a crop of alfalfa. The roots break up, aerate and drain stiff subsoils and add humus. Spring sowings will yield a crop the following fall and two crops the following year. Sow 15 pounds per acre July to October or February, March. Prices: lb. 75c; 2 to 9 lbs. @ 57c per lb.; 10 to 59 lbs. @ 44c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 37c lb.; 60 lbs. or more @ 32c lb.

**F80 White Dutch Clover** Because of its spreading habit and persistent year 'round growth White Dutch is invaluable for lawn and pasture use. It grows in all soils and will grow both in the shade and open areas responding to lime and fertilizers recommended for other clovers. Like other clovers White Dutch enriches the soil while furnishing nutritious grazing. Sow 6 to 8 pounds per acre alone or 2 to 3 pounds with other clovers or grasses. Prices: lb. \$1.55; 2 to 9 lbs. @ \$1.35 lb.; 10 to 59 lbs. @ \$1.22 lb., postpaid. Not prepaid, 10 to 59 lbs. \$1.15 lb.; 60 lbs. or more @ \$1.10 lb.

**F82 Red Clover (N. C. Grown)** One of the most productive of the clovers. Well adapted to our Piedmont soils. Especially valuable in pasture mixtures, soil building and hay making. Sow early spring or fall 20 pounds per acre. Lime and fertilize as for other clovers. Prices: lb. \$1.20; 2 to 9 lbs. @ \$1.00 per lb.; 10 to 59 lbs. @ 87c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 80c lb.; 60 lbs. or more @ 75c lb.

**F81 Red Clover, Kenland** High yielding, double cut anthracnose resistant Red Clover adapted to the Southeastern Clover belt. Culture same as for other clovers. Prices: lb. \$1.25; 2 to 9 lbs. @ \$1.07 per lb.; 10 to 59 lbs. @ 94c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 87c lb.; 60 lbs. or more @ 82c lb.

**F84 Reseeding Crimson Clover** The Crimson Clover you plant only once. For early Spring grazing, winter cover, erosion control and soil building. Prices: lb. 75c; 2 to 9 lbs. @ 55c per lb.; 10 to 59 lbs. @ 44c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 37c lb.; 60 lbs. or more @ 35c lb.

**F95 Sericea Lespedeza (Perennial)** Scarified and re-cleaned. It grows on the poorest soils without fertilizer or lime and while it steadily improves the land, it produces an abundance of nutritious hay if cut when tender. Prices: lb. 75c; 2 to 9 lbs. @ 55c lb.; 10 to 59 lbs. @ 57c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 50c lb.; 60 to 99 lbs. @ 45c lb.; 100 lbs. or more @ 43c lb.

**F94 Rowan Lespedeza** A new high yielding variety of Korean Lespedeza, resistant to powdery mildew and two common forms of rootknot nematode. In N. C. its superior yielding ability has been particularly striking on nematode infested soils, where in trials, it has doubled the yield of Korean. On nematode free soils, differences have not been as great, but it is considered superior to common Korean where nematodes are not a problem. Rowan is not resistant to all forms of nematode. It is adapted throughout the Korean belt and matures about the same time as Korean. In the tidewater area, Kobe is still recommended. Prices: lb. 85c; 2 to 9 lbs. @ 67c lb.; 10 to 24 lbs. @ 52c lb., postpaid. Not prepaid, 10 to 24 lbs. @ 54c lb.; 25 to 99 lbs. @ 44c lb.; 100 lbs. or more @ 42c lb.

**F93 Kobe Lespedeza** A variety particularly adapted to lowlands and lighter soils. The leaves and stems are slightly coarser making a heavier hay crop. Recommended by Experiment Stations for all but the mountainous regions of North Carolina, South Carolina and Virginia. Sow 30 to 40 lbs. per acre. Responds to liming and fertilizing. Write for prices.

**F92 Korean Lespedeza** Does best in heavy soils. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is almost equal to alfalfa in feeding value, and compares favorably in fineness, palatability and protein content. Korean is earlier than other lespedezas, enabling harvest in time for planting small grain. Sow 30 pounds of seed per acre February to April. Write for prices.

## COKER CORN HYBRIDS

These two white hybrids of proven merit were bred from inbred lines selected from Southern varieties that have proved their ability to successfully meet southeastern corn problems.

Their important characteristics are: good root system and excellent stalk strength; high yield of good quality, hard white, dented grains. Plants have broad dark green leaves resistant to blights; stalks medium short, very sturdy with ear placement medium low and turned down at maturity, reducing weather damage.

**Coker 811.** A widely adapted hybrid of proven merit for the Coastal Plain and Southeast with tight husks that amply cover the ears giving good weevil resistance. Medium late maturity. Prices: \$12.50 a bushel. Not prepaid.

**Coker 911.** This hybrid has the same general characteristics as Coker 811, except Coker 911 is adapted and recommended in the Piedmont. Medium maturity. Prices: \$12.50 a bushel. Not prepaid.

Corn, Coker 811

### ADAPTED CORN HYBRIDS

**F5 N. C. 29 (White)** A pure white, 2-ear hybrid with a white cob. A high yielder, comparable to N. C. 27 (yellow) except under conditions of a severe drought. Grain quality and weevil resistance are also about equal to N. C. 27. The two good ears per stalk are well protected by fairly tight husks. N. C. 29 is slightly later than N. C. 27. Stalks are vigorous, stand well and moderately resistant to leaf spot and brown spot. The good qualities of this hybrid coupled with its white cob make it an excellent milling variety for the Coastal Plain where it is recommended. Prices: 7 lbs. (½ pk.) \$2.45; 14 lbs. (pk.) \$4.35, postpaid. Not prepaid, 7 lbs. \$1.85; 14 lbs. \$3.40; 56 lbs. (bu.) \$11.90.

**F14 N. C. 31 (White)** Released by the N. C. Agricultural Experiment Station in 1951 for seed production and general distribution last year. Ears are larger tending toward a one-ear variety, producing a high yield of excellent milling corn on white cobs. Grain quality equals and stalk strength is as good or better than N. C. 27. **F44 Kentucky 31 Fescue-Certified** A tall or giant Fescue adapted to a wide variety of soils and uses. Like most long lived grasses, growth is slow after germination and should not be grazed until 6 inches high. Once established it promises to be the most versatile and valuable grass in a generation. It is the highest yielding grass in virtually every experiment station where it has been tried; is palatable and grows over a longer period each year than other grasses. This giant has a remarkable resistance to drought and its dense, deep roots make it ideal for erosion control, soil building, weed control, roadside planting, athletic fields, parks, airports, etc. In combination with suitable legumes it produces an excellent almost year 'round pasture. Because it has no underground root stocks it cannot become a pest and is readily killed by plowing. Continued high yields will require feeding, especially nitrogen which may be supplied partly by seeding with clover. Seed in a prepared, firm seed bed fall or early spring 15 to 20 lbs. per acre alone; 8 to 12 lbs. with 3 lbs. Ladino, White Clover, or 15 lbs. Lespedeza. Prices: lb. 80c; 2 to 9 lbs. @ 60c; 10 to 24 lbs. @ 47c, postpaid. Not prepaid, 10 to 24 lbs. @ 40c; 25 to 99 lbs. @ 38c; 100 lbs. or more @ 36c lb.

## HEGARI

**F197 Hegari** Recognized as the most valuable and widely adapted member of the sorghum family, and well suited to conditions in the Southern states. Hegari has great forage value for two reasons. First because its high sugar content makes stalks and leaves highly palatable to livestock, and second, it yields heavily with its many broad leaves and substantial stalks. As an ensilage crop many acres are planted to Hegari every year in the South. As a pasture crop, in thickly seeded plantings it pastures well and also makes good hay. Its largest use is in bundle feeding and it can be left shocked in the field until fed, or as is coming into more general practice, it is ground head, stalks and leaves through a hammer mill. Hegari makes a good substitute crop for corn, which it out yields on light soils, and it can be planted much later. Prices: lb. 55c; 2 to 9 lbs. @ 35c; 10 to 24 lbs. @ 22c lb., postpaid. Not prepaid, 10 to 24 lbs. @ 15c; 25 to 99 lbs. @ 12c; 100 lbs. or more @ 10c lb.

F47 Orchard Grass Seed Production

## For Better Stands of Clean SORGHUMS Treat Your Seed With DuPont ARASAN

Protect your sorghum seed against diseases that cause it to rot in the ground. These diseases cause poor stands, low yields and smut.

## Pre-Tested INOCULANTS

More and more growers have become convinced that the use of a good inoculator . . . on legume seed just before every planting . . . pays big returns.

Before being released for use, every lot of NOD-O-GEN is pre-tested in Laboratory and greenhouse to make sure of the presence of billions of vigorous bacteria of the right kind. Be sure to name seeds to be inoculated when ordering.

Inoculation of Legume Crops improves their quality, insures a better and more luxuriant growth and a bigger yield. Well inoculated legumes also enrich the soil, as inoculation with Legume nodule bacteria enables the legume plant to utilize nitrogen from the air.

**SAVE LABOR . . .** Sinkers are planted to a stand. No labor for thinning! Rapid Sinkers germination permits cultivation within a week, saving greatly on chopping labor. Sinkers early maturity means lower first picking costs and higher grades.

**SAVE MONEY . . .** Planting Sinkers saves money. Plant only ¼ the amount of Sinkers you do of fuzzy seed. The great saving in time and labor throughout the planting and growing season means a great saving to you in money.

F145 Soybean, Lee

## SOYBEANS

**F143 Roanoke** A new bean developed in the N. C. Experiment Station, U.S.D.A. Co-operating. Bean yield is higher than other popular varieties and the oil content of the bean is higher. Prices: 15 lbs. (pk.) \$2.50, postpaid. Not prepaid, 15 lbs. \$1.50; 60 lbs. (bu.) \$5.00; 2 bu. bags or more @ \$4.75.

**F144 Jackson** A new soybean developed by the U.S.D.A. and co-operating State Experiment Stations. Adapted in the Coastal Plain and Gulf Coast areas of the Southeast, Jackson is expected to lower soybean production costs through higher yields, resistance to lodging, seed quality, oil content and other desirable characteristics. Plants average 39.6 inches high compared with Roanoke 36.5, yield is ½ to 2½ bushels per acre better than Roanoke, a day or two later, and oil content 21.7 compared with 22 per cent for Roanoke. A most important characteristic is Jackson's ability to make taller growth on lighter soils and produce higher yields of beans than comparable varieties. Prices: 15 lbs. (pk.) \$2.95, postpaid. Not prepaid, 15 lbs. \$2.00; 60 lbs. (bu.) \$6.50.

**F145 Lee** A new variety developed by the U.S.D.A. and co-operating State Experiment Stations in the Southeast. It is the most shatter resistant variety so far developed and is resistant to several major soybean diseases. Lee has shown little shattering 8 to 10 weeks after maturity and is expected to replace Ogden for this reason. Lee is also more tolerant to rootknot nematode than Ogden.

This variety is especially adapted to the eastern two-thirds of North Carolina and a large area of the Southeast and Mid-South. Yields averaged 29.3 bushels per acre in over 90 tests in 12 Southeastern states during 1951-53. Oil content averaged 21.5 for Lee and 21.3 for Ogden. Plants average 30 to 36 inches high, have moderate sized stems, heavy foliage and purple flowers. Supply limited. Write for Prices.

**F146 Ogden** Ogden is considerably earlier than most beans and is consequently better adapted to rotations with small grains. Seedings as late as June in the Wake County trials made a substantial production of hay. Average bean yield from 6 tests at scattered points in the state during 1943 was 27.8 bushels per acre. Plants are nicely branched and for that reason are more desirable for hay than the coarser growing types. Prices: 15 lbs. (pk.) \$2.50, postpaid. Not prepaid, 15 lbs. \$1.50; 60 lbs. (bu.) \$5.00; 2 bu. bags or more @ \$4.75.

**F150 Volstate** A yellow seeded variety producing high yields of good oil beans. Plants are somewhat taller than Ogden and slightly less branched. For a hay crop or a crop that might be optional we recommend Ogdens, but for a crop planted on light land and for combining we recommend Volstate owing to the height of the plant and the fact that the beans are somewhat bunched on the plant. Write for prices.

Prices subject to change.

## COWPEAS

**F113 Mixed Cowpeas** Good quality Cowpeas are quite scarce due to drought conditions prevailing over most of the producing areas.

### F226 NC-2

This is one of the new peanuts developed by the N. C. Experiment Station. The superior vigor and uniformity of NC-2 resulting in higher yields and a greater percentage of extra large kernels of higher market value make it a more profitable variety. Compared with good farm stock seeds in 14 tests during 1952 in the 8 largest N. C. peanut counties, NC-2 produced 2657 to 2411 pounds per acre; 68% against 64% marketable; 37% extra large kernels to 28% in the farm stock and brought a total average of \$12.87 per 100 lbs. compared with \$12.01, for a per acre average earning of \$341.96 for NC-2 compared with \$289.56 with farm run. A similar superiority prevailed in 6 tests during the dry 1954 season.

NC-2 is a semi-bunch variety with large leaves, heavy stems; highly resistant to Southern Stem rot. Prices: (For shelled nuts) N. C. Certified Seeds; lb. 85c; 2 to 9 lbs. @ 65c; 10 to 24 lbs. @ 52c, postpaid. Not prepaid, 10 to 24 lbs. 45c; 25 to 99 lbs. @ 42c; 100 lbs. or more @ 40c lb.

# WYATT'S TOBACCO SEEDS

## BLACK SHANK RESISTANT

### F262 Oxford 1-181, Certified

Shows Black Shank resistance comparable to Oxford 1. However, heavy losses may occur where Black Shank is severe, especially if unfavorable soil and climatic conditions exist. For best results, a good rotation is very important. This variety is very similar to that of such medium broad leaf varieties as Virginia Bright Leaf and Bonanza. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

## GRANVILLE WILT and BLACK SHANK RESISTANT

### F266 Dixie Bright 101, Certified

Dixie Bright 101 has moderate resistance to Black Shank and high resistance to Granville Wilt. Grows tall and normally produces broad and well proportioned leaves of medium length. Since the crop grows with a yellow cast, it must appear well-ripened when primed; so as to prevent the leaf from curing white. Suitable throughout the state where growers are using a rotation to keep Black Shank infestation down, or where both Black Shank and Granville Wilt are present, or where Granville Wilt alone is present. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

### F261 Dixie Bright 102, Certified

Probably the highest quality variety available today, having high resistance to Black Shank and Granville Wilt. Dixie Bright 102 needs to be primed when mature and ripe and can be cured to a rich lemon color. The variety is suitable throughout the state where Black Shank and Granville Wilt are present. Fertilize liberally on lighter soils. Space plants 16 to 18 inches in the row and top high. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

## MH-30

(Maleic Hydrazide)

## SUCKER GROWTH INHIBITOR

Field tests have been run by experimentation workers on flue-cured tobacco in the Southeastern States for the last three years. Results have consistently shown that when properly applied, MH-30 will effectively prevent development of suckers with no reduction in yield or adverse effect on quality. MH-30 is simple to apply and has saved money over costs of hand suckering.

MH-30 is a plant-growth inhibitor. When applied to tobacco plants, it is absorbed and moves internally to various parts of the plant. Those cells which have already formed when MH-30 is applied continue to expand and develop normally so that yield is not reduced but development of new growth (the suckers) is prevented.

MH-30 does not kill tobacco suckers—it keeps them from growing. Best results are obtained by applying MH-30 when plants require topping, but before suckers appear or are less than two inches long. 3 Quarts per Acre. Prices: 1 qt. \$7.35; 1 gal. \$20.80, postpaid.

Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

### F254 Oxford 26, Certified

Highly resistant to Granville Wilt, also showing some resistance to Fusarium Wilt. Recommended only for fields known to be contaminated with Granville Wilt. This strain is highly resistant, but for best results should be grown on soil rotated to other crops for 1 to 2 years. It can be planted closer together in the row for increased yield and the quality compares favorably with other varieties. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.

### F269 Dixie Bright 27, Certified

Has about the same degree of resistance to Granville Wilt as Oxford 26. No Black Shank resistance. Yields 200 to 400 pounds more per acre than Oxford 26. Allow to become well-ripened before harvest. Prices: oz. \$2.00; ¼ lb. \$7.00; lb. \$26.00, postpaid.
